of the 1950s and 1960s. The later movements’ ability to mobilize mass interracial support, their thoroughly articulated commitment to nonviolent resistance based on Christian morality, and their focus on integration and legal rights distinguish these predecessors from Don’t Buy Where You Can’t Work campaigns. During the 1960s, Operation Breadbasket, under the leadership of Reverend Jesse Jackson, revived economic boycotts against large-scale retail establishments in Chicago. This incarnation of consumer boycotts, however, occurred after the civil rights’ victories of the mid-1960s, when African-American political movements began to shift their focus from legal rights to economic power, and from integration to nationalism.

DORR WAR

The colony of Rhode Island, founded in 1636 by Roger Williams, was an oasis of religious and political freedom in New England. Although nearby settlements coveted the diminutive area, Williams and especially Newport physician John Clarke secured a liberal charter in 1663 from King Charles II, son of the slain monarch executed during the Puritan revolution in England. The document actually encouraged Rhode Island to experiment with religious toleration and representative democracy in the face of neighboring Puritan orthodoxy and the religious fratricide that recently ripped the mother country. The charter empowered the Rhode Island General Assembly to determine voting rights. These early legislators tied the franchise to land ownership, empowering most residents in this agricultural area.

After the American Revolution grafted some of the Ocean State’s liberal tradition into the nation’s new polity, Rhode Island engineered the country’s industrial revolution at Slater’s Mill in Pawtucket in 1790. In the ensuing half-century, native-born citizens and immigrants flocked to the expanding textile industry that paid workers, including children, in hard currency. As pioneering factory laborers abandoned farms, they also lost the land that allowed them to reach the \$134 threshold to vote. By 1840, almost 60% of adult white males did not own enough property to qualify to cast a ballot.

Nor could they serve on a jury, initiate legal action, or participate in other civic functions. Nonetheless, they still had to pay taxes and perform militia and fire brigade service. The state degenerated into a declining democracy, governed by an ancient English parchment. The King Charles Charter, once a blueprint for enlightened and tolerant government, now accomplished the opposite of its original intent.

Furthermore, Rhode Island’s earliest rural towns enjoyed greater representation in the legislature despite dwindling populations and paltry tax payments while the new industrial cities suffered from underrepresentation while paying the lion’s share of financial assessments. The tiny municipality of Middletown, for example, with a population of 1300 sent four delegates to the general assembly while the capital city of Providence with 23 thousand inhabitants had the same number of representatives. Adding insult to injury, the eldest sons of eligible voters could cast a ballot under the antique provisions of primogeniture that harked back to medieval Europe and outlasted the American Revolution.

Numerous attempts at constitutional change in the first two generations of the nineteenth century failed despite a powerful alliance between skilled workers

and some of Rhode Island's elite, most notably Thomas Wilson Dorr, a Harvard-educated lawyer imbued with the democratic passion of the Founding Fathers not to be taxed without democratic representation. The aristocratic Dorr championed the rights of the handful of pre-famine Irish-Catholic immigrants who became a flashpoint in the Yankee backlash to reform. On a personal level, he also supported voting privileges for African-Americans, a stand that his followers narrowly defeated as too provocative in a constellation of already radical proposals.

In the face of the state's ruling class—a group of about 8,000 freemen in a population of about 100 thousand—Dorr brilliantly orchestrated the passage of a People's Constitution in 1841. In a scrupulously documented three-day election, the forces of change allowed both freemen who could already vote as well as those who would be empowered under Dorr's proposed liberal provisions. In a stunning victory, Dorr and his followers won a clear majority from both sets of voters who endorsed a new constitution that did away with most financial qualifications.

The political leadership of the ruling opposition (the Whigs)—unwilling to recognize the legitimacy of the extralegal election—organized their forces into the Law and Order party and prepared a multifaceted reaction, especially on the judicial and military front. They finally offered some reform measures of their own (although they had fought all such measures prior to the reform election) while at the same time the state Supreme Court accused the Dorr juggernaut of treason against the state. Lines had hardened since the astonishing victory of the People's Constitution. The Law and Order party fanned the flames of class warfare and prejudice against the state's small Irish immigrant population in order to unite its own conservative Yankee base. The local press, stalwarts of the status quo, forcefully attacked the radical nature of the reforms. The state militia prepared to mobilize.

Scheduled elections in the spring of 1842 pitted moderate Democrats against the ruling Whigs, who won handily. However, Dorr's backers scheduled another extralegal vote at the same time and chose Dorr as the state's chief executive along with a slate of delegates. Rhode Island now had two sets of governors and legislators.

Dorr, Rhode Island's inadvertent leader, threw caution to the wind and led his forces in an inconclusive midnight attack on the state arsenal in May 1842. Ironically, some of Dorr's own patrician relatives defended the armory. Another battle followed in the northern part of the state as textile workers and other laborers continued to back Dorr while his more genteel supporters left the fold as events turned

violent. The Law and Order group unleashed the militia and, in a remarkable and creative tactic, attracted the state's African-American population into their ranks by guaranteeing them the right to vote. One local congressman remarked that his constituents would rather see blacks vote than the despised Irish.

In a mopping-up operation, the state militia arrested several hundred "Dorrites," including the working-class leader, Seth Luther, as well as Dorr. Sentenced to life imprisonment in 1844, he was pardoned several years later but died of poor health in 1854. Issues from the relatively bloodless insurrection landed in the United States Supreme Court, initiated a thousand-page indictment of Law and Order rule by Congressional Democrats, and became a part of the 1844 Democratic presidential election that featured the slogan, "Polk, Dallas, and Dorr." Although the forces of Law and Order instituted some of Dorr's reform package, especially for native-born citizens, vestiges of voter restraints lasted late into the twentieth century. An immediate outcome of the conflict enfranchised hundreds of black voters for supporting the conservative forces while Irish-Americans, and later immigrants, remained the most disenfranchised caste outside the southern states.

DRUM, FRUM, ELRUM

In 1968, black autoworkers in Detroit began to organize militant, race-based revolutionary unions that openly proclaimed a black Marxist-Leninist position. *DRUM* (Dodge Revolutionary Union Movement), *FRUM* (Ford Revolutionary Union Movement), and *ELRUM* (Eldon Avenue Revolutionary Union Movement) were the largest and most active of the affiliated unions. Founding members of the revolutionary union movement included John Watson, Ken Cockrel, Mike Hamlin, Luke Tripp, General Baker, Chuck Wooten, and Ernest Allen. Former Student Non-Violent Coordinating Committee (SNCC) and Black Panther party organizer James Forman joined the group later as well. In early 1969, The League of

Revolutionary Black Workers was established to coordinate the policies, strategy, and activities of the various revolutionary unions.

Following the July 1967 uprising, black auto workers began meeting for discussions in caucus-style assemblies at the Dodge Main plant (Hamtramck assembly plant). The *Inner City Voice*, a radical black newspaper, also began to appear in publication in Detroit's ghettos in September of the same year. In May of the following year, the paper's editors united with nine black workers at Dodge Main to form DRUM. DRUM was organized in the immediate aftermath of a spontaneous, interracial wildcat strike by 4,000 workers at Dodge Main on May 2, 1968. Seven workers were fired (five black, two white), while all but two (both black) were eventually rehired. Following the strike and firings, DRUM began publishing a weekly newsletter entitled *drum*. The first issue was devoted to an assessment of the recent strike and argued that it was caused by a production speed-up from 49 to 58 units per hour. In addition, the newsletter highlighted the double standard with which the striking black workers were treated and attacked Chrysler for racist labor practices. Subsequent newsletters expanded on the union's positions and explained why a new structure outside of the United Auto Workers (UAW) union was necessary. DRUM noted that black workers represented 60% of the laborers at Dodge Main, worked in unsafe and unclean conditions, and were the target of racist procedures within both the plant and the union hall. The DRUM consistently argued that UAW leadership failed to address the grievances of black workers sufficiently. It therefore felt that black autoworkers should have a separate contract and be able to conduct direct negotiations with Chrysler. Relations between DRUM and the UAW deteriorated further when the UAW publicly endorsed the Detroit Police Department's annual field day celebration. Most white members and leaders of the UAW regarded DRUM as extremist and worried it would splinter the unionized Dodge workforce.

The DRUM organized a series of rallies and wildcat strikes against Chrysler in the summer and fall of 1968 that succeeded in attracting more members but failed to produce concrete improvements. After a mass rally on October 24, 1968, at Chrysler's Highland Park headquarters drained DRUM's treasury, the group attempted to raise both funds and the revolutionary consciousness of workers through a fund-raising raffle on November 17 in which the prizes were an M-1 rifle, a shotgun, and a bag of groceries.

The DRUM was also known for maintaining a confrontational posture toward those within the black community whose activities were seen as

inconsistent with DRUM policies. In its first newsletter, DRUM editors identified particular black workers within Chrysler plants who worked closely with management or refused to strike as "Uncle Toms." Likewise, when the Detroit chapter of the Urban League held a luncheon at the Statler-Hilton Hotel in November 1968 to present equal-opportunity employment awards to Chrysler, Ford, and General Motors, uninvited DRUM workers wearing heavily soiled work clothes created a disruption by parading through the formal luncheon with protest signs.

The DRUM activities during 1968 inspired other black autoworkers in Detroit to establish their own revolutionary unions. The FRUM and ELRUM, both organized in November of 1968, were the most prominent. Others included Mack Stamping (MARUM), Forge (FORUM), Jefferson Ave. (JARUM), Cadillac (CADRUM), Chrysler (CHRYRUM), Mount Road Engine (MERUM), as well as two nonauto affiliates, United Parcel Service (UPRUM) and Detroit News (NEWRUM). The ELRUM was especially problematic for Chrysler because the Eldon Avenue plant was Chrysler's only gear and axle plant, making the company vulnerable to a strategic shut-down. In fact, when ELRUM completely shut down plant production with its first wildcat strike on January 27, 1969, Chrysler responded by firing 26 striking workers. Although most fired workers were eventually rehired, the president of ELRUM, Fred Holsey, was not. The ELRUM strike was significant for two reasons. First, a higher percentage of black workers took part than in previous actions; and second, black workers represented an even larger proportion of the labor force at the Eldon Ave. plant than at the Hamtramck assembly plant. In 1970, ELRUM initiated two more wildcat strikes. In April, ELRUM workers maintained a three-day strike to protest the firing of John Scott, a worker accused of threatening to beat a foreman with a pinion gear in self-defense. As a result of the strike, Scott was rehired, and the foreman was removed from his position. In addition, a wildcat strike against unsafe working conditions at the Eldon Ave. plant occurred in May when jitney operator Gary Thompson was killed in a job-related accident.

The Revolutionary Union Movement (RUM) in Detroit gradually faded out of existence as a result of internal dissension. A major split emerged in 1970 between revolutionary Black Nationalist workers and Marxist-Leninist organizers and intellectuals. In addition, the RUM organizations faced consistent opposition from management, local and international UAW leadership, and law enforcement agencies. Because of the flexible and transitory nature of the RUM organizations, an accurate count of RUM membership is not possible. However, it is clear that

thousands of black workers took part in RUM, and it inspired wildcat strikes and other organizing activities. Judging from newsletter distribution, tens of thousands of black workers across the nation were sympathetic to RUM efforts. The RUM model spread beyond Detroit's auto plants throughout the late 1960s and early 1970s. Affiliated revolutionary unions were organized in New Jersey's and Georgia's auto plants; within New York's, San Francisco's, and Chicago's transit systems; among members of the U.S. Steelworkers union and the Building Service Employees International; and even inside the American Federation of Teachers.

DUAL UNIONISM

Labor-opposition groups faced a chronic paradox. The characteristic form of workers' organization under capitalism, unions, gathered individuals together on the basis of shared interests and grievances, contributing perhaps in the process to a heightened sense of working-class solidarity. Activists who established competing, dual unions were apt to be branded traitors sowing seeds of division. Often, to leave the established union and to start a new organization in competition with it was to cut oneself off from the heart of the working-class community and to abandon what appeared to be the natural base for the creation of a radical movement. Yet labor unions were reformist by nature, designed not to transform society but to win limited concessions from employers. American Federation of Labor (AFL) and other unions were often inhospitable environments dominated by conservative, white, male business unionists inclined to inhibit or repress whatever radical potential workers might display. This tension between the vital role of unions in working-class life and the difficulty many radical activists had in working within them lies at the heart of the history of dual unionism in the United States.

The basis for dual unions might be racial or ethnic as well as political. Anarchists established separate union federations in Chicago, New York, and other cities during the 1880s. A revolutionary principle was involved. In building this movement, anarchists hoped to harness the power of the unions to destroy the capitalist state, undermine private property, and build a libertarian society. But the constituent organizations that formed these new federations were most frequently dual ethnic unions based in German, Czech, and other recent-immigrant communities. Feeling unwelcome in the mainstream unions, the immigrants organized their own, which tended to be far more radical than craft union counterparts. Also in the 1880s, "trade assemblies" of the Knights of Labor, with its expansive labor reform ideology, overlapped and sometimes competed with craft unions in the same industries. Black workers, particularly in the World War I and 1920s era, sometimes chartered new organizations outside of the AFL and the railroad brotherhoods when the existing unions insisted on maintaining the color line.

There was an implicit radical logic in the actions of the anarchists, and later the socialists, in constructing such separate radical movements; the business unionists seemed not only disinterested but often hostile to change. But there is no doubt that their actions frequently led to splits even among the radicals themselves and further alienated them from the mainstream unions. When the Socialist Labor Party (SLP) launched the Socialist Trades and Labor Alliance (STLA) in 1895, the move failed to win not only most unionists, but even some of the party's own members who preferred to remain in the AFL to contest for power in what was already a mass organization. The split caused within the SLP over the issue of dual unionism helps to explain the appearance of the Socialist Party of America (SP) in 1901. Most SP members preferred to join existing unions and work within the AFL. The failure of groups like the STLA and the relative strength of socialist influence in the AFL around the turn of the century suggest the wisdom perhaps of the SP argument.

By far the most famous organization to embrace the principle of dual unionism, the Industrial Workers of the World (IWW) won considerable strength among diverse groups of unorganized workers between its birth in 1905 and its eclipse during the 1920s. Anarchosyndicalists, the Wobblies envisioned a new federation of revolutionary industrial unions, each one organizing all of the workers in its respective industry regardless of skill, race, nationality, sex, or politics. The decision to obliterate the color line was striking in an era of rampant segregation and discrimination in which many AFL and railroad unions

specifically barred African-Americans, Chinese, and other workers of color. Wobbly activists provided charismatic leadership for a whole series of mass strikes by immigrant men and women in the textile, steel, auto, and other industries from 1909–1913. Although the AFL employed the term dual unionism often in its attacks on the IWW, some of these IWW unions did not compete directly with existing mainstream unions. In some cases, they organized in industries where no unions of any description existed, as in their efforts to build agricultural unions in the World War I era. In other cases, they were not really competing because they organized among despised immigrant, Asian, and black workers where the AFL unions were making no efforts themselves. Even where they did not compete directly with AFL unions, however, the IWW projected a far more inclusive and militant model of unionism and in this sense threatened the vested business unions. In part because they were facing enormous odds, however, IWW organizations tended to be fleeting. Most were either destroyed in employer and government counterattacks or simply withered away by the early twenties.

Coming directly out of the IWW, William Z. Foster and his Syndicalist League of North America (SLNA) developed an alternative to dual unionism based in part on the French syndicalist model. Foster argued that rather than abandon the mainstream unions, activists must transform them into revolutionary weapons through a process he called “boring from within.” A militant minority within each of the unions would agitate for a more aggressive line and for the organization of the unorganized. Although neither the SLNA nor a later organization, the International Trade Union Educational League, ever grew substantially, the group of syndicalists around Foster played important roles in the World War I organizing drives, which seemed to demonstrate the effectiveness of working within existing unions. The concept of boring from within won even greater acclaim when it was embraced by Lenin and his new Red International of Labor Unions in 1921.

Although originally inclined toward dual unions and shrill attacks on the AFL, the new Communist movement abandoned any plan to integrate with the IWW and firmly rejected the dual-union strategy from 1921–1928. In the process, the movement enjoyed some success. Employing Foster’s Trade Union Educational League (TUEL) as a base, Communist unionists and their allies organized oppositional groups within several important unions, though the league’s members were subject to constant expulsions, particularly in the mining and needle trades industries. These expulsions and a new turn in Communist trade union policy provided the basis for a new

dual-union initiative in late 1928—the Trade Union Unity League (TUUL). The new league established revolutionary unions in several industries where they competed directly with existing AFL organizations, notably in mining, metalworking, and the garment and auto industries. The TUUL organizations led a series of spectacular strikes in 1929 and the early 1930s, facing considerable violence from employers’ forces, vigilantes, and police.

When it was liquidated with the appearance of the new Popular Front line in 1935, many of the TUUL’s activists emerged as organizers in the Congress of Industrial Organizations (CIO). Organizers for this new federation of industrial unions competed in some cases with weak, existing AFL unions in basic industry and in other cases led drives where no unions existed at all. In bitter conflicts between the two federations, AFL organizers often leveled the dual-union charge at the new CIO. The rivalry ended only with the expulsion of the CIO’s left-wing unions in 1949, and the merger of the two federations in 1955. In order to undermine the left-wing unions, the CIO chartered a series of dual unions that competed with them, often successfully, in the 1950s.

Given frequent tension between conservative leaderships and rank and file activists, the danger of competing breakaway unions was always present. One of the most spectacular and violent of these conflicts involved the struggle between the United Mine Workers of America (UMWA) and the Progressive Miners of America (PMA), established in 1932 by radicals in Illinois District 12. The breakaway union competed directly with the UMWA for membership, occasioning considerable violence in the Illinois coalfields throughout the 1930s, and it declined only gradually after the UMWA returned to the AFL in 1946.

With newer industrial unions more open to unskilled, women, and minority workers and rank-and-file movements scoring notable successes in the late 1960s and 1970s, breakaway unions were less common in the postwar era. By the end of the twentieth century, with the labor movement under attack and in decline, union mergers were far more typical. The notion of launching new unions in such an inhospitable climate was undoubtedly a daunting prospect.

Dual unions never won most workers to a radical union program. Yet anarchist, IWW, syndicalist, Communist, and other radical organizers played important roles in organizing the unskilled, women, and minority workers excluded by the mainstream unions. In the process, they pioneered new forms of organization and new strategies and kept alive an alternative vision of the labor movement as a vehicle for social change.

DUBINSKY, DAVID (1892–1982) President, International Ladies' Garment Workers' Union

An influential American trade union leader and official who served as president of the International Ladies' Garment Workers' Union (ILGWU) from 1932–1966. Dubinsky (originally Dobniewski) was born in Brest-Litovsk in Russian Poland on February 22, 1892, the youngest of six children in an impoverished Jewish family. His father moved the family to Lodz where he operated a bakery and where at age 11 David began his working life. At 14, Dubinsky joined a bakers union affiliated with the German Jewish Workers' Union—or the Bund—an ideological organization consisting mainly of Jews in Eastern Europe and Russia. The union advocated global socialism. Dubinsky was soon arrested and imprisoned by the Russian Czar's police. Though he was to be exiled to Siberia, Dubinsky managed to escape and secured passage to the United States, where he entered New York on New Year's Day, 1911.

Dubinsky apprenticed as a fabric cutter in New York's bustling apparel trade and joined the prestigious Local 10—the cutters' union affiliate—of the ILGWU. At age 29, he was elected head of the local

and soon rose to be an officer in the ILGWU, served as union secretary-treasurer, then president from 1932 until his retirement in 1966. At the outset of his term as president, the ILGWU had been decimated by the industrial slowdown precipitated by the Great Depression. The union was also nearly bankrupt from dwindling membership and an internal struggle between Communist and moderate forces. Denouncing Stalinist-led unionists, Dubinsky allied the ILGWU with Franklin Roosevelt's New Deal and advocated the democratic reform of industrial capitalism to ameliorate poverty, human suffering, and fairer treatment of workers. He served as a vice-president of the American Federation of Labor (AFL), the first garment workers' union president to serve on the labor federation's executive council, and he led the union in joining the Committee for Industrial Organizations (CIO). Dubinsky was also influential in securing the American labor movement's affiliation with the International Labor Organization—a dramatic policy shift that replaced American labor's isolationist history with a broader agenda of international worker solidarity. However, when the AFL suspended the CIO unions (1936), Dubinsky resigned from the federation. At the same time, he opposed the establishment of the CIO on a permanent independent basis, and in 1938 he also broke with it, thus making the ILGWU independent until 1940, when it reaffiliated with the AFL. In 1936, he was one of the founders of the American Labor Party in New York. When it fell under Communist influence, he resigned and played a key role in founding the Liberal Party. In 1945, he again became a vice-president and member of the executive council of the AFL, retaining the position after it merged with the CIO in 1955. His efforts at ousting corrupt union leaders culminated in the new ethics standards adopted by the AFL-CIO in 1957.

Along with such influential labor leaders as John L. Lewis, Sidney Hillman, George Meany, and Philip Murray, Dubinsky played a central role in building the American labor movement and advocating on behalf of workers. A firm believer in social unionism and economic justice, Dubinsky and other ILGWU leaders—men and women—successfully negotiated employer contributions to a health and welfare fund, a member pension fund, vacation time, and equitable compensation. From the late 1930s–1950s, Dubinsky led strong organizing campaigns to unionize apparel manufacturers who had begun to locate outside of the metropolitan New York area in search of cheaper, nonunion labor. Dubinsky was among few pioneering labor leaders and unionists who foresaw the threat from the movement of capital ever in search of cheaper labor (a threat that would be global by the end of the twentieth century). Such

manufacturers were known as “runaway” factories and usually secured contracts to produce goods for New York-based jobbers. Yet they typically paid workers a fraction of what unionized New York workers earned, ignored minimum-wage and maximum-hour laws, and skirted statutory mandates when it came to workers’ compensation, workplace safety, and child labor. Dubinsky saw to the establishment of union locals and affiliates in locales that were increasingly popular in runaway factories, including Scranton and Hazleton, Pennsylvania; and locales in upstate New York and New England.

Dubinsky was also influential in establishing cultural and social institutions that served ILGWU members’ needs. These included a New York-based union leadership school; a Labor Stage for worker-based performing arts; the ILGWU’s vacation and education resort, Unity House, in the Pocono Mountains of Pennsylvania; a union-owned radio station; and he was influential in establishing union-operated health care centers in key apparel-making hubs, including Manhattan, and Allentown and Wilkes-Barre, Pennsylvania. The ILGWU also constructed housing for member-retirees in New York.

With a membership that approached one-half million by the 1960s, the ILGWU had grown to be one of the most powerful labor institutions in the United States. Dubinsky ensured the union’s role in local, state, and national politics by aligning it with influential and progressive Democratic politicians and policymakers. The ILGWU proved to be an influential lobbyist in the U.S. Congress, with various presidential administrations, and in state capitols around the nation but especially in the industrial Northeast. The union was a natural ally of Presidents John F. Kennedy and Lyndon B. Johnson and progressive legislators at the state and national levels.

Retiring as president in 1966, Dubinsky assumed the role of director of the ILGWU’s Retiree Services Department where he served until 1981. He continued to provide advice and counsel to the ILGWU, the AFL-CIO, and the labor movement. Dubinsky passed away on September 17, 1982 in New York. He was inducted into Labor’s Hall of Fame in January 1994.

DU BOIS, W. E. B. (FEBRUARY 23, 1868–AUGUST 27, 1963)

African-American Activist and Author

Probably the most prominent African-American intellectual in American history, W. E. B. Du Bois wrote many works on labor and working-class issues in his voluminous publications. His 95 years took him on an ideological odyssey, from Gilded Age *laissez faire* liberalism, through twentieth-century progressivism and liberalism, ending up as a Communist expatriate.

Du Bois was born in Great Barrington, in western Massachusetts. A precocious student, he was the first black graduate of his integrated high school and attended Fisk University in Tennessee, thence transferring to Harvard. He earned his B.A. and M.A. there and after two years at the University of Berlin, a Ph.D. He began to teach at Wilberforce University and worked as a teacher and writer, along with his political activism, for the rest of his life. His education was both wide and deep, with training in classics, history, and economics. In 1896, he married Nina Gomer. The couple had two children—Burghardt (who died at the age of three) and Yolande.

Du Bois’s early views on labor and political economy were quite conventional. Like most of the educated middle class, black and white, Du Bois held classical liberal, or *laissez faire*, opinions. He described himself as favoring free trade and good government along with other Mugwump reformers of the 1880s. He decried the violent labor unrest of the Gilded Age and approved of the Haymarket executions. While in graduate school in Berlin, he outlined a novel in which an African-American entrepreneur’s business was destroyed by his white workers at about the same time as the Pullman strike. On the other hand, Du Bois admired Prussian state socialism while studying in Berlin and sketched another novel whose protagonist was a socialist. He found himself in the great battle between classical and historical schools in the university’s department of economics and later claimed that he considered himself a socialist while in Berlin. He had lauded Bismarck in his

Dr. W. E. B. DuBois. Library of Congress, Prints & Photographs Division [LC-DIG-ggbain-07435].

Fisk University commencement address and wore the Kaiser's goatee and mustache for his entire life.

His early sociological studies were also consonant with the liberal ethic of individual responsibility, self-control, self-help, and the Victorian moral code. In the *Philadelphia Negro* (1899), a path-breaking depiction of the city's black population, he condemned white prejudice and discrimination but emphasized the need for black responsibility and maintained his faith in free enterprise and economic competition. It sometimes sounded as if Du Bois were, in the phrase of a later generation, "blaming the victim." He also encouraged blacks to show greater interest in business and called for "Negro Businessmen's Leagues," an idea that Booker T. Washington turned into the National Negro Business League.

Though he later made his mark as the main opponent of Booker T. Washington, the two were quite close in the 1890s. Du Bois congratulated Washington on his "Atlanta Compromise" address, in which he urged blacks to defer demands for political and social equality and focus on economic progress, calling it "a word fitly spoken." "Here might be the basis of a real settlement between whites and blacks in the South," he wrote. Du Bois repeatedly considered working under Washington at the Tuskegee Institute. Their different opinions on education—Du Bois stressing liberal training for the elite, Washington industrial

and vocational schooling for the masses—have also been exaggerated. Their estrangement was largely due to Du Bois's independent spirit, which recoiled against the centralized control that Washington exercised through the "Tuskegee machine."

Du Bois's later radicalism, and his propensity to revise the story of his life in his numerous autobiographies, has obscured his early conservatism. Around the turn of the century, Du Bois was beginning to work with black leaders who would come to break with Washington. One of these organizations was Alexander Crummell's American Negro Academy, an attempt to form a black professional society, as opposed to Tuskegee's focus on practical, vocational, industrial education. Du Bois presented a paper to the academy in 1897 entitled "The Conservation of Races." In it he criticized the individualism and assimilationism dominant among American Negroes and hoped that they would recognize and preserve their distinct cultural gifts. Their "spiritual, psychological" nature would "soften the whiteness of the Teutonic today," Du Bois wrote. "We are that people whose subtle sense of sound has given America its only American music, its only American fairy tales, its only touch of pathos and humor amid its mad money-getting plutocracy." Throughout his life, Du Bois would try to advocate a system in which blacks could retain their distinct identity and yet contribute fully to a white-majority society. Neither separatism nor assimilation but pluralism was his goal.

Thus, both his views on race and labor exhibited the characteristic "double consciousness" that Du Bois described in the *Souls of Black Folk*. In the early twentieth century, as he openly broke with Washington, Du Bois grew closer to white progressives and socialists.

Many of these dissidents came together in the Niagara Movement of 1905. Its "Declaration of Principles" stated, "We hold up for public execration the conduct of two opposite classes of men: The practice among employers of importing ignorant Negro-American laborers in emergencies, and then affording them neither protection nor permanent employment; and the practice of labor unions in proscribing and boycotting and oppressing thousands of their fellow-toilers, simply because they are black."

Like many progressives, Du Bois was profoundly ambivalent about organized labor. His early liberalism still shone through the rising socialism of these decades. His two works that addressed black labor most closely, *the Negro Artisan* (1902) and *the Negro American Artisan* (1912), were extremely critical of organized labor. His 1909 address to the National Negro Committee (a forerunner to the National Association for the Advancement of Colored People)

expressed liberal labor principles in showing how white workers sought to eliminate black competition and used government power to do so. He carried this analysis into the *Crisis*, the NAACP monthly that he edited. "So long as union labor fights for humanity, its mission is divine," he wrote. "But when it fights for a clique of Americans, Irish [,] or German monopolists who have cornered or are trying to corner the market in a certain type of service, and are seeking to sell that service at a premium, while other competent workmen starve, they deserve themselves the starvation which they plan for their darker and poorer fellows." Too often he saw the latter as the nature of the American labor movement. Though he supported Woodrow Wilson in 1912 (the year after briefly joining the Socialist party), Du Bois's economic philosophy was socialist by World War I.

But he was unable to accept the socialist explanation for discrimination in organized labor—that employers fomented racial discord in order to frustrate proletarian solidarity. He saw too many cases in which white workers excluded and discriminated against blacks for their own advantage to believe that the race problem would resolve itself once capitalism was abolished. He was also skeptical about programs that emphasized race consciousness too much, such as Marcus Garvey's Back to Africa movement or the Communist party's calls for a separate African-American state in the black belt of the South.

Du Bois surmised that although white workers were more easily exploited under segregation, they enjoyed a "social and psychological wage" due to their superior social status. This insight, adumbrated in the cultural approach of his "Conservation of Races" essay, has been invoked in recent years by cultural studies theorists who describe the "construction of whiteness." His suspicion of left-wing alternatives to the trade-unionist AFL also followed from his belief that race consciousness was not simply a by-product of class struggle. He wrote after the 1917 race riot in East St. Louis, which was largely a reaction to the migration of black workers into that city, that "there is absolutely no hope of justice for an American of Negro descent" under AFL leadership. Ten years later, when the AFL lobbied for legislation to curb the use of injunctions in labor disputes, Du Bois told the NAACP leadership that these generally anti-union devices had often benefited black workers.

By the time that organized labor began to gain political power under the New Deal, Du Bois was moving in a retrograde direction. His response to the severe privation and unemployment of the Great Depression was to emphasize black economic cooperation. Race consciousness had always been a part of Du Bois thinking, and it returned in the 1930s, in a

way similar to that of his great antagonists, Booker T. Washington and Marcus Garvey. Du Bois' argument that blacks could turn segregation to their own advantage—that there could be "segregation without discrimination"—led to his resignation from the NAACP in 1934.

Du Bois returned to full-time teaching and writing at Atlanta University. His Marxian views on American labor can be seen in his monumental 1935 book, *Black Reconstruction in America*. Du Bois had been arguing for a new view of Reconstruction, stressing the role played by African-Americans in it and the positive results that it achieved, for decades. In this book, he described how the slaves helped to win their own freedom by refusing to work, in what he described as the first general strike in American history. He also praised the active role that the Reconstruction governments played in the political economy. Slowly, this black- and labor-centered revisionist view of Reconstruction gained power in the academy and has been the dominant one since the 1960s. Applying the sociological methods that he had pioneered at the turn of the century, Du Bois prepared the ground for a new generation of social historians in the 1960s, who explored American society "from the bottom up."

Du Bois became increasingly alienated from American politics and turned radical in the last third of his life. He returned briefly to the NAACP in 1944 as their director of special research but soon left again as the rift between him and Walter White widened. He turned his attention increasingly to world affairs. He was impressed by the success that the Japanese showed in ousting European colonial powers from Asia, despite their brutal treatment of Chinese, Koreans, Filipinos, Indonesians, and others. His affinity for the Soviet Union grew, especially after his second marriage to Shirley Graham in 1951. In Leninist fashion, he saw the problems of African-Americans as part of a global phenomenon whereby European capital exploited the resources and labor of the colored Third World. He supported Stalin throughout the Cold War. He was unsuccessfully prosecuted for serving as an officer of the Peace Information Center, a Soviet propaganda organization. Finally, in 1961, Du Bois joined the U.S. Communist party and moved to Ghana. Most historians and biographers avert their eyes at these last years in which he supported regimes unarguably more repressive than the Jim Crow South and focus on his earlier and otherwise illustrious career. He died in Ghana in 1963, the day before the March on Washington for Jobs and Freedom was held in Washington, D.C.

Du Bois's long and prolific career thus contains a multitude of significant ideas. Nobody struggled

longer to understand the roles that race and class play in American and world civilization. These problems and his work will surely continue to compel the attention of intellectuals of future generations.

DUNLOP COMMISSION

The Dunlop Commission was established by the Clinton administration in March 1993, and was formally known as the Commission on the Future of Worker-Management Relations. It was known as the Dunlop Commission because John T. Dunlop, a Harvard University professor and prominent mediator who was labor secretary in the Ford administration, chaired it. The commission was established by the Clinton administration under the auspices of Labor Secretary Robert Reich and Commerce Secretary Ronald Brown. Reich had been a noted labor economist and academic prior to his appointment as labor secretary by President Clinton. The commission was created in response to the 1992 Electromation decision issued by the National Labor Relations Board. The board ruled in that decision that some labor-management cooperation mechanisms violated Section 8(a)(2) of the National Labor Relations Act. The Dunlop Commission was an effort to create a new compromise between labor and management by offering organized labor easier union recognition, while also offering business new methods of promoting labor-management cooperation.

The commission pursued three main objectives. The first was to determine what new methods or institutions should be encouraged or required to enhance workplace productivity through labor management co-operation and employee involvement. The second was to identify what changes should be made in the present legal framework and practices of

collective bargaining to enhance cooperative behavior, improve productivity, and reduce conflict and delay. The third was to examine what should be done to increase the extent to which workplace problems are directly resolved by the parties themselves rather than through state and federal courts and regulatory bodies. These seemingly innocuous objectives aroused a range of responses from commentator across the political spectrum.

The commission conducted a number of hearings, with 11 held in Washington and an additional six meetings held around the United States. It heard presentations from 354 witnesses and accumulated 3,858 pages of transcripts. The report that the commission produced reviewed the changing environment of worker-management relations, employee participation, and labor-management cooperation in American workplaces; worker representation and collective bargaining; and employment regulation, litigation, and dispute resolution. The favorable response of the labor movement to the report and the business community's largely negative response were based on the report's recommendations.

The report identified many changes in the American economy, including a decline in long-term productivity, the impact of technology on the workplace, stagnant real hourly compensation, and a growing division between full-time and part-time employment. A decline in collective bargaining and fewer strikes and lockouts were also discussed. The report suggested that the American economy could not continue on the route that it was proceeding and mentioned the growing bifurcation of the workforce as a particularly significant issue.

Several trends in the workplace were identified in the commission's report. Employee participation was identified as a growing, partially diffused development across the United States. It was further suggested that from 40 to 50 million workers would like to participate in decisions on the job if they had the opportunity to do so. Labor and management expressed differing views about the role of employee participation on the workplace. Union representatives argued before the commission that they viewed employee participation as an opportunity to improve both productivity and workplace democracy and viewed independent representation as necessary to achieve these objectives. Management saw employee participation as part of the work process, and felt that effective worker representation could be achieved in both unionized and nonunionized workplaces. While long-term employee participation in the workplace could lead to improved economic performance, the report noted that historical and contemporary evidence indicated the fragility of employee-participation structures. A number of

issues were identified as barriers to implementing a viable employee-participation plan.

The report identified several flaws in the labor relations system in the United States. The number of National Labor Relations board elections for union certification had fallen in recent years, and representation elections were identified as conflictual activities for workers, companies, and unions. Workers who exercised their legal rights under the National Labor Relations Act faced the possibility of discharge or unfair discrimination for exercising those rights. Approximately one-third of workplaces that vote for union representation did not conclude a collective agreement, and the report further noted that there was a negative side to American labor relations in which employers facing an organizing drive violated the rights of workers wishing to organize.

The various changes in the economy, the workplace, and in the labor relations system were also linked to a complex legal framework. The report noted that the number of federal laws governing the workplace had grown significantly since the 1960s, with the Department of Labor solely responsible for enforcing these laws. A large increase in litigation related to the workplace had led to a backlog for the Department of Labor agencies responsible for administering the various labor laws. The report identified over reliance on civil courts as a problem with resolving workplace disputes. The use of other methods of dispute resolution in other countries, such as tripartite employment courts, was noted, and the commission suggested the possibility of the United States introducing such methods.

The Dunlop Commission was part of a select number of similar commissions and committees in twentieth-century American history. Four Congressional commissions on labor-management relations had been established in the twentieth-century: The 1898–1901 U.S. Industrial Relations Commission, the 1912–1915 U.S. Commission on Industrial Relations, the 1936–1940 LaFollette Committee, and the 1957–1960

McClellan Committee. Presidential commissions were established in 1919 by President Wilson and in 1945 by President Truman. A further two labor-management committees were established by President Johnson in the mid-1960s and by President Ford in 1975. The Dunlop Commission was thus part of an important sequence of commissions and committees established by Congress and the president for the purpose of examining labor-management relations.

The commission ultimately could not establish a basis for a compromise between labor and business that would balance the need for easier union recognition and better labor-management cooperation. Business was uninterested in accepting measures that would strengthen unions in return for new schemes for labor-management cooperation. The failure of the commission to meet this objective represented broader difficulties with creating a basis for a national consensus on labor-management relations in the late twentieth century. This difficulty with reaching a consensus also occurred as the American workforce experienced the changes described in the commission's report, including economic restructuring, increased job insecurity, and growing demographic change. The creation of the Dunlop Commission did, however, mean that the executive branch of the federal government was prepared to make an effort to address these changes in order to determine how workplace policy in the United States should be shaped in the future

E

EDUCATION, LABOR

Labor education programs in the United States have been characterized by three basic assumptions: That workers' interests are best served through alternative, independent working-class educational institutions; that education is key to political development and organizational strength; and that individual worker students bring a formal knowledge of the workplace and of the broader world that create a special pedagogical environment. Despite these common views, the workers' education movement in the United States has been marked by considerable variation in terms of goals, funding, pedagogy, and political commitment. With programs ranging from craft-centered guilds and mechanics' institutes to schools representing the full assortment of labor philosophies from Marxist and progressive politics to religious-based, feminist- and union-sponsored colleges dedicated to everything from organizing, social conservatism, and reform to public speaking and vocational advancement, the goals of labor education represent a spectrum for understanding the ideas that have shaped labor in the United States. Often the sights of important pedagogical experiments, worker-centered schools and their curriculums, impacted broader developments in American education, such as the expansion of adult education programs and evening division courses, especially in the post-1945 period. This dynamic blend of function and innovation makes these educational programs one of the labor movement's greatest contributions to American cultural history.

Early Precedents of Labor Education in the United States

Traditions of labor education were first transplanted to the United States from Europe in the colonial period through the establishment of craft guilds. Overseeing apprenticeships for young male craft workers, guilds served important social needs and welfare functions while also providing a more general education in reading and civics. Similar associations arose to represent artisans in the mechanical arts, and by the 1830s, mechanics' institutes were important features of a new urban culture, providing educational opportunities for a mostly male clientele through establishment of reading rooms and libraries, public lecture programs, and formal schools that offered a range of classes focused primarily in the sciences. The most successful of these schools was Philadelphia's Franklin Institute. Founded in 1824, it maintained a permanent faculty that offered courses in technology and business, while sponsoring annual competitions for aspiring engineers. Mechanics' institutes continued earlier guild traditions stressing social harmony between master craftsmen and younger apprentices, while emphasizing individualistic values that placed hard work and upward mobility as central tenants of a uniquely American character.

With industrial expansion in the early nineteenth century, and the corresponding sharpening of class interests, alternative views of labor education soon emerged. Early labor activists, such as Frances

Wright and Robert Dale Owen, called for the establishment of a nonsectarian, national public education system to foster democratic civic values and social equality. Yet the development of state-sponsored education at the primary and secondary levels focused primarily on socializing workers into accepting the capitalist values of their employers. Additionally most workers had limited access to formal education, with the majority of youth discontinuing school at an early age to enter the industrial workforce. Many workers continued to seek education in informal ways. In response workers and their associations inaugurated new types of worker-controlled schools outside of the mainstream educational system. Increased European immigration, particularly from Germany and Eastern Europe, energized this new development in labor education in the post-Civil War period. Independent schools, usually conducted in the evening or on Sundays, played important roles in an alternative workers' culture, stressing collective, political, and workplace goals. German groups, such as the *Arbeiter-Verin*, provided coherence for immigrant workers and adapted European political commitments to the American environment. Similar schools were prevalent in most immigrant communities, with classes sponsored in the 1890s and early 1900s in New York City by the United Hebrew Trades (UHT) and in Duluth, Minnesota, by the Finnish People's College. Many of these programs also stressed the involvement of women as both teachers and students, marking a break from earlier traditions.

One of the defining characteristics of the labor schools of the late nineteenth and early twentieth centuries was their emphasis on political education. In this effort there was a marked shift away from the mechanical arts toward the humanities, with curriculums focusing on history, political organization, sociology, and the law. Seeing education as key to forging a mass movement, labor schools played prominent roles in radical political strategies. From the 1880s on, socialist parties of all types actively supported independent educational efforts. Foremost among these was New York City's Rand School of Social Science. Founded in 1906, the Rand School, like most labor colleges, catered to a part-time student body, with a peer-centered curriculum that focused on question-and-answer sessions and reading groups rather than lecture methods. One of the most successful labor programs in the twentieth century, the school was in operation for almost 50 years, and its history marked by themes shared by many labor colleges of this era. Although always committed to socialist change, the school's faculty and students often disagreed on strategy, with outside attempts by various leftist groups to direct the curriculum sometimes

exacerbating the infighting. The Rand School of Social Science's open embrace of Marxist ideology also brought on government surveillance and repression, resulting in its eventual demise in the 1950s.

Further to the left, the Communist Party of the United States of America (CPUSA) also adopted a rigorous program of labor education. Communist activists in the 1920s and 1930s paid close attention to all independent and union-sponsored workers' schools, infiltrating many programs to steer them toward more revolutionary goals. The CPUSA also initiated a variety of educational efforts aimed not only at adults, but at adolescents and children through such programs as the Young Pioneer's summer youth camps that provided a utopian environment where youths participated in programs that included dance, music, sports, and theater within a cooperative setting. In the 1940s, New York City's Jefferson School of Social Science emerged as the central school for the party's national network of labor schools. Like the Rand School of Social Science, the Jefferson School faced severe government repression through its years of existence and eventually disbanded in 1956.

Labor colleges across the political spectrum adapted innovative pedagogies, a hallmark of the workers' education movement. Many of these developments drew on the ideas of progressive education that emerged in the United States in the early twentieth century. Centered on the theories of John Dewey and other innovators, progressive education sought a more collaborative classroom model, de-emphasizing formal lectures and stressing group discussions and interaction. For the most part, labor school faculty came from the working class, with many courses taught by trade unionists with experience in organizing and strike campaigns, newspaper editing, collective bargaining, and political strategy. Besides these organic intellectuals, labor education efforts were also supported by university-trained teachers in history, sociology, and the legal profession, who advanced the cause of labor by offering their expertise in the classroom.

Women played an important role in implementing new ideas in labor education settings. Jane Addams's early experiments at Hull-House in Chicago was a model for many similar programs, with urban settlements offering classes in nutrition, childcare, consumer habits, and English language instruction. These experiments in urban education helped inform broader experiments in the field of labor education. In 1914, the National Women's Trade Union League formed the Training School for Women Workers in Chicago. This groundbreaking program introduced women to a range of practical skills useful in union work, such as journalism and public speaking. From

this additional programs for women appeared, including the Bryn Mawr Summer School for Women Workers in Industry. Formed in the summer of 1921 at Bryn Mawr College outside Philadelphia, this residential program stressed women's role in bringing about social harmony, reflecting a middle-class uplift ideology that distanced it from more radical curriculums. Bryn Mawr's director Hilda W. Smith, a social worker and veteran of the suffragist movement, would emerge as an important leader within labor education for over a generation.

Trade Unions and Workers' Education

Organized labor has played a fundamental role in shaping the history of labor education in the United States. As part of its earliest organizing efforts in the 1870s, the National Labor Union established reading rooms and libraries in chapters across the country, with identical efforts embraced by the Knights of Labor and the American Federation of Labor (AFL). The International Ladies' Garments Workers' Union (ILGWU) pioneered union sponsorship of workers' education, formally establishing an education department to oversee an expanded program in 1914. Modeled after the schools of the United Hebrew Trades, the ILGWU program implemented courses in trade unionism and the humanities while also organizing such cultural activities as museum trips and concerts. In the 1920s, the AFL officially recognized the importance of labor education by advocating resources to adopting education departments in local unions. This move also reflected the AFL's wariness about the radical political agenda that marked many labor schools of the era. Through the 1920s and 1930s, AFL unions adapted educational programs, with noteworthy sections in the National Maritime Union of America and the Amalgamated Meat Cutters and Butcher Workmen. The AFL's union of local government workers, the American Federation of State, County and Municipal Employees (AFSCME) was active in workers' education, sponsoring summer training seminars and a large education and research center that focused on government reform and the promotion of civil service initiatives.

The 1920s saw the emergence of a number of independent labor colleges. Perhaps the most influential of this era was Brookwood Labor College, located in Katonah, New York. Brookwood's early curriculum was influenced by its director, A. J. Muste, a former labor official who turned to education as a way of furthering the cause of labor at a time of

organizational decline. Unique as a residential program, Muste implemented a standard two-year course load that combined book learning in a nonhierarchical classroom setting along with a wide range of extracurricular activities, such as debate clubs, music, and theater. The school did have formal links to organized labor, with its staff represented by the American Federation of Teachers, Workers' Education Local 189, which pioneered in promoting the workers' education movement across the United States. Brookwood Labor College provided an educational experience for hundreds of graduates who eventually emerged as leaders of a revived labor movement in the 1930s.

One of the most important developments in labor education in the 1920s was the establishment of two agencies dedicated to the promotion of workers' education on a national scale. Founded in 1921, the Workers' Education Bureau of America served as an informational clearinghouse for labor education, organizing forums around the country and assisting local programs. The American Labor Education Service (ALES), established five years later, had a similar agenda, functioning as a general advisory service and providing information for education directors through the publication and distribution of labor education pamphlets, biographies of leaders, and books on U.S. labor history. The ALES also provided field services for existing labor education programs and encouraged new ones through the organizing of regional and local conferences and the publication of a national registry of workers' education teachers.

Organized labor's membership growth in the New Deal period saw a parallel expansion in workers' education programs. The Workers' Education Bureau of America and ALES, along with AFT Workers' Education Local 189 oversaw the rising popularity of these classes by sponsoring the adoption of a federal project for labor education with the Federal Emergency Relief Administration's Emergency Education Program. Organized by Smith in 1934, the Emergency Education Program trained approximately 1,700 teachers in a series of six-week courses offered at university and college campuses across the United States. The first federally funded teacher program in U.S. history, the initiative shared similar experiences with labor education programs through the twentieth century, with competing labor and political groups contesting the agency's objectives. Like other New Deal cultural initiatives, the Emergency Education Program was criticized for fostering politically leftist views and was eventually abandoned. Official government support of labor education continued however through the Labor Education Service Branch. Under direction of the Department

of Labor, this branch was officially nonpartisan, performing as a distributor of information and research services while fostering voluntary programs that stressed union responsibilities in collective-bargaining agreements.

Besides union-supported educational workshops, the New Deal and World War II periods are noteworthy for the development of worker-based education in all regions of the nation. Schools were established in the Far West, including the California Labor School in San Francisco and such southern institutions as the Georgia People's School, the Southern School for Workers in the South, and the residential program at Highlander Folk School at Monteagle, Tennessee. A variety of religious-based labor schools also appeared. Pendle Hill, established by the Religious Society of Friends (Quakers) in 1930 in Wallingford, Pennsylvania, had a regional reputation for its seminars and summer programs based on the Brookwood model. Catholic labor colleges also marked the educational landscape. Stressing a belief in social justice while advocating antiradical political objectives, such schools as the Xavier Labor School in New York and the Comey Institute in Philadelphia emerged as models for similar experiments around the country. Some of these programs, such as the courses run by LaSalle College's Brother Alfred, also introduced arbitration associations that proved important in settling labor disputes well into the post-war period.

Within the house of labor in the 1930s and 1940s, the Congress of Industrial Organizations (CIO) embraced the concept of labor education more fully than the AFL, incorporating education into its major organizing campaigns. More importantly it saw the function of education as a tool in the broader transformation of American institutions. Through its Education and Research Department, the CIO served all of its international unions, providing important information concerning the national economy and the political objectives of the labor movement. In this way, by educating leadership and members, the CIO could promote an economic program that could be advanced by informed advocates in community forums across the country. The United Auto Workers (UAW) was the most active union within the CIO in its embrace of labor education, reflecting the social unionism of its leader Walter Reuther, a graduate of Brookwood Labor College. Throughout his years as UAW head, Reuther advanced the idea of union-sponsored education courses as a key aspect of an engaged trade unionism. Under his direction, the union eventually established the UAW Family Education Center, located in Black Lake, Michigan, as a yearlong education and recreation center.

College- and University-Based Labor Education Programs

The relationship between labor and institutions of higher learning was well-established early in the twentieth century, with successful experiments at Bryn Mawr College and numerous other colleges and universities. These links were strengthened in the post-1945 period. Several reasons account for the turn toward university- and college-based worker education programs in this era. The success of labor programs at universities, especially through the federal programs of the 1930s, showed administrators the financial benefit of providing continued course offerings to nontraditional students. This coupled with the new veterans' education benefits sponsored through the G.I. Bill paved the way for increased interest in labor-oriented adult education in the United States. Changes in labor's relation to the state also shifted its educational prerogatives by the postwar period. New Deal legal reforms created a new federally mandated collective bargaining order in American industry that called for the training of labor experts to facilitate workplace agreements and to oversee labor peace. Both business and labor interests took advantage of new labor management programs that were initiated across the nation. Finally McCarthy period government suppression of politically leftist labor schools shifted the priorities of labor education away from oppositional agendas toward more mainstream political goals.

Although numerous universities had been active in promoting labor education, the University of Wisconsin at Madison developed the most respected program linking higher academics to the cause of progressive labor. Steered by John R. Commons, an economist who had allied with radical causes in his early career, Wisconsin was a center for labor theorists and intellectuals in the years before World War I. The political climate at Madison was fostered by the university's relationship with Governor Robert M. LaFollette, who actively sought faculty input as he crafted reforms that reshaped the state's workplace policies. The program at Wisconsin provided education not just for academics allied to labor's cause, but to average union members through the School for Workers, which remains the oldest running university-based labor education program in North America. Cornell University's School of Industrial and Labor Relations continued this model, often seen as the foremost post-1945 professional labor program in the United States. Established as the New York State School of Industrial and Labor Relations by the New York state legislature in 1945, the school was sponsored to help

improve labor relations in the state. The only four-year undergraduate institute in the United States that offers a labor management BA, Cornell's labor relations school has been active in supporting union-friendly programs by placing experienced union activists on its faculty and by offering seminars on such topics as steward training and organizing. Similar programs have been implemented in hundreds of colleges and universities across the United States, often in alliance with union education departments.

The stronger alliance between organized labor and higher education in the post-1945 period reflects a corresponding decline in class-consciousness among American workers. The disappearance of alternative, independent labor schools suggests the parallel decline of a separate working-class culture that marked the rise of labor education in the mid-nineteenth century. Some within the labor movement have sought to revive the earlier traditions of independent educational programs directed by labor for its own interests. The National Labor College in Silver Springs, Maryland, established by the AFL-CIO in 1974, was seen by many as a move in this direction. The school's primary goal has been to develop professional staff for national unions, with expertise in collective bargaining, legal studies, statistics, and economics, although the overall climate at the institute has often fostered a more class-based political consciousness. In the 1990s, the National Labor College received recognition as an independent, accredited institution of higher learning, changing its name to the George Meany Center for Labor Studies. One of the highlights of this center has been the inauguration of an organizing institute meant to energize a new period of membership growth. Although this objective has not been realized in the first decade since its founding, organized labor continues to stress the need for education. In the cyclical patterns of U.S. labor history, labor education has been a source of direction and hope in times of decline, serving as a tool for planning new courses of action. As organized labor seeks new paths in the twenty-first century, labor education continues as a long, viable tradition within American labor culture.

ELAINE, ARKANSAS MASSACRE (1919)

In the fall of 1919, an incident outside a church where an African-American union meeting was taking place led to a massacre of over a hundred African-Americans. Viewed in the context of the Red Scare and labor strife, both of which were attracting attention across the country, any activism on the part of African-Americans represented a particularly threatening challenge to the system of peonage in place on southern plantations. In fact African-Americans in the Arkansas delta and elsewhere in the South had endured segregation and disfranchisement long before the post-World War I Red Scare, and while it is true that the war gave returning black servicemen a sense that they should exercise their rights more forcefully, African-Americans had never been totally quiescent and subordinated. Long before the massacre at Elaine, individual sharecroppers and tenants had attempted on occasion to secure their fair share of the crop

settlement from their landlords, and sometimes these confrontations led to violence. What was different in 1919 was that blacks had banded together under the banner of the Progressive Household Union of America and hired an attorney to represent them in suits they planned to file. The threat of a united force of African-Americans availing themselves of legal counsel prompted a swift and deadly response from planters who were able to use racism and the rumor of race war to unite whites across class boundaries to quash the black union.

Some time during the spring and summer of 1919, Robert Hill, an African-American farmer, began organizing the Progressive Household Union of America. He organized local chapters and collected dues, preaching the need to band together and file suit against planters in order to secure a fair settlement at the end of the crop year. During the last years of World War I, cotton prices had recovered after decades of disappointing returns, and African-American sharecroppers believed they deserved to share in the bonanza, but their planters thought otherwise and kept them indebted. Planters became aware of the union and grew increasingly alarmed, some of them circulating rumors that the union meant to murder whites and take their lands. In fact Hill had hired a white attorney from Little Rock, U.S. Bratton, to represent the union, and he had sent his son to Phillips County to interview members of the union in order to gather evidence. Young Ocier Bratton was in town on the morning of October 1, 1919, when the massacre got underway and was himself arrested and held in the Phillips County jail.

The evening before Bratton's arrest, a group of black sharecroppers were holding a meeting in a black church at Hoop Spur, a small hamlet near Elaine, when a car carrying two deputies and a black driver stopped just a few yards up the road. What happened next remains a matter of conjecture, but either the black union sentries standing at the door or the deputies opened fire. Both of the deputies were wounded, one of them mortally. The black driver made his way back to Helena, Arkansas, and alerted authorities, although the substance of his exact report remains unknown. The first news stories printed in the next morning's papers suggested that the officers had encountered bootleggers, but within hours rumors of an alleged insurrection of black sharecroppers spread throughout the county. A posse was dispatched, and soon the alarm attracted gangs of whites from other Arkansas counties as well as from across the river in Mississippi and Tennessee. Soon any semblance of order dissolved into chaos as whites rampaged against blacks, most of whom had played no part in the union organizing. Estimates of the total death toll among

blacks ranged from 26—the official total—to 856. In fact it is likely that from 100–200 African-Americans lost their lives. Governor Charles Brough authorized the use of federal troops, veterans of the Great War stationed at Camp Pike, to restore order. Arriving on the morning of October 2, 1919, they disarmed blacks and whites, but historians debate the role the federal troops played in adding to the black death toll. Only five whites died, one of them a soldier.

On October 27, the Phillips County Grand Jury began to meet and four days later charged 122 African-Americans with participating in the riot. The only white man to face the threat of prosecution was Ocier Bratton, who was accused of having incited the African-Americans, but he never came to trial. Allegations later surfaced that the black prisoners were tortured into confessing to various crimes, including murder. After brief and cursory trials, some of which lasted no more than a few minutes, 65 were sentenced to prison and 12 to death. A concerted effort to spare the 12 condemned men from the gallows then ensued, with African-Americans in Arkansas participating in raising funds to represent them. The National Association for the Advancement of Colored People (NAACP) sprang into action and hired two Arkansans, one of them black and one white, to appeal the convictions of the Elaine Twelve. Scipio Jones, a noted African-American attorney from Little Rock, was joined by George Murphy, a Confederate veteran, in pursuing the cases. The Arkansas Supreme Court upheld convictions in six of the cases, which came to be known as the "Moore defendants," but required new trials in the other six cases, which came to be known as the "Ware defendants." The Arkansas Supreme Court was convinced by Murphy's argument that the original trial court had failed to designate which degree of murder Ed Ware and five others were guilty of having committed. New trials were ordered, but they were soon convicted once again and on July 23 were again sentenced to death. Later that year however, the Arkansas Supreme Court again overturned the convictions, this time on the basis of the fact that blacks had been excluded from the jury. While the local courts delayed retrying those cases, the NAACP relentlessly pursued further appeals in the other cases—the Moore cases—and the appeals eventually made their way to the United States Supreme Court, which called for new trials. By that time, no one in Arkansas wanted to revisit the cases, and by January 1925, the last of the Elaine Twelve were freed.

ELECTROMATION v. TEAMSTERS LOCAL 1094 (1992)

The case of *Electromation v. Teamsters Local 1094*, decided by the National Labor Relations Board (NLRB) in December 1992, had dramatic implications for the corporate administration of nonunion employee cooperation efforts. Since the return and proliferation of these programs in the 1980s under such names, for example, as quality of work life programs, quality circles, and employee involvement programs, these cooperative efforts have been of intense concern for unions who often felt that their implementation was at best a union-substitution strategy and at worst an outright anti-union instrument designed to prevent the formation of independent unions. Thus many union proponents viewed such vehicles as nothing more than modern-day company unions that were made illegal under Section 8(a)(2) of the 1935 National Labor Relations Act. Specifically Section 8(a)(2) prevents an employer from either controlling or obstructing the establishment or management of any labor organization or from supporting it, financially or otherwise, in any manner. Prior to the *Electromation* decision, the NLRB interpreted this provision quite narrowly in prohibiting certain types of employee dealings with management. However the board's decision in this case resulted in the NLRB creating tests for deciding the legality of

union-management cooperation programs in non-union settings.

Electromation, a nonunion electrical parts manufacturer, established action committees of employees after Teamsters Local 1094 launched an organizing drive at the company. These committees discussed a variety of personnel issues, including absenteeism, the no-smoking policy, attendance bonuses, communication, and pay increases for the company's top jobs. The Teamsters requested employer recognition after the committees' creation and filed an unfair labor practice charge with the NLRB, arguing that the company had violated Section 8(a)(2) of the NLRA. Specifically the union claimed that the committees were labor organizations that *Electromation* had dominated and unfairly supported. Ruling that the action committees were controlled by the company, the NLRB ordered *Electromation* to dissolve the committees.

In the post-*Electromation* environment, nonunion employers who engaged in employee-participation efforts became concerned that their programs might be illegal with regard to the current interpretation of Section 8(a)(2). Based on NLRB and court rulings after the *Electromation* decision, employee-participation programs will probably be determined to be legal assuming the following seven conditions are present. First employee representatives are elected by coworkers to serve on the committees with terms of service regularly rotated among employees. Second employees cannot be unhappy with these participation programs, and these cooperative efforts cannot exhibit any type of anti-union bias. Third a union organizing drive cannot be taking place when these programs are created. Fourth employee participation is not coerced but voluntary. Fifth employees are allowed to join a union. Sixth the participation committee has the power to make and implement final and binding decisions, and seventh the topics discussed by these committees can be only ones that are not subjects determined to be bargained in contract negotiations.

While the *Electromation* decision neither led to increased union-organizing success nor to arresting the continuing decline in U.S. union density in the late twentieth century, it did make nonunion employers more cautious in the implementation of their employee-participation programs. In that sense employees gained some leverage in the workplace and clearly benefited from the decision. It remains to be seen however whether unions can use the *Electromation* decision to their advantage in developing successful union-organizing strategies in the first decade of the twenty-first century.

EMANCIPATION AND RECONSTRUCTION

Emancipation and the reconstruction of the American South during and after the Civil War involved the reorganization of both the antebellum South's labor system and racial order. The abolition of slavery was also an essential element of the transition to more distinctly capitalist social relations in the South.

Slavery and the Old South

On the eve of the Civil War, nearly four million slaves labored on plantations and farms in 15 states from Delaware to Texas. Between one-quarter and one-third of white households throughout the slave states held slaves. Most slaveholdings were relatively small. The large majority of slaveholders held fewer than 20 slaves, with most of these owning one or two, but the majority of slaves lived on plantations with holdings of more than 50 slaves. In addition to raising cotton, the South's most important staple crop, slaves grew tobacco in Virginia, North Carolina, and Kentucky; rice along coastal South Carolina and Georgia; and sugarcane in southeastern Louisiana and eastern Texas. They also worked on the smaller landholdings of yeoman farmers, both within the plantation belt and in the upcountry.

The South before the Civil War was a predominantly rural and agricultural society, but thousands of slaves also labored in the South's small industrial sector, in factories, on railroads, or in building canals. Many slaves also lived and worked in southern cities, mostly as domestic servants or manual laborers. Skilled slaves were often hired out by their owners. They were permitted a considerable degree of

independence in their daily lives and allowed to retain some of the income they earned for their masters.

While scholars have debated the question of whether the slave South was a genuinely capitalist society—with some maintaining that it was not, since slaves could not sell their labor (or more accurately, their "labor power") on a free and open market—there is no doubt that slaveholders operated within the capitalist system and were motivated by a desire to maximize profits through the production of staple crops for sale on domestic and international markets. Moreover scholars also debate whether or not slavery impeded southern industrial development and economic progress, but they agree that slavery as a labor system was both efficient and highly profitable.

The Civil War and the Abolition of Slavery

Although President Abraham Lincoln and most northerners originally viewed the Civil War as a war not to abolish slavery but rather one to preserve the Union, the war ultimately resulted in the abolition of slavery. The flight of thousands of slaves from plantations in areas of the South where the Union army gained control compelled Lincoln, the federal government, and the North at large to confront the issue of slavery. Lincoln and most northerners eventually came to see the necessity of abolishing slavery as a means of both winning the war and undertaking the reconstruction of southern society, resulting in Lincoln's Emancipation Proclamation of January 1, 1863.

Both before and after this date, the fugitive slaves who sought refuge behind Union lines forced federal, military, and civilian officials to provide humanitarian assistance as well as to begin to institute programs of free or compensated labor. On farms and plantations in northern Virginia and along the Virginia and North Carolina coast, on the South Carolina Sea Islands south of Charleston, throughout the Mississippi River valley, and in southern Louisiana, former slaves worked for wages or for a share of the crops under federal auspices. They labored on plantations whose owners had remained on the arrival of Union troops as well as on abandoned or confiscated plantations under Union military control. In addition former slaves worked in freedmen's villages, home colonies, or contraband camps established by federal, military, and civilian officials and often administered by northern reformers and missionaries.

The features of wartime free labor varied from state to state and among the different crop regions, and former slaves did not benefit from many of the rights that northern workers enjoyed, such as geographical mobility and the right to negotiate their own terms of employment. Nonetheless wartime free labor instituted the principle of compensated labor while prohibiting corporal punishment, the sale of human property, and other practices of slavery. By the end of the war, as many as a half-million former slaves had some experience with wartime free labor, while another quarter-million black men and women worked in the Union army for pay as military laborers (in addition to some 200 thousand black men who formally served in the Union army and navy).

Presidential Reconstruction and the Problem of Labor

The large majority of slaves did not gain their freedom until the end of the war, and the abolition of slavery was not complete until formal ratification of the Thirteenth Amendment to the U.S. constitution in December 1865. But throughout the former slave states, both in areas that had experienced wartime free labor and those that had not, the central issue was the same: The conflict between former slaveholders and former slaves (or freedmen) over the control of economic resources, especially land and labor. Many if not most former slaveholders remained adamantly opposed to the freeing of their slaves, but even for those who had reconciled themselves to emancipation, the primary goals of all planters were to retain control over labor and to secure a dependable labor force to operate their plantations. They continued to envision themselves as the primary source of authority on their estates, with decision-making power in all aspects of plantation management and in the laborers' working lives, including the issue of compensation. For freedmen by contrast the primary goals were to achieve a measure of independence in their daily working lives and to escape gang labor under white supervision, as had been customary under slavery. Former slaves also demanded a voice in determining such basic matters as the hours, pace, and conditions of labor, as well as the mode and level of compensation. Most freedmen envisioned access to economic resources, in particular the ownership of land and other forms of productive property, as the best means of securing their freedom. For them freedom meant more than simply returning to work on the plantations for meager compensation.

In the immediate postwar period, the former antebellum political leadership, which was largely dominated by planters, returned to power under the policies of Lincoln's successor, Andrew Johnson. A southern Democrat who had remained loyal to the Union, Johnson saw Reconstruction as a matter of restoration rather than as one of fundamentally restructuring southern society. Johnson had little concern for black civil or economic rights and was adamantly opposed to an expansion of federal authority. Under Johnson's policies, southern white leaders enacted a series of laws known as the "black codes" that essentially defined black people as second-class citizens and that were designed to restrict the freedmen's economic opportunities and to bind them to the plantation system. Although the black codes were effectively negated by military authorities and by the 1866 Civil Rights Act, planters continued to use local law enforcement and the courts to reestablish control over labor.

Freedmen were not without resources. Near the end of the Civil War, the Republican majority in Congress had created the Bureau of Refugees, Freedmen, and Abandoned Lands, commonly known as the Freedmen's bureau. A division of the War Department, the bureau was entrusted with authority over all matters concerning freedmen and the transition to freedom. In particular the bureau picked up where military authorities had left off at the end of the war in overseeing creation of a system of free labor for the South. It was also given control over the nearly one million acres of abandoned and confiscated land in the former Confederacy and was authorized to begin the process of dividing this land into 40-acre plots for distribution among freedmen.

As broad as the bureau's mandate was however, it never received adequate resources to fulfill its mission, and it was consciously created as a temporary agency rather than as a permanent or even long-term one. In this respect the bureau reflected divisions among Republicans and many northerners over the federal government's role in addressing the economic status of the former slaves and the reconstruction of southern society. Radical Republicans believed that the federal government had a responsibility to provide substantial and long-term assistance to freedmen in order to address the distinct historical experience of enslavement. Moderate and conservative Republicans by contrast argued that the federal government should guarantee freedmen legal equality and the right to enter into contracts voluntarily within the capitalist marketplace, or what some thought of as "contract freedom," but that freedmen should receive no special treatment or dispensations from the federal government.

An opponent of the bureau, Johnson interfered in its operations and was eventually able to prevent it from carrying out its mission of providing land to freedmen. Instead he saw that almost all of the bureau-controlled land was returned to its former owners, thus delivering a crippling blow to the prospects of the federal government making land available to former slaves. Nonetheless, despite all of the difficulties under which the bureau operated before its closing at the end of 1868, freedmen came to see it as an important ally in the struggle with planters over the new labor system, and they did not hesitate to petition bureau agents for assistance in securing their rights as free workers.

Radical Reconstruction and the Evolution of the South's Labor System

By early 1867, Republicans had broken with Johnson over Reconstruction, and most northerners had likewise rejected Johnson's conservative policies and supported Republicans on the need to guarantee legal equality and contract freedom. With the implementation of radical (or congressional) Reconstruction in 1867 and 1868, black men gained the right to vote, hold office, and otherwise shape the creation and implementation of public policy. Although black office holding and leverage over local and state government varied from state to state until Reconstruction ended in 1877, black political power profoundly influenced the evolution of labor relations throughout the South. Former slaves came to see the issues of legal and political equality and those involving land, labor, and economics as inseparable and indeed as interdependent parts of the same struggle to define freedom. Planters for their part attempted to use both legitimate state power and when necessary, extralegal violence to thwart black political and economic aspirations.

As freedmen gained access to political power during the late 1860s and the 1870s, the South's new labor system slowly took definitive shape, although the manner in which labor was organized and the mode of compensation varied among the different crop regions. In the cotton South, the system that came to be known as sharecropping would eventually predominate, although this term is often used to describe a host of different labor arrangements. In essence sharecropping was a system in which the planter or landlord provided land, work animals, implements, and other forms of working capital, while the laborer, or sharecropper, provided labor and perhaps some working capital of his or her own. The sharecropper

and his or her family rented and worked a specified amount of land, usually purchasing necessities on credit from the landlord or a local merchant. At the end of the crop season, landlord and sharecropper split, or shared, the crop, and the sharecropper's account was settled with the proceeds of his or her share. The laborer's share of the crop depended on the assets he or she originally brought into the bargain. In instances where a sharecropper owned a mule or farm implements, he or she could negotiate a better deal for as much as half the crop; in cases where the sharecropper brought only his or her labor, with the planter providing everything else, the sharecropper received a considerably smaller share. In either case sharecropping was in theory a form of wage labor, since the landlord retained control of the crop and compensated the sharecropper for labor with a share of the crop instead of cash. In some instances freedmen who had accumulated the necessary assets to work their own farms but who lacked only land rented land for a cash payment and were able to retain control of the entire crop. Such arrangements were known as tenancy.

There has been much scholarly debate about the origins and development of sharecropping. Some scholars have maintained that sharecropping emerged out of the natural workings of the free-market system. Others however attribute its origins to the immutable class conflict between former slaveholders and freedmen in the contest over the South's new labor system. Nonetheless most scholars agree that sharecropping evolved in response to the contending desires of planters and freedmen as well as to the particular economic conditions that prevailed in the postwar South. Since it required little cash, sharecropping was attractive in a region that notoriously lacked capital. Since both landlord and laborer had a stake in the crop, sharecropping spread the risk of failure or success between the parties. But most importantly sharecropping gave freedmen a measure of control over their daily working lives, and offered them the possibility of capital accumulation and eventual land ownership even as it ensured planters a stable labor force and overall control over plantation management.

Although various kinds of sharecropping or rental arrangements also prevailed on the upper South's tobacco plantations, sharecropping was not so ideally suited to the South's other crop regions. On southern Louisiana's sugar plantations, which had traditionally been characterized by large concentrations of land, labor, and capital, highly integrated plantation organization survived after slavery, with laborers continuing to work in gangs under white supervision and to live in centralized quarters. In return, sugar workers received monthly or daily cash wages in addition to

rations, housing, and the right to keep garden plots. Despite the similarities in plantation routine during and after slavery in the sugar region, workers nonetheless used their skills and knowledge of the complex process of sugar production to gain important leverage in determining the conditions of labor. In the rice kingdom of low-country South Carolina and Georgia by contrast, a wide array of labor arrangements initially replaced slavery, but production never reached antebellum levels, and the story of the postbellum rice industry in the low country was one of irreversible decline and eventual demise. Indeed coastal South Carolina and Georgia were one of the few areas of the postwar South where the antebellum plantation system was replaced by extensive, small-scale black landholding and where the production of staple crops was supplanted by subsistence agriculture and truck farming.

If the low country was exceptional for the demise of its plantation system, it was not so for the presence of black property holders. Throughout the rural South, but especially in the tobacco regions of Virginia and North Carolina, parts of the South Carolina piedmont, the interior of the Yazoo-Mississippi delta, as well as in the low country, former slaves managed to acquire property. Individual black families marshaled together their meager resources or demonstrated an entrepreneurial spirit by putting domestic and household production toward acquisitive ends, so that places like Promiseland, South Carolina, and Mound Bayou, Mississippi, became thriving and self-sufficient communities of black property holders. By 1900, approximately one out of every four southern black farmers owned the land they worked.

Some scholars have debated the question of whether the former slaves in the postbellum southern countryside constituted either a black peasantry or a rural proletariat. Perhaps less important than ascribing such labels is a recognition that a complex array of labor arrangements and methods of compensation coexisted within the southern agricultural sector. Moreover the status that individual blacks occupied was not static; instead individuals moved up and down the economic ladder over time as circumstances and conditions changed. Likewise the various members of black families and households undertook a number of different economic activities simultaneously, all working toward the goal of autonomy and independence.

Urban and Non-Agricultural Labor

One of the most dramatic developments in the postbellum South was the migration of thousands of

former slaves from plantations and the countryside to urban areas. Black people were attracted to what they believed were the greater economic opportunities that cities had to offer, as well as to the schools, churches, and benevolent and fraternal societies that tended to cluster in urban areas. Both the overall populations and the black populations of such cities as Washington, D.C., Richmond, Charlotte, Atlanta, Memphis, and New Orleans increased dramatically, while other cities, such as Charleston and Mobile, experienced significant black population growth.

The overwhelming majority of black men and women in cities were engaged in manual labor. Most men were employed as unskilled day laborers, although some obtained skilled employment, and most women worked as domestic servants. Cities were also home to the very small minority of black people who achieved professional or middle-class status, mostly as doctors, lawyers, educators, newspaper editors, and ministers, as well as to those very few African-Americans who became entrepreneurs by starting up, for example, black insurance companies.

Although they suffered severe racial discrimination, black people also found employment in the South's slowly expanding industrial sector. Many black men worked in the coal mines of Appalachia, in the naval stores industry, and in the South's burgeoning timber industry, while others were employed in iron foundries or steel mills, such as those in Birmingham, Alabama. Black men and women also labored as a small proportion of the workforce employed in the textile mills of piedmont South Carolina and North Carolina. Perhaps most tragically many thousands of black people, the large majority men but some women, endured horrific working and living conditions as convict laborers throughout the South, especially in Georgia, Alabama, Louisiana—where a seven-year term was equivalent to a death sentence—and Mississippi, home to the infamous Parchman farm.

Black Labor in the Post-Reconstruction South

Although former slaves and their descendants faced overwhelming obstacles during Reconstruction in achieving economic independence, their prospects for attaining that goal dramatically worsened at its end in 1877. In a process that began in several states before that date but that intensified and became widespread after it, the southern white propertied classes, including many planters and former slaveholders, regained political power and proceeded to use the

mechanisms of local and state government to re-establish control over labor. Combining their still-formidable financial power with the force of law, planters and other capitalists restructured legal and economic relations to their own benefit and to the disadvantage of labor. Most black sharecroppers found sharecropping to be a permanent status instead of a stepping stone to independent property ownership, with many reduced to the condition of debt peonage, although historians have debated the extent of this practice. Wage laborers for their part similarly found themselves with few options to that of selling their labor within a capitalist marketplace that was skewed in the interests of capital. Starting in the 1890s moreover, southern state governments moved systematically to impose legal segregation and to strip voting rights from black men, while lynching, race riots, and other forms of racial violence became increasingly commonplace. Black people may not have been legally re-enslaved in the decades following emancipation, but the overwhelming racial and economic oppression that they endured by the turn of the century made a mockery of black freedom, and it has caused scholars ever since to wrestle with the question of how different the new South was from the old South.

EMPLOYEE REPRESENTATION PLANS/COMPANY UNIONS

Company unions (also known as work councils or employee-representation plans) date back to the late nineteenth and early twentieth centuries, when the emergence of large-scale and impersonal economic enterprises and a rise in worker militancy and trade unionism began to pose major threats to the efficiency, autonomy, and power of American employers. Shop committees and informal company-specific worker organizations had existed in the nation's factories in the nineteenth century—as early as 1833—but employers became interested in initiating and controlling such bodies in the 1890s and early twentieth century, when early welfare capitalist experiments promoting industrial “betterment,” labor-capital mutualism, and company loyalty began to spread through the nation. Some of the earliest examples of such initiatives came in smaller firms that were making adjustments to workforce expansion—and in the service sector. The adoption of company unions

however became most pronounced later in larger industrial firms and in the railroad industry.

Perhaps the earliest example of a true company-initiated union can be found in the Filene Cooperative Association (FCA), a company union of female employees established in 1898 and formalized in 1905 at the Filene Boston department store. It was an innovation that came with a variety of other welfare capitalist initiatives: Medical care and insurance, social and athletic programs, company-sponsored cultural activities—all designed to address issues of worker alienation, low morale, and efficiency. The FCA was modeled on the structure of the US government, with the chief executive officer at the top and two representative deliberative bodies—one elected by the workers, the other appointed by the company president—charged with resolving wage disputes and the varied grievances of the department store's workers. Company officers also served as a cabinet of sorts. The FCA also worked closely with Filene's welfare work department, charged with overseeing the general welfare of employees.

Other employers were motivated to adopt employee-representation reforms out of social gospel motives. Such employers as Holbrook FitzJohn Porter, vice-president of the Nernst Lamp Company, were motivated by a religious conviction heavily influenced by social gospel theologians. In addition to the usual panoply of welfare activities undertaken by the firm, Nernst established a factory committee in the winter of 1903–1904 made up of rank-and-file shop and clerical workers and line-level supervisors.

Though Nernst's and Filene's motives in adopting company unionism were not directly related to a union threat, this was not true of other firms. In fact many company unions were specifically created by executives hoping to avoid strikes and trade unions. The Pittsburgh Railroad for example emerged from the Railroad Strike of 1877 determined to avoid such destructive conflagrations with employees in the future; it did so by actively promoting company unions with limited but significant power. The Packard Piano Company of Ft. Wayne, Indiana, hired Industrial Relations Consultant John Leitch of Philadelphia in 1912 to address employee problems that threatened production. Leitch formulated a company union model not dissimilar from that of Filene's, again modeled on a two-house congressional structure. One house, an industrial House of Representatives, was made up of representatives elected by workers, and the other, a Senate, by foremen; the cabinet was entirely composed of corporate executives. Since both houses and the cabinet were required to approve all proposals, and one house and the cabinet was entirely composed of supervisory and administrative

personnel, there was no doubt that real power remained firmly in the hands of management. Because of this, it was not surprising that so many firms looking for mechanisms to address labor problems began to mirror the so-called Leitch plan. Goodyear Tire and the Durham Hosiery Mills of North Carolina were but two of 20 firms that adopted it.

Not surprisingly radicals and trade unionists were extremely critical of company unions in whatever form; the movement toward company unions became a significant one during the 1910s and into the 1920s, and few trade union leaders could ignore it. Common criticisms emphasized the hollowness of corporate-initiated and structured representative schemes and the blatant anti-union motives behind many of them. In spite of such criticisms, the movement continued to grow through the 1910s. Besides the initial stimulation of the movement by Leitch's active proselytizing of his ideas (see, in particular, his classic *Man to Man: The Story of Industrial Democracy*), company unions were most pronouncedly catalyzed by the Colorado Industrial plan (or Rockefeller plan), which emerged in the wake of the Ludlow Massacre of April 1914. The Rockefeller family was the largest stockholder in the Colorado Fuel and Iron Company, the firm against which 9,000 miners affiliated with the United Mine Workers' (UMW) Union struck in the late summer and early fall of 1913. The strike was broken by the use of the Colorado National Guard. The guard attacked a striking miners' camp in Ludlow; gunfire took the lives of 10 men and a child, and a deadly tent fire (the guards had set miner tents on fire) led to the suffocation of another 11 children and two women. Following this, and in response to public outrage against the firm and the Rockefellers, John D. Rockefeller Jr. hired Clarence J. Hicks, who had extensive experience in administering welfare work at International Harvester, and W. L. Mackenzie King, former Canadian minister of labor (and future Canadian prime minister), to reform the labor practices of the firm. One of the results of their collaboration was an employee representation plan (ERP). The plan created local district committees democratically elected by the miners who would attempt to resolve grievances brought forward by workers. If workers could not get satisfaction from foremen or mine superintendents, they could appeal directly to a Joint Committee on Industrial Cooperation and Conciliation or the firm's president (through a presidential industrial representative who periodically visited each mining district). Without a viable alternative—since the UMW had been defeated in the strike—84% of voting workers gave their assent to the plan in 1915.

The Colorado Industrial plan was extended to other Rockefeller firms, such as Standard Oil, and

soon—in a variety of forms—it spread throughout the nation, as Midvale Steel Company, Bethlehem Steel, and many other firms adopted it. Perhaps the greatest catalyst for the expansion of the movement however was World War I, when government promotion efforts and labor shortages both came into play as motivating factors. With wartime production and efficiency key considerations, and anxiety over possible strikes and violence in the nation's shipyards and railroads rising, the Wilson administration looked to various forms of employee representation to ward off these threats.

Government wartime agencies, including the War Labor board, the Shipbuilding Labor Adjustment board, the U.S. Railroad Administration, and the U.S. Fuel Administration, established shop committees in various strategic industrial settings. The U.S. Railroad Administration, for example, created a national board with equal representation of labor and capital charged with settling railroad disputes. It in turn fostered the creation of local shop committees to alleviate an impossible burden of dealing with thousands of grievances from around the nation. By 1919, more than a hundred firms had adopted some form of employee representation under government pressure, and many more did it voluntarily (many perhaps in anticipation of government pressure). As many wartime employee-representation initiatives were government- rather than company-initiated, it may be questionable whether to consider wartime shop committees true company unions; nonetheless they borrowed much from prewar corporate experiments, including the Rockefeller plan and the Leitch plan. In the context of World War I idealism, and calls by the Wilson administration to spread democracy around the world, it was a natural leap to apply such ideas to the industrial realm. The language of industrial democracy began to resonate with both labor and progressive employers. Of course it meant different things to these two disparate groups. For the former it meant real independent trade unions; for the latter it meant the Leitch plan or the Rockefeller plan or a half-dozen other variations on the theme.

The wartime experience had a postwar legacy. With growing fears of a spreading Bolshevik revolution, with domestic postwar worker militancy on the rise (the 1919 national steel strike being one important example), with a trade union movement growing dramatically (it grew by 50% from 1916–1920), and with Wilsonian democratic rhetoric pervasive, a significant number of large employers began to recognize the need to implement some form of industrial democracy in harmony with the nation's democratic political traditions. Some believed that employee representation would, like other welfare capitalist

initiatives, bring workers closer to management and teach them a respect for the often-unpleasant responsibilities of supervisory personnel and managers. Though the recession of 1920–1921 and escalating worker expectations—reflected in a growing number of labor grievances brought forward for review by worker and company representatives—led employers to slow their adoption of shop committees and other forms of company unions (especially the Leitch plan), the overwhelming tendency in the postwar era was toward an increasing adoption of company unionism.

The number of workers covered by employee representation plans grew through the decade of the 1920s; by 1928, around 1.5 million workers were operating under the umbrella of one or another form of ERP, most of them employed by large firms. There is little unanimity among scholars on the question of to what extent workers accepted or embraced employee-representation initiatives. Some historians emphasize success, others hostility or apathy. Some scholars measure the notion of success from a managerial perspective, others from labor's point of view. A significant recent group of revisionist historians and economists, such as Daniel Nelson, David Fairris, and Bruce E. Kaufman, argue that there was much that was positive about the development of employee-representation plans in the first three decades of the twentieth century, that in fact, many plans improved industrial relations and furthered the interests of both workers and management. Most labor historians however are less sanguine about ERPs.

It is clear the record is varied both within and across firms. In several instances, company unions became quite powerful and effective in extracting wage increases and improvements in working conditions. Employees of Kimberley-Clark, Colorado Fuel and Iron, Standard Oil experienced concrete improvements in wage and working conditions. One detailed analysis of grievances adjudicated by Bethlehem Steel Company's ERP noted that over 1,600 grievances out of 2,300 were settled in favor of the employees. Labor Economist William Leiserson noted in the 1920s—the heyday of the company union movement—that between two-thirds and 70% of grievances brought up for review by ERPs were settled in the employee's favor. In some instances shop committees and councils did help reduce labor turnover and seemed to contribute to worker loyalty to the firm—goals that promoters of company unions had argued to justify their adoption. But it is hard to identify a consistent long-term pattern of significant improvements—either from a labor or managerial perspective. As Leiserson also observed, a pro-employee predisposition was most evident in the initial years of an ERP's operation.

On the other side, more than one scholar has identified a correlation between representation plans and wage cuts, suggesting that companies may have adopted company unions in part in anticipation of wage decreases—as a mechanism to ward off or limit labor unrest. Company unions tended to draw in family men, generally more moderate—even conservative—than younger, single workers. This had important implications on the intensity and level of worker militancy and activism within such unions. Furthermore representatives were not labor or economic professionals and dealt only with local conditions. They rarely developed a more national and global perspective on the economic conditions they were often the victims of—perspectives that international and national trade union officials more often had. These are all arguments made by some business and labor historians, as well as union organizers, against the long-term effectiveness of company unions in promoting the interests of employees. Similarly contemporary businessmen and scholars noted that escalating grievances and heightened expectations in the wake of the creation of employee-representation plans introduced as many labor relations crises as they may have tried to ward off.

Through the 1920s, so long as companies and their company unions delivered some concrete benefits to workers, employee-representation plans were often accepted as the only viable route to settle grievances. Yet with the coming of the Great Depression and the New Deal, the equation that sustained company unionism changed dramatically. Economic downturn meant corporations were less able to satisfy worker expectations, and government's aggressive intrusion into labor-management relations—one hostile to company unions—soon created a major crisis for American corporate managers. From 1928–1932, the years encompassing the early years of the Great Depression, many firms began to abandon company unions, resulting in an 18% decline in employees represented by them. This pattern was temporarily reversed with the passage of the National Industrial Recovery Act of 1933, which recognized—under Section 7(a)—labor's right to collective bargaining and to establish independent trade unions. In defensive reaction, firms throughout the nation began to implement employee-representation plans to head off independent trade unions. The result was an increase in the number of workers covered by such plans from 1.8 million in 1934 to 2.5 million in 1935. A growing and widespread hostility to this blatant attempt to block the growth of true independent labor organizations finally led to a legal prohibition against company unions and all forms of employer-dominated labor organizations, codified by Section 8(a)(2) of the

Wagner Act (National Labor Relations Act) of 1935. When the Supreme Court failed to overturn the act in 1937, the government began aggressively to break up company's unions. The 1938 Newport News Shipbuilding and Dry Dock Case (*Newport News Shipbuilding & Dry Dock Co. v. Schauffler*, 303 U.S. 54) was the landmark Supreme Court case that finally terminated the 35-year-old movement.

The hundreds of company unions throughout the nation in the mid-1930s followed various tracks following the government prohibition. Some chose the path of establishing independent, nonaffiliated unions. This was the case with the Gadsden, Alabama Goodyear Tire plant. Workers violently rejected attempts by the American Federation of Labor (AFL) and the Congress of Industrialized Organizations (CIO) to organize plant workers. Instead they chose to establish the Etoawah Rubber Workers' Association. A significant percentage of workers enrolled in company unions followed a similar track; from 1935 to the early 1940s, around half of all workers enrolled in company unions and newly established independent unions voted against affiliation with AFL or CIO unions in National Labor Relations Board (NLRB)-supervised elections.

On the other hand, there were also numerous examples of company unions being either rejected when viable alternatives were offered to workers or becoming springboards to trade independence in the 1930s. Trade union organizers captured employee-representative committees at Pittsburgh's steel mills and lobbied effectively for employee support of the CIO. In early 1937, US Steel finally accepted the Steel Workers' Organizing Committee (SWOC), affiliated with the CIO, as the bargaining unit of their employees. A similar transition took place at General Electric—though it took various routes in the firm's diverse plants. There at the firm's West Lynn, Massachusetts, plant, a works' council had been in existence since 1918 (formed in response to government pressure). But led by a militant pattern maker named Al Coulthard, a concerted effort began in the early 1930s to replace the works' council with an independent union. In an election monitored by the New England Regional Labor Council, Coulthard's independent union defeated the council by a margin of 82% to 18%. In the Schenectady Works of General Electric, one of the firm's largest production centers, industrial union organizers—several of them Communists—became active in the firm's works' council, originally established in 1924. Already under pressure to comply with Section 7(a) of the National Recovery Act (NRA) management first attempted to convince government watchdogs that the firm was already in compliance with the law. The firm modified the council in late 1933 though, changed the Schenectady

organization's name to the Workers' Council, strengthened grievance procedures, and increased worker input into wage determinations. To assuage workers further, management announced a wage increase of 10% on April 1, 1934, and cited the effective negotiation pressure of the council as a factor in the wage increase. With the power of the council increasing, labor militants began to look to it as a mechanism to accomplish more dramatic changes in the firm. They flocked into its ranks and began to advocate for an open NLRB election to replace the council with an independent industrial union. The final result of that process led to the formation of Local 301 of the United Electrical, Radio and Machine Workers of America (UE) in early 1937.

The later 1930s witnessed an end to company union initiatives. The legacies of these initiatives and the company union movement as a whole were mixed, but in their final years, employee-representation plans and workers' councils formed bridges to independent trade unionism—small, independent, and local, as well as large, affiliated, and national. The ideas and ideals of company unionism, often more than the realities, seemed to keep alive the idea of industrial democracy among workers. And as historian Irving Bernstein has noted, whether sustaining or contradicting those ideas and ideals, company unionism offered workers a language that they could use to fashion a more truly democratic and independent form of unionism, reflected in the rise of the CIO unions in the late 1930s.

EMPLOYEE RETIREMENT INCOME SECURITY ACT (1974)

Most laws relating to private-sector pensions in the United States are contained either in federal tax law or in the Employee Retirement Income Security Act (ERISA), which was first enacted in 1974. Although ERISA also deals with so-called "employee welfare plans," including, for example, health plans, pension provisions take up its bulk.

The ERISA does not require any employer to establish a retirement plan and does not dictate retirement benefits. However it does subject those pension plans that are established to numerous legal requirements, mainly aimed at ensuring that pension plans are actually used for the benefit of covered employees. The ERISA is a very large and extremely complex law, encompassing many disparate goals.

The ERISA regulates both "defined-benefit" and "defined-contribution" retirement plans. (The former term refers to a plan wherein benefits are based on a specifically defined formula, usually based on years of service and salary at or around the time of retirement. The latter refers to a plan wherein benefits are based on the size of an account to which the employee, and sometimes the employer as well, has/have contributed.) However defined-benefit plans are the type that is truly contemplated by the law and thus such plans are far more regulated by ERISA.

The Problem of Retirement

Pensions as we know them did not always exist. Neither for that matter did retirement. Prior to the Civil War, as a general rule most Americans appear to have died relatively young, worked until they died, and worked in an agricultural environment. Retirement was mostly unknown. Following the Civil War however, more people came to work in industry, where older people are commonly thought to be of less use than in agriculture. Further the population of the country generally aged from the Civil War to the 1930s. The concept of the pension slowly began to develop as a way of ensuring an income for people who were considered to be of no further use as workers.

The first American pensions appear to have been exclusive to either disabled or retired Civil War veterans (sources differ). Despite various administrative problems, the program was popular and became an important precedent. Though there is some disagreement, most sources indicate that first American private-sector pension plans were established in 1875 (by the American Express Company) and in 1880 (by the Baltimore-Ohio Railroad Company).

From here pensions grew only in number, size, and importance. Pension plans appear to have become major financial players relatively early in their history.

The Rise of ERISA

Government accommodation and regulation of pensions dates back to the Revenue Acts of 1921 and 1926, which first gave pensions a special tax status. Other laws were enacted throughout the 1940s, 1950s, and 1960s.

Pension reform began in earnest however in the late 1950s, in response to a series of major pension-related scandals; two particularly important ones involved Teamsters union leader James “Jimmy” Hoffa, and another involved the Studebaker car manufacturer. A series of federal laws, dating back to 1958, ultimately discredited Welfare and Pension Plan Disclosure Act of 1958 (WPPDA), and a Presidential Committee on Corporate Pension Funds (put together by President John F. Kennedy in response to the Studebaker scandal) led up to the enactment of ERISA. Following the issuance of the presidential commission’s report, New York Senator Jacob K. Javits took the lead on the issue and is usually credited with principal authorship of the bill that eventually became ERISA some years later in 1974 (PL 93-406, also known as the Pension Reform Act). Why ERISA went through exactly when it did is an extremely interesting question to which the answer is rather murky.

Although ERISA has been amended several times since 1974 (most notably by the Revenue Act of 1978 and the Retirement Equity Act of 1984), its essentials appear to have remained very similar since its initial enactment.

The Basics

Many of ERISA’s provisions are detailed, technical, and complicated. However the basics of the law are fairly easy to summarize in the broadest terms.

Without requiring employers to establish pension plans or mandating what benefits are payable, ERISA subjects pension plans to various requirements. For example requirements for vesting in a plan (vesting refers to the point after which an employee can draw benefits after reaching normal retirement age for the plan even without long service to the employer) were enacted. These requirements are considered important because they limit the ability of employers to take away employees’ pensions entirely by firing them late in their careers and assist employees in changing jobs without losing their pensions entirely. Toward similar ends, requirements for benefit accrual were also established.

Provisions were also made requiring employers to report, regularly and accurately, to members regarding the benefit package and the fiscal health of the plan. Requirements for investment and financial management were also enacted. In general investors for the plan are required to make investments for the exclusive benefit of plan members, are required to invest prudently (considered to be a higher obligation than the “reasonable man standard” that often appears in other areas of law), and mandated to diversify investments unless prudence clearly dictates otherwise. Further an agency called the Pension Benefit Guaranty Corporation (PBGC) was established to pay benefits for plans that failed.

In general ERISA regulates traditional defined-benefit pension plans, wherein benefits are based on a formula that is known from the outset, more so than defined-contribution plans, such as 401(k) plans, where benefits are determined by the size of an account. The latter were not as popular when ERISA was enacted as they are now and in some circles are considered to be less retirement plans per se than deferred-compensation or assisted-savings programs. Defined-contribution plans are regulated by ERISA, only somewhat less so.

Current Issues

Within the last few years prior to the writing of this article, pension-related scandals have once again shined a spotlight on ERISA and led to calls for its amendment. At the time of writing, some proposals have been enacted, but many have not, and the basic provisions of ERISA as previously described remain about the same. To an extent ERISA’s reporting requirements have been strengthened, along with other reporting, accounting, and auditing requirements for businesses.

Employer advocates generally argue for ERISA's provisions to be strengthened in light of the various scandals where plans proved to be underfunded and instances where employers and plan managers have either violated ERISA or have sought to subvert its intent while remaining within its letter. On the other hand, some employers have argued for a lessening of ERISA's requirements, arguing that due to certain financial techniques, pension plans can coast for longer periods of time without being actually sound actuarially.

At the time of writing, many companies under financial stress have begun to seek the protection of the courts through the bankruptcy laws, and pension obligations, typically considered particularly expensive for companies, have often been the first targets of discharge or lessening of company debt pursuant to the bankruptcy laws. A study issued by the PBGC late in 2005, for example, showed that 9.4% of pension plans covered by ERISA had frozen benefit accruals; this means that while the plans were still in existence, members' benefit levels were frozen and could not grow any further despite their continuing to work for the firm.

Even before the recent rash of "dumping" of obligations, the PBGC was considered to be on rather shaky financial ground, and the increasing reliance on it to pay the pension obligations of ostensibly bankrupt firms has not helped matters. These factors together with other circumstances have led some commentators to worry that a crisis looms in the nation's private-sector retirement system.

ENGLISH WORKERS

English workers played crucial roles in American labor history. Among all immigrants they made unique contributions to the development of industry and labor organization. This was due to an essential fact: Great Britain—England especially—was the world's first industrial nation and until the late nineteenth century, led the world in industrial technology and manufacturing. It had the world's most advanced and diversified economy and labor force, with the largest share of its population working in modernizing industries. Thus English workers in the United States—from the Revolution through the nineteenth century and beyond—offered valuable skills and experience. They brought a transatlantic industrial revolution from Britain to the United States that profoundly changed the American economy and society.

Another feature that distinguished the English from other immigrants in American labor was the fact that they already shared the same language and basic religious and political culture with most white Americans. England after all was the mother country and had planted a culture that remained essentially English after the Revolution in spite of the arrival of many non-British peoples. English workers in the United States then found a culture and institutions that were more familiar than different. They were "invisible immigrants" in the sense that they were often not seen as true foreigners but as cousins of the same stock. They blended in quickly with the larger American society. Sometimes the English did feel hostility from overly patriotic Americans who questioned their loyalty—especially in the years immediately after the Revolution, during the War of 1812, and other times of tension between the two nations. But generally the English were warmly welcomed and appreciated for their skills, hard work, common values, and quick assimilation to American life. They did not form ethnic communities or establish ethnic presses or other institutions like other immigrant groups did. Thus the English entered American labor quickly, often in leading roles. The great majority were not fleeing poverty but seeking greater opportunities in America. Some however were indeed poor. As early as the 1770s, the English in American cities began establishing St. George societies to assist English newcomers who needed help to get established as workers in the United States.

Industrial Skills

The industrial revolution is closely associated with innovation in textiles, and all of the major

breakthroughs occurred in England: James Hargreaves's spinning jenny (1764), Richard Arkwright's water frame (1769), Samuel Crompton's spinning mule, and Edmund Cartwright's power loom (1785). The transfer of these innovations from Britain to the United States occurred quickly through English immigrants like Samuel Slater. He had been an apprentice to one of Arkwright's partners and came to the United States in 1789. Slater was responding to advertisements for skilled mechanics that American state legislatures published in English newspapers—so strong was the American demand for advanced skilled labor and the accurate perception that England was the source. Slater, like other early skilled workers heading for the United States circumvented the English law that forbade the emigration of skilled workers by simply declaring himself an apprentice. In 1790, Slater signed a contract to build a water-powered cotton-spinning mill based on Arkwright's designs, and he set up his own factory in Pawtucket, Rhode Island, in 1793. After his brother joined him from England, he built another mill in a town soon-called Slatersville. He also expanded his operations in Massachusetts. Slater employed other English workers along with local people, and he established a family system of labor, which combined some aspects of Arkwright's management system with new approaches to avoid England's tendency for horrible factory conditions. By the time of his death in 1835, Slater was involved with 13 textile mills. Another important English immigrant, Arthur Scholfield, similarly brought the latest textile technology to Pittsfield, Massachusetts, and his five brothers and their families to help him. Other less spectacular examples of English immigrants building textiles mills in the United States or bringing the latest skills are common and stretch into the mid-nineteenth century and beyond.

What happened in the transfer of textile technology and skills occurred in most industries. The early iron mills of Pennsylvania and Ohio relied heavily on English people who discovered ore bands and exploited them and others who brought experience with modernizing iron production from England. English workers helped build the first U.S. iron-rolling mill in Pittsburgh in 1812, and they brought the boiling method for puddling iron in 1837. The English introduced the method of coal-fired blast furnaces and the technology to build the first coke ovens in the 1830s. They also introduced the production of blister and crucible steel and helped develop the first U.S. rail production. Naturally the English rose quickly in the mills as supervisors and owners. And when steel began to replace iron—after the Bessemer process was brought from England following the Civil

War—it was often with the help of English workers who had acquired the necessary skills and experience in their native land. The English also transferred the necessary workers and tools to establish the modern brass-making industry in Connecticut. In the 1830s, potters from Staffordshire established the pottery industry in East Liverpool, Ohio, and in Trenton, New Jersey. For decades English workers dominated and developed the industry in those cities, such that by the post-Civil War Era, the Americans could successfully compete with the English in pottery.

The English were especially important in American mining. Since the Middle Ages, the English had pioneered coal mining, and in the eighteenth and early nineteenth centuries they created the modern coal-mining industry. As their mines plunged more than a thousand feet below the earth's surface and even under the sea bed, they developed new techniques of ventilation, water pumping, and safe methods of tunneling. Mining—whether of coal or ores—was a skilled craft until mechanization took over in the late nineteenth century, and the English (as well as the Welsh and Scots) brought that skill and experience to the United States. They opened the coalmines of Pennsylvania, Ohio, Illinois, and other key states. In the 1850s alone, at least 37,000 British miners (most of whom were English) arrived in the United States, and they rose quickly to become mine bosses and owners. All over Pennsylvania and the Midwest, English workers discovered and developed important coal seams.

In other areas of mining, too, the English were instrumental. The Cornish—though ethnically distinct—were considered English as well, and they opened up the lead mines of the upper Mississippi River valley, especially in southwest Wisconsin, northwest Illinois, and eastern Iowa. The same was true of the iron and copper mines in upper Michigan and other areas in the Midwest. And of course when gold was discovered in California, and silver throughout the American West, the English were quick to exploit the new opportunities. They could apply their mining skills to the more precious ores, and with their common language and ease of participation in American life, they could move throughout the country rapidly to make the most of their situations. Virtually wherever one looks at American mining, one sees the English in prominent numbers and roles.

An overview of the occupational background of English workers in the United States reveals a remarkable diversity and comparatively high level of skill. During the late 1820s and 1830s, the English arriving in the United States were largely farmers and pre-industrial craft workers—especially building trades workers, miners, woodworkers, and so on.

ENGLISH WORKERS

Also prominent were skilled industrial workers in textiles and iron. They were generally not desperately poor or escaping technological displacement but could afford to travel as families in search of richer American opportunities. More poor workers arrived during the famine years of the late “hungry forties,” but during the prosperous midcentury, farmers and engineers and skilled machinists (who were generally doing well in England) were entering the United States in significant proportions. In 1851 alone, an estimated 440 engineers and 660 ironworkers came from Britain (mostly England) to the United States. This was just what the young, industrializing nation needed for economic development.

During the 1860s, early 1870s, and 1880s, English immigration to the United States rose. They came increasingly from urban areas and were mostly building trades workers, miners, and unskilled workers. Many professionals, including lawyers, teachers, and clerks, also arrived throughout the century. A surprising number of all of these people from industrial and professional backgrounds took up farming in the United States. The availability of cheap, fertile land had attracted many of the English to the United States in the first place. And though most of them had nonagricultural occupations in England, many had been raised on or near farms. Farming was in their blood, and land ownership was a powerful incentive for their move. Thus when the English came to the United States and took up work in industry, mining, the building trades, and other nonagricultural fields, it was often a means to acquire the necessary capital to purchase land and take up farming.

English women in the United States were most commonly textiles workers, seamstresses, or domestic servants; but many were also active in teaching and medicine. They made essential contributions to family incomes and were also crucial for agriculture. They played more diverse roles in American labor than other immigrant women. Altogether the English contributed valuable industrial skills and experience and accelerated the growth and development of the United States. The 1890 United States census shows that the English were still much more likely than other immigrants to have skills and to be working in textiles, iron and steel, machine making, and other various skilled occupations.

Labor Organization

English workers also contributed to labor organization. For though the Americans were leaders in

political democracy, the British were the leaders in industrial democracy. English workers coming to the United States carried their awareness of the need for labor unions and their experience in attempting organization. Some had been Chartists, demanding full democratic rights, but many more simply had a determination to reform the industrial system to benefit the workers. Some American businessmen who recruited skilled English workers were surprised to find that they now had employees who were organizing fellow workers for better pay and conditions, and some avoided hiring the English precisely for that reason. One of the earliest U.S. labor organizations—New York’s Workingmen’s party—was established in 1829 under the leadership of English immigrants, and in the 1840s, the arrival of English Chartists helped bolster the state’s labor movement. In 1850, when Parliament began to devise safety codes and inspection systems in response to the miners’ agitation, English miners brought their determination to accomplish the same goals in the United States. They led the formation of the American Miners’ Association in 1861.

The importance of the English in American labor organization is also illustrated in the life of Samuel Gompers. Born in London’s East End to Dutch Jewish immigrant cigar makers, he came to the United States with his family in 1863, with financial help from his father’s trade union. Starting out as a cigar maker in New York, Gompers began meeting with other skilled workers and used the British experience with labor organization to demand higher dues from the workers to allow benefits like sick relief, unemployment compensation, and especially a strike fund. With this British model, Gompers established the Federation of Organized Trades and Labor Unions in 1881, which he transformed into the American Federation of Labor in 1886, serving as its president. Because of the role of Gompers and many other English workers, the American labor movement grew with more speed.

The peak number of English-born people in the United States was recorded in the 1890 census at over 900,000. In the twentieth century, the numbers fell as the English were drawn more to the Commonwealth. But the English were still important for the American labor force. They were more concentrated in the professions, as the “brain drain” from Britain to the United States brought more educated people into the universities, the entertainment industry, medicine, and high technology. Altogether the English made an enormous impact and contribution to American labor.

ENVIRONMENTALISM

American environmentalism, from its Progressive Era antecedents to the first Earth Day in 1970 and beyond, must be understood as one of several social movements that arose in response to the profound changes in American political economy and society that began during the second half of the nineteenth century and continued into the twentieth century. Like trade unionism, progressivism, and New Deal-style industrial unionism, the conservation and environmental movements emerged as a result of the United States' transformation from an agrarian and rural society into a predominantly industrial and urban society. As two distinct responses to this same fundamental development, the environmental movement and the various movements organized by, or on behalf of, the working class have experienced a history of uneasy coexistence. The two reform impulses have complemented one another to the extent that they each have posed challenges to the modern corporate-industrial economy, most often by looking to the federal government to curb the excesses of the corporate-industrial order. Ultimately however different constituencies and different goals have led to many intractable contradictions between environmentalism and working-class movements.

Origins of American Environmentalism, 1890–1945

The roots of modern American environmentalism are found in the Progressive Era conservation movement

that emerged at the end of the 1800s. This conservation impulse was a response to three late nineteenth century developments in the American political economy: Industrialization, urbanization, and the symbolic closing of the frontier due to the westward expansion of settlement. Industrialization ensured that the exploitation of the nation's timber and mineral resources occurred at unprecedented levels, while the westward spread of settlement meant that fewer land remained immune to this new level of exploitation. Urbanization placed seemingly unsustainable demands on the nation's forests, rivers, and farmlands and also created new environmental problems in the form of urban air and water pollution. These developments engendered a sense of anxiety among many Americans that the public domain was vanishing and that the U.S. economy was exploiting the nation's natural resources at an unsustainable pace. Perhaps historian Roderick Nash in his seminal *Wilderness and the American Mind* has explained this development most succinctly: Americans' concern for the nation's remaining natural areas became more pronounced as the advance of the urban-industrial economy threatened to destroy those areas.

Progressive era conservation was above all else a federal-level legislative and administrative response to this anxiety over dwindling natural resources. As early as 1864, George Perkins Marsh, considered by most historians to have been an early prophet of American environmentalism, cautioned against the overexploitation of American resources. In his book *Man and Nature*, Marsh warned that the rampant deforestation he observed in his native New England and in neighboring New York threatened environmental catastrophe in the form of soil erosion, flooding, and localized climate change. But for decades his warnings went unheeded. Such legislation as the Homestead Act (1862), the General Mining Law (1872), the Desert Land Act (1877), and the Free Timber Act (1878) reflected preconservation, *laissez faire* attitudes. The framers of such laws sought to promote economic growth simply by giving away to private developers the rights to public land, timber, and mineral resources. The Progressive conservation movement therefore signified an important revolution in the management of the nation's natural resources. In contrast to the long tradition of the *laissez faire* approach to natural resource policy, Progressive Era conservation policies inserted the federal government into the long-term management and regulation of American forests, soils, and rivers. The United States Forest Service (USFS) was created in 1905 and charged with managing federally owned forestlands. The Newlands Act (1902) created the Bureau of Reclamation, an agency charged with managing

rivers and irrigation projects in the arid American West. The goal of these two agencies was to shift away from concerns over immediate profitability in order to promote long-term, efficient economic development. On the other hand the American Antiquities Act (1906) authorized the president to designate as national monuments areas of historical or archaeological significance for the expressed purpose of exempting these lands from economic development in perpetuity. Congress created the National Park Service (NPS) in 1916 in order to manage these and other preserved lands. As this list suggests, the new managerial role for the federal government was contradictory from the outset. The Bureau of Reclamation and the USFS clearly intended to use federal power to promote the orderly and efficient use of the nation's natural resources. Such legislation as the Antiquities Act and such agencies as the NPS envisioned the federal government as the guardian of the nation's wild or natural places.

The questions often debated by historians of Progressive Era conservation are who spearheaded these legislative and administrative changes in conservation policy, and who benefited from these changes? Samuel P. Hays, in his classic *Conservation and the Gospel of Efficiency: the Progressive Conservation Movement, 1890–1920*, argued that elite, scientific-minded experts foisted these conservation policies on the public and managed the nation's public lands to the benefit of American industry. Hays' archetypal conservationist was Gifford Pinchot, considered by historians the founder of American forestry. Pinchot espoused a utilitarian view of conservation that called for the "right use" of natural resources to benefit the greatest number of people for the longest amount of time. Natural resources, Pinchot argued, should not be squandered by rapacious American industry, but nor should those natural resources be "locked up" or preserved from all economic development. As chief forester of the USFS, Pinchot developed the policy of sustained-yield forestry, whereby the national forests were managed as a crop with the goal of promoting future economic development. Historian Stephen Fox, on the other hand, argued that the Progressive Era conservation impulse is best understood as a fight between the people and the interests. In *The American Conservation Movement: John Muir and His Legacy*, Fox stressed the degree to which preservationists like John Muir, avid outdoorsman, founder of the Sierra Club, and tireless promoter of the preservation of spectacular natural landscapes, spoke on behalf of the people and against the interests of logging, mining, and ranching elites. The creation of 13 national parks from 1872–1913 at the insistence of preservationists like Muir, Fox argued,

was fundamentally a democratic development and represented the protection of public lands from private industry.

One possible way to reconcile this debate and also to assess the legacy of Progressive Era conservation movement is to acknowledge the degree to which the Progressive Era conservation movement—including Muir's preservationist Sierra Club—was largely an elite affair, as Hays suggested. Indeed conservationists shared many of the anti-immigrant and illiberal attitudes toward the working class with other Progressive Era reformers (the notorious nativist Madison Grant for example, was also a member of the Save the Redwoods League, a founder of the Bronx Zoo, and on the board of trustees at the American Museum of Natural History). But it is equally important to acknowledge that government regulation of the nation's natural resources amounted to a revolutionary break with past *laissez faire* policies, regardless of the business-friendly mentality of Pinchot and other utilitarian conservationists. At the end of the Progressive Era then two competing strands of thought—one utilitarian, the other preservationist—had emerged, each with its own elite constituency.

Indeed the flurry of conservationist and preservationist legislation passed during the Progressive Era is a testament to the fact that the earliest environmental impulse was a movement among elites. It is important to note however that Pinchot and other Progressive Era conservationists, such as Senator George Norris and Senator Francis Newlands, did view conservation as a way to promote social equity through a more even distribution of natural resources. But without a self-organized movement among the working or even the middle classes, promises of social equity made by conservationists inevitably went unfulfilled.

Just as American business leaders during the 1920s were able to co-opt the language and logic of the labor movement by calling for American plans and company unions, so, too, were industrialists able to bend the language and logic of Progressive conservation to their needs. Such industry-dominated groups as the American Forestry Association used Pinchot's language of "multiple" or "right" use, initially intended to ensure a wide distribution of forest resources, to argue successfully for repeated rounds of road building and logging in the national forests that favored larger timber companies. Similarly large agribusiness interests in such states as California secured extensive Bureau of Reclamation irrigation projects, justifying their actions using the egalitarian promise of 160-acre homesteads even as these agribusiness interests circumvented such acreage restrictions. Senator Newlands, the author of the legislation that

created the Bureau of Reclamation, had envisioned the 160-acre limit as a way to ensure that the benefits of irrigation would flow in democratic fashion to small-family farmers. But quickly the scope of the bureau's projects made Newlands' idea seem quaint at best, and downright backward as far as agribusiness interests were concerned. The failure to make strides toward a more equal distribution of natural resources continued unabated during the New Deal Era. The Tennessee Valley Authority (TVA) was created in 1933 and charged with building a series of dams in order to promote hydroelectric power, flood control, and economic growth in the Tennessee River valley. The brainchild of Senator Norris, the TVA was supposed to promote social equity by bringing low-cost, publicly generated electricity to one of the more impoverished regions of the South. But to such critics as Benton MacKaye, a forester, regional planner, and creator of the Appalachian Trail idea, the TVA quickly sacrificed socially and ecologically sound regional planning at the altar of economic growth. Similar disappointments followed the construction of the Bonneville Dam on the Columbia River. The absence of a self-organized conservation movement among the middle and working classes, along with the Depression Era need to alleviate unemployment and create economic growth, meant that conservation projects placed the federal government squarely in the role of increasing the productive capacity of the nation's environments. The goal of an equitable distribution of natural resources, always less important to Progressive Era and New Deal Era policymakers than the developmental imperative that lay behind these utilitarian conservation works, was in eclipse by the end of the New Deal.

Modern American Environmentalism, 1945–2005

Modern American environmentalism began when increasing numbers of Americans recognized that the environmental consequences of post-World War II economic growth not only jeopardized the health of distant national forests or national parks but also threatened public health and quality of life at home in their own neighborhoods. Just as Progressive Era conservation and preservation stemmed from the development of the urban-industrial economy during the late nineteenth century, the development of modern environmentalism reflected significant shifts taking place in the American political economy during the middle of the twentieth century. Economic

growth led to an expanding middle class and a new consumer-oriented economy. Suburbanization invaded previously undeveloped lands at the edge of urban areas, and automobiles soon rivaled factories as a source of air pollution. Spurred by wartime innovation, newer industries, such as plastics, pesticides, chemicals, petroleum, and nuclear energy, grew tremendously. Moreover the large-scale public-works projects begun in the 1930s yielded truly Herculean levels of environmental transformation by the end of World War II. By the mid-1940s, for example, the Bureau of Reclamation's numerous hydroelectric dams had so thoroughly harnessed the Columbia and Colorado rivers that the bureau was capable of generating more electricity than any other entity, public or private, in the world. Clearly then economic growth in the postwar United States was predicated on massive changes in the American landscape and came at a high environmental price. Modern American environmentalism thus grew from a paradox at the heart of the new postwar American political economy: Robust economic growth made economic security more widespread than ever before in American history, but many Americans in the expanding middle class found their newfound sense of economic security almost immediately undercut by fears that economic growth jeopardized both environmental stability and public health. Post-World War II environmentalism was therefore more democratic than the earlier eras of expert-led conservation in the sense that during the postwar era, the environmental impulse was more widely shared. But for much of this era, environmentalism was still open to charges of elitism because it was largely a middle-class movement, a characteristic that distinguished environmentalism from the organized labor movement.

The first stage of postwar environmentalism involved the protection of iconic public lands and dramatically expanded the constituency of environmental organizations beyond their historically elite base and into the ranks of the expanding middle class. The familiar debate between preservationists and utilitarian conservationists that had been raging since the 1890s came to a head in the early 1950s when the Bureau of Reclamation announced plans to build a dam at Echo Park inside Colorado's Dinosaur National Monument. This proposal was part of the larger Colorado River Storage Project (CRSP) and reflected the utilitarian spirit of Progressive and New Deal Era conservation. It would have flooded federal lands that were supposedly protected from economic development. Led by David Brower, the Sierra Club's dynamic new executive director, more than a dozen preservationist organizations waged a publicity campaign that forced the Bureau of Reclamation to scrap its plans

for Echo Park due to the public outcry. What was remarkable about this episode was that the Echo Park project would have been so very unremarkable during the 1930s or 1940s. But as middle-class Americans flocked to the national parks during the 1950s and 1960s, they could be mobilized to defeat public-works projects that adversely affected these public recreational lands. Dams in the works for Glacier, Big Bend, Kings Canyon, and Grand Canyon national parks were also scrapped as a result of this middle-class hostility toward such proposals. The fight against the CRSP marked the apogee of the preservationist strain of environmentalism that began with Muir. During this era the Sierra Club and other preservationist organizations first enjoyed widespread public support. Such organizations expanded beyond their historically elite base in the decades following the 1950s, as many middle-class Americans decided that at least the nation's publicly owned parklands should be protected from rampant economic development. This first stage of postwar environmentalism questioned the logic of incessant economic growth but only as far as iconic public lands were concerned.

The 1960s and 1970s were important decades during which the environmental movement articulated a more direct challenge to the logic of continuous economic growth. This was the second stage of postwar environmentalism. A series of high-profile environmental problems surfaced during this era. Scientists linked smog clouds over Los Angeles and other cities to automobile exhaust; middle-class Americans in suburbia found their drinking water contaminated by pollutants traced back to phosphates found in household laundry detergents; ecologists declared Lake Erie to be ecologically dead in the mid-1960s due to industrial pollutants; Cleveland's Cuyahoga River became so polluted that it famously caught fire in 1969, and so on. But perhaps the most startling revelation occurred in 1962 with the publication of Rachel Carson's *Silent Spring*. Widely regarded as one of the most influential books in the history of American environmentalism, Carson's book revealed to unsuspecting Americans the degree to which such chemicals as DDT had deleterious—and even fatal—impacts on animal life throughout the food chain and could cause significant health problems in humans. In the wake of *Silent Spring*, many Americans came to consider pollution and toxic chemicals as direct threats to their health, security, and quality of life. As these connections between public health problems and environmental degradation on the one hand and unrestrained economic growth on the other became increasingly obvious, environmentalists began to call for a series of regulations that marked a significant departure from the earlier concern with iconic

parklands. Now the actions of privately owned businesses and the use of privately owned resources that polluted the air, water, and land were to be regulated. The Clean Air Act (1963) and the Clean Water Act (1972), both of which were amended several times in the coming decades, sought to reduce air and water pollution to safe or acceptable levels by requiring industry to restrict its emissions of harmful materials. The National Environmental Policy Act (1970) mandated environmental impact statements (EIS) in order to evaluate the wisdom of proceeding with industrial projects likely to adversely affect the environment. The Environmental Protection Agency (EPA) was created (1970) to oversee the regulation of air and water quality, solid-waste disposal, and to supervise the EIS process. Congress banned the use of DDT (1972), and the Toxic Substances Control Act (1976) called for more stringent monitoring of the use and disposal of industrial chemicals. The Endangered Species Act (1973) mandated the protection of species designated by scientists as threatened or endangered without any consideration of the economic consequences of protection. And the Comprehensive Environmental Response, Compensation, and Liability Act, better known as the Superfund Act, was passed in 1980 and authorized the creation of an environmental rehabilitation fund to be financed by a tax on the chemical industry. It also authorized the EPA to sue corporations for clean-up costs if corporate negligence could be proven. Taken collectively these environmental measures amounted to a frontal assault on corporate U.S. managerial prerogatives to use their privately owned resources as they saw fit.

The environmental reforms achieved during the 1960s and 1970s were far from perfect, and many environmentalists argued that they did not go far enough, but the conservative backlash against environmental regulations since 1980 suggests the degree to which environmental legislation did in fact place significant restrictions on managerial prerogatives. Since 1980, capital and its conservative political allies have argued that environmental regulations hurt the American economy and cost Americans jobs. The “job blackmail” or “jobs versus the environment” debates that have raged since 1980 are examples of this. These arguments had salience in large part due to the wrenching economic changes that the American economy experienced during the late 1970s and early 1980s. Ronald Reagan's famous proclamation that “government is the problem” led him to slash the EPA's budget, for example, and appoint a series of cabinet-level officials hostile to the very idea of federal management of natural resources, ostensibly in the name of increasing the productivity of private enterprise and boosting employment for American

workers. In addition to this pragmatic argument that environmental regulations cost jobs and hurt the economy, the conservative backlash against environmentalism has also been bolstered by the larger ideological shift toward private property rights in American political culture that has accompanied the resurgence of the conservative movement. The Wise Use movement, a movement consisting of a coterie of wealthy western miners, ranchers, loggers, and landowners assuming the appearance of a grassroots uprising, has argued that the federal government had no right to regulate any use of privately held lands and demanded an end to government regulation of natural resource use. Similarly the Republican party's 1994 Contract with America included an effort to re-interpret the Fifth Amendment to include a "takings clause." Traditionally under the rules of eminent domain, the government compensated private landowners only if their property was physically occupied. The proposed takings clause called for remuneration if any restrictions whatsoever—including regulations designed to reduce pollution or protective actions mandated by the Endangered Species Act, for example—were placed on private owners' land use options. Such a clause would make most environmental regulations unaffordable. The backlash against environmental regulations was part of the larger ideological movement to free the private sector from as much governmental regulation as possible.

Modern American Environmentalism and the Labor Movement, 1945–2005

In 1990, environmentalists successfully petitioned to have the northern spotted owl listed as threatened under the Endangered Species Act. This triggered actions to protect the owls' habitat, the old growth forests of the Pacific Northwest. The timber industry ominously predicted the loss of over 100,000 jobs if these forests were removed from the market. Environmentalists argued that this was an exaggerated threat and that any jobs lost were the result of a timber industry that was ailing regardless of whether or not remaining old growth forests were cut. Members of Earth First!—a grassroots environmental organization—heightened the tension when they engaged in direct-action protests that included "monkey wrenching," or the sabotaging of logging equipment. Afraid of losing their jobs and resentful of what they perceived as environmentalists' economic and cultural elitism, blue-collar loggers sided with the timber industry. The ensuing fight between environmentalists and workers quickly came to epitomize what is often

assumed to be the inherent disconnect between the environmental and labor movements. As this disagreement between loggers and environmentalists suggests, it is important to acknowledge the deep fissures that exist between the labor and environmental movements. Both movements challenged the prerogatives of industry, but environmentalism and organized labor have historically represented different constituencies that did not always challenge the corporate-industrial order in the same way. Middle-class environmentalists ensconced in professional jobs were free to question the logic and desirability of incessant economic growth, particularly in such extractive industries as logging. Labor unions, constrained by patterns of firm-centered collective bargaining in place since the Wagner Act, were understandably devoted to ensuring the health of their industry and hesitated to endorse any measures that threatened its economic growth. Different constituencies and different core values have meant that labor and environmentalism have often been at odds.

But collaboration between environmentalists and organized labor has not been impossible, and the assumption that there is an irresolvable conflict between organized labor and environmentalism is incorrect. Before the 1970s, there were considerable areas of overlap between the two movements, particularly when workers' health and the health of working-class communities were concerns. Middle-class Americans may have been worried about the negative environmental impacts of industrial processes, but without a doubt working-class Americans and their communities were the most adversely affected by industrial pollutants, and unionized workers often pushed for reforms that in retrospect seem like early instances of what would later be considered environmental demands. The United Steelworkers (USW) began supporting clean air measures as a result of the infamous killer smog incident in 1948, when local weather patterns trapped polluted air over the working-class city of Donora, Pennsylvania, killing 20 people. The steelworkers supported federal clean air measures through the landmark legislation of the 1970s, as did the United Auto Workers (UAW), the International Association of Machinists (IAM), and even the United Mine Workers (UMW) (so long as smokestack "scrubbers," and not alternative sources of energy, provided the basis for the clean air acts). Workers' health was also an issue that led to unions articulating environmental demands. The United Farm Workers (UFW) for example teamed with environmental organizations in order to reduce pesticide use in California agribusiness during that union's organizing campaigns in the late 1960s. A similar concern with toxins in the workplace led the USW,

IAM, UAW, and the Oil, Chemical, and Atomic Workers (OCAW) to lobby for the passage of the Occupational Safety and Health Act (OSHA) in 1970. Although most environmentalists failed to openly support OSHA, several mainstream environmental organizations, including the Sierra Club, Friends of the Earth, the Earth Defense Fund, and the Izaak Walton League, supported OCAW's 1973 strike and boycott against the Shell Oil Company, a strike designed to force Shell to comply with OSHA regulations. In the wake of this strike, formal alliances were sought by labor and environmental leaders. Environmentalists for Full Employment (EFFE) was founded in 1975 in order to provide a way for environmentalists to reach out to the organized labor community. And in 1976, the leaders of over 100 labor and environmental organizations attended the Working for Environmental Justice and Jobs conference held at the UAW's Black Lake center in Michigan. Such alliances were instrumental in getting the Clean Air, Clean Water, Toxic Substance Control, and Superfund acts passed. This list suggests that when the health and safety of workers and their communities were concerns, support for environmental causes has been possible among the ranks of organized labor.

But these labor-environmental alliances fractured during the 1980s and 1990s. This happened for several related reasons. The alliances between labor and environmental groups forged during the 1970s were for the most part created only at the leadership levels. Such alliances failed to address the significant cultural and class differences between the rank-and-file of the two movements. And the resurgence of free-market conservatism created a hostile political climate during the 1980s and 1990s, making these decades a period of retrenchment for both environmentalism and organized labor. Indeed the most significant instance of labor-environmental collaboration during this period highlights the tenuousness of the labor-environmental alliance. From 1984–1989, members of the Oil, Chemical, and Atomic Workers engaged in a bitter dispute with the management of chemical giant BASF at that company's Geismar, Louisiana, facility. Capitalizing on the chemical industry's checkered environmental record, OCAW allied with a collection of citizen's environmental groups and local chapters of national environmental organizations, such as the Sierra Club. The OCAW and the environmentalists publicized BASF's many violations of federal and state environmental laws and argued that only a unionized workforce could force the company to comply with environmental regulations. The resulting public pressure forced BASF to reinstate locked-out union workers in 1989, a rare victory for both organized labor and environmentalists during an

era characterized by concessionary bargaining and the permanent replacement of striking workers. But the conditions under which this successful labor-environmental alliance was forged suggested just how unlikely other such alliances had become: The workers at BASF had already lost their jobs and were therefore immune to jobs-versus-the-environment arguments; BASF was committed to expanding its Louisiana facilities and therefore could not credibly threaten to move its operations elsewhere; and local residents were easily persuaded that BASF's operations had a deleterious impact on their health and safety. Indeed most of the labor-environmental relations during the last two decades have gone the other way. In addition to the divisive fight between environmentalists and loggers in the Pacific Northwest, there were other high-profile disputes between organized labor and environmentalists. The UMW broke with environmentalists over the acid rain provisions contained in the Clean Air Act of 1990. More recently, the UAW has resisted calls for strengthening the federal Corporate Average Fuel Economy (CAFE) standards for cars and trucks sold in the United States. In a classic case of jobs-versus-the-environment logic and despite significant improvements in fuel economy technology, U.S. automakers maintain that the implementation of more stringent CAFE standards will result in the loss of union jobs. The UAW, already buffeted by declining union density due to foreign competition and automation, continues to side with the auto industry on this issue.

Conclusion

The history of American environmentalism demonstrates that environmentalism and the labor movement have not simply been driven apart by the machinations of corporate managers and political conservatives hostile to all intrusions into the free market. There are fundamental differences between the two movements that have made cooperation difficult. During the Progressive and New Deal eras, the conservationist and preservationist impulses were primarily confined to elites, did not have a broad popular base, and had little relation to the labor movement of those times. Since 1945, environmentalism has developed a much larger constituency but one that was for the most part confined to the middle class. Cooperation among environmentalists and organized labor was not impossible, particularly where labor issues dovetailed with environmental health and safety concerns. But tensions between middle-class

environmentalists and organized labor's working-class membership were exposed when declining union density, structural changes in the American economy, and a hostile political environment severed the fragile links between the two movements. The fundamental class differences between the two movements must be acknowledged.

It may be too simple to argue that workers and environmentalists have been driven apart by their enemies then, but the current excesses of global corporations and the ideology of free trade may yet drive these two movements together. It is not surprising that an era in which private property rights are celebrated and the public sphere is disdained has also been an era that produced a corporate order committed to rolling back labor and environmental regulations even though these regulations were the result of laws passed by democratically elected Congresses. As free trade makes it easier for corporations to circumvent such labor and environmental standards, members of the two movements have come to see each other as potential allies. The 1999 protests against the World Trade Organization at its meeting in Seattle, when tens of thousands of laborites and environmentalists marched together as part of a new coalition called the Alliance for Sustainable Jobs and the Environment, could thus come to symbolize the beginning of a new era of labor-environmental cooperation.

EQUAL EMPLOYMENT OPPORTUNITY COMMISSION

Title VII of the Civil Rights Act of 1964, which prohibited employment discrimination on the basis of race, color, national origin, religion, or sex, established the Equal Employment Opportunity Commission (EEOC). Initially EEOC sought compliance from employers, labor organizations, and employment programs but could not directly enforce Title VII. Subsequent legislation expanded EEOC's powers and jurisdiction, which came to include disability, age, and pregnancy discrimination and sexual harassment. Yet EEOC's growing authority as the lead enforcement agency in workplace discrimination did not bring parallel increases in resources and funding.

The EEOC operates under five bipartisan commissioners and a general counsel, appointed by the president and confirmed by the Senate. Commissioners serve staggered five-year terms, and the general counsel a four-year term. The president designates a chair, who is chief executive officer of EEOC. Franklin D. Roosevelt, Jr., served as first chair (1965–1966).

Following him were Stephen N. Shulman (1966–1967), Clifford L. Alexander, Jr. (1967–1969), William H. Brown, III (1969–1973), John H. Powell (1973–1975), Lowell W. Perry (1975–1976), Eleanor Holmes Norton (1977–1981), Clarence Thomas (1982–1990), Evan J. Kemp, Jr. (1990–1993), Gilbert Casellas (1994–1997), Ida L. Castro (1998–2001), and Cari M. Dominguez (2001–2006).

The Early EEOC

The EEOC's initial lack of enforcement powers was a key concession to Republicans and conservative southern Democrats in congressional debate over the Civil Rights Act. What helped the act pass in mid-1964 was elimination of proposed EEOC power to issue cease-and-desist orders or initiate litigation. Congress authorized EEOC only to interpret Title VII and to investigate and “conciliate” charges of discrimination filed by workers.

Per Title VII, EEOC was to issue employment guidelines and with individual complaints, determine whether there was reasonable cause to believe that illegal discrimination had occurred. When EEOC found reasonable cause, it was to seek compliance with Title VII “by informal methods of conference, conciliation, and persuasion.” If conciliation failed, EEOC could recommend legal action to the U.S. Attorney General, who was empowered to sue where “patterns or practices” of systematic discrimination were found (in the first year, only 11 cases were so referred). Or far more likely, EEOC advised the complainant of her or his right to file a civil action within 30 days.

What limited power the early EEOC had it applied unevenly, critics charged. Leaders of the new commission made clear that they considered sex discrimination less important than racial discrimination, a belief encouraged by the last-minute inclusion of sex in Title VII, a bill otherwise devoted to African-American rights. Working women certainly took the new law seriously—a full third of the complaints filed in 1966 concerned sex discrimination (53% concerned race). Feminists outside and within EEOC, including founding Commissioners Aileen Hernandez and Richard Graham and lawyer Sonia Pressman Fuentes, pressed for more action on women workers' behalf. Veterans of the African-American freedom struggle wondered why the new commission—a product of civil rights activism—was dominated by political insiders and bureaucrats with business ties but little relevant experience.

Making Title VII Meaningful

The early EEOC accomplished much simply in interpreting what Title VII meant and required. Congress had been vague in many areas, so it fell to EEOC to specify the parameters of employment discrimination—and it did so expansively. Particularly important was the commission's insistence that illegal discrimination did not require intentional acts that overtly targeted individuals (known as “disparate treatment”). Discrimination also occurred, EEOC argued, when an employment policy adversely and disproportionately affected a protected group, regardless of appearance or intent (known as “disparate impact”). If an employer did not prove the business necessity of such a policy, EEOC considered it illegal. Similarly EEOC narrowly interpreted the bona fide occupational qualification, or BFOQ, exception to Title VII. The BFOQ clause of Title VII allowed employers to discriminate on the basis of sex, national origin, or religion (but not race) if they showed that doing so was “reasonably necessary” to “normal” business operations. The EEOC decided this applied only rarely, such as in acting or in the hiring of a minister, priest, or rabbi. Finally believing employers were obliged not merely to stop discriminating but also to address ongoing effects of past bias, EEOC promoted affirmative action programs.

As the commission's interpretations and *amicus* briefs proved increasingly persuasive to the courts by the 1970s, workers and EEOC together gave Title VII force and meaning. Successful targets included the blatant sex typing of occupations as well as seemingly neutral educational requirements and tests whose effect was not to ensure skill levels, but to bar minorities from jobs and promotions. Workers' own organizations came under fire, too. The EEOC investigated unions for colluding in employer discrimination and even enforcing inequality through seniority systems. In some occupations and industries, EEOC-supported worker activism brought dramatic change: Airline flight attendants no longer had to be single, under 35, and female, while in the heavily southern textile industry African-Americans went from holding a mere 3% of jobs in 1960 to over 18% by 1978.

Growing Power and Responsibilities

In 1972, EEOC gained enforcement power. Congress decided it had underestimated the extent of discrimination and overestimated the potential of voluntary compliance with Title VII. With the Equal Employment

Opportunity Act of 1972, Congress amended Title VII to give EEOC right-to-sue powers, including “pattern and practices” suits previously under the U.S. Attorney General’s purview. The act also expanded Title VII coverage to civil service at federal, state, and local levels and to educational institutions, and lowered its minimum threshold from 25 to 15 employees.

Within three years, EEOC had filed more than 450 lawsuits on individual charges. It also began systematic attacks on racial and gender discrimination at some of the nation’s largest employers, including AT&T, Ford, and Sears Roebuck. Such efforts resulted in several high-profile agreements: with AT&T in 1973, then the nation’s largest private employer; the nine largest steelmakers in the U.S. and the United Steelworkers in 1974; General Electric in 1978; the Associated Press in 1983; and General Motors and the United Auto Workers in 1984. These agreements brought workers millions in back pay and featured affirmative action plans to move more women and minorities onto and up the employment ladder, out of blue- and pink-collar ghettos. Hardly all investigations resulted in such successes, however.

In the late 1970s, EEOC’s increased powers expanded to new areas of discrimination. The Carter administration gave EEOC responsibility for enforcing the Equal Pay Act of 1963 and the Age Discrimination in Employment Act of 1967, previously the Department of Labor’s duty. By the 1980s, age discrimination was the fastest growing area of workers’ complaints. In 1978, Congress passed the Pregnancy Discrimination Act, amending Title VII to prohibit bias against pregnant workingwomen. When EEOC issued its first guidelines on sexual harassment in 1980, it brought yet another area of discrimination under sustained scrutiny. (Ironically charges of sexual harassment against former EEOC Chair Clarence Thomas while he was vetted for the U.S. Supreme Court in 1991 dramatically raised public awareness of this newer area of sex discrimination.)

The early 1990s brought a final wave of expansion in EEOC’s jurisdiction and authority. Congress charged the commission with enforcing Title I of the Americans with Disabilities Act of 1990, banning discrimination in employment based on disabilities. Congress also responded to the growing conservatism of the courts with another Civil Rights Act in 1991. It revised Title VII to reflect EEOC standards for defining and proving discrimination; enabled workers to seek damages, along with back pay and reinstatement; and extended Title VII coverage to Americans working overseas.

Underfunded and Always Behind

Whatever the political climate, EEOC never enjoyed adequate resources to investigate, let alone conciliate or litigate, the flood of workers’ complaints it received. The original EEOC, with fewer than 100 employees and a budget of \$2.25 million, expected 2,000 complaints in its first year. It received nearly 9,000. Though it quickly expanded, the commission would only fall further behind as its caseload swelled and Congress provided budgets of far less than requested. Pursuit of voluntary employer compliance brought limited results at best. Successful conciliations ran in the low hundreds annually for the first several years, while new charges were in the several thousands. With new power and expanded jurisdiction came even more complaints. After a decade the backlog of unprocessed cases topped 100,000 and the average complaint took more than two years to resolve (Title VII’s original timeframe was 60 days). Other problems became clear by the mid-1970s: Efforts to monitor employer compliance with settlements were lax or non-existent, and high turnover at the top had created instability.

By the mid-1970s, many believed EEOC desperately needed reform. Carter-appointed Chair Eleanor Holmes Norton instituted speed-up processing of new charges and backlog-reducing measures. Norton’s reforms did slash the backlog, but critics saw a new policy of indiscriminate settlement, regardless of a case’s merit. Under Reagan-appointed Clarence Thomas, EEOC recommitted itself to full investigations of individual complaints and pulled back from higher impact systematic approaches. The change in focus, combined with staff reductions due to funding cuts and increased responsibilities, saw the number of unprocessed charges skyrocket again in the 1980s. Under President Clinton’s appointees, new systems of prioritizing investigations and voluntary mediation reduced the backlog again, with less controversy.

Throughout its history, EEOC has struggled to provide individuals with relief while attacking discrimination broadly and to fulfill its educational and conciliation mandates (or claims adjuster role according to critics) while wielding regulatory and litigation powers. Perpetual underfunding, despite increasing responsibilities, has necessarily limited the commission’s agenda and impact. Whatever the enforcement philosophies and achievements of successive EEOC regimes, many thousands of workers have had their charges of discrimination lost in the political and bureaucratic shuffle. But those who did succeed in pressing complaints have helped, and been helped

by, EEOC in banishing more egregious forms of discrimination from many American workplaces.

EQUAL PAY ACT OF 1963

Support for a federal equal pay law for women dates back to the nineteenth century. Male unionists had long supported equal pay, especially in industries where the replacement of men with women loomed large. It took concrete form as a legislative campaign however only when large numbers of women entering the World War II production workforce demanded that they be paid on a par with men. In general women were not, but they did take up jobs previously designated as men’s jobs and destabilized the notion that women were unfit to perform certain kinds of

work. Women came to expect more money and greater status in the workplace and union with this new responsibility. At the very least, they wanted to be paid what men working alongside them were paid.

As reasonable as equal pay legislation seemed in the 1940s, it would take nearly 20 years for Congress to pass an equal pay law. The reasons for the delay in passage were many: Legislators waffled on the wording of the proposed law; union leaders failed to invest the necessary resources to promote the measure; and officials in the executive branch during the presidency of Republican Dwight Eisenhower in the 1950s did not pursue such social legislation as equal pay.

The real force behind moving equal pay legislation through Congress came from a loosely formed coalition that was sponsored by the U.S. Women’s Bureau. The so-called Women’s Bureau coalition had as its members unionists and those representing liberal interest groups, some of whom had their roots in the progressive movement. The new administration of Democrat John Kennedy, elected in 1960, was not only more open to social legislation than the Republicans but included several unionists receptive to women’s issues. Esther Peterson, a longtime union staff member, revitalized interest in equal pay legislation from her post as Women’s Bureau head and assistant secretary of labor for President Kennedy. The legislation, along with President Kennedy’s Commission on the Status of Women, expansion of the Fair Employment Standards Act to include low-paid and marginalized workers, and the enactment of a federal law providing daycare support, marked a period of transition to support for gender equality.

Conservative legislators and the business community weakened the measure considerably. The act, modeled on the Fair Employment Standards Act coverage, exempted employers with fewer than 25 employees and permitted a gradual elimination of wage differentials between men and women workers. Unionists helped defeat an attempt by conservatives to include a provision in the bill postponing the effective date of the Equal Pay Act in the case of employees covered by current labor-management contracts until two years after enactment or until contracts expired. They worried that such an allowance would set a dangerous precedent when they called for examining the minimum-wage or maximum-hours provisions of the Fair Labor Standards Act.

In its first decade of enforcement, court decisions interpreted the meaning of equal pay broadly by refusing to limit the measure to identical jobs. As a result the government awarded 171,000 employees \$84 million in back pay. The law was one of several signs in the early 1960s that support for gender equality in the workplace was on the rise. The new law

underscored a shift in working women's sentiment that would manifest itself over the course of the next decade in feminist activism.

ERDMAN ACT

The Erdman Act bears witness to the critical position railways and railway unions played in the evolution of twentieth-century labor law and practice. The act extended the *de facto* protection of the federal government to the four railway-operating brotherhoods (engineers, firemen, conductors and trainmen) while simultaneously making industrywide strikes difficult if not impossible to sustain. Representing the first substantive effort by the federal government to move beyond simply assisting in the suppression of strikes, the act emerged from 20 years of widespread agitation by railway employees for a determinative voice in the circumstances, wages, and administration of their work.

Though its genesis lay in suggestions found in the report of the United States Strike Commission's investigation of the 1894 Pullman strike, the bill reflected the concerns of its primary author, President Grover Cleveland's attorney general, Richard Olney. He sought to find a path to labor peace that recognized the legal existence of the operating brotherhoods but which also prevented railway employees from substantially interfering with interstate commerce through strikes and boycotts. Drafted in 1895,

the bill saw debate in several sessions of Congress before President William McKinley signed it into law on June 1, 1898.

The act called on the chairman of the Interstate Commerce Commission and the commissioner of labor to mediate disputes between railways and their operating employees at the request of either party. If mediation failed, the act provided for the creation of a three-member panel of arbitration, composed of a neutral party and one delegate each from the disputants. Unlike the provisions of the Arbitration Act of 1888, the decision of the arbitration panel would be enforceable by law in federal courts and stand for one year. The act required parties in arbitration to maintain the *status quo antebellum* for up to six months. Furthermore the bill proscribed a series of anti-union practices that the railway brotherhoods found particularly noxious, including yellow-dog contracts, discrimination against union members, blacklists, compulsory participation in company-sponsored insurance and relief associations, and finally mandated specific fines for violations of those prohibitions.

In practice the act fell far short of its promise. After an initial attempt to use its arbitration procedures failed because the railroads in question refused to participate, the law fell into disuse. However from 1906–1913, when it was superseded by the Newlands Act, railways and unions brought a total of 61 requests for action of which more than half were eventually settled by mediation, arbitration, or a combination of both.

Traditionally scholars of American labor have interpreted the Erdman Act as a tentative first step toward extending the protection of the state to unions and workers but one that was quickly stymied by a conservative Supreme Court in the *Adair v. United States* decision of 1908. However in recent years a number of legal and political scholars have argued that this interpretation ignores a long-standing congressional penchant for deferring difficult or unpopular questions to the federal courts. Debates on this issue continue.

EVANS, GEORGE HENRY (1805–1856) Jacksonian Era Labor Activist

Born in 1805, George Henry Evans was a printer, writer, political activist, and land reform advocate who participated in many of the reform activities of the Jacksonian era labor movement, including the Working Men's party, the bank crusade, the National Trades' Union, and the National Reform Association. Born in Bromyard, Herefordshire, England, Evans emigrated to the United States at the age of 15 with his father and brother and was apprenticed to an Ithaca printer soon thereafter. Under the influence of several mentors, he immersed himself in the works of eighteenth-century radicals Thomas Paine and Thomas Jefferson. Emulating his hero, Paine, Evans became an atheist and an anticlerical. From 1824 to 1827, Evans edited the Ithaca *Museum and Independent Corrector*, through which he made use of his Jeffersonian-Paineite education by attacking political chicanery, social inequality, and the religious revival known as the Second Great Awakening, which was then sweeping western New York.

Apparently ambitious by nature, Evans moved to New York City in 1827, and in 1829 began publishing the *Working Man's Advocate*, which started as the semi-official organ of the New York Working Men's party and which under differing names and a few pauses, Evans published for 20 years. Though Evans was neither a labor union member nor a union leader, he was nevertheless a consistent and committed voice for the constellation of reforms, including hard money, free public land, opposition to chartered monopoly, shorter working hours, universal education, secularism, and poll tax abolition, that characterized labor-oriented reform in the Age of Jackson. In short he was sympathetic to the constituency and aims of the labor movement, whose leaders were frequently his closest ideological and political allies. Most importantly Evans was always true to the spirit and ideals of Jeffersonian and Paineite republicanism,

from its emphasis on the ownership of land by nearly everyone as a great bulwark to the Republic to its strict insistence that all men are created equal; from its Enlightenment optimism to its skeptical stance toward organized religion. The *Declaration of Independence*, the *Rights of Man*, and the *Age of Reason* constituted the holiest books of his radical Bible. After the demise of his last reform journal, *Young America*, Evans retired to his New Jersey farm, where he died in 1856.

Evans first got involved in labor politics in October 1829, when he began publishing the *Working Man's Advocate*. A young man of 24, Evans was never a leader of the Working Men's party, though as editor of the *Advocate* he was drawn into the internecine, three-way factional struggles that characterized the party in 1829 and 1830. Thomas Skidmore, an autodidact machinist whose polemical book, the *Right of Man to Property*, advocated the redistribution of wealth and abolition of inheritance, was the leader of the party in its early days, when it won several local races and seemed poised for even greater successes. Shortly after the November 1829 elections however, an alliance between Robert Dale Owen and Fanny Wright, who urged universal free education as a panacea, and Henry Guyon and Noah Cook, who were politicians attempting to use the party as a weapon against the regular Tammany Hall Democrats, forced Skidmore out of the party. Within months Guyon and Cook had managed to expel Owen and Wright as well. Though initially attempting to mediate these disputes, Evans eventually turned against the radicalism of Skidmore and embraced Owen's State Guardianship plan for universal public boarding schools. Divided into three separate parties however, the Working Men's movement achieved little further success and was dead by 1831.

For the two years following the demise of the Working Men's party, Evans continued to publish his newspaper and attempted to keep the spirit of reform alive with proposals for public bathhouses (to improve the public health), abolition of the military academy at West Point, hard-money opposition to chartered banks, and antisabbatarianism. The latter of course reflected the anticlerical influence of Paine, as Evans argued that laws prohibiting activities on Sunday amounted to an imposition of the Christian religion on the populace in violation of the Constitution.

The bank issue, which Evans raised as early as 1831, became a political issue of national importance in 1832, when Congress, at the urging of Nicholas Biddle, president of the Bank of the United States,

renewed the bank's charter four years early, and President Andrew Jackson vetoed the legislation. The banking issue resonated deeply in the urban working class. Small-scale artisans and others in the laboring classes had long argued that the banking system was rigged to hold down the honest mechanic by limiting access to capital to those with wealth or political connections. Further employers paid wage laborers not in hard specie, but in bank notes that often proved to be fraudulent or worthless. Thus the bank issue was, unbeknownst to the inept Biddle and the bourgeois Whig party, a labor issue, which Henry Clay handed to Andrew Jackson, who turned a simple veto into a powerful statement of the populist sympathies of the Democratic party that still resonates today. Evans, who however was always more of a Jeffersonian than a Jacksonian, entered the fray only in 1833, and added nothing new to the debate, preferring to reprint the contributions of others, such as *New York Post* editor William Leggett. Early in 1835, in response to the New York Assembly's grant of several new state bank charters, Evans helped organize and became vice-president of an organization called "The Working Men Opposed to Paper Money," which helped organize antibank sentiment into an electoral force, which contributed to Democratic political victories.

Evans's first direct participation in labor union activity was short-lived. In 1834, Evans gave needed editorial support to the new National Trades' Union, (NTU) which proposed to unite the various local trades' confederations into a national organization. The NTU specifically recommended that its members read the *Advocate*, along with several other reform journals. At the NTU's inaugural convention however, Evans was greatly disappointed by the decision to abjure politics and focus on the hours of labor and wages. By mid-1835, Evans was in serious financial difficulty and relocated to his New Jersey farm, giving up his journalism for about five years.

In 1840, Evans emerged from his self-imposed political exile advocating the panacea of free public land. The idea that the federal government should give away public lands to those willing and able to till its soil was not new: The NTU had urged free public land in 1834, and many others before and after as well. Most importantly to Evans, his old hero Thomas Paine had urged, in *Agrarian Justice*, that uncultivated land was the "common property of the human race," though he had made no specific proposal for its distribution. Drawing on the ideas of Paine, Thomas Skidmore, English radical political economist Thomas Spence, and French Associationist

Charles Fourier, Evans argued that because property is the produce of labor, and land is not the produce of labor, land cannot be property. Thus Evans concluded, land should not—indeed could not—be bought or sold. He proposed that the federal government should give away public land in the form of 160-acre, nonalienable homesteads to anyone willing and able to use that land productively. On death the homesteads would be distributed to others: An arrangement not unlike the life tenancy that had once characterized the holdings of many English yeomen. He further urged the abolition of all laws for the collection of debts, imprisonment for debt, long hours of labor, chattel slavery, and wage slavery.

In 1844, along with the Irish Chartist Thomas Devyr, Evans was instrumental in the founding of the National Reform Association (NRA), whose stated purpose was to pursue land reform along the lines Evans was advocating. Evans published and edited the NRA's triweekly journal, the *People's Rights*, while reviving the *Advocate* as well. The availability of so much land in the West, particularly in light of the controversies over the annexation of Texas and the Oregon boundary, made land reform a fairly salient issue in the politics of the 1840s, and Evans's talents as a writer ensured that land reform became a well-known cause. Nevertheless Evans's proposal, especially the requirement that land be neither bought nor sold, was still too radical for most Americans or for passage by Congress. Urban workers and their unions, too, failed to flock to the plan, since they were more concerned with economic issues related to the work place. By 1848, the NRA and radical land reform were dead issues, though both continued in one form or another for several years. When Congress did finally pass land reform, the legislation provided only for cheap, but not free and not inalienable, homesteads. Disillusioned by the failure of radical land reform, Evans retired from politics in 1849 and returned to his farm for the last time.

Though Evans met limited success in his career as a reformer, his contribution to the American labor movement goes well beyond a tally of wins and losses. Evans was the prototypical radical printer turned reform journalist, an originator of a tradition that would include John Swinton, J. A. Wayland, and George E. McNeill. His participation in left wing politics was almost always a consequence of his work as a newspaper or book publisher, and though he barely transcended his Paineite and Jeffersonian roots, he always lived up to them.

F

FAIR EMPLOYMENT PRACTICE COMMITTEE

In its day, President Franklin D. Roosevelt's Fair Employment Practice Committee (FEPC) was the most controversial federal government agency ever created. The FEPC's mission was to receive, address, and resolve any instances of employment discrimination by employers with defense contracts. If today the elimination of job bias remains a radical, "hot button" political issue, in the 1940s any notion of altering American race relations bordered on the revolutionary. President Roosevelt himself wanted little to do with fighting job discrimination while he was preparing the United States to potentially fight fascism in Europe and in Asia. He was forced, however, by a group of African-American civil rights leaders, most notably A. Philip Randolph, to deal with unfair employment practices. Although Roosevelt's FEPC did yeoman work, it ultimately failed to redress the fundamental racial and ethnic injustices in the American economic system. Still, the Committee's work and the efforts of the civil rights groups that supported it provided the necessary impetus and substance to transform the struggle for equality in the twentieth and twenty-first centuries.

The origins of the Fair Employment Practice Committee lay in the rapid mobilization of the United States for military conflict beginning in late 1939. When Hitler unleashed his Nazi forces upon Europe, President Roosevelt started to prepare the United States for the inevitable. The federal government poured billions of dollars in the economy to equip

and train millions of soldiers. And despite the approach of war clouds, there was one practical benefit from this massive spending. As Americans began to pound ploughshares into swords for the second time in 20 years, the Great Depression in the United States dissipated and eventually disappeared. One group of Americans, however, was left out of the new emergency-spurred prosperity: African-Americans.

This was nothing new to black workers. Historically, they were the most-downtrodden of the working class. Emerging from centuries of chattel slavery, African-American workers had only known a few years of opportunity and hope during the later years of the Civil War and the first few years of Radical Reconstruction. By the 1880s, the old patterns had returned. In no way were black workers on equal footing with that of whites. The Great Depression had made matters worse, as they were pushed to lower rungs of the economic ladder as white workers took jobs that they previously had refused such as domestic servants, hod carriers, and common laborers. The New Deal had provided some relief, but not all of Roosevelt's alphabet agencies treated blacks the same. The National Youth Administration and especially the Works Projects Administration were sympathetic and helpful to African-American workers. Other agencies, such as the Civilian Conservation Corps, reflected the norm of American race relations. The CCC discriminated and segregated, treating needy blacks as second-class citizens.

As the New Deal gave way to defense mobilization, conditions for blacks remained all too similar. For

example, six months after the Japanese attack on Pearl Harbor, African-American workers were barred from about half of all available work in defense factories. The situation was bad in the South but worse in other sections of the nation. In 1942, one out of every two war jobs in Texas were for whites only. In Michigan, the figure was eight out of every 10 jobs. And in Indiana, 94% of all available war work was for whites only. Black leaders of the National Association for the Advancement of Colored People (NAACP), the National Urban League, and other groups shared the frustrations of black workers as their complaints to local employers and local government officials fell on deaf ears. NAACP head Walter White described the situation succinctly when he said that blacks had been “left out in the cold.”

If the economic reality for black Americans in 1940 and 1941 was not unusual, their reaction was. In stark contrast to the general support African-Americans gave the Wilson administration during World War I, blacks across the political spectrum and across class lines voiced disgust with the mobilization effort. The vanguard of this discontent was a newly established civil rights organization, the March on Washington Movement. In spring 1941, A. Philip Randolph, the head of the Brotherhood of Sleeping Car Porters (AFL), called on 100,000 African-Americans to march on Washington, DC, to protest discrimination in defense employment and the military. But FDR's actions were woefully inadequate to deal with the enormity of the problem. A Socialist and a strident advocate for civil rights and black labor rights who had actually opposed American intervention in World War I, Randolph hoped to push President Roosevelt into more dramatic and effectual action. And he knew that he had the president cornered. FDR did not want a march on Washington to protest racial discrimination. Not only would such an event embarrass the “arsenal of democracy,” but it could also provoke a race riot in the nation's capital. In late June 1941, Roosevelt called both Randolph and the NAACP's Walter White to the White House. There Randolph repeated his pledge to march unless FDR did something to rectify the issue. At that point, Roosevelt turned to White, the more conservative of the two, and asked how many would march. Although he did not know for sure, White told the president that Randolph would bring 100,000 African-Americans down Pennsylvania Avenue. In return for calling off the march, Roosevelt then told the civil rights leaders that he would issue an executive order banning discrimination in defense factories. Although Randolph did not get everything he wanted—no mention was made of discrimination in the military—he agreed

and called off his march. On June 25, 1941, FDR signed Executive Order 8802, which established the policy of the United States that “there shall be no discrimination in the employment of workers in defense industries or Government because of race, creed, color, or national origin.” Executive Order 8802 also created the Fair Employment Practice Committee to enforce the ban.

The creation of the FEPC was tremendously significant. For the first time since Reconstruction, the federal government had set up an agency specifically designed to deal with the problems of minority workers. Additionally, it was a major advance in the struggle to solve what Swedish sociologist Gunnar Myrdal called the “American dilemma,” that is, the problem of a nation that had not fulfilled the promise of its founding, which had been based upon ideas of liberty and civic virtue. Yet, there were limits to what the FEPC could do. First, the Committee was a part of administrative law. As such, it had no access to the federal courts to subpoena, fine, or jail offenders of Executive Order 8802. The Committee's members would have to use moral suasion and forceful persuasion to convince recalcitrant employers to stop their unfair employment practices. Second, the Committee was limited by a meager budget and a small staff, which at no time numbered over 130. Finally, the FEPC could work only with employers with federal contracts or with federal agencies. Employers outside the contracting systems or attached with a state or local government were beyond its purview.

Despite these shortcomings and handicaps, the Fair Employment Practice Committee accomplished much during its short five-year life. From June 1941 to June 1946, the FEPC processed over 12,000 complaints of job discrimination and settled nearly 5,000 to its satisfaction (42%). From August 1944 to August 1945, it held 15 public hearings, docketed 3,500 cases, and resolved over 1,100 of them. Two examples will have to stand for thousands. In January 1942, six ranking members of the FEPC held a public hearing in Chicago, Illinois, to resolve several dozen complaints against employers in the Windy City and in Milwaukee, Wisconsin. Among the companies appearing that day was A. O. Smith, a manufacturer of various military supplies. At that time, A. O. Smith's managers had hired not a single black worker. After several days of public castigation and behind-the-scenes negotiations, A. O. Smith relented. By the war's height in 1944, it employed over 800 African-Americans, who made up over 5% of its workforce. These instances of success were, of course, tempered by failures. In 1943, Willie Webb, a black woman from Cincinnati filed a complaint with the FEPC. Although she had amassed

over 500 hours of training as a welder, officials at the Crosley Radio Corporation, maker of naval signaling equipment, had denied her a position. In March 1945, the FEPC held a public hearing in Cincinnati to redress Webb's grievance and those of nearly 50 other black women and 20 black men. Although there were some breakthroughs at these hearings, most Cincinnati employers continued to ignore Roosevelt's fair employment policy. The Cincinnati hearings, which were among the FEPC's last, illustrated the pattern of discrimination that the Committee's members discovered. In northern areas with tight labor markets, change was quite possible. In border areas and in the South, regardless of labor conditions, the FEPC had an extraordinarily hard time easing the color line in employment. It is important to emphasize that tight labor markets alone did not create equal employment opportunities, as the 1942 Chicago hearings well illustrated.

Despite the FEPC's accomplishments and activities, or perhaps because of them, its days were numbered. Congressional conservatives in both the Republican Party and the Democratic Party had vehemently opposed the Committee since its creation in 1941. However, after 1943, when the FEPC was reorganized and strengthened, congressional leaders sought to destroy it. Since the late 1930s, a coalition of conservatives had presented numerous problems for the Roosevelt administration. The advent of World War II had quelled much of the rancorous politics of the late New Deal. But by 1944, FDR and his alphabet agencies were once again the target. Of particular concern was the FEPC, which according to Democratic Representative John Rankin (Miss.) was in essence a Communist plot to subvert the American way and Christianity. With the cooperation of key Republicans such as Senator Robert A. Taft (Ohio), Congress successfully cut all funding for the FEPC, thus killing it at the source. The Committee also suffered a severe political blow when President Roosevelt died in April 1945. President Harry S. Truman was initially unresponsive and did nothing as the Committee disappeared.

Although it was a short-lived and small New Deal agency, the Fair Employment Practice Committee had an enormous influence. Some of the Committee's members went on to significant careers in politics and the federal government. One such person was Elmer Henderson, who as an FEPC official began legal proceedings against the Southern Railway Company, which had discriminated against him. The lawsuit eventually went to the U.S. Supreme Court. In 1950, the Court sided with Henderson and in so doing overturned its previous decision in *Plessey v. Ferguson*. From the 1950s through the 1980s, Henderson

worked on Capitol Hill as a political liaison between the Congress and various presidents.

The FEPC was also important because after World War II, it became *the* model for civil rights reform for more than 30 years. From 1946 to 1964, 35 states and over 200 cities passed fair employment laws and ordinances. One of the central organizations pushing for these kinds of reforms was A. Philip Randolph's post-war civil rights group, the National Committee for a Permanent FEPC (NCPFEP). The NCPFEP's central goal was a new federal FEPC, but it did work with state and local groups like the Committee for a Pennsylvania FEPC and the Ohio Commission for Fair Employment Practice Legislation. Although by the 1960s more than half of the states had fair employment laws and agencies, most of them were weak and ineffectual. The powerful and well-funded New York State Committee Against Discrimination was the exception. Wisconsin's FEPC, for example, was run by a single woman, Virginia Huebner, who had neither the legal power, staff, or time to adequately address the serious problems of discrimination in the Badger State.

The failures and frustrations of state FEPCs added momentum to the movement to re-create the federal FEPC, which culminated in the passage of the 1964 Civil Rights Act and the creation of the Equal Employment Opportunity Commission (EEOC). Although similar, the EEOC and the FEPC differ in several ways. Because it was established by a statute, the EEOC has had access to federal courts. Moreover, it has an expanded mission. The EEOC is charged with eliminating job bias against workers because of race, color, religion, national origin, *and* sex. In the early 1970s, the EEOC was re-organized and given more powers. And yet, like the FEPC, the EEOC has found that fighting job bias is no easy task. Like the original FEPC, the modern version has had to fight racially insensitive employers and unions as well as constantly battle with conservative politicians who wish to eliminate it.

FAIR LABOR STANDARDS ACT

The passage of the Fair Labor Standards Act (FLSA) by Congress in June 1938 marked a historic turning point for labor in the United States. For the first time, the federal government mandated wages and hours standards for the majority of the nation's workers, a goal that reformers had sought since the Progressive Era.

The Minimum Wage Movement Begins in the United States

While nations such as Great Britain and Australia possessed national minimum wage laws by 1910, the first minimum wage law in the United States did not exist until two years later, when Massachusetts established a minimum wage commission. Efforts to expand this precedent proceeded fitfully for the next two decades. While the Supreme Court upheld minimum wage legislation for male workers in *Stettler v. O'Hara* (1917), six years later it rejected a similar law for women workers (*Adkins v. Children's Hospital*). The minimum wage movement lost its momentum after 1923, and although reformers in several states, most notably New York, continued the fight, the *Adkins* precedent seemed to foreclose any national effort.

The Great Depression Provides Further Impetus

The Great Depression did not start immediately after the stock market collapses of late October 1929, but by late 1932, the dire salary situation facing labor became painfully evident. From 1929 through 1933, the weekly wages of manufacturing workers in the United States decreased from approximately \$25 to less than \$17, a decline of 33%. With an accompanying decline in retail sales from \$48 billion to \$24 billion in the same four years, the need to stabilize workers' salaries so as to increase consumption, and thus revitalize the nation's economy, became a primary objective of President Franklin D. Roosevelt when he assumed office in March 1933. The passage by

Congress of the National Industrial Recovery Act (NIRA) in May 1933 reflected this concern.

The NIRA Sets a Precedent for Federal Hours and Wages Legislation

The NIRA lasted only two years, but it proved the first significant step toward federal hours and wages legislation. Not only did the NIRA establish the National Recovery Administration (NRA), but Section 7(a)(3) of the statute required that "employers shall comply with the maximum hours of labor, minimum rates of pay, and other conditions of employment approved or proscribed by the President." As the NRA's committees worked with both management and labor to establish industrial hours and wages standards, President Roosevelt advanced the idea of voluntary agreements with employers, known as the President's Reemployment Agreement (PRA). By 1935, over two million agreements came into effect, covering over 16 million employees throughout the nation.

Although the Supreme Court declared the NIRA unconstitutional in May 1935, U.S. Secretary of Labor Frances Perkins continued the momentum for federal labor standards with the Walsh-Healey Public Contracts Act, passed by Congress in 1936. The Act required federal contractors to meet minimum wage standards. Perkins also held seven national minimum wage conferences during the first Roosevelt administration.

The Introduction of the FLSA

By early 1937, several key forces united behind a federal labor standards law. The American Federation of Labor (AFL) traditionally opposed federal legislation, fearing interference with both trade unionism and labor negotiations. But the AFL changed its viewpoint after experiencing positive results with the NIRA. The new Congress of Industrial Organizations (CIO), which represented millions of unskilled workers throughout the United States, also supported federal legislation, particularly through its influential vice president, Sidney Hillman. Buoyed by his unprecedented re-election mandate in 1936, moreover, President Roosevelt decided to prepare a presidential message to Congress on the subject.

On May 24, 1937, as Roosevelt sent his message to Congress, selected congressmen introduced the

administration's measures in both houses of Congress. Known as Senate Resolution (S.R.) 2475 and House Resolution (H.R.) 7200, the original bills provided, among other features, for a five-member Fair Labor Standards Board; a minimum wage of not more than 80 cents per hour, or \$1,200 a year; the mandating of a 40-cent-per-hour, 40-hour workweek except in unusual circumstances; and the prohibition of interstate shipment of goods produced with "oppressive child labor."

The FLSA Is Passed

As is usual with major legislation, the final law proved far different from the original statute. In addition, new political factors complicated the passage of the FLSA. The failure of Roosevelt's attempt to reform the U.S. Supreme Court by mid-1937 damaged his credibility and solidified the growing congressional coalition of conservative Republicans and southern Democrats. Business interests feared government interference with their affairs, while southerners opposed a federal labor law that favored the North's higher wages.

Thus, while the Senate quickly reported out an amended version of S.R. 2475 in July 1937, the House Rules Committee delayed consideration of H.R. 7200 on the legislative floor. AFL leaders also objected to the Senate proposal because their recommendations failed to make the final version. Although the entire House of Representatives voted to discharge H.R. 7200 from the Rules Committee in December 1937, the bill eventually returned to the House Labor Committee. A final, compromise measure passed both houses of Congress in June 1938, and Roosevelt quickly signed the bill.

The new statute created a Wage and Hour Division in the U.S. Department of Labor; mandated a 40-cent-per-hour minimum wage by 1945; required a maximum workweek of 44 hours, with a reduction to 40 hours by 1940; established an overtime wage rate at one and a half times the regular rate of pay; and prohibited "oppressive" child labor. While no regional wage differentials were recognized, southern concerns were implicitly accepted by the exclusion of agricultural employees, among other workers, from the law's provisions.

"That's that," President Roosevelt exclaimed as he signed the FLSA on June 25, 1938. Ironically, Roosevelt's expression signified more than just a sigh of approval; the new measure represented the last significant legislative achievement of the New Deal. Conservative gains in the 1938 congressional

elections, and the burgeoning war in Europe, ended any further domestic reform until after World War II.

The FLSA Passes Constitutional Muster

Business interests challenged the new federal law in two cases, *United States v. Darby* and *Opps Cotton Mills, Inc., et al. v. Administrator of the Wage and Hour Division of the United States Department of Labor*. The cases quickly reached the U.S. Supreme Court, which announced its decisions in February 1941. By this time, the nation's highest court had sanctioned minimum wage legislation in *West Coast Hotel Co. v. Parrish* (1937), and President Roosevelt's several Court appointments from 1937 through 1940 had replaced conservatives with justices sympathetic to the New Deal.

Not surprisingly, the Court upheld the FLSA in both cases, rejecting the claim that the statute regulated only the manufacture of goods, and thus failed to involve Congress's power to regulate interstate commerce under the U.S. Constitution. The Court held that the power to regulate interstate commerce encompassed the production, as well as the transportation, of goods and that the FLSA could thus prohibit the shipment of goods in interstate commerce produced under its "forbidden substandard labor conditions." The justices also rejected the claim that the FLSA's minimum wage requirements violated employers' rights, citing *West Coast Hotel Co. v. Parrish*.

The Continuing Effect of the FLSA

The FLSA's original hours and wages requirements came into effect well before the prescribed deadlines, as industrial committees appointed by the Department of Labor quickly enacted the mandated standards. The first FLSA amendments, passed as part of President Harry S. Truman's "Fair Deal" program in 1949, increased the minimum wage to 75 cents per hour and also expanded coverage to airline and cannery employees. Except for an increase of the minimum wage to \$1 an hour in 1955, no major changes then occurred until the first year of John F. Kennedy's administration. The hourly minimum wage became \$1.25, and retail and service employees now received coverage. Congress's 1966 amendments proved the most significant changes to the FLSA since its original passage, as over nine million workers now became eligible for a floor wage.

FAIR LABOR STANDARDS ACT

By the beginning of the twenty-first century, continuing FLSA amendments brought the minimum wage to \$5.15 an hour. Many labor advocates argued, however, that the minimum wage failed to provide workers with adequate incomes for their families. Business interests and their conservative supporters in Congress claimed, in turn, that a large increase in the floor wage would mean higher labor costs, forcing layoffs. The federal government under President George W. Bush also passed regulations restricting the use of overtime pay for certain classes of so-called white-collar employees. These controversies demonstrated that the FLSA not only stood as one of the most significant labor laws of the 1930s, but also remained viable in a new century.

FAMILY AND MEDICAL LEAVE ACT

The Family and Medical Leave Act of 1993 (the official citation is Public Law 103-3) guarantees unpaid but job-protected leave to many, but not all, working Americans.

Covered employees are guaranteed up to 12 weeks of such leave during any 12-month period, for personal or family medical conditions (work-related or otherwise), the addition of a child into the family (by birth, adoption, or foster care), or like matters.

The impact of the Act is commonly regarded as positive upon employees and negligible or minimal

upon employers, despite complaints by employers at the time of enactment (and continuing to this day).

History

Like many laws, the Family and Medical Leave Act (FMLA) as an idea was around for some time prior to its eventual enactment. As working Americans increasingly complained of difficulties managing work/life issues, and as an apparently decreasing willingness of employers to accommodate their concerns spread, they turned to public policy makers. In turn, policy makers looked outside the United States for inspiration. While family and medical leave, usually paid as opposed to unpaid, seemed to be common (and indeed typical) across Europe, in the United States guaranteed leave for non-work-related disability was rare, and for such leave to be paid was even rarer. For example, in the early twenty-first century, only six states had a form of off-the-job disability insurance, and even then it was typical for the covered individual's job to not be guaranteed upon recovery or upon this paid leave running out.

The idea saw bill form during the administration of President George H. W. Bush (1989–1993, referred to as the “First President Bush” to differentiate him from his son, who also served). President Bush, however, based upon the objections of business, vetoed the bill twice, once in 1990 and once in 1992.

Democratic presidential candidate William J. “Bill” Clinton, during the election of 1992, announced that he would sign the bill if he were elected, and Congress passed it again. After he assumed office in 1993, Congress did just that, and President Clinton signed it as Public Law 103-3. For most employers, the act was effective August 5, 1993.

Main Provisions

The FMLA guarantees covered employees up to 12 weeks of unpaid, but job-secure (in other words, an employer cannot legally fire an employee for taking FMLA leave) family and medical leave, during a 12-month period. The employer is allowed to define the start date of the 12-month period. It could be the calendar year or any 12-month period following the enactment of the FMLA.

Quoting directly from a U.S. Department of Labor document, covered employers include government entities (including state, local, and federal employers)

and private businesses that employ 50 or more employees in 20 or more workweeks.

To be eligible for FMLA benefits, an employee must:

- Work for a covered employer (see above)
- Have worked for that employer for a total of 12 months
- Have worked at least 1,250 hours over the previous 12 months
- Work at a location inside the United States, or in any territory or possession of the United States

Covered forms of family and medical leave include time off for the birth, adoption, or foster care of a child (this child-care leave must be concluded within 12 months of such birth, or adoption, or start of foster care); to care for an immediate family member with a serious health condition; or for employees unable to work because of a serious medical condition (including both job-related and non-job-related conditions) to recover or take care of themselves. This guaranteed leave is unpaid.

The Act appears to be considered a “floor” rather than a “ceiling,” and provisions of collective bargaining agreements or employer policies can supplement it.

Employees have been allowed to switch back and forth between FMLA leave and other forms of leave offered by their employers, sometimes during the same working day. For example, an employee could be considered to be on FMLA leave for, say, four hours in a given day, and then take four hours of “personal time” as granted by the employer.

While sometimes employers complain that the administrative tasks associated with these practices are onerous, and that some employees take advantage of the system, there appears to be very little, if any, evidence that it actually is all that much of a burden. Further, employers are often granted the right to determine if a given use of leave is FMLA leave or some other kind of leave.

Significance and Current Issues

At the beginning of the twenty-first century, the FMLA seemed to be relatively stable. Some “noise” from the administration of President George H. W. Bush (the son of the earlier President Bush, who vetoed the first version of the FMLA) was made about modifying the Act so as to limit the ability of employees to mix and match FMLA leave and other

forms of leave. These measures did not appear to be a high priority for the administration, however.

Also, the second Bush administration rolled back regulations propagated under President Clinton allowing states to compensate employees on FMLA leave for birth or adoption of children using Unemployment Insurance (UI).

There were some important, but technical, issues involving the interaction of FMLA leave and state workers’ compensation programs that had yet to be worked out. The FMLA could apply to work-related injuries or illnesses, which were also, by definition and intent, the domain of state workers’ compensation programs. It was often not clear, for example, if employees on workers’ compensation had to be required to draw upon their FMLA leave.

The broader significance of the FMLA for working-class life is a matter for debate. It certainly, by definition, provides protections that did not exist prior to its enactment. However, the fact that the leave is unpaid has, in the arguments of some commentators, effectively granted rights that members of the working class literally cannot afford to exercise. The Act has, however, clearly been an extremely important right to specific members of the working class in certain specific circumstances.

At the beginning of the twenty-first century, the Act covered roughly 60% of the American workforce. Some working-class advocates wanted to see that figure increased, but this, too, seemed rather unlikely.

FAMILY WAGE

The term “family wage” is a key word in academic discourse about the history of the sexual division of labor and is also central to public policy and religious debates about the historical relationship among wage labor, morality, and family life. In contrast with the term “living wage,” with which it is often paired, working-class Americans have rarely used the term “family wage.” Among the social workers and policy makers who popularized the term in the post-World War I years, and the political commentators and academics who re-introduced it in the late twentieth century, the phrase came to stand in for two somewhat contradictory notions, both with authentic roots in American labor history: the ideal of a male breadwinner who could support his family on his wages, on the one hand, and the reality of the “family wage economy,” in which all family members contributed their wages as a cooperative survival strategy, on the other. Many commentators assume that over the course of the twentieth century, America has moved from the former to the latter, that is, from a country in which male breadwinners predominated to one of multiple wage earners. In fact, throughout American history, most families have needed more than one breadwinner to support themselves, and it was only for a brief period in the United States—beginning in the 1920s—that a majority of American families consisted of a breadwinner husband, a homemaker wife, and children at school rather than the workplace. The stresses of the Depression and the increasing number of married women in the workplace during World War II and in the postwar years made this supposed “norm” surprisingly short-lived. What is often taken as the rule, in other words, is really the exception. While it is true that two-earner families have become increasingly common since World War II, the reality is that two meanings of the family wage—the ideal of the male breadwinner and the family wage economy—have been paired in tension from the very beginning of the development of a wage labor economy in the early nineteenth century.

The family wage—understood as a male breadwinner capable of supporting a family on his wages—was a long-standing ideal for working-class families, dating back to the early nineteenth century.

As wage labor became increasingly common in the early nineteenth century, and as the republican ideal of independent proprietorship became correspondingly rarer, many male workers, and their families, demanded a subsistence wage that would enable them to support their families and even to have savings for retirement. This version of the family wage, based on socially defined needs of workers as citizens

and family supporters, provided workers with an alternative to the “natural laws” of supply and demand, which employers used to justify low wages. With this notion of the family wage, workers for the first time adopted the idea of wage labor, which they had previously rejected, as acceptable. These moral economic claims also promoted a sexual division of labor—male breadwinners, female homemakers—consistent with the Victorian ideal, if not the reality, of “separate spheres” for men and women. “We must strive to obtain sufficient remuneration for our labor to keep the wives and daughters and sisters of our people at home,” a Philadelphia trade union declared in the 1830s (Carlson, 2001). As the American labor publication, the *Ten Hour Advocate*, editorialized in 1846: “We hope the day is not distant when the husband will be able to provide for his wife and family, without sending the [wife] to endure the drudgery of a cotton mill” (May, 1982, p. 401). Despite these clarion calls for a single male breadwinner, even in the nineteenth century, the reality was that working-class families typically relied on a family economy consisting of husbands, wives, and children, all earning wages and helping, in varying degrees, with household labor. The Victorian ideal of “separate spheres” was far more descriptive of middle-class families than it was of laboring families. In the early twentieth century, as an increasing number of wives entered the paid labor force, the reality was often even further from this family wage ideal. And it is widely acknowledged that by the late twentieth century, this ideal bore little relation to reality for most American families, which consisted largely of dual wage earners and of single-parent breadwinners.

Throughout the late nineteenth century and into the twentieth century, American workers and their organizations demanded “living wages” that would enable them to support their families, participate in public life, and maintain an “American Standard of Living.” While initially these demands for what later became known as “family wages” were derided as “communistic,” many distinctly non-Socialist reformers, religious leaders, politicians, and businessmen came, for a variety of reasons, to support the idea of a family wage. In 1914, the pioneering automaker Henry Ford, for example, began offering his male workers five dollars per day (at a time when the typical wage for a worker was about half that much) as a means of promoting mass consumption, minimizing class conflict, and solidifying traditional gender relations in working-class families. According to Ford, “The man does the work in the shop, but his wife does the work in the home. The shop must pay them both.... Otherwise we have the hideous prospect

of little children and their mothers being forced out to work” (May, 1982, p. 415).

Ford and other employers, such as Edward Filene, the Progressive department store owner, were echoed by proponents of Social Gospel Protestantism, who embraced the idea that working people should earn enough to provide the essentials of food, clothing, and shelter for a family as well as the creature comforts and respectable consumer satisfactions of life in an industrializing America. Many reformers, alongside many workers, who held the ideal of the male breadwinner as a goal, used the phrase “family wage” as shorthand for the effort to promote a wage that would support a single breadwinner for a family. As the Progressive economist Robert W. Bruere noted, “Too many employees are in the habit of interpreting the family wage as meaning the total earnings of all members of the family, rather than the wage paid to the head of family alone.” In 1919, Bruere called for a “minimum guaranteed family wage,” and in so doing became one of the first to use the phrase “family wage” (Bruere, pp. 95–100).

The Roman Catholic Church has, since the late nineteenth century, also strongly supported the effort to secure a single breadwinner “family wage.” Pope Leo XIII’s 1893 encyclical, *Rerum Novarum* (“The Condition of Labor”), pointed to the familial nature of the just wage. Forty years later, Pope Pius XI called explicitly for a family wage for every male adult, as a matter of social justice. In books such as *A Living Wage* (1906) and *Distributive Justice* (1916), Father John A. Ryan, the leading American advocate, called the family wage the linchpin of a moral economic system. Ryan declared that “the laborer has a right to a family living wage because this is the only way in which he can exercise his right to the means of maintaining a family.” The welfare of society made it “imperative that the wife and mother should not engage in any labor except that of the household.” Ryan insisted that “the State has both the right and the duty to compel all employers to pay a Living Wage.” In 1981, Pope John Paul II’s encyclical, *Laborem Exercens* (“On Human Work”) continued the Church’s call for family wages: “Just remuneration for the work of an adult who is responsible for a family means remuneration which will suffice for establishing and properly maintaining a family and for providing security for its future.” John Paul II noted his preference for this remuneration to be given “through what is called a family wage—that is, a single salary given to the head of the family for his work, sufficient for the needs of the family without the other spouse having to take up gainful employment outside the home” (http://www.vatican.va/holy_father/

[john_paul_ii/encyclicals/documents/hf_jp-ii_enc_14091981_laborem-exercens_en.html](http://www.vatican.va/holy_father/john_paul_ii/encyclicals/documents/hf_jp-ii_enc_14091981_laborem-exercens_en.html)).

If a consensus in favor of the family wage formed in the first half of the twentieth century, it is important to note that the concept was never without its critics. These critics came from opposite ends of the political spectrum. Many business leaders and politicians believed that the family wage interfered with the free market for wages and freedom of contract. The family wage concept was also criticized by some feminists both in and out of the labor movement who believed that it undermined the idea of equal pay for equal work. They argued that the family wage ideal sanctioned gender discrimination and a sexual division of labor, in which women earned lower wages. Historians generally concede that the family wage ideal served a masculinist ideal of male breadwinners, which contributed to the difficulties of female breadwinners to breach the sexual division of labor that rewarded “male” jobs more highly than “female” jobs.

Whatever the historical costs or benefits of the family wage ideal, by the late twentieth century, there was a widespread consensus that this ideal was in crisis. And in recent decades, a call for a revived family wage has been made by a diverse coalition of conservative Christian promoters of “family values” as well as laborite supporters of living wages. The former believe that a family wage will provide incentives for the return of the “traditional” family of stay-at-home moms and working dads. The latter believe that it is necessary to recognize that workers, including many single mothers, support families. The slow increase in the legal minimum wage, making it worth less in real dollars in the 1990s and 2000s than it was in the 1960s and 1970s, suggests that these pleas have not been widely heeded in policy. Moreover, despite the diverse coalition of support for the family wage, critics remain. As one critic recently suggested, “returning to a system of male breadwinning is an unworkable and for many families, an undesirable solution.” Feminist advocates of the living wage argue that the solution to the family wage problem is not to pay men more but to compensate women for their labor. “The breadwinner-homemaker household is a short-lived arrangement that, even at its height in the 1950s, never met the needs of countless women, men and children” (Letter from Kathleen Gerson, “Homemaker Nostalgia,” *New York Times*, September 12, 1995). So the consensus that the family wage ideal collapsed in the last third of the twentieth century has not led to a clear solution to this problem, since for many critics, it was the family wage ideal itself that was the problem. With increasing globalization

and economic insecurity, debates about the family wage will doubtless continue well into the twenty-first century.

FANSTEEL v. UNITED STATES (1939)

Nineteenth-century striking workers effectively prevented continued production by removing their tools and knowledge from the workplace. Twentieth-century employers could continue mass production during strikes by bringing in new workers to run the massive machinery and assembly lines. Workers could be sure of stopping production only by sitting down at their machines. The first such strike occurred at a General Electric plant in Schenectady, New York, in 1906. It was revived by tire and rubber workers from 1934 to 1936 in Akron, Ohio, most often over use of non-union workers, speedups, and work rule changes, and most often as spontaneous rank-and-file beginnings. Most of these strikes started among younger workers

on the night shift. In 1936–1938, a wave of more than 62 sit-down strikes spread to other industries attempting to force employers to bargain with unions, the most famous being the autoworkers strike in Flint, Michigan. In the vast majority of sit-downs, little damage was done to plants and machinery, and then mostly during eviction attempts.

The U.S. Supreme Court decided the legality of the sit-down tactic under the National Labor Relations Act (NLRA), *NLRB v. Fansteel Metallurgical Corp.*, 306 U.S. 240 (1939). Fansteel processed rare metals in Waukeegan, Illinois. The Amalgamated Association of Iron, Steel, and Tin Workers of North America, Lodge 66, affiliated with the CIO, first attempted to represent Fansteel employees during September 1936. The plant superintendent, A. J. Anselm, replied that the company would not deal with an outside union. The company hired the operative Alfred Johnstone, National Metal Trades Association, to infiltrate and spy on union activities, isolated the union president, John Kondrath, next to the superintendent's office, and enlisted employees in a company union. On February 17, 1937, Lodge 66, representing 155 of 229 employees, again demanded collective bargaining and was refused. At 2:00 p.m. that day, the union determined to strike by sitting down. By 2:30, approximately 95 employees seized key buildings 3 and 5.

At 6:00 p.m., Anselm, company counsel, and two policemen approached the seized buildings, announcing in a loud voice that the men were illegally trespassing and were all fired. The next day, the company sought an injunction against continued possession of the buildings. On February 19, the sheriff passed copies of the writ through an open window to Swanson and Warner, the respective leaders in the two buildings. Later that day, the sheriff, with approximately one hundred deputies, tried to forcibly evict the men with tear gas bombs, a battering ram, and baseball bats. They were met by a fire hose and a hail of nuts, bolts, small tools, parts, and sulphuric acid until the sheriff withdrew after two hours.

At dawn, February 26, the sheriff, with a slightly larger force, wheeled a truck with a 30-foot armored scaffold to the buildings. From the higher vantage, they fired tear and emetic gas into the windows. After an hour of pitched battle, the occupying men scattered and fled.

The company suffered \$75,000 in broken windows, small tools, and parts thrown from the building, all of which occurred during the two stormings of the buildings, but no major damage to the heavy machinery. During and after the strike, the company solicited individual employees and strikers to return to work, rehiring 35 of the sit-downers. After the strike, the company encouraged membership in a new union, the

Rare Metal Workers Union No. 1, providing it with a place to work and meet, and supplies.

Thirty-nine of the sit-downers were prosecuted for contempt in state court. They were fined between \$100 and \$1000 and jailed for 10 to 240 days.

The National Labor Relations Board, 5 NLRB 124 (1938), found violations of the NLRA, sections 8(1) interfering with the right to self-organize, 8(2) supporting a company union, 8(3) discriminating against union activity, and 8(5) refusing to bargain and attempting to bargain with individuals. The Board ordered reinstatement of all the strikers and bargaining with the union under its remedial power to effectuate the purposes of the NLRA. It argued that allowing the seizure to disqualify the workers from relief would reward the company for its unfair labor practices.

The Seventh Circuit Court of Appeals refused to enforce the order 2-1, and the Supreme Court affirmed 7-2. Recognizing the existence of the unfair labor practices, Chief Justice Hughes nonetheless stated, "We are unable to conclude that Congress intended to compel employers to retain persons in their employ regardless of their unlawful conduct—to invest those who go on strike with an immunity from discharge for acts of trespass or violence against the employer's property." The only concession to the Board suggested a Board-supervised election to determine the majority's representation choice. The dissent by Justices Reed and Black would have returned the parties to the same position they were in before the unfair labor practices and the strike, enforcing the Board's order, arguing it is too easy for employers to get away with unfair labor practices as long as the employer has a nonrelated reason to fire the strikers.

The loss of the sit-down had legal, economic, and organizational consequences. First, sit-downs largely worked for meeting workers' demands. Second, aside from removing a key tactic in the successful organization drives of the CIO in the late 1930s, the majority's rationale weakened the Act's reach by elevating the property rights of employers over the organizing abilities of workers. This was a judicially imposed choice not mandated by the NLRA. Third, another loss to labor was the increased solidarity among the rank and file who had time to talk about their work and get better acquainted during the strikes. This held over in the form of increased demands from workers in those plants experiencing sit-downs. Finally, usually short sit-down tactics were perceived by workers as spontaneous rank-and-file actions, the removal of which encouraged centralization of bargaining and grievance machinery.

FARM EQUIPMENT AND METAL WORKERS UNION

The Farm Equipment and Metal Workers Union (FE), a relatively small union that was influenced by the U.S. Communist Party (CPUSA), had a jurisdiction that overlapped with the much larger United Auto Workers union (UAW). Beginning as the Farm Equipment Division of the Steel Workers Organizing Committee in July 1938, the Congress of Industrial Organizations (CIO) chartered the FE as the international union whose jurisdiction encompassed the farm implement industry. At its peak, the FE had 70,000 members, with its major base of strength located in the plants of the International Harvester Corporation, where the union represented 40,000 workers. During the 17 years (1938–1955) of the union's existence, the FE pioneered an independent shop floor unionism and was a vigorous proponent of racial egalitarianism and civil rights for its African-American members.

Believing that the workers were involved in a constant struggle with capital, the FE at both the national and local levels encouraged a shop floor unionism based on direct action at the point of production in defending workers' rights. This militancy was expressed in the union's continuous use of work

stoppages—both authorized and unauthorized—throughout most of the union’s life. For example, at Harvester during the years between 1945 and 1951, the FE engaged in 849 strikes, while UAW members participated in 171 walkouts.

With regard to the union’s commitment to racial egalitarianism within the workplace and the union, the FE was successful in its fight to upgrade African-American workers to better jobs. For example, at the McCormick Works (Chicago), where 80% of the employees were white, although the majority of blacks still labored in the foundries, FE Local 108 won the right for African-Americans to hold jobs as assemblers, inspectors, welders, and polishers by 1949. Furthermore, blacks were amply represented in the local’s leadership positions, ranging from shop steward to the executive board. And in the 1949 elections, four of the 11 executive board members and three of the seven grievancemen voted in were African-American. FE Local 236’s (Louisville) record on fighting for racial equality was as good if not better than that of Local 108. It had obtained a nondiscrimination clause in its 1946 contract with Harvester and aggressively fought to desegregate Louisville’s white-only parks and hotels.

The FE’s Relationship with the UAW, 1945–1949

Until 1945, the rivalry between the UAW and the FE was handled by the two unions splitting up the jurisdiction over the relevant industrial units, with the FE organizing the agricultural implement factories and the auto union maintaining control over the truck plants. However, after World War II, this arrangement abruptly ended, with the two unions competing to organize new plants. In addition, the UAW attempted to raid, that is, to replace one union with that of another as the collective bargaining agent, the FE plants for the first time.

In 1947, the UAW membership rejected a proposed merger of the FE into the auto union when Walter Reuther, the UAW president, and his faction (the Reuther Caucus) actively opposed the combination on the grounds that FE’s addition to the UAW would tip the balance of power within the union in the direction of the CPUSA-supported Thomas-Addes forces. That same year, the passage of the Taft-Hartley Act, with its requirement that all union officials sign noncommunist affidavits in order to retain National Labor Relations Board (NLRB) protection, had severe consequences for the FE when the union’s officers refused to comply.

FE Local 105, which represented 16,000 production workers at the Caterpillar Tractor Company’s Peoria plant, struck Caterpillar in early April 1948 when its contract expired. Arguing that since the union had not fulfilled the Taft-Hartley Act requirements, Caterpillar ceased bargaining with Local 105 in March, stating that it did not want to spend time negotiating with a union that might be replaced by a legitimate labor organization certified by the NLRB at a later date. Shortly thereafter, four unions initiated organizing drives in order to lure the Caterpillar employees away from Local 105. With the FE ineligible to be on the ballot, the runoff election between the UAW-CIO and the UAW-American Federation of Labor (AFL) resulted in the former obtaining bargaining rights for the Caterpillar workers and depriving the FE of nearly 25% of its membership.

Shortly after the Caterpillar debacle, the FE officers complied with the Taft-Hartley Act affidavits, which made other UAW raids on FE plants later in the spring of 1949 unsuccessful. The FE soundly defeated the auto union at the John Deere Plow Works in Moline (Illinois) and the Oliver plant in Iowa.

The UAW’s Raids on the FE, 1949–1954

When the CIO expelled the FE in the fall of 1949, along with 10 other Communist-led unions, the federation sanctioned raids by the UAW against the FE. In an attempt to protect itself from these attacks, the FE merged with another CIO union that had also been expelled for its ties with the CPUSA, the United Electrical, Radio and Machine Workers of America (UE), also becoming known at this time as the FE-UE.

The UAW-FE rivalry, which accelerated after the union’s expulsion from the CIO, reached a crescendo in 1952 when the union struck Harvester and the UAW provided no support to the beleaguered FE. In June 1952, two months before the strike, the UAW launched an unsuccessful raid against FE Local 108. With the hostility between the two unions having reached a feverish pitch, Harvester had steeled itself to engage the FE in an all-out struggle.

The FE strike, which commenced on August 21, 1952, involved approximately 30,000 workers in eight Harvester plants throughout the United States. In an attempt to break the work stoppage, the company kept its plants open and conducted a vigorous campaign, encouraging the strikers to return to work. With McCarthyism nearing its peak in 1952, Harvester

took advantage of the anti-Communist fervor sweeping the country to sway public opinion against the FE. The corporation took out advertisements in the Chicago newspapers emphasizing the intimate connection between the FE leaders and the CPUSA. Another devastating blow to the union occurred when the House Un-American Activities Committee arrived in Chicago a mere two weeks into the strike in order to examine the influence of Communism in Chicago unions.

Despite the walkout's violent nature, employees were returning to work. By the end of the first week in November, a considerable percentage of workers had crossed the picket lines in all eight plants. With the strike disintegrating at an astonishingly rapid rate, Geralde Fielde, the FE Secretary-Treasurer, ended the work stoppage on November 15 by signing a contract that totally capitulated to Harvester on all of the union's original demands.

The conclusion of this disastrous strike against Harvester only emboldened the UAW in its raids of the weakened FE. At this time, the auto union consciously selected plants where the "back-to-work movement" had been the strongest in order to petition the NLRB for new representation elections. However, the UAW was unsuccessful in ousting the FE at these factories. The Richmond (Indiana) plant workers voted for the FE over the auto union by a 2-to-1 margin. At the West Pullman plant in Chicago, the level of victory was even greater, with the FE beating the UAW 3-to-1. Realizing that it had no chance to defeat the FE at the Farmall (Rock Island, Illinois) plant, the auto union dropped out just two days before the NLRB election.

In spite of the union's ability to successfully retain its membership in these poststrike raids, problems within the FE first surfaced in two Harvester plants in the Quad Cities of western Illinois in the middle of August 1953. At the East Moline and Rock Island facilities, the workers conducted membership referendums and voted to disaffiliate their two locals from the FE. The East Moline NLRB representation election, held on May 26, 1954, led to the first irreparable crack in the FE Harvester chain when the workers voted to affiliate with the UAW rather than to remain in the FE.

However, raids were not the FE's only worries at this time. With McCarthyism still in full force throughout the nation, the FE was confronted with the Communist Control Act of 1954. The Act granted the attorney general the authority to use the Subversive Activities Control Board to decree that a union was controlled by Communists, thus depriving it of any protection under the National Labor Relations Act (NLRA). In addition, if a mere 20% of a

Communist-controlled union's members demanded a representation election, the union could re-organize under new non-Communist leadership and still be able to retain its contract and have access to both the NLRA and the NLRB.

After the defection of the East Moline plant, the next plant to leave the union for the UAW was Farmall. After these two losses in the Quad Cities, the movement expanded to include the Chicago Harvester plants, the stronghold of the FE membership, and finally to all of the union's plants.

The FE's Affiliation with the UAW, 1955

At the end of January 1955, a committee of five top-level FE officers met with a comparable committee of UAW representatives. This meeting, called under the guise of achieving unity between the two unions during the upcoming negotiations at Harvester, however, was little more than a way for the FE leaders to see what they could get from the UAW for bringing their members, as a group, into the auto union.

In the middle of March 1955, the FE Harvester Conference Board voted for disaffiliation from the United Electrical Workers Union and decided to join the UAW as a group. Under the arrangement, the auto union agreed to retain the former FE staff representatives (except for the president, Grant Oakes, and the secretary-treasurer, Gerald Fielde) for the FE bringing their locals into the UAW. In the subsequent NLRB representation elections held in the former FE Harvester plants in May and June 1955, the UAW won all elections over the rival AFL unions and the "no union" choice by decisive margins. The end of the FE, and its rivalry with the UAW, came with a whimper, not a bang.

FARMER-LABOR PARTY

The Farmer-Labor Party (FLP) was an attempt in the post-World War I years to establish a viable third-party political party uniting workers from all aspects of society.

The impetus for a labor party after WWI came from many sources. Another influence came from the success of the British Labour Party. Many believed that similar successes could come from a similar American organization.

At the time of the formation of the FLP, many labor organizations across the country were starting to organize their own political parties. While it is uncertain where the first true labor party was formed, there was considerable action in several states. In Chicago, under the call of the Chicago Federation of Labor (CFL), unsuccessful attempts came in 1905, 1908, and 1910. According to some scholarship, the first vital party was formed in 1918 in Bridgeport, Connecticut. In Minnesota, a Farmer-Labor Party was begun in the same year as in Connecticut. The Minnesota party had some success with the election of three governors and four U.S. senators. The party called for protecting both farmers and labor unions, and government control of some industries. But it was especially in the Chicago arena that the ideas came together.

John Fitzpatrick, the longtime CFL president, pushed for independent political action, an act which he knew would meet with opposition by the American Federation of Labor (AFL) president, Samuel Gompers. While not opposed to political action itself, Gompers believed in nonpartisan political action by supporting those who would promote labor concerns. Radical groups such as the Socialists were also opposed to the idea of a labor party for two reasons. First, they argued it would divide the working-class vote at the polls, and two, it would take away from their own publicity and membership.

The CFL started developing the drive for the national party in 1918, when it first formed a local party for Cook County (the county in which Chicago is located), and then a state party afterward. Neither party met with much, if any, success. During August 1919, along with 30 representatives from across the country, the CFL called for the formation of a national party. Each city's central labor body was permitted to send one delegate each, and local parties and unions could send one delegate for every 500 members. The convention met three months later in Chicago. With over 1,200 delegates in attendance, party officers were chosen, and a party platform developed, mostly taken from that of the Illinois party. Also in attendance were the single taxers, farmers,

and the progressive "Committee of 48." Since the national elections were not until the following year, that first convention did not feel any need to make major decisions, including a candidate for the presidency.

The next national convention met in Chicago during July 1920. At this time, the party blended many groups into one, and a new name was chosen—the Farmer-Labor Party. Delegates from the Non-Partisan League, the World War I Veterans, the Single Tax League, the Farmers' League, and the Committee of 48 attended. To promote their activities, the FLP especially used the CFL newspaper *The New Majority*, which was initially founded to promote the CFL's local political activities.

The platform, once again, was based upon that developed in Chicago. The 48ers objected to many of its provisions, such as the "democratic control of industry," which they believed to be too socialistic. The 48ers had no objections to antimonopoly provisions, but they were dead set against any sort of nationalization of any industry. The platform also called for recognizing the Soviet Union, civil rights for African-Americans, and nationalization of the mines, among other provisions.

The 48ers would also become disappointed with the FLP's choice for a presidential candidate. Instead of choosing LaFollette, the convention nominated Parley Parker Christensen, of Salt Lake City, and Max S. Hayes, a former Socialist candidate, for vice president. Furthermore, LaFollette expressed no interest in being a candidate. To many, the 48ers were latecomers to the movement and wanted to take over the FLP merely to promote their own agenda. Since the 48ers had no sort of a majority, their ideas were overridden.

The election in November 1920 was an utter disaster for the FLP. Warren G. Harding won by a landslide, easily defeating James Cox, the Democratic Party candidate. Christensen received less than a quarter of a million votes, not even 1% of the total. The Socialist labor leader Eugene V. Debs, currently serving time in prison for having violated the WWI Espionage and Sedition Acts, received just over 900,000 votes. Furthermore, the local parties created by the CFL suffered mostly devastating defeats as well. Any successes were in winning seats on the local level in places such as Illinois, New York, Washington, and Minnesota.

The CFL called for constant organization, believing that any hope for success in future elections depended upon not waiting for another election, but rather keeping their platform before the public. But the defeat in 1920 took its toll on the party. The next

congressional elections would be in 1922, and calls were made to prepare. Popular sentiment toward the party was fading, and fast. Despite trying to portray itself as a party for all Americans, the FLP could not interest the general public, including labor's own rank and file. The Socialists proposed a meeting with the National Executive Committee to discuss possible options, but was turned down.

The CFL also began a "member contest," a last-ditch effort to keep the party moving by heavy recruitment of new members. The winners would be given dues for 12 months, a 12-month subscription to the *New Majority*, and an invitation to the next party dinner. The *New Majority* never reported the results.

At the 1923 convention, policy would be dictated by the Communists, led by Fitzpatrick's former organizing partner, William Z. Foster. With the FLP in a weakened state, the Communists were able to impose their will on the convention. Many of the less radical FLP members withdrew from the party, with Fitzpatrick himself furious at the move. To ally themselves with the Communists was political suicide, especially during the early 1920s when the first Red Scare took aim at any radicals, real or perceived. With the Communists in control, the FLP name was changed to the Federated Farmer-Labor Party.

In May 1924, Fitzpatrick and the CFL abandoned the idea of independent political action. The repeated failures, and the party takeover by the Communists, sent the CFL straight back into the AFL fold of nonpartisan political action. In a speech, Fitzpatrick lamented the turn of events while praising the AFL tactics. To further separate themselves from the now-defunct FLP, the CFL changed the name of its paper from the *New Majority* to *Federation News*, a name that remains into the present day. *Federation News* also declared its allegiance to AFL policies. While the party was dead on the national scene, the FLP continued to exist in Minnesota. In 1944, the Minnesota Democratic Party, led by the verbose Hubert H. Humphrey, merged with the FLP, then becoming known as the Minnesota Democratic-Farmer-Labor Party.

The FLP's failure stemmed from its lack of popular support, organization, funds, and coverage from the mainstream press, as well as staunch opposition from the leadership of the AFL.

FARM LABOR ORGANIZING COMMITTEE

The Farm Labor Organizing Committee (FLOC) represents the most successful and long-lasting unionization effort among Midwestern farmworkers in the twentieth century. Created in 1967 to address the needs of migrant farmworkers who toiled on tomato farms in Ohio, FLOC has since expanded to include farmworkers in the South as well.

FLOC is very much associated with its founder, Baldemar Velasquez. Born in Texas in 1947, Velasquez worked as a migrant laborer with his family, regularly traveling between the Southwest and the Midwest. In 1954, the Velasquez family settled in Putnam County, Ohio, where they continued to work together in the fields. However, Velasquez also attended school, and after graduating from high school, he enrolled in college at Bluffton College in Ohio, where he took part in the emerging civil rights and free speech movements.

In 1967, based on his own experience in the fields as well as the supportive influence of Jesse Salas, who was already organizing pickle fieldworkers in Wisconsin, Velasquez decided to organize FLOC. He envisioned FLOC as a way to address the kinds of hardships he and thousands of Mexican and Mexican-American migrant farmworkers faced in Ohio—low pay, substandard housing, isolation, and limited educational opportunities. Since almost all the farmers who grew tomatoes owned relatively modest family farms, the FLOC organizers' first strategy revolved around trying to pressure individual growers to work voluntarily with them to improve living and working conditions as well as wage rates. Velasquez and his fellow organizers soon realized, however, that even

gaining access to farmworkers would present a formidable challenge. Many farmers refused to allow FLOC organizers to visit with or speak to the migrant farmworkers. As such, FLOC organizers challenged their exclusion in court, and thereby successfully gained access to migrant workers, though they were not allowed to photograph the workers' living conditions inside migrant camps. FLOC also attempted to reach as many farmworkers as possible by sending organizers to Texas each winter to meet with migrant workers who would be traveling in the spring to work in Ohio. Equally important, FLOC began a well-organized publicity campaign to highlight the plight of migrant workers in the Midwest. This publicity campaign included a traveling theater, a bilingual union paper (*La Voz del Campesino*), and a radio program.

After failing to convince the farmers to address the working and living conditions of migrant workers, in September 1968, FLOC organized a strike against 10 Ohio farmers, including grower James Ackerman. FLOC demanded wage increases, life insurance, day care, paid hospitalization, and various wage guarantees to protect workers in case of inclement weather and delayed growing seasons. Though most growers refused to negotiate with FLOC, five growers agreed to sign a contract establishing FLOC as the sole bargaining agent and labor recruiter. The growers also agreed not to discriminate against union activists as well as to provide a minimum wage and limited insurance during the growing season. In return, FLOC members agreed to remain in the fields until the end of the growing season. Within a couple of weeks, a total of 21 farmers signed contracts with FLOC as well.

By 1969, FLOC's membership had grown to three thousand workers, and organizers looked forward to even more victories. However, FLOC soon faced an increasingly organized and militant opposition as various growers, associations, including the Farm Bureau, went on the offensive. Of the 21 growers who had signed the FLOC contract in 1968, 12 simply stopped growing tomatoes, while others tried to undermine FLOC by offering workers minimum wage increases on their own. Although FLOC officials were successful in using the court to force the growers to abide by the 1968 agreement, and even successfully negotiated two-year contracts with 11 growers, the prospect of trying to convince dozens of individual growers to sign contracts each year forced FLOC organizers to rethink their organizing strategy. Velasquez feared that negotiating contracts with individual growers would not deliver the kinds of long-term benefits that he and his associates hoped to achieve. Moreover, even the recently hard-won victories

provided plenty of evidence that the strategy of negotiating one-on-one with Ohio's farmers left FLOC in a particularly vulnerable position.

In the post-1969 period, FLOC directed its energies toward challenging the processors with whom the farmers contracted to grow tomatoes—most importantly, the Campbell Soup Company—rather than just the farmers. The idea was that if organizers could convince the processors to sign multiparty contracts, this would force growers and farmworkers to recognize their common interests as well as ensure uniform wage rates and better living conditions for the thousands of farmworkers dispersed throughout the Ohio countryside. To achieve these multiparty three-way contracts, however, FLOC had to get the processors to come to the bargaining table.

The battle to convince Campbell Soup to engage in three-way collective bargaining and to sign multiparty contracts lasted for seven years. During that time, FLOC expanded its public relations campaign by calling for a national consumer boycott of all Campbell's products. In 1983, FLOC also engaged in a well-publicized protest walk from Ohio to Campbell's headquarters in Camden, New Jersey. By 1986, these efforts to reach out to the broader public paid off when Campbell Soup finally agreed to engage in three-way collective bargaining. Soon thereafter, other processor companies also agreed to three-way contracts, including Heinz, Vlasic, Aunty Jane, Dean Foods, and Green Bay Foods.

While FLOC organizers continued to organize farmworkers in the Midwest in the 1980s and 1990s, they also recognized the fact that since the market for tomatoes was becoming more national and international, they, too, needed to begin to organize workers outside the Midwest. Therefore, in 1997, FLOC expanded its organizational strategy by looking to organize farmworkers in North Carolina. Doing so posed new challenges. In contrast to the relatively homogenous farm labor force in Ohio, the nearly 40,000 migrant farmworkers in North Carolina included significant numbers of single men from diverse backgrounds, including the United States, Mexico, Central America, and the Caribbean. The prospect of successfully organizing this diverse workforce was further hampered by the very antiunion environment of this conservative southern state.

FLOC began its 1997 organizing campaign in North Carolina by directing its attention to the Mt. Olive Pickle Company. Though FLOC hoped that Mt. Olive would cooperate and help pressure local farmers to engage in three-way bargaining, Mt. Olive proved to be a formidable opponent. Mt. Olive executives insisted that since they hired neither the farmers nor the farmworkers, they had no authority to engage

in any kind of bargaining. To counter Mt. Olives' intransigence, FLOC began another public relations campaign, including a well-publicized boycott, which received support from over two hundred labor, community, and religious groups. Mt. Olive responded with its own campaign, which received support from many antiunion conservatives. However, after a seven-year battle and a five-year boycott, in 2004, the Mt. Olive Pickle Company and the North Carolina Growers' Association capitulated to FLOC's call for three-way multiparty bargaining. In addition to agreeing to negotiate living and working conditions, Mt. Olive also pledged to increase the growers' pay by 10% over a three-year period to encourage them to increase the workers' pay as well. The 2004 victory provided FLOC with renewed optimism about organizing migrant farmworkers in the twenty-first century.

FEDERAL BUREAU OF INVESTIGATION

The U.S. Department of Justice initially relied on other federal agencies to conduct investigations. A 1908 bill to create a Bureau of Investigation failed due to congressional opposition to a central spy agency. President Theodore Roosevelt insisted that the Department needed detectives and instructed his attorney general to create the Bureau after Congress adjourned. In 1935, it was renamed the Federal Bureau of Investigation (FBI).

Starting as a small agency with narrow jurisdiction, the FBI grew rapidly under J. Edgar Hoover, director from 1924 until his death in 1972. Hoover had joined the Justice Department in 1917 and headed the Radical Division, quickly renamed the General Intelligence Division, from 1920. Hoover amassed huge files, which he used to create a political role for the FBI that, for most of the twentieth century, exceeded its statutory responsibility. He maintained

dossiers on every member of Congress, the Supreme Court, Cabinet, and the eight presidents under whom he served. He shaped the Bureau's internal labor policies and its approach to labor organizations. Determined to control personnel, Hoover refused to cooperate with the Civil Service, and he barred African-American men as agents.

Bureau agents participated in the 1917 Espionage Act raids against immigrant working-class radicals, Socialists, the Industrial Workers of the World, and critics of the war. Despite lack of authorization, the Bureau assisted the Immigration Department in 1919 to arrest 750 immigrants, of whom over 200 were deported. Hoover helped organize the 1920 Palmer Raids, mass arrests of four thousand radicals in 33 cities, made possible by undercover agents in positions of sufficient leadership in the radical movement to organize the simultaneous meetings.

Federal officials claimed lack of jurisdiction, however, to investigate the 47 murders during the 1917 East St. Louis race riot, an antiblack rampage ignited by white craft workers. The FBI did investigate the East St. Louis black community for any influences which might foster attacks on whites, and it worked with employers to portray the riot as proving the dangers of unions. The FBI did not investigate any lynchings, averaging 65 per year during and after World War I, often the result of white hostility to black men in uniform. Nor did the FBI evince interest in labor racketeering. According to James B. Jacobs, the FBI devoted few resources to organized crime while Hoover was alive. Popular impressions to the contrary stem from confusion with other agencies (Al Capone was stopped by Treasury agents) and from Hoover's extraordinary promotional skills. The FBI joined with the Military Intelligence Division of the Army and the Office of Naval Intelligence to investigate the 1919 Steel Strike. FBI agents infiltrated the 1922 Railroad Shopmen's strike. Unable to develop evidence of radicalism, agents nonetheless helped make the case for federal troops. Although the General Intelligence Division was abolished in 1924, the FBI maintained its files on labor organizers and worked with plant security forces to develop fingerprint collections with which labor activists were tagged for blacklisting.

In 1932, the FBI infiltrated the Bonus March, a nonviolent demonstration by veterans, in an unsuccessful search for evidence to support President Herbert Hoover's claim that the marchers were Communists or criminals. The FBI used wiretapping extensively in violation of the 1934 Communications Act and helped train other police forces in its use. Wiretapping and related practices such as break-ins and mail intercepts were illegal, and illegally obtained

evidence was inadmissible in court. However, the FBI found them effective in antiunion operations where the objective was disruption and provocation rather than prosecution. The FBI also shared wiretap information with employers.

The 1942 FBI break-in at the Los Angeles Communist Party headquarters provided the membership lists underpinning the Hollywood movie studios' blacklist. From 1934 to 1945, the FBI participated in an unsuccessful campaign to deport Harry Bridges, the president of the International Longshoremen's and Warehousemen's Union. Other labor targets in the 1940s included the Congress of Industrial Organizations (CIO), including CIO leader and key Roosevelt ally Sidney Hillman, the National Maritime Union, the United Mine Workers, and the New York City Teachers' Union. In 1946, Hoover proposed to President Harry Truman an emergency detention list including labor and civil rights leaders, which Attorney General Tom Clark authorized two years later. The FBI launched an anti-Communist and antiunion educational campaign in 1946, using cooperative columnists to disguise the FBI initiative.

President Truman's 1947 Federal Employee Loyalty Program increased both the FBI's surveillance mandate and its de facto unaccountability to constitutional standards. FBI files, inadmissible in court, proved decisive in loyalty dismissal proceedings. After the accused lost their positions, continued FBI surveillance and visits to prospective employers enforced blacklisting. FBI files on homosexuals, compiled without authorization since 1937, led to dismissals of thousands of federal employees.

The FBI provided information for congressional investigations of union activists, particularly leftists in the CIO, and shared information with plant security. In the 1953 House Committee on Un-American Activities hearing in Pittsburgh, the FBI supplied information about the United Electrical, Radio and Machine Workers of America that it had received from the manufacturers' labor spies and an FBI informer on the union's staff.

The FBI also gave information about union leftists to selected union leaders. James Carey, president of the International Union of Electrical Workers, started exchanging information with the FBI in 1943. In the March 1952 Detroit hearing against United Auto Workers (UAW) Local 600, the FBI provided CIO Vice President Walter Reuther with information from an informer in the local. The FBI spied on A. Philip Randolph, especially regarding the World War II-era March on Washington Movement for fair employment, and also reported to Randolph about possible Communist influence within the march.

The FBI engaged in disruption of black organizations. When the Memphis sanitation workers struck in 1968 and organized in the American Federation of State, County, and Municipal Employees, the FBI filed reports on the strikers (and shared information with the antiunion mayor) from the strike's inception. After Dr. Martin Luther King's assassination, the FBI continued to monitor the Poor Peoples' Campaign, sharing information with the Military Intelligence Division and Central Intelligence Agency, as well as leaking derogatory gossip to reporters. A paid FBI informant provided the diagram of the apartment in which Fred Hampton, a charismatic young Black Panther Party leader, was shot while asleep by the Chicago police in 1969. FBI testimony, disputed by historians and Amnesty International, led to the sentence of life imprisonment for the American Indian Movement member Leonard Peltier following a shoot-out at the Pine Ridge Reservation in 1975.

After Hoover's death, the FBI began to focus more on organized crime. The passage of the Organized Crime Control Act of 1970 (including the Racketeer Influenced and Corrupt Organizations [RICO] Statute and the Witness Security Program) provided the FBI with tools to combat labor racketeering; it focused especially on corrupt locals within the International Brotherhood of Teamsters. There has been debate within the union movement whether the FBI can be effective against labor racketeering, as it remains closely attuned to the demands of the presidency and largely immune to working people's priorities for law enforcement and union democracy.

FEDERAL COAL MINE HEALTH AND SAFETY ACT

In 1969, President Nixon reluctantly signed the Federal Coal Mine Health and Safety Act (FCMHSA) in the face of a rank-and-file movement of U.S. coal miners. It heralded a paradigm shift by comprehensively committing the federal government to creating and enforcing safety standards, and compensation for disease, in America's most hazardous industry. The prior reliance on states' initiatives had resulted in a dismal record on coal-mine safety in the United States, with over 90,000 officially reported fatal accidents from 1906 to 1970 (in bituminous mines alone), over 1.5 million injuries from 1930 to 1969, and likely even higher numbers killed and disabled more slowly by black lung disease.

Among other measures, the 1969 Act mandated federal inspections of each underground mine; fines for violations, with criminal penalties for willful violations; and the right of miners to request federal inspections. Soon, the groundbreaking 2 mg. of respirable dust per cubic meter of air rule was adopted, and coal miners were given periodic X-ray exams, with the right to demand less dusty work when black lung (Coal Workers' Pneumoconiosis, or CWP) was detected. The 1978 amendments created the Mine Health and Safety Administration (MSHA) within the Department of Labor (DOL) to take charge of mine safety matters, replacing the historically passive Department of the Interior. Proposals in 1978 for safety representatives, chosen by the miners, who would carry out the sampling of respirable dust, were rejected as a radical infringement on property rights.

Title IV of the FCMHSA (amended expansively in 1972 and 1978 and restrictively in 1981) created a federally administered black lung benefits program. The industry promptly challenged its constitutionality and lost in the Supreme Court. Title IV was originally a temporary federal commitment, under which:

- (1) benefits would be paid from government revenues to those older disabled miners and widows still surviving the pre-1970 cover-up and abuse;
- (2) a model adversarial workers' compensation program would then be created, followed by,
- (3) adoption of similar programs by the states.

In practice, the backlog of older miners was too great, and the bureaucracy too unwieldy, to dispose of both rapidly and fairly. Furthermore, epidemiological evidence showed that the disease was more widespread than had been thought, because many miners whose X-rays were negative for the "textbook" picture of CWP nonetheless had coal dust-induced disease—both "classical CWP lesions" and Chronic Obstructive Pulmonary Disease (COPD), which was shown to result from coal dust exposure as well as from smoking.

The states could not rise to the challenge. In 1978, the federal program was made permanent, and the legal definition of pneumoconiosis was amended to include all respiratory disease arising out of coal-mine dust. An industry-financed Trust Fund was established for the older miners, whose last coal-mine work was prior to 1970. Those miners were freed from the opposition of the individual employers to their claims.

Then the 1981 amendments, supported by the coal industry and President Reagan, abolished several of the lenient eligibility provisions that had been won by the continuing vigilance of black lung activists. The approval rate plummeted from a high of 37% to a low of 5%. The decline also resulted from the shrinking number of "Trust Fund" cases and, concomitantly, the growing involvement of individual coal-mine operators. Their armies of well-paid lawyers and medical consultants vastly "outgunned" claimants on fixed incomes, and their appeals against the few claims awarded dragged on for years. In 2000, miners and their advocates won passage by the Clinton Administration of long-sought changes in the DOL's implementing regulations. These rules sought to level the field by limiting the quantity of evidence that could be submitted by employers, and they explicitly recognized the link between COPD and coal dust. The industry filed suit against the regulations and lost, but continued challenging the rules case by case.

One generation into the FCMHSA, mine fatalities have been greatly reduced (only in part because there are far fewer underground miners). Over 600,000 miners and widows have been awarded billions of dollars in benefits, and a network of clinics for diagnosis and treatment has been created. On the other hand, fatal accidents have still not been eliminated, especially at cost-cutting, often nonunion mines. It was revealed, in the late 1990s, that leaving the operators in charge of collecting and submitting dust samples for analysis had resulted in widespread fraud, condemning many miners unnecessarily to future disabling black lung. The problems with dust control added a certain irony regarding the resources—public and private—expended on adversarial battles over

black lung claims, a situation which the 2000 regulations may partly alleviate.

The compensation aspect of the Act, “paying the piper” for years of accumulated neglect, has probably generated the most sustained adversarial conflict. Efforts to use black lung benefits as a model for federally administered compensation of all chronic occupational disease have thus far failed, despite government findings (1978) that 20% of Social Security Disability beneficiaries were disabled because of their jobs, and that only 5% of those with work-related illnesses were receiving state compensation. On the prevention side, the FCMHSA helped break ground for the Occupational Health and Safety Act one year later. Thus, the impact of the Act on coal miners and, to a degree, on workers in general has been substantial.

FEDERAL EMERGENCY RELIEF ADMINISTRATION

In 1933, the Roosevelt administration unveiled the Federal Emergency Relief Administration (FERA) as part of its New Deal economic reform program. Congress allocated \$500 million to fund the program that provided large-scale direct relief to the many unemployed of the Great Depression. The program operated by providing block grants to states, which provided matching funds, allowing states to stretch their limited relief funds greatly. This represented a sharp break with prior policy, as the federal government had previously tended to leave poverty relief to states and had traditionally been extraordinarily hesitant to provide any direct relief whatsoever.

Franklin D. Roosevelt appointed Harry Hopkins to head FERA. Hopkins was an enthusiastic supporter of the agency, eager to spend money to alleviate the suffering of those in need, and eventually Hopkins proved to be one of the most popular and influential advisors to Roosevelt. Hopkins sought not only to disburse FERA funds directly to the needy, but also to use FERA as a laboratory to experiment with novel forms of poverty relief.

The agency did not disburse cash in most cases; rather, recipients received coupons to buy necessities like food, fuel, and clothing. Still, from the outset, the idea of giving unearned money to the needy troubled everyone involved in the program, including Hopkins and Roosevelt. Most government officials and local reformers favored a system of earned stipends. Thus, FERA chartered the first of the work relief programs of the New Deal, the Civil Works Administration (or CWA). The CWA put the nation’s unemployed to work building schools, roads, parks, and other public improvements. The CWA eventually employed over 4 million workers. While the CWA was not part of the original legislative intent in creating FERA, it quickly became the most popular part of the program, both for the program’s participants and for those who disapproved of direct government assistance to the poor. There were critics, however. Conservatives saw the CWA as a mass program of busy work. The American Federation of Labor (AFL) feared the CWA’s real potential to undercut union wages, as CWA workers received a bare living stipend. Thus, the union movement would push to make CWA workers paid a prevailing local wage. Overall, union leaders remained

wary of the program, as government work relief had the potential to replace high-paying private sector jobs with low-paying government work relief.

FERA was an enormously popular measure of the Roosevelt administration's New Deal. It greatly expanded the ability of government to provide relief to those most in need, and served as a model for later programs like Aid to Families with Dependent Children (AFDC) that provided a more thorough social welfare system. Congress perceived the popularity of the most popular program of FERA, the CWA, and extended it. But Roosevelt and Hopkins both saw government relief as a temporary expedient for relieving poverty. They ended the CWA in the spring of 1934. The program served as the inspiration, however, for later, larger New Deal work relief programs such as the Works Progress Administration and the Public Works Administration.

FEDERAL MEDIATION AND CONCILIATION SERVICE

The U.S. Congress established the Federal Mediation and Conciliation Service (FMCS) with Sections 202–205 of the Taft-Hartley Act of 1947. Taft-Hartley charged the FMCS with preventing strikes, lockouts, and other work stoppages by working to settle labor disputes with mediation and conciliation. Taft-Hartley created the FMCS as an independent organization, separate from the U.S. Department of Labor. Further, the mediation services that the U.S. Department of Labor had provided were transferred to the FMCS.

The FMCS is divided into an Eastern and Western region, which are subdivided into 10 districts and 70 field offices. The national office is in Washington DC. Contact information for the national, regional, and district offices is available on the FMCS Web site (www.fmcs.gov).

The Federal Mediation and Conciliation Service offers mediation services during collective bargaining negotiations. Any party to a collective bargaining dispute can request that the FMCS provide a free mediator during a contract negotiation. Mediators will attempt to help both sides come to an agreement.

They may make suggestions, but all of their recommendations are nonbinding. In addition to providing mediation during a contract negotiation, the FMCS can also provide grievance mediation. While the FMCS does not mediate routine grievances, it will attempt to mediate chronic problems between employers and employees, with the goal of improving overall workplace relations. The FMCS has turned increasingly toward preventative measures such as grievance mediation to stop labor disputes before they begin.

Federal law requires both employers and unions to notify the FMCS 60 days before they intend to terminate or renegotiate a contract. The FMCS Web site provides an F-7 form to notify the agency about a potential labor dispute. Once the FMCS receives an F-7 form, it will assign a mediator from the nearest regional office. Depending on the circumstances of the negotiations, the mediator could become very involved or relatively uninvolved.

The FMCS also serves as a reference for parties that wish to pursue arbitration. If the parties to a labor dispute choose to submit to arbitration, the FMCS will provide a list of “qualified neutrals” who will hear a case and produce a solution. The FMCS will also produce a panel of seven prospective arbitrators. The two parties to the dispute can then either mutually agree on an arbitrator, or each side can rank the panel by preference. The FMCS will then review the two lists and appoint an arbitrator from the panel. Whereas FMCS mediators make suggestions that either party can choose to adhere to or ignore, a decision produced by an arbitrator is legally binding.

The creation of the FMCS in the Taft-Hartley Act was a part of the broader trend to limit the militancy of labor. The FMCS was also emblematic of the move toward cooperative rather than antagonistic labor relations—which some have praised, and some have seen as hostile toward labor.

FERRELL, FRANK Knights of Labor

In the mid-1880s, at the height of the Knights of Labor's strength, Frank Ferrell was the best-known

African-American labor activist in the United States. A native of Brooklyn, New York, and a member of the "Home Club" organization within District Assembly 49 (DA 49), Ferrell burst onto the national scene during the Knights' October 1886 "General Assembly" in Richmond, Virginia. This national convention, only months after a nationwide strike for the eight-hour day and the dramatic Haymarket events in Chicago, attracted press coverage across the country. Reporters, who expected the assemblage of nearly 1,000 delegates to pass historic resolutions on the eight-hour day, strikes, relations between the Knights and trade unions, violence, legal repression, and a call for amnesty for the Haymarket martyrs, instead found issues of race relations (popularly known as "social equality") dominating the gathering's two weeks. And at the center of these issues was Frank Ferrell.

Ferrell traveled to Richmond as the only African-American among DA 49's 60 delegates. In a letter to the *New York Sun* posted just before it left via steamship for Richmond, the delegation pledged to challenge the system of racial segregation that had emerged in the former capital of the Confederacy and many other southern cities. When they arrived in Richmond, they attempted to register in a white-only hotel, where they had made reservations beforehand. When the desk clerk refused Ferrell admission, all 60 delegates walked out and secured lodging in a variety of African-American establishments. This action scandalized the local press, which regaled its readers with daily front-page stories of black and white delegates sharing rooms ("sleeping together") and assertions that such behavior revealed that the Knights stood for "social equality." Some articles even quoted wealthy whites' complaints about a new "impudence" evinced by local African-American servants. The national media echoed such concerns. "Genuine social equality can be witnessed" at one black hotel, reported the *New York Tribune*.

Ferrell and his New York compatriots launched additional challenges to local racial mores. On the steamship that carried them to Richmond, they had met a touring Shakespearean drama troupe on its way to perform *Hamlet* at the nationally recognized Richmond Academy of Music. The thespians gave the labor delegates free tickets to the opening night of the show. All of the tickets were in the traditionally whites-only orchestra section, and Ferrell's insistence, with the support of his allies, that he not be banished to the "colored gallery" occasioned uproar and a near riot. Once again, Ferrell and his colleagues made front-page news, locally and nationally, as purveyors of "social equality."

This perception was given added significance by the decision of Knights' General Master Workman Terence Powderly to invite Ferrell to introduce him to the assemblage at the opening session of the convention. DA 49's leaders had actually asked for more, urging that Ferrell introduce Virginia's governor, Fitzhugh Lee, the nephew of Robert E. Lee and a well-known white supremacist. Unwilling to go quite that far, Powderly did place Ferrell on the stage with Lee and himself, which offered a striking visual image of the labor organization's commitment to racial equality. Ferrell told the audience, "One of the objects of our Order is the abolition of those distinctions which are maintained by creed or color." Powderly's remarks affirmed Ferrell's: "When one that happened to be of a dark skin, of a delegation of some sixty men, could not gain admission to the hotel where accommodations for the delegation had been arranged, rather than separate from that brother, they stood by the principles of our organization which recognizes no color or creed in the division of men." He then explained his selection of Ferrell to introduce him to the General Assembly as evidence that "we practice what we preach."

These actions provoked responses not only in the media, but also in the ranks of the Knights. Some delegates praised Powderly, Ferrell, and DA 49, while others, particularly white southerners, condemned them. The African-American community, including not only members of locals affiliated with Black District Assembly 92 but also political activists, businessmen, and professionals, embraced Ferrell, DA 49, and the Knights. Midway through the convention, a parade saw black participants far outnumber white ones. The thousands of black spectators who lined the parade route led one correspondent to speculate that "the entire colored population of Richmond" was in attendance. A week later, when the General Assembly came to a close, local black activists organized a banquet to honor DA 49 and Frank Ferrell. They packed the hall above a prominent funeral parlor, listened to speeches from local African-American activists, and gave toasts in honor of their guests from New York.

Over the next four years, the Knights of Labor slid down a slope toward overall decline, losing numbers, strength, and power. Interestingly, though, their popularity among African-Americans, especially in the South, even the rural South, actually grew. Frank Ferrell had fired their imaginations, while Terence Powderly and the Knights of Labor had reached out publicly to him in a way that suggested that they did, indeed, practice what they preached.

FILM

At the start of the twentieth century, leisure in the United States was stratified by class and marked by a distinct gulf between high-brow and low-brow entertainments. Movies emerged in the early twentieth century as a primarily working-class pleasure, and working people were simultaneously the primary consumers, producers, and subjects of the early silent films. As nickelodeons and storefront theaters proliferated in American cities, movies quickly surpassed dance halls, vaudeville theaters, amusement parks, and other cheap amusements to become the mainstay of working-class leisure.

During this period, too, the experience of moviegoing was quite different from that of more respectable, high-brow entertainments. Working-class movie audiences were not passive cultural consumers; rather, they actively engaged with the movies and each other. As audiences cheered their heroes and hissed the villains, sang along with the musical accompaniment

or talked amongst themselves, a trip to the movie theater became a distinctly communal and participatory experience and one that contrasted sharply with the regimentation of the workplace. Moviegoing was also critically important in reshaping women's leisure and use of public space. Theaters encouraged women to bring children to the show, and movie houses were a key site for family-centered leisure. Single women, too, were ardent filmgoers, and "movie-struck girls" relied on film images in negotiating new freedoms and gender conventions. For young women and men, movie theaters also offered an ideal space for sociability and new opportunities for romance both on- and off-screen. The appeal of movies crossed racial as well as ethnic and gender lines. Though many theaters remained racially segregated, African-Americans were avid consumers, not only of mainstream movies, but also of "race films," produced by African-American filmmakers specifically for black audiences. Thus, both the content and experience of these early silent films helped to bridge ethnic, religious, gender, and sometimes racial divisions within the laboring population.

In the years before World War I, when relatively little capital was required to produce the one- and two-reel silent shorts, film production was remarkably fluid. Small-scale entrepreneurs, often immigrants, and women (who worked in the film industry in greater numbers and more diverse positions during this period than ever again) vied with established companies like Biograph and Edison to meet the seemingly insatiable demand for movies. Lary May estimates that in 1912, nearly 100 small companies scattered throughout the East and Midwest were involved in film production. The entrepreneurial nature of early film production translated into a complex amalgam of film styles and subjects, ranging from documentaries to melodramas and comedy to romance.

Though film historians continue to debate the significance and extent of class representations in early silent films, many have argued persuasively that these movies exhibited a distinct working-class sensibility. The silent era's slapstick comedies were as popular as they were potentially subversive. Mack Sennett's bumbling Keystone Kops lampooned law and order and police authority, while Charlie Chaplin's Little Tramp mocked everything from middle-class pretensions to gender roles to the mechanization of labor. The social realism of Progressive Era art and literature also influenced silent films. As in the paintings of the Ashcan School or the photography of Lewis Hine, images of the modern city, the bustle of street life, and the diversity of working people, predominated

in silent film. The hardships as well as the dignity of working-class life were dramatized in a wide range of movies, from “social problem” films to less politically explicit melodramas and romances. A number of prominent filmmakers shared the Progressive Era’s reform impulse. Lois Weber, for example, used film to explore issues of birth control, divorce, child labor, and capital punishment, while D. W. Griffith—though perhaps better known for his epic defense of white supremacy in *The Birth of a Nation* (1915)—also sympathetically contrasted the exploitation of workers with the decadence of capitalists in *A Corner on Wheat* (1909). Movies like *The Jungle* (1914), an adaptation of Upton Sinclair’s muckraking novel, and *The Blacklist* (1916), which dramatized the Ludlow Massacre of striking mine workers, not only depicted struggles for justice against corrupt bosses and politicians, but also encouraged working-class solidarity.

Steven J. Ross has also identified a thriving pre-World War I worker film movement composed of radical filmmakers, often affiliated with labor organizations or socialist movements. Drawing inspiration and material from the labor struggles of the period, from the 1909 Uprising of the Twenty Thousand to the free speech fights of the Industrial Workers of the World, the movies of the worker film movement emphasized collective action and the power of an organized working class to reform the public sphere. These radical films competed with films produced by conservative business interests, making movies an ideological battleground over representations of labor militancy. Where the worker film movement depicted unionists engaged in rational and peaceful negotiations or social action, the conservative labor films depicted passive workers becoming unruly mobs under the influence of wild-eyed anarchists. Whatever their political perspective, the confrontational class politics in these labor-capital films worked to raise political consciousness and shape audience response to the world of work.

From the beginning, then, movies were broadly understood not simply as entertainment but as a powerful vehicle for shaping public consciousness and behavior. As such, movies quickly became a site of contention for middle-class reformers. While some applauded the democratizing and Americanizing potential of movies, others argued that movies encouraged crime, juvenile delinquency, and sexual promiscuity. Closely linked to the Progressive Era antivice crusades, the campaign against the movies called for the voluntary regulation not only of film content but also of theaters themselves, which were seen as sites of urban disorder and immorality.

The Rise of the Studio System

During the 1920s, the film industry and the movies themselves changed dramatically, as the entrepreneurial mode of production gave way to the studio system. As filmmakers and small production companies struggled to meet the growing demands for longer and more sophisticated films, the pressure to centralize and standardize the production process became overwhelming. Between 1915 and 1930, nearly every aspect of filmmaking was standardized, economized, and regimented, and film production was centralized in the business-friendly frontier town of Hollywood, though the marketing and administrative functions remained in the corporate offices in New York. By 1930, eight vertically integrated companies dominated the film industry, together producing up to 600 full-length features a year.

The consolidation of film production under the Hollywood studio system affected movies and audiences in myriad ways. During the 1920s, studios sought to expand their audience, investing in opulent theaters in more affluent neighborhoods to attract middle-class patrons. These movie palaces helped to make moviegoing respectable and, in the process, significantly changed the ways movies were watched and experienced by audiences of all classes. Ticket prices rose to match the rising costs of film production. The star system spurred higher salaries for actors as well as a full-blown publicity machine to nurture the emerging fan culture around major movie personalities like Clara Bow, the “It” Girl, and “Hollywood’s Sweethearts,” Mary Pickford and Douglas Fairbanks. The introduction of talkies in the late 1920s had a significant impact on the film industry as well, requiring the studios not only to retool theaters to accommodate the new technology, but also to recruit and maintain a stable of more sophisticated writers. As the studios’ financial investment in film production soared and each studio produced fewer, more expensive movies each year, box office returns took on an inordinate importance. In sharp contrast to the pre-World War I era, the new studio moguls were less willing to take a chance on controversial subjects or specialized films that seemed unlikely to appeal to a broad audience. Despite—or perhaps because of—their own immigrant and working-class backgrounds, the Hollywood moguls were deeply conservative and antagonistic to the use of movies to raise public consciousness or dramatize social issues. Insisting that movies were simply “entertainment,” Harry Cohn once famously growled, “If you want to send a message, use Western Union.” As movies became the epitome of mass

culture in the 1920s, the worker film movement and the culture of the masses of the pre-World War I era dissipated. Though working people continued to be represented on film, themes of working-class solidarity and collective action gave way to stories of cross-class romance and upward mobility.

This trend held to a great extent through the 1930s, despite the widespread economic dislocation of the Depression and the resurgence of the labor movement under the New Deal. Hollywood's initial response to the Depression was mixed. Hoping to attract the dwindling audience to theaters, the studios offered wildly extravagant entertainments like *Gold Diggers of 1933*, which infused a conventional rags-to-riches romance and glitzy musical numbers (most notably "We're In the Money") with both escapist glamour and a working-class élan. In contrast to the frivolity of much of the film, *Gold Diggers* closes with "Remember My Forgotten Man," which invoked breadlines, homelessness, and the Bonus Marchers. The early 1930s were also the heyday of the fallen woman film and the gangster film, both of which suggested that economic hardship had led to the moral downfall of these protagonists. The backlash against the perceived violence and immorality of these films, however, also spurred the creation of the Production Code Administration (PCA) in 1934 to forestall government regulation and assuage conservative organizations like the Legion of Decency. In its zeal to banish offensiveness from movies, the Code sharply defined the representational parameters of Hollywood films during this period, imposing sharp restrictions on a wide range of issues, primarily sexuality, but also class, race, labor relations, and particularly any negative representation of capital and business.

Thus, the films of the 1930s reflect both the conservatism and self-censorship of the Hollywood studios and the revitalized class consciousness and populist ethos of the New Deal era. On the one hand, movies such as *Black Fury* (1935) and *Black Legion* (1936) depicted labor unions as corrupt institutions that led passive workers astray, while on the other hand, movies like *The Grapes of Wrath* (1940) sympathetically dramatized the struggles of working people while gritty films such as *I Am a Fugitive from a Chain Gang* (1932) and *Dead End* (1937) suggested the social realist tradition was alive and well. Certainly, class remained a central pre-occupation across film genres, though the overwhelming emphasis in films of the 1930s is on upward mobility, individual success, and personal solutions to political problems. Nonetheless, the cross-class romance theme in screwball comedies like *Easy Living* (1934) or *My Man Godfrey* (1936) offered numerous opportunities to poke fun at the pretensions of the rich and to applaud the

"regular Joe." Both comedies and melodramas of the 1930s also featured the "city boy," epitomized by James Cagney, Humphrey Bogart, and John Garfield, and the "wise-cracking dame," epitomized by Rosalind Russell, Myrna Loy, and Barbara Stanwyck, new models of masculinity and femininity that were deeply inflected with a working-class sensibility even when the films in which they appeared elided working-class politics.

A more direct result of the New Deal-era resurgence of labor came in the intense and convoluted struggles to unionize key sectors of the film industry itself. The screenwriters, always the most politicized of the talent workers, led the way, founding the Screen Writers Guild (SWG) in April 1933; the Screen Actors Guild (SAG) followed suit three months later, while the Directors Guild was founded in 1936. The studio moguls fought unionization with belligerence and divisiveness. Though the 1935 National Labor Relations Act authorized collective bargaining, it was ignored by the studios. The threat of an actors' strike two years later finally forced the studios to recognize SAG in 1937. Despite recognition of SWG by the National Labor Relations Board in 1938, the screenwriters battled the studios and the company union, the Screen Playwrights, before a contract agreement was reached in 1941. This bitter and protracted unionization battle between the talent guilds and the studios reinforced the participants' sense of themselves as cultural *workers* and gave birth to a highly politicized left-liberal cadre in Hollywood.

These progressive filmmakers were key players in the New Deal-era "laboring of American culture" described by Michael Denning. Despite the creative and political constraints imposed by the studio heads and the PCA censors, Hollywood progressives consistently attempted to address issues of class and labor, with varied success. Ironically, perhaps, film radicals gained a new legitimacy during World War II, as the studios drew upon their political expertise to produce hundreds of films depicting the threat of fascism and explaining "why we fight" to American moviegoers. Nonetheless, with the oversight of the Office of War Information, which declared a moratorium on social problem filmmaking for the duration, Hollywood representations of class and labor were largely refracted through the lens of patriotic Americanism. Films depicting the home front emphasized the contributions of laboring men and women to the war effort, while war films depicted military units as cross-class microcosms of the American melting pot fighting to preserve the American way of life.

The immediate postwar period in Hollywood witnessed a volatile jurisdictional struggle between Hollywood craft unions, as the left-liberal Conference

of Studio Unions (CSU) battled unsuccessfully against the mob-controlled International Alliance of Theatrical Stage Employees. Two protracted CSU strikes between 1945 and 1947, marked by red-baiting and violent clashes between strikers and studio police, augured both the burgeoning anti-Communist climate and the breakdown of the left-liberal coalition of the Popular Front period. As Lary Ceplair and Ken Englund suggest, the conservatism of the studios' postwar agenda was signaled as early as 1945, when Eric Johnston, the new head of the Motion Picture Producers Association, announced to a meeting of the Screen Writers Guild, "We'll have no more *Grapes of Wrath*, we'll have no more *Tobacco Roads*, we'll have no more films that deal with the seamy side of American life. We'll have no more films that treat the banker as a villain." Nonetheless, Hollywood progressives greeted the postwar period with enthusiasm, eager to tackle the domestic social problems that had been discouraged by the Office of War Information during the patriotic frenzy of the war years. Postwar films like *Crossfire* (1947) and *Gentleman's Agreement* (1947) indicted American anti-Semitism while *Pinky* (1949), *Home of the Brave* (1949), and others explored the problem of racism. This flurry of progressive filmmaking was cut dramatically short, however, by the postwar investigations into subversion in the film industry by the House Un-American Activities Committee (HUAC), which resulted in the blacklisting of the Hollywood 10 in 1947 and hundreds more Hollywood leftists during a second round of hearings in the early 1950s.

The Postblacklist Period

With Hollywood's postwar attack on domestic social problems derailed by the HUAC investigations, dissent—particularly around issues of class—in 1950s films merely seeped through the cracks of the Cold War consensus, confined largely to *film noir*, with its sordid settings, paranoid protagonists, and existential despair, and to juvenile delinquency films like *The Blackboard Jungle* and *The Wild Ones* (as well as a whole slew of B films), featuring alienated, angry youths rebelling against a conformist adult world. During this period, blacklisted producer Adrian Scott identified several troubling trends in Hollywood filmmaking: a postwar cycle of anti-Communist films (which bombed at the box office), films glorifying the American businessman and the capitalist order, and films glorifying the military might of the United States. Most disturbing to him, however, was that, in the vacuum created by the blacklisting of radical

cultural workers, liberal filmmakers abandoned social and economic causality and wholeheartedly embraced the individualistic, psychological solutions of the postwar therapeutic culture.

The widespread affluence and decline of labor militancy in the Eisenhower years also re-inforced the notion that the problem of class in America had finally been solved. In this context, sympathetic or overtly political images of the labor movement and working-class people were few and far between. Nonetheless, Judith E. Smith points to the persistence of an ethnic or working-class sensibility in a handful of films she describes as "everyman's love stories": *Born Yesterday* (1950), *Marty* (1955), *The Marrying Kind* (1952), and *A Raisin in the Sun* (1961). In contrast, *On the Waterfront* (1954) resurrected earlier images of corrupt unions and powerless workers, and in the wake of director Elia Kazan's decision to name names to HUAC, raised troubling questions about labor solidarity and the politics of informing. One striking exception to this trend was *Salt of the Earth* (1953). Produced outside the studio system on a shoestring budget by a handful of blacklistedees, the film dramatized a strike by Latino mine workers in New Mexico. Though distribution of the film was blocked in the 1950s by the major studios and the anti-Communist network, *Salt of the Earth* was rediscovered in the 1970s and praised for its progressive treatment of gender and race as well as its powerful evocation of labor solidarity.

Despite the collapse of the studio system and the resurgence of progressive political movements in the 1960s and 1970s, the New Hollywood, built by independent production companies, powerful agents, and multi-industry conglomerates, did little for the representation of the labor movement and the working class. Though certainly a number of Hollywood films from this period, such as *Norma Rae* (1979), *Bound for Glory* (1976), and *Silkwood* (1983), offered sympathetic portrayals of working-class consciousness and the possibilities of collective action, for the most part, Hollywood continued to depict unions as cynical and corrupt in such films as *F.I.S.T.* (1978), *Blue Collar* (1978), and *Hoffa* (1990). Since the 1980s, a number of independent filmmakers have offered exceptionally progressive labor films, including John Sayles' *Matewan* (1987), a dramatization of cross-race solidarity in a 1920s West Virginia coal strike, as well as Ken Loach's *Bread and Roses* (2000), which depicts the struggles of two Latina immigrant sisters to win justice for janitors. Perhaps the most significant film representations of working-class life and labor since the 1970s have come from documentary filmmakers, from Barbara Koppel's *Harlan County, USA* (1976) and *American Dream* (1991) to Michael Moore's

Roger and Me (1989) and *The Big One* (1997). Though the New Hollywood offers increasing opportunities for independent filmmakers, the future of labor and film remains to be seen.

FINNS

The Finnish presence in North America dates to the 1600s, when Swedish colonizers relied on Finns for their skills as woodsmen. Though Finns were few in number, historians have argued that they set the pattern of colonial backwoods homesteading. After this initial foray, the Finnish migrant stream dried to a trickle until the high tide of Finnish immigration came on suddenly at the turn of the twentieth century, when hundreds of thousands joined the millions of New Immigrants then filling the ranks of the industrial workforce of the United States. Immigrant Finns confronted racism, nativism, grinding work,

and horrible conditions, but they organized and confronted these obstacles with a unique brand of ethnic radicalism that persisted through the conservative 1920s into the post-World War II era.

“America Fever” began in the extreme northern part of Finland in the 1860s. Michigan’s Upper Peninsula drew large numbers of Finns after a copper company recruited a number of them to work its mines. These miners sent word home, and the urge to move west spread to more populous industrialized regions of Finland, themselves undergoing economic and industrial transformations that displaced thousands of farmers and workers. In all, some 350,000 Finns, one ninth of the total population of Finland in 1900, left for the United States, the vast majority arriving between 1900 and 1914. From the Upper Peninsula of Michigan, Finns spread out to settle in the Northeast, the Upper Midwest, the Mountain West, and the Pacific Northwest, drawn to jobs through transatlantic networks of kin, community, and friendship. With the development of Minnesota’s Mesabi and Cuyuna Iron Ranges in the late 1890s, large numbers of Finns moved there, and within a short time most Iron Range communities possessed their own “Finntowns,” pejoratively dismissed as “Pig Towns” or “Finn Hells” by some of their neighbors. By 1920, almost 150,000 Finns lived in northern Minnesota alone, but Finnish enclaves could be found in mining communities across the American West.

Finnish miners faced harsh lives in the raw, undeveloped mining towns of the Midwest and West. A few miners lived in company towns—model villages of trim cottages and clean streets—but in Minnesota, most lived in “locations,” temporary towns built in close proximity to mines that could be easily moved should the mining companies wish to extract the underlying ore. Though some of these locations were relatively clean, most were ramshackle and squalid affairs thrown up by residents with little or no assistance from the companies. In addition to their refusal to concern themselves with the living conditions of employees, mining companies in Michigan, Minnesota, and western states like Montana and Arizona kept costs low by refusing to pay for safety devices in the mines, employing industrial spies to discourage unions, ethnically and racially segmenting their workforces to keep wages down, and using brutal strikebreaking tactics when necessary. Finns also faced virulent racism and nativism encouraged by companies, which in one instance in Minnesota tried to have some Finn union organizers deported as “Mongolians.”

While many Finns arrived in the United States already radicalized by events in Europe, especially those who arrived from the urban areas of Finland

after the abortive 1905 Revolution in Russia, most joined unions as a result of the conditions they encountered in the mines; Finnish miners embraced labor radicalism in this hostile environment. Though not all Finns joined radical labor unions—there were strong divisions between Church Finns (deeply religious men and women also known as “white” Finns or Temperance Finns) and the radials (“Red” Finns)—they nevertheless gained a reputation for a propensity toward radicalism wherever they worked. Finns spearheaded organizing efforts with the Western Federation of Miners and the Industrial Workers of the World (IWW) in the mining regions of Michigan, Minnesota, Montana, and Arizona, though the locus of their activity remained in the Upper Midwest.

Finnish immigrant miners first distinguished themselves in the 1907 strike against Minnesota iron-mining companies, an industry dominated by a U.S. Steel subsidiary, the Oliver Mining Company. Iron miners suffered from lower pay than their native-born coworkers. They had to pay the cost of materials like tools and explosives. The work season forced them to shift for themselves over the long winter months, when Lake Superior shipping routes were icebound. Most important, miners complained of a dismal record of safety in the underground mines. When the Western Federation of Miners began to organize on the Range, Finns proved to be eager and enthusiastic members, and when a wildcat strike broke out at a Range sawmill in the summer of 1907, Finns quickly turned it into a general strike against the mine companies. The companies fought back and imported Eastern European strikebreakers, blacklisted hundreds of Finnish miners, and induced local merchants to cut off the credit of striking miners. By the end of the summer, the strike had been defeated. Finnish miners responded in a number of ways: some left the Range for other mining regions—notably in the Mountain West—while those who remained formed cooperative stores (many of which survived into the 1950s) and flocked to the Industrial Workers of the World.

This pattern repeated itself again in a 1913 strike against Michigan’s copper mines that involved almost 15,000 copper miners, most of them Finns, who struck for 265 days before giving in to company pressure. As in Minnesota, companies turned to strikebreakers, threats of violence, and blacklists. In the 1916 Mesabi Iron Range strike, Finns again took leadership roles and turned their extensive network of Finn Halls into headquarters for IWW organizing efforts. One-time strikebreakers from Italy, Russia, Croatia, Serbia, and Montenegro joined the Finns to demand equal pay, better and safer conditions, and more benefits. The Oliver Mining Company recruited over a thousand

armed guards and engaged in a systematic campaign of threats and violence to suppress this strike of some 20,000 miners, ultimately instituting one of the most extensive industrial spy networks in the country, which effectively forestalled future strikes.

The decline of iron and copper mining and the consequences of immigration restriction in the 1920s took their toll on the once-flourishing Finnish enclaves. Finns still constitute a visible ethnic presence where they settled the most thickly, however. Snatches of Finnish polkas can yet be heard in the backyards of western mining towns like Butte, Montana, and distinctive blue-and-white bumper stickers bearing slogans like “*Suomi* (Finland) Power” and “*Sisu*” (Strength) can be seen across Michigan’s Upper Peninsula and in northern Minnesota, proclaiming the tenacious ethnic pride of local residents.

FITZPATRICK, JOHN (1871–1946) President, Chicago Federation of Labor

John Fitzpatrick was one of the most important Chicago labor leaders in the first half of the twentieth

century, and was also a national leader of what historian John Keiser labeled “progressive unionism” between 1915 and 1925.

Born in Ireland, Fitzpatrick came to America in 1882 following the death of both of his parents. He found work in Chicago’s stockyards, and in the wake of the labor unrest in 1886 in favor of the eight-hour day, Fitzpatrick joined the International Union of Journeymen Horseshoers of the United States and Canada and the Blacksmiths, Drop Forgers and Helpers Union. He held a number of positions within these unions, including business agent, treasurer, and president. The office for which he is best known, however, was the presidency of the Chicago Federation of Labor (CFL), which he held from 1904 until his death, from a heart attack, in 1946, with one short interruption.

Fitzpatrick won the CFL presidency through the efforts of local progressives and municipal reformers, including the recently formed Chicago Teachers Federation. In fact, Fitzpatrick represented one of the best efforts at combining progressive reform and labor activism. Nevertheless, Fitzpatrick’s program was ultimately a failure, and by 1925, he was forced to repudiate many of the reforms he had fought for. To a large extent, this failure was a result of the structural difficulties inherent in progressive unionism, particularly the need to steer between the extremes of Gompers-style trade unionism on the right and revolutionary socialism on the left. When the strength of the left began to decline in the 1920s, Fitzpatrick was easily tarred by his “conservative” opponents within the American Federation of Labor (AFL) for his closeness to socialists and Communists like William Z. Foster.

Fitzpatrick was instrumental in two major organizing campaigns, the drive to unionize the Chicago stockyards in 1917 and the national steel strike in 1919. In both campaigns Fitzpatrick, along with Foster, his friend and ally, pioneered the notion of “federated” unionism, a position halfway between the trade unionism advocated by the AFL and the more radical industrial unionism called for by groups like the Industrial Workers of the World (IWW). Drawing on the example of the railroad brotherhoods, under federated unionism an umbrella organization was created that contained delegates from all of the trades present in a given industry. This organization would then coordinate organizing activities for the industrywide organizing campaign, while the international unions would retain their authority over collective bargaining.

Federated unionism was initially successful in both campaigns. The Stockyards Labor Council and the National Committee for Organizing Iron and Steel Workers (both of which were chaired by Fitzpatrick), the umbrella organizations in the stockyards and

steel campaigns, respectively, managed to temporarily head off jurisdictional disputes between the various trade unions involved in the campaigns, and considerable numbers of workers were organized. Both campaigns, however, were ultimately defeats for the labor movement. While much of the blame has been placed on the growing business intransigence toward unions after the war and the conservative, antilabor consensus that began to dominate in the 1920s, the inability of the various trade unions to cooperate long-term also played a major role in the campaigns’ defeats. In the stockyards, for instance, the Amalgamated Meat Cutters withdrew from the Stockyards Labor Council and attempted to claim the newly organized packing-house workers for itself, precipitating the defeat of the federated unionism attempt. Nevertheless, Fitzpatrick and Foster’s attempts at federated unionism served as one of the important precursors to the wave of industrial unionism under the Congress of Industrial Organizations (CIO) that occurred in the 1930s.

Fitzpatrick was also closely involved with the American Labor Party movement, which arose in the aftermath of World War I. The Chicago Federation of Labor created one of the earliest of these labor parties in 1918, and Fitzpatrick and the CFL were instrumental in creating the Illinois State Labor Party as well as the national Farmer-Labor Party in 1920. Fitzpatrick himself ran for office twice on the Labor Party ticket, first for the Chicago mayoralty in 1919 and then for United States senator in 1920. The various labor parties, however, largely failed to appeal to workers, and the Labor Party’s share of the vote steadily declined after its founding. In an attempt to broaden its appeal, Fitzpatrick advocated amalgamating the Labor Party with other independent political movements, including the National Non-Partisan League, an organization of small farmers. This union led to the creation of the Farmer-Labor Party in 1920.

Unfortunately for the Labor Party movement, Fitzpatrick decided to extend his attempts at amalgamation to include a number of small left-wing and socialist parties. Among these was the Workers Party, which was, at the time, the secret, aboveground arm of the American Communist Party. In 1923, William Z. Foster, who had by then become a member of the Communist Party, betrayed his former ally, Fitzpatrick, and helped pack the July Farmer-Labor Party convention with Communists. Foster succeeded, and a new party, the Federated Farmer-Labor Party, controlled by the Communists, was created. This split created a great deal of confusion and led to the decline of the Farmer-Labor movement outside of Minnesota.

Fitzpatrick and his progressive unionism had long been a thorn in the side of Samuel Gompers, and the head of the AFL took the Farmer-Labor debacle as an

opportunity to re-assert his control over Fitzpatrick and the CFL. During the 1923 AFL convention, a resolution favoring independent political action on the part of labor was soundly defeated. This turn of events, along with consistent pressure from Gompers, left Fitzpatrick to choose between abandoning his advocacy for the Labor Party and other progressive causes or leaving the AFL. Lacking an independent base of support outside of his position in the CFL, Fitzpatrick chose to remain within the AFL and moderate his positions. He remained a major labor leader on the Chicago scene for the next 20 years, although his role as a national labor leader waned with the defeat of progressive unionism.

FITZSIMMONS, FRANK E. (1906–1981) President, Teamsters Union

Succeeding James R. Hoffa as the leader of the largest union in the United States, Frank E. Fitzsimmons had originally been appointed as a caretaker, who would hold his predecessor's place during his jail term. But the unassuming Fitzsimmons made this position his own and led the Teamsters through a period of continued growth and controversy from 1967 to 1981.

Fitzsimmons was born in Jeannette, Pennsylvania, a small town outside of Pittsburgh. The family later moved to Detroit, and at age 16, with his father ailing, Fitzsimmons left school to begin working in a local factory. He eventually became a long-haul truck driver and through that job joined the Teamsters Union in 1934. His fellow drivers elected him to the post of shop steward, and through that position he met Hoffa, then an ambitious business agent for a Teamsters local in Detroit. With Hoffa's support, Fitzsimmons steadily progressed up the union's ranks, becoming a business agent in Hoffa's Local 299 in 1937, and then vice president of the local in 1940. By 1961, Fitzsimmons was elected thirteenth vice

president of the national Teamsters union, making him a member of its ruling General Executive Board. As a trusted Hoffa loyalist, but also one whose ambitions and abilities seemed limited, Fitzsimmons became Hoffa's choice to lead the union in his place when he faced the certainty of a prison sentence. In 1966, Hoffa convinced the union's convention to create a new position, general vice president, who would be empowered to lead the union in the general president's stead. Hoffa then supported Fitzsimmons's election to that new post. The next year, in 1967, when Hoffa began serving a 13-year jail sentence, Fitzsimmons assumed the role that Hoffa had created for him.

But Fitzsimmons soon proved himself to be more than a mere placeholder for Hoffa. As general vice president, he ran the union in his own way, telling other members of the General Executive Board that he would let local and regional Teamster leaders operate with more autonomy, thus reversing Hoffa's policy of centralization within the union. That policy, as well as the solid gains Fitzsimmons won in national trucking industry contract negotiations in 1967 and 1970, helped him build up a core of his own supporters. When Hoffa, in an effort to win parole, resigned all of his union offices in 1971, Fitzsimmons was unanimously elected general president by the Teamsters convention in 1971.

In some ways, the union prospered during his leadership. Membership grew from 1.6 million in 1967 to 2.1 million by 1975, and wages and benefits increased steadily. But the union remained notorious for its corruption and its alleged connections to organized crime. That notoriety was only further heightened by the disappearance in 1975 of Hoffa, widely believed to have been killed by the Mafia. Like his predecessors, Fitzsimmons took no real constructive action to deal with the problem of corruption, limiting himself to indignant attacks on the union's critics. He died in office in 1981, a victim of lung cancer.

FIVE-DOLLAR DAY

In a decisive series of industrial and technical innovations, Ford factory managers, engineers, and others

developed sequential methods of mass production in the Highland Park Plant between 1910 and 1914. Then, in January 1914, Henry Ford astounded the nation when he announced that the Ford Motor Company would pay its workers the then unheard-of sum of \$5.00 a day, about double the existing rate for factory work. *The Wall Street Journal* proclaimed that Ford was a “traitor to the capitalist class,” since his announcement would destroy prevailing wage rates. The Socialist *Milwaukee Leader* praised Ford for the “large melon” that he offered to American workers. Workers from around the nation swarmed into Detroit in an effort to obtain the Ford jobs with the big wages. On a freezing January day, Ford officials turned fire hoses on workers who massed at the factory gates and who sought the Ford jobs that paid the big money.

The famous Five-Dollar Day was much more complicated than simply a generous increase in the wages of Ford automobile workers. It was a grand experiment in welfare capitalism rooted in the transformation of production and intended to fashion the new worker for progressive or line production in the mechanized Ford plant. It arose from Henry Ford’s desire to produce the extremely popular “motorcar for the great multitude,” from the modern production methods to satisfy the huge demand for the Model T Ford, and from the need to instill the necessary work and industrial discipline in the habits and culture of a largely unskilled immigrant workforce.

In the recently mechanized Ford plant, mass production truly revolutionized the nature of factory work and the social composition of the workforce. The most salient feature of the Fordist work regime was the drastic removal of skill in factory work. At their machines and on the assembly lines, work became simplified, routinized, and monotonous. Far fewer skilled and semiskilled workers were required for the actual production of automobiles. Large numbers of unskilled Southern and Eastern immigrants replaced the more skilled Northern European and American-born workers. But this new immigrant workforce, a majority from pre-industrial parts of Europe, did not have the industrial skills and work discipline for modern factory work.

As mass production unfolded, absenteeism and labor turnover soared in the newly constructed Highland Park Plant. By 1913, absenteeism averaged 10% of the workforce through the week; turnover reached an astonishing 360%. In other words, an average of 1,500 extra workers needed to be hired each day to work at machines and to maintain production. Or each year, Ford personnel managers needed to hire around 54,000 workers to ensure a workforce of 15,000. In many

ways, Ford workers expressed their widespread dissatisfaction with tedious and repetitious jobs at machines and on assembly lines. In addition to high rates of absenteeism and turnover, they soldiered and malingered, restricted output, and began expressing an interest in various forms of unionism. Ford officials sorely needed some mechanism to stabilize, regularize, and reward its largely immigrant labor force.

Consequently, Ford and his factory managers instituted the now famous Five-Dollar Day. This was not a wage increase but rather a sophisticated profit-sharing scheme to reshape the habits and culture of a largely immigrant workforce. Under this unique scheme, a worker’s daily compensation was divided into two parts—wages (approximately \$2.40 for an unskilled worker) and profits (about \$2.60). All workers received their wages for the tasks that they performed in the mechanically and organizationally controlled work environment of the Highland Park Plant. In order to receive their profits, they needed to prove their “worthiness” and demonstrate what Ford officials labeled “right living.” Developed in the Progressive Era, when social reformers believed that a good environment produced good people, Ford and his associates felt that a good home created good habits, which in turn generated good workers.

To implement this innovative program, Ford officials created the Sociological Department (later called the Educational Department) to ensure that Ford workers were worthy and lived according to the appropriate Ford standards. Almost immediately after the Five-Dollar Day’s announcement, Ford officials established a staff of more than 100 investigators to examine a Ford worker’s production figures, to investigate a worker’s home conditions and habits, and to assess whether or not the worker merited Ford profits. Embedded in the Sociological Department standards were distinct American and lower-middle-class values. The Ford investigators approved profits for hard workers who lived with their families in neat and clean homes and who neither stayed out late, drank alcohol, nor smoked. If a worker did not meet these criteria, the investigator typically allowed six months for the reform of living conditions and work habits or recommended dismissal. For approved workers, the investigators conducted follow-up visits to ensure that they did not become backsliders.

As part of the acculturation to modern factory work, Ford officials also established the Ford English School for non-English-speaking workers. Meeting after work hours, foremen instructed laborers in the rudiments of the English language, the proper industrial habits and work discipline, and the skills needed in a modern industrial society. In addition to

FIVE-DOLLAR DAY

procuring the advice of investigators and establishing English School instructors, Ford labor managers produced lavishly illustrated pamphlets and brochures that provided detailed information on how best to satisfy the Ford requirements and to receive the Five-Dollar Day.

Over the short term, the Five-Dollar Day was enormously successful. Workers simply accepted the trade-off of high wages for boring and degraded work. The technical advantage of progressive production allowed Ford to pay the high level of compensation. Absenteeism and labor turnover fell to more reasonable and manageable levels. Those workers who resented the encroachment into their personal lives moved on to other less-intrusive firms. With the high “wage,” Ford was able to select and to skim off the cream of the Detroit workforce to work in the Highland Park Plant.

But over the long term, other Detroit automobile firms soon adopted the Ford technical innovations and also increased their workers’ pay. In the same time, wartime inflation eroded the incentive to change worker attitudes and values. At the end of the First World War, a Ten-Dollar Day would be needed to provide the same financial incentive. Moreover, against the background of postwar labor activism, Ford labor policies became more brutal in the wake of the antiunion offensive known as the American Plan. By the 1920s, the Sociological or Educational Department transmuted into Harry Bennett’s notorious Service Department, which took the lead in Ford labor relations and which created a harsh regime of factory spies and shop-floor thugs to monitor and discipline underperforming and dissident Ford workers.

FLETCHER, BENJAMIN HARRISON (1890–1949) Industrial Workers of the World

Benjamin Harrison Fletcher was an important African-American labor activist in the most influential radical union of the early twentieth century, when few blacks

were permitted in unions and fewer still belonged to left-wing organizations. Fletcher helped lead the largest, most powerful, and longest-lasting interracial union of the era, Local 8, which was Philadelphia’s longshore union belonging to the Industrial Workers of the World (IWW), nicknamed the Wobblies.

Fletcher began his career in the IWW as a young man. Born in Philadelphia in 1890, Fletcher seemed a typical young black man, working as a day laborer and longshoreman. One of the better jobs a black man could find in early twentieth-century Philadelphia was longshoring, which involved the loading and unloading of ships. Around 1912, he joined the IWW and the Socialist Party. It is not known how he became radicalized; presumably, he heard Wobbly soapbox speakers address working-class audiences in his riverside neighborhood. Fletcher became a local activist, beginning a long career in public speaking that won him many accolades for his fine voice and incisive arguments for overthrowing capitalism, the goal of both Wobblies and Socialists.

Fletcher was the most prominent member of Local 8. In May 1913, thousands of longshoremen struck for better wages and union recognition: their new union, the IWW; their best-known leader, Fletcher. Local 8 and Fletcher seemed to prove one of the Wobblies’ central tenets: race was used to divide workers who shared a more important identity, that of class. While this notion is hotly debated, Local 8 undeniably proved that interracial unionism was possible, and arguably essential, to working-class might.

However, that power did not last, and Fletcher, again, proved central. As America formally entered World War I, Philadelphia became one of the nation’s most important ports. Though they engaged in but a single work stoppage (Local 8’s birth was celebrated annually with a one-day strike), the government targeted Local 8’s leaders in its national raids on the IWW. Fletcher was the only African-American among the hundred Wobblies tried for treason in 1918. Though no evidence ever was provided against Fletcher, Local 8, or even the IWW (most “evidence” was statements of the IWW’s anticapitalist beliefs, not any planned actions to interrupt the war effort), all of the defendants were found guilty. Fletcher’s punishment was 10 years in the federal penitentiary in Leavenworth, Kansas, and an astronomical \$30,000 fine. As the sentences were announced, the Wobbly leader William D. “Big Bill” Haywood reported, “Ben Fletcher sidled over to me and said: ‘The Judge has been using very ungrammatical language.’ I looked at his smiling black face and asked: ‘How’s that, Ben?’ He said: ‘His sentences are much too long.’” Fletcher’s release became a celebrated cause among black radicals, championed by *The Messenger*, a monthly

coedited by A. Philip Randolph. Fletcher served around three years, pardoned along with most other Wobblies in 1922.

After his release, Fletcher remained committed to IWW precepts, though he never played as active a role, especially after Local 8 collapsed amid a brutal lockout in late 1922. Fletcher briefly organized the Philadelphia Longshoremen's Union but rejoined the IWW by 1925, though Local 8 never resumed its former influence. He occasionally gave speeches, on tours and street corners, into the 1930s. Fletcher's health failed while he was still young, typical for longshoremen, and he suffered a stroke in his 40s. In the 1930s, he rolled cigars, moved to New York with his wife, and managed a small apartment building owned by a fellow old-time Wobbly, before dying in 1949.

Fletcher was unique as a black leader in the IWW. The union that he helped lead for a decade, Local 8, stands at the pinnacle of interracial equality in the Progressive Era. Widely acclaimed while alive, he is now largely forgotten, although his legacy of working-class power and racial equality lives on.

FLYNN, ELIZABETH GURLEY (1890–1964)

Industrial Workers of the World, Communist Party of the United States

Elizabeth Gurley Flynn, nicknamed the "Rebel Girl," remains one of the premier female radicals in U.S. history. An activist while still a teenager (hence her nom de plume), Flynn remained committed to the Left for 60 years. As a leader of both the Industrial Workers of the World (IWW) and the Communist

Party of the United States of America (CPUSA), Flynn deserves the attention she has received.

Born into an Irish-American family, Flynn learned her politics and activism from her parents, both of whom were socialists. Flynn's father also was involved in the struggle for Irish independence, and thus steeped his daughter in a transatlantic world of resistance. Not surprisingly, Flynn became a socialist. Famously, Flynn gave her first public speech, titled "Women under Socialism," at 15.

Shortly thereafter, Flynn joined and became a leader of the soon-legendary IWW, often called the Wobblies. Like many of her time, she felt that the Wobblies were the leading organization in an era of revolutionary change that soon would occur. She became a much-sought-after public speaker, traveling nationwide to spread the IWW gospel of industrial unionism, direct action tactics, and socialism. She spoke in countless towns to untold numbers of workers, often the only woman present. Flynn took part in many a strike but none more famous than the 1912 Lawrence, Massachusetts, "Bread and Roses" affair. After the first Wobbly leaders were arrested on false murder charges, Flynn and "Big Bill" Haywood took the reins, leading 25,000 textile workers, mostly immigrant women, to a stunning victory. Flynn helped a young Margaret Sanger to organize the much-publicized "Children's Crusade," which sent children of strikers to sympathetic families across the Northeast. After she visited with him in his Utah jail cell, where he sat on a still-controversial murder conviction, Joe Hill, the famous bard of the IWW, wrote a song about Flynn called "The Rebel Girl."

Flynn was the author of the controversial pamphlet "Sabotage," written in 1913 during a Paterson, New Jersey, silk strike. The use of the term "sabotage" typically is presumed to suggest violence, but Wobblies took it to mean slowing down on the job, in order to pressure employers to concede demands by hitting them in the pocketbook. In that pamphlet's preamble, Flynn wrote, "Sabotage is to this class struggle what the guerrilla warfare is to the battle. The strike is the open battle of the class struggle, sabotage is the guerrilla warfare, the day-by-day warfare between two opposing classes."

When World War I erupted, most Wobblies took an antiwar stand, though the organization as a whole did not; yet despite this official nonposition, the IWW—Flynn included—came under government attack. When 166 leaders of the IWW were arrested nationwide, Flynn was the only female in the bunch. Due to her prominence, Flynn had more options (read: wealthy supporters) than most of the accused. She split with the other defendants, believing that the only way to get a fair trial was to have individual

Elizabeth Gurley Flynn, Dr. Mary Engi(?), R. Marsh(?), and Helen Schuster walking side by side on sidewalk. Library of Congress, Prints & Photographs Division [LC-USZ62-55896].

ones; by contrast, most stood together *en masse* in a single trial of 100 defendants. Flynn was found innocent, while the entire large group was found guilty. In the process, Flynn incurred the wrath of many fellow Wobblies.

Just as she was active in IWW free speech fights in the 1910s, Flynn was at the forefront of the international cause célèbre of the 1920s, the fight to save Sacco and Venzetti, two Italian-born anarchists sentenced to die by the state of Massachusetts. Along with many other leftists, anarchists, and civil libertarians, Flynn championed their case until they were executed in 1927.

In 1937, Flynn joined the CPUSA, which was at the height of its influence in U.S. history. She quickly took charge of the Women's Commission for the next decade. She ran for U.S. Congress, as a Communist, in 1942, and won 50,000 votes, championing the most oppressed Americans, whom she identified at that time to be African-American women. Flynn was one of the leaders of the CPUSA and recognized as the premier woman in it.

During the high point of domestic anticommunism during the early years of the Cold War, many Communists were imprisoned, and Flynn led the fight for their release. Flynn herself was arrested under the Smith Act in 1951, and then ran for Congress again, this time from a jail cell. Her campaign slogan was, "Vote No! to McCarthyism. For Peace and Jobs! Amnesty for all." Flynn served three years in the Alderson Women's Federal Prison in West Virginia.

Later in life, at the age of 65, Flynn wrote her autobiography, *I Speak My Own Piece*, now seen as a masterpiece among those interested in women of the Left.

She continued to suffer from persecution because of her political affiliations. In 1961, she was elected chairperson of the CPUSA. In January 1962, the State Department revoked Flynn's passport, as well as several other Communists'. Flynn protested that denying citizens the ability to leave the country freely because of their political beliefs was unconstitutional. The Supreme Court ruled in Flynn's favor in 1964. Subsequently, Flynn returned to the Soviet Union, where she died. The Soviet Union held an official state funeral for her. Communists from across the world mourned her passing.

Though she became gray-haired and a Communist, many considered her the "rebel girl" of Joe Hill's song and a Wobbly. As the *New York Times* reported in its front-page obituary, Flynn remained true to her beliefs to the end: still dreaming of a socialist America and world. For more than 50 years, Flynn worked with most of the leading, radical lights of the American labor movement: "Big Bill" Haywood, Gene Debs, Mother Jones, Joe Hill, Frank Little, Earl Browder, and many more. As with the remains of the Haymarket martyrs and her fellow Wobbly-turned-Communist Haywood, Flynn's remains are buried at Chicago's famous Waldheim Cemetery.

FONER, MOE (AUGUST 3, 1915– JANUARY 10, 2002) 1199/SEIU, New York’s Health and Human Service Union

Moe Foner was 1199/Service Employees International Union (SEIU), New York’s Health and Human Service Union’s longtime executive secretary and campaign strategist, whose public relations efforts helped establish 1199 as the nation’s first union for employees in private, nonprofit hospitals.

Born in Williamsburg, Brooklyn, the son of Russian and Polish immigrants, Foner was the third of four boys. His older brothers, the twins Jack and Phil, became well known as college teachers and as authors of numerous publications on American labor and black history. His younger sibling, Henry, was president of the Fur and Leather Workers Union in New York.

Joining and then also managing his brothers’ band in his teen years, Foner discovered both radical politics and an ability to orchestrate diverse talents. Moe attended Brooklyn College, where, in 1934, he joined the Young Communist League. After graduating, he worked in the registrar’s office at City College of New York (CCNY). In 1941, Moe and Phil, along with some 50 other CCNY employees, were fired as a result of investigations by the Rapp-Courdert committee, which had been created by the New York State legislature to purge alleged Communists from the government.

Foner married Anne Berman in 1941. He was drafted into the army during World War II and served as a commissary clerk on Governor’s Island, New York. After the war, as the education director for Department Store Local 1250, Foner staged *Thursdays ’Til Nine*, a musical review based on the job experiences of store workers, some of whom also performed in the show. For Foner, union-produced cultural programs were neither “fluff” nor a diversion

from labor’s bread-and-butter concerns. Such events served as a vital link, beyond dues paying and contract gains, between the union and its members.

In 1950, Local 1250 was absorbed into District 65, Wholesale and Warehouse Workers Union. An intense internal struggle developed within 65 over the Taft-Hartley Act’s requirement that labor officers sign non-Communist affidavits. Foner, caught in the middle of the dispute, left in 1952 to join the staff of Local 1199, Retail Drug Employees Union, as activities director and editor of *1199 News*. In the late 1950s, Leon Davis, president of 1199, recruited Elliot Godoff, a pharmacist and skilled organizer, to launch a union campaign among workers in New York City’s voluntary, not-for-profit hospitals. Foner’s effective marshaling of support from prominent public figures like Eleanor Roosevelt and his ability to enlist hard-bitten news reporters to cover the strike were critical to the success of the union’s first major effort, at Montefiore Hospital in the Bronx, New York. For his efforts as a labor publicist in this campaign, Foner received the Silver Anvil Award from the American Public Relations Association.

Firmly entrenched in New York City, 1199 secured a breakthrough contract in 1968 establishing a \$100-per-week minimum salary for its members. The following year, attempting to build on its success in the New York metropolitan area, the union launched a “union power, soul power” national campaign in Charleston, South Carolina. Four years later, after successful efforts in Philadelphia and defeats in some other cities, 1199 established itself as the National Union of Hospital and Health Care Employees. In each of these union drives, Foner orchestrated public support of 1199 from civil rights leaders such as Dr. Martin Luther King (who described 1199 as “my favorite union”), Bayard Rustin, and A. Philip Randolph, and from labor movement leaders such as Harry Van Arsdale, president of the Central Labor Council, and Walter Reuther, president of the United Auto Workers.

With Davis’s health deteriorating, issues of succession and merger dominated 1199 in the 1980s, leading to an internal rift in 1982 between the New York metropolitan area local and the national union. Under the leadership of Dennis Rivera, who became president of the New York union in 1989, 1199 was reunited. Then, in 1998, the long-sought merger of health care unions was accomplished as 1199: National Union of Health and Human Service Employees Union, SEIU, AFL-CIO.

Foner retired as 1199’s executive secretary in November 1982 during the civil war that rent the union. Nevertheless, working under the banner of “Bread and Roses,” he continued to produce theater projects, art and photography exhibits, concerts,

lectures, and other cultural programs for 1199. One of his last projects before his death, “Unseen America,” distributed cameras to working people and to the homeless and then enabled them to exhibit their photographs in 1199’s gallery. In *Bread and Roses*, as in his lifelong commitment to the labor movement, Foner held to a vision of creating a fairer, more humane world. Foner passed away at age 86 on January 10, 2002.

FOOD PROCESSING

Of all industrial products, processed food is unusually ubiquitous. American consumers encounter it repeatedly each day. In fact, few commercially available foods are truly unprocessed. Even the freshest produce is extensively manipulated before it finds its way onto supermarket shelves. But unlike most industrial products, food also makes up and becomes part of what we are. On the one hand, its prevalence makes processed food easy to take for granted. On the other hand, our close relationship with it makes understanding the history of processing and the workers who manufacture the food we eat especially important.

Like the varieties of food available, the industry’s activities are diverse, ranging from fresh produce packing to engineering food-related chemicals, with much in between. Each of these sectors has its own labor history, and as a result, overarching generalizations about food-processing work must be qualified. However, several trends have helped shape the experience of food workers in the United States since colonial times. First, processing has transformed from a geographically distributed sector composed primarily of small- to medium-scale firms into one that is both geographically and industrially concentrated. Second, a sector that was once very skilled has become predominantly unskilled. Deskilling throughout the

industry—through the combined effects of mechanization and increasingly minute divisions of labor—has led to a mounting lack of political leverage for food workers. But while some aspects of processing have become almost completely automated, others have proven nearly impossible to mechanize entirely, resulting in a continuous need for unskilled workers. Third, the industry has historically fulfilled its labor needs by hiring new immigrants from Europe, Asia, and Latin America, African-Americans, and female workers. Fourth, the industrialization of processing work has often been facilitated by the support of the state.

From Colonial America to the Civil War

Processing played an important role in the colonial and early American economies. Preserved cod—split, salted, and packed in barrels—was one of the most prolific and profitable colonial exports. Baking, brewing, and cheese making were small-scale, geographically dispersed, skilled operations. Although processed, these foods were highly perishable, forcing processors to locate near raw materials and markets. For these same reasons, slaughterhouses were built close to centers of consumption. Live animals were herded to slaughterhouses, where skilled groups of workers killed and prepared carcasses for shipment. Retail butchers then carved these into cuts of meat.

Food processors began to mechanize operations at an early date. In the 1780s, Oliver Evans patented a partially automated flour mill, which used a water wheel to power conveyors, a grindstone, and a mechanical sifter that separated kernels from flour. Evans marketed his design by emphasizing that it produced more, higher-quality flour than traditional mills, yet it required only half the workers. Reducing labor led to significant cost savings for mill owners, and it decreased their vulnerability to worker control.

A growing network of navigable waterways aided the food industry’s westward expansion. Grain and livestock, especially, were produced in increasing quantities in the West and shipped to eastern markets. One of the first western meat centers, Cincinnati, shipped livestock and preserved pork to eastern packinghouses and butchers via the Ohio and Mississippi rivers and New Orleans. These meatpackers began applying assembly line-style divisions of labor to the disassembly of animals during the 1830s, significantly changing the experience of packinghouse work. Workers led livestock up ramps to the top floor of multistoried packinghouses, where animals were slaughtered. Carcasses were then attached to hooks hanging from overhead rails, and gravity moved them from

floor to floor, where other workers performed specific cuts on the passing carcasses. In this fashion, by the 1840s, 20 workmen could incrementally disassemble 77 hogs an hour.

Civil War and Nineteenth-Century Expansion

While the Civil War devastated the southern economy, northeastern and western food processors thrived. The army purchased vast amounts of food: Union soldiers consumed some 500 million pounds of meat and ate enormous amounts of canned food, such as condensed milk and pork and beans. Wartime demand, in fact, was instrumental in establishing canning as a major food industry, the output of which doubled each decade between 1890 and 1960 (with the exception of the 1930s). Early canneries were for the most part coastal, labor-intensive, small- to medium-scale operations. Some steps in the canning processes, particularly hand-soldering tins and cooking, required significant skill. At the same time, many jobs, such as sorting and slicing produce or scaling salmon, required only minimal training. Cannery owners staffed these jobs with unskilled, seasonal workers who could be hired and fired as business waxed and waned.

The division of skilled and unskilled cannery work was racialized and gendered. In the mid-1800s, white, male workers occupied most skilled positions, while immigrant workers performed unskilled tasks. In California and along the West Coast, Chinese barred from gold prospecting did the bulk of the unskilled work; however, with the Chinese exclusion legislation beginning in the 1880s, the Chinese population began to decline. From 60% of the cannery workforce in 1870, Chinese workers accounted for only 4% by the end of the first decade of the twentieth century. Cannery owners replaced Chinese workers with female workers, who they assumed would accept low wages and seasonal employment, and would be unlikely to organize. By 1900, there were approximately 16,000 female cannery workers in California, nearly all of whom were paid less than their male coworkers and were assigned to unskilled jobs. Even so, many saw cannery work as a step up from domestic employment.

The potential for worker control in nineteenth-century canneries was high, and skilled workers in particular exercised significant autonomy over their daily lives. In part as an effort to gain more control over the manufacturing process, owners installed mechanical processing machines. The machines eliminated both skilled and unskilled jobs, smoothed seasonal labor cycles, and increased production speeds.

In addition, machines could also help achieve racial goals. The inventors of a machine called the “Iron Chink,” which could eviscerate 43 salmon a minute, boasted that each one could replace more than 10 skilled Chinese workers. Realizing the effects of mechanization, workers strenuously, sometimes violently, resisted. In one cannery, a guard brandished a gun while a machine was installed.

Produce canneries were supplied by growers who themselves sometimes seemed more like manufacturers than farmers. In the late 1800s, Atlantic Coast market gardeners used hothouses, sophisticated botanical knowledge, and efficient transportation systems to distribute their perishable products. California growers of fruits and vegetables soon joined these eastern growers. In 1887, the first ice-cool railcar filled with oranges departed from California toward eastern markets, and before the year was out, one million boxes had followed. By the turn of the century, southern California produced 77% of the United States’ oranges and 90% of its lemons. Heavily capitalized, these growers employed migrant Asian-American and later Mexican-American workers, relied heavily on transportation, and utilized sophisticated production technologies and marketing techniques.

Civil War demands and an increasingly extensive rail network pushed Chicago to the forefront of meatpacking, and by 1900, fewer than half a dozen Chicago meatpackers controlled 90% of the American red meat market. Prior to the 1850s, Chicago meatpackers (like their Cincinnati competitors) mostly shipped live animals and whole carcasses to eastern slaughterhouses. However, with the development of ice-cooled storage and railcars in the 1860s, Chicago packers began to ship “dressed” cuts of meat. In the years between their opening in 1865 and the turn of the century, the yards processed 400 million cows, pigs, and sheep. By 1900, the yards had a daily processing capacity of 455,000 animals. Meatpackers became the city’s largest employer, with approximately 25,300 laborers in 1899.

Chicago meatpackers deployed the assembly line on an unprecedented scale. Steam power carried carcasses suspended from overhead rails throughout the packinghouse, and networks of pipes transported animal bits from one part of the factory to another. But meat processing proved difficult to mechanize completely, prompting managers to rely on a minute division of labor. The result was a mechanized yet labor-intensive manufacturing process, in which a single animal would pass in front of more than 150 workers before exiting the factory. The division of labor shifted the composition of the workforce toward unskilled workers, a change that increased line speeds and reduced worker autonomy.

Workers in the Chicago packinghouses in the late 1800s were a mix of European immigrants. Established Germans and Irish held the more skilled jobs, while more recent Central and Northern Europeans held unskilled positions. As the century drew to a close, female workers, mostly in their 20s, worked in increasing numbers in packinghouses. For the most part, they were confined to the least-desirable and lowest-paying jobs in packinghouse canneries and by-product processing. Wages were low: in 1900, average wages were 15 cents an hour, and by World War I, they had increased only a cent and a half.

Packinghouse workers labored and lived in what can only be described as shocking conditions, and attempts to organize in response began in the 1880s. Early strikes in the 1890s, however, were unsuccessful and sometimes violently put down. In 1904, the Amalgamated Meat Cutters and Butcher Workmen (Amalgamated) called its first strike, with demands for improved wages. In response, managers hired African-American strikebreakers. In 1906, Upton Sinclair published his famous muckraking novel, *The Jungle*, based on his experiences living with Union Stockyard workers. A call for organization, Sinclair's book described a world that was smelly, loud, backbreaking, and unsanitary.

Wars and Depressions

Fueled by military food purchases, the processing industry grew during World War I. Working conditions and wages began to improve, while the war also provided opportunities for unions. By 1918, the Amalgamated increased its roster from a low of only 2,000 in 1904 to 28,000. During the 1920s, the food industry concentrated significantly. Large companies dominated nearly all sectors of the industry, from meat to canned and frozen produce, from dairy to baking.

Building on methods for producing and marketing frozen and refrigerated food that had existed since the late nineteenth century, Clarence Birdseye and General Foods began developing an improved method for industrial freezing in the 1920s. Contrary to advertisements that portrayed frozen food as a revolutionary product, links to existing truck farms, canneries, and meatpackers were strong. Early production of frozen food concentrated in the Mid-Atlantic states, most notably in New Jersey, a state that had established itself as a source of fresh and canned produce. Frozen food manufacturing maintained many of the labor relations familiar to the canning and packing activities it supplemented. Introduced at the onset of the

Great Depression, frozen food was slow to take off. In fact, one of the first commercially successful frozen products was concentrated orange juice, invented in 1945. Designed by government researchers as a way to supply troops with vitamin C, frozen concentrated orange juice became an incredibly popular consumer item. For orange growers in Florida and California, concentrated juice provided a way to process surplus harvests into a profitable product.

Canning remained a hazardous, monotonous, and often unsanitary occupation during and after World War I. Gendered and racial divisions of labor persisted, an arrangement that management believed would reduce worker solidarity. Male workers continued to hold permanent, skilled positions, while female workers held seasonal, unskilled ones. In California—which between 1939 and 1950 produced more canned fruits and vegetables than any other state—the number of female cannery workers steadily increased, as did their percentage in the workforce. From 16,000 in 1900, by 1939 there were 75,000; by 1945, 75% of the California cannery workforce were female. The ethnic composition of cannery workers began to change dramatically as well. In 1928, Los Angeles County boasted the highest percentage of Mexican-American cannery workers, at 23.5% of the workforce. By 1975, the California canning industry tallied that upwards of 70% of its workers had Spanish surnames.

During the Great Depression, both the production of processed food and wages for food workers declined. From the perspective of these workers, the government's response was decidedly mixed. While the National Industrial Recovery Act guaranteed collective bargaining rights for most manufacturing workers, it only covered some food-processing workers. At issue was whether these workers were manufacturing or farm laborers (the latter were not covered by the Act). The government adopted a geographic solution to this problem. Processing on the farm was considered agriculture; processing in another place was manufacturing. In practice, this meant that two workers who did the same kind of work might have different labor rights, depending on *where* they worked. The Wagner Act, on the other hand, adopted a definition based on practice. All workers who manufactured food (as opposed to grew and harvested it) could organize. The Wagner Act was a boost for food unions. By the time the United States entered World War II, the Packinghouse Workers Organizing Committee (later the United Packinghouse Workers of America, UPWA) claimed 80,000 members, and Amalgamated 100,000. Similarly, the United Cannery, Agricultural, Packing, and Allied Workers of America made significant gains

in organizing women and Mexican-American cannery workers.

As in previous wars, processed food was essential to the defense effort, and World War II pulled the industry from depression. Through the Lend-Lease program, the government purchased vast amounts of processed food to send to Europe. The deployment of American soldiers only compounded demand for specially produced rations, canned food, and meat. Conditions for food workers improved through the course of the war for two main reasons. First, processing was regulated by the National War Labor Board, which enforced a set of minimum labor standards. Second, the war precipitated an industrywide labor shortage. Many male workers were conscripted, while other workers were drawn into different industries. For those who remained, processing wages rose (although they remained lower than other war industries). Doors opened for female workers, who for the first time moved into the skilled and managerial posts previously unavailable to them. At the same time, labor shortages encouraged processors to further mechanize their operations, leading to an overall decrease in their reliance on labor.

Even so, the decades immediately following World War II were a rare period of success for processing unions. Meatpacking workers enjoyed wage parity with other industrial workers for the first time. Even as intense competition raged between rival unions—sometimes prompting red-baiting and illegal agreements between organizers and processors—membership increased dramatically. Unions themselves began embracing African-American and female workers, who historically had been treated as a threat to white, male employment.

Food Technology and Factory Labor

The prevalence of deskilling in food manufacturing was in many ways made possible by the industry's increasing reliance on highly skilled engineers who called themselves "food technologists." Since the turn of the century, these researchers played a central role in developing new sorts of food products and the technologies of industrial food manufacturing. Their role in the industry only grew in the decades following World War I. In university departments of food technology and processors' own industrial laboratories, researchers invented machines, engineered the texture of food, and developed chemical preservatives and flavors.

In many cases, this work was supported by the state through land grant universities, extension stations,

and military funding. In 1972, Jim Hightower and the Agribusiness Accountability Project published *Hard Tomatoes, Hard Times*, a report that criticized public institutions for conducting research and development for the food industry. His report contended that tax-funded research was benefiting large processors to the detriment of workers, consumers, and small businesses. Hightower went so far as to claim that improving food was not the driving motivation behind technological development in the industry. Rather, "The major impetus for food engineering has come from the desire to eliminate labor by mechanizing the harvesting and processing phases of agriculture."

The title of Hightower's report referred to mechanical tomato harvesters and a specially bred thick-skinned tomato that could withstand automated packing and long-distance shipping. The two interrelated technologies were developed in tandem by the University of California and became the subject of a contentious lawsuit over the proper relationship between the state and the agriculture and food industries. Indeed, the debut of this expensive system in the 1960s had striking results. Many small tomato producers could not afford the new technology, and within a few years, 85% were driven out of business, while thousands of migrant fieldworkers saw their jobs eliminated at the same time. Large producers who could afford to purchase the system grew larger.

This case was hardly an isolated one. In dairy processing and cheese making, new machines, processes, and chemicals led to nearly complete automation. For those businesses that could not obtain the credit necessary to finance new technology, the outlook was not good. By 1974, 85% of the dairy processors in business 24 years earlier had closed. A similar situation faced canneries, one quarter of which shut their doors between 1947 and 1954. Other production processes like dehydrating and baking were also extensively automated, while the transfer of more and more processing—for instance, skilled butchering—out of retail markets and into factories affected the daily experience of retail workers.

Hightower's report emphasized the fact that the interrelated processes of mechanization and deskilling were not inevitable or automatic. Widening profit margins and reducing labor requirements in factories required expensive and highly skilled work in the laboratory. While lowering their dependence on one kind of labor, processors were becoming dependent on another. Most important, the financial support provided by the state often masked the true expense of food technologists' work. But the impact on food manufacturing workers seemed clear: many lost their jobs, while those who remained became less and less skilled.

The Work of Food Preparation

The prevalence of processed food in the twentieth century affected the consumer as well. Because processed food could be stored for long periods and transported over large distances, seasonal and geographic variations in food consumption began to decline. Even as class-based differences in diet began to decline, this new diet was more expensive than the old. As Harvey Levenstein notes, even as the income of the average household rose in the 1940s and 1950s, so too did the percentage of its income spent on food—from 22% in 1941 to 26% in 1953. The rising cost of the American diet in the decades following World War II was attributable to increasing consumption of processed foods. In 1953 alone, Americans consumed 16 billion pounds of canned goods. Purchases of frozen foods totaled \$2.7 billion in 1959, representing a 2,700% increase over 1949. Consumers were paying not only for the food itself, but also the technology that supported its production. Food processing altered the work of domestic food preparation. Processors claimed that their products dramatically reduced household labor. In a 1957 article titled “Kitchen Revolution,” one advocate claimed that processed foods came with “built-in maid service.” According to this vision, the tedium of preparation would be transferred from the home to the processing plant. No longer would housewives spend hours preparing dinner. Instead, frozen, precut, and precooked ingredients needed only to be heated and served. The reality, however, was not so simple. If processed food made any one job faster or simpler, it also contributed to rising expectations of what constituted a complete and proper meal. Encouraging this trend, processors published cookbooks—perhaps the most famous of which were authored by the fictional Betty Crocker—with instructions on incorporating new food products into ever more complicated and labor-intensive menus.

Processed food also had a major impact on work in commercial food preparation. Its influences are perhaps most clearly seen in the fast-food industry. Fast food as we recognize it today began in the 1940s in southern California, where companies like McDonald’s began as small, family-owned restaurants. These self-service restaurants relied on high volumes of sales from simple menus, a strategy that kept the costs of ingredients low. Fast food caught on, and it quickly became a national business, and then an international business. In 1970, Americans spent \$6 billion dollars on it. In 2001, McDonald’s was the largest purchaser of beef and potatoes in the United States (and the second largest customer for chicken), and Americans spent \$110 billion on fast food.

From its infancy, the fast-food industry has been an avid customer and developer of food technologies like those discussed in the previous section. In 1948, for example, the founders of McDonald’s developed the “Speedee Service System.” Its purpose was not simply to offer quick service for customers, but also to reduce labor costs for the owner. The system divided the process of preparation into a set of discrete, assembly line-like steps, each of which was performed repeatedly by unskilled workers. The concepts underpinning the system are now commonplace in the fast-food industry. Technologies like computerized ovens with conveyor belts automate preparation. In addition, fast-food companies rely heavily on processing companies for pre-prepared foods, such as precut French fries, seasoned and breaded chicken, shredded lettuce, and shaped burgers. Rarely are these items prepared from scratch within a restaurant itself, further reducing the necessary skill level of workers.

In a highly capitalized industry like fast food, the cost of labor is one of the few variables over which restaurant franchisees have control. While there are certainly exceptions, the industry often keeps labor costs low by hiring young people on a part-time basis. For many of these young people, fast-food work is not a final goal, and many leave after a short time, resulting in a high industrywide turnover rate. For others, however, fast food is one of but a few options. For recent or undocumented immigrants, fast-food work can be relatively easy to obtain. For all workers, long hours are common. Compensation for this repetitive work is low, and in 1990, the 3.5 million fast-food workers represented America’s largest minimum wage workers group.

Many obstacles to organization exist. Unionization is often not a priority for young workers, who view the job as temporary. At the same time, the fast-food industry takes advantage of high employee turnover rates. In some cases, fast-food companies have delayed union votes for so long that the organizing workers have simply left to find other work. Moreover, the industry’s low skill requirements make organizing workers easy to replace.

The “IBP Revolution”

The decade and a half of union success in the meat-packing industry following World War II began to wane in 1960, when a new company opened its first packinghouse in Iowa. With a plan to take full advantage of nonunionized and highly mechanized production, IBP avoided urban union strongholds by

opening its plants in rural areas with lower prevailing wages. Occasionally, it would shut down a unionized plant and re-open it with an unorganized workforce. The depressed economy of the 1980s facilitated IBP's successful transformation of the meatpacking sector. By 1989, IBP was the largest meatpacker in the world with approximately \$6.8 billion in sales. Nine of its plants were nonunion, while only three were organized. By the late 1990s, the labor representation that remained was done by the United Food and Commercial Workers, which, while boasting a membership of one million in various food and retail sectors, had been forced to make regular concessions to IBP.

Working conditions in the post-"IBP revolution" period were harsh. Conveyors dictated the work pace more than ever before. Line speeds were high, and repetitive stress traumas, lacerations, and other injuries were all too commonplace. In 1985 alone, meatpacking had the highest worker-injury rate of any industry, with 30.4 injuries per 100 full-time workers—and this was an improvement. Wages fell below other manufacturing industries and to a fraction of what they were in unionized plants. Even though they composed a growing segment of the workforce, female, Mexican-American, African-American, and Asian-American workers were assigned to the worst jobs and were paid less than their white, male coworkers. Job security was nearly nonexistent, since unskilled workers in rural areas with high unemployment were easy to replace.

Poultry processing followed a similar path. Between the 1930s and 1960s, chicken processors began to vertically integrate feed production, chicken rearing, slaughtering, and processing. Consumption of chicken soared during World War II, since it was not rationed like other meats. Originally concentrated near eastern markets in the Delaware-Maryland-Virginia region, the postwar expansion of poultry processing was focused in the South, where lower prevailing wages made factories especially profitable. Attempts by the Amalgamated, UPWA, and the Teamsters to unionize poultry workers met with mixed success, but antiunion campaigns followed in the 1980s and 1990s. Today, a single plant can process 40,000 pounds of chicken a day, and a line worker might conduct the same operation on more than 40 chickens a minute.

Work in poultry factories has been highly gendered and racialized. While the sector historically employed more female workers than red meatpacking, women were in the minority. In the 1990s, approximately two thirds of poultry employees were male. Female workers were generally assigned to lower-paying disassembly line jobs, ostensibly because they were unsuited

for jobs that require mechanical skills or heavy lifting. These line jobs have been among the most monotonous and prone to injuries. In 1997 alone, the Occupational Safety and Health Administration (OSHA) reported over three hundred instances of repetitive trauma at a single chicken processor. In 1999, Tyson was fined for violating child labor laws for employing two underage workers, both of whom were casualties of industrial accidents. What has changed significantly, however, is the ethnic composition of the workforce. As white workers left the South in increasing numbers during the last decades of the twentieth century, the poultry industry began employing Mexican and Latin American immigrants, many of whom were undocumented. Processors have been known to use the threat of deportation to force worker concessions.

Alternatives

In the 1970s, activists proposed an alternative to processed food. They conceived of organic food as a rethinking of production, processing, and consumption. By refraining from chemicals and processing and relying instead on small-scale, local production, organic was envisioned as being friendlier to the environment, workers, and consumers. Thirty-five years later, however, organic food has fallen short of its original goals. Nearly all of the large processing companies, using familiar labor strategies, have entered the organic market. The USDA definition of organic permits chemical flavorings and preservatives, making possible mechanically produced and highly processed, yet certified-organic, food.

A history of industrial concentration, worker disempowerment through intense deskilling, gendered and racialized divisions of labor, and state support for businesses over workers has helped to define the work experience in the industry over the past centuries. As attempts to create alternative foodways suggest, industrial food processing, and the labor relations and business organization it relies on, seem to have considerable momentum.

FOREIGN MINERS TAX

In 1850, the California State Legislature passed the Foreign Miners Tax that would purge thousands of Latino and Chinese miners from the gold diggings. Under the legal doctrine of foreign trespass, all miners who were not citizens of the United States or who had not become citizens under the Treaty of Guadalupe Hidalgo would have to buy a miner's license for a monthly fee of \$20 (about \$400 in today's currency); the tax collector would receive \$3, and the remaining money was split between the county and the state. While the law's professed goal was to raise \$200,000 a month from Mexican and South American miners, the tax became a tactic in ethnic cleansing.

On Sunday, May 19, 1850, four thousand armed French, Mexican, and Peruvian miners seized control of the plaza in the California foothill town of Sonora and declared that they would never pay the tax (Holliday, p.173; Lang, pp.30–34). Facing them was a vigilante army of five hundred Anglo tax collectors and miners. When the mob fired on the Latinos, the Chilean and Mexican miners retreated from the diggings, on burro and on foot (Holliday, p. 172; Lang, pp. 30–34). In early June, another vigilante army of three hundred men marched into the Latino diggings in the mining town of Columbia to collect the first tax. But facing protests from Irish, English, Canadian, and German miners, the law was rewritten to exempt any "free white person" or any miner who could become an American citizen.

The tax launched a reign of terror, spurred on by "The Great Greaser Extermination Meeting" in Sonora that demanded that all Latino miners leave the goldfields in 48 hours. Assaults and lynchings followed. Ten thousand Mexican miners returned home. By 1860, four fifths of the Latino population had been driven out of the California mines.

Missing their customers, white merchants from across the Sierras petitioned Governor Peter Burnett to repeal the Foreign Miners Tax (Holliday, 173; Lang, 34, 44–45). While Burnett could dismiss protests by Mexican miners, he listened to the Tuolumne County real estate owners and merchants and had the tax repealed, just 11 months after its passage (Lang, p. 34, 44–45; see also Steven Lavoie, "Miss LIBERTY," in Holliday, p. 172). Years later, white miners still recalled "the long train of fugitives" leaving the gold diggings and returning home: "Some were going North; some South; the great body was probably bound for home; some by way of the sea; others by Los Angeles and the Great Desert" (Johnson, p. 215).

The Chinese were to follow. In 1852, the Chinese formed one tenth of the state's population and nearly one third of the mining population. By 1855, 175,000

miners from all over the world—tense, poor, and disappointed—were crowded along California’s rivers, deltas, and beaches. That year the Foreign Miners Tax was reborn, with the express purpose of expelling the Chinese from California. The new tax forced each foreign miner to pay a fee of \$3.00 per month for the right to mine; in 1853, it was raised to \$4.00, and in 1855, to \$6.00, with the provision that each successive year there would be a further \$2.00 increase. No Chinese man was allowed to mine for gold until he paid the tax, one half of which went to the county treasury, and the rest to the State of California, with a fixed fee for the tax collector. In practice, the tax was limitless. Between 1852 and 1870, years in which *one billion* dollars worth of *untaxed* gold was mined in California, Chinese miners paid a staggering \$58 million to the state, ranging from one fourth to one half of California’s revenue.

The tax launched a fierce wave of Chinese expulsions. Although the law stated that private parties had no authority to eject “aliens” who failed to pay the tax, it allowed collectors to seize and sell a Chinese miner’s claim and tools. Fraudulent collectors sprang up all over the mountains; real and scam collectors repeatedly visited the same Chinese camps and threatened violence or deportation if the Chinese miner did not pay up. The Chinese miners did their best to avoid the tax. Some bribed the tax collectors; others paid a small amount directly to the collector and agreed not to ask for a receipt. Some simply refused to pay. Others hid in the woods, or in winter, moved into town. Many escaped the tax by going to work for absentee owners or mining corporations, which, as early as 1853, began investing in the costly technology of tunneling and quartz mining. In 1855, groups of Chinese men in Tuolumne and Mariposa counties were killed as they attacked the tax collectors.

Not all Californians agreed that the tax was a good idea. Some worried that it was a form of “taxation without representation” that could lead to Chinese demands for citizenship (Letter from an Old Miner). During the era of abolition, others predicted that it would create a population of paupers who could easily become a desperate class of slaves or burden the state into bankruptcy. And then there was the revenue. The Shasta Miners Convention reminded the legislature that in 1854 alone, the counties and the young state gained \$300,000 from the Chinese miners’ tax, which would have been lost if it had forced the Chinese out.

On May 8, 1852, the Second Columbia Miners Convention declared that “no Asiatic or South Sea Islander shall be permitted to mine in this district

either for himself *or for others*” and formed a Committee of Vigilance to ensure that none of the “degraded inhabitants of China and Islands of the Pacific” either purchased their own claim or worked for an absentee company (*Alta California*, May 15, 1852). The anti-Chinese movement threatened commercial interests (Johnson, p. 248).

The Foreign Miners Tax cut the Chinese population by the thousands for several years. But new arrivals soon equaled and quickly doubled the number of those who departed the Sonora foothills. Many refugees who returned to China stayed only temporarily (Chiu, p. 142; Coolidge, p. 498).

By 1870, the tax was nullified. At least two legal challenges in California prevailed. In 1870, Congress targeted state laws such as the Foreign Miners Tax when it modified the Civil Rights Act of 1866, and banned any tax imposed on “any person immigrating...from a foreign country which is not equally enforced...upon every person immigrating to such a State from any other foreign country” (Civil Rights Act of 1870, ch. 114, 16 Stat. 140). In 1870, in *U.S. v. Jackson* (26F.Cas 563 [1870 or 1874], a collector of the miners tax), the Supreme Court upheld the constitutionality of the revised Civil Rights Act, and the Foreign Miners Tax became null and void—long after its most egregious effects had passed (McClain, pp. 28–29). Nonetheless, during the two decades of its enforcement, 98% of \$4,919,536.40 collected came from Chinese miners.

FOREIGN POLICY

Efforts by American workers to influence foreign relations date back to at least the American Revolution. The historian Dana Frank has noted the key role of sailors and artisans in acts of revolutionary defiance like the Boston Tea Party and the critical participation of workers in economic and military campaigns against the British. The political mobilization of ordinary people during the revolution in turn undermined patterns of social deference and gave birth to an ideology of labor republicanism that stressed equal rights for white male workers and helped lead to broad suffrage for this group by the Civil War. White male workers in the United States thus possessed more political power to influence foreign policy in the late eighteenth and early nineteenth centuries than their counterparts in many other industrializing countries.

Yet the role of the emerging U.S. working class and labor movement in shaping foreign policy before the Civil War remains unclear. As the industrial revolution transformed the Northeast, replacing household manufactures with products from newly created mills and factories, fledgling trade unions emerged to protect the rights of industrial workers. Yet although such unions used local publications to voice occasional opinions on foreign policy issues, they lacked sufficient power to influence national debates over American diplomacy. The dearth of independent labor voices in national debates may have made enfranchised white male workers susceptible to cross-class appeals that urged them to support the quest for continental empire at the expense of people of color, including Native Americans, African-Americans, and the Creole and Mexican populations in the Southwest.

Early Labor Critiques of the International Division of Labor and American Quest for Empire

In the post-Civil War era, elites expanded their appeals to white workers, emphasizing that the country now needed not just a continental but also an overseas empire to ensure a healthy economy. Advocates of an aggressive and militaristic foreign policy,

as the historian Kristin Hoganson has argued, also emphasized overseas empire as a way to revitalize American manhood and forge a bond between white brothers of all classes. But several national trade union movements afforded labor activists a forum to promote alternative labor perspectives on foreign policy and empire. No consensus emerged among the nation's trade unions about what role labor should play in shaping the nation's foreign policy between the Civil War and World War I, but healthy debates about the international division of labor and about potential divergences between class interests and so-called national interests helped to clarify what was at stake for workers—both at home and abroad—in supporting U.S. foreign policies.

The short-lived National Labor Union, created in 1866 and led by the dynamic William Sylvis, brought attention to foreign policy issues and questions of international labor solidarity by announcing its intention to affiliate with the initially European-based International Working Men's Association or First International. Leaders of the First International such as Karl Marx emphasized that imperialistic foreign policies grew naturally from capitalism and its never-ending quest for new markets, investments, and natural resources. By encouraging their governments to acquire or dominate new territories and populations, businessmen could enlarge their profits and avoid the contradictions of overproduction and underconsumption even while continuing to exploit workers in their home countries. Marx urged workers to counteract the imperialist designs of government and business through a two-pronged approach that involved supporting the collective actions of international labor organizations and using political channels available within their respective countries.

Sylvis and his supporters within the National Labor Union agreed with Marx about the desirability of limiting the mobility of capital and labor and gaining increased international influence for workers. Although the National Labor Union unraveled before its alliance with the First International was fully consummated, activists within the union helped to publicize the class-based critique of international affairs developed by Marx and other European radicals. American socialists as well as European immigrants to the United States also spread the doctrines of the First International, and by the end of 1871 it boasted 27 sectional chapters and several hundred members in the United States. Perhaps propelled by its popularity in the United States, the First International relocated its headquarters to New York in 1872. But the organization proved faction-ridden and was dissolved at a meeting in Philadelphia in 1876.

The Knights of Labor also helped in unique ways to promote a class analysis of international affairs and U.S. foreign policy. Founded in 1869, this inclusive organization's membership peaked in the mid-1880s at about 750,000 workers. Although some Knights of Labor leaders developed a hostile attitude toward the socialists who dominated the First International, immigrants within the Knights often stressed the linkages between the American class struggle, class struggles in their former homelands, and imperialist domination. Irish-Americans proved an especially important force within the Knights. Weaned on Irish land reform and anticolonial ideologies, Irish-American labor activists naturally conceptualized their trade union battles in the United States as part of a worldwide struggle between the owning and producing classes and used local Knights meetings to raise support for the Irish nationalist cause. Given the internationalist currents flowing through the grassroots intellectual life of the Knights of Labor, it is hardly surprising that Knights chapters spread throughout Canada, and to Ireland, Scotland, and Britain. Although the Knights spent little time lobbying the U.S. government on foreign policy issues, they helped both to advance the cause of international labor solidarity and to lay the intellectual groundwork for an anticolonial critique of U.S. and British foreign policy upon which future immigrant labor activists would build. The Knights of Labor itself, however, would soon be overshadowed by the American Federation of Labor (AFL).

Early International Activities and Foreign Policy of the American Federation of Labor

Founded in 1886, the American Federation of Labor was composed predominantly of craft unions—some of whom had previously belonged to the Knights of Labor—that emphasized improving wages and working conditions for skilled and semiskilled workers rather than eliminating or fundamentally transforming capitalism. Despite its pragmatic focus and narrow membership base, the AFL developed an early interest in the activities of international labor organizations and in giving labor an independent voice in international affairs. In 1889, the AFL worked with the Second International that convened in Paris in 1889 to coordinate the first celebrations of May Day in Europe and the United States. The AFL's relationship with the Second International subsequently cooled, but during the early twentieth century, many individual AFL unions became active in international trade secretariats. These organizations were

composed of trade unions from the same industry but different countries that came together to promote their international interests. Among the AFL unions that joined international secretariats in the early twentieth century were the miners, molders, painters, and shoemakers. AFL President Samuel Gompers followed the lead of constituent unions and made the AFL an active member of the International Secretariat of Trade Union Centers, which subsequently became the International Federation of Trade Unions. This organization concerned itself not only with international labor standards but with pacifist endeavors designed to encourage labor mediation of international disputes between nation-states—a cause in which Gompers himself was keenly interested during his early career.

The AFL also demonstrated an early interest in directly influencing U.S. foreign policy, and became particularly active in the debates surrounding the Spanish-American-Cuban-Filipino War and the acquisition of an overseas empire in the 1890s. When Cuba first rebelled against Spain, a majority of delegates to the AFL convention called on the AFL to demand that Congress recognize Cuban belligerency. Supporters of the Cuban rebellion argued that trade unionists in the United States had a responsibility to help fellow Cuban workingmen win their liberty. Yet a vocal minority opposed committing the AFL to support the revolution because it might encourage war with Spain. And war, they argued, always disproportionately hurt workingmen because they were the ones who inevitably did most of the fighting. Interestingly, some also wondered whether labor might be playing into the hands of business leaders in supporting Cuban belligerency, since the United States would no doubt seek to dominate the island nation if Spanish forces were defeated there. As Andrew Furuseth of the Seamen's Union explained at the AFL convention in 1897, the question was really one of "whether the New York speculator or the Spanish capitalist should skin the Cuban workingman." The debate demonstrated that there was no consensus within the ranks of the AFL about supporting nationalist rebellions or about the virtues of an American overseas empire.

For his part, AFL President Samuel Gompers initially supported proposals to recognize Cuban belligerency but opposed President William McKinley's decision to declare war against Spain and to annex former Spanish territories such as the Philippines and Puerto Rico at war's end. Gompers, however, subsequently came to what the historian Delber Lee McKee called a "tacit compromise" with the State Department. The AFL president toned down his opposition to U.S. annexation and imperial control

of the Philippines and other acquired islands in return for government and business acquiescence in AFL campaigns to build labor unions in these areas. In contrast to Marx and other socialist theorists, Gompers and his closest colleagues on the AFL Executive Council reasoned that if they could raise labor standards in the island protectorates, then U.S. imperial control might actually benefit U.S. as well as island workers. Goods from these areas would not undersell their American counterparts, and businesses would not be tempted to establish low-wage factories there. Island workers, for their part, might use increased wages to buy American products. Gompers thus proved susceptible to cross-class appeals that emphasized the benefits of U.S. economic expansion and empire for workers both in the United States and abroad. Doubtless cultural messages that proliferated in the American media and in government circles about the need for white men of all classes to participate in the paternalistic oversight of nonwhite races also influenced Gompers. As Delber McKee has documented, Gompers referred to the people in newly acquired territories as “semibarbaric.” Initially, Gompers feared that such barbarians might immigrate to the United States and undermine labor standards. But over time Gompers came to believe that such problems could be prevented if island workers were tutored in principles of trade unionism by their more experienced Anglo-Saxon brothers.

World War I

Gompers’s interest in cooperating with business and government elites to promote economic expansion and overseas empire led to a full-fledged commitment to corporatist forms of power sharing during World War I. Social scientists use the term “corporatism” to refer to cooperative relationships that develop among business, labor, and the state in modern industrial capitalist societies in order to encourage industrial harmony and efficiency as well as to promote national economic expansion into foreign markets. President Woodrow Wilson (1912–1920) was committed to promoting such a cooperative relationship in the United States, as became clear when he created the Department of Labor and the Commission on Industrial Relations to oversee industrial arbitration and to make recommendations on increasing industrial productivity.

Significantly, when Wilson began to promote military preparedness after the outbreak of war in Europe, he also created a Council of National Defense

to develop plans for the conversion from peacetime to military production. AFL President Samuel Gompers eagerly accepted a position on the council and created a labor subcommittee within the council composed of business, government, and labor representatives to study questions of industrial coordination and to draw up guidelines on wages, hours, and mediation in war-related industries. Gompers’s writings reveal that he clearly believed he was laying the groundwork for a permanent system of industrial arbitration. When a U.S. declaration of war against Germany seemed likely in March 1917, Gompers called a special labor assembly of the representatives of the AFL’s constituent national and international unions and secured a pledge of support for any future U.S. war effort from the meeting. Significantly, AFL-affiliated city labor councils were excluded from the meeting on the grounds that they were centers of pacifism. Local activists in turn charged that the meeting was not democratically constituted and argued that the AFL should instead demand that the government have a referendum vote of the entire population on the question of the war. Gompers, however, ignored such pleas and used the AFL’s patriotic pledge as leverage to gain more positions for AFL leaders within emerging war boards. AFL representatives were also asked to serve on the Root Commission to Russia, and the AFL sent two missions to Europe during the war to win support for Wilsonian war aims.

The AFL’s support for the war thus won it unprecedented diplomatic and domestic political influence within the Wilson administration. Yet its collaboration with the government also spurred intense criticism from socialists, some Industrial Workers of the World (IWW) members, and many local AFL activists. As the historian James Weinstein has documented, a majority within the Socialist Party of America continued to vigorously oppose U.S. participation in World War I after President Wilson’s war declaration and lambasted the AFL for becoming “a fifth wheel on the capitalist war chariot.” The syndicalist IWW viewed U.S. involvement in the war as an unfortunate distraction from its efforts to promote one big union and to encourage militant strike activity in the United States. Although some IWW activists cooperated with the government in its efforts to encourage workers to register for the draft, others carried on what the historian Fran Shor has called a “discursive campaign” against both U.S. involvement in World War I and the AFL’s collaboration with the government. Both the Socialist Party of America and the IWW faced severe government persecution for their questioning of government policy, and in

contrast to the AFL, emerged from the war greatly weakened and faction-ridden.

Some militant AFL-affiliated city labor councils such as the Chicago Federation of Labor (CFL) and Seattle Central Labor Council also renewed their criticism of the AFL by war's end. Such councils, as Gompers and his colleagues correctly assumed, were often more organically connected to immigrant working-class subcultures in the cities they served than to the AFL and became hotbeds of pacifist activity before the United States entered the war. As the historian Elizabeth McKillen has shown, the Chicago Federation of Labor and Seattle Central Labor Council criticized but reluctantly supported the AFL's wartime loyalty pledge after the United States entered the war in 1917 because they believed that to oppose the AFL's foreign policy during wartime would be comparable, in the words of one activist, to being a "scab" during a strike. However, both councils doubted the benefits of wartime collaboration for labor and following the armistice created local labor parties in defiance of the AFL's political policies. The parties raised critical questions about the AFL's corporatist approach, arguing that the AFL should not merely seek equal representation with labor in government councils, but should demand representation for labor "in proportion to its voting strength." In contrast to AFL leaders, who hoped for one labor representative on the peace commission that would travel to Paris at the end of the war, CFL activists asked for representation for workers at the peace conference and in future international organizations "in proportion to their numbers in the armies, navies and workshops of the world." Similar labor parties erupted in some 45 other cities in the immediate postwar era and drove the movement to create the national Farmer-Labor party of 1920, a group with a strongly anti-Wilsonian and anti-imperialist agenda.

Gompers and other AFL leaders, by contrast, remained strongly committed to Wilson and a corporatist approach in the postwar era and sought to convert the war boards into permanent arbitration councils. Gompers also joined Wilson at the Peace Conference in Paris and, at Wilson's request, chaired the International Labor Legislation Commission that created the International Labor Organization (ILO). An advisory body to the League of Nations, the ILO was designed to make recommendations regarding questions of international labor standards and other international issues relevant to labor that could be either accepted or rejected by the League and by individual countries. The organization clearly bore the imprint of Gompers's corporatist thinking: it was

designed to include not just trade union representatives but national delegations composed of two government, one business, and one labor representative. Critics like Andrew Furuseth of the Seamen's Union complained at the AFL convention in 1919 that to trust business and government leaders in the ILO to deal fairly with international labor standards, one would have to assume that "men all of a sudden have become saints."

European labor leaders initially boycotted the Peace Conference because it refused to allow leaders from the defeated countries on French soil and complained that Gompers and the International Labor Legislation Committee had acted without consulting European labor. Ironically, European trade unionists came to dominate the ILO after the U.S. Congress rejected the Paris Peace Treaty, thereby preventing U.S. representatives from participating in the League of Nations or its advisory bodies. The AFL also distanced itself from the International Federation of Trade Unions and Red International after quarreling with these organizations over their support for international strike and boycott activities.

Interwar Years

Isolated from European labor, the AFL devoted its international energies to improving its relations with Latin American labor movements in the 1920s. During 1918, with the help of secret financial aid from the Wilson administration, the AFL had joined with representatives from several Latin American labor movements to create the Pan American Federation of Labor (PAFL). The official goals of the organization were to raise labor standards in Latin America, curb abuses of labor by international capitalists, and promote the growth of unions in the Americas. AFL leaders also hoped to use the organization to resolve immigration problems between the United States and Mexico and to promote AFL trade union principles in Latin America while undermining those of the Industrial Workers of the World and other radical organizations. The Pan American Federation of Labor, however, declined rapidly in the late 1920s as more left-leaning organizations gained influence in Mexico and Latin America and criticized PAFL as an instrument of U.S. imperialism.

Largely isolated from European and Latin American trade union movements, the AFL at first advocated a nationalist approach to the Great Depression. It resisted Franklin Roosevelt's efforts to promote expanded trade through reciprocal agreements with

other countries and instead promoted “Buy American” campaigns and higher tariffs as a way to stimulate the American economy. Yet oppositional subcultures within the AFL helped prevent it from retreating into full-scale isolationism. In particular, the historian Bruce Nelson has documented how maritime workers, whose “legendary rootlessness and transiency” isolated them “from the main integrative institutions of American society,” were also natural internationalists who alerted fellow workers to the dangers of fascism. One typical example occurred in July 1933 when workers from American and Danish merchant ships joined together to pull a swastika from a German ship trying to enter Olympia harbor. Concerns about the growth of fascism in Europe helped to provoke AFL boycotts of German and Italian goods and doubtless played some role in the AFL’s decision to re-affiliate with the International Federation of Trade Unions in 1937.

The AFL’s renewed interest in international labor politics was also likely inspired by the emergence of the Congress of Industrial Organizations (CIO). The CIO is primarily known for organizing mass industrial unions that incorporated most grades of workers in critical industries like steel and rubber. But the CIO also won much sympathy from trade unionists in other countries by initially pursuing a foreign policy that was more accommodating to Latin American nationalism and by seeking to co-operate with trade unions from the Soviet Union during World War II and the early Cold War.

World War II and the Cold War

Because most allied labor movements were hostile to fascism, they were willing to work closely with their governments during World War II on wartime planning issues. But Victor Silverman suggests that the war also encouraged an increased spirit of labor internationalism that pervaded working-class life in the major democracies after 1941. In the United States, increasing numbers of workers no longer felt they could remain isolated from world affairs. Meanwhile, in Britain the war stimulated sympathy for the Soviet Union among workers and resulted in the creation of an Anglo-Soviet Trade Union Committee. The success of this committee in turn led British labor leaders to propose that a new labor organization be created at war’s end that incorporated the Soviets. The AFL refused to attend a conference designed to organize the new labor international, but the CIO eagerly sent delegates and played an important part

in the creation of the new World Federation of Trade Unions (WFTU) in October 1945. The CIO distinguished itself within the organization by championing the demands of trade unions from colonial areas for representation independent of their mother countries.

But the new organization soon fell victim to Cold War politics. From the beginning, the AFL’s Free Trade Union Committee collaborated with the State Department to weaken the WFTU by sowing discord between the communist and noncommunist European trade union movements. The AFL also successfully worked to prevent international trade secretariats from affiliating with it. The CIO, desperate to appear loyal in the face of mounting anticommunist hysteria at home, asked the WFTU to officially endorse the Marshall Plan. As Peter Weiler has written, the “introduction of the Marshall Plan into the WFTU brought the Cold War directly into the international trade union movement.” When the Soviets refused to endorse the Marshall plan, the CIO and many European movements withdrew from the WFTU and joined the AFL in creating the International Confederation of Free Trade Unions (ICFTU). The AFL, CIO, and ICFTU subsequently helped to implement the Marshall Plan in Europe but also played divisive roles within European trade unions movements by encouraging discord between communists and non-communists.

The AFL and CIO’s early Cold War foreign policies also produced mixed results in occupied Japan and in Latin America. In Japan, AFL and CIO leaders became part of the Labor Division of the Occupation bureaucracy and helped to establish the legal framework for Japanese workers to organize unions, bargain collectively, and strike. Yet when the Japanese labor movement started to drift to the left, American labor leaders encouraged the creation of anticommunist cells within the movement and eventually called for the development of an anticommunist labor federation in Japan called Sohyo. In Latin America, AFL leaders co-operated with the Central Intelligence Agency and United Fruit Company in undermining the left-leaning government of Arbenz Guzman in Guatemala. After a coup in Guatemala that was partly financed and directed by the CIA, Carlos Castillo Armas took power and proved quite hostile to the Guatemalan labor movement, dissolving thousands of unions. Anticommunism thus re-inforced a longstanding corporatist animus within the American labor movement that placed greater priority on co-operating with American business and state leaders in promoting national foreign policy goals than on encouraging international labor solidarity.

Debate and Changes in the AFL-CIO's Foreign Policy

After the AFL and CIO merged in 1955, the new labor federation struggled to overcome the increasingly negative international image of the American labor movement. During the 1960s, the AFL-CIO created three new labor centers: the American Institute for Free Labor Development (Latin America), the African-American Labor Center, and the Asian-American Free Labor Institute to provide assistance, education, and training for trade unionists from these areas. Yet some charged that paternalistic assumptions about the need for American trade unionists to uplift their less-developed brethren permeated the centers' educational programs. More troubling than charges of paternalism were claims that the institutes worked with the CIA to undermine democratically elected governments in these areas. The American Institute for Free Labor Development, for example, was implicated in U.S. efforts to undermine the governments of Joao Goulart in Brazil in 1964 and Salvador Allende in Chile during 1973. Such disclosures led labor dissidents to conclude that the institutes had been an exercise in trade union colonialism. Grass-roots labor groups emerged by the 1980s to oppose the AFL-CIO's foreign policies in Latin America.

The Vietnam War further undermined consensus within the AFL-CIO over foreign policy goals. AFL-CIO President George Meany unwaveringly supported the Lyndon Johnson administration's Vietnam policies, as did the yearly AFL-CIO convention. Newscasts, meanwhile, highlighted hard-hatted unionists attacking antiwar demonstrators. But opposition to the war had always existed within militant subcultures in the labor movement, and after 1967, these groups coalesced in the National Labor Leadership Assembly for Peace. Labor opponents of the war like Walter Reuther grew especially vocal when President Richard Nixon widened the war by bombing the neutral country of Cambodia.

Antiwar labor activists helped to revive debate within the labor movement not only about Vietnam but also about the AFL-CIO's broader foreign policy goals during the Cold War. They questioned not only the morality of AFL-CIO Cold War foreign policies aimed at combating or overthrowing left-leaning governments abroad, but also whether such policies served the economic interests of U.S. workers. By using trade union funds to intervene in the internal political struggles of other countries, they argued, the AFL-CIO had sometimes helped to bring to power right-wing dictators who suppressed workers' rights and who created low-wage economies that encouraged U.S. capital flight and investment

overseas. Meanwhile, products from such countries often undersold their American counterparts and caused economic stagnation in the United States. Protests particularly erupted over the role of cheap imports in undermining the sales of American-made products like automobiles.

The end of the Cold War in 1989 helped ensure the birth of a new labor foreign policy. When the reformer John Sweeney was elected AFL-CIO president in 1995, he shut down many of its existing overseas operations, including the CIA-linked American Institute for Free Labor Development, and created in their place the American Center for International Labor Solidarity. The new organization, as the name implied, was designed to encourage transnational labor strategies for counteracting the global machinations of corporations rather than to aid U.S. government interventionism in other countries. Many individual unions within the AFL-CIO have, for their part, also forged ties with foreign union movements in order to develop effective tactics for coping with multinational corporations and the global economy. Meanwhile, the AFL-CIO's continuing opposition to the North American Free Trade Agreement suggests that its leaders have become more critical of the corporatist and Cold War assumptions that freer markets always bring economic expansion and create freer and more prosperous workers. Since bipartisan consensus has often reigned on NAFTA, some activists have rallied behind a new labor party movement as a way to gain an independent voice on foreign policy issues. A new generation of labor leaders also seems dedicated to developing increased international influence by continuing the task of building a strong international labor movement that was begun in the nineteenth century.

FOSTER, FRANK K. (D. 1909) **Labor Activist**

The 1880s were a tumultuous decade for the labor movement in the United States. Not only did hundreds of thousands of workers join labor organizations, participate in strikes, and struggle for the eight-hour day, but they also engaged in arguments about the form, scope, ideology, strategies, and tactics appropriate for the new labor movement. Frank K. Foster was one of the most important voices in these debates.

Like many of the key labor activists of this era, Foster straddled social classes in his own work and social life. He learned the printer’s trade, participated as a leader in the International Typographical Union

(ITU) at the local and national levels, and became editor of several newspapers that not only provided news coverage and editorial statements but also promoted poetry and fiction. Foster himself wrote some of this material and, later in life, published a novel and a collection of poetry.

In the early 1880s, Foster, like many of his peers, sought to maintain membership in both the trade union movement (not only the International Typographical Union, but also the Boston Central Trades and Labor Union, and the Federation of Organized Trades and Labor Unions, the precursor to the American Federation of Labor) and the Knights of Labor (KOL). He was a visible and prominent advocate of both organizations at the national as well as the local levels. At the same time, he was president of the Cambridge local of the ITU, secretary of the Boston Central Trades and Labor Union, and editor of the Haverhill *Daily and Weekly Laborer*, the official Massachusetts newspaper of the Knights of Labor. In 1886, he even sought the Democratic Party nomination for lieutenant governor of Massachusetts.

But by 1886, internal tensions were rippling through the Knights of Labor, revolving around the Order’s relationship to the growing trade union movement, the struggle for the eight-hour day, the fallout from the Haymarket violence, arrests, trials, and executions in Chicago, the emergence of socialism and labor politics, and the issues of racial justice raised by the Richmond, Virginia, KOL General Assembly in October 1886. Of course, these conflicts were also overlaid by personality conflicts among key figures in all the movements, from Terence Powderly in the KOL to Adolph Strasser and Samuel Gompers in the American Federation of Labor (AFL), and the likes of Albert Parsons, Daniel De Leon, Eugene Debs, and others, at first on the margins, but increasingly building followings. Activists like Frank K. Foster were caught in the middle, the ground beneath their feet pulling apart into a chasm.

By 1887, Foster—and many of the other men from similar craft and experiential backgrounds—were moving into the trade union camp. They were uncomfortable with the increased criticism of craft unionism, collective bargaining, and the protection of union work rules emanating from within the KOL, as well as the Order’s apparent move toward cooperatives, independent labor politics, and ideological radicalism. Foster expressed many of his concerns in a chapter on the history of shoemakers’ unionism, which he contributed to George McNeill’s seminal volume, *The Labor Movement: The Problem of Today*, in 1887.

In this essay, Foster criticized the pressures being exerted by the Knights of Labor to integrate shoemakers into “mixed locals” rather than allowing them to maintain their specific, separate trade organizations. At the same time, Foster praised the KOL’s commitment to solidarity, their ability to organize community support for striking shoemakers in a number of struggles, and their efforts to promote labor activism.

Indeed, although Foster ultimately moved solidly into the AFL camp, becoming the editor of the *Labor Leader*, the voice of the Massachusetts American Federation of Labor, he never became an advocate of mere “pure and simple trade unionism.” While he advocated craft organization, apprenticeship regulations, control over the labor market, and the values of skilled labor, he also upheld principles of solidarity, class organization, and the importance of a broad labor movement. Interestingly, he even became a more outspoken voice for the inclusion of cultural material and perspectives within the movement, encouraging the writing and publication of poetry and fiction. Foster—and many of his peers—continued to see the United States in class terms and to understand workers as producers of a class-based culture that revolved around values of equality, independence, justice, and solidarity. They may have rejected socialist ideologies, the organization of cooperatives, and the practice of independent labor politics, but they remained committed to a vision of broad social transformation.

FOSTER, WILLIAM Z. (1881–1961) Communist Party Activist

William Zebulon Foster was an American socialist, syndicalist, and communist leader who participated in some of the most dramatic conflicts of twentieth-century American labor and radical history. Coming of age and reaching maturity in the late nineteenth and early twentieth centuries, he was stirred and influenced by militant U.S. trade union struggles raging throughout the nation and by international revolutionary developments in Russia and Europe. His career within the Communist Party (CP), beginning in 1921, encompassed the decades of the Party’s most spectacular rise and decline. Foster’s ideological loyalties and personal dilemmas reflected the continuing contradictions and tensions inherent in the intersections of national and international radical movements on American soil.

Born in 1881 in Taunton, Massachusetts, to an Irish-Catholic immigrant family, Foster spent most of his youth and young adulthood not in Massachusetts, but in Philadelphia’s working-class West End, to which his parents had moved soon after his birth. There, he came into contact with a boisterous, urban political and trade union culture, characterized by militant strikes and numerous competing strains of socialism and syndicalism. Surrounded by constant local and national evidence of the class struggle—the Homestead steel strike of 1892, the Pullman strike of 1894, and the Philadelphia street railway strike of 1895—Foster drank deeply of the culture of working-class radicalism. His early experience with strikes taught him about the “class struggle” and formed the foundations of his lifelong dedication to revolutionary action.

The disintegration of his family following the untimely death of his parents led Foster into an itinerant lifestyle. He traveled widely, developed extensive contacts with a multiplicity of workers, and took up various jobs: newspaper hawker, laborer, steamfitter, fireman, engineer, seaman, railroad worker, and miner. He worked in the streets of West Philadelphia, the packinghouses of Chicago, and the steel towns on the south shore of Lake Michigan, learning from each encounter with skilled and unskilled labor, and with inflexible and exploitative employers.

Drawn into the world of De Leon socialism and into an increasingly international radical community, Foster soon became associated with left-wing socialists who eschewed electoral politics and instead emphasized industrial unionism and worker initiatives.

Though he had joined the Socialist Party in 1901, he was expelled in 1909 during a factional battle between left- and right-wing Socialists in Washington state. Hardly one to stay unaffiliated, Foster soon joined the recently established Industrial Workers of the World (IWW), an organization more consistent with his syndicalist beliefs. He forged broad and disparate contacts with radicals around the country—in Seattle, the Midwest, and especially Chicago, California, New York, Montana, the South, and Canada.

His travels soon widened; he went abroad in 1910 as an IWW representative and attended the International Union Conference in Budapest the following year. He began to expand his familiarity with French, English, and German syndicalism and increasingly identified himself with a worldwide worker movement. Upon his return from Europe, Foster used his own organizational experiences and examples from abroad to develop institutional forms that he hoped would foster industrial and syndicalist unionism in the United States. The British syndicalist Tom Mann's British Industrial Syndicalist Educational League (ISEL), for example, provided Foster with a model for the Syndicalist League of North America (SLNA), founded in 1912, the International Trade Union Educational League (ITUEL), founded in 1915, and later the Trade Union Educational League (TUEL), established in 1920. Through his immersion in the first two decades of the twentieth century in international labor and radical organizations, Foster soon became a global, and globally known, labor activist.

Throughout his career, Foster continually pointed out and sought to remedy the weaknesses inherent in America's undisciplined, parochial, and craft-dominated trade union movement. His early pre-CP activism was heavily focused on nurturing militant strike movements and building an internal left opposition group to challenge Samuel Gompers's leadership in the American Federation of Labor (AFL). All of this was consistent with his early syndicalist ideals. World War I and the growing militancy of workers that came in its wake provided Foster with several opportunities to demonstrate the potential of industrial unionism. In 1917, while a railway car inspector in Chicago and a member of the AFL Railway Carmen's Union, Foster joined with the progressive labor leader John Fitzgerald, president of the Chicago Federation of Labor, in a successful effort to organize wartime packinghouse workers in the city. Over 200,000 workers joined the newly established organization. Then, with his now established and well-earned status as a shrewd and successful organizer, Foster took on his most significant challenge.

It came in the post-World War I era, when he led a coalition of 24 steel industry craft unions in a unified attempt to re-organize the steel industry (an older union, the Amalgamated Association of Iron, Steel and Tin workers had been reduced to impotency by Andrew Carnegie, J. P. Morgan, and a coterie of virulently anti-union steel industry managers). The steel organizing drive of 1918–1919 began brightly, with the rapid recruitment of over 100,000 workers. The steel organizing committee hoped to avoid a strike and sought immediate collective bargaining. Its initial demands included an eight-hour day (it was 12 hours then) and an increase in wages. But Elbert H. Gary, chairman of the board of the United States Steel Corporation, declined to “discuss business” with any trade union representatives. The call went out for a strike, and the Great Steel Strike of 1919 began in late September of that year. Within a week, 350,000 workers in nine states had put their tools down and ceased work. The 1919 Steel Strike anticipated the more general industrywide strikes of the 1930s CIO era in its scope and goals. Foster and his allies were attempting to demonstrate to AFL leaders the potential of industrywide organizing and bargaining. Yet, despite Foster's outstanding organizational and leadership skills, the strike failed, and so did postwar efforts to build an industrial labor movement in the United States.

Though there is disagreement over which factors—domestic or foreign—most heavily shaped the trajectory of Foster's life in the post-World War I period (reflected in the contrasting views of Foster's two major biographers, James Barrett and Edward P. Johanningsmeier), it is certainly obvious that Foster's immersion in international politics had an important influence on his ideological development. His encounter with the Russian Communist Party in 1921 and his growing familiarity with the course of the Russian Revolution led Foster to a belief in the potential power and need for a disciplined, centralized, and militant revolutionary cadre. It also led him into the American Communist Party in late 1921, where he quickly rose to the front ranks of the organization. Three times he ran as the Party's candidate for the U.S. presidency, in 1924, 1928, and again in 1932.

Throughout the 1920s and early 1930s, as Foster navigated between shifting Communist Party lines and existing trade union realities, he was continually forced to compromise his own beliefs on how best to engineer the transition from American business unionism to a revolutionary working-class trade and political movement. Foster's varied work experiences amongst skilled and unskilled laborers, his political and organizational experiences in Seattle and Chicago, and during the steel strike, led him again and

again to a recognition of the need to work within existing trade union institutions and transform and radicalize them. But the debates within the CP on organizing autonomous revolutionary unions or “boring from within,” supporting or undermining third-party initiatives, and cultivating progressive allies or keeping them at arm’s length were not always resolved in harmony with Foster’s better judgment. His own experiences taught Foster that working with existing organizations and steering them leftward was the most sensible way to operate within American institutional and ideological realities. That belief was reflected in the Trade Union Education League (TUEL), which he helped found in 1920 and which he brought into the Russian *Profintern* (the Red International of Labor Unions, the RILU) in 1923. The goal of the TUEL was to steer conservative AFL and independent unions to the left by helping to foster insurgent and militant worker movements *within* existing craft-dominated organizations. Nonetheless, Foster was forced to adapt to Party dictates when, during the Stalinist “Third Period” from 1928 until 1934–1935, he yielded to a dual-union emphasis and concentrated his efforts on building competitive and more militant alternatives to existing AFL organizations. The TUEL gave way to the TUUL, the Trade Union Unity League, in 1929, and began immediately to establish new unions. Around a dozen industrial unions were founded in the following six years, in a variety of economic sectors: textiles, marine labor, mining, shoe and leather manufacturing, agricultural labor, and more. More than 50,000 workers were soon organized by TUUL affiliates.

With the rise of the Congress of Industrial Organizations (CIO) and the abandonment of Third Period Communism in 1935, Foster was able to return to a personally more appealing “boring from within” strategy. He and the Party helped funnel hundreds of effective and disciplined Communist organizers into John L. Lewis’s newly established industrial union organization, assisting in the transformation of the American labor movement in the 1930s and 1940s.

Following the uncomfortable and potentially disastrous two years of the Hitler-Stalin Pact, Soviet and U.S. unity during World War II helped revive and sustain the Party’s effective trade union work. But the political and economic de-radicalization of the Party during World War II by Party head Earl Browder (he transformed the CPUSA into an “association”) alienated Foster from Browder and led the former to spearhead efforts to oust Browder in 1946. Adapting to American realities and encouraging wartime unity was one thing; but forsaking basic socialist principles was another. When Browder moved further and further to the right and became almost

indistinguishable from Franklin Roosevelt, Foster had enough. The publication of the famous critical letter by French Party leader Jacques Duclos in the late spring of 1945 gave Foster and his allies all the ammunition they needed to purge the now-discredited Browder. Foster succeeded Browder in 1946 and for the remaining 15 years of his life led the Party during its most sectarian and self-destructive period. Unwilling to tolerate deviations from Party discipline, Foster stifled various attempts to reform and democratize the U.S. party during the Cold War years and was unwilling to challenge Moscow’s violent put-down of the Hungarian Revolution. Even after Khrushchev’s revelation and condemnation of Stalin’s excesses in 1956, Foster remained steadfast in holding on to Communist orthodoxy. He became rigid in his dealings with internal dissent and unwilling to tolerate the many calls for reform that spread through the Party’s rank and file in the wake of Khrushchev’s disclosure of Stalin’s many moral and ideological transgressions.

In the final years of his life, in the late 1950s, as he wrestled with illness and remained unbending in his ideological course, Foster watched and—according to many scholars—contributed to his Party’s self-destruction. Over 80% of the CP’s membership abandoned the organization in the remaining years of the decade. Finally, succumbing to a heart disease that plagued him since the early 1930s, on September 1, 1961, in a sanatorium just outside of Moscow, Foster died.

FOURIERISM

Fourierism—also called Associationism by Americans—was a nineteenth-century communitarian movement with wide appeal in the United States. Between 1841 and 1846, idealists and reformers, working under the tutelage of boosters like Albert Brisbane and Horace Greeley, inaugurated 25 communities—including the famous Brook Farm—that housed between 7,000 and 8,000 people. The founding of a few other colonies followed in the 1850s, and the last Fourierite colony lasted until 1892.

FOURIERISM

The historian Carl Guarneri has estimated that when interested hangers-on are counted among the Associationists, their numbers reached perhaps 100,000. Although none of the Fourierite communities lasted long, while they did last they featured innovative experiments in the management of labor and in progressive education, and were hotbeds of reformist energy.

Charles Fourier, a French cloth merchant and obscure social theorist who lived from 1772 to 1837, was never taken seriously in his own country, where only one Fourierite community was ever constructed. Fourier's ideas were translated to the American context by Albert Brisbane, a native of New York who experienced a forceful ideological conversion while in Europe, and subsequently made popularizing the ideas his life's work. Through the pages of the *New York Tribune* and several books, Brisbane transformed Fourier for an American context, leaving out some of Fourier's more controversial notions.

What was left was "attractive industry," the idea that humans had a limited variety of personality types and that each personality was uniquely suited to a type of industry. Through an emulative vocational education that began as soon as a child could walk and talk, people might be ideally matched with the type of light industry or agricultural work that would uniquely suit them. Accompanied by bands of music and wearing colorful uniforms, they would march to the fields or workshops. There, they would have interesting workdays, full of variety, spurred on to great heights of productivity by friendly competition among "groups" and "series" of workers and by the presence of attractive workmates of the opposite sex. In Fourier's notion, there was someone in a community who was perfect for every job—young boys, who love to play in mud, would naturally serve as garbage collectors for a community, for example.

Fourier had envisioned his communitarians living in phalansteries, symmetrical communities of 2,000 individuals whose geographic planning resembled college campuses. The phalanstery, to be created by members taking out shares in a joint-stock company, was the optimal mix of country and city: a little castle in the midst of the rural idyll. In reality, no Associationist community in the United States was able to attract 2,000 residents—the longest-lived community, the North American Phalanx, had about a hundred. Nor were the Associationists able to construct phalansteries on the scale that Fourier had detailed in his drawings—some, like the community in Ceresco, Wisconsin, had plenty of land but not the capital for grand public buildings; others were swamped with residents and forced to build quickly. Forced to compromise on these key issues, Associationists used

available buildings or constructed group housing that resembled the local vernacular architecture.

While Fourier had emphasized agriculture, especially the growing of fruit, as the prime industry for his communities, American Fourierite communities practiced a wide variety of industries, including shoemaking, milling, and tailoring. Like many so-called utopian socialists, Fourier had boasted of the advantages to women of housework being done communally, but some women who joined the communities complained that equality in tasks and pay existed more in theory than in practice. This was a characteristic of the Fourierite communities: even the groups, series, and task rotations so integral to Fourier's plan were impossible to achieve with tens or hundreds rather than thousands of members.

Fourierite communities were notable for their progressive ideas about the education and role of children. In 1844, under the supervision of member George Ripley, the Brook Farm commune became a Fourierite experiment—one that would later be chronicled by Nathaniel Hawthorne in *The Blithedale Romance*. Brook Farm would become best known for its school—a school that attracted children from many of the area's best families. Children in Fourierite communities earned wages for their work and could become self-supporting by the time they were in their teens—a fact that conflicted with traditional family arrangements in some of the communities.

While they lasted, Fourierite communities promised people an altered lifestyle that they hoped would serve as a model for broader societal change. For their residents, they provided an active social life, with musical evenings, lecture series, charades, sledding, and festivals that they created themselves. Fourierite communities were also hotbeds of reform in antebellum America. Reforms embraced by individuals and groups included temperance, vegetarianism, the abolition of slavery, and land reform. Fourierites viewed all of these as inferior to the one great reform: when society was organized around communitarian lines, all of the other issues could easily be mastered.

What explains the popularity of Fourierism? At a time of commercial transformation in America, during which the structure of the workplace was changing and the waged workplace increasingly separate from the home, Americans were attracted to many kinds of alternative living arrangements or "patent office" models for the improvement and reconfiguration of society, including Shakerism, Mormonism, and the Oneida Community. The Fourierites differed from the others by their willingness to embrace new technologies, both in their daily lives and to propagate their propaganda. In addition to Brisbane's column in the *New York Tribune*, Fourierites had their

own wide-circulation newspapers, the *Phalanx* and later the *Harbinger*, which helped to spread news of the far-flung communities and to unite physical participants in the program with a network of interested reformers and followers. John Allan and John Orvis, the movement's itinerant lecturers, traveled through upstate New York and Massachusetts and as far west as Wisconsin, taking advantage of the mania for lyceums and self-improvement. Capitalizing on the desire for voluntary association among new urban dwellers, the Fourierites formed clubs of followers in major cities. The response was strongest among the middle classes and skilled artisans.

Despite the strong appeal of both the ideology and its propagation machine, the longest-lived antebellum experiment lasted only 12 years. Individuals chafed under the restraints imposed by a minutely planned vision of society. Strained finances could not cope with fires that claimed major buildings. Perhaps most important, the Fourierites, unlike later Socialists, never rejected the individualist, familial, and private-property-owning aspects of American society, making it easy for members of the communities to drift away and seek their fortunes in the world once the American economic situation improved in the 1850s.

FRATERNAL ORDER OF POLICE

To portray the Fraternal Order of Police (FOP) as a genuine labor union is historically inaccurate. During most of its existence, the FOP maintained that the unionization of any police force was dangerous and vigorously resisted any attempt to be labeled a police union by city officials or other labor organizations. Although it has long been organized in a manner similar

to labor unions, with local lodges subordinate to state lodges, which are affiliated with the national Grand Lodge, it is only recently that the FOP has adopted the purpose and tactics of traditional labor unions.

Founding

The Fraternal Order of Police was founded in 1915 by two Philadelphia police officers, Martin Toole and Delbert Nagle. The two officers possessed a distinct view of the United States in general, and American police in particular, that stressed the exceptional nature of American civilization and the role of the police as its guardians. They looked to an idealized Roman Empire as their civilizational model and adopted the Roman motto "*Jus, Fidus, Libertatum*" ("Law is the safeguard of liberty") as their own. Ironically, this Roman motto was the source of some confusion within the FOP. Since its founding in 1915, the organization had translated the Latin phrase as "Fairness, Justice, Equality." However, in the early 1920s, a member of the Ladies Auxiliary of the FOP pointed out that the word *fairness* could not be translated from the Roman phrase *Jus, Fidus, Libertatum*. Hence, the translation was adjusted to "Justice, Friendship, Equality." The correct translation (Law is the safeguard of liberty) was not recognized and adopted until 1968, by which time changing the Latin motto on all FOP publications would have been too costly.

The political context during the founding of the FOP accounts for its traditional anti-union stance. Europe was engaged in World War I when the order was founded in 1915. After the sinking of the *Lusitania*, Delbert Nagle, the first grand president of the FOP, assured the public that his organization would be the first to rally around the flag during any national crisis. When the United States entered the war, the FOP passed a resolution pre-emptively endorsing every act of the president. After the war, as anti-German and anti-immigrant sentiments transformed into antiradical hysteria, all forms of workforce organization became suspect in the view of industry and government. Since local police forces were so often used against striking workers, a police union seemed particularly troublesome, if not contradictory.

It was this same tension between the police officers' obligation to break up strikes and their own desire to fight for better pay and working conditions that shaped the stridently conservative identity of the Fraternal Order of Police. From the very beginning, the Order's founders insisted that they had no desire to form a police union. The Order's first constitution reflected this concern; union affiliation and police

strikes were strictly prohibited. In fact, when representatives from the American Federation of Labor (AFL) contacted the FOP leadership about building a working relationship, the Order's grand president staunchly refused on the basis that police siding with striking workers could result in social upheaval.

Expansion

The FOP's overt opposition to police unionism during the post-WWI Red Scare stimulated a substantial increase in FOP membership. Ironically, it was the actions of a non-FOP affiliated police force that facilitated the swelling of the FOP's ranks. The widespread labor radicalism of the era produced the first police strike in American history. Boston police officers went on strike in 1919 when the city refused to recognize their affiliation with the AFL. Governor Calvin Coolidge had to call in the National Guard to quell the violence and looting that took place in the wake of the police strike. The corresponding backlash by city officials and the national media produced a nationwide assault on all efforts by police to organize. Although the FOP was not exempt from these attacks (it was repeatedly condemned as radical, anarchist, Bolshevik, and Communist), the Order's forceful denunciation of all things radical and its continued opposition to police unionism and strikes convinced most of its critics that it was sufficiently antiradical. Since most states passed laws banning organized bargaining rights for police officers in the wake of the Boston strike of 1919, the FOP remained as the only viable, nonunion alternative for police officers. From that moment until the 1960s, the FOP lobbied legislative committees and employed publicity campaigns to improve the working conditions of its members.

Membership in the FOP also increased when it proved its ability to deliver better pay and working conditions to prospective members. Originally conceived as a national organization, each gain made by the FOP in its mission to improve the lives of police officers has served as a major selling point in its effort to garner new members. The Order made its first attempt to expand shortly after its inception during WWI. Its first major victory came in 1916 when the Pittsburgh lodge successfully lobbied the city council to give police officers two days off a month with pay. The following year, the original founders mandated the publication of an official FOP journal as a means to communicate with its rank-and-file members and to raise funds through advertising. The use of revenues from the publication soon became a contentious issue within the FOP when Nagle and Toole made the

journal their private enterprise. They were soon purged from the FOP and accused of fraud, misappropriation of funds, and theft (though criminal charges were never brought against them). Despite such an inauspicious end for the Order's founders, the organization grew steadily during the 1920s as antiradical sentiments fueled heightened concern for law and order. The FOP grew so rapidly in the 1930s that a general instability descended upon the Order as huge numbers of new members created new coalitions and factions within the original organization. The ensuing power struggle pitted founding members from the Pittsburgh lodge against new members from Ohio, Indiana, and West Virginia. Fistfights during the Order's annual conventions were not an uncommon occurrence throughout this period. Stronger state lodges emerged from the infighting, and membership tripled from 5,000 in 1930 to 15,000 in 1940. Though concentrated in the Midwest, the FOP was now the largest police organization in the nation, stretching from Pennsylvania to Arizona. During WWII, dissent within the ranks decreased as new membership growth slowed. In 1952, the FOP began publishing its Annual Survey of Salaries and Working Conditions of the Police Departments in the U.S. This allowed all officers, departments, and city officials to have access to comparative statistics on salaries and working conditions from police departments throughout the country. The Annual Survey proved to be the single most important tool in the FOP's lobbying effort on behalf of its members. By 1960, with 500 local lodges and FOP membership at 40,000, the Order had become a powerful national organization able to fight for and defend the interests of police anywhere in United States.

Challenges

The 1960s were the most critical years for the Fraternal Order of Police. A growing emphasis by civil rights organizations on police misconduct led to calls for civilian review boards that would have the power to discipline abusive police officers and overly aggressive tactical units. The Order's uncompromising defense of any officer charged with police brutality brought thousands of officers into the ranks of the FOP. In just five years, the FOP grew by 20,000 members to a total of 60,000 in 1965. Since civilian review boards represented a threat to both local police forces and the local governments that employed them, a close working relationship developed between city governments and local FOP lodges. The Order organized legal defense funds and alarmist publicity

campaigns to resist challenges brought by the American Civil Liberties Union (ACLU), Congress of Racial Equality (CORE), Student Nonviolent Coordinating Committee (SNCC), Southern Christian Leadership Conference (SCLC), and even Robert Kennedy's Justice Department. As quoted in Justin Walsh's history of the FOP, "The public should be scared into supporting us," suggested Grand Lodge President John Harrington. The tactic worked; few civilian review boards were ever established.

This period was also marked by a growing police unionization movement across the country. Existing unions such as the International Brotherhood of Teamsters and the American Federation of State, County, and Municipal Employees, as well as new unions such as the National Union of Police Officers, the International Brotherhood of Police Officers, and the International Conference of Police Associations, attracted growing numbers of police officers because of their willingness to engage in collective bargaining and even strikes to fight for the interests of its members, tactics that the FOP leadership had resisted for 50 years. The more militant posture of these unions forced the FOP to adopt a similar stance. A change in FOP attitude toward union activity and strikes became clearly evident by 1967 when FOP members refused to reaffirm the Order's ban on such actions. FOP members engaged in their first strike in Youngstown, Ohio, on September 6, 1967, and received a \$100 a month pay raise. The FOP has functioned as a genuine labor union for police officers ever since. By 1975, FOP membership had risen to 120,000.

Political Efforts

Broader issues for which the FOP has lobbied for in the past include effective gun control laws and forced sterilization of repeat offenders. In addition, the FOP has organized against affirmative action hiring of women and minorities and is on record as opposing the hiring of homosexuals. The FOP leadership, in accordance with the more activist posture of the 1960s, endorsed the segregationist George Wallace for president in 1968 and Richard Nixon for re-election in 1972. By 1976, the FOP had begun to routinely endorse and campaign for pro "law and order" politicians.

FREE-SOILISM

"Free-Soilism" refers to the popular mid-nineteenth-century plan to provide cheap federal land in the West to poor settlers while excluding slavery from that same land—in essence, free land and land free of slavery.

Calls for equitable distribution of public land dated back to eighteenth-century Enlightenment radicals. Building on this tradition, Jacksonian-era labor reformers developed the concept of free soil as a cure for low wages and unemployment suffered by urban workers. Free productive land parceled out in small plots would support underemployed workers, end land speculation, and, by drawing labor out of the cities, improve conditions for those remaining behind. Opposition to slavery fed into land reform because slaveholders constituted a powerful interest that threatened to engross public lands at the expense of ordinary Americans. The free-soil critique of slavery owed more to labor reform arguments that banks and corporate monopolies undermined the equality of white citizens than it did to the abolitionist argument that slavery and the racial hierarchy that supported it were morally wrong.

George Henry Evans, an immigrant British printer and editor, led the fight for free soil. He developed his ideas while involved with the utopian Robert Dale Owen and the Workingman's Party in the late 1820s. The agrarian Thomas Skidmore and the anti-slavery Democrat William Leggett also influenced Free-Soilism's development. In the mid-1830s, advocates of free land distribution included the National Trades Union, the antimonopoly Locofoco faction of the Democratic Party, and, for a time, New York City politico Mike Walsh. In 1844, Evans and two other printers organized the National Reform Association, headquartered in New York City. National Reformers promoted free soil by urging workers to "vote yourself a farm."

Evans opposed slavery and was one of the few whites to praise Nat Turner's rebellion. However, Evans also criticized abolitionists for paying more attention to slaves than to white wage earners. That narrowed vision of free labor's concerns enabled Free-Soilers to win support from racist whites who nonetheless worried about the growing power of slaveholders, but it undermined political antislavery's commitment to racial equality. The racism of Free-Soilers led abolitionist followers of William Lloyd Garrison to keep the movement at arm's length.

Nonetheless, as foes of slavery, Free-Soilers attracted some abolitionists who had supported the Liberty Party in 1840 and 1844. Free soil also appealed to tenant farmers in Upstate New York

who fought against high rents. Followers of the communitarian theorist Charles Fourier, including Albert Brisbane and, through Brisbane's influence, editor Horace Greeley, also took up the cause of free soil. Along with these constituencies, free soil won adherents in the major parties who worried about the growing power of slaveholders. Northern Democrats witnessed this power in 1844, when southerners blocked New Yorker Martin Van Buren's nomination for president because they doubted his support for slavery's expansion. Similarly, antislavery Conscience Whigs, such as Massachusetts' Charles Sumner, grew restive at the collusion between "the lords of the loom and the lords of the lash"—northern industrialists and southern.

The annexation of Texas in 1845 and the ensuing war with Mexico brought southwestern territories under U.S. control and heightened northern concern that slaveholders would dominate settlement of public lands. In 1846, David Wilmot, a Democratic congressman from north-central Pennsylvania, proposed a ban on slavery in land conquered from Mexico. The so-called Wilmot Proviso was narrowly defeated, but it sparked a new political movement. In 1846, the first Free Soil Party appeared in New York. In New Hampshire, a coalition of free-soil Whigs and Democrats led by John Parker Hale won control of the legislature.

In 1848, the Free Soil Party nominated Van Buren for president. Van Buren campaigned on free soil, but he advocated other labor reform issues such as public works, cheap postage, and the elimination of unnecessary public offices. In the industrial state of Massachusetts, Free-Soilers pushed for the 10-hour day and enjoyed strong support in manufacturing centers like Lynn. Although the Free Soil Party refused to endorse racial equality or immediate emancipation, free black abolitionists like Frederick Douglass and Charles Remond supported it as a necessary step in converting white northerners to anti-slavery. In the election, Van Buren polled 291,804 votes, 10% of the national total and 14% of all northern ballots. The Free Soil Party did best in rural areas where small farmers had little access to prosperity-generating canals and railroads.

The federal Compromise of 1850, which brought California into the union as a free state, temporarily quieted conflict over western land, but the opening of Kansas and Nebraska to slavery in 1854 re-ignited free-soil protests in the North and spawned the Republican Party. The Kansas-Nebraska Act rescinded an 1820 ban on slavery in these lands by allowing voters in Kansas and Nebraska to decide slavery's status for themselves. Across the North, workers

and farmers worried that wealthy slaveholders would buy up the best land, wring profits from it with unpaid slave labor, and drive out ordinary farm families. Exploiting these fears, the new Republican Party promised to provide white families with free homesteads in the West and stop slavery's expansion.

Over the next six years, Republicans challenged the increasingly proslavery and prosouthern Democratic Party for control of the federal government. Like other Free-Soilers, Republicans emphasized slavery's harm to whites and downplayed universal emancipation and racial equality. That argument had mass appeal in the North where anger at the Slave Power had to counterbalance white racism that had in earlier times helped slaveholders win support in the free states.

The Republican Abraham Lincoln's victory in the 1860 presidential election sparked the secession of 11 slave states, and civil war ensued. During the Civil War, Lincoln's administration made good on free-soil promises by passing the Homestead Act of 1862, which gave 160-acre lots to farmers who paid a \$10 fee and settled the land for five years. In 1863, Lincoln announced the Emancipation Proclamation, which freed slaves in rebel-held territory, and, in 1865, the Thirteenth Amendment to the Constitution banned slavery throughout the United States.

FRENCH-CANADIANS

Since the establishment of New France in 1608 and its subsequent conquest by the British following the Seven-Year War, French-Canadian settlers were largely concentrated along the Saint Lawrence Valley,

with a significant minority scattered throughout its vast hinterlands. One of the major activities they were engaged in—the fur trade—had taken many of them to the most remote corners of the continent, and even after the Conquest, many remained in the employ of fur companies as voyageurs, *engages*, and artisans. When in 1867 British North America was re-organized into the Canadian Confederation, French-Canadians made up the majority of the population of the newly created province of Quebec.

Throughout much of the nineteenth century, French Canada remained essentially an agrarian society despite the growing importance of proto-industrial activities and a few commercial centers such as Quebec City, Three Rivers, and Montreal—soon to emerge as the province's leading manufacturing and metropolitan area. The co-existence of commercial and subsistence agriculture proved unable to sustain the natural growth of this rural population, whose birthrate was one of the highest in the western world. Moreover, in the absence of adequate public policies to encourage the settlement of largely forested hinterland regions, rural French-Canadians began to overflow from the old parishes toward commercial centers and increasingly across the border and into the United States. Public concern about the loss of population to the United States was voiced as early as the 1830s. By mid-century, the southward population movement seemed to have become irreversible, as ascertained by an 1857 Quebec public inquiry. While the majority crossed into rural districts of neighbouring states, and a few joined the expanding agricultural frontier in the American Midwest, a growing number migrated seasonally to work in canal and railroad construction and logging—thus providing a significant labour input to the initial phase of industrialization associated with antebellum America.

Cross-border migration accelerated dramatically following the Civil War and reached its all-time peak in the 1880s, when the net population loss to the United States for that decade rose to 150,000. Despite the ensuing declining trend, French-Canadians continued to migrate south in large numbers up until the onset of the Great Depression. Estimates covering the 1840–1940 period have placed their net migration to the United States at 900,000.

Despite the multidirectional nature of these cross-border flows, two sections in the United States acted as major poles of attraction: the Great Lakes region, owing—at least initially—to the previous existence of French-Canadian enclaves that had survived the decline of the fur trade; and New England, on account of the geographical proximity of its expanding labour markets.

French-Canadians in the Midwest

On the eve of the Civil War, the states of Michigan, Illinois, and Wisconsin had become the destination for nearly one half of all French-Canadians residing in the United States. Of these, Michigan soon rose as by far the leading pole of French-Canadian settlement. One key factor was the pull exerted by the forestry industry, whose rapid development by the 1860s had made Michigan the major producer state in the union. Many French-Canadian lumberjacks had followed the forestry industry in its continental move from the East to the West; others, encouraged by improvements in fluvial and rail transportation, joined it in Michigan as enclaves and communities started to multiply, particularly in the Saginaw Valley, where much of the forestry production was concentrated. By 1885, French-Canadians made up 13% of the valley's population, with more than half of their labour force employed in logging operations and sawmills—thus making them the largest immigrant group within the valley's forestry industry. So intimately bound was their economic future to that resource industry that when a major strike broke out in 1885 around the issue of a shorter working day—one that proved to be the major labour/capital confrontation in the valley during that era—French-Canadians joined their fellow immigrant and American workers, and offered their community center for rallies and other organizing purposes. Outside the forestry sector, a significant minority of French-Canadians residing in the valley were engaged in skilled trades, either as employees or as independent craftsmen. Others became well established in the service sector (hotels, saloons), often as owners.

In the northern section of Michigan—known also as the Keweenaw Peninsula—French-Canadians began to arrive in the 1850s. To a large extent, their early arrival and subsequent influx were related to the rapid growth of copper mining and its central role in the region's economy. So acute was the labour shortage in this sector that on many occasions employers had to send recruiting agents across the border and entice Canadians with the promise of higher wages. By the end of the century, French-Canadians made up 12% of the peninsula's population and had created a stable institutional network, particularly in the towns of Lake Linden and Calumet.

Not surprisingly, mining-related work became the leading single sector of occupation among French-Canadians, followed by logging and a variety of service-related occupations.

Among the manufacturing centers of the Midwest, it was the city of Detroit that exerted by far the most important pull for French-Canadians. By 1900, they

had become the leading immigrant group after the British, the Anglo-Canadians, and the Polish, and were engaged primarily in unskilled and semiskilled occupations.

Migrating to New England

However significant the influx of French-Canadians into the Great Lakes region, its importance within the overall migration movement decreased substantially as the industrial landscape of the nation changed. By the turn of the century, in fact, for every French-Canadian headed to the Great Lakes states, four more were choosing the New England states as their destinations.

During the first half of the nineteenth century, much of the French-Canadian population overflow into New England border counties—from Vermont to Maine—had been essentially an agrarian phenomenon. But with the unprecedented industrial growth marking the “Gilded Age,” New England consolidated its role as a major pole of attraction for immigrant labour in the nation.

Of all manufacturing sectors, it was textile production—mostly concentrated in central and southern New England—that drew the largest proportion of French-Canadians. In ever-growing numbers, they discovered the possibilities that the textile mills to the south offered them, and inversely, textile employers discovered the Quebec countryside as a source of labour willing to submit to the particularly harsh working conditions prevailing in that manufacturing sector.

Geographic proximity, of course, played a leading role, particularly now that Quebec had become integrated within the New England rail network. Unlike European immigrants, who were separated from New England labour markets by an often strenuous Atlantic crossing, most French-Canadians only had to reach a nearby rail junction in order to find themselves, in less than a day trip, in any of the labour-hungry industrial centers of New England. Often they were encouraged to migrate by recruiting agents sent by mill owners. Studies of Lewiston, Maine; Lowell, Massachusetts; Manchester, New Hampshire; and Woonsocket, Rhode Island—among others—have traced the early entry of French-Canadians in the textile industry to the 1860s. In many such cases, their arrival and subsequent influx into textile production took on the proportion of a historic immigrant turnover in an industry that had previously relied largely on Irish labour, and before it, on a local Yankee workforce. By 1900, in fact, French-Canadians represented the majority of the population in some large textile

centers such as Woonsocket, Rhode Island, as well as in a myriad of smaller mill towns throughout the Blackstone Valley. Moreover, they made up nearly one half of the entire labour force employed in textile manufacturing in Maine and New Hampshire, and in Massachusetts and Rhode Island they accounted for nearly one third of the textile workforce.

But what best explains the historic encounter of rural French-Canadians with the New England textile industry was the particular type of labour market engendered by a production process that was the first one to be mechanized on a large scale and made to depend significantly on the labour of women and children. As a result, hard-pressed small holders, as well as subsistence and tenant farmers in Quebec, saw in textile work a rare possibility to turn several of the family members into wage earners. Not surprisingly, family migration became the main pattern of this movement, resulting in extended kin-based chain migration; and the reliance on the work of children was a key consideration for those envisaging a move south of the border. By 1880, for instance, about 30% of the French-Canadian immigrant population in the state of Rhode Island were children aged 14 and younger—a striking contrast with most European immigrant populations. Perhaps even more significantly, 81% of that population was made up of nuclear families. The same survey revealed that 80.4% of all French-Canadian children aged 11 to 15 were reported at work as against only 8.5% reported at school—thus making this cross-border movement not only a chapter in immigrant working-class history but also a chapter in “children’s history.” Even when, during the Progressive Era, child labour laws kept a large number of them out of the labour market, French-Canadian older children kept contributing significantly to the family wage. As shown by a New England-wide survey of French-Canadians in the cotton industry produced by the U. S. Senate’s Immigration Commission (1908–1911), the earnings of children aged 14 and 15 accounted, on average, for 33% of the total family income, with the earnings of fathers accounting for 52%. Throughout these years, only a small minority of male heads of families gained access to textile manufacturing. The majority of them tended to find work as unskilled day labourers or semiskilled production workers in boot and shoe factories and in brick manufacturing.

French-Canadians and Labour Activism

The stereotype circulated in the 1880s by Massachusetts labour reformers depicting French-Canadians as “the

Chinese of the East” for their ethnic gregariousness, their submission to employers’ whims, and their lack of interest in American institutions has long served to explain their low proclivity for labour militancy. In effect, despite the growing instances of French-Canadian workers’ resistance unearthed by historians, their participation in the waves of industrial strife marking the Gilded Age and Progressive America bears little proportion to their weight within the New England workforce.

A more historically sound explanation may be found in the previously mentioned demographic and labour-market realities marking their industrial experience, as well as in the organizational priorities of the craft unions prevailing in textile throughout that era, which kept the overwhelming majority of low-skilled, French-Canadian mill workers out of their concerns. Geographic and cultural factors also played their role. Proximity to Quebec, in fact, and the existence—throughout the New England region—of family and kin networks encouraged what one may call “a mobility of abstention.” In periods of protracted labour strife, French-Canadians tended to leave their strike-ridden mill towns and head back temporarily to Quebec or join family or relatives in other textile centers. Yet, in some cases, these choices were prompted by a refusal to act as scabs.

But perhaps a more important deterring factor was the significant degree of social control exerted on the community by the church and the local ethnic elite.

It is important to stress that church authorities in Quebec had long condemned out-migration to the United States for the spiritual dangers it posed to those who subjected themselves to the evil influences of urban/industrial life; along with a Quebec nationalist elite, they had also condemned out-migrants for abandoning their fatherland, thus weakening French Canada’s political weight within the Canadian Confederation. In the hope of stemming the exodus, they had resorted to repatriation programs as a way to re-channel the southward exodus toward colonisation of Quebec’s hinterlands—though with little success. But in the face of the movement’s resiliency, the church redefined its mission by joining immigrants in the land of exile in order to ensure that they preserve their French-Canadian traditions (religion, language, family)—thus sheltering them from the evil influences surrounding them.

This posture soon took the force of an ideology known as “*La survivance*” (the survival), which in many areas of settlement pervaded the elaborate institutional network French-Canadians created and which encompassed national parishes, hospitals, French-language schools, mutual-aid societies, recreational activities, and the press.

Just as in Quebec the nascent French-Canadian labour movement was effectively dominated by church officials, who ensured that workers’ demands, when economically justified, occur within the framework of enlightened paternalism, so in New England local *curés* exerted intense pressures on their parishioners, viewing, as they did, American labour unions as the embodiment of modernism and socialism, and strikes as a form of disobedience to established authority. But not all French-Canadians yielded to those pressures.

One should not lose sight of the fact that most immigrant communities, regardless of their ethnic backgrounds, experienced the tension of trying to maintain cultural traditions and ethnic associations while at the same time undergoing the Americanisation pressures brought about, most acutely, by the World War I patriotic drives and the ensuing nativist ethos prevailing in much of the country. This tension appears to have been much more pronounced among French-Canadians on account of the growing confrontation in most communities of rival elites: those seeking to enforce *survivance*, and those encouraging naturalisation and participation in the wider civil society. The proximity to Quebec ecclesiastical influences and to the growing Quebec ethno-nationalist movement translated—at least initially—in added ideological ammunition for the former group. Still, this traditionalist-modernist mix defies generalisation, as it varied significantly according to local circumstances and community leadership. But it runs as a common thread in the history of much of New England’s “Franco-America,” inevitably impacting the types of relations workers had with the local labour organizations and industrial strife.

As resilient as the *survivance* ideology may have been, it did not prevent a new generation of French-Canadian workers—some born in Quebec, but increasingly U.S.-born—from heeding the labour call and joining strikers as the New England textile industry underwent the convulsions associated with the growing competition from southern production, or resulting from the industrial mobilisation of the war period and from the nationwide, historic capital-labour confrontation of the postwar years. A number of skilled workers among them took up labour responsibilities in the United Textile Workers or in other local textile unions such as the Woonsocket-based Independent Textile Union, playing key roles in reaching the mass of French-Canadian unskilled and semiskilled workers. In one of the major textile strikes of the 1920s, fought against the giant Amoskeag corporation, in Manchester, New Hampshire, French-Canadian workers were among the labour activists who spearheaded the nine-month-long

confrontation (1922)—thus challenging both the company’s entrenched paternalism and their ethnic leaders’ call for submission.

While ending in defeat, the Amoskeag strike reflects the transformations occurring in the demographic and political composition of French-Canadian textile workers, and in many ways stands as a rehearsal for the massive, and more successful, organizing drives of the turbulent 1930s, when class interest and solidarity took precedence over ethnic loyalties.

During much of the 1920s, in fact, French-Canadian immigration declined sharply, coming to a virtual end with the onset of the Great Depression. By 1930, nearly two out of three individuals of French-Canadian stock were born in the United States and inevitably subject to the Americanisation influences of the inter-war years. To many of them, the labour militancy that swept through the nation, and the ensuing U.S. involvement in the “good war,” gave the opportunity to partake in the building of a new, more democratic industrial order, while at the same time adjusting their culture and traditions to a more mainstream vision of Americanism.

FREY, JOHN American Federation of Labor

John Frey was a conservative stalwart of the American Federation of Labor (AFL) in the early to mid-twentieth century. In the internal union struggles of the 1930s, Frey argued for the maintenance of the AFL’s craft unionist tradition. Frey cut his teeth in the metals unions, serving as vice president of the Iron Molders from 1900 to 1950. Frey also served with the national AFL, as secretary and director of the Metal Trades Department. As head of the Metal Trades Department, Frey sought to defend the old jurisdictions of the craft unions against the emergence of new industrial unions.

Frey’s political outlook was generally antistatist. He resisted government involvement in labor, and in the economy generally. In the early 1920s, he opposed the creation of Unemployment Insurance, and in the 1930s, he opposed the creation of the Social Security system. Frey feared that government involvement in the welfare of workers was bound to sap labor’s independence. Frey initially supported the Wagner Act of 1935 and the creation of the National Labor Relations Board (NLRB). But the actions of the Board soon seemed to threaten the skilled workers that Frey represented. Because the NLRB tended to favor the creation of large bargaining units, skilled workers were often included with unskilled workers. The ensuing union certification votes tended to favor industrial organization over craft organization. Frey lobbied for changes to the Board’s policies of bargaining unit creation, but was largely unsuccessful.

Frey’s period of greatest prominence and influence came during disputes between the Congress of Industrial Organizations (CIO) and the AFL. Frey opposed the CIO from the beginning, even when it was created within the AFL as the Committee for Industrial Organization. His opposition to the CIO became still more strident as it split from the AFL and became the independent Congress of Industrial Organizations. In 1936, Frey led the charge from the AFL Executive Council to suspend the 12 major unions of the CIO. Frey charged the Committee for Industrial Organization with “fomenting insurrection.” Frey

also charged leaders like John L. Lewis and David Dubinsky with encouraging “dual unionism.” Frey held that the charters granted by the AFL to affiliates were exclusive, and that the Committee for Industrial Organization was infringing on the rights of craft unions. By encouraging workers to organize into CIO unions in industries where the AFL had granted charters to craft unions, Frey claimed, the CIO was violating the AFL constitution, and should be suspended. Frey prepared a case for the AFL Executive Council against the 12 major unions in the Committee for Industrial Organization, and then presented evidence against them. The ensuing “trial” culminated in the suspension of the 12 unions from the AFL and the eventual schism of the American union movement into the AFL and CIO. In late 1937, as some sort of reconciliation seemed possible, Frey opposed any reunification between the AFL and CIO. He claimed that Lewis’s position of leadership in the CIO was weak, that the CIO was suffering financial troubles, and that the intervening year had proved the AFL’s old policies of craft unionism were still superior.

Frey continued to hound the CIO even after the split, accusing the CIO of Communist subversion. In 1938, Frey allied himself with Martin Dies, chair of the House Committee on Un-American Activities. He became one of Dies’s star witnesses, presenting sensational charges of Communist domination of industrial unions.

Almost every historian of the labor movement in the 1930s demonizes John Frey. Frey operated through underhanded tactics. He was an unapologetic elitist, and his actions sowed division amongst his fellow unionists. These criticisms are accurate and fair. Frey’s legacy is basically that of a hit man for the old guard of the AFL. He was resistant to change, unwilling to organize unskilled workers, and vehemently opposed the presence of radicals of any stripe in the union movement. Yet Frey represented a group of workers that were numerous and dedicated to their beliefs. In the world of 1930s unionism, the craft tradition that Frey defended was still surviving, and in some cases thriving.

FUGITIVE SLAVE ACTS

The Fugitive Slave Acts refer to laws passed by Congress in 1793 and 1850 providing for the capture and return of escaped African-American slaves to their owners. Although the Supreme Court upheld the constitutionality of the Fugitive Slave Act in *Ableman v. Booth* in 1859, the acts were eventually repealed in 1864.

Early History

The origins of the Fugitive Slave Acts date back to the colonial period. The earliest act is found in the Articles of Confederation of the New England Confederation of 1643, which contained a clause requiring the return of all fugitive slaves. In 1787, delegates from 12 states met in Philadelphia for what became known as the Constitutional Convention, and wrestled with key issues of slavery, mainly among the northern-southern divide. At this same time, Congress met under the existing Articles of Confederation and passed the Northwest Ordinance (also known as the Ordinance of 1787), which banned slavery in the Northwest Territory and included a clause requiring the return of slaves who escaped to the Northwest Territories. The new U.S. Constitution included a similar fugitive slave clause in Article IV, Section II. It is important to note that the passing of both fugitive slave clauses was a part of major negotiations and compromises between northern and southern states.

Fugitive Slave Act of 1793

Despite the inclusion of a fugitive slave clause in the new U.S. Constitution, states did not always cooperate over the handling of escaped slaves due to major philosophical and legal differences. A conflict that erupted between Pennsylvania and Virginia over an escaped slave named John Davis led to the passing of the 1793 Fugitive Slave Act. This conflict, which lasted over three years, is instructive for understanding the many differences that existed between states over the issue of slavery. Pennsylvania Governor Thomas Mifflin called for the extradition of three men from Virginia accused of kidnapping Davis and returning him to their home state. Virginia Governor Beverly Randolph refused Mifflin’s request, claiming that Davis was a fugitive slave who was subject to rendition. Mifflin argued that Davis was actually a free man and thereby protected by law. The Fugitive Slave Act of 1793 was written in response to the

FUGITIVE SLAVE ACTS

Davis case and was approved by Congress by a strong majority. President George Washington signed it into law in February 1793.

The impact on slaves and even on free African-Americans was tremendous. The act guaranteed the rights of slave owners to reclaim escaped slaves and established the legal processes through which escaped slaves could be apprehended and returned to their masters. All escaped slaves were seen as permanent fugitives. The act made it a federal crime to assist an escaped slave in any way, including giving an escaped slave refuge. Escaped slaves were denied jury trials. Notably, this law denied constitutional rights even to freed slaves. The capturing of slaves became a cottage industry, and even free African-Americans were sometimes kidnapped, seized, and sold back into slavery. The Underground Railroad eventually developed in response to the incredible impact of the Fugitive Slave Act of 1793.

Personal Liberty Laws

Many in the North opposed the 1793 act, and Indiana, Connecticut, New York, Vermont, and Pennsylvania reacted by passing versions of what came to be known as personal liberty laws. These laws were designed to curtail the capture of escaped slaves and to protect free African-Americans. They did so by raising the legal standards in these cases: slave hunters were required to prove that a captive was in fact a fugitive slave, and those captured were often given the right to a trial by jury. However, in 1842, the Supreme Court ruled in *Prigg v. Pennsylvania* that Pennsylvania's personal liberty laws, as well as all related state fugitive slave laws that countered the 1793 Fugitive Slave Act, were unconstitutional—while states were not obligated to enforce the federal law, they could not override it with state-level laws. Massachusetts, Vermont, Rhode Island, and Pennsylvania responded with legislation that forbade state officials from aiding in enforcing runaway slave laws and using state jails to incarcerate fugitive slaves. Slave catchers were left to kidnap fugitive slaves and return them to their owners or hope to appear before federal judges who were not bound by state laws.

Fugitive Slave Act of 1850

Leaders of southern states were angered by northern states' lack of cooperation in capturing escaped slaves

and by the growth of the Underground Railroad. Southern leaders' demand for more assistance resulted in the Fugitive Slave Act of 1850. This legislation was part of the Compromise of 1850. The act made federal marshals who refused to enforce the law subject to heavy fines. Any person caught assisting escaped slaves was subject to imprisonment and stiff fines. All law enforcement officials were obligated to arrest anyone even suspected of being a runaway slave, often on very little evidence. Accused fugitive slaves could not testify on their own behalf and were denied the right to a trial by jury. Resistance to the new law continued, however, as abolitionists became more active, Underground Railroad activity increased, and many northern states passed new rounds of personal liberty laws.

Demise of the Fugitive Slave Act

In 1859, the Wisconsin Supreme Court ruled in favor of an abolitionist convicted of violating the Fugitive Slave Act. The Supreme Court, in *Ableman v. Booth*, denied the right of state courts to interfere in federal cases and upheld the Fugitive Slave Act. However, the Fugitive Slave Act was soon to come to an end. In March 1862, the federal government prohibited Union army officers from returning fugitive slaves, effectively annulling the act. On January 1, 1863, the Emancipation Proclamation was signed into effect by President Abraham Lincoln. In 1864, Lincoln signed a repeal of the Fugitive Slave Act. And in January 1865, Congress ratified the Thirteenth Amendment of the United States Constitution, thereby abolishing the institution of slavery.

FURUSETH, ANDREW (1854–1938) **International Seamen’s Union of America**

An Oslo-born sailor and fisherman, who jumped ship in 1880 to make his home in San Francisco, Andrew Furuseth was a self-taught exponent of sailor union federation, craft unionism, and ultimately, political regulation of the waterfront. A close friend of the American Federation of Labor (AFL) president Samuel Gompers, Furuseth moved through several union consolidations, from the Coast Seamen’s Union (1885) to the Sailors’ Union of the Pacific (1891) to the National Seamen’s Union (1892) to the presidency of the International Seamen’s Union (ISU) of America (1899). Together with James G. Maguire, the San Francisco Democratic congressman and former judge, he had begun crafting seamen’s reform bills as early as 1894, and particularly so after 1900, when he practically turned his leadership of the Seamen’s Union into a full-time lobbying position in Washington DC. The power and pathos of his argument, together with his sheer persistence of effort, won this ascetic, lifelong bachelor (with a face that some compared to the “prow of a Viking ship”) a growing circle of influential friends and admirers.

Undoubtedly, Furuseth’s supreme achievement was passage of the Seamen’s (aka La Follette) Act of 1915, a complex piece of legislation that, most famously, eliminated the vestiges of coerced labor (that is, heretofore quitting a ship could land a sailor in prison for desertion) for American ships on the high seas. Furuseth’s biographer has aptly noted that his subject spent 20 years trying to pass the seamen’s bill and another 20 years trying to defend it before unsympathetic administrative and legal authorities. His famous (but perhaps apocryphal) words on the subject of sailor incarceration have been oft-repeated: “You can put me in jail, but you cannot give me narrower quarters than as a seaman I have always had. You cannot give me coarser food than I have always eaten. You cannot make me lonelier than I have always been.”

A common defense of the long-standing desertion law had likened a sailor’s contract to his duty in a marriage contract. Before the Senate Commerce Committee in 1912, Furuseth quickly dismissed such analogies in favor of a graphic focus on the sailor’s world:

When we talk about a ship we always say: “Thank God, I am not married to her.”... [The bill] is not worth discussion from that point of view.... I have seen men go ashore and commit misdemeanors to get clear of a vessel. I have seen men eat soap to get clear of a vessel. I have seen men go and put their feet through plate-glass windows to get clear of a vessel.... I have run from a vessel and left L50 due me and was glad I had a chance to run away.

Given the emotional wedge of the desertion issue, it was perhaps not surprising that when, at a key moment in the seamen’s bill deliberations in 1915, Furuseth, the crusty old Norwegian leader of the ISU, “personally begged” President Woodrow Wilson “to make him a free man,” it moved the president, according to the bill’s sponsor, Senator Robert M. La Follette, as “[I] had never seen him moved on any other occasion” (Auerbach, p. 359).

Yet, it was no altruistic game that Furuseth and other advocates were playing. For them, the intended international jurisdiction of the Seamen’s Act was more than a desirable extension of the bill’s logic: it was the very core of that logic. The reformers’ logic began with an appreciation for the American sailor’s (and by inference the American shipper’s) weak bargaining positions on the world’s seas. It assumed a single world market for seagoing labor in the foreign trade. If “sea labor,” like any other commodity, were allowed to float at market price, then all would-be employers would have to pay that price. The draconian penalties against desertion, however, prevented the operation of a “free market” in labor, segmenting sailors according to national wage norms, while also preventing lesser-paid sailors from taking advantage of opportunities at higher-wage ports of call. “If conditions can be brought about whereby the wage cost of operation will be equalized,” argued Furuseth and the ISU, “the development of our merchant marine and our sea power will be unhampered.... The remedy is to set free the economic laws governing wages.”

Though an effective advocate of the expansive use of the power of government in the case of the Seamen’s Act, Furuseth otherwise generally fit in the most “old school,” conservative side of AFL-type craft unionism. A vociferous, openly racist opponent of Chinese (or other Asian) access to maritime work, he also consistently opposed alliances between sailors and longshoremen and fought socialist and “Wobbly” (Industrial Workers of the World, IWW)

competitors for sailor loyalty on many occasions. He was also loath to surrender national standard-setting instruments on the high seas for forms of international regulation; he thus opposed both the post-*Titanic* London Conference on Safety of Life at Sea in November 1913 and the formation of the International Labor Organization in 1919, a position which alienated the seamen's leader even from the more pragmatic Samuel Gompers. Altogether, the post-WWI years proved frustrating for Furuseth. Following big gains in membership and wages from 1916 to 1921 (more likely stimulated by wartime demands than the effects of the Seamen's Act), a crackdown by ship-owners precipitated a disastrous seamen's strike in 1921. Maritime unionization was effectively curtailed for the next 15 years. When mobilization revived beginning with the San Francisco general strike of 1934, an irascible as well as terminally ill Furuseth found himself unable to stem the tide of left-led militancy. When he died on January 22, 1938, his coffin was placed on display in the auditorium of the Department of Labor Building, the first labor leader to be so honored.

FUTURE OUTLOOK LEAGUE OF CLEVELAND

In February 1935, a group of southern-educated, middle-class African-Americans gathered at the home of a local political activist, John O. Holly, in Cleveland, Ohio, to found the Future Outlook League (FOL). Holly, a clerk at the Federal Sanitation Company and president of his electoral precinct's Democratic Club, joined a number of local black professionals and white-collar workers to form the FOL's leadership circle. FOL leaders and allies touted the group as a younger and more militant alternative to the National Association for the Advancement of Colored People (NAACP) and the National Urban

League (NUL). The FOL directly challenged both organizations; the League's job campaigns tested the NUL's traditional job-placement role, while its direct action took attention and money from the NAACP's legal actions.

The League was one of a number of organizations—including the Congress of Industrial Organizations (CIO), the National Negro Congress, and the Brotherhood of Sleeping Car Porters—that forged new labor-minded civil rights coalitions to fight racial discrimination in northern cities. The FOL won jobs for many blacks in Cleveland by connecting "Don't Buy Where You Can't Work" campaigns with direct-action techniques such as picketing and letter-writing campaigns. Beginning in July 1938, the FOL also fought for rent decreases and against arbitrary evictions. The League's membership varied a great deal over time. FOL leaders claimed membership of 10,000 in 1936, 18,000 in 1939, and 20,000 in 1943. Historians agree that these numbers were exaggerated; dues-paying members numbered in the hundreds, not the thousands. However, the FOL won power in Cleveland in fights for jobs and tenants' rights. Its influence spread through the FOL's own journal, *The Voice*, and the essential publicity provided by William O. Walker, the editor of Cleveland's black newspaper, the *Call & Post*.

The FOL's programs were remarkably innovative. In 1936, for example, the FOL organized 75 previously independent African-American-owned beauty parlors into the unprecedented Future Outlook League Beauticians Association. More generally, the FOL grounded its direct action on unconventional community organizing techniques. African-American women, who generally controlled household economies, were key organizers of consumer boycotts and acted as "shock troops" on picket lines with black men. The FOL was also exceptionally conscious of not perpetuating the color bias among African-Americans; when employers asked for the lightest-skinned applicants possible, the FOL repeatedly sent prospects with dark skin. Finally, the League created a unique Employees' Association, consisting of dues-paying League members who found jobs through FOL programs. The Association worked to enforce agreements with employers and to improve working conditions. In 1940, the Association became a federally certified labor union, the Future Outlook League Employees Union Local One (EU).

The League's greatest successes came in sometimes-violent struggles to gain jobs for blacks in Cleveland's Central Area, the city's virtually all-black section. A flurry of activity in 1935 won dozens of jobs in retail stores and theaters where the clientele was predominantly black but the workforce was all white. From 1936 to 1940, the FOL continued its

campaign to integrate Central Area merchants, while also pressuring the Cleveland Railway Company to hire black motormen and conductors. In 1941, the FOL pressured Ohio Bell Telephone to hire black women. This campaign marked the first time the League fought for jobs outside the Central Area. In addition, many black churches, professionals, and local chapters of the NAACP and the NUL that previously criticized the League's militancy joined in the action. Significantly, African-American women pushed Holly and the leadership circle to pursue direct action against Ohio Bell, as they would in later fights to integrate defense industries.

In 1942, the FOL joined widespread efforts to compel the federal government to enforce integration of defense industries. For the first time, the FOL pursued its agenda through the courts. In two cases—*Effie M. Turner v. Warner and Casey Co.* and *Claretta J. Johnson v. Thompson Products*—the FOL sought to force war industries to employ black women or give up their federal contracts. The case gained national attention but did not directly win any jobs for black women in Cleveland. The local court decided in favor of employers' contract rights. Moreover, by the time the case reached the Ohio Supreme Court, Cleveland's war industries had already succumbed to unprecedented labor shortages and the necessity of hiring black women.

The FOL battled legal obstacles, intransigent employers, uncooperative unions, and unfavorable public opinion. During the League's first three years, employers were able to win injunctions from business-friendly judges who ruled that antiracial discrimination pickets were not legal labor disputes protected under the 1932 Norris-LaGuardia Act. This changed in 1938 when the U.S. Supreme Court expanded the definition of a labor dispute to include protests against racial discrimination. Nonetheless, FOL pickets, which often ended in violence, remained controversial in public opinion. Although it was generally unclear who sparked the clashes—shop owners, League members, or passersby caught up in the excitement—the specter of violence hung over the FOL's activities. Trade unions affiliated with the American Federation of Labor (AFL) presented yet another obstacle to the FOL. In struggles to integrate streetcar conductor and motormen positions, the FOL ran into opposition from the Streetcar Trainmen's Union; and the Bakery Drivers' Union, Local 52, obstructed a 1940 drive to convince local companies to hire black drivers in the Central Area. Finally, money was a constant concern for the FOL; its fluid membership of unemployed and recently employed workers was often unable or unwilling to contribute much-needed sums.

In late 1940s and 1950s, the League's power gradually faded. The FOL won less publicity as it became more of a clearinghouse for social needs. In addition, a grand vision for a \$100,000 capital campaign to build a new community center largely failed, and the League came under suspicion for how it allocated the funds it did raise. The political environment of the 1950s destroyed popular support for militant direct action, and the League's original leadership core began to diverge. John O. Holly himself concentrated on a career in local and state politics, without much success. Finally, the FOL's working-class base was generally not as desperate as during the Depression, while other movements captured public imagination. An effort to revive the FOL in the 1960s never gained momentum. The League's decline does not diminish the power and concrete gains it achieved at a key moment for urban black workers. Especially important was the FOL's ability to tap the collective power of jobless African-Americans during the Depression and to respond to demands for direct action from black women and men in Cleveland.

G

GARMENT INDUSTRY

The production of clothes from the Colonial Era up until the early nineteenth century was small-scale and largely home-based. Clothes were made to order and fitted for an individual. Given the prevalence of this mode of production, there were few demands for the industrialization of the production process. Indeed in many households, clothes were made by family members. Those who could afford to hire artisan tailors and dressmakers to make them an entire garment from start to finish. These skilled tailors and tailorsesses tended to be native-born Americans or German and British immigrants, with immigrant groups represented to a lesser degree. Some tailors traveled from house to house in search of work carrying their tools with them. Other tailors and dressmakers worked from workshops, usually in, or connected to their homes, and employed journeymen and apprentices. The master craftsman was thus a manufacturer, a teacher, and a retailer. Even at this early date, New York City was the largest center of clothing production and remained so up until the late twentieth century, although increasingly garments were also produced in other locations.

Both tailors of men's clothing and their apprentices were male, although the assistance of female family members was often called for during the finishing process or when the workload was especially heavy. Dressmaking was one of the few craft trades open to women in this period, largely because it was considered improper for men to engage in the physical contact with women involved in fitting a dress. This

concern carried over into the twentieth century, and women continued to remain a large proportion of workers in the custom-made dress trade.

The garment trade in the United States expanded following the introduction of a protective tariff in 1816, which allowed American garment producers to capture the market in ready-made clothing for southern slaves, heretofore dominated by English companies. Ready-made garments—those not made to order and of a lesser quality than those worn by whites—relied more heavily on unskilled labor. The expansion of the ready-made trade catering to Americans of all races and classes beginning in the nineteenth century produced significant changes to the garment industry.

In the first half of the nineteenth century, ready-made garments became increasingly popular among a broader spectrum of the male population; accordingly the men's clothing industry underwent considerable change. The growth in ready-made clothing that was designed to fit an average person, as opposed to measured to fit a specific individual, meant that the manufacturing process could be standardized, greater numbers of semi- and unskilled workers could be employed, and production could be expanded. Although there remained a custom-made trade for the middle and upper classes, increasingly production of ready-made clothes moved out of the small-scale workshop, away from the guidance of an artisan tailor, and into the factory, where the manufacturer replaced the artisan. The first recorded factory was established in New York in 1831 (Boston and

GARMENT INDUSTRY

New Bedford, Massachusetts, became other centers of clothing manufacture by the mid-nineteenth century).

Unlike in the factories of the late nineteenth or twentieth centuries, garments were not actually assembled in these early plants. Clothes were designed and cut in factories, but the cut fabric was sent out to be sewed by individuals who worked in their homes in what was known as “home work.” Because of the labor-intensive nature of the garment industry, coupled with the general lack of equipment necessary, clothes were assembled in workers’ living spaces. This meant that workers paid for lighting and heating in addition to the purchase of needles and thread, which continued even once production had moved to factories. Manufacturers thus increased their profit margin while workers turned their homes into production centers. Despite such exploitation some workers, particularly married women with children, preferred home work because it with them to engage in wage labor while attending to their domestic responsibilities, namely, childcare.

The Garment Industry in the Late Nineteenth Century

The demand for uniforms during the Civil War (1861–1865) further encouraged the development of the ready-made trade in the men’s garment industry. At the same time, changing fashions facilitated the development and growth of the women’s ready-made trade. Largely because of women’s fashions, it was not until the post-Civil War years that the women’s garment industry adopted ready-made techniques on a large scale, although cloaks (originally meaning capes or coats but increasingly including suits) had been made *en mass* before the 1860s. Home work was less prevalent in the women’s garment trade and inside shops, in which the majority of a garment was made in one establishment employing girls and young women, dominated until the 1880s. However, conditions in these shops were poor. A study in Boston (the center of the cloak industry at this time) in 1871 recorded that workers were crammed into upper floor rooms with poor ventilation, often with no toilets or drinking water. These girls and women usually worked for 10 hours a day, but as they were paid by the piece, they often took work home with them to finish late into the night. After the 1880s, the women’s ready-made garment trade became more like the men’s. More male workers were employed, suits were made in larger quantities, and contracting was introduced.

By the 1880s, garment centers had developed throughout and beyond the Northeast. Important centers included Chicago, Philadelphia, Cleveland, Detroit, Baltimore, Milwaukee, Rochester, St. Louis, Cincinnati, Louisville, and Syracuse. Manufacturers built larger factories; there was greater standardization of sizes, styles, and processes; and the manufacturing process was subject to a greater subdivision of tasks. Subcontractors began to distribute the cut cloth to be sewn as manufacturers expanded and could no longer handle all the orders themselves. As fashions changed more frequently and orders were put in at the last minute, manufacturers were precluded from producing year round and stockpiling. In addition to poor working conditions, workers were thus faced with seasonal slow downs or unemployment in the production of both men’s and women’s clothes. The men’s garment trade peaked between January and March and then fell off until November. The women’s had two distinct peaks in the spring and fall. In between these months, many workers were unemployed. Some found casual work, while many women returned to their domestic commitments.

This expansion of the garment industry in the 1880s and 1890s occurred at the same time as waves of European immigrants were arriving in the United States. The makeup of the workforce changed as people from Eastern Europe (the majority of whom were Jewish) arrived, replacing a workforce that was largely of Irish and German descent. New immigrants, some of whom had worked as skilled tailors in Europe, provided an abundant cheap-labor supply and thus assisted in the expansion of the industry but were habitually exploited. Many immigrants found work through ethnic networks, and the dominance of immigrants in the garment trade meant that the ability to speak English was not necessarily a requirement. This was especially true when the employer was an immigrant entrepreneur who had moved from the workforce to a subcontracting or management position.

Sweatshops became endemic around the late nineteenth century (not just in the United States but in Europe, too) as demand for, and production of, ready-made clothing increased. Sweatshop conditions occurred in factories as well as in people’s homes. Sweatshops were characterized by long hours for low wages in poor conditions. Deductions were often made for thread and needles; mistakes had to be paid for by the worker; rooms were often badly lit, were too hot in the summer and too cold in the winter, and were poorly ventilated. Both women and men worked in such conditions and at times child labor was used, especially by workers who worked in their own homes where clothing manufacture could involve the whole family.

Garment workers parading on May Day, New York, New York. Library of Congress, Prints & Photographs Division [LC-USZ62-41871].

The 1892 Tenement House Act in New York, although difficult to enforce, encouraged a move from production in homes to factories. Inside-shops thus grew, particularly in the newer garment centers, such as Chicago, which produced 17% of goods in the men's garment trade (to New York's 40%) by 1909. Factory production was more inclined to standardization of products and the division of the production process into multiple semi- or unskilled tasks. The subdivision of the work process entailed dividing a single skilled job into multiple tasks. The individual tasks tended to involve less skill, although there was no inherent necessity for them to do so. For example the task system that had long been practiced in Europe and was brought to the United States by immigrants in the late nineteenth century maintained skill levels but encouraged specialization. The incentive on the part of the employer to deskill the individual tasks was twofold. Lower wages could be paid to semi- and unskilled workers, and by paying piece rates (based on the number of items completed) instead of weekly rates (based on the number of hours worked), workers were encouraged to increase their own production levels in order to earn a decent wage.

Closely connected to this was the fact that the deskilled, subdivisional system afforded the employer greater control over the workers for s/he was less reliant on skilled workers who were of more limited supply.

Processes of mechanization were closely connected to subdivision and the move to factories; indeed they often happened hand in hand. The mechanization of the garment industry began in the 1850s when the first viable sewing machines were marketed. (Elias Howe invented the sewing machine in 1846.) Singer became the pre-eminent manufacturer, increasing its output from 810 machines in 1853 to 21,000 a decade later and 232,000 by 1873. Within 4 years 87,000 had been sold in the United States. Sewing machines were put to use in both small-scale workshops, larger scale factories, and by individuals at home as prices fell in the interwar years. Other machines included the band-knife, also introduced in the 1850s; the buttonhole machine that in the 1880s could sew six buttonholes a minute; and Dearborn's blind-stitch machine for felling hems that was first introduced in 1900 and was improved 2 years later so that it could be used for padding collars and lapels.

GARMENT INDUSTRY

In factories workers used electrical sewing machines, edge-pressers, collar- and lapel-padding machines, and felling machines, all of which led to a further growth in semi- and unskilled jobs in the trade. For example at a Hart, Schaffner, and Marx factory in Chicago, 150 separate operations were involved in the manufacture of a coat. Such machines could also lead to rationalization and thus a loss of skilled positions. Skilled positions (such as cutting and pressing) tended to be occupied by male workers, while women were employed as machine operators and finishers (for example buttonholers), which were perceived to require less skill. This gendered division of labor was not unique to the garment industry. However the discourse surrounding clothing production was more readily able to draw on contemporary gender discourses that perceived domestic chores, including sewing, to be women's work. Constructing sewing as something women could do naturally meant that it was not considered an acquired skill and thus had neither high payment nor status.

Unionization at the Turn of the Twentieth Century

The large number of immigrants arriving in the United States looking for work and the lack of union organization in the garment trades facilitated these poor conditions. Small groups of workers working in a multitude of locations across a city were incredibly difficult to organize, and although attempts were sporadically made to challenge single issues, it was not until the turn of the twentieth century that nationwide unions had any strength. One of the first significant protests occurred in New York in the summer of 1883. Seven hundred cloak makers and dressmakers, half of them women, struck in what New York newspapers named the "Emigrants' Strike." Although the Cloak and Dressmakers' Association was formed out of the strike, it was short lived, as was common at the time.

Until 1891 in the men's garment trade and 1900 in the women's, there were no national garment workers' unions although workers often organized on a city or state basis. National unions were needed in both sectors of the industry, for increasingly manufacturers looked to other cities when faced with a strike to get their garments made. Without nationwide unions, there was no way of limiting this, and thus workers' power was considerably limited. In the last half of the nineteenth century, numerous unions representing the range of workers in the garment industry sprung up sporadically, often around strikes,

at times affiliating with the national federation the Knights of Labor. The workers who organized with the Knights tended to be the more skilled and more educated, which by the late nineteenth century, were the minority in the garment industry.

The first nationwide garment union was the United Garment Workers (UGW), founded in New York in 1891 to organize the men's garment industry. The first elected leaders were American-born workers who supported the American Federation of Labor's (AFL) pure and simple unionism, while the majority of union members were immigrant workers who were often sympathetic to socialism and anarchism. Although the leadership remained male-dominated, the UGW claimed to do a better job of organizing women workers than many of the previous local unions. Nevertheless women still remained excluded from the union executive, and the union demonstrated limited commitment to their organization.

The Garment Industry and Garment Unions in the Twentieth Century

The structure of the industry as established by the early twentieth century changed little in the next century. It remained a labor-intensive, low-technology trade reliant on cheap labor. Immigrant workers remained an important factor, although the immigrant groups changed. As competition from imported goods in the later twentieth century increased, American companies looked for cheaper production methods, including relocating within the United States and then going overseas in search of even cheaper labor markets.

Although the work process remained the same and manufacturers were reluctant to improve working conditions, they were increasingly pushed to do so as garment trade unions grew stronger. Cloak makers, who were among the most skilled in the women's garment trade, founded the International Ladies' Garment Workers' Union (ILGWU) in 1900. The ILGWU got off to an inauspicious start with only 11 delegates from seven local unions, all of whom were Jewish and from the East Coast, attending the founding convention. However a strike of children's cloak makers in New York in 1907 helped to revitalize the union. The 1909 Uprising of the Twenty Thousand, in which thousands of shirtwaist workers, many of whom were women, walked out in New York, galvanized the ILGWU's position. Following the Great Revolt, another strike in 1910 in New York that saw 60,000 workers on strike, the ILGWU demonstrated its potential power in securing an unprecedented agreement

known as the Protocol of Peace that secured wage and hour standards and allowed for the impartial arbitration of disputes and a joint commission to address workplace health concerns.

Workers in the men's garment industry inspired by the New York protests also began to challenge the standards in their sector of the industry. In Chicago in the winter of 1910–1911, a general strike in the men's garment industry peaked with 40,000 workers out. The strike began when 18-year-old Hannah Shapiro, a Ukrainian Jewish immigrant who worked at Shop 5 of Hart, Schaffner, and Marx, led her coworkers out in protest of reduced wages, and soon spread across the city. As in the Uprising of the Twenty Thousand, women thus played an important role in the Chicago strike, although also as in New York, the public voice of the strike all too quickly became male. Nevertheless both the Uprising of the Twenty Thousand and the Chicago strike demonstrated the potential of cross-class alliances that were the foundations of the women's labor movement. The Women's Trade Union League in both cases played an important role in organizing soup kitchens, negotiating with city officials and employers, and using their role in the public eye to draw attention to the plight of working women.

The 1910–1911 Chicago strike sowed seeds of dissent within the men's garment trade unions. Unhappy with the role of the UGW leadership in December 1914, Chicago workers led a group of delegates at the UGW convention in Nashville, Tennessee, out of the convention to form a rump session that became the Amalgamated Clothing Workers of America (ACWA). It organized workers on a quasi-industrial basis and thus was more welcoming to semi- and unskilled workers, many of whom were immigrants and women. Women played a central role in work protests and were an increasing constituent of the membership, but they remained marginal among union officials. Although Dorothy Jacobs Bellanca became the first female vice-president of a major trade union (the ACWA) in July 1916 at the age of 21 and Fannia Cohn became organizing secretary of the ILGWU General Education Committee in the same year and then educational director 2 years later, they remained the only women on the executive committees of the two leading garment unions.

Because the ACWA claimed jurisdiction over the same group of workers as the UGW, it was perceived to be a dual union by the American Federation of Labor (AFL) and thus was not issued a charter. Nevertheless the ACWA had rapid success. By 1916, it had a national membership of 48,000, and this had jumped to 138,000 just 3 years later. Moreover the ACWA secured a landmark agreement with Hart,

Schaffner, and Marx in 1919 that secured a 44-hour week, and New York's manufacturers soon followed.

The Great Depression caused decreased production and increased unemployment in the garment industry. In 1934, the production value of garments produced in Chicago was only 30% of what it had been in 1929; in Rochester, New York, it was only 28%. As union membership dropped, employers shattered the wage and hour standards that the ILGWU and ACWA had secured in the 1920s. Nevertheless the ILGWU and the ACWA capitalized on Section 7a of the New Deal's National Industrial Recovery Act (June 1933) that gave workers the right to join unions and to engage in collective bargaining. In particular they tried, with varied success, to organize the newer garment centers, such as Puerto Rico and Los Angeles. By 1924, the latter was already the fourth largest center of garment production in the United States. Also in the 1930s, both the ILGWU and the ACWA as advocates of industrial unionism were highly influential in the formation in November 1935 of the Committee for Industrial Organization (CIO—later the Congress of Industrial Organizations).

After World War II the trend that had begun in the 1920s of garment manufacturers relocating in search of higher profit margins was accentuated. Often this meant moving from a union stronghold to the non-unionized South or West. Thus the garment industry declined in the Northeast and Pennsylvania. The West, especially California, and the South, especially North Carolina, benefited. The former became the center of the burgeoning sportswear industry. Immigrants still made up a large proportion of the workforce, but instead of being eastern European Jews and Italians, by the 1960s the dominant groups were southeast Asians and Hispanics. (Workers from these ethnic groups were also an increasingly important component of the workforce in such cities as New York.) This was true of other areas garment manufacturers moved to. For example Miami's garment industry was boosted in the late 1960s by New York-based companies leaving a union stronghold to relocate in Florida and employing members of the Cuban immigrant community, which was unorganized and at least initially relatively passive. The ILGWU and ACWA (which merged with the Textile Workers' Union of America in 1976 to form the Amalgamated Clothing and Textile Workers' Union [ACTWU]) continued to try to organize these new garment centers.

By 1989, Los Angeles had surpassed New York as the largest U.S. garment-producing center. Many workers were undocumented, and employers used this against them if they protested low wages or poor conditions. The industry remained seasonal, as

it had been since the nineteenth century. Work peaked in March, declined in the summer before picking up again in the fall, then dropped off again in January to begin the cycle again. Surveys in the 1990s revealed extensive violation of laws regulating health and safety, wages, hours, and homework, but with a declining number of government inspectors, there was little that could be done to enforce such regulations.

As the twentieth century came to a close, imported garments increasingly threatened the American-based industry. By the late 1990s, more than 60% of garments sold in the United States were imported, mostly from Asian countries. The first large wave of Asian imports in the 1960s forced American companies to look for cheaper production methods. Item 807 of the U.S. Tariff Schedule (1963) facilitated the move to overseas production. Under this ordinance cut garments could be shipped overseas for assembly and when re-imported to the United States; U.S. duties were paid on only the difference in value that low-cost assembly had added. In 1983, the Reagan administration further encouraged such processes with the creation of the Caribbean Basin Initiative that extended special trade rights to 22 countries. Although more work was available in these overseas locations, investigations in the late twentieth century revealed that real wages in the garment industry declined in the countries chosen for relocation.

Despite advances in the technology of clothing manufacture and the textiles involved and decades of stability in the garment trade, unions' highly exploitative sweatshop conditions still remained at the turn of the twenty-first century. In August 1995, the Department of Labor raided a compound in El Monte (a middle-class suburb of Los Angeles) and uncovered a sweatshop where 72 undocumented workers from Thailand worked behind barbed-wire fences earning around \$1.60 an hour. The clothes they made were destined for such well-known stores as Macy's, Filene's, and J. C. Penny's. Indeed across the Los Angeles area at the turn of the twenty-first century, conditions were remarkably similar to those a hundred years earlier. The largest garment center in the country may have moved from the East to the West Coast and the immigrant groups employed shifted from eastern and southern Europeans to Central Americans and southeast Asians, but workers, a majority of whom are women, still worked in sweatshop conditions with little organization or protection. Trade unions widened their campaign base in the 1990s as they had in the 1910s. They found support on U.S. college campuses with the formation of United Students against Sweatshops in 1998. However companies continued to resist the unionized shop. Indeed some companies responded to attempts by the

United Needletrades, Industrial and Textile Employees (UNITE—founded in 1995 from the merger of the ILGWU and ACTWU) to organize in California by moving production to Mexico.

GARVEY, MARCUS (AUGUST 17, 1887–JUNE 10, 1940) Black Nationalist

Jamaican native Marcus Garvey led the first mass movement among African-Americans in the United States. Garvey's short-lived and ultimately unsuccessful effort to stoke black nationalism into a Back-to-Africa movement provided a dramatic episode in the Harlem Renaissance of the 1920s.

Garvey was born in Jamaica and received an elementary education there. He was trained as a printer,

became a foreman, and led a printers' strike in Kingston in 1907. The strike failed and probably permanently soured Garvey on collective labor action. He was blacklisted and worked in Costa Rica and Panama before settling in London and returning to work as a printer in 1912. In London he studied the works of Booker T. Washington and admired his philosophy of racial self-help. He also met Duse Mohhamend Ali, who was working toward self-determination for Egyptians. Garvey wrote for Ali's magazine and began to imagine a program of racial solidarity among blacks of the Diaspora, who would return to and redeem Africa.

After a brief return to Jamaica, Garvey moved to the United States and settled in Harlem in 1916. With war raging in Europe and the United States torn over whether to join it or not, this was a particularly exciting time and place to be. Booker T. Washington, widely regarded as the premier race leader, had just died, and the National Association for the Advancement of Colored People (NAACP), formed by many of Washington's rivals, was beginning to grow into the nation's principal civil rights organization. Hundreds

of thousands of southern blacks were migrating into northern cities, attracted by industrial jobs and less formal segregation and pushed by poor cotton crops and southern racism, in what was known as the Great Migration. This migration continued into the 1920s, especially when Congress made permanent the wartime interruption of European immigration. Garvey established the Universal Negro Improvement and Conservation Association and African Communities' League, usually called the Universal Negro Improvement Association (UNIA). He published a newspaper (the *Negro World*) and launched a number of business ventures, the most important of which was the Black Star steamship line, which would show that blacks could be successful entrepreneurs and aid in the return of African-Americans to Africa. He was a flamboyant orator and showman, dressed in imperial regalia as he led his crusade. Many of his detractors, most particularly W. E. B. Du Bois at the NAACP, regarded him as a vulgar charlatan, and his methods did smack of those of the rising European dictators of the interwar years.

Like Booker T. Washington and most black leaders of the period, Garvey was largely hostile to

organized labor. He was impressed at the power that the American Federation of Labor (AFL) had acquired during World War I and urged black Americans to organize their own unions. He warned black workers to steer clear of white unions, either of Communists or what he called the American Federation of White Workers or Laborers. He urged blacks to undercut white unions by working for lower wages. As a racial separatist who wanted to build a separate black economy, he was especially hostile to the white and light-skinned socialists and integrationists in the NAACP. He went so far as to praise the Ku Klux Klan for "their honesty of purpose toward the Negro. They are better friends of my race, for telling us what they are, and what they mean, thereby giving us a chance to stir for ourselves." His supporters mailed a severed hand to union leader A. Philip Randolph as a threat in response to his criticism of Garvey.

In the early 1920s, the *Negro World* had 50 thousand subscribers; and there were perhaps as many dues-paying members of the UNIA. But Garvey's business methods proved to be his undoing. The Black Star Line was a fiasco, and Garvey was indicted for mail fraud related to its finances in 1922. He was convicted and began a 5-year prison sentence in 1925, continuing to run the UNIA from his Atlanta cell. President Coolidge commuted his sentence in 1927, and the U.S. deported Garvey. After unsuccessfully trying to revive the UNIA in Jamaica, he moved back to London in 1935, where he died 5 years later.

For all his failings, the charismatic Garvey obviously struck an important chord among African-Americans. He was able to claim a mass appeal and legitimacy as a race leader that few have been able to match. His emphasis on separatism and racial pride tapped into a persistent African-American sentiment that marked Booker T. Washington before him and the Black Power militants of the 1960s. Many of his critics perhaps let their aversion to his tone and style obscure their similarities. Du Bois for example embraced economic separatism and self-help in the 1930s and ended up returning to Africa himself. At the very least Garvey signaled a new consciousness among black Americans as they urbanized and moved North in the interwar years.

GASTONIA STRIKE (1929)

The violent strike at the Loray mill in Gastonia, North Carolina, that began in April 1929 stood out in the wave of unrest that swept the southern textile industry in the late 1920s and early 1930s because of the leadership role played by the Communist-led National Textile Workers' Union (NTWU). Unions of any sort were uncommon in the South at the time, so it seemed particularly incongruous that a Communist union might make headway in the region. But in the early days of the strike, thousands of white, pro-segregation, God-fearing cotton mill workers attended strike rallies organized by labor activists who stood for atheism and racial equality in addition to promoting the interests of industrial workers.

Since the 1870s, Gastonia had grown considerably along with the rise of the southern cotton textile industry. Thousands of impoverished farmers from the Piedmont and southern Appalachia had fled to industrial centers like Gastonia looking for a chance to escape from debt. Boosters in Gastonia promoted their English-speaking, hardworking, cheap, and faithful work force. Mill owners emphasized their paternal oversight of company-owned villages, including their support of churches. While the Loray mill had been constructed largely with local capital, in 1919 it was purchased by the Jenckes Spinning Company of Rhode Island, which merged with the Manville Company, also of Rhode Island, in 1923. This was part of the long-term but rapidly escalating transition of the textile industry from the North to the South, where labor costs offered a competitive advantage.

The 1929 strike in Gastonia arose from the same combination of pressures and grievances that had already produced serious textile labor conflicts in Henderson, North Carolina, in 1927 and earlier in 1929 in Elizabethton, Tennessee. Most significantly the market for textiles had been erratic at best during the 1920s. Following the exhaustion of the wartime economic boom, textiles slumped into serious depression in 1921 and had experienced only a few months of prosperity at a time since then. Cotton prices, the largest factor in the cost of production, were unpredictable throughout the decade, largely because of the boll weevil. Having only limited control of their circumstances, mill owners, including those at Loray,

Strike's on—they put away the spools. Library of Congress, Prints & Photographs Division, NYWT & S Collection [LC-USZ62-109628].

were forced to economize by increasing the pace of work and adding more tasks to each employee's routine.

At the Loray mill, a new superintendent in 1927 had to contend with declining markets for his main product, fabrics used in the production of automobile tires. The auto industry was slumping, and tire manufacturers were developing their own textile mills. In response the Loray superintendent cut the work force from 3,500 to 2,200 while maintaining the same level of production. In many cases workloads doubled. In addition workers suffered from two 10% wage cuts and arbitrary power exerted by supervisors. Weavers at Loray walked out briefly in protest in May 1928. The superintendent was replaced in late 1928, and his successor eased the stretch-out and invested more in community welfare programs. But mill workers were obviously exhausted and angry well before the much larger 1929 strike.

Triggering the Strike

In March 1929, representatives of the NTWU entered Gastonia, hoping to organize southern textiles as a stepping stone toward a Communist United States. The Loray strike, claimed the NTWU, would lead to

a general strike in Gaston County, followed by an uprising of the entire southern textile labor force. The NTWU's lead organizer, Fred Beal, found Loray workers ripe for a strike but worried about adequate organization and preparation. After several union supporters were fired, Beal called a meeting for March 30 that was attended by nearly 1,000 people. Two days later virtually the entire Loray workforce went on strike. The NTWU helped formulate the workers' list of demands, which for the most part emphasized basic trade union concerns like recognition of the union, a minimum weekly wage, a 40-hour week, ending the stretch-out and speed-up, and improved cleanliness and sanitation in both the mill and village. These demands hardly distinguished the NTWU from the more ideologically conservative United Textile Workers (UTW), affiliated with the American Federation of Labor (AFL). But the NTWU lambasted the UTW for its inability to lead successful strikes in Henderson and Elizabethton, not to mention an earlier failure in Gastonia in 1919. Ironically civic boosters praised the absent UTW in 1929 but offered only firm resistance to any sort of unionism before, during, and after.

Although NTWU organizers in Gastonia were sensitive to local concerns, top Communist party officials demanded advocacy of racial equality and atheism. Given the long-term segregation of textile jobs, very

few Loray workers were black, and all of them were confined to menial jobs. When the NTWU tried to organize local blacks to demand equal opportunities in the mill and equal membership in the union, few turned out for fear of white reprisal. White Loray workers seemed to tolerate union calls for racial equality as long as the NTWU fought harder for their demands. Local Communist organizers strategically played down the union's atheism as well. Town leaders however trumpeted the evils of an organization that would promote race mixing and abolish churches.

The strike's fate was sealed however by the force of the state. On April 2, pickets at the Loray mill scuffled with local authorities at the plant gate, prompting the governor to send the National Guard to restore order, which was defined as assuring that the plant could operate. This show of force resulted in dozens of arrests of strikers and an opportunity for strike-breakers to enter the plant with military protection. Many strikers were among those willing to cross the picket lines. Within two weeks the strike was effectively over, and within a month, only some 200 die-hards continued to hold out. It is impossible to know exactly why the strike crumbled so quickly, but Beal's concern about lack of preparation appears to have been well-placed. The NTWU had nowhere near the resources necessary either to replace the strikers' paychecks or to offer even minimal relief. Moreover the company threatened to evict rebellious workers. Continued striking appeared likely to lead to hunger and homelessness if not incarceration as well.

Bloody Aftermath

The Loray strike made its mark however because of events that occurred well after the strike was essentially broken. After their headquarters was burned, holdout strikers and their NTWU backers organized themselves in a tent colony outside the company's jurisdiction and continued to agitate for their demands. On June 7, the "bitter enders" held a rally and marched toward the mill. On the way they were turned back by Gastonia police, some of whom demanded to search the new union headquarters in the tent colony. A major fight ensued, shots were fired, and a striker and four police officers were wounded. No one knows who fired the shots, but one of the officers, Police Chief Orville Aderholt, died the following day. This set in motion a wave of repression against strikers and NTWU organizers, with most strike leaders arrested for murder before they could be lynched.

The first prosecution of the defendants ended in a mistrial because after authorities brought a life-size

wax model of Aderholt into the courtroom, a juror suffered an emotional breakdown. The suspension of legal proceedings served as a green light to many anti-union activists in Gastonia. Some remaining NTWU organizers were kidnapped and beaten, while others were taken out of the county and jailed elsewhere. The tent colony was attacked to the point that it had to be abandoned. In this wave of repression, the NTWU officially called off the strike but not before a group of union supporters traveling in a truck were attacked with gunfire by vigilantes. In this altercation a single mother of five, Ella May Wiggins, who was known as a feisty woman and as the strike's balladeer, was shot to death. Despite dozens of eyewitnesses, no one was ever convicted of Wiggins's murder.

Those accused of killing the police chief however were convicted after a second trial. The prosecution emphasized atheism more than evidence, and the jury deliberated for less than an hour. The NTWU defendants however skipped bail and escaped to the Soviet Union. After becoming disillusioned with life under communism, Fred Beal returned to the United States and was ultimately sent back to Gastonia to serve his sentence. Four years later, Beal was paroled by the governor.

The Gastonia strike received national attention because of its violence and the presence of Communists in such an unlikely location. Much of the later attention to the conflict has centered on the Communist leadership and the subsequent trials that convicted Aderholt's alleged killers and exonerated Wiggins's. The conditions of labor for the thousands of textile workers however worsened throughout the 1930s. The speedup, stretch-out, and arbitrary power of management continued to be the millhands' primary complaint and would be at the core of their unsuccessful participation in the General Textile Strike of 1934.

GENDER

Most human societies have allocated different tasks to men and women. The ways in which tasks are allocated, however, varies widely over time and across cultures. Both sexual difference and social constructions of masculinity and femininity have influenced the kinds of work that women and men historically have performed. Labor thus is marked by gender, a term that refers not only to sexual difference, but to the social and historical meanings societies ascribe to sexual difference and to the power relations those meanings produce.

Gendered Divisions of Labor

Gendered divisions of labor are not natural, that is, they are not necessarily linked to sex differences. They have instead emerged in response to particular historical developments and have shifted over time. Although the labor of both men and women has been equally important to the survival and prosperity of human societies, male and female work roles have not always held equal value. For much of American history, the labor of men has held higher value than that of women. Women's political and social status and the value accorded to women's work are linked. In general women's status tends to be higher when they contribute substantially to the economy, control the fruits of their labor, and receive public recognition for their contributions. Women's status also tends to be higher where there is no clear distinction between public and private and no sharply defined class structure.

There is nothing fixed about the relationship between sexual difference and the ways in which societies allocate labor. Archeological evidence indicates that early humans probably did not link work roles closely to sex differences and that women hunted along with men. Foraging societies that subsisted on a combination of gathering available vegetation and hunting both small and large game animals would gain no survival benefit by assigning either of these tasks exclusively to men or women, and anthropological evidence gleaned from foraging societies in the

recent past indicates that hunting is not entirely incompatible with pregnancy, childbirth, and child-rearing. The tendency for women to spend less time producing food and more time nursing and caring for children may have arisen in part from improved hunting technologies that boosted infant survival rates. Eventually the development of agriculture gave rise to new sets of tasks that more closely matched the rhythms of childcare.

In precontact Native American societies, farming and hunting complemented one another. Among the matriarchal Iroquois, women farmed and so provided the most abundant and stable source of food. They controlled food distribution. Men hunted, but they also cleared the fields so that women could plant. Iroquois men and women held relatively equal status. Although Iroquois men ran tribal political organizations, women had the power to nominate council elders and depose chiefs. Among Pueblo societies, men cultivated the cornfields, but women owned the corn and controlled the processing and distribution of corn meal. Women built the houses and acted as household heads, while men's status was tied to hunting, warfare, and religion. Hunting and warfare tended to increase male power and status, but they produced gross gender inequality only in societies where women lacked power based on their contributions to the economy. The fact that Iroquois and Pueblo women could divorce their spouses as easily as could men serves as a measure of women's relative equality in both cultures.

Intruding European cultures changed the division of labor within Native American societies in ways that marginalized women's economic contributions, limited their political influence, and reduced their social status. French traders for example were interested primarily in acquiring furs supplied by the Native American men of the Great Lakes region, not in the small game, tools, utensils, or clothing that women produced. Moreover as the items women produced became more readily available through trade, women's contribution to community subsistence became less important. Women's work came to revolve narrowly around preparing furs for trade. Although women's work was vital to the fur trade, women did not produce furs, nor did they control the price and distribution of furs. Before the Spanish colonized New Mexico, Pueblo women controlled their households and the distribution of the meat their husbands provided through hunting. Franciscan priests intervened directly to change the work roles of Pueblo women and men. As priests began converting the Pueblo peoples to Catholicism, they encouraged men to assert authority within the household and put households and property in the hands of men rather than women.

English colonists brought to the new world social, political, and religious structures that subordinated women within both church and state. Married women had no independent legal status, no voice in public affairs, and no status within their own households. Households were patriarchal; women had no control over household affairs, property, or children. Northern rural families divided labor between field work and home work, with men generally performing the former and women the latter. However men's and women's work roles tended to complement each other, and their tasks sometimes overlapped. Women had primary responsibility for the production of cloth, for example, but men assembled looms, planted flax, and sheared sheep. During the height of the growing season and at harvest time, women helped in the fields and performed some of the same tasks as boys, such as hoeing, haying, and husking corn. There were other tasks women could have performed but did not. For example they did not drive cattle to market nor carry grain to the mill, as boys did. Women's work, though varied, remained centered on household and farmstead.

Although men held broader political rights and economic responsibilities than did women and men's work held higher status, households were the basic units of economic production, and women were essential to their operation. Women's economic activities and the autonomy those activities fostered contrasted sharply with their legal and political status. As historian Laurel Thatcher Ulrich has demonstrated, northern colonial women participated in and managed a largely invisible economy that brought income into the household. They kept their own accounts, contracted for work, and paid their own bills. Within this circumscribed, female network, women contributed substantially to household economies and controlled what they produced and earned as they traded and sold goods like butter and cheese and generated income from such activities as spinning, weaving, and midwifery.

As in rural economies, women's domestic labor remained critical to the functioning of urban households, but urban economies provided work opportunities for colonial women that rural economies did not. Although shop keeping and other mercantile activities were largely male occupations, both married and unmarried women in towns took in lodgers, ran taverns, and kept shops. Still women's opportunities remained far more restricted than those of men, since women were far less likely to acquire specialized training in a craft or skill. Unmarried women could enter into male-dominated occupations more easily than married women whose domestic tasks kept them from pursuing other work. Unmarried women could

exchange credit and debt, own and rent property, and control their own money. Married women could however keep accounts and act as "deputy husbands" in a spouse's absence, and many widows continued family businesses after the death of a husband. In urban as in rural economies, single women developed mutually beneficial economic networks, and urban women's contributions to local economies gave them a degree of status and autonomy.

Early Industrial Capitalism and Gendered Divisions of Labor

As commerce expanded in the early 1800s, distinctions between men's and women's work grew sharper. The example of the New England shoemaking industry suggests that the development of a more rigid sexual division of labor resulted from a conscious decision on the part of male shoemakers to expand production and yet protect the status of their craft. In order to increase production, male artisans assigned wives, daughters, and female household help the task of shoe binding, or sewing shoe uppers. Artisans then separated shoe binding from knowledge of the rest of the craft. Women were excluded from apprenticeships, thereby ensuring that they would remain subordinate to men in the production process and reserving the artisan training system for men. This sexual division of labor carried over into the early factory system. By excluding women from certain jobs, men protected their positions as skilled workers; built worker solidarity grounded in a mutualistic, masculine identity; and maintained greater control over the workplace. As merchant manufacturers began to replace artisans as employers, shoe binders divided into two groups. Married women still worked at home in the out-work system, earning the lowest wage in the shoemaking industry. Young, mostly single women worked in the factory system, where their work remained limited to shoe binding. As men's and women's work roles grew more distinct, the complementarity that had characterized pre-industrial labor gave way to labor competition between men and women.

The slave labor system, on the other hand, tended to blur gendered divisions of labor. Slave men and women labored together in the fields. Although slave men generally were expected to perform the heaviest work, women also performed hard labor and were similarly punished if their work came up short. Within their own quarters however, slave families preserved a gendered division of labor that resembled that of white rural families. Men hunted, fished, and

trapped during off-work hours; and women cooked, sewed, and cared for children. The work that African-American men and women performed for their families was of necessity cooperative. They relied on kin networks as well as on nuclear families to maintain households under the slave system.

Class-Based Constructions of Gender

Although class structure remained relatively fluid in the early stages of industrial capitalism, clear class distinctions gradually emerged and with them class-based constructions of gender. During the 1840s and 1850s, as the number of self-employed workers fell and the ranks of wage workers swelled with the arrival of large numbers of immigrants, skilled workers lost ground both to mechanization and labor competition. Decreasing wages and the presence of a slave labor system in the South led northern industrial workers to characterize their condition as “wage slavery.” Masculinity stood at the core of working-class formation. In the North a distinctive working-class construction of manhood emerged that rested on workingmen’s ability to control work rules and the pace of production, to command respect from the bosses, and to earn a family wage, that is, a wage sufficient to support a family of dependents so that women and children would not have to become wage earners themselves. The family wage ideal thus emerged as a response to specific industrial conditions. It also developed within the presence of a powerful, middle-class ideology defining male and female gender roles and as a reflection of working-class masculinity.

Middle-class constructions of manhood rested on the image of the self-made man and emphasized independence, self-sufficiency, and the ability to provide for one’s family. As entrepreneurial and managerial positions developed in commercial centers, middle-class men’s productive work moved away from the household while middle-class women remained in the domestic sphere. As consumer goods became more readily available to middle-class women, they performed less productive work and more reproductive work. The “cult of true womanhood” elevated middle-class women’s status as wives and mothers and gave them greater moral authority within the household, but the labor they performed as housekeepers and child minders became less visible and less valued.

Working-class men whose wages and status were declining saw in the middle-class model of domesticity a means to raise wage rates, resist industrial capitalism, and shore up working-class masculinity. They

argued that an industrial system that pushed wages down and so forced wives and children into the labor market threatened to degrade working-class women. The wives and daughters of the well-to-do would, they pointed out, no more associate with factory girls than they would slaves. Workingmen argued that not only would their wives and children suffer if they were forced to enter the labor market in order to supplement the family income, but that their own status as workingmen would be degraded as well if their wives and daughters were forced to become factory girls.

Factory girls themselves had a different view. As the textile industry developed in the 1820s, young, single women from rural areas began to migrate to factory towns like Lowell, Massachusetts, to work in textile mills. Drawn by the promise of both economic and cultural opportunities, they entered the workforce in large numbers during the 1830s. Sensitive to middle-class prescriptions of womanhood, factory owners tried to reproduce the domesticity that presumably protected true womanhood by lodging women in company-managed boarding houses, enforcing strict moral standards, and closely monitoring their activities. Factory girls resisted company control, asserted their independence, and upheld the dignity of labor. The female work culture gave rise to a version of class consciousness that reflected women’s experiences as workers and that challenged both the cult of domesticity and capitalist labor relations.

The Lynn shoe workers strike of 1860 demonstrates the ways in which workingmen’s and women’s interests diverged. When the strike began, male shoe workers asked for workingwomen’s support. They hoped to organize female shoe binders as an auxiliary force to encourage community support and to boycott uncooperative shoe bosses. Yet male artisans remained committed to the family wage. They were not prepared to acknowledge or fight for the interests of female factory operatives. For their part the factory operatives opposed a strike strategy whose only goal was to raise men’s wages. They began to organize female shoe workers, asking married women who worked at home to join them in striking for higher wages. Such a gender-based coalition would have protected the wages of both married outworkers and single factory operatives. Male workers opposed this alliance, fearing that higher wages for factory operatives would encourage wives to enter factory work rather than stay at home. Male shoe workers persuaded their wives that joining the factory girls would alienate the bosses, result in less home work, and hurt men’s chances to win a family wage. The home workers rejected the strategy of the factory girls, supporting higher wages for men instead.

Home workers who put family interests above their individual interests as wage earners weakened the position of female shoe binders relative to employers. Male artisans who defined women primarily as family members rather than acknowledging their interests as workers largely excluded them from the process of class formation and thus weakened the ability of the working class to challenge industrial capitalism. In the process of resisting capitalist intrusion into their craft, men and women shoe workers debated not just the place of women in the shoe industry, but the meanings of womanhood and manhood.

Labor, Gender, and Relations of Power

Working-class men's ambivalence toward female workers continued through the late nineteenth and into the twentieth century. In 1869, the newly formed Knights of Labor declared its support for equal rights for all workers regardless of race or gender but at first excluded women from membership. When a group of female shoemakers in Philadelphia won a strike in 1881, formed a labor organization, and sought admission into the Knights of Labor, the national organization was forced to stand by its principles and admit them to the union. Women subsequently joined in large numbers, particularly in the shoemaking, textile, and clothing industries. By the mid-1880s, women constituted 10% of Knights of Labor membership. Despite opposition from some male members of the order, women served as union organizers and proved to be active, even militant, unionists. In 1888, female organizers called on the Knights of Labor either to uphold the principle of equal pay for equal work or admit that it was a mockery and eliminate the statement supporting an equal pay policy from their platform.

As the Knights of Labor faltered in the 1890s, the American Federation of Labor (AFL) took its place and grew to include 4 million workers by 1920. During that same period, the proportion of women in the workforce increased rapidly. In a competitive labor market, male unionists understood the threat that unorganized female workers posed. Trade unionists repeatedly affirmed a commitment to unionize female workers and support equal pay for equal work but did so largely in order to protect male wage rates. Unionists continued to pursue the family wage, arguing that women's contribution to the home and their duties as mothers were so valuable that they ought not to be in the workforce at all and that employers' exploitation of mostly unskilled, female workers constituted a capitalist assault on the working-class family. As the

pragmatic, craft-based AFL came to dominate the labor movement, antagonism toward female workers grew among some affiliates, and a discourse that centered on male privilege developed. An article appearing in the July 5, 1893, issue of the *Coast Seamen's Journal* commented that women were mentally and physically incapable of achieving great things, but they were capable of making it impossible for men to be what nature intended them to be, that is the providers and protectors of women and children. The author argued that the labor movement's principal responsibility was to ensure that every man had a chance to earn enough to provide for a wife and family. Ignoring any wage-earning aspirations that female workers might have had themselves, he wrote that once male workers earned a family wage, the issue of women in industry and in the union would cease to exist. Such rhetoric bore little relation to reality. The family wage, had workers succeeded in getting it, would have benefited only women in stable marriages. It did no good for single, divorced, or abandoned women whose interests would have been better served by access to high-paying jobs that offered opportunities for advancement. In the end keeping women out of the workforce proved impossible. Most women working for wages in the early 1900s were single, and they often supported mothers and younger siblings with their pay. Only 3.3% of female industrial workers were organized into trade unions. Because unskilled women could not count on trade unions to work on their behalf for higher wages or better working conditions, working-class women sought the help of middle-class reformers and legislators to address the problems of organizing female workers and improving working conditions.

In 1903, middle-class reformers and working-women founded the National Women's Trade Union League (NWTUL), a national labor organization dedicated to unionizing female workers in order to obtain better working conditions and higher wages. Many if not most middle-class women involved in labor reform remained convinced that women's place was in the home, but they realized that women who worked had to do so in order to support themselves and their families. Given the necessity of women's work, middle-class reformers committed themselves to improving working conditions and wage rates. Middle-class women did not however support strikes as a means of achieving those goals. Rather they supported state intervention in the form of minimum wage laws and protective labor legislation. States began to enact laws regulating the conditions and hours for workers in the early twentieth century. The Supreme Court at first struck down such legislation on the grounds that it

denied workers the right to make their own employment contracts. However in *Muller v. Oregon* (1908) the Court sustained protective legislation for women on the grounds that their “physical structure” and “maternal functions” placed them at a disadvantage. In the Court’s estimation, women could not work so long or so hard as men and requiring them to do so endangered the health and well being of the nation’s future citizens. But passing protective labor legislation could hurt as well as help working women. While it shielded women from some of the worst abuses of early twentieth-century industrial capitalism, it also excluded them from a number of highly skilled, highly paid occupations that required night work or that were deemed too physically taxing for women. As historian Alice Kessler-Harris has pointed out, because protective legislation divided workers into those who could and could not perform certain work roles, it is responsible in part for institutionalizing women’s subordinate position in the labor force. Protective legislation drew fire from groups like the Women’s League for Equal Opportunity, which lobbied against night work laws and the 54-hour workweek for women. The chief opponent of protective legislation was the National Woman’s party (NWP), the nation’s most militant suffrage organization. In 1921, the NWP proposed an equal rights amendment to the Constitution of the United States that read: “No political, civil or legal disabilities or inequalities on account of sex nor on account of marriage, unless applying equally to both sexes, shall exist within the United States or any territory thereof.” The proposed amendment sparked a battle between groups like the NWTUL, which believed that it would worsen conditions for workingwomen, and groups that believed effective union organization would do more for women than protective labor legislation. A new style of unionism that had taken shape during the pre-World War I period of Socialist party activism gave the latter groups some hope that they were right. The new unionism fostered a sense of working-class solidarity that was absent in the craft unions of the AFL. These new unions enrolled female members, offered social programs for workingwomen, and won wage increases and shorter working hours. The new unions however remained as male-dominated as the old. Women were permitted greater involvement at lower levels of organization, but men monopolized all union offices and male leaders did not trust female organizers nor allow women to handle strikes. Limited job opportunities, protective labor legislation, and varying levels of exclusion from labor union participation isolated women from the mainstream of the labor movement and marginalized women within sex-segregated jobs.

Labor and Gender in the Twentieth Century

The number of workingwomen increased steadily over the course of the twentieth century, but they remained in sex-segregated jobs. In 1910, 51% of single women worked for wages, but until World War II, about 90% of all working women filled only 10 different occupations. These occupations included secretarial work, retail sales, telephone switchboard operation, and teaching. Black women, who had far fewer opportunities than did whites, remained employed mostly in agricultural or domestic work. Sex-segregation contributed to the assignment of low wages and status to these jobs even when those jobs previously had been filled by men.

During World War II, new opportunities opened up for women. War work made women aware of job possibilities they had not previously considered, but Kessler-Harris has argued that women’s wartime experience reflected continuity as well as change. The inroads women made into higher paying, male-dominated occupations continued an earlier trend of working women to seek better wages, higher status, and greater job satisfaction. The war provided women some of what they sought. Patriotic rhetoric suggested that war work took precedence over home responsibilities, handing those women who aspired to work outside the home a compelling reason to do so. Black women, older women, and professional women all took advantage of the wartime labor shortage to enter well-paying jobs. Black women’s gains were most dramatic. About 20% of black women who previously had been limited to low-paying domestic service jobs before the war found higher paying positions. By the end of the war, the number of black women working as factory operatives and in clerical, sales, and professional work had increased substantially.

Still the gains women made were limited by the view that they were temporary workers. During the war employers refused to integrate women into training programs that might provide access to skills beyond those essential for their immediate tasks. Management believed that additional training would be a wasted investment for temporary help. Women pressed for pay equal to that of male workers, and unions fought to maintain wage levels during the war in order to protect men’s wages, but most women were forced to return to lower paying, sex-segregated jobs. After the war women’s participation in the work force dropped by the same percentage as it had risen to meet wartime labor shortages, indicating that most of the women who remained in the workforce after the war would have been working for wages anyway.

But by 1950, the overall rate of women's participation in the workforce had risen to 32%, a net gain of 16% from 1940–1950.

The publicity accorded female workers in war industries during World War II made it clear to Americans that women could do men's work but whether or not they wanted to was a different matter. The shop floor represented a stronghold of male culture, a world away from family responsibilities and feminine influences. When women did invade the male culture of the shop floor, as they did occasionally before the war and more permanently beginning in the 1970s, they met with derision, hostility, and sexual harassment. The gap between the jobs women were interested in and capable of performing and the limitations imposed by a return to the prewar, sex-segregated labor market fueled second-wave feminism. The women's movement of the 1960s challenged both the sex-segregated labor market and the gender-based wage differential. From 1960–1970, the number of women in skilled, male-dominated trades had risen by 80%. By 1970, more than 40% of married women worked for wages. Women's wage rates however remained only 59% of those for men. The tension between the rising participation of women in the workforce and consistently low wage rates prompted demands for legislation to address gender inequalities in the workplace. As more and more women from all classes and levels of education entered into the workforce, gendered divisions of labor became less rigid and the sex-segregated labor market began to break down, though not so fast nor so fully as women hoped. Many male jobs opened up to women, but less rigid gender-based divisions of labor also offered broader opportunities for men drawn to traditionally female occupations like nursing or for fathers who wanted to take a more active role in child rearing by staying home with their children part-time. Comparing men's and women's work roles in the late twentieth and early twenty-first century to those in earlier periods of American history demonstrates the degree to which gendered divisions of labor, gender constructions, and gender-based relations of power have shifted and evolved over time.

Gender and Labor History

Human labor—its allocation, organization, and valuation—has always been marked by gender and so have analyses of labor history and working-class formation. Through the 1960s, labor historians focused on formal institutions of power, such as trade unions,

and on male labor leaders and organizations and so excluded women from labor history. Labor historians have relied on male experiences and changes in workingmen's status in order to periodize labor history and working-class formation. As labor historians shifted from studying men who held formal positions of power to ordinary union members and unorganized workers, they began to look at workers and work cultures and at how race and ethnicity shaped working-class experiences. At the same time, the fields of women's history and feminist theory were developing, and working-class historians began incorporating perspectives on women and families in their analyses.

But the incorporation of women's experiences and perspectives in working-class histories did not in and of itself make for a gendered analysis of labor history. As Joan Scott pointed out, E. P. Thompson's path-breaking study of working-class formation, *The Making of the English Working Class*, included the stories of individual women but still constructed class as a masculine identity. Thompson associated working-class consciousness and class formation with the politics of male workers and focused on women's domestic experience even when women as workers, not wives, constituted the subject of his narrative. His concern was to assess capitalism's impact on male workers, not to assess the reasons for women's lower status and lower value in the labor market.

The development of feminist theory and gendered interpretations of workers' experiences have expanded, enriched, complicated, and fundamentally changed labor and working-class history. Using gender as a category of analysis has opened the field up to new questions and new ways of thinking by redefining the terms worker and workplace, highlighting gendered divisions within working-class households, on the shop floor, and in the labor movement; and challenging the notion that a unified set of class interests exists. Feminist historians have asked how divisions of labor based on sex led to women's lower status and lower value in the labor market. Attending to social constructions of gender has raised questions about when and why working-class men and women supported family-wage ideology, why craft unions excluded women, and how employers used gender ideology to divide the working class. Analyzing relations of gender has illuminated the ways in which men and women used particular gender constructions and ideologies to promote their own interests, their families' interests, and working-class interests. Viewing shop floor and factory as gendered spaces has yielded insight into how male and female work cultures have fostered worker solidarity and challenged employers for

control over the workplace. The scholarship that has emerged from using gender as a category of analysis amply demonstrates how gender was embedded in daily work practices and class relations and offers historians a fresh and fruitful perspective on labor history.

GENERAL WORKERS' LEAGUE

Various associations of *émigré* German craftsmen and radicals adopted the name *Arbeiterbund* (Workers League or Labor league) in the years before

the Civil War. These were largely the work of revolutionary-minded German artisans who had been active overseas before immigrating to the United States, although conditions for immigrant labor in the United States sustained the organizations. Their presence had a major impact on the American workers' movement at a formative period in its history.

German Workers' Associations and the Workers' Revolution

The cooperationist goals, conspiratorial means, and insurrectionist tactics of the nineteenth-century French revolutionary associations may have been even more appealing to the relatively transient German artisans. Auguste Blanqui's *Société des Familles* and *Société des Saisons* inspired the 1834 formation of the *Bund der Geachteten* (the League of the Proscribed, or Outlaws), which reorganized 2 years later as the *Bund der Gerechten* (the League of the Just).

The group embraced a German version of an emergent socialist ideology, specifically that of Wilhelm Weitling (1808–1871), a Magdeburg tailor, whose numerous works include, most famously, his *Garantien der Harmonie und Freiheit* (1842). The league also sought to foster ideas of international labor solidarity through broader educational societies. Its general socialist ideas and its broad orientation drew Karl Marx and Friedrich Engels into the group. In 1847, it adopted a new name, the *Bund der Kommunisten* (Communist league), on behalf of which Marx and Engels wrote their famous *Manifesto*. Some of these generally migratory workers found their way to the United States, and the numbers would become a legion with the defeat of the 1848–1849 revolutionary upheavals.

General Workers' League

A former member of the league, Hermann Kriege (1820–1850), came to the United States, and then launched a newspaper to promote revolutionary and socialist ideas. In 1845, he founded the *Association der Social-Reformer* (the Social Reform association) in New York City, and it spread to Newark, Cincinnati, Milwaukee, Philadelphia, Chicago, and St. Louis. The group embraced American land reform radicalism, but Kriege gave his deepest loyalties to the Democratic party. Kriege returned to Germany for

the 1848 revolutionary upheavals but returned a less ambitious and more conservative figure.

Weitling's immigration to the United States was permanent. In 1850, as American workers were forming citywide industrial congresses and other bodies, Weitling helped unite 2,400 German artisans in New York into a *Centralkommission der verinigten Gewerbe* (Central Commission of the United Trades). Riding the tide of a strike movement and inspired by the cooperative vision of continental socialism, it mobilized 4,500 members in 1,700 trades, inspiring similar bodies in Baltimore, St. Louis, and other cities.

Weitling and others eager to establish a national coordinating body called the October 1850 convention that founded the *Allgemeiner Arbeiterbund* (General Workers' league). The group gained sometimes large affiliates in Baltimore, Buffalo, Cincinnati, Detroit, Dubuque, Louisville, Maysville, Newark, Philadelphia, Pittsburgh, Rochester, St. Louis, Trenton, and Williamsburg, as well as New York City. English-speaking radicals at the New York City Industrial Congress also established American Labor leagues, presumably cooperative bodies inspired by their German comrades.

However this *Arbeiterbund* did not pursue the earlier successes in the trades but pursued cooperative agitation and invested much effort in launching a socialist society at Communia in Iowa. Local associations, calling themselves a *Verein* or a *Gemeide*, surely attained a greater influence on labor activism in those years. Finally the organization seemed even more utopian against the background of the explosive agitation over slavery. By 1852, this *Arbeiterbund* went into decline.

The American Workers' League

In that year a handful of veteran radicals started a tiny *Proletariarbund*, partly to fill the void left by the orientation of the *Arbeiterbund*. Its primary leader was Joseph Weydemeyer (1818–1866), a veteran of the Prussian artillery as well as the Communist league and the 1848 revolutions. It proclaimed labor solidarity, human equality, hostility to slavery, and opposition to all capitalist parties.

By March 1853, the ideas of Weydemeyer's *Proletariarbund* proved sufficient to draw some 800 workers from the New York area to a convention that launched a new *Amerikanische Arbeiterbund*. It briefly drew together many of the local *Arbeitervereine*, established a *Frauenverein* for women, and restated the radical egalitarianism of its predecessor.

The organization gained some support in German-speaking communities across the country, but was overshadowed by the existence of the much broader *Sozialistischer Turnerbund*. A revolutionary republican gymnastic and theatrical club in Germany, the Turners in the United States were explicitly in favor of abolishing classes.

Then, too, from 1854–1858, a loose federation of émigré groups evolved in New York uniting German socialists with French, Italian, Hungarian, Polish, Cuban, and other radicals. They formed a general Universal Democratic Republican Society, then an ongoing convention of liberal societies that celebrated revolutionary anniversaries beneath socialist slogans and red flags.

Communist Club and International Ties

The Panic of 1857 led to massive demonstrations by the unemployed and the final phase of antebellum German workers' organization. The nationalists, largely still looking for a revival of the republicanism of 1848 launched another *Allgemeiner Arbeiterbund von Nord-Amerika*, but it never revived the promises of its namesakes.

That same year, Friedrich Albert Sorge (1828–1906), a veteran of the earlier efforts by both Weydemeyer and Weitling, took the initiative in launching a tiny local *Kommunist Klub* that revived the militant egalitarianism and socialist vision of the earlier groups. By July 1858, the group helped form an American section of the international association. Although largely dominated by the old republican nationalism of 1848, the group became the most immediate forerunner on both sides of the Atlantic of the International Workingmen's Association, the "first international" formed in 1864.

By 1858, however, Weydemeyer had moved into the Midwest, ultimately to St. Louis. He and much of the antebellum German workers movement were consumed by the Union war effort in the Civil War.

GEORGE, HENRY (1839–1897) Political Economist, Reformer

A self-taught political economist, Henry George wrote one of the most powerful and widely read critiques of the late nineteenth-century industrial United States. Published in 1879, *Progress and Poverty: An Inquiry into the Cause of Industrial Depressions and of Increase of Want with Increase of Wealth*, argued that the growing inequities between social classes in the Gilded Age threatened American democracy. It went on to become the best-selling book on political economy in the nineteenth century and launched George as a prominent social reformer with an international following.

Henry George was born in Philadelphia on September 2, 1839, the son of Catherine (Vallance) George and Richard George, a publisher of religious books. Disinterested in formal schooling, he quit at age 13 to serve as a foremast boy on a 1-year journey aboard a ship. On his return in 1856, he worked briefly as an apprentice printer before striking out for San Francisco to prospect for gold. After years trying his hand at many different jobs, often living in extreme poverty, he eventually embarked on an uneven career as a journalist, writing for and editing numerous San Francisco papers. In 1861, he married Annie Fox, with whom he had four children.

By the mid-1870s, George became increasingly interested in questions of political economy and social justice, especially as he experienced personal poverty and witnessed growing labor unrest in California during the depression of 1873–1877. Despite his lack of formal education, George read widely, especially the classics of political economy. He was also an evangelical Christian who came to view his reform impulse in almost messianic terms and laced much of his writing with biblical references.

Fundamentally George was worried about the deleterious effects of industrial capitalism on American democracy. Why, he wondered, were the many indisputable benefits of industrial progress accompanied by an increase in the number of people living in poverty? Could the defining features of the nation's republican ideals and institutions—liberty, equality, and opportunity—endure in a society increasingly dominated by large corporations and powerful millionaires like Jay Gould and William K. Vanderbilt?

Deeply troubled by these questions and committed to answering them, George began writing *Progress and Poverty* in 1877 and completed it 2 years later. Land monopoly, explained George, caused modern industrial society to produce “an increase of want

with [an] increase of wealth.” Real estate speculators and land monopolists, he asserted, siphoned off a major portion of the wealth created not by them but rather by the collective labors of the community. Monopolists grew rich on these unearned profits while a growing number of society's producers toiled in poverty with little opportunity for advancement: Hence, the growth of poverty amid progress.

The solution, asserted George, was for the government to appropriate these profits through a uniform land value tax or what his supporters eventually took to calling the “single tax.” With the rewards of speculation eliminated, undeveloped land and resources held by speculators would be made available to those seeking to develop them. Economic opportunity would once again flourish, and poverty would decline. Tax revenues would rise, allowing for the construction of parks, schools, libraries, and other institutions dedicated to public benefit.

George offered his readers this vision of a future utopia but also one of apocalyptic horror should society fail to heed his warning. “This association of poverty with progress,” he wrote at the beginning of his book, “is the great enigma of our times.... It is the riddle which the Sphinx of Fate puts to our civilization, and which not to answer is to be destroyed.” If unchecked by radical reform, *laissez faire* industrial capitalism would ultimately destroy the American republic.

While radical in many respects, especially for his challenge to private property rights, George was not a socialist. In many ways he offered his single-tax program as an alternative to both *laissez faire* economics and socialism.

Initially *Progress and Poverty* drew almost no attention from readers and critics. Undaunted George decided in 1880 to move to New York City to raise his profile and draw attention to his book. There he met influential people and delivered lectures to reform-minded groups. He also joined the Land league, an Irish nationalist organization dedicated not only to winning Ireland's independence from Great Britain, but to abolishing the landlord system that left most of the Irish people in poverty. Although not Irish, George joined the cause because he saw the Irish struggle against land monopoly as a test case for his single-tax reform. In 1881–1882, he traveled to Ireland as a special correspondent for the *Irish World* (New York), reporting on the progress of the struggle for land reform. Before long working-class Irish Americans were some of George's greatest admirers.

Indeed working-class Americans of all ethnicities emerged as George's strongest base of support in those early years. As one labor leader put it, *Progress*

and Poverty taught them that “poverty is an artificial condition of man’s invention,” and not an inevitable aspect of human existence. “Workingmen and women, learning all this,...commenced to wrestle with their chains.”

Progress and Poverty also attracted a wide readership among intellectuals and middle-class reformers in the United States and Great Britain. His tours of Ireland and Britain in 1881–1882, 1884, and 1885 brought him into contact with many prominent figures, such as Herbert Spencer. He later became a correspondent with Leo Tolstoy, who admired his writings on land reform.

From 1883–1886, George continued to write and lecture on the ideas expressed in *Progress and Poverty*. In 1883, he agreed to write a series of articles on social problems for *Frank Leslie’s Weekly*, one of the most popular journals of the day. These were eventually collected into book form and published as *Social Problems* (1883). By this time George had also become a staunch proponent of free trade, a highly contentious issue in the Gilded Age, eventually publishing *Protection or Free Trade; An Examination of the Tariff Question, with Especial Regard to the Interests of Labor* (1886).

In 1886, a year of unprecedented labor unrest, workers in New York City nominated George as the United Labor party candidate for mayor. George conducted a spirited campaign in a race that drew national attention. On election day, George outpolled the republican candidate, the 27-year-old Theodore Roosevelt but lost narrowly to Democrat Abram Hewitt. George and his supporters hoped this strong showing was the sign of greater things to come, perhaps even the establishment of a national reform or labor party and a presidential campaign in 1888. But infighting, some of it generated by George’s decision to purge the movement of socialists, led to the collapse of the United Labor party in 1887.

For the rest of his career, George found his strongest base of supporters among middle-class reformers. By 1889, they had established 131 single-tax clubs across the country to promote his ideas. In 1890, George went on a world tour, delivering lectures and meeting land reform advocates. By the mid-1890s, single-tax clubs sprang up in Great Britain, Canada, Ireland, Australia, Denmark, and Hungary. He suffered a stroke in late-1891 and curtailed his travels in favor of writing. He started writing the *Science of Political Economy*, a book not published until after his death in 1897. In 1892, he published *A Perplexed Philosopher*, a book in which he vented his ire at the British political economist Herbert Spencer for turning against land reform. Over the next few years, George opened his Manhattan house as

a salon for progressive-minded people to meet and talk.

In 1897, New York City reformers again turned to George to run for mayor as a candidate of the Thomas Jefferson party. In poor health, George died five days before the election. Running in his place, his son, Henry George, Jr., still managed to garner 5% of the vote.

The influence of *Progress and Poverty* extended far beyond the life of its author, shaping the consciousness of many prominent late-nineteenth- and early-twentieth-century reformers, including Jacob A. Riis, Ignatius Donnelly, Fr. John A. Ryan, and Robert LaFollette. The book is still in print, and Henry George schools and single-tax organizations operate in at least 22 countries.

GERMANS

Germans have played a distinctive and substantial role in American labor history, particularly during the peak of the American industrial revolution in the last-third of the nineteenth century. This period coincided with the highest wave of German immigration to the United States as well as with intense political ferment and organizational innovation within labor circles in Germany. Thus large in number, German immigrants also brought with them political ideas and organizational models that figured prominently in the history of American workers even when the volume of German immigration subsided after the turn of the century.

Germans and the International Reach of German Culture

There are Germanic peoples spread throughout central Europe; and they have never been encompassed within the boundaries of one nation state to the extent of the English, French, and Spanish. Today most German-speaking people are included in the three

nations of Germany, Austria, and Switzerland; but there are pockets of ethnic Germans in northern Italy, the Czech Republic, Hungary, Romania, and Russia. Small remnants of their former selves, most of these enclaves derive from the Austro-Hungarian Empire that dominated central Europe for centuries before it was broken up after World War I. This multi-ethnic empire made German the most common language of business and government for much of central Europe. Thus the German language, and through it German culture, had a considerably wider reach than the German nation founded by Otto von Bismarck in 1871 that people today typically equate with Germany and the Germans.

Migration patterns reinforced this extensive influence, particularly for working people. European journeymen, including those from Scandinavia, traditionally wandered before settling down in one city. German was the most useful language for both traveling and learning a trade within central Europe. It even served workers well in the United States. Samuel Gompers, the most important American labor leader before the 1930s, was of Dutch and Jewish extraction; but he grew up in London and New York City, where he worked in a small cigar-making firm whose workers spoke mainly German. In the 1870s, a Swedish cigar maker translated the *Communist Manifesto* for the young Gompers, who was so interested in German socialism that he taught himself the language so he could read German labor thinkers.

Founding a German Nation and Exporting *Émigrés*

Germans were late in founding a nation state in comparison to the English, French, and Americans. The efforts of Germans to build a nation in the nineteenth century profoundly influenced the emigrants who left and thus their role in American labor history as well.

Since Germanic people were so dispersed, they lacked a common culture and in many respects, a common language because they spoke so many dialects. Even within the area united by Bismarck, there were 39 separate states and free cities. In the late eighteenth and early nineteenth centuries, German intellectuals tried to standardize the language and build a more unified culture as the first step in building a nation. They also created numerous voluntary organizations to promote cultural unity and patriotism. This combination of cultural and political goals was evident in the popular Turner societies, which

were designed to form the citizens of the new German republic through physical exercise, primarily gymnastics, cultural activities, and political action. The ubiquitous mutual benefit societies, whose main goal was providing insurance, also sometimes pursued similar cultural and political activities. Familiar with such groups, German immigrants, especially artisans, brought with them to the United States organizational models and experience useful for promoting the culture and politics needed by labor movements. *Émigrés* informed by the efforts to found a German nation were particularly important carriers of these traditions.

In the midnineteenth century Germans made two attempts to found a modern nation state in the area roughly between Switzerland and Austria to the south and the Baltic Sea to the north. In 1848, a wave of popular uprisings swept Europe, and their one unifying characteristic was opposition to monarchy and aristocracy. Opinion about a desirable new order ranged from conservative constitutional monarchies to radical republics. Within the numerous contemporary German states, artisans—particularly journeymen—took part in these revolutions, pushing the revolutionaries toward re-ordering society and the economy, not simply the political order. Yet the established powers counterattacked and crushed the revolutions, inaugurating a reactionary period in European history and sending waves of political refugees abroad, including to the United States.

Known as the “48ers” in American history, these political *émigrés* quickly assumed leadership positions in the German immigrant communities already established in American cities. The skills at organizing and agitation they had honed in Germany served them well in the United States amid the political ferment of the 1850s. For the 48ers the Civil War was a second chance to fight and defeat aristocracy, this time in the form of southern slaveholders. They enthusiastically led their followers, many of whom were German craftsmen, in support to the North and the Republican party. During the war the 48ers and their allies advocated emancipation sooner than mainstream Republicans, and during Reconstruction, they pushed for the radical transformation of the southern social and political order. They were usually friendly to the numerous unions that emerged in the North during the war, and some of them helped lead the movement for an 8-hour workday afterward. Although not typically workers themselves, the 48ers helped integrate working-class German immigrants into American politics; and they gave German-based labor organizations energy and a distinct political direction.

While Americans were preoccupied with the Civil War and Reconstruction, Bismarck led Prussia into

a series of military conflicts that resulted in the founding of the Second Empire in 1871, following the decisive defeat of France in the Franco-Prussian War. At the same time Ferdinand Lassalle organized the first German labor movement.

His movement was rooted in a network of social and political clubs appealing mainly to craftsmen and lower level professionals, not in labor unions, principally because there were so few unions within the German states at the time. Industrialization, and consequently unions, had not advanced in Germany so far as in Great Britain or in the northern United States; and in addition Lassalle's political movement fit into the ferment created by Bismarck's nation building politics. Strong unions did emerge in Germany as did a core of Marxist labor leaders. Both provoked intense debates in the late 1860s and 1870s about the role of unions and political parties within the labor movement as well as about how labor should address Bismarck's reactionary monarchy. These debates produced the vital German labor thought that so impressed Gompers. Many of the debaters themselves fled to the United States when Bismarck's government passed the Antisocialist Laws, which were in force from 1878–1890.

This whole period from the mid-1860s through the 1880s sent a stream of German labor and political *émigrés* to the United States comparable in size and influence to the previous generation of 48ers, although the newcomers tended to be more radical and more embedded in labor organizations and culture. In 1869, such *émigrés* as Friedrich A. Sorge helped found the International Workingmen's Association, as the American branch of the First Communist International. They were prominent in subsequent labor initiatives like the Workingmen's party of the United States as well as in the anarchist labor movement that played such a large role in the Haymarket Affair of 1886. The same wave of exiles helped found and maintain a web of unions, Turner societies, newspapers, political clubs, and mutual benefit societies that sustained German-language labor movements within New York, Brooklyn, Philadelphia, Buffalo, Chicago, Cleveland, St. Louis, Cincinnati, and Milwaukee. The existence of such movements illustrated the unusually large role of German immigrants in the workforces and economies of American industrial cities, particularly those in the Midwest. German-language labor movements by no means encompassed all or even most German workers in these cities, but they enlivened and emboldened Germans who belonged to English-language unions and political parties. The culture sustained by these movements also inspired German workers in smaller cities.

The Mass Migrations

The 48ers and the post-Civil War labor *émigrés* were numerically tiny elements in a massive international migration of Europeans in the second-half of the nineteenth century. People from the area encompassed in Bismarck's Reich constituted the largest national element in this European exodus, and the highpoints of German emigration mirrored those of all Europeans. With the advent of the twentieth century, the patterns of German and European emigration diverged.

From 1840–1900, people from Ireland, Scandinavia, and central Europe dominated the European emigration. After 1900, the origins of the emigrants shifted to the east toward Russia and south toward Italy and the Mediterranean. In the nineteenth century there were three waves of European immigrants arriving in the United States, peaking in the mid-1850s, the late 1860s, and the mid-1880s. The third wave was the largest and the second the smallest, though still very substantial. The volume of emigration from the area defined by Bismarck's Reich corresponded exactly to these three larger waves from Europe, with the peak years for the Germans being 1854, 1869, and 1882. During the whole 60-year period, Germans always constituted from a quarter to a third of all the foreign-born in the United States.

The Germans settled disproportionately in the mid-Atlantic and midwestern states where the contemporary growth of American industry was concentrated. The Midwest also offered enough available farmland to attract a substantial proportion of the Germans to the countryside. Nonetheless the strong demand from industry attracted even more to urban areas: In 1890, two-fifths of Germans lived in cities, almost double the figure for native-born Americans.

Both the geographic origins and kinds of people leaving Germany changed substantially from 1840–1900. Those leaving before the Civil War came largely from the Rhine River valley, that is, from west central and southwestern Germany. Economic dislocation and political turmoil prompted people to leave, and the Rhine offered convenient transportation to international ports in Holland. The emigrants tended to be peasants and artisans who, while desperate at the time, were not economically destitute. They had the resources to make an international journey; and they often traveled in families, intending to settle permanently in the United States. When they did so, they created German enclaves in both the countryside and cities that became models for defining ethnic culture in America.

The relatively small excess of men over women in mid-nineteenth-century German districts illustrated

the intent of the people to settle and create communities. In contrast when immigrants planned to work and then leave, as in mining camps, men dramatically outnumbered women. German women in cities entered the labor market in smaller proportions than did women of many other nationalities, preferring to contribute to their families' income by taking in boarders or helping out in family-owned shops or businesses. The proportion of German women entering the labor market in the United States did increase toward the end of the nineteenth century; and they showed a growing preference for factory work, particularly in the garment industry, over domestic service, which originally had been their most typical occupational choice. Women also began to take a more prominent role in the labor movement.

After the Civil War the origins of the emigrants began to shift to the north and east within Germany, encompassing larger German port and industrial cities as well as vast East Prussian agricultural areas dominated by large noble landowners known as *Junkers*. Thus more and more emigrants were both experienced urban workers and impoverished rural laborers, who did not have the resources to set themselves up on farms in the United States. These trends among the German emigrants reflected the advancing industrial revolution within Germany and the expansion of a transatlantic labor market using innovations in transportation and communication, such as steamships and the telegraph. Thus a higher proportion of the post-Civil War German emigrants followed leads in an international labor market in pursuit of wage labor rather than a farm or their own workshop, which were increasingly unlikely objectives given the development of the American economy. The experienced urban workers among them, women included, were more likely to emigrate by themselves rather than with families. In the twentieth century practically all German emigrants were workers of this type.

By the early twentieth century, the German industrial revolution had developed so extensively that Germany itself was importing workers, commonly Poles from the East. The era of mass German emigration was over, since most German migrants went to their own country's burgeoning industrial cities. Meanwhile new waves of immigrants were arriving in the United States from eastern and southern Europe, making the first decade of the twentieth century the highpoint of European immigration to this country, although this time the Germans did not mirror the larger trend. While German immigration remained significant after 1900, it was modest by former standards.

From German Immigrants to German-American Workers

The diversity, volume, and timing of German immigration in the second-half of the nineteenth century accentuated the impact of Germans on American labor history. German immigrants came from a huge European region encompassing an extensive range of economic development, from backward rural areas to advanced industrial cities. Experienced urban workers combined with the post-Civil War *émigrés* to provide leadership to Germans new to both cities and the labor market. The Germans also came in huge numbers comparable only to the Irish at the time. This mixture of quantity with diversity created the possibility for German-speaking labor movements within the United States. The possibilities for such movements were enhanced by the success of German entrepreneurs in dominating whole economic sectors in American cities, such as brewing and distilling, baking, tailoring, and furniture making.

The timing of the German mass migration was as important as its diversity and scale. The highest German waves coincided with the most dramatic and traumatic phase of American industrialization when everyone, whether immigrant or native-born American, was trying to understand and build a place for him/herself in a modern industrial society. Anyone with a viable model or cogent idea at least got a hearing. Because of this ferment, Germans were able to make an unusual contribution toward defining the shape of American labor institutions by adapting their experiences and traditions to American conditions. This process required both imagination and sacrifice.

Social-Democratic politics could not perform the same unifying role in the United States as it had in Germany, where it functioned as a cultural and political touchstone for defining and unifying the German industrial working class. In the different American political culture, Social-Democratic politics could not even unite German immigrant workers, much less link them in a larger movement with other immigrants and native-born Americans. At the same time in the United States, the German models of union organization and cultural institution building became especially important even as Germans provided the largest constituency for various socialist political parties as well as for the anarchist movement of the 1880s. Thus Germans contributed mightily not only to the American left but also to defining and sustaining bureaucratically organized craft unions and business unionism generally.

The twentieth century brought a profound crisis to Germans in the United States, and not only because

the German mass migrations were over. The corporate reorganization period in the United States from 1898–1904 not only set up the model for the new corporate economy but also weakened the German-dominated sectors of the U.S. urban economy. Caught up in a new economic order and lacking a sustaining stream of immigrants, German labor movements were no longer viable. For all Germans, not only workers, the early twentieth century posed the fundamental problem of how to be first of all American but of a distinctive German cast. Ethnic folk culture provided one option, but there were others that did not rely on the German language or distinctive cultural markers. Among them was “municipal socialism,” the American term for Social-Democratic politics, which became prominent during the Progressive Era, particularly in midwestern cities. Another such option was building craft unions, usually with substantial benefits and often with left-leaning politics, within the American Federation of Labor (AFL). The anti-German patriotic feeling unleashed by World War I made these options for being a German-American worker even more important because they were less visibly German.

GI BILL

Signed by Franklin D. Roosevelt in June of 1944, the GI Bill, or Serviceman’s Readjustment Act of 1944 (SRA), delivered a cornucopia of benefits to 7.8 million veterans of World War II at a cost of \$77 billion. Hailed as an expression of the nation’s gratitude to those who had rendered military service during the war, the GI Bill was just as fundamentally a labor-market intervention designed to prevent a postwar depression. Most Americans recognized that barring some external stimulus, when hostilities ended and the military discharged 16 million American servicemen into the civilian economy, the number of workers would far exceed the available jobs. The specter of idle, hungry workers waiting in endless lines for government handouts struck fear in the hearts of a population that had grown accustomed to the high wages

and creature comforts made possible by the booming wartime economy.

At first glance the GI Bill appeared to offer something to every veteran of the Second World War. Qualifying veterans received federally backed, low-interest loan guarantees for housing, businesses, and farms; tuition for education and vocational training, as well as unemployment and self-employment subsidies and services. The education and training benefit for which the GI Bill is best-known offered veterans one year of full-time training at colleges, trade schools, and business and agriculture programs in addition to time equal to their military service, for a maximum of 48 months. Federal subsidies reaching \$500 a year flowed through the Veterans' Administration to universities and trade schools. So enthusiastic was the response that by 1947 veterans comprised 49% of college students. Many were the first in their families to seek higher education. At Rutgers College in New Jersey, the influx of ex-GIs swelled enrollment from 750 in September 1945 to 4,200 2 years later and set the stage for an explosive expansion in facilities. Less academically oriented veterans who qualified might get seed loans to start farms or businesses. Still others (59%) cashed in on a special unemployment fund, claiming \$20 a week for up to one year. Not only did the GI Bill launch the careers of a generation of doctors, lawyers, teachers, academics, and businessmen, it also birthed a generation of skilled laborers.

A central premise of the GI Bill, namely, that the federal government had a responsibility to take an expansive role in the postwar economy, came straight out of the New Deal. The National Resources Planning Board (NRPB) had been conceived by Harold Eckes in 1933 to coordinate the efforts of the Public Works Administration. Once the war began, its focus shifted to attaining full employment after the war. In 1943, the NRPB released two pamphlets detailing its vision of postwar social provision. In *After the War—Full Employment*, Alvin H. Hansen, the nation's leading Keynesian and a member of the Harvard Economics Department, advocated aggressive deficit spending and an increase in personal and corporate income tax to allow the federal government to continue after the war to prime the demand side of the economic equation. In *Security, Work, and Relief Policies*, members of the NRPB proposed a range of social supports administered by the Federal Security Administration to meet the employment, housing, and educational needs of all Americans. The report endorsed federal programs to put money into the hands of the poor through expanded unemployment insurance, general assistance, and a massive, ongoing public works' program, as a means to stimulate the economy.

To many on the labor-left, the prospect of universal social security seemed not just morally desirable, but fiscally sound as well as politically realistic. Organized labor—represented by the newly swelled ranks of the Congress of Industrial Organizations (CIO), the American Federation of Labor (AFL) and independent unions—welcomed the NRPB reports. The Socialist party and the National Farmers Union also endorsed the plans. Champions of the rights of the disenfranchised, among them Clark Foreman of the Southern Conference for Human Welfare and Lester Granger of the National Urban League, likewise cheered the proposals as overdue amendments to such New Deal programs as the National Labor Relations Act and the Social Security Act. Written in the 1930s to the specifications of southern Democrats and a handful of Republicans whose support was necessary, these programs had excluded many of the nation's poorest citizens, leaving as much as one-third of the African-American labor force, as well as a wide swath of white workers, without any safety net. Essentially the NRPB proposed demobilization of the armed forces as a double opportunity: to remedy gaps in New Deal social provision and set the economy on stable footing.

Critics derided these postwar plans as pie-eyed and worse. To the *Wall Street Journal*, the postwar proposals looked like “a halfway house to socialism!” Congressional conservatives like Senator Robert Taft of Ohio jeered that the plans for full employment had been hatched in a den of Marxism. Editors at the *New York Times* fanned the flames encircling the NRPB, condemning the proposals as “Bismarkian.” Altogether the response revealed that the fragile consensus that had held through the late 1930s would not survive the challenge of postwar planning. Results of the midterm elections of 1942 had only emboldened the anti-New Deal cohort in Congress. Midwestern voters in particular had elected Republican candidates committed to the return of private enterprise as the engine of a healthy economy. Their ascendancy meant that FDR lacked the political capital, if he ever had the will, to effectuate the NRPB's ambitious plans. Weeks after the group released its reports, Congress cut off its funding. Plucked from their New Deal roots, postwar plans grew energetically, but in a decidedly different direction.

Having kicked the NRPB to the curb, conservatives in Congress turned to the American Legion, the nation's largest veterans group, for its vision of postwar federal planning. Founded in 1919 by veterans of World War I descended from some of the nation's oldest families (including Teddy Roosevelt, Jr.), the American Legion gained national attention in its first year of existence in a lethal face-off with the Wobblies

in Centralia, Washington. It was a fitting *entrée*, since the legion, whose members—unlike its leadership—were mainly middle-class white men living outside the nation’s cities, maintained close ties to the Chamber of Commerce and the National Association of Manufacturers and would develop a track record of support for immigration quotas, veteran bonuses, racial segregation, strike breaking, and loyalty oaths through the next several decades.

Congressman John E. Rankin of Mississippi introduced a legion-authored version of a GI Bill of Rights in the House. Rankin’s endorsement alone spoke volumes about the limits of the proposal. Chairman of the House World War Veterans’ Committee and a southern Democrat *par excellence*, Rankin mingled his support for the rights of veterans with outspoken racism, anti-Semitism, and antipapism. Just as he and other southern Democrats had left their mark on federal legislation during the 1930s, crafting policy palatable to white southern interests because it excluded the mostly African-American domestic and agricultural workforce, Rankin and his colleagues insisted that postwar veteran legislation likewise accommodate the racist political economy of the South.

Like the bulwarks of the welfare state that preceded it, the GI Bill emerged race and gender neutral on its face. But both the design and implementation of the law guaranteed *de facto* discrimination. Rankin, and his Senate counterpart, Missouri Democrat Bennett Champ Clark, a founder of the American Legion, insisted on an omnibus bill that combined the bill’s diverse features (concerning housing, education, unemployment insurance, and so forth) into a single provision and vested loose administration of the funds in the Veterans’ Administration (VA) under General Omar Bradley, a reliable ally.

From the perspective of Republicans and southern Democrats, the genius of the bill hinged on local control of federal funds. Since the federal government guaranteed only loans and reimbursed tuition, veterans had to apply to local, typically white-run institutions. Loan applicants who lacked collateral or credit encountered grim odds. The VA offered no hope, hewing as it did to the segregationist policies of the Federal Housing Authority, which mandated that, “properties shall continue to be occupied by the same social and racial classes.” Institutionalized racism also limited the ability of veterans of color to access the education provision of the GI Bill. Of the South’s 647 colleges and universities after World War II, only 102 admitted blacks. Theoretically the situation improved as one moved north. Yet in 1946, 46 African-American students joined nine thousand white coeds in classes at the University of

Pennsylvania—making it among the least restrictive schools in the Ivy League.

But some of the problems associated with the GI Bill ran deeper than discriminatory implementation. Even if bankers and college administrators had treated all veterans fairly, beneficiaries of the legislation would still have been disproportionately male and white because on balance, most veterans fit this demographic. Under the guidance of Director General Louis Hershey, the Selective Service Administration had enlisted Americans in numbers disproportionate to their representation in the population. For example women’s participation in the military topped out at 2%. For African-American males, generations of inadequate health care and education compounded by discriminatory draft boards that conspired to keep their numbers down. Since only half of young black males, as compared to three-fourths of whites in the same age bracket, entered the armed forces during the war, even in the absence of racism, proportionately fewer African-Americans would have qualified for benefits.

Arguably women workers paid the highest price when the legion’s version of the GI Bill edged out plans for a broader entitlement. Administrators at the Bureau of Labor Statistics (BLS) described the “imbalance between wartime additions to the labor force and industry’s normal demand for women workers.” Absent a federal plan for full employment, corporations righted the imbalance themselves, turning out their female wartime hires in droves. Anecdotal evidence on this point abounds. At the Federated Press, a leftist news service in New York City, journalist Betty Goldstein (later Betty Freidan) lost her job to a veteran. Records from the U.S. Employment Service (USES) confirm that along with the Veterans’ Re-employment Act of 1946, the GI Bill shunted women workers, especially those in manufacturing, to the end of the job queue or into lesser-paid, pink-collar jobs. From July of 1945 to April of 1946, nearly 3.5 million women exited the labor force, while almost 3.8 million men (re-) entered.

According to popular wisdom, women had joined the workforce “for the duration” and looked forward to leaving their jobs when it had ended. Of course millions of women already worked for a wage before the war, and a survey by the Women’s Bureau suggested that 75% wished or needed to do so after the war. Even in the midst of the longest strike wave in American history, management and unions colluded with the federal government to force women workers out. They greeted the flurry of pink slips as a return to normal labor market conditions—not as evidence that the GI Bill had boosted some workers over others.

Through the mid-to-late 1940s and across the spectrum of the labor-left, a smattering of organizations condemned the exclusivity of the GI Bill as anathema to American ideals. Progressive and Communist veterans bored into the American Legion, by then over one million members strong, hoping to weigh in on post-war plans—before being expelled. At the University of Chicago, social scientist St. Clair Drake founded the United Negro and Allied Veterans. Goals of the group, including “protection of lives and property of veterans in the Deep South,” and “enforcement of federal laws governing Negro rights and benefits,” spoke volumes about the status of many black veterans. Declaring themselves “citizens first, veterans, second,” diverse veterans, including cartoonist Bill Mauldin and civil rights pioneer Medgar Evers, joined chapters of the American Veterans’ Committee (AVC). Members of the AVC picketed the offices of Metropolitan Life, principal backer of the Levittown developments constructed across the country for the benefit of white veterans. Before being neutralized by anticommunism, many of these groups pressed federal lawmakers to expand on a universal scale the benefits the GI Bill had enshrined for some veterans.

Despite its partiality, fans of the GI Bill have always drowned out its critics. Many veterans did use the provision as a bridge to a more comfortable existence. But because of the way the law was written, many other veterans and nonveterans could not. In relative terms their position actually worsened as a result. It is even possible that the broad entitlements outlined in the GI Bill actually undercut efforts to win universal opportunity and equality of citizenship. Today the 1944 GI Bill is remembered not as an entitlement program, but rather as a patriotic gesture. The effect perpetuates the belief that when at midcentury a generation of white men stepped into coveted jobs, schools, and neighborhoods, they did so by merit alone rather than by explicit design.

GILDED AGE

The Gilded Age, referring to the years from the 1870s to the end of the nineteenth century, constituted a formative period in American labor history. These years witnessed very rapid economic development, urbanization, and the growth of immigration. The period also saw the growing social polarization of American society, expressed not only in socio-economic segregation in cities and the growth of both poverty and great wealth, but also in bitter and often violent strikes that punctuated the period. Finally the era saw the emergence of key labor institutions like the American Federation of Labor (AFL) and the national trade unions, the growth and then decline of an alternative model of labor organizing, the Order of the Knights of Labor (KOL). The central paradox of the Gilded Age, the extremely rapid economic growth and generation of wealth on the one hand and the growth of social inequality and poverty on the other hand, was effectively summed up in the title of a widely read 1879 book by the social reformer Henry George: *Progress and Poverty*.

Economic and Technological Change

By the end of the Gilded Age, the United States had become the leading industrial nation in the world, decisively overtaking its rivals, England, France, and Germany. American factories, mines, and mills turned out products on a scale that would have been incomprehensible to an earlier generation, while new inventions, like the telephone, typewriter, and electric lighting, reshaped American life. In 1890, for the first time in American history, the value of manufactured goods overtook that of agricultural products.

The U.S. economic growth in this period was based in part on its vast natural resources. Farmland provided food for a growing urban workforce, while extensive coal reserves, iron deposits, and mineral resources supplied the raw materials to feed mills and factories. Federal policies, such as banking acts

(which established a stable currency), high tariffs (which gave protection from foreign competition to infant industries), and large federal loans and land grants to railroad companies, also provided important spurs to industrialization.

A massive surge of railroad construction lay at the center of American economic growth in this period. From 1873–1893 over 100,000 miles of track were laid, giving the United States the most extensive transportation system in the world. Railroad building stimulated industrialization directly by generating a huge demand for iron, steel, coal, and lumber and indirectly by linking the diverse regions of the country into a vast national market, thus offering potentially huge profits to industrialists who could provide this market with manufacturing goods.

Improvements were also made in the quality of rail transportation. By the end of the 1880s, all the nation's railroads maintained a standard gauge, permitting cars to be transferred easily between tracks owned by separate companies. Such technological improvements as the Westinghouse air brake allowed trains to move more safely at faster speeds, though accidents, especially in cities, left many urban residents injured or dead each year and engendered much hostility to the railroads. Railroad companies even divided the nation into its present time zones to increase the regularity of service.

By increasing the speed of transportation and the quantity of goods that could be shipped, these developments helped set off a revolution in industry by encouraging manufacturers to adopt techniques of mass production. In the new steel industry for example, manufacturers introduced the most important invention of the period, the Bessemer converter, which increased the speed of steel production dramatically and allowed the output of steel to one-half million tons in 1877 to nearly five million tons in 1892. By the end of the nineteenth century, the United States was the greatest steel-producing nation in the world. The output of copper and crude oil increased dramatically as well. Steelmaker Andrew Carnegie captured the rapid pace of change dramatically in 1885 when he observed: "the Republic thunders past with the rush of the express."

The Gilded Age was a period of tremendous inventiveness. By the 1890s, there were over 300,000 telephones, which Alexander Graham Bell had invented in the 1870s, in use around the country. Thomas Edison, who produced his first electric lamp in 1879, was manufacturing over a million light bulbs a year by 1890. But most industries that gained prominence in this period produced capital goods rather than consumer goods like telephones and lights. Though the pre-Civil War phase of industrialization had revolved around

such consumer industries as clothing and shoes, this phase was based on manufactured goods that would be used by other industries—above all the railroad.

But for all its impressiveness, economic growth in the Gilded Age was marked by profound uncertainty. While the years from the end of the Civil War to 1873 were tenuously prosperous, the so-called Panic of that year threw the nation's entire financial system into chaos and led to 4 years of the most severe depression the nation had yet seen. An upswing in the late 1870s brought a return of good times, but this was followed by another (less severe) depression that lasted from 1882–1885. Worse than either of these downturns was the depression of 1893–1897, which scarred towns and cities across the nation with massive unemployment and sharply falling wages. For workers this newly prominent "business cycle," a pattern of several years of rapid economic growth followed by several years of economic downturn accompanied by widespread unemployment and declining wages, became a source of tremendous concern.

Many U.S. workers toiled in the factories and workshops of the Midwest and the Northeast, the industrial heart of the nation in these years. It was the economic core stretching from Massachusetts and Maryland in the east to Illinois, southern Wisconsin, and eastern Missouri in the west that felt the greatest impact of industrialization. The scale of the workplace also changed dramatically. In the 1870s, only a handful of factories that employed over 500 workers existed in the country. Manufacturing took place mainly in small and medium plants. By 1900, there were over 1,000 American factories that employed over 500 workers. In Pennsylvania there were three steel-making facilities that employed over 8,000 workers.

The period was marked by the dramatic growth of big business in a number of sectors of the economy but most notably on the railroads. The railroad network created a national market, and the railroads themselves became the nation's first truly large business, employing thousands of people and pioneering new organizational structures in the process. Large business organizations also emerged in iron and steel, the electrical industry, oil drilling and refining, and farm machinery manufacture. Huge enterprises like the Pennsylvania Railroad, Standard Oil, and International Harvester not only became household names, but also began to exert tremendous political power in the nation.

Not every part of the nation was affected equally by these changes. In the South for instance, while important manufacturing cities like Atlanta and the new steel center of Birmingham emerged and while large coal-mining and lumbering operations became

important, much of the economy still turned on agriculture, where black and white sharecroppers and tenant farmers eked out a meager living on the land. Cotton, so central to the early phase of American industrialization, remained dominant in the region even if slavery no longer existed. New Orleans, the South's great city, developed as the port of this region, with a variety of black and white workers laboring on the city's docks and in its warehouses. So, too, in the Far West, extractive industries like lumbering and mining remained critical in these years. Along with the rapid growth of farming on the Great Plains and on the Pacific Coast, this increased the population of the region significantly, while not leading to the kind of great industrial cities that emerged in the East and Midwest.

In global terms this was a very significant period. In the last-quarter of the nineteenth century, a true world economy came into being. International trade grew rapidly along with the movement of both people and capital across national borders. Food and raw materials of various sorts produced around the globe found their way to the industrializing economies of Europe and North America. All of this was inextricably connected to developments in the United States and particularly to the heavily immigrant composition of its growing working class.

The Working Class: Composition and Conditions

Not surprisingly given this rapid economic expansion, the size of the American labor force grew dramatically over these years. This growing labor force was made up partly by the movement of those Americans from agriculture to industry. Though agriculture expanded dramatically in the late nineteenth century, especially on the Great Plains, millions of black and white rural Americans sought jobs in rapidly growing cities or found industrial wage work (coal mining, railroad building and track maintenance, lumbering) in rural areas. But massive immigration from Asia, Mexico, and especially in these years, Europe was one of the most important facts of the whole period. From 1870–1900, nearly 12 million immigrants entered the United States. By 1900, 10.4 million American residents were foreign-born, representing 13.6% of the total population. The working class was even more heavily immigrant than the population as a whole.

At the beginning of this period, immigrants from northern and western Europe (particularly Germany, Scandinavia, Britain, and Ireland) tended to dominate the flow. Especially after 1890, immigrants

from southern and eastern Europe (Italy, Russia, and the Austro-Hungarian empire) grew important, a trend that would reach a peak in the early years of the twentieth century. Though less significant in total numbers, migrants from Mexico played a critical role in the Southwest, constituting an important part of the labor force in mining and smelting, railroad maintenance, and large-scale agriculture. Immigration from China, which had been crucial to the California economy in the 1860s and 1870s and to the completion of the first transcontinental railroad in 1869, was curtailed by the Chinese Exclusion Act of 1882. A product of an intensely xenophobic anti-Chinese movement, the act led to an increase in immigration from Japan, while also tracing the shape of restrictive immigration legislation that would be widely adopted in the twentieth century.

The high levels of immigration in this period made the American working class the most ethnically and racially diverse in the world. A similar diversity could be found in workers' labor conditions and standards of living. For the working class as a whole, steadily falling prices and advancing wages from the 1870s to the 1890s led to an important rise in standards of living. Yet there remained a wide gulf in the living standards of different groups among workers, particularly between highly skilled workers whose wages allowed them to live in some comfort and those of less skilled and prosperous urban or rural workers.

But life for even the relatively prosperous workers remained extremely precarious in this era. The absence of pensions, compensation for on-the-job injuries, or any form of unemployment insurance meant that workers lived in constant fear of injury or layoffs. The length of the working week (60 hours or more for many) and the intensity of work was also a source of dissatisfaction for many workers. But perhaps most galling was the obvious disdain with which middle-class and upper-class Americans viewed the working class. This disdain reflected important shifts in the larger ideological context within which the labor movement operated.

Ideological and Legal Context

The Gilded Age was among other things a period of significant ideological change. In earlier periods many American writers and politicians had expressed concern about the potential of economic growth to produce social inequality, monopolistic abuses of economic power, and political corruption. Though such concerns did not entirely vanish in this era, they were supplanted by an emphasis on the links between economic growth

and upward social mobility: American capitalism was increasingly praised as paving the way for the self-made man. This linkage made the otherwise troubling rise of large-scale industrial capitalism seem fully compatible with American democracy.

This ideological shift was reflected in rulings by state and federal courts (including the U.S. Supreme Court) that gave business important new rights while providing a major challenge to workers and the labor movement. In particular the courts increasingly moved to a position that allowed no room for state laws (including for instance maximum-hour laws) that tried to regulate business. Workers' rights by contrast were limited to nothing more than "liberty of contract" and "ownership of the capacity to labor." The due protection clause of the Fourteenth Amendment, originally designed to enable the federal government to overturn state laws that violated the rights of citizens, was transformed in a series of court decisions to emphasize the rights of corporations.

This trend culminated in 1905 when in the *Lochner v. New York* case, the Supreme Court overturned a state law that limited the working hours of bakers, declaring that the law "interfered with the right of contract between employer and employee" and thus violated individual freedom. But even in the Gilded Age, the trend in the law was increasingly clear and sharply limited the ability of the labor movement to achieve some of its most important objectives.

Strikes and Conflict

The rapid pace of economic change along with the deep social inequality characteristic of this period led to considerable labor conflict. In some famous strikes, workers went down in defeat, though in many local strikes, especially in the building and metal trades, worker gains were not uncommon. There were notable peaks in strike activity during these years (particularly 1885–1886 and 1892–1895), but beyond this Gilded Age, strikes demonstrated a clear pattern over time: Strikes became more organized and more likely to be coordinated by unions. And one particular type of strike, the sympathy strike, in which a group of workers went out in support of another group, was particularly prominent in this era.

The period in addition was marked by several very large strikes that focused the attention of much of the nation on what was called the "labor question." In July 1877, wage cuts on the Baltimore and Ohio Railroad triggered a walkout by railroad workers in Martinsburg, West Virginia, and wage cuts by the Pennsylvania Railroad triggered a nationwide

railroad strike that spread across the entire nation. After the Philadelphia militia fired on strikers in Pittsburgh, killing 20 people, railroad workers, supported by local ironworkers and other city residents, responded by up setting fire to the property of the Pennsylvania Railroad there. Spreading to cities as far away as Galveston, Texas, and San Francisco, the strike remained peaceful and orderly in some localities. In St. Louis for example, a general strike, drawing support from both black and white working-class residents, virtually shut down the city for several days. But in others localities, such as Chicago, the actions of heavily armed police and eventually troops in working-class districts, led to tremendous violence. In San Francisco white working-class racism came to the fore as a crowd meeting to discuss action against the railroads ended up rampaging through the city's Chinatown, burning buildings and killing several residents. The strike, which lasted two weeks, came to an end only with the introduction of federal troops on the side of the railroads.

The rapid growth of the KOL (see the following paragraphs) and the revival of trade unions in the late 1870s and early 1880s prepared the stage for another period of intense class conflict in the middle years of this decade. The trigger this time was the demand for the 8-hour day. Coordinated especially by trade unionists through the Federation of Organized Trade and Labor Unions, a lobbying body they established in 1881, the movement first took the form of campaigning for state laws that mandated the 8-hour day. But the ineffectiveness of laws that were passed led many workers to turn to direct action. A series of large demonstrations and strikes across the nation that began on May 1, 1886, won shorter hours for many workers while generating considerable fear among middle- and upper-class Americans. When Chicago police moved to break up an 8-hour meeting in Haymarket Square, a bomb thrown into the ranks of the police (and killing one officer) focused middle-class fears on the threat of anarchism. The execution the following year of four men (all radical leaders but none of them implicated convincingly in the actual murder of the police officer) won much enthusiastic support from the middle-class press while convincing many in the labor movement that a grievous miscarriage of justice had been perpetrated.

The 1890s saw industrial conflict on an even larger scale. In 1892, steel maker Andrew Carnegie, determined to break the power of the local Amalgamated Iron and Steel Workers' lodge at his giant steelworks in Homestead, Pennsylvania, initiated a massive lock-out of the union workers that led to months of conflict, occasioned by gun battles between workers and Pinkerton detectives. This bitter conflict ended

in November of that year with a complete victory for Carnegie, who was now on the road to achieving a completely nonunion operation.

Not all industrial conflicts ended this way. On the New Orleans docks, a dynamic center of biracial unionism in spite of the racism of many white workers and the segregation of blacks and whites off the job, a struggle of African-American teamsters and white packers and scale men for shorter hours culminated in a successful general strike in 1892 that gave union workers one of their most significant victories in the nineteenth century. But in the wake of the depression that began the following years, it became much more difficult for workers to win strikes or improve their position, a point most clearly visible in the great Pullman strike and boycott of 1894.

The background of this conflict was the rapid growth of the American Railway Union (ARU), an industrial union led by Eugene V. Debs that embraced workers from a wide variety of different railroad occupations across the country. At its convention in June 1894, workers then on strike at the Pullman Car Company's manufacturing operations in Illinois asked the ARU to support them by refusing to handle Pullman cars (luxury sleeping cars) on tracks anywhere in the country. The convention agreed, and the Pullman boycott (essentially a large-scale sympathy strike) ensued. By early July a strike of massive proportions had spread across much of the Midwest and West, leading to equally massive intervention by the federal government. An injunction was handed down against the strikers, Debs was imprisoned, and armed troops across the nation (along with a declaration of martial law in Chicago) brought defeat to the Pullman workers and eventually destruction to the new ARU.

Labor Organizations

Underneath and related to the intense industrial conflict of this era, many workers were attempting to build labor organizations to improve their position. In the early 1870s, several groups of workers, especially anthracite (hard) coal miners and coopers, had some notable successes in building such unions, though these were mainly wiped out by the depression of the middle years of the decade. In the mid-1880s, which saw the nineteenth-century peak of membership in labor organizations (with nearly a million members of trade unions or KOL assemblies in 1886), dock workers, meatpacking workers, bituminous (soft) coal miners, and iron and steel workers also made

important strides, joined by railroad workers and workers in the building trades in the early 1890s. Building and maintaining such unions though necessitated a constant struggle, not only with employers, but with fellow workers, for it involved asserting a mutuality and solidarity in the face of the individualism that was at the center of the ideology of the period.

In addition to unions representing workers in particular occupations, there were also efforts to bring workers across occupational lines into larger umbrella organizations. The National Labor Union, in the Civil War era, had been an important example of such an organization, but the NLU collapsed in the early 1870s. Building on the traditions of the NLU, but much more significant during this period was an organization called the Noble and Holy Order of the KOL, which, in membership terms, was the largest labor organization in the nineteenth century. Much more than a labor union or federation of unions, the KOL represented a truly massive expression of working-class opposition to the social inequality and political corruption of the Gilded Age. In its heyday in the mid-1880s, the Knights expounded a cooperative and mutualistic philosophy that ran counter to the individualism and materialism that dominated the era.

Founded by Uriah Stephens and a small group of his fellow garment cutters in Philadelphia in 1869, the Knights were at first closer to a secret fraternal society than a labor organization. But as one of the few organizations of workers to survive the depression of the 1870s, the order put aside its secrecy in 1878 and embarked on the building of a national labor reform movement. Led now by Terence V. Powderly, a former machinist and the mayor of Scranton, Pennsylvania, the Knights sought to create an organization that would encompass all members of what they called the "producing classes." In fact the Knights did organize across lines of skill, gender, religion, and nationality. Female factory and mill workers for example, though excluded from the order in the 1870s, forced Powderly and other leaders of the KOL to recognize their right to join following a successful 1881 strike by female shoemakers in Philadelphia. By the mid-1880s, women constituted one-tenth of the KOL membership, and female organizers like Leonora Barry and Elizabeth Rodgers were highly visible leaders of the order.

Race proved to be a greater hurdle. In the Far West in fact the organization expressed racial animosities openly, often spearheading the powerful white working-class movement against Chinese immigrants in this region. The KOL leaders praised the 1882 Chinese Exclusion Act as a victory for American workers. During the 1880s, members of the KOL

participated in San Francisco boycotts of Chinese-made cigars and in a race riot in Rock Springs, Wyoming, that left 28 Chinese workers dead.

The Knights' relationship to African-American workers however was quite different. In spite of considerable white working-class hostility to African-Americans, the KOL both admitted and attracted many southern African-American members, numbering approximately 60,000 by the summer of 1886. The order's national convention of that year, held in Richmond, Virginia, asserted the willingness of the organization to organize southern African-American workers despite the intense opposition from southern elites. African-American Knights continued to face discrimination within the organization, and a true biracial unionism never emerged, but the order continued to represent a vehicle for the expression of African-American working-class aspirations through the entire decade of the 1880s.

The Knights were also actively involved in American politics. Though they never established a political party of their own, members of the KOL were full participants in an explosion of independent working-class political activity that spread across the nation in the years from 1885–1888. But beginning the middle of the decade, employers, supported by the government and the press, resisted further union growth and broke strikes, weakening the order in fundamental ways. The Haymarket incident and the antiradical sentiment that followed on its heels also hurt the order despite Powderly's strong opposition to anarchism. Finally the KOL experienced serious internal divisions as many members shifted their allegiance to unions affiliated with the new American Federation of Labor (AFL). As a result the order's membership fell from a peak of 700,000 in 1886 to just 200,000 in 1890; by the turn of the century, it was all but dead.

As the Knights declined however national unions of a variety of workers, particularly cigar makers, carpenters, iron molders, iron and steel workers, printers and coal miners, continued to grow. The growing strength of these new national unions, and more particularly, the jurisdictional disputes that erupted between these unions and the KOL, led them to establish the AFL in December 1886. Building on the foundations of the earlier Federation of Organized Trades and Labor Unions (by now virtually dead), the AFL differed from the Knights in asserting the fundamental right of each national union to control its trade. Led by Samuel Gompers, a cigar maker and former socialist, Adolph Strasser, and Peter J. McGuire, the AFL set an agenda of building new national unions and mobilizing workers in a new campaign for the 8-hour day. Gompers and other

AFL leaders urged workers (especially skilled craftsmen who were the federation's main constituency) to avoid what they saw as "utopian" movements to abolish the wages system.

While the AFL was much smaller through this period than the Knights had been, the willingness of highly skilled craftsmen to use the strike (and especially the sympathy strike) to achieve their ends made the AFL and the national unions the dynamic center of the labor movement by the opening years of the 1890s. The depression and bitterly fought strikes of this decade weakened the organization in the years from 1893–1897. But as economic growth returned in the years after the end of the depression, the AFL was positioned to grow, and trade union membership grew dramatically in the years from 1897–1904. Important victories in bituminous coal mining (1898) and the metal trades (1901) increased the appeal of the AFL, though these would also help trigger the anti-union open-shop drive that dominated the first part of the Progressive Era.

GLOBALIZATION

The U.S. labor history has been marked by shifts in the manner in which global capitalism organizes itself to accumulate and distribute profits. Such shifts result in historic periods that are not only economic but also political. A shift to a new period presents unique challenges to workers attempting to organize themselves. The phenomenon known as globalization represents the most recent period in these terms.

Viewed as a system for the accumulation and distribution of capitalist profit, globalization has a number of dimensions. Central to this system is a high mobility of capital achieved through an extensive worldwide credit system and the development of new technologies. The technologies include the ability to break up the production of goods into small parts and produce each part in a different location. Globalization has also been institutionalized through such supranational institutions as the World Bank, the International Monetary Fund (IMF), the World Trade Organization (WTO), and the North American Free Trade Agreement (NAFTA). Changes in domestic laws that include economic policies; privatization; the elimination of barriers to foreign goods, services, and capital; and deregulation of business are also part of the institutionalization of globalization. Most importantly for labor, globalization involves a search for “flexible labor markets” that are defined in terms of the reduction of many high-wage jobs, elimination of costly benefits, the eradication of many work rules, and the removal of barriers to part-time and temporary labor. Because this system represents an historic shift, a proper understanding of globalization requires that we trace its development over time.

The Historical Context of Globalization

The industrial revolution represented a shift that led to the formation of the earliest U.S. labor unions. In the early twentieth century, another shift occurred that was generated by a new form of production process that included huge factories with assembly lines that engaged in mass production. This so-called

“Fordist” period led to a new form of labor organization based on entire industries. In the U.S. this shift initially generated the organization of the International Workers of the World (IWW) and later the Congress of Industrial Organizations (CIO).

The economic crisis of the 1930s and the growth of mass-production industries led to a high degree of labor union militancy. That militancy resulted in concessions from the government, which passed legislation to sanction the right to organize and bargain collectively (Wagner Act of 1935). The militancy subsided during World War II but picked up again thereafter. It was at this point that there was a distinct shift to a new period that would enable Fordism to become a global system. This shift was initiated at a conference attended by representatives of 44 nations in Bretton Woods, New Hampshire, in July of 1944.

The Bretton Woods Conference resulted in an agreement that was to govern global capitalism until 1971. It put the United States in a position to be the dominant player in world commerce through its role in the rebuilding of Europe and Japan in the wake of the destruction of World War II. The key features of the system included making the U.S. dollar the international medium of exchange, with its value relative to other currencies fixed and redeemable in gold. The World Bank was established to offer loans largely for the rebuilding of Europe, and the IMF offered short-term loans that enabled nations to avoid inflationary pressures that could interfere with the reconstruction process. A protocol, called the General Agreement on Tariffs and Trade (GATT), was also established to avoid trade wars.

Initially the need for postwar rebuilding and the Bretton Woods Agreement created a huge demand for U.S. products. But the system needed two things for it to sustain itself. One was the ability of the United States to extract cheap resources from the developing world. A challenge from the growing Soviet Union undermined this ability and became the context for the Cold War and U.S. foreign policy from 1945 to 1991, when the Soviet Union collapsed. The second need was for continuity in the U.S. production process, which required an end to militant trade unionism and unpredictable strikes. As a result the U.S. government essentially offered labor a share of the profits of the postwar system in return for support for U.S. foreign policy and some guarantee that production would not be disrupted by untimely strikes. This was the context for the Taft-Hartley Act of 1947 that limited organized labor’s tactics. The deal also led to the merger of the American Federation of Labor (AFL) with the more militant CIO in 1955 and the expulsion of some of the more militant union leaders throughout the 1950s. The AFL-CIO

also established overseas institutes that supported U.S. foreign policy objectives in many developing nations.

In return labor received concessions of its own through a strong alliance with the Democratic party. The larger labor unions negotiated long-term contracts that often tied wages to productivity. Unions disciplined their members to eliminate work stoppages during the term of the contract. These contracts were protected by the government, and there was an informal yet universally honored agreement that workers engaged in legal strikes would not be replaced. Furthermore government economic policy emphasized employment growth. The Employment Act of 1946 called for policies to promote “maximum employment, production and purchasing power.”

The Birth of Globalization

In the 1960s and 1970s, a number of forces combined to unravel the Bretton Woods system. For one thing the postwar rebuilding process was complete, and Europe, Japan, and the Soviet Union all emerged as serious challengers to U.S. economic dominance. Wars of national liberation in colonies and the emergence of a nonaligned nations’ movement in the developing world undermined easy access to cheap natural resources. The loss of the Vietnam War in 1975 confirmed the decline of U.S. hegemony in the developing world. Domestically during the 1960s, the Civil Rights movement challenged the fact that people of color had often been left out of the benefits of the old Bretton Woods system.

These forces began to manifest themselves both economically and politically. Economically there were wide-spread economic crises throughout the world. In the United States in the early-to-middle 1970s, this took the particularly virulent form of “stagflation,” a previously unknown phenomenon of simultaneous high unemployment and high inflation. In 1971, a run on the dollar, whose value was guaranteed in gold under the Bretton Woods Agreement, caused President Nixon unilaterally to cancel that guarantee by not honoring demands for gold for dollars. In 1973, President Nixon unilaterally announced that the exchange rates of all currencies would fluctuate and be determined by supply and demand. This action canceled a central tenant of the Bretton Woods system. In 1974, a cartel of oil-producing nations (OPEC) restricted oil output of its members, thus driving up the global price of oil. This act fueled global inflation, adding to the growing economic

crisis. A second such “oil shock” occurred in 1979, deepening the crisis even further.

Inside the United States, the growing antiwar movement and the civil rights movements were gaining momentum at the very time that the post-World War II prosperity period was ending. In some of the major industries like auto and steel, caucuses within unions were forming, demanding equal treatment for people of color and women and in some cases, an end to the blanket support unions were giving to U.S. foreign policy.

Meanwhile beneath the radar screen of most working people, there were other developments under way that were paving the way for the major political and economic shift now known as globalization. One was the flow of dollars in the form of loans to the developing world. The U.S. government and those of other developed nations began to try to win spheres of influence in the increasingly independent-minded developing world by giving loans—often propping up regimes that were friendly to the West. In addition with the collapse of the gold standard and floating currencies, many banks were caught with a glut of dollars, which were loaned out with abandon to developing nations. As a result debt in the developing world began to skyrocket. From 1973–1984, debt in developing nations increased from \$100 billion to over \$900 billion. But in 1982, the global economic crisis was pressing hard on the developing world, and there began a series of major debt defaults that included Mexico, Brazil, Argentina, and India, as well as such smaller nations as Ghana, Zaire, Bangladesh, and Somalia.

In the face of global debt default, the IMF stepped in offering 10-year “bridge loans” that would enable these nations to pay their debts. But in return the IMF imposed what became known as structural adjustment programs (SAPs) that required these nations to open up their economies to foreign goods and capital and to restructure their economies to emphasize production for export markets. The SAPs also included internal economic policies that emphasized inflation reduction, such as tight money, social spending cuts, and wide-scale privatization. The World Bank followed suit by offering long-term development loans with similar strings attached. In addition associations of lenders—both governments and banks—played a role in monitoring compliance with these terms. Over time economic policies of many developed nations were fully under the control of the United States and other developed nations as well as their banks.

Another important development going on behind the scenes on the world stage were a series of informal meetings and funded research projects that were being

carried on by global elites and their governments to attempt to formalize and further institutionalize the emerging world order. One of the most significant forums was the Organization for Economic Cooperation and Development (OECD), which consists of government officials of the richest nations of the world. A series of reports by the OECD beginning in 1977, led by U.S. economist and presidential advisor Paul McCracken, spelled out the goal of “labor market flexibility.” The so-called McCracken Commission traced the world’s economic woes to the lack of such flexibility and set out a series of policy goals that included reduction in excessive wages, benefits and work rules, and an end to barriers to the use of part-time and temporary labor. The McCracken report and a series of other reports by OECD and other elite associations, such as the Trilateral Commission, began to spell out a broad policy alternative to the Bretton Woods system. These initiatives were followed by some clear policy shifts in the United States that clearly ran counter to the Bretton Woods era deal with labor.

In 1978, the Humphrey-Hawkins Full Employment and Balanced Growth Act was passed, reaffirming the priorities of the 1946 Full Employment Act. But 2 years later the U.S. Federal Reserve Bank effectively nullified this act of Congress by pushing up interest rates to halt inflation even though it meant that unemployment would soar to nearly 10%. From that point forward, U.S. economic policy shifted from one that emphasized fighting unemployment to a priority on lowering inflation even at the expense of employment and job growth. A second policy shift that ended the Bretton Woods era labor policy came when President Reagan fired striking air controllers in 1982 and announced that they would be permanently replaced. This act sent a signal to employers that it was now politically acceptable to replace striking workers. And employers took that signal and began using permanent replacement workers to break strikes.

Globalization in Practice

The shifts in domestic economic policy are not solely aimed at organized labor. They also reflect the key role that finance plays in the emerging phenomenon of globalization. As noted earlier, high capital mobility is central to the definition of globalization itself. Debt is one aspect of this. Not only is debt a mechanism to regulate and control economic policies in the developing world that are favorable to mobile capital, it has become a major industry. Since the spike in debt of developing nations to \$900 billion in 1984, that

debt now stands at approximately \$2.5 trillion. But debt is not limited to the developing world. Within the United States debt has become a key way to prop up standards of living. In 1949, U.S. household debt as a percentage of personal income was 29.5%. By 1979, it was up to 63%, and only half of that was due to mortgages. By 1989, that percentage was up to 76%, and today it is over 90%. Similarly credit card debt has spiked during this period. Not only has the business of making loans expanded, but debt itself has become a commodity. Various kinds of debt are now packaged and sold in global capital markets, their price being a function of how much return can be realized by collection and sales of debt. A secondary market for debt has expanded rapidly during this period in which speculators buy debt instruments in anticipation of its value at some specified future date. One measure of this growth is the relative importance of such financial futures contracts at the Chicago Board of Trade (CBOT). While in 1975 such contracts comprised only 1.5% of CBOT business, today they are over 80%.

The biggest risk to creditors in a system where there is strong political control over the economic policies of debtor nations and where there is a strong secondary market for debt itself is inflation, because it lowers the value of dollar-denominated financial assets. That is why domestic economic policies in the United States place such a priority on keeping inflation rates low even at the expense of employment. But capital mobility is also a key part of globalization in other ways. The structural adjustment policies that accompany debt open economies to foreign investors who not only invest in plants and equipment, but also in foreign stocks and bonds. Such portfolio investment represents over a third of capital flows into the developing world. It now averages about \$47 billion a year, up from only \$5 billion two decades ago. These trends combined with technological developments in process, transportation, and telecommunication technologies make it possible for large corporations to pursue a search for flexible labor markets all over the globe. The production of goods can be broken into pieces and carried out in different locations, with final assembly at a different location altogether. These same forces have also enabled service industries to source workers globally. The growth of such information technology workers as programmers in India is but one example.

In the U.S. these developments have led to a sharp decline in manufacturing jobs and more recently in selected service industries. During the 1990s, 1.5 million manufacturing jobs were lost in the United States. From 2000–2003, another 3 million jobs have disappeared, many due to the 2001 recession, but

manufacturing job loss continued throughout the so-called “jobless recovery.” Service jobs are just beginning to leave the country, so there is still a net growth. But highly skilled computer programmer jobs and entry-level call center and telephone operator jobs are already leaving the country. Estimates of the number of service jobs in the United States that are at risk range from 3 to over 14 million. These trends are not confined to the United States. A number of countries that initially benefited from the movement of production jobs are themselves experiencing rapid job dislocations. Globalized agricultural markets and SAP-imposed trade policies have led to the decline of agriculture jobs in countries like Mexico and India. At the same time many of the factory assembly jobs in Mexico’s *maquiladora* sector (see References) that came from the United States have left for Bangladesh and China. And India is also experiencing the dislocation of many of its textile and apparel jobs.

In the United States the fact of capital mobility and the present political and policy climate that are also part of globalization have encouraged employers to use more aggressive tactics toward organized labor. A study of union-organizing efforts found that from 1992–1995, over half the employers surveyed had used the threat of closing and/or moving production during union-organizing drives. The average annual number of organizing efforts has declined from about 300,000 in the mid-1970s to less than 100,000 by the mid-1990s. The percentage of private-sector U.S. workers in unions is now under 9%, down from over 40% in the 1940s. The percentage has fallen more than five points in the last decade alone.

Meanwhile the institutionalization of globalization has continued over that same decade. Beyond the continuation and expansion of the SAPs by the IMF and World Bank, there have been a series of so-called trade agreements that have further strengthened the programs embedded in the SAPs. These agreements include the lowering of barriers to trade, but more importantly, they have opened many nations to a regulation-free form of capital mobility. The largest such agreement involved replacing the Bretton Woods era GATT with the WTO in 1995, which enforces a broad array of global rules that bind more than one hundred nations. The NAFTA between the United States, Canada, and Mexico, which contains even more stringent rules, went into effect in 1994. In addition there have been dozens of bilateral and multilateral agreements including nations in Africa and Latin America.

There have also been continuing changes in U.S. domestic policy that reinforce the policy trends discussed earlier. Changes in welfare and job-training legislation have encouraged a movement of workers

into nonunion employment where wages are below federal poverty standards and benefits nonexistent. These jobs are often in the temporary help industry, representing a successful effort to establish flexible labor markets in the United States. Recent changes in labor legislation allow replacement workers hired during a strike to decertify the union if a strike lasts more than a year. Appointments to labor relations’ boards that hear complaints about violations of labor law have further weakened organized labor.

Historically a shift to a new period has meant a response from labor. And that response is well under way, although it is far from complete. The challenge yet to be met is how to organize in a climate where firms can replace striking workers, decertify their unions, and take production of goods and services out of the country. Organized labor has begun to meet the challenge by opposing further institutionalization of globalization. While many major trade agreements and SAPs have gone forward over labor’s efforts to stop them, there have been some successes as well, and nationally the form of globalization has become a political issue. Organized labor has also eliminated its old overseas institutes and formed coalitions with labor unions in other nations to stop SAPs and trade agreements and also to present internationalist alternatives. Finally there have been efforts to ally with community organizations and other nongovernmental organizations around issues of economic and social justice—to broaden the constituency of the unions beyond their own membership base.

GOLD RUSH

The discovery of gold in California commenced the greatest of the American mineral rushes and provided the model for all future precious metal strikes in the United States. In January 1848, one week before the signing of the Treaty of Guadalupe-Hidalgo formally ended the Mexican-American War and ceded California to the United States, gold was discovered on the American River. Slowly word spread back East and then around the world. In the spring of 1849, thousands of men set off by boat and the Overland Trail for the western slopes of the Sierra Nevada Mountains. In the 1850 census, three-quarters of California's population of 85,000 were American-born; fewer than 1,000 of the Americans were blacks. The largest foreign-born delegations were from Mexico, England, Germany, France, China, and Chile. The forty-niners were of varying social background. The adventurers, as the press dubbed them, were, in an oft-repeated phrase, "of all classes of men." Passenger lists of ships heading for California from American ports show that the majority were skilled and semiskilled manual workers. The expense of the journey was too high for laborers to come. There were also large contingents of nonmanual workers and farmers. While ethnically and occupationally the miners were diverse, in one respect those who came to the West Coast were remarkably uniform—they were overwhelmingly male. Ninety-three percent of California's population was male; almost three-quarters were males aged 20–40.

The gold was found mostly in placers, deposits of sand and gravel along the banks of rivers and creeks. Placer mining was hard, muddy, work. The period in which miners could profit by individually panning gold was short, and by 1849 most worked in groups. Typically one or two men would dig gravel from the riverbank and place it in a sieved device known as a cradle; another man would rock the cradle as a third poured water into it to separate the gold from the rock. The physical labor mining demanded tended to blur the line that separated social classes in the East. All were now manual workers—the eastern notion that "hand work" was undignified was discarded. Miners of middle-class background often abandoned the tenets of respectable society and drank, gambled, and brawled in ways eastern workers would have found familiar. A potent solidarity resulted. Miners

stuck closely together. It was almost unheard of for companions to desert each other, and injured or sick gold hunters were tenderly cared for by other forty-niners.

Membership in the fraternity of miners was open only to whites. Occasionally native-born Americans opposed all other groups in the mines, including French and German immigrants, but usually it was the color line that mattered. Stories of exceptional solicitude to fellow white miners in diaries and reminiscences are interspersed with accounts of savagery to people of color. Mexicans, "greasers" in miners' parlance, and Chileans, were targets of white miners' wrath. Although Chileans had been the first to mine a promising stretch of the Calaveras River, in December 1849 white miners forced them to leave, precipitating a violent confrontation the press called "the Chilean War." In the struggle a Chilean and two Americans were killed. In retaliation the American miners took the Chileans involved into custody, executed three by firing squad, and cut off the ears of three others. Though the numbers of Chinese miners were small in the early rush, they were targets of ferocious prejudice, foreshadowing later anti-Chinese activities by white California workers.

Over 400 million dollars worth of gold was extracted in California from 1849–1855. Making \$10 or even \$15 a day was common in 1849, huge sums by eastern standards. But supplies were extraordinarily expensive, and it was difficult to accumulate much money. Only a very few struck it rich. By 1850, easily worked deposits were becoming scarce. Miners began to build dams to divert rivers and then dig up the riverbed. This required larger groups of men and considerable capital. "To get gold, you must employ gold," the expression went. In 1851, there were said to be 10 dams on the Feather River, each costing around \$8,000. Mining was becoming a business, and investment companies formed in California and the East. In addition to river mining, entrepreneurs turned to hydraulic mining in which a powerful stream of water was aimed at a hillside and the muddy runoff directed into a sluice to separate the gold. Underground mining operations were begun. The shift that had taken several decades in the East from small groups of men working by hand to large capitalized operations with many employees was accomplished in California in a few years. The days of the independent prospector clearly were over; "mining is now reduced to a system," one disgusted adventurer wrote. Many of the forty-niners returned East or decided to try their hand at prospecting elsewhere in the West.

Mining companies in the mid-1850s began hiring workers for three or four dollars a day. Given the high living expenses, employees often did little better

GOLD RUSH

than break even. Bosses increasingly turned to immigrants to work at such wages. Chinese were hired in growing numbers, as were Irish and Germans. Almost everywhere mining was carried on in the United States there were Cornish miners, and the Golden State was no exception. The 1860 census showed 82,000 men employed in mining in California, making it by far the largest occupation in the state. Those dissatisfied with wages or working conditions usually simply quit to find a better job either in another mine or in another occupation; it was only in the 1870s that the first miners' unions were formed in California. The amount of gold dug peaked in 1852, after that it declined fairly quickly before leveling off in the mid-1860s. By 1880, there were still 37,000 miners in California, exceeded only by the number of laborers.

GOLDMAN, EMMA (JUNE 27, 1869– MAY 14, 1940) Anarchist

Emma Goldman, the anarchist writer and lecturer for freedom in all realms of life and champion of the cause of the oppressed—like many American anarchists—had a complex and paradoxical relationship to labor. On the one hand, she supported the rights of labor, but on the other, she believed that even the 8-hour workday was a concession to a capitalist system, the lifeblood of which was largely dependent on the exploitation of the working class.

Goldman was catapulted into political action as a young garment worker and recent *émigré* to Rochester, New York, from Kovno, Lithuania, in the aftermath of the dramatic trial and execution of the anarchists blamed for the violence that erupted at a labor demonstration at Chicago's Haymarket Square. Determined to give voice to those who had been silenced, she moved to the Lower East Side radical enclave of New York City in 1890. The Russian Jewish immigrant found her first

constituency with non-English-speaking immigrant workers—especially German anarchist militants and clusters of Jewish and Italian anarchists. Goldman searched for a place within the American Left and strongly identified with those who simultaneously supported the rights of labor, were impatient with gradualism, and believed that the power structure of the labor unions themselves bred corruption. Goldman herself had worked in garment factories and like most militant anarchists was a member of the International Working People's Association (IWPA, known as the Black International), a federation of loose-knit autonomous groups of mostly German workers (a group—reconstituted as the IWMA—that she rejoined in 1922 on leaving Russia and with whom she continued to be affiliated when she worked with the anarchists during the Spanish civil war from 1936–1938). She believed that labor agitation at the workplace, on the streets, at public meetings, and demonstrations was integral as a strategy for a complete transformation of society.

Emma Goldman on a street car. Library of Congress, Prints & Photographs Division [LC-B2-4215-16].

Although Goldman supported militant labor unions' efforts to win their demands, she was critical of the union structure itself, viewing it as a bargaining agent that ultimately rigidified the antagonistic dichotomy between workers and bosses. In her lectures, she encouraged workers to question the various hierarchies within their unions: and to recognize the divisive impact of the distinctions among the trades, the practice of ethnic and racial exclusion, and the generalized insensitivity to the plight of the unemployed not only among unions but in a culture that celebrated "labor's day" in times of tremendous unemployment. She worked closely with the unemployed movements of 1893, 1908, and 1914—and even went to jail for 10 months (1893–1894) for addressing a crowd of demonstrators ostensibly with the call: "You demand bread, and if you cannot acquire it through peaceful means you will get it by force. Unite and take it by force, if you cannot take it peacefully." Goldman characterized this incident in her autobiography as a punishment for encouraging the poor to take food from the palaces of the rich as their sacred right. Ever the gadfly, she had no qualms about riding the strength of an organized movement nor playing devil's advocate; the conscience, the truth-teller, the thorn in the side of liberals and of some union reformers, Goldman was ever-ready to push it further to the left. In her acceptance of the fact that work was basic to life she argued that "everyone should do that which he likes best, not merely a thing he is compelled to do to earn his daily bread" (in an interview with Nellie Bly, 17 September 1893). Though she never officially became a member of any union in the United States, the horrific work conditions and brutal reprisals against organizers and strikers outraged Goldman and prompted her to devote a great part of her life to raising awareness of the plight of labor. Many moderate union negotiators publicly distanced themselves from Goldman and the anarchists even though they appear to have sanctioned militant activists who boldly practiced direct action tactics—like work slowdowns or even the use of dynamite—to bolster the union's ability to flex their muscles on the bargaining table. Still Goldman maintained close ties to various labor organizers and consistently rallied support and legal defense funds for strikers.

Support for Industrial and Trade Union Labor Struggles

Among the many unions she spoke before—in the years from 1891–1901—were the American Labor Union in Newark, New Jersey; the Glass Blowers'

Union in Monaca, Pennsylvania; the Brewers' and Malsters' Union, the Painters and Decorators' Union, and the Scandinavian Painters' Union in Chicago, Illinois; and the United Labor League in Philadelphia, Pennsylvania. In spite of ideological differences and sporadic tensions, Goldman marched in the 1891 May Day parade with the Working Women's Society of the United Hebrew Trade (UHT) Organization. But when in 1892 Alexander Berkman, her closest comrade, shot and stabbed steel magnate Henry Clay Frick as a symbolic act of labor retaliation for his role in the Homestead Plant Pinkerton's shooting of locked-out striking workers, the UHT chose not to come to his defense. Berkman was sentenced to 22 years in prison, during which time Goldman worked almost incessantly to build ties to as many unions as she could rally across the country and in Europe to lobby for the commutation of Berkman's sentence (who was released after 14 years when a law applying to corrupt politicians inadvertently was applicable to his case). Among the unions that joined her campaign were the United Mine Workers, who passed a resolution in 1900 demanding Berkman's release, and some smaller unions, including the Central Labor Union and the Brewers' Union. After 14 years, Goldman's (and others') efforts on Berkman's behalf succeeded—and he was released.

Her agitation for Berkman's release included working with delegates from the American Federation of Labor (AFL) even though she was critical of its policies with the focus on trade unions of skilled workers, its exclusion of many new immigrants, and its general aversion to anarchists. Goldman was especially reproachful of its president, Samuel Gompers, whom she labeled "the great mogul of the American Federation of Labor," characterizing him as the epitome of conciliatory leadership ("Letters from a Tour," *Sturmvoegel* 15 December 1897–February 1898). Even with her various complaints, her behind-the-scenes lobbying effectively prompted the drafting of a resolution at the 1896 AFL conference to the Pennsylvania Board of Pardons condemning Berkman's sentence as excessive and moved Gompers himself to write to Senator Boise Penrose requesting that he intercede on Berkman's behalf.

Those Central Labor Unions that had considerable numbers of anarchists in their ranks opened their doors to Goldman, especially in Boston, Massachusetts, and in Detroit, Michigan. Genuinely committed to labor, in spite of her critique of the shortcomings of the union movement, she spoke out about the all-too-common brutality of her times against striking workers, emphasizing incidents like the horrific Hazelton–Latimer massacre of 1897 to expose the bitterness of the battle. Her lectures

included “The Struggle between Capital and Labor,” “Cooperation, an Important Factor in the Industrial Struggle,” “The Failure of So-Called Free Unions,” and “The Right to Be Lazy.” She delivered her talk on “The Effect of the War on the Workers” in England in 1900, as part of a general critique of England’s role in the Boer War. During her time in Paris in 1900, as she awaited the commencement of the banned International Revolutionary Congress of the Working Peoples where she attended several secret meetings, she was impressed with syndicalist ideas emerging from the French labor movement. By 1907, when she attended the Anarchist Congress in Amsterdam, anarchists were engaged in formal discussions about the incorporation of syndicalist tactics into anarchist practice along with their more general debate about the efficacy of individual and collective action; Goldman spoke in favor of the complementarities of both strategies. In 1913, in Goldman’s pamphlet on the possibilities and influences of Syndicalism, she contrasted, as she did all through her life the young and relatively underdeveloped American labor movement to the sophistication and power of its European counterparts.

In 1901, just after the assassination attempt on President McKinley by a man who claimed to be an anarchist influenced by Goldman’s ideas, she found herself devastatingly isolated from most of the labor movement. Most unions and radicals distanced themselves from anyone associated however wrongly with the act. Restrictive anti-anarchist laws that followed, intended to further isolate anarchists, actually created a free-speech advocacy link between radicals and middle-class liberals that was in some ways a greater force than either had experienced before. Goldman’s power to articulate these issues and to reach the American public on the issue of free speech became an extraordinary asset to the ongoing battle for free expression and the right to organize at the workplace.

Goldman’s fight for free speech also included voicing the desire to free people from the prison of conventional mores—especially the public’s fear of unharnessed sexuality. The ongoing cultural war was often perceived as, or manipulated by conservatives to appear to be, more threatening than the challenges of labor unrest or even of the raging ideological political battles—including the anarchist critique of government—to the fragile stability of the social order. Goldman defined anarchism as a philosophy that advocated the possibility of a harmonious social order outside the bounds of law and government; it included free speech, sexual freedom, birth control; a critique of the nuclear family, prisons, war, the economy, church, schools; and a response to “the call of labor” in her bold assertion of labor’s right to defend itself. Goldman supported and spread information

about labor struggles in the United States, and abroad in her magazine *Mother Earth* (from 1906 until it was banned in 1917). In its very first year of publication in 1906, she wrote about “The Idaho Outrage”—in which Western Federation of Miners’ militant union officials Haywood, Moyer, and Pettibone were extradited from Colorado and charged with the murder of ex-Idaho governor Frank Steunenberg. She collected money for their defense at her meetings, wrote an obituary for Pettibone in 1908, and by 1913, befriended Bill Haywood. A reading of the “Fund Appeals” in *Mother Earth* along with the documents that track Goldman’s collections at meetings include an impressive range of labor defense funds, including the Aberdeen Free Speech Fund (1911), the Alexander Aldamas Defense Fund (1912–1913), the Wheatland Case (1913), the Colorado War Fund (a 1914 collection to purchase arms for striking workers in and around Ludlow), the Free Speech Fight (Everett, 1916), and the Ingmar Defense Committee (March 1916).

Wobblies and Anarchists

Although some historiography associates anarchists and anarchism with the Industrial Workers of the World (IWW), Goldman’s particular relationship to the IWW was far from unreservedly enthusiastic. From her perspective the IWW seemed to have begun as a predominantly socialist union in 1905, and although Goldman adhered to its advocacy of the inclusion of all workers, she detested its hierarchy—often considering the IWW a front for socialists engaged in a factional fight to gain power. Unlike some anarchists who did join the IWW, Goldman stayed clear of any formal organizational ties—a decision she held to even in 1908 when the IWW abandoned its actual support for mainstream political movements (although the organization debated the issue for years). Not until 1909, when the IWW’s active and often violent direct-action free speech fights spread across the West Coast, did Goldman offer her public support. She went to San Diego in 1912 to join the IWW Free Speech Fight with her manager, Ben Reitman. Vigilantes dragged him into the desert, covered him in tar and sage brush, and the police promptly escorted her out of town. Her brush with mob violence against the Wobblies was an indelibly horrific experience that in the end made her remarkably effective in speaking out against the rampant brutality against those who dared to organize labor.

Her tendency toward sectarianism on labor issues was muted and in many ways, countered by

responsibilities to her journal, which was created in part to offer a space for information and support of movements that meshed with her anarchist principles and strategies for change. Thus while she voiced her support for the IWW free speech fights in San Diego, Goldman also opened the pages of *Mother Earth* to an article about the Butte, Montana, labor struggles by William Z. Foster, who was then associated with the short-lived Syndicalist League of North America. This group (which included the anarchists Jay Fox and Lucy Parsons, who left the IWW with the intention of revolutionizing the AFL from the inside) practiced the French tactic of working within the existing union structure. They identified themselves as a militant minority within the AFL and adhered to the strategy of “boring from within” rather than working in a separate union like the IWW. Later in 1915 and 1916, Goldman opposed the IWW’s movement toward centralization within the organization. But Goldman herself who never engaged in the micro-factions within the unions also began to express a comradely loyalty to the IWW, in part because it was becoming clear that the government had redirected much of its suspicions and violence away from anarchists toward the Wobblies. This phenomenon, symbolized by the murder of Joe Hill, was a travesty of justice to which she added her voice in a chorus of outrage and continued to support both IWW-led strikes and their retaliatory actions.

Intellectual Proletarians, Women, Theater, and a New Rapprochement with Industrial Labor

Goldman’s definition of workers and of class oppression extended beyond the parameters of the industrial labor force to what she labeled in her 1914 lecture and essay “the intellectual proletarians”—writers, artists, professionals—whose material privilege often masked the weakening effect of the system on them. However she saw the potential in this stratum to hold to a vision beyond basic needs and to go to the people as the Narodnaya Volya group of Russia had before them. Such a rapprochement with labor could be expressed in action and in their common template for a more just world. In part influenced by the ambiance and literature of the Russian revolution and by her own experience as a woman, Goldman also saw the potential of women, especially middle-class American women, as an eventual force of liberation—not on the basis of their fight for suffrage but for their remarkable attunement to internal oppression, which held its own universality. As her audiences expanded

beyond her immigrant anarchist circles, she rode the wave of the woman’s movement and as she had in the labor movement, tried to move them further to the left. Her ideas on the power of women and of the middle class made her an anomaly to most union activists—whose struggle for labor justice was often so all-consuming that it was difficult to reach farther than their more immediate economic goals.

But Goldman believed that the struggle for freedom extended beyond material necessities. She hoped to bring her ideas on cultural issues, including the social significance of modern drama, not only to those who traditionally frequented the theater, but also at least once to workers on lunch break deep within a mine shaft. She sometimes used the characters in plays, especially those in the works of Henrik Ibsen, to underscore the value of single heroic acts—whether expressed in interpersonal relations or in public actions. In so doing she reinforced the strength and potential of the people who attended her lectures, no matter where they fell on the social hierarchy of power and money.

She referred to the power of the theater to affect change as the dynamite capable of bringing down the old and of building toward the new. And yet the metaphor of dynamite had other ramifications in Goldman’s political lexicon. Believing that American workers were in the midst of a vicious social war, with institutional force from industry, government, and police virtually relentless, Goldman asserted both overtly and covertly that the right of retaliation, of using force against force was a necessary strategy—borne both of desperation, hope, and the desire for self-respect.

Supporting Militancy

Regardless of their guilt or innocence, she supported the McNamara brothers after the 1910 *Los Angeles Times* explosion—a position she articulated in her 1914 essay “Self-Defense for Labor.” The suspected suppliers of dynamite for the McNamaras, Matthew Schmidt and David Caplan, benefited from Goldman’s efforts on their behalf: She harbored Schmidt and raised funds within and outside the unions for both Caplan and Schmidt when they were arrested. And yet it is important to note that of the hundreds of fund appeals to help those in battle with the law over their militant actions, hers was not a blanket support; all of her efforts were connected first and foremost to labor’s right to defend itself and to actions she perceived that would in some way further the anarchist cause.

In July 1916, when Goldman planned to lecture in San Francisco on “Preparedness: The Road to Universal Slaughter,” a bomb went off at the Preparedness Day parade. Militants within the San Francisco labor movement were prime suspects. The Antipreparedness Movement was not only in defense of the young working-class men who were sure to be drafted into military service for World War I, but it was a union-initiated movement that also feared that the influx of an armament industry would break the strength of the city’s renowned closed shop. Although Goldman was less acquainted with union activists imprisoned in relation to the bombing than her comrade Alexander Berkman, she did know some of the local union organizers. While others hesitated, unsure about associating with the act and fearful of reprisals, Goldman and Berkman quickly mounted a campaign on both the East and West coasts to raise funds and support from unions for the arrested suspects in the Preparedness Day bombing. By August they had revived the International Workers Defense League, and by December 1916, Goldman addressed a large crowd on the subject at a rally in New York City’s Carnegie Hall sponsored by the UHT. When Berkman was threatened with extradition from New York to San Francisco as a suspect in the bombing because of his close association with the militant unionists, the UHT joined a support committee—and not only published the pamphlet “They Want to Hang Alexander Berkman,” but also donated over a thousand dollars to his defense.

At this time Goldman’s interest in helping labor activists close to the IWW who had become targets for arrests culminated in the formation of the League for the Amnesty of Political Prisoners—a group whose manifesto was published in the March 1918 issue of the IWW paper, *Labor Defender*. In part for their work in linking issues of labor with the anti-conscription sentiments that were growing as the United States prepared to enter the First World War, both Goldman and Berkman were arrested in New York in 1917 and ultimately deported to Russia in 1919.

Conclusion

Although she never abandoned her commitment to the working class—and documented her own dreadful experiences in New York’s garment factories in her autobiography *Living My Life*—she was never a Mother Jones or an Elizabeth Gurley Flynn. Goldman was a propagandist, an articulator of challenging

ideas, an arouser of consciousness, more than a day-to-day organizer or operative in a larger structure—even if that structure for change was a union that held within it a template of the concerns and practices of the society she hoped to create.

Some of her rigidity with regard to unions and to cynicism about progressive labor laws eased over the years. When Goldman was allowed back into the United States for a 90-day visit in 1934, she modified her blanket critique of legal reform by applauding President Franklin Delano Roosevelt’s plan for social security in the United States, which she viewed as a positive change, within the limits of government, a bold expression of sympathy with, and interest in, protecting the nation’s workers. And from 1936–1938, during her many visits to Spain to work with the Spanish anarchists, she allied herself fully with their union movement: In this case to the CNT-FAI anarchist labor federation—an act of allegiance to a union that had no precedent in her relation to the union movement in the United States. This anarchist workers’ federation supplied the unifying vision and promise that felt more in synchrony with what she referred to as her beautiful ideal.”

When Goldman died in 1940, unions from across the globe sent their respects. A Communist newspaper in the United States accused her of being an agent of the government because of her vocal critique of the Soviet experiment (specifically her strong opposition to the submergence of the Soviets and unions into the Bolshevik system and the loss of free speech that culminated in the brutal attack by the Red Army on the Kronstadt sailors who demanded union and Soviet autonomy). She was ultimately lauded for being true to her belief in the power of critical thinking, in questioning authority and ingrained assumptions—and even for her critique of unions struggling for the same justice to which she devoted her life.

GOMPERS v. BUCK'S STOVE AND RANGE CO. (1911)

Although it did not establish a significant precedent within labor law, *Gompers v. Buck's Stove and Range Co.* was arguably the most highly publicized court case involving unions during the Progressive Era. American Federation of Labor (AFL) leader Samuel Gompers was threatened with jail; the case figured prominently in the 1908 presidential election; and many citizens believed that free speech for unionists and the successful incorporation of workers into the polity were gravely threatened. In the end the outcome of the case was anticlimactic, but it nevertheless galvanized significant changes within the labor movement.

The case began at almost the same time that labor suffered a significant blow to its ability to conduct secondary boycotts in *Loewe v. Lawlor* (better known as the Danbury Hatters case). Indeed the same bitterly anti-union organization, the American Anti-Boycott Association (AABA), instigated both *Loewe* and *Gompers*. In the latter case however, the players were much more prominent.

Buck's Stove and Range was a powerful St. Louis firm; its chief executive, James Van Cleave, was also president of the National Association of Manufacturers. In 1906, Van Cleave refused to adhere to a union-employer agreement that effectively standardized wages and hours throughout the stove industry. The AFL retaliated by placing Van Cleave's company on its We Don't Patronize list.

Van Cleave had long been spoiling for a fight with unions. With the aid of the AABA, he sought an injunction to prevent AFL leaders from carrying out their boycott. He won a temporary injunction that did not technically prevent the boycott but prevented any written or oral communication that might spread it.

Despite the threat it represented, Gompers embraced this opportunity as an affront to labor's rights. The AFL leader had been preparing an offensive against the organization's enemies, hoping to strictly limit or even outlaw the labor injunction. Such a campaign might not only strengthen organized labor, but at a time of considerable socialist opposition

to his moderate policies, cement Gompers's position within the AFL.

Gompers and his lawyer Alton Parker (the 1904 Democratic presidential nominee and a president of the American Bar Association) formulated a strategy that would garner maximum public support. The AFL formally dropped Buck's Stove from its boycott list but continued to speak out against Van Cleave as unfair. This was still a conscious violation of the injunction, but for many it turned the case into a clean free speech issue.

In July 1908, Gompers, AFL Vice-President John Mitchell, and AFL Secretary Frank Morrison were held in contempt. Gompers, worried that the very existence of the AFL might be in danger, scrambled to gain as many progressive allies as possible. In a historic turn, the AFL repudiated its nonpartisanship and latched on to the Democratic party for protection from rapacious capitalists and especially tyrannical judges.

Republicans, recognizing a possible public relations disaster in their generally antilabor stance, maneuvered to ensure that the case would not be heard until after the 1908 presidential election. Soon thereafter, reckless and corrupt judge Daniel Thew Wright of the District Court for the District of Columbia shocked the nation by sentencing Gompers to a year in jail on the contempt charges (Morrison received a six-month sentence; Mitchell, nine months). Appellate decisions upheld Wright, although bail allowed the three unionists to stay out of prison.

By the time the cases (one on the legality of the injunction and one on the contempt charges) were combined and reached the Supreme Court in 1911, an unexpected twist stole much of the episode's thunder. Van Cleave had died the previous year, and his successor at Buck's Stove quickly settled the boycott—which had been having a devastating effect on the company. The injunction issue was thus rendered legally moot. In turn the court overturned the contempt charges against Gompers and his colleagues on a technicality. Judge Wright forced a tragicomic coda to the case when he sought to institute criminal, as opposed to the previous civil, proceedings against the AFL leaders, but the Supreme Court rebuked him again in 1914 in the case of *Gompers v. U.S.*

Labor celebrated a victory in these two cases, but their legal triumphs were actually quite narrow. Instead the AFL's greatest achievement in *Buck's Stove* flowed from the political vindication that came from its defense of free speech. With labor's increasing legitimacy came a newfound political power that then mildly blossomed during the administration of Woodrow Wilson.

GOMPERS, SAMUEL (1850–1924) Founder, American Federation of Labor

Samuel Gompers, founder and president of the American Federation of Labor (AFL) for 37 years, was both extraordinary and exemplary of many skilled workers during the late nineteenth and early twentieth centuries. Born into a family of Dutch Jewish immigrants in London in 1850, Gompers attended four years of school before leaving formal education to join his father on the benches of a cigar shop at the age of 10. In 1863, the entire Gompers family used the Cigar Makers' Society of England's emigration fund to immigrate to New York City. Arriving at the New York City docks in the midst of the Draft Riot of July 1863, the Gompers family settled into a typical immigrant existence in New York. The Gompers men, including young Sam, soon found employment as cigar makers and joined the U.S. cigar makers' union. At the age of 17, Gompers married Sophia Julian, who proceeded to give birth to at least nine children.

Like many other young immigrants, the teenaged Sam Gompers quickly became immersed in New York City's immigrant, intellectual, and fraternal life. From 1863–1880, Gompers belonged to, and participated in, the early Cigar Makers' International Union (CMIU), the Ancient Order of Foresters, the Independent Order of Odd Fellows, the Knights of Labor, the International Workingmen's Association, Felix Adler's Ethical Culture Society, the debating club at Cooper Union, and many others. Though Gompers generally eschewed organized religion, his Jewish background gave him another level on which to identify with the Jewish immigrants pouring into

Manhattan's industries at the time. From this mix of influences, Gompers began to develop his ideas about the best form and function possible for unions.

The young Gompers quickly became active in the CMIU, both locally and nationally. During the 1870s, he managed the union's aggressive campaign to abolish tenement house cigar making in New York City, ultimately achieved through the passage of state legislation making such production illegal. Gompers carried the insights and skills he had gained in the anti-tenement-house fight in the CMIU into the new attempt at a national organization of unions, the Federation of Organized Trades and Labor Unions (FOTLU), in 1881 becoming the head of FOTLU's legislative branch.

In 1886, Gompers attended the Ohio meeting that transformed FOTLU into the AFL. Based in large part on his reputation as head of FOTLU's only effective branch, the assembled union delegates elected Gompers to the presidency of the new organization.

He would be re-elected to that position every year except one up until his death in 1924.

Gompers often spoke of the lessons he learned from one of his early coworkers and mentors, Ferdinand Laurell. In his autobiography, Gompers wrote, "Time and again, under the lure of new ideas, I went to Laurell with glowing enthusiasm. Laurell would gently say, 'Study your union card, Sam, and if the idea doesn't square with that, it isn't true.' My trade union card came to be my standard in all new problems" (*Seventy Years of Life and Labor: An Autobiography*, 1925). Throughout his life, Gompers used this concept to make decisions about both his own actions and those of other unions and their leaders.

Gompers brought his experiences in the CMIU into the AFL and based many of his early actions and decisions in that organization on his old mentor's advice. Throughout his years in leadership of the AFL, he would stress the importance of the autonomy of individual national unions and their need to focus on economic goals and fiscal stability. From his own union experiences, Gompers truly believed in the efficacy of craft unionism, the organization of workers along occupational lines, the establishment of a system of dues and corresponding benefits, and the necessity for union leaders to maintain control over the actions of their members and therefore over the payment of such things as strike benefits. Along with these principles came Gompers's defense of the autonomy and jurisdictions of the individual national unions. In this view the AFL itself was supposed to be a helpful support for national unions and those workers hoping to establish such unions. In return Gompers expected those unions and their members to demonstrate the kind of careful self-discipline he himself had learned in the CMIU.

In the early years of the AFL, Gompers and his fellow AFL officers succeeded in large part in carrying out this vision of American unionism. Faced with an economy still dependent on the skills of a minority of workers within the working class, the ideals of craft unionism worked to protect and maintain unions for these workers who could afford craft union dues. Gompers also believed in the early years that this basic structure of unionism could simply be extended to workers in other less-skilled occupations. Unskilled laborers, semiskilled factory workers, women, African-Americans, and immigrants could all achieve successful organization if they just followed the pattern set by the skilled-craft unions. This required first and foremost that these workers be prepared to keep up the payment of regular dues to their union and that they then accept the control of the union over fiscal disbursements. While Gompers could at times express sympathy with those workers

who could not afford to pay dues at the level paid by skilled workers, his sympathy often ended with the belief that they simply could not be "good union members of good unions." Without financial stability and tight fiscal discipline, the craft unions of Gompers's vision would not survive.

Gompers's early years in New York also set the roots of his attitudes about strike mediation and negotiations. Tied closely to his conception of union self-discipline, Gompers believed that the most constructive resolutions of strikes came out of a bilateral discussion of the workers' interests. The presentation and debate of strike issues would create greater understanding by both sides. The resulting compromises and agreements provided what Gompers believed to be the most lasting conclusions to strikes, contributing to an increasingly solid base for future union demands and negotiations. Accordingly Gompers spent considerable amounts of time presenting himself as a mediator for unions in strike situations. Whether he was dealing with garment workers in New York or workers elsewhere, Gompers would attempt to set forward strikers' demands to employers in as rational a manner as possible. Once Gompers or some other union leader successfully worked out a compromise, Gompers expected union members to understand the importance of union stability and ratify the agreement accordingly. Later in the AFL's history, Gompers would carry this concept over into his dealings with the National Civic Federation when he became one of the first union leaders to join this national organization, which sought to mediate labor disputes before they erupted into open conflict.

At the fourteenth annual convention of the AFL in 1894, the always-simmering debates over socialism within the organization boiled over into open and often rancorous disputation. In the heated political atmosphere of the preceding year, the 1893 convention had asked member unions to vote on a detailed "political programme" for the national organization, the platform of which included Plank 10, calling for "the collective ownership by the people of all means of production and distribution." Gompers led the charge against the programme and particularly Plank 10 at the 1894 convention, contributing to the ultimate defeat of both. The other planks of the programme were ratified, leaving the organization with a range of issues to address but without an official political stance. In the aftermath of the two-day-long debate, the convention voted to replace Gompers with John McBride of the United Mine Workers as president of the AFL.

Gompers's one-year hiatus from the presidency ultimately led to several important changes in the AFL itself. Gompers would spend the year traveling

both internationally to meet with various European trade union leaders and nationally to continue to support U.S. workers' organizing efforts. His meetings with British and other European unionists provided Gompers with additional examples of the benefits of constructive craft unionism and the drawbacks of irresponsible socialism. Travel throughout the United States and in particular, a long southern swing on behalf of the United Garment Workers, reinforced Gompers's basic beliefs about union organization: Organization along craft or trade lines coupled with the financial responsibility and organizational self-discipline of both workers and their unions. Throughout his life Gompers would not waver from these concepts. Neither would he countenance vacillations on the part of the AFL itself. In many ways this marks the beginning of his growing conservatism over questions of union structure and form.

During Gompers's sabbatical year, as he called it, McBride moved the AFL's headquarters to Indianapolis, Indiana, far from Gompers's original base in New York. When the AFL re-elected Gompers to its presidency at the convention of 1895, Gompers temporarily moved to Indianapolis to take back the office. He did not move his family from New York City at this time, believing that this first year back with the AFL would prove the organization's fate. On reelection again in 1896, Gompers, firm now in his conviction that the AFL had chosen to follow his vision of trade unionism, moved the headquarters to Washington, D.C., in 1897. In so doing Gompers affirmed his belief in the endurance of the AFL as an actor, both economically and politically, on the national stage.

Biographer Bernard Mandel suggested that "Gompers's trade union policy for the twentieth century marked the end of the A.F. of L.'s youthful militancy and the beginning of its conservative middle age" (B. Mandel, *Samuel Gompers, A Biography*, 1963). When Gompers moved the AFL headquarters (and his family) to Washington in 1897, he himself was 47 years old, the father of six, and the leader of the most powerful organization of workers in the country. Gompers had more than 30 years' experience in the union movement by this time. His future efforts on behalf of the AFL and its members would continue to be based on these early experiences. Fewer and fewer men would be able to shake him in his beliefs.

The years immediately preceding the AFL's move to Washington had seen a growing number of judicial moves against the union movement. In Gompers's first years in Washington, legal decisions became increasingly important in his work. Gompers had been wary of employers' use of injunctions dating from the early 1890s. In fact this wariness had led him to

oppose the passage of the Sherman Anti-Trust Act in 1890. Despite many unionists' support for the act, Gompers insisted that it was written in such a way that it would be used against unions. He had then had to grapple with the invocation of the act against unions time and time again. In Gompers's eyes, the entire legal system became suspect. In the early twentieth century, Gompers would become entangled in two key court cases: That of the Danbury Hatters and that of Buck's Stove and Range Co. In both cases national business organizations provoked and supported the lawsuits. Both cases also would ultimately land in the Supreme Court. These cases as well as his own legal liabilities in each helped convince Gompers that the AFL had to enter politics in order to obtain relief from the power of injunctions.

On March 21, 1906, Gompers and other AFL representatives presented an eight-point Bill of Grievances to President Theodore Roosevelt, the speaker of the house, and the president *pro tem* of the Senate. All three politicians immediately rejected its consideration. Prepared for this reaction, the AFL threw itself into political activity. While they did not desert completely their previous nonpartisan stance, Gompers and other union leaders began to take a much stronger political stand than they had previously. Gompers had already stated his opinion that the unions should "Reward [their] friends and punish [their] enemies." This basic belief would now be carried out with much more vigor. In the summer of 1908, Gompers would appear before the platform committees of both the Republican and Democratic national conventions, failing to influence the Republican party but succeeding in gaining some support from the Democrats.

Unlike the political programme of 12 years earlier, the 1906 Bill of Grievances contained no overtly socialist points. Gompers assured friends and colleagues that economic activities remained the prime purpose of the labor movement and that these political demands would never detract from the efforts of constructive trade unionism. The AFL's entrance into the political arena in 1906 provided a model for union voluntarism, or careful nonpartisan political participation. Rather than highlighting the AFL's long and tortured relationship with socialists, the 1906 Bill of Grievances represented more its newfound points of complicity with the Progressive movement of the time. Ultimately this political move would lead Gompers to endorse Woodrow Wilson for president in 1914 and thereby ensure Gompers's ultimate involvement in World War I planning and execution.

At the same time that Gompers and the AFL were becoming increasingly involved in politics, a new labor organization was creating new problems for

the craft union movement. The Industrial Workers of the World (IWW), established in 1905, contained many of the ideas (and individuals) from the Left that Gompers had come to hate most heatedly. On top of calling for an end to capitalism and advocating sabotage and violence if necessary, the IWW also threatened to organize less-skilled workers into unions, embodying the antithesis of Gompers's constructive craft unions. Garnering considerable publicity through their innovative tactics, the IWW quickly became widely known and discussed. Gompers probably felt personally threatened by the IWW's new tactics and publicity. The IWW's penchant for violence in language if nothing else as well as its pacifist stance toward World War I would soon place the organization even more at odds with Gompers and the AFL. Newly linked with a sitting U.S. president, Gompers would support the U.S. efforts in the war and encourage AFL unions and their members to cooperate with war efforts both military and industrial. Mirroring President Wilson's path into the world war, Gompers moved through neutrality to preparedness and finally endorsed the United States becoming a belligerent in the war. Through cooperation with the war efforts, Gompers expected the AFL to gain respect from all sides: The public, government, and businesses. He would advise the White House on labor conflicts in the United States during the war, oppose the Bolshevik revolution in Russia, and travel through the war zone in Europe.

Did Gompers feel that his cooperation with the war effort had been worth the effort? While he would continue to defend his wartime work, the events of the immediate postwar years belie his generally rosy view. The War Labor Board was discontinued after the war ended, and the new Communist Party U.S.A. would soon become a hotbed of dual unionism. In 1924, Gompers supported Robert La Follette's independent campaign for president as a protest against the established parties' continued spurning of the AFL's support. By the end of the war in 1919, Gompers was 69 years old. His vision was failing and his hearing weakening. His wife suffered a stroke that year, dying in May of 1920. Gompers then married a divorcee some 30 years his junior in 1921. By all accounts, she made his life miserable for his remaining years.

Gompers would continue to run the AFL, refusing to let any but his closest friends and employees know of his weakening health. In November 1924, Gompers presided over every session of the Forty-Fourth Annual Convention of the AFL in El Paso, Texas, his last. For months he had been declining from kidney problems and a weakening heart. He knew this would be his final convention. William Green read

Gompers's prepared statement for him at the convention's opening. In this statement, Gompers reminded delegates that he had been with the AFL since its beginnings in 1881 and urged them to remain committed to his vision of craft unionism. On adjournment the entire convention went to Mexico City for the inauguration of the first labor President in North America and the ensuing Pan American Federation of Labor meeting. On December 8, Gompers took to his bed. He was then rushed back to San Antonio, Texas, where he died on December 13. He was buried in Tarrytown, New York, on December 18, 1924.

GRADUATE TEACHING ASSISTANTS

Graduate teaching assistants (TAs), along with other forms of contingent academic labor, such as adjunct or part-time instructors, have become increasingly important in the modern university. According to the American Association of University Professors, the number of graduate students who also serve as classroom instructors rose by 35% from 1975 to 2000. As the number of graduate students employed as teaching assistants and instructors has grown, a movement in favor of organizing TAs into unions has arisen. While the earliest TA union was founded in the late sixties at the University of Wisconsin-Madison (UWM), this phenomenon did not become common until the 1990s. Today academia is one of the few areas of union growth, and the movement to organize graduate students has led to jurisdictional disputes, especially between the American Federation of Teachers (AFT) and the United Auto Workers (UAW).

GRADUATE TEACHING ASSISTANTS

The first graduate teaching assistant union, the Teaching Assistants' Association (TAA) at UWM was originally founded in 1966 as an outgrowth of antiwar and New Left activism on campus. It slowly evolved into a union throughout the late sixties, and in 1970, the TAA led a successful four-week strike in order to pressure the university into bargaining with them in good faith. The major issues that motivated the TAA were a desire to ensure job security and complaints over teaching conditions, particularly workload and class size. Despite the success of the TAA, graduate teaching assistants at other universities did not follow the example of the UWM students.

Beginning in the late 1980s and early 1990s however, a series of unions were formed at state universities across the country. This increase in academic unionization paralleled both the unprecedented growth in the number of graduate student instructors and the increasingly tight academic labor market. In addition the fact that unionization campaigns on academic campuses were much more likely to succeed than the national average encouraged a number of unions without a history of academic organizing to encourage the unionization of TAs. With the decline of unionization in their traditional industries, such unions as the UAW, the Communications Workers of America (CWA), and the United Electrical, Radio, and Machine Workers of America (UE) all became involved in TA organizing drives. These drives have been largely successful, and as of 2003, TA unions existed at around 25 public university campuses, representing almost 40,000 graduate students.

The success of TA organizing on public universities was not paralleled on private university campuses however. Private universities fall under the jurisdiction of the National Labor Relations Board (NLRB), which held until 2000 that graduate teaching assistants were primarily students rather than employees and that therefore they were not entitled to unionization. However in 2000, the NLRB ruled in favor of the right of graduate students at New York University (NYU) to organize a union of teaching and research assistants. This ruling seemed to throw the door open for further unionization of teaching assistants on private campuses. However in 2003, a new NLRB, led by three Republicans appointed by President George W. Bush, reversed its earlier decision, ruling that graduate teaching assistants at Brown University were not primarily employees and thus were not entitled to union representation. The board based this decision primarily on the 25-year precedent that preceded the NYU decision and had consistently denied TAs at private universities union recognition.

Despite the general lack of success of organizing efforts on private campuses, TA unionization is a

growth industry for unions. Surprisingly the UAW is the largest player in the graduate employee union movement, with over 40% of the TA union members belonging to the autoworkers' union as of 2003. This has led to some criticism of the UAW by others within the labor movement and has opened TA unionization efforts to criticism from the outside as well. The movement of some unions, especially UAW and the United Steelworkers of America, away from their traditional bases into such sectors as retail and academia has drawn criticism from the unions that traditionally served those areas. And these sorts of jurisdictional disputes have on at least one occasion sparked contentious organizing drives between the UAW and AFT on the same campus. More importantly perhaps the image of the UAW as a blue-collar, mass-production union has been used against it during a number of TA organizing drives. Some have attributed its loss at Cornell in 2003 to, among other things, the fear that the autoworkers' union would not be as effective in an academic environment as a more traditional teaching union, such as the AFT.

GREAT DEPRESSION: 1930s **The Initial Impact of the Economic Collapse**

In the American popular imagination, the Great Depression began on Black Tuesday, October 29, 1929, when the stock market crashed. Indeed that dramatic event marks a fitting end to the Roaring Twenties, a decade remembered for its frenetic embrace of modernity and all its material and cultural products. But for American working people, the beginning of the Great Depression is much harder to pinpoint. Beneath the glittering surface of the 1920s prosperity lay a deep vein of poverty affecting entire regions and large numbers of people. The working people associated with the so-called "sick industries"—agriculture, mining, textiles—never did participate in the good times. But the overall magnitude of the crisis as it unfolded after the Crash made misery nearly universal for working people. As the economy collapsed, the unemployment spike was stunning: From 3.2% in 1929 to 24.9% in 1933. Seesawing throughout the 1930s, unemployment still never fell below 14%. Workers who were lucky enough to hold on to their jobs frequently took sharp pay cuts; in 1933—87% of

businesses reported that they had lowered wages since 1929 by an average of 18%, and many more had reduced hours.

The aggregate statistics on unemployment hide a great deal of variation by region, by industry, by such demographic factors as gender, race, and ethnicity. Southerners for example sometimes claim that they never even noticed the Depression; they had been poor so long it looked normal. Per capita income in the South was already just 50% of the national average in 1929. But it got even worse: Income from cotton, still the backbone of the southern economy, fell by more than two-thirds by 1932. Sharecroppers and tenant farmers were devastated, with black farmers doubly so. By 1933, over 12,000 black sharecroppers had been forced off the land, and a new urban migration was underway. In the region's chief industry, textiles, extreme competition from the mid-1920s on drove down prices and deep wage cuts became endemic.

The heavy-industry belt of the Northeast and Midwest took a major hit. The Depression arrived a little later in this sector, with sharpest contractions occurring after 1930. By 1932, unemployment in Chicago was 40%; on Minnesota's Mesabi Range, an astonishing 70% of the iron miners were out of work. New England textile workers shared the fate of their southern brethren. The electrical industry fell in slow motion; General Electric (GE) workers for example first lost the perks of welfare capitalism, then saw wages and hours spread thin; then half of them lost their jobs. Steel and auto were laid low. In Detroit unemployment stood at nearly 50%. Midwestern farmers suffered, too. In Wisconsin dairy farmers striking for higher prices ambushed their neighbors on country roads, dumping milk into the dirt. And farmers on the Plains saw their prices fall first and then their topsoil take off in the wind, settling eventually in such unlikely places as downtown Memphis and the decks of ships at sea.

The legacy of racism intensified the troubles of minority populations. In California xenophobia ratcheted up as jobs became scarce. Mexican and Mexican-American farm workers were pushed out to make way for white migrants from the distressed South and Plains states, and hundreds of thousands were deported and repatriated against their will. Further up the coast, recent Filipino immigrants, technically U.S. citizens as colonial subjects, were reclassified as aliens in 1934 and pressured to repatriate. African-Americans nationwide once again found themselves first out the door and last in line for relief.

Women's experience was complex. The service industries where most women work were less severely affected than heavy industry, and in fact by the end of

the 1930s, that sector had expanded and with it the numbers of women employed. In some respects the very rigidity of the sexual division of labor preserved women's jobs. Seldom were men, however desperate, willing to take women's work. An exception was teaching, where women's share of jobs fell from 85% to 78% over the decade. Still women's already too-low wages were cut, and job scarcity created enormous cultural pressures on women to leave the workforce and cede their jobs to breadwinners. The pressure was particularly hard on married women. Many municipalities and businesses fired women with employed husbands. At its 1931 convention, the American Federation of Labor (AFL) re-affirmed its conviction that women's proper place was in the home and declared that employment preference should be given to those on whom others depended, a seemingly gender-neutral category that nevertheless signaled men. Work relief programs as they developed in the mid-1930s were constructed with the male breadwinner as model; few programs were designed for women and those that were reinforced traditional women's roles by emphasizing domestic occupations like housekeeping and sewing. Minority women were additionally disadvantaged by New Deal programs—Social Security and the Fair Labor Standards Act, for example—that excluded agricultural and domestic workers.

The Early Response to the Crisis

American institutions and the political establishment were singularly unprepared to cope effectively with a crisis of this magnitude. Among industrialized nations, the United States was notably resistant to the notion of the state's responsibility for social provision. Veterans' pensions constituted the sole legitimate entitlement of any kind. In the face of mounting unemployment, no federal or state program existed to provide relief or in any way aid the unemployed. A handful of large corporations had instituted private unemployment programs, but they were few and their benefits meager. General Electric, for example, had installed a program based on mandatory employee contributions partially matched by the company; the plan carried GE workers through the harsh winter of 1931 but crashed that April.

The lack of government assistance reflected the widespread notion, especially popular in elite circles, that poverty, whatever the cause, was most likely an individual moral failure, not the byproduct of a flawed system. President Herbert Hoover, though not quite so callous or naive, nevertheless believed staunchly that direct relief by the federal government

would corrode the moral fiber of free individuals. Hoover believed that the proper sphere for such activities was local government and the voluntary contributions of private individuals. The face-to-face interaction of benefactor and recipient could weed out the slackers from the worthy poor. Relief tended to be in kind rather than in cash and frequently had some small, meaningless, manual task attached as a moral tonic. As the logical outgrowth of this orientation, breadlines and soup kitchens became the relief form of choice, ubiquitous in cities, run by private charities and individuals and agencies of local government. But such sources were overextended and rapidly exhausted. Still Hoover resisted calls for relief until the final months of his administration when he signed the Emergency Relief and Construction Act that allocated \$300 million for loans to states.

At the beginning of the crisis, radicals on the Left were the only groups actually taking action to aid the desperate. The Communist Party, USA (CPUSA) was first to act; even before the market crash, Communists were organizing in the cities among the poor and unemployed, so by 1930, when unemployment began to become a mass phenomenon, the party was well-positioned to respond. On March 6, 1930, the CPUSA organized unemployed demonstrations in major cities that mobilized several hundred thousand marchers, much to the party's surprise. The size and energy of the demonstrations put the problem on the national radar scope for the first time and inspired the Communists to create a national organization, the Unemployed Councils of the USA. At the national level, the council lobbied, organized petition drives, and staged two national hunger marches. But the councils' greatest impact remained at the local level, where they responded to the particular local grievances of the unemployed. Local councils intervened to assist relief applicants for example and to pressure local officials for more adequate relief without the humiliation of intrusive investigations. When relief took the form of jobs, the councils agitated for better compensation and working conditions. But their most dramatic and popular actions were eviction protests. Council members vigorously and physically resisted police attempts to enforce eviction orders, mobilizing whole neighborhoods very effectively.

Other Left groups were slower to respond but eventually as successful as the Communists. The sclerotic Socialist party did nothing until stung into action by the young activists of their League for Industrial Democracy (LID). The LID was quite successful though less confrontational than the Communists, favoring negotiation over the more flamboyant and disruptive council tactics. The socialists, like the Communists, were attentive to the particular distress

of minorities; both groups were interracial in composition and leadership and worked to raise awareness about the higher rate of unemployment among African-Americans and persistent discrimination in relief programs as they developed.

The third major radical group addressing unemployment were followers of A. J. Muste. The Musteites crafted what they called an American approach to the problem, wedding self-help and patriotic appeals to form the Unemployed Citizens' League. The league, whose first incarnation was the vigorously effective Seattle Unemployed Citizens' League, grew particularly well in small cities and towns, notably in the mining towns of Pennsylvania and West Virginia and steel towns of Ohio, where the main street values of patriotism and self-help resonated strongly.

With the beginning of the New Deal and the advent of federal relief programs in 1933, and especially the extensive work programs of the Works Progress Administration (WPA) in 1935, the orientation of radical unemployed activism changed. The New Deal Administration became the focus of unemployed workers' hopes and expectations, and as attention shifted from local to national, the unemployed groups did likewise. And they began to cooperate with each other across the factional lines that ordinarily divided them. The CPUSA's inauguration of the Popular Front did much to foster cooperation, and in 1935, the three groups merged to create the Workers' Alliance. The alliance began to function more on the national level, as a pressure group attempting to influence policy formation, particularly working toward enactment of federal unemployment insurance.

The radical response to unemployment was a critical contribution to the federal programs that eventually emerged. The radicals defended the rights and dignity of working people as citizens, defined the problem as systemic, and insisted that the federal government take on the responsibility for social provision. Their ideas and orientation influenced the leftish wing of the New Deal relief administration and the shape of programs that they designed. Many of the unemployed activists took their new skills and moved on into other arenas, especially the industrial union drives that erupted in the late 1930s.

The New Deal

Franklin D. Roosevelt's energetic attack on the massive problems created by the Depression presented a vivid contrast to Hoover's cautious restraint. Roosevelt took office in March 1933; within the first three months, the famous 100 Days, the New Deal

Administration had crafted and launched relatively bold initiatives to provide temporary relief to the suffering citizenry and stabilize the reeling economy. Among the agencies created to provide relief to poor and working people were the Federal Emergency Relief Administration (FERA), the Civil Works Administration (CWA), and the Civilian Conservation Corps (CCC), and finally the Works Progress Administration (WPA). The New Deal's initial programs to stabilize agriculture and industry, the Agricultural Adjustment Administration (AAA) and the National Recovery Administration (NRA), also inaugurated programs that deeply affected farm and factory labor.

Roosevelt's relief programs were structured as federal-state collaborations, with the money flowing from the federal spigot but distributed by the states. This arrangement was intended to secure state-level political support and to give states discretion in identifying and addressing needs, but it also opened the door to distortions. Southern administrators for example were often able to sustain discriminatory policies, a two-tiered approach, that entrenched racial inequality. New Deal relief policy also favored work over direct relief, a nod to the cultural predisposition to distrust the able-bodied unemployed. But New Deal work relief was not the degrading, punitive "make work" of traditional relief but rather socially useful projects that restored pride and won widespread public acclaim.

The FERA, enacted May 12, 1933, was primarily a direct-relief program providing one federal dollar for each three put up by the states, a provision necessarily waived often due to the insolvency of the states. The CWA was a short-term experiment in public works created in the fall of 1933 and intended to help the unemployed survive the winter. An ambitious project headed by Harry Hopkins, the CWA put 3.5 million workers on jobs in the first six weeks. In its short lifespan, the CWA workers constructed over 500,000 miles of roads and began many construction projects later completed by the WPA. In addition the agency created projects to address needs of women workers—sewing, of course—and white-collar workers. The CWA was quite popular despite the brevity of its existence and functioned as a precursor to the much-larger WPA.

Young people were disproportionately affected by the crisis, and the CCC was for them or at least the males among them. The CCC had the dual purpose of taking care of young men and repairing the devastation resulting from a century of unregulated environmental exploitation by industry and agriculture. The young men were paid \$30 per month, with \$25 sent directly to their families, to provide for their support. At its peak the CCC enrolled 500,000 young men who

lived in camps and performed a dazzling array of tasks. They built roads and campsites in parks, planted millions of trees, fought forest fires, built irrigation systems, fought soil erosion. Like most New Deal programs however the CCC had its racist dimension. Young blacks were allowed to enroll in the corps but into segregated units and unlike white youth who often traveled far from their homes to work, for instance, on western projects, the black youths were kept primarily in the South. They were also subjected to a quota system rather than admitted according to need.

The most famous and controversial initiative was the WPA, enacted by executive order on May 6, 1935. The WPA was an election-year project truly massive in scale, averaging over two million workers on the monthly payroll for the entire 6 years of its existence. The WPA supported a diverse range of occupations from the typical construction worker to artists and writers. The bulk of the projects were aimed at reconstructing and completing the national infrastructure. The WPA workers constructed over 500,000 miles of roads, like the beautiful Blue Ridge Parkway that snakes over the Appalachian peaks from Virginia to Georgia, and numerous public buildings, including 85,000 courthouses, 5,900 schools, and over 1,000 airports.

Roosevelt's programs to stabilize agriculture and industry also had tremendous impact, by no means all positive, on working people, particularly in the South. There the AAA moved to aid farmers by creating mechanisms like production control subsidies, price supports, and credit that would keep farmers on the land and limit agricultural output until commodity prices recovered. Local committees administering the program allowed landlords to pocket the allocations, giving them the capital to begin mechanization, while putting tenant's land into the acreage-reduction scheme. Displaced sharecroppers and tenant farmers migrated to the cities where New Deal relief kept them afloat until harvest time when their labor was again in demand. It was a sweet deal for landowners—not so good for already-impoorished sharecroppers and tenants. Thousands migrated from the region.

Organized Labor and the New Deal

The labor movement was at low ebb when the Depression began. A decade of open-shop repression had vitiated the gains made during WWI, and in 1929, the craft unions of the AFL could claim only 3.6 million members, 11% of the nonagricultural

labor force. By 1941, membership had grown to 10.5 million, nearly 28% of the workforce. The stunning growth is indicative of a remarkable decade in U.S. labor history. In the course of the Depression, the U.S. labor movement was transformed structurally and demographically, augmenting the craft union structure of the AFL with a new industrial unionism embodied in the Congress of Industrial Organizations (CIO) that embraced the multitudes of unskilled and semiskilled operatives, many of them ethnic, and racial minorities and women, who populated the vast mass-production industries. Labor also transcended the AFL's traditional distrust of political engagement during the decade. From the federation's founding in 1886, the state had been little more than an engine of repression; by 1941, for better or worse, organized labor had become a vital element in the Democratic party's New Deal coalition. And finally the movement came out of the Depression thoroughly enmeshed in a new, state-regulated labor relations regime.

Labor's change of fortune began with passage of the Norris-LaGuardia Act, signed by Hoover in 1932, which addressed some of the more egregious anti-union practices of the modern era. The act outlawed the infamous "yellow dog" contracts that required workers to eschew unions as a condition of employment, and it restricted the use of the hated federal injunctions that had been used promiscuously against strikes and boycotts. Norris-LaGuardia was very important but quickly eclipsed by the passage of Roosevelt's industrial recovery program, the National Industrial Recovery Act (NIRA) passed on June 16, 1933, that set up the National Recovery Administration. The NIRA required that industries write codes to govern all elements of the production process, from wages and prices to market shares, as a means of eliminating the cutthroat competition that had undermined prices. The act also mandated that certain new rights be extended to workers.

Section 7(a) established workers' right to bargain collectively with their employers through representatives of their own choosing, opening the door to union organization as a means of improving workers' wages and consumer power. Workers all over the nation responded with what employers considered unseemly enthusiasm, organizing in droves and petitioning for AFL charters. In the year following the NIRA passage, the AFL signed nearly one million new members.

But the AFL could not or would not adapt to the very different organizational needs of the disparate workforces of mass industries, so they cut skilled workers from the new unions, annexed them to appropriate craft unions, and generally neglected the remaining unskilled and semiskilled workers whose occupations fell outside traditional craft jurisdictions.

In the process they undermined workers' strength in the industrial workplace.

By late 1934, employers' refusal to recognize their employees' unions plus the ineffective response of the AFL had exposed the flaws of Section 7(a) and discredited AFL leadership. Heightened expectations met massive obstacles, and frustration erupted in strikes across the nation involving 1.5 million workers, including the Textile Strike of 1934, the largest strike in U.S. history, and an astonishing outburst from the long-oppressed "lintheads" of the South. The 1934 strikes were an accurate barometer of rising working-class anger after years of comparative passivity, and the active leadership of radicals in many of the struggles once again raised red flags in the centers of power, from corporate boardrooms to Washington, D.C.

Within the AFL key leaders sympathetic to the desire for industrial organization began to push hard for the federation to adapt to the new form. Chief among them were John L. Lewis of the United Mine Workers (UMW), Sidney Hillman of the Amalgamated Clothing Workers of America (ACWA), and David Dubinsky of the International Ladies' Garment Workers' Union (ILGWU). All three headed unions that were industrial in structure, and they were thus inclined to respond favorably to the demand for industrial organization raised by workers in the industrial core. Together they launched the Committee for Industrial Organizations on November 9, 1935, and began to issue industrial union charters. The committee stayed within the AFL until November 1938, when it left and formed a rival federation of industrial unions, the Congress of Industrial Organizations (CIO).

In May 1935, the NIRA was ruled unconstitutional by the Supreme Court, and Section 7(a) expired. But employers' refusal to abide by its labor provisions had inspired Senator Robert Wagner (Democrat-NY) to develop a new bill to remedy the weaknesses of Section 7(a). The National Labor Relations Act, known as the Wagner Act, was passed July 5, 1935, and reaffirmed by the Supreme Court in 1937. Wagner was much tougher and more explicit in its advocacy of workers' right to organize. The act expanded worker protections, outlawed key employer antiunion practices, and created a three-member National Labor Relations Board (NLRB) with meaningful enforcement power. Most importantly the act established mechanisms for conducting representation elections and required that employers bargain with winning unions.

Armed with this new weapon, and in the very favorable political climate created with Roosevelt's landslide re-election in 1936, the CIO went to town,

fielding a veritable army of skilled and dedicated organizers, many of them Communists. The CIO launched dramatic campaigns from 1936–1937 that succeeded in organizing the heart of the industrial core. The autoworkers' victories in the winter and spring of 1936–1937 truly energized the movement.

The critical event was the famous six-week sit-down strike conducted by auto workers in Flint, Michigan, against General Motors, the largest and most profitable U.S. corporation. The autoworkers' stunning victory there came to symbolize CIO solidarity and militancy, galvanizing not only autoworkers but all labor. By the end of the decade, workers in auto, steel, rubber, the electrical industry, and many more had organized industrial unions and affiliated with the CIO. In an era when the stress of hard times easily divided people, the CIO formed unions that were inclusive, organizing all workers in a given industry regardless of race, ethnicity, or sex or skill. Stung by the CIO's success, the AFL began to compete vigorously, and in the end the established federation outdid the CIO, emerging from the Depression nearly twice the size of the younger organization.

Legacy of the Great Depression

Roosevelt's programs did much to alleviate the distress despite their flaws and limitations, but the New Deal is not generally credited with ending the Great Depression. That honor goes to World War II. By 1939, war in Europe prompted rearmament in the United States, and American workers went back to work. Much had changed. Though much of the New Deal was intended to be temporary, some legislation had established permanent changes that benefited working people. The Fair Labor Standards Act of 1938 established minimum wages, maximum hours, and new standards governing child labor. The Social Security Act provided some measure of old-age security and a system of unemployment compensation. Both acts typically discriminated against minorities but still established the framework for a minimal system of social provision that continued to improve for the next four decades until rolled back in the Reagan revolution. Unions, existing tenuously on the borders of legitimacy at the beginning of the Great Depression, had achieved a degree of institutional stability that was to be solidified through the war years. The state was now an active agent in the new, regulated regime of labor-management relations. The "rule of law" was introduced into the workplace.

GREAT MIGRATION

The Great Migration of the World War I era witnessed the geographical relocation of 450,000 to 500,000 African-Americans from the states of the South to industrial cities in the North; during the 1920s, another wave of migration brought an additional 700,000 black southerners to northern cities. While African-Americans had never been stationary, the scale of the Great Migration was unprecedented. As such it was accompanied by considerable public scrutiny and at times, social conflict. African-Americans, like their white counterparts, discussed and debated the causes, character, and impact of the movement of so many people; unlike their white counterparts, they tended to understand and even

GREAT MIGRATION

celebrate the movement as a decisive move toward a better life despite the obstacles to advancement that blacks encountered in the North.

If the movement of southern blacks “came as a surprise, to North and South alike,” as the white periodical, the *Contemporary Review*, put it in 1918, “its causes were of long standing.” African-Americans’ reasons for migrating were straightforward. So-called “push factors” prompting the decision to leave the South included grinding poverty, widespread antiblack violence, the denial of political rights (capped by a wave of disfranchisement laws and constitutional provisions), the lack of educational and other opportunities, and the day-to-day humiliations that the system of white supremacy and Jim Crow imposed on black southerners. As largely rural sharecroppers, southern blacks were often mired in debt and poverty, exercising little control or influence in the economic realm. The outbreak of World War I in 1914 cut off the European market for southern cotton exports, contributing to an agricultural depression, while flooding and a growing boll weevil infestation of southern cotton crops initially hurt southern farmers and sharecroppers. Economic, social, and political conditions in the South then convinced many southern blacks to undertake the risky move of re-establishing their lives in the North.

While the magnitude of the World War I era migration was unprecedented, black mobility was not. Within the South a steady stream of African-Americans migrated to southern cities and more often engaged in local geographical moves in search of better economic opportunities. The need to earn cash led many black southerners to embrace a strategy of seasonal migration that took black men to timber, railroad construction, or turpentine camps or to brickyards or coal mines, where they engaged in wage labor for brief periods of time before returning to their families in rural communities. For their part, some black women engaged in limited migration to work as domestic servants or washerwomen. In some instances spontaneous or organized campaigns promoted the migration of black southerners. Following the final collapse of Reconstruction, as many as 25,000 former slaves from Louisiana, Texas, and Mississippi took part in what contemporaries referred to as an exodus to Kansas in 1879–1880, despite fierce opposition from both black leaders and white elites. Known as “exodusters,” these people made explicit their desire to escape from political and economic violence and seek opportunities outside of the South. Over a decade later in the 1890s, tens of thousands of southern blacks made their way to the Oklahoma Territory when the federal government opened the region to non-Indian settlers.

One of the strongest obstacles to black migration to the North in the pre-World War I decades was an absence of jobs open to black workers there. Northern businessmen shared much of the racial prejudice of southern businessmen and planters. With an alternative labor supply in the form of significant numbers of eastern and southern European immigrants, northern businessmen erected and maintained racial barriers to employment that relegated the relatively small number of northern blacks to unskilled jobs in industry or to domestic service or other service jobs, moves endorsed by skilled white workers. When the start of World War I in 1914 led to a dramatic reduction of immigration from Europe however, the northern employment situation for blacks in the North slowly changed. Labor shortages led employers to begin hiring small but growing numbers of black workers by 1915–1916; when the military draft and voluntary enlistments heightened the labor shortage in 1917 and 1918, employers increasingly turned to black labor, particularly southern black migrants, as a solution. For the first time, the industrial sector of the North—including packinghouses, steel mills, and automobile plants—began hiring thousands of black male (and in the case of packinghouses, female) workers, while black women found jobs in lumber and railroad yards and numerous smaller factories. The new availability of work in the North constituted a powerful “pull factor” drawing southern blacks to the region.

Southern blacks learned of these new opportunities from a variety of sources. Labor agents representing several railroad companies (including the Erie, Pennsylvania, and Union Pacific railroads) actively recruited black men for jobs laying or repairing railroad track in the North and West. While many historians have argued that labor agents played only a minor role in spurring migration, southern whites were convinced that agents were stirring up trouble and contributing to a labor famine in their region. Accordingly municipalities and state governments passed laws to restrict or ban labor recruiting, and local police departments harassed agents and migrants alike. More important in promoting the migration process were northern African-American newspapers like the *Chicago Defender*, which publicized abundant job openings in the North, condemned southern racial practices, and portrayed the North in positive terms as a land of hope and promise. Although white officials sometimes sought to prevent their distribution in the South, black newspapers made their way into countless black homes. Finally black southerners who successfully established new homes in the North communicated through letters to, and return visits with, their relatives and friends

left behind, reinforcing the clear message that migration North led to social and political advancement and economic prosperity.

Conditions for African-Americans in the North in many ways represented a sharp improvement over those in the South; blacks could often vote without harassment and could participate in a wide range of rich cultural, religious, and fraternal organizations, for instance. Yet migrants encountered considerable racial hostility and discrimination in their new homes. Skilled white workers, many of whose unions had long barred African-Americans from membership, resented the arrival of so many potential black competitors; in some cases, they refused to work with blacks or resorted to work stoppages to block their introduction into previously all-white labor forces. Striking white workers in East St. Louis, Illinois, took out their fury on black migrants during a bitter labor conflict in July 1917. Although no precise figures are available, contemporaries estimated that from 40 to 200 blacks were killed by white rioters, while 6,000 blacks were driven from their homes. Described by the National Association for the Advancement of Colored People (NAACP) as the “massacre of East St. Louis,” the organization blamed white trade unionists for the violence and condemned the city police and state militia for doing little to protect those under attack. “Mr. President, Why Not Make America Safe for Democracy?” read the NAACP’s protest signs during a silent march of 10,000 demonstrating against the violence.

Conflicts over employment were not the only source of racial discord during the era of the Great Migration, for housing issues proved contentious as well. Housing markets were often highly segregated, with blacks relegated to specific geographical sections of cities and to markedly inferior housing stock. Black efforts to move into better white neighborhoods were almost uniformly met with opposition and even violence.

In the aftermath of World War I, whites across the country expressed hostility to black wartime gains and in some cases, vowed to roll back the clock. The year 1919 witnessed a massive strike wave affecting many of the country’s industrial centers, the repression of newly formed chapters of the NAACP, and a rise in racial violence. (There were approximately 76 lynchings of black Americans that year.) During the summer of 1919, brutal race riots occurred in many cities, including Washington, D.C. and Chicago, where whites, led by street gangs, spent five days assaulting black Chicagoans. In Elaine, Arkansas, planters unleashed a reign of terror against sharecroppers who had organized the Progressive Farmers’ and Household Union, killing a minimum of 25

people (and possibly several hundred) and arresting many other participants.

The vehemence of the white reaction can be attributed in part to resentment of black advances and evidence of a new disposition among black Americans. The migration itself disquieted southern white planters who feared a loss of control over their black labor force. Although few southern whites honestly admitted to the brutality of their labor and racial systems that prompted black departures, African-Americans often did not hesitate to point out inequality or identify oppression as a source of the migration. Some even described the outflow of southern blacks as “a silent protest” against southern oppression or as a “Great American Protest” against “the unbearable living conditions” in the South.

That new disposition also manifested itself in a new willingness by blacks to challenge racial inequalities directly. Even before the war, white observers had detected a “growing race consciousness” among northern blacks. By the war years, talk of the emergence of the “new Negro” was common. African-American socialists A. Philip Randolph and Chandler Owen began publishing the *Messenger* magazine during the war, a journal that harshly attacked American racial practices, capitalism, participation in the war, and moderate black leaders too willing to compromise. While few blacks adopted such a radical stance, many did reveal what black government official George Edmund Haynes described in 1919 as “a new consciousness.” Howard University’s Alain Locke concluded that the “younger generation is vibrant with a new psychology; the new spirit is awake in the masses” (*The New Negro*, 1983). What this meant in practice was a growing willingness on the part of many African-Americans to engage in more direct protest and to insist on citizenship rights. Although the rise of Marcus Garvey’s short-lived Universal Negro Improvement Association is often viewed as the primary vehicle for black protest in this era, it had considerable company in many other quarters. The NAACP, initially a middle-class organization, grew tremendously during the war years, attracting many working-class black members in the South. By the end of the war, the association could boast of 90,000 members, up from only 6,000 or so in 1914. The black club women’s movement also grew considerably in these years, undertaking social-uplift programs, lobbying efforts, and the campaign for women’s suffrage. Even trade unionism attracted a growing number of black participants in these years despite the movement’s often-hostile stance toward African-Americans. The wartime and postwar Stockyards Labor Council in Chicago and the United Mine Workers of America in Alabama, which welcomed

GREAT MIGRATION

blacks as members, may have been interracial exceptions to the broader rule of white union hostility, but thousands of black workers joined all-black unions to pursue their own agendas and protect their own interests. Gulf Coast longshoremen, Florida phosphate workers, Mobile commercial laundry workers, Birmingham district coal miners, southern domestic workers, timber workers in Louisiana and East Texas, and railroad firemen, brakemen, Pullman porters, dining car waiters, and freight handlers formed or joined union locals (usually all-black) during the war.

The postwar “racial counterrevolution” halted and in many cases wiped out many if not all of the wartime black advances. Southern NAACP chapters were driven out of existence, many black (and white) unions were destroyed, and local challenges to the racial order were met with white violence. But try as they might, whites could not fully reestablish the pre-war racial status quo. Black migrants lost economic ground in the industrial sector immediately after the war, but they retained their foothold in the dynamic core of the nation’s economy. During the 1920s, migration again picked up, ultimately surpassing that of the war years. Black communities in the North, particularly Harlem in New York and Chicago, expanded dramatically in size, offering a modicum of cultural and political independence and creating the foundation for a new black politics in the 1930s and 1940s, characterized by a new grassroots militancy that would itself establish the groundwork for the emergence of the modern civil rights movement that ultimately brought down the Jim Crow order.

GREAT SOCIETY/WAR ON POVERTY (1960s)

In the era of the 1960s, the U.S. government sought to tackle the vexing phenomenon of substantial poverty within the world’s wealthiest society. *The Other America*, written by democratic socialist Michael Harrington and published to wide attention in 1962, shocked Americans by informing them that a great deal of poverty remained amid the general affluence of American society. At least 20% of the U.S. population fell below the U.S. government’s official poverty line in the early 1960s. At a time of rising liberalism and surging idealism, poverty became a prominent item on the nation’s agenda for action. At the high tide of this liberal idealism, during the presidency of Lyndon B. Johnson (1963–1969), the ambition to reduce poverty levels was enfolded in the far broader agenda of social improvement that went by the name “the Great Society.” Antipoverty efforts, like other elements in the Great Society that mainly benefited the middle class, persisted through the 1960s and most of the 1970s under both Democratic and Republican administrations in Washington.

By 1970, the national poverty rate had fallen to less than 13%, and this trend continued for several years. Although the Great Society and specifically the War on Poverty would become controversial in the

ensuing decade, the achievements of these programs were substantial. So why did these programs stir such controversy? Part of the explanation is political. Although the organized labor movement was a key element in the Democratic party coalition led by presidents John F. Kennedy (1961–1963) and Johnson, its concerns—and more broadly, those of the working class as a whole—were not much taken into account in developing these programs. This lack of connection set the stage for rightist efforts to detach labor from the Great Society coalition.

From Kennedy to Nixon

Kennedy was aware of the stir caused by Harrington's book, but he already had authorized an antipoverty initiative by 1962. Embodied in the Area Development Act of 1961, Kennedy's effort sought to address the widespread privation that afflicted Appalachia. Kennedy had witnessed this poverty first-hand while campaigning in the Democratic presidential primary race in West Virginia in 1960. Addressing Appalachian poverty through a governmental program carried little political risk—something that was surely taken into account by the hardheaded pragmatists and politicians of the Kennedy administration—as this was largely white poverty. The specter of technically driven unemployment also began to loom large at this time. In response Kennedy signed into law the Manpower Development and Retraining Act (MDTA) in 1962. This act provided matching funds to state governments that financed programs to teach marketable skills to workers rendered jobless by automation. The MDTA was not presented as part of a poverty policy, but its focus soon shifted from those thrown out of work by automation to young men, especially African-Americans, who had never had good jobs in the first place.

When Johnson became president following Kennedy's assassination, he took Kennedy's antipoverty effort much further. In his January 1964 state-of-the-union address, he declared “unconditional war on poverty” in America. This marked the rhetorical high point of liberal hopes to eliminate the contradiction of “want amid plenty.” As had Kennedy, Johnson presented unemployment and poverty as two distinct problems. Johnson's war on poverty included a wide array of programs, including job training, legal assistance for the poor, and support for early childhood education, known as Head Start. In later years critics of the War on Poverty often conflated it with the Great Society. But the Great Society programs were distinct

from the War on Poverty. They aimed to benefit the broad middle class and included an astonishing array of initiatives, among them the improvement and beautification of America's highways, the creation of public television, the large-scale sponsorship of the arts, and federal aid to elementary and higher education. Some of the Great Society programs did benefit the poor in particular. The most important such instance was Medicare, the program created in 1965 that provides medical care to all elderly Americans regardless of income or wealth. Medicaid, created at the same time as Medicare, offered health coverage to the poor of all ages. But the quality of Medicaid varied from state to state because the federal government allowed the states to administer the program and set benefit levels, and it pegged its own contributions to what the individual states were willing to spend.

Less than a decade after Johnson's stated commitment to eradicate poverty, most of his antipoverty program was gone, and the War on Poverty was routinely scorned by those on the right (as well as some in the center) as the embodiment of misguided 1960s-era big government. Yet paradoxically Johnson's successor, President Richard M. Nixon (1969–1974), continued to increase government spending to alleviate poverty even as he shut down Johnson's program. Nixon approved a large expansion of the food stamp program, and at his most ambitious, he proposed guaranteeing a minimum income to all American families. This Family Assistance Plan was defeated in Congress after it was attacked both from the right (for the usual reasons) and from the left (for its parsimony).

When discussing 1960s antipoverty efforts, commentators often paint with a broad brush, portraying these efforts simply as a series of handouts to the poor. Such portrayals are inaccurate. In fact there were three different types of antipoverty programs in existence in the 1960s. One type was indeed public assistance or welfare, mainly in the form of Aid to Families with Dependent Children (AFDC), which was first created as Aid to Dependent Children in the 1930s. Its caseload grew more than threefold from 1960–1975; most of this growth occurred under Nixon, not under Johnson. A second type was the War on Poverty, administered through the Office of Economic Opportunity (OEO). It was composed not of welfare programs but of service programs designed to help the poor gain decent positions within the productive economy. As the OEO slogan put it, the government was offering a “hand up not a handout.” The third type was social insurance, composed of universal or entitlement programs that provided benefits to rich and poor alike. The main entitlement

programs were Medicare, created in 1965, and Social Security, which was created in the 1930s and augmented under Johnson and Nixon.

Structural Unemployment or a Culture of Poverty?

In the 1960s, two ideas dominated analyses of poverty: “Structural unemployment,” which focused on economic factors, and the “culture of poverty,” which focused on the behavior and attitudes of the poor. Harrington popularized both ideas in *The Other America*; both concepts at that time were associated with the political left. Structural unemployment was not the result of the regular downturns in a capitalist economy. Rather it was created through changes in economic geography that placed certain populations that at one time had had access to employment outside the region of good opportunities. Generating economic growth would thus not solve the problem of structural unemployment; targeted governmental efforts were required. Despite the widespread awareness of the existence of structural unemployment in the United States, this concept became the orphan of the War on Poverty.

The culture of poverty theory saw the poor as trapped by hopelessness. Prolonged deprivation had left them dispirited and apathetic, incapable of envisioning a better life and thus unable to take action to improve their own lot. While conservatives tended to view poverty as impervious to government-administered cures, liberals intended the service programs of the War on Poverty to break down the culture of poverty. The OEO, under the leadership of Sargent Shriver, was charged not just with helping prepare the poor for productive work, but also with involving the poor in finding their own, local solutions to their problems; this was the purpose of the Community Action Program (CAP). Some hoped that CAP, by bringing the poor into the political process, would give them a sense of empowerment and agency and in this way undermine the culture of poverty. But CAP proved highly controversial in ways that its planners had not envisioned. City governments found themselves besieged by militant activists demanding better and more costly services for the poor. The chieftains of local political machines, some of them allied both with the national Democratic party and with labor unions, were appalled to find that the people making trouble for them were sometimes supported by CAP funds. When these political bosses complained about CAP to the White House, there was little doubt that

their unhappiness would count for more than the opinions of social scientists, poverty advocates, and the poor themselves. This political conflict helped to dim Johnson’s enthusiasm for OEO early in its history.

Jobs or Job Training?

From the start leftist critics viewed the War on Poverty as a halfway measure at best. They were likely to point out that from 1964–1967, OEO spent only \$6.2 billion, less than 1% of the gross national product in those years, to address the problems of one-fifth of the population. They also were disappointed with Johnson’s unwillingness to consider large-scale job creation through New Deal-style public-works programs, or the redistribution of income (by taxing the well-off and giving cash payments to the poor). To Johnson such approaches were politically impossible. He did not fear criticism from his left so much as attacks from his political right. In this apprehension Johnson was at least partly correct, since Nixon and his conservatives allies did dismantle OEO as soon as they had the opportunity.

Antipoverty policy debates in the 1960s first intersected with the concerns of the labor movement during the early months of the Johnson administration when various government appointees worked at Johnson’s behest to develop proposals quickly for his consideration. Few of the key players in this process had links to organized labor, and for the most part, they did not think about antipoverty policy in terms of a job’s policy. The exception was Johnson’s secretary of labor, Willard Wirtz. He pressed the idea that job creation was the best antipoverty policy, echoing views that had been expressed earlier by Kennedy’s first secretary of labor, Arthur Goldberg. While Wirtz advocated a public-works program to expand government employment, he did not see this as the only method for reducing poverty. But he thought it should be part of the policy mix, establishing the federal government as the “employer of last resort.”

Johnson’s response to this proposal is highly instructive: He was coldly silent. He was a “budget hawk” and had no intention of spending large sums of money on the War on Poverty. Johnson also had no appetite for a confrontation with private businesses, which since the 1930s had fiercely opposed big public-works projects, viewing them as competition for workers, which would drive up wages. The job-creation idea was dropped, never coming back into policy discussion at high levels. Job

training would be the dominant theme in the employment dimension of the War on Poverty. Johnson administration officials proposed involving the craft unions, which ran their own apprenticeship systems, in job-training efforts aimed at young male African-Americans, whose unemployment rate was especially high and whose representation in the craft unions, especially the building trades, was very low. This linkage between the craft unions and the War on Poverty's job-training program created considerable friction. Two important elements in the Democratic party's political coalition became locked in bitter conflict, ultimately damaging the fortunes of that party.

Conflict with the Trade Unions

After the rioting by young African-Americans in the Watts neighborhood of Los Angeles in 1965, the Johnson administration felt a more urgent need to address the problem of joblessness among the black urban population. Government requirements for nondiscriminatory hiring by government contractors, which affected construction trade unions, were tightened. This effort dovetailed with the War on Poverty's job-training emphasis, since the government sought voluntary cooperation from the lily-white building trades in job-training programs that would bring young black men into the trades. The craft unions in general sought to fend off any infringement on their members' control over entry into the unions. The building trades had an especially stark history of keeping African-Americans out, as civil rights leaders pointed out forcefully and often. When Johnson's efforts to bring change with a minimum of coercion brought paltry dividends, threats of tougher action—with specific hiring goals and timetables (which the union described as quotas)—followed.

When Nixon became president, he made good on those lingering threats. In 1969, his secretary of labor, George Schultz, announced the implementation of the Philadelphia plan, which mandated hiring goals and timetables for government construction contracts around the country. The new, tougher policy resulted in a significant increase in the representation of people of color in the skilled trades in the 1970s. The policy also provided Nixon with a political dividend by worsening the conflict between skilled white labor and African-Americans, a traditional social cleavage that already had worked to Nixon's advantage in the 1968 election. Even though Nixon was aiding black workers in this instance, his hostility to other elements

in the civil rights agenda helped him reap the benefits of the growing "white backlash" of the era.

Increased Assistance, Declining Poverty

Despite criticism on all sides of the alleged ineffectiveness of the War on Poverty, it is sensible to see the decline in poverty in the 1960s and 1970s as the result of three factors: Antipoverty efforts; the expansion of universal entitlement programs; and the unusually high levels of overall economic growth that characterized the mid-to-late 1960s and early 1970s.

Poor relief grew enormously during Nixon's presidency through the expansion of food stamps and other programs. Why the numbers of people drawing AFDC payments grew so much during the 1960s and 1970s is a matter of interpretation. Most scholars attribute the growth to a new assertiveness among the poor who, influenced by the civil rights and other movements of the 1960s, claimed the governmental assistance to which they were entitled but for which many poor Americans in earlier decades had been too intimidated to apply. Some of the stigma traditionally attached to welfare had dissipated in the 1960s, a development that commentators on the right lamented and those on the left viewed positively.

In the 1980s and 1990s, the expansion of government support for the poor that had occurred under Presidents Kennedy, Johnson, and Nixon came under serious and successful attack. Just as poverty rates had declined in the era of the 1960s when poor relief had been increased, so poverty rates rose in the 1980s and 1990s as government policy toward the poor became stingier. Great Society entitlement programs, which tied the fate of the poor to that of the middle class to some degree, were less vulnerable to attack.

GREAT UPHEAVAL

“Great upheaval” is a term used by historians to describe an upsurge in labor and political activism beginning in mid-1885. Historians differ on when it ended, with some opting for as early as 1888 and others as late as 1890. The Great Upheaval represented a serious challenge to the emerging hegemony of industrial and investment capitalism. For a brief moment, it appeared possible that capitalism itself could be supplanted by (or have to compete with) alternative economic systems. In the end capitalism prevailed but in compromised forms that ultimately blunted some of its harshest aspects.

The great upheaval is an analytical construct that emerged from the “new social history” of the 1960s and 1970s. Earlier histories often neglected the narratives of working people, immigrants, women, and minorities in favor of political narratives that saw power as a top-heavy process in which decisions filtered down to largely passive masses. The “bottom-up” focus of the new social history altered such interpretations and forced historians to pay more attention to factors like race, class, ethnicity, and gender. This led to a serious re-evaluation of the 1880s, which had traditionally been viewed as a conservative period. In older narratives the 1886 Haymarket riot in Chicago stood as an aberration that was quickly and effortlessly subdued. By looking at local politics, reform movements, labor unions, and immigrant associations, social historians reinterpreted the 1880s as a restive period that produced serious challenges to the elites who dominated political, social, cultural, and economic life after the Civil War.

The term great upheaval is sometimes applied to the cataclysmic 1877 railroad strikes, but most historians now restrict it to the mid-to-late 1880s and see 1877 as part of an overall pattern of discontent that reached its fullest expression a decade later. Nearly all historians agree that the Knights of Labor's

(KOL) unexpected strike victory over Jay Gould's Southwestern rail system in August 1885 was the opening salvo of the great upheaval. The KOL's triumph gave hope to dispirited workers at a key moment in time.

Labor organizations struggled after the Civil War. Various labor congresses produced manifestos that were more sound than fury, 8-hour leagues met with little success, and the National Labor Union failed to materialize as the potent nationwide labor federation its founders had hoped. It, like many trade unions, perished in the aftermath of the severe Panic of 1873, an economic downturn that stretched into 1878. The railroad strikes of 1877 ended in a rout for capital, which, coupled with hysteria over arrests of alleged Molly Maguires in 1876, contributed to a general repression of labor and reform organizations. Third-party attempts, like the Greenback-Labor party, which hoped to fuse the concerns of farmers, urban workers, and monetary reformers, generated local success in the late 1870s but also faltered as national movements. The KOL, founded in 1869, had just over 28,000 members in 1880, hardly enough to challenge the power structure. The Federation of Organized Trade and Labor Unions (FOTLU) formed in 1881 but was practically moribund by 1884, due in part to another recession in 1882–1883.

By the 1870s, it was clear that new forms of capitalism based on industrial output, speculation, and investment were supplanting older forms of wealth based on land, rent, agricultural production, and proprietorships. The logic of new capitalist schemes was even harsher than that of older paternalist models. Most workers toiled long hours, often under dangerous conditions, for poverty-level wages. Moreover the ideology of social Darwinism justified both rapacious capitalism and poverty by positing business success as an expression of a survival-of-the-fittest biological imperative and impoverishment as a personal, moral failing. Mark Twain and Charles Dudley Warner called the period of ruthless capitalist speculation the Gilded Age, a label that stuck.

Gilded Age speculators and captains of industry faced a serious challenge in the mid-to-late 1880s. Capitalism, though ascendant, was still viewed with suspicion by many Americans. During the great upheaval the very logic of wage earning was attacked. Agrarian reformers associated with farmers' alliances and many urban workers appealed to older ideals of an independent yeomanry, thus renewing calls for land reform. Groups like the KOL set up cooperative production and retail enterprises in which the price of goods was determined by the labor theory of value, not the profit motive, and called for an end to the wage systems. Various socialist and anarchist

organizations also called for an end to capitalism, some advocating the use of violence if necessary. Even many trade unions, on the rise again after 1884, called for the ultimate abolition of wages, all the while seeking to raise them in the short term.

Gilded Age social and cultural norms were also challenged. Women's suffrage and feminist groups gained momentum, temperance groups won new members, and African-American leaders lobbied for civil rights. Within religious institutions, early adherents of the Social Gospel movement began to challenge social Darwinists and denounce the hypocrisy of well-heeled congregants who repressed laborers. On a less salutary note, reformers often also demanded immigration restriction, especially of the Chinese.

The KOL's dramatic victory over Jay Gould gave hope to millions. Gould, who once bragged he could hire half of the working class to kill the other half, was the epitome of a robber baron. As the principal stockholder of Western Union, he crushed the KOL and telegraphers' union in an 1882 strike. He was also the architect of the sprawling Southwestern Railway system, a conglomerate that controlled thousands of miles of track and individual rail lines in the Midwest and Southwest. Gould was known as a brutal employer, even by the Gilded Age's debased standards. The KOL workers along Gould's lines fought off wage cuts in 1884, then endured a May through August strike in 1885 that forced Gould to capitulate. When the details of the settlement were released in September, working people rushed to join the Knights under what proved to be the illusory assumption that if Gould could be defeated, labor could prevail against any foe.

The KOL saw its membership surge from fewer than 112,000 to between 729,000 and a million in a single year. Many workers who had never before been union members joined the organization, including increasing numbers of African-Americans and women. So many workers rushed to join the KOL that it was forced to declare a moratorium against chartering new locals until existing applications were processed, a task it never completed. Both Knights and workers outside the organization took matters into their own hands, with 1886 seeing an upsurge of strikes; whereas 1885 saw 645 strikes idling 159,000 workers, in 1886 more than 407,000 workers walked off in 1,436 separate work stoppages. For the next 10 years, there were more than a thousand strikes each year except for 1888. Many of these involved the KOL, even though the KOL officially opposed strikes except as a last resort. The general tenor of the times was such that the KOL's leaders were unable to control the zeal of their own rank-and-file, a situation that ultimately crippled the organization.

The most infamous moment of the great upheaval occurred in Chicago in early May 1886. A nationwide strike had been called for May 1—the inaugural International Workers' Day—in which workers would walk away from their jobs in a show of strength designed to foist the 8-hour day on recalcitrant employers. May Day was actually a bust as a national movement, since the KOL and several trade unions refused to sanction an event organized largely by anarchists and Marxists. Rather than the millions organizers hoped would protest, fewer than 300,000 actually struck on May 1. About one-fifth of the total took to the streets of Chicago, where the 8-hour protest coincided with an ongoing strike against the McCormick Harvester works. When police killed two workers on May 1, a protest in Haymarket Square was called for May 4. As the last speaker was finishing his speech, police cordoned off the area and began advancing on the crowd when a bomb was hurled, and the police opened fire. Seven officers and four protestors died, and more than 50 were wounded.

The Haymarket bombing and the subsequent arrest of eight anarchists touched off demands by elites to repress radicals, but it galvanized labor groups and reformers just as fervently as it did the Gilded Age power structure. Millions decried the arrest, trial, and conviction of the anarchists as a travesty of justice, and massive protests erupted in the United States, Canada, and Europe. The ballot box became another focal point to express dissatisfaction. Third parties proliferated in advance of state and local elections, the most-famous being the United Labor party, which put forth single-tax architect Henry George as its candidate for New York City's mayor. George finished a close second in New York, but across the United States, numerous working-men's candidates won local races. Knights of Labor candidates were elected in at least 58 different towns and cities and wielded significant political power in large cities like Milwaukee and Richmond, and in smaller towns like Rochester, New Hampshire, and Rutland, Vermont.

Trade unions were also revitalized by the great upheaval. In December 1886, Samuel Gompers and Adolph Strasser reorganized the FOTLU as the American Federation of Labor (AFL), an umbrella organization that saw the strike as a primary weapon in the struggle between capital and labor. Given the rise of the AFL and the reconstituted membership of the KOL, 1887 was destined to be a strike-plagued year. Many workers embarked on job stoppages heedless of warning signs that the 1885 victory over Gould would prove difficult to duplicate. The KOL was already reeling from losses in the Chicago stockyards and in a second strike against Gould in 1886.

Strikes in 1887 by New England shoemakers, New York and New Jersey dockworkers, and Reading Railroad employees all ended badly and touched off bitter battles between the KOL and trade unions with each accusing the other of betrayal.

Although incompetence and broken solidarity played a role in lost strikes, their overall significance has been exaggerated. In truth organized labor underestimated the power of capitalist foes and failed to anticipate the strength of the backlash it launched to counter the great upheaval. Four of the Haymarket men were hanged in November 1887, and labor was already on the defensive by 1888, the year Edward Bellamy's novel *Looking Backward* inspired the birth of the quasi-socialist Nationalist movement. A strike loss by rail workers on the Chicago, Burlington & Quincy line proved traumatic. By then the KOL was in steep decline, and the AFL proved more adroit at winning jurisdictional battles against the Knights than in defeating employers.

Moreover capital proved itself better organized than labor. Many of labor's 1886 electoral victories were undone from 1887–1890, due in part to well-funded oppositional campaigns. Republicans and Democrats often put forth fusion candidates to avoid vote splitting and where necessary, even used gerrymandering processes to isolate labor's ballot box potential. Capitalists did not hesitate to use heavy-handed tactics when political maneuvers failed. The use of labor spies, scabs, and Pinkerton detectives was commonplace in workplaces where unions appeared strong. The KOL was especially vulnerable, since it represented more workers in mass-production industries controlled by wealthy investors than the AFL, whose skilled workers tended to be found in smaller workshops. Equally at risk were ideological radicals, especially anarchists who found themselves frequent victims of repression.

By 1890, the year the lost New York Central strike eviscerated what was left of the KOL's presence in the urban United States, the great upheaval was largely a spent force. Labor's dreams of jettisoning the wage system gave way to the AFL's focus on pure-and-simple unionism, a strategy that confined itself largely to negotiations over wages, hours, and working conditions. The 1890s was a particularly brutal period in American labor relations in which the full blunt of the capitalist backlash played itself out in dramatic strikes, such as Homestead (1892) and Pullman (1894), and in exercises of raw power like the Lattimer massacre (1897).

Although it is tempting to view the great upheaval as a failure, such a conclusion is overly pessimistic. It was a turning point in history in which sincere

alternatives to competitive capitalism were put forth but failed. Nonetheless turning points seldom yield simplistic either/or results, and the great upheaval was no exception. The events of the 1880s, followed by the unsettled and violent 1890s, led many Americans, especially among the rising middle classes, to embrace the cause of social reform, repudiate *laissez faire* business practices, and battle against corruption. In retrospect the great upheaval was both the swan song of social Darwinism and a precursor of the Progressive Era.

GREENBACK-LABOR PARTY

The Greenback-Labor party (GLP) was the first nationally organized third-party movement since the close of the Civil War that combined various local electoral coalitions, some of which were labor parties.

Origins

What came to be called "greenbackism" was rooted in antebellum labor reform ideology. Albert Brisbane, Josiah Warren, William B. Greene, and, especially, Edward N. Kellogg advocated the exchange of value through a paper medium. By the 1850s, they argued that the manipulation of the money supply, coupled to cooperation, might transform the social order.

Far more broadly though, the federal government financed the Civil War in part through the printing of paper "greenbacks." Wartime spending and the inflation that resulted helped farmers minimize indebtedness, fueled business investments, and contributed to employment and in parts of the work force, prosperity. After the war reform-minded leaders of the Democrats, nationally the minority party, were eager to focus on new issues like "the Ohio idea" that the government should continue to print limited amounts of paper money.

Greenbackers

Postwar labor reformers took up the issue along with the demand for a legislated 8-hour workday. By 1868, adherents of the National Labor Union (NLU) formed state labor reform parties in New England and, in 1871 moved the NLU to call for a new party. In February 1872, the National Labor Reform Party (NLRP) convened in Columbus, adopted a remarkably uninspiring platform centered on the reform Democratic position on paper money and nominated Illinois Democrat David Davis in an effort to influence his nomination by that party. When Davis declined, a delegated interim committee of the NLRP simply endorsed the straight-out Democratic candidate, who received so few votes that it is doubtful the ranks of the NLU followed the endorsement.

The Panic of 1873 politicized the mass organizations of midwestern farmers, like the Patrons of Husbandry or the Grange. Illinois farmers built a Peoples' Antimonopolist party, and a similar Independent party formed in Indiana. By 1874, such parties formed in Missouri, Michigan, Nebraska, Iowa, Minnesota, Kansas, and Wisconsin. While these insurgents had been divided on paper money, on June 10, 1874, the original two state parties held coordinated state conventions that adopted paper money. A November 25 convention in Indianapolis united the new insurgents with former NLRP groups from Connecticut, Illinois, New York, Ohio, Pennsylvania, and West Virginia. Although NLRP leaders favoring a broader platform met in Harrisburg on March 3, 1875, the meeting generated little interest. The new organization called itself the Independent party or the National party (as opposed to the state parties), but the press called it the Greenback party.

Congressional passage of the Specie Resumption Act (1875) authorizing the elimination of greenbacks by 1879 threatened further economic hardships and seemed to offer the insurgents a common grievance just as the Kansas-Nebraska Act a generation before inspired the rise of the Republican party. The nominating convention that gathered on May 15, 1876, in Indianapolis was as dominated as the former NLRP by large delegations from Ohio and Illinois urging a nomination to influence the Democrats. Under the urging of a small New York group, the convention named the aged Jacksonian Peter Cooper and California Senator Newton Booth, the latter later declining and being replaced by Samuel F. Cary of Ohio. Once more, the Democrats were not interested, and the official count gave Cooper only 81,740 votes.

Laborites

After the NLRP debacle of 1872, the more radical participants turned to the International Workingmen's Association, which self-fragmented along ethnic lines in short order. In 1874, various suspended sections combined with a Newark labor party to launch the Social Democratic Workingmen's Party of North America, which merged with some midwestern organizations in 1876 to form the Workingmen's Party of the United States (WPUS).

The brutal and bipartisan repression of the railroad strike of 1877 inspired a wave of mass working-class protest votes. The railroads announced yet another round of pay cuts that July, and their desperate employees walked out, detonating what became a national general strike. The federal authorities, often over the objection of local officials, sent troops to break the strike.

After this workers' organizations grew quickly. Most remarkably, the Knights of Labor abandoned secrecy in 1882 and began absorbing trade unions and other workers' associations. Sometimes in conjunction with the socialists and sometimes in competition with them, local labor parties contended for office. From New Haven to St. Louis, Milwaukee to Covington, workers began electing socialist and labor nominees to office. In other places they became Greenbackers or formed a natural alliance with other insurgents.

The GLP

On February 22, 1878, a small convention in a bitterly cold Toledo schoolhouse united the Greenbackers with representatives of many of these local independent labor groups. This was what called itself the GLP.

A number of important groups remained aloof. The Union Greenback Clubs declined to merge into the GLP. The socialists ignored the development and transformed their WPUS into the Socialistic Labor party (SLP) at the end of 1877. In the South a number of independent splinters from the Democrats took place with the triumph of white "redeemer" Democratic governments, with Virginia's Readjusters' party in the forefront. The Workingmen's party of California remained focused on the exclusion of the Chinese, who were vilified for having brought down wages and standards of living. Finally an association of freethinkers launched a National Liberal party.

The GLP assumed the same community functions in places as those of the Grange. The party gained

GREENBACK-LABOR PARTY

some serious pockets of strength outside the Midwest, offering a real possibility for a fusionist strategy. When the GLP elected officials in parts of Republican New England, Democrats offered fusion. So, too, where the GLP gained ground in northern Alabama, fusion with the Republicans offered a greater opportunity for victory.

The GLP Strength

The off-year national election of 1878 produced what was proportionately the largest third-party movement in U.S. history not to result in the displacement of a major party. From 802,000 to 852,000 votes went to exclusively Greenback, Independent, Independent Greenback, or National candidates, with another 25,000 divided between the socialists and prohibitionists. Those running with either Democratic endorsements or no Democratic opposition got another 303,400, with another 217,000 going to insurgents who seemed to have Republican support. Independent Democrats running against Democratic candidates had another 150,000 and independent Republicans over 18,000. This totaled an insurgent vote of between about 1,000,000 and counting the results of fusion, 1,600,000. The numbers sufficed to elect 22 independents to Congress, including future members of the Bellamy socialist clubs, Reverend Gilbert Delamater of Indiana, and James Baird Weaver of Iowa, and the St. Louis labor reformer, Nicholas Ford.

In June 1880, a national convention at Chicago expanded the GLP platform. Among other things it endorsed woman suffrage and adopted the SLP's resolution: "We declare that land, air, and water are the grand gifts of nature to all mankind, and the law or custom of society that allows any person to monopolize more of these gifts of nature than he has a right to, we earnestly condemn and demand shall be abolished." The party nominated Republican Weaver for president and the elderly Texan Barzalai J. Chambers for vice-president. The candidate actively stumped the country, campaigning not only against a monopoly over the money supply, but over land and the means of transportation as well. Weaver also became the first American presidential candidate to defend without qualification the rights of all workers to organize.

Despite its promise, the national campaign faltered and failed on the strategy of fusion. Officeholders in Maine hoped to retain their positions through an alliance with the Democrats even though such a coalition would be disastrous in Alabama. Weaver warned against the strategy and found himself

marginalized, misreported, and then rendered invisible in the nation's press. Fusion in Maine, adopted in spite of his protests, eventually reclassified the 65,310 ballots cast for mostly GLP electors into officially Democratic votes. The official national totals gave Weaver-Chambers a mere 306,867 votes, a radical falling-off from the 1878 numbers.

Legacy

After 1880, the focus of political insurgency shifted from the Midwest and its currency issue. The National Antimonopoly party in 1884 and the Union Labor party in 1888 pre-empted the remnants of the GLP, which opted merely to endorse the candidates of other parties.

The labor attitude to the Populists after 1890 radically colored the memory of the GLP. Now organized by the American Federation of Labor rather than the Knights, workers remained far more skeptical of the Populists than they had been of the GLP. For ostensibly different reasons, the organized socialists similarly kept their distance.

GUATEMALANS

The first large wave of Guatemalan immigrant workers in the United States occurred in the early 1980s, when many *campesinos* (peasants)—as well as liberal and progressive professionals—were driven from their homes by the violence of Guatemala's 36-year civil war between a right-wing military dictatorship in charge of the country since a U.S.-led coup in 1954 and a Marxist-led guerrilla army. Altogether the violence of that war, cresting in the period from

1978–1982 with the razing of entire Mayan villages deemed too sympathetic to the insurgency, left some 200,000 casualties and nearly one million displaced persons. Many of the latter would find their way to the United States, particularly the West Coast, Texas, and Florida, where they initially found work alongside Mexicans and other Central Americans as agricultural laborers. Soon they were drawn to more urban, industrial employment as well, particularly food processing, construction, landscaping, and ultimately, low-wage service jobs. By the early 1990s, as the civil war wound down toward an eventual formal peace agreement between government and guerrilla factions in 1996, the earlier stream of war refugees gave way to a chain migration of economic refugees (from a land with nearly 40% unemployment) drawing on family and village ties. Both groups of migrants fled by foot, bus, and van rides across Mexico, crossed the border of Texas or Arizona, then generally headed west to pick crops in California and/or east to do the same in Florida. From these initial ports of entry, they engaged in secondary migrations to find work. Kansas, Georgia, Alabama, North Carolina, Colorado, as well as Toronto, British Columbia, and even Prince Edward Island, Canada, all reported significant clusters of new Guatemalan arrivals by 2000. By 2002, an estimated 1.2 million Guatemalans were living in the United States.

For a brief time the Guatemalans actually possessed a special employment advantage under U.S. immigration and refugee law, even over other Latin American laborers. Beginning in the fall of 1986, the Immigration Reform and Control Act (IRCA) affected would-be immigrants in important ways. On the one hand IRCA implemented a generous legalization program for some two million undocumented immigrants who had arrived prior to 1982; on the other hand it both beefed up border surveillance and established tough new sanctions for employers who hired more recent, illegal aliens. While throwing a new obstacle in the way of undocumented Mexicans and others, the new rules left a slight window ajar for Guatemalans and other *émigrés* from war-torn Central America in the form of appeals for asylum under the Refugee Act of 1980. To be sure the initial opening was not very inviting; less than 1% of Guatemalans for example who filed for asylum from June 1983 to September 1986 were granted protection. Especially after the Immigration and Nationalization Service (INS) entered into a settlement agreement with advocates for both Salvadoran and Guatemalan asylum applicants in *ABC v. Thornburgh* in 1991, the INS not only guaranteed due process under more lenient guidelines (that is, “without consideration of

nationality”) for future claimants but agreed to re-adjudicate the claims of every Salvadoran and Guatemalan applicant who had previously been denied relief. In the wake of *ABC*, a tide of Guatemalan asylum applications poured in; given the huge backlog of such applications, applicants (and their employers) could count not only on an initial, temporary work permit but also on regular annual renewals pending a distant asylum hearing. This welcome mat was withdrawn when new restrictions were announced with the Illegal Immigration Reform and Immigration Restriction Act (IIRAIRA), authorizing the “expedited removal” of “inadmissible aliens,” in 1997. Though softened in impact by administrative mandates for a few years, the events of 9/11 led to strict enforcement of IIRAIRA provisions and generally a new climate of fear and insecurity among the still largely undocumented Guatemalan working-class in the United States.

While largely unorganized and situated in decidedly nonunion areas of the U.S. labor force, in selective cases, Guatemalan immigrants have displayed a capacity to blend informal community ties with labor union mobilization. The rise of a newly powerful Los Angeles labor movement in the 1990s—including the Service Employees International Union’s (SEIU’s) Justice for Janitors campaign, the Hotel and Restaurant Employee’s New Otani drive, and other efforts led by drywallers, house framers, and tortilla makers—found political refugees from the previous decade’s struggles in Guatemala and El Salvador taking important grassroots roles. In Morganton, North Carolina, a location otherwise remote from union influence, for example, the Case Farms poultry plant, with some 80% Guatemalan workforce, witnessed nearly a decade-long unionizing campaign. Winning a National Labor Relations Board (NLRB) representation election in 1995 but failing thereafter to secure a collective-bargaining contract, this laboring community effort devolved into a Worker Rights Center, struggling at once for work place protections and better immigration laws.

GUTMAN, HERBERT (1928–1985) Historian

Born the son of left-wing, Jewish immigrant parents in Queens, New York, Herbert G. Gutman became one of two leading voices (the other is David Montgomery) of what became known as the new labor history—effectively an intellectual renaissance in the field—that began in the late 1960s. Perhaps best known for his essays that highlighted the roles of ordinary workers in previously little-examined industrial communities of the Gilded Age, Gutman had established a reputation as one of the nation's premier historians of African-American as well as labor and social history before his untimely death from a heart attack in 1985.

Gutman's intellectual interests developed both from his training and his reactions to the world around him. A product of New York City public schools, he advanced from Queens College, where he studied history alongside his journalism major, to Columbia University, where his emergent social history interests met the disinterest of his advisor, Richard Hofstadter, to the University of Wisconsin, where left-wing heterodoxy flourished and where he began a widespread set of inquiries about American working-class history, culminating in a 1959 Ph.D. dissertation, inelegantly titled, "Social and Economic Structure and Depression: American Labor in 1873 and 1874." Professionally Gutman moved from Fairleigh Dickenson College to the State University of New York at Buffalo to the University of Rochester and finally to appointments at both the City College of New York and the Graduate Center of the City University of New York.

As a historian Gutman's literary legacy is several-fold. Though for years avid readers searched for his essays either in relatively obscure state historical journals or pressed friends for unpublished copy circulating only in manuscript form, two significant anthologies now facilitate access to Gutman's work: *Work, Culture, and Society in Industrializing America: Essays in American Working-Class and Social History* and the posthumous collection edited and supplemented with a fine introduction [on which this entry heavily relies] by Ira Berlin, *Power & Culture: Essays on the American Working Class*. In addition those who wish to appreciate, and reckon with, Gutman's work and characteristic method should read *The Black Family in Slavery and Freedom, 1750–1925* and *Slavery and the Numbers Game: A Critique of "Time on the Cross."* Finally his influence is palpably evident in the two-volume textbook that was initiated under his direction on the American Social History Project,

Who Built America? Working People and the Nation's Economy, Politics, Culture, and Society.

For most readers the first hint of new directions in the field of labor history arrived with Gutman's "The Workers' Search for Power: Labor in the Gilded Age," in *The Gilded Age: A Reappraisal*. Previously labor history, with its disciplinary origins rooted in the institutional economics of the Progressive Era, had focused almost entirely on labor unions and their leaders. Now Gutman focused attention on the lives, and willed self-activity, of ordinary working people, both at their workplaces and in the larger social, religious, and political life of their communities. Distilling the evidence from the several case studies of his dissertation, Gutman emphasized the public skepticism with which the small-town United States greeted industrial capitalism as well as the effectiveness of alliances hatched between workers and shopkeepers to keep corporate power at bay. The seeming openness of the political system to alternative trajectories at a key moment in the modernization of American life challenged assumptions about a unified, liberal American ideology common to the postwar consensus school of American historiography. That Gutman's discoveries occurred just as domestic contemporary politics themselves became embroiled in the conflicts of the civil rights, student, and antiwar movements lent outside fuel to the fires of a conflict-oriented school of social history. Publication of the British neo-Marxist E. P. Thompson's *The Making of the English Working-Class* in 1964 lent inside support—and an inspiring model—to the same cause.

Both Gutman's skills as a social historian of *histoire totale* and his preoccupation with the puzzle of U.S. class consciousness (or what many have called the problem of "American exceptionalism") are on display in many of his signature articles, such as "Labor in the Land of Lincoln: Coal Miners on the Prairie," written in 1966–1967 and published posthumously in the Berlin-edited anthology. The themes of town building, immigration, class structure, social mobility, standards of living, women's place in community protests, racial divisions, and class and ethnic structure all receive extended treatment even as the author follows two Scottish-born miners, John James and Daniel McLaughlin, through a narrative focusing on labor conflict and political organization. Though Gutman convincingly documents the strength of local, immigrant-based worker solidarity in the union stronghold of Braidwood, Illinois, across the 1860s and 1870s, he also uncovers patterns that would frustrate such solidarity over the long haul. The nearby town of Streator, for one, failed to maintain the strike discipline of the Braidwood miners. For another

erstwhile union stalwart John James moved up the ranks in area coal companies and ended up as anti-union mine superintendent. Long after he had written the Braidwood manuscript, Gutman, in a 1982 address to the Organization of American Historians, implicitly returned to such dilemmas. He identified a “central tension in all dependent groups over time” as that “between individualist (utilitarian) and collective (mutualist) ways of dealing with, and sometimes overcoming, dependence and inequality.”

Gutman’s single most influential argument for labor and social historians was likely that contained in his 1973 *American Historical Review* essay, “Work, Culture, and Society in Industrializing America, 1815–1919.” The result of his own assimilation of the cultural Marxism and cultural anthropology, Gutman here emphasized the continuous cultural clash of a largely rural and immigrant-derived working class with the discipline imposed by the factory system. At once upholding the integrity of pre-industrial traditions and insisting on the peculiarities of an American working class continually re-made by great immigrations and internal migrations, he countered the dominant notion of immigration historians (as centrally defined by the work of Oscar Handlin) that immigration necessitated an immediate breakdown of old values in order to assimilate to consensual American norms.

The emphasis on cultural persistence and resistance, as particularly transmitted through family ties, central to “Work, Culture, and Society,” also fundamentally informed Gutman’s next great research project on the history of the black family in slavery and freedom. Provoked by the contemporary debates that tied the 1960s-era wave of urban crime and violence to the pathology or breakdown of African-American family in slavery, Gutman extended an initial critique of the Moynihan Report into a far-reaching empirical probe. His own late

nineteenth-century data on multiple urban sites, for example, indicated that the great majority of black workers lived in nuclear families with both parents present. Now with an extensive sweep of plantation records, he documented the thick and very African-influenced bonds of kinship that sustained the enslaved peoples during their greatest trials. The post-Civil War determination to reunite families broken by slave sale attains an heroic centrality in Gutman’s work. Overall, he argued, the family functioned as a central agent of resistance, and class formation, within the African-American community. Such emphasis on lower-class agency helped to spark a long-running argument (one might better say feud) with Gutman’s former Rochester colleague, slavery historian Eugene D. Genovese. Though both drew heavily on Marxist influences, the latter’s top-down emphasis on ruling-class hegemony proved inimical to Gutman’s core emphasis on, and sympathies with, ordinary working people. In any case, their disagreements for a time fueled insightful but also painfully vitriolic exchanges over the direction of American social history.

H

H-2 PROGRAM

Named for a provision of the 1952 Immigration and Nationality Act (McCarran-Walter Act) that permitted the temporary admittance of foreign workers, the H-2 Program allows U.S. agricultural producers to import foreign laborers to work in the fields on a seasonal basis. Growers who wish to participate first must demonstrate that they are unable to hire sufficient domestic workers, as certified by the U.S. Department of Labor. Upon receiving certification, growers' organizations may contract directly with foreign governments to import workers on a temporary basis. The program requires that growers pay for workers' transportation to the work site and back (which can be recouped if the worker does not work the entire season), provide free housing for workers, pay a minimum wage called an Adverse Effect Wage Rate (AEWR) designed to ensure that imported labor does not depress wages for domestic workers in the same industry in a given region, and offer workers employment for at least three fourths of the workdays covered by the contract. Meanwhile, laborers who enter the United States via the program—sometimes called H-2 workers—must work where assigned by the sponsoring growers' association and are expected to return to their home countries once their contract expires. On the surface, the program appears to satisfy the needs of growers in need of a stable, but temporary, labor force; U.S. government officials hoping to stem the tide of illegal immigration; foreign governments seeking to supply their citizens with access to jobs; and workers hoping to avoid the pitfalls of

immigrating illegally. In reality, however, the program has never fully pleased its participants.

The modern H-2 Program—also referred to as the H-2A Temporary Agricultural Worker Program to reflect the distinction between temporary agricultural workers and other temporary workers created by the 1986 Immigration Reform and Control Act (IRCA)—has its roots in the World War II experience. Wartime exigencies created labor shortages in many agricultural regions. In August 1942, Congress established the Mexican Labor Program in response to demands from western growers for access to more labor. The Bracero Program, as it came to be known, permitted the recruitment of Mexican citizens to work on U.S. farms on a temporary basis. All told, the wartime program—which lasted until 1947—brought nearly 220,000 Mexican workers to work in U.S. agriculture. In 1943, Congress created a similar British West Indies (BWI) Labor Program in response to pressure from eastern growers eager to obtain foreign workers. The program provided for the recruitment of workers from Jamaica, the Bahamas, the British Virgin Islands, and Barbados, but unlike braceros, BWI workers could work in industries other than agriculture. Most of the roughly 70,000 workers who came between 1943 and 1947, however, worked on farms from New England to Florida. In 1947, when unable to justify the program as a wartime necessity, federal authorities gave growers' organizations the authority to contract directly with foreign governments to import workers.

In 1951, citing a critical shortage of agricultural workers, Congress formally re-established the Mexican

H-2 PROGRAM

Labor Program by passing what came to be known as Public Law 78. From 1951 to 1964, when abuses led Congress to bring the program to an end, hundreds of thousands of temporary Mexican workers came to the United States through the program each year. At the request of East Coast growers, Congress left BWI workers out of this program and instead permitted these workers through a provision in the 1952 Immigration and Nationality Act, Chapter 1, section 101, paragraph H, part 2—hence the shorthand of H-2—of the law allowed for temporary admission of aliens into the United States “to perform other temporary services or labor, if unemployed persons capable of performing such services or labor cannot be found in this country.” Unlike Public Law 78, which provided for formal agreements between the U.S. and Mexican governments as to the conditions under which workers might be imported, this law provided broad approval for U.S. employers to import workers under conditions to be determined by the attorney general in consultation with the Department of Labor. Modeled after European “guest worker” programs established to allow for the temporary admission of workers for postwar reconstruction work, the H-2 provision codified a special class of non-immigrant workers in U.S. immigration law for the first time.

U.S. agricultural interests, many of whom had been importing workers all along following the end of the wartime program, stepped up use of the imported labor after passage of the law. East Coast apple and Florida sugarcane growers, especially, came to depend less on native migrant workers—the traditional source of seasonal farm labor along the eastern seaboard—and more on imported Caribbean guest workers. Throughout the 1960s and 1970s, tens of thousands of Jamaicans and Bahamians came to the United States on temporary visas to pick apples and cut sugarcane. While the use of H-2 workers appeared to be declining in the 1970s and 1980s, agreements made in the early 1990s between U.S. growers and the Mexican government, which at first had refused to allow its citizens to participate in the program because of the abuses of the Bracero Program, once again expanded the program. In 1999, roughly 96% of the more than 28,000 visas issued for the program went to Mexican citizens. By this time, tobacco growers, who hired roughly 42% of the H-2 workers, had replaced sugarcane and apple growers as the greatest employer of imported foreign labor, although H-2 workers continue to be employed in a diverse number of agricultural enterprises, from picking strawberries in Florida to herding sheep in Wyoming.

Despite its increasing popularity, the H-2 Program has created a number of problems and encountered criticism from a number of sectors, even from those

who are generally supportive of its work. Growers complain that the program’s regulations, especially its Adverse Effect Wage Rate, create an undue burden and have called for reductions in government oversight. Farmworker advocates, meanwhile, have responded that growers have benefited from the program by both eliminating the need to offer higher wages to attract local workers and preventing the movement of H-2 workers from one farm to another, effectively working around the laws of supply and demand that guide labor markets. At the same time, workers have reported numerous instances of employer misconduct, including, among other things, failure to pay the AEWR, failure to provide livable housing, and violence against workers. At the same time, critics of illegal immigration have noted that, despite the program’s promise of stemming the flood of immigrants entering the United States illegally, it has instead provided a conduit for increased illegal immigration. A 2001 study of H-2 workers in North Carolina, for example, found that upwards of 40% of workers left their assigned job sites before finishing their contracts, an act that made their very presence in the country illegal.

It is expected that use of the H-2 Program will grow further in the coming years. While H-2 workers make up only a small percentage of farmworkers at the present time, an increasing number of U.S. agricultural producers have expressed interest in participating in the program. In addition, an increasing number of elected officials have voiced support for expansion of the program as a way of providing a stable agricultural labor force without the pressure of illegal immigration. If the program expands, it is a certainty that temporary workers will become a permanent feature of American agricultural production.

HALEY, MARGARET (1861–1939) Founder, Chicago Teachers’ Federation

Margaret Angela Haley was the founding leader of the Chicago Teachers’ Federation, the first teachers’ association to affiliate with organized labor. As the Federation’s paid business representative for 40 years, Haley organized over half of the city’s women elementary teachers into a powerful political unit, while promoting teachers’ activism around the country. An advocate for women teachers’ rights as workers and for educational reform, Haley was both a charismatic local union leader and a nationally known educational and political activist.

Margaret Haley was born in Joliet, Illinois, to Irish immigrant parents. Her father had labored with other Irish workers in the construction of the Illinois and Michigan canal and was a member of the Knights of Labor and the Irish National Land League. Haley began teaching in rural Illinois schools as a teenager and later moved with her family to Chicago, where for 16 years she taught elementary school in the heart of the Stockyards district. During that time, she studied progressive education at the Illinois Normal School, where she read Henry George’s *Progress and Poverty*; the Cook County Normal School, where she studied under the progressive teacher educator Francis Parker; and Catholic summer schools for teachers, where she learned about liberal Catholic social movements.

Haley began her political activism in a Catholic women’s fraternal insurance organization, where she led a revolt against an authoritarian leader. In 1898, she joined the recently founded Chicago Teachers’ Federation, which organized to advocate for improved pensions and salaries. The Federation represented only women elementary teachers, who comprised the great majority of the Chicago teaching

force and who worked under a separate salary scale from predominately male administrative and secondary school staff. In 1900, Haley left the classroom to become the paid business representative, lobbyist, and administrative leader of the Federation, a position she held until her death in 1939. Catherine Goggin, a founding member of the Federation, shared leadership with Haley until her death in 1916.

Haley shaped the nascent women’s organization into a powerful political force. Drawing on her observations of the Chicago labor movement, Haley argued that public school teachers had the right to shape their own working conditions, and she developed professional supports and education for teachers with representative councils, classes on progressive education, a regular news bulletin, and monthly membership meetings. Early on, Haley recognized that disenfranchised women teachers’ demand for improved salaries carried little weight with the elected officials who controlled the public purse. Supported by John Fitzpatrick of the Chicago Federation of Labor (CFL), Haley convinced her membership that affiliation with labor was the only way that women teachers could gain political leverage. This was a difficult sell because it went against the public perception that women teachers were middle-class professionals who should be above the belligerent masculine politics of industrial labor unions. Furthermore, many male unionists suspected that women workers would dilute the labor movement. In 1902, the Federation affiliated with the CFL. For over a decade, the Chicago Teachers’ Federation played an active role in the CFL, as well as the Illinois State Federation of Labor, the American Federation of Labor, and the Women’s Trade Union League.

In 1916, Haley joined the Federation with seven other teachers’ organizations to form a national unit, the American Federation of Teachers. As the oldest and largest of the groups, the Chicago Federation was designated Local 1. This affiliation was short-lived, however, when the Chicago Board of Education enacted a series of regulations that effectively prohibited its teachers from membership in labor unions. In 1917, the Federation withdrew from all of its local, state, and national labor affiliations.

Haley’s vision of teacher organization reached beyond bread-and-butter issues to a wide range of social and educational reforms. First among these was her advocacy of school finance reform. An advocate of Henry George’s single tax, Haley argued for the enforcement of taxation laws on private corporations, and she lobbied against private interests’ contributing to the curriculum, funding, and management of public schools. Haley’s most celebrated accomplishment within the Federation was her investigation and successful legal challenge of corporate tax deductions

that had lowered Chicago school board income so that teachers were denied a long-promised raise. Haley led the legal battle of the widely publicized “tax case” between 1900 and 1904, and it led her to work for other municipal reform movements including electoral reform, municipal ownership of basic utilities, and women’s suffrage.

Haley argued that teacher unions should advocate for democratic practices in educational management and that women teacher union members should be key players in educational policy making. Haley traversed the country to promote political activism among the nation’s predominately female teaching force, pressuring the powerful, administrator-dominated National Education Association to include the representation of women teachers. In her 1904 speech before that group, “Why Teachers Should Organize,” she argued not only for the organization of protective unions for teachers, but also for an expanded notion of teacher professionalism that included the democratic participation of teachers in school management. Haley fought against powerful textbook companies’ influence on the curriculum, objected to vocational education, which she believed narrowed the opportunities of working-class students, and led campaigns against what she called the “factoryization” of education through economic restrictions, standardized curriculum, and centralized leadership.

Haley was a charismatic leader and a dynamic speaker, who strategically played off of her appearance as a petite middle-aged Irish school marm in her campaigns for fiscal equity and teachers’ rights. She was an expert at maneuvering high-profile political figures to support her cause. Yet she was also known for her stubbornness and inability to compromise, and she resisted changes in the city’s teaching force, ignoring the needs of the increasing number of male and African-American teachers. The Federation declined in power and prestige through the 1920s and refused to join with the more inclusive Chicago Teachers’ Union in 1937.

As a woman who played a central role in labor, civic, and educational politics, Haley was an extraordinary figure in American history. She is unique as a woman labor leader who made the unprecedented link between progressive education and teachers’ working conditions, arguing that the two were interdependent.

HAMILTON, ALICE (FEBRUARY 27, 1869–SEPTEMBER 22, 1970) Physician

A physician and leading expert in the field of industrial toxicology, the study of work-related illnesses and the dangerous effects of industrial metals and chemical compounds on workers, Alice Hamilton became one of the most important advocates for federal regulation of the workplace for workers’ health and safety. Her studies of lead poisoning in enamel workers, carbon monoxide poisoning in steelworkers, mercury poisoning in hatters, and “dead fingers” syndrome among laborers using jackhammers raised awareness and led to major improvements in the work environment that saved countless lives. Her death in 1970 at the age of 101 came just three months before the passage of the Occupational Safety and Health Act (OSHA).

Hamilton was also a social activist for women’s and workers’ rights, and an internationalist who worked for peace and human rights on a global scale. Her progressive views were shaped by her experiences as a resident of Hull-House, the social settlement founded by Jane Addams and where Hamilton was a resident for four decades.

Born in New York City to Montgomery Hamilton and Gertrude (Pond) Hamilton, the second of four daughters, she was raised in her father’s hometown of Fort Wayne, Indiana, where Hamiltons had been founders. Her father, a Princeton graduate unsuccessful in business, was an intellectual who provided his daughters with opportunities for critical thinking and delved into theological and philosophical subjects. Her mother was less analytical but passionate about issues of social justice, speaking out against the lynching of African-Americans, child labor, and cruelty to prisoners. Willing to think outside Victorian conventions, she impressed upon Alice her belief that every woman had a right to privacy. Alice and her sisters were tutored at home in languages, history, and literature, and received a superior education.

Following Hamilton tradition, the four sisters attended Miss Porter’s School in Framington, Connecticut. Returning to Indiana, and to the reality that

she would need to be self-supporting, her biographer Barbara Sicherman writes that Hamilton selected medicine because it was the only profession open to women that would allow her to be both independent and useful. Lacking a rigorous science background, Hamilton was tutored in physics and math before she entered Fort Wayne College of Medicine, which prepared her for study at the University of Michigan. She interned at hospitals in Minneapolis and Boston (1893–1894) and then returned to Ann Arbor in 1895 to assist in the bacteriology laboratory of her former professor, F. G. Novy. Hamilton next studied in Leipzig and Munich. She did postgraduate work at Johns Hopkins Medical School.

In the fall of 1897, she became a professor of pathology at the Woman's Medical School at Northwestern University in Chicago and also a resident at Hull-House. The settlement's involvement with the antisweatshop movement radicalized her. "At Hull-House one got into the labor movement as a matter of course, without realizing how or when," Hamilton explained (*Exploring the Dangerous Trades*, p. 80). Soon she was volunteering for the early morning [strike] picket "because the police were much less in evidence then" and she was "in mortal fear" of being dragged about if arrested (p. 82). She began to investigate the work and living conditions in the neighborhood realizing that labor unions were so caught up in efforts to safeguard wages that nothing was being done about industrial hygiene.

In 1902, she accepted a position at the new Memorial Institute for Infectious Diseases in Chicago. Hamilton adapted the Hull-House method of social investigation to her interest in public health issues. Just as Florence Kelley had investigated the sweatshop system and mapped household wages in the neighborhood, Hamilton investigated the incidents of typhoid and tuberculosis. She wrote articles and gave popular lectures to disseminate her findings and soon was appointed to public health committees.

In 1908, Hamilton was appointed to the Illinois Commission on Occupational Diseases, the first state to have such a commission. Hamilton's findings, published in 1910, led to Illinois establishing laws requiring job-related safety measures. As a result, the U.S. Bureau of Labor asked Hamilton to do a federal survey of occupational diseases in 1911. Hamilton continued her investigations for the bureau, but maintained her residency at Hull-House, and her independence. She became a pacifist and joined Jane Addams in the 1915 Women's Peace Conference at The Hague. Both she and Addams found time just 10 days prior to their journey abroad to testify at hearings in Springfield, Illinois, on child labor.

In 1919, Hamilton became an assistant professor of industrial medicine at Harvard University Medical School, the first woman appointed to its faculty. She asked for a six-month annual contract so she could maintain her connections with Hull-House and the freedom to pursue her own work. Hamilton began to publicize the dangers of the new industrial poisons that she discovered as new processes proliferated following World War I. Her book *Industrial Poisons in the United States* (1925) was the first American text on the subject and established her as one of the two leading authorities in the world. She instigated the U.S. surgeon general to call national conferences on tetraethyl lead (1925) and radium (1928).

Deeply disturbed by the conservative backlash in the 1920s, Hamilton protested the treatment of aliens and restrictive immigration laws. She joined the campaign to obtain commutation of the death sentence for Sacco and Vanzetti.

After her retirement from Harvard in 1935, Hamilton became a consultant in the Division of Labor Standards of the Department of Labor. In 1943, she wrote her autobiography, *Exploring the Dangerous Trades*. She served as president of the National Consumers' League (1944–1949) and remained a respected advisor to Hull-House. As an anti-Cold War liberal protesting the infringements on civil liberties at home, she was considered "dangerous" by the House Un-American Activities Committee in 1949. The FBI kept an active file on Alice Hamilton through the 1960s; she protested the war in Vietnam in 1963.

HAPGOOD, POWERS (1899–1949) **Socialist Party Activist**

Powers Hapgood was an important figure in the industrial union movement and the Socialist Party who won widespread recognition as a crusader for industrial democracy, civil liberties, and social justice during the first half of the twentieth century. His political odyssey was representative of an important historical relationship: connections between reform-minded elements of the middle class and the working class that provided vital support for the growth of the labor movement during the Progressive Era and the New Deal. Hapgood also wrestled with many of the key issues that have historically challenged the American labor movement and was a rare public voice that questioned the direction of industrial unionism and liberal politics at the outset of the Cold War.

Born into one of the Progressive Era's most prominent liberal families (his uncles were leading muck-raking journalists and his father ran an Indiana company that won widespread praise as a model of industrial democracy and workers' control), Powers Hapgood was deeply influenced by familial commitments to service, sacrifice, and social responsibility. Following graduation from Harvard in 1920, he worked in coal mines, where he encountered class-conscious workers with an almost religious faith in their union, the United Mine Workers of America (UMWA), and a work culture rooted in values of self-reliance and solidarity that he found lacking within the middle class. He also discovered a mentor in John Brophy, a Pennsylvania UMWA leader whose advocacy of a "larger program" for the union based on public ownership of the mines, aggressive organizing, and workers education became the foundation for Hapgood's own brand of labor politics. Hapgood's prominent role in a bitter 1922 miners' strike in western Pennsylvania won him respect from workers and public recognition from liberals. It also led to his becoming a trusted interpreter of working-class struggles to middle-class audiences.

However, Hapgood's hopes of rising to a position of leadership in the union were dashed following the strike when he openly challenged the powerful UMWA president, John L. Lewis. Lewis contended that as a perpetually besieged institution, unions could not afford the luxury of democracy, while Hapgood insisted that democratic unionism was essential to provide workers the opportunity for civic participation and present industrial democracy as a legitimate alternative to corporate capitalism. This

conviction, fundamental to Hapgood's vision for the labor movement, led him to manage John Brophy's unsuccessful bid for the UMWA presidency in 1926. In retaliation, John L. Lewis had Hapgood expelled from the union.

Hapgood spent the next decade on the political margins. Recruited to join the Communist Party (CP), he rejected its invitation because he doubted the party's democratic commitments. Instead, he became a leader within the Socialist Party but in contrast to many anti-Communist leftists, continued to defend the CP's legitimacy within the labor movement. Hapgood persisted in his quest to nurture industrial democracy by supporting insurgent efforts against John L. Lewis, seeking to extend workers' control within his father's company and aiding an interracial tenant farmers union in the southern United States. Demoralized by the failures of these efforts, Hapgood decided to submerge his qualms about centralized, top-down labor leadership and became one of the first three organizers hired by John L. Lewis in 1935 to help direct the Committee for Industrial Organization's (CIO) efforts to organize workers in America's mass production industries.

Hapgood emerged as one of Lewis's most trusted lieutenants, joining with other CIO organizers to provide critical strategic support that helped rubber workers in Akron, Ohio, and auto workers in Flint, Michigan, win some of the fledgling organization's most significant victories over powerful corporate opposition. Yet by the beginning of World War II, Hapgood feared that the democratic spirit of industrial unionism was being blunted by the growing centralization of union leadership and the new legalistic system that was emerging to govern industrial relations. In a personal effort to reclaim the CIO's early promise, Hapgood, now serving as a union leader in Indiana, aggressively sought to organize African-American workers and pressed the labor movement to combat discrimination within its own ranks. He also foresaw that Cold War-inspired attacks on the Communist Party would have a chilling effect on liberal politics and fought for the rights of Communists, a stance that eventually cost him his job, with a CIO bent on purging its ranks of CP-leaning unions.

Hapgood's premature death in 1949 cut short his efforts to recast labor and liberalism. His career remains significant, however, as an example of the social empathy and personal commitment that made cross-class alliances such a powerful political force during the first half of the twentieth century.

HARRINGTON, MICHAEL (1928–1989) Socialist Intellectual

Michael Harrington was the best-known American socialist of his generation, and as such was one of the few prominent intellectuals in the 1960s, 1970s, and 1980s to identify himself as a strong supporter of the labor movement.

Harrington was born in St. Louis on February 24, 1928, into a staunchly Democratic, middle-class Irish-Catholic family. He was educated in the city's parochial schools and its elite Jesuit-run St. Louis University High, before going off for higher education at Holy Cross College in Worcester, Massachusetts, at the age of 16. He graduated from Holy Cross three years later, enrolling for a year in Yale Law School (where he made law review but decided against a career as a lawyer). In 1948–1949, he attended the University of Chicago, where he received his master's degree in English. He moved to New York City at the end of 1949, intending to become a writer.

With the outbreak of the Korean War in the summer of 1950, Harrington's life underwent a dramatic transformation. A crisis of faith and conscience led him in 1951 to join the radical pacifist Catholic Worker movement, a group founded and led by Dorothy Day. Harrington spent the next two years living amongst and caring for the poor in the Worker's "House of Hospitality" on New York's Lower East Side.

In time, Harrington grew disenchanted with the Catholic Worker's other-worldliness, feeling that the movement was putting the spiritual perfection of its adherents before the larger goal of changing society for the better. As his Catholicism waned, he was drawn to socialist doctrine, joining the Young People's Socialist League (YPSL) in 1952 and helping found the even more radical Young Socialist League (YSL) in 1954, which functioned as the youth affiliate of Max Shachtman's Independent Socialist League

(ISL). He worked for a time as executive secretary of the Workers Defense League (WDL), a left-wing legal advocacy organization, but increasingly supported himself as a freelance writer, contributing frequently to publications like *Dissent*, *Commentary*, and *Commonweal* magazines.

For much of the 1950s, Harrington's political activities were bound by the musty confines of radical sectarianism. In the later years of the decade, however, he was drawn into some of the early civil rights protests through his association with the black radical activist Bayard Rustin. In 1959, the ISL merged with the Socialist Party (SP)/Social Democratic Federation led by Norman Thomas, and the following year Harrington became editor of the SP's newspaper, *New America*. He also coedited a collection of essays with radical journalist Paul Jacobs on the contemporary labor movement, *Labor in a Free Society*, published in 1959, his first book.

It was Harrington's second book, *The Other America: Poverty in the United States*, published in 1962 by Macmillan, that would make him famous as "the man who discovered poverty." Making extensive use of U.S. Census data, Harrington argued in *The Other America* that a quarter to a third of the American population lived below the officially defined poverty level. An expanding economy was not enough, Harrington believed, to lift this "other America" out of poverty, for they were bound to their condition by a "culture of poverty." The poor were "people who lack education and skill, who have bad health, poor housing, low levels of aspiration and high levels of mental distress. . . . Each disability is the more intense because it exists within a web of disabilities." The book, which went on to sell over a million copies, helped inspire President Lyndon Johnson's War on Poverty. Harrington was invited to take part in some of the early strategy sessions in Washington to draw up the legislation that would become the Economic Opportunity Act of 1964.

In the 1960s, Harrington forged ties with leading figures in the labor movement, including United Auto Workers president Walter Reuther. He also worked closely with leading civil rights activists, including Martin Luther King Jr., and would help with the planning for King's Poor People's March on Washington in 1968, before King's assassination.

Harrington's political dream was to bring together a great coalition of labor, the poor, and civil rights, liberal, and student activists that he would refer to as "the left wing of the possible." But this dream was shattered by the explosive conflicts over the war in Vietnam and racial separatism of the later 1960s. Younger left-wing activists were dismayed by

Harrington's reluctance to break with the Johnson White House on the issue of the war in Vietnam. And they were mystified by his allegiance to the labor movement, discredited in their eyes by AFL-CIO president George Meany's belligerently prowar views. Harrington's support in 1968 for the United Federation of Teachers in the conflict over community control of schools in New York's Ocean Hill-Brownsville school district alienated many younger activists and intellectuals whom he looked to as natural allies.

Harrington also found himself increasingly at odds with many of his SP comrades, who reacted to the controversies of the 1960s by turning rightward, some of them becoming influential figures within the neo-conservative movement. When the Socialist Party refused to back George McGovern against Richard Nixon in the 1972 presidential campaign, Harrington decided he could no longer remain a member of the party; the following year he led a split which resulted in the founding of the Democratic Socialist Organizing Committee (DSOC), with Harrington as its chair.

DSOC and its successor organization, Democratic Socialists of America (DSA), enjoyed modest successes in the 1970s and 1980s, growing to a peak of about 5,000 members and enjoying close ties with the UAW and other liberally inclined unions. Harrington continued to publish extensively (writing 16 books on political topics before his death in 1989) and enjoyed a reputation as an eloquent public speaker. He also joined the political science department at Queens College and became a member of its American Federation of Teachers local.

HARVARD UNION OF CLERICAL AND TECHNICAL WORKERS

The Harvard Union of Clerical and Technical Workers (HUCTW), organized in 1988, represents 4,800 workers at Harvard University. The union's members are 70% women, and HUCTW has developed what its leaders call a "feminine model" of unionism. This model takes the union to be a vehicle not only for winning economic gains, but for building a community at work and promoting worker participation in

a wide variety of workplace decisions. It pursues these goals through direct, person-to-person contact among members and a program of labor-management cooperation or "jointness" with the university administration.

Organizing the Union, 1973–1988

HUCTW won legal recognition in 1988 after an organizing drive that lasted nearly 15 years and faced strong opposition from Harvard. Sympathetically chronicled in works by the journalist John Hoerr and the economist Richard W. Hurd, the drive began in 1973 among research assistants in the Harvard Medical Area, which comprises Harvard Medical School and the Harvard School of Public Health. The drive was fueled by young, female workers frustrated by sexist treatment, a lack of career mobility, and low pay. Many workers, inspired by the women's movement, saw the union drive as an expression of feminism. The campaign took place alongside a wave of union organizing among women office workers and public-sector workers during the 1970s and 1980s.

Led by the research assistants Leslie Sullivan and Kristine Rondeau, both of whom eventually left their lab jobs to work as full-time organizers, the Medical Area workers held two unsuccessful union elections in 1977 and 1981. After the 1981 election, the National Labor Relations Board (NLRB), at Harvard's behest, ruled that the Medical Area was not an appropriate bargaining unit and that the workers needed to organize all of the university's 3,500 clerical and technical workers—a task considered nearly impossible. Rondeau launched a universitywide organizing drive in 1984, and the union won the election on May 17, 1988, in a close vote of 1,530 to 1,486. Harvard recognized HUCTW in November 1988 after an unsuccessful NLRB challenge.

The organizing drive was a grassroots affair that involved workers, students, and faculty. On campus, HUCTW was known for its creativity and sense of humor. Workers organized actions such as Hollywood-style bus tours of administrators' homes, and rallies featured parodic songs by the union's singing group, the Pipets.

Harvard conducted sophisticated anti-union campaigns before each election, using captive-audience meetings, one-on-one meetings between workers and supervisors, and a barrage of anti-union letters. Harvard's president, Derek Bok, a labor law scholar considered sympathetic to unions, sent anti-union letters to every worker in 1977 and 1988. During the 1981

Washington School for Secretaries. Students at Washington School for Secretaries at typewriters. Library of Congress, Prints & Photographs Division, Theodor Horydczak Collection [LC-H824-T-1215-003].

election, Harvard stationed armed guards around the voting site.

HUCTW's national affiliation changed twice during the organizing drive. In 1974, it affiliated with the industrial union District 65 because of its interest in women workers and its willingness to let the Harvard workers direct their own drive. District 65 affiliated with the United Automobile Workers (UAW) in 1979, and the organizers developed conflicts with that union's organizing model. They ran the campaign independently from 1984 to 1987, when they affiliated with the American Federation of State, County, and Municipal Employees (AFSCME).

“Women’s Way of Organizing”

HUCTW developed an unusual organizing philosophy, which Rondeau has since promoted as “women’s way of organizing.” Whereas most unions conduct rapid organizing drives to limit the development of employers’ anti-union campaigns, HUCTW slowly met workers one-on-one and focused on building relationships in the workplace. They used no literature, believing that it could become an easy but

ineffective substitute for person-to-person contact. Organizers did not ask workers to sign union cards until the last stages of the campaign, maintaining that card signing did not build commitment to the union but should be the culmination of an organizing process that developed that commitment. Relationship building was not simply a tactic; organizers believed that women wanted a community at work and that creating one should be a central function of a union. This unorthodox approach caused the 1984 break with the UAW. By contrast, it impressed AFSCME, which later sent HUCTW staff to organize workers nationwide.

HUCTW’s leaders maintained that organizing around specific concerns—low pay, sexist treatment, or anything else—invited the employer to quickly fix those problems to defuse the organizing effort. Instead, HUCTW organized around the idea that workers should be able to participate in decision making about their jobs. By “participation,” HUCTW’s leaders meant labor-management cooperation in determining workplace policies. Their philosophy of “jointness” or “codetermination” between workers and management found expression in an early slogan, “It’s not anti-Harvard to be pro-union.” Union leaders maintained that they wanted Harvard to function

well and that they could help it do so if they had an institutional voice. According to HUCTW, there was no necessary opposition of interests between workers and management.

During the drive, the workers' energy and Harvard's hostility partially obscured the union leaders' commitment to labor-management cooperation. Many saw the union as jocularly confrontational because its public actions freely poked fun at Harvard. However, organizers did not promote anger at Harvard or position the union as the university's opponent.

HUCTW's leaders maintained that their nonoppositional approach came from the natural inclinations of women workers, who they believed were averse to aggression and conflict. The union's philosophy of "jointness" also had roots in the UAW, whose leadership had helped make labor-management cooperation the ascendant model in the automobile industry during the 1980s.

A minority of HUCTW members has consistently opposed jointness, however, arguing that it reflects not gender difference but a conciliatory political orientation. These members have maintained that women workers as much as men have conflicts with employers that are based on their opposing interests. They have run opposition candidates in union elections, winning up to 40% of the vote.

Jointness has proved contentious not only within HUCTW but in the U.S. labor movement as a whole. HUCTW, like the leadership of the UAW, has occupied a place at one end of a national debate about whether labor-management co-operation is a strategy for worker empowerment or a cooptive program for cultivating consent in the workplace. Elsewhere in the labor movement, jointness gave rise to mass rank-and-file opposition, most notably the 1980s New Directions movement within the UAW.

Jointness in Action, 1989–2004

HUCTW's contracts have produced strong gains in pay and benefits, with the average member salary rising from \$20,000 in 1989 to nearly \$36,000 in 2004, and the top of the pay scale reaching above \$60,000 in 2004. HUCTW has also won strong family-oriented benefits, including generous maternity and paternity leave, subsidies for child care and after-school enrichment, domestic partner benefits, and flexible scheduling.

HUCTW's commitment to jointness has made its accomplishments dependent on the attitudes and interests of administrators. Between 1989 and 1991, Bok chose the Harvard economist John Dunlop to

oversee relations with HUCTW. Dunlop, an architect of postwar industrial relations in the United States, had become an advocate of labor-management cooperation, which he believed could contain industrial conflicts that might otherwise destabilize the U.S. economy. Dunlop and Rondeau led the 1989 negotiations that produced HUCTW's unusual first contract. The contract provided significant economic gains, but in a departure from traditional labor practice, did not contain a grievance procedure, job classifications, seniority provisions, or rules governing transfers, promotions, or layoffs. HUCTW's leaders explained that they did not want a workplace governed by rigid rules, but one in which workers and managers creatively solved problems using moral reasoning.

The contract replaced the traditional grievance procedure with a "problem-solving procedure" in which workers first aimed to resolve conflicts with their supervisors and, failing that, turned to labor-management "problem-solving teams" to negotiate solutions. The contract also created joint councils and committees to discuss policy issues on an ongoing basis. HUCTW leaders argued that the problem-solving process and joint bodies allowed workers to address a broader range of issues than would a grievance procedure, which is designed to enforce only written contract provisions. The sociologist Susan C. Eaton argued in 1996 that joint processes helped HUCTW members change their relationships with supervisors, faculty, and students. However, she suggested that they were not effective at changing workplace policies. At best, they let workers decide how to implement managerial objectives.

The labor-management relationship ruptured in 1991, when Bok resigned and Neil Rudenstine became president. Rudenstine's administration took an adversarial stance toward HUCTW; in response, the union became more oppositional. Between 1992 and 1998, a large minority of joint councils did not function because of managerial hostility. HUCTW negotiated three contracts amid protracted conflicts, most significantly a successful fight from 1995 to 1997 to defend part-time workers' health benefits. The union also won financial support and internal hiring preferences for laid-off workers. In retrospect, HUCTW leaders express pride in their victories but lament the existence of conflict and describe this period as unproductive.

In 1999, a different group of administrators assumed responsibility for relations with HUCTW, and both sides renounced labor-management conflict. In 1999, HUCTW won membership for 1,000 workers whom Harvard had deliberately misclassified as contingent or managerial employees. Contracts ratified in 2001 and 2004 created new training and education

programs to provide job skills and liberal arts education during work time. The contracts also created “New Work Systems at Harvard,” a project to restructure jobs such as the “team concept” restructured auto assembly beginning in the 1970s. The project aims to train workers in a variety of skills and organize them into teams that function with minimal managerial supervision. The team concept, associated with the idea of jointness, has been hotly debated in the labor movement since the 1970s. HUCTW leaders maintain that teams give workers independence; New Directions members argued that they were co-optive.

In addition to its contract campaigns, HUCTW conducts a high level of internal organizing using one-on-one meetings. In 2004, women constituted 14 of HUCTW’s 15 executive board members and three quarters of its 190 area representatives and joint council members. HUCTW staff have also successfully organized, and represent, workers at the University of Massachusetts-Memorial Hospital in Worcester, Massachusetts, and are organizing clerical and technical workers at Tufts University.

HAWAII

Known to Portuguese as *terra nova*, “new land,” or Chinese as *tan heung shan*, “the fragrant sandalwood

hills,” workers migrated to the islands of Hawaii throughout the nineteenth and twentieth centuries in search of new possibilities. Work on the sugar plantations and other industries in Hawaii undoubtedly provided opportunities for many immigrants, but for all, the work was long, arduous, and poorly paid. Indeed, the gap between working-class expectation and experience frames much of the restive history of labor in Hawaii. Over the last two hundred years, Hawaii’s working class has negotiated the rapid transition between indigenous community, colonial plantation economy, transpacific hub for people and commodities, and destination for tropical tourism.

The Emerging Plantation Economy

Prior to contact with European and American traders, work and production in the Hawaiian Islands were largely self-sufficient and shaped by kin networks and the powerful Polynesian monarchy. Migrating north from the Marquesas Islands to Hawaii between 500 AD to 700 AD, Polynesians imported crops like taro, sweet potatoes, and most notably, sugarcane. Along with these important food crops, settlers also brought sophisticated techniques of cultivation and technologies for oceanic transportation. Early anthropological accounts suggest the centrality of agricultural life. The significant imprint of agricultural work, for example, was evident in the social stratification, the geographic dispersal of villages, and even the naming of children. Hawaiians also maintained a vast knowledge of trade routes in the Pacific Ocean, exchanging goods like sandalwood throughout Oceania.

Contact with North America and Europe had significant implications for the conduct of trade, work, and production in Hawaii. Europeans’ “discovery” of the islands in 1778 instantly established Hawaii as an important resupply point for Pacific whaling vessels. In turn, Polynesian natives “discovered” new markets for their wares, which led to a boom in the sandalwood trade to Asia. Despite these changes, the native economy remained largely intact for much of the late eighteenth and early nineteenth centuries under indigenous control. The establishment of Hawaii’s first sugar plantation, in Koloa, Kauai, and the advent of large-scale private land ownership, known as the “Great *Mahele*” in 1848, transformed the social and economic conditions of Hawaii. For agricultural capitalists, like Koloa’s operator William Hooper and his financiers, Ladd and Company, sugarcane was “to serve as an entering wedge” that would split the

indigenous economy, opening the way for modern agricultural capitalism. The reticence or open resistance of the *maka'ainana*, or planter/worker class, to new systems of work and labor was evident in the consistent complaints of managers about native indolence, laziness, or irregular attendance in the fields. Increasingly unsatisfied, workers staged the first labor strike in 1841 over low wages and payment methods. Given the inconsistent labor supply, landowners' lack of expertise, and insufficient capital investment, early attempts to establish large-scale sugar production were quite unsuccessful, but they foreshadowed the future to come.

Unable to satisfy their enormous appetite for labor in the islands, sugar planters looked abroad for workers. Thousands of contract laborers from China arrived in 1852 under the newly established Master's and Servant's Act. When the global flow of coolie laborers dwindled, groups like the Planter's Labor and Supply Company, founded in 1882 and the predecessor to the Hawaiian Sugar Planters' Association, began to recruit heavily in Japan. Pushed off their land by conflict, drawn by the exaggerated promises of labor recruiters, and following previously established networks of migration, contract laborers believed Hawaii held promise. The migration of workers eventually brought nearly 46,000 Chinese and 180,000 Japanese to the islands. These two foundational populations would later be supplemented by 66,000 Filipinos, as well as workers from Portugal, Norway, Sweden, and Korea. The importation of labor and the subsequent explosion of sugar production in the islands, from 3 million pounds in 1850 to 24 million pounds in 1875, established Hawaii as a significant hub in the network of oceanic trade and helped cement the United States' presence in the Pacific.

Life on the Plantation

Hawaii's new residents struggled to create opportunity and develop a sense of community, despite the strenuous conditions of life in plantation work camps. Workdays in the sugarcane fields were long and difficult. Few tasks on the plantation were mechanized, and workers were strictly supervised by foremen, known as *lunas*, from the early morning to around 8:00 p.m. Plantations were largely a male homosocial world, until the turn of the century when contract laborers increasingly came to Hawaii as permanent settlers rather than sojourners. After *pau hana*, "quitting time," workers participated in community organizations, familial groups, and formed mutual aid societies, like the Japanese *tanomoshi*. Immigrants also

maintained many of their cultural practices, celebrating important religious and national holidays or preparing traditional foods.

To maintain order and ensure productivity on plantations, landowners employed a variety of methods, ranging from benevolent paternalism to heavy-handed repression. Nearly all aspects of the Hawaiian economy were consolidated within the hands of five companies, commonly referred to as the Big Five, which allowed landowners a tremendous degree of control in the islands. Moreover, plantation owners often insisted on racial segregation in work camps to discourage interracial solidarity. Planters offered workers free housing, medical care, and recreation, a package of benefits known as the perquisite system. In exchange, bosses demanded obedience to the plantation system, high productivity, and justified paying low wages. When these perquisites failed to satisfy workers' demands, plantation owners openly relied upon violence. Instances of physical abuse were not uncommon, and organized protests were often violently suppressed, as in the case of the lynching of a Japanese worker in 1899, the mass arrest of Filipino strike organizers in 1924, or the infamous Hilo Massacre in 1938, when police shot 50 unarmed demonstrating workers.

Resistance and Organization

Throughout the late nineteenth and early twentieth centuries, workers in Hawaii acted to improve the difficult conditions of plantation life, though often in hidden and unorganized ways. Much to the chagrin of their supervisors, fieldworkers regularly attempted to assert control over their work schedules through diffuse methods like absenteeism and foot dragging. Workers also endowed cultural practices like singing, poetry, and language with political meaning. Japanese work songs, known as *hole hole bushi*, or the common language among fieldworkers, pidgin, provided a medium for messages of working-class resistance and often reflected experiences of hardship and race and gender discrimination. Instances of organized resistance did occur. Chinese workers staged several work stoppages in 1891 and 1899, and Japanese workers conducted large-scale labor actions involving more than one thousand strikers in 1900, 1906, and 1909. Ethnic and racial divisions, however, consistently proved to be the greatest roadblock to successful labor organizing. The first multiplantation strike on the island of Oahu in 1920 united more than 12,000 Japanese, Chinese, and Filipino workers within the Hawaii Laborers' Association and

suggested the power of interracial unity. But after five months, the strike came to an end due to the unwavering strength of plantation owners and a growing racial schism between the Japanese and Filipino leadership.

For Hawaii's workers, the 1930s and 1940s marked the beginning of successful long-term labor organizing. In 1935, after carefully monitoring the spread of industrial unionism along the Pacific coast of the United States, a group of longshoremen in Honolulu applied for a charter to the International Longshoremen's Association, the progenitor of the International Longshore and Warehouse Union (ILWU). In 1937, backed by the organizing strength and experience of the ILWU, fieldworkers on sugarcane and pineapple plantations fought for union recognition. Despite the impediment of World War II, the union grew rapidly during the 1940s and eventually represented more than 30,000 agricultural workers by 1946. The distinctiveness of labor and the working-class relations in Hawaii was evident throughout the ILWU's organizing campaign. The ILWU relied upon its prior experience organizing multi-ethnic working-class communities and workers. In addition to its traditional repertoire of tactics, in preparation for the "Great Sugar Strike" in August of 1946, the union developed a number of distinct strategies, such as organizing and lobbying in workers' native communities in the Philippines and Japan and forming multinational and global alliances with other sugar workers. By the end of the decade, the ILWU's campaign to organize Hawaii had been so successful that by some accounts, nearly one in eight working Hawaiians were represented by the union.

The 1940s also marked the beginning of labor's enduring impact on the islands' politics. For the first 40 years of territorial governance, the Big Five and a landed elite held firm control over Hawaiian politics. Political enfranchisement, public education, and most notably, the new power of organized labor began to undercut this oligarchy. Under pressure from labor unions, the National Labor Relations Board (NLRB) recognized the right of many plantation workers in the territory to organize unions in 1945. Originally excluded from this decision, fieldworkers won the right to collectively bargain later that year when the ILWU secured passage of the "Little Wagner Act," the first recognition of its kind in the United States. With momentum from these victories and backed by the power of labor unions, the Democratic Party swept statewide elections in 1954, instituting a progressive tax system in 1957, a sweeping land reform bill in 1959, and later, significant environmental protections and a comprehensive health insurance plan. Legislation in

1970 allowed public employees to collectively bargain, opening the door for groups like the Hawaiian School Teachers Association, the American Federation of State, County, and Municipal Employees (AFSCME), and the Hawaiian Nurses Association.

Challenges to Hawaiian Labor

Despite organized labor's overwhelming political successes, however, charges of a communist conspiracy stunted the power of organized labor and particularly the ILWU. Throughout the 1950s, the Federal Bureau of Investigation conducted numerous interviews with labor activists, and 66 residents were called before the House Un-American Activities Committee (HUAC) in April 1950. Many refused to testify and were indicted for contempt, earning them the title "the reluctant 39." When several ILWU members, namely Ichiro Izuka and Jack Kawano, publicly broke with the Union and provided federal investigators with details about communist activities in the islands, anticommunist groups, such as Imua, leveled strident claims against labor activists like Jack Hall, Bob McElrath, David Thompson, Levi Kealoha, and Tadashi Ogawa. In the most infamous incident, seven labor leaders were convicted and imprisoned for several months under provisions of the Smith Act for conspiring to teach the overthrow of the U.S. government. Despite the strength and vigor of the "red hunt" in the islands, the memory of labor's strike victories in the late 1940s and more recently in 1951 and 1952 remained strong. Working-class Hawaiians demonstrated their support for Hall and others, staging protests and work stoppages. In 1958, anticommunist organizations lost support and faded from public politics.

Since 1950, tourism has been the most dominant force of change for Hawaii's working class. Prompted by local calls for economic diversification and fueled by low-cost air travel, service sector jobs exploded in the late 1950s and 1960s. Meanwhile, union jobs in the sugar industry declined precipitously, from a peak in 1940 of 35,000 jobs to just 17,000 in 1957. Organized labor struggled to keep pace with rapid economic change. Several jurisdictional disputes in the grocery and retail sectors broke out between the ILWU and AFL-CIO in 1958 and 1959. To lessen the impact of the decline in sugarcane, unions sponsored job-training programs to help displaced workers transition from plantation work to the burgeoning tourist industry. Many workers have found new jobs in the service industry, but the struggle for union control has been difficult. In December 1970, ILWU workers

HAWAII

organized the longest strike of hotel workers, 75 days. Other unions, such as Local 5 of the Hotel Workers' union (Hotel Employees and Restaurant Employees, HERE), have confronted large hotel chains' reliance upon nonunion labor, leading work stoppages in 1952, 1966, and a large strike of 7,500 workers in 1990.

Although tourism has largely replaced the agricultural economy, the early experience of plantation work has left an indelible mark upon the islands. Hawaii's population remains tremendously diverse, and unlike many other states, working-class organizations continue to influence the character of Hawaii's social, economic, and political life.

HAWAII LABORERS' ASSOCIATION

The Hawaii Laborers' Association (HLA) was founded in 1919 as the Japanese Federation of Labor or the Federation of Japanese Labor. The Association and the strike it initiated in 1920, often referred to as the "dual strike," are notable in the history of labor in Hawai'i because both represent the first effort on the part of Japanese and Filipino workers to organize across ethnic lines for the common good of sugar plantation workers. The dual strike was the first strike in Hawaiian history in which the two largest groups of workers attempted to work together to press for their demands. When the Hawaii Sugar Planters' Association (HSPA) and local politicians accused workers of being agents for the Japanese government during a strike on the sugar plantations of O'ahu, the Japanese Federation of Labor changed its name to the Hawaii Laborers' Association to symbolize its commitment to higher wages and better working conditions for all sugar plantation laborers.

The Japanese Federation of Labor was an umbrella organization founded by delegates from local labor associations in the Islands' plantation communities. These smaller organizations formed in the wake of a 1909 strike to protect the interest of plantation workers. In spite of the vast distances between plantation towns, they were able to stay organized by taking advantage of an existing network of community organizations. In smaller plantation towns, they often used religious organizations such as the Young Buddhist Association to meet and discuss the labor situation on the plantations. In 1919, representatives from these organizations met in Honolulu to discuss the economic situation of plantation workers. In the face of rising costs driven by wartime inflation and stagnating wages, Hawai'i's sugar workers demanded a raise in pay from 77 cents to \$1.25 per day. In a formal petition to the HSPA, they articulated their demands: in addition to a raise, they asked for an eight-hour workday, paid maternity leave, and better health care and recreational facilities.

Filipino workers also began to organize in 1919. The Philippines became the newest source of labor for the plantations after the United States restricted Japanese immigration under the terms of the 1908 Gentleman's Agreement. As a protectorate of the United States, the Philippines offered plantation owners easy access to a large labor force. In the decade between 1909 and 1919, the number of Japanese workers on sugar plantations had declined from approximately 64% to 44% percent. During the same decade, the number of Filipino workers increased from a few hundred to nearly 10,000 workers, about 20% of the total workforce.

Because Filipinos had not been in the islands very long, they lacked the social networks of community organizations that facilitated labor organizing. However, they were led by a charismatic union organizer named Pablo Manlapit. Manlapit, who had arrived in Hawai'i from the Philippines in 1918, organized the Filipino Labor Union, which formed a loose affiliation with the Japanese Federation of Labor. Manlapit was to act as a go-between for the Japanese Federation and the Filipino workers. However, language and cultural differences impeded smooth cooperation between the two groups.

After the HSPA rejected the demands for higher wages, the Japanese Federation set out to plan its strike. Having learned from previous experience, the Japanese workers had planned to strike in the spring of 1920 as the sugar cane was ripening in the field and ready for harvest. It was thought that if their profits were rotting in the fields, sugar plantation owners would be more likely to negotiate. In addition, by not striking right away, they allowed themselves

the several months it would take to raise the money for a strike fund to support workers and their families for the duration.

Filipino workers, however, jumped the gun and walked off several O'ahu plantations in January of 1920. This forced the hand of the Japanese Federation and a general strike was called for February, long before they were ready. Although they attempted to present a united front, there was no question that Japanese and Filipino workers and union leaders were at odds with one another over strike tactics, money, and the duration of the strike.

As it had in the past, the HSPA refused to negotiate and used its control over local politics, government, and media to undermine the workers, their union, and turn public opinion against them. Using spies and speculation, the HSPA fueled the ember of anti-Japanese sentiment by suggesting that the union was acting on the orders of the Japanese government. Through rumormongering in the press, they accused Federation officials of taking advantage of innocent workers in order to "Japanize" the islands. In response to these constant attacks, in April of 1920, the Federation changed its name to the Hawaii Laborers' Association to signal their independence from any foreign government and to deflect the accusation of "racialism."

The Japanese and Filipino workers also used publicity to attempt to encourage public support for the strike. On April 3rd they organized a "77 cents parade" through the streets of Honolulu, timed to coincide with the local celebration of the one hundredth anniversary of the arrival of Protestant missionaries in Hawai'i. Even as the local Protestant community was celebrating the triumph of Christianity in Hawai'i, women and children marched in Honolulu carrying picket signs that said, "God has created us equal" and "My Papa 77 cents a day. My Mama 58 cents a day."

As effective as their strategies were, the strike was broken after six months by the HSPA. Even local religious leaders had failed to bring the HSPA to the table. Once the strike was over, the HSPA and the local government worked to abolish the union by prosecuting its leadership. After the strike, 21 leaders of the Hawaii Laborers' Association were charged with conspiracy in the bombing of the house of a plantation translator named Sakamaki. Although there was little physical evidence to link the men to the crime, 15 were convicted and served from four to 10 years in prison. Upon their release, many returned to Japan.

The Hawaii Laborers' Association did not survive much beyond the strike of 1920 due to the organized strength and control of the HSPA. The strike and the

Association were, however, influential in future labor organizing and demonstrated both the need and potential for cross-racial union organizations in Hawai'i.

HAYMARKET AFFAIR (1886)

On May 4, 1886, at about 10:30 p.m., a protest rally near Chicago's Haymarket Square was about to end when six columns of police (176 officers in all) marched to the rally site on Desplaines Street and ordered the meeting's participants to disperse. The rally had been called by the city's anarchists, who were organized into the International Working People's Association, a group composed mainly of German and Bohemian immigrant workers. The purpose of the May 4 meeting was to protest an event that took place the night before when Chicago police intervened to stop strikes from assaulting strikebreakers leaving the McCormick harvester works on the South Side. In the fighting that ensued, the police shot and killed four strikers.

The city's leading anarchist organizer, August Spies, had opened the Haymarket meeting calling for a peaceful protest, though he had at many other times told workers to arm themselves and prepare to use dynamite bombs if and when the police and militia attacked. Like the other main speakers that night, Albert Parsons and Samuel Fielden, Spies was a visionary who believed that the workers' struggle for power would lead to a social revolution that would be violent because the ruling class would use all of its forces to put down any uprising or revolt.

Sam Fielden, the last speaker of the evening, did not call upon the crowd to attack the police, but he did say that workers should "throttle" and "kill the law." Hearing these words, plainclothes policemen reported to their commander, Chief Inspector John Bonfield, that Fielden was making incendiary remarks.

HAYMARKET AFFAIR (1886)

Although the mayor of Chicago, Carter H. Harrison, had told Bonfield that the rally was peaceful and that he should send police reserves home, the chief still decided to march on the rally and to disperse the small crowd that remained.

When the police arrived, Fielden objected to the command to disperse, saying, "But we are peaceful." Then he reluctantly agreed to end the meeting. Just then, a bomb was thrown into the police ranks; it exploded with terrific force. Wild gunfire erupted from the police revolvers, and according to police witnesses, firing came from the crowd as well, although this fact was disputed by many other eyewitnesses. One police officer died within minutes of the explosion, and six others died later from their wounds, although it is not clear how many were killed by the bomb fragments or by bullets, and it is not clear how many of the gunshots came from the police officers' own revolvers, though many probably did. At least 60 officers were wounded, along with unknown numbers of civilian bystanders (at least three of them were confirmed dead as a result of police gunfire).

The Haymarket bombing created hysteria in Chicago and across the nation, and led to the nation's first red scare. The *Chicago Tribune* blamed the mayor for allowing free speech for the anarchists and insisted that the government deport them and exclude any other "foreign savages who might come to America with their dynamite bombs and anarchic purposes."

In the aftermath of the bombing, Chicago police arrested scores of workers suspected of being anarchists, raided homes and offices without warrants, and stopped all public meetings. Immigrants were intimidated by the red scare and scapegoating that followed; it was a time when newspapers and public officials created a terrifying image of the European immigrant as a potential anarchist murderer—an image that endured in the popular imagination.

The red scare also had a chilling effect on the insurgent labor movement of the time, one that had propelled more than 300,000 workers into the streets on May 1, 1886, in a mass strike for the eight-hour day. Chicago was the epicenter of a storm of strikes that had been building for nearly two months, as skilled and unskilled, native and foreign-born men and women joined together in what they thought of as a freedom movement to gain precious hours of "their own time" from employers who arbitrarily insisted on at least 10 hours' work five days a week plus at least a half day on Saturday. Indeed, thousands of workers had already gained shorter hours in April as a result of strikes and demands on employers, including some by workers who demanded an eight-hour day with no reduction in pay.

There were political tensions in the strike movement, especially in Chicago where a strong anarchist-led body, the Central Labor Union, opposed the city's mainstream Trades and Labor Assembly. The former group, composed mainly of German and Czech

The Anarchist Riot in Chicago—A Dynamite Bomb Exploding Among the Police [McCormick Strike, Haymarket Square]. Library of Congress, Prints & Photographs Division [LC-USZ62-796].

immigrants, saw the eight-hour reform as a means of uniting workers toward a more revolutionary end, whereas the city's craft unions, led by American, Irish, and English moderates, regarded shorter hours as an end in itself. Tensions also existed between the anarchists and the reform leaders of the Knights of Labor. Some Chicago Knights shared the fears of their national leader, Terence V. Powderly, that a mass strike for eight hours would heighten class conflict and lead to violence.

However, as of May 3 the strikers had remained unified, and their strikes had remained nonviolent. This peaceful period ended that night when the police killed the strikers at the McCormick works, an event that led directly to the Haymarket rally on May 4 and to the violence that followed there.

Within a few days after the bombing, most of the eight-hour strikes had ended, as many trade unionists, like Samuel Gompers of the Federation of Organized Trades and Labor Unions, blamed the Haymarket bombing and its aftermath for killing the shorter hours movement. There were other reasons the movement receded, notably the actions of aggressive employer associations and the ambivalent attitudes of many union officials, but the Haymarket bombing nevertheless marked a turning point in labor history, one that signaled the rapid decline of the Knights of Labor in most cities and industries.

The trial of the eight Chicago anarchists indicted for the bombing began in Chicago on June 22, 1886. At the time, few outside the anarchist movement displayed any sympathy toward the defendants, who were assumed by the press to be guilty and worthy of hanging. The trial was a sensational affair that lasted most of the summer and attracted international attention. Then, as the proceedings wore on, more and more trade unionists and other citizens began to worry that the jury seemed to be packed with jurors who were biased against the defendants when the prosecution produced only circumstantial evidence that the accused anarchists were directly responsible for the bombing. Indeed, none of the anarchists were actually charged with throwing the lethal hand grenade; the prosecution charged them as accessories to murder because the anarchists had allegedly conspired with the bomber and abetted the bombing with their words and actions. Even sympathetic observers realized, however, that whatever the weaknesses in the state's case, the jury would find the defendants guilty.

Still, many observers were shocked when the jury members joined the announcement of their guilty verdict with a death sentence for all seven anarchists they had tried: August Spies, Michael Schwab, George Engel, Adolph Fischer, and Louis Lingg (all

German-born workers), Samuel Fielden (an Englishman employed as a teamster), Oscar Neebe, and Albert Parsons (both American-born tradesmen).

All of these men had been active and effective union organizers and eight-hour strike leaders as well as dedicated anarchist agitators and propagandists. Indeed, August Spies and Albert Parsons had become nationally known figures in labor and radical movements of the time. Spies, the publisher of the nation's largest anarchist newspaper, *Chicagoer Arbeiter Zeitung*, was an author of the historic Pittsburgh Manifesto, a revolutionary document issued in 1883 by socialist militants who had given up on electoral politics and the gradual overthrow of capitalism; and Albert Parsons was a legendary speaker and organizer much in demand as an orator and agitator.

Soon after the verdict was rendered in the Haymarket case, many labor union members, especially immigrants, began to feel that the anarchists had been tried and sentenced to death, not for the bombing, but for their militant words and actions on behalf of the working class. The anarchists' lawyers appealed for a new trial, complaining that the proceedings and the jury were blatantly biased against their clients. However, in October 1886, the judge who tried the case, Joseph E. Gary, sentenced three defendants (Fielden, Schwab, and Neebe) to 15 years in prison and condemned the other five men to death on the gallows. Before Gary issued his final edict, the anarchists delivered highly charged speeches to the court that would later be published, translated, and disseminated in many nations.

During the legal appeal of the death sentence to the Illinois and national supreme courts in 1887, concern and sympathy for the condemned men grew across the United States and in Europe, culminating in a massive petition campaign in November aimed at the governor of Illinois, Richard J. Oglesby, who was asked to commute the anarchists' sentences to life imprisonment. Workers, especially union members, generated most of the support for clemency, but the campaign attracted a few noted writers like the muckraker Henry Demarest Lloyd as well as many leading citizens of Chicago, including some who feared that executing the anarchists would make them martyrs to the revolutionary cause.

Scores of people descended upon the Illinois State capitol in Springfield as the execution date approached in November 1887. Governor Oglesby accepted petitions for clemency signed by thousands of citizens and heard many appeals, including an especially powerful argument for clemency made by Samuel Gompers, president of the newly formed American Federation of Labor, who also feared that the executions would confer martyrdom on the five

condemned revolutionaries, who would be remembered as heroes who died fighting for freedom of speech.

As the governor pondered his decision, one of the anarchists, Louis Lingg, reportedly exploded a small dynamite cap concealed in a cigar in an apparent attempt to commit suicide. As Lingg lay dying, Governor Oglesby announced his decision that Spies, Parsons, Engel, and Fischer would be executed on November 11, as ordered by the court.

After the hangings took place on that day, long known to anarchists as “Black Friday,” an intensely emotional reaction followed among workers, especially immigrants, and among anarchists and socialists in Europe. A few noted Americans like the writer William Dean Howells also expressed dismay over what the famous novelist called a “judicial murder” in Chicago.

The Haymarket case refused to die in the public imagination, especially in Chicago, where some citizens were haunted by the fear that a grave injustice had been done. The feelings of regret surfaced in June 1893 when an impressive monument was unveiled at the grave of the five anarchists in Waldheim Cemetery, outside of Chicago, and when the governor of Illinois, a Democrat of German birth named John Peter Altgeld, pardoned the three surviving anarchists serving time in prison. Altgeld’s famous pardon included an expression of outrage over what the governor regarded as the injustice of the anarchists’ 1886 trial.

In the late 1890s, the anarchists, now regarded by socialists and anarchists as the Haymarket martyrs, seemed to fade from view as radical and labor movements declined during the ensuing depression and the repression that followed the defeat of the Pullman boycott of 1894. And yet, the memory of the Haymarket anarchists proved to be remarkably resilient, especially in Spain and Italy, where the celebration of May Day as the international workers’ holiday after 1890 was used to recall the sacrifice of Chicago revolutionaries who were remembered as having died for the eight-hour day. This memory endured even longer in Latin America, especially in Mexico where May 1 was known as the “day of the Chicago martyrs.”

The memory of the Haymarket martyrs was also revived in the United States when socialists and anarchists celebrated May Day in the years between 1907 and 1917; it reappeared in 1937 after the Memorial Day massacre in Chicago, when police killed 10 unarmed picketers and the newspapers blamed it all on a Communist-inspired riot; and it resurfaced during and after the centennial on May 1, 1986, when a stream

of plays, songs, poems, posters, documentaries, and historical essays retold the unforgettable Haymarket story.

HAYWOOD, WILLIAM D. “BIG BILL” (1869–1929) Cofounder, Industrial Workers of the World

Perhaps the best-known member of the Industrial Workers of the World (IWW), William D. “Big Bill” Haywood cofounded and helped run the legendary union, the pre-eminent radical organization of its time. Previously, Haywood had been a leader of the militant Western Federation of Miners (WFM) and the Socialist Party. He still is recalled for his commanding presence, speaking style, and leadership.

Born in Utah Territory in 1869, Haywood grew up in a working-class family. Haywood first worked in a mine at the age of nine, the same age at which he lost one of his eyes (in a boyhood accident); his one-eyed visage later contributed to his imposing persona.

From 15, he worked in a series of mines—following the boom-and-bust industry. Along the way, he married and fathered two daughters; his wife became an invalid from difficulties in labor, and they drifted apart.

The WFM was at the forefront of Gilded Age labor strife, resisting increasingly powerful mining corporations in the Rocky Mountain West. Haywood joined the WFM in 1896 when working in Silver City, Idaho, moved up the ranks of local leadership, and relocated to Denver in 1902 to help lead the union. The 40,000-strong WFM became steadily more militant, violent, and leftist in response to intense corporate and governmental attacks.

This struggle expanded when Frank Steunenberg, a former governor of Idaho and noted anti-unionist, was murdered in 1905. Haywood, along with two other WFM leaders, was accused of the crime. The murderer confessed but claimed that Haywood and the others had hired him. Thus began the era's most celebrated case, ending in the acquittal of all three—primarily because the prosecution provided no evidence to corroborate the murderer's testimony.

That same year, 1905, Haywood helped found the IWW. Many socialists and radical unionists believed that the American Federation of Labor (AFL) was

far too conservative. By contrast, the IWW—with Haywood chairing what he termed a "Continental Congress of the Working Class"—was committed to organizing all workers (regardless of their craft, gender, nationality, or race) in industrial unions and overthrowing capitalism. Haywood came to such radical notions from his own experiences as a miner, unionist, and organizer. As Haywood reportedly said, "I've never read Marx but I've got the marks of capitalism all over me."

Haywood became an IWW leader, especially during the period from 1912 to 1918. For years Haywood had struggled within the Socialist Party, but in 1913, he largely abandoned it for the more job-focused Wobblies. One of his most famous battles was the 1912 "Bread and Roses" textile strike in Lawrence, Massachusetts. After the first group of leaders was arrested on bogus murder charges, Haywood and Elizabeth Gurley Flynn led the 25,000 workers, mostly immigrant women, to a stunning victory. In 1913, while leading 30,000 striking silk workers in Paterson, New Jersey, Haywood captivated another group. New York City's bohemians, denizens of Greenwich Village, were enthralled by Haywood, who they said was a true working-class hero. He was known to them for his many quotable sayings,

W.D. Haywood leads Lowell strike parade. Library of Congress, Prints & Photographs Division [LC-DIG-ggbain-10357].

including his quote that the IWW is "socialism with its working clothes on."

With Haywood at the helm from 1914 to 1917, the IWW dramatically expanded. The IWW organized workers in war-related industries that experienced intense labor shortages (thereby giving workers more power). The 1910s experienced a surge in unionism and radicalism, not just in the States but in nations worldwide. Though many Wobblies argued that working-class men did all of the fighting and dying in all armies, the IWW, true to its anarchist leanings, left support of or opposition to the war to its members' consciences. Nevertheless, the IWW was widely considered to be an antiwar organization.

The IWW's radicalism and power made it a target, resulting in federal raids on IWW offices nationwide in September 1917. The following year, one hundred Wobblies were defendants in what became the longest trial in U.S. history. After four months, the jury came back in under an hour, finding all the defendants guilty on all counts. Haywood was sentenced to 20 years in a federal penitentiary. The Wobblies claimed they were tried on their beliefs—and no evidence of a planned general strike to undermine the nation's war effort ever has been uncovered.

After serving a year in Leavenworth, Haywood was freed temporarily in 1921 pending appeal, jumped bail, and fled to the Soviet Union. Haywood's actions were highly controversial among Wobblies, many believing he had abandoned the struggle. Haywood did not see the point in remaining in a capitalist jail, when he could join the world's first nation to overthrow capitalism. Moreover, Haywood was in failing health, his diabetes and ulcer having worsened dramatically while jailed.

Haywood's decade in the Soviet Union was troubling. He contributed little to his newly adopted home. Haywood could not return to his beloved homeland, did not speak Russian, and became an alcoholic. He died in 1928. Half of his ashes were placed inside the Kremlin's walls; the other half went to Chicago's famed Waldheim Cemetery, where the Haymarket Martyrs are buried. His memoir, *Bill Haywood's Book*, likely ghostwritten, was released in 1929.

Big Bill Haywood's life is typical and atypical of working-class Americans of his time. Like many poor boys, he had little formal education, instead entering the workforce. Subsequently, he experienced the insecurities, hard work, and dangers of such an existence. Like millions of others, he joined a union because he believed that he was powerless to protect his interests otherwise. Like hundreds of thousands, unionism and corporate hostility further radicalized him. He looms large over American labor history.

HEIGHTON, WILLIAM (1801–1873)

William Heighton's career as an activist cleaves into two stages, one as a labor radical and one as an anti-slavery advocate. Born in 1801 in the village of Oundle in Northamptonshire, England, Heighton emigrated with his family around the War of 1812, settling in Philadelphia, where he married (Ann Beckley) and plied his trade of shoemaking in order to support a growing family. Little was heard from him until the second half of the 1820s, when he steered the Quaker City's struggling workers in a new direction.

The deterioration of the crafts attendant upon the acceleration of the market revolution plus the influence of political economists turned Heighton by the mid-1820s toward Anglo-American radicalism. Though he was familiar with the work of Thomas Paine, Heighton was especially impressed with the more recent writings of David Ricardo as well as John Gray, the primitive socialist who argued that working-class poverty stemmed from economic exploitation and political oppression, not simply the latter, as earlier radicals believed. In 1827, Heighton became the city's leading labor activist, delivering the first of three major addresses over the next two years, which were printed in pamphlet form and widely distributed within the city and to other urban centers. His spring and fall speeches in 1827 were hard-hitting polemics based on the labor theory of value along with a comprehensive plan for economic reconstruction and working-class organization. Heighton depicted an economic landscape populated by "producers," and "accumulators," or the many and the few. The former group, which consisted of working people, farmers, and others working with their hands, were the creators of wealth; the latter, which consisted of bankers, merchants, and manufacturers, were

among the nonmanual workers who appropriated the wealth created by producers. Accumulators prevailed in the political arena as well as in the economy because they had seized control of the political machinery in the wake of the Revolution. They maintained power by keeping producers ignorant generally and unaware of their own economic interests.

Heighton's remedial plan caught on. Between his two addresses, he had worked with a committee of comrades to draft the constitution and bylaws of what would become the Mechanics' Union of Trade Associations (MUTA). In January 1828, shortly after his second address, delegates from about nine trade unions ratified the new document, formally launching the nation's (and arguably the world's) first citywide organization of trade unions. Some members of the MUTA's leadership, including Heighton, doubled as the editorial committee of the *Mechanics' Free Press* (MFP), the union's official organ, which appeared in January 1828. Not long afterward, a meeting of the MUTA gave rise to nominating committees, which became known as the Working Men's Party, the first labor party in the nation. The Working Men got off to a rough start in 1828 but drew enough interest in 1829 to hold the balance of power; they ran even better in 1830 but lost the balance of power and disappeared entirely after the 1831 campaign. The new party faced the same obstacles that would hinder political insurgencies for the rest of the antebellum era, including thin resources and weak organization. In addition, the Democratic Party in the city of Philadelphia proved to be rather more flexible than its counterparts elsewhere, making room for working-class insurgents and selectively borrowing from their agenda.

Heighton took the 1830 election very hard, denouncing the "blindness" and "sappiness" of working people and leaving the city in a huff (MFP, October 29, 1830, and March 2, 1831). He wound up in rural Salem County, New Jersey, possibly with the idea of starting life anew. He remarried in the mid-1850s following the death of his first wife in the 1840s, and in the early 1860s he set aside his shoemaker's kit to pursue farming. He seems to have eschewed labor activism but retained his animus for the Protestant clergy (they were accumulators who also kept workers in darkness). He also took a growing interest in land reform, a nostrum in the 1840s that attracted a good number of labor advocates from the 1830s. In addition, the rusticated radical established a name among abolitionists, though it is not known when he became concerned about slavery (having published a single antislavery piece in the MFP) or if he joined the American Anti-Slavery Society or its New Jersey affiliate. By the Civil War, he was known well enough in

abolitionist circles to be asked to contribute a short essay in 1865 for a book being prepared by George L. Stearns, the Medford, Massachusetts, linseed manufacturer and radical abolitionist who a decade earlier had been a member of the "Secret Six" who supported John Brown in Kansas and then in Virginia. In a letter he called his "political daguerrotype," Heighton argued that if "you wish to uproot slavery, break up the land monopoly" of the Old South. Otherwise, the "barbarous land-barons," in the region would "vent their spleen on the innocent and helpless freedmen" (Stearns, p. 43).

The one-time labor radical and autodidact and now radical abolitionist found himself in the eminent company of Wendell Phillips and Frederick Douglass. He had come a long way since leaving behind the labor movement. Future scholars would do well to chart that course.

HENRY, JOHN

The story of John Henry follows from a song. John Henry was a giant—a powerful black man who worked on a tunneling gang on the Chesapeake & Ohio (C&O) railroad. He drove a “nine-pound hammer” into a steel chisel, hitting it so hard that “every time he brought his hammer down, you could see the steel going through.” As the chisel buried itself into the side of the mountain, John Henry sang to match the beat:

Ain't no hammer
in these mountains,
rings like mine,
rings like mine.

The tunneling gang worked to pierce a million-year-old mountain in western Virginia that separated the east from the west. But the task seemed impossible. When John Henry first saw it, he feared he would fail. “The rock was so tall and John Henry so small that he laid down his hammer and he cried.” Progress was slow, and the work was perilous. An inventor came up to the mountainside with a steam drill, which he declared was faster than any tunneling gang. John Henry challenged the steam drill to a race. The steam drill hammered on one side, John Henry on the other. John Henry sang while he hammered. His buddy had a stack of chisels, replacing each one as the tip dulled. John Henry and his hammer moved like a blur.

While the steam drill was powerful, John Henry was a “mighty, mighty man.” At the end of the contest, John Henry “drove in fourteen feet, the steam drill only made nine.” Then, just as John Henry finished, “his head spinning 'round,” he fell. He knew where he was going, and asked for a cool drink of water before he died. Such a powerful man was John Henry, such an important man, that they took him to the White House and buried him in the sand. Even the steam engines paid their respects to the grave of John Henry, for “every locomotive come a roarin' by, said yonder lies a steel-drivin' man.”

If a hundred people saw a contest between a hammer man and a steam drill in the early 1870s, there are more than a hundred versions of the song, the ballad of John Henry. By the 1880s, white men in the Appalachian Mountains knew it as a “Negro banjo pickers' melody.” By the 1930s, it was so popular in the mountains of Virginia and Kentucky that the earliest country musicians, including Fiddlin' John Carson and the

Skillet Lickers, had versions of the song. Every blues musician in eastern Virginia and along the Mississippi River could play it. In the middle 1930s, the folklorists Guy Johnson and Louis Chappell, with a small regiment of graduate students, traveled around the South to find the traces of John Henry. They discovered contradictory versions of the John Henry legend, placing him in North Carolina, Virginia, West Virginia, Alabama, Texas, and Jamaica. The folklorists and their students followed the story as well as they could, published their results, and moved on. There was something here: the Chesapeake & Ohio railroad *was* built through the mountains of western Virginia between 1870 and 1872. Steam drills had been tried there. Men and women knew of the many lives lost building those tunnels. But the records were lost, and the stories were contradictory.

By the 1920s, the song had become an anthem among members of the Harlem Renaissance, the American Communist Party, and white textile mill workers in the American South. For Communists, the John Henry ballad seemed to express exactly the Communist Party's view of black workers' struggles. Finally, in the 1960s, as black power activists became interested in his story, John Henry became more expressly a symbol of the battle against white power structures, while for musicians at the Newport Folk Festival he represented their opposition to new technologies like electric guitars and amplifiers. In the 1960s, John Henry became the focus of an event in West Virginia called the John Henry Folk Festival, a celebration organized by Ed Cabbell, an African-American musician, schoolteacher, and self-made expert on the story of John Henry. Cabbell's festival has gained new popularity due to the novel *John Henry Days* by Colson Whitehead, who visited the festival and explored how the story of John Henry's life could be shaped for commercial exploitation, appeal to jazz musicians, and become a kind of anthem for the epidemic of crack cocaine.

Scott Nelson has argued that John Henry was an actual person, a convict from the Virginia Penitentiary who participated in the construction of the Lewis Tunnel on the Chesapeake & Ohio Railroad. That tunnel was built between 1871 and 1873, and Nelson has demonstrated that John Henry, the convict, was shipped to the mountains to work on the railroad beginning in 1868, and that steam drills were used at the Lewis Tunnel site between 1872 and 1873 alongside the convicts from the penitentiary. Nearly two hundred workers died in the construction of this tunnel and were apparently all returned to the Virginia Penitentiary because of a stipulation in the employment contract that the C&O had to pay a \$100 fine “for each prisoner not returned.” The bodies

appeared to have been returned, only to be buried in the sand next to the old white house of the Virginia penitentiary. This, according to Nelson, accounts for the final verse of many of the songs:

They took John Henry to the White House,
And buried him in the san'
And every locomotive comes roarin' by,
Says there lies a steel drivin' man,
Says there lies a steel drivin' man.

These bodies were only recently discovered, in 1992, when contractors dug up the grounds of the penitentiary to make room for new construction.

HERSTEIN, LILLIAN (APRIL 12, 1886– AUGUST 9, 1983) Union Activist

Lillian Herstein, whom *Life* magazine described as "the most important woman in the American labor movement" in 1937, was a public schoolteacher, union activist, advocate of workers' education, and candidate for national political office. Herstein was born on April 12, 1886, on the west side of Chicago, the youngest of six children. Her Jewish parents, Wolf and Cipe, emigrated from Lithuania, then part of Tsarist Russia, to the United States shortly after the American Civil War. Her family owned a bookstore in Chicago. She attended Northwestern University, where she gained a degree in Latin and Greek and obtained an M.A. from the University of Chicago in 1924. After graduating from Northwestern University in 1907, Herstein, like many college-educated women at the time, became a schoolteacher. She taught in

high schools in Franklin Grove, Illinois, and Mount Vernon, Indiana, before entering the Chicago public school system in 1912. She initially taught in high schools and then in junior colleges for the rest of her career in Chicago. Like most women teachers of her generation, Herstein never married.

Influenced by her sister Gusta, a sales clerk who was active in the labor movement, and by the reform work of Margaret Haley and the Chicago Teachers' Federation, Herstein became a union activist. She joined the newly formed Federation of Women High School Teachers in 1914, a local affiliate of the American Federation of Teachers (AFT). Herstein represented her union in the Chicago Federation of Labor (CFL) and was for 25 years the only woman on the executive board of the CFL. She became active in the Chicago branch of the Women's Trade Union League. The League, formed in 1903, set out to organize women into unions, to establish workers', education programs, and to bring about legislation for shorter hours and protection for women. The organization was one in which schoolteachers like Lillian Herstein, middle-class reformers like Jane Addams of Hull-House and Mary McDowell of the University of Chicago settlement house, and labor leaders like Agnes Nestor worked together.

In addition to teaching in the Chicago public schools for 36 years, Herstein spent her evenings, weekends, and summers active in workers' education. In the 1920s and 1930s, Herstein taught English and public speaking at the Chicago Labor College run by the CFL and the Chicago Women's Trade Union League. She also taught at the University of Wisconsin, the University of Chicago, and the Bryn Mawr Summer School for Women Workers in Industry. Herstein went on to head the Chicago Works Progress Administration workers' education program in the 1930s.

To pursue her belief in democracy and social justice, Herstein became active in local and national progressive politics. She joined the Labor Party after World War I and then participated in the Farmer Labor Party, formed in 1920, which sought, unsuccessfully, to become a third-party alternative to the two major parties. In 1932, Herstein ran unsuccessfully for Congress in Illinois on the Progressive Party ticket, calling for old-age pensions and unemployment insurance. In 1936, she supported the re-election of President Franklin Roosevelt and directed the speaker's bureau of Labor's Non-Partisan League in Illinois, an organization formed to help win the re-election of Roosevelt. In the summer of 1937, President Roosevelt picked Herstein to serve on the U.S. delegation that attended the International Labor Organization (ILO) meeting in Geneva, Switzerland.

In the late 1930s, Herstein became active in the Chicago Teachers' Union (CTU), formed in 1937 by a merger of Herstein's union, the Federation of Women High School Teachers, and three other teacher unions. Chicago public schoolteachers had suffered from nonpayment of salaries in the early years of the Depression and from pay cuts throughout the 1930s. Nearly two thirds of the Chicago public schoolteachers joined the CTU, led by the high school teacher John M. Fewkes, making it the largest teachers union in the country. Herstein saw the union as a vehicle for reforming the public schools and in particular removing the political influence of Mayor Edward J. Kelly and the Democratic machine from the school system. She served on the executive committee of the CTU, participated in the work of the American Federation of Teachers, and ran for president of the AFT in 1938 but lost to Jerome Davis.

Herstein became disillusioned with the CFL and the CTU in the late 1930s. John Fitzpatrick, the leader of the CFL, moved the Federation closer to the Chicago Democratic political machine led by Mayor Kelly, and became more authoritarian in running the organization. The CTU became dominated by John M. Fewkes and his supporters, who wanted to eschew the social reformism of Herstein and embrace bread-and-butter unionism. In January 1940, Lillian Herstein resigned from the executive board of the CTU, accusing Fewkes of not consulting with the rest of the leadership. When she retired from teaching at the age of 65 in 1951, Fewkes unceremoniously removed her as CTU representative from the CFL.

During World War II, Herstein devoted herself to the war effort. She became a member of the War Production Board in 1942 as its woman's consultant on the West Coast and helped obtain child care and other facilities for women workers until the end of the war. When the war ended, Herstein returned to Chicago and helped expose the corruption and patronage that blighted the public school system and joined the campaign to remove Mayor Kelly from office. In December 1946, Kelly announced he would not run for re-election, and his supporters who ran the public schools at his behest resigned their posts.

After her retirement from teaching, Herstein worked for the Jewish Labor Committee, formed in New York in 1934, which opposed anti-Semitism and racism. The committee later became very involved with race relations in the United States, and she became a member of the Chicago Commission on Human Relations, initially formed in 1943 as the Mayor's Committee on Race Relations, and campaigned to racially integrate the building trades. Herstein continued to teach for local unions, wrote for

labor journals, and campaigned for reform politicians against the Chicago Democratic machine. Herstein died on August 9, 1983.

HIGGINS, MONSIGNOR GEORGE G. (1916–2002) Catholic Labor Activist

Beginning in the early twentieth century, a number of Catholic clergy became active in and on behalf of American labor unions. For 60 years, Monsignor George G. Higgins exemplified the ideal of the "labor priest." His strong public presence and his status as an official in the Catholic Church's bureaucracy lent credence to the view among Catholics and others that the Church was friendly toward the goals of organized labor. Similarly, his vigorous participation in the labor movement promoted the same idea among union officials and members. In this way, Higgins exerted significant influence on the character of the relationship between labor and the Church in the United States—a relationship considerably more confrontational in many other national contexts.

A native of Chicago, Higgins was ordained a priest for that archdiocese in 1940. He obtained master's and doctoral degrees in economics and political science from the Catholic University of America in Washington, DC, where he wrote his dissertation on "Voluntarism in Organized Labor in the U.S., 1930–1940." In Washington, he became involved with the Social Action Department of the National

Catholic Welfare Conference (NCWC), the national organization of the United States Roman Catholic bishops. Through the Catholic University and the NCWC, he became acquainted with and influenced by key figures in American Catholic social reform, including Bishop Francis Haas, Father Raymond McGowan, and Monsignor John A. Ryan.

Following completion of his studies in 1944, Higgins joined the staff of the Social Action Department, eventually succeeding Ryan and McGowan as its head and as author of the weekly column, "The Yardstick." Higgins retired from the bishops' conference in 1980 and concluded his career by teaching theology at the Catholic University. At his death, he was widely lauded by officials in both organized labor and the Church.

Higgins was an ardent supporter of organized labor, writing, speaking, and frequently acting in favor of workers' demands. His syndicated column and occasional articles appeared throughout the Catholic press, and his lecture engagements included the first Congress of Solidarity in Poland. He led prayers at innumerable rallies and strikes.

As the head of the bishops' social policy arm, Higgins played an important role as liaison between the Church and labor unions. He knew personally most of the major labor figures of the time, including Walter Reuther, Philip Murray, and George Meany. He supported the merger of the AFL and CIO and delivered the invocation at the first joint meeting of the new conglomerate in 1955.

He was appointed by the bishops to a committee charged with mediating the late-1960s dispute between César Chávez's United Farm Workers (UFW) and California grape owners, and was instrumental in bringing Church support to Chávez. When the Teamsters sought a separate arrangement with lettuce growers, Higgins opposed the action and defended the UFW. "My involvement in the farm labor problem has given me greater satisfaction than almost anything else I have done," he wrote later. Chávez, for his part, said in 1980, "I doubt that anybody has done as much for us as Monsignor Higgins has."

He also sought to influence labor in a fashion consistent with Catholic morality by, for example, arguing against unions' taking of positions in favor of abortion rights and by denouncing union corruption and racism. He supported congressional committees formed to investigate union abuses in the 1950s. "Unions cannot count on the support of the Church," he wrote in 1977, "when they discriminate against blacks, Hispanics, or other minority groups, when they engage in unjustified strikes, when they resort to violence, racketeering, or other lawless practices."

Yet Higgins insisted that the majority of American unions were not guilty of such offenses: "In general they are on the side of the angels . . . and are deserving of the support [of the Church]." Many Catholics, however, contested Higgins's vocal advocacy of union activity. During the UFW struggle, the vicar general of the Diocese of Monterey addressed a letter to all the priests in the country, criticizing Chávez and denouncing the "poorly informed churchmen" who supported him.

While defending organized labor against conservatives in the Church, Higgins had simultaneously to justify the Church's role in the labor movement against critics on the left who viewed Higgins and his allies, such as the Association of Catholic Trade Unionists, as harmfully conservative forces within American labor.

The popularity of Higgins's positions waned with the decline in union membership in the 1980s and 1990s. The labor priest model of Catholic engagement of social questions was increasingly beleaguered by criticism from various directions: conservative, communitarian, and socialist. Higgins recognized the decline in the power of unions and their popularity in the Church in his 1992 autobiography, but he remained optimistic about the future of organized labor.

HIGHLANDER FOLK SCHOOL/ HIGHLANDER RESEARCH AND EDUCATION CENTER

The Highlander Folk School stands as a beacon of social activism in Appalachia and the American South. Yet the school's origins were hardly propitious. Miles Horton, the school's founder and leading light for much of the twentieth century, established

Highlander during the midst of the Great Depression and in one of the poorest counties of the nation. Started in 1932 in the Grundy County, Tennessee, town of Monteagle, Highlander ultimately served as a meeting place and training ground for local and national leaders in the union movement, the civil rights movement, and the Appalachian Alliance. Though the school was sometimes compartmentalized into its various iterations, Horton insisted that Highlander was one school, simply targeting different groups over the first 75 years of its existence—CIO organizers in the 1930s and 40s, civil rights leaders during the 1950s and 60s, and Appalachian activists during the 1970s, 1980s and 1990s. Thousands of grassroots activists have attended Highlander’s training workshops and residential programs, as have scores of national leaders, such as Eleanor Roosevelt, Martin Luther King Jr., Rosa Parks, Pete Seeger, Fannie Lou Hammer, Ralph Abernathy, Woody Guthrie, Andrew Young, Julian Bond, Stokely Carmichael, Septima Clark, and Esau Jenkins.

Horton envisioned Highlander as a center for social change where education would lie at the heart of the school’s mission. The education would not involve traditional learning, where teachers impart knowledge to their students. Rather, Horton believed that knowledge resides in the experiences of people, that people know what their problems are and through discussion can come to viable solutions. To the extent that Highlander staff “taught,” they did so through analogy, peer teaching, and storytelling. Horton was convinced that grassroots leadership entailed drawing on one’s own experiences and learning to make collective decisions in seeking solutions. Horton knew, though, that experiences constituted nothing more than the raw material of learning. As he told Bill Moyers in a PBS documentary, “You only learn from the experiences you learn from,” and “An experience you don’t learn from is just a happening.”

Workshops at Highlander followed a standard pattern. Small groups of roughly 25 to 30 people from specific institutions or movements came together to tackle fundamentally transformative issues, not simply to engage with smaller infrastructural issues. In his edited collection *Teaching for Social Justice*, William Ayers noted that workshop attendees collectively probed which problems needed solutions, what they needed to learn in order to resolve their predicament, and how group members would implement the decisions on their return to their respective communities (Ayers, p. 154). The curriculum was always based on the experiences that the students brought with them, their awareness of the problems facing their communities, and the relationship of that problem to conflict. They might, as Horton

commented in his autobiography, “have been opposed by mine owners or government, prevented from eating in some restaurants or denied their fare share of public resources” (Horton, p. 148). During workshops, Highlander staff generally re-inforced notions that working people deserved more than what they were getting, be it union recognition, more pay, better working conditions, political rights, or improved educational facilities for their communities. The staff further encouraged participants to assert control over the processes through which they could achieve these objectives.

In addition to community workshops, Highlander ran a variety of other programs. Some involved more intensive residential programs that lasted from six weeks to two months. Students came from unions and cooperatives and were expected to return to their communities better able to deal with the problems of their organizations. Other initiatives took Highlander’s regular staff out into the field in outreach programs. Highlander’s former students and other schools involved in leadership training drew on the Highlander staff to help with educational programs. Throughout all these activities, Highlander and its staff saw themselves as instruments to empower people.

Cultural activities like dance, drama, and especially music formed an integral part of the Highlander program. Horton believed that these cultural forms nourished the soul, created camaraderie, fostered determination, and developed pride in Appalachian and southern culture. In his autobiography, Horton credits his first wife and trained pianist, Zilphia Johnson Horton, for invigorating the cultural curriculum at Highlander. After learning the church hymn, “I’ll Overcome Someday,” from members of a South Carolina Congress of Industrial Organizations (CIO) Food and Tobacco Workers Union in the mid-1940s, she reworked it into the influential activist song, “We Shall Overcome” (Horton, pp. 77–78). Other singer-songwriters, like Pete Seeger, Guy Carawan, and Leadbelly, popularized songs like “No More Mourning” and “Bourgeois Blues” in a wide range of labor and civil rights settings.

Horton told Bill Moyers in his PBS interview that one measures people not just by their friends, but also by their enemies—that one needed “good, healthy enemies.” By this measure, Horton was a remarkably successful man. In the words of Bill Moyers, who wrote the preface to his autobiography, Horton had been “beaten up, locked up, put upon and railed against by racists, toughs, demagogues and governors” (Horton, p. ix). The animus that Horton and his social project evoked also confronted Highlander as an institution. As the civil right movement

gathered steam in the late 1950s, Highlander came under increasing attack. Unhappy with the ideas emanating from the institution, the governors of Georgia and Arkansas accused Highlander of being a communist training center where blacks and whites met as social equals. Without warning, the Internal Revenue Service revoked the school's tax-exempt status, and on July 31, 1959, Tennessee state troopers arrived at Highlander to search for evidence that would justify closure of the school. They ostensibly found three such rationales—that Highlander sold liquor without a license, that Horton operated the school for personal gain, and that the school was nonracial. Only the last charge had a basis in reality, but since Grundy County was dry, the presence of any intoxicating spirits provided a ready pretext for the state to padlock the doors and ultimately to revoke the school's charter and liquidate its property. Anticipating the failure of their appeals to these charges, Horton applied for a new charter, which he received in August 1961. The school re-opened as the Highlander Research and Education Center, based temporarily in Knoxville. A little more than a decade later, on February 11, 1972, Highlander moved yet again—this time to New Market, Tennessee, 25 miles east of Knoxville, on a farm in the foothills of the Smoky Mountains. As Horton reflected in a 1959 *Chicago Defender* article, recounted by Frank Adams, "You can padlock a building. But you can't padlock an idea. Highlander is an idea. You can't kill it and you can't close it in....It will grow wherever people take it" (Adams and Horton, p. 133).

HILL, JOE (1879–1915) Songwriter

Undeniably one of the most well-known, yet nevertheless mysterious, figures in U.S. labor history, Joe Hill was a celebrated songwriter who became, in death, a legend. Hill was recognized for writing many of the songs in the *Little Red Song Book*, published by the Industrial Workers of the World (IWW) sometime around 1904, although it is not possible to date the first publication exactly. His fame only grew after he was arrested for murder and executed. In subsequent decades, his status has become truly mythic, for the life he lived, the songs he wrote, the manner in which he died, and the many songs and stories that encircled him.

Curiously, precious little is known about a man whose fame is so great. Born in Gävle, Sweden, in 1879, Joel Hagglund grew up quite poor in a very large Lutheran family. Like many poor, young Scandinavians, he moved to the United States in 1902, eventually anglicizing his name to Joseph Hillstrom and then Joe Hill. He moved frequently, joining the large migratory working class in America. Hill worked a variety of trades including longshoreman, logger, machinist, sailor, and musician. There are large gaps in our knowledge of Hill's whereabouts and activities for significant stretches of time, sometimes entire years.

Hill very much saw himself as steeped in the class struggle, in an era of intensifying industrial capitalism. The American West, relatively new to this powerful system, saw its land, resources, and peoples transformed and often destroyed. Like many others, he became increasingly hostile to capitalism, instead believing that a system that shared the wealth with those who produced it was far preferable. Around 1910, he joined the revolutionary, anticapitalist Industrial Workers of the World, nicknamed the Wobblies, and committed his life to the organization. He participated in strikes in British Columbia, the revolution in Mexico, and Wobbly organizing drives across the West.

Hill's fame was a result of his songwriting abilities, which he wielded for unionism and revolution. Hill became the leading folk labor troubadour, despite his status as a non-native speaker of English. Like many folksingers, Hill borrowed his melodies from popular songs of his day, so that anyone who might want to sing along would only need to learn the lyrics. As he made his way across the West, he wrote many songs for the famous IWW *Little Red Song Book*, which a worker could fit in his shirt pocket, cost a quarter,

and was an important Wobbly organizing tool. Among his many songs, some of the most famous include: “The Preacher and the Slave,” which attacked missionary Christians for promising people who suffered hope in an afterlife, thereby making them quiescent in this life; “Casey Jones, the Union Scab,” which assailed craft unions for putting their narrow interests above those of the entire working class; and “There Is Power in a Union.”

The impact of his songs was immense. The IWW is an important part of American history and culture not because of its large membership. Rather, the IWW was influential for the powerful ideals that it stood for, its members’ commitment to the cause, and the colorful methods through which the union spread its gospel. Where many movements are serious to a fault, the IWW was playful, humorous, and willing to poke fun at itself. The IWW used popular culture, including music and cartoon, to deliver its message. Hill’s songs were central to this effort.

Hill is known for not only his songs but also his still controversial demise. In 1914, a Salt Lake City area grocer was killed. Hill was convicted of the murder and sentenced to die. Hill steadfastly maintained his innocence, yet never produced a convincing alibi. Some have charged the state with not providing a fair trial. Others have suggested that Hill was set up because he was a radical Wobbly. While in jail, Hill remained in the public eye, receiving numerous visitors and supporters. One fellow Wobbly, Elizabeth Gurley Flynn, became the recipient of a Hill-penned song that earned her the nickname, “The Rebel Girl.” Hill’s case became a national cause célèbre, taken up not just by radicals but the mainstream American Federation of Labor and many liberals.

Hill always saw himself as a member of the rank and file, an ordinary, if militant, workingman. When asked, while sitting in jail, about his own background, he demurred by calling himself a “citizen of the world” and “from a planet called earth.” Maintaining his innocence to the end, Hill was executed by firing squad. Famously, Hill penned his oft-cited “Last Will” and even more legendary final advice, “Don’t mourn, organize.” Per his request, his ashes were scattered in every state save Utah and across the globe.

The legend of Joe Hill lives on, appropriately, in songs and books about him. In 1936, Earl Robinson and Alfred Hayes published the song “Joe Hill,” with its introduction, “I dreamed I saw Joe Hill last night.” The song describes a conversation between the singer and the spirit of Hill, who continually insists “I never died,” presumably as long as the ideas he espoused still are cherished. This song struck a chord with the

American public, particularly as sung by the noted African-American radical Paul Robeson, whose baritone defined the song through the 1950s. Hill remained in the limelight when the highly respected author Wallace Stegner wrote a novel in 1950 about the life of Joe Hill, in which Stegner contended Hill was guilty. In 1969, Joan Baez sang an elegiac version of “Joe Hill” at Woodstock and recorded it the following year, bringing the song to a new generation. The passion with which he is remembered is testimony to his ongoing importance.

HILLMAN, BESSIE ABRAMOWITZ (MAY 15, 1889?–DECEMBER 28, 1970) Feminist and Labor Activist

Bessie Abramowitz Hillman reigned as one of the leading twentieth-century labor feminists for over 60 years. As a young immigrant woman in Chicago, Hillman led a massive strike that laid the foundation for the birth of the Amalgamated Clothing Workers of America (ACWA), the largest men’s garment workers’ union in the country. Following her marriage to the union’s first president, Sidney Hillman, Bessie defied cultural dictates by continuing to organize and educate union workers even after the birth of her children. In 1946, Hillman was elected an ACWA vice president and spent the last 25 years of her life advocating for workers’ rights.

Bas Sheva (Bessie) Abramowitz, the fourth daughter of Emanuel Abramowitz and Sarah Rabinowitz, was born during Passover in the tiny *shtetl* of Lino-veh, Belarus. Her father was self-employed as a commission agent, buying wholesale commodities from the trains passing through the station near the Abramowitz home and selling them to peasants in the countryside. Sarah supplemented the family income

by renting rooms to boarders. Bessie's parents hired a private tutor to educate their children at home.

In 1905, motivated by the probability of an arranged marriage to a local boy, Abramowitz decided to immigrate to America in the company of two cousins. Within days after arriving in New York, 16-year-old Abramowitz traveled to Chicago to stay with distant relatives who owned a boardinghouse. She took a job as a button sewer, hand finishing men's pants. Appalled by the sweatshop conditions, she organized and participated in a number of walkouts. In 1910, after obtaining work with Chicago's largest men's clothing firm, Hart, Schaffner and Marx (HSM), Abramowitz led a small group of women out the door of HSM Shop No. 5 and onto the streets of Chicago. At first, most workers laughed at the young immigrant women. But within three weeks, workers in other shops joined them. Margaret Dreier Robins, the president of the Women's Trade Union League (WTUL), donated thousands of dollars to the strikers and became a principal negotiator along with John Fitzpatrick, the president of the Chicago Federation of Labor. Eventually, even the men came out and the strikers' ranks swelled to almost 40,000, shutting down the entire industry.

Only the Hart, Schaffner and Marx workers won substantial gains, including the right to organize and the establishment of an arbitration board that set the precedent for collective bargaining in the industry. The majority of workers returned to their jobs in February 1911 after enduring frigid temperatures, police brutality, and near starvation without any concessions. Yet, the establishment of arbitration machinery, the cross-class alliances built between supportive progressive reformers and immigrant strikers, and the emergence of a core of strike leaders in the industry were extremely important developments. During the strike, Abramowitz met both Jane Addams, who became a mentor to her, and her future husband, Sidney Hillman, who became the first president of the Amalgamated Clothing Workers Union that was born during the 1910 Chicago Garment Workers Strike.

When the ACWA was officially founded in 1914, Bessie Abramowitz became the first woman elected to the General Executive Board. She served as a union officer until her May 3, 1916, marriage, when she relocated to New York. Bessie Abramowitz Hillman remained active in the union after the births of her two daughters, Philoine, born in 1917, and Selma, born in 1921.

During the Depression, Hillman played an instrumental part in the campaign to organize the runaway shops. These shops, which manufactured primarily shirts, left New York and other metropolitan areas

to escape union jurisdiction. After the shops reopened in the rural regions of the northeastern states, the union sent organizers out to bring the workers into the union throughout the mid-1930s. Between 1937 and 1939, Bessie Hillman helped to organize the laundry workers in New York and became the first educational director for the laundry workers. Working closely with black workers for the first time in her life inspired Hillman to work on behalf of the civil rights movement. Labor rights and civil rights became synonymous in Hillman's mind for the rest of her life.

When World War II broke out, Franklin Roosevelt appointed Sidney Hillman to the Office of Production Management in Washington. Bessie stayed behind in New York to head the Amalgamated's War Activities Department, coordinating food, book, and blood drives for the troops overseas. Bessie Hillman helped to abolish the national Red Cross's blood segregation policy. The Hillmans had a personal stake in the war. Bessie Hillman lost 17 immediate family members as a result of the Nazi atrocities in Europe. Exhausted and disappointed when he was passed by for a position when the administration restructured its wartime agencies, Sidney suffered his fourth and final heart attack within a year after the war ended.

As she struggled to overcome the loss of her husband, in 1946, Bessie was re-elected to the General Executive Board as a vice president. Although she had finally achieved her rightful place in the union she helped to found, due to restrictions placed on women in the male-dominated ACWA, she found it impossible to act as she would have liked. Male union leaders assigned Hillman, the lone national female leader of a union where women composed the majority of workers, to ceremonial duties.

Bessie Hillman mounted intense campaigns for civil rights and for women's rights throughout the 1950s and 1960s. At the first Industrial Union Conference for women trade union leaders in 1961, Hillman berated the male-dominated hierarchies prevalent in trade unions, including her own. Token representation and lack of leadership positions was no longer acceptable to women unionists. Articulating her labor feminist agenda, she pressed for working women's full rights as workers, as union members, and as citizens.

In 1961, the President's Commission on the Status of Women chairperson Eleanor Roosevelt invited Hillman to serve on the Protective Labor Legislation Committee. Bessie used this national venue to continue to seek protective laws for women workers. In 1963, the commission published its report, *American Women*, and helped to lobby for the passage of the Equal Pay Act the same year. Hillman worked to

expand the opportunities for women and minority workers. In the last year of her life, she traveled to Puerto Rico to help organize men's garment workers, and when no other union would, Hillman and the ACWA organized the production workers at Xerox Company in Rochester, New York. Bessie Hillman died in New York on December 28, 1970.

HILLMAN, SIDNEY (MARCH 23, 1887– JULY 10, 1946) Founder, Amalgamated Clothing Workers of America

Sidney Hillman came out of Czarist Russia to help found the largest union of men's garment workers in the United States at the age of 27. During Hillman's 32-year tenure (1914–1946), the Amalgamated Clothing Workers of America (ACWA) grew to one quarter of a million members. Under Hillman's hand, the labor movement was transformed by the introduction of industrial democracy that promised workers social and economic justice replete with full citizenship rights both on and off the shop floor. Hillman came of age just as the United States emerged in the international arena as an industrial power. Progressive reformers were among the first to recognize Hillman's talents as a premier mediator who could skillfully negotiate on behalf of labor with the owners of industry and government officials. He devised a strategy for a "new unionism" that accepted the principles of modern management in return for greater union control in the workplace. Consequently, Hillman's major accomplishments included the implementation of collective bargaining practices throughout the clothing

industry. Sidney Hillman encouraged the union's rank and file to participate in the organization's educational activities and in the political arena to elect representatives sympathetic to labor interests. Hillman helped to create a new working-class consciousness among garment workers that demanded improved living and working conditions for all workers.

Sidney Hillman was born into a Russian Jewish family in Zagare, Lithuania, a small town in the Russian Pale of Settlement on March 23, 1887. His parents, Schmuell Hillman, a merchant, and Judith Paikin, the owner of a small grocery store, expected him to continue the rabbinical family tradition by attending yeshiva. However, Hillman cut his religious training short to take a job where his contemporaries exposed him to the Jewish enlightenment movement (*Haskala*) as well as to the classic works of Darwin, Marx, Mill, and Spencer. At the age of 15, Hillman joined the General Jewish Workers Union, the Bund, and was jailed twice for his part in demonstrations during the Russian Revolution of 1905. The months he spent in prison strengthened his Marxist convictions, thus rendering him a "half-intellectual" in an increasingly secular culture.

After his second release from prison, Hillman fled to the home of his wealthy uncle in Manchester, England, where two of his three brothers were already staying. In 1907, Hillman arrived in New York, migrating soon afterward to Chicago, where one of his former Bund comrades had a pharmacy practice. Hillman worked in the warehouse, as a stock clerk and finally as a package wrapper at Sears before being hired as an apprentice cutter at Hart, Schaffner and Marx (HSM), the largest men's clothing firm in Chicago. While Hart, Schaffner and Marx had a reputation for modern Prussian-style management, it was no less oppressive as far as wages and hours than a small sweatshop.

On September 22, 1910, a group of young women who were frustrated by a series of arbitrary wage cuts walked off their jobs at Hart, Schaffner and Marx Shop Number 5. Hillman's future wife, 18-year-old Bessie Abramowitz, led the strike. Three weeks later, the male workers, including Sidney Hillman, who at first made fun of the mostly immigrant women strikers, joined them in the streets of Chicago. Workers from other shops swelled the strike ranks to almost 40,000. The workers who participated in the conflict endured an extremely harsh winter and police brutality. Due to the refusal of the xenophobic United Garment Workers (UGW), the only men's clothing union in existence at the time to support the strikers, and staunch employer resistance, only the Hart, Schaffner and Marx workers won strike concessions. The 30,000 workers in the other shops stayed on the

picket lines until February, many eventually losing their jobs, while the HSM employees returned to their jobs with the guarantee of union recognition and the establishment of an arbitration board.

Despite the mixed results spelling defeat for the workers outside the HSM shops, the strike proved pivotal for the men's garment workers. Hillman emerged as a leader and benefited immensely from the friendship of the labor lawyer Clarence Darrow. Over the next few years, both Darrow and John E. Williams, the first chairman of the Board of Arbitration under the HSM agreement, became important mentors to Hillman, schooling him in English and in the art of industrial mediation. The Board of Arbitration provided for in the strike agreement marked the beginning of a collective bargaining process in the men's clothing industry. Hillman and the other young strike leaders also made important connections to the Chicago reform community that unconditionally supported the strikers, including Hull-House residents Jane Addams, Ellen Gates Starr, and Grace Abbott; the Women's Trade Union League president Margaret Dreier Robins; the progressive lawyer Harold Ickes; and the Chicago Federation of Labor (CFL) president John Fitzpatrick. The solidarity built among the diverse ethnic groups of men's garment workers in Chicago laid the foundation for the Amalgamated Clothing Workers of America. Hillman impressed all who observed him in action, earning a reputation as the leading labor statesman of his generation.

Following the strike, Hillman served as a business agent for the reconfigured Local 39 and also helped to organize workers in other Chicago shops. In 1914, he accepted an invitation from the International Ladies Garment Workers' Union (ILGWU) to move to New York to administer its Protocol of Peace, the system for arbitrating grievances in the women's clothing industry. While in New York, Hillman spent some time with Louis Brandeis, a progressive lawyer who had helped the strikers in the 1910 Chicago Strike and was committed to the employment of arbitration mechanisms to achieve industrial peace. Several months later, Hillman received a telegram from a group of insurgent workers attending the UGW's convention in Nashville, enlisting him as the new president of the union they were in the process of establishing. After some hesitation, Hillman accepted the presidency in December 1914 and returned to Chicago to help get the Amalgamated Clothing Workers off the ground and to marry in 1916 Bessie Abramowitz. The Hillmans relocated to New York so that Sidney could work at the union's headquarters. Sidney Hillman devoted his early union years to organizing the many ethnicities in the leading

garment centers of Chicago, New York, Baltimore, Philadelphia, and Rochester.

During World War I, Hillman worked to facilitate arbitration agreements guaranteeing collective bargaining practices in the military uniform industry. He extended his influence outside the labor movement, working closely with influential progressive leaders in and around the government including Florence Kelley, the secretary of the National Consumer's League, and Felix Frankfurter and Walter Lippman, both officials in the secretary of war's office.

In the postwar years, the ACWA embraced Hillman's vision for "new unionism," which combined the concepts of scientific management and worker cooperation. True to the ACWA slogan, "To touch the worker from cradle to grave," the union introduced social welfare benefits such as unemployment insurance for Chicago workers, and cooperative housing projects and banks in New York. Although offering an alternative to the welfare capitalist practices of some of the nation's largest corporations, the union faced a number of challenges during the 1920s that threatened its very existence. In the aftermath of the red scare, unions—particularly those with ties to Russia like the ACWA, led primarily by Russian Jewish immigrants who supported the Russian Revolution from abroad—were suspect. Sidney Hillman successfully battled the anti-union sentiment prevalent in American society. He defeated extortion attempts from union racketeers and power coups by a small group of leftists within the union. Hillman successfully purged the corrupt elements within the union's ranks by the end of the decade. He also encouraged the development of educational and cultural programs to forge a sense of solidarity among the diverse unionists. Programs that offered English and citizenship classes proved popular among immigrant workers. Gradually, separate foreign language locals were dissolved and replaced with locals based on job types.

The economic decline that began in the late 1920s spiraled out of control by the early 1930s, exacting a high price for the Amalgamated. The stock market crash of 1929 and the Great Depression that followed virtually decimated the ACWA. Membership declined from 177,000 in 1920 to fewer than 110,000 by 1929. In the midst of the unfavorable political and economic climate, Hillman's 1931 proposal before the United States Senate Committee seeking the establishment of a national economic council representing agriculture, labor, and industry fell flat. Franklin Delano Roosevelt's election to the presidency marked the dawn of a new day for labor. Sidney Hillman recognized the opportunity for increased government responsibility and participation

in the lives of the workers in the overtures the new president made to labor.

During his administration, Franklin Roosevelt amassed a national coalition of reformers, manufacturers, and labor leaders that included Sidney Hillman. With remarkable speed, Hillman ascended from the margins of American society to a government insider instrumental in shaping labor policy. Roosevelt named Hillman to the Labor Advisory Board of the National Recovery Administration (NRA) in 1933 and to the Industrial Recovery Board in 1934. Closer to the center of power, Sidney Hillman fortified labor's position by successfully advocating for the enactment of codes to standardize wages in the clothing industry. When the United States Supreme Court declared the National Industrial Recovery Act, with its provision for workers' rights to bargain collectively with their employers through representatives of their own choosing unconstitutional, Hillman helped to draft the Wagner Act. The 1935 passage of the National Labor Relations (or Wagner) Act guaranteed labor's right to organize and established collective bargaining practices as the foundation for industrial relations. The act also established the National Labor Relations Board (NLRB) to help protect workers' rights by ensuring that they were free to choose to be represented by unions. Hillman also lobbied for the passage of the Fair Labor Standards Act in 1938, which provided minimum wage and maximum hour regulations for many American workers.

By the mid-1930s, Hillman attempted to solidify the ACWA's place in the labor arena by affiliating with the American Federation of Labor (AFL) in 1933. But the Amalgamated was expelled from the AFL three years later. Due to the defeat of the industrial union resolutions at the 1935 AFL convention, Hillman became a founding member in the Committee for Industrial Organization (CIO). In 1938, the CIO held its first official convention and changed its name to the Congress of Industrial Organizations. Sidney Hillman became a CIO vice president. As the ACWA regained its strength, it supported the campaign for industrial unionism in the automobile, rubber, steel, and textile industries. In 1937, Hillman also helped to launch the Textile Workers Organizing Committee, which eventually became the Textile Workers Union of America. The rise of these new unions and the emergence of a new national organization, the CIO, marked the dawn of a new day for the labor movement.

Throughout the late 1930s, as labor and politics intertwined, Hillman established himself as a political entity. He made valiant efforts to coalesce the labor movement's varied political interests into a single association that would rally behind Roosevelt. In

1936, Hillman played a vital part in the founding of Labor's Non-Partisan League (LNPL). Roosevelt's re-election that same year represented a triumph for labor. As they worked to organize the industrial masses, Hillman and other CIO leaders hoped that someday labor could shepherd its own independent party.

During the war years, labor continued to make substantial strides under Hillman's guidance. As a member of the National Defense Advisory Commission (NDAC), he insisted that all government defense contractors obey labor laws and abide by a maximum 40-hour workweek. He encouraged the government to withdraw contracts from companies found to be in violation of existing legislation. In 1941, he achieved unprecedented power when FDR promoted him to the position of associate director of the Office of Production Management (which replaced the NDAC), where he was charged with guaranteeing a reliable supply of workers for the war effort. Yet 1941 marked a turbulent and strike-prone year for American workers that forced Hillman's hand and marked the decline of his influence in the Roosevelt administration. Appointed to the Labor Division of the War Production Board in 1942, he devised a plan for sweeping social and economic reform that ensured union security but failed to win the president over. In April 1942, FDR created the War Manpower Commission, bypassing the Amalgamated president and appointing the former governor of Indiana, Paul McNutt, to lead the agency instead. With his health impaired by the pressure of national defense work and worried about his family in war-torn Eastern Europe, Hillman suffered a major heart attack in the early summer of 1942 that left him hospitalized for months.

Out of a government post, nonetheless Hillman remained committed to Roosevelt and loyal to the Democratic Party. He created the CIO's Political Action Committee (PAC) in mid-1943 and immediately became its chairperson. He spent the remainder of the war years enlisting the CIO's political machinery in Roosevelt's name. The 1944 election elevated Hillman to the national spotlight when Republicans tried to discredit Roosevelt in the press by suggesting that the United States government was in the hands of a foreign-born Jew in the person of Sidney Hillman. The Republicans tried to create the impression that Hillman wielded unscrupulous power over the presidential administration. *The New York Times* reported that when the Democratic Party leaders asked for an endorsement of the vice presidential nominee, FDR supposedly replied, "Clear it with Sidney." Despite the negative publicity, Hillman was able to swing the labor vote to elect Roosevelt to an unprecedented

fourth term. As World War II came to an end, Hillman allied with the British Trade Union leader Sir Walter Citrine to create the World Federation of Trade Unions, an organization that sought an official advisory position in the postwar arena. Much to Hillman's dismay, as the victor nations scrambled to oversee the rebuilding of Europe, the organization and its goals were not taken seriously.

The intensity with which Hillman performed his work exacted an overwhelming personal toll. In the months following the war's end, the Hillmans learned that they had lost 17 immediate family members to Hitler's wrath. Exhausted, Sidney Hillman succumbed to his fourth heart attack at the age of 59 and died at his Point Lookout cottage on Long Island on July 10, 1946. In the struggle to establish a more egalitarian society, Hillman left a legacy of landmark labor legislation that continues to protect workers' rights and improve their living standards. He is remembered with a number of health centers honoring his name and with the annual presentations of the Sidney Hillman Foundation, established in 1950, which makes annual awards for excellence in media and publishing exemplified by the ideals of Sidney Hillman.

HISTORIOGRAPHY OF AMERICAN LABOR HISTORY

For nearly three quarters of a century, between the 1880s and the 1950s, the writing of labor history remained primarily the province of academic labor economists and a handful of amateur historians

linked to specific trade unions and left-wing political parties. Sociologists also wrote numerous contemporary studies of working-class communities that drew upon knowledge of the past to illuminate the present. Before the end of World War II, however, few professionally trained, academic historians ventured into the field of labor history.

Because economists and partisans dominated the writing of labor history at first, it was usually written to promote specific public policies or special causes. Most of the amateur labor historians wrote on behalf of their unions or political parties, and enjoyed little readership beyond their own organizational circles. The labor economists had a different agenda. Nearly all of them, beginning with perhaps the first of the breed, Richard Ely, a professor of economics at the University of Wisconsin, advocated trade unionism and collective bargaining. They acted as social reformers and many of them were among the most prominent figures in the progressive movement of the early twentieth century, pioneers of the "Wisconsin idea," and of such concepts as workers' compensation, unemployment insurance, and social security. Their interest in public policy and their dual role as policy makers shaped the labor history that they wrote.

Labor history as a field of scholarship can best be said to begin with the work of John R. Commons, a protégé of Ely and the lead author of the first multi-volume history of labor in the United States. Commons orchestrated not one but two massive multivolume works devoted to labor history. He edited an 11-volume documentary history of U.S. industrial society from the colonial times to 1880 that covered nearly every aspect of labor history, including the place of indentured servitude and slavery. The 11 volumes provided a foundation for the narrative labor history written by Commons, his students, and those influenced by the "Wisconsin school" of labor history. Commons's four-volume history of labor in the United States, published between 1918 and 1935, defined and dominated the field for decades. Commons himself wrote only brief introductions to two of the four volumes; the remainder of the first two narrative volumes carried the story of labor from colonial times to 1896, and the third volume, a collection of essays on structural rather than historical aspects of the subject, was written entirely by students and faculty associates of Commons. The fourth and perhaps most famous volume in the series, a history of American labor from 1896 to 1932, was the work of Selig Perlman and Philip Taft, two of Commons's more notable former students, and themselves leading long-term scholars of American labor history.

The Commons volumes shared a teleological quality, presenting the history of labor as the unfolding of a tale in which working people shed their individualistic behaviors and aspirations in order to accept their place as a permanent, dependent wage-earning class that could best serve its own interests by uniting collectively in responsible trade unions that bargained with employers about how to distribute equitably the wealth created by capitalist enterprises. Selig Perlman, the most intellectually ambitious of Commons's students, provided a theoretical framework for the history he and other labor economists wrote. Perlman asserted that workers shared a scarcity consciousness that led them to stress job control and to create unions that regulated access to jobs through strict conditions of apprenticeship, rigid rules for union membership, and closed-shop agreements with employers. For Perlman, the American Federation of Labor (AFL) craft unions that practiced job control through tightly controlled memberships and closed shops reflected the scarcity consciousness and core beliefs of American workers. Inclusive unions that admitted all workers, promoted class conflict, and sought the abolition of capitalism were, for Perlman, the product of the fevered imaginations of intellectuals that had no purchase among ordinary workers.

Nearly all the labor history written between 1918 and the 1950s shared some part of the Commons-Perlman approach. The economics department at The Johns Hopkins University and the university's press, for example, published a series of books that examined historically how trade unions regulated the labor market, restricted their memberships, exercised their labor market power through strikes, boycotts, and union labels, and engaged in contract bargaining with employers. Robert F. Hoxie and Norman Ware, two labor economists who wrote partly outside the Commons-Perlman framework, in their histories of organized labor between 1860 and 1918, nevertheless treated labor movement opponents of job-conscious AFL-style craft unionism, whether the Knights of Labor or the Industrial Workers of the World (IWW), as utopians whose visions lacked deep resonance among most workers and who were doomed to fail. Almost without exception, all the books written about labor history focused on the stories of individual unions, union federations, famous strikes, and routinized collective bargaining between unions and managements.

Even the most notable dissenter from the Commons-Perlman school, Philip S. Foner, a historian not an economist, wrote a multivolume history of labor in the United States and a myriad of separate studies that scarcely varied from the narrative model developed by the Wisconsin school. For Foner, like Commons, Perlman, Taft, and all the

labor economists, labor history was primarily the story of trade unionists, strikes, bargaining with employers, union politics and lobbying, material factors that could be measured and quantified and not cultural factors that fell outside the sphere of union institutions and that eluded easy measurement. Foner followed the original script but reversed its heroes and judgments. For him, the AFL, while an advance over the utopian Knights of Labor, represented a setback for the mass of working people. Its leaders were men who neglected or oppressed African-Americans, Asians, and even southern and eastern European immigrants, women, and common laborers. They collaborated with employers rather than battling them; they disciplined their followers rather than encouraging them to wage class conflict; and they made peace with capitalism rather than overthrowing it. Foner had his own teleology. In his narrative, labor history must lead ineluctably to the rejection of job-conscious unionism, the triumph of socialism (communism after November 1917), and the end of capitalism.

A French historian of labor, Georges Haupt, captured precisely the limitations of the interpretive model built by such scholars as Commons, Perlman, and Foner. Their history, he wrote, "narrows the dimensions of the workers world and encloses it within a framework that is fixed and congealed. It does not focus on the working class itself but on its organizational and ideological representations." Such studies, the Frenchman concluded, "affect at the very most a small circle of partisans or lovers of historical detail."

Toward a New Labor History

Although most histories of labor continued to be written by labor economists or by Marxist-oriented scholars like Foner and to focus primarily on white male workers, their unions, and their struggles, a number of sociologists, some influenced by Marxism, began to write about different aspects of the working-class experience. Even Commons and Perlman hinted at a more capacious version of labor history. Perlman noted that the history of unions reflected workers' constant adaptation to their environment, both material and mental, through which they struggled not as "a class-conscious proletariat" but as American citizens with their own ideal of liberty. Here Perlman presaged the concept of "republican citizenship" that evolved into a staple of 1980s new labor history. Another Commons disciple expressed sentiments that decades later might better be associated with the ideas of Herbert Gutman, who some credit as the founding

father of the “new labor history.” Alluding to the “great migration” of African-Americans north during World War I, the Commons team member noted, “their manner of living and their modes of thinking had to be recast. The readjustment from the *modus vivendi* of agricultural peasants to that of industrial wage earners involved as great changes in their lives as in those of European peasant immigrants to the United States” (Commons, vol. 3, p. 44).

Other scholars, however, seized such kernels of scholarly complexity and turned them into more expansive portrayals of labor history. Vera Shlakman and Caroline Ware treated the world of women workers in the New England textile industry, most of whom lived their daily lives beyond the reach of trade unions or other institutionalized manifestations of the labor movement. Shlakman and Ware probed the factors that moved women into textile towns and factories, how their experiences as full-time wage workers shaped their daily lives outside the factory as well as within its gates, and the particular kind of female culture these workers created. Other observers and scholars wrote a series of books that dissected the lives and cultures of southern textile workers, most of whom entered the mills as family units. Although many of these studies were inspired by a series of strikes that swept across the Southern Piedmont between 1928 and 1934, the vast majority of mill families remained beyond the reach of unions. For most of them, religion and the church occupied a far more vital and influential part of their daily lives than trade unionism, as the study by the sociologist Liston Pope, *Millhands and Preachers*, attested. Sterling Spero and Abram Harris wrote the first general history of African-American workers in the industrial age, and Horace Cayton and George S. Mitchell described in their *Black Workers and the New Unions* how the labor upheaval of the 1930s transformed the relationship between African-American workers in mass-production industry and unions, turning it from one founded on mutual antipathy and despair to one based on cooperation and hope. The Yale sociologist E. W. Bakke published two books that portrayed the daily lives, family relations, cultural values, political practices, and search for work by the unemployed in Depression-era New Haven. Alfred Winslow Jones did much the same for the rubber workers of Akron, Ohio, using opinion-sampling methods to uncover how that city’s industrial workers felt about such issues as corporate power, private property rights, religion, education, and politics. Had any historians paid attention to such scholarship in the 1930s and 1940s, they might have sensed a whole new way of writing the history of labor in the United States.

When historians, as distinguished from labor economists, industrial relations mavens, and sociologists, finally turned their attention to labor history in the late 1940s and 1950s, they concentrated on the staple agenda of traditional U.S. history. The big question asked by historians writing about workers was, did labor support Andrew Jackson? They questioned Arthur Schlesinger Jr.’s re-interpretation of Jacksonian Democracy, which claimed that the political movement drew its strongest support among workers in the nation’s eastern seaboard and interior cities, not among western farmers and frontiersmen. Most of the historians who asked the question answered in the negative and even doubted that workers in the Jacksonian era thought of themselves as a class and behaved as one. One of the young historians who joined the debate, Richard Hofstadter, later one of the nation’s most distinguished scholars, would forever remain linked to the “consensus school” of historical interpretation and to the notion that the United States was fundamentally a one-class, middle-class society. Alone among that group of historians, Edward Pessen continued to write books and articles about labor history, though that was never his primary interest.

What later came to be known as the “new labor history” emerged without proclamations, publicity, or even awareness that such a subfield existed. The three names most commonly associated with the creation of the “new labor history”—David Brody, Herbert Gutman, and David Montgomery—became linked to labor history only after its invention as a subfield of history. Indeed, the book that in some ways marked the birth of a new labor history, Irving Bernstein’s *The Lean Years* (1959), remained the work of an industrial relations scholar. A year later, when David Brody’s *Steelworkers in America: The Non-union Era* appeared, reviewers failed to stress its contribution to labor history. Instead, they treated the book largely as an addition to the growing body of literature on the impact of industrialization and immigration on the modernization of the United States. Only with hindsight can Brody’s book be characterized as the opening salvo in the historians’ emerging critique of the Commons-Perlman version of labor history. What made Brody’s book notable was its emphasis on a nonunion labor force and its comparison of the cultures and behaviors of immigrant common laborers and U.S.-born skilled workers. Brody highlighted the aspects of working-class experience that Commons, Perlman, et al. neglected; he opened the pathways that other historians of labor would soon follow.

Yet nearly a decade passed before the sort of history that Brody wrote in 1960 had a real impact on

professional history in the United States. During that time, omens of what later were characterized as the “new labor history” appeared. Most important perhaps were a brilliant essay and an epic book by the English historian Edward P. Thompson. His essay on the “moral economy of the premodern workers” and his larger book, *The Making of the English Working Class*, altered how historians came to understand and to write labor history. Thompson ended the sway of mechanical Marxists and nuts-and-bolts labor economists by endowing ordinary working people with nonmaterial customs, traditions, and beliefs, many of religious origin, that enabled them to resist their superiors and to act as their own historical agents in the making of a working class. Slowly at first and rapidly thereafter, historians of the United States would try to apply Thompson’s methods and concepts to the history of American workers. Little noticed at that time, a young American historian had been publishing articles in minor state historical journals that paralleled some of Thompson’s concerns and findings. That young scholar, Herbert Gutman, studied theretofore obscure events in labor history: strikes and riots in small railroad-dominated communities, a demonstration by unemployed workers in New York City, a comparison of a strike-torn coal-mining community and an iron enterprise-dominated city, and industrial conflict and social mobility in Paterson, New Jersey. In those articles, Gutman illustrated how workers viewed their world as well as the traditions and values that governed their behavior.

As the 1960s drew to an end, labor history still seemed to be peripheral to U.S. history’s dominant concerns. Reviewers treated the eminent labor historian David Montgomery’s first book *Beyond Equality* (1967) more as a re-interpretation of civil war and reconstruction historiography than as a venture in the writing of labor history. And they deemed Melvyn Dubofsky’s first book, *When Workers Organize* (1968), as primarily a contribution to the historiography of Progressivism. But then in a paper delivered in 1969 and published a year later, David Brody announced the coming of age of labor history, an event he associated with the publication of two books in 1969: Irving Bernstein’s *Turbulent Years* and Melvyn Dubofsky’s *We Shall Be All*. Soon Brody and others heralded a “new labor history” that they distinguished from the old history associated with Commons and Perlman. The “old” had limited itself to the story of unionized workers for whom AFL-style craft qua business unionism represented the sine qua non of labor history in the United States. The “new” took as its province the entire working class, the vast majority outside of unions as

well as the unionized minority; it treated neither the AFL nor business unionism as the be-all and end-all for organized labor and its history; it preferred contingency to determinism, and it treated workers as active citizens who made their own history.

Not only did the field of labor history flourish in the 1970s, but its practitioners also won greater respect within the larger discipline of history. Gutman, whose scholarship had appeared previously in peripheral journals or had remained unpublished, now found his work published in U.S. history’s two primary scholarly journals of record: the *American Historical Review* and the *Journal of American History*. In 1975, one of the most respected trade publishers released a collection of Gutman’s major published and unpublished essays and articles under the title *Work, Culture, and Society in Industrializing America*. Allan Dawley won the Bancroft Prize in History for his book on the shoe workers of Lynn, Massachusetts, and by the end of the decade a bequest from the family of the late Philip Taft established a Taft Prize for the best book published annually in labor history.

A burgeoning series of community studies, meantime, sought to determine the realities of occupational and social mobility across the mid- and late- nineteenth century, the most famous of which were Stephen Thernstrom’s dissections of mobility among working people in Newburyport and Boston, Massachusetts. Other community studies challenged the “consensus school” of history, seeking to prove that a process of proletarianization in which artisans were separated from their tools of production created a distinct working class conscious of its subordinate position and determined to change it through collective action. Unlike the Commons-Perlman interpretation, which tightly linked class and trade unionism, the “new labor history” portrayed class consciousness as manifested in oppositional cultural, ideological, and religious ways that built on historical traditions and customs. Many of these younger labor historians saw themselves as disciples of E. P. Thompson and as scholars who had uncovered “the making of the American working class.”

If anything, the myriad of community studies, a stream that never slackened, led to confusion as much as to enlightenment. Rather than revealing a working class conscious of its own interests, such studies disclosed a working class fractured along lines of ethnicity (national origins), race, and gender. Instead of attesting to the “making of an American working class,” the new labor history revealed many working classes in a constant state of decomposition and re-composition. David Brody and David Montgomery sought to bring a measure of order out of the scholarly chaos in separate essay collections that focused

on the workplace as the site of a collective job consciousness (in Brody's case) and of a workers' control ethic based on the autonomy and manliness of the skilled worker (in Montgomery's). Yet, when workers returned to their neighborhoods from their places of labor, they separated themselves on the basis of ethnicity, race, religion, and even politics. The more that was written and published about labor history, the more diffuse the subject grew. In 1984, the older and the younger practitioners of the "new labor history" met in a conference funded by the National Endowment for the Humanities, at which they discussed how to bring synthesis to the field. That conference, which gathered at Northern Illinois University, went about its business in a metaphorical and literal fog. Rather than establishing the basis for a new synthesis in American labor history, the conferees further fractured the field by raising the subjects of gender and patriarchy. Now, not only did labor historians have to contend with workers divided by ethnicity, race, and religion, but they also had to recognize that Montgomery's manly craftsman and Brody's job-conscious trade unionist were but a part of a working class that must perforce include its women. After such scholars as Alice Kessler Harris and Mari Jo Buhle laid down the challenge at the 1984 conference to treat gender as a vital aspect of labor history, historians have written a flood of books and articles on women workers, women and the labor movement, and masculinity as a central characteristic of the male worker.

The large, new body of scholarship about gender has clarified how women's work, career, and life trajectories differed from those of men. It attempted to explain how women and their work were marginalized by men and their unions as well as in most of the extant literature about the history of labor. Its practitioners interrogated the concept of skilled labor, suggesting that gender (masculinity), not knowledge acquired through years of training, created skill. They argued that concepts of masculinity and femininity defined nearly all aspects of work and the differential beliefs and behaviors of male and female workers and union members. Several gender scholars even credited the labor movement's hyper-masculinity with the movement's Pyrrhic victories and too-frequent blatant failures. Yet many of the interpretations and conclusions drawn by the historians of gender rested more on putative theories and assertions than on careful analysis or firm evidence. Indeed, much of the scholarship on gender and labor could be read to re-inforce prevailing beliefs in the field of labor history rather than to transform core knowledge in the field. In fact, one might argue that

gender scholarship has served more to add to our knowledge of labor history than to reconceptualize how we perceive and comprehend the subject.

Goodbye to the New Labor History

As the twentieth century drew to its close, there was little new about writing "history from below," giving voice to the heretofore inarticulate, perceiving the diversity of working people, or introducing gender as a category of historical analysis. Not only had labor history created a valued place for itself in the larger discipline, it had become as diverse as the people and institutions that it studied. Labor economists and industrial relations authorities continued to write institutional histories of trade unions, labor markets, and collective bargaining. Sanford Jacoby, for example, wrote two of the finest books on the subject of corporate labor policies: *Employing Bureaucracy* and *Modern Manors*. Historians published books and articles about the rise and fall of trade unions and labor federations, among which the most notable might have been Robert Zieger's massive history of the Congress of Industrial Organizations, which delineated the lives of such labor leaders as John L. Lewis, Sidney Hillman, Walter Reuther, Jimmy Hoffa, and Samuel Gompers. Radical movements and industrial conflicts also remained essential parts of labor's story. Historians as well as sociologists persisted in studying local communities, and for them, as well as for many other scholars of labor, ethnicity, race, and gender remained vital parts of labor's history.

Two sets of scholars, however, dismissed the "new labor history" as old. One group, influenced by post-structuralism and postmodernism, rejected labor history's emphasis on measurable or quantifiable data, its focus on the material aspects of everyday life, and its acceptance at face value of the languages of trade unionism and working-class radicalism. These scholars became associated with what was known as the "linguistic turn" in labor history, a movement that borrowed from linguistic scholars, literary critics, and philosophers and that treated language rather than material factors as the source of human consciousness, including class consciousness. Language, rather than the forces and relations of production, constructed cultural meanings. Language thus created whatever sense of class existed. Hence, cultural studies rather than labor history held the key to understanding the working-class experience. Scholars attracted to the "linguistic turn" have been heavily involved in rewriting the history of gender, as attested to most

notably by Joan Scott's leading role and by the stress on language and culture in the writings of Alice Kessler Harris, Nan Enstad, and Elizabeth Faue, among others.

A second group, associated most closely with the writings of David Roediger, insisted that the key to opening the hidden history of American workers was the concept of "whiteness." For them, "whiteness" and American citizenship acted as synonymous terms. Those workers defined as white occupied a privileged position causing each generation of new immigrant workers to struggle to define themselves as white, a possibility denied to those of African, Asian, and Native American (thus many Hispanics) origins. Thus, race had to be as much about being white as being black, brown, red, or yellow. Like the scholars and historians who took the "linguistic turn," the historians of whiteness focused more on language and cultural practices, both of which they read in particular ways, than on hard, or measurable, archival and documentary evidence to prove that Caucasian workers treasured their white skins and the privileges it conveyed. Because most of the scholars of whiteness, Matthew Frye Jacobson and others as well as Roediger, rely for their evidence mostly on language, which can be read in multiple ways and malleable cultural concepts, their findings have been subject to withering criticisms, most notably by Eric Arnesen and Peter Kolchin.

Yet another group of scholars unwilling to jettison either the old or the new labor history set as its agenda the internationalization of U.S. labor history. Aware that the history of workers in the United States has its own peculiarities, these historians insist that there is little exceptional about the American experience. From early on in the nineteenth century, capital and labor circled the globe. In the heyday of industrialization (1870s–1920s), the labor force in the United States was overwhelmingly immigrant in composition, composed in the main of working people who carried with them traditions and customs as well as concepts about worker movements that originated in their lands of origin. And such immigrant workers, as countless new studies have proved, rarely broke their links to their original home places, continuing to communicate with those who remained behind. The late twentieth century saw this process repeated on an even grander geographical stage, with capital circulating around the world more rapidly than ever and peoples from all continents moving in search of jobs and income. For a new generation of American labor historians, then, transnational capital, worker, and labor movements became the subject of their research and writing.

If labor history at the start of the twenty-first century no longer carried the freighted charge it had

when its "newer" version was invented in the 1960s, it was well rid of that burden. Its practitioners have indeed restored voice to the previously inarticulate, turned those at the bottom of society into historical subjects with will and agency, and portrayed working people in all their ethnic, racial, gendered, and cultural diversity. They have continued to write solid institutional histories and substantial biographies; add more and more working-class communities to our knowledge base; broaden substantially our understanding of nonwhite workers; explore how gender has governed the behavior of workers; interrogate the language and cultural practices of working people; and probe the ever-changing relationship among workers, the state, and the law. Labor history has become a movable feast.

HITCHMAN COAL & COKE COMPANY v. MITCHELL (1916)

At the turn of the twentieth century, labor unions were influencing the free market competition among coal operators in the United States. Nonunion companies in the South that paid their workers under union wages were outselling companies from the Midwest that employed union miners. The union operators that comprised the Central Competitive Field sought the assistance of the United Mine Workers (UMW) to standardize miners' wages to even the competition. Nonunion operators fiercely resisted the UMW's subsequent organizing campaigns in southern mines, generating a number of lawsuits. The definitive case that emerged out of this conflict was from West Virginia.

The lawsuit filed by the Hitchman Coal & Coke Company (HCCC) in 1907 against the United Mine Workers (UMW) executives was based on a history of volatile relations between the company and the union. In 1902, the HCCC opened a mine in Marshall County, West Virginia. Though it initially hired only nonunion miners, within a year, the UMW successfully organized the workers. That year and again in 1904, the miners went on strike over wages. Both strikes settled after several weeks, with the Company reporting significant financial losses after each strike. In 1906, the Hitchman miners went on strike again, this time in support of a strike called by the UMW over wage disputes by other regional miners. The HCCC responded aggressively.

The HCCC determined to transform its mine into a nonunion workplace. It re-opened and hired only those miners who professed they were not union members and agreed to keep the mine nonunion. These accords, commonly called yellow-dog contracts, included discharge as a penalty for violation. When UMW organizers attempted to persuade the new Hitchman miners to secretly join the union in violation of the yellow-dog contracts, the HCCC secured an injunction against UMW President John Mitchell and other executives barring them from soliciting the miners and initiating a strike.

In 1917, the United States Supreme Court upheld the legality of the yellow-dog contracts and the injunction. The majority held that the same liberty that

allowed workers to form unions allowed other workers to agree not to form unions. It acknowledged that workers had a right to unionize, but asserted it was not an absolute right, insisting that it must be balanced against the company's conflicting property right to compete in the free market. Only Justice Brandeis's dissent drew on the emerging Progressive legal theories that rejected the classical reasoning that privileged employers' right to compete over labor's right to organize and strike.

In 1931, Congress negated the holding in *Hitchman* by passing the Norris-LaGuardia Act, which outlawed yellow-dog contracts, validated labor's right to form unions, and prohibited federal courts from issuing injunctions against unions engaged in peaceful activities. The Supreme Court upheld the Act in 1938. The Act, however, did not settle the issue of whether laborers could establish a closed shop. Though the National Labor Relations Act (1935) did permit employees and employers who were covered by the Act to jointly agree to hire only union workers, the Taft-Hartley Act (1947) effectively outlawed the closed shop, supporting an employee's right to work and not join a union. Yellow-dog contracts, nonetheless, remained illegal.

HOBOES

Hoboes were migrant workers—primarily men—who stole rides on freight trains to move about the country in search of work, from the time the economic crisis of the 1870s created the first wave of mass unemployment. They found their jobs in the highly seasonal occupations of the West: crop harvesting, logging, mining, and especially railroad construction and maintenance. During the winter slack season, they made temporary homes in the transient districts of Chicago, Minneapolis, Kansas City, Spokane, Denver, Seattle, and

Meal time at the homeless men's bureau (for unattached men). Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USF34-010131-D].

Oakland. By the mid-1920s, this seasonal migration was in decline, but the Great Depression swelled the ranks of the hoboes and created a new lore of poverty, travel, and rebellion. A small number of people continued to “ride the rails” throughout the twentieth century, but poor workers increasingly favored travel by automobile.

The exact origins of the term “hobo” are not known, but the most likely guess is that it was a modification of a greeting among western railroad workers—“Ho, Boy!” Another possible origin is “hoe boy,” indicating an agricultural laborer. In the early twentieth century, the term “hobo” was frequently invoked as part of a hierarchy of vagrant workers. “Hoboes” were said to be those who traveled to find work, “tramps” were those who worked to support their travels, and “bums” were those who neither worked nor traveled. However, seasonal migrant laborers were just as likely to be known by varied occupational designations: harvest hand, lumberjack, and gandy dancer (railroad worker), to name a few.

Popular opinion associated hoboes with various social ills: crime, alcoholism, prostitution, and, more covertly, homosexuality. The seasonal workforce had its share of outcasts, dangerous criminals, and lost souls, but in the aggregate was a cross-section of working-class men in North America. As the labor

economist William Leiserson wrote in 1916, “practically every wage earner” was in the migrant labor pool at one time or another. The result was a wide personal familiarity with the excitement of hoboing, as well as with the deprivation, physical strain, and exploitation of seasonal labor. With the growth of transient districts in Chicago, Minneapolis, and the West Coast towns, the world of migrant workers became linked with that of nonconformist artists, radicals, and sexual minorities. These districts fostered the popular unease with migrant culture but also offered an opportunity for voyeuristic nonmigrants to dabble in the wild world of the outcast.

Between 1915 and 1924, the Industrial Workers of the World (IWW) made significant gains organizing migrant workers, especially in timber, wheat harvesting, and oil pipeline construction. In 1915, the organization formed the Agricultural Workers Organization (AWO) with the goal of unionizing the wheat harvest of the Great Plains. This annual work event drew upwards of 100,000 people to the wheat belt, where they worked a succession of jobs following the harvest northward from Oklahoma to Canada. The AWO (renamed the Agricultural Workers Industrial Union, AWIU, in 1917) quickly became the largest and wealthiest union within the IWW organization. Following its members into other seasonal trades, the

union funded organizing drives among lumberjacks in the upper Midwest and the Pacific Northwest, iron miners in northern Minnesota, and oil workers in the southern Great Plains.

This success drew the ire of employers and law enforcement officials, and the AWIU was almost completely suppressed between 1917 and 1919, with most of the organizers in jail. The union enjoyed a brief resurgence that ended with the IWW's factional split in 1924. By that time the seasonal labor market was in decline due to mechanization in wheat harvesting and construction, as well as a general decline in railroad building, and a shift toward automobile travel over trains.

The IWW drew many of its most memorable songs from these hobo workers, including *Hallelujah, I'm a Bum*, *The Big Rock Candy Mountain* (by Haywire Mac McClintock), and *The Preacher and the Slave* and *The Rebel Girl* (by Joe Hill). Their irreverent lyrics lampooned the religious missionaries and celebrated travel as much as they did the movement. Other activists learned to identify with the hobo world, even if their connections were scant. Although he was a commercial artist by training, Ralph Chaplin, the author of *Solidarity Forever*, highlighted his own youthful experiences in the harvest labor force. During the 1930s, country and western artists popularized the hobo song tradition, although with the exception of Woody Guthrie, most were not politically inflected.

HOFFA, JAMES P. (1941–) International Brotherhood of Teamsters

James P. Hoffa assumed the leadership of the International Brotherhood of Teamsters on March 3, 1999. As general president, Hoffa attempted to reverse the decline in membership in one of the nation's oldest and most influential labor unions. The Teamsters union had been plagued by corruption, mob

influence, internal divisiveness, and ineffective leadership. Son of James R. Hoffa, a former general president of the International Brotherhood of Teamsters who disappeared mysteriously in 1975, Hoffa aimed to rejuvenate the union's membership rolls, its public image, and political influence through stronger grassroots organizing. During his term as president, Hoffa led the highly controversial move to split from the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO), ending the union's 50-year association.

Background

Born on May 19, 1941, in Detroit, Hoffa entered the labor force as a teenager in Michigan and Alaska, working as a loader, driver, and operator of heavy equipment. At the age of 18, Hoffa earned his first union card and was inducted into the Teamsters by his father. In high school, he played football and graduated with honors. In 1963, Hoffa attended Michigan State University, where he continued to play football and earned a degree in economics. He received a law degree in 1966 and the following year worked in the Michigan State Senate through a Ford Foundation Fellowship. Between 1968 and 1993, Hoffa practiced labor law, specializing in workers' compensation and Social Security cases, gaining increasing visibility in the union while representing Teamsters Joint Councils and union chapters. President George W. Bush appointed Hoffa to the Council on the 21st Century Workforce in 2002. Hoffa also held a seat on the Secretary of Energy's advisory board that same year.

Hoffa's first attempt at running for general president of the Teamsters was foiled by Ron Carey in 1996. Hoffa won his second bid for general president of the union in 1998 after Carey, accused of money laundering, was barred from running again. Vowing to boost membership in the Teamsters, Hoffa set out on a rigorous plan to rid the union of corruption and its association with organized crime. Hoffa claimed that years of internal strife and ineffective leadership, combined with the effects of a growing global economy, had contributed not only to a decline in Teamster membership, but to labor's influence on the whole.

General President of the International Brotherhood of Teamsters

Upon taking office, Hoffa set several goals for the union, including strict fiscal reform and budgetary

accountability. He increased efforts in fighting unfair trade practices, specifically with nations such as Japan, Korea, and China, nations whose habit of dumping cheap goods into the American market hurt American workers. While he acknowledged that some aspects of globalization were unavoidable, Hoffa insisted the United States needed to insulate its strong, robust economy from the detrimental effects of outsourcing labor and importing cheap foreign goods. He advocated for stricter health and safety regulations, increased Teamster contract negotiations, and stronger enforcement of existing agreements. Although crediting the government in combating years of corruption, Hoffa concluded that such oversight had become unnecessarily oppressive and was no longer needed. Hoffa's term as general president can be characterized as one of increasing the union's self-determination, with a focus on building a strong membership base, thereby increasing its influence through support of local, state, and federal members' political aspirations. Hoffa achieved many of his goals for the union in the first few years of his presidency. The union's membership rolls increased, yet still remained below the 2 million members enrolled during his father's term as president. For the first time in 10 years, the Teamsters organization achieved a balanced budget. The Teamsters continued to fight for labor concessions, most notably for America West Airlines customer service representatives in 2005.

Controversial Split with the AFL-CIO

Hoffa's initial reforms, ambitious in scope and successful, were accompanied by heated controversy. In July 2005, and after 50 years of affiliation, the Teamsters' General Executive Board decided to end the Teamsters' membership within the powerful bloc of AFL-CIO-affiliated unions. In statements to the AFL-CIO president John J. Sweeney and to the Teamsters' union, Hoffa cited the AFL-CIO's focus on political influence over politicians as a major reason for the split. He accused AFL-CIO leadership of throwing money at politicians with no personal investment or experience in labor issues. He countered that the Teamsters would be more effective politically through increased membership and political involvement. He argued that labor could only become more effective through encouraging more union members to enter the political arena. In a sense, Hoffa was urging a return to labor's grassroots political activism reminiscent of his father's era.

The Teamsters and the Service Employees International Union (SEIU) alone took approximately one

third of the AFL-CIO bloc's members with them. The AFL-CIO leader John J. Sweeney accused the Teamsters and other unions involved in the split of dividing the labor movement and creating a favorable environment for those who seek to reverse worker gains. Sweeney warned that splintering the larger bloc of unions would open the door for corruption and the return of mob influence on the local level, weakening labor's influence in the workplace and at all political levels. Despite the split with AFL-CIO over the vision for labor's future, Hoffa insisted that the Teamsters would continue to support other unions' activism. To emphasize this, Hoffa pushed for a Teamsters partnership with the Communications Workers of America (CWA) in 2005.

"Change to Win" Federation

Hoffa's Teamsters and the Service Employee's International Union's exit from the AFL-CIO culminated in the formation of a new federation of unions including the United Brotherhood of Carpenters and Joiners of America, the United Food and Commercial Workers' Union (UFCW), UNITE-HERE (a union representing hotel, restaurant, and garment workers), United Farm Workers of America (UFW), and the Laborers International Union of North America (LIUNA). Under the moniker of "Change to Win," the new bloc of unions issued a statement vowing to vigorously pursue and implement strategies to organize workers in the private sector.

HOFFA, JAMES R. (1913–1975?) President, International Brotherhood of Teamsters

One of the most notorious and controversial U.S. labor leaders in the twentieth century, James Riddle Hoffa began as a local union leader in Detroit in the 1930s and served as president of the International Brotherhood of Teamsters (IBT) from 1957 to 1971. During his career, he used aggressive organizing tactics to promote the union's growth while at the same time working to centralize its operations. Gains in wages and benefits during his tenure made him popular with the membership, but allegations of organized crime ties and corruption made him infamous with the general public. He came to symbolize for many Americans in the post-WWII era the problem of union corruption.

Hoffa's origins lay in the small-town Midwest. He was born in 1913 in southern Indiana, the son of a coal prospector of German-American heritage. His father's death in 1920 left his mother struggling to support four children by running a home laundry. In 1924, when Hoffa was 11 years old, the family sought better opportunities by relocating to Detroit. In an effort to supplement the meager wages his mother earned at an auto parts factory, Hoffa left school after completing the ninth grade to work as a stock boy in a dry goods store.

His first involvement with union organizing began in his late teen years. In the early days of the Great Depression, in 1930, the 17-year-old Hoffa took a job at a loading dock and warehouse run by the Kroger grocery store line. Although the 32 cents an hour Hoffa earned at Kroger's was a relatively good wage, he and the other employees there resented their working conditions. The men were paid only for time spent unloading freight, and usually they spent half their workday on-site waiting around to be assigned work. In addition, the supervisor, whom

they nicknamed "the Little Bastard," verbally abused his employees and often fired them for capricious reasons. Hoffa helped organize his fellow employees and led a job action, which they timed to coincide with a shipment of fresh strawberries; the danger of having the whole shipment spoil placed extra pressure on the company to come to terms with the strikers. The job action succeeded, and the company agreed to many of the workers' demands. Hoffa was elected vice president of the local union that emerged in the warehouse.

He began working for Teamsters Local 299 in Detroit in 1935 and within a decade became one of the IBT's most important leaders in the Midwest. When he began with the IBT, its local affiliates in Detroit were small, struggling organizations. Hoffa worked alongside older, local Teamster leaders, such as Owen "Bert" Brennan and Albert Squires, seeking to organize both trucking and affiliated warehouse workers. Detroit newspapers described the frequent use of violence in these organizing campaigns. According to these reports, employers were threatened, businesses were bombed, and nonunion drivers assaulted. These activities brought Hoffa his first criminal conviction. In 1940, Hoffa pleaded no contest to a charge of violating the Sherman Anti-Trust Act by helping to set up a cartel of union-organized carting firms that would control Detroit's waste paper hauling. The indictment included an allegation that one of the businesses that had refused to go along with this cartel had been bombed. These aggressive tactics, however, did bring results. The first major organizing breakthroughs came in the carhaul industry, firms that transported new cars from the factories out to the various dealerships. Later victories in local cartage and warehouse work brought in more members, and the two locals with whom Hoffa was most identified, Local 299 and its affiliated warehouse local, Local 337, grew dramatically. In 1937, the two locals combined had about 2,000 members, and by 1950, they had more than 20,000.

In this period, Hoffa was strongly influenced by his contact with the Minneapolis Teamster leader Farrell Dobbs, who was a Trotskyist socialist. Building on a dramatic victory over employers in Minneapolis in 1934, Dobbs had begun to create a regionwide organizing and bargaining structure in the upper Midwest. From Dobbs's campaigns Hoffa came to see how the newly emerged intercity trucking industry allowed the Teamsters Union to engage in a kind of leapfrog organizing. Unionized warehouse workers in one city could refuse to handle freight from nonunion trucks coming from another city, forcing those trucking companies to agree to a union contract. At the

same time, unionized drivers could refuse to deliver to a nonunion warehouse, forcing the warehouse employer to come to terms. Harnessing such tactics required the Teamsters to move away from the union's traditional localism and to create new regional levels of union governance, such as the North Central District Drivers Council, created in 1937 at Dobbs's urging. In such regionwide organizing, the union developed larger collective bargaining units, eventually creating a standard contract for Midwestern trucking industry employees in 12 states.

When Dobbs left the Teamsters in 1939, Hoffa became the leading force in the Midwestern Teamsters organization, pushing for regional centralization. He assumed Dobbs's post as the negotiating chairman of the Central States Drivers Council, the regional organization that had emerged out of the earlier North Central District Drivers Council. In the 1940s, Hoffa drew on the union's strength in the upper Midwest to organize trucking operations in the South. Using the leapfrog organizing technique, Hoffa wielded the threat of secondary boycotts to force southern nonunion trucking firms to sign collective bargaining agreements with the Teamsters. Hoffa then organized those employers into regional bargaining units, whose contracts were timed to expire at the same time as the Central States Drivers Council. By the end of the decade, the contract terms for union truck drivers from Louisiana to Minnesota were exactly the same. Hoffa had managed not only to breach the walls of the anti-union South, but had also won significant wage gains for southern truck company employees.

During this same period, Hoffa fought a number of jurisdictional battles in Detroit, and these inter-union struggles helped earn him a reputation for violence and ruthlessness. A series of violent feuds took place throughout the late 1930s and early 1940s, in which the Detroit Teamsters struggled against several unions, including the Brewery Workers Union, the Retail Clerks, and the Dairy Workers. Over the course of these conflicts, the staff of the Detroit Teamsters Joint Council, including Hoffa, became known for their affinity for street fighting. One of the most bitter and violent conflicts involved a Congress of Industrial Organizations (CIO) affiliate, the United Construction Workers Organizing Committee (UCWOC), formed in 1939 at the behest of John L. Lewis and directed by his brother Dennie Lewis. In September 1941, UCWOC launched a campaign directed at the heart of the jurisdiction of Hoffa's Local 299; UCWOC dispatched its organizers to sign up carhaul drivers. The Detroit Teamsters responded by fielding teams of their own organizers, who attacked UCWOC's people on sight. The resulting street

battles marked a high point in Detroit's jurisdictional battles in this era, and some accounts have claimed that Hoffa turned to a local Mafia leader, Santo Perrone, for support in this conflict.

Hoffa's reputation for fiercely defending the union's jurisdiction, as well as his organizing triumphs, helped speed his ascent up the ranks of the IBT hierarchy. The Teamster president Daniel Tobin appointed Hoffa an International Trustee in 1944, and he was elected to that position by the union's convention in 1947. Five years later, at the fairly young age of 39, he was elected to one of the union's International Vice President posts, making him a member of the IBT's General Executive Board, its ruling body. In addition, he held a number of significant local and regional posts.

His real base of power, however, lay in his work with the interstate trucking industry, where he had long served as the chief negotiator for the Central States Drivers Council. Through his leadership role there, he had played a pivotal part in organizing and bargaining with trucking employers throughout the Midwest, the South, and increasingly the East Coast as well. Gains achieved in wages and benefits drew him support from the Teamster rank and file in the trucking locals. At the same time, the expansion of the collective bargaining unit, which included more and more locals under one standard contract, gave Hoffa, who helped administer that contract, the ability to reward local officials who supported him and punish those who did not.

Having accumulated a strong following, Hoffa was poised to take advantage of the opportunity that emerged in 1957 when Dave Beck, Tobin's successor as president of the IBT, chose not to run for reelection. The U.S. Senate's McClellan Committee had held well-publicized hearings into union corruption in early 1957 that focused on charges of malfeasance involving Beck. The scandal that emerged badly damaged Beck's reputation, and his support within the union evaporated. Hoffa's prominence in the union made him a front-runner to succeed Beck, but in his effort to do so, Hoffa faced bitter opposition from the McClellan Committee. The Committee's chief counsel, Robert Kennedy, helped set up an FBI sting operation in early 1957 that appeared to catch Hoffa in the act of bribing a member of the Committee's staff for inside information on its investigations. When Hoffa won an acquittal at trial on those charges, the McClellan Committee responded by holding two sets of public hearings in the months leading up to the IBT Convention (where the election of national officers would take place) in an effort to discredit Hoffa in the eyes of the union's delegates. Those hearings raised allegations of Hoffa's links with organized crime

figures and of his improper involvement in a real estate development deal. The Committee also publicized a very lucrative truck leasing agreement between Hoffa's wife and a Teamster employer, an arrangement that amounted to an illicit gratuity for the Detroit Teamster leader.

The hearings made Hoffa a notorious figure, but they did not destroy his political position within the IBT. Neither in 1957, nor over the course of the next two years of repeated hearings on Hoffa, could the committee ever prove that Hoffa had taken an outright bribe to betray the interests of his members. Nor could it demonstrate that he had personally profited from any act of malfeasance involving union funds. To the extent that the McClellan Committee clearly had launched a crusade to end Hoffa's career, he could depict himself as the victim of a conspiracy by anti-union congressmen who disliked him for his vigorous efforts on behalf of his members. His support within the union was far from unanimous, but his opponents were a divided minority who faced difficult institutional barriers.

Meanwhile, the ability of Hoffa to survive the McClellan Committee hearings further increased his notoriety, and his case was used by many political figures to justify the need for stronger regulation of unions. The Landrum-Griffin Act, passed in 1959, was described by its supporters as a law that would respond to the threat posed by Hoffa and his type of union leader.

Hoffa's tenure as president of the IBT was marked both by his success in creating a national trucking contract and by his willingness to abet corrupt local leaders. In the face of stiff opposition from local unions that rejected the loss of autonomy it would bring, Hoffa gradually brought together all of the different regions and in 1964 signed the National Master Freight Agreement (NMFA). Covering workers involved in trucking and warehouses, Hoffa's NMFA created a standard set of wages and benefits all across the country. The achievement marked the high-water mark of his efforts to create a more centralized union. It also demonstrated his dedication to improving the working conditions of Teamsters in the freight industry. At the same time, however, Hoffa displayed an apparent indifference to other IBT members trapped in locals that were controlled by corrupt local leaders, many of whom had ties to organized crime. In Chicago's Local 777, for example, insurgents challenged their union's corrupt leader, Joseph Glimco, a reputed capo in the Chicago Mafia. They denounced Glimco's misuse of union funds and the local's failure to protect their working conditions. Hoffa reacted to their complaints by offering Glimco

every possible form of support, and he responded in similar ways to other local reform efforts.

His support for individuals such as Glimco was usually seen as evidence of his close ties to organized crime. An illegal FBI wiretap in the early 1960s indicated that Hoffa communicated almost daily with a Detroit Mafia figure named Anthony Giacalone. He had similar long-term relationships with organized crime figures in New York and Chicago. The precise nature of his relationship with organized crime remains unclear, but clearly he facilitated particular kinds of corruption within the union. By protecting mob-connected local leaders such as Glimco, he allowed them to exploit vulnerable local members and extort employers. Hoffa also abetted the efforts of organized crime groups to profit from the financial decisions of various Teamster benefit and pension funds. Loans made by the Central States Pension Fund, for instance, often required the applicant to make a kickback to an organized crime sponsor with ties to the Teamsters.

Under the leadership of Attorney General Robert Kennedy, the Justice Department mounted a campaign to win a criminal conviction against Hoffa. The Department's efforts succeeded in 1964 when Hoffa was convicted of witness tampering and mail fraud. While appealing his convictions, Hoffa arranged for the creation of a new IBT post, a general vice president, who could function as a caretaker during his prison sentence. His goal was to maintain control of the union even during his jail sentence. At the IBT's 1966 convention, Hoffa supported the election to that post of one of his most trusted and seemingly least ambitious associates, Frank Fitzsimmons. Then, having exhausted his appeals, Hoffa began serving his 13-year prison sentence in 1967.

He disappeared four years after his release from prison in 1971. Hoping that it would improve his chances for parole, he resigned the union presidency in June 1971. Six months later, Richard Nixon granted him a presidential commutation that released him from jail. The conditions of that commutation barred Hoffa from any involvement in union affairs until 1980, but he soon began talking about running once again for the IBT's top post, possibly in 1976, when the next election was scheduled. Those plans may have been the cause of his death. Most accounts conclude that he was murdered at the behest of the Mafia in order to stop him from re-assuming leadership of the Teamsters. According to this theory, organized crime groups had found it easier to work with his successor, Fitzsimmons. On the day he disappeared, in July 1975, he had been scheduled to meet with the Detroit Mafia figure Giacalone. Hoffa's body has never been

found, and to this date the investigation into his disappearance remains an open case.

HOME CLUB

Home Club is the name of a loosely confederated band of dissidents within the Knights of Labor (KOL) from 1882 to 1890. Some scholars doubt the existence of such a group, and others feel its influence has been exaggerated, but the Home Club was powerful enough to shape KOL policy between 1885 through 1888. It was not a unified conspiracy, rather a lightning rod around which disgruntled Knights could strike at the KOL administration, especially its international leader, Terence V. Powderly.

The term "Home Club" derives from a plan to purchase a retirement home for aged Knights, credited to Victor Drury, a French-born KOL radical. It is not clear whether Drury was serious about said plan, or if it was a smokescreen to disguise plots against the KOL's central administration that focused on disputes

over secrecy, ideological discord, and personality clashes. Some of these reflected contradictions inherent within the KOL from its 1869 inception.

The KOL was originally modeled on fraternal organizations, and it employed secretive, quasi-Masonic ritual practices. Secrecy both protected members from employer backlash and regulated the worthiness of members. Early on it was forbidden even to write or utter the organization's name publicly. This worked as long as the KOL was a small body whose membership was largely confined to Pennsylvania, but as the organization grew, ritual secrecy proved less practical. Discussion of altering secret practices emerged at the KOL's first national convention in 1878, the year Powderly succeeded the founder, Uriah Stephens, as head of the organization. Powderly, like many Knights, was a Roman Catholic who faced church sanctions due to the Vatican's prohibition against secret societies.

After years of debate, the KOL became a public organization on January 1, 1882, though its ritual remained a guarded secret. The decision to modify secrecy angered the traditionalists, many of whom accused Powderly of subverting the order's values. Brooklyn Assembly 1562 simply refused to abide by the decision. That same Brooklyn local was also the center of ideological and structural disputes that rocked the KOL.

As the KOL expanded into larger cities, it encountered a hodgepodge of ideology. Older Knights were mainly liberals, Greenbackers, or mild socialists, but New York City was a hotbed of more radical ideals. The KOL's dispute over secrecy coincided with a regional struggle between Marxian and Lassallean socialism. After 1882, most Greater New York locals were under the auspices of District Assembly 49 (DA 49). Local 1562 was composed of a large number of doctrinaire Marxists, several of whom precipitated a boycott against the Duryea Starch Company that was deemed without merit by the KOL's executive board. Key members, including Theodore Cuno and P. J. McGuire, were suspended from the KOL.

District 49 decided to make 1562's travails a cause célèbre, even though its leadership was composed mostly of Lassallean socialists and anarchists who rejected the Marxian precept that trade unions were latent revolutionary cells from which a new society could be formed. Instead, they called for independent political action and denounced trade unions as reactionary bodies that guarded the interests of skilled workers at the expense of class unity. This was a potentially explosive situation for the KOL, which contained both single-trade locals and "mixed" assemblies containing workers of various trades. Led by Victor Drury, an ex-Marxist convert to anarchism,

DA 49 launched a convoluted plan in which it appeared to champion suspended Marxists while, in fact, isolating them. The goal was to discredit the KOL's central administration, which Drury felt was too conservative and too sympathetic to trade unions. Plots and counterplots swirled from 1882 to mid-1886, with Powderly and others devoting enormous time and resources to combating the Home Club. Those efforts were hampered by the Home Club's successful cooptation of the secrecy issue. Drury and his New York allies actively recruited disgruntled Knights on behalf of the Home Club.

This meant that there was widespread discontent within the KOL at precisely the point in which it encountered a membership surge. Between 1885 and 1886, the KOL's official membership increased by nearly 700%, due largely to enthusiasm following the order's dramatic strike victory over the railroad baron Jay Gould. So many members poured into the KOL that it called a moratorium against new assemblies in March 1886 so that overstretched administrators could process applications. The KOL also convened a special assembly in late May to address the order's growing pains, including a spate of unauthorized strikes. That convention appointed six "auxiliary" members to the KOL's executive board, four of whom were critical of Powderly's administration. This gave anti-administration forces nine of the KOL's top 14 administrative posts.

That convention also investigated allegations of a Home Club conspiracy. Powderly surprisingly sided with a report that whitewashed the Home Club and decided to cooperate with the new executive board. He perhaps realized that the Home Club's base was too diffuse and bargained that he could divide it along ideological lines. Given that the special assembly convened just three weeks after the Haymarket explosion in Chicago, Powderly may also have decided to wait for the radical climate to cool before moving against dissidents.

In the interim, rejuvenated trade unions arose to challenge KOL supremacy, and Home Club Lassalleans steered the executive board toward an anti-trade union stance that divided the Knights. Trade-union supporters within the KOL, like Thomas Barry, Joseph Buchanan, P. J. McGuire, George McNeill, and John Morrison, made lurid charges about the Home Club and Powderly that further divided the Knights. The KOL soon found itself losing members nearly as fast as it gained them in the halcyon days of early 1886.

Despite a second whitewashed report in November 1886, the Home Club was on the defensive by early 1887, in part because the prostrike policy it endorsed in defiance of official KOL policy led to a series of

ill-advised job actions that ended in defeat. Nonetheless, leaders like Drury and James Quinn proved adroit at transforming the Home Club from an ideological clique to one that drew upon general discontent. By late 1887, Powderly denounced the Home Club, though malcontents accused him of coddling it. Drury re-organized his inner circle as The Class and renewed recruitment efforts and deflected anger toward Powderly. At the 1887 convention, Powderly's supporters once again attacked critics with more ardor than the Home Club.

By mid-1888, however, the Drury-led coterie had overplayed its hand. A bruising fight within District 49 isolated most of the Home Club old guard, and the fall convention saw a repudiation of Home Club anti-trade union policies, as well as a Drury proposal to return the KOL to secrecy. By then, though, the damage was done. Trade unions denounced the Knights, the order continued to hemorrhage members, and the secretary-treasurer, John Hayes, originally a Home Club appointee, began to wrest power from Powderly. By 1890, most of the Home Club inner circle had been purged from the KOL. Ironically, doctrinaire Marxists, including Cuno, regained control of District 49. They, in coalition with agrarian radicals, ousted Powderly in 1893.

Although one can be skeptical of how much power the Home Club formally held, its influence on the KOL was enormous. In the early 1880s, it consumed organizational time and resources that could have been devoted to more productive enterprises, and its influence on strike and trade-union policies between 1885 and 1888 proved disastrous. The Home Club stands as an unfortunate example of how a small group can disrupt large organizations.

HOME ECONOMICS

Home economics traces its roots to the nineteenth-century work of Catharine Beecher, whose *Treatise on Domestic Economy*, first published in 1841, offered

practical advice to women on cooking, family, health, infant care, and children's education, along with observations on proper home management. Schools of cookery, like the one managed by Fannie Merritt Farmer in Boston in the 1890s, also served as precursors to the home economics movement.

The home economics movement took shape during a decade of conferences held at Lake Placid, New York, from 1899 to 1908. Organized by Ellen Richards, the Lake Placid conferences brought together several disparate groups that ultimately united to form the American Home Economics Association in 1909. Richards, a chemist trained at Vassar and the Massachusetts Institute of Technology, led the domestic science faction that emphasized nutrition and sanitation along with training in institutional management. The household arts faction promoted instruction in cooking, sewing, and textiles. Proponents of domestic economy hearkened back to Catharine Beecher and focused on the housewife and her problems, particularly the difficulty in obtaining domestic servants.

Ellen H. Richards, who chaired the first Lake Placid meeting in the summer of 1899, acted as the "engineer" of the home economics movement. She sought to professionalize and upgrade home economics to provide a career path for college-educated women trained in science and to facilitate their employment in academics, social service, and industry. Her emphasis on rigorous research in the natural and social sciences led her protégées to become some of the most successful career women of their day. Among them was Marion Talbot, who parlayed her training in home economics at Wellesley College into a career in university administration at the University of Chicago. Early advocates of home economics sought to move women into public life, not to confine them to the kitchen. Home economics, which extended its domain into "municipal housekeeping," fed directly into the broader movement for social reform called for by its contemporaries in the Progressive Movement.

Ellen Richards's attempts to establish home economics in the prestigious Seven Sister schools of the East ran up against the opposition of M. Carey Thomas, the president of Bryn Mawr, who dismissed home economics as too gendered to be intellectually rigorous. Instead, home economics took hold in the co-educational land grant colleges in the Midwest and West. In some cases, male administrators used home economics to segregate women students. Iowa State launched the first home economics department in 1873, and similar departments soon followed in Kansas, Illinois, Florida, and California.

In 1914, the Smith-Lever Act, designed to improve life in rural America, provided funds for home economics through the Cooperative Extension Service of

the Department of Agriculture. Under the direction of Martha Van Rensselaer, the College of Home Economics at Cornell University in Ithaca, New York, played a leading role in training home demonstration agents to work with farm women. In 1917, the Smith-Hughes Act funded home economics training on the college level for primary and secondary school teachers, making teacher training the central mission of collegiate home economics. While both measures provided needed funding for home economics, in the long run they proved a mixed blessing for the field: Smith-Lever tied home economics to rural life at the moment when the country was becoming increasingly urban, and Smith-Hughes promoted vocational training at a time when many colleges and universities increasingly valued research over teaching.

In times of national crisis, home economists used their professional training to advantage. During World War I, home economists helped the nation stretch its food resources, and in the depression of the 1930s, home economics advised women how to "make over and make do." But the reform ethos of the home economics movement lost steam with the demise of progressivism in the 1920s. Emphasis in the field gradually shifted to the individual home and family. In the 1920s, home economists entered business, running test kitchens and serving as mediators between their employers and female consumers. At the same time, self-styled experts like Christine Frederick (not a trained home economist) urged women to adopt scientific management in the kitchen, exhorting them give up the goal of a career and "come into the home."

In the long run, home economics, like nursing and other gendered professions, could never escape negative gender stereotypes. In the academy, not even a scientist of the stature of Agnes Fay Morgan at the University of California, Berkeley, could sustain her department. In 1955, a year after Morgan retired, Berkeley voted to dump its home economics department, leaving a more gender neutral "nutritional sciences" graduate program.

By the 1960s, home economics found itself increasingly beleaguered. In 1968, the Carnegie Corporation funded a study of the field, published under the title *The Changing Mission of Home Economics*. The author, Earl J. McGrath, confessed that he went into the study believing the field should be discontinued. Instead, he recommended its expansion. Nevertheless, universities continued to eliminate home economics or to hire male administrators, who quickly abandoned the gendered title in favor of terms like human development or human ecology. At the same time, a new generation of women who associated "home ec" with aprons and white sauce, attacked

the field as part and parcel of the feminine mystique Betty Friedan lambasted in her 1963 best seller. The feminist Robin Morgan, invited to speak to the American Home Economics Association (AHEA) in 1973, announced, “I am here addressing the enemy,” ignoring the reality that home economics had for decades provided careers for women and had served as the only bastion for women scholars in academia prior to the advent of women’s studies. Indeed, Cornell University offered one of the first women’s studies courses in the nation under the auspices of its College of Human Ecology.

In the ensuing decades, home economics struggled to redefine its mission and to escape the gendered stereotype of “stitching and stirring.” In 1994, the AHEA voted to change its name to the American Association of Family and Consumer Sciences (AAFCS). Today the organization defines its mission as “improving individual, family, and community well-being; impacting the development, delivery, and evaluation of consumer goods and services; influencing the creation of public policy, and shaping social change.”

HOMESTEAD STRIKE (1892)

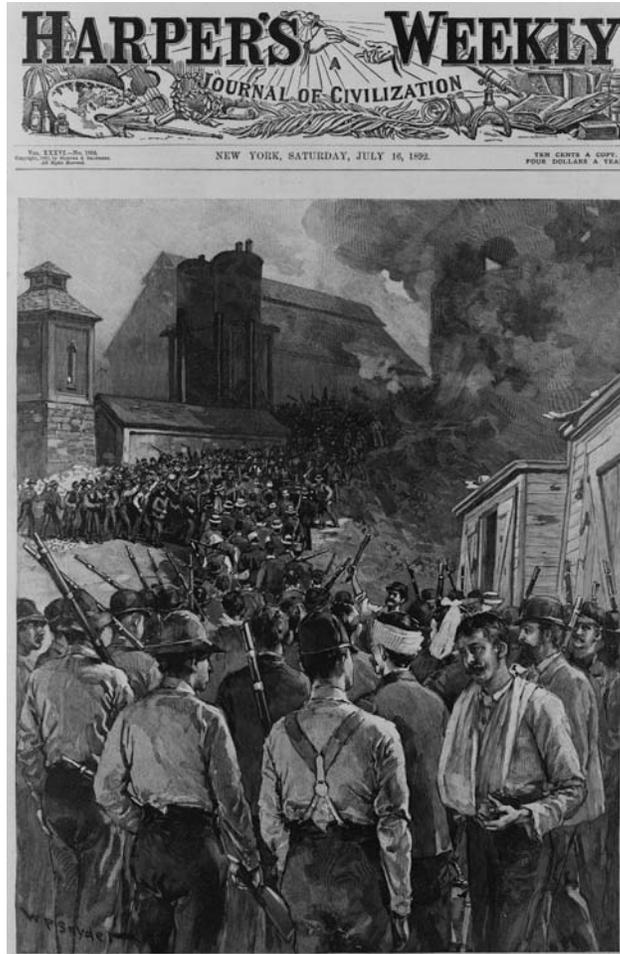

The episode that most late nineteenth-century Americans associated with the Homestead Strike of 1892 was a bloody battle that took place between three hundred Pinkerton detectives and thousands of citizens of Homestead, Pennsylvania, on July 6, a confrontation that culminated in the community’s violent retribution against the surrendering Pinkertons. Yet, as the historian Paul Krause has emphasized, to focus on the bloodshed of July 6 ignores the broader

context for the conflict that was in fact decades old between, on the one hand, workers committed to protecting a “competence,” or minimum standard of living, and on the other hand, industrialists dedicated to the primacy of the laws of supply and demand.

By the mid-nineteenth century, iron producers saw the Bessemer converter as the key to overcoming the workplace controls exercised by skilled workers, particularly puddlers, who carried on a long tradition of carefully and deliberately turning pig iron into wrought iron. The Bessemer process promised to make the work of puddlers irrelevant and to allow ironmasters a much freer hand in setting the terms and conditions of work for all mill employees. The process also created steel, a malleable metal that made possible the most important symbols and motors of industrial and national growth—a sprawling system of railroads, immense bridges and skyscrapers, and, for the U.S. Navy, battleship armor. Andrew Carnegie and other ironmasters saw progress in the new technology, but to steelworkers, these changes threatened to undermine their power and rights. Their relative independence, which, in their view, guarded the American republic against tyranny, was by the 1870s fast succumbing to the awesome political and economic influence of large-scale corporations.

The first salvo in the 1892 strike was fired nearly 20 years earlier in the 1874–1875 lockout of iron and steelworkers in the Pittsburgh area, where the factory town of Homestead was located. The lockout commenced after the puddlers’ union, the Sons of Vulcan, rejected Pittsburgh manufacturers’ call to tie their baseline wage to market prices for iron. The puddlers won, but with victory came their realization that they must renounce their traditional exclusiveness, as manufacturers had played on divisions of race and skill among steelworkers during the conflict, and the Bessemer process threatened the puddlers’ entire occupation. In search of protection, the Vulcans cooperated with skilled metalworkers in forming the Amalgamated Association of Iron and Steel Workers (AAISW). In 1881, the AAISW opened its doors to skilled black workers, although, as the historian Dennis C. Dickerson has observed, most white unionists did so begrudgingly. Many steelworkers also joined the Knights of Labor (KOL).

Besides the issue of a “fair day’s wages,” the other chief issue animating steelworkers’ labor activism involved the anti-union measures that metal makers took in the wake of the Great Strike of 1877, especially the ironclad agreement, which barred employees from union membership. While the historian Harold C. Livesay has characterized Carnegie’s pre-1892 labor policies as an exception to this anti-union trend, in fact Carnegie aggressively sought to

The Homestead riot / drawn by W.P. Snyder after a photograph by Dabbs, Pittsburg. Library of Congress, Prints & Photographs Division [LC-USZ62-126046].

eliminate the influence of the AAISW and KOL in his mills. Certainly, in the wake of the 1886 labor unrest, Carnegie publicly expressed sympathy with unionism and criticized the practice of hiring strikebreakers to fill the places of strikers. Yet in 1887, he used Pinkertons and strikebreakers to defeat the AAISW and KOL at his Edgar Thomson Steel Works when workers refused his demand for wage cuts, a longer workday, and a reduction in the workforce. Carnegie then moved to implement these same changes at his Homestead Steel Works, which he had acquired in 1883. In 1886, he installed open-hearth furnaces, which effectively destroyed what little relevance puddlers held at the plant and reduced the skilled labor force. In May 1889, he announced that employees must accept a 25% wage reduction, a 12-hour day, and a three-year ironclad agreement.

In 1889, Homesteaders succeeded, as they had before. They united to physically eject strikebreakers from the town, who were mostly black, Southern

European, and East Europeans, and turned back deputies sent to assume control of the mills. The company's inability to fill orders weakened Carnegie's hand. In the end, he was forced to sign a three-year contract with the AAISW. The AAISW had also won a strike against the mill's previous owners in 1882. Geography can in part explain these victories: outsiders had limited access to the town, so citizens were more easily able to defend it from strikebreakers. Second, Homestead's AAISW lodges, in contrast to the national union, granted membership to the unskilled and maintained amicable relations with the KOL. Despite the strong nativist sentiment of some of the town's citizens and the close association between ethnicity and skill, East Europeans, "old" immigrants, and native-born focused on their shared religious and political traditions in opposing mill owners' power. However, Homesteaders' strength in 1889 was illusory. Its union victories were isolated ones. Elsewhere in western Pennsylvania, the AAISW and KOL were

unable to reverse a precipitous decline in labor's fortunes in the steel mills, mines, and the voting booth during the 1880s. Much was at stake, then, as Homesteaders well knew, in the 1892 conflict.

With the 1889 agreement set to expire on June 30, 1892, Carnegie turned to gaining full control over his Homestead workforce. In January, he ordered a survey of wage rates in Pittsburgh's steel mills, which found some skilled Homestead workers earning significantly more than their counterparts in Pittsburgh. Publicly, Carnegie's officials made much of these findings and the larger problem of a saturated steel market in explaining the call for wage cuts. They also claimed that the introduction of new technology had lightened the loads of skilled workers. In reality, Carnegie's foremost concern was unionism, as he made clear in his instructions to company officials.

In negotiating the new wage scales, Carnegie's representatives stalled repeatedly and insisted on impossible terms, such as a proposal that the contract end in the winter rather than the summer. The change was crucial. The collective power of steelworkers was weakest in the winter, when unemployment and the cost of living were highest. On the issue of wages, Homestead unionists objected to the notion that market forces rather than custom should govern workers' baseline income. They also viewed with alarm the company's proposition that it might reduce wage scales in any department that saw technological improvement. Contrary to company arguments that the plan would negatively affect only a small minority of workers, potentially, nearly all were at risk.

Henry Clay Frick, the chief of operations at Homestead, gave union leaders until June 24 to accept these terms. Once the deadline passed, Frick oversaw the construction of watchtowers and a barbed wire-topped fence on the steelwork's premises. He also sent for the Pinkerton agents and on June 29, ordered a lockout of the entire workforce. The AAISW Advisory Committee worked with local authorities in governing the town during the conflict, preventing damage to mills and blocking the entrance of strikebreakers. Despite strikers' orderliness, Frick succeeded in acquiring the county sheriff's aid in regaining the company's physical control of the steelworks. The Advisory Committee warned the sheriff that the arrival of nonunion men would bring violence. When a force of deputies arrived, townspeople showed them the unharmed mills and the way out of town. The next morning, when the Pinkertons attempted their well-known landing, Homestead's bitter, exhausted, desperate, but determined steelworkers, their families, and neighbors were waiting for them.

Ironically, most of the Pinkerton agents were unaware that the purpose of their journey was to

assist in the lockout. They arrived heavily armed in company-owned barges, the *Iron Mountain* and the *Monongahela*. Town scouts warned of the Pinkertons' approach in the predawn hours of July 6. The mass of men, women, and children who filled the river's shoreline in front of the company's mills paid little heed to the strike committee's prohibition of violence, and despite the plea of the strike leader, Hugh O'Donnell, to turn back, the Pinkerton's commander, the zealous Frederick H. Heinde, ordered his men to disembark. A fight quickly broke out between Homesteaders and the agents; someone—it is unclear who—fired the first shots, and the two sides frantically exchanged a barrage of bullets. As the number of dead and wounded workers mounted, events escalated. Some workers unleashed a cannon against the Pinkertons, while others repeatedly attempted to sink the barges. Homesteaders insisted that they would accept surrender only on condition that the agents face charges for the murder of workers killed in the melee. The Pinkerton agents agreed, but despite the strike committee's promise of protection, once on shore they endured a punishing march through crowds of vengeful bystanders, one the widow of a killed striker, who beat them unmercifully. While no Pinkerton died at the hands of the crowd, the press described the violence in lurid terms and characterized the townspeople's revenge upon the Pinkertons as the actions of an irrational, savage mob.

On same day that the Pinkertons suffered the crowd's outraged assaults, Carnegie was vacationing in his native Scotland, quite purposely avoiding direct involvement in the clash that he knew Frick's tactics would inevitably bring. He had entrusted the handling of the lockout to Frick and instructed him to not back down. When reporters finally located Carnegie, he gave Frick his full support. Carnegie privately regretted his manager's handling of the strike, probably because he recognized almost immediately that the hostilities at Homestead belied his public professions of admiration for workers and trade unions. More indirectly and gradually, Carnegie admitted his own culpability as Frick's supervisor and sponsor. That acknowledgment came after years of public criticism of not Frick, but Carnegie, for his hypocrisy and spineless retreat across the Atlantic while a subordinate did his dirty work.

For his part, Frick almost certainly understood that the induction of a private army to secure the mills for strikebreakers would provoke townspeople to violence and thus the state to intervene on the company's behalf. On July 12, 8,500 state militiamen descended on Homestead and enforced martial law for over three months. Within weeks, Frick, too, fell victim to violence. On July 23, anarchist Alexander Berkman badly wounded him in an assassination

attempt. The attack, and the ensuing association of the strike with it, further splintered the AAISW leadership. Less than three weeks later, 1,700 strike-breakers were running the mills at full capacity. On November 17, several hundred of the strikers returned to work, signaling the end of the lockout.

Labor repression, not labor reform, followed the Homestead debacle. While 13 states, including Pennsylvania, banned the use of nonresidents (that is, Pinkertons) as deputies, companies continued to employ private guards and local police officers to defeat striking or locked-out workers. In Homestead, the state made examples of strike participants and supporters. When a young soldier expressed glee at the news of Frick's brush with death, the militia's commander had him hung by his thumbs and dishonorably discharged. Carnegie's chief counsel, Philander Chase Knox (a Republican lawyer who went on to a career in national politics), aggressively pushed to convict over one hundred strikers of riot, murder, and conspiracy. Most eventually gained acquittal, but many who could not make bail were jailed during the long process, and a few were found guilty on questionable grounds and served time in prison. Knox also sought to bring treason charges against Advisory Committee members. While this legally groundless offensive failed, it demoralized labor activists and, as with the other legal charges, depleted strikers of energy and funds.

Although Carnegie's reputation deteriorated due to the lockout, the new management system that he imposed at Homestead helped make possible the spectacular rise of the Carnegie Steel Company, a consolidation of his various steel enterprises that formed in the midst of the strike on July 1, 1892. The new system was union-free. Ethnic and racial antagonisms among steelworkers, which amalgamation had tempered, quickly and violently came to the foreground. Not until the 1930s would unionism again make significant inroads in the steel industry.

HORTON, MYLES (1905–1990) Founder, Highlander Folk School

Born in the southwest Tennessee town of Savannah in 1905, Myles Horton dedicated his life to the attainment of social justice for southerners, both black and white. In 1932, he founded the Highlander Folk School in Monteagle, Tennessee—an adult education center that brought pride and dignity to the people of Appalachia and that eventually helped to mold the leaderships of both southern unions and the civil rights movement.

Horton's early consciousness was powerfully shaped by experiences on farms and in mining and mill towns, along with a steady diet of Christian teachings. According to William Ayers, Horton once quipped, "I always liked the idea of Christianity, only problem was I never saw anyone practice it" (Ayers, p. 151). If Horton berated southern Christians for failing to act on their professed ideals, he nonetheless observed in his autobiography, *The Long Haul*, that he took to heart his mother's exhortation that "God is love, and therefore you love your neighbors" (Horton, *The Long Haul*, p. 7). In the opening pages of his autobiography, he further noted the pervasive influence of this simple tenet in his thinking and social practices. "If you believe people are of worth," Horton reflected, "you can't treat anybody inhumanely, and that means you not only have to love and respect people, but you have to think in terms of building a society that people can profit most from, and that kind of society has to work on the principle of love" (Horton, *The Long Haul*, pp. 6–7). Horton recognized that such idealism was easy to mouth. He would spend his life learning, studying, and teaching how to bring it alive in social practice.

Horton further honed his social philosophy by studying and discussing his ideas with some of the foremost social critics of his day. Starting his university education at Cumberland University in Lebanon, Tennessee, he continued it at the Union Theological Seminary in New York and at the University of Chicago. Between his junior and senior years at Cumberland, he spent the summer directing a Presbyterian vacation Bible school program in the town of Ozone, nestled in the Cumberland region of the east Tennessee mountains. When it became clear to him that the church hosting him was not meeting the needs of its congregants—people from mining and logging communities that were past their heydays—Horton instituted communitywide meetings where these working people could share their problems and seek joint solutions. Topics for discussion included how to build

sanitary privies, test for typhoid in the wells, and restore denuded forests. Congregants pooled their knowledge and sought additional information and assistance from county officials. This experience of relying on communal expertise would serve as a model for Horton's approach at the Highlander Folk School, which in turn came to form the basis of twentieth-century social activism in many southern communities.

Horton coupled his Christian beliefs and formative experiences in Ozone with intensive reading and intellectual discussions with the likes of Reinhold Niebuhr (the Union Theological Seminarian and socialist who related Christian faith to modern politics), Robert Parks (the University of Chicago sociologist who coined the phrase "human ecology" to understand the vitality of society), John Dewey (the Columbia University philosophy professor who believed that the skills and knowledge that students learned be integrated fully into their lives as persons, citizens, and human beings), and Jane Addams (the social reformer and founder of Chicago's Hull-House Settlement). As William Ayers notes, all of these mentors helped Horton develop his ideas about a school for life, where people could solve problems together in an informal setting, and where experience would be the main teacher (Ayers, p. 153).

From Horton's founding of the Highlander Folk School on the eve of the New Deal, to his death in 1990 as the Soviet Union collapsed and America's commitment to deregulation gathered steam, he worked to translate his philosophy into practice. (Horton officially retired in 1973 but continued to live and work at Highlander.) During the early years, he focused Highlander's resources on improving the lives of Appalachian timber, mill, and mine workers. Later, Horton and the institution he led established programs on citizenship, school desegregation, and voter education. This work earned Horton wide admiration from social activists and community members. But he increasingly attracted critical attention from local, state, and federal officials. In the 1950s and early 1960s, he faced a series of trumped-up charges, including allegations that he promoted the sale and consumption of intoxicating liquor, and that he aided and abetted the Communist Party. This later charge had an ironic twist to it, since Horton was never a member of the Communist Party and eventually broke with the Congress of Industrial Organizations (CIO) partly over this issue. Of one charge, though, Horton stood proudly guilty—of operating a school that blacks and whites attended together. Once asked how he got blacks and whites to eat together in the segregated South, he responded, in words heard by

Rosa Parks and recorded by William Ayers, "All I did was put food on the table and ring the bell" (Ayers, p. 155). Horton's most significant legacies are a still-vibrant institution—the Highlander Research and Education Center (renamed in 1961)—and the powerful idea that oppressed people in America can effectively challenge their oppression through peer learning and collective action.

HOTEL AND RESTAURANT EMPLOYEES INTERNATIONAL UNION

The Hotel Employees and Restaurant Employees International Union (HERE) has long represented groups that, until recently, were relatively rare in the labor movement: low-wage and often female service workers. Founded by food servers and bartenders, HERE expanded to include various hotel staff and, more recently, casino workers. Over the past century, the union has been wracked by internal conflicts and government probes into corruption, among other challenges. But HERE survived and still provides union representation for workers in the vast and growing hospitality industries.

Early Years

As early as 1866, waiters and bartenders in Chicago organized a union. By the 1880s, several such unions

had formed and joined the Knights of Labor, but the relationship was a strained one (the formally anti-alcohol Knights wanted to exclude bartenders). By the late 1880s, waiters and barmen began affiliating with the new American Federation of Labor (AFL). On April 24, 1891, the AFL chartered the Waiters and Bartenders National Union, the original incarnation of HERE.

HERE suffered the first of many internal power struggles in the late 1890s, between factions led by Chicago-based, politically ambitious William C. Pomeroy and the St. Louis-based, bureaucratically scrupulous Jere L. Sullivan. By 1899, Sullivan triumphed and, with AFL backing, went on to serve for nearly three decades as the union's all-powerful secretary-treasurer (early presidents were essentially figureheads).

Over the course of the next few decades, HERE directed its energy to organizing bartenders, following the AFL craft model of representing only better-paid, skilled workers. The bartenders seemed a better bet to Sullivan than the other elite of the culinary world, the polyglot, high-turnover cooks and the low-wage, mostly foreign-born workers who staffed dining rooms and hotels. HERE was quite successful in organizing bartenders, particularly in working-class taverns. Within just a few years, a majority of the 20,000-plus male bartenders in the United States were unionized. The International did much less, however, in the large urban hotels and restaurants that, as of 1900, employed more than 300,000 workers. Still, the union grew quickly thanks to various local organizing efforts across the country. By 1904, HERE hit an early peak of 50,000 members and more than 500 locals.

Prohibition and a New Era of Growth

Prohibition devastated HERE. The Eighteenth Amendment's ban on liquor sales in 1920 quickly cost the union a third of its membership. The employer open-shop drives of the 1920s contributed to the decline, and the bartender-dominated union failed to take advantage of growth elsewhere, such as in the cafeteria trade. Concern grew throughout HERE over Sullivan's narrow approach to organizing, and in 1927, President Edward Flore (1911–1945) spearheaded a movement to dethrone him. Sullivan's death the next year enabled Flore to re-organize the union, shifting power permanently from the secretary-treasurer's to the president's office. Flore turned to the West Coast locals, traditionally more radical and inclusive, for help in broadening HERE's base.

By the 1930s, amid the Great Depression and the historic rise of industrial unionism in the United States, HERE adopted mixed craft- and industrial-style organizing and enrolled bellhops, maids, busboys, and other lower-level hotel and restaurant workers across the country. The union's membership nearly doubled in 1933, the first year New Deal legislation encouraged unionization. Widespread strikes in 1936 and 1937 brought further growth, as did economic mobilization for World War II. By 1940, membership topped 200,000, and by 1950, 400,000. At mid-century, HERE achieved its highest rate of unionization, when a quarter of all hotel and restaurant workers were organized.

Women, especially waitresses, grew more prominent in HERE in these years. In 1900, 50 Seattle waitresses, led by Alice Lord, had formed Local 240, the first waitresses' local in HERE. Additional waitress-only locals soon appeared in several Midwestern cities. As Prohibition devastated the bartending craft, it hastened the feminization of table service, and by the end of the 1920s, waitresses were a fifth of the HERE membership. Though more mixed-sex locals opened to them, waitresses' separate locals grew increasingly powerful, with around 40,000 of HERE's members by the late 1940s. Women in various trades composed 45% of the union's entire membership by 1950.

In the 1930s and 1940s, too, racial barriers in the union began to recede. Segregated locals became less common, and the particularly virulent hostility reserved for Asian culinary workers declined. HERE made little effort, however, to combat the engrained patterns of racial discrimination in culinary work.

Postwar Challenges

Into the postwar decades, HERE for the most part stagnated, maintaining a membership of 400,000 to 500,000, while the hotel and restaurant workforce grew into several millions. Under presidents Hugo Ernst (1945–1954) and Ed S. Miller (1954–1973), HERE won better working conditions, wage increases, and health and pension plans for many members after World War II. Particularly important were hour reductions in an industry with longer working days and weeks than most. The union found some new frontiers, such as Miami Beach's resorts in the 1950s, the small but high-profile Playboy Bunny workforce in the later 1960s, and Las Vegas, where HERE claimed 10,000 members by the 1980s. But aside from such bright spots, HERE could not keep up in the expanding hospitality industry. Growth was concentrated in the hard-to-unionize Sunbelt and suburbs, and the

increasing number of part-timers also made new organizing difficult.

As total membership began to tumble in the 1970s, HERE underwent significant re-organization. A court determined in 1972 that the Civil Rights Act of 1964, which forbade sex discrimination in employment, rendered HERE's sex-segregated locals illegal. So ended seven decades of separate organizing by waitresses. The International soon decided to eliminate all craft-based distinctions as well. HERE thereafter was composed of amalgamated city locals containing workers from all hotel and restaurant trades.

Centralization of locals—and thus of power in the union—piqued federal interest in suspected mob influence over HERE. The government launched an official probe in 1976 of the union's alleged infiltration by organized crime. Mob involvement with some of the locals dated back to the era of Al Capone, but authorities believed it was spreading under the president, Edward T. Hanley (1973–1998). In 1986, a federal commission on organized crime named HERE among the nation's four most corrupt unions. Various investigations resulted in trusteeships for the large Atlantic City and New York City locals and a federal watchdog for the International from 1995 to 2000.

By the early twenty-first century, HERE's membership had fallen to 260,000, half its peak. But the union had a new president, John W. Wilhelm, renowned for his organizing skills, and in Las Vegas, one of the fastest-growing private-sector locals in the United States, with 50,000 members. In mid-2004, HERE joined with UNITE, the Union of Needletrades, Industrial and Textile Employees, to form UNITE HERE, representing more than 450,000 workers throughout North America. UNITE was itself the product of an earlier merger in 1995 of two other of the nation's oldest unions, the International Ladies' Garment Workers' Union (ILGWU) and the Amalgamated Clothing and Textile Workers Union (ACTWU). The UNITE-HERE merger brought together unions that historically represented many immigrants and women—and still do. Purged of corruption and proud of its racially diverse and majority female membership, HERE had come a long way from its early days as a bartenders' craft union.

HOUSE UN-AMERICAN ACTIVITIES COMMITTEE/DIES COMMITTEE

The House Committee on Un-American Activities (HUAC) was established as a permanent committee of the House of Representatives in 1946. Its predecessor, the Dies Committee (named after its chairman, Representative Martin Dies, a Texas Democrat), was founded in 1938 and initially focused its investigations on the Ku Klux Klan and American Nazi sympathizers. During World War II, the Dies Committee turned its attention toward Communist subversion within the New Deal. After the beginning of the Cold War, HUAC began to focus almost exclusively on investigating the influence of domestic Communists in various institutions, such as government agencies, labor unions, and Hollywood.

HUAC's most memorable hearings involved claims that domestic Communists were engaged in espionage within the United States government. The most contentious of these hearings involved Alger Hiss, a high-ranking State Department employee who was accused by a former Communist, Whitaker Chambers, of having been a spy for the Soviet Union. Hiss denied the charges but was later found guilty of perjury for having denied under oath that he was a spy. While Hiss maintained his innocence until his death and claims of his innocence remain popular among certain segments of the American left, a growing scholarly consensus has arisen, based largely on declassified American and Soviet intelligence reports, that Hiss was indeed guilty of espionage.

The committee also investigated Communist infiltration of the labor movement, particularly within the Congress of Industrial Organizations (CIO). Its investigations turned up over two hundred CIO organizers who were alleged to be members of the Communist Party USA (CPUSA), and played an important role in strengthening the anti-Communist forces within the labor federation, which eventually purged 11 Communist-led unions by 1950. The most frequently cited HUAC investigation into labor, though, was the 1947 investigation of Communist subversion in the film industry, led by the committee's second chairman, John Parnell Thomas, a New Jersey Republican. This investigation became infamous when 10 members of the Screen Writer's Guild, the union representing writers in motion pictures and television, were cited for contempt of Congress because they refused to answer questions at HUAC hearings. In response

to these citations, the Hollywood film studios set up a blacklist to prevent known or suspected Communists from working under their own name or with screen credits. Some estimates have placed the number of blacklisted artists at over three hundred.

HUAC has been the recipient of considerable criticism, both from contemporaries and from later scholars. It has been accused of making wild and unfounded accusations against individuals, engaging in witch hunts, and selecting its targets out of partisanship. Much of this criticism is undoubtedly correct, and much of the committee's rhetoric was extreme and incendiary. Nevertheless, recent revelations from both American intelligence decrypts and newly opened Soviet archives have made some of the committee's claims more plausible. In particular, many of those accused of having worked as Soviet spies during the New Deal and World War II eras appear to have engaged in espionage.

During the 1960s, HUAC became considerably less influential and was widely criticized by large segments of the mainstream of American opinion. In 1969, it changed its name to the Committee on Internal Security and was eventually abolished by the post-Watergate Congress in 1975.

HOUSEWORK

In pre-industrial America, housework was divided between men, women, and children. There was a sexual division of labor, though its development sometimes seems mysterious. For example, men made cider and mead, but women made beer, ale, and wine. Women made and mended cloth clothing, while men worked with leather. Women and men both carried out tasks that required brute strength. Men chopped and hauled wood and also pounded and hauled corn. But women did laundry, a long and grueling task with pre-industrial tools, and also made soap. There were also a number of tasks that both men and women performed, such as weaving, milking cows, and paring potatoes. The work of both men and women was focused on the home. However, households were still tied to the market economy, because there were always some goods and services each could not produce and had to barter for, but the

pre-industrial home was much more self-sufficient than its successor.

The historian Laurel Thatcher Ulrich has pointed out that the colonial American household did indeed rely on significant amounts of trade, and while the world of women was in some ways circumscribed by the borders of the family land, they were expected to seek out commerce that would benefit the home. Colonial women were manufacturers, agriculturalists, and traders—and the poorer the household, the more blurred the line between male and female work. Account books from the period often make trade appear as a male province, dominated as they were by both the names of men and the produce of their manufacture. But Ulrich has identified complex webs of barter and borrowing that women engaged in that composed a sort of informal, usually unrecorded, economy that was essential to the success of households. Her notion of the wife as “deputy husband” indicates that women were expected to do the work of men if necessary, although many tasks were normally gender specific. In colonial America, women were expected to accept a broad, and sometimes quite flexible, responsibility for the well-being of their families.

The historian Jeanne Boydston has argued that the early nineteenth century saw a shift from a gendered division of labor to a gendered definition of labor. As industrialization lured men outside the household and into the wage economy, the wage itself began to define legitimate work. This cultural devaluation of the household economy made the work of many women less visible just as the demands upon them were increasing. To make up for the often low wages paid to their husbands, wives had to be careful consumers and often avoided the marketplace if household production was possible. The industrial revolution that provided both the mass-produced goods and the wages for modern consumers to spend on them did not simply transform women into buyers and men into earners. Women built home furnishings and practiced cooking economies, for example, that made households viable, and they did so with decreasing help from men and children. The industrialization of the home during the latter half of the nineteenth century made up for this shortfall of human labor to some degree, but this transformation also produced new family demands on women while according them little recognition as workers. Like men toiling in factories, women houseworkers also became machine tenders, but the household had already been effectively removed from the cultural definition of work.

The historian Ruth Schwartz Cowan has argued that men increasingly left the household economy for wage work over the course of the nineteenth century because industrial-era household technologies made

men's work redundant, increased the load carried by women, and necessitated a cash income. She used the iron stove to illustrate these dramatic changes. This innovation became the first widely owned "consumer durable" and made an extraordinary impact on the standard of living, relegating the open hearth to the past. The iron stove did not require the expensive services of a mason to install, used less fuel, and could be placed centrally in a room to heat its occupants while cooking their food. Men had spent a lot of time chopping and hauling wood in the era of the open hearth, but these stoves required coal, so that household responsibility was eliminated. However, the stove meant more work for women, who did the cooking. The stove greatly increased the cook's control over heat and made it possible to work with multiple dishes simultaneously, and because of more efficient fuel, they could do so for a longer period. Cooking became more of an art, and family expectations rose along with houseworker preparation time.

Men had other tasks replaced as well. The cheap availability of fine white flour made baking bread more complex for women than it had been with meal, but it meant that men no longer had to haul and pound grain. The mass production of shoes and the rise of the meatpacking industry meant that men no longer needed to work leather or butcher animals at home either. But obtaining coal, flour, shoes, and meat now required a regular supply of money. This trend only increased as households, over the course of the twentieth century, became wired to an array of complex technological systems: electricity, central heating, the telephone, running water, sewage disposal, and so on. A break in the supply of money would spell disaster for the household, so someone needed to bring in that money full-time. Men assumed this role, in part, because so much of their housework had been made technologically obsolete. They went out to bring home wages, and the work environments of men and women often greatly diverged.

Cowan's assertion that the home underwent thorough industrialization raises a number of important observations. Houseworkers of the industrial era were much more isolated than many of their counterparts in the wage economy and were usually engaged in a much wider variety of tasks. They were also, of course, unpaid and therefore had far less autonomy and power in a cash economy. However, the productivity of both industrial houseworkers and industrial wage workers often relied on complex machinery they could not make or repair. Thus, many workers both inside and outside the home were alienated from the tools that made their labor possible. These tools relied on nonhuman sources of energy, such as petroleum or electricity, and thus were often part of large and

complex technological systems even further beyond their control. Yet, houseworkers have adopted machinery eagerly because it has usually raised the standard of living of their families and has made some tasks, such as laundry, far less grueling.

Americans tend to believe that the household, in the industrial era, became a unit of consumption and virtually ceased being a unit of production. While elements of the production of food, clothing, and health care have been removed from the home, others still remain. Also, examples abound to indicate that technological change has invented new types and standards of household production. The production of transportation services made possible by near universal access to the automobile by the mid-twentieth century was a major addition to housework. Pre-industrial households used to consume transportation services. Peddlers came to the door; retailers and service providers delivered and made house calls, but no longer. Delivery work shifted from seller to buyer, and thus houseworkers shifted from consumers to producers of transportation services. New standards, from the iron stove on, also created more work. Indoor plumbing made much higher hygiene standards possible and thus increased family expectations of the production of cleanliness by houseworkers. The historian Susan Strasser has noted that the impact of the automatic washer on doing laundry may have been to restructure, rather than reduce, the time required. As the process became far less arduous, families expected it to happen more often and to include clothing that previously would not have been deemed soiled enough to require washing. The evolution of the automatic dryer and synthetic fabrics yet further increased expectations, even as these innovations lessened hanging and ironing labor.

One study of families that had a comfortable standard of living in 1912 revealed that houseworkers toiled 56 hours per week. Subtract servants and add at least periodic wage or piecework employment, and the burdens on working-class women appear heavy indeed. In 1965, a study found that affluent houseworkers devoted 55 hours per week to household and child-care labor and their working-class counterparts devoted just two hours less. Thus, the workload for affluent houseworkers remained consistently high during the industrial era, though their households became thoroughly industrialized. Affluent women were also more likely to be working a "double day" in the latter half of the twentieth century, which working-class women had long known, while fulfilling housework expectations elevated by technological advances and doing so with considerably less servant labor. The basis of the economy shifted away from industry and toward services during this period,

HOUSEWORK

decreasing, but by no means bringing into equilibrium, the proportion and types of paid work coded as masculine and transforming the educational possibilities of women. These opportunities, where actually gained, were often hard won through movements such as the National Organization for Women, which pressured the government to expand and protect the economic rights of women during the 1960s and after. Even as women streamed in to the paid labor force in the latter half of the twentieth century, the cultural construction of housework as a full-time endeavor for women proved persistent. The industrialized household immeasurably improved the standard of living in the United States and made many crucial tasks less physically demanding for houseworkers, while also creating new types and standards of work and increasingly embedding it in ever more complex economic and technological systems.

HUDSON, HOSEA (1898–1989)

Hudson was born in Wilkes County, Georgia, and raised by his grandmother, Mrs. Julia Smith, a sharecropper. In 1917, he married Sophie Scruggs and continued work as a sharecropper until 1923, when at the age of 25 he became an iron molder, working in steel foundries in Georgia and Alabama. Their son, Hosea Jr., was born in 1920. In 1924, they moved to Birmingham and he began work as an iron molder. He worked at the Stockham Pipe and Fitting Plant in Birmingham, Alabama, from 1927 to 1932.

Unemployed in the late Depression days of the early New Deal era, he worked with the Alabama

Welfare Department and after that the Federal Works Project Administration (WPA) in 1933 and 1938. Here he helped to organize the unemployed in Birmingham through mass mobilizations and demonstrations.

Returning to the steel industry, he worked at the Wallwork Foundry, which belonged to the Tennessee Coal and Iron Railroad Company, from 1937 to 1938, the Alabama Foundry Company from 1939 to 1942, and the Flakley Foundry Company from 1942 to 1947.

In 1931, Hudson joined the Communist Party USA (CPUSA). The Party was organized on the club, cell, or unit level, and he soon became a leader of his primary unit. His first task was to organize workers at the Stockham Foundry, but when his Party membership was discovered by the owners, he was fired in 1932.

He became active in the Scottsboro Case in 1931, joining the worldwide campaign to free nine young black men falsely accused of raping two white women in Alabama. In 1932, he became active in the Unemployed Councils, where he became involved in neighborhood initiatives to keep landlords from evicting tenants. If the landlords refused, the Council would put the tenants back in the buildings and, in case of cold weather, would take apart empty buildings for firewood.

Realizing his organizational abilities, the Central Committee of the CPUSA brought him to its national Training School in New York City in 1934. Here Hudson spent 10 weeks studying Marxist economics and social theory. He also learned more about trade union history and leadership skills and saw how he could relate theory to practice and vice versa. He was then sent by the Party to Atlanta, where he organized under the pseudonym Larry Brown.

Returning to Birmingham in 1937, his next job was at the Tennessee Coal and Iron Railroad Company, where he was assigned to the hot and oppressive Wallwork Foundry. He joined the United Steelworkers of America union (USWA), which did not have a Local 1489 at another plant. He soon became its recording secretary.

Elected as a delegate to the Southern Negro Youth Congress's (SNYC) second convention in 1938, he met its early leaders, among them James E. Jackson Jr., Edward Strong, and Louis Burnham. When the SNYC established its national headquarters in Birmingham, in 1939, Hudson worked closely with its leaders and with Esther Cooper Jackson, who later became its executive director. There Jackson and her husband James, who was a Southern Region coordinator of the Communist Party, held daily sessions

with Hudson, helping him further develop his reading and writing skills.

Finding himself unemployed again in 1938, Hudson plunged into his new work with the WPA. He then became vice president of Local 1 of the Workers Alliance Union of the Birmingham and Jefferson County locals of the WPA. Working successfully to bring more worker projects and unemployment aid to Jefferson County (Birmingham), he soon became vice president of the Jefferson County Industrial Union Council.

Following that, he began work at the Jackson Foundry of the Flakley Foundry Company, where he organized Local 2815 of the USWA and became president of the local. He also found the Right to Vote Club of Birmingham. He held other various union positions within the Birmingham Industrial Council and the USWA from 1940 until 1947. In 1945, he continued his work in the mass movement as vice president of the Alabama People's Education Association.

Identified by the *Birmingham Post* as a member of the National Committee of the CPUSA in late 1947, he was expelled from the union and fired from his job at the Jackson Foundry. He also was banned from work in any other foundries, where he had for years worked as a molder in the beginning years of the McCarthy–Truman Cold War era. His marriage of 30 years ended in 1946.

Hudson developed extensive contacts with many groups during these Birmingham years. He organized black workers within the confines of the Congress of Industrial Organizations (CIO). He also played a role in fighting for black voting rights throughout the South. Blessed with a strong bass baritone voice, he also sang with church choirs and barbershop quartets and was best known for his rendition of the song, "I Just Want to Be a Leader."

Hudson attempted to continue his political work by organizing the United Political Action Committee, but like many Communists during the period, Hudson was finally forced "underground" in 1950. From 1951 until 1953, he worked as CP liaison to Party units in the South. He also lived and worked as a mason and other odd jobs under various pseudonyms in Birmingham until Eugene "Bill" Connor, the infamous Birmingham police commissioner, using the Klu Klux Klan and police, tracked Hudson down and forced him to leave the city for good under threat of death. Finally, in 1954, he moved north to New York and took odd jobs, the last being as a janitor in a restaurant.

In 1962, he married his second wife, Virginia Marson, and in 1965, he retired from the restaurant. They moved first to Newark, New Jersey, and then settled

in Atlantic City. His wife died in 1971, and he moved to Florida in 1984.

In the early 1970s, Hudson served as an adjunct professor at the Antioch College's Washington campus, and in 1972, he published his autobiography, *Black Worker in the Deep South*. Richard Arrington, the first African-American mayor of Birmingham, gave Hudson the keys to the city on February 26, 1980, which was also proclaimed Hosea Hudson Day. He wore the key around his neck on public occasions. He was a founding member of the Coalition of Black Trade Unionists.

Hudson moved to Florida in 1984 and remained there until his death at 91.

HUERTA, DOLORES C. (APRIL 10, 1930–) Cofounder, United Farm Workers of America

Dolores Huerta is the cofounder of the United Farm Workers of America (UFW), AFL-CIO, and the most prominent Chicana labor leader of her generation in the United States. For over 50 years, she has tenaciously devoted herself to the struggle for unionization of farm workers and dignity and justice for agricultural laborers, Mexican-Americans, immigrants, and women. Huerta's unwavering dedication to social change is celebrated in song, murals, newspaper articles, and magazines, through honors and awards, and in the lives of tens of thousands of union members and supporters. Still active and organizing, she is recognized as one of the foremost women in the U.S. labor movement, Mexican-American groups, progressive politics, and feminist circles.

A nationally admired labor leader, political activist, and supporter of women's rights, Huerta was born in the small mining town of Dawson in northern New Mexico. She was the second child and only daughter of Juan Fernández and Alicia Cháves Fernández. Her father was a miner, a fieldworker, and after the couple divorced, a union activist and briefly a member of the New Mexico state legislature. After her divorce,

Alicia Fernández moved her family to Stockton, California. As a single parent during the Great Depression, she experienced difficulty supporting her young family. While she worked at a cannery at night and as a waitress during the day, Huerta's grandfather watched the children. During the 1940s, her family's circumstances improved. Huerta's mother, who had remarried, owned and operated a restaurant and hotel that catered to a multiethnic clientele. While Huerta and her brothers and stepsister helped run the establishment, their mother instilled in them an ethic of community service and encouraged their participation in a variety of social activities. Reflecting opportunities made possible by her emerging middle-class lifestyle, Huerta took violin, piano, and dance lessons. She also sang in the church choir and was an active Girl Scout.

Prodded by parental ambitions, Huerta excelled in school. After her high school graduation, she enrolled at Delta Community College, briefly interrupting her studies for her first, short marriage in 1950 to Ralph Head. Soon divorced with two daughters, she returned to school to prepare for a teaching career. Frustrated with her inability to help her students with their urgent needs of hunger and poverty, Huerta yearned for a more direct way to deal with social injustice and inequality.

Social and Labor Activism

She soon discovered an outlet for her desire for social change in the new wave of labor, civic, and political activism then sweeping the country after World War II. She joined the Agricultural Workers Association (AWA) founded by her local parish priest in Stockton, California. It later merged with the AFL-CIO-sponsored Agricultural Workers Organizing Committee (AWOC). Huerta won election as the secretary-treasurer of the group. Frustrated by the leadership and its policies, she eventually left. The postwar organization that would dramatically alter her life was the Community Service Organization (CSO), a Mexican-American self-help association that spread throughout the Southwest. The group asserted that grassroots organizing held the key to improving the conditions of the poor and politically disenfranchised barrio residents throughout California. A preferred strategy was the house meeting. The CSO recruited volunteers to teach citizenship classes, initiate voter registration drives in Mexican-American neighborhoods, and press for improved services in their communities. Because Huerta was outspoken, passionate, and determined,

the organization's leaders asked her to join the staff to advocate for CSO initiatives in Sacramento. Here she gained valuable experience as an organizer, activist, and lobbyist. During her tenure, she successfully lobbied for bills, including landmark legislation that allowed farm laborers to receive public assistance, retirement benefits, and disability and unemployment insurance, regardless of citizenship status. She also labored to end the Bracero (guest worker) program. Most significantly, she worked with César Chávez. The two were very different in temperament and had a contentious relationship throughout their association, but they shared an abiding commitment to social justice. Discouraged by the CSO's unwillingness to embrace the organization of farmworkers, the pair left to found the National Farm Workers Association (NFWA), the precursor to the United Farm Workers of America (UFW), in Delano in 1962.

Undaunted by her estrangement from her second husband, Ventura Huerta, and the responsibility of raising her family of seven children, Huerta threw herself into the organizing effort. She remained in Stockton for several years to organize workers in the agricultural valleys of northern California before Chávez successfully prevailed upon her to move her family to Delano and to work directly with him. Despite the long tradition of male dominance in the labor movement, Huerta was the first vice president and maintained a highly visible profile. As second in command to Chávez, she exerted a direct influence on guiding the union. In the pivotal 1965 Delano grape strike initiated by AWOC and joined by the NFWA, she devised strategy and inspired workers with her determination and courage. Eventually, the two organizations merged into the United Farm Workers Organizing Committee (UFWOC). The only woman on the executive board, Huerta took charge of negotiations and secured the first contract with Schenley Wine Company. Her tenacity and unconventional tactics extracted major concessions from wineries, such as pay raises, pesticide regulations, paid holidays and vacations, unemployment benefits, sanitation facilities, clean drinking water, health benefits, and eventually pensions. In addition, the union hiring hall replaced the exploitive labor contractor system. This collective bargaining agreement challenged the traditional power relations between farm laborers and corporate agriculture. It served as the model for contracts with other wineries such as Almaden, Gallo, Paul Masson, Christian Brothers, Franzia, and Novitiate.

When table grape growers refused to bargain, the union resorted to the nonviolent boycott. Huerta became a prominent figure in 1968 as director of the boycott in New York City, the primary distribution

point for grapes, and then the East Coast director. Supported by a vibrant civil rights movement, she mobilized unions, political activists, ethnic and racial associations, students, religious supporters, environmentalists, and concerned consumers on behalf of “*La Causa*,” the farmworkers’ cause. In New York, Huerta also became aware of the growing feminist movement through her contacts with Gloria Steinem and other women’s activists. Consequently, Huerta began to incorporate a feminist critique into her human rights’ philosophy and sexual harassment clauses into her negotiations. Her passionate defense of farmworkers’ rights provided a compelling model for women, encouraging them to move beyond traditional roles to join picket lines, marches, and boycotts across the nation despite their own personal reservations and over objections of unsupportive fathers or husbands. After five years of striking, the growing power of this cross-cultural and cross-class grassroots coalition finally forced Coachella and Delano table grape producers to negotiate the historic contracts of 1970.

Even before the union could fully savor its victory, it immediately confronted the lettuce, Gallo wine, and table grape boycotts of the 1970s. It was during this decade that the union ceased to be the United Farm Workers Organizing Committee (UFWOC) and became the United Farm Workers of America, or UFW. As in previous campaigns, Huerta’s charisma, energy, organizing skills, frenetic travel calendar, and prodigious speaking schedule renewed the national boycott. Huerta juggled her union responsibilities with growing family demands as she began her unconventional liaison with Richard Chávez, brother of César Chávez, which produced four more children. Frequent separations from her large family did not deter her from her number one priority, the union. Unlike her male colleagues, Huerta’s domestic arrangements departed from conventional expectations and drew criticism and comments from co-workers and observers in the media. She brushed off such concerns and focused on her work. Nevertheless, her constant travel, organizing, and publicizing contributed to the passage of the Agricultural Labor Relations Act (ALRA) in 1975, the first law to recognize the collective bargaining rights of farm laborers in California. This legislation raised expectations that the turmoil in the fields would come to an end.

The struggle between agribusiness and the UFW did not stop, but assumed a new legal dimension. The emphasis moved to elections in the fields and political organizing to protect the new legislation. As part of this effort, Huerta headed the union’s Citizenship Participation Day Department (CPD), the political arm of the UFW, as she fought to defend the law

in Sacramento. In the 1980s, Huerta directed her energies to another ambitious initiative, the founding of Radio Campesina, the union’s radio station (KUFW). This resource would become vital as the union faced an increasing conservative challenge from Republican administrations, including the Reagan presidency and the election of California Governor George Deukmejian, both allies of agribusiness.

Like other unions during this inhospitable political environment, the UFW lost hard-won contracts and experienced a declining membership. Huerta filled her schedule with speaking engagements, fund-raising, and publicizing the renewed boycotts of the 1980s. Appearing before state and congressional committees, she offered impassioned testimony on a variety of issues, including pesticides, the health problems of fieldworkers, Hispanic issues, and immigration policy. The 1985 Immigration Act she lobbied for provided amnesty and citizenship for over one million farmworkers who had lived, worked, and paid taxes in the United States. Her energy and commitment seemed boundless.

Huerta’s loyalty to the farmworkers movement claimed a personal toll—family sacrifices, more than 20 arrests, and a life-threatening injury during a 1988 peaceful protest against the presidential candidacy of George H. W. Bush in San Francisco. Clubbed by a police officer, Huerta collapsed on the picket line. She was rushed to the hospital with broken ribs, and her spleen was removed in emergency surgery. A legal suit forced the police department to revise its rules regarding crowd control and police discipline. The court issued an \$825,000 financial judgment as a consequence of her personal injury.

During her convalescence, Huerta took a leave from the union to work on the Fund for the Feminist Majority’s Feminization of Power Campaign. While crisscrossing the country recruiting and encouraging Latinas to run for office, she was stunned by the premature death of her longtime collaborator, César Chávez, in 1993. Huerta returned to the union. With Chávez’s untimely death, she became the revered elder. Always in demand as a speaker, she addressed a wide variety of labor, women’s, political, student, and community groups, assigning her honorariums to the union. She contributed to organizing campaigns, even returning to the strenuous demands of the bargaining table to pressure strawberry, tomato, and mushroom growers.

Later Political Activism

In 2000, the 70-year-old Huerta reluctantly decided to cut back on her union activities. That year, she chose

not to seek re-election to the union's Executive Board as secretary-treasurer. Her "retirement" did not mean abandoning her advocacy of labor, political, and women's issues. As the union's first vice president emeritus, she continued to speak on behalf of farmworkers, participated in the presidential campaign of Al Gore, and steadfastly supported women's rights. Toward the end of the campaign, she was suddenly stricken with an abdominal aneurysm that required surgery and massive blood transfusions. Confounding the medical community, but not those familiar with her fighting spirit, she recovered. After recuperating, she established the Dolores Huerta Foundation to train community leaders to advocate for immigrants, women, and children. Still drawn to politics, the Kerry/Edwards campaign appointed her to head up *Mujeres con Kerry* (Women with Kerry) in 2004.

Huerta's dedication to social change has been commemorated in murals and ballads; schools and parks have been named after her; and she has won numerous honors. The California State Senate awarded her the Outstanding Labor Leader Award in 1984. In 1993, she was inducted into the National Women's Hall of Fame. President Bill Clinton bestowed the Eleanor Roosevelt Award upon her in 1998.

A tireless activist for farmworkers, Mexican-Americans, women, and social justice, Huerta created an inspiring and unforgettable legacy to the labor, civil rights, and women's movements of the twentieth century. She steadfastly clung to her conviction that agricultural laborers, a workforce dismissed by the largely white leadership of mainstream unions as unorganizable, could be unionized. Proud of her Chicana heritage, she roused multiple generations of Mexican-Americans to fight for their rights. Rejecting mid-twentieth century ideals of femininity, she ignored conventional expectations for women and for Mexican-American women, in particular. For women, and especially Chicanas and Mexicanas, she has blazed a pioneering trail. Surmounting gender, ethnic, and class expectations, she has provided a powerful example and role model in the struggle for a decent standard of living, equality, and justice.

HULL-HOUSE SETTLEMENT (1889–1963)

Jane Addams and Ellen Gates Starr, founders and residents, established Hull-House, Chicago's first settlement on September 18, 1889, as a protest against the widening gap between the haves and the have-nots in the industrial districts of modern cities. As residents, they took no salaries but paid their own expenses, choosing to live among working-class families and to learn about their needs. Instead of imposing solutions, Addams and Starr sought to work with their neighbors to improve urban life and were committed to sharing their cultural and educational advantages. After renting the once fashionable house built by the realtor Charles J. Hull in 1856, they decorated it as if it were their own home, with paintings, sculpture, and books, and invited their neighbors to social evenings, classes, and lectures.

Settlements proliferated in the 1890s, a period of labor unrest. Soon after opening Hull-House, daily experiences in the neighborhood focused Starr and Addams, and the other residents who soon joined them, on the labor struggle, and they allied themselves with labor leaders and reformers in the antisweatshop movement. Residents collected and publicized data about sweatshop conditions, demanded new laws to regulate the workplace and keep children in school, and encouraged their neighbors to organize themselves into unions. Highly politicized by life in the Nineteenth Ward of Chicago's Near West Side, an

industrial neighborhood just west of the city's downtown, Hull-House residents began to advocate for public health reforms, construction of playgrounds and recreation centers, and improved affordable housing and better sanitation. Responsive to the needs of immigrants and their children, they redefined the nature of programs and educational curricula for public schools. These initiatives were fully expressed in the Progressive Party platform of 1912 that was developed in large part by settlement leaders. At the Bull Moose convention held in Chicago, Jane Addams seconded the nomination of Theodore Roosevelt as candidate for president of the United States.

Over the years, Hull-House welcomed reformers and radicals, socialists, communists, anarchists, and trade unionists as residents; there were also a significant number of young professionals from the fields of business, law, and medicine. Artists and writers, university people, social workers and college graduates in search of meaning in their lives also came to live at the settlement for periods of six months, one or two years, or in some cases for decades.

Some historians emphasize the social control features of settlement house initiatives, arguing that middle- and upper-middle-class residents hoped to assimilate immigrants into American middle-class values about family life and social behavior. Others question the motivation of the settlement movement in expanding the role of the state, especially arguing that the maternalist values of settlement leaders, who were predominantly women, led eventually to a two-tiered social welfare system in the United States that disadvantaged working-class women and minorities and attempted to enforce middle-class behavior and mores. Historians have also critiqued the race policies of social settlements, pointing out that these associations rarely resulted in interracial programs.

Hull-House and Gender

The overwhelming majority of residents at Hull-House were single women. Among these, a small group spent their adult lives at Hull-House. Many others, including Florence Kelley, Mary Kenney, Julia C. Lathrop, Grace Abbott, and Alice Hamilton, were leaders in the women's political culture of the late nineteenth and early twentieth century. Alliances forged at Hull-House linked social activist women in national and international networks. For many women, Hull-House and other settlements provided a new kind of social space in between a traditional domestic sphere and a new civic or professional life. Hull-House included male residents, too, but the

settlement's leaders were women. Hull-House was a privately funded settlement for most of the association's 74-year history on Halsted Street. Money came primarily from reform-minded women. Louise deKoven Bowen was the single largest contributor to the settlement, and after she was appointed treasurer of Hull-House Association in 1907, she assumed much of the responsibility for fund-raising. Other major donors were Mary Rozet Smith, Addams's companion, and Helen Culver, heir to the Hull property. The wealthy male philanthropists Charles Hutchinson, Edward B. Butler, and Julius Rosenwald also contributed to Hull-House, but the settlement was never their major philanthropic focus as it became for Smith and Bowen. The settlement was incorporated as the Hull-House Association (HHA) in 1895, with Addams, John Dewey, Helen Culver, Allen B. Pond, and Mary Rozet Smith serving as trustees. Pond was the architect for the 12 additional settlement buildings. Educator and philosopher John Dewey was active at Hull-House during his tenure at the University of Chicago. The board of trustees remained small (less than 10) during Jane Addams's tenure as head resident and president. She remained in these positions until her death in May 1935, never receiving a salary and using her own inheritance to sustain the enterprise.

The almost unconditional support she received from the close-knit and small group of women donors who shared her political agenda was a major reason why Jane Addams could risk taking unpopular positions. She was also empowered by the independent status of Hull-House, one of the few settlements in the country that was not affiliated with either a religious body or a university.

After Addams's death, the Hull-House resident Adena Miller Rich served as head resident (1935–1937), refusing to accept any compensation in an effort to continue the original settlement tradition. Charlotte Carr (1937–1942) became the first paid director, and with her tenure during the New Deal came a greater reliance on public funding, a change that the HHA had resisted until almost the end of the 1920s. Professionalism in the field of social work as well as increased public funding and a full-time salaried director contributed to the demise of the settlement as a co-operative, resident-based community based on volunteerism.

Hull-House as a Social Center

Hull-House programs grew at a rapid pace as settlement residents became more familiar with the needs of the neighborhood. By 1907, the settlement was a

HULL-HOUSE SETTLEMENT

complex of 13 buildings, 12 additional edifices having been constructed by architects Pond & Pond as new programs and services were added and space for a growing number of women and men residents was provided. Services for children included a kindergarten, nursery, well-baby clinic, public gymnasium, and playground. In 1907, Hull-House residents founded the Juvenile Protective Association (JPA), and in 1908, they established the Immigrants' Protective League (IPL). Both the IPL and the JPA were housed in the settlement's buildings and had their own boards and staff who worked closely with Hull-House. The settlement included a branch of the public library, a post office, and a cooperative boardinghouse for young workingwomen, the Jane Club. It acted as a liaison with city charities and social service agencies. Numerous social and recreational clubs attracted both children and adults. Educational programs for adults included college extension classes, lecture series, and vocational training. The arts were addressed through a rigorous Music School program, classes in visual and craft arts, sponsorship of theater groups and productions, exhibits, dance classes, and a collection of artwork for loan to club members. Many activities were geared toward neighborhood immigrants. Hull-House sponsored ethnic festivals and social events, and offered English and citizenship classes. By 1907, the settlement reported that nine thousand people attended classes or participated in activities.

Using the Performing and Visual Arts to Create Community

Addams and Starr, who had met while attending the Rockford Female Seminary in Rockford, Illinois, were influenced by Toynbee Hall, the East London settlement started in 1884 by Oxford graduates. They first put into place programs and activities that reflected their reading of John Ruskin, William Morris, and T. F. Horsfall, following the theory that it was essential that working people should have the opportunity to express themselves through the arts. It is not surprising that well-educated women who were disturbed by the seeming isolation and alienation of the working classes initially would turn to high culture as a means to bridge the class gap. The Shakespeare classes, the Plato Club, and the college-extension courses they offered appealed to the American-born clerks and schoolteachers of German and Irish descent, who still remained in the neighborhood that was rapidly being populated by newly arrived immigrants from southern and eastern Europe. Later,

Addams and residents Enella Benedict, head of the Art School, Eleanor Smith, director of the Music School, and Laura Dainty Pelham and Edith de Nancrede, of the Drama department, realized that the performing and visual arts could be vehicles for intercultural and cross-class activities. Theatrical and musical events where neighborhood children and adults performed for audiences that included the settlement's wealthy patrons, for example, created opportunities for privileged Chicagoans to learn first-hand about immigrant and working-class people. At the same time, pageants and holiday celebrations brought together neighbors from different cultural backgrounds.

As successive groups of European immigrants and migrants from the southern United States arrived in the Hull-House neighborhood, residents adapted the performing arts programs as ways of bringing children and adults of different races, ethnicities, and religions into social contact. Reproductions of European art and sculpture initially decorated the settlement's interior space, and the first new building added to the Hull home included art galleries and studios and a lending library where books and art reproductions could be borrowed. The Labor Museum that opened in 1900 also privileged European crafts. With the founding of the Hull-House Kilns in 1927, the settlement acknowledged the migrations of Mexicans. The Kilns were incorporated as a business, a reflection of the fact that Hull-House had become a major institution in the neighborhood and an employer of local crafts people in its industrial shops. Artists from Mexico were employed, but the directors of the kilns were Americans with connections to the School of the Art Institute of Chicago, and the paid workers were Mexicans from the neighborhood whose primary roles were to produce ceramic dishes that were sold in downtown Chicago shops. There were also opportunities to produce individual art pieces.

During the New Deal era, Hull-House increased its staff with federally funded workers and introduced a department of Workers' Education. Cultural differences in the neighborhood were decentered as shared working-class interests informed creative expressions in the visual and performing arts. Art exhibits included the work of Chicago-area African-American artists, and efforts to integrate programs and staff to reflect the changing demography of the neighborhood had mixed results. With the loss of federal funding during World War II and its aftermath, Hull-House resumed its Eurocentric emphases, as illustrated by the presence of a Latvian theater group in the 1950s.

Support of Labor Organization

The arrival of Florence Kelley brought labor issues to the center. Taking leadership of the antisweatshop campaign, Kelley and her allies were successful in obtaining passage of the first Factory Inspection Act in Illinois in 1893; this legislation also had provisions for reduction of hours for women workers (the eight-hour day clause) and compulsory school attendance for children through the age of 14. Appointed chief factory inspector, Kelley located her office in the settlement house.

Hull-House invited workers interested in organizing new unions to meet in its facilities and, when the new unions engaged in strikes, became sympathetic allies, providing bail money, contributing to the fund for striking workers' families, and protesting the anti-union politics of the employers. Chicago branches of the Women's Union Label League and the Women's Trade Union League met there. During the economic depression of 1893–1894, Hull-House opened a Model Lodging House for unemployed women and funded it through a cooperative arrangement with the Chicago Woman's Club. With the assistance of Hull-House, Mary Kenney and a group of women workers formed the Jane Club, a co-operative and self-governing boarding club. A house was built in the Hull-House complex for the club's use.

Sociological Investigation and Advocacy

The belief that an enlightened citizenry could be mobilized for reform causes was part of the Progressive Era's faith in the efficacy of social science investigation to produce solutions for society's problems. *Hull House Maps & Papers (HHM&P)* (1895) is the first study of its kind in the United States and directly influenced subsequent social surveys that also emanated from settlement houses rather than from universities. *HHM&P* condemn the sweating system in the garment trades and argue that only those workers who organized themselves into trade unions were able to improve their status. In subsequent studies—23 different investigations were conducted between 1892 and 1933—Hull-House residents explored child labor, tenement conditions, ethnic groups, infant mortality, midwifery, cocaine use, and the causes and prevention of truancy. Many of their findings were published in the *American Journal of Sociology*. They used this information to lobby for reforms.

Departure

The Hull-House neighborhood continued to change demographically. In 1938, the Jane Addams Homes, the city's first public housing development, was built southwest of the settlement. In the 1950s, parts of the neighborhood were razed for industrial use and to accommodate two expressways. Hull-House's director, Russell Ballard (1943–1963), advocated for community participation in the redevelopment of the old neighborhood, but by the 1950s, settlement houses no longer were in the vanguard of reform. There were discussions about the future of Hull-House.

In 1961, the Hull-House neighborhood was selected as the site for a new urban campus for the University of Illinois, and plans initially proposed the demolition of the 13-building settlement complex and the whole neighborhood that surrounded it. The plan provoked considerable protest from the neighborhood and generated a campaign to save some of the original Hull-House buildings. Two buildings were saved: the original Hull home and the Residents' Dining Hall building. The social service functions of the HHA moved to other Chicago sites in 1963. In 1967, the Jane Addams Hull-House Museum opened in the two remaining structures that had been saved and restored.

HUTCHESON, WILLIAM L. (1874–1953) President, United Brotherhood of Carpenters and Joiners (UBCJ), 1915–1951

Having experienced long periods of unemployment and witnessed failed organizing campaigns as a young itinerate carpenter, William L. Hutcheson developed a firm belief in business principles and the importance of centralized organization and strong leadership to the American labor movement. His style of leadership is usually described as business unionism, and his policies were often criticized as conservative and undemocratic. Nevertheless, he fought hard to preserve his union's jurisdictional claims and powerful position within the labor movement. He was among the most prominent labor leaders in the twentieth century.

Soon after becoming the general president of the UBCJ upon the death of the president, James Kirby, in 1915, Hutcheson intervened in a wage dispute between the New York District Council and the Building Trades Employers' Association. When locals called a strike without the approval of the national organization, he negotiated a settlement with the Employers' Association, and the UBCJ General Executive Board suspended and re-organized 61 locals. Because of the New York locals' tradition of independence, Hutcheson's decisive actions made it clear that powerful local unions and autonomous district councils would be closely monitored under his leadership.

Throughout his career, Hutcheson steadfastly opposed the concept of industrial unionism. For the leaders of the Carpenters union, the prospect of industrial unions raised the specter of jurisdictional losses and internal discord. Since 1914, the UBCJ had adhered to a policy of craft industrialism. In short, this meant that although the union claimed jurisdiction over the entire woodworking industry, it preferred not to organize all workers. Instead, the Brotherhood preferred to police the industry in the interests of

preserving the carpenters' craft interests. In the 1920s, Hutcheson promptly expelled suspected agitators in response to Communists' attempts to infiltrate the UBCJ. When debates within the American Federation of Labor (AFL) over chartering industrial unions began in 1933, Hutcheson was a leading opponent. The split within the AFL, which led to the creation of the Congress of Industrial Organizations (CIO), was famously underscored in 1935 when Hutcheson and the United Mine Workers (UMW) president John Lewis engaged in a fistfight on the AFL convention floor. The UBCJ and the CIO continued their battles in jurisdictional disputes and remained bitter rivals for the remainder of Hutcheson's career.

Hutcheson rejected third-party political movements and argued that labor stood to gain more as a nonpartisan political pressure group. During World War I, for example, he was successful in achieving all of the Carpenters major wartime labor demands through his co-operation in the creation of the National War Labor Board. Throughout his career, Hutcheson sought to achieve gains for labor through the Republican Party. GOP principles meshed well with Hutcheson's conservatism, which generally tolerated only minimal governmental intervention in the economy. Within the labor movement, he warned rank-and-file members that the government could take away just as quickly as it could give to labor. He retreated slightly from this stance during the Great Depression and supported public works projects and unemployment insurance, but he opposed President Roosevelt in each of his elections.

Over the course of his career, Hutcheson became the dominant labor figure within the Republican Party. He turned down offers to serve as secretary of labor under presidents Harding, Coolidge, and Hoover, but advised each on labor issues. In addition to serving as a delegate to several Republican conventions, he was a regular visitor at the White House during Hoover's administration, and in 1944, he was considered as a potential vice presidential candidate. Despite his own conservatism, Hutcheson considered himself a liberalizing force within the Republican Party.

Hutcheson continued to support the Republican Party after passage of the Taft-Hartley Act in 1947, but he devoted much of the remainder of his career to fighting antilabor legislation. According to his biographer, Hutcheson helped influence President Truman to veto the Taft-Hartley Act, and in 1948, the Carpenters union joined the rest of the labor movement in campaigning against congressmen who had voted for the bill. Although he felt betrayed by Robert Taft and other conservative party members, Hutcheson remained a Republican and continued to

advocate a nonpartisan policy for labor even when the AFL came out in support of the Democratic presidential candidate, Adlai Stevenson, in 1952.

Suffering from health problems, Hutcheson resigned his post as president in 1951 at the age of 77. He was succeeded by his son, Maurice, who held the office until 1972. After a brief stay at the union's retirement home in Lakeland, Florida (which he had been instrumental in establishing), Hutcheson returned to the Midwest, where he died on October 20, 1953.

I

ILLINOIS WOMAN'S ALLIANCE

The Illinois Woman's Alliance (IWA) was formed in November 1888 as a cross-class and interracial coalition of 25 diverse women's organizations. Two prior decades of successful political organization by Chicago women around issues of women's rights and the protection of women and children had prepared the way for the IWA. Middle-class and elite women had enlarged the scope of their organizations to incorporate labor issues, and during the same period, women workers had formed labor unions and had affiliated with the men's Trade and Labor Assembly of Chicago.

The immediate incident leading to the IWA's formation was journalist Nell Nelson's "City Slave Girls," a shocking expose of conditions in Chicago's sweatshop, which appeared in the *Chicago Times*. Chicago had a tenement and workshop inspection law on the books that had been enacted in 1879 in response to the revelation that garments were being produced in tenement rooms where men, women, and children lay sick with diphtheria, measles, smallpox, tuberculosis, and other diseases that could be transmitted to purchasers of the garments. The inspection law was not enforced.

The IWA had 25 affiliates ranging from representatives of the Knights of Labor to the Chicago Woman's Club and the Prudence Crandall Club, one of the first African-American women's clubs in Chicago. At its peak the IWA could fill the city council chambers with 500 women. The IWA members included socialists, dress reformers, spiritualists, temperance advocates, and clubwomen.

Elizabeth Morgan, Caroline Huling, Corrine Stubbs Brown, and Fannie Barrier Williams all were IWA officers and represent a cross section of the women's movement in Chicago in the late nineteenth century. Morgan, British-born socialist, in 1888 helped found the Ladies' Federal Labor Union, No. 2703. It was affiliated with the American Federation of Labor (AFL) and adopted the Knights of Labor principle of treating housewives as producers. Morgan represented the Ladies' Federal and the larger Trade and Labor Assembly of Chicago in the IWA. Corrine Brown, a schoolteacher for 13 years and a principal for six before she married Frank Brown, a Chicago banker, was a member of the Socialist Labor party. She was both a leading clubwoman and the head of the Ladies' Federal Union No. 2703. Brown and Morgan issued the call for the formation of the IWA. Caroline Huling, the daughter of a newspaper publisher with political connections in New York State, was an early convert to France E. Willard's Women's Christian Temperance Union and a leader in the Cook County Equal Suffrage Association. She edited a short-lived suffrage newspaper, and in March 1888 was a delegate to the first International Council of Women. Fannie Williams, raised in Brockport, New York, taught school before she married S. Laing Williams, a black lawyer, and settled in Chicago. A member of Chicago's black elite, Williams authored newspaper and magazine articles, founded the Prudence Crandall Club, a literary society of upper-class African-American women and, after heated debate, was voted a member of the CWC.

The IWA slogan, "Justice to Children—Loyalty to Women," reflected the potential conflict inherent in the coalition as traditionalist women advocated moral reforms while feminists attempted to expand the authority and power of women in society. There were also disagreements between trade unionist women who resisted political solutions to economic problems initially and middle-class reformers who sought an expanded role of the state in these matters. The national solution of the race question in 1896 into acceptance of a system of segregated women's organizations meant that the interracial coalition achieved by the IWA would be an anomalous event, not the beginnings of a social transformation.

The balance of power of the coalition shifted when in 1892, Hull-House resident Florence Kelley became the leading figure of the antisweatshop movement. Kelley was a strong advocate of political solutions and with Corrine Brown and the IWA, lobbied successfully for the passage of a state factory inspection system and was appointed the first chief factory inspector. For the next 3 years, Kelley enforced the act's chief clauses. The 1893 act outlawed the labor of children under 14 years of age; it regulated the labor of children age 14–16; it banned the production of garments in tenements. It prohibited the employment of women and minors for more than 8 hours a day, a clause that made the Illinois act the most advanced in the United States.

The Illinois Manufacturers' Association (IMA) immediately challenged the 8-hour clause in the courts. In a surprising move that was condemned by members of the Trade and Labor Assembly and by many middle-class members of the IWA, the alliance passed a resolution in 1894 condemning the 8-hour clause. Accused of being the action of an antilabor group that had acted without a quorum, IWA stalwarts held another meeting and endorsed the controversial clause. There were charges that political and religious influences were at work in the IWA, steering the alliance away from its original prolabor stance. The IWA delegates to the Trade and Labor Assembly complained that the alliance had refused to pass a resolution in support of the Pullman strikers and had instead expressed its disapproval of strikes as a means to settle labor troubles. The IWA appeared to be on the brink of dissolution. Three years later the IWA still held meetings, but its officers did not include leading socialists or trade unionists or the leading clubwomen who had supported factory inspection legislation, including the 8-hour clause, and the alliance's agenda instead focused on more traditional women's issues, including the care and disposition of dependent children in state and county institutions. The Illinois Supreme Court had ruled in 1895 that the

8-hour clause was unconstitutional because it violated women's right to contract their labor on any terms set by their employer. The IWA however had demonstrated the power of a coalition that crossed the boundaries of class and race.

IMMIGRATION AND NATIONALITY ACT OF 1965

The national origins system set in place during the 1920s began to unravel during World War II, although the specific quotas were not replaced until 1965. During World War II, as a gesture to America's ally China, Congress repealed the Chinese Restriction acts, dating to 1882. The lawmakers, with the support of the Roosevelt administration, granted China a quota of only 105 annually and gave Chinese immigrants the right to become U.S. citizens. In 1946, India and the Philippines were also given quotas. The McCarran-Walter Act of 1952 granted all Asian countries small quotas. Japan was given the largest number: 185. Most nations received only 100 slots. The 1952 law also repealed a ban on naturalization for Asian immigrants. At that time the largest group of Asian immigrants in the United States was the over 70,000 Japanese who could now become United States citizens, and most did so.

These modifications responded to the changing post-1945 world and the United States' new role in that world. Foreign policy became part of immigration law because the United States did not wish its immigration laws to be explicitly racist. In a similar manner Congress agreed to admit 110,000 war brides (mostly English and German but 6,000 Chinese women as well) without regard for quotas and some other minor aspects of immigration law.

Congress and postwar presidents also wanted to admit many Europeans who were displaced because of the war and the outbreak of the Cold War, even though many lived in countries with small

national-origins quotas, sometimes the minimum of 100. Congress responded to the refugee crisis by passing the Displaced Persons acts of 1948 and 1950. These laws allowed 400,000 persons to come to the United States regardless of their small allotments. The legislation allowed individual countries to mortgage their future quotas; in some cases this procedure mortgaged individual national allotments for over 100 years.

The McCarran-Walter Immigration Act of 1952 might have opened the door for limited Asian immigration, but it kept the Johnson-Reed system of national origins for Europeans. However the next year President Dwight Eisenhower asked Congress to admit another 200,000 persons regardless of the quotas, and the legislators agreed. Then by the parole power, Eisenhower admitted over 35,000 refugees fleeing the failed Hungarian revolution of 1956, and Congress sanctioned the president's action by enacting legislation allowing them to become immigrants. Still other refugees were granted entrance by special laws during the 1950s. When Fidel Castro seized power in Cuba and Cubans began to flee to the United States, once again President Eisenhower and later presidents admitted them. In 1961, President John F. Kennedy followed a similar pattern when he paroled into the United States 14,000 Chinese who had fled to Hong Kong.

Western Hemisphere nations had no quotas, but few immigrants came during World War II. Congress did authorize the importation of temporary Mexican workers, known as *braceros*, during the war. This program continued after 1945, lasting until 1964. Some of the *braceros* returned after their terms expired, becoming regular immigrants or undocumented aliens. Thus immigration from Mexico and the Western Hemisphere began to grow, running to roughly 120,000 annually in the early 1960s. These nonquota immigrants coupled with the various refugees from Europe and Asia meant that from 1945 to the early 1960s two-thirds of all immigrants entered as nonquota migrants.

Passage of the Immigration and Nationality (Hart-Celler) Act of 1965

Clearly the 1920s system was not working as intended. Moreover fear of immigrants had lessened during the 1950s and 1960s. Both Presidents Harry S. Truman and Dwight Eisenhower proposed substantial alterations for immigration policy, but neither president proposed scrapping the national origins quotas entirely. However President John F. Kennedy

went further and suggested a plan to end national origins quotas but without a large increase in immigration. After Kennedy's assassination, President Lyndon Johnson took up the call for immigration reform.

The liberal climate of the 1960s produced the Civil Rights acts of 1964 and 1965, Medicare, the War on Poverty, and other Great Society programs. With this climate it seemed that immigration reform would pass easily. The overwhelming victory of President Johnson in 1964 over Republican Barry Goldwater and a huge democratic majority in Congress reinforced the possibility of legislating new immigration policy.

In spite of the growing support for immigration reform, the president and other political leaders did not believe that substantial increases in immigration would pass. Thus proposed legislation liberalized immigration law but only cautiously. In the first place the total places enacted for the Eastern Hemisphere were only 170,000. The Johnson-Reed Act of 1924 used a figure of 150,000, which had been increased by several thousand after World War II. Thus the new system for the Eastern Hemisphere would have added only about 15,000 slots more than the current figure.

Spouses and minor children of U.S. citizens had been exempt from the quotas since 1924, and Congress added parents of U.S. citizens to the exempt list. The total of exempt persons was estimated to be only 50,000 or so, but the actual figures went over 300,000 during some years of the 1990s, a number that the framers of the 1965 law had not projected.

The main liberalization of the Hart-Celler Act was to give all nations the identical quota. Now Asian nations would have the same allotment (20,000 annually) as Great Britain and Germany, the countries favored under the Johnson-Reed Immigration Act.

This liberalization was not expected to be major, for Congress created a seven-category preference system to determine who would be permitted under the quotas. The Johnson-Reed Act had preferences for occupations and family members, but of course these had to fit within the national origins quotas. The preferences of the Hart-Celler Act were geared toward family unification, which accounted for 74% of the slots. The largest preference (24%) was for brothers and sisters of U.S. citizens, which prompted some observers to call the new law the "brothers and sisters act." The second largest preference was for spouses and minor children of permanent resident aliens (immigrants). The preferences aimed at aiding those nations, mostly European, with backlogs for family unification. Italy and Greece were expected to take advantage of the new system because they had backlogs of persons wanting to join family members

already in the United States. They did so in the immediate years after the 1965 act went into effect. Italy for example, whose old quota was under 6,000, averaged over 25,000 for the first years after the new law went into effect.

Two preferences were set aside for those with special skills needed in the United States. These categories amounted to 20% under the preference system and were not expected to have a significant impact on employment, which helped to win support of organized labor. In the end these two categories were very important for Asian immigrants, for many possessed the desired skills. For example Asians, especially Chinese, Filipinos, Koreans, and Indians, entered as medical professionals. Once established they could use the family preferences to build a network of new immigration, thus making possible the large number of Asian immigrants by the 1980s. In part Asians could use the new system so effectively because the pressure for emigration in Europe lessened after the 1960s. The economies of Western Europe had recovered from World War II, and some nations, such as Germany, were importing temporary workers, and not sending many persons to the United States.

Congress also recognized that the large number of refugees from Europe, Asia, and the Middle East arriving after 1945 were admitted on an *ad hoc* basis, either by presidential use of the parole power or by special legislation. To remedy this situation, the lawmakers set aside the last preference for refugees, amounting to 10,200 places. This figure quickly proved inadequate and later forced Congress to revise and increase programs for refugees.

What of the Western Hemisphere? Key senators were alarmed by the growing number of Latinos entering the United States after the 1950s. These senators, with some support in the House of Representatives, persuaded the Johnson administration to accept for the first time a limit for the Western Hemisphere, amounting to 120,000 persons, a figure approximately equal to the number of newcomers from Canada, the Caribbean, and Latin America in the early 1960s. As was the case with the Eastern Hemisphere, spouses, minor children, and parents of U.S. citizens were exempt from the ceiling. In establishing this limit, Congress made the law more restrictive than the Johnson-Reed Immigration Act of 1924. Under the Hart-Celler Act the Western Hemisphere nations did not have preference categories, nor did they have national limits of 20,000, which proved to be an advantage for Mexico, the nation with the largest flow of immigrants to the United States in the early 1960s. However in the 1970s Congress gave the Western Hemisphere the same preferences as the

Eastern Hemisphere, and in 1979 lawmakers created a worldwide uniform system by combining the two hemispheres.

As finally developed, the new immigration acts abolished the discrimination of national origins, replacing it with a total of 290,000 immigrants, with spouses, minor children, and parents of U.S. citizens being exempt. It was projected that the worldwide system would permit approximately 350,000 new immigrants to enter annually. Yet by the 1990s, immigration was averaging one million annually. Clearly other changes were required after the 1970s to make such large increases possible. The Hart-Celler Act had begun the process of liberalization of American immigration policy.

IMMIGRATION RESTRICTION

In spite of the importance of immigration to the U.S. national identity, the question of immigration has been a complicated one. The founding generation expressed a great deal of ambivalence toward immigration. Many were concerned that perhaps immigrants would not be able to adopt the American ideals of individual liberty and republican principles that were undergirding the new nation. This concern however was moderated by the sense that the United States had a special mission as a place of asylum.

Perhaps even more important, the founding fathers and the generations that succeeded them realized that immigrants—whether coming as indentured servants or independent individuals—would play an important role in building the nation characterized by a perennial labor shortage and what seemed like boundless land to the West yet to be conquered.

Considering the important role of immigration in the nation's founding, it might at first seem a bit surprising that the framers of the Constitution paid little attention to it. In fact the Constitution addresses the issue of immigration only once in its provisions, barring Congress from limiting the "migration or importation" of persons until 1808. Just as the framers left questions of immigration largely unaddressed, they also said little about the issue of naturalization, instead providing Congress with the power to "establish a uniform rule of naturalization." As such in 1790, the nation's first Congress responded by passing the Naturalization Act of 1790. This act stipulated that in order to become a naturalized citizen, immigrants had to have resided in the United States for 2 years and that one had to also pledge loyalty to the ideals embodied in the Constitution. Equally revealing the act also required that prospective citizens be "free white persons." Both substantively and symbolically, these stipulations demonstrated the importance of the idea of freedom and the notion of volitional citizenship—that partaking in shared republican ideals made disparate persons a people. However the "free white persons" clauses reaffirmed that only those who were white could truly be free, thereby racializing citizenship and reaffirming racial hierarchies.

Although the nation's first naturalization policy was exclusive and racist, Congress did nothing to try to limit the number of immigrants, even those not considered white. Nearly a century would pass before Congress would attempt to seriously limit who could come to the United States. The fact that Congress did not pass any meaningful restrictive legislation until the last quarter of the nineteenth century however does not mean that all residents viewed immigration positively. During the 1830s, 1840s, and 1850s, restrictionists looked for ways to limit the influence of Irish and Catholic immigrants. The creation of the American party in 1851 provided an institutional base for all those who hoped to redefine the nation's political community by dramatically increasing the number of years required for naturalization and limiting the rights of alien residents. However the historically easy pathway of naturalization open to free and white immigrants meant that by the early nineteenth century, many immigrant/ethnic communities had already

amassed political strength that the Whigs and the Jeffersonian Democrats of the 1830s and 1840s, or the Republicans of the 1850s and 1860s, could not easily ignore.

Recognizing the nation's need for labor, during the 1860s Congress, rather than restrict immigration, took steps to try to attract immigrant laborers to come to the United States. In 1862, Congress passed the Homestead Act providing 160 acres of land to those willing to toil on it for 5 years. Both citizens and aliens were eligible to apply. Two years later Congress passed an act to encourage immigration, which provided funds to overseas consular officials to publicize land and labor opportunities in the United States. This act also included a clause allowing businesses to pay the fare for European laborers who were willing to sign a 1-year labor contract. (This section was repealed in 1868 due to the political pressure of labor groups who feared that the incoming immigrants would be held in semiservitude and undermine the wages and rights of laboring men.)

Race and Labor Restrictions

The relative openness that characterized U.S. immigration policy began to change during the 1870s and 1880s. At the behest of western congressmen, who feared the influence of Chinese immigrants, in 1875 Congress passed the Page Law. This law banned "coolie labor" by making it illegal to bring in Asian immigrants without their voluntary consent. This act also excluded prostitutes from coming into the United States, a rather poorly veiled attempt to limit Chinese women from entering at all. Though western nativists celebrated the passage of the Page Law, they were far from satisfied. Just a year later they helped to spearhead the creation of a Joint Special Committee to Investigate Chinese Immigration. Charged with the task of assessing the "character and extent" as well as effect of Chinese immigration on the United States, the commission interviewed over one hundred witnesses (most prorestrictionists) and established a fact-finding mission. In spite of the public face of impartiality, the special commission merely repeated the racist charges made by westerners for decades—that Chinese immigrants undermined white labor and that Chinese immigrants could not assimilate into American culture politically, socially, racially, or economically. Largely adopting the report's findings, in 1880 both Democrats and Republicans pledged to place immigration restrictions on Chinese immigration, transforming the question of Chinese

IMMIGRATION RESTRICTION

immigration and Chinese-American labor into a national rather than just a regional issue.

In 1882, Congress answered calls to limit Chinese immigration by passing the Chinese Exclusion Act, the most significant piece of immigration legislation since the nation's first Congress limited naturalization to free white persons. The Chinese Exclusion Act stipulated that Chinese laborers would be barred from coming into the United States for 20 years, a term that was changed to 10 years due to the pressure of President Chester Arthur, who was concerned about treaty obligations. (Chinese merchants and students were exempted from these restrictions.) Chinese laborers already in the United States who wished to travel outside the United States would need to attain certificates or face the prospect of being denied entry on trying to return. In addition to excluding future Chinese laborers and circumscribing the movement of Chinese laborers already in the United States, the act also made it easier to deport Chinese immigrants from the United States. It also stipulated that no state government could naturalize them.

It took just 6 years for Congress to revise the Chinese Exclusion Act, making it even more difficult for Chinese immigrants already in the United States. The Scott Act of 1888 revoked the right of Chinese laborers to travel outside the United States and gain reentry regardless of whether they had certificates allowing them to do so. Furthermore the Scott Act explicitly stated that Chinese merchants attempting to come into the United States would have to prove their exempted status by demonstrating the possession of \$1,000 worth of property. (This represented an attempt to make it more difficult for Chinese laborers to come into the United States under the merchant status.) Finally in 1892, the year the original Chinese Exclusion Act was scheduled to expire, Congress passed the Geary Act. This act made permanent the prohibitions of Chinese laborers coming into the United States. It also stipulated that Chinese aliens in the United States had to carry certificates of residence, proving that they had been in the United States before 1882.

The original Chinese Exclusion Act marked an important turning point in U.S. immigration and labor law. First it linked race and class exclusions, thereby codifying popular assumptions that certain races were "unfree" laborers who undermined white workingmen and the republican ideals of the nation. The legislation also had a less apparent but nonetheless important effect—its enforcement required the building of an administrative immigration bureaucracy.

The issues of open immigration, labor, and race continued to garner public concern throughout the

late nineteenth century. While western nativists campaigned to exclude Chinese immigrants, labor groups spearheaded efforts to limit U.S. businesses' access to contract laborers. Led by the Knights of Labor (KOL), laboring groups throughout the nation began to call for a general contract labor law that would make it illegal for U.S. companies to recruit foreign workers abroad. The reasoning behind the demand for a contract labor law was based on the assumption that those workers coming in with contracts were not really free workers but rather semi-enslaved workers. The KOL officials and supporters also believed that U.S. corporations recruited immigrant workers to break strikes, undermine wages, lower the standard of living, and defuse the political power of American workers.

In 1885, Congress responded to demands for a contract labor law by passing the Foran Act, also known as the Contract Labor Act. This act represented the KOL's most important legislative victory. The act invalidated all contracts made to import alien workers and empowered the federal government to deport any workers who had come to the United States after having been contracted to work while still overseas. Corporations that violated the act faced the prospect of fines up to \$1,000. In spite of the celebration of the Foran Act as a labor victory, it did little to impede the mass migration of immigrant workers into the United States or to uphold the wages and standard of living of workers already here.

Expanding Restrictions

Although the Foran Act did little to restrict immigration, this does not mean that the federal government abandoned its efforts to regulate immigration. In 1891, Congress passed the Immigrant Act of 1891, mandating the creation of a new federal bureaucracy—the Immigration Bureau—to coordinate and oversee the nation's borders and screening of potential immigrants. With the creation of the Immigration Bureau the federal government took over from states and private agencies the power to determine who would be allowed into the United States. Equally important the 1891 legislation expanded the kinds of restrictions established with Foran by specifically excluding certain persons from entering the United States, including polygamists and those with contagious diseases. This act also made it easier for the Immigration Bureau to deport persons likely to become a public charge. The last provision, which came to be known as LPC, reflected the assumption that only those immigrants

who could be self-supporting workers should be admitted into the United States.

The new restrictions laid out in the 1891 law did little to stop the growing numbers of immigrants coming into the United States: Millions of southern and eastern Europeans immigrated to the United States from 1890 to the early 1920s. The arrival of these immigrants on American shores and the essential role that they played in the booming industrial economy assured that immigration and labor would be two of the most important political issues of the late nineteenth and early twentieth centuries. On one hand these newest immigrants faced charges that they represented a docile, dependent, and servile labor force that embodied the worst abuses and effects of American capitalism. On the other hand nativists insisted that these very same immigrants were anarchists and socialists bringing in radical foreign ideals that would tear asunder the democratic fabric of the nation, both figuratively and literally.

Though these two charges—the one that immigrants were docile and the other that they were radical revolutionaries—might at first appear contradictory, nativists had no trouble making both claims at once. What wedded these two visions was the assumption that the newest immigrants were racially inferior. Labor organizations, which had often called for restricting immigration, were now joined by a host of patriotic and academic societies looking for ways to ferret out the undesirable immigrants. Whether motivated primarily by racial, social, political, or economic concerns (and most often a combination of all), these nativists insisted that southern and eastern Europeans represented a cheap immigrant labor force, which undermined the nation's economy and political ideals. (The fact that the nation suffered numerous economic recessions and depressions in this era did much to reinforce the assumption that immigrants were undermining the nation's economy.) Armed with the new science of eugenics and new allies in academic and political circles, the movement to restrict immigration into the United States gained greater strength and respectability.

As concern about the influence of the newest immigrants on the U.S. economy and society mounted, Congress created the Dillingham Commission in 1908 to study the issue of immigration, labor, and race and to come up with possible solutions. Supported with a significant budget and staffed by hundreds of expert social scientists, the commission produced a 42-volume report. The report compared and contrasted the nation's old (British, German, Irish, and so forth) immigrants with the newest arrivals, characterizing the former in a positive light while calling into question the influences of the latter

immigrants on the nation's economy, social structure, political institutions, and racial makeup. In fact southern and eastern European immigrants were most often portrayed as an unskilled labor force of men and women who caused innumerable economic, social, political, and racial problems for the nation. As such the commission recommended that Congress pass a literacy test, increase the head tax, and begin to restrict immigration based on the prospective immigrant's national origins.

It took a number of years for all of the commission's recommendations to be put into place, but by the middle of the 1920s, all of the restrictions had been instituted. After many years of trying to pass a literacy clause, in 1917 Congress finally succeeded in doing so over the veto of President Woodrow Wilson. Four years later and after concern that the number of immigrants from southern and eastern Europe would increase dramatically now that World War I was over, Congress passed a Temporary Emergency Act to limit the number of immigrants coming into the United States to 387,803 a year. Rather than dole out these slots on a first-come basis, the act created a proportional representation quota system whereby the number of immigrants from any particular nation entering the United States could not be more than 3% of the immigrants already in the United States based on the 1910 census. In 1924 Congress agreed on a more permanent solution, further decreasing the number of immigrants to 186,437 a year and revising the quota system so that the number of immigrants allowed into the United States each year would be based on a percentage of immigrants already in the United States in 1890 rather than 1910, further decreasing the numbers of southern and eastern European immigrants who would be allowed to immigrate to the United States. This act also stipulated that only immigrants who could become naturalized citizens—which at this point included only those who were white and those of African descent—could immigrate to the United States at all, effectively barring all Asian immigrants from coming to the United States. Though the 1924 National Origins Act did not explicitly exclude laborers like the Chinese Exclusion Act, in practice it had a similar effect: Limit the number of supposedly racially inferior immigrants whom the nativists charged had begun to undermine the nation economically, socially, and politically.

Immigration Exceptions

In spite of the broad scope of the National Origins Act, it did include one very important exception—the

IMMIGRATION RESTRICTION

Western Hemisphere. The history of immigration policy toward the Western Hemisphere, and Mexico in particular, followed a very different trajectory than the one the United States was developing toward Asia and Europe. In 1911, the Dillingham Commission even lauded Mexican immigrants as a migratory and temporary workforce that would help to meet the needs of U.S. agriculture without changing the demographic profile of the United States. During World War I, the U.S. secretary of labor invoked a provision of the Immigration Act of 1917 to allow U.S. agricultural interests to recruit agricultural workers at the Canadian and Mexican borders by waiving head taxes, literacy tests, and contract labor laws. To make sure that these workers would return to their home country, the U.S. Department of Labor fingerprinted and photographed the incoming workers and withheld part of their wages. This program formally ended in 1921.

The relatively porous border between the United States and Mexico did not go unnoticed. Shortly after Congress succeeded in passing immigration restrictions with respect to European immigrants, it turned its attention to the issue of Mexican immigration. Many of the nation's leading restrictionists were concerned that the nation had closed the front door while leaving the back door completely open. In response during the latter half of the 1920s, both the Senate and the House hosted numerous hearings and entertained a variety of bills that would have restricted immigration from the Western Hemisphere or Mexico alone. The restrictionists who wanted to restrict Mexican immigration made both racial and economic arguments, insisting that the Mexican immigrants who came to the United States undermined the racial foundations of the nation, which the just recently passed National Origins Act was supposed to protect, and undermined white workingmen and farmers who could not compete with the low wages and low standard of living of Mexican immigrants. Since many Mexican immigrants toiled in agriculture, these restrictionists also insisted that Mexican immigration led to the downfall of family farms and the rise of large corporate landed estates. These restrictionists however faced an equally well-organized and vocal contingent of antirestrictionists from the Southwest and Midwest who claimed that Mexicans were integral to the future of American agriculture. These antirestrictionists attempted to quell the race fears of restrictionists by claiming that Mexicans had a homing instinct that drew them back home. The issue, they insisted, was not one of immigration but rather a labor question. With the back-room influence of the U.S. State Department, which feared the diplomatic fallout if the United States restricted immigration

from the Western Hemisphere, the antirestrictionists prevailed.

The failure of Congress to pass a restrictive act to exclude Mexican immigrants however does not mean that the issue of Mexican immigration was simply ignored. In fact the United States turned to administrative means to try to monitor the number of immigrants coming into the United States, relying on a newly created border patrol and implementation of head taxes and LPC clauses to suit the needs of American agriculture. The underlying assumption of these administrative means of regulating Mexican immigration was the idea that Mexicans were not really immigrants but workers who could be allowed in when needed and propelled to leave when no longer necessary. This is perhaps best reflected during the Great Depression when municipal and state authorities, often working hand-in-hand with Mexican consular officials in the United States, repatriated thousands of Mexican immigrants to Mexico. Though the program began as a voluntary repatriation campaign whereby Mexican nationals wishing to return home would be provided transportation, it soon evolved into a coercive program as various U.S. officials pressured many Mexicans out of the United States.

The perception of Mexican immigrants as workers who could be imported and exported as need be was further codified in the Emergency Labor Importation Program, which began in 1942 as an emergency wartime measure and extended until 1964, years after the conflict had ended. This program, which became known as the *Bracero* program, was a bilateral agreement between Mexico and the United States, in which the former agreed to provide workers as long as the United States ensured wages, working conditions, and living standards. In practice U.S. officials did little to enforce the provisions of the program, and Mexican officials often found themselves powerless to force their northern neighbor to abide by the initial agreement. The program was finally disbanded in 1964 due to pressure from a public anxious about Mexican immigration as well as labor and civil rights groups who pointed to labor and civil rights violations.

A year after the disbanding of the *Bracero* program, Congress passed the Immigration Act of 1965, which abolished the national quota system, limited immigration worldwide to 290,000 a year, and created a maximum ceiling of 20,000 immigrants per country. In addition to creating a more equitable system for admissions, the 1965 legislation created a seven-category preference system of admissions, privileging family reunification while also reserving some slots for immigrants with special work skills.

The history of labor and immigration restriction can be characterized as *laissez faire* until the 1880s, when fault lines based on race and labor emerged. The restrictions on Chinese workers and contract labor extended the racialized and economic ideals embodied in the nation's first naturalization policy—that one had to be a free white person. Over the course of the late nineteenth and early twentieth centuries, Congress expanded the restricted categories, barring almost all Asian immigrants in 1917 and making sure that fewer southern and eastern European immigrants would come in 1921 and 1924. The most important exception to these widening restrictions was the Western Hemisphere, and Mexico in particular. The unwillingness of Congress to include the Western Hemisphere or Mexico in the national origins restrictions however was based on the idea that Mexican immigrants were not really immigrants at all but merely workers who would return to Mexico one day. Not only until 1965 did the United States abandon the racially influenced national origins and adopt a more egalitarian immigration policy.

INDENTURED SERVITUDE

A shortage of labor plagued settlers in British Colonial America (1607–1775). Human brawn, aided only by animal and wind power, was required for most of the extremely labor-intensive tasks required in the American colonies. To meet this demand for labor, European settlers in British Colonial America relied on indentured servants. Though there were regional variations, this system of unfree labor thrived throughout British Colonial America.

Indentured servitude involved a written contract—an indenture—that a young person signed before coming to British Colonial America. This contract (indenture) specified that a laborer would work for a set number of years. The term ranged from 4–7 years, depending on specific circumstances. In return the indentured servant's passage to the colonies would be paid for and food and clothing would be provided for the duration of the contract. (The British American colonist who bought the indenture would pay these costs.) In some cases servants would also receive land or money (freedom dues) at the conclusion of their term. In the seventeenth and eighteenth centuries a lively trade in servants developed. Recruiters in England convinced young people to migrate to the colonies. In British Colonial America, colonists bought and sold indentures. Young men, often no more than teenagers, comprised the overwhelming majority of those who signed indentures. In many colonies, where men overwhelmingly outnumbered women, female indentured servants often faced the risk of sexual assault. Though servants usually signed the indenture voluntarily, they had no say over who bought the indenture or the type of labor they had to perform. Moreover indentured servants could neither marry nor take part in the political process. Servants legally belonged to the individual who purchased the indenture.

Indentured servitude flourished first in the English Chesapeake colonies of Virginia and Maryland during the seventeenth century. With the production and export of tobacco, beginning in the 1610s, planters turned to white indentured servants from England in order to meet the seemingly insatiable European craving for the American weed. The majority of these servants were young men. They cleared the land, planted, and tended the young plants before harvesting the mature leaves. The process involved intense labor. To encourage the emigration of servants as well

INDENTURED SERVITUDE

as the growth and profitability of the Chesapeake colonies, planters received 50 acres of land under the headright system for every servant they paid to emigrate. For the young and destitute in England, the possibility of owning land in British Colonial America in return for serving as a servant proved to be a powerful inducement for making the voyage. Servant contracts sometimes even specified that a parcel of land would be granted on completion of the indentures. Yet most indentured servants in Virginia and Maryland did not survive their term of service. Disease, poor diet, and cruel treatment claimed thousands of servants' lives. While some successfully served the full term of their indentureship and managed to enter the ranks of the landowning planter class, others found it next to impossible to do so. Discontent among former servants found expression in 1675–1676 during Bacon's Rebellion in Virginia. This uprising, named after the insurgent leader Nathaniel Bacon, pitted land-hungry former servants against the royal governor who had tried to limit Anglo settlement on native American lands. After Bacon's Rebellion collapsed, planters gradually turned to African slave labor. For much of the seventeenth century, Africans in the Chesapeake colonies had served as indentured servants. Some Africans became landowners and had bought indentured servants as well. By the end of the seventeenth century however, especially after Bacon's Rebellion, racial antipathy toward those with black skins as well as the belief that black slaves would be more manageable than white servants led to the foundation of racially based slavery.

White indentured servants flocked to the English West Indies, especially the island of Barbados. From the 1620s to the 1640s, the English in the West Indies followed their counterparts in the Chesapeake colonies by growing tobacco. Just as in Virginia and Maryland, tobacco production spurred the emigration of a vast number of young English men and a few women who willingly sold themselves into servitude. Several factors worked against indentured servants in the West Indies however. First the islands proved to be a death trap for the English. The mortality rate from disease among the English servants in the West Indies surpassed that of the Chesapeake colonies. Second when the English West Indies turned from tobacco to sugar production in the 1640s, the labor system changed as well. As sugar supplanted tobacco, slavery surpassed indentured servitude as the primary labor system. By the 1640s, the English had fully colonized the small West Indian islands, making it highly improbable for white indentured servants to become planters. A rebellion by servants in the late

1640s on Barbados illustrates the level of frustration among those whose dreams of upward social mobility had been frustrated. Because of the transition to sugar and slavery, the English West Indies had ceased to be a major destination for white indentured servants by the early 1700s.

In the eighteenth century, planters in the Chesapeake colonies as well as those in the Carolinas and Georgia relied on both white indentured servants and African slaves. Colonial laws separated the two groups of laborers however. White servants were accorded the protection of colonial law while black slaves were defined as property. In some of the southern mainland colonies, most notably in South Carolina, African slavery was the major labor system.

Most indentured servants in the New England colonies (the Massachusetts Bay Colony, Plymouth Colony, New Haven Colony, Connecticut Colony, and Rhode Island) did not emigrate from England but rather were the children of the colonists themselves. Because colonial New England families tended to be very large, with six or more children being the norm, the region essentially produced its own labor force. The use of New England children as indentured servants served several purposes. First in colonial New England, where the Puritan faith predominated, indentured servants received religious instruction in the households where they worked. In this way the use of Puritan children as servants created communities bound together by shared religious belief. Second this system of indentureship allowed for extensive supervision over the large number of young people in New England. The placement of servants in the households of relatives increased the degree of oversight and control. Some of the strains experienced by New England's indentured servants found expression in cases of witchcraft. The historical record illustrates that on several occasions, young servants believed the Devil tempting them with promises of easing the burden of work if they would serve him. Other New England servants ran away. Many escaped the New England labor regime by going to sea. The most famous New England runaway, Benjamin Franklin, broke his indenture to his brother James by taking flight from his native Boston in 1723 and going to Philadelphia.

The middle colonies of New York, New Jersey, and Pennsylvania absorbed great number of servants from Europe. These colonies, especially Pennsylvania, received praise as the "best poor man's country." The French writer J. Hector St. John de Crevecoeur, who never served as an indentured servant, applauded the region as a place where an indentured servant, through hard work and perseverance, could become

a landowner. Others found the middle colonies disappointing. One servant, William Moraley, signed an indenture in 1729 and set sail with other servants to Philadelphia to seek his fortune. On his arrival Moraley was sold to a New Jersey Quaker. Unhappy with his dependent status, Moraley ran away only to be caught and returned to the Quaker's household. He completed his indenture in the early 1730s. Unable to find a place for himself in British Colonial America however, Moraley returned to his native England in 1734.

Indentured servitude in British Colonial America can be credited with laying part of the foundation for what would later be termed the American dream. During the Colonial Era, when a rigid European social hierarchy separated an elite leisure class from a mass of drones, coming to British Colonial America as an indentured servant appeared to be a way to escape dire poverty and substantially improve one's lot in life by potentially owning land. Many European promoters of colonization vigorously publicized the idea of upward social mobility during the seventeenth and eighteenth centuries. Indentured servitude did provide access to the status of an independent landowner for some migrants. For the majority of indentured servants however, life was filled with unending toil and hardship. For many indentured servitude led to an early death in British Colonial America. Other indentured servants, like Moraley and the more successful Benjamin Franklin, ran away. On several occasions discontent among indentured servants took the form of armed rebellion, most notably the 1675–1676 uprising in Virginia. However one chooses to interpret indentured servitude, this type of labor system helped to meet the urgent need for workers in British Colonial America.

INDEPENDENT UNION OF ALL WORKERS

In 1933, under the leadership of veteran Industrial Workers of the World (IWW) activist Frank Ellis, Hormel packinghouse workers in Austin, Minnesota, organized themselves and launched the Independent Union of All Workers (IUAW). The IUAW practiced many of the principles of the IWW—industrial as opposed to craft organization, a reliance on direct action, an emphasis on the values of solidarity, and a militant standing toward the employer—but it also went beyond its predecessor in its extension of wall-to-wall organizing to communities as well as workplaces. Over the next 4 years, it spread to at least 12 other midwestern communities, organizing not only packinghouse workers but also manufacturing, retail, transportation, and service workers. In 1937, amid a wave of turmoil in national labor politics, Minnesota Farmer Labor politics, and an economic collapse that shifted the labor climate, the IUAW voted to dismember itself, with groups of workers and networks of locals choosing to affiliate with existing American Federation of Labor (AFL) and Congress of Industrial Organizations (CIO) unions or organizing committees. Although the organization itself faded from existence, its dynamics, practices, and values left a living legacy for midwestern unions of packinghouse workers, warehouse workers and truckers, waitresses and department store clerks, and public employees.

Frank Ellis and a cadre of activists began the IUAW by building a strong shop-floor organization in the Hormel plant in the summer of 1933. They stopped production in the hog kill to force foremen to tear up Community Chest pledge cards as a way of protesting strong-arm management tactics as well as the low level of wages. A few months later, they walked off their jobs to join members of the Farm Holiday Association in picketing roads into Austin as part of their campaign for higher hog prices. Such actions inspired other Hormel workers to join the IUAW and to understand that collective direct action was the path to improved compensation and a recognition of workers' rights in the workplace.

In the country's first officially recorded sit-down strike, Hormel workers took over their plant on November 10, 1933, and held it—and millions of dollars' worth of equipment and semiprocessed meat—for the next three days. The IUAW leaders insisted that company management come into the occupied plant for negotiations, where according to local folklore, they felt a rise in temperature every time they turned down a union demand at the bargaining table. Farmer Labor party Governor Floyd B. Olson refused to dispatch the National Guard to retake Hormel's property from its workers. Instead he rushed to Austin to mediate a settlement. At the end of three days, the IUAW had its first contract, a substantial wage increase, and the momentum to spread beyond the Hormel plant itself.

Inside the plant and wherever they gained a foothold, the IUAW relied on direct action—slowdowns, stoppages, workplace protests, and—to expand workers' ability to control work rules, the pace of production, the systems of compensation, and the like. Their militant reputation—and their success—caught the imaginations of thousands of other workers, first in Austin and nearby communities like Albert Lea, and then across Minnesota and into North and South Dakota, Iowa, and Wisconsin. The IUAW sent teams of rank-and-file volunteer organizers into other communities, organized mass meetings featuring the kind of soapbox speaking that had been practiced by the IWW, and then offered practical support from picket lines to food pantries. In some communities they published newspapers, ran candidates for school board and city council, and promoted the vision of a society and culture in which workers were leaders.

In the late spring of 1937, a series of developments and events came together to create an organizational crisis for the IUAW. As the national economy plunged into the second trough of the Great Depression, unemployment leapt upward for the first time in 4 years, employers cut wages and dug in their heels

against the further extension of union recognition and collective-bargaining agreements. Shifting political tides turned nationally against President Franklin Delano Roosevelt, while the Minnesota Farmer Labor party suffered the blow of the untimely death of Governor Olson, followed by increased infighting surrounding the new governor, Elmer Benson. Within the national labor movement, AFL leaders stepped up their efforts to undercut the new CIO unions, while CIO leaders and activists sought to consolidate their organizational breakthroughs.

The IUAW found itself in the midst of a hard-fought series of sit-down strikes in Albert Lea, 20 miles west of Austin, which included two substantial American Gas Machine manufacturing plants, three trucking warehouses, and the Woolworth's store. Coordinated sit-down strikes, linked by nightly marches led by the IUAW's Drum and Bugle Corps and bolstered by hundreds of militant rank-and-filers from the Austin Hormel plant, expressed workers' determination to win union recognition and improved conditions. When the Freeborn County sheriff launched a military attack, reminiscent of the Pacific Northwest violence against the IWW in the World War I era, on the "sitdowners" and the IUAW's hall, a showdown was precipitated, bringing Governor Benson himself to the scene. All of this happened while the IUAW founding spirit and chief strategist was locked away in state prison on questionable morals charges.

This crisis led to a complex negotiated settlement in which Albert Lea employers offered union recognition and contracts to local unions that would affiliate with specific AFL or CIO national unions. The IUAW leaders agreed to allow Albert Lea, and then Austin, and then other cities' members to vote on dissolving their "horizontal" organization in order to win security and apparent stability. In the next half dozen years, IUAW locals became part of the Packinghouse Workers' Organizing Committee-CIO (and then the United Packinghouse Workers of America), the Steel Workers' Organizing Committee-CIO (and then the United Steelworkers of America), District 50 of the United Mine Workers of America (and then the Oil, Chemical, and Atomic Workers' Union), the United Automobile Workers, and the Teamsters' Union. For many years, the particular locals they joined tended to manifest the dynamics, strategies, and values that had been inculcated by the IUAW. The vitality of this legacy was reflected in the Hormel strike of 1985–1986, when United Food and Commercial Workers' Union Local P-9, a descendant of the IUAW, waged a nationally significant struggle against the corporate demand for concessions.

INDUSTRIAL DEMOCRACY

Industrial democracy was a protean concept used by a wide range of historical actors to frame debates about labor relations from the 1890s through the 1960s. Its origins can be traced to late nineteenth reformers, progressives, socialists, and Social Gospel advocates who worried that the rise of large-scale industrial capitalism was undermining the autonomy of workers and the quality of democracy in the United States.

Among the first to use the term industrial democracy was Lyman Abbott, an energetic Social Gospel reformer who succeeded Henry Ward Beecher as editor of the *Christian Union*. In Abbott's use, the term was meant as a critique of the “wages” system.” Abbott advocated a host of reforms under the banner of industrial democracy, including profit sharing, cooperation, and incentive pay. Whether Abbott was the first American to use the term is not clear. What is clear is that by the 1890s, the term had gained wide currency among reformers. Henry Demarest Lloyd, Richard T. Ely, and many others began invoking notion of industrial democracy as a necessary antidote to growing corporate power during the depression of the 1890s and the merger wave that followed it. Work relations needed to become more democratic or else concentrated economic power would undermine American democracy, they warned.

The British reformers Sidney and Beatrice Webb provided an elaborate articulation of the notion in their 1897 book *Industrial Democracy*. To the Webbs, industrial democracy meant the organization

of democratic trade unions, the recognition of those unions by employers, collective bargaining between employers and unions over the terms of labor, the development of a constitutional government of industry in which unions and employers developed policies jointly. Their ideas in turn influenced Americans like the economist John R. Commons, who advocated collectively bargained trade agreements in the United States as the proper way to advance industrial democracy in the early twentieth century.

A new phase in the dissemination of the industrial democracy ideal came when it was embraced by progressive reformer Louis D. Brandeis around 1910. Brandeis, who was also an advocate of “scientific management,” came to believe that workplace efficiency could not be maximized without the active consent of workers. For him the idea of industrial democracy spoke to the necessity of finding ways through which employers and workers could cooperate in creating workplace rules. Influenced by Brandeis, reformer Robert G. Valentine won some converts to industrial democracy even among the followers of the guru of scientific management, Frederick Winslow Taylor. Brandeis also helped persuade some progressive businessmen, like the Boston retailers Edward and Lincoln Filene, to implement a form of industrial democracy through shop representation plans for their workers. Brandeis allies Felix Frankfurter, Walter Weyl, and Walter Lippmann were all writing about the need for the nation to democratize its workplaces in the years before World War I.

Still talk of industrial democracy remained largely confined to the world of middle-class progressive reformers until the 1913–1915 investigation of the U.S. Commission on Industrial Relations (USCIR) and the subsequent impact of the U.S. entry into World War I. In 1913, appointed President Woodrow Wilson appointed the USCIR to investigate the sources of labor violence in the nation and to recommend solutions. Labor lawyer Frank P. Walsh of Kansas City, Missouri, chaired the USCIR and through his committee's well-publicized hearings, Walsh became the most passionate and well-known advocate of industrial democracy in the nation. Walsh became a bitter opponent of company unionism practiced by employers like John D. Rockefeller, Jr. The only way for the nation to democratize its autocratic work relations, Walsh argued, was for the government to protect workers rights to organize unions. Walsh advocated national legislation that would allow workers to join unions without fear of intimidation or dismissal. Such legislation did not come to pass for nearly two decades, but on the eve of World War I, Walsh had succeeded in identifying industrial democracy with the cause of trade

unionism. Thereafter labor activists increasingly adopted the term in their calls for union recognition. Even the radicals of the Industrial Workers of the World (IWW) began using the term to express their own vision.

The U.S. entry into World War I only widened the intense debate over industrial democracy. President Wilson unintentionally reinforced demands for industrial democracy by framing World War I as a war “to make the work safe for democracy.” If Americans fought for democracy in Europe, they should also enjoy a measure of it in the places where they earned their livelihoods, argued labor activists. The extent to which industry might be democratized during the war was never clear. But the creation of the key war labor agency, the National War Labor Board (NWLB), in 1918 raised hopes that significant reforms could be won. Cochaired by Frank P. Walsh and former president William H. Taft, the NWLB actively promoted industrial democracy by calling on nonunion employers in war industries to bargain collectively with their workers through elected shop committees in cases where they refused to recognize unions. The NWLB’s wartime stand helped legitimize workers’ organizing efforts. The American Federation of Labor (AFL) grew by more than 1 million members during the war and broadly disseminated the idea that workers ought to have a say in shaping the terms of their work relations.

Following World War I, fierce conflicts took place between employers and unions over the survival of union organizations in mass-production industries where they had begun to take root during the war. Those conflicts led to the unprecedented strike wave of 1919. Employers emerged victorious during these strikes, uprooting recently formed unions in the steel, electrical-manufacturing, and meat-packing industries. But many large-scale employers were not able to roll back the clock to re-establish prewar patterns of labor relations. Rather employers had to recognize workers’ demands for a voice in their workplace. Thus in the 1920s, large-scale employers in many basic industries created company unions and explicitly argued that such organizations would secure industrial democracy for their employees. By the end of the 1920s, it appeared that employers had largely succeeded in identifying company unionism with industrial democracy.

Yet the Great Depression undermined employers’ efforts to claim that they were delivering on workers’ demands for industrial democracy. As the welfare capitalism of 1920s’ employers collapsed, workers once again called for independent union organization. Union organizing gathered momentum following the enactment in 1933 of Section 7(a) of the National

Industrial Recovery Act, which provided for collective bargaining in industry. As in the World War I era, workers who sought to form unions did so under the banner of industrial democracy. Contesting the legitimacy of the employer-dominated employee representation plans (ERPs) that remained legal under the NRA, trade unionists argued that only independent union organizations could secure industrial democracy. When the 1935 Wagner Act triggered the formation of the Congress of Industrial Organizations (CIO), the demand for industrial democracy became central to CIO rhetoric. After the mid-1930s, industrial democracy had become fully identified with trade unionism’s aspirations and had lost its previous connection to employers’ welfare capitalism or the visions of Taylorite efficiency engineers.

What workers and labor activists meant when they used the term industrial democracy was still something of an open question however in the years before the United States entered World War II. For example left-leaning labor leaders like Walter Reuther of the United Automobile Workers (UAW) advanced plans for labor’s comanagement of war industries under the banner of industrial democracy. But the war mobilization put on hold the most radical hopes for labor’s comanagement of industry. Under the guidance of a second National War Labor Board (1942–1945), what instead emerged were union security arrangements that entrenched trade unionism in the nation’s basic manufacturing industries and facilitated the expansion of collective bargaining between unions and employers, while demarcating the limits of union power. Nonwage benefits became a chief feature of wartime collective-bargaining agreements, but labor’s efforts to achieve comanagement never came to pass.

When the war came to an end in 1945, labor movement waged an aggressive campaign to expand the limits of wartime industrial democracy. From 1945–1946, a huge strike wave swept the nation. This upheaval differed from the strike wave of 1919. After World War II employers did not attempt to crush unions. Rather employers simply resisted labor’s efforts to take a hand in the management of industry. The UAW’s strike against General Motors (GM) was indicative of how this postwar struggle played out. Autoworkers initially demanded that GM open its books to the union and allow the union a say in the pricing of its products. General Motors firmly resisted these demands and ultimately the UAW gave in on management issues in return for a considerable wage increase. In the postwar era most conflicts over the right to manage were settled in similar ways, with unions agreeing to better wages and benefits in lieu of greater say over how businesses were run. Unions

simply lacked the political and economic power to force a different outcome in such struggles. Once the Taft-Hatley Act was passed in 1947, management's rights were further reinforced by that act's legal protections.

After 1947, the once contested meaning of postwar industrial democracy became clearer. Unions and collective bargaining had become firmly entrenched in basic manufacturing industry, but unions were unable to encroach on management rights. In this context the once insurgent possibilities of industrial democracy were tamed. Whereas the ideal of industrial democracy had once excited radicals and conveyed the possibility of worker-run industries, in the postwar era its meaning had been narrowed to what historian David Brody calls "workplace contractualism." Workplace contractualism amounted to trade union collective bargaining, the elaboration of jointly administered benefit programs, and the development of a workplace rule of law that circumscribed arbitrary and capricious treatment of workers by management. If this more modest form of industrial democracy fell short of the lofty hopes once entertained by radicals, it was nonetheless an enormous achievement. During the height of the uneasy postwar labor-capital accord (roughly 1947–1973) organized workers enjoyed a greater say over the terms and conditions under which they labored than they had ever enjoyed before or since that time. A semblance of democracy had indeed been brought to industry.

Yet no sooner had industrial democracy been entrenched in the form of the postwar collective-bargaining regime than the concept itself began to fall into disuse. By the 1970s, even trade unionists rarely spoke any longer about industrial democracy. At least four developments helped eclipse the industrial democracy ideal. First when the meaning of industrial democracy became clear in the postwar era, the concept suddenly proved less attractive to the wide range of groups who had once competed to define it. Neither employers nor radicals tended to invoke the concept of industrial democracy from the 1950s onward. No longer the protean ideal it had been early in the twentieth century, industrial democracy simply attracted fewer enthusiasts.

Second the very success of postwar workplace contractualism facilitated a subtle shift in workers' visions from industrial democracy to what Brody has called "industrial justice." Once unions' drive for access to decision-making in corporate boardrooms was blunted, workers turned to the task of creating what labor economist Sumner Slichter called "industrial jurisprudence," rules that would free them from arbitrary treatment. Defending and extending those shop-floor rules, not contesting the balance of

power in industry, became the chief mission of the labor movement. Industrial democracy seemed an increasingly anachronistic term.

Third the civil rights revolution of the 1950s and 1960s fostered an alternative conception of worker empowerment. The rights consciousness spawned by the civil rights struggle did not usually channel workers' struggles into collective forms. Rather it helped to shift the locus of workers' struggles from picket lines to courtrooms. As this shift took place, the language of industrial democracy was increasingly supplanted by rights talk.

Finally the economic structures that had given rise to the idea of industrial democracy in the early twentieth century no longer existed in the post-1960s United States. The ideal of industrial democracy was the product of the distinctive historical era of "Fordist" mass production when employers sought to win the loyalty of workers whom they hoped to retain in life-time employment and when government was both deeply interested in, and broadly capable of, regulating workplace relations. In the years after the mid-1960s, the preconditions of industrial democracy evaporated as capital roamed the globe in search of cheaper labor, and government regulation of markets, including labor markets, rapidly receded.

If the idea of industrial democracy had emerged in the 1890s, by the 1990s it no longer resonated in debates about the workplace. When employers, labor leaders, or government officials debated labor questions in the 1990s, they no longer invoked the notion of industrial democracy. Instead they embraced vaguer terms like "labor-management cooperation" and "employee involvement." The distance between the early twentieth-century demand that industry be made democratic and the late twentieth-century plea for workplace cooperation between labor and management was considerable and called attention to how weak organized labor had become by the century's end.

INDUSTRIAL UNION OF MARINE AND SHIPBUILDING WORKERS OF AMERICA (IUMSWA)

The Industrial Union of Marine and Shipbuilding Workers of America (IUMSWA) was founded on October 3, 1933, at New York Shipbuilding Corporation, Camden, New Jersey. Initially its only members were workers at the Camden yard. The union had an industrial rather than craft form of organization, which was inclusive of all production workers and was independent of the American Federation of Labor (AFL) and its craft unions that previously had members in numerous shipyards during World War I.

Capable leaders were crucial to the IUMSWA's early organizing success, with John Green the most important. He had worked in Scottish Clydeside shipyards since 1916, where he was active in the United Society of Boilermakers and Iron and Steel Shipbuilders. In 1923, he emigrated from Clydebank to Philadelphia, working in a number of manufacturing jobs before starting as a sheet metal worker at New York Ship in 1933.

Green also joined the Socialist party, where he met Moshe (M. H.) Goldstein, who served as the IUMSWA's chief legal counsel from the early 1930s through the 1960s, and Phil Van Gelder, who helped

lead the New York Shipbuilding IUMSWA strike of 1934. Van Gelder had a degree from Brown University, but during the Depression, he became involved in union organizing, including with the Amalgamated Clothing Workers (ACW). Van Gelder never worked in a shipyard, but his organizing abilities and his connections to industrial unionists, such as Sidney Hillman and later, John L. Lewis, greatly advanced the IUMSWA in its early, tenuous years. Green and Van Gelder led the IUMSWA during its first decade as national president and national secretary-treasurer, respectively. Thomas Gallagher, who worked as a rigger in the New York Shipyard, was another central figure during the IUMSWA's first decade and served as the main leader of New York Shipbuilding's IUMSWA Local 1 after Green, later becoming the national union's first organizing director. In contrast to Green and Van Gelder, Gallagher identified with the Democratic party, which had a strong base in Camden.

In the early 1930s, the largest private shipyards in the Northeast were New York Shipbuilding; Fore River Shipyard (owned by Bethlehem Shipbuilding, in Quincy, Massachusetts); and Newport News Shipyard in Virginia. These major yards continued to receive minimal naval contracts as well as merchant, tanker, and passenger ship contracts during the 1920s and early 1930s when shipbuilding production reached a low point. When Franklin D. Roosevelt became president in early 1933, his administration substantially increased naval production and shipbuilding employment through National Industrial Recovery Act (NIRA) contracts to these big yards and also smaller but significant private builders, including Federal Shipbuilding (Kearny, New Jersey); Electric Boat (New London, Connecticut); Sun Shipbuilding (Chester, Pennsylvania); and Bath Iron Works (Bath, Maine).

The increase in production and jobs at New York Shipbuilding also was accompanied by restrictions on weekly working hours mandated under the new NIRA and a resultant pay cut that was deeply resented by the yard's workers. The company had installed a weak company union to prevent independent union organizing but failed to stop internal organizing. By fall 1933 workers voted 1,819 to 142 for the new IUMSWA and against the company union in a worker-sponsored poll.

The IUMSWA sought a charter from the AFL a few months later but was refused because it threatened existing jurisdiction claims by AFL metal trades unions. When John L. Lewis established the independence of the Committee of Industrial Organizations (CIO) in November 1936, he brought two independent

unions into the new organization—the IUMSWA and the United Electrical Workers (UEW)—which effectively ensured the permanent split between the AFL and the CIO.

Initially New York Shipbuilding management refused to recognize the IUMSWA, precipitating a seven-week strike in 1934. New York Shipbuilding management's refusal to bargain in 1935 led to a second strike that lasted from March to August. The IUMSWA set up mass picket lines and gained extensive support from the community and such unions as the United Mine Workers (UMW), ACW, and locals of regional AFL unions. Congressional hearings were conducted to investigate the causes of the strike, and the U.S. Department of Labor, including Secretary of Labor Frances Perkins, intervened in efforts to mediate.

President Franklin D. Roosevelt finally broke the deadlock when he responded to Secretary Perkins's pleas and told the U.S. Navy and shipyard management that they had to negotiate with and recognize the IUMSWA, or else it would lose existing naval contracts. Management and the union then agreed to the establishment of a special arbitration board, ending the 11-week strike. The final settlement guaranteed full union recognition and a reasonable wage increase. Although IUMSWA Local 1 did not win the union shop, extensive internal organization enabled the IUMSWA to maintain relatively full membership throughout the yard. This stable membership base allowed the IUMSWA to begin organizing beyond Camden.

Organizing Expansion in the 1930s

Throughout its existence the IUMSWA was unable to organize in government yards due to AFL dominance. The AFL also dominated all West Coast yards except small repair yards in the Los Angeles region where the IUMSWA gained a small membership. As a result the IUMSWA was mainly concentrated in private Northeast port shipyards from the 1930s and later decades.

In the IUMSWA's early years, Van Gelder's efforts to direct organizing drives at Fore River, Newport News, Sun Ship, and Bath Iron Works failed in the 1930s largely because of these yards' well-organized company unions. The IUMSWA never won a union election at Newport News and lost elections at Bath Iron Works numerous times until 1955. The IUMSWA did win a victory at Fore River in mid-1945 (then the largest Congress of Industrial Organizations (CIO)

victory to date in New England) after a disastrous loss in 1941, and at Sun Ship in 1944, both led by organizer Lou Kaplan.

The IUMSWA made its first national breakthrough in the New York port region in 1936 at United's Staten Island Shipyard. Within a year the IUMSWA had locals chartered at a majority of the port region's repair yards, including those in New Jersey bordering New York City. However recognition came only after a bitter repair yard strike in mid-1937 that led to some gains but also losses of some yards.

Federal Shipyard (a subsidiary of U.S. Steel Corporation) was the most important early gain outside Camden. In spring 1937, inside IUMSWA organizers, directed by staff organizer Mike Smith (originally from New York Ship), won a majority on the company union, then voted it out of existence and replaced it with the IUMSWA. Following a massive strike of several days, management agreed to recognize the IUMSWA and signed a first contract. Full recognition and adherence to the grievance procedure by management did not occur until a March 1940 NLRB election that the IUMSWA won by a landslide.

World War II and Shipyard Organizing

By 1941, the Federal Shipbuilding gains and a series of NLRB election victories in other New York port region yards gave the New York port region a membership strength equal to that of the IUMSWA's original base in the Camden-Philadelphia-Delaware River region. This new membership concentration created factional rivalry within the union between the ports of Philadelphia and New York, but also between shipyard union locals, especially those in the largest yards, and the national officers directing union policy and organizing.

In the case of Federal Shipyard, the local had completely failed to sustain dues' collections of members from 1940–1942, leading to bitter fights within the local and suspension of the local's autonomy by the national office. In August 1941, Federal Shipyard workers briefly went on strike demanding enforcement of the National Defense Mediation Board (NDMB) decision calling for a maintenance-of-membership provision. The IUMSWA wanted a union shop with membership a condition of employment, but this NDMB alternative requiring continuous membership once signed up, for the life of the contract, gained the

union's support. As a result of the strike and management's refusal to agree to the NDMB order, the U.S. Navy temporarily took over the yard, but the issue remained unresolved even after ownership returned to private management. Sustaining shipbuilding employment stability had become a major national defense production problem, especially after the attack on Pearl Harbor and the urgency of rapidly increasing the American naval fleet. The IUMSWA was one of the first CIO unions to agree to the no-strike pledge in support for war production, but workers—including those at Federal Shipyard—conducted numerous wildcat (unauthorized) strikes when their demands were not met.

President Roosevelt finally met with IUMSWA representatives, management, and government officials (including the Navy) in the White House in the spring of 1942, where he reiterated his unequivocal support for the NDMB, now the National War Labor Board (NWLB) decision endorsing the maintenance-of-membership provision on union security. The U.S. Steel's management capitulated, and the provision became standard throughout the defense industry, although failure to fully enforce the provision precipitated wildcat strikes at Federal until management agreed to government requirements.

Shipyard employment levels had a major influence on union-organizing success. Only 33,000 worked in private yards in 1933, but naval contracts boosted numbers to 48,700 in 1934 and by 1936 matched pre-Depression levels with over 60,000. As jobs became more secure, the demand for better wages increased. By 1941, private and government shipyards employed over half-a-million workers, with half of these in the North Atlantic region where the IUMSWA had its main membership. Peak World War II shipbuilding employment for all yards was 1,686,600 workers in 1943, with 1,400,000 in private yards. North Atlantic yards employed a majority of all shipyard workers, followed by the Pacific Coast region, and the remainder in Virginia, the Gulf Coast, and the Great Lakes. The IUMSWA membership reached 208,000 in 1943, the highest number attained over the union's 55-year history.

Almost one-fourth of this wartime membership was concentrated in a single yard, Camden's New York Ship, reaching some 50,000 at its peak. Management had difficulty running the yard with its own staff and turned to the union for assistance. Skilled shipyard workers who were IUMSWA members moved into foremen and subforemen positions, and organized a subforemen's division within Local 1. The union also assumed much of the responsibility for hiring and training new workers.

In New York Shipbuilding, Federal Shipbuilding, and the huge Bethlehem yards at Fore River and Sparrow's Point (Baltimore), these new workers included women and black workers, but these workers were generally concentrated in auxiliary yards that lasted only for the duration of the war. At Sun Ship, management created a separate yard with black employees only. This racial division among workers became an organizing target for the IUMSWA in two wartime election campaigns, the second led by organizer Lou Kaplan, which ended this employment segregation. In southern yards, particularly Mobile, Alabama, efforts to break down racial barriers were less successful, with IUMSWA organizers bowing to the tradition of segregation and discriminatory practices to secure union membership among white workers.

During World War II, the federal government regulated wages and hours through various agencies, including the tripartite Shipbuilding Stabilization Committee, but also through mediation efforts involving regional "zone conferences" of union and management representatives. The IUMSWA held sole representation only on the Atlantic conference, shared representation positions with the AFL metal trades unions on the Gulf and Great Lakes conferences, and had no position on the Pacific conference dominated by the AFL. Delays in implementing wage increases, which required approval from the NWLB, led to numerous wildcat strikes in most shipyards that were opposed by the IUMSWA national leadership.

Dissension also occurred at the local and national levels of IUMSWA over the presence of Communist party activists, particularly those elected to union office. At the 1941 IUMSWA convention, delegates approved an anti-Communist clause that later led to the expulsion of national General Executive Board (GEB) member, Irving Velson. Others who were not in the Communist party but who advocated a broad left coalition, including Secretary-Treasurer Van Gelder, later were targeted by IUMSWA President John Green. By the 1940s, Green served as a CIO vice-president and increasingly played a major role in attacking Communists within the CIO.

Postwar Dissension and the Collapse of American Shipbuilding

At the IUMSWA's January 1946 convention, an open split emerged between left and right factions in the national union. Van Gelder, recently returned from army service in Europe, challenged Ross Blood for his old position of secretary-treasurer and had

substantial support from a Federal Shipbuilding delegation led by Lou Kaplan, but Green forces seated only a rightwing slate despite delegate election challenges. Other opposition came from New York Shipbuilding, led by Local 1 president Andy Reeder. After the defeat of the left at the January convention, Green called another convention in September to consolidate his forces. Van Gelder, Reeder, and others again tried to challenge the national leadership, but failed.

New York Shipbuilding Local 1 members remained alienated from the national leadership, but by the late 1940s, with Reeder's failure and departure, came under the rightwing opposition leadership of Tommy "Driftpin" Saul.

Shipyard employment collapsed at the end of the war, with all auxiliary yards closing and even Federal Shipbuilding shutting down by 1948. Strikes in shipbuilding in 1947 and 1948 gave workers some wage gains, but employment security remained precarious. Green decided to expand the IUMSWA's jurisdiction to regain membership. In 1947, the recently created CIO United Railroad Workers of America (URWA), made up of maintenance of way and shop crafts, merged with the IUMSWA. In early 1948, an anti-Communist group of Connecticut-based locals in the International Union of Mine Mill and Smelters, known as the Progressive Metalworkers' Council (PMC), seceded and joined the IUMSWA with Green's approval, over the strong objections of CIO heads Phil Murray and Alan Haywood. By January 1948, IUMSWA had 78,420 members, with 42,850 employed in shipbuilding, but by June 1950, IUMSWA membership had plummeted to 41,858, with only 25,000 in shipbuilding.

Following the membership gains from the URWA and the PMC, tensions arose between shipyard worker members and those in railroads and metal shops over national union positions and charges of national neglect by shipyard locals. As a result New York Ship's Local 1 led by Saul voted to disaffiliate with the IUMSWA in September 1948, and Sun Ship's IUMSWA local disaffiliated in April 1949. In 1950, the IUMSWA lost an NLRB election at New York Ship in a landslide to the AFL's Boilermakers' Union. This loss and the crisis over nonshipbuilding membership led Green to resign as IUMSWA national president in 1951, and national vice-president John Grogan, who came from the Hoboken repair yard in New Jersey, replaced him. Grogan reversed Green's earlier expansion plans and returned to organizing and consolidating the union's original base in shipbuilding. He also presided over the departure of the URWA and former PMC metal workers' locals into the United Steel Workers of America.

Final Decades to 1988 Merger

Grogan remained national president of the IUMSWA until his death in 1968, even though he was elected to the full-time position of mayor of Hoboken, New Jersey, in 1953. With the disaffiliation of the IUMSWA's largest local—in Camden—and the departure of half of the union's nonshipbuilding workers, membership in 1951 declined to 34,100 even though Bethlehem's eight Atlantic Coast shipyards alone still employed some 31,000 workers. World War II era national officer Andrew Pettis became national president after Grogan's death in 1968. In the 1970s, Eugene McCabe became national president, and in the early 1980s, Arthur Batson, Jr., became the last national IUMSWA president.

In the early 1950s, Japan overtook the United States in shipbuilding production, with American yards moving almost exclusively into naval contracts and abandoning virtually all merchant and tanker building. Production in the United States also shifted more to southern and Pacific Coast yards, devastating the IUMSWA. Its membership dropped to 25,600 in 1960, where it remained until the 1980s. By this time the combined employment at the nation's two biggest East Coast shipyards—the USWA's Newport News (specializing in aircraft carriers) and the AFL Metal Trades' Electric Boat (specializing in nuclear submarines)—exceeded the total national membership of the IUMSWA.

By 1988, New York Shipbuilding had closed, and Fore River management announced their yard's closure the following year, leaving only Maine's Bath Iron Works as the national union's single major yard. At only 13,000 members, the IUMSWA finally merged with the IAM, with 7,000 shipbuilding workers in a union mainly based in the aerospace industry, in 1989.

INDUSTRIAL UNIONISM

Industrial unionism, which gathers all of the workers in an industry into a single labor organization, saw its heyday in the United States during the 1930s. Some workers and labor leaders challenged the more traditional craft or trade basis of organization quite a bit earlier however. In 1870, the Knights of St. Crispin (KOSC), a union of shoe workers, achieved almost total industrial organization and won a strike in Lynn, Massachusetts. One of the few successful factory workers' unions of its day, the KOSC was a contemporary of the national Knights of Labor (KOL), founded in Philadelphia in 1869 on principles of broad labor solidarity and dedicated to building a "cooperative commonwealth." The KOL admitted workers as individual members, and then placed them in trade assemblies when possible or in mixed assemblies when members of a single trade at a particular locality were insufficient in number. Because the mixed assemblies included unskilled workers and outnumbered the trade assemblies by the 1880s, the KOL took on a unique character that presaged the advent of industrial unionism. However the KOL's emphasis on the development of workers' cooperatives and its desire to organize all workers regardless of skill failed to produce an enduring organization at a time when the rapid concentration of industrial wealth; the abiding hostility of business corporations; and racial, linguistic, and religious barriers among workers made working-class cohesiveness very difficult.

By the late nineteenth century, the emergence of national business corporations and trusts, along with technological change, was weakening the power of trade unions through the geographic diffusion of production and the subdivision of labor into lower-skilled tasks. The first truly national businesses were the railroads, and it was there that one of the earliest efforts at modern industrial unionism took place. In 1893, Eugene Debs and 50 other railroaders founded the American Railway Union (ARU) in Chicago. Prior to this time most railroad workers had no union, and a minority belonged to five brotherhoods with no common alliance between them—the engineers, conductors, firemen, brakemen, and switchmen. The new organization was dedicated to bringing all categories of railway workers together, even car builders and coal miners in railroad employ. While the ARU was open to men and to women, its industrial unionism was still limited by race, since only white workers could join. The ARU led an 1894 strike by Pullman Palace Car employees and the ensuing nationwide Pullman car boycott. As a result of federal intervention and the union's violation of court

injunctions, the ARU was virtually destroyed that same year.

Divisions in the Early AFL

By the time of the ARU's demise, the dominant national labor organization was the American Federation of Labor (AFL), born in 1886 and committed to trade unionism and trade autonomy. Although many of its founding members saw the AFL as a corrective to the KOL's mistakenly broad admission policies and consequently as a better guardian of the prerogatives of skilled workers, there were others who tackled the question of industrial unionism very early on. In 1901, the contest between advocates of craft and industrial organization was reflected in the AFL's Scranton Declaration, which on the one hand affirmed craft autonomy and on the other suggested that some rare industries might benefit from having all their workers organized in a single "paramount organization." On the basis of this second principle, the AFL gave one member union, the United Mine Workers (UMW), founded in 1890, jurisdiction over all workers in and around the mines, including those craftsmen that might normally have belonged to other organizations. The UMW was unusual, since the United Brewery Workers (UBW), which was already established on an industrial basis when it applied for AFL affiliation in 1887, was confronted with repeated demands to limit its organizational reach. Its membership in the federation led to years of bitter jurisdictional disputes and threats of expulsion that persisted through the 1930s. In yet another case, the craft-based International Ladies' Garment Workers' Union (ILGWU), founded by skilled male cloak makers in 1900, evolved into an industrial union after a 1909 strike by female shirtwaist makers in New York. The "uprising of the twenty thousand" brought these young Jewish and Italian immigrant women into the ILGWU, which achieved a female membership of 50% by 1916. In men's clothing, the AFL's United Garment Workers of America (UGW), which had been larger than the ILGWU prior to 1909, neglected the male counterparts of these same women. The immigrant men who labored in the ready-made suit sector abandoned the UGW and created their own industrial union outside of the AFL in 1915, the Amalgamated Clothing Workers of America (ACWA). The ILGWU and ACWA both proved the viability of industrial unionism and the potential for organizing women and immigrants, contrary to much of the rhetoric inside the AFL. Both of the garment unions were also overtly socialist.

The IWW

From 1905 through the First World War, the AFL was challenged by the radical Industrial Workers of the World (IWW), an openly anticapitalist labor organization that sought to organize workers on an industrial basis only. Critical of the “labor aristocracy” that had coalesced in the craft-based AFL, the IWW made a special effort to organize unskilled, foreign-born, and migratory workers that the AFL had ignored. Its principal founding union, the Western Federation of Miners (WFM), was itself an industrial union born in 1893 that had left the AFL in 1897 on account of the federation’s neglect of workers in the Rocky Mountain States. Mirroring the WFM, the IWW devoted considerable attention to workers in the extractive industries of the West, including timber workers, miners, and agricultural workers. While the IWW was in theory composed of a large number of specific industrial departments, its practical organization was very loose, and its membership at any one time was small. The IWW organizers often gave form to workers’ spontaneous struggles rather than building a permanent organizational edifice. The IWW’s militancy and its opposition to the First World War invoked the wrath of employers and government, leading to its destruction by 1920.

The CIO

The heyday of industrial unionism in the United States came in the aftermath of the Wagner Act of 1935, a federal law that protected workers’ right to join unions and unions’ right to engage in collective bargaining. The opportunities presented by this New Deal era law re-opened old fissures within the AFL, causing the federation’s advocates of industrial unionism to set up a Committee for Industrial Organizations (CIO) in November 1935. The committee, which sought to lead the AFL in organizing workers in mass-production industries, included the leaders of the UMW, ACWA (now in the AFL), and ILGWU, as well as leaders of the Typographical Union; United Textile Workers; Mine, Mill, and Smelter Workers; Oil Field, Gas Well, and Refining Workers; and the Cap and Millinery Department of the United Hatters. Rebuffed in its efforts to achieve industrial charters for workers in steel, automobiles, radio, and rubber, the CIO went ahead with its own organizing drives, broke with the AFL, and recast itself in 1938 as the Congress of Industrial Organizations under the direction of the UMW’s John Lewis. The new unions it

helped to create also subsumed the organizational efforts of the Trade Union Unity League, a collection of industrial unions under Communist leadership since 1929. The birth of the CIO corresponded to a shift in the Communist party line to a position of support for a unified democratic front against fascism, and Communists won some significant positions in the new unions, especially in the United Electrical, Radio, and Machine; Transport Workers; Maritime Workers; Fur and Leather Workers; Mine, Mill, and Smelter Workers; and International Woodworkers.

Because the CIO grew so rapidly—to 3.7 million members by the end of 1937—its success suggested that a tremendous latent demand for organization among ordinary production workers had gone unmet until the New Deal era. Workers certainly did exhibit substantial signs of militancy and determination, as most famously illustrated by a sit-down strike at General Motors in Flint, Michigan, from late December 1936 through mid-February 1937. The strike resulted in recognition of the United Automobile Workers and was the first time the CIO had obtained an agreement from an open-shop industry, no less one of the world’s biggest corporations. The labor victory led to a wave of strikes and union organizing drives across the country, with sit-down strikes as the tactic of choice until mid-1937.

The advent of the Second World War allowed the industrial union movement to consolidate its membership gains if not its independence of action as the National War Labor Board adopted the principle of “maintenance of membership” in war industries. While not an endorsement of the closed shop, the rule required union members and new recruits to keep up their membership for the duration of a contract. In 1955, the CIO and the AFL merged, with the latter organization adding an Industrial Union Department in recognition of the permanent need for industrywide unionism. With few exceptions, such as the Union of Needletrades, Industrial, and Textile Employees (UNITE), which derives from a 1995 merger of the Amalgamated Clothing and Textile Workers’ Union with the ILGWU, the major industrial unions in the United States as of 2005 have come down to us unchanged as a legacy of the CIO organizing drives of the 1930s.

INDUSTRIAL WORKERS OF THE WORLD

Committed to organizing all workers regardless of race, skill, gender, or ethnicity into one large union dedicated to abolishing the wage system and overthrowing capitalism, the Industrial Workers of the World (IWW) embodied the revival of revolutionary fervor in the American labor movement in the first two decades of the twentieth century. From 1905–1924, the IWW inspired a spirit of radical working-class activism throughout the country that broke sharply from the business unionism advocated by the American Federation of Labor (AFL). Although its official membership was never very large, the IWW struck fear in employers who responded to the challenge of the Wobblies (a nickname for members of the IWW) with a concerted campaign of intimidation and repression that intensified during World War I. The IWW never regained its prewar militancy, but its legacy of direct action, industrial unionism influenced the American labor movement for decades to come.

Origins, Goals, and Membership

In June 1905, an assemblage of dissident radicals and labor activists gathered in Chicago to, in the words of keynote speaker and militant western mine unionist William D. "Big Bill" Haywood, create "a working-class movement that shall have for its purpose the emancipation of the working class from the slave bondage of capitalism" (P. Renshaw, *The Wobblies*, 1967). Delegates to the Chicago convention, what Haywood called the "Continental Congress of the working class," formed the Industrial Workers of the World. Those who attended—western miners, competing factions of socialists, industrial unionists, anarchists—agreed on little other than their hostility

toward the conservative craft unionism of the AFL. The Western Federation of Miners, the largest delegation in attendance for example had learned first hand the ineffectiveness of the AFL, which had proved an unreliable ally in the union's desperate struggles against mine operators in the Mountain West. Having experienced firsthand the multiple tactics that mine operators deployed to break their union—strikebreaking, martial law, private detectives—these veterans of the western mine wars came to Chicago with a sharpened class consciousness. They understood that industrial organization and securing allies across the labor movement rather than affiliation with the AFL was the only way to protect the interests of the working class. The preamble to the IWW's original constitution—"the working class and the employing class have nothing in common"—thus reflected the lived experiences of the workers gathered in Chicago. Declaring "an injury to one an injury to all," they advocated a cooperative, egalitarian spirit that they hoped would transform the American labor movement.

Although the delegates to the Chicago convention submerged philosophical differences in the interest of creating one big industrial union, factionalism quickly sapped the fledgling organization. In 1906, reformist socialists, after a conflict with revolutionary socialists, deserted the IWW. A year later moderates within the Western Federation of Miners persuaded its members to abandon the revolutionary industrial unionism of the IWW, diminishing the ranks of the Wobblies to perhaps less than 6,000. The internal debates within the Western Federation of Miners reflected a deeper debate within the IWW over the strategies and tactics the union ought to pursue to achieve the emancipation of the working class. Some saw industrial unionism as a means to more effectively organize the working-class vote, which would help to elect socialist political candidates. Others saw the exercise of the democratic ballot as flawed as the pure-and-simple unionism of the AFL. Political action, they argued, would lead only to the reform of capitalism, not its overthrow. Instead they favored an organization that would wage direct economic action, enabling workers to seize the means of production of entire industries. At the 1908 convention advocates of direct action gained the upper hand, ousted their opponents, and amended the constitution to eliminate political action as a viable tactic or strategy for achieving the abolition of the wage system. Among those expelled from the 1908 convention was the fractious Marxist ideologue Daniel DeLeon, who founded a faction of the IWW in Detroit. Although this splinter group, which later renamed itself the Workers' International Industrial Union, tried to rival the IWW,

it never exerted much influence before it disbanded in 1924.

After the 1908 convention the IWW dedicated itself to the pursuit of two simultaneous goals. First it sought the practical task of organizing the masses of American industry into one big union. The IWW thus launched an aggressive organizing campaign that urged all workers regardless of skill level, race, ethnicity, nationality, or gender to join. This commitment to inclusiveness distinguished the IWW from exclusionary craft unionism of the AFL and its history of discouraging the participation of unskilled immigrant and African-American workers. The IWW's second and revolutionary goal was to "take possession of the earth and the machinery of production, and abolish the wage system," as it declared in its 1908 constitution. Direct action through industrial unionism would be the vehicle for achieving this utopian vision. By organizing all workers in all industries, the IWW would control the country's factories, mines, and railroads. Workers would then wage a general strike that would cripple capitalism and usher in a new day of a democratic, wageless, and classless society governed by workers themselves. Because of its revolutionary goals, the IWW pledged never to negotiate or seek peace with employers by signing binding contracts.

Direct-Action Campaigns before World War I

Achieving its utopian vision was a distant goal, so the IWW focused its energies on organizing unaffiliated workers. Despite the predominance of western radicals among the IWW's founders, the union gained national credibility from important victories in labor struggles in the industrial Northeast and Mid-Atlantic regions where immigrant factory workers and African-American longshoremen proved eager converts to the IWW's philosophy of direct action.

In 1912, the IWW supported the spontaneous strike of more than 20,000 textile workers who walked out in protest of wage cuts at the American Woolen Company in Lawrence, Massachusetts. Many of the strikers were young women aged 14–18 who had become malnourished and overworked as the company imposed wage reductions and forced them to endure the stress of a system designed to speed up the pace of work. "We want bread and roses, too" demanded the strikers in a phrase that became the signature slogan of the strike. Since most of the strikers were immigrants—Poles, Italians, Lithuanians, Russians, and members of several other nationalities—the IWW played a critical role in sustaining worker solidarity across difficult

language barriers. The IWW distributed literature in dozens of languages and translated speeches, which sustained unity and solidarity as strikers maintained a massive picket line, held rallies, and organized stage parades through city streets. As the strike wore on, providing relief proved one of the greatest challenges to the strikers. The IWW's strike and relief committees served workers of different nationalities by providing supplies, maintaining soup kitchens, and distributing other critical aid. The strikers held their ground even as national guardsmen descended on Lawrence and the city imposed martial law and a ban on public meetings to disrupt their activities.

The IWW carefully cultivated public sympathy throughout the strike. Strike committees coordinated with labor sympathizers in nearby cities to aid the children of strikers by providing them care and temporary out-of-town safety during the duration of the conflict. The response was overwhelming; the image of underfed children in rags generated sympathetic publicity for the strikers and their cause. Distressed by the effectiveness of the strikers' ability to coordinate, Lawrence authorities moved to disrupt their strategy, declaring that children would not be allowed to leave the city. The tide of the strike turned when the police interfered by attacking a transport of 200 children destined for Philadelphia. A public outcry over the tactics of Lawrence authorities forced the mill owners' to settle, offering pay raises, overtime, and other improvements in working conditions.

In 1913, longshoremen in Philadelphia formed the interracial, multiethnic Local 8 of the IWW's Marine Transport Workers' Industrial Union. A long history of racial and ethnic conflict among Philadelphia's waterfront workers enabled employers to control the labor force of the city's docks. But longshoremen reversed that trend during a strike in 1913, when eastern European immigrants and African-Americans who worked the docks voted to affiliate with the IWW. Instrumental to the success of Local 8 was Ben Fletcher, who became one of the most prominent Wobblies in the United States. Fletcher, a Philadelphia native and young dockhand in his early twenties, ascended the leadership in the city's IWW. During the strike he emerged as a leader of Local 8. Fletcher was not the only black leader in Local 8: Several other key positions within the union, including those of business agents, meeting chairs, and secretaries, were held by African-Americans at one time or another. The union's careful efforts at political education and balancing the needs and interests of the union's different members made the union a powerful force on the Philadelphia waterfront for more than a decade.

The IWW's message of direct action appealed to the multitude of drifters—miners, loggers, farm

hands—who toiled about the Trans-Mississippi West. The shift to an industrial form of agricultural—wheat on the Great Plains and fruits and vegetables in California and Washington—increased the demand for seasonal, migrant farm labor. Young, single, male, unskilled migrant farm hands endured an endless search for work, riding the rails from job to job, following the harvest season. At each work site, they settled into camps with poor lodging and inadequate bathing facilities and worked jobs that were strenuous, intensely supervised, and low-paying. During harvest season these hoboes became ripe recruits for the Wobblies. Thousands joined, forming in 1915 the Agricultural Workers' Organization (AWO), which later re-organized as the Agricultural Workers' Industrial Union. Until the late 1920s, these militant casual laborers built a union that was strongly centered at the level of the rank-and-file and for a while posed a formidable threat to employers. The IWW's organized farm hands in many ways pioneered the idea of industrial unionism in agriculture. The IWW also established a strong presence among the loggers of the timber camps of the Pacific Northwest. Here a mix of revolutionary appeals and the demands for immediate improvements in working and living conditions attracted thousands of loggers into locals that waged a series of strikes in the decade before World War I.

The Wobbly Counterculture

Beyond a commitment to waging direct-action campaigns against employers, the IWW spread a working-class culture that challenged the dominant values of competitive, acquisitive individualism. Through its newspapers the *Industrial Worker* and *Solidarity* and other publications, such as Covington's hall paper, the *Lumberjack* (later entitled *Voice of the People*), the IWW spread its political education of the working class, which drew on humor, song, and iconoclasm. Cartoons ridiculed Scissor Bill, the fictional American worker—and a ubiquitous presence at mines, mills, and lumber camps throughout the country—who resisted unionization and remained the dutiful servant of employers, earning nothing more than a life of sloth, gambling, drinking to excess, and residing in filth. Ernest Riehe's memorable Mr. Block cartoons, through mockery and humor, educated working-class readers on the values of class solidarity and industrial unionism. Mr. Block represented the naive American worker who faithfully believed that his material interests were served by obeying the law and remaining

faithful to the commands of his employers. As one IWW publication put it, "Mr. Block owns nothing, yet he speaks from the standpoint of the millionaire. . . . he licks the hand that smites him and kisses the boot that kicks him; he is the personification of all that a worker should not be." By following the adventures of Mr. Block, readers witnessed his discovery that the courts fail to protect him, that depositing wages in banks ensures him of no savings, that employer promises of plentiful jobs at high wages never materialize, and that the AFL only reinforces the power of capitalists. By raising the class consciousness of American workers through the humorous education of Mr. Block, Riehe and the IWW aimed to destroy the blocks on which capitalism was built.

The IWW spread its culture of class solidarity and industrial unionism through song as well as humor. The IWW music pledged to "fan the flames of discontent." In 1909, an IWW committee in Spokane, Washington, compiled the first of many editions of workers' songs, which became affectionately known among Wobblies as the "Little Red Song Book," after the color of its paperback cover. The songbook project reflected the talents of its compiler, J. H. Walsh, an energetic West Coast itinerant soapbox organizer who considered himself both an agitator and an entertainer. Wobbly music chronicled the travails of the male, migrant worker, who endured a life on the road with its endless search for work, crowding in unsanitary work camps, and exploitation at the hands of deceitful labor agents. Songs also urged direct action. They celebrated the uncompromising defiance of the IWW, mocked emasculated lackeys, such as Mr. Block and Scissor Bill; memorialized the heroics of legendary unionists, such as Joe Hill and rebel Elizabeth Gurley Flynn; mused at the destruction of property at the hands of Wobbly saboteurs; and promoted an ethic of cooperation and solidarity amid struggle.

But if songs registered workers' frustrations and lionized their militancy, nearly all of them struck a note that inspired dreams of the coming new day. Consider the chorus to Ralph Chaplin's "Commonwealth of Toil": "But we have a glowing dream / Of how fair the world will seem / When each man can live his life secure and free / When the earth is owned by Labor/And there's joy and peace for all/In the commonwealth of Toil that is to be" (*I. W. W. Songs*, 2003).

Although perhaps no more than 60,000 people ever belonged to the IWW at its zenith, many millions of American workers gained exposure to the IWW's revolutionary philosophy through the union's

cultural propaganda of culture of humor, song, and militant class solidarity.

A masculine work life culture of the rails, mines, mills, and logging camps also spread the cultural values of the Wobblies. Hopping freights and living in tent colonies with other migrant workers, however unappealing, nurtured a masculine spirit of camaraderie, rebelliousness, and independence, values that the IWW taught in its newspapers, pamphlets, and stump speeches. Union delegates drifted through migrant camps, distributing IWW literature, buttons, and pasting stickers inside freight cars, rented rooms, and other places where migrants gathered. Organizers won many converts to the Wobbly cause when they displayed militant solidarity in action. Union men intimidated nonunionists, daring them to fistfights, shootouts, and other tests of masculinity. Wobblies enhanced their visibility and reputation among migrant workers when they stood together to resist eviction from freight cars. Engineers and conductors often harassed workers who rode the rails to work sites, trying to extort money from the migrants and forcing them off the train if they refused to pay. Wobblies defied these incursions on what they considered their right to ride the rails, resorting to coordinated acts of physical violence to repel railroad crews. The defiance of the Wobblies, not the deference of nonunionists, secured free passage to the next work site and taught the value of the militant, fighting spirit of the IWW to nonunion observers. Veterans of the rails and lumber camps thus served as emissaries of the IWW's counterculture of rebellious class solidarity.

Repression and Response

The IWW encountered coordinated repression, engineered by both the state and employers, to disrupt its organizing, its direct-action campaigns, and the spread of its cultural propaganda. To further its education of the working class, the IWW deployed a contingent of street-corner speakers and soapbox orators throughout western towns. They thundered before crowds of migrant, casual laborers and led public demonstrations against the abuses of private-employment agencies, or "employment sharks" in the vernacular speech of the IWW, who charged high job-placement and transportation fees to workers. Municipal officials drafted local ordinances that prohibited public-street speaking but exempted such religious organizations as the Salvation Army from the regulations. From 1909–1916, the IWW responded to these legal restrictions with its famous free-speech fights

in such places as Spokane, Washington, Fresno, California, and Minot, North Dakota. Wobblies defied local authorities with a coordinated plan by which one speaker would mount a soapbox and address the gathered crowd until the police intervened and arrested the offender for violating the ordinance. Immediately a second speaker would follow, leading to more arrests, until the IWW overwhelmed the jails and courts, forcing the police to release the prisoners. The demonstrators won public sympathy, not only from other radical groups, but also from civic groups and the mainstream press, which eventually led to the repeal of many of these ordinances. Despite victories in the free-speech fights, these battles divided Wobblies. Internal debates between advocates of soapbox organizing and those who feared that such tactics wasted critical union resources on courtroom costs raged, the latter insisting that time and money could be better spent organizing work sites and staging strikes.

Even as the Wobblies established a presence in mines, construction camps, logging fronts and sawmills, canneries, steel mills, and meatpacking plants, they confronted employers who had the authority to call on the coercive powers of the state to defend their interests over those of the IWW. Despite the IWW's victory at Lawrence for example, American Woolen slowly regained control over its mill. A recession in the textile industry in 1913 enabled mill operators to shift production to nonunion mills, fire unionists, and purchase the loyalty of workers who pledged to shun the Wobblies with promotions and other favors. Employer tactics undermined the IWW's persuasion with workers, who saw the union as powerless to protect the interest of its members. Membership dwindled, and a company-imposed stretch-out eroded pay gains won in the strike. Later that year the IWW endured another stinging defeat. The IWW supported a strike at the silk mills in Paterson, New Jersey, that quickly became one of the union's epic struggles. When silk operators rejected workers' demands, some 25,000 workers forced more than 300 silk mills to go idle. For more than 5 months, silk workers held together through a variety of tactics, including staging a celebrated pageant that dramatized the strikers' cause. Yet the employers' united front eroded worker unity as Paterson officials sanctioned police brutality against strikers, which employers succeeded in blaming on anarchists, a charge that stuck in this town with a reputation as a hotbed of anarchism. Violent repression of the strikers without fear of reprisal from local or state authorities emboldened the hand of company officials. The strike was defeated, and the IWW lost important credibility until the founding

of the AWO in 1915 rejuvenated the union's mass appeal.

The onset of World War I posed even bigger challenges to the "one big union." When the war began in Europe in 1914, the union vowed to oppose it, arguing that it was a struggle between capitalist and imperialist powers in which the working class had no stake. When the United States entered the conflict in 1917, the IWW leadership never made an official antiwar declaration, although it refused to adopt a no-strike pledge and to suspend its commitment to class conflict for the duration of the war. Many Wobblies did resist the draft or went out on strike, but many others did not. Nevertheless Wobblies incurred the indiscriminate wrath of public officials and private citizens who condemned unionists as unpatriotic and pro-German, whose actions undermined American resolve and deprived the United States of mobilizing its vital war industries.

The passage of the Espionage Act (1917) empowered the federal government to intimidate and imprison such radicals as the Wobblies. At the pleading of the interests of the country's major industrial and agricultural interests, the federal government conducted a series of raids against the IWW. Federal agents stormed into union halls, libraries, and private homes, confiscating files, literature, supplies, office equipment, and even personal items. Thousands of organizers and rank-and-file Wobblies were arrested and indicted for violating the Espionage Act. In a series of mass trials, federal authorities prosecuted Wobblies for obstructing the war effort. In the largest of these trials, held in Chicago, William D. Haywood and scores of other Wobbly defendants were found guilty of sedition and sentenced to 20 years in prison.

Not only did the federal crackdown ensnare such IWW leaders as Haywood, but it took its toll on rank-and-file members as well. The federal investigations of the IWW were part of a larger federal campaign of fear waged against all kinds of alleged radicals. Vigilante groups, such as the American Protective League, worked in concert with state and local officials to expose and intimidate Wobblies who dodged the draft, failed to report for military training, or who were foreign-born and at risk for deportation as an enemy alien. Police arrested thousands of suspected Wobblies for vagrancy. Vigilantes in local loyalty leagues lynched, tar-and-feathered, and clubbed unionists. Even Wobblies who supported the war effort and served in the military were not immune from vigilante repression. For example war veteran and lumberjack Wesley Everest was lynched for resisting a mob of American Legionnaires who stormed the IWW union hall in Centralia, Washington, on Armistice Day in

1919. The war dealt a crippling blow to the IWW's offices, membership, and infrastructure.

Decline and Legacy

Although some pockets of Wobbly activism—such as the wheat fields of the Great Plains—saw a resurgence in the 1920s, the IWW never recovered from wartime repression. The union invested its limited resources and energies into the defense of wartime prisoners, which undermined any renewed efforts at organizing and direct action. Much of the leadership dispersed. After the war working-class radicals also began to gravitate toward the Communist Party of the United States of America (CPUSA), which was founded in 1919. Spearheaded by former Wobbly William Z. Foster, the CPUSA's Trade Union Educational League (TUEL) pushed to build industrial unionism within the trade union movement. Throughout the 1920s, the TUEL trained hundreds of field organizers who developed the skills, networks, and tactical experience to redirect working-class radicalism in the 1930s. Finally even the Wobbly revival on the plains was short-lived, since critical changes in agricultural technologies reduced agribusiness's dependence on migrant labor, the greatest source of new membership. The introduction of the automobile also undermined the work culture of the West, which weakened the Wobblies' ability to appeal to potential recruits. As workers traveled to work sites by car, they bypassed the sociability of riding the rails and the jungle camps, two places where activists had succeeded in wooing migrants to the Wobbly cause.

Despite its decline the IWW left important legacies. By taking seriously the importance of organizing unskilled workers, the IWW undermined the credibility of the AFL's craft unionism as a model for an effective labor movement. By organizing African-American longshoremen in Philadelphia, immigrant textile workers in Lawrence, and migrant harvest workers, and timber hands of various stripes, the IWW anticipated the industrial unionism of the Congress of Industrial Organizations, founded in the 1930s amid the Great Depression. The Wobblies direct-action tactics found renewed expression among activists in the United Mine Workers, the United Automobile Workers, and the Amalgamated Clothing Workers. Moreover the IWW's original idealism continues to inspire many on the left to this day. The union still maintains its own website (see References) where the project of working to build one big union remains alive. For many in the labor movement today, both activists and scholars, the IWW's expansive

vision and idealism—that takes seriously the idea that “an injury to one is an injury to all”—is as relevant in today’s world of global capitalism as it was in 1905 at the zenith of American industrial capitalism.

INJUNCTIONS

By definition an injunction is a court order directing a person, and if necessary his or her associates, to refrain from pursuing a course of action. For the labor movement, the injunction became a powerful legal weapon that was used to hamper its activities. From strikes to boycotts to peaceful picketing, U.S. courts would issue injunctions on the behest of employers to prevent workers from carrying out their forms of protest. Ever since the Pullman strike of 1894, curbing the use of the injunction became a serious quest on the behalf of labor.

Injunctions had their origin in the common law system of England. The king was given the power to prevent any sort of injury by banning someone from committing an act rather than taking action against such person after the injury was performed. Later on the English courts took on this responsibility with the idea of protecting property from any sort of threat and if the law provided for no other defense. In the United States however, the injunction was actually not used much, if at all, until 1877, when courts of equity issued injunctions to stop striking railroad workers. But the use of the injunction prior to Pullman had little if any far-reaching affects. For instance on March 26, 1886, Charles Brusckke, an Illinois furniture maker, obtained an injunction against his striking workers. On April 2, both sides appeared before the court to argue their case, with Brusckke winning a permanent injunction on May 20. Nevertheless the use of the injunction was not very widespread at this time.

In the United States if an immediate threat to property is seen, the courts will issue a temporary restraining order, a move that does not place blame on either side. If no further relief is seen, a temporary injunction will be issued to allow further investigation into the case. After viewing both sides, a judge may decide that more protection is needed and issue a permanent injunction.

However when it came to labor disputes, this path was rarely if ever taken. Courts tended to issue an injunction straight away. The problem concerning labor activities is that of time. When an injunction is issued, a hearing is scheduled for a later date. For a union, or a group of workers conducting a strike, this puts them in a precarious situation. Should they obey the injunction, they will lose the momentum of the strike. Should they disobey, they will be in contempt of court and face possible jail time.

Many labor groups and individuals protested the use of the injunction. They protested that this action was entirely judge-made law. There was no jury involved. Furthermore the side on whom the

INJUNCTIONS

injunction was issued was not allowed to present its case until the hearing; only the petitioner had any access to state its position prior to that time. Also on many occasions, some judges issued blanket injunctions. When doing so many people would be placed under the requirements of the injunction but have no idea as to the situation and would therefore be liable for contempt of court.

The Pullman strike helped to promote the use of the injunction. In protesting wage cuts instituted by the Pullman Company against its workers, the American Railway Union (ARU), which was under the direction of Eugene V. Debs, called for a boycott of Pullman railroad cars to accompany the strike. The Pullman company turned to President Grover Cleveland for assistance. Under the guise of protecting the mails, Cleveland sent in federal troops both to maintain order and to protect the mails and interstate commerce. On the arrival of troops, violence broke out. A federal court issued an injunction against the ARU forbidding any interference with the mails or interstate commerce that the railroads provide, an action that Debs and the ARU ignored. Debs was jailed for contempt of court, and the strike eventually failed.

Once employers saw how the injunction could be used against the labor movement, its use picked up momentum. Ever since the celebrated 1842 Massachusetts case *Commonwealth v. Hunt*, unions had the legal right to exist as long as their purposes were legal. This was a matter of interpretation, especially when it came to the right to strike or conduct a boycott. In conducting strikes and boycotts, courts repeatedly defined and redefined what constituted a legal or illegal activity on the part of labor. The injunction was often used to create these new definitions.

On the other side were those who sought an injunction. A company owner rightfully considered his business his property. Should a labor dispute arise and he was faced with the possibility of a strike preventing him from conducting business, he would also face the loss of income and possibly find himself unable to open his company. An injunction would enable him to continue to use and enjoy his property.

Across the country the argument waged heavily on both sides. The injunction was denounced in the 1896 Democratic platform. Many of the injunction supporters were friends of big business and saw this court action as a way not only to ensure their profits, but also cut deep into labor activities, all while keeping the peace. Some took the middle road and examined injunction usage, distinguishing between proper and improper rulings. And as previously stated, the labor movement saw the injunction as a form of despotism, dictatorship, and harmful to society as a whole.

Writers and labor leaders weighed in heavily on the subject of injunctions. In 1930, Edwin Witt, a noted author and labor law specialist, called injunction judges kings. He argued that unions are painted as lawless when injunctions are ineffective. In 1919, Andrew Furuseth, a prominent national labor leader during the 1920s, argued that injunctions are “revolutionary and destructive of popular government.” In 1923, Herbert Bigelow, another prominent labor leader, saw the issue as “a matter of life or death to organized labor.” Others thought that injunctions prevented the vital dialog between labor and management that was so urgently needed.

Whenever possible labor organizations went out of their way to point out judges they believed to abuse the power of the injunction. Under the Chicago Federation of Labor (CFL), several judges met with labor’s ire. Two particular judges were James Wilkerson and Jesse Baldwin, both of whom were accused of labor baiting. Judge Dennis Sullivan of the Superior Court of Cook County (the county in which the city of Chicago resides) was especially hated by the CFL, who even attempted to use the ballot box to oust him from his position. However Sullivan had the backing of the Chicago Bar Association and was apparently not repugnant to Chicago society and easily won re-election to the bench.

Many states saw the injunction abuses on the part of the courts and worked to pass legislation to curb its use. States like Illinois, Arizona, and New York worked to create legislation that would pass court approval. In many cases the American Federation of Labor (AFL) provided some guidelines and model language for these acts. By 1914, six states had laws that restricted the use of the injunction. Many felt that federal legislation would help in this quest. The first real piece of congressional law that originally seemed to favor labor was the Sherman Antitrust Act of 1890, which was meant to curb corrupt business activities. When the Sherman Act was actually later used against labor, it was strengthened with the Clayton Antitrust Act of 1914, which was dubbed the Magna Carta of labor. In Clayton labor was not deemed a “commodity or article of commerce” and forbade using the injunction unless there might be irreparable harm to property. Strikes, boycotts, and peaceful picketing were protected.

However three U.S. Supreme Court cases in 1921 put all back to square one: *Duplex Printing Press v. Deering*, *American Steel Foundaries v. Tri-City Trades*, and *Truax v. Corrigan*. *Duplex* involved the issue of secondary boycotts. In this decision the Court held that such boycotts were enjoined under Clayton, which supposedly protected that very right. In *American Steel Foundaries*, Chief Justice, and former

president, William Howard Taft applied the commerce clause of the U.S. constitution to uphold an injunction against striking workers, holding that the picketing presented an obstacle to interstate commerce. In *Truax*, an Arizona anti-injunction law, which used wording from the Clayton Act, was tossed out. The Court held that picketing deprived the owners of their property under the due process and equal protection clauses of the Fourteenth Amendment.

Using the Supreme Court decisions as a starting point, especially in light of the invalidation of the Arizona law, many states went back to work to draft new legislation that would apply the standards described in those decisions. Illinois was one such state. A new bill was drafted and submitted to the legislature in 1925. This bill provided sweeping rights for unions to exist, as well as greatly limited the use of the injunction unless there was irreparable harm to property. The bill was made into law. Its supporters knew one more hurdle was awaiting them: Court approval. Almost immediately after the passage of the law, one judge refused to issue an injunction under the language of the act. The law was not officially reviewed until the 1934 Illinois case of *Fenske Brothers v. Upholsterers International Union*. The Illinois Supreme Court found the law to be constitutional.

Opponents of the injunction knew that strong federal legislation was needed. On February 7, 1928, the U.S. Senate Judiciary Committee began to hold hearings concerning a federal bill. As with legislation on the state level, injunction opponents were looking for wording that would stand the test of constitutionality.

The dream of federal legislation became reality in 1932 with the Norris-LaGuardia Federal Anti-Injunction Act. This law spelled out “the public policy of the United States with respect to Employer-Employee relations.” In this new law, federal courts were forbidden from using the injunction to sustain anti-union employment contracts or to prevent such activities as strikes, pickets, and boycotts. The act also addressed the “inequality of bargaining power between employers and employees” by limiting the court power to intervene in labor disputes. However while Norris-LaGuardia may have limited legal powers in some areas, in others labor organizations were still liable for civil suits and criminal activities.

Norris-LaGuardia was passed on the eve of the New Deal, a period that provided a great many legal benefits to organized labor. However in 1947, Congress passed the Taft-Hartley Act. At one point Congress considered repealing Norris-LaGuardia completely in order to allow courts to issue injunctions in case striking workers violated a no-strike

clause. While repealing the law did not happen, Taft-Hartley did restrict many of the gains given to labor during the previous decade. The General Counsel of the National Labor Relations Board (NLRB) was required to seek an injunction against either unions or employers who violated the act, as well as obtaining an injunction against a secondary boycott.

In the early twenty-first century, the injunction issue is not a very prominent one. But for the period starting from the late nineteenth century through the post-World War II years, eradicating its use was indeed a major problem for the U.S. labor movement.

INTERNATIONAL ASSOCIATION OF MACHINISTS AND AEROSPACE WORKERS

From its underground beginnings in 1888, the International Association of Machinists and Aerospace Workers (IAMAW) has grown into a membership of over 730,000 in various North American industries. Along the way the union has won important rights for workers, including better pensions, stable health care through retirement, safe working conditions, and job security.

The Founding of a Union

On May 5, 1888, Thomas Wilson Talbot, a machinist in an Atlanta, Georgia, railway yard, gathered 18 of his fellow workers for a clandestine meeting in a railroad pit. Believing that railroad machinists needed a union to cope with problems particular to their craft, this small group formed the Order of United Machinists and Mechanical Engineers. The order, formed during a time when employers were often hostile to organized labor, remained underground for several years. Despite its secrecy the order spread beyond Georgia, thanks in part to the “boomers,” men who traveled the railway lines for work. The boomers established local lodges in areas where they were not already present. Within 1 year there were 40 lodges; by 1891, there were 189.

With 34 locals represented, the first convention of the order was held on May 6, 1889, in the Georgia Senate chamber in Atlanta. Tom Talbot was elected grand master machinist (later known as the international president), and William L. Dawley was elected grand secretary (now known as the grand secretary-treasurer). The organization’s name was changed to the National Association of Machinists, and a constitution was drawn up. It was also agreed that a journal, *Machinists Monthly Journal*, would be published monthly consisting of “no less than sixteen pages.”

Also during the 1889 convention, the machinists sought a design for a union emblem. The winning entry was submitted by Frank French, representing Lodge 12 in Houston, Texas. The figures on the design were a flywheel, friction joint caliper, and the machinist’s square with the initials of the organization in between the spokes of the flywheel. French’s design featured symbols important to the members: “The flywheel is significant because it generates a lot of power once it gets started.” French also explained that the calipers signified “that we extend an invitation to all persons of civilized countries who are

practical machinists. The square signifies that we are square and honest.”

Delegates of the second Grand Lodge Convention also adopted a secret code, known as the Russian Prison Knock Cipher, to be distributed to the membership. The code’s purpose was to help machinists communicate with one another when organizing or on other union business. For many years officers and representatives of the IAMAW had no way of quickly communicating from one locality to another except by telegram. In many places the only telegraph office in town was in the railroad depot. This meant that the primary employers of IAM members, the railroads, could review union messages. At least to the eve of World War I, cards bearing new secret traveling passwords were reissued to officers and representatives every 6 months.

In 1890 and 1891, the machinists’ union reached out to its first international members as a Canadian local was founded in Stratford, Ontario. Locals were also formed in Mexico. Consequently the name of the union was changed at the 1891 convention in Pittsburgh, Pennsylvania, to the International Association of Machinists. The international headquarters were moved to Richmond, Virginia, around this same time.

The IAMAW along with the boilermakers and blacksmiths signed a contract with the Atchison, Topeka & Santa Fe railroad in 1892. This was the first agreement entered into in the United States between a railroad company and an organized shop craft.

Acceptance of application into American Federation of Labor (AFL) affiliation would have been automatic were it not for the color bar, which went back to the IAMAW’s southern beginnings. One of Thomas Talbot’s primary objectives in working to establish this union had been to restore and enhance the image of machinists as aristocrats of labor. From the first membership was strictly limited to an exclusive fraternity of white male machinists. This meant no production workers, no specialists, no women, and no blacks. At the 1895 convention, the word black was removed from the constitution. That same year the IAMAW relocated its headquarters to Chicago, Illinois, and became affiliated with the AFL.

After a successful strike, Local Lodge 52 in Pittsburgh negotiated the IAMAW’s first 9-hour day contract in 1898. In October 1899, many Canadian members won a 9-hour day after a 10-day strike against the Canadian Pacific Railroad. This also included a raise in minimum wage. By 1915, the IAMAW lobbied successfully for an 8-hour workday, increased wages, and improvement to work conditions in many shops and factories. They were especially successful in New England.

On the move again, the machinists established their headquarters in Washington, DC, in 1899. By the turn of the century, the young union had become an international organization that had grown to include 450 local lodges with a membership of 35,000.

Shortly thereafter IAMAW International President James O'Connell signed an agreement with the National Metal Trades' Association (NMTA), a group representing company owners' and employers' interests. Known as the Murray Hill Agreement, this contract provided there would be no discrimination against union labor, defined machinist in the terms of the IAMAW Constitution, stipulated extra pay for overtime, adopted an apprenticeship ratio, and most importantly, promised to put a 54-hour week into effect May 1, 1901, 1 year from the signing of the contract. One year after the agreement was signed however, the NMTA refused to pay workers the same pay for fewer hours per week, beginning 35 years of labor-management antagonism.

In 1911, the IAMAW began allowing some new types of workers into its ranks. Since its beginnings the IAMAW had been primarily composed of skilled, white, male railroad workers. In that year they changed their constitution to allow unskilled machinists as well as female workers. Women had been accepted into the IAMAW membership for some time despite language to the contrary in the constitution. James O'Connell pointed out, "We have female members . . . because of [union shop] agreements." By 1948, IAMAW membership was opened to all regardless of race or gender.

On June 28, 1915, the great strikes on the Illinois Central Railroad, the Harriman Lines, and the Pere Marquette Railroad were terminated. These strikes, in progress for more than 3 years, had been maintained at a tremendous cost to both organized labor and the railroad companies. This same year the union affiliated with the International Metalworkers' Federation. One year later automobile mechanics were admitted to the membership.

Changes in the Ranks: The War Years

During World War I, the Machinists' membership had reached 300,000, making it the largest union in the nation in 1918. However as the war ended and wartime production ceased, IAMAW membership sharply dropped off, plummeting to 80,000 by 1923. The situation worsened during the Great Depression: By 1933, membership was at only 50,000, and 23,000 of those workers were unemployed. The 1930s and 1940s did see new laws passed to help get the unemployed back

to work under Franklin D. Roosevelt's New Deal and with industrial production for World War II. The jobs however decreased again with the end of the war and returning anti-union sentiment.

During the 1944 Grand Lodge Convention, delegates voted to establish an Education Department as well as a newspaper. President Harvey W. Brown persuaded the delegates to support publishing a supplement to the *Journal*. This would be a weekly IAMAW newspaper, the *Machinist*. Eventually the *Journal's* production was cut back to twice a year, and then it was voted out of existence in 1956. The *Machinist* was closed down in 1994. It was replaced with a quarterly magazine, the *IAMAW Journal*, which is still in publication today.

The IAMAW disaffiliated with the AFL in 1945. This break was over the failure of the AFL to settle a jurisdictional dispute between the IAMAW and the United Brotherhood of Carpenters and Joiners of America, the Amalgamated Association of Street and Electric Railway Employees of America, and the International Union of Operating Engineers. The machinists argued that the AFL was assisting and encouraging these unions to trespass on the jurisdiction and raid the membership.

In 1947, Congress passed the Taft-Hartley Act (officially known as the Labor-Management Relations Act), which placed restrictions on union activities (specifically, it contained provisions that made closed shops illegal and outlawed secondary boycotts). Section 14(b), the most controversial, allowed states to pass right-to-work laws, which would enable them to regulate the number of union shops. The machinists worked with other AFL unions to repeal the act but to no avail. Because of the limitations imposed on union political activity by this act, the Machinists' Non-Partisan Political League was founded. Despite these reverses, the railroad machinists did manage to win a 40-hour workweek in 1949.

Postwar Years

Beginning in 1935 the machinists started organizing within the airline industry and won several victories. In 1936, the Boeing Company in Seattle, Washington, signed the industry's first labor agreement. By 1938, the IAMAW negotiated the first union agreement in air transportation with Eastern Air Lines.

In 1948, Lodge 751 went on strike in Seattle, Washington, against the Boeing Company. For the machinists the issues were preserving longstanding seniority rules that the company wanted to abolish and achieving a 10% per hour raise for all categories

of labor. On strike for 4 months, the machinists went back to work under the terms set by the National Labor Relations Board. The IAMAW joined the International Transport Workers' Federation in 1950 and re-affiliated with the AFL in January 1951.

When the AFL merged with the Congress of Industrial Organizations (CIO) in 1955, Machinists International President Al Hayes was elected vice-president as well as chairman of the Ethical Practices Committee for the new organization. The shift of the IAMAW had changed the composition from skilled craftsmen into essentially an industrial union. The bulk of the membership had moved from the railroads to the metal-fabrication industry, with aircraft industry workers composing the largest component of the workers. From new worksites and plants in California down to Cape Canaveral (later Cape Kennedy) in Florida, aerospace workers began joining the IAMAW.

By 1964, the IAMAW changed its name yet again, this time to the International Association of Machinists and Aerospace Workers. The newly named union was able to shut down most of the airline industry 2 years later by striking against five major airlines in the business, including Eastern, National, Northwest, Trans World, and United Airlines. A united effort of 35,400 IAMAW members in 231 cities grounded the airlines for 43 days, finally winning 5% raises in three successive years as well as a cost-of-living escalator. The great airline strike of 1966 also led to President Lyndon B. Johnson eliminating the 3.2% limit on pay raises. This benefited both the public and private sectors by eliminating the cap on pay raises.

After 1970, several new departments were added to headquarters to meet members' needs as well as mirror the diversity of the members that formed the union. These included the Departments of Civil Rights (1976), Organizing (1976), Older Workers and Retired Members (1981), Women (1996), Automotive (2002), and Employment Services (2003).

At the 1984 convention in Seattle, Washington, delegates voted to fund the Placid Harbor Education Center in Maryland to train and educate members of the union as well as "to improve the level of understanding of workers in an ever-changing world." This center was later renamed the William W. Winpisinger Education and Technology Center in 1998 to honor the late international president.

The Late Twentieth Century and Beyond

In 1991, the Pattern Makers' League of North America merged with the machinists. The International

Woodworkers of America would do the same in 1994. The IAMAW, the United Auto Workers (UAW), and the United Steelworkers of America in 1995 debated plans for unification by the year 2000. This unity plan would have created the largest, most diverse union in North America, with more than 2,000,000 active members and 1,400,000 retirees. However by 1999 the unification effort with the steelworkers and the UAW ended because of major philosophical differences. During the same year, the National Federation of Federal Employees affiliated with the IAMAW. In the twenty-first century, the union represents more than 200 industries and has become a large and diverse organization.

INTERNATIONAL BROTHERHOOD OF ELECTRICAL WORKERS

The International Brotherhood of Electrical Workers (IBEW) traces its roots to a convention of electrical workers held in a small room above Stolley's Dance Hall in St. Louis, Missouri. On November 21, 1891, 10 delegates representing 300 electrical workers in cities throughout the Midwest named their fledgling organization the National Brotherhood of Electrical Workers (NBEW). Henry Miller was elected grand president at this first convention, and he immediately sought recognition by the American Federation of Labor (AFL). The federation acknowledged the need to organize the growing electrical industry and issued a national charter to the NBEW on December 7, 1891. In 1899, with the establishment of a local union in Ottawa, Canada, the organization formally became the IBEW.

The road to that historic meeting at Stolley's Dance Hall began in the 1840s when electricity left the experimental realm of the laboratory and was put to a practical commercial purpose in the form of the telegraph. Carried by wires strung on poles, the popularity of real-time communication over great distances spawned the new breed of construction workers referred to as linemen. These linemen led a nomadic

life creating the spider web of telegraph lines across the continent. As more and more linemen were needed in the quest to connect coast to coast and city to city, there was no shortage of men attracted to this new and exciting opportunity for work and travel.

The second-half of the nineteenth century saw the emergence of many unions centered on individual crafts, and during the early years of the specialization of the electrical workers trade, there had been various attempts to organize linemen unions in particular cities and localities without much success. The fact that new telegraph lines were always emanating into new territories meant the workers were an itinerate and isolated workforce. However by 1880, there was enough support and communication among linemen to reach out for affiliation with the Knights of Labor, and while this relationship held for a while, an 1883 failed strike against the Western Union telegraph company subsequently broke up the first fledging union of electrical workers.

The failure of the strike did not dampen the urge to organize, and in 1884, a group of linemen, under the cloak of secrecy for fear of their loss of a job, formed a secret organization called the United Order of Linemen. Headquartered in Denver, this group did attain success organizing linemen in the midwestern and western states. However it was at the St. Louis Exposition of 1890 and the widely announced plan for the Expo to display to the world the wonders of electricity that provided, for the first time, a large project where electrical workers from across the country could work in one place for a prolonged period of time. Discussions among the electrical workers from different parts of the country highlighted the differences in pay and the general lack of safety measures, and these informal bull sessions became the spawning ground culminating in that first convention above Stolley's Dance Hall.

The 10 delegates at that first convention had set a far-reaching agenda, and during their convocation they composed a constitution, established a dues and per capita structure, planned for a death-and-strike benefit, and limited strike activity to only that sanctioned by national officers. Realizing that their dream of a better and safer life depended on increasing the membership, the delegates made organizing all workers in the electrical industry their primary goal. When the convention did adjourn, the delegates returned home flushed with vigor to carry the message to the unorganized in their respective cities. Some, like President Miller, went on the road traveling across the United States helping to set up locals and bring in new members wherever electrical work was being done.

The next convention in Chicago in 1892 saw the head count rise to over 43 local unions and an official

membership of about 2,000. This convention also welcomed the first female telephone operators to become members and authorized the publication of a national magazine called the *Electrical Worker*, which has been published continuously under various names since the first issue in January of 1893.

While the majority of the early membership was concentrated in telegraph and telephone distribution, there was also another dynamic arising in the electrical industry. The growth of electrical power generators to provide electric street lighting and the much-desired electric lamps for use inside buildings produced electrical workers known as inside wiremen. With this new classification came new safety concerns and differing pay schedules, which needed to be addressed differently from linemen. A severe depression during the mid-1890s tested the bonds of brotherhood, but the union prevailed and entered the twentieth century claiming 24,000 members in 1905.

Several hardships that were holding back the IBEW from reaching its full potential were addressed early in the new century. The union had been struggling without a full-time, paid leadership that it needed to deal effectively with outbreaks of unauthorized strikes. The 1903 convention in Salt Lake City brought about the election and provision to pay a full-time salary to Frank J. McNulty as grand president. Given the opportunity to devote himself fulltime to the business of running an international organization, McNulty proved to be a strong leader effectively putting an end to wildcat strikes and restoring credibility with employers regarding contract obligations.

McNulty's 18 years as president were not without conflict. The long-simmering differences and dissensions between linemen and inside wiremen came to a head in 1908 with a large number of members rejecting the leadership of McNulty and holding their own convention, electing J. J. Reid as president. At one point the rebellious faction numbered almost three-fourths of the membership and rejected all initial efforts of the AFL to reconcile the opposing groups. It took a court decision in 1912 that declared the fractious convention of 1908 illegal and that all its actions were to be voided before the rebellious members would heed the AFL effort of reunification under President McNulty with no penalties to those who had seceded.

The Twentieth Century: Growth, Decline, Resurgence—Carrying the Union Torch

After full reunification membership rapidly began to increase. Most important to the growth of the union

was the approach of World War I and the demand it put on the electrical industry. The effort to prepare the country possibly to be on the international war stage prompted the federal government to work with the IBEW and electrical contractors. The IBEW trained inside electricians, and linemen were hired through bona fide electrical contractors to build the military training camps, the arsenals, the navy yards, and even the Panama Canal. In 1917, the federal government took over the railroads, and 90% of the electrical workforce on the railroads joined the IBEW. In 1918, the National War Labor Board (NWLB) was established and endorsed the right to organize, leading many electricians employed in private-sector manufacturing to become IBEW members, and from 1913–1919, the membership exploded from 23,500 to 148,000 members.

The post-WWI United States brought hard times to all in the labor movement. Employers throughout the construction trades became enamored with the open-shop movement. An all out effort to break union influences over work rules was launched by anti-union forces, resulting in prohibitive legislation and antilabor court injunctions. Strike-breaking activities and terrorizing of members and potential members became common practice, and this combined with a depression in 1920–1921, led to IBEW membership dropping to 56,349 in 1925, a decrease of 70% in only 6 years.

Despite a decline in membership, the 1920s were still a time of great foresight for the IBEW. In 1920, the Council of Industrial Relations (CIR) came into existence as a compact between the IBEW and the National Electrical Contractors' Association (NECA). This agreement mandated representatives of employees and employers meet and discuss disputes arising in the industry and to abide by the mutually determined decisions and effectively eliminated strikes in the industry.

The 1920s also saw the formation of the Electrical Workers' Benefit Association in 1922 and the restructuring of the death benefit for union electricians. In 1928, the IBEW Pension Plan was instituted.

The IBEW suffered during the Great Depression, and financial difficulties resulted in canceling conventions from 1929–1941. Economic distress was felt throughout the industry and throughout the union. Officers' and representatives' salaries were cut, and some staff were laid off. However IBEW membership never dropped below 50,000 while other unions were forced out of existence.

New Deal legislation beneficial to workers affected the IBEW in a positive way by emphasizing the right of all workers to organize. However industrial semiskilled electricians did not have the training to

stand side-by-side with IBEW trained construction electricians and linemen. This led to a protectionist attitude by long-time IBEW members, and this perceived arrogance was seen by industrial electricians as an indifference to their concerns. By the time the IBEW became ready to enjoin these workers, the United Electrical, Radio, and Machine Workers of America (UE) had filled the void. When John L. Lewis, leader of the newly established Committee for Industrial Organizations, endorsed the UE, the goal of the IBEW to enroll all electrical workers was thwarted.

As before the First World War, the buildup of the war effort saw great expansion in all phases of electrical work. Industrial production and electrical construction and distribution soared as the military relied on all things electrical and on the fledgling electronic infusion. Realizing the importance of labor in the war effort, Roosevelt appointed Daniel Tracy, IBEW international president (1933–1940, 1947–1954), to serve as assistant secretary of labor, thus guaranteeing organized labor would be a major player. Tracy worked hard to assure labor peace and harmony with the war effort and helped to craft a no-strike policy, wage-stabilization programs, and concessions on premium pay.

The economic stimulus leading up to WW II and continuing through the war years brought a large increase in IBEW membership. The IBEW membership grew from 50,000 in 1933 to 347,000 by the end of the war, picking up many utility, manufacturing, and government employees.

The Taft-Hartley Act of 1947 made organizing new members much more of a struggle for all of organized labor. However in 1947, training of electrical workers took on a new importance, and the IBEW-NECA National Joint Apprenticeship and Training Committee was established and became the major conduit of new workers coming into the industry.

During the postwar years the IBEW was forced to take a look at its policy concerning hiring of minorities. Historically the organization was overwhelmingly white. Through its history the union did have a legitimate contention that the transient nature of the work situation caused members to travel throughout the country and into racially segregated cities where work for blacks could not be guaranteed. However this statement could no longer hold as the civil rights movement drove down segregating laws.

The IBEW did not rush to hire minorities as either journeymen or as apprentices, but much of this resulted from a strong unwritten sentiment toward nepotism. The union did promote opening all aspects of membership to minorities during the early sixties in order to meet government standards for

apprenticeships. However it took individual locals, such as New York City Local 3, to lead the way in demonstrating that minorities could become productive workers and good union members.

The second-half of the twentieth century saw a large decline of organized labor membership brought on by anti-union entities and right-to-work laws. The establishment of trade schools and nonunion electrical-training programs during the 1970s and 1980s specifically hurt IBEW recruitment efforts. In the early 1990s, the IBEW launched the Construction Organizing Membership Education Training (COMET) program. This aggressive organizing campaign became the model for organized labor and has been highly successful for all the skilled trades.

In 2005, IBEW membership stands at approximately 750,000. Union members are comprised predominantly of inside and outside electrical workers; utility workers; workers in cable broadcasting, radio and television, motion picture and telecommunications, railroad, manufacturing, and government.

The IBEW is headquartered in Washington, DC, and holds national conventions every 5 years. Principle officers are the international president, international secretary-treasurer, 11 international vice-presidents and a nine-member international executive committee.

INTERNATIONAL BROTHERHOOD OF RED CAPS/UNITED TRANSPORT SERVICE EMPLOYEES OF AMERICA

Founded in 1937, the International Brotherhood of Red Caps (IBRC), which changed its name to the United Transport Service Employees of America (UTSEA) in 1940, represented a largely unskilled occupational group dominated by African-Americans in an industry that was marked by pronounced racial divisions. Initially an interracial association affiliated with the American Federation of Labor (AFL) as a federal union (that is, affiliated directly to the AFL,

not to any of its constituent international unions), the IBRC became an all-black union shortly after its establishment; it soon disaffiliated in protest from the AFL and after 5 years as an independent body, joined the Congress of Industrial Organizations (CIO) in 1942. Possessing no critical skills enabling them to pressure their employers effectively in their workplaces, red caps relied almost exclusively on publicity and the federal government—in particular the courts and the administrative agencies overseeing labor relations in the railroad industry—to win contracts, wage increases, and improvements in working conditions.

The job category of red cap emerged only in the early 1890s. According to legend, a black teenager, James H. Williams, signaled his availability to carry passengers' bags at New York's Grand Central Station by affixing a piece of red flannel to his cap. Within several years, numerous stations were employing groups of station porters to deliver luggage to and from railroad passenger cars. While smaller stations employed only a few men, larger ones, such as Grand Central Station in New York City, placed as many as 500 men on their payroll by the mid-1930s. A U.S. Department of Labor study in 1942 estimated that 3,787 men worked as red caps throughout the country, while another 316 nonredcaps sometimes carried baggage. The employment status and job responsibilities of the red caps remained varied. In some stations, they performed janitorial services, while in others they focused exclusively on baggage carrying.

The men who secured jobs as red caps were a heterogeneous group by the early twentieth century. Although whites and a small number of Japanese worked as baggage carriers, African-Americans numerically dominated the job category. If the overall labor force was racially mixed, individual railroad stations tended to employ members of only one racial group. Requiring only a strong back and little formal skill, the job attracted men with little formal education, highly educated but unemployed black professionals, and black college students in search of money, especially during periods of high-seasonal travel or summer breaks.

Red cap wages and working conditions had been sources of complaint prior to their unionization in the 1930s. In rare instances red caps were salaried employees, but in many other cases they survived on gratuities alone. The Great Depression diminished the willingness or ability of rail passengers to tip generously. With no salaries, seniority rights, or grievance procedures, red caps experimented unsuccessfully with unionization during and after World War I. As one observer put it, red caps' bargaining position was

extremely weak: If “every Red Cap in the Grand Central Station resigned,” he noted, “they could be replaced by double the amount of men within 24 hours.”

The upsurge in unionization during the 1930s in general, and the widely publicized efforts of the Brotherhood of Sleeping Car Porters in particular, provided the impetus for successful red cap unionization. In January 1937, an interracial group of Chicago red cap activists launched a unionizing campaign and founded the Brotherhood of Railroad Depot, Bus Terminal, Airport and Dock Red Caps, Attendants and Porters, which became AFL federal Local 20342. Blacks and whites divided leadership positions, with a white red cap serving as president and a black one, Willard S. Townsend, as vice-president. Seeking to build a larger organization, the local sponsored a multicity gathering in May 1937. The election of Townsend, an African-American, to the presidency of this larger body prompted the withdrawal of most white delegates, who eventually sought affiliation with the all-white Brotherhood of Railway Clerks. Second-class status within the AFL proved unacceptable to the black unionists, who withdrew their new organization from the federation to pursue an independent course of organizing red caps across the nation. At a conference held in January 1930, some 60 delegates representing as many as 4,000 workers officially founded the IBRC.

Over the next several years, the IBRC made civil rights and black equality a central tenet in its struggle for legitimacy. In fending off the jurisdictional claims of the white clerks’ union, which insisted that all station workers—including freight handlers, janitors, and red caps—fell under its control, red caps charged their white challenger with outright discrimination and exclusion. A 1940 court decision awarding red caps in St. Paul, Minnesota, to the IBRC, according to one labor journalist, “struck the shackles of jim crow unionism from the legs of the Negro railroad worker and sounded the death knell for discriminatory practices which have enthroned prejudice in the railroad industry.” That assessment, while incorrect, captured the spirit with which red cap activists framed their crusade. But when given a choice, station porters, objecting to the clerks’ “color bar,” overwhelmingly chose the IBRC in representation elections.

Their weak bargaining power in the labor market pushed red caps into a heavy dependence upon the federal government and the labor relations machinery enacted during the New Deal years. The first crucial step was to secure government recognition of its members’ right to organize and bargain collectively. Managers of railroad stations claimed that red caps

were not in fact railroad employees but technically were rather “privileged trespassers” or independent contractors working for tips. That definition of red caps’ employment status if upheld would deprive them of access to the labor relations machinery—the National Adjustment Administration and the National Railroad Adjustment Boards—established under the terms of the Railway Labor Act of 1934. In late 1937 and 1938, the IBRC undertook a March Forward to Job Legality campaign, spearheaded by the union’s white attorney, reformer Leon Despres, to convince the Interstate Commerce Commission (ICC) that red caps were bona fide railway employees. In September 1938, the ICC ruled in the red caps’ favor, finding that the black workers’ “‘independent’ status was wholly fictitious.” Officially designated railroad employees, red caps now invoked the services of the governmental National Mediation Board to conduct union representation elections in numerous stations across the country, elections that the IBRC overwhelmingly won. In the contract negotiations that ensued in the late 1930s and early 1940s, the IBRC won grievance procedures and work rule improvements but few financial gains. Resorting to the newly passed Fair Labor Standards Act of 1938, red caps attempted to secure a minimum wage, which promised to be an economic boon for the majority of red caps working only for wages. Managers at over 200 railway stations responded by instituting a new “accounting and guarantee” system, which included gratuities as part of a red caps’ salary as a means of evading the new law. The IBRC’s court challenges to the system ultimately proved ineffective, as did its attempts to block a 10-cent-a-bag fee imposed by stations on passengers.

The IBRC’s track record was a mixed one. The U.S. Department of Labor’s Wage and Hour Division concluded in a 1941 study that unionization had brought observable improvements to red caps in the realm of seniority rights, a decrease in working hours, the elimination of the 7-day week, modest wage gains, and inclusion under unemployment compensation and retirement laws. The union had also successfully blocked the white clerks’ union’s effort to absorb and dominate black red caps in a racial, inequitable union structure. In 1942, the UTSEA’s affiliation with the CIO provided it with an organizational platform from which to protest racial discrimination. On affiliation UTSEA President Willard S. Townsend was appointed to the CIO’s executive board, the first black American to hold that position.

That limited success could not prevent the decline of red capping jobs. From the late 1940s through 1960s, railroad stations relied less and less on red

caps' services. Rising baggage fees discouraged passengers from using station porters, while the long-term decline in railroad passenger traffic on account of competition from busses, cars, and planes decreased demand further. By 1955, one observer noted, rail passengers found "the search for the familiar red cap of a porter a desperate one." The advent of two-wheeled baggage carts and "Do-It-Yourself" plans in the mid 1950s displaced even more red caps. By 1972, the UTSEA, which then claimed only 1,700 members, merged with its former rival.

INTERNATIONAL BROTHERHOOD OF TEAMSTERS

Historically the International Brotherhood of Teamsters (IBT) has been one of the most powerful and most controversial of unions in the United States. Its power has stemmed from the union's strategic position in the transportation industry. The controversy has resulted from recurring charges of corruption against the union's leadership. Those charges reflect systemic factors in the union's jurisdiction and its governance that have encouraged corruption and undercut reform. But the corruption charges also often resulted from concerns by anti-union forces about this labor organization's strategic power. Some teamster officials have engaged in corrupt actions that betrayed the interests of the membership, but union opponents also used the label of corruption to tar aggressive union tactics that did not constitute a betrayal of union members.

Early Union History

The origins of the IBT lie in the growth of the teaming industry in the latter part of the nineteenth century.

Teamsters drove horse-pulled wagons, and in the growing cities of that era, they played a central role in the urban transportation network. The increasing scale of the teaming industry encouraged efforts at union organization, which took place at the local level in a number of cities in the late 1800s. The American Federation of Labor (AFL) worked to gather these local organizations into a new national union, and as a result, seven local leaders came together at the 1898 AFL convention to sign a national union charter creating the Team Drivers' International Union (TDIU), the organizational predecessor to the IBT. The union's first president was a Detroit teamster named George Innis.

The early years of this new national teamsters' union were marked by rapid growth and internal dissension. Partly by organizing new locals and partly by bringing existing local unions into the TDIU, the new union quickly grew to include 30,000 members by 1901. In many places, such as Chicago, team owners were encouraged to cooperate with the new union in return for its help in allowing them to control competition. Team owners would form an association that agreed to a closed contract with a local in exchange for the local policing the association's cartel arrangements. Intent on building a large union, TDIU leaders adopted an inclusive organizing strategy that welcomed African-Americans, recent immigrants, and even small-scale employers. The TDIU's constitution made team owners who employed less than five teams and who drove a wagon themselves eligible for membership. The inclusion of those employers generated dissension within TDIU, and in 1901 a secession movement resulted in the creation of a rival organization, the Teamsters' National Union (TNU). The AFL brokered a resolution of the conflict that allowed self-employed teamsters, but not employers, to remain members, and in 1903 TDIU and TNU merged to form the IBT.

The new organization's first president was Cornelius Shea, a Boston teamster, whose leadership generated much controversy. Shea led the union into a sympathetic strike against Montgomery Ward and Company in Chicago in the spring of 1905. The Chicago Employers' Association (CEA) joined this conflict on the side of Montgomery Ward and sought to use the strike to break the union's power in Chicago. Charges of corruption emerged as the CEA encouraged the state prosecutor's office to launch an investigation into the union's leadership. The investigation sought to link Shea to a local strike broker, John Driscoll, and also publicized salacious details regarding the teamster leader's private life. The strike ended in a draw, but Shea's reputation and that of the union's had been badly tarnished. Over the next

2 years, Shea stifled efforts within the union to unseat him, and as a result reformers turned to secession movements, most notably in 1906 with the formation of the United Teamsters of America (UTA). This internal dissension along with legal problems that stemmed from the 1905 Chicago strike brought the union to the brink of bankruptcy. In 1907, a reform candidate, Daniel Tobin, defeated Shea's effort for reelection. Tobin's victory marked a limited reform achievement. While Shea was ousted, Tobin found his ability to clean up particular problem locals in New York and Chicago limited. Faced with the threat of Tobin's intervention, local leaders simply pulled their organizations out of the national union, and in this way, the same tactic of secession proved equally useful to reformers and their opponents.

Transitional Era, 1910s to 1930s

A conservative union leader who described the IBT as "a business institution" that "must be run on business lines," Tobin led the union from 1907 to 1952. His leadership brought stability and financial

health to the IBT. Tobin convinced the UTA to end its secession, and by 1915 the IBT had recovered from the membership losses of the previous decade. Over the next two decades, membership continued to grow at a steady pace reaching 90,000 by 1930. Carefully guarding the union's finances by discouraging local leaders from engaging in precipitous strikes, Tobin built the treasury up to \$2.5 million by 1935. The union's constitution championed a democratic structure that sheltered local union autonomy, but Tobin circumvented those constraints. He built a strong hold over the organization through a network of loyal regional leaders who held the office of international representative. The international representatives owed their position to Tobin and dutifully represented him in their regions, intervening frequently in local union affairs and directing the union's frontlines during its conflicts with employers and other unions.

During these same years, the growth of the motor-trucking industry changed the nature of the union's core constituency. Firms hauling freight began to shift over to motor trucks in the first decade of the twentieth century, but the second decade marked a watershed in this transition. By 1930, according to

Tobin, 70% of the union's members drove motor vehicles, and horse-drawn wagons were becoming anachronisms. Trucking in this era was mostly short-haul, but to the extent that a long-haul interstate-trucking industry had emerged by the late 1920s and early 1930s, Tobin urged local union leaders to organize the drivers in this new industry.

Tobin's rhetoric, which celebrated a conservative craft-conscious ideal of unionism, conflicted with his aggressive policies in broadening the union's jurisdiction. Under Tobin's leadership, the IBT brought in categories of workers in various industries who did not drive but whose membership in the union would increase the organization's strategic position. The teamsters in this era laid claim to, among others, stable hands, employees in the ice and dairy industries, gas station attendants, and later warehouse workers. Like other AFL organizations, it became a kind of industrial union built around the organizational needs of its core membership, the drivers. This inclusive policy combined with the union's strategic role in the transportation industry allowed the IBT to take advantage of the more hospitable environment for organizing that emerged in the 1930s and early 1940s. In the same era, regional leaders, such as Dave Beck and Farrell Dobbs, pioneered new tactics that drew on the growing interstate-trucking industry. As a result, the membership ballooned to a half-million members by 1941, and the IBT became the largest union in the United States.

It also became known as one of the most corrupt. A study of union corruption published in 1938 labeled the teamsters "the most racketeer-ridden union in the United States." This notoriety stemmed from a number of factors. The IBT locals often sought to organize business sectors where entrepreneurs engaged in collusive arrangements to control competition. Local union leaders in those sectors convinced employers to accept collective bargaining by agreeing to participate in these collusive arrangements. By the late 1920s, those anticompetitive arrangements, many of which violated antitrust laws, were often described as racketeering. In addition Prohibition had transformed the nature of organized crime groups, which drew on the illegal liquor trade to become better organized and more aggressive over the course of the 1920s. In Chicago, New York, and elsewhere criminal gangs took on the role of regulating collusive arrangements in various industries, and in doing so, they sought to control the local unions involved. The teamsters' strategic role made their local unions frequent targets for criminal gangs. At the same time, opponents of organized labor, alarmed by its growing power, focused much of their attention on the IBT. Critics,

such as the conservative newspaper columnist Westbrook Pegler, used a broad definition of corruption to condemn the teamsters, whose ability to shut down road traffic during legitimate strikes was described as a kind of racketeering. The union's use of secondary boycotts and its participation in sympathy strikes brought similar condemnation.

Transformation of the Union Under Beck and Hoffa

Dave Beck served as president from 1952–1957, and James Hoffa held the office from 1957–1971. Like Tobin, both Beck and Hoffa described the IBT in business terms, and they sought to structure it accordingly. The union provided a service to its members, selling their labor at the highest price possible, and in order to achieve that end, both men saw a limited role for the rank-and-file membership. Instead they wanted union officials who acted as professionals, meaning well-compensated individuals who had accumulated a level of expertise and who would be required to achieve results or face dismissal. To promote this style of governance, the IBT developed layers of regional and industry-specific administration. On the West Coast, Beck had pioneered the creation of statewide joint councils and later a regional body, the Western Conference of Teamsters. In the 1940s and 1950s, at his urging, that same pattern of administration was extended across the rest of the country, which was divided into four large area conferences. At the same time, locals were also integrated into different regional trade divisions according to the kinds of industries in which their members worked. These trade divisions and conferences coordinated organizing campaigns and provided a new level of oversight on local leaders by keeping track of what proportion of their local's industry had been organized. Local leaders who failed to measure up faced the possibility that the national leadership might impose a trusteeship and oust them from office.

The size of the bargaining unit in the trucking industry also steadily grew. Beginning in the upper Midwest, Hoffa worked to bring all of the trucking locals into one national bargaining unit that would sign onto a national master freight agreement with the trucking industry. He achieved that goal in 1964, thus further integrating local unions into a national structure.

These changes created a more effective union administration, but at the cost of decreased local autonomy and by extension decreased union democracy.

The IBT could mount nationwide organizing campaigns that succeeded against stubborn corporate opponents like Montgomery Ward and Company. But areawide bargaining usurped the independent role traditionally played by local leaders in dealing with their local employers. It also left local leaders opposed to the national administration open to a new range of repercussions, including adverse grievance rulings against their membership at the conference level by grievance boards now dominated by the national leadership.

The relentless pressure to organize however also meant that the IBT was relatively open in this era to minorities and women as members. From its earliest years, the teamsters had welcomed African-American members. Historically the union had followed regional customs by having segregated locals in the South and mostly integrated locals in the North. Blacks served as local union officials and attended the union conventions as voting delegates. When racial tensions surfaced during the Chicago teamsters' strike of 1905, the union's leadership admonished white members to remember the valued role played by black teamsters in their union. By the 1930s, Tobin claimed that the IBT had more black members than any other union, and African-Americans probably made up about one-seventh of the membership. Without making a formal announcement, the union's southern locals were integrated in the late 1950s and early 1960s.

Similar to other biracial unions in this era however, the teamsters allowed a range of discriminatory practices to continue, especially at the local level. Many local unions, especially in local delivery and long-haul trucking jurisdictions, excluded African-American members or kept them out of the better jobs. Although about 200 thousand blacks belonged to the IBT by the 1950s, no blacks held office at the national level until the 1970s.

A similar pattern holds true regarding women's membership in the IBT. The union's broadened jurisdiction had resulted in female members as early as the 1930s, and they steadily grew in number in the 1940s and 1950s. By the 1960s, the union estimated that about 80,000 women belonged to the IBT out of a total union membership at the time of 1.7 million. The national leadership promised women equal treatment within the union. But while these women gained a range of benefits from their membership, it remained true that local leaders worked to keep them out of certain jobs and abetted employer practices that resulted in lower pay for women workers.

The IBT had become by the 1950s a diverse union whose 1.5 million members worked in a range of industries from various kinds of light manufacturing,

food processing, and warehousing to the organization's more traditional jurisdiction in the trucking industry. Especially in trucking the union brought significant wage benefits to its membership. By 1956, 85% of all local truck drivers were part of a welfare plan through their job, and 50% of them had pension benefits. The IBT was known for its aggressive bargaining and tenacious organizing.

In the late 1950s, the IBT also once again became the center of controversy that stemmed from allegations of corruption. The McClellan Committee (1957–1959) held hearings that publicized charges of malfeasance against Dave Beck, and in the wake of the controversy that resulted, he chose not to run for re-election. The committee mounted a major effort to end Hoffa's career in a similar way but without success. Although it publicized his ties to organized crime figures and it highlighted his tolerance and even support for corrupt local leaders, Hoffa won election to the union presidency in 1957. The AFL-CIO cited the charges against him and the union's unwillingness to oust him as justification for expelling the IBT in 1957. Despite the outside pressures, Hoffa retained a firm grip on his office even after he was sent to jail on mail fraud and witness tampering charges in 1967. As with earlier waves of controversy, corruption charges in this era combined legitimate criticism with politically motivated hyperbole. Hoffa did have ties to organized crime; he did abet corruption at the local level; and he allowed the misuse of one of the union's largest benefit funds. But anti-union forces also depicted Hoffa and the teamsters' power as a threat to national security in an effort to justify new restrictions on union-organizing efforts.

Recent History

In an effort to gain parole, Hoffa resigned from the teamsters' presidency in 1971, and he was succeeded by Frank Fitzsimmons. Released from jail in 1971, Hoffa disappeared in 1975. He is generally believed to have been murdered in an effort by organized crime to block him from re-assuming the teamsters' presidency. This widely accepted explanation reflects the degree to which allegations of organized crime influence in the union continued after Hoffa's fall from power. Evidence indicates that his successors, Frank Fitzsimmons (president, 1971–1981), Roy Williams (president, 1981–1983), and Jackie Presser (president, 1983–1988), each had strong connections to organized crime figures. Efforts by reform groups, most notably Teamsters for a Democratic Union (TDU), to

challenge these leaders proved unsuccessful. Insurgents enjoyed relatively few victories at the local level and thus had few delegates at the IBT conventions, where the national union leaders were elected. By the 1980s, the federal government had decided to intervene. The Justice Department cited organized crime's influence over the union to support a Civil RICO suit in 1988 calling for a court-imposed trusteeship over the union. A settlement reached on the eve of trial in 1989, led to a court-monitored consent decree that allowed a range of different types of government oversight.

This continuing oversight brought a measure of change to the IBT. Government-monitored direct elections held in 1991 led to the election of Ron Carey, a self-proclaimed reformer who received support from TDU. But Carey's effort to win re-election 5 years later was marred by a scandal involving the use of union funds to support his re-election campaign. The IBT's internal review board, created by the 1989 consent decree, removed Carey from office, and another election was held in 1998. This time James P. Hoffa, the son of James R. Hoffa, won in a victory that was widely seen as a defeat for the reformers. Supported by most of the union's long-time corps of officials, Hoffa has sought to end the government oversight on the grounds that it is no longer necessary.

These recent contests involving corruption and reform have taken place in the midst of dramatic shifts in the political and economic context facing the union. In 1979, Congress passed legislation deregulating the trucking industry, and the result was a 50% decline in the rate of union organization in the trucking industry. The union's membership fell from a peak of about two million in the mid-1970s to roughly 1.5 million by the year 2000. A political climate favorable to anti-union forces has undercut efforts to recoup membership losses with new organizing campaigns in the trucking industry. The existence of this large, unorganized segment in the trucking industry constrains the union's collective-bargaining position, but it remains true that teamster drivers enjoy better wages and working conditions than their nonunion counterparts. Those conditions in turn influence wages in the nonunion sector, where firms have to make their wages competitive in order to stave off organizing efforts. In this way the union continues to wield much influence in its key jurisdiction.

INTERNATIONAL CONFEDERATION OF FREE TRADE UNIONS (ICFTU)

Origins and Early Years

The International Confederation of Free Trade Unions (ICFTU) was born in London, between November 29 and December 6, 1949. Founding American affiliates included the American Federation of Labor (AFL), the Congress of Industrial Organizations (CIO), and the United Mineworkers of America (UMW). Fifty-nine labor union centers from 53 countries representing more than 48 million members attended.

The ICFTU was a "dual union" center. It was a spin-off from the existing World Federation of Trade Unions (WFTU), founded in 1945 as the

labor counterpart to the United Nations' Organization and successor to the International Federation of Trade Unions (IFTU) founded in 1913. The CIO and most other major labor union centers had been enthusiastic early members of the WFTU. Its continuation of the broad alliance against Hitler and Japanese militarism during World War II meant that such Communist labor centers as the All-Union Central Council of Soviet Trade Unions were also members. The AFL steadfastly refused to work with Communists under any circumstances and thus never joined the WFTU, working instead to undermine the organization.

The WFTU became a major site of conflict in the emerging Cold War in the late 1940s. Outside the organization, the AFL's Free Trade Union Committee and U.S. government agencies fought to deny WFTU representation in major international bodies like the International Labor Organization and United Nations; the AFL and other agencies also sought to influence individual national labor centers in France and Italy and the re-emergent labor unions in Allied occupation areas of Germany and Austria. Inside the organization, sharpening international tensions led to growing opposition to WFTU Secretary-General Benoît Frachon who, although not formally a Communist, was considered to be acting as one through his opposition to the Marshall Plan, among other important international issues. After a shift in the internal balance of power during 1948 and 1949, the CIO was ready to join the British Trades' Union Congress (TUC) and other northwestern European labor centers in abandoning the WFTU to found a rival organization.

From the first, like other international organizations, the ICFTU, headquartered in Brussels, was an organization housing differing and often-competing constituents. The relationship between the ICFTU and European labor unions on the one side and the AFL (AFL-CIO after 1955) on the other was stormy. From the mid-1950s, relations between colonial and ex-colonial labor movements and the Europeans who led the ICFTU became increasingly tense. Much of the dissension was fueled by very close ties between national labor centers and their own governments, which pursued their foreign policies through international bodies.

The first secretary-general of the ICFTU was J. H. Oldenbroeck of the Netherlands, a veteran anti-Communist and leader of the powerful International Transport Workers' Federation. During World War II he had worked closely with the AFL and Office of Strategic Services (OSS), a forerunner of the CIA. Under Oldenbroeck, the organization of the ICFTU developed, as did its independence from AFL influence.

American Labor and the ICFTU during the 1950s and 1960s

Almost from the beginning, George Meany, president of the AFL (then AFL-CIO), regarded the ICFTU as insufficiently militant when it came to communism. For their part ICFTU leaders like Oldenbroeck lived in an environment where the strong presence of Communists was a reality. They disdained American missionary zeal on the issue. Friction quickly developed. The AFL refused to contribute funds to the organization. The Americans felt slighted by the ICFTU leadership. They slammed what they considered the ponderous approach of the European leaders in building a network of regional labor organizations to lead the fight against communism. Dominated by the AFL, in the Western Hemisphere the first regional section of the ICFTU was founded in 1951, the Organización Regional Interamericana del Trabajadores (ORIT). The AFL also refused to end its independent international activities, a move that led to more independent activities by the TUC. The resulting funding crisis meant the ICFTU was hamstrung. Strong U.S. anticolonial attitudes ran counter to the conservative colonial outlook of British, French, and Belgian unions. In 1951, existing difficulties were increased when Victor Tewson of the TUC was elected president of the ICFTU in contravention of an unwritten agreement that the organization should be led by representatives of the smaller affiliates to avoid struggles between the more powerful members. The personal rivalry of Meany and President Walter Reuther of the CIO was reflected in the support given by the CIO to Oldenbroeck and Tewson.

The merger of the AFL and CIO in 1955 meant a more united American approach to the ICFTU and to a temporary deal. The AFL-CIO agreed to renew its financial obligations to the ICFTU, channel its international work through the organization, and enlarge its secretariat. The 1955 Vienna Congress of the ICFTU accepted these proposals and in return promised that no affiliates would establish contacts with Communists. A new, powerful director of organization was to be appointed to provide a counterweight to Oldenbroeck. The job proved so politically sensitive it took a year to find a suitable candidate for the position. Charles Millard, Canadian director of the United Steelworkers of America was a compromise candidate. Millard was placed in an impossible position, caught between the efforts of the Americans and Europeans to dominate the ICFTU. With morale at ICFTU headquarters low due to Oldenbroeck's personal style of leadership (he did not like to share responsibility), the AFL-CIO once again withheld its

financial commitments. Independent AFL-CIO activity in Africa after 1957 led to clashes with the British. By 1959, the ICFTU had upset the Americans, the British, and the Africans. It failed to develop a sound regional structure for the continent; omitted to consult Africans in instituting a training school; appointed the British union official Albert Hammerton as African regional director, a person previously criticized by Africans for his colonialist positions; and proved unable to respond to AFL-CIO pressure for a greater American presence to counter growing neutralist and Communist movements. The upshot was a vigorous American-led move to force the resignation of Oldenbroeck and the entire ICFTU leadership.

Despite the replacement of Oldenbroeck by the American-backed Omer Becu in 1960, relations between the AFL-CIO and the ICFTU improved little. The establishment of AFRO, the African Regional Organization of the ICFTU that same year was hardly a giant step forward. It was followed a year later by the establishment of the All-Africa Trade Union Federation and an intensified struggle within and among African labor unions over disaffiliation from any outside organizations. Eventually most left the ICFTU.

By 1965, George Meany had had enough. He demanded a full accounting of all monies donated to the ICFTU's solidarity fund and refused further funds until all unspent monies were returned and accounted for. Financial mismanagement of ICFTU monies in Africa was real. By 1968, when Reuther's United Automobile Workers (UAW) withdrew from the AFL-CIO, in part over foreign policy issues, the crunch arrived. Before withdrawing, Reuther and the ICFTU held talks concerning the application of the UAW for membership. The AFL-CIO was not informed, though Meany was subsequently told and asked not to oppose the application. Regarding this as interference in the internal affairs of a national affiliate, Meany requested the application be rejected, then took the AFL-CIO out of the ICFTU in 1969. Other reasons included condemnations of the United States over the war in Vietnam, supported by the AFL-CIO, and greater fraternization of the Europeans with Communist neighbors. The AFL-CIO remained affiliated with ORIT and increased its dominance. Throughout the 1960s, the AFL-CIO increased its activities independent of the ICFTU. In 1963, the American Institute for Free Labor Democracy (AIFLD) was founded as a partnership of the AFL-CIO, multinational U.S. corporations, and the U.S. government. In 1965, the African American Labor Center (AALC) was set up to oversee operations in Africa, and in 1968, as the Vietnam War entered its most severe phase, the Asian American Free Labor Institute (AIFLI) was

established, both with heavy U.S. government financial support.

The End of the Cold War and the Evolution of the ICFTU

Only in 1982, after the death of Meany, did the AFL-CIO rejoin the ICFTU. The move was part of a major reconsideration of AFL-CIO foreign policy. By that time the ICFTU had sharpened its positions on human rights—for free labor, against slave labor, for women's rights, against child labor, for freedom of association, for workers' rights as a fundamental guarantee of human rights more generally. It was also focusing ever more tightly on the challenges posed by globalization. From the early 1980s, these were also issues of increasing concern for the AFL-CIO. Such concerns led to a much greater ICFTU effort in developing nations. In 1984, the final regional organization, the Asian and Pacific Regional Organization (APRO) was established. Working both through the major international organizations and on the ground, a remarkable transformation was enacted. Working together and separately, the AFL-CIO and ICFTU supported the independent Polish labor movement *Solidarnosc* in its efforts to represent the interests of working people outside government control and in campaigns for human rights in Chile, South Africa, and Turkey, among others.

As the Cold War ended in 1989 and 1990, the ICFTU was in a good position to consolidate its position as the most representative trade union organization in the world. By 1999, as the other world labor union federations—the WFTU and the formerly Christian World Confederation of Labor (WCL)—stagnated or declined in membership, the ICFTU grew to approximately 124 million members in 213 national trade union centers in 143 countries. Moreover by 1999, the ratio of members in developing countries to those in developed countries had risen dramatically to reach 48% of the total.

One of the central tensions in the ICFTU remained the North-South divide between industrialized and developing nations. The bureaucratic leadership of the ICFTU lagged behind the improving balance in membership and was challenged to integrate the concerns and struggles of workers from quite different environments. The ICFTU responses to issues of foreign debt, reform of multilateral institutions, international cooperation and free trade, and the liberalization of foreign investment were all challenged by leaders of workers of the South as bureaucratically rather than democratically determined and

insufficiently sensitive to southern perspectives. Tensions led to the increased autonomy of the regional organizations after 1996. Reforms of ORIT in particular became models for calls to reform the ICFTU itself in a more decentralized direction.

By 2004, the ICFTU had grown to 234 affiliates in 152 countries with a combined membership of 148 million. It worked closely with the European Trade Union Confederation, the Trade Union Advisory Committee of the Organization for Economic Cooperation and Development (TUAC) and had deepened its historical working relationship with the International Trade Secretariats now renamed Global Union Federations (international groupings of national labor unions in a single trade). At its eighteenth world congress in December 2004 in Miyazaki, Japan, resolutions were passed for reforms that included a move toward unification with the WCL and tightening the relationship between the regional organizations and ICFTU headquarters to promote cohesive and concerted global action. Evidence of U.S. participation in the ICFTU can be seen in the fact that AFL-CIO President John Sweeney served that year as president of the TUAC and on the steering committee and executive board of the ICFTU, while AFL-CIO Executive Vice-President Linda Chavez-Thompson was president of ORIT.

INTERNATIONAL FISHERMEN AND ALLIED WORKERS OF AMERICA

The International Fishermen and Allied Workers of America (IFAWA), a Congress of International Organizations (CIO) affiliate, represented fishing industry workers on the Pacific Coast of the United States in the years during and after World War II. The IFAWA focused on the protection of fishers' incomes and access to the fishery resource. While initially enjoying great organizational success, the union nevertheless became the target of successive attacks by the Federal Trade Commission (FTC) through the 1940s, which interpreted contractual demands for minimum fish prices as collusion to fix prices and restrain trade. These legal setbacks eventually forced IFAWA to reinvent itself as the Fisheries' and Allied Workers' Division of the International Longshoremen's and Warehousemen's Union (ILWU) in 1949. Along with the ILWU, the fishers were expelled from the CIO for alleged political affiliations later that year. The division was moribund by the mid-1950s.

The IFAWA emerged in 1937-1938, after a half-century of relatively isolated union action by Pacific fishers, with the affiliation of six smaller, regionally focused fishers' unions with the CIO. One year later these regional affiliates joined with several directly affiliated unions to create IFAWA, headquartered in Seattle. Nevertheless given its diverse parentage and the geographical specificity of each local's organizational and natural resource concerns, the union constitution allowed for considerable local autonomy, and the organization remained highly decentralized.

Like many other unions, IFAWA grew throughout World War II. At its peak in 1946, IFAWA membership exceeded 22,000, and the FTC declared that the "Pacific North West fishing industry is one of the most highly unionized industries of the country." Locals operated in every major fishing port on the coast, from Bristol Bay in western Alaska to San Diego, and members participated in virtually every commercially significant Pacific fishery—crab, salmon, sardine, tuna, herring, and halibut, for example—with the full range of commercial gear: Trawl, long-line, purse-seine, and gill net, among others.

Three groups comprised the greater part of IFAWA's membership: Company fishers, fisher-boat owners, and shares' fishers. Company fishers fished with boats and gear owned by fish processors or

“operators” and were paid a share of their catch. This arrangement was more common in more geographically isolated fisheries. Fisher-boat owners, or independents, owned or leased their boats and gear and sold their catch to operators by weight or piece. Shares’ fishers crewed independent boats and were paid a share of the sale price of the catch, commonly after some agreed-on deduction for the cost of boat and gear maintenance. A proportionally less-significant fourth group, shore workers employed by the operators, performed a variety of jobs in the plants and on the docks.

Joe Jurich led IFAWA from its inception and remained president until the merger with the ILWU a decade later. Jurich’s dynamism notwithstanding, the major organizing and strategic work was done at the local level in the face of challenges specific to fishery or locality. For example IFAWA’s heated battles with the Seaman’s International Union (SIU-AFL) in the early 1940s over participation in the Monterey sardine fishery was managed by Local 33, based in San Pedro, California, not by the international. Rather the international’s principal organizational role was the representation of the union in three critical arenas: (1) To the membership, primarily through the publication of the union newspaper, the *International Fisherman and Allied Worker*, and the organization of fishery-specific coastwise conferences; (2) to state and federal fisheries managers through the conduct and publication of scientific research; and (3) before federal trade and labor regulators, the FTC in particular, in hearings and before the courts.

It is these latter two activities, and their institutional and ecological contexts, that make the history of IFAWA of particular interest. First the union’s organizational form—a loosely coordinated set of virtually autonomous locals across thousands of miles of coast—reflected the ecological dimensions of the resource on which the membership depended. Not only would inconsistent pricing across regions undercut the power of all locals, but the mobility of the fish stocks, and the consequent risk of nonlocal risks to stock sustainability simultaneously encouraged vast geographical coverage and a commitment to local autonomy. The international’s commitment to fisheries’ science and population research was a logical result of these same pressures.

Second and most significantly in the union’s history, the great majority of the international’s attention—and that of powerful locals like San Pedro, San Francisco (Local 34), and Astoria, Oregon (Local 50), among others—was absorbed by the efforts of the FTC’s antitrust division to indict the union under the Sherman Anti-Trust Act. The indictments, which began as soon as the union was organized in

1939, and continued unabated throughout the life of IFAWA and the ILWU fishers’ division, were founded on the assertion that IFAWA’s members were “independent contractors,” engaged in the sale of commodities to processors. As such all efforts to set minimum fish prices constituted illegal price discrimination. Fishers’ refusal to fish, a fishing strike, or “tie-up” was configured as restraint of trade.

The IFAWA, usually represented by Jurich and the union’s California representative, Jeff Kibre, asserted that fishers were employees in everything but name. In the face of operator monopsony, the debt relations in which most fishers were involved with processors, and the perishability of fish that prevented the search for the highest price, even independent fishers were merely delivering fish to operators for what IFAWA called a “wage price.” They argued that conflicts with processors were not the matter of the Sherman Act, but constituted labor disputes under the Norris-LaGuardia Act.

In the early 1940s, the legal interpretations of these conflicts varied: Despite the support, the FTC position from the Supreme Court in its decision in *Columbia River Packers Association v. Hinton*, the National War Labor Board generally recognized IFAWA’s appeals for wage adjustments. By 1946, however, the courts had become far less sympathetic, and a series of defeats—especially in the Second Circuit’s decision in *Local 36 of International Fishermen and Allied Workers of America v. United States*—created significant organizational instability, marked most notably by the secession of the membership-rich Alaska Fishermen’s Union. The union never recovered; further indictments followed precedent, and locals collapsed or disaffiliated. The effort to save the union by joining the ILWU was further hampered by the disintegration of the CIO, and by 1957, even the Fisheries’ and Allied Workers’ Division was basically no more than a file folder.

INTERNATIONAL FUR AND LEATHER WORKERS' UNION

The International Fur and Leather Workers' Union (IFLWU) was the most left-wing of the Congress of International Organization's (CIO's) unions. The union was established in 1939, when the International Fur Workers' Union (IFWU), with its heavily Jewish—and smaller Greek—membership, merged with the recently created National Leather Workers' Association after a CIO-inspired industrial union campaign. The former organization itself was born of an earlier alliance, when eight American Federation of Labor (AFL) unions representing the various crafts of the fur trade joined together in 1913 to form the IFWU.

The 14,000-member IFWU was continually plagued by internal corruption, autocratic leaders, and constant factional battles. In the New York fur district, the industry's largest and most important center, organized crime soon managed to infiltrate the union, reaching accommodating arrangements with various employers. A radical group, led by Russian-born, New York Joint Board Chairman Ben Gold, an open Communist prominent within the national Communist party (CPUSA), began a concerted effort to regulate the industry and purge the union of all vestiges of criminal control. In a 4-month strike starting in February of 1926—waged mainly for a five-day, 40-hour week—Gold and his supporters challenged the district's employers and their organized crime supporters within the union. The strike ended in an unstable success and was followed the following year by yet another strike—mainly to enforce the settlement reached after the previous year's conflagration. Gold was not able to totally rid the union of corruption and was forced to wage a decade-long struggle against his right-wing enemies within the leadership of the international union—and the AFL. The Executive Council of the AFL and AFL President

William Green soon targeted Gold, appointing a special committee charged with ridding the New York City joint board of its Communist leadership. Faced with such concerted opposition, Gold lost his position as head of the joint board in 1928 but continued to lead the left-wing opposition group of the union, and then worked with the Trade Union Educational League and the Trade Union Unity League over the next few years to develop an industrial union, the Needle Trades Workers' Industrial Union, which would bring skilled and unskilled workers together in one expansive working-class organization. For the ensuing 7 years, unionization in the fur industry was sharply divided and chaotic. It was not until the spring of 1935, when the temper of trade unionism began to shift further to the left when the Communist party abandoned its "third-period" line and began once again to oppose dual unionism and emphasize unity and when rank-and-file workers had had enough of their organized-crime-tainted leadership that Gold returned and worked his way back into leadership of the IFWU. He was subsequently elected international president of the union in May of 1937. Soon afterward he took the IFWU out of the AFL and into the recently established CIO. In early 1938, Gold led the entire union in a successful strike that achieved wage increases and seasonal job security (the fur industry was a highly seasonal industry). Perhaps most important the strike finally unified the fur workers, forcing managers to sign an industrywide collective-bargaining agreement.

With the fur workers finally unified and the industry firmly organized, the new CIO-affiliated union shifted its focus to the leather trades and began cultivating an alliance with the National Leather Workers' Association, established by the CIO in 1937. In 1939, both the leather workers and the fur workers voted affirmatively for merging their two organizations and soon afterward established the IFLWU. The new industrial union immediately turned to organizing hitherto unorganized leather workers—in Pennsylvania, upstate New York, New England, and in the shops of the Midwest, close to the stockyards of Chicago.

During World War II, following the uncomfortable 1939–1941 alliance between Germany and the Soviet Union, codified in the Nazi-Soviet Pact, the union, like other left-led CIO unions, took on a hyperpatriotic stance and limited militant and radical action. It adopted a no-strike pledge for the duration of the war and accommodated to working out its demands through the War Labor Board. But the post-war era brought another turn. The IFLWU began to distance itself from the mainstream of the CIO. On

foreign policy and domestic political issues, the union became an outspoken critic of the Truman administration. By 1948, Gold and his supporters turned away from the Democratic party and gave their support to Henry Wallace, former vice-president, who ran a full-employment, propeace, anti-Cold War campaign. The divergent path treaded by Gold and his union ultimately led to a fratricidal ideological battle within the CIO, finally culminating in the expulsion of the IFLWU in 1950, along with 10 other left-led unions.

Expulsion could be survived, but the Taft-Hartley Act of 1947 became Gold's and the union's Achilles' heel. In 1953, Gold was accused of perjury for signing a non-Communist Taft-Hartley Affidavit and was forced to resign as president of the union. He had publicly announced his withdrawal from the CPUSA in August of 1950 in order to sign the required non-Communist oath, required of all labor leaders under Section 9(h) of the act in order to gain for their unions the recognition and protections of the National Labor Relations Board (NLRB). A federal grand jury however determined that Gold had indeed perjured himself and was still involved in Communist party affairs and business; in April of 1954, he was sentenced to serve 1–3 years for violation of two counts of the Taft-Hartley Act. Though the Supreme Court would reverse Gold's conviction in January of 1958 because of FBI pressure on jury members and the government would ultimately drop its prosecution of the case, the immediate aftermath of the decision deeply harmed the union. As a result of Gold's 1954 conviction, in the summer of 1954, the IFLWU formally lost all NLRB protections.

In reality however many employers, like the Endicott Johnson Corporation—a large shoe and leather-manufacturing firm located in the southern tier of New York—and the various tannery mills in Fulton County, New York, had already taken advantage of the union's red reputation and vulnerability. They ceased negotiating with union representatives as early as 1947, even before the Taft-Hartley Bill had been signed, counting on favorable NLRB rulings against Communist-led locals.

Besides being targeted by employers and the government, from 1950–1955, the disaffiliated, independent union faced constant attempts throughout the country by CIO and AFL competitive unions to pick away at its membership. Finally in 1955, after much negotiation, a weakened IFLWU merged with the Amalgamated Butchers and Meat Cutters of North America. One of the conditions of that merger, set by George Meany, then president of the AFL (which was soon to merge with the CIO), and by Patrick E.

Gorman, secretary-treasurer of the Amalgamated, was the permanent removal of Gold from any leadership position in the union and the general “decommunization” of the union. Gold returned to the shops as a fur worker; his three decades of union leadership had ended.

In spite of the expulsion of Gold and many of his fellow Communist supporters in the IFLWU, the now-merged fur and leather division of the Amalgamated—the Joint Board Fur, Leather and Machine Workers' Union—persisted in following a progressive, left-wing track; it remained a radical voice and force within the AFL-CIO and the American labor movement. The union participated actively in the various civil rights and peace movements of the late 1950s–1970s, particularly under the leadership of Henry Foner, who had joined the IFLWU in 1948 as educational director. In 1961, following the death of Sam Burt, then president of the joint board, Foner was elevated to the presidency of the union and retained that position till his retirement in 1988—taking the union through yet another merger. Under the strain of a shrinking labor movement in the final decades of the twentieth century, the Amalgamated and its constituent unions began to explore mergers with other unions. In 1979, it joined with the Retail Clerks' International Union (RCIU), founded in 1888, to form the United Food and Commercial Workers' union (UFCW). The UFCW now has a membership of approximately 1.4 million workers.

INTERNATIONAL LABOR DEFENSE

The International Labor Defense (ILD) was founded in Chicago on June 23, 1925. Closely associated with the Workers' party (which later became the American Communist Party) from its inception, the ILD satisfied V. I. Lenin's classic definition of a mass organization, one that was nominally non-Communist but firmly guided by the leadership of the party. In this way, Lenin theorized, non-Communists could gradually be drawn into the Communist orbit. The ILD was largely the brainchild of James P. Cannon, a leader of the Workers' party during the early 1920s when the American Communist movement was often split by bitter factional disputes. Cannon maintained that it had been inspired by a 1925 meeting in the Soviet Union with "Big Bill" Haywood, the leader of the Industrial Workers of the World (IWW) who had been indicted under the Sedition Act for his opposition to the involvement of the United States in World War I, jumped bail, and fled into exile in the Soviet Union. Convinced of the need for a legal defense organization that would defend activists in the labor movement and provide aid and assistance for their families, Cannon worked tirelessly to bring the organization into being. His efforts led to his election as national secretary at the 1925 meeting, a position he maintained until 1928, when he was expelled from the Communist party for his Trotskyite views.

For the ILD legal and political defenses were inextricably intertwined. It was firmly wed to the belief that legal strategies and tactics were in themselves inadequate to defend working-class people from a court system that was designed to represent the interests of the ruling classes. Although the ILD committed itself to securing the services of the most skilled, experienced, and politically adept lawyers it could find, it boldly linked its courtroom battles with sustained efforts at mass mobilization: Demonstrations, mass meetings, fund-raising events, petition drives, and telegrams and letters to established authorities. Moreover the ILD relied on its extensive network of international mass organizations, such as International Red Aid (known by its Russian initials MOPR) to mobilize international public opinion around its causes. These were the tactics the ILD pursued and fine tuned over the course of its existence.

Shortly after its emergence, the ILD plunged into the defense efforts mounted on behalf of Nicola Sacco and Bartolomeo Vanzetti, joining with liberals, radical anarchists, workers, immigrants, and people of conscience in an ultimately unsuccessful attempt to save their lives. By 1928, shortly before his expulsion, Cannon reported that the ILD had organized numerous new branches across the country; laid the basis

for the defense campaigns of nationally known labor martyrs Tom Mooney and Warren Billings, as well as the Centralia, Washington, IWW workers; sponsored national tours on "revolution and counterrevolution in China" and "Polish fascism"; and dramatically increased the circulation of its magazine *Labor Defender*.

Cannon was replaced as national secretary by J. Louis Engdahl during a period that coincided with the 1928 Sixth Congress of the Communist International's (Comintern's) elevation of the Negro question as a central priority of the international Communist movement. The "black belt" of the South was named as the source of African-American oppression, the "black peasantry" as potential allies of the revolutionary working class. The Communist party shifted considerable effort and resources to organizing in the South; the ILD maintained a watchful eye for cases that captured these interests. One of the most important cases of this kind was the infamous Scottsboro case of 1931: Nine unemployed young black men were dragged off a freight train in Scottsboro, Alabama, and accused of raping two white women who, like them, were "hoboing" in search of jobs in Depression era America. Successfully wresting the defense of the Scottsboro boys from the hands of the National Association for the Advancement of Colored People (NAACP), the ILD aggressively waged a campaign throughout the 1930s that transformed it into a cause that generated international attention, led to two major Supreme Court decisions, and successfully derailed the sustained attempts of the State of Alabama to execute the Scottsboro defendants. The ILD also played a central role in bringing public attention to bear on the case of Angelo Herndon, an African-American Communist party organizer arrested in Atlanta, Georgia, in July 1932, for leading a biracial demonstration and indicted on a charge of incitement to insurrection—a law that carried a maximum penalty of death. Cases such as these, as well as the ascendancy of an African-American attorney to the position of national secretary after J. Louis Engdahl's death in late 1932, played a decisive role in bringing the ILD and the Communist party to the attention of the black community during the 1930s.

As a mass organization, the ILD from the beginning sought out reputable non-Communists to serve on its national executive board, but Communist party leadership ran the organization. In 1937, however, during the "popular-front" period, the ILD was re-organized; Vito Marcantonio, the radical congressman from East Harlem was named president; Anna Damon, a party member, became national secretary.

After the outbreak of World War II, the ILD's influence began to wane. By the end of the war, its status as a distinct organization had come to an end. It merged with the National Negro Congress and the National Federation for Constitutional Liberties to form the Civil Rights Congress, an organization that continued the struggle for civil rights and liberties into the mid-1950s.

INTERNATIONAL LADIES' GARMENT WORKERS' UNION (ILGWU) (1900–1995)

The International Ladies' Garment Workers' Union (ILGWU) was founded as the principal representative of workers in the women's and children's sectors of the apparel industry in June 1900 at the Labor Lyceum, 64 East Fourth Street, New York, New York. Representatives of the Cloakmakers' Protective Union of Philadelphia, United Cloak Pressers of Philadelphia, Cloakmakers' Union of Baltimore, United Brotherhood of Cloakmakers of New York and Vicinity, Newark Cloakmakers' Union, and the Shirtmakers' Union of New York formed the ILGWU. Centered in New York, the union's mission was to improve wages and working conditions in women's and children's garment factories in the United States and Canada. At its founding the ILGWU affiliated with the American Federation of Labor (AFL).

As the end of the nineteenth-century drew near, the manufacture of clothing in the United States shifted from small artisan shops, individual homes, and immigrant-occupied tenements of urban industrial areas, such as New York's Lower East Side, to a growing number of factories. Though the roots of

factory-based apparel making can be traced to the 1840s, several factors spawned its expansion at century's end. The advent of the foot-powered sewing machine in 1846 and the mechanical cutting knife in 1876, along with the introduction of steam power by the 1880s, meant that large quantities of fabric could be made into finished clothing with greater efficiency. New technology transformed and enhanced production and resulted in more division of labor to meet growing consumer demand for ready-made clothing. Advances in transporting raw materials to manufacturers and finished goods to consumers opened new markets. Work-ready immigrants in urban areas contributed to the industry's growth as the nineteenth century drew to close.

In 1880, the typical New York garment-making establishment was owned by a German Jewish clothing retailer who employed small numbers of people. Most of the workers who made clothing for women and children—the focus of this study—were female. In the years to follow, tens of thousands of Jews emigrated from Russia and Eastern Europe in flight from pogroms, religious persecution, and political discrimination. Many possessed skills as tailors and seamstresses and entered the women's clothing industry *en masse* to be joined by Italian immigrants. By the dawn of the twentieth century, immigration significantly impacted U.S. apparel making.

Many workers were employed in so-called "inside shops" owned by a manufacturer who purchased raw materials, planned production, and hired immigrant labor to cut, sew, press, and finish fabric into consumer products. The manufacturer arranged for their sale in the marketplace. The main branches of the women's apparel industry included dresses, cloaks and suits, corsets and brassieres, undergarments, neckwear, rainwear, and infants' and children's wear. Although some large factories emerged in East Coast cities most garment-making establishments remained relatively small: The average factory employed about 30 people in 1899. Women's apparel making expanded to cities from coast to coast—including Cleveland, Chicago, St. Louis, Los Angeles, and San Francisco—but Manhattan remained a prime locale throughout the twentieth century.

Unionization began in the same city in 1879. The Knights of Labor established a short-lived workers' association that was superseded in 1883 by the Dress and Cloak Makers' Union and the Gotham Knife Cutters' Association of New York and Vicinity. Unions were also formed in Toledo, Baltimore, and Philadelphia. Worker-led protests of poor wages, long hours, and working conditions were common. The cloak trade workforce in New York struck in August 1885 demanding higher wages and shorter workdays.

In 1886, workers struck to protest contracting to small nonunion producers who paid pittance wages. The following year 30 walkouts were reported in the New York area over similar issues. Numerous garment strikes hit New York and Philadelphia in 1888 as workers demanded improved working conditions and higher wages. Disputes typically were settled with limited concessions to workers.

By the 1890s, the socialist United Hebrew Trades created the Operators' and Cloak Makers' Union No. 1 in Manhattan with affiliates in Chicago, Boston, Baltimore, and Philadelphia. After a major strike in New York in the spring of 1890, employers recognized the union. By the end of the year, the Operators' and Cloak Makers' Union No. 1 reported a membership of 7,000. However by 1892, the union was in disarray.

The tumultuous drive for unionization continued in 1892 with the formation of the International Cloak Makers' Union of America, headquartered in New York, where Barondess managed its metropolitan branch. The union had affiliates in Boston, Baltimore, Chicago, and Philadelphia and joined the AFL. The new union also set out to organize men's tailors and clothing makers, the traditional domain of the more conservative AFL-affiliated United Garment Workers' Union.

Over the next few years the pattern of union formation and dissolution in women's apparel continued, as did infighting between socialists, anarchists, and

moderates. In June 1900, representatives from the several apparel unions met at Manhattan's Labor Lyceum to resolve cantankerous relations between workers and manufacturers. The conclave resulted in the formation of the ILGWU.

The union set out to organize workers, raise their wages, and win recognition. Garment manufacturers—in part to avoid the ILGWU and its demands for higher wages and better working conditions—expanded a practice that had its roots in the nineteenth century: Contracting to outside shops. Under this arrangement manufacturers and jobbers purchased fabrics, designed new styles, then contracted for the making of the garments. Small, highly competitive contractors bid on the orders, paying low wages and demanding long hours from employees. With its notoriously low wages and poor working conditions, contracting gave rise to the industrial sweatshop so often associated with garment making on Manhattan's Lower East Side. The system threatened unionization. Two significant strikes and a tragic fire brought public recognition to the struggles of garment workers and the ILGWU.

In 1909, 20,000 shirtwaist makers went on strike against New York employers. With support of the Women's Trade Union League, workers protested unsafe working conditions, low wages, long hours, and the imposition of employer-imposed taxes for electricity, sewing needles, and chairs. The ILGWU's shirtwaist makers affiliate, Local 25, spearheaded the

strike, dubbed the “uprising of twenty thousand.” Over 600 workers were affected. When the strike was settled, about half of the employers agreed to a 52-hour workweek, eliminated discrimination against hiring union members, ended all employer-charged taxes, and provided four annual paid holidays.

The uprising was followed in 1910 by the “great revolt” of 60,000 New York cloak makers. Worker grievances were similar to those prevalent in the uprising. Employers responded to the strike by forming the Cloak, Suit, and Skirt Manufacturers' Protective Association and issuing public statements claiming that workers were treated fairly. Louis Brandeis, Boston lawyer and later U.S. Supreme Court justice, mediated a settlement of the dispute by creating the historic protocol of peace.

While the protocol was in its infancy, tragedy struck at the Triangle Shirtwaist Company in March 1911. Located at New York's Washington Square, Triangle employed hundreds in a cramped, unsafe, multiple-story building where workers logged days of 12 hours or more. On March 25, 1911, during the daytime shift, a fire began on the middle floors of the building. Fueled by an abundance of cloth and other material, flames quickly spread. Frantic workers screamed for help and gasped for air from upper-story windows as flames billowed around. Rather than succumb to the inferno, some leapt from heights of eight stories. Sixty-two jumped to their end on the sidewalk below. Others died in the inferno bringing total fatalities to 146.

Strikes and the Triangle tragedy set the stage for Brandeis's labor-management relations experiment. The protocol of peace established several important precedents by creating a Committee of Grievances and a Board of Arbitration to mediate and arbitrate employer-union disputes and worker grievances, a Joint Board of Sanitary Control to oversee factory and employee health and safety, and a preferential union shop in which employer-hiring practices were limited to union members. The protocol was among early mediation attempts in U.S. labor-management relations. Within a few years its status was jeopardized by contracting.

The union expanded in other eastern cities, such as Philadelphia, Baltimore, and Boston, and by the end of World War I, had a membership of about 100 thousand. During the following decade, internal power struggles between Communists, socialists, and moderates nearly destroyed the ILGWU. In 1920, William Z. Foster formed the Trade Union Educational League (TUEL) to coordinate the work of leftist activists in the American labor movement. The TUEL policy advocated class struggle, international unification of industrial workers, mass organization

across industries, creation of a labor party, recognition of the Soviet state, and destruction of capitalism. Communists—led by Louis Hyman of the cloak makers and Charles (Sasha) Zimmerman of the dress-makers—expanded their influence in ILGWU affiliates and by 1924, elected a majority on the executive boards of key New York Locals 9 and 22. The ILGWU President Morris Sigman—a socialist who rejected Communist dogma—expelled TUEL supporters.

Conflict between radical and moderate forces peaked with a Communist-led strike in early 1926. Nearly 40,000 New York-based cloak makers walked off the job in protest over employer contracting to small nonunion factories outside of the New York area. The shutdown lasted 28 weeks at a total cost to the ILGWU treasury of \$3 million. Sigman encouraged strike-weary, hungry, and penniless workers to affiliate with the union's more moderate influences. Most workers came back to the ILGWU, and Sigman successfully negotiated a contract with the employers that however lacked significant restrictions on contracting. Meanwhile Communists aligned themselves with the new Trade Union Unity League. In the needle trades disenchanted leftists joined the Needle Trades Workers' Industrial Union. Not all Communists followed this path. Hyman and Zimmerman rejected the move and remained with the ILGWU, becoming stalwart anti-Stalinists.

In 1928, Benjamin Schlesinger once again assumed the ILGWU's presidency (he had served in the post on two previous occasions: 1903–1904 and 1914–1923). David Dubinsky, the head of Local 10 representing garment cutters, assumed the post of secretary-treasurer. By the time of their ascendancy, the Communists had been expelled from ILGWU locals. Yet their actions and the impact of the 1926 strike endured. The union was bankrupt. Membership dwindled to 60,000, while New York members were threatened by unemployment and underemployment as the practice of contracting to nonunion factories expanded.

At its 1922 convention union delegates voted to levy a 4-dollar per-capita assessment to form the Eastern Out-of-Town Organizing Department to organize contractors that were sprouting in areas removed from the city. By the mid-1920s, the department enlisted 2,500 members organized in 29 locals in New Jersey, Connecticut, and on Long Island.

By the time Dubinsky assumed the presidency of the ILGWU in 1932, the union's future appeared grim. The Great Depression had caused a significant industrial slowdown; the union's membership dwindled to fewer than 25,000; and its financial situation remained precarious. Out-of-town shops had grown

to a problem of major proportion. As the nation's economy stalled, competition among jobbers put tremendous pressure on contractors who were played against one another for even the smallest margins. Contractors responded by ignoring union agreements, paying below market wages, breaking the union altogether, and seeking the cheapest labor possible by fleeing to remote areas.

By the 1930s, the union expanded its definition of out-of-town to include a territory covering a one-hundred-plus mile radius from Manhattan, where it estimated that over 25,000 workers were employed in a virtual "sweatshop swamp." A 1933 general dress strike brought some organizing success, increased wages, and shortened hours, but problems remained as contractors continued to seek lower cost production. Pennsylvania's anthracite coal region and in particular its northernmost reaches around Wilkes-Barre and Scranton—which contained high-population concentrations and afforded relatively easy access to metropolitan markets—were prime locales for contractors who produced dresses and children's clothing for New York jobbers.

As the contracting system expanded during the 1920s and 1930s, out-of-town shops received nearly all of their work from New York jobbers. By 1937, nearly one-third of all cotton dresses sold in the eastern United States were manufactured in contract shops as was about 50% of all children's apparel.

The effect of low-cost competition from contractors impacted the New York dress industry as jobs were siphoned away. The ILGWU reported that, from 1946–1956, its membership declined by over 10,000 as a direct result of jobs going to lower-wage nonunion shops in Pennsylvania. The trend would continue well into the 1950s and 1960s as manufacturers moved production to the American South where the ILGWU would follow with organizing drives. By the late 1970s, and for the remainder of the twentieth century, apparel production shifted to Central and South America, Asia, and Pacific Rim nations. The ILGWU's membership dwindled to fewer than 200 thousand by the century's end.

Despite the union's peaks and valleys, throughout its history the ILGWU has been recognized as one of the foremost U.S. labor organizations, committed to social unionism, education of its members, and political activism. The ILGWU became the first American labor union to establish a health care center for its members in Manhattan in the early twentieth century. By the 1950s, union health care centers were established in nearly every major metropolitan area in the Northeast as well as in remote reaches where the apparel industry had spawned, such as Easton,

Pennsylvania, and locales in the American South. The ILGWU also established cultural and social institutions that served ILGWU members needs. These included a New York-based union leadership school; a "labor stage" for worker-based performing arts; a union-run vacation and education resort, Unity House, in the Pocono Mountains of Pennsylvania; and a union-owned radio station.

The ILGWU also constructed housing for member retirees in New York and was among the first unions successfully to negotiate health, welfare, and vacation funds in contracts with employers in the 1940s. The union nurtured its own chorus that conducted live musical performances in a variety of venues ranging from community fundraisers to political rallies and campaigns. And it implemented workers' education programs throughout its districts and locals to enlighten worker members on issues ranging from workplace health and safety to politics and political activism. The union was routinely active in voter registration drives and regularly endorsed and advocated for prolabor political candidates and incumbents, usually Democrats. Finally the ILGWU was at the forefront of an active national union label campaign from the 1960s to the mid-1980s to educate and encourage American consumers on the value of purchasing products made in the United States. Though it did not succeed in the long run, the union label campaign gained national acclaim as organized labor fought overseas imports of products ranging from apparel to electronics and children's toys.

In 1995, the ILGWU merged with the Amalgamated Clothing and Textile Workers' Union (ACTWU) to create UNITE! or Union of Needletrades, Industrial, and Textile Employees. The merger accompanied a 10 million-dollar campaign to organize domestic and overseas apparel workers in collaboration with the international labor movement. To assert such control, the new union turned to familiar practices reflective of its educational and political traditions.

The UNITE! members also took part in and supported massive protests targeted at the World Trade Organization's (WTO) third annual ministerial conference held in Seattle, Washington, in late 1999. In one of the largest (and most violent) protests of its kind, scores of protestors disrupted trade talks and demanded improved labor standards in developing economies and a greater voice for workers in trade agreements. Environmental, human, and labor rights' issues were the central focus of those concerned about negative repercussions of international free trade policy. Despite the perception of weakened clout

and credibility, the WTO protests defined the labor movement's militancy in the arena of international trade, as did its spring 2000 opposition to the U.S. Government's move to normalize trade relations with the People's Republic of China in which UNITE! played an oppositionist role due in large part to workplace conditions in the Asian nation. In a related move UNITE! supported student-led antisweatshop campaigns to stop colleges and universities from selling apparel made with sweated labor. Student-inspired organizations, such as the United Students against Sweatshops, collaborated with the union and the Workers' Rights Organization.

On July 8, 2004, UNITE! merged with the Hotel Employees' and Restaurant Employees' International Union (HERE) to form UNITE HERE. The union represents more than 450,000 active members and more than 400,000 retirees throughout North America. The UNITE HERE is largely comprised of immigrants, including a high percentage of African-American, Latino, and Asian-American workers. The majority of UNITE HERE members are women.

In July 2005, UNITE HERE joined with three other labor unions—the Service Employees' International Union, International Brotherhood of Teamsters, and United Food and Commercial Workers—in boycotting the national AFL-CIO convention held in Chicago. The four unions comprise the Change to Win Coalition and have openly defied and challenged AFL-CIO policy and traditions and call for greater effort in grassroots organizing.

INTERNATIONAL LONGSHOREMEN'S ASSOCIATION

The International Longshoremen's Association (ILA) is one of the American Federation of Labor's (AFL's) oldest trade unions. Established in Chicago in 1892, the ILA would eventually expand its geographical base from the Midwest lake district to the Pacific Coast, the Gulf, and finally the Atlantic coastline. There had been numerous attempts to organize longshoremen beginning in the early nineteenth century. Most attempts were destroyed by economic conditions or employer intransigence. The economic and financial panics of the 1870s and 1880s did much to stall union organization. The Knights of Labor successfully organized New York's longshoremen, but a strike in 1889 witnessed a total destruction of the Knights' power. Contributing to this defeat was the use of Italian strikebreakers, and by the end of the nineteenth century, Italians dominated dock work in Brooklyn, Staten Island, and New Jersey.

In the Midwest and gulf ports, the story was different however. As early as 1877, tugboat worker Daniel Keefe had established a longshoremen's local in Chicago. He cautiously began to nurture locals in other midwestern ports. His perseverance paid off when longshoremen in Detroit and Cleveland and others agreed to use Keefe's Chicago local as a template. Because Keefe had also organized some Canadian locals, the title of the new organization would be the International Longshoremen's Association. By 1905, it appeared that the ILA's cautious approach was paying dividends. It had organized 100,000 longshoremen; 50,000 were from Great Lakes' ports, but New York remained as yet unorganized. Other ports of ILA strength were concentrated in the Gulf. Galveston, Mobile, and New Orleans were particular centers of union strength. Keefe's conservatism (he had close personal links with U.S. Senator Mark Hanna and the National Civic Federation) isolated him from many of the ILA locals. This was particularly the case with the Gulf longshoremen. These longshoremen fought bitter and violent battles against shippers and stevedores. Accustomed to fighting aggressively for advances, these longshoremen were wary of Keefe's cautious approach. In 1908, a stunned membership learned that Keefe had resigned. Taking his place was another Great Lakes ILA leader, T. V. O'Connor.

O'Connor appeared just as cautious as Keefe although relations with the AFL stood on happier ground. But O'Connor refused to support other maritime workers. In the Great Lakes region seamen had asked for support during a 1908 strike. O'Connor refused the plea leaving in his wake a hostile union

Longshoremen loading cargo onto a ship at Port Authority Piers, Furman St., Brooklyn, New York/World Journal Tribune photo by Matthew Black. Library of Congress, Prints & Photographs Division, NYWT & S Collection, [LC-USZ62-124237].

movement. Just as important the seamen lost the strike and personally blamed O'Connor and the ILA for their defeat. For all the lack of support for other maritime unions, the ILA's membership expansion continued apace. In 1911, there were over 307 locals. The majority were still in the Great Lakes region, but expansion had reached further into Canada, Puerto Rico, and the Atlantic ports of Baltimore, Philadelphia, Hampton Roads, and Norfolk, Virginia. The West remained a weak spot though. Although ILA locals were evident in San Diego, San Francisco, Oregon, and Washington, they held tenuous power and at times left the ILA fold accusing it of conservatism or acting like a company union.

Southern locals continued their strong showing. Just as dynamic these locals practiced a form of biracial unionism whereby black and white longshoremen were members together. Gulf longshoremen were unique in that they actively practiced a form of enlightened race relations. Although separated into white and black locals, white longshoremen recognized that accommodation to African-American dockworkers was a strategic necessity. Operating in a Jim Crow milieu, the New Orleans longshoremen paradoxically worked together to form a vibrant and successful alliance. Unlike longshoremen in the northern and

midwestern ports, these longshoremen in New Orleans built a biracial labor movement that could actively resist employer power.

New York City, the largest port in the nation in terms of cargo handled and number of longshoremen, was still relatively unorganized. Stalling ILA efforts was the Longshoremen's Union Protective Association (LUPA). By 1912, the ILA had to share the spoils with the LUPA. Such dual unionism hampered a united front and left the majority of New York and New Jersey longshoremen unorganized. O'Connor dispatched organizers into the port and aggressively began organizing ILA locals. A district council was formed to represent the locals throughout the port. Such tactics bore fruit when the members of the LUPA either agreed to join the ILA or were simply absorbed. By 1914, the ILA had at last gained an impressive foothold. Such success was replicated in Boston and Baltimore. Philadelphia longshoremen however aligned themselves with the Industrial Workers of the World (IWW). Nonetheless the ILA was at last becoming a truly national organization. Encouraging such growth was a sympathetic federal government. President Woodrow Wilson's administration had done much to encourage trade union growth generally. The establishment of the Department of

Labor and the passage of the Clayton Anti-Trust Act made clear the shift toward more supportive government of trade union growth.

The organization of the New York longshoremen was beset with difficulties however. The giant port and its relatively large number of longshoremen, numbering approximately 30,000, were considered a very attractive prize by some union officials. The strong localism of the union made for unstable situations at times. The ethnic and racial character of the workforce added another layer to this traditional localism. Longshoremen locals tended to operate around specific piers. Such concentration was ethnically and race-based. On the west side of Manhattan, the Irish dominated the piers by the West Village, Chelsea, and Hells' Kitchen. In Brooklyn Italians controlled most of the locals, but in others there was a smattering of African-American and Scandinavian control. In New Jersey the mix was even more diverse with Italian, Czech, Polish, and Irish ethnics laboring. By the early 1920s, these same groups dominated the hiring process, thus preventing competition from so-called outsiders. In fact it merely confirmed a racial and ethnic hierarchy.

This hierarchy was no more evident than in Manhattan. Irish control of the more lucrative passenger terminals ensured a clear dominance in the port and in the union. Centered in this area was Local 791, known also as the "mother local." It was one of the largest and more militant of the union locals. It tended to lead the way in setting standards of work and wage demands. From Local 791 would come a future leader of the ILA, Joe Ryan. Ryan had moved through Local 791 to become the voice of the New York District Council.

But Ryan had to bide his time because once O'Connor stepped down from the presidency in 1921, he was replaced by another Great Lakes union official, Anthony Chlopek. Chlopek tried to continue the ILA goal of expansion but lacked the centralizing power to drive a nationwide campaign. Indeed the power had been transferred to the district and local levels, just as problematic employer offensives on the West Coast and at Gulf ports had rolled the union back. The ILA was now concentrated on the Great Lakes and the Atlantic Coast. The ILA barely hung on, and Chlopek retired a mere 6 years later in 1927.

For Joe Ryan his time had come to assume the presidency. He had made a name for himself by earlier supporting O'Connor and ridding New York of separatist tendencies. His presidency also represented a fundamental shift of power. The Great Lakes region, while obviously still important, could not compare in terms of numbers to the Atlantic Coast locals. As the major Atlantic ports were organized, a critical

shift had taken place; consequently the center of power now resided in New York.

Joe Ryan would become a highly controversial figure. He became one of the longest ruling presidents, being in power from 1927 to 1954. His actions or nonaction with regard to criminal control of some New York locals would tarnish his image and that of the ILA. While at the helm, union locals in Brooklyn, Staten Island, Jersey City, and a smattering on the east and west sides of Manhattan became controlled by criminal elements. Notorious Italian and Irish gangsters used union locals as fiefdoms to control rackets, shake down employers and longshoremen, and organize theft on a large scale. To some extent the criminal infiltration on New York's waterfront coincided with Ryan's rule. When asked about the large number of ILA officials who had police records, Ryan merely responded that he was helping felons with an opportunity to go straight. Ryan also charged that Communist encroachment on the piers needed to be confronted with aggressive means. Indeed throughout his tenure as president, Ryan was always more concerned about Communist activity than that of criminal loading rackets.

The Port of New York's reputation for widespread criminal activity ensured that other regional districts were not pleased by the domination by New Yorkers of the ILA hierarchy. This resentment or alienation was no more apparent than with the West Coast longshoremen's revolt from the ILA. Since World War I, West Coast longshoremen had lacked a fighting organization and were forced to work with a company union. In 1934, these longshoremen rebelled against the arbitrary power of employers. A series of bloody street battles in San Francisco followed, resulting in deaths of two longshoremen. The ILA, and in particular, Joe Ryan, attempted to rein in the West Coast men urging that they remain patient and wait for the right moment to confront employers. The men rejected such overtures and instead formed a new union, the International Longshoremen's and Warehousemen's Union (ILWU). Led by Australian-born Harry Bridges, the ILWU was to become a permanent feature along the West Coast. The ILA had thus lost a significant membership section and would never regain its power on the West Coast.

Just as problematic, the ILA was facing a revolt within its ranks on the Atlantic Coast. Fed up with poor wages and working conditions, New York's rank-and-file were ripe for rebellion. Pete Panto, an Italian-American longshoreman from Brooklyn, helped create an organized opposition to the ILA hierarchy. In 1939, Panto was addressing meetings of thousands of Brooklyn's longshoremen. Panto was trusted by the men because he was one of them, a rank-and-file

longshoreman. For the ILA leaders in Brooklyn, Panto's challenge was deemed a serious affront. Making the situation dangerous was that most of the Brooklyn union locals were controlled by mobsters linked to organized crime. Panto was warned to shut up and stop agitating against the established ILA leadership, but the momentum of the oppositional movement continued. In 1939, however, Panto went missing. Some union officials argued that his disappearance was a ruse to garner sympathy. His supporters believed that something more sinister was afoot. Chalk messages were written along the waterfront and in Brooklyn Heights asking, "Where is Pete Panto?" With Panto gone, the movement he had headed disintegrated. The message had clearly been sent; do not challenge the Brooklyn ILA leadership.

Not until after World War II was Panto's body discovered in a mob-run cemetery in New Jersey. He had been strangled and dumped in a lime pit. It was subsequently revealed that Panto had been murdered by members of Murder Inc. Murder Inc. was a notorious hit squad for the New York mob. The leading member was Albert Anastasia, whose brother, Tony Anastasia was the leader of the Brooklyn ILA. In response to Panto's disappearance, police officials did a short investigation, and the Brooklyn District Attorney asked Ryan to clear up the mob-dominated Brooklyn waterfront. Ryan agreed, but 20 years later in the 1950s, the same mob-related officials were still in power of most of the Brooklyn docks.

Panto's disappearance had a chilling effect on the insurgency. Lacking a respected leader, New York's longshoremen once again adopted a posture of grudgingly accepting their lot. Following Pearl Harbor and the entry of the United States into World War II, the ILA longshoremen were further defenseless in opposing the speed-up on the Atlantic Ocean docks. Sling loads increased, and the rhythm of work intensified. The only escape for many of the longshoremen was to leave the respective waterfronts for other jobs or enter the military. Indeed large numbers of Brooklyn and Manhattan longshoremen joined the armed forces. For those remaining, they experienced a dramatic deterioration of working conditions, including an almost absence of safety regulations on the job.

Once the war ended, the ILA confronted an angry and frustrated rank-and-file. Adding to the volatile mix were returning veterans who were no longer just going to accept the status quo. The spark for the revolt was a wage agreement negotiated by Ryan in 1945. Members of mother Local 791 walked off the job and were quickly joined by others throughout the port. Within days the port was shut down. For

the first time, there appeared to be an organized opposition to the ILA leadership. Ryan responded by using redbaiting tactics when he blamed Communists for fomenting the trouble. True there was some Communist involvement, but it was peripheral at best. The charge was a potent one however. Those insurgent leaders who did emerge were quickly isolated and then violently attacked. William E. Warren and Sal Barone, for example, were viciously beaten, thrown out of the ILA, and told to stay away from the docks.

Such intimidation, although effective in the preceding case, could not forestall opposition to the ILA leadership. By 1948, returning veterans had transformed the political climate. These men had experienced death and destruction on a grand scale. Just as vital they had developed a distinct resentment of authority, whether military or union officialdom. Communist agitators were also active on the docks, particularly in Brooklyn. Trouble quickly followed another wage agreement that Ryan had negotiated. Again it was Local 791 that led the walkout. Local 791's leader, Gene Sampson, initially took charge of the revolt. Within days not only was the port of New York closed, but also ports in Boston, Philadelphia, and Baltimore. The rebellion had therefore spread to other ports. Ryan repeated his charge that Communists were spreading dissension and attempting to disrupt a "fine agreement." Such an accusation fell on deaf ears. Even the Federal Bureau of Investigation (FBI) was unimpressed with Ryan's accusation. In Brooklyn though, Communist influence was prevalent in the insurgency's leaders. Paul O'Dwyer, the brother of New York City Mayor William O'Dwyer, and Vincent Longhi, were both Communist sympathizers and helped create an oppositional organization. Such action was fraught with danger because gangsters were close by and could have easily attacked the organization.

The ILA was forced to renew negotiations. This time the ILA negotiated a larger wage increase and welfare fund. With such a turnaround, the opposition felt emboldened, and with the help of labor priests, they began organizing. In 1951, the situation was rife for change. Ryan had again negotiated a wage increase that was rejected by the rank-and-file. Correspondingly another wildcat strike broke out in New York and along the Atlantic coastline. Ryan's charge of Communist conspiracy rang hollow. The strike lasted for 11 days, resulting in a wage increase above that of Ryan's agreement. The strike also caught the attention of officials in New York. Governor Thomas Dewey unleashed an investigation of the ILA and its affiliated New York locals. What followed was a sensational series of hearings where a slew of ILA

officials were cross-examined. Ultimately the hearings proved that the ILA was replete not only with criminal elements, but also members of organized crime.

The findings of widespread criminal infiltration forced the AFL to kick the ILA out of the established movement. The AFL created a rival union, the International Brotherhood of Longshoremen and a series of National Labor Relations Board (NLRB) elections were held. Each time however the New York men voted for the ILA. The ILA was eventually allowed back into the AFL after it promised to clean up the union. But the ILA has continued to be investigated for its criminal activities. Even as recently as the 1990s, a series of arrests of ILA officials highlighted the continuing involvement of criminal groups in the union.

INTERNATIONAL TYPOGRAPHICAL UNION

One of the oldest and most successful trade unions in North America, the evolution and history of the International Typographical Union (ITU) reflected the strengths and weaknesses of American craft unionism.

Origins

Printers established some of the earliest trade unions in North America in response to trends that unfolded through the late eighteenth and early nineteenth centuries. During these years, even before mechanization, the division of labor eroded the importance of the long apprenticeships and training. This introduced “two-thirds” and “half-way” journeymen, as well as young boys into the shops and allowed employers radically to expand the size of the workplace. The process degraded the value of skilled labor, reduced wages, and simply throttled the kind of

mobility typified by the success of Benjamin Franklin in colonial days.

Journeymen in the craft began negotiating for better wages and working conditions as early as 1778, going on strike by 1786, and forming their own organizations in Philadelphia and New York by the 1790s, and in Boston, Albany, Baltimore, and Washington by 1815. That year also saw the first discussions begin about the need to establish a common wage scale for the northeastern seaboard.

Early efforts at national organization followed. In 1836, representatives from half-a-dozen locals formed a National Typographical Association, which reconvened in 1837. During these same years, there were also locals in at least 16 other communities as well as a Canadian society. In 1844, printers on the East Coast had a short-lived Order of Faust, apparently a fraternal organization named for the mythical, historical figure whose efforts created the craft.

The National Typographical Union

Near the middle of the nineteenth century, technological innovations converged to transform the craft. Early in the century, techniques of stereotyping allowed casts of forms for an entire page to be made and stored indefinitely. At about the same time, papermakers learned how to produce continuous rolls of paper, and steam-powered presses began to mechanize the process. In the 1840s, the Hoe rotary press combined these innovations in a way that made large-scale factory productions viable. The larger newspapers in New York and Philadelphia built massive new structures to house the gigantic new presses, the demands of which employed unprecedented numbers of workers, laboring by shift.

Journeymen working in these new concerns, together with others in less technologically developed smaller shops, held national conventions in 1850 and 1851 before organizing the National Typographical Union (NTU) on May 3, 1852. The NTU convened annually but had very little power over local organizations. It used its moral influence to attempt resolution of the varying standards among the locals for how to deal with wage scales, negotiations, and scabs. For example the NTU gradually drew New York’s Co-operative Printer’s Union representing job printers into its own No. 6, mostly newspaper printers.

The NTU could not overcome the different scale and orientation of the locals largely because local conditions were hardly similar in the craft as in the wider society. As this came to a head, the NTU

postponed its 1861 convention, and the organization largely imploded under the impact of the Civil War. Still the wartime inflation and prosperity inspired new and larger reorganizations even as hard-pressed employers introduced women into the industry. By 1867, the NTU's own reconstruction involved renewed efforts to extend its power in relation to those of subordinate bodies and locals. In many respects the latter would long retain power.

Reconstruction of the union posed questions that came to a head at the 1869 convention. Although the NTU left whether or not to admit black members to the locals, many of which remained white-only, it decided 10 years later to require all locals to accept transfers of membership regardless of race. So, too, the NTU grappled with the question of the women who had entered the industry, opting for a distinct women's local in some cases. At the same time, the admission of Canadian locals transformed the NTU into the ITU.

Heyday: Shaping an American Craft Unionism

Locals organized within specific workplaces or chapels. In a craft where apprenticeship survived in such a state as not to provide many of the essential skills, the ITU became an arbiter of those skills. This suited the larger and more successful employers as well as the union, so the ITU gained much more control over the hiring and firing of workers than most American unions. This included control over the list of unemployed members who could substitute for the regularly employed, although a standardized ITU control over the sublist took until 1890. This went beyond the workplace as well because members "tramping" from job to job could replace their regular dues card with a traveling card that would be honored by all unions and therefore their employers.

Before the ITU assumed that authority, a series of secret societies within the union assumed that function. The Brotherhood of the Union, an antebellum forerunner of the Knights of Labor likely entered the union through the New York merger in the 1850s. Through the 1870s, it sought to secure the employment of the most committed unionists by taking control over hiring and firing in many chapels. This paradoxically established the foundations for cliquish privilege and corruption. After an ongoing battle at the conventions from 1880 to 1896, the ITU took on this authority and specifically placed the activities of the brotherhood beyond the bonds of acceptance.

Nevertheless as late as 1912, a secret society known as the Wahnetas had assumed the same functions as the brotherhood.

The only way the ITU could supersede what the Wahnetas or the brotherhood had done was to take control itself over the sublist and related issues. By the turn of the century, the progressives battled "administrationists" to do so, creating a unique two-party system within a North American union. (By the late 1920s, the independents would replace administrationists.)

Progressive Policy

From the 1880s into the 1920s, the ITU introduced a number of noteworthy innovations during this period. When the new Linotype machine finally allowed type to be set from a keyboard in the 1880s, union printers did not resist the machine but made it their own. Through rigorous training, they made sure that the overwhelming majority of Linotypes in use by 1915 were operated by unionists.

Insofar as the Linotype increased the exposure of printers to lead fumes, it afflicted many members with the printers' disease, tuberculosis. Given the ITU's long-standing interest in alimony and benefits, it opened a sanitarium in Colorado for treatment of the disease in 1892. Other reforms were even more directly associated with the wider ideology of progressive reform.

Printers had always preferred means other than strikes to impose their decisions. If a conflict became intense enough to inspire a work stoppage, other ITU locals might or might not respond with financial support. During the great strike wave of the 1880s though, the ITU began to put together a common defense fund to support the increasingly larger and more expensive local strikes. This forced the ITU to assume considerable control over job actions and encouraged collective bargaining and arbitration with employers. The approach reached its peak success during the First World War with the 1917–1922 arbitration agreement providing a legal alternative to litigation whereby both parties agree to submit their respective positions to a third party who would arbitrate or negotiate a resolution satisfactory to both sides.

In addition to arbitration, the ITU took up the idea of the referendum, which came to be used systematically to resolve questions in the union after 1889, and eventually used the referendum for its regular governance.

Organizing the Unorganized: The Congress of Industrial Organizations

From its inception the ITU functioned alongside other craft unions like that of the pressmen and lithographers. The Amalgamated Lithographers of America (1886) formed independently of the ITU, but the very success of the latter in elevating the wages and working conditions of compositors and typesetters inspired renewed efforts of these related crafts, creating the International Printing Pressmen's Union (1889), the International Brotherhood of Bookbinders (1892), the International Stereotypers' and Electrotypers' Union (1901), and the International Photoengravers' Union (1904). It was a founding participant in the American Federation of Labor (AFL).

The ITU extended its progressive unionism to industrial organization to break with the AFL in 1935, participating in the new Committee for Industrial Organization (CIO). Although this became a point of contention between the progressives and independents during the war, the ITU, like the other CIO unions, clashed with the government over National War Labor Board in 1943–1944, and after the war, Taft-Hartley Law 1947.

Postwar Demise

Despite the ITU's past adaptability, most locals and the international itself failed to adjust to the post-World War II technological and demographic changes in the industry. This proved fatal to the union's future.

After World War II, the officials who built the CIO and battled Taft-Hartley fared poorly in the climate of prosperity and anticommunism. Suburbanization and television drove a number of big-city dailies out of business. Eventually the Newspaper Preservation Act (1971) set aside earlier antitrust legislation by allowing rival publications to combine their production and delivery resources. This essentially authorized the extension of control by Gannett, Knight-Ridder, and Media General, Inc. over many urban newspapers.

The industry turned increasingly toward offset printing and photocomposition, and phototypesetting. These became commercially viable in the 1930s and became the dominant mode of printing in the 1950s. This technique conveys images to paper from rubber rollers, which pick up the ink from metal or paper plates. Dark parts of those plates repel water

and absorb ink, while light parts repel ink and absorb water. These come from a photographic image of a sheet, the text for which was entered on a typewriter keyboard instead of a Linotype. This opened the craft to new workers, particularly women with good key-boarding skills.

Although the ITU and its locals fought the introduction of *ersatz* printing into the industry, it eventually established training programs for its members. However its main strategy was to negotiate guaranteed jobs for members already employed in the industry. Contrary to its own long traditions, the ITU never took stock of the state of the craft, much less opened itself to organization of the unorganized.

Unionism in the Computer Age

Computers transformed the craft entirely in the 1970s and 1980s. These made possible digital typesetting, while word-processing software and the quick-printing industry created an explosion in small-press publishing. Although at the center of this rapidly growing industry, ITU membership actually fell from over 106,634 in 1964 to only about 38,000 working members by the mid-1980s.

The cost of making printing profitable continued to encourage the concentration of media, which pit the ITU against more powerful employers. The deregulation of the 1980s brought ownership from outside of the industry to new levels. By then the large city newspapers moved digitized technology toward plateless printing, where images could be transferred by ink jet, photographic, or quick-copy techniques. While these remain ancillary to large-scale operations like a newspaper, they are frequently used for the production of printed matter in small quantity.

All these shifts further blurred the lines between the ITU and other unions like the Newspaper Guild, the Newspaper and Graphic Communications Workers' Union, and others. On the one hand employers ruthlessly exploited the persistence of these divisions. By 1975, the production of the *Washington Post* involved so many different unions that it successfully pit them against each other to win a pressman's strike. Similar scenarios had been played out earlier in many other cities.

On the other these developments made a new approach unavoidable. Through the 1970s into the 1980s, a series of mergers brought pressmen, bookbinders, stereotypers, electrotypers, photoengravers, and lithographers into the Graphic Communications International Union. By the mid-1980s, the ITU

sought unions with which it might merge. In 1986, it folded its organization and resources into the Printing, Publishing, and Media Workers' division of the Communication Workers of America.

INTERNATIONAL UNION OF OPERATING ENGINEERS

Founded in 1896, the International Union of Operating Engineers (IUOE) has historically consisted of two branches of engineers: Stationary engineers and hoisting and portable engineers. In general stationary engineers operate, maintain, and repair equipment in buildings and industrial complexes, while hoisting and portable engineers operate heavy equipment used in the building and construction trades. Over the course of its history, the union has experienced its most impressive growth in the construction industry, and in the second-half of the twentieth century, the IUOE established itself as one of the strongest building trades unions in the United States.

Constituency

Five of the original six local craft unions that joined to form the IUOE in 1896 represented highly skilled stationary engineers who operated the steam engines that powered the heating and refrigeration systems in large commercial buildings (the word steam appeared in the union's title until 1927). Stationary engineers comprised a majority of the IUOE's membership until 1940, but their prestige was undermined by the decline of the steam engine. As central power plants replaced the single-building steam engine, the responsibilities of operating engineers gradually became the maintenance of central heating, air conditioning, refrigeration, and electrical systems. The stationary

branch of the IUOE responded to these challenges in the post-World War II period by launching organizing drives in such other areas as nuclear power plants, oil and chemical refineries, hospitals, and public utilities.

In contrast to their stationary counterparts as well as to other building trades unions, hoisting and portable engineers generally benefited from technological change. In fact the job did not exist before the invention of the first practical hoisting engine in 1875. And as hoisting, pumping, cement mixing, and excavating machines improved, so did the job of the hoisting and portable engineer. In 1907, the American Federation of Labor (AFL) awarded the IUOE jurisdiction over all forms of construction equipment regardless of power source, thus ensuring that the union would survive the demise of the steam engine and would win a majority of its jurisdictional battles with other unions. After the IUOE amalgamated with the International Brotherhood of Steam Shovel and Dredgemen in 1927, they were poised to organize the operators of the heavy machines used in future highway and heavy construction projects, such as dams, airports, subways, pipelines, and bridges. In the post-World War II construction boom, these construction projects became the main source of employment for the IUOE and helped transform it from a financially weak organization of mostly stationary engineers into one of the most powerful unions in the building trades.

Leadership, Gains, and Conflict

Throughout its history the IUOE has remained committed to a course of business unionism, although since World War II, union leaders have exhibited flexibility in altering bargaining and organizational strategies to adjust to economic, technological, and political changes. Each general president and most international officers until 1921 were members of stationary locals, and every president since has come from the building trades division.

In the period that stationary engineers controlled the central organization, IUOE leaders focused on regulating entry to the craft and striking a workable balance between the international organization and local unions. In 1906, the IUOE began organizing lesser skilled workers into branch locals, each of which were subordinate to a parent local. In addition to serving as a substitute for a formal apprenticeship program, these branch locals also allowed the IUOE to neutralize the competition of nonunion workers for hoisting jobs, which would have undercut the union's

wage rate. The most divisive internal conflicts that erupted during this period, particularly the problem of recalcitrant locals and internal jurisdictional disputes, were gradually resolved through amalgamation and the overall growth of the union's central organization during the 1920s and 1930s.

From 1940–1975, the IUOE enjoyed its greatest period of economic growth. Operating engineers had always enjoyed certain advantages when bargaining with employers. Contractors felt that they could depend on the IUOE to supply well-trained operators, which became increasingly important as contractors increased their investments in equipment and entered labor markets where they were unfamiliar with employers. In addition since operating engineers could halt an entire construction project simply by refusing to hoist materials, contractors were inclined to maintain good relations with the union. These factors combined with the expansion in the construction of highways, airports, pipelines, and other earth-moving projects to establish unprecedented wage settlements that significantly outpaced interest rates. With many of the union's internal disputes settled and the union experiencing healthy membership and financial growth, leaders in the post-World War II period were able to concentrate on reviving its stationary branch and moving into new fields, developing safety programs, pressing for workplace health and safety legislation, restructuring its job, and organizing training programs.

The IUOE leaders have also had to respond to external challenges. In the postwar period, building trades' unions were targeted by civil rights groups and protesters for excluding minorities and women. With passage of the Civil Rights Act of 1964, establishment of the Job Corps program, and implementation in 1969 of the Philadelphia Plan, the federal government also began to compel building trades unions to alter their membership and apprenticeship practices. The IUOE was resistant to any form of interference with its apprenticeship and membership policies, but in 1977 the union made inclusion of minorities a priority and created a department of civil rights.

More serious challenges to the IUOE's success however have been posed by the ascendance of political conservatism in the United States, economic recession and rising unemployment in the construction industry, and an aggressive open-shop drive led by large firms that purchase the services of contractors. Although by the 1960s, the National Labor Relations Board had begun applying Taft-Hartley regulations to building trades unions and anti-union state and national legislators launched attacks against prevailing wage legislation, contractors generally continued

to prefer IUOE labor. This soon changed however as the high-wage settlements of the 1960s had the unintended effect of making contractors responsive to anti-union campaigns launched by the large firms that blamed union wage rates for high construction costs. As a result the IUOE suffered substantial membership losses and watched as many of its collective-bargaining gains were rolled back. According to the union's historians, the IUOE regrouped after its nadir in the 1980s and began a period of new growth in the 1990s.

INTERNATIONAL WOODWORKERS OF AMERICA

The International Woodworkers of America (1937–1987) was unique among Congress of International Organizations (CIO) unions in two respects. First it was the most Canadian of international unions, with Canadians composing from 40%–60% of the union's membership throughout its history. Secondly it experienced an early internal political rift that would serve as a dress rehearsal for the conflict the labor movement experienced during the Cold War era. The history of the IWA demonstrates both the strength of the CIO's original industrial union strategy and that vision's limitations when confronted by the globalization of the economy at century's end. When the IWA finally divided into two national unions in 1987, one based in Canada and the other in the United States, the divorce demonstrated the limits of international union solidarity in this new world order.

Origins of Unionism in the Wood Products Industry

The lumber and sawmill industry had been the scene of turbulent labor unrest since the nineteenth century. This was especially the case in the Pacific Northwest,

where the industry migrated as forests in the East and Midwest were cleared by the timber industrialists of the era. The wood products industry was an extremely dangerous place to work, especially for loggers. This group, dominated by unmarried men working in remote communities, provided a particularly fertile ground for labor radicalism. Early organizing success by the Industrial Workers of the World prompted fierce interunion rivalry between labor radicals, conservative craft unions, and a significant employer-dominated company union, the Loyal Legion of Loggers and Lumbermen. The vast majority of the industry's workers were unskilled, and the highly labor-intensive nature of production encouraged employers to squeeze workers with low pay and benefits. Seasonal fluctuations in product markets and chronic overcapacity led to frequent unemployment, further depressing the rural economies where logging and sawmills proliferated.

The IWA was founded in Tacoma, Washington, in July 1937, by woodworkers disaffected with the craft unionism policies of the United Brotherhood of Carpenters (UBC). The Timber and Sawmill Workers' union was given jurisdiction of the industry by the American Federation of Labor (AFL) in the early 1930s but was never granted full membership status under the UBC constitution. Discontent exploded in the spring of 1935, when Oregon and Washington locals launched a regionwide strike. When insurgent unions (mostly in Washington State) opposed the UBC-led efforts to settle the dispute on less than acceptable terms, local leaders accused them of selling out and formed a rump Federation of Woodworkers' organization. They quickly sought affiliation with the national CIO and seceded from the UBC to form the new international union. Central to the IWA grievances were the second-rate status wood workers suffered within the UBC and the segregation of locals by craft, autocratically enforced by UBC officials. As delegates to the founding IWA convention sang, "We've gone CIO boys, we've gone CIO. The Carpenters and Joiners have always tried to corner our dough, but we'll stick together, for rank-and-file control." The IWA would be one of the most democratically structured of CIO international unions.

Canadian Influence and Disputes Over Communism

From the beginning the IWA was strongly influenced by its Canadian segment. The IWA's first president, Harold Pritchett, was a shingle weaver and member of the Canadian Communist party. He became only

the second Canadian to head a U.S.-based international union. The Canadian region of the IWA was heavily influenced by left wingers, including leadership from the Communist party-affiliated Lumber Workers' Industrial Union, which fought a bitter, 5-month strike on Vancouver Island in 1934.

The IWA was split between a red bloc led by Pritchett and a white bloc of anti-Communists with strength in the Columbia River district of the union in Oregon and Washington. Observers have noted that the IWA "got redder as you went north," and this has been a source for debate about the politics of the union. One theory is that the northern mills encouraged a more radical rank-and-file because they were larger, more mechanized, and the workers more "proletarianized." Another relevant factor was the ethnic mix of workers within the IWA's two Pacific Northwest regions. The southern part of Region 3's membership (Oregon and Northern California) tended toward Germans of Midwest farming backgrounds, while Washington and Region 1 in British Columbia had more Scandinavians, and especially Finns, who are often associated with left-wing labor activism.

Rivalry with AFL Sawmill Workers

In addition to the battle over communism, the IWA faced significant resistance organizing from the rival AFL timber union (now known as the Lumber and Sawmill Workers [LSW]). Other AFL and CIO affiliates often joined the bitter disputes between the two, as the unions sought to enforce boycotts against their rival's products. An early partner of the IWA in these battles was the newly formed International Longshoremen's and Warehousemen's Union, another left-led union, whose successful 1934 coastal strike was a watershed historical moment for many Industrial Workers of the World (IWA) members. The recession of 1938, the red/white split, and fierce competition with the (LSW) exacted a serious toll on the new union. Membership fell from 40,000 at the first convention to 20,000 in 1938. The conflict prompted CIO President Phil Murray to install one of his staff, Adolph Germer, as organizing director, leading to a final showdown between the red and white blocs.

The white bloc deposed Pritchett in 1941 after his visa to enter the United States was denied when he attempted to attend the union's convention in Portland. The events surrounding Pritchett's defeat were notable because of the active involvement of the national CIO office, a precursor to the more open internecine warfare that the CIO would experience in 1947-1950. With white-bloc candidate Worth Lowery

the new president, the left wing of the IWA retreated to British Columbia's District 3, where Harry Pritchett remained director.

Despite the ongoing political turmoil within the union, the IWA's first 15 years marked a remarkable organizing thrust that made the lumber and sawmill industry in the Pacific Northwest one of the most organized sectors in the entire North American manufacturing economy. Wartime labor policies boosted organizing, and by the late 1940s, 80% of the industry's workers were represented by a union.

Despite holding on to power in District 1, Pritchett's red bloc was seriously compromised by a fatal strategic decision made in 1948. Rather than submit to the Taft-Hartley Act's requirements to sign anti-Communist affidavits, British Columbia IWA leaders, on advice from the Canadian Communist party, took the region out of the IWA and formed an independent Woodworkers' Industrial Union of Canada. Shortly they faced raids from competing AFL and CIO unions, and the left-wing leadership was defeated. In 1950, the WIUC dissolved and went back into the IWA.

The IWA enjoyed great success in the 1960s and 1970s, with its membership peaking at 112,000 in 1977 as the housing boom drove a strong albeit cyclical industry. Significant strikes on both sides of the border strengthened pattern bargaining agreements in the United States and more centralized industrywide negotiations in British Columbia, where a corporate political environment encouraged government intervention in labor relations to stabilize crucial economic sectors.

Dissolution of the International Union

Despite success at the bargaining table, serious structural economic changes were at work that would undermine the strength of the IWA. Like other manufacturing industries, technological change was reducing employment drastically in wood products. Furthermore U.S.-based employers began increasingly to move operations to the South, where wages were considerably lower. Like other manufacturing unions of the era, the IWA found it difficult to organize in southern states or in the Canadian Maritimes, where a vicious anti-union campaign defeated IWA organizing efforts in Newfoundland in 1959. Finally in the late 1970s and 1980s, changing international markets for lumber would increasingly put Canadian and U.S. members at odds with each other as the United

States imposed stiff tariffs on British Columbia lumber entering the country.

The organizational watershed for the IWA occurred in the early 1980s. Employers in the United States aggressively sought concessions from unions, often using permanent striker replacements, a tactic not possible under British Columbia's labor code. Louisiana Pacific was the first to challenge the wood products' unions, breaking the IWA and the LSW in a 1983 strike and instituting wage cuts of 10%. In British Columbia the IWA successfully fought back employer concessions after waging the longest strike in provincial history in 1986. But later that year, the U.S. woodworker bargaining system came apart when the Weyerhaeuser Corporation forced concessions of \$4 per hour after threatening to replace IWA members who had been on strike for six weeks. The paths of the two regions had diverged significantly due to differences in the two national labor regimes and different strategies with regard to contract concessions.

The IWA was officially dissolved into two national unions in March 1987. Subsequent declines in membership led both unions to seek mergers with stronger organizations. The IWA-US became a division of the International Association of Machinists in 1994 and the Industrial, Wood, and Allied Workers of Canada (the renamed IWA) eventually returned to a U.S.-based union, merging with the United Steelworkers of America in 2004.

INTERNATIONAL WORKERS' ORDER

The International Workers' Order (IWO) was founded on May 30, 1930, at Cooper Union in New York City by Yiddish-speaking left-wing Jews as a mutual-aid fraternal organization. William Weiner became the first president; Reuben Saltzman, the general secretary; and Kalman Marmor, the cultural director. The IWO provided low-cost life insurance for workers as well as credit, health care, and burial benefits. The IWO promoted a socialist pro-Bolshevik ideology, and its members actively supported progressive social causes, union struggles, and minority rights. The IWO federations provided a rich social and cultural life for their working-class members with summer colonies, choirs, theater groups, marching bands, sports leagues, and orchestras as well as language schools and summer camps for children.

The IWO emerged from divisions in the Workmen's Circle or *Arbeiter* Ring organized in New York in 1892 as a national labor fraternal order, an umbrella organization that encompassed labor Zionists, Bundists, and territorialists. All had a secular approach to Jewish identity, a concern with widespread anti-Semitism, and a desire to end class exploitation. An important undertaking of the *Arbeiter* Ring was the development of *shules* (schools) for children and summer camps where Yiddish language and literature were taught from a secular socialist point of view. They also incorporated drama, music, and dance into their programs, providing opportunities for impoverished immigrant children that would otherwise have been denied to them as well as an intellectual and social world for poor Jewish immigrants.

By the early 1920s, the *Arbeiter* Ring membership was split between the linke, those who supported the Bolshevik revolution, and those who remained Social Democrats. People took their politics seriously and were passionate about their views. The vituperation was bitter, the rhetoric vitriolic, and after a number of battles in the 1920s, the Left, or those who celebrated the Russian revolution and the emergence of the U.S.S.R. withdrew from the organization and called on others to follow and "help build a real proletarian Order."

At first the *international* in the name of the new organization was an aspiration that expressed a political outlook rather than a reality. The founders stressed the common class interests of workers avoiding what they viewed as the narrow chauvinism and nationalism of existing ethnic organizations. The approach was to first of all gather together existing fraternal organizations of varying nationalities, and then to organize language sections in other language

communities. The strategy succeeded. From its beginnings as a Jewish workers' organization, it soon developed into a multi-ethnic and multiracial association. In addition to the large Jewish and English sections, there were 13 different language federations that were members by the mid-1930s, including the Hungarian Workmen's Sick, Benevolent, and Educational Federation; the Slovak Workers' Society; the Garibaldi American Fraternal Society (Italian speaking); the Polonia Society; the Ukrainian American Fraternal Union; the Rumanian American Fraternal Society; the Russian National Mutual Aid Society; the Croatian Benevolent Fraternity; the Cervantes Fraternal Society (Spanish-speaking); the Serbian-American Fraternal Society; the Carpathian-Russian Peoples' Society; the Hellenic American Brotherhood; the Czech Workers' Society; and the Finnish American Mutual Aid Society, a descendant of the Finnish Socialist Federation.

The IWO was unique in its attempt to attract blacks and ethnics into one organization and to offer insurance at the same rates to all working people regardless of race or occupation. At the time the IWO was the only organization where blacks could get insurance at the same rate as others and where people in high-risk occupations were welcome, which made the order attractive to coal miners in West Virginia and Pennsylvania. At its strongest in the 1940s, the order had a membership of 184,000. The largest ethnic group remained the Jewish section, which in 1944 became the Jewish People's Fraternal Order (JPFO). Jewish IWO members represented approximately one-third of the membership.

The leadership of the IWO were members of the Communist party, and this was reflected in IWO policy. However the majority of the rank-and-file, while favorably disposed toward the Soviet Union, were not party members, and not subject to party discipline. The structure of the organization allowed for considerable autonomy among the language groupings, which organized their own cultural and educational activities as they saw fit. The order flourished in the 1930s and 1940s, becoming the largest and most successful left-wing organization in U.S. history. A number of the language sections were part of a North American movement. For example the Jewish section had close ties with its Canadian counterpart, the Labour League, and the schools used both teachers and materials coming from New York. The Labour League in Canada became the United Jewish People's Order in 1945, which still exists.

Active in struggles to organize the CIO, IWO members engaged in campaigns for social security legislation and were very vocal in their opposition to

anti-Semitism and the rise of fascism in the 1930s. Chartered as an insurance carrier by New York State, the IWO had certified insurance licenses in 17 other states and the District of Columbia. The left-wing politics of the international order, in particular the connection between IWO leaders and the Communist party ultimately destroyed the order during the height of the Cold War. In 1947, it was named a subversive organization and placed on the attorney general's list of subversive organizations. This list, supposedly to be used to ensure employee loyalty for federal government agencies, received national publicity and became the cornerstone of the Red Scare. In 1949, a time when the anti-Communist crusade had become a national obsession in the United States, the IWO was reviewed by the Mutual and Fraternal Bureau, a regulatory body that was part of the Insurance Department of New York State.

Although it was financially healthy, and its practices conformed to the insurance regulatory laws, James B. Haley, the insurance examiner for New York State found the order's fraternal activities unpatriotic and a "moral hazard," justifying withdrawing the license and liquidating the order. The case was heard in the Supreme Court in 1953, but the decision was upheld. The state took over the IWO and its assets, and the order was destroyed. It was the first and only time that an insurance company was disbanded for its unpopular politics. These included participation in the peace movement in the postwar years, in particular supporting the Stockholm Peace Petition, which proposed outlawing nuclear war. The IWO maintained that the Cold War was a threat to world peace. The organization was critical of American foreign policy—in particular the Marshall Plan, the Truman Doctrine, and U.S. engagement in Korea. By the 1950s, internal policy was no longer considered so radical: The battles for union recognition had largely been won, and Social Security, unemployment insurance, workers' compensation, public housing, and Fair Employment Practices were supported by most liberals.

After the IWO was eliminated, the Jewish section (Jewish People's Fraternal Order) reconstituted itself as the Jewish Cultural Clubs and societies. The camp, *Kinderland*, is thriving, and some of the Yiddish schools, now Sunday schools, still exist. The Canadian counterpart, the United Jewish People's Order still exists, as do the United Ukrainian Canadians. Although far smaller in numbers than previously, they represent an approach to ethnic identity that combines respect for one's heritage with the commitment to social justice.

INTERNATIONAL WORKINGMEN'S ASSOCIATION ("FIRST INTERNATIONAL")

Though short-lived and considered by most of its participants a failure, the International Workingmen's Association (IWA) is famous for being the only political organization founded and led by Karl Marx. Established in London in 1864 and officially pronounced dead by 1876, in its few short years the First International brought together a cadre of organizers who represented nearly all the existing variants of radical thought and ideology of its day. While its own initiatives and schemes all came to naught, its fame steadily grew along with the international renown of Marx, and subsequent international socialist congresses claimed themselves successors to its legacy.

Initially organized by an eclectic group of English and French artisans, expatriate revolutionists, trade unionists, and democratic reformers, the association was quickly pulled toward greater ideological discipline by Marx. While disagreeing with the party's majority of reformers, Marx believed that it could be a vehicle for spreading socialist principles at a crucial time in European and American history. Marx's tremendous energy, overawing intellectual leadership, and extensive contacts, helped the organization spread widely while his efforts at purifying the IWA's ranks by purging those elements that he deemed backward—a group that included not only anarchists, but leaders of the English trade union movement, Italian nationalists, Spanish syndicalists, and Yankee socialists (as Marx called native-born American radicals)—fractured it in many directions.

The IWA burst into international prominence with the French worker's revolt known as the Paris Commune of 1871. Though Marx and other IWA leaders had had little to do with the declaration of

the commune that spring, or the events that led to its bloody suppression, a number of communard leaders declared themselves internationalists, and both governments and newspapers were quick to accuse the IWA of responsibility for it. Of course for revolutionaries and radical reformers from Moscow to Missouri, this only established the international's credentials and added to its prestige.

Founded first in the United States by German-American immigrants, many of them refugees from the European workers' rebellions of 1848, the IWA soon grew beyond the urban immigrant enclaves where it first took root. In the United States a uniquely American brand of social reform, a cross-class eclectic movement that encompassed abolition, feminism, temperance, spiritualism, communitarian socialism, and various health regimes, briefly joined forces with the competing socialist doctrines of Karl Marx. For a period of about 5 years, from 1867 to 1873, a significant number of native-born, English-speaking sections of the international had sprung up across the country, in both large cities, such as Baltimore and San Francisco, as well as in smaller places, such as Galveston, Texas; Terre Haute, Indiana; and Hammond, New York.

The U.S. IWA, for a fleeting moment in time in the early 1870s, was one big tent sheltering immigrant Marxists, communalists, anarchists, spiritualists, feminists, and land reformers, radical groups that had not been united in pursuit of a single cause since their members were joined in the abolitionist crusade against slavery. The IWA was an organization more characterized by its contradictions than its consistencies; it brought together those recognized as being the intellectual fathers of native anarchism with those credited with introducing Marxism to the United States. It enlisted both ideological atheists and the founders of American spiritualism. Among its members were trade unionists determined to preserve the privileges of the racially and gendered U.S. industrial caste system and the leading champions of the equal rights of women and minorities. Attracting both rich and poor, black and white, native and immigrant, men and women, the IWA stood at the crossroads of American society and American radicalism.

Of all the differences and potential divisions contained within the IWA, it was the deep ideological chasm between a hardening Marxist orthodoxy and the republican ideals of Yankee radicals that proved insurmountable. The diversity of individuals attracted to the IWA flew in the face of the strategy that Marx and his German American cohorts had hammered out for the United States. Marx had called for organizing a coalition of German and Irish workers who would together radicalize the American proletariat.

Such a vision of the IWA as a worker's vanguard capable of organizing and directing the fledgling U.S. industrial proletariat into a sharp tool of class struggle fared badly at recruiting American workers. Much to the chagrin of the IWA's class-conscious German American leaders, it instead found itself deluged with Yankee radicals who shared a distrust of coercive authority in any guise. By 1870, the American reform element outnumbered the socialist Germans and had a widely circulated newspaper of its own, *Woodhull & Claflin's Weekly*. By the fall of that year the block representing English language sections threatened to take control and democratize the IWA's American governing body, the central committee.

Yankee internationalists pursued their own broad egalitarian goals from under their new red umbrella. In New York native American reformers symbolically marched with African-American veterans in their foremost ranks. They organized black sections and railed against discrimination of all kinds in their newspapers. They nominated Victoria Woodhull and Frederick Douglass for the highest offices in the land. They worked with the National Woman Suffrage Association to secure women's franchise. From the viewpoint of the German Americans who maintained close ties to Marx in London, such actions were viewed as unscientific, idealistic, and simply wrong-headed. To them the Yankee radicals stood as the greatest obstacle to the success of their revolutionary strategy, and go they must.

In 1871, after but a year of coalition, the agents of Marxist orthodoxy in the United States became convinced that the reputation of their party among bona fide workingmen was in jeopardy because of their partner's pursuit of the moralistic and idealistic issues of women's rights, municipal ownership of utilities, and democratic reforms. In December of that year, a German American faction, led by Friedrich Sorge, expelled their fellow English-speaking radicals from the party, a move that spelled the end of the international in the United States and foreshadowed a similar schism and collapse of its parent organization in Europe. After the demise of the First International, the first U.S. Marxist movement, had destroyed itself, its so-called Yankee members continued their egalitarian and anticapitalistic crusade in a diverse array of causes, including providing leaders to such organizations as the Eight-Hour League, the Knights of Labor, and the Sovereigns of Industry.

IRISH

Irish people immigrated to the United States nearly continuously from the seventeenth century until the present day, making the Irish one of the largest, most sustained, and most influential of the population movements that shaped the American working class. Irish Catholics began moving to the United States in large numbers around 1830, and because they arrived early, spoke English, and settled primarily in large cities, they became powerful in institutions that would earn the loyalty of many subsequent members of the urban ethnic working class, including the Catholic church, the Democratic party, and organized labor. Their influence therefore was even greater than their numbers would suggest.

Before about 1830, most Irish emigrants were members of Ireland's minority Protestant community, many of them of Scottish descent and hailing from the Northern province of Ulster. A substantial minority were Catholic, but they settled in dispersed communities, and deprived of contact with other Irish Catholics, many did not retain ethnic or religious ties. Furthermore although discriminatory legislation significantly limited Irish Catholics' political rights and economic opportunities, most Irish Catholics were reluctant to leave Ireland. The early Irish-American community therefore comprised mostly Protestants, many of whom were hostile to their Catholic co-ethnics. After Catholics began immigrating in large numbers, the Protestant and Catholic Irish-American communities remained largely distinct, with different settlement and economic patterns and separate institutions. Protestant Irish-Americans are often referred to as the "Scots-Irish" and are discussed in a separate entry.

Irish Catholics began arriving in the United States in larger numbers in the early nineteenth century. Although very small numbers of Irish men and women fled to the United States in the late eighteenth, nineteenth, and twentieth centuries to escape being prosecuted by the British authorities for political offenses, the overwhelming majority of emigrants left Ireland for economic reasons. Starting in the early nineteenth century, changes in the agricultural economy made it more difficult for Irish people to support their families as farmers or farm laborers, and Ireland

was actually losing rather than gaining industrial jobs that might have offered an alternative means of earning a living. Most Irish people were reluctant to emigrate and attempted to adapt to these economic challenges, most notably by subsisting on potatoes, a high-yield crop that could feed a family on relatively little land. However to improve their prospects or to avoid slipping into the ranks of the impoverished, some Irish Catholics, especially young men from relatively prosperous backgrounds, chose to come to America. This pattern was suddenly and tragically amplified when the potato crop failed repeatedly from 1845–1850. About a million people died in the Great Famine, and another 1.8 million desperate refugees made their way to North America, with the majority eventually settling in the United States. The famine refugees were, for the most part, not among the poorest Irish agricultural workers, most of whom could not afford passage to North America. However few brought savings or supplies with them, and most had only agricultural skills, which were not in demand in eastern and midwestern urban centers in which they settled. Moreover they faced significant prejudice, both because of their religion and ethnicity. Therefore they found jobs at the bottom of the economic ladder: In factories, as common laborers, and among women, in domestic service. After the famine ended, rates of emigration remained high, and although not nearly as desperate as famine-era refugees, later Irish immigrants continued to concentrate in cities and to find jobs as unskilled or semiskilled laborers. Two aspects of postfamine Irish immigration patterns are particularly notable. First an unusually high percentage of Irish immigrants were women. By the early twentieth century, more than half of all immigrants were female, most of them young, single women who hoped to find jobs and ultimately husbands in the United States. Second although many Irish immigrants dreamed of one day returning to Ireland, the overwhelming majority remained in the United States for the rest of their lives. In this they differed from most other immigrant groups, which had substantial rates of return to their home countries. Once they settled in the United States, Irish immigrants sent money back to Ireland, supporting remaining relatives and often paying for friends' or family members' passage to the United States. If Irish-Americans were unable to return to the land of their birth, they were considerably more successful at recreating their communities in the United States.

By the end of the nineteenth century, the Irish-American community was increasingly prosperous and stable. Although Irish immigrants were disproportionately likely to be unskilled laborers, many immigrants and most members of the second generation

achieved a measure of economic mobility, gaining skills and sometimes entering the lower middle class. Young immigrant women were most likely to work in factories or domestic service, but their daughters and granddaughters often found jobs as teachers or clerical workers. There was also considerable geographic diversity in the Irish-American experience: Irish-Americans found fewer avenues to economic mobility in New England cities, such as Boston, than in midwestern and western cities, such as St. Louis or San Francisco, where anti-Catholic and anti-Irish prejudices were less entrenched.

If Irish-Americans were more prosperous by the end of the nineteenth century, they also benefited from no longer being the most recent or alien-seeming immigrant group. In the late nineteenth century, new immigrants from southern and Eastern Europe began arriving in the United States. Many of them, like Irish-Americans, were Catholics from agricultural backgrounds, and many settled in the same urban centers in which Irish-Americans had lived for decades. There was of course nothing new about Irish-Americans sharing urban space with members of other ethnic groups. Most notably in the nineteenth century, the Irish often lived in close proximity to African-Americans. Irish-Americans seldom felt solidarity with their African-American neighbors, and they seem to have been anxious to distance themselves from people who were even more despised and oppressed than themselves. Irish-Americans often refused to work with African-Americans, and their hostility sometimes spilled over into mass violence, as in the 1863 Draft Riots, which included appalling instances of racial violence. This attitude however stands in marked contrast to their approach to the new immigrants of the late nineteenth and early twentieth centuries. Irish-Americans may have felt superior to new immigrants, and new immigrants may have resented Irish-American power, but they nonetheless forged uneasy alliances. Irish-Americans came to act as “ethnic brokers,” helping new immigrants negotiate their relations with the dominant society. In theory the relationship between the Irish and new immigrants was mutually beneficial: New immigrants could call on Irish-Americans’ experience dealing with an often-hostile society, and Irish-American leaders gained a new constituency. In practice however, relations were sometimes much more unequal and strained. These alliances were often negotiated in institutions that the Irish did not found but in which by the late nineteenth century, they held considerable influence: The American Catholic church, labor unions, and urban political machines.

Irish Catholics began arriving in the United States during a period of profound religious change in

Ireland. Although Irish Catholics had always identified strongly with the Catholic faith, it was only in the second-half of the nineteenth century that they became especially observant. Before the famine only about one-third of all Irish Catholics attended Mass each week; by the end of the nineteenth century, weekly Mass attendance was around 90%. The number of Irish priests and nuns also increased exponentially in the nineteenth century. The American Catholic church was transformed by the influx of Irish Catholics, who placed unprecedented demands on what had previously been a small, genteel institution dominated by Maryland planters. The newly observant Irish immigrants themselves helped achieve this transformation. Out of their meager paychecks, they donated money to build churches, schools, hospitals, and orphanages; Irish and Irish-American priests and nuns provided much of the staff for these institutions. By the time new immigrants from Eastern and southern Europe began arriving in the United States, the Irish dominated the American hierarchy, and they often clashed with immigrant Catholics who wished to retain their distinctive ethnic identities and traditions. Despite these tensions Catholicism could serve as a rallying point, uniting disparate people against a seemingly hostile, Protestant-dominant culture. Moreover although Irish Catholicism was usually conservative, stressing the individual’s duty to submit to established authority, Catholic social thought also stressed that bonds of obligation were reciprocal and that employers had a duty to provide a decent standard of living for their workers. There was space in American Catholicism therefore for a labor movement, albeit usually a relatively conservative one.

Irish-Americans also became a significant force in politics, especially at the local level. Irish Catholic immigrants had considerable experience with mass politics before they ever arrived in the United States. From 1829–1847, the Irish Catholic leader Daniel O’Connell campaigned successfully to remove the last legal barriers to Catholics’ full political participation and then unsuccessfully to gain a measure of independence for Ireland. O’Connell’s strategy was to mobilize the entire Irish Catholic population, encouraging even the poorest people, who did not meet the property qualification for the vote, to donate a penny to the cause and organizing massive protests called “monster meetings” to put pressure on the British government. Before they set foot in the United States therefore, many Irish immigrants thought of themselves as political actors and of politics as a way of expressing group identity. Perhaps for this reason, Irish immigrants quickly adapted to American partisan politics, naturalizing and voting at higher rates than other nineteenth-century immigrants and for the

most part, forming a strong attachment to the Democratic party. By the early twentieth century, they had come to dominate local politics in many American cities. Irish-Americans were particularly adept at managing political machines, institutions that won the support of voters by offering them tangible, individual benefits, such as jobs. In such cities as Chicago, machines ultimately became multi-ethnic institutions, but Irish-run machines were as likely to exclude new voters, who required jobs or other costly rewards to earn their loyalty, as to encourage them to participate in the political process. When machines did incorporate new ethnic or African-American voters, they often bought their loyalty with low-status and low-paying jobs or with federal benefits that were administered by local authorities. Machines may have helped incorporate new voters into the system therefore, but they also reinforced inequality within the system. By the mid-twentieth century, most urban machines were on the decline, but Irish-Americans continued to be disproportionately powerful in local politics and increasingly to make their mark on the national scene as well, culminating with the election of John F. Kennedy to the presidency in 1960.

If Irish-Americans were unusually active in American politics, they also retained an interest in the politics of their homeland. Many Irish-Americans hoped that Ireland would become independent of Britain, although they disagreed about whether this should be done through force or by peaceful means. During periods of heightened nationalist activity in Ireland, tens of thousands of Irish-Americans joined organizations and donated money to try to achieve that goal. Irish-American nationalism was often a conservative movement, led by members of the middle-class, eschewing economic goals, and stressing the need for Irish-Americans to adhere to middle-class standards of respectability in order to prove that Irish people were capable of self-government. Some historians have suggested that middle-class Irish-Americans used nationalism to obscure class divisions within the community and unite Irish-Americans behind middle-class leadership. Yet nationalism could also reinforce working-class consciousness and introduce Irish-Americans to radical politics. In 1879, nationalists in Ireland took up the cause of land reform, attacking the landlord system and adding an economic element to the movement for Irish independence. In the United States many nationalists believed that support for land reform was merely a tactic in the larger battle for Irish independence, but a faction of Irish-American nationalists, represented by Patrick Ford's newspaper the *Irish World and American Industrial Liberator*, fused nationalism, Catholicism, and demands for economic justice in both Ireland and the United States. Some

Irish-American nationalists supported Henry George's single-tax scheme, bringing them into contact with Protestant radicals whom they had previously viewed with hostility. Economic and social radicalism were always minority strains in Irish-American nationalism, but they continued to be present in the twentieth century. In the early 1920s, for instance, Chicago Federation of Labor President John Fitzpatrick founded the Labor Bureau for Irish Independence, which linked commitments to Irish nationalism, global anti-imperialism, and justice for workers.

This connection between nationalism and labor reflects the fact that the Irish were extremely well-represented in both the rank-and-file and leadership of American labor unions. Irish immigrants brought from Ireland traditions of labor protest, some of which were not suited to a modern capitalist economy. In the 1870s, the "Molly Maguires" attempted to bring premodern modes of protest to bear on the problem of industrial exploitation in Pennsylvania coalmines. Using ritualized forms of violence that were common in the Irish countryside, workers threatened and ultimately murdered mine officials in an attempt to force mine owners to fulfill what Irish peasants took to be employers' obligations to their workers. These efforts were futile, resulting only in the prosecutions of Irish-American workers, many of whom may have been innocent. Some immigrant contemporaries of the Molly Maguires had experience with British and Irish unions, and they may have been more likely than other first-generation Irish-Americans to participate in organized labor. However most Irish-American union leaders seem to have been American-born, such as Knights of Labor leader Terence Powderly, who was born in Pennsylvania in 1849, the son of Irish immigrants. Irish-Americans were so ubiquitous in the labor movement that it is hard to generalize about them: They were active in the most radical as well as the most conservative factions. It is probably safe to say however that they were more likely to be conservative than radical. Indeed some Irish-dominated unions, like some urban political machines, seemed more interested in securing benefits for their members by excluding outsiders than in forming coalitions with members of other ethnic groups or even more recent Irish immigrants. However Irish leaders could be found in the Congress of Industrial Organizations (CIO) and even the IWW, as well as the more-conservative American Federation of Labor (AFL).

In the 1920s, the flow of Irish immigration slowed because of laws restricting immigration and because the Great Depression eliminated the economic opportunities that drew Irish men and women to the United States. Young Irish people continued to emigrate in

large numbers, but Britain, rather than the United States became their preferred destination. Perhaps because there were fewer recent immigrants to create a concrete bond to Ireland, the community seems to have lost some of its distinctiveness, and some scholars suggest that Irish-Americans' Catholic identity gradually supplanted their Irish affiliation. The Irish-American community was also increasingly middle-class, with rates of college graduation and white-collar employment higher than the overall population, and increasingly suburban. In the early twenty-first century, Irish-Americans no longer reliably support the Democratic party, and their voting habits look much like those of the population in general. Although the community has lost many of its distinctive characteristics, many Irish-Americans continue to be committed to their Irish identity.

In the 1980s, facing a recession in Ireland, Irish people again began to immigrate to the United States in larger numbers. They were aided in this by a visa program that favored the Irish, but many came as undocumented immigrants. Legal immigrants found jobs throughout the economy, including in professional occupations. Undocumented Irish immigrants were concentrated in such jobs as construction, restaurant work, and childcare. In recent years the Irish economy has experienced remarkable growth, and for the first time since the seventeenth century, Ireland has become an immigrant-receiving, rather than an emigrant-sending nation. Many Irish immigrants who arrived in the 1980s have decided to return to Ireland and pursue opportunities at home, something that was not possible for their earlier counterparts.

IRON

See **Steel and Iron**

IRONS, MARTIN (OCTOBER 7, 1830–1900) Knights of Labor

Martin Irons was a machinist and a Knights of Labor member who led the 1886 Southwest strike against railroad king Jay Gould's southwestern system of railways. The conflict was a pivotal event of the Great Upheaval of 1886, when Gilded Age working-class protest peaked. The walkout's defeat contributed to the decline of the knights. For Irons, who was haunted throughout his life by personal demons and tragedy, the strike brought first public recognition, and then controversy and hardship.

Irons was born on October 7, 1830, in Dundee, Scotland. His father was a sailor and sail maker, and his mother may have been a milliner. Irons was 14 when he arrived with a guardian in New York City. Six years later he began an itinerant life, moving about mostly in Kentucky, Ohio, and Missouri. In 1852, he married Mary Brown, also from Scotland. He often met with unemployment, drank heavily, and was a physically abusive husband, family sources reveal. Around 1876, Irons left Richmond, Missouri, where he had settled for 6 years and returned to an itinerant life without his family.

Around 1880, Irons arrived in Sedalia, Missouri. He married again, found a job as a machinist in a Gould system shop, and met with other workers to discuss labor issues. Once a member of the Grange, the Odd Fellows, and the Ancient Order of Workingmen, Irons joined the Knights of Labor, probably in 1884. By the fall of 1885, District Assembly (DA) 101, composed of about 5,000 knights across Gould's Southwest system, had elected him their master workman and chair of the executive board.

Like many railroad workers, Irons believed that Gould was conspiring to impose wage slavery on his employees and that only the enforcement of previous agreements and the recognition of DA 101 as the collective-bargaining agent on the Gould system could prevent this. The 1886 walkout began over precisely these issues. A massive, popularly supported strike in March 1885 and the knights' threat of a national railway strike later that year had resulted in much heralded contracts that railroad managers routinely ignored. Moreover railroad management widely discriminated against knights and consistently frustrated the efforts of Irons and other leaders to gain a hearing.

The general strike on the Gould system began on March 6, 1886. At a meeting in the midst of the conflict, Irons confided to Terence Powderly, the national knights' leader, that a mystery gunslinger had forced him at gunpoint to sign the strike order. Historian Ruth

Allen has accepted Irons's account although no independent evidence supports it. More likely Irons fabricated the story in order to distance himself from a failing walkout, one that DA 101 had undertaken without consulting the national knights. By the time Irons met with Powderly, railroad officials had obtained injunctions against strikers who interfered with freight traffic, and freight traffic was resuming with the aid of strikebreakers, returning strikers, and skilled trainmen. One week later and against Powderly's instructions, Irons pushed to expand the walkout to include knights throughout the country. A sympathy strike in East St. Louis that had paralyzed railway traffic in the region encouraged him, but a bloody clash there between prostrike crowds and railroad-employed deputies brought the state militia in to protect railroad property, effectively ending the 1886 walkout.

Much of the press and public associated Irons with the sabotage, riots, intimidation, and bloodshed that marked the strike in its final phase, although clearly many knights had engaged in these tactics. Irons insisted that he had consistently urged knights against violence, but the record suggests otherwise. Whatever the case the weight of the strike's failure fell disproportionately on him. His critics charged that he had aggressively pursued a clash with Gould in order to amass power. Embittered Sedalia knights forced him to resign and leave town. Blacklisted by the railways and alone (his second wife had died during the strike of pneumonia), Irons roamed in search of better circumstances in Missouri, Arkansas, and Texas, with little luck. He escaped various legal troubles, including a child molestation charge. Still despite his infamy, Irons never tired of discussing social and economic questions and was an active member of the People's party. During the 1890s, a doctor in Bruceville, Texas, took in and befriended an ailing and impoverished Irons, who died in 1900. In the decade after his death, Eugene Debs and Mother Jones praised him, and the Missouri State Federation of Labor voted to erect a monument in Bruceville to commemorate Irons's contributions to the labor movement.

ITALIANS

Italian migrant workers have been coming to North America since the earliest European settlements—a number of Venetian glass blowers had settled in Jamestown by 1622—and during the peak years of their migration, they constituted a critical, and heavily exploited, part of this country's working class. A handful of people from the peninsula that became Italy were enumerated in the 1820 U.S. census, and by 1850, a little more than a decade before Italy was united during the *Risorgimento*, the 3,645 Italians in the census were scattered across the country. Most of these early migrants, though certainly not all, were from provinces in northern Italy. There were population concentrations in New Orleans, San Francisco, and New York; over half the Italian migrants at that point lived in the South. There were agricultural settlements as well that extended the breadth of the country in places like Texas, New Jersey, and California.

The character of this immigration changed drastically during the peak years of Italian immigration. Over 300,000 arrived during the 1880s, and in the first decade of the twentieth century, over two million made the journey. From 1880–1920, over 4.1 million Italians entered the country. Most of these migrants came from southern provinces and the island of Sicily. Most were from rural areas, though some were artisans; few had solid industrial skills, and fewer could read. They were predominantly male—men outnumbered women by about 3 to 1. Their settlement patterns in the United States changed as well. Almost 97% arrived in New York, and many decided to settle there. By 1920, 400,000 Italian migrants made New York City their homes. There were sizeable Italian populations in Boston, Philadelphia, San Francisco, New Orleans, and growing populations in Chicago and in smaller and medium-sized cities, like Rochester, Utica, and Kansas City. But this wave of migrants concentrated mostly in the northeastern and mid-Atlantic states and mostly in large cities in those regions.

This summary though belies the complexity of Italian migration. Italians had a history of movement throughout Europe that preceded, and overlapped with, movement to the United States. Italian workers began seeking industrial employment to supplement sparse agricultural income in the earliest stages of industrialization on the European mainland. Seasonal journeys to industrial centers in Italy, France, Germany, and Switzerland extended across oceans when steerage rates on trans-Atlantic ocean liners began to drop in the late nineteenth century. Even then Italians did not necessarily head for the United States. By 1900, two of every three Italians

Family of Italians who came from nearby towns to pick beans as day laborers. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USF34-057686-D].

who crossed the Atlantic sought other destinations, like Argentina, Brazil, or Montenegro.

Nor was there any guarantee they were going to stay. Most Italians were determined to return home once they made enough money to buy property in Italy. Not every Italian did so, but their return migration rates were as high as any other migrant group. Calculations of these rates are undependable at best, but historians estimate that from 30% to over 50% of Italian migrants left the United States. In 1908, the peak year of their migration, more Italians actually left the country than entered it. This was the second year of an economic depression in the United States. Nonetheless the statistic is telling.

Reception

The predominance of southern Italians in this massive wave of migrants, their penchant for return migration, their concentration in large cities, and their skill levels on arrival had enormous implications for working-class Italian migrants' reception in this country. At the end of the nineteenth and the beginning of the twentieth century, large-scale migration from across southern and Eastern Europe alarmed many native-born Americans. Politicians and labor leaders

clamored for immigration restriction, and scholars in new social sciences like sociology began to characterize these new immigrants in racial terms. They considered them superior to Asians and Africans in the hierarchy of race but well below northern and western Europeans. Even in this scorned population, Italians, and especially southern Italians, were often singled out as the most contemptible. Scholarly works not only defined southern Italians as the lowest of European races, they often advised Anglo Saxons not to intermarry with them. They were considered, as one angry Italian migrant labor organizer put it, "the garbage of American social life."

Southern Italian immigrants at times experienced attitudes and treatment more similar to blacks than to other European immigrants. They were recruited to work on plantations to prod uncooperative ex-slaves. In the segregated South, they worked side-by-side with blacks, and their children often attended the same schools. Southern Italians suspected of crimes were occasionally lynched, a brutality almost exclusively endured by blacks. In the most infamous instance, 11 Italians in New Orleans were lynched in 1891. Three more were lynched in the city in 1896, and two in Tampa, Florida, in 1910.

As scorned as they were however, only the quality of their whiteness was challenged—rarely if ever the fact of it. Southern Italians may have been widely

considered inferior to other European immigrants, but they still shared the privileges and advantages that whiteness conveyed in the United States. They did not face systematic, legalized segregation. They were not only legally allowed to naturalize (the naturalization law of 1790, not altered until 1952, reserved this opportunity solely for whites), they were encouraged to do so. Nor were they denied the right to vote—they were often criticized for not voting often enough.

Work

In many ways southern Italians were like the Irish immigrants who worked as manual laborers in the antebellum years—social commentators at the end of the nineteenth century commented explicitly that they were taking jobs that had previously belonged to the Irish and that Italian migrants were assuming their desultory social status as well. Certain Italian men actively sought outdoor manual labor, and Italian migrants moved in large numbers into the construction industry. They concentrated in other areas as well, especially in the garment and textile industries. Young, Italian immigrant women worked in the latter in large numbers. Many daughters in Italian families began work outside the home early to contribute to the family income. Most left this sort of work, if not when they married, then when their first babies were born. Married Italian women frequently sought work that enabled them to remain at home, taking in boarders, doing piece work for garment shops, or assembling artificial flowers or costume jewelry, often with the assistance of their small children.

Italian immigrant workers usually found employment through one of two means. The first was through *padrones*, or labor agents, who acted as intermediaries between them and potential employers. This system, more prevalent in the nineteenth than in the twentieth century, was often profoundly exploitive. *Padrones* often worked with employers to bilk immigrants out of their labor and their pay. *Padrones* were supplanted gradually by the links of chain migration—Italians migrating from the same region, village, or even street would seek each other out, and help each other find shelter and employment.

The work that these immigrants found was often extremely dangerous. In coalmines in Pennsylvania and Arizona, in Pennsylvania steel plants, and on building sites throughout the country, for example, Italian immigrant men faced potential injury or death daily. In textile and garment factories, Italian immigrant women risked disfigurement and mortal injury

as well. In 1912, for example, a young girl testifying about unsafe conditions in textile mills showed U.S. senators how one of the machines had ripped off a piece of her scalp. The year before locked exit doors in the Triangle Shirtwaist factory in New York City had doomed 146 Italian and Jewish young women when lint from the machines caught fire. The image of these women leaping to their deaths to avoid the flames would haunt the city for decades.

Organizational Life

In the face of hardship and contempt and danger, Italian immigrants organized themselves, often drawing on institutions they had created in Italy. They formed mutual benefit societies, which provided a sense of community and often insurance in case of injury and funeral benefits in case of death. These associations' members usually organized themselves along regional lines or even by specific villages. Regionalism ran deep among Italian immigrants, in part because Italy itself had only existed as a nation since 1861, and in part because resentments between northern and southern Italians were so strong. Many also drew on the solace of religious faith. Despite the dominance of the Irish in the American Catholic hierarchy and their often open contempt for Italian Catholics, religious festivals were important events in Italian neighborhoods, and many—especially women—remained faithful church goers.

But the hesitance of many Italian immigrants about church services spoke to their wariness about certain organizations. There was a deep strain of distrust for the state and the church (often seen as one and the same in Italy) especially among southern Italian immigrants. Their anticlericalism kept many away from the church even if many still saw life through the lens of the religious imagery with which they had been raised. Their experience of the state as predominantly an oppressive institution contributed to very low rates of naturalization and use of the franchise among these immigrants.

Unions and Radical Organizations

It is small wonder then that the first migrant radicals to make their presence felt in Italian immigrant communities were anarchists. Like other Italian immigrant revolutionaries, these anarchists were small in number but deeply devoted and arduous activists.

ITALIANS

As with so much of Italian immigrant life, much of this anarchist culture was rooted in Italy. The first anarchists to proselytize in Italian immigrant communities were sojourners from Italy who stayed in the country anywhere from a few weeks to a few years. They helped to develop anarchist circles, often named after Italian revolutionaries, in places like Tampa, Florida; Paterson, New Jersey; and Barre, Vermont. The most prominent of them, Luigi Galleani, also stayed the longest in the United States. Arriving in Paterson in 1902, he edited *la Questione Sociale* there before moving to Barre to join fellow immigrants from the Piedmont region in Italy who had settled there to work in the marble quarries and as sculptors. There he began the *Cronaca Sovversiva*, the most important voice of Italian immigrant anti-organizational anarchism in the United States, which reached anarchist men and women all over the country. He and his followers, Nicola Sacco and Bartolomeo Vanzetti among them, argued that a decent and dignified life for all could be achieved only by destroying existing institutions and starting over. Galleani encouraged his followers to act on their beliefs, publishing a bomb manual in about 1905, and certain of them responded—evidence points to their involvement in a number of bombings during and after World War I.

Italian immigrant syndicalists also considered the state an incurably corrupt institution but argued that unions should be the focal point of revolutionary activity. Though like the anarchists, relatively small in number, these syndicalists had an impact on the American labor movement that exceeded their numerical strength because of their willingness to risk prison time and even death in confronting factory owners and state officials. Led by people like labor activist and poet Arturo Giovannitti, they strived to use their *Federazione Socialista Italiana* (FSI) and its newspaper *il Proletario* to reach Italian immigrant workers. The apex of their efforts came in 1912, when they worked with the Industrial Workers of the World (IWW) to help over 20,000 striking textile workers in Lawrence, Massachusetts, achieve an unexpected victory. Soon after however disagreement about how to respond to World War I splintered the organization. Some of its members, among them former *il Proletario* editor Edmondo Rossoni, became staunch defenders of Italian nationalism and eventually joined Mussolini's Fascist party.

Although so few Italian immigrants voted in the early twentieth century, there was a small group who aligned themselves with the electoral strategies of the Socialist party. Their organization, the *Federazione Socialista Italiana* of the Socialist Party of America (FSI/SPA), was based in Chicago. Its members had

some success organizing garment workers in the Midwest and on the East Coast.

World War I and Its Aftermath

While certain historians argue that their participation as soldiers in World War I gained Italian immigrants some level of respectability, wartime and postwar repression delivered a crushing blow to most Italian immigrant radicals. Italian anarchists, syndicalists, and even socialists were hounded, imprisoned, and deported. Though Italian immigrants took part in large numbers in the wave of postwar strikes that swept the nation, hostility to their perceived foreignness and fear even of moderate labor unions peaked in the late 1910s. The Red Scare, which stretched from the end of World War I into the early 1920s, had no clearer symbols among Italian immigrants than Sacco and Vanzetti, who were executed after a 7-year trial and series of appeals that revealed the potential injustice and danger Italian immigrants and radicals faced. As their appeals progressed, Congress passed two laws, one in 1921 and one in 1924, which slowed immigration from Italy (and elsewhere in southern and Eastern Europe and Japan) to a trickle.

The 1920s were marked by a decline in radical energies and by the rise of fascism in Italy—and increasing support for it among Italian Americans. Italian American radicals devoted much of their energy to combating Fascist supporters in Italian immigrant communities, often with considerable success. Carlo Tresca and his allies in New York for example made the streets unsafe for Fascists throughout the 1920s. But divisions among these radicals—particularly with the rising influence of the Communists in revolutionary circles—made successful opposition difficult. More importantly, opposition faced overwhelming enthusiasm for Mussolini and fascism among the Italian immigrant elite and in its press, as well as among many native-born Americans through the 1920s and early 1930s.

The 1920s also witnessed the emergence of corrupt labor organizers among Italian Americans. Unions in the clothing, garment, and construction industries and among dockworkers for example fell under the influence of organized criminal syndicates. These were not the first labor unions to fall prey to criminal elements; they would not be the last. And this corruption was neither specific to, nor confined to, Italian Americans. But here were roots of an association between Italian Americans and organized crime that continues to haunt them, especially through mass media and popular culture, to this day.

Italian Americans

By the 1930s and the 1940s, and especially by the end of World War II, Italian Americans were well on their way to entering the American mainstream. There was still of course support for fellow ethnics like Fiorella la Guardia, who became mayor of New York City. There were even remnants of past radical affiliations, most significantly in New York, where Italians in Harlem elected Communist sympathizer Vito Marcantonio to Congress repeatedly from 1936–1950. But most Italian American workers supported new Congress of Industrial Organization unions and Franklin Delano Roosevelt's New Deal. As sons and daughters—even grandsons and granddaughters—of Italian immigrants, most began to consider themselves part of the ethnic composition of a multiethnic United States.

J

J. P. STEVENS CAMPAIGN (1963–1980)

In the spring of 1963, leaders of the Textile Workers Union of America (TWUA) selected J. P. Stevens as the target for a major organizing campaign. The second-largest textile firm in the nation, Stevens employed more than 36,000 people, the bulk of them in the South. For more than 30 years, textile unions had struggled to organize the growing southern textile industry, the region's largest employer. Across the South, employers fiercely opposed the union, often backed up by local politicians and community leaders. By the early 1960s, unions had only managed to sign up around 10% of the southern textile workforce, and most of these employees worked in small plants. Seeking to make more progress, TWUA leaders reasoned that if they could organize a large firm, other employers would look more favorably upon the union.

At Stevens, the battle between the two sides raged on until the fall of 1980, becoming a symbol of labor's determination to try and break through in the most nonunion area of the country. When an agreement was finally reached, the union called off a boycott of Stevens's products while the company agreed to recognize the union at the plants that it had managed to organize.

Labor Law Violations

TWUA leaders picked Stevens in the hope that the New York-based firm would look on it more

favorably than southern-owned companies. This proved to be a miscalculation, as from the start Stevens repeatedly violated labor laws in order to thwart organizing. Like many other companies, Stevens had moved south after World War II, specifically because it wanted to pay lower wages and avoid unions. The Stevens CEO, Robert T. Stevens, a former secretary of the Army, disliked the way that his company had been picked out by TWUA and was determined to make a stand. For over 17 years, company officials argued that the union was an unwanted "third party" that would interfere with the direct relationship between management and its employees.

Stevens workers, however, received wages that were well below the manufacturing average, and they had few benefits. Many initially responded enthusiastically to TWUA, but company officials soon targeted activists. Between 1965 and 1976, Stevens was cited for violating the National Labor Relations Act (NLRA) in 15 different cases, paying out around \$1.3 million in back pay to approximately three hundred workers. In a series of judgments by both the National Labor Relations Board (NLRB) and the courts, Stevens was accused of having open disregard for labor law.

At the heart of Stevens's strategy was the widespread dismissal of the union's most influential supporters. Supervisors used a wide range of pretexts in order to remove union advocates, even dismissing highly experienced workers as incompetent. Others were fired for practices that had long been tolerated, such as engaging in horseplay or buying soft drinks

during company time. Such behavior led the national American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) to brand the textile giant as the greatest labor law violator in the entire United States. Feeling that they could not allow such behavior to go unpunished, in the summer of 1976, the AFL-CIO threw itself behind a boycott. Earlier in the year, TWUA had merged with the Amalgamated Clothing Workers of America (ACWA) in order to form a bigger union that could bring Stevens to its knees. In the fall of 1976, the Amalgamated Clothing and Textile Workers Union (ACTWU) officially launched its boycott, the first time that this tactic had been attempted against an employer of Stevens's size. In doing so, activists particularly hoped to force the company to recognize the union at its plants in Roanoke Rapids, North Carolina, where the union had won an election in 1974 but had been unable to secure a contract.

The Campaign at Its Peak

The boycott brought the Stevens campaign to national attention, as thousands of protesters marched against the company in the nation's largest cities. "Don't Sleep with Stevens," they declared, a call for consumers to stop purchasing Stevens's sheets, a central part of its business. The union used issues of sexual and racial discrimination to mobilize the support of civil rights groups such as the National Association for the Advancement of Colored People (NAACP) and the Southern Christian Leadership Conference (SCLC), together with large parts of the women's movement and many church and student groups. In addition, the boycott was endorsed by 56 U.S. representatives and many high-profile figures, including the actress Jane Fonda, the sports commentator Myron Cope, and the economist John Kenneth Galbraith.

Alongside the boycott, the maverick activist Ray Rogers ran the first "corporate campaign" in U.S. history. As part of this, ACTWU's supporters disrupted Stevens's shareholders' meetings, securing publicity of the company's labor record. In addition, Rogers revealed that many of Stevens's directors were also CEOs of firms with union ties. Rogers successfully caused embarrassment and investor discontent, and two of the firm's directors were forced to resign.

At its peak, the Stevens campaign also inspired the film *Norma Rae* (1979). In the popular movie, Sally Field won an Oscar for her depiction of a character that was loosely based on Roanoke Rapids worker Crystal Lee Sutton. Following the movie's release, Sutton herself conducted a nationwide tour to

promote the union's case, securing a great deal of positive press coverage in the process. As a public relations weapon, in fact, the boycott was clearly a success, although its economic impact on the firm was mild, especially as Stevens only sold around one third of its products directly to the consumer.

At its height, the campaign attracted a lot of attention from journalists. Detailed articles on the struggle appeared in national papers such as the *New York Times* and *Washington Post*, as well as in a range of journals that included *The Nation*, *Fortune*, *Business Week*, and *Time*. At the same time, journalist Mimi Conway produced a popular account of workers' struggle in Roanoke Rapids. Based largely on oral history interviews, Conway's work provided a vivid insight into workers' daily lives.

Since these contemporary accounts, historical scholarship has been limited. Some scholars have written articles exploring the making and impact of *Norma Rae*, while others have provided overviews of the campaign. Only recently has the entire campaign received its first book-length treatment. Making extensive use of recently released documents, Timothy J. Minchin's *"Don't Sleep with Stevens!": The J. P. Stevens Campaign and the Struggle to Organize the South, 1963–1980* provides an up-to-date account of the Stevens struggle.

Alongside the boycott and "corporate campaign," the union re-ignited its organizing efforts, yet it continued to struggle to make real gains. As Stevens had established such a harsh reputation, few workers were willing to risk discharge by signing union cards. Racial divisions also hurt organizing. ACTWU's leaders found that African-Americans, who were coming into the textile industry in increasing numbers, were more likely to join the union. They were still overwhelmingly concentrated in low-paid jobs, and many had been radicalized by the civil rights movement. Their activism, however, scared off whites, who saw the union as "black."

Following the 1980 settlement, the union continued small-scale organizing efforts until the fall of 1983, when the two sides settled all remaining NLRB charges. ACTWU abandoned its organizing efforts at Stevens's plants, while Stevens paid out \$1.2 million and promised to obey the law in the future. Following this settlement, the two sides established a stable relationship at organized sites.

Significance of the Stevens Campaign

The Stevens campaign was not a complete victory for either side, and both were scarred by such a long fight.

For organized labor, the battle proved highly expensive, as it poured more than \$30 million into the effort. At the time, this was the largest amount that a union had ever spent on a campaign against a single company. Despite all its efforts, the union never brought more than 7% of the company's workers under contract. While refusing to reveal how much it had spent, Stevens's corporate image was clearly harmed, and it had spent too much time fighting the union rather than modernizing its plants.

Overall, the Stevens campaign had a number of important consequences for U.S. labor relations. The company showed other firms that they could avoid unionization by deliberately violating labor laws. In subsequent years, many other executives copied these tactics, especially as the powers of the NLRB were further eroded during the 1980s. The willingness of some employers to openly disregard the NLRA prompted the AFL-CIO to fight for labor law reform, but labor-backed bills narrowly failed to become law in both 1978 and 1994.

Despite this, the campaign also highlighted to the labor movement that it could achieve the most if it worked with its allies in the broader community, a trend that has continued in subsequent years as striking has become less effective. The union's efforts, particularly its innovative "corporate campaign," brought Stevens to the bargaining table, no small achievement given the firm's virulent opposition to organized labor. Since the early 1980s, however, ACTWU's breakthrough has been undermined by the flight of the textile industry to the developing world, a trend that has undermined its ability to conduct further organizing. Ironically, in the years after the Stevens campaign, both managers and workers have come together to lobby for protection against cheap imports, yet this campaign has failed to convince Congress. In the 1980s and 1990s, the number of textile employees tumbled, and Stevens itself disappeared as a corporate entity in 1988, when it was bought out by a competitor and divided into three.

JAMAICANS

More than any other modern international event, World War II motivated an unparalleled effort to recruit foreign labor for agricultural work in the United States. At the onset of WWII, farmers worried that they would face severe labor shortages because of the military draft and the high-paying defense industry jobs that had siphoned off many agricultural workers from farms, as well as the possibility of paying higher wages during the harvest season. In response, the U.S. government intervened on behalf of the growers and allowed them legally to import labor from Mexico and the British West Indies. On August 4, 1942, an executive order initiated the Mexican bracero program, which recruited Mexicans to work in the United States. Following the precedent of the bracero program, the U.S. government established a similar program to recruit workers from the British West Indies. The first agreements were reached with the colonial authorities in the Bahamas in March 1943 and with Jamaica in April 1943.

These two agreements established the British West Indies (BWI) Temporary Alien Labor Program and like the bracero program was formalized with the passage of Public Law 45, a series of farm labor appropriations acts authorizing the U.S. government to admit temporarily foreigners to perform agricultural labor in the United States. Other West Indians (from the Bahamas, British Honduras, St. Lucia, St. Vincent, Dominica, and Barbados) eventually joined the program; however, they never composed a significant portion of the farmworkers. Jamaicans always far outnumbered other Caribbean farmworkers, second only to the Mexican workers employed on the West Coast. Nearly 50,000 Jamaican men were recruited over the four years of the wartime program.

JAMAICANS

Several factors influenced the decision of the U.S. government to recruit large numbers of men from Jamaica. First, East Coast growers preferred Jamaicans to Mexicans because they spoke English. Jamaica was also considered an ideal source for foreign labor because of the island's geographical proximity to the eastern United States. Other factors included the island's high rates of unemployment, which meant there was significant support for any migration scheme that would alleviate the unemployment on the island. Additionally, the diplomatic relations between the crown colony governments of the islands, Great Britain, and the United States, allowed the intergovernmental agreement to be concluded easily.

In May 1943, the first Jamaican men recruited as farmworkers entered the United States. The average age of Jamaican men recruited as farmworkers was 25 years old; the oldest workers were 45 and the youngest not under 18. By the end of the first year, more than 11,000 Jamaican farmworkers were in the United States. They were dispersed throughout 14 states along the eastern seaboard from Florida to Maine. Workers harvested rhubarb, asparagus, peas, spinach, and beets in Pennsylvania; picked and harvested strawberries, spinach, onions, and potatoes in New York and New Jersey; worked on tobacco farms in Connecticut; and even helped bring in the sugar-beet crops in Idaho and Michigan. The harvesting of seasonal crops required significant stooping, squatting, and lifting, in the elements, from morning until late afternoon. During each contract period, Jamaican men moved from one locality to the next, with most ending the season cutting cane in Florida.

According to the intergovernmental agreement, the U.S. government, not individual farmers, employed Jamaicans, and they were guaranteed basic protections. The main provisions of the intergovernmental agreement guaranteed each man employment for at least 75% of the period for which he was contracted and that each man receive a minimum of 30 cents an hour and be required to work no more than six days a week. The agreement also stated that workers were not to "suffer discriminatory acts which would subject them to living conditions and sanitation and medical services . . . inferior to those afforded other agricultural workers" and would be housed in facilities maintained or approved by the U.S. government, and receive "all necessary food, health and medical care and other subsistence living facilities."

Despite the contract provisions, Jamaican farmworkers found that housing, food, and wage standards were frequently disregarded. Some Jamaicans, when housed by their employers, sometimes endured unsatisfactory housing in fairground cattle exhibition

sheds and garages. Those not housed with their employers were placed in government camps called Farm Labor Supply Centers. These facilities were not permanent structures, usually army-issued tents, or prefabricated wooden huts, and included very basic accommodations. Provided with a cot and thin mattress, the typical quarters for the men were crude and furnished only to provide the men a place to sleep at the end of a long day of work. The quantity and quality of the food served in the camps was also a point of great frustration. Because of wartime rationing, certain food items, especially the products Jamaican men liked the most—meat, sugar, and rice—were in very short supply. The cold bologna and cheese sandwiches were the basis of many of the men's complaints. Yet, more than any other issue, dissatisfaction over wages was the most contentious. The Jamaican men's contract stated, "there shall be no strikes, lockouts, or stoppages of work during the period of employment," but they often organized work-slowdowns or stoppages and used other creative tactics to force farmers to improve their wages and comply with contract standards. Jamaican men were vulnerable to growers' threats of repatriation, and workers identified as "troublemakers" frequently found their contracts terminated, and they were sent home to Jamaica.

The BWI program was supposed to be a temporary expedient during a wartime emergency and concluded on December 31, 1947; however, the program lasted much longer. During the years 1947–1952, the BWI program converted into a temporary-worker program, as allowed under the provisions of the Immigration Act of 1917. Tripartite contracts were drawn up between the Jamaican workers, the Jamaican government, and U.S. employers. Employers wanting Jamaican farmworkers could, with authorization from the Immigration and Naturalization Service, recruit within Jamaica or other West Indian islands. In 1952, this temporary system received permanent sanction when the Department of Labor, under section H-2A of the new Immigration Nationality Act, authorized American employers to contract with West Indian men for farm work if they could prove that no domestic workers wanted the jobs. Under the program, U.S. agricultural employers, Jamaican workers, and the Jamaican government signed working contracts, thereby eliminating the U.S. government's involvement and liability. Farmworkers' wages and hours were set, and employers were required to provide suitable living and working conditions; however, with little official oversight, violations were rampant, and workers were reluctant to complain because of the threat of being sent home to Jamaica.

After 1952, American employers recruited in Jamaica, St. Lucia, St. Vincent, Dominica, and Barbados, although Jamaicans remained the largest group of West Indian farmworkers. Most Jamaicans worked as cane cutters under H-2A temporary contracts for Florida sugar plantations in the 1980s and early 1990s. They lived in atrociously inferior housing and were paid sub-minimum wages. However, by 1995, few Jamaicans were contracted to cut cane, and this change was in large part due to the mechanization of the Florida sugarcane harvest. Since 2002, the U.S. Department of Labor has reported that many apple growers have been hiring Jamaicans as H-2A workers in West Virginia, New York, and New England. Jamaicans work from tree to tree on 12-foot ladders hauling bags that they pack full of apples. The apple harvest season lasts no more than two months out of the year and is incredibly backbreaking. Under the H-2A provisions, problems of housing, food, wages, and general mistreatment of Jamaican farmworkers have continued to beleague the H-2A program, just as they did during World War II.

JANITORIAL/CUSTODIAL

Janitors clean and maintain the buildings of urban America. Thus, their numbers have increased with the growth of cities and the industries that support them. In 1900, over 56,000 people worked in the occupation. In 2003, there were 2,064,350, making an average hourly wage of \$9.77 or \$20,320 annually. A manual

occupation of low status, janitorial work has traditionally attracted a high proportion of immigrants and African-Americans. From the early twentieth century, janitors have been prominent trade unionists.

The Work

Janitorial work appears deceptively simple. Janitors clean floors, rugs, walls, and windows. They take out the garbage, empty wastebaskets, mow lawns, and shovel snow. They do numerous minor repairs to faucets and fixtures; they paint walls and fix damaged woodwork; and they make sure that heating and air-conditioning equipment works properly. In other words, they perform a set of low-skilled, manual, building service tasks. Nonetheless, this short summary leaves out the challenges of managing the numerous duties and dealing with the people who live or work in the buildings.

In contrast to factory workers, janitors do not typically work together in groups but rather service individual buildings by themselves or with a few co-workers. Also, unlike factory laborers, janitors do not usually work under the direct supervision of a superior. This quality of the job demands much of janitors, while constituting one of the occupation's main attractions. Since janitors are the responsible person on the spot, tenants or teachers go immediately to them to solve problems. This responsibility also means that they seldom work a normal day or week. At the same time, the janitor's responsibility for a building has meant that he could be "his own boss," an option that most manual laborers have not had.

The tasks that janitors perform are seldom physically strenuous in themselves but do require constant bending, stooping, and stretching, which can cause injuries like strained backs. Although rarely demanding individually, janitorial tasks can nonetheless be challenging in their multiplicity, timing, and required knowledge. The janitor has been the one managing the numerous duties, and the tasks themselves usually require more knowledge than is initially apparent. In the days of coal furnaces, maintaining a fire without burning too much fuel required skill and experience. Today, the furnace may be computer driven, but for that reason it requires sufficient experience with digital equipment to maintain basic operation. Many janitorial tasks in schools and offices impinge on health and safety codes. Unionized positions require knowledge of contractually defined work.

Thus, janitorial work has required more skills than is commonly assumed. Janitors need to read well enough to understand memos from supervisors and

instructions on machines. They have to write sufficiently well to keep records. They need time management skills to orchestrate the complex menu of tasks. Yet, most important, they need social skills. The janitor is responsible to a building owner or manager but also—in many cases—to a union. Both can issue demands, which may conflict. Even more challenging are the frequent requests from teachers, tenants, and office workers. While not having direct authority over the janitor, these people commonly assume that they can make demands, too, in part because they feel socially superior. Learning to deal with, and manage, the building's users has typically been one of the janitor's greatest challenges. Thus, janitorial work can often demand levels of intelligence, self-discipline, and maturity that exceed considerably the occupation's menial status and low pay.

The Workers

Janitorial jobs have typically attracted recent immigrants and African-Americans. The ethnic and racial characteristics of male janitors in 1900 set a pattern that has largely remained: about 35% were immigrants, and another 15% were the children of immigrants. Thus, half were immigrants and their offspring. Just over 20% were African-Americans, leaving 30% American-born whites of native-born parents. This basic pattern of an occupation dominated by first- and second-generation immigrants and African-Americans has persisted. The origins of the foreign-born janitors have, of course, changed dramatically. While immigrant janitors formerly came from Europe, in the late twentieth century they typically came from Latin America.

African-Americans have been notable for their early and persistently strong representation in the occupation. African-Americans constituted over a fifth of janitors well before the Great Migration out of the South that began during World War I, and they still make up 20% of janitors and cleaners (see Figure 1).

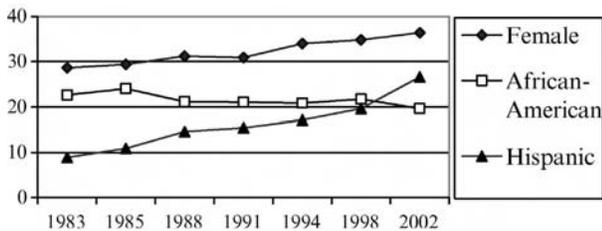

Figure 1. Janitors and Cleaners by Sex, Race, and Hispanic Origin: 1983 to 2002.

A service occupation, janitorial work has fit with similar economic niches where, from an early date, African-Americans have earned a living in cities, such as waiting, barbering, and domestic service. Since janitorial work has grown rapidly, it became a substantial field of opportunity, especially for African-American males.

The representation of women in the janitorial workforce has changed significantly. In 1900, women made up about 14% of janitors. Today, they constitute over 35% of the workforce, and their proportion is expected to increase significantly in the future. The rise in the proportion of female janitors and cleaners is a reflection of the historic movement of women into the gainfully employed workforce during the last 40 years. Cleaning contractors have contributed to this larger trend by specializing in hiring women, particularly Hispanics. The rise of the cleaning contractors has reduced the number of traditional unionized janitorial jobs, where African-American males have been strongly represented. This development helps explain why the proportions of women and Hispanics have trended upward together in the janitorial workforce, while the percentage of African-Americans has decreased.

The age of janitors helps account for their historically prominent role in labor organizing. The occupation has traditionally attracted a substantial proportion of middle-aged men. A study of Missouri's school janitors in the 1930s found that their average age was 49. In 1998, 42% of janitors and cleaners were 45 years old or older. Since janitors perform light physical labor, the occupation has attracted manual workers who can no longer perform in more physically demanding jobs in fields such as construction or mining. The stability of the occupation has added to its attractions to older workers. In addition, traditional janitorial work has required maturity and social skills that come with age. At the same time, the low status and pay of janitors have meant that the occupation is not the first choice for workers. Thus, janitorial work has attracted older workers often with considerable background in other occupations, including experience with the trade unions. Even if such workers were only a minority among janitors, they have formed an experienced and reliable constituency for supporting unions.

The Industry

Since all buildings need to be cleaned and maintained, janitors and cleaners work across a range of industries. In 2003, local government, most notably school

systems, hired over 20% of janitorial workers. Janitors employed by the federal government and by all colleges and universities together constituted another 5%. The remaining 75% worked primarily, though not exclusively, for private industry in residential buildings, offices, and hotels—that is, in the building services industry as traditionally understood.

Throughout its history, building services has been a metropolitan industry, which means first of all that its markets—including the one for labor—have been defined by cities and their economic hinterlands. Like other metropolitan industries, such as construction, building services has been characterized by numerous small- to medium-sized businesses, as well as, of course, some large ones. The apartment industry is the most obvious example, characterized by hundreds, if not thousands, of individual owners, even when national corporations may own the largest buildings in town.

The numerous businesses owning and operating buildings not only compete with each other but also try to manage their metropolitan markets. Historically, for example, they have tried to maintain a stable level of advantageous prices, which usually has required limiting access to their markets from outside competitors. Maintaining a price level also means disciplining local businesses that undercut it. Businesses' cooperative efforts to achieve these goals have typically been unstable, particularly because of the diverging interests between small and large firms. Unions have played a complicated role in the metropolitan building service industries, fighting for higher wages and better working conditions, while also sometimes cooperating to maintain agreed-upon price levels by, for example, disciplining businesses that pay below scale. When janitors' unions have gained control of the labor market in a metropolitan area, they have helped stabilize competition among building owners by putting a floor under wage reductions to gain cost advantages.

The substantial growth of contract cleaning firms in the last third of the twentieth century has brought a new level of competition to the building service industry and challenged the dominion of unions. The cleaning firms fit the mold of a metropolitan industry. In 2002, the nation had 51,345 firms providing janitorial services, and they hired more than 45% of the over 2 million janitors and cleaners. Although there were some large firms, these businesses employed an average of 18 workers. Also fitting the historical mold of the building service industry, the contract cleaners gained a competitive advantage by opposing unions and exploiting immigrants, in this case particularly, Hispanic women. Because the contract cleaners can provide cleaning services below the cost of unionized

janitors, they have started a trend toward outsourcing janitorial cleaning tasks.

Notably, however, because the buildings being serviced cannot be moved, these janitorial tasks cannot be outsourced overseas. Metropolitan markets are also subject to local political influence. These are two advantages to unions in an industry that is otherwise difficult and expensive to organize.

Unions and Politics

The dispersal of janitors across a metropolitan area has made organizing them complex and costly. The same dispersal has made their development of collective identities difficult. In addition, the numerous modest-sized employers in the industry require unions to confront and bargain with a host of businesses instead of a few. For much of the twentieth century, it was common for one janitor to service several residential buildings, often with different owners. Thus, the unions had to deal with more employers than they had members. The employment of a substantial minority of janitors by various governmental bodies has created further problems for unions, because government employees work under different laws and regulations.

These structural problems have helped push janitors' unions into politics from their earliest days. Most obviously, unions organizing publicly employed janitors have found political influence one of the few reliable means for aiding their members, since government workers have typically lacked legal collective bargaining rights, attaining them only since the 1960s. More generally, unions have used local politics to influence the real estate industry in which their members work. Historically, local governments have profoundly shaped the owners of real estate through court decisions, public works investment, zoning, building codes, and various health and safety regulations. Thus, gaining influence with these governments has been a means for shaping an often fragmented and complex industry. Ironically, the dispersal of the membership has aided the political influence of unions because they have members spread across political jurisdictions who know the local area intimately and engage in basic political work under the unions' central direction. In Chicago, the janitors' local was one of the most effective grassroots political organizations in the city.

Stable janitors' unions formed first in Chicago under the leadership of William F. Quesse, the native-born son of German immigrants. Quesse's local achieved a citywide contract in 1917 and went on to form the

core of the new Building Service Employees International Union (BSEIU) in 1921. Other cities represented among the charter members were New York, Boston, St. Louis, and Seattle. Also from Chicago was a local of female school “janitresses.” Quesse’s Local 1 remained the center of power in the International for the next several decades. In the 1930s, Local 1 came under the influence of an alliance of Chicago and New York mobsters, who installed New Yorker George Scalise as head of the International. After Scalise was successfully prosecuted in the early 1940s, William McFetridge, Quesse’s nephew, took over the leadership of both Local 1 and the International. Whereas Quesse supported a local Republican faction, Local 1 under McFetridge allied with Richard J. Daley’s Democratic machine.

Both Local 1 and the International prospered after World War II. In 1968, the BSEIU changed its name to the Service Employees International Union (SEIU) to acknowledge its expanded organizing among health-care and government workers. In 2004, the SEIU had 1.7 million members across the United States, Canada, and Puerto Rico, making it the largest union in the AFL-CIO, as well as the source of some of its most energetic and innovative leadership. In 1995, John J. Sweeney moved from international president of the SEIU to president of the AFL-CIO. The SEIU has taken the lead in organizing the largely immigrant workers in the contract cleaning industry. Its Justice for Janitors campaign in the 1990s became a model for contemporary union organizing by mobilizing local communities to exert political pressure within metropolitan areas such as Washington, DC and Los Angeles.

JAPANESE STRIKE IN HAWAII (1909)

Between May and November of 1909, nearly seven thousand Japanese workers struck sugar plantations on O’ahu in the territory of Hawai’i. The strike was instigated by a group that called itself “The Higher Wage Association.” The Association was led by a small group of local intellectuals and writers, Motoyuki Negoro, Yasutaro Soga, and Kinzaburo Makino, who launched a campaign to increase the pay and improve working and living conditions of the largely Japanese workforce. The strike was a watershed in Hawai’i labor history because it was the first organized mass walkout of workers in the sugar industry. The strike united workers on many plantations and garnered the support of laborers on other islands and local business, trade, and union organizations. The strike also helped to consolidate the power of the Hawaii Sugar Planters’ Association (HSPA), which represented all of the sugar plantation owners in the territory. Both sides used the power of the

press to spread their messages, pitting Japanese- and English-language newspapers against one another in a war of words. Although the strike was eventually broken, the HSPA later conceded to many of the demands made by the striking workers, leading to higher pay and improved living conditions on the plantations.

The sugar industry in Hawai'i was established in the early 1840s. The industry enjoyed rapid growth after 1887 when the Kingdom of Hawai'i signed a reciprocity treaty with the United States guaranteeing Hawai'i's sugar duty-free entry into American ports. Because of years of depopulation due to introduced disease, the local Hawai'ian population was insufficient to provide enough labor for the industry. Sugar plantation owners, working in cooperation with the Hawai'ian government, began importing laborers from Asia, first China and, by the late nineteenth century, from Japan. During the first decade of the twentieth century, Japanese workers represented more than half the local workforce on sugar plantations.

Hawai'i plantation owners enjoyed a far-reaching control over their workers. According to Kingdom law, under the Masters and Servants Act, employees could be restricted to the plantation, could be jailed for failing to fulfill the terms of their contract, and enjoyed little to no legal recourse in the case of a dispute with an employer. After 1900, as a territory of the United States, the terms of labor contracting underwent liberalization, but Japanese immigrant workers were still subject to the dominion of plantation owners and managers. Workers were vulnerable to arrest, imprisonment, or deportation if they protested conditions on the plantations too strenuously.

Prior to 1909, labor strikes in Hawai'i were often spontaneous acts of resistance to the abuses of a *luna* (foreman) or a means to resolve a dispute over pay on a specific plantation. The 1909 strike was the first organized strike aimed at changing living and working conditions for all workers in the industry. Although it was confined to O'ahu, it was supported by plantation workers throughout the territory.

The 1909 strike was provoked by a call for higher wages. In July of 1908, Motoyuki Negoro published an editorial in *Nippu Jiji*, a Japanese-language newspaper in Honolulu. Negoro noted that the industry was enjoying an unprecedented level of profits and that workers had a right to share in those profits. The debate over higher wages continued throughout the year, eventually culminating in a meeting of the Japanese community leaders to discuss the issues. Those who wished to press ahead formed the Higher Wages Association and proceeded to formulate a set of demands to present to the Hawaii Sugar Planters' Association.

The petition presented to the HSPA documented the hardship of workers trying to survive on an average wage of 14 dollars a month. In addition to wage demands, the Higher Wage Association also stipulated that the HSPA address the substandard living conditions on the plantations. It called for an eight-hour workday, improved housing, sanitary and bathing facilities, and larger quarters to accommodate growing families. The petition also demanded an end to race-based wage scales that paid Japanese workers less than Portuguese and white workers.

The HSPA studiously ignored the demands of the workers as outlined in the petition. It refused to acknowledge or negotiate with the Higher Wage Association and instead began to plead its case before the public in the English-language press. It warned the white community of the potential for anarchy and unrest in the territory and suggested that the strike organizers were radicals, possibly Communists.

The strike began on May 5 when workers at Wai-pahu plantation presented their demands to local management. On May 9, 1,500 workers in Aiea walked off the job. By the end of the month, the Higher Wage Association estimated that 7,000 workers were striking all O'ahu plantations. The HSPA responded quickly; as an organization, it privately pledged to share the cost of the strike amongst its members so that no one plantation owner was vulnerable to excessive financial loss. Striking workers were kicked out of plantation-owned housing and charged with trespassing if they re-entered the premises. Plantation owners hired replacement workers from the Korean, Hawai'ian, and Portuguese communities, sometimes paying twice the going daily rate. The HSPA employed spies within the Higher Wage Association and used its influence in local government to harass the strike leaders. In June, the leadership of the Higher Wage Association and sympathetic writers and editors of the *Nippu Jiji* were arrested and charged with conspiracy. In August, they were convicted and sentenced to 10 months in prison and fined \$300 each. Although they were eventually pardoned and released from jail, the HSPA demonstrated its potential power over union organizers because of the control it exercised over local government.

The arrest and imprisonment of the leaders crippled the strike. The strike fund was insufficient to take care of the thousands of workers and their families who, having been ousted from their plantation housing, were living in parks, beaches, and warehouses in Honolulu. On August 5, 1909, the Higher Wage Association voted to return to work.

In the months and years following the strike, the HSPA gradually conceded to many of the demands made by the strikers. It made incremental shifts in

wage scales and instituted measures designed to make plantation camps more livable. The strike demonstrated the willingness and ability of workers to organize against the formidable power of the HSPA.

JEWISH LABOR COMMITTEE

The Jewish Labor Committee (JLC) formed in 1934 as a direct response to the Nazi seizure of power in Germany the preceding year. Its founders, composed of leaders from within the ranks of Jewish labor, sought to mobilize the general American labor movement to fight against fascism. In the years after the defeat of Nazi Germany, the JLC broadened its agenda on several fronts, including assisting survivors of the Holocaust, strengthening labor movements abroad, and fighting prejudice in the United States.

When the Nazis seized power in 1933, several American Jewish labor leaders convinced the American Federation of Labor (AFL) to call for a boycott of German products. Most American Jewish groups, such as the American Jewish Committee, believed a boycott would only lead to Nazi reprisals against German Jews or worse, an outbreak of anti-Semitism in the United States. Jewish labor leaders dismissed these concerns, and in 1933, convinced AFL leaders to call for the boycott. These Jewish labor leaders believed it necessary to create a permanent body to deal with this threat, and in February 1934, the JLC was created to develop more lines of attack against fascism and provide support for the victims of fascism.

The JLC formed with representation from the most powerful forces in the Jewish labor movement, most notably the International Ladies' Garment Workers' Union, the Amalgamated Clothing Workers of America, the United Hebrew Trades, the Workmen's Circle, and the Jewish Daily Forward Association. Its agenda consisted of four primary goals: raise awareness among the American public about the fascist threat, aid refugees of fascism, provide material and moral support for groups fighting fascism, and defend Jewish rights throughout the world.

At the AFL's 1934 convention, the JLC's president and founding member, Baruch Charney Vladeck, addressed the American Federation of Labor's annual

convention and convinced AFL leaders of the need to create a special fund called the Labor Chest. The money from this fund was designated to assist refugees as well as promote various projects the JLC deemed necessary to educate the general public on the fascist threat.

In 1936, the JLC organized one of the largest of these projects. It sought to divert attention away from the Olympic Games in Berlin by organizing the World Labor Athletic Carnival at Randall's Island in New York, featuring athletes who did not wish to participate in the Berlin games. This "counter-Olympics" attracted prominent figures in labor and politics to serve as honorary chairpersons of the games, including the New York governor, Herbert Lehman, the New York City mayor, Fiorello LaGuardia, and the AFL president, William Green.

During World War II, the JLC succeeded in three major endeavors despite the immense obstacles created by the war. First, it made contact with underground forces in Nazi-occupied Europe and sent funds to assist them in fighting the Nazis. Second, it established a committee in New York composed of exiled European trade-union leaders, which maintained contact with partisans in Europe. Third, the JLC lobbied the U.S. government to provide visas for over a thousand European leaders in politics and culture, both Jewish and non-Jewish, and attained for them safe passage to the United States.

With the end of the war in 1945, JLC leadership believed the fate of Jewish children in postwar Europe needed to be addressed. Accordingly, it established the Child Adoption Program, which sought to provide these children with necessities such as clothes and food packages in addition to school supplies and toys. The program's leaders requested that union shops, locals, fraternal societies, or even individuals "adopt" a child for \$300 each year.

Throughout the war years, the JLC supported Jewish immigration to Palestine as a practical solution to the refugee problem, especially since Congress refused to make exceptions to the immigration restriction laws of the 1920s. Yet, within the JLC, divisions among members over the issue of Zionism prevented the JLC from endorsing a Jewish state in Palestine until 1948. Most JLC members hailed from the Bund or General Jewish Workers' Union of Lithuania, Poland, and Russia. Bundists opposed nationalist movements such as Zionism as distractions from the socialist enterprise. Nonetheless, by the end of World War II, the realities of the Holocaust led most JLC members to view a Jewish state in Palestine as the only hope for Jewish survivors in Europe. By 1947, JLC leaders worked diligently to secure the votes

within the United Nations supporting the partition of Palestine. With Israel's creation in 1948, the JLC spent the next few decades lending financial and moral succor to the Jewish labor movement in Israel and helping to develop Israel's infrastructure.

In addition to aiding Israel, the JLC implemented several plans to assist the survivors of the European war, including non-Jews. It sent clothing and food in mass quantities to European survivors, helped reunite families separated during the war, built libraries, and provided shelter and food for children who lost their parents during the war. Domestically, the JLC developed educational programs to inform American workers on issues of prejudice. These programs, which received support from the general American labor movement, began a long-term commitment by the JLC to civil rights.

Initially, the JLC set up several committees at the local level in the United States and Canada designed to battle prejudice. Eventually, it assisted in the creation of civil rights departments in several national unions in both countries, which led ultimately to the formation of the AFL Civil Rights Department. During the 1960s, the JLC also played a role in the creation of the United Farm Workers.

Although founded as a reaction to the rise of Nazi fascism, the JLC became a pro-active organization dedicated to strengthening ties between labor and the Jewish community. Its actions before and during World War II demonstrate that Jewish and labor activists worked together in preventing, and later, alleviating the effects of Nazi persecution. Over time, the JLC expanded its agenda beyond the Jewish community to the national and international arena, leaving an indelible mark on the American labor movement and the Jewish community.

JEWS

During the twentieth century, the Jewish labor movement in the United States played a transformative role in the American labor movement. With the mass arrival of Eastern European Jews to the United States in the late nineteenth and early twentieth centuries, a new influx of Jewish workers entered the American labor force and brought a new sensibility to organized labor. After Jews were initially ostracized from the American labor movement by Gentile members resentful of the newcomers, Jews steadily worked their way to acceptance and helped implement new approaches and innovations to trade unionism and labor/management cooperation. Most of the Jewish influence within the American labor movement centered in the garment industry and in urban centers, especially New York, Chicago, Boston, and Philadelphia. By the mid-twentieth century, the number of Jewish rank-and-file workers diminished, but Jewish leadership within the American labor movement remained influential for the rest of the century.

The first masses of immigrant Jewish laborers found themselves generally blocked from entry into unions belonging to the American Federation of Labor (AFL), the dominant labor federation at the turn of the twentieth century. Through a combination of obstacles, including high initiation fees, approval from union leaders for membership, or insistence on a foreign union card, Gentile union leadership generally blocked the entry of new Jewish arrivals. Through perseverance and the assistance of important allies such as the AFL president, Samuel Gompers, Jews began making headway into the American labor movement by the 1890s. Still, resistance to their presence remained through the early twentieth century.

By the 1920s, Jewish labor suffered through a tumultuous decade of strife caused by communist agitation within the garment industry and the increased influence of organized crime used by both management and union leadership to intimidate foes. These two elements would be subdued by union leaders during the 1930s, however, and the New Deal legislation of President Franklin Roosevelt's administration opened up new opportunities for American labor to thrive. Jewish labor leaders recognized the opportunities offered first by the National Recovery Act (NRA) and then by the Wagner Act, and they introduced new innovations to American trade unionism that would set a new standard for labor-management practices. Jewish-led garment unions, such as the Amalgamated Clothing Workers of America (ACWA) and International Ladies' Garment Workers' Union (ILGWU), created the first cooperative housing projects, pension and welfare funds, worker

education institutes, and union health centers. Additionally, they provided funding for fellow labor movements outside the United States and became politically engaged in the civil rights movement of the 1950s and 1960s. In New York State, Jewish labor leaders formed two third parties, the American Labor Party (ALP) and the Liberal Party of New York, both of which shaped the state's political landscape for decades. Throughout the mid-twentieth century, Jewish labor leaders applied this expansive vision, inspired by the revolutionary movements of their youth in Eastern Europe, to the American labor movement. In the process, they played a major role in the evolution of the American labor movement from a "bread-and-butter" unionism to a movement encompassing a broader social vision for American society.

Origins of a Movement

Defining "Jewish unions" is problematic. Although many of the early garment unions based in New York City during the late nineteenth century consisted of Jewish majorities among workers, by the early twentieth century, union demographics had shifted. For example, the ACWA, one of the most powerful

garment unions during the twentieth century, originated under a predominantly Jewish membership. By the 1920s, however, this Jewish predominance diminished as Jews came to comprise just under half of the ACWA's membership. By the turn of the twentieth century, even the United Hebrew Trades (UHT), an organization founded in the 1880s explicitly to assist Jewish workers, accepted non-Jewish members and found that at various points during the 1930s, nearly half of its members were not Jewish.

Despite the demographic changes in union membership, however, Jewish leadership in these unions remained constant throughout the early and mid-twentieth century. Even with the large number of women comprising garment workers, the executive boards remained predominantly male and Jewish. By the mid-twentieth century, many Jewish garment workers had worked their way into the middle class, or at least their children breached it. Yet for decades, Jewish leadership remained entrenched, leaving a profound imprint on the American labor movement years after the number of rank-and-file Jewish unionists had dramatically diminished.

The dominance of Jewish leadership in the garment unions came only after a long struggle to create a labor movement among Jewish immigrants. During the 1880s, Jewish immigrants typically sought upward mobility as fast as possible, and therefore, never

cultivated a strong trade-union movement. Many Jewish garment workers saw themselves as future employers and rarely engaged in the communal struggles necessary to form a vibrant and cohesive labor movement. In the early 1900s, the majority of the hundreds of thousands of garment workers in New York remained unorganized, and those unions that existed operated with minimal energy. Additionally, most of them had little connection with other American workers and little exposure to socialism. Thus, few immigrant Jews possessed a class-consciousness capable of sustaining a trade-union movement.

After 1905, this mentality changed rapidly. The second generation of Eastern European Jewish immigrants hit the shores of America with a bubbling romanticism for socialist ideals bred by revolutionary ferment in late nineteenth- and early twentieth-century Eastern Europe. Most arrived fresh from the abortive 1905 Russian Revolution, which despite its failure, left veterans of the revolt hopeful of applying their socialist vision in the United States.

This vision clashed, however, with the dominant attitude of the native, American labor movement, composed of non-Jewish workers. During the late nineteenth century, leaders of the emerging AFL embraced a labor philosophy known as “bread-and-butter” unionism. AFL leaders stressed wages, hours, and working conditions, shunning broader visions of social transformation. Many of the Jewish immigrants, imbued with socialist ideology, found this “bread-and-butter” unionism wanting. Their commitment to socialism encouraged workers to strive for a broad social vision that encompassed social insurance, government activism, and racial equality, all things anathema to AFL leaders of the early twentieth century. By the early 1900s, despite AFL resistance to such an expansive agenda, Jewish garment workers began to coalesce around the radical doctrine of their Eastern European homelands. They spent the first two decades of the twentieth century forming unions or strengthening previously existing ones.

The Jewish labor movement was not limited to the large memberships within the garment unions. Jewish workers also created labor organizations and associations to address their socialist vision such as the United Hebrew Trades. Founded in 1888, the UHT helped immigrants seeking food, shelter, and work, and provided financial support for sick workers, offered recreation opportunities, and educated workers in socialist principles. Additionally, by the early 1900s, Jewish workers formed fraternal organizations, most notably the Workmen’s Circle (*Arbeiter Ring* in Yiddish), to promote social interaction and offer economic assistance and educational opportunities.

Jewish trade unionists also found assistance in many cases from Jewish community leaders. During the late nineteenth century, the mass arrival of Eastern European Jews to the United States raised concern among Jews already living in the country. Unlike Jewish immigrants of the mid-nineteenth century, many of whom came to the United States with some money and quickly assimilated, these new Jewish immigrants appeared quite foreign to most Americans and did not seem as readily assimilable as their predecessors. Despite these concerns among American Jews, some efforts were made to assist these new arrivals in their transition to life in the United States. Since many of these immigrants would be working in factories, notable American Jews sought to make their transition as smooth and quiet as possible. Some Jewish manufacturers tried to keep labor strife quiet by working with the newcomers in addressing labor issues. Additionally, Jewish community leaders sought to avoid trouble between manufacturers and workers by mediating disputes. In 1911, for example, Louis Brandeis arbitrated a cloakmakers’ strike and drafted the protocol of peace, which helped establish a cooperative relationship between labor and management within the garment industry. Although many battles emerged between Jewish management and labor during the century, this attitude of quiet mediation and cooperation played a major role in allowing the Jewish labor movement to grow in an otherwise hostile environment.

The rising number of Jewish garment workers in the United States made it difficult for native garment union leaders to prevent them from joining their unions. Many native garment workers viewed these Jewish newcomers as aliens with radical beliefs, potentially undermining the garment unions. Even so, by World War I, Jewish-led labor battles had gained Jewish workers entry into established unions and had created new organizations such as the ACWA. The ILGWU emerged as a force in the garment industry after a 1909 strike among shirtwaist makers in New York known as the “Uprising of the 20,000.” This strike marked the emergence of the ILGWU. Its gains continued in 1910 as a cloakmakers’ strike, called the “Great Revolt,” earned workers a 50-hour workweek, minimum wages for certain workers, and a Joint Board of Sanitary Control. Such hard-fought strikes won respect from AFL leaders. By the 1920s, as most Jewish labor leaders traded the radicalism of their youth for a more reform-minded approach to labor-management relations, they began to enjoy growing influence with the AFL. Yet, as the 1920s began, ideological conflicts within the Jewish labor movement and confrontations with organized crime nearly destroyed the Jewish labor movement in its nascent stages.

The 1920s: Struggles on Two Fronts

Despite Jewish labor's growing influence within the American labor movement, the 1920s proved a tumultuous decade for Jewish labor generally as communists engaged right-wing socialists in internecine conflicts that led in certain cases to destructive strikes, especially a 1926 strike that nearly destroyed the ILGWU. Additionally, organized crime entered the garment industry in growing numbers, with gangs working as strikebreakers for some manufacturers and strike enforcers for some labor unions.

Communism made major inroads within the Jewish labor movement during the decade, and many communists took an active role in union activities, including running for elected positions within the unions. Although the left wing of the Jewish labor movement also included anarchists and left-wing socialists, it was the communists whom union leaders such as Morris Sigman, David Dubinsky, and Alex Rose sought to purge from the garment industry. After anticommunist Jewish labor leaders actively sought the removal of communists from influential positions within the garment unions, the communists found themselves in retreat by the end of the decade. Still, the financial and psychological damage done to some garment unions, especially the ILGWU, lasted for years to come.

Organized crime also played a role in this weakening of the garment industry during this decade. Both manufacturers and unions hired gangsters from different gangs to work as "muscle" in either breaking strikes and protecting scabs or protecting picketers and attacking scabs. During a 1926 strike that paralyzed the garment industry, only the intervention of Arnold Rothstein, the influential gambler with mob connections, could successfully convince the gangs involved to cease their activities. This opened the way to a settlement but did not end mob influence within the Jewish labor movement. Mobsters infiltrated the trucking unions within the garment industry as well as some locals. By the early 1930s, Jewish labor leaders such as Sidney Hillman and David Dubinsky worked diligently to purge the mob from their unions. Their efforts met with generally good results, but some level of mob influence lingered for years to come.

A New Era

The 1930s proved both a successful and divisive era for Jewish labor. On the one hand, President Roosevelt's New Deal brought legal recognition to the labor

movement through the Wagner Act as well as significant measures to protect union organizing. Concurrently, however, the labor movement fractured over the issue of organizing unskilled labor. Many Jewish labor leaders, including Sidney Hillman of the ACWA, David Dubinsky of the ILGWU, and Max Zaritsky of the United Hatters, Cap, and Millinery Workers' Union (UHCMWU), joined the Committee of Industrial Organizations (CIO) in an effort to organize the multitude of unskilled labor in the United States. Many AFL leaders feared losing bargaining leverage if they organized unskilled workers, whom management could easily replace with scabs. They preferred to focus their energies on skilled workers, much to the chagrin of Jewish labor leaders, who believed such a mentality to be parochial and out of touch with reality. For several American labor leaders, several of them Jewish, the future of the American labor movement lay with industrial unionism and the organizing of the unskilled laboring masses.

During the 1930s, Hillman, Dubinsky, and Zaritsky, along with John L. Lewis (the president of the United Mine Workers) and Charles P. Howard (the president of the International Typographical Union), pressed for the AFL to aggressively organize industrial workers, the labor movement's most energetic fighters during the 1930s, for major changes in worker-management relations. Prior to this period, industrial unionism remained stagnant on the AFL leadership's agenda, but by the 1930s, these labor leaders argued vehemently for the mass organization of industrial workers. In 1935, AFL apathy led Lewis, Howard, Hillman, Dubinsky, and Zaritsky to create the Committee for Industrial Organizations. They worked with AFL locals to convince the old craft unions that they could co-exist with industrial unions. By the late 1930s, fractures within the CIO over fears of dividing the labor movement led Dubinsky and Zaritsky to attempt peacemaking between CIO and AFL officials. They implored the AFL leadership to recognize the need for mass industrial organization while attempting to convince CIO leaders of the need for accommodation. Although Jewish labor leaders could not bridge this divide for nearly two decades, they served in the forefront of American labor's recognition of the need for mass industrial organization. While the ACWA remained in the CIO throughout the 1930s and 1940s, the ILGWU and UHCMWU rejoined the AFL by the 1940s.

With the onset of U.S. entry into World War II by 1941, the entire American labor movement experienced full employment. After the war, American labor enjoyed its greatest period of influence and prosperity. During this time, the Jewish labor movement played an important role in New York and national

politics as well as supporting the international labor movement. The American Labor Party, founded in 1936 to support President Roosevelt's re-election, became a permanent New York state party dedicated to the ideals of the New Deal. After communists gained significant control within the party, right-wing socialists and liberals left the ALP to create the Liberal Party of New York. Both parties played influential roles in local New York politics and presidential elections during the mid-twentieth century.

Internationally, Jewish labor leaders worked through international labor organizations such as the International Confederation of Free Trade Unions (ICFTU) to strengthen free labor movements throughout the world. Additionally, garment unions provided direct assistance to several nations where labor movements sought aid, especially in Israel. Even before World War II, the Jewish labor movement assisted the Jewish labor movement in Palestine, known as the Histadrut. After the war, this assistance increased dramatically after the complete revelation of the Holocaust. Through generous donations, the Jewish labor movement helped the nascent state of Israel develop infrastructure and housing as well as lobby U.S. politicians to support Israel politically and financially.

The Decline of a Movement

By the 1960s, the Jewish labor movement moved into a steady decline as more and more children of union leaders and rank-and-file workers entered white-collar positions. David Dubinsky's retirement as the president of the ILGWU in 1966 signaled the end of an era. A continual increase in non-Jewish minorities ushered in a new era in the garment industry as Jewish labor leaders retired or died in office. Although some notable Jewish labor leaders continued to make an impact on the AFL-CIO's fortunes during the late twentieth century, an era of Jewish labor influence had passed. Yet, this influence, despite its eventual demise, left an immense impact on the American labor movement, both past and present.

JOHNSON-REED (IMMIGRATION RESTRICTION) ACT (1924)

In enacting the Johnson Reed Immigration (Restriction) Act of 1924, Congress responded to a half century of concern about immigration. The legislators banned nearly all immigration from Asia and severely curtailed immigration from Southern and Eastern Europe through a system called "national origins." Newcomers from Africa were also limited to small quotas. The Western Hemisphere was left without numerical limits, but even that migration was brought to a near halt during the lean years of the Great Depression.

Asians

Prior to 1875, states managed immigration, but that practice ended when the United States Supreme Court held it to be a federal matter. Following that decision, federal lawmakers passed the Page Act in 1875, which barred prostitutes from coming to America. Seven years later, Congress went further and banned the entrance of Chinese laborers. The law responded to labor agitation against Chinese immigrants in California and growing racism in the United States overall. Racists argued that the Chinese were an inferior and unassimilable people who worked for virtual slave wages and depressed the American wage scale. Chinese merchants and their wives, students, and diplomats could still come to the United States, but the vast majority of potential migrants were barred.

When Japanese immigrants appeared in Hawaii and California, Californians created a diplomatic problem for President Theodore Roosevelt. The San Francisco school board announced that Japanese students were to be segregated. In 1907, President Roosevelt negotiated a diplomatic agreement with Japan (the Gentleman's Agreement) in which the federal government pressured the school board to reverse

its decision and the government of Japan stopped allowing Japanese laborers to sail for America.

Other Asians faced similar hostility and racism. For example, Asian Indians were banned in 1917. Eventually, the Johnson-Reed Act barred virtually all Asians. Filipinos, who migrated to Hawaii and the mainland United States largely as agricultural workers, were not covered by the law. However, during the Great Depression, Congress gave them an annual quota of only 50. After 1945, when the Philippines became independent, they would no longer be eligible to migrate to the United States.

Europeans

Although the 1924 law banned nearly all Asians, the chief goal of the legislators was to curtail European immigrants, especially the largest source of immigrants after 1890: those from Southern and Eastern Europe. By 1910, nearly 15% of the American population was foreign-born. World War I did decrease immigration substantially, but after the war the large-scale movement of people to America renewed, and it increased the alarm of those who believed these newcomers were a danger to the United States.

By the 1920s, the calls for European immigration restriction could no longer be ignored. Business groups still wanted their labor for the growing industries of the United States, but labor leaders, such as Samuel Gompers, saw immigrants as competitors. Some Progressive reformers believed that the burgeoning immigrant communities supported corrupt urban bosses. A revived Ku Klux Klan saw many threats to American society, among them Roman Catholic immigrants and Jews, especially those from Russia and Poland, who, according to anti-Semites, could never successfully assimilate. After the Civil War, white southerners favored immigrants as workers, for many believed that blacks would not be reliable farmworkers. White southerners attempted to recruit Europeans and even Chinese, but these efforts proved to be unsuccessful. As a result, after 1900, southern white politicians turned against immigration, largely using racist arguments. Then World War I released a flood of anti-immigrant sentiment, as did the Russian Revolution of 1917. During World War I, German-Americans were persecuted, and immediately after, many “radical aliens” were rounded up and deported. This was not an unpopular move; many Americans feared that immigrants would import radical sentiments to America.

The rise of nineteenth-century racism crystallized in the “eugenics movement,” which held that certain

groups were inferior. This played a key role in the growing movement to restrict immigration from Europe as well as Asia. By 1900, a variety of academics, politicians, and popular writers were warning that the basic ethnic fabric of American society was in danger due to the “pollution” of America’s demographic stock. The new racism acknowledged that Europeans were all white, but were whites of different abilities. Those who came before the late nineteenth century—the English, Scots-Irish, Scots, Germans, and Scandinavians—were deemed acceptable because of their alleged innate superiority. Even the Irish, who had been the victims of nativism in the nineteenth century because of their poverty and Catholicism, were becoming part of the desirable immigrant stream.

Among the popular eugenics writers was Madison Grant, the author of a popular 1916 book titled *The Passing of the Great Race*. Grant believed that the early Americans were from the Nordic race, but that that stock was now being diluted by mixing with those who came in later years.

Psychologists also took up the role of claiming that the Nordics were superior by nature. Carl Brigham of Princeton University, using the mental intelligence tests of the United States Army uncritically, said these tests proved that the Nordic or Old Stock Americans scored higher because they were naturally superior.

When barring Chinese beginning in 1882, Congress had also enacted a number of restrictions on other immigrants, such as persons “likely to be a public charge” (1891) or persons with certain diseases such as trachoma. Convicts were also added to the banned list, as were anarchists following the assassination of President William McKinley in 1901.

These growing restrictions kept few immigrants out; at Ellis Island 98% of Europeans managed to pass inspection and become legal immigrants. In the 1890s, a new anti-immigrant organization formed with a plan to cut the flow. The Immigration Restriction League, composed of elite Bostonians, suggested that a literacy test was needed for newcomers. The test would ban those over age 16 who could not read and write either English or their native tongue. In 1907, Congress created the Dillingham Commission, which echoed the recommendation. The literacy test passed in Congress, only to be vetoed by presidents Grover Cleveland, William Howard Taft, and Woodrow Wilson. Finally, in 1917, on the eve of the American entrance into World War I, Congress marshaled enough votes to override President Wilson’s veto. Yet many Italian, Slovak, Greek, and Slavic immigrants, who would have had difficulty passing the exam in the 1890s, were more apt to be literate by the 1920s. In 1921, 805,000 immigrants passed through Ellis Island

and other ports of entry, with the prospect of millions of others wanting to come to America. If they were to radically reduce the flow, lawmakers had to find new ways, which they did in enacting the Johnson-Reed Act of 1924.

In 1921, Congress passed a one-year measure that limited immigration from the Eastern Hemisphere to approximately 350,000 annually, with each nation having a share based on its proportion of the foreign-born population of 1910. The act was extended the next year. Those who wanted more drastic cuts persuaded the legislators to cut the total and use 1890's foreign-born population as the base line. Because so few Southern and Eastern European immigrants had arrived before that date, the new law drastically reduced their immigration.

Although the restriction was extended several times, ultimately the national origins quotas used the 1920 census numbers, but the proportion was finally based on the entire white population and not simply the foreign-born. The change gave Southern and Eastern European nations more places than by using the 1890 figures. However, the quotas that went into effect in 1929 and that lasted until 1965 gave Great Britain, Germany, and Ireland over two thirds of the total of approximately 150,000 slots. Italy had fewer than 6,000 places, and Greece had only a few hundred, which was exactly what Congress and the administration intended. Using the population-derived formula, some nations had so few slots that the legislators gave them a minimum of 100.

The Western Hemisphere

The Johnson-Reed Act did not give the Western Hemisphere an overall limit or establish individual national quotas. Some in Congress insisted that Mexicans were just as inferior as Poles or Italians. Congress instead listened to the State Department, which said that quotas for the Western Hemisphere would hurt American foreign policy, and to agricultural interests, who claimed that Mexicans were needed to labor on American farms. Persons from the Western Hemisphere still had to pass a literacy test, pay a head tax, and satisfy other provisions of the immigration laws, but these were easily done. And if Mexicans and Canadians could not meet the requirements, many easily crossed the border, albeit illegally. There was no border patrol until 1924, and even after that date it was more interested in keeping liquor from flowing into the United States and catching Asians who were trying to evade immigration ports. However, during the Great Depression of the 1930s, federal, state, and

local officials rounded up and deported several hundred Mexicans and their children, many of whom were American-born United States citizens, and shipped them back to Mexico. Many Europeans also faced difficulties in attempting to enter the United States during those years. Only 500,000 persons managed to gain entrance to America in the 1930s.

JOINT COUNCIL OF DINING CAR EMPLOYEES

During the 1930s, African-American railroad workers engaged in unprecedented union-organizing campaigns, the results of which were the formation of new, powerful labor associations. In this era, three substantial unions emerged: the Brotherhood of

JOINT COUNCIL OF DINING CAR EMPLOYEES

Sleeping Car Porters (BSCP), which was affiliated with the American Federation of Labor (AFL); the United Transportation Workers (UTW), which was affiliated with the Congress of Industrial Organizations (CIO); and the Joint Council of Dining Car Employees (JCDCE), which was affiliated with the Federation but in practice worked with both the AFL and CIO. Like the BSCP and the UTW, the JCDCE was a “racial” union and was dedicated to advancing both labor and civil rights.

Black dining car workers formed the JCDCE to fight racial employment discrimination by employers and by other unions. Their battle was another chapter in a much larger struggle within the labor movement. From their inception in the nineteenth century, American labor unions had generally ignored the needs of African-Americans and frequently excluded them. This was particularly true of the national labor umbrella organizations: National Labor Union, the Knights of Labor, and the American Federation of Labor, the latter of which had the worst record on race relations. These labor organizations tended to bow to the racist attitudes and practices of their constituent unions, which were made up mostly of white workers. The major railroad unions were among the worst offenders. The Railway Mail Association only allowed as members workers “of the Caucasian race.” The Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees just admitted “white persons, male and female, of good moral character.” Similar provisions were in most railroad labor organizations. By discriminating against minorities, whites in these unions secured higher wages, better benefits, and elevated their social standing. Similarly, railroad owners profited from the situation by exploiting their disadvantaged employees. Black railroad workers were paid less than their white counterparts, even when they did the same job. For example, occasionally a dining car ran without a white steward. In those instances, a black worker became a “waiter-in-charge,” essentially a steward, but without the title, the higher wages, and the respect. Complaining to an all-white railroad union like the Brotherhood of Dining Car Conductors was fruitless. Black workers had to look elsewhere for redress of their many grievances.

By the early 1930s, there was an organizing model for black dining car workers to follow. In the 1920s, A. Philip Randolph had helped African-American sleeping car porters form a labor brotherhood. Although for years the Brotherhood of Sleeping Car Porters had floundered, in 1934, it received a new lease on life. The 1934 Railroad Labor Act, which was one of President Franklin D. Roosevelt’s New Deal reforms, provided new bargaining rights to

unions. The BSCP used the law to wrestle a contract from the Pullman Palace Car Company. In 1937, the same year that the BSCP gained formal recognition from Pullman, Randolph helped to establish the Joint Council of Dining Car Employees.

The Joint Council grew out of the slow movement of dining car employees to form unions. In 1917, a group of black dining car workers created the Brotherhood of Dining Car Employees on the New York, New Haven and Hartford Railroad. The Brotherhood steadily gained members throughout the 1920s and early 1930s, and eventually it merged into the Hotel and Restaurant Employees’ International (HRE), which was affiliated with the AFL. The formation of the Joint Council in 1937 represented the desire of many black dining car employees to unite the efforts of various union locals. Two dining car workers—Ishmael Flory of Oakland’s HRE Local 456 and Solon Bell of Omaha’s HRE Local 465—were instrumental in the formation of the JCDCE. Both Flory and Bell were exceptional organizers. By the end of the 1930s, the Council had 7,000 members in 15 locals. The Joint Council was also an integrated union that appealed to men and women. In 1939, there were 1,500 white cooks and waitresses who belonged to the JCDCE.

Like its close organizational cousins, the BSCP and the UTW, the leaders of the Joint Council pursued an agenda to improve the lives of dining car workers specifically and all African-Americans generally. All three unions were dedicated to eradicating discrimination in employment and inside the labor movement. The JCDCE and the BSCP faced an uphill battle to change the AFL. Despite Flory’s and Bell’s courageous efforts, very little progress was made. For example, for years, the AFL’s Railroad Employee Department refused to integrate its annual convention. The leaders of the JCDCE as well as the BSCP protested, but they were simply not allowed to attend and represent their interests at the meeting.

Although the JCDCE and other black railroad unions worked harmoniously on occasion, the Joint Council’s political outlook and its specific goals and methods often brought conflict with other unions and civil rights groups. The main problem related to Flory’s and Bell’s communist connections. Allegations that Flory was using his post to recruit for the Communist Party in an attempt to facilitate a takeover of the railroad industry resulted in punitive measures by the AFL on the Joint Council. Eventually, the HRE president, Edward Flore, fired Ishmael Flory and his comrade, Solon Bell, both of whom continued to labor on behalf of black dining car employees and established a rival union, the Dining Car and Railroad Food Workers Union. The challengers

annoyed but did not defeat the JCDCE. The Joint Council also weathered the dramatic transformations in American transportation in the 1960s as railroad passenger travel was supplanted by air travel. Unlike the BSCP and the UTW unions, which faded and eventually merged into stronger unions, the JCDCE was one of the few original "racial" unions to survive.

JONES, "MOTHER" MARY HARRIS (1837–1930)

Arrested once again in West Virginia in 1913, old Mother Jones used the labor and radical press to send out her missives to the world, and workers, organizers, and friends of labor responded with petitions, demonstrations, and letter-writing campaigns. Wrote T. J. Llewellyn from Missouri to the Secretary of Labor, "I have carried a gun three times in the industrial wars in this country, and by the eternal, if any harm comes to the old Mother, I'm not too old nor by the same token too cowardly to carry it again." Margaret R. Duvall warned of an aroused working class "more dreadful than this country has ever seen" should any harm come to Mother Jones or her fellow prisoners. And A. Van Tassel of Ohio begged President Woodrow Wilson to free the Miners' Angel: "This beautiful hero of the labor movement has committed no crime, but is being slowly murdered because she insisted on agitating and educating the workers to realize their true status in society."

Who was Mother Jones? Aside from a progressive magazine named in her honor, and an occasional invocation of her famous line, "pray for the dead, and fight like hell for the living," she is a faded memory. Yet during the first quarter of the twentieth century, she was one of the most famous women in America.

Her friend Upton Sinclair, author of the great exposé of the Chicago stockyards, *The Jungle*, described her this way in his lightly fictionalized account of the Colorado Coal War of 1913–1914:

There broke out a storm of applause which swelled into a tumult as a little woman came forward on the platform. She was wrinkled and old, dressed in black, looking like somebody's grandmother; she was, in truth, the grandmother of hundreds of thousands of miners....Hearing her speak, you discovered the secret of her influence over these polyglot hordes. She had force, she had wit, above all she had the fire of indignation—she was the walking wrath of God....She would tell endless stories about her adventures, about strikes she had led and speeches she had made; about interviews with presidents and governors and captains of industry; about jails and convict camps....All over the country she had roamed and wherever she went, the flame of protest had leaped up in the hearts of men; her story was a veritable Odyssey of revolt.

What Sinclair said was literally true; for 25 years this elderly woman did not have a permanent home, or as she explained to a congressional committee when asked where she lived, "my address is like my shoes, it follows me wherever I go." When she was in her 60s, her 70s, and her 80s, she renounced home, friends, and possessions to live on the road and be with her people, and out of that commitment grew working families' powerful sense of identity with her.

Her story is a difficult one to uncover because it is so shrouded in myth, much of it created by herself, especially in *The Autobiography of Mother Jones* (1925). For example, she says that she was born to Irish dissident parents on May Day, 1830. She followed her family to Canada, learned to be a school teacher and a dressmaker, and then found her true vocation in the 1870s, organizing the working class. In fact, she exaggerated her age to add to her venerability (she was born not on what became the International Workers' Holiday, but in August 1837), and her family came to America not because they were radicals fleeing the English, but because they were impoverished by the Great Hunger, or the Potato Famine, as Americans called it.

Mary Harris spent her early years in the city of Cork, where she witnessed the unspeakable horrors of the Famine—which she never discussed—then finished up her education in Toronto, including a semester at the normal school. As she became an adult, she left her family, first moving to Michigan to teach school, then briefly to Chicago, and then to Memphis, where she married an iron molder named George Jones, who was a member of William Sylvius's Molders' Union. Between 1861 and 1867, Mary and George Jones had four children. In the fall of that

year, not long after she turned 30 years old, yellow fever struck her household. She was left to bury the dead, all of them, George and her four children. Mary Jones returned to Chicago and resumed dressmaking for the next three decades.

There is no reason to doubt that she became increasingly interested in the labor movement—after all, Chicago was the most radical city in America. But there is no evidence that she was an important player through the 1870s, 1880s, or 1890s, as she implies in her *Autobiography* when she discusses the 1877 Railroad Strike and the Haymarket Affair. Clearly, by the 1890s she had gotten to know some important men in the movement—Terence Powderly of the Knights of Labor, Eugene Debs of the American Railway Union (and soon to head the Socialist Party), and Julius Wayland, editor of the socialist newspaper *The Appeal to Reason*. We have evidence of her marching with a branch of Coxe's Army in 1894, and she was active organizing anthracite miners in Pennsylvania for the new United Mine Workers Union (UMW) in the 1890s.

But the important step for her was becoming "Mother Jones." Mary Harris was a poor Irish famine immigrant, a young school teacher and dressmaker, who drifted away from her working class Toronto family to pursue a life in the United States. Mary Jones was the wife of a working-class man and mother of a young family, until plague took them all and

left her a middle-aged widow, making ends meet sewing dresses in Chicago. It was in that shock city, which doubled in population every 10 years—a place where hundreds of thousands of people from overseas and from America's rural heartland came to start fresh—that she re-created herself and became somebody new. By the late 1890s, she was almost as dispossessed as an American could be—poor, of working class background, an Irish immigrant, widowed, elderly (she turned 60 years old in 1897). With precious little left to lose, in other words, she invented and inhabited the role of Mother Jones.

The new persona transformed Mary Jones. After about the turn of the century, she never called herself Mary; all of her letters were signed "Mother Jones," and union leaders, businessmen, even presidents of the United States all called her "Mother." She began to look the part, always wearing antique black dresses; she frequently referred to her advanced age, her impending mortality; and by her very looks she invoked a mother's claim to moral virtue. Yet Mother Jones skillfully combined her saintly image with hell-fire oratory and raw physical courage. She stood up to police, private detectives, and national guardsmen; she flaunted judges' injunctions and defied governors; she was arrested several times, and spent months in prison. She organized the wives of workers for powerful demonstrations, and she cajoled, encouraged, and berated union workers to stay true to

their organizations. As *Mother Jones*, she was able to make moral claims speaking for the family of labor. Her message rejected the untrammled rule of the marketplace and substituted the necessity of creating humane communities for working families. She invoked wrenching images of blood stolen, bodies mangled, and youth exploited to dramatize the injustice of poverty in America. Above all, she gave working people hope and told them that their *collective* aspirations were in the best traditions of American freedom.

During the first decades of the twentieth century, the era of her greatest prominence, it is important to remember the conditions of laboring men and women. Roughly three quarters of a million men mined coal, were paid in company scrip, and made roughly \$400 per year; their families often lived in company towns and had their lives policed by private armed guards who routinely abrogated their civil liberties. Half a million steelworkers labored on 12-hour shifts, six days a week. Not only men but millions of women and children worked in mills and sweatshops for pennies, sometimes with little option but to work or starve. Beyond simple working conditions, the transformation of America from the Gilded Age through the Progressive era—the re-organization of society, economy, law, politics, and culture that accompanied the growth of vast new concentrations of wealth and power in modern corporations—engendered an era of tremendous ideological ferment. It is best to think of Mother Jones as part of an age that produced the socialism of Eugene Debs, the anarchism of Emma Goldman, the struggle for black rights championed by W. E. B. Du Bois, the cracker-barrel radical journalism of Julius Wayland, and a host of others who responded to the crushing weight of corporate power with new and often radical ideas. All sought to mobilize Americans—through unions, through syndicalism, through politics—even to the point of open rebellion. Mother Jones, in other words, participated in contentious, even violent times.

She worked more for the United Mine Workers than for any other organization, especially in the early days of that organization when it was the largest industrial union in America, and she was instrumental in organizing anthracite miners in Pennsylvania and bituminous workers in the Middle West's Central Competitive Field. She broke with the UMW leadership as it turned more conservative early in the twentieth century. In 1903, she organized an early protest against child labor, the "March of the Mill Children," from Philadelphia to President Theodore Roosevelt's home on Long Island. Between roughly 1905 and 1912, she was on the road organizing for the Socialist Party, and for the radical Western Federation of Miners. She was a founding mother of the Industrial

Workers of the World, and a signer of that group's original charter. But she was willing to help out in any strike, so she worked for a while with copper miners in Calumet, brewery workers in Milwaukee, and garment workers in Chicago. She rejoined the Mine Workers as a paid organizer around 1912, just as it launched two massive efforts that ground on for months and turned quite violent in West Virginia and Colorado. "Medieval West Virginia," she said of the Mountain State, "with its tent colonies on the bleak hills! With its grim men and women! When I get to the other side, I shall tell God almighty about West Virginia." She certainly did not win all of the strikes she was involved with, but she was the most prominent and successful organizer of the Mine Workers, which was, in the early twentieth century, one of America's largest and most successful unions.

After the mine wars, she continued to travel about the country. She worked with Mexican revolutionaries based in the United States who sought their country's freedom from the tyranny of the Porfirio Díaz regime; she raised money for political prisoners like Tom Mooney in California; and she campaigned tirelessly from Chicago to Pittsburgh during the Great Steel Strike of 1919. Yet by the end of World War I, her health began to fail, as did her oratorical powers. She continued to make appearances, and she worked on her autobiography. She stayed embroiled in union politics, supporting various reformers in the United Mine Workers against the autocratic reign of John L. Lewis. On May Day, 1930, she and hundreds of well-wishers celebrated her hundredth birthday (she was really 93). Then, just six months later, she passed away.

She asked to be buried at the Union Miners' Cemetery in Mount Olive, Illinois, alongside the brave boys who fell in labor's cause. Thousands gathered to hear Father John Maguire's funeral oration, and tens of thousands more listened to the services over WCFL, Chicago's voice of labor:

Today, in gorgeous mahogany furnished and carefully guarded offices in distant capitals wealthy mine owners and capitalists are breathing sighs of relief. Today, upon the plains of Illinois, the hillsides and valleys of Pennsylvania and West Virginia, in California, Colorado and British Columbia, strong men and toil worn women are weeping tears of bitter grief. The reasons are the same.... Mother Jones is dead.

Above all, working people thought of Mother Jones as one of their own. If her efforts led to a mixture of successes and failures, of some shops and even industries organized, others not, what is most striking is that she was heard at all. Mother Jones's greatest achievement was creating a loud and clear

voice, for who could be more silenced in early twentieth-century America than an elderly widow, and a working-class immigrant at that. Yet she found a way to find and then raise her prophetic voice in the cause of America's workers. And she was heard.

JOURNEYMEN CARPENTERS STRIKE IN NEW YORK (1833)

Strikes in the late eighteenth and early nineteenth centuries by journeymen cordwainers, house carpenters, and printers provide valuable lessons in American labor history. The strike of New York City's journeymen house carpenters of 1833 highlights the problematic situations many artisans faced when confronting their employer's whims, fancies, and heightened sense of power.

Artisans who engaged in combining faced conspiracy charges by the courts, which often led to heavy fines and imprisonment, as the example of the haters of New York City in 1823 shows. However, such threats did not stop workers from going on strike. By the late 1820s, when labor's awakening first got under way, emboldened workers struck for the 10-hour day. As artisans in nearby Philadelphia in 1827 paved the way for America's nascent labor movement, in New York City that struggle took another step forward in 1833.

Facing greater vulnerability and insecurity, New York's journeymen carpenters felt compelled to demand higher wages and less hours of labor. As their own circular stated, they planned to "render justice where justice is due." Formerly they had been working for \$1.37 a day, and now they wanted \$1.50. The employers refused to grant the increase, and a strike ensued. At that point, the journeymen house carpenters issued an address "to the Citizens of New York" in mid-May, telling them that they were determined to adhere to their demands until they were met. Within

days, they had deliberated and passed resolutions approving the conduct in general of the Journeymen House Carpenters as being the only means by which they could establish themselves as freemen and gain a compensation for their labors equivalent to the services rendered.

The New York *Evening Post* (June 10, 1833) counted between one to two thousand journeymen house carpenters on strike. Its editor claimed that rancorous feelings between the large body of useful mechanics and their recalcitrant bosses or master carpenters brought on the strike, commenting that not only had the artisans lost enormous wealth, but that wasted wealth had forever been "lost to the community," which resulted in a "total and irremediable loss." Responding to an editorial in the New York *Journal of Commerce* (May 22, 1833) urging every good citizen to "set his face like a flint against all combinations" that either raised or depressed the price, the Typographical Society quickly issued a circular "to the Journeymen Mechanics and Artisans of New York," calling upon all trades to appoint delegates to meet in "a general union." Declaring that "the time has now arrived for the mechanics of our city to arise to their strength," they determined not to ever again "submit to the thralldom which they had patiently borne for many years," nor "suffer employers" who took unfair advantage of their labor. As fellow mechanics engaged in the same cause, they promised to assist the striking journeymen carpenters by getting each member to donate 25 cents a week during the nearly month-long strike.

Before appealing for aid, 11 journeymen jewelers sent them \$13. Afterward, the strikers appointed a committee to receive aid "from those who feel friendly towards us in the struggle for our right." Soon printers, tailors, masons, brush makers, tobacconists, and others helped them out. Next, some 15 trades met in separate meetings, passed resolutions of sympathy, made collections for the benefit of the strikers, and took new efforts to secure their self-protection; other enterprising men called a meeting to create "a general union of the Journeymen Mechanics and Artisans of every branch in this city." Thus aided by the contributions of nearly \$1,200, the journeymen house carpenters, noted the *Morning Courier and New-York Enquirer* (June 3, 1833), could now afford to hold out.

The journeymen house carpenters won their battle and returned to work on their own terms on June 17: \$1.50 for a day of 10 hours from March 10 to November 10, thereafter \$1.37 for a day of nine hours for the remainder of the year.

On August 14, 1833, nine trades organized the General Trades Union (GTU); a year later, 20 more trades representing 11,500 men had joined somewhere

between 20% and 30% of Manhattan's entire white male workforce—prompting the *Evening Post* to ponder such implications.

The birth of the city's trades union thus dates from the journeymen house carpenters strike of 1833. That strike not only became the nucleus around which the GTU was formed, but further, notes the historian Edward Pessen, the cornerstone upon which the early labor movement was based.

JUSTICE FOR JANITORS

"*Si se puede!*" "Yes, we can!" janitors chanted on picket lines in cities across the United States, rattling noisemakers made from soda cans and stones. Justice for Janitors, a national campaign launched by the Service Employees International Union (SEIU) in 1987, combined street theater and civil disobedience with legal and corporate strategies to organize the janitorial industry. Justice for Janitor's astonishing success stood out in an era when American unions lost most organizing campaigns.

The SEIU started out as a Chicago janitors union in 1902, and the union built a strong core membership of janitors cleaning office buildings in urban markets, particularly New York City and Chicago. In the mid-1980s, a confluence of factors suddenly wiped out much of the union's strength. During the

1980s, commercial real estate ownership consolidated among a shrinking number of large developers and institutional investors. As real estate values tumbled in a cyclical crash, property owners began contracting out cleaning to independent janitorial companies that competed for business on price. Since labor constituted the single largest expense for a cleaning company, contractors constructed successful bids by trimming wages and benefits. In Los Angeles, for example, janitors' wages fell 36% from 1983 to 1989. Contractors hired newly arrived Central American immigrants, expecting quiescence from largely undocumented workers. In city after city, the union's predominantly African-American janitors swallowed contract concessions as they watched their membership evaporate.

A 1985 lockout in Pittsburgh roused the union to fight back. Members held the line against contract concessions in a yearlong struggle and galvanized the union to develop a plan to deal with the industry's transformation. The union's long-standing decentralization impeded a coordinated response. Powerful local presidents accustomed to autonomy and cordial contract bargaining sometimes refused to join multi-local campaigns, fearing erosion of their authority. Meanwhile, cleaning contractors had mushroomed into national and multinational firms with customer bases that far exceeded any local's ability to affect revenues enough to win with traditional union leverage like strikes.

The SEIU proceeded on two fronts: developing a centralized campaign apparatus, and deploying it in markets without resistant locals. The union created a new division to unite janitor locals under a coordinating umbrella. The division hired a crew of staffers, many from the United Farm Workers, with experience doing community organizing among Latino immigrants. A staffer, Stephen Lerner, helped craft the underlying theory: pressure building owners, not cleaning contractors, with demands for union recognition and fair contracts, since owners could oblige contractors to settle or lose the cleaning contract, and build the added cost of settlement into the contract terms.

They selected Denver in 1987 as the first market for new organizing and demonstrated the range of tactics that would characterize Justice for Janitors. The campaign attacked from above and below. Several contractors cleaned the Denver airport with union crews, while operating nonunion in the city. The union demanded that the political appointees on the airport governing board fire such "double-breasted" contractors unless they recognized the union in the city. Meanwhile, organizers laid out the plan to Latino janitors across the city and worked with community

groups to build coalitions. A cadre of militant janitors marched on their bosses with demands for union recognition and marched in the streets to pressure politicians. Justice for Janitors caught Denver by surprise and won sizable gains within a year.

Buoyed by success, the union turned to Atlanta in 1988. A prominent Atlanta real estate developer with close ties to the Democratic Party looked like a promising target as Atlanta hosted the Democratic National Convention. African-American janitors cleaning his buildings demonstrated when he refused to recognize them, and the union picketed his convention events and dressed their delegates in Justice for Janitors T-shirts. But the mayor crossed the picket line, and the party brass sided with their fund-raiser over the janitors. Atlanta showed that political pressure and street militancy would not be enough in most cities.

Los Angeles and Washington, DC, were the laboratories for honing strategy. Beginning in late 1988, organizers in Los Angeles started talking to the overwhelmingly Latino janitors and building committees of workers willing to act as shock troops. Many workers had fled bloody civil war and insurgencies in El Salvador and Guatemala (and some had fought in those conflicts, as insurgents or soldiers) and found civil disobedience far less daunting than did native-born workers. Janitor committees heckled building owners at restaurants and country clubs by day and signed up members in house visits and on bus rides at night. Meanwhile, organizers tallied unpaid overtime hours and safety problems and used the union's lawyers to assemble legal complaints alleging employer violations of federal wage and hour and safety laws. And the campaign used leaflets and raucous demonstrations to compel office-building tenants to force building owners to settle with the union. Tenants resented the publicity but invariably complained to owners, thus accomplishing the union's goals. After registering modest successes, the union came up against an intransigent employer in Century City, a large office complex. Janitors and organizers agitated for a strike. The workers struck in May 1990 and ran a noisy picket line filled with community allies. Tensions rose among building owners and police. On June 15, as janitors and their allies marched toward Century City, the police attacked, clubbing marchers in full view of television cameras. Public support for the janitors boiled over, obliging the mayor to speak out for the janitors and driving the union's powerful New York local president to finally threaten the cleaning contractor to settle in Los Angeles or risk unrest in New York. The contractor settled, and with a major contractor defeated, janitors rapidly seized the rest of the market, winning a master agreement by 1991.

Building owners proved more intractable in Washington DC, where they had a strong industry association to coordinate their opposition and the union had scant membership. The union dug in and experimented with tactics like protesting zoning changes desired by developers and challenging favorable real estate tax assessments. Civil disobedience escalated from marches and building-lobby demonstrations to highly coordinated mass actions like blocking major traffic arteries during rush hour. The local's African-American leadership, unprepared for an infusion of Latino workers, bucked the International and resisted the campaign. After seven years of pitched battle, the International called a public truce to ratchet down the hostilities and trusted the local. In 1997, the union finally began picking up settlements.

Several key organizing and bargaining concepts shaped Justice for Janitors. First, the union abjured National Labor Relations Board (NLRB)-supervised elections to demonstrate a majority and compel employer bargaining. With extremely high turnover among janitors and many undocumented workers, an election would represent only a snapshot in time of a fluctuating membership. Moreover, the NLRB procedures treated the cleaning contractor as the employer rather than the building owner, who actually controlled the bargaining relationship. Instead, organizers built a militant minority among janitors and pressed for recognition via a majority of signed union cards or a community election. This spared the union the endless litigation and arcane bureaucratic maneuvering that the NLRB election procedure had become. Second, the union negotiated "trigger" agreements with cleaning contractors that initially granted recognition and union rights but modest wage and benefit improvements. Once the union signed up a majority of contractors in a market, the agreements "triggered" negotiations among all the contractors to set a market rate. This strategy forestalled the problem of making a union contractor uncompetitive in a market shaped by labor costs. With a majority of contractors organized, no contractor was disadvantaged by the extra costs for higher wages and benefits. Trigger agreements functioned as a mechanism for pattern bargaining in the service sector, and the SEIU exported the practice to its other service-sector campaigns. The SEIU also laid the groundwork to link markets in national campaigns by lining up contracts in multiple cities to terminate on the same dates. And in 1995, the SEIU required all janitor contracts to include a provision stipulating the right to honor picket lines.

Critics generally assailed Justice for Janitors from two directions: union democracy and the trigger

agreements. Where recalcitrant local officials refused to participate, the SEIU simply removed them, installing trustees to run the locals and then running the trustees for the presidency. In some cases, these trustees came from the rank and file, like Rocio Saenz, a Mexican-born janitor who took over the Boston local; others came from the ranks of union staff organizers, like Mike Garcia in Los Angeles or Michael Fishman in New York. At the same time, the SEIU merged small city locals, many of which represented workers in multiple industries, into regional or state-wide janitorial locals; it was hard for rank-and-file workers to campaign or win office in these staff-run organizations.

As for the trigger agreements, which some derided as settlements for a “nickel and dues checkoff,” criticism subsided abruptly after the SEIU ran a national rolling strike to win health-care benefits in 2000. In April, janitors walked out in Los Angeles, San Diego, and Chicago; as contracts expired in 30 markets, including New York, Cleveland, Chicago, and Seattle, contractors settled quickly, some before expiration. That October, janitors in Stamford and Hartford, Connecticut, struck for union recognition. Janitors routed contractors across the country, winning sizable wage increases and health-care benefits. The union turned to organizing the suburban markets around its strongholds and picked up Orange County, Long Island, suburban Chicago, and northern New Jersey. In 2000, Ken Loach, a leftist British filmmaker,

produced “Bread and Roses,” a Hollywood movie based on the Los Angeles campaign. Justice for Janitors had arrived.

In 2005, 20 years after launching Justice for Janitors, over 70% of janitors in 23 of the top 50 U.S. cities were organized. Despite its great successes, however, the union had lost ground. The South remained overwhelmingly nonunion, and burgeoning suburban office markets added janitors much faster than the union could organize them. The SEIU estimated that its density in the industry had slipped from 40% in the 1950s to 10% in 1980 to 6% by 2000. But a victory in 2005 offered hope. Janitors in New York, Chicago, and dozens of other cities honored picket lines thrown up by Houston janitors working for the same building contractor. The contractor folded quickly, and the union won a master agreement in Houston, marking the first real beachhead in the South.

K

KANSAS COURT OF INDUSTRIAL RELATIONS

The Kansas Court of Industrial Relations was an experiment in state-mediated labor relations that grew out of the Kansas coal strike of 1919. The court was actually a three-man board appointed by the governor that could make rules concerning labor relations, settle disputes, and take over and run businesses. It allowed for collective bargaining but declared strikes illegal. The Kansas Court of Industrial Relations was abolished in 1925 by the Kansas Legislature after the Supreme Court of the United States overturned a number of its decisions and curtailed its power.

In November of 1919, the United Mine Workers (UMW) declared a national strike and thousands of Kansas miners heeded the call. The strike was declared illegal by President Wilson, and the UMW called it off, but 12,000 Kansas miners led by Alexander Howat, president of UMW District 14, stayed out and threatened the state with a coal shortage heading into winter. In response the Kansas Supreme Court allowed the state government to take over the mines. Republican Governor Henry Allen still could not induce the miners to return to work, so he called for volunteers and got about 10,000 mostly college student volunteers to work as scabs, many of them recruited during halftime of the Kansas–Missouri football game. These volunteers were reinforced by the Kansas National Guard and about 600 regular army troops.

This strike was soon defeated, and state control of the mines lasted only three weeks, but Governor Allen

wanted to avoid any future strikes in vital services. The month following the coal strike, Allen called a special session of the state legislature of Kansas in January of 1920 to establish a labor arbitration board that would have authority over any labor disputes in an industry that affected the public welfare. This new Kansas Court of Industrial Relations was given the power to regulate working hours, fix a minimum wage, prohibit strikes, run certain industries if necessary, and levy severe penalties for noncompliance.

The court attracted considerable national attention as an experiment, but because it severely curtailed the rights of workers to strike and gave the government almost unlimited power to arbitrate labor disputes, it was vehemently opposed by organized labor. In 1922, Allen used the court to outlaw picketing during a railroad strike and even arrested his friend William White, editor of the *Emporia Gazette*, for putting a placard in favor of the strike in his window. White subsequently became the first Kansan to win the Pulitzer for his attack on this arbitrary arrest and his defense of free speech.

Some employers also objected to the activities of the court, as in the case of the Wolff Packing Company, which was ordered to increase wages to its workers in January of 1921. Wolff Packing Company appealed this decision to the Supreme Court of the United States, arguing that the decision violated the company's Fourteenth Amendment right to have no property taken without due process. In the case *Chas. Wolff Packing Co. v. Court of Industrial Relations of State of Kansas*, 262 U.S. 522 (1923), the Supreme

Court unanimously overturned this decision of the Kansas Court of Industrial Relations on the grounds that the declaration of a legislature that a business is concerned with the public interest is insufficient grounds for regulating that business. This severely curtailed the Kansas Court of Industrial Relation's power.

The court heard 166 cases over its 5-year existence and was lauded by many politicians as a novel experiment, but it was generally regarded as a failure.

KEARNEY, DENIS (1847–1907) Workingmen's Party of California

Denis Kearney was a leader of the Workingmen's Party of California (WPC) in the late 1870s and a vehement advocate of Chinese exclusion. A polarizing figure with scant labor background, Kearney was an electrifying speaker whose racist oratory helped nationalize the issue of Chinese immigration.

Kearney was born on February 1, 1847, in Oakmount, County Cork, Ireland. The second of seven sons from a poor family, he went to sea as a cabin boy at age eleven and over the next decade worked his way up to first mate and captain. He married Mary Anne Leary in 1870 and 2 years later settled in San Francisco, where he purchased a draying, or trucking, business. He became an American citizen in 1876. Although he had little formal schooling, he attended a club known as the Lyceum of Self-Culture, at which he participated in weekly debates and developed his speaking skills.

Kearney burst onto the public scene in 1877 in the wake of the national railroad strike after members of an "anticoolie" club barged into a workers' meeting in San Francisco in July and commandeered the audience. With shouts of "on to Chinatown," gangs of white men and boys roamed the city, attacking Chinese homes and property. Kearney joined a vigilante group to suppress the rioters, or "hoodlums," as the press labeled them. In August many of these hoodlums, along with workers and sympathizers, began gathering at a large, vacant space near City

Hall, called the sandlots. Amid the glow of bonfires and torches, sandlot speakers—led by Kearney, who had switched sides—denounced corporations, monopolists, and Chinese immigration. On August 22, Kearney helped organize the Workingmen's Trade and Labor Union of San Francisco and was named secretary.

The momentum of these nightly meetings led to formation of the WPC, and on October 5, Kearney was made president. The party's most fiery orator, Kearney laced his speeches with incendiary comments. "There isn't an honest man in office today," he told one crowd. "The only way to get laws passed in our favor is to surround the Capitol with bayonets and shoot those who vote against us." Kearney was arrested in November for incitement to riot—the first of many such arrests—but acquitted in January 1878. Under Kearney's direction, the party grew, and although his defiant rhetoric and uncompromising personality caused dissension, he remained its leader, chief organizer, and spokesman. Kearney attracted followers by uttering class-based appeals, but he directed his most vicious attacks at Chinese immigrants. The "moon-eyed lepers," with their "putrid carcasses," could live on "rice and rats," he declared. The Pacific Coast was "cursed with parasites from China.... My chief mission here is to secure the expulsion of Chinese labor from California." Sandlot meetings began and ended with Kearney's trademark cry, "the Chinese must go." As he later wrote the English historian Lord Bryce, "Every speech and every document written by me ended with the words, 'And whatever happens the Chinese must go.'" (D. Nunis, *Pacific Historical Review* 36, 1967)

In early 1878, WPC candidates scored victories in San Francisco, Santa Clara, Oakland, and Sacramento. The party's swift ascent alarmed Republicans and Democrats, and in the election for delegates to the state constitutional convention in June, the two major parties nominated a joint nonpartisan slate. Still the WPC captured one-third of the delegates. Flushed with success, Kearney embarked on a tour of the East in the summer of 1878. He spoke in more than a dozen cities, from Boston and Washington to New York and Chicago. Newspapers everywhere reported his denunciations of "capitalistic vagabonds," "lecherous bondholders," and "Asiatic lepers"; the enormous press coverage turned the "howling hoodlum" into a national figure and working-class spokesman. Kearney voiced little interest in unions, however, urging workers instead to abandon the two major parties. "The Workingmen's party must win," he said in Cincinnati, "if it has to wade knee deep in blood and perish in battle." Hoping to cement an alliance with the fledgling Greenback-Labor party,

Kearney also campaigned in Massachusetts for Ben Butler, then running for governor as a Greenbacker. Although showering him with attention, the press excoriated Kearney as a Communist and demagogue, and most workers, union leaders, and labor advocates—who initially welcomed him—soon spurned him for his lack of substantive ideas and his race baiting of Chinese immigrants.

Largely discredited in the East, Kearney returned in November to California where he still retained a sizable following. He campaigned heavily in support of the new state constitution, which Californians approved in May 1879, and steered the WPC toward nominating a large slate of candidates for the upcoming statewide elections. In August, two weeks before the voting, a would-be assassin shot the WPC candidate for mayor of San Francisco, putting the city on edge. Kearney counseled peace, and the party swept to victory, electing the chief justice of the Supreme Court, five associate justices, 11 senators, 17 assemblymen, and the mayor of San Francisco, who recovered. Both the WPC's and Kearney's influence reached their zenith. Leaders of the National Greenback-Labor party, then mounting a serious challenge for the White House in 1880, took notice of these victories and sought to capitalize on them. By winning over Kearney, they hoped to win over the WPC, gain workingmen's votes, and thereby capture California. The Greenbackers invited Kearney to become a leader of the party, and he readily accepted. Emboldened by his newfound respectability, he ratcheted up the intensity of his sandlot speeches. Proposing to build a gallows on the sandlots, he declared, "If I hear any man plotting to kill me, I will kill him so help me God." For uttering these words, Kearney was arrested.

While Kearney was in prison, the WPC split over whether to support the Greenbackers or the Democrats for president. The state Greenback party meanwhile repudiated Kearney. Undeterred, Kearney, released from prison in May 1880, immediately headed to the Greenbackers' national convention in Chicago. In what would be the final major speech of his life, Kearney attacked his enemies as "beggars... robbers... pimp[s] and nincompoops" and declared, "The Chinese must go, even if we are to deluge the state of California in blood." His speech polarized the convention, and he returned home to find the WPC collapsing and the Greenback party imploding. Most WPC members returned to the Democratic fold, and the Greenbackers quickly faded. A year later Kearney himself provided an epitaph: "There is no Workingmen's Party now, and it would take a telescope larger than Lick's to find a vestige of the giant that shook not only the state but the nation." Kearney all

but disappeared from politics. He later inherited a fortune, invested in wheat, sugar, and oil, and died in obscurity on April 24, 1907, in Alameda, California.

Kearney leaves a legacy both familiar and unique. He fits into a long line of charismatic figures who combined rabid populism with vicious racism. Like Mike Walsh in the 1840s, Tom Watson at the turn of the century, and George Wallace in the 1960s, he gained notoriety by spouting class-conscious, racist epithets. A magnetic orator who both attracted and repelled, Kearney rallied supporters to form a vibrant third party, yet his querulous, mercurial personality played a central role in its demise. He became synonymous with the anti-Chinese crusade, which led to passage of the Chinese Exclusion Act in 1882.

KEATING-OWEN CHILD LABOR ACT (1916)

The Keating-Owen Child Labor Act of 1916 banned goods produced by child workers from interstate and foreign commerce and was the first statute that prescribed federal regulation of child labor. The act set a minimum age of 14 for factory work, an 8-hour day for workers between the ages of 14–16, a 6-day week, and prohibited work between the hours of 7:00 P.M.–6:00 A.M. With bipartisan support in Congress, President Woodrow Wilson signed it into law on September 1, 1916, to take effect exactly 1 year later. Its passage culminated decades of activism by social justice reformers and labor advocates, investigations compiled

by the U.S. Children's Bureau, and public educational campaigns waged by the National Child Labor Committee (NALC) to combat the evils of child labor. After being in effect for only 9 months, the Supreme Court overturned the Keating-Owen Child Labor Act with its *Dagenhart* decision on June 3, 1918.

Child labor reform was a complex proposition involving the minimum age and maximum hours for children across diverse industries and regions in the country. Labor and social reformers began investigating the exploitation of child workers in the late nineteenth century and campaigned for the enactment of state regulation. By 1900, 26 states had passed laws for compulsory school attendance, minimum employment age, or laws that prohibited children from night work or work in dangerous industries. However the patchwork of state laws lacked enforcement, were ignored by employers, and circumvented by needy working-class families. A national movement to end child labor began in the twentieth century and was organized by the NALC.

A federal solution to child labor faced strong resistance from manufacturers' associations and fractiousness among political moderates and progressives. When in 1906, Senator Albert Beveridge suggested that goods produced by children be banned from interstate commerce, objections arose questioning federal interference in parental and states' rights; NALC added its support and lost members, and American Federation of Labor (AFL) President Samuel Gompers argued federal intervention undercut labor's autonomy. Federal attention was sustained during the administrations of Roosevelt and Taft that supported a study of children's and women's working conditions by the Bureau of Labor, banned child labor in the District of Columbia, and created the U.S. Children's Bureau. In 1914, NALC drafted what became the Palmer-Owen bill (Rep. A. Mitchell Palmer [D-PA] and Sen. Robert L. Owen [D-OK]), which, like the Beveridge bill, banned from interstate commerce goods produced by children under the age of 14 and set an 8-hour day for workers aged 14–16. Although President Wilson doubted its constitutionality, he gave his support, and on February 13, 1915, it passed the House, with sectional opposition from representatives of southern manufacturing states—North Carolina, South Carolina, Mississippi and Georgia—where more than one-quarter of cotton and textile mill workers were children. The bill did not make it to the Senate before adjournment and was reintroduced to Congress the following year. Sponsored by Representative Edward Keating (D-CO) and Senator Owen, it passed the House, 343 to 46, and the Senate with 52 votes for the bill, 12 against, and 32 abstentions.

Anticipating the passage of the Keating-Owen bill, the executive committee of Southern Cotton Manufacturers raised a suit to challenge it before the U.S. Federal Court in North Carolina, which resulted in an injunction of the act's provisions in the state on August 31, 1917. The Supreme Court received *Hammer v. Dagenhart* quickly and in a 5-4 decision ruled that the act had transcended congressional power of the Commerce Clause (Article I, Section 8, Clause 3) and that authority rested in the states. Since its passage many workplaces had conformed to the Keating-Owen Child Labor Act, yet the lifting of federal regulation reversed child labor's decline. Reformers continued their campaigns, gaining support for a tax on profits produced with child labor (Pomerene Amendment to the Revenue Act of 1919) and a constitutional amendment in 1924. However not until the New Deal's provisions during the 1930s would the standards set by the Keating-Owen Child Labor Act be realized.

KEEFE, DANIEL (SEPTEMBER 27, 1852–JANUARY 2, 1929) Seamen and Longshoremens Union Leader

An example of the union bureaucrat of the late nineteenth century, Keefe comfortably traversed the world of union hall and corporate office. Concerned primarily with upholding the terms of the labor contract, Keefe was the quintessential union leader in the mold

of Samuel Gompers and the American Federation of Labor (AFL).

Keefe began his career as a union functionary by organizing seamen who worked along the Great Lakes ports of the Midwest. Prior to that he had worked as a tugboat hand along the Great Lakes, which had given him an invaluable insight into the working conditions of seamen throughout the region. What he saw appalled him. Long hours and low wages were the norm. On board the ships the seamen confronted unsanitary conditions, poor food, and tyrannical skippers. Therefore in 1878, Keefe began to organize these men, quickly gaining results. The seamen joined the new organization, the Lake Seamen's Benevolent Association (LSBA), in great numbers. The LSBA established wage rates for all members, which were generally pasted or pinned to a wall near the docks. The union also encouraged collective action in defending their rights. Seamen for example refused to work with nonunion labor. Union members also boycotted merchants or landlords who serviced nonunion seamen.

Such tactics bore fruit as the LSBA took firm control over hiring and wages. Ship owners counter-attacked in 1880–1881 by bringing in replacement labor and discharging union members. The situation was made more difficult due to internal strife within the LSBA. Sailors had been fighting a running battle to exclude from their ranks seamen who worked on steam-driven vessels. The sailors were losing the battle however, as steam ships were rapidly displacing sailing ships. The bickering weakened the union just as the employers embarked on their anti-union campaign. By 1881, the LSBA had been effectively destroyed on the Great Lakes.

Keefe then turned his attention to the Great Lakes' longshoremen. As with his organizational strategy with the seamen, Keefe traveled from port to port signing up new members. By 1892, Keefe had successfully organized 11 locals from Chicago to Buffalo. Keefe called an organizational meeting in Detroit, and there the assembled delegates agreed on the name of the International Longshoremen's Association (ILA). The ILA adopted an aggressive policy of expansion. Not content to just organize longshoremen, the ILA reached out to other workers along the Great Lakes coastline. Correspondingly Keefe helped bring into the ILA fold marine engineers and oilers, tugboat workers, marine pilots, fishermen, grain elevator workers, steam shovel engineers, and marine pile drivers. To a large extent Keefe had succeeded in creating an industrial union. By the end of this initial round of organizing, the ILA had organized 40 marine occupations.

Such territorial advancement encountered resistance. Other unions, most notably the Seamen's Unions, cried foul. For the next few decades, a jurisdictional war broke out as a series of unions charged that Keefe had trampled on their areas of operation. Keefe's political posturing reflected the labor movement's conservative tilt. Once signed, Keefe insisted that ILA locals abide by the contract. When union locals refused and embarked on strike action during the life of the contract, Keefe was merciless in his response. Keefe supplied strikebreakers to break industrial action by his local unions. For Keefe, the contract was sacrosanct; any action that threatened the terms of the contract, whether strikes or boycotts, were perceived as being unwarranted, and at worst, ungrateful.

Keefe's comfortable relationship with employers was epitomized by his relationship with U.S. Senator Mark Hanna and the National Civic Federation (NCF). The group was created ostensibly to steer a middle course between employers who espoused a rabid anti-unionism and radical trade union leaders. Keefe's reputation as a no-strike labor leader was considered particularly attractive. Keefe's elevation as supposed responsible labor leader and member of the NCF had a remarkable effect on him. By the turn of the century, he carried himself more as a successful businessman as he dressed in elegant clothes and smoked expensive cigars.

But for all his conservative leanings, Keefe remained a union leader. Under his tenure the ILA grew into a fighting organization. By 1905, the ILA had 100,000 members. The ports of the Great Lakes had been organized, as had those in Galveston and New Orleans. But in 1908, Keefe abruptly resigned from the ILA. The episode remains clouded in mystery. The most likely reason is that the AFL leadership (who resented Keefe's expansionist aims) had pressured ILA officials to force him out. Whatever the reason, Keefe was a union leader who oversaw the rapid expansion and consolidation of the ILA. Unfortunately such a strategy resulted in a union that refused to support other maritime unions in recognition battles, and in some extreme cases, the same union disciplined its own members for violating signed contracts by striking.

KELLEY, FLORENCE (SEPTEMBER 12, 1859–FEBRUARY 17, 1932)
Antisweatshop Activist

Florence Kelley dedicated her life to industrial reform, serving as a prominent leader in the antisweatshop movement. As the daughter of William “Pig Iron” Kelley, a radical Republican congressman and Caroline Bartram Kelley, a Quaker and abolitionist, she made an early commitment to social reform that persisted throughout her life. Kelley earned her bachelor’s degree in 1882 as a member of the first generation of college-educated women. She trained in the social sciences both at Cornell University and at the University of Zurich after the University of Pennsylvania refused her admission on account of her sex. During her studies abroad, Kelley became a socialist and translated into English Friedrich Engels’s *The Condition of the Working Class in England in 1844* and a Karl Marx speech on free trade. When Kelley returned to New York in 1886 with her Russian husband and three children, she continued her socialist activities and began to focus her energies on reforming the circumstances of wage-earning women and children.

Kelley became a leader in the antisweating movement when she moved to Illinois with her children in 1891. Divorced, Kelley became a resident at the Hull-House settlement in Chicago where she immersed herself in industrial reform activities. In 1892, she joined with the Illinois Woman’s Alliance in reporting on the neglect of school children in the city’s poorest wards. That year she also conducted an investigation of the labor conditions in the Chicago garment industry for the Illinois Bureau of Labor Statistics, participated in a survey of the city’s tenements for the federal commissioner of labor, and was one of the key speakers at a mass meeting denouncing the sweatshop. Kelley and other Hull-House residents enlarged this study and produced the *Hull-House Maps and Papers* (1895), depicting the occupation, nationality, and living conditions of the residents of Chicago’s nineteenth ward. With this evidence Kelley drafted and secured a state law that set maximum hours for women, prohibited child labor, set factory safety standards, and provided for state inspections. Governor John Altgeld appointed Kelley the chief factory inspector, and with a staff of 11, she immediately began to document violations for the state’s attorney. Frustrated that most of the violations were not prosecuted, Kelley secured her law license and prosecuted some of the cases herself.

In the mid-1890s, Kelley and the antisweating campaign endured setbacks, leading Kelley to engage in

a new consumer-based strategy. In 1895, in *Ritchie v. Illinois* the Illinois Supreme Court held that the 8-hour provision in Kelley’s factory law was unconstitutional because it inhibited female workers and their employers’ freedom to contract. The following year John Tanner won the governor’s election and fired Kelley as chief factory inspector. In response in 1897, she joined with wealthy clubwoman Ellen Henrotin to create an Illinois Consumers’ League, modeled after the New York league that worked to use the purchasing power of middle-class women to improve the treatment of factory workers. In 1898, she represented the Illinois League at a multibranch convention and suggested that they create a white label that they would award to goods produced under fair conditions. The branch leagues created the National Consumers’ League (NCL) to coordinate this effort and chose Kelley to run its operations. Kelley moved with her children to the Henry Street settlement house in New York in 1899 to serve as the NCL secretary.

Kelley led the NCL for three decades. She expanded the organization, developing additional local leagues throughout the North and West and led the national and local leagues in their white-label and protective-labor legislation campaigns. Initially Kelley supervised inspections of working conditions in factories throughout the country, assessing which companies should receive an NCL white label. The league conferred the distinction to those who followed state labor laws, did not use home manufacturing or child labor, and did not require overtime. It then urged middle-class female consumers, through ethical and economic appeals, to purchase only goods with a white label. Kelley enhanced the campaign by reviving her state and federal legislation efforts to establish factory safety standards, maximum hours and minimum pay for female workers, and efforts to defend existing laws against constitutional challenges. Most significantly the NCL submitted a brief through then-Attorney Louis Brandeis in the defense of Oregon’s maximum hour law for women. The brief included sociological evidence collected by the NCL that illustrated the hazards of working long hours in factories. The U.S. Supreme Court upheld the Oregon 10-hour law in *Muller v. Oregon* (1908).

Kelley took the NCL agenda beyond its membership and broadened her social reform work. She sought assistance for the antisweating campaigns from numerous organizations, including the Women’s Trade Union League, the General Federation of Women’s Clubs, the National Congress of Mothers, and the National American Woman Suffrage Association (NAWSA), educating them on the hazards

of sweating and the importance of protective labor legislation. She assisted in the creation of the National Association for the Advancement of Colored People (1909) and the Women's International League for Peace and Freedom (1919). She fought for woman suffrage, serving for a time as vice-president of the NAWSA. She worked with Lillian Wald and other Henry Street settlement residents in the establishment of the U.S. Children's Bureau in 1911 and in conjunction with the NCL, provided key support for the Sheppard-Towner Maternity and Infancy Protection (1921) that provided federal funds for health care to working mothers and their children.

Kelley persevered in her social and labor reform work in the 1920s as the political climate became more conservative and opposition to labor reform from the courts, the legislature, and some other women's organizations intensified. During the Red Scare and its aftermath surrounding World War I, Kelley had to defend herself against right-wing, anti-Communists attacks. Kelley and the NCL also fought against the 1921 Equal Rights Amendment (ERA) proposed by the National Woman's party, which she and the NCL perceived as an indirect attack on protective labor reforms for women. In 1923, in *Adkins v. Children's Hospital* the U.S. Supreme Court found that a state minimum-wage law for women was unconstitutional, and in 1926 Congress stopped funding the health care programs created under the Sheppard-Towner Act. When the Great Depression began, Kelley and the entire labor movement endured even more opposition to labor reform.

Kelley died in 1932, but her work survived her. During the New Deal years in the 1930s, the U.S. government adopted many of her labor reform efforts, most significantly the 1938 Fair Labor Standards Act that included minimum wage and maximum hours for men and women.

KENNEY O'SULLIVAN, MARY (JANUARY 8, 1864–JANUARY 18, 1943) Cofounder, American Women's Trade Union League

Mary Kenney O'Sullivan was a labor activist and a reformer. The daughter of immigrant railroad workers, she became the first woman organizer for the American Federation of Labor (AFL) and was one of the founders of the American Women's Trade Union League. She especially fostered cross-class alliances among women and used them to advance the interests of laboring women.

Kenney's labor activism was infused with demands for gender equality. Kenney's first job in Chicago was for a bindery company. The bindery trade was one of many that divided tasks by gender and paid a lower wage for women's jobs. Kenney organized her sister workers in the trade to both overcome its gender division and to secure better working conditions.

Kenney sought assistance for organizing her first union from the Ladies Federal Labor Union 2703 (LFLU), a new organization founded to organize female workers. Kenney went from shop to shop persuading female bookbinders to come to an organizational meeting where the LFLU, in its first undertaking, helped the workers form the Women's Bookbinding Union No.1 (WBU). Kenney was elected the WBU delegate to the Chicago Trades and Labor Assembly.

Kenney next accepted help in her organizing efforts from Hull-House settlement founder Jane Addams. Hull-House became the meeting place for the WBU and many of the settlement's residents and middle-class affiliates assisted Kenney in organizing unions, managing strikes, and providing direct assistance to female workers. Kenney also persuaded Addams to found Jane Club, a housing cooperative for working women situated near Hull-House. Kenney served as president of the cooperative.

In 1891, AFL President Samuel Gompers appointed Kenney the federation's first national female organizer. The AFL authorized the position for only

a 5-month trial period. Kenney began her service on the East Coast, traveling from New York to Massachusetts attempting to organize women working in the trades. Most notably Kenney worked with Leonora O'Reilly in organizing the Local 16 of the United Garment Workers in New York. Against Gompers's recommendation however, the AFL terminated Kenney's appointment after 5 months, explaining that her low success rate did not justify the financial costs. Its decision demonstrated the AFL's tenuous relationship with female workers. Gompers nonetheless encouraged Kenney and other female labor leaders to continue to organize female workers.

Kenney returned to Chicago and Hull-House in 1892, where she resumed her organization efforts and developed a friendship with labor activist Florence Kelley. Kenney assisted Kelley in her campaign against child labor and the sweating system. Kelley's tactics included both investigations of industries that employed women and children, paying under factory wages to complete work at home, and drafting legislation to abolish such work and regulate the hours of work for women and children. Kenney assisted Kelley in the investigations and chaired a mass meeting in support of a bill Kelley drafted to end sweating and improve working conditions for women and children. The bill included a provision for the creation of a state inspector's office with deputies to enforce the prohibitions in the legislation. When the bill was enacted in 1893, Kenney was appointed a deputy inspector to serve under chief inspector Florence Kelley.

In the fall of 1893, Kenney moved to Boston to work with social reformer Hannah Parker Kimball and labor activist Jack O'Sullivan. The following year Kenney and O'Sullivan married. The pair continued their labor activities throughout their marriage. Kenney became a member of the board of directors of the Boston Women's Educational and Industrial Union (BWEIU), which lobbied for protective labor legislation, provided services to female workers, studied industrial conditions in the city, and assisted in organizing unions. She was also a member of a women's federal labor union organized primarily by her husband for the AFL that comprised laborers and professionals who worked for labor interests. When O'Sullivan died in a train accident in 1902, Kenney secured employment as a property manager for a real estate association to support herself and her children and continued her labor activism.

In 1903, wealthy reformer and socialist William English Walling solicited Kenney to assist him in establishing an American Women's Trade Union League (WTUL). Modeled after the British WTUL, the American league joined workers, social reformers,

and settlement workers with an aim to organize women into trade unions. Kenney was elected the WTUL's national secretary.

Kenney remained active in the WTUL over the next decade but broadened her activist work in a myriad of directions. Kenney joined with wealthy female reformers to found a summer camp for the children at the Boston Dennison House settlement. She also worked as a trade union reporter for the *Boston Globe* and became a peace activist and woman's suffrage proponent. She supported suffrage because she believed it would help laborers improve their working conditions. She spoke out in anger at antisuffragists, accusing them of not caring about workers.

In 1912, Kenney stopped organizing and ended her relationship with the AFL. She had long urged the AFL to hire more female organizers and pay more attention to the conditions of working women, but her disappointment in the organization climaxed over the AFL's failure to aid striking mill workers in Lawrence, Massachusetts. Though the AFL did not typically lend its support to unskilled workers, Kenney publicly criticized the federation and lent her support to the Industrial Workers of the World (IWW), an organization whose mission focused on organizing unskilled workers. When the strike settled, Kenney became an inspector for the Massachusetts Board of Labor and Industries, a position she held for the next 20 years. Kenney retired in 1934 at 70 years of age. She died 9 years later.

Kenney devoted her entire life to the labor movement. Most prominently, she joined her efforts to organize women with the work of middle-class female reformers, significantly facilitating cross-class alliances among women to advance the labor movement.

KIRKLAND, LANE (1922–1999)

Lane Kirkland was the American Federation of Labor-Congress of Industrial Organization's (AFL-CIO's) second president. The federation's Kirkland Years, 1979–1995, were contentious, controversial, and ultimately damaging to the labor movement as a whole. The question that historians grapple with is: How much was Kirkland responsible for the AFL-CIO's untimely downturn during the 1980s and early 1990s? Kirkland's detractors point out his administration's many failings. The AFL-CIO seemed powerless to stop the antilabor actions of President Ronald Reagan. Even President George H. W. Bush's "kinder, gentler" conservatism went virtually unchallenged. Under Kirkland's watch, the labor movement seemed to grow frail, unresponsive, and sluggish, unable to provide answers to the difficulties presented by an unfriendly federal government, rising costs of living, and the dramatic changes in the economy. Kirkland's patriots point out that organized labor and the AFL-CIO's chief did the best that they could do in the face of Reaganomics, de-industrialization, and the triumph of political conservatives. They agree that the state of the labor movement has seemingly returned to the 1920s nadir. But they assert that Kirkland's leadership brought unity back to organized labor. Moreover as President Bill Clinton once said, Kirkland was a "five-star general in the global fight for human liberty," supporting democratic movements in Europe, Central America, and the Middle East. Finally Kirkland was the self-proclaimed standard bearer for New Deal Democrats, stumping for the working class's bread-and-butter interests and holding the line against unchecked identity politics.

Joseph Lane Kirkland was the second of Randolph and Louise Kirkland's five children. Born on March 12, 1922, Lane grew up in Camden, South Carolina. He was the product of a fine southern aristocratic family. His male ancestors were men of distinction: planters, judges, politicians, industrialists, entrepreneurs, and even adventurers. Although his parents were not wealthy, Lane had a happy childhood. His father was a cotton buyer and later a cotton broker. In good economic times, the family got by with little to spare. In bad times, like most of the late 1920s and through the 1930s when the bottom dropped out of the cotton market, life was rough. It was during the lean years of the Great Depression that

Lane developed many of his life-long personal characteristics, such as his optimism and equanimity and his politics, which were decided, unabashedly "Rooseveltian." In addition to an adherence to liberal politics, the family as a whole seemed to have liberal views on race. Lane grew up in an integrated neighborhood, and relations between the family and African-Americans appeared to be quite respectful and cordial.

Kirkland's experiences with unions happened outside his middle-class family. In his teenage years, Lane developed a serious case of wanderlust. In 1939, following in the footsteps of his ancestor who had joined the American expedition to circumnavigate the globe, Lane went off to sea, joining the crew of the *S.S. Liberator*, a merchant ship. He remained with the merchant marine after the United States formally entered the Second World War in 1941. During the war he joined Local 88 of the Masters, Mates, and Pilots' Associations, thus beginning a five-decade association with organized labor. Still the draw to devote his life to the labor movement was not an obvious one to Kirkland, and after the war, he toyed with various career moves. But in 1947, Lane went to hear the AFL President William Green speak about unions and the vicious assault on them, specifically the passage of the Taft-Hartley Act. Green, who had all the rhetorical tools of a Baptist minister, moved Kirkland, spurring him to ask Green for a job with the federation. Green gave him a post as a researcher and speechwriter.

Through the late 1940s to the early 1960s, Kirkland's *ad hoc* assignments grew in importance. From writing speeches for the Democratic vice-presidential candidate in 1948, Alben Barkley, to penning those of presidential candidate Adlai Stevenson in 1952, Lane became a top spokesperson for the AFL. His work brought him within the closeted circles of political power in the United States. Perhaps nothing illustrates this more than the passage of the 1964 Civil Rights Bill. In 1963, the AFL-CIO finally stepped up its somnambulant campaign for civil rights. President John F. Kennedy (JFK) had on his desk an omnibus civil rights reform bill, which included a provision for a new federal fair employment practices commission (FEPC). The inclusion of an FEPC into the legislation made it quite controversial, causing JFK to shy away from it. It was at this moment that AFL-CIO President George Meany sent his top legislative aide, Andrew Biemiller, as well as Lane Kirkland, to speak with Kennedy. Biemiller and Kirkland convinced the president not to drop his support for fair employment. In the end President Kennedy listened to Meany, Biemiller, and Kirkland, as well as several influential civil rights leaders, such as A. Philip Randolph and

Roy Wilkins, and the bill that passed after his assassination contained the FEPC, which was rechristened the Equal Employment Opportunity Commission.

Despite the legislative advances during the Lyndon Johnson years and Kirkland's appointment in 1969 to be the AFL-CIO's secretary-treasurer, the 1960s were a troubled time for him. His first marriage fell apart in 1969. He witnessed with great apprehension the disintegration and transformation of the Democratic party. In Kirkland's view, the singular goal of liberal politics was to advance the standard of living for the working class. He had very little use for antiwar protestors, feminists, environmentalists, and gay rights activists. Kirkland frequently lamented the introduction of so-called identity politics into his Democratic party. To the end Kirkland remained an anti-Communist, bread-and-butter unionist. He was thus devoted to Great Society politics: the War in Vietnam and the War on Poverty. Unfortunately for him this political outlook was best suited for the Cold War of the 1950s and early 1960s, and not the decades that followed the Vietnam War and Watergate.

By the time Kirkland was elevated to the AFL-CIO presidency in 1979, he was already something of an anachronism. Throughout the 1970s, large segments of the labor movement, including coal miners and truck drivers, were seeking more democratic, less bureaucratic solutions to their problems. Despite his great sympathies with workers everywhere, Kirkland was a product of the federation's bureaucracy. Moreover he was not always comfortable in the national spotlight as George Meany had been, particularly with reporters and the New Left's social activists. Rather than adapt his style to new political realities, Kirkland instead charged ahead, leading with what he knew and understood: Fighting for a better deal for workers and fighting against communism across the globe.

Initially Kirkland's political goals found fertile ground. He and President Jimmy Carter got along well. Together they had worked on a labor-management-government arrangement, the so-called National Accord, which ideally would have ushered in a new era of cooperation and give labor unions unprecedented influence in the formation of national economic policy. Kirkland fashioned the outline of the National Accord in preparation for the 1980 presidential election. The AFL-CIO and its member unions went all out for their candidate, Jimmy Carter. Unfortunately for Kirkland, drumming up political support within the labor movement proved much harder than originally thought. Although union leaders backed Carter, many rank-and-file members voted for Ronald Reagan and conservative contenders for the U.S. Congress. Reagan's ascendancy was a disaster for

the AFL-CIO on the domestic level. And yet Kirkland was able to use Reagan's hard Cold War stance in the world to propel the federation's desire to create more democratic unions around the world.

Reagan's "morning in America" policies were tremendously damaging to the labor movement and workers generally. Under Reagan's leadership, conservatives in the federal government launched long-planned attacks on unions and living standards. They wanted to enact all sorts of reforms from lowering the minimum wage to reducing federal support for collective bargaining and workers' rights. President Reagan first showed the nature of his administration in 1981. Instead of bargaining with striking air traffic controllers, who belonged to the Professional Air Traffic Controller Organization (PATCO), Reagan fired all 10,000 workers. They were subsequently blacklisted as well. While supportive of the workers, the AFL-CIO seemed powerless to rein Reagan in. Kirkland was left with the job of rallying laborers and drumming up support for Walter Mondale's lackluster 1984 presidential campaign.

After the stunning and stinging defeat of organized labor's candidate, Kirkland began to focus more on international issues. He had always been interested in foreign affairs and diplomacy. As a died-in-the-wool cold warrior, Kirkland became the AFL-CIO's point man on the U.S. attempt to challenge the Soviet Union in Europe and Central America. He had been involved in carrying out some of the logistics for the operations surrounding the Bay of Pigs fiasco. In the late 1980s, Kirkland became an important voice in the national debates about Cold War foreign policy. Politically he was to the left of Reagan but to the right of those on the Left. He derided any actions to support the oppressive and murderous right-wing dictatorships and was equally critical of the left-wing Central American revolutionaries and governments. He supported middle-of-the-road democratic forces, especially trade unions set up on the federation's model. At the time Kirkland's moderate view seemed to win few converts. However his position became vindicated with the political transformations in Poland and Nicaragua. Kirkland's support for Lech Walesa's Solidarity Movement was decisive and instrumental in the creation of a prodemocracy, non-Communist Poland. (It also made Kirkland a Polish national hero.)

Kirkland's emphasis on foreign policy as well as his particular political outlook in the Cold War was controversial within the AFL-CIO. Not everyone wanted the federation to adopt a moderate tone in the U.S. approach to the global fight with the Communists. Moreover some felt that the concern with international issues was taking the focus away from

the eroding position of organized labor within the United States. Beginning with the failed PATCO strike, unions suffered a series of setbacks. Encouraged by their victories in the early 1980s, anti-union employers and their associations mounted a frontal assault on organized labor. These right-wing forces found sympathy, support, and assistance from the federal government. President Reagan's appointees on the National Labor Relations Board turned that agency into a decidedly pro-employer body. During the 1980s, workers lost about half of their petitions for certification for collective bargaining. Making matters much worse were dramatic and expansive changes to the American economy. Technological innovation, federally sanctioned use of permanent replacement workers, and de-industrialization worked together to deskill and downsize the labor force. All workers suffered as high-paying manufacturing jobs were replaced by low-paying service jobs, but unions and unionists bore the heavy burdens. By the end of the 1980s, union density was at historic lows.

Kirkland tried the best he could to stem the rising conservative tide against organized labor. In the 1980s, he worked tirelessly to bring unity back to the fractured labor movement. His efforts culminated in the re-entry of three major unions—the United Automobile Workers (1981), the Teamsters (1987), and the United Mine Workers (1989)—into the AFL-CIO. Kirkland also led the charge against such potentially antilabor initiatives as North American Free Trade Agreement (NAFTA). Finally he worked to diversify and harmonize the labor movement by encouraging women and minorities to take more leadership positions within the AFL-CIO and by adopting neutral stands on such critical social issues as abortion. Despite these accomplishments, many in the labor movement in general, and the AFL-CIO in particular, felt as though the emperor was fiddling while Rome was burning.

Following the election of President Bill Clinton in 1992, forces within the AFL-CIO began to organize a challenge to Kirkland's presidency. In October 1994, at the federation's annual convention, a group of unionists collectively known as the New Voice, engaged in surprise attacks on Kirkland. Taken completely off guard, he became very defensive and resistant to the calls for reform. In particular the New Voice unionists, who were led by John Sweeney, Linda Chavez-Thompson, and Rich Trumka, wanted a renewed focus on organizing new union members; a new approach to the national media; and new support for women, minorities, and low-income wage earners. Rather than fight his vocal opponents, Kirkland decided to retire in the spring of 1995. He was

devastated by the rebuke, which he saw as a condemnation of all that he had accomplished over the last five decades. Moreover at 72, he had been eyeing retirement for some time. In his place the AFL-CIO chose Tom Donahue, who served as president until October 1995, when the federation elected Sweeney. After his ouster Kirkland faded from public view while traveling, enjoying his family, and working on a memoir that was never published. He died in 1999.

To this day Kirkland's critics have not mollified their views of him. Perhaps we are all still too close to the events to make a decisive judgment. It remains difficult to answer the question whether Kirkland could have done more to reverse organized labor's decline since the 1980s. In the midst of a hostile political environment and during one of the most transformative periods in American economic history, he was able at least to keep the AFL-CIO together, challenge some of the more pernicious politicians and public policies, and score some victories, especially on the international stage. But Kirkland's inability or unwillingness to engage in new organizing campaigns, his disregard of the media, and old-style political style did hamper the growth of the federation. Weighing these historical factors will be the work of future labor historians.

KNIGHTS OF LABOR

On May 4, 1884, the Union Pacific Railroad Company slashed pay rates for all of its workers. Over 12,000 machinists, yardmen, freight handlers, firemen, and engineers from Nebraska to Oregon struck in protest. In Denver, Colorado, a committee of railroad laborers came to editor and Knights of Labor (KOL) organizer Joseph Buchanan's office for help. The men convinced Buchanan to address a group of local picketers. When he arrived the KOL leader heard militant rhetoric that revealed both workers' anger and their spirit of collectivism. He helped provide expression for the raw passions of these men and their

fellow operatives in other cities by creating KOL District Assembly (DA) 82, which represented all Union Pacific employees from Omaha to Portland. Over the next decade DA 82 proved one of the KOL's strongest affiliates, and its workers earned the highest pay on any railroad line.

During the next year, 1885, tensions between Denver's railroad laborers and their employer arose again, this time spilling over into a citywide display of working-class militancy. Picketers, rioters, paraders, and boycotters blended as a series of actions supported the KOL insistence that all workers receive the remuneration their work had earned them. The housewives and female laborers belonging to Denver's two women's local assemblies of the KOL, for example, appeared on Monday May 18, the first day of the strike, to halt scabs by pushing them into irrigation ditches. Buchanan quipped that a "scab tried to get through the line" and "half a dozen women gave him the 'ditch degree.'" "Those house wives of labor" he wrote, "were fervent believers in the virtues of water." Later that evening protestors marched two miles "loudly singing the battle hymn of organized labor in the West, 'Hold the Fort, ye Knights of Labor!'" Buchanan remembered that the singing stopped twice. First the crowd held "a little bonfire" outside the office of the *Rocky Mountain News*, burning recent issues that had condemned the strike. Second the "nearly two thousand voices" stopped singing to issue "cat-calls, groans, and hisses" at Shed's Cheap Store. The KOL organized a boycott of the store because it refused to recognize the local clerks' union.

To understand Buchanan's activism is to understand the KOL. Born in Missouri in 1851, he eventually chose journalism and union organizing as his trades and went to Colorado in 1878. Between his arrival and his decision to move to Chicago in 1887 in order to aid KOLs falsely accused and erroneously convicted of a bombing at the city's Haymarket Square, he created a number of local assemblies and two district assemblies and led two major railroad strikes, coal miners' strikes, parades, and boycotts. He was a craft union printer who helped organize the Denver Trades Assembly, and he was the KOL's leading organizer in the country. As editor of the Rocky Mountain West's largest labor newspaper, the *Labor Enquirer*, he encouraged workers to find a vision of political economy that resonated most with them, all the while insisting that they privilege pragmatism over dogma. The pages of the *Enquirer* proved eclectic as readers found the writings and speeches of theorists who ranged from doctrinaire Marxists to anarchists to utopian co-operativists to land reformers. No matter their ideological bent, he

consistently reminded his readers that organizing, striking, and boycotting achieved the desired short-term ends of all proponents of the labor movement. His commitment to possessing multiple views led him to join two different socialist societies and endorse Greenback, Union Labor, and Republican candidates for office.

The range of Buchanan's antimonopolistic thought as well as the various actions that resulted from it reflected the changing industrial order. Knights of Labor across the country shared the sense that their rights as citizens were being usurped by corporations. The long hours for low pay, not to mention the dangerous conditions found in factories, mines, and on railroad lines, challenged workers' conception of work and reward. Most KOLs accepted the labor theory of value or the idea that labor created all wealth and therefore workers deserved the lion's share of what they produced. Deciding exactly what the fair share of the fruits of their labor provided often proved difficult. Instead of seeking a wage formula, workers by the 1870s were willing to accept the wage bargain as a transitory phase that allowed them to save enough money eventually to purchase their land or buy a workshop. In the Jeffersonian tradition that many postbellum Americans still held dear, owning land or a small shop signified the promise of American freedom. From this perspective the creation of a permanent wage workforce existing on subsistence pay threatened to prevent generations of laborers from ascending to the promised status of independence. Thus many workers joined the KOL in order to prevent their bosses from keeping them in a dependent state or turning them into wage slaves.

During the 1870s, chronic unemployment and constant wage cuts heightened workers' fears that they now lived in a world where social mobility was dead. When railroad owners cut their laborers' pay yet again, workers' responded by participating in the Great Strike of 1877. With evidence of a collective opposition to wage slavery, KOL leaders outlined the organizations' beliefs and aims in its Preamble and Declaration of Principles. The 1878 document argued that the unchecked "aggressiveness of great capitalists and corporations" would result in the "hopeless degradation of the toiling masses." To ensure that workers received "the wealth they create," KOL favored abolishing the wage system and replacing it with cooperatives. Recognizing the complete restructuring of the nation's economic order would take time, the KOL's declaration also called for more immediate changes to limit the inequalities workers faced. Protecting public lands for "actual settlers" instead of granting acreage to railroad companies, promoting

workplace safety, ending child labor, and making 8 hours the standard workday were among the reforms KOL demanded. Buchanan emerged as the KOL's best organizer because like the order's manifesto, he successfully mixed practical objectives and actions with idealistic goals and rhetoric.

The KOL rank-and-file members accepted this blend of pragmatism and radicalism because they realized that it allowed the ideological and strategic flexibility necessary to construct a national labor movement. Most also realized that much of the KOL's emerging strength resulted from the fact that power within the order flowed from the bottom up. Local, district, state, and national trade assemblies existed under the umbrella of national bodies, which included the general assembly, the general executive board, and the grand master workman. Some local and district assemblies consisted of a single trade, while others were mixed or accepted all those regardless of occupation who wanted to join the order in a given area. The KOL barred lawyers, bankers, speculators, gamblers, and drunkards, since they understood them to be nonproductive workers and immoral human beings. Leaders and members proudly spoke of their acceptance of immigrants, African-Americans, and women. Organizers and elected leaders however also took equal satisfaction in their support of Chinese exclusion and their insistence to ban Asian immigrants from their locals. Many KOL publications, influenced by the racist pseudoscientific writings of the day, considered Chinese workers insimilable and therefore a permanent pool of cheap labor. Thus in order to understand the KOL and their many contradictions, we must look at some of the battles the workers who belonged to the over 12,000 local assemblies organized in roughly 3,000 communities, fought with their employers, and each other. Only then we can grasp how an organization with 110,000 workers in 1885 could grow to 729,000 members in the next year, and then fall to roughly 250,000 members by the end of the 1880s.

Philadelphia tailors created the Nobel and Holy Order of the Knights of Labor in 1869, and chose Uriah Stephens their leader. Influenced by the Masons, these garment cutters founded a fraternal order committed to ritual and secrecy and as a result remained rooted mostly in the Philadelphia area until the 1870s. By 1876, the unskilled laborers in Pittsburgh's emerging industries and a number of Pennsylvania's coal miners joined the order and changed the face of the organization. Crucial to the transformation of the KOL from a fraternal organization into a federation of industrial workers was a change in leadership. Terence Powderly, an Irish Catholic former railroad worker turned machinist,

won the order's top post of grand master workman in 1878. In 1881, Powderly convinced members to abandon secrecy. He also pushed organizers to bring laborers in the emerging factory towns of Buffalo, Chicago, Cleveland, Detroit, and Milwaukee into the KOL and demonstrated his commitment to building an organization for industrial workers by moving the KOL's headquarters from Philadelphia to Pittsburgh. As more and more workers joined the order, Powderly and other leaders pushed new members to focus on their similarities, such as their opposition to wage labor, rather than their differences, namely, political beliefs that ranged from socialism to anarchism to general reform. Indeed this commitment to unity can be found in the KOL's motto, adopted in 1882, that "an injury to one is the concern of all."

National leaders' commitment to fostering a working-class culture of unity certainly contributed to the order's growth, but victories on the industrial battlefield proved the real engines of expansion. Workers throughout the nation were becoming more militant as indicated by the increasing number of strikes. In 1881, for instance, there were roughly 101,000 workers involved in 474 strikes compared to 407,000 workers participating in 1,432 strikes in 1886. In fact from 1881 to 1900, at least 22,739 strikes occurred. From 1880 to 1884, most of these protests were spontaneous, but after 1884, they were increasingly called by unions. Officially the KOL opposed strikes except in extreme circumstances, but the reality of power flowing from the bottom up meant that local leaders followed the wishes of their constituents rather than national officers. For example when a manager on railroad magnate Jay Gould's Wabash line fired a KOL-affiliated shop man in 1885, his fellow workers refused to handle any more cars. The walkout spread, and Gould eventually backed down. The Wabash strike stirred workers' faith in the power of organized collective action. From July 1885 to June 1886, 6,200 new district assemblies formed. In fact the executive board suspended the granting of new charters for 40 days in early 1886 to try and catch up on the flurry of requests for membership. For a brief period then workers won strikes, membership rolls swelled, and militant actions, not Powderly's rhetoric of cooperation with capital, determined the order's course.

Suggesting the promise of a truly inclusive grassroots working-class movement was the fact that 60,000, or ten percent, of the order's new cardholders were African-Americans. Also, female operatives claimed nearly a ten percent share of the KOL total membership as well. As the women belonging to Denver's local assemblies illustrated, they could be as

militant as the white male majority. This democratic spirit did have its limits.

The Rock Springs Massacre in September 1885 provided an example of white workers' willingness to subscribe to social Darwinism and use brutality in attempting to control the labor supply. Union Pacific coal miners, belonging to DA 82, marched from their union hall to the outskirts of the small Wyoming town. Earlier in the day a fistfight between white and Chinese miners saw the whites call a strike. Although the Chinese outnumbered white coal diggers 331 to 150, whites still surrounded Chinese homes with rifles and revolvers. Many of the Asian immigrants fled by train, as did two white foremen who received death threats, but some remained. As evening settled on Rock Springs, the white KOL members set fire to the local Chinatown, and then shot at those exiting their burning homes. In the end 28 Chinese died, 15 were wounded, and the 14 white miners arrested were acquitted.

Divisions over political beliefs and organizational structure also led to violence and revealed the weakness that existed within the order. Attempting to build on the momentum of the southwestern victory and promote unity through a common reform agenda, both national and regional leaders advocated an 8-hour day movement. The shorter hours movement garnered support from both craft unionists who, led by New York cigar maker Samuel Gompers, belonged to the Federation of Organized Trades and Labor Unions (FOTLU), and Chicago's Anarchist International. Members of both organizations belonged to the KOL. The FOTLU's leaders proposed that workers across the country strike on May 1, 1886 for 8 hours. By early spring 8-hour rallies were held around the country. But all was not well within the KOL. On March 13, Powderly informed local and district assemblies that he opposed the strike plan, arguing that the order did not have the necessary funds for strike relief that this massive action would require. By that point however, Chicago workers proved too excited to wait for May 1 and struck early. Powderly and his supporters found themselves in an increasingly difficult position by the end of April as nearly 50,000 Chicago unionists had made 8 hours the standard workday. As May 1 approached, those who insisted on caution appeared to lack nerve. Despite the grand master workman's objections, KOL members struck.

On May 1, 1886, about 200,000 workers went on strike across the nation; 40,000 lived in Chicago. On May 3, antilabor police captain John Bonfield ordered some of his men to attack picketers outside the McCormick reaper plant. At least two unionists were fatally shot, and a number of other

demonstrators were wounded. In opposition to this extreme act of police brutality, labor activists organized a protest rally at Haymarket Square on May 4. As speakers condemned city leaders for their indifference to the murdered strikers, a bomb exploded killing four policemen. Policemen who had marched to the middle of the square just before the blast opened fire on the crowd. Employer and police hyperbole aided by the *Chicago Tribune's* anti-union flair stirred public fears that they sat on the brink of revolution. Over the next three weeks, Chicago's district attorney incited 31 people for the murder of Mathias Degan, a police officer killed by the bomb. Eventually eight men stood trial for conspiracy to commit murder, and the judge found all of them guilty. After the appeals process, the State of Illinois sanctioned the hanging of four of the conspirators.

Workers across the nation protested the convictions and voiced their opposition to state-sponsored repression. Worried about the image of the KOL, Powderly however refused to authorize an official protest. Already angered by his lack of support for the 8-hour strikes, opposition to Powderly within the order grew. The divisions that workers had put aside during their efforts to acquire pragmatic reforms ended with Haymarket. More specifically the leaders of DA 49 in New York had long pushed their fellow KOLs to follow a more radical path that included organizing laborers into only mixed locals and forbidding organization along craft lines. They had fought with Gompers and the cigar makers over this issue in 1875. By 1886, they held a majority of spots on the KOL's general assembly, and during the KOL's annual meeting, they passed a motion removing the cigar makers from the order. Gompers and other purged workers responded by forming the American Federation of Labor (AFL).

Buchanan found himself at the center of this affair. The order's best organizer argued that by expelling the cigar makers the executive board was dividing the labor movement and destroying the KOL. Instead of siding with Buchanan, the thin-skinned Powderly rebuked the Denver printer. Buchanan had critiqued Powderly based on the master workmen's failure to support the accused Haymarket bombers. Powderly countered by claiming that Buchanan had injured the order's image both because of his support for the conspirators and his membership in socialist organizations. In early 1887, Buchanan decided to leave Denver and move to Chicago to defend the convicted Haymarket bombers and try to build an anti-Powderly base. He soon found himself expelled from the KOL.

Buchanan failed largely because the order was hemorrhaging members. In February 1887, Powderly

realized the error of his ways regarding the cigar makers, but by that point Gompers rejected any type of peace. By July 1888, the once powerful KOL stood at 220,000 members. By 1890, that number would fall to 100,000. Although the national office would not disband until 1917, the KOL had become ineffective as a national movement by the early 1890s. Yet the number of members should not be the only test of strength.

In some places, such as the Rocky Mountain West, workers maintained the tradition Buchanan started and continued to work with each other across union and skill lines by engaging in collective actions on both the industrial and political fronts. In Butte, Montana, for example, virtually every male wage by 1890 received \$3 per day. This rate, originally set by the Butte Miners' Union, became the standard. When some laborers excavating a cellar discovered, on May 3, that contractors planned on paying them a daily rate of only \$2.50, they stopped working. Unionists across the city met and threatened a general strike. By May 6, 500 Butte unionists walked picket lines in support of the common laborers' demand for a 3-dollar day. By early June the strike was successful, and the KOL-affiliated Butte Workingmen's Union emerged to represent all unskilled labor in the city.

The unity of Butte workers by the 1890s was also displayed in the political arena. Nationally KOL locals across the country attempted grassroots political efforts from 1885–1888 and then worked with farmers and eventually became tied to the Populist movement in the early 1890s. Following this trend Butte workers created a Workingmen's party in 1888, but only two of the candidates the unionists supported proved victorious. Divisions over tactics, ideology, and religion blunted the promise of this movement. Leaders of the District Assembly 98 (headquartered in Butte) tried again by joining forces with the Helena Trades and Labor Assembly and the Farmers' Alliance to organize the Independent Labor in 1890. The party's platform calling for the 8-hour day, a more stringent mine inspection law, equal wages for men and women, and stronger enforcement of the Chinese Exclusion Act. Like its predecessor the Independent Labor party failed. Eventually Montana's KOL succeeded in the mid-1890s as members of the Populist party when they elected local officials and a governor who ran on a fusion Populist-Democratic ticket. Although the KOL's political efforts proved limited nationally, they functioned as a building bloc for Socialist party victories in the Progressive Era.

In the end the KOL strength also proved its weakness. Power did flow from the bottom up, and that

meant that skilled organizers could mould workers' passions into a culture of unity that translated into victories on the industrial battlefield. It also meant that national leaders had troubles controlling factional crises, setting strike policy, healing ideological divisions, and articulating a clear political agenda. The order demonstrated that the class struggle had to start on the local level and that workers could have some success nationally when they maintained their culture of unity.

KNIGHTS OF ST. CRISPIN AND THE DAUGHTERS OF ST. CRISPIN

Massachusetts shoemakers organized the International Knights of St. Crispin (KOSC), founded in 1867, to oppose the impact of industrialization on shoemaking. The post-Civil War introduction of steam-powered machinery increasingly divided work by job and specialization. Resistance to the power of industrial capitalism required factory workers to organize and confront their employers over wage cuts and control of work processes. In 1868, Lynn shoe workers organized the first KOSC craft lodge in Massachusetts. The transnational activities of the KOSC, led by the craft lodges in Massachusetts, expanded into shoe centers in the American Northeast and Canada. The mechanization of sewing light leather already employed many female shoe workers. Seeking to protect women who migrated to northeastern shoe centers in search of higher wages, the national Daughters of St. Crispin (DOSC), founded in 1869, sought to represent the economic interests of

female shoe workers, both migratory and resident in shoe towns. Led by female workers, the DOSC organized separately from the KOSC but cooperated in strikes and in pressuring employers to arbitrate wages and grievances.

Borrowing the patron saint from English cordwainers, the KOSC transferred artisan values into the emerging post-Civil War shoe factory. These men organized the most successful union of industrial workers in the early 1870s, representing various jobs from skilled lasters to teams of bottomers. Native-born Massachusetts residents, migratory Yankee workers from Maine and New Hampshire, and Irish immigrants joined the Crispin movement, which in 1870 reflected the interests of about half of all American shoe workers. At the same time, the activism of artisan-trained shoe workers in Canadian factories in southern Ontario and Quebec provinces made the KOSC organization international.

Efforts by large New England manufacturers to dominate the American shoe market through higher productivity and lower costs confronted shoe workers with intensifying mechanization, wage cuts, and concentrated, exhausting seasons of production. Crispinism represented both a critique of industrial capitalism and a labor organization. Employers defined labor costs as just another commodity in their calculations and blamed supply-and-demand forces for wage cuts. Crispins feared that wealth and power were concentrating to undermine their fair share of the value created by factory labor. They denied that their labor was a commodity to be buffeted by market forces.

By 1869, the Crispin organization in Massachusetts, spearheaded by activists in Lynn, Worcester, and Brockton, claimed 30,000 members/sympathizers. Two thousand Lynn lasters in Unity Lodge backed by Mutual Lodge with 500 members organized in 1870 to seek a citywide wage scale protected by arbitration. They timed a strike over wages to interrupt the fall busy season. Many small manufacturers, wishing to stabilize wage levels, agreed to arbitration. While unfilled orders piled up, a citywide wage scale was negotiated for 1 year with five Crispins and five manufacturers as a joint board of arbitration in Lynn. This agreement was renewed in 1871. As the leading center of shoe production in New England, Lynn factories joined by others throughout Essex County in Massachusetts set the scale of wages for the Crispin organization expanding in such shoe centers as Utica, New York, and Philadelphia. Similar agreements stabilized wages in Toronto and Hamilton, Ontario.

The KOSC in Lynn became politically active to protest the state legislature's refusal to grant a charter

for the KOSC in 1869 and successfully offered Labor Reform party candidates for state offices, winning local elections. In 1878, the offshoot Workingmen's party candidate and long-time Crispin activist beat the incumbent mayor, a large manufacturer and key opponent of the KOSC. The KOSC in Massachusetts joined the statewide push for the 10-hour day and advocated cooperative shoe factories as an alternative to industrial capitalism. The KOSC opposed Chinese immigration based on the destruction in 1870 of the KOSC in North Adams, Massachusetts, by Asian strikebreakers.

In late 1868, female workers in Lynn shoe factories organized Central Lodge No. 1 of the DOSC to prevent wage cuts. Thirty-one female delegates from DOSC lodges in the Northeast met in Lynn in 1869 to form the national association. The sexual division of labor, which assigned women to machine-stitching uppers, created no serious competition with male workers. The KOSC and the DOSC cooperated but met separately as organizations and in negotiations on wages.

Twenty-four DOSC lodges formed in late 1869, the largest in Rochester, New York, while together the KOSC and DOSC won strikes in Syracuse and Baltimore in 1871. The DOSC represented the self-supporting boarding stitcher and the female-head of family to a greater extent than residents living in male-headed families.

To protect working women's mobility, the KOSC and the DOSC joined forces in 1871 when Lynn shop owners who subcontracted stitching for large manufacturers attempted to stop the turnover of skilled working women during the busy season who left to seek higher wages elsewhere. Infuriated stitchers struck, rejecting the requirement of a week's notice backed by a wage deposit or the disgrace of a dishonorable discharge. The DOSC and the KOSC in Lynn quickly backed the strikers, forcing the employers to agree that stitchers could leave any shop without penalty.

As Lynn manufacturers sought to dominate the national market in high-buttoned ladies shoes, the KOSC and the DOSC faced downward pressure on wages. The depression years, 1873–1878, which reduced demand for fancy styles and crowded labor markets, cut earnings. The national DOSC collapsed in 1874 and the Lynn lodges in 1879. From 1875–1878, arbitration of wages and grievances in Lynn settled strikes, protected profits, and maintained wages for union men. In 1878, Lynn manufacturers, eager to sustain their dominant position in the reviving shoe market, undermined Crispin arbitration. Local lodges struck, while the manufacturers fired Crispins and recruited strikebreakers in the depression-era labor

market. After five weeks the Lynn Crispins lost the right to arbitration, but not the right to organize in lodges. Without a negotiated citywide wage scale, their fight to sustain wages failed. Still the KOSC and the DOSC had developed effective organizations to oppose the power of industrial capitalism.

KNOW-NOTHING PARTY

In the mid-1850s, the Know-Nothing party, the nickname of what was officially termed the American party, rose to national prominence by vowing to curb the influence of foreigners and Catholics in public life and pledging to safeguard the federal union from corrupt politicians and sectional extremists. Native-born skilled workers comprised an important Know-Nothing constituency, especially in industrializing cities. Know-Nothings supported American workers' requests that government counteract economic slumps and combat immigrant job competition. The ascendancy of Know Nothings worsened ethnic divisions among workers, but by the late 1850s, those conflicts receded in the face of renewed struggle over slavery's status in the West. Almost as fast as it rose, the Know-Nothing party declined as voters' allegiance shifted to the free-soil Republicans in the North and proslavery Democrats in the South.

The Know-Nothing party traced its origins to the American Republican party, a short-lived, anti-immigrant and anti-Catholic party that fielded candidates in 1844 and 1845. Shortly after those elections, New York City's American Republican mayor James Harper and Thomas R. Whitney, an engraver and Whig party activist, helped found the Order of United Americans (OUA), a semisecret nativist society. The OUA remained small and confined to the urban Northeast. In 1853, it merged with another secret society, the Order of the Star Spangled Banner, which restricted membership to native-born Protestants who swore to vote only for men of the same status. The device of an oath-bound secret society prevented opponents from gauging Know-Nothing strength until election day and enforced loyalty that would override voters' attachments to the established Whig and Democratic parties.

In 1853, the name Know-Nothing first appeared in print in the *New York Tribune*. It is unclear if the term referred to members' directive to tell outsiders that they "knew nothing" about the order or if observers who were unable to learn anything about the secretive group coined the phrase.

Anti-immigrant nativism, which was often intertwined with Protestant hatred for Catholics, had a history dating back to the colonial rivalry between Protestant England and its Catholic rivals, France and Spain. Nativism as a force in elections and government has tended to be most intense when spikes in immigration coincide with turmoil in national politics, as occurred in the mid-1850s.

Pre-Civil War immigration peaked from 1845–1854. During those years almost three million immigrants arrived in the United States, more than four times the number that had come during the previous 10-year span. Hard hit by the potato famine and declining opportunities for tenant farmers, Ireland supplied the largest number of newcomers. The states of western Germany, which were affected by crop failure and pressure on handcraft industries, came in a close second.

Immigrants provided a convenient target for voters anxious about disruptive social change. Native-born Americans complained that European newcomers lacked knowledge of republican political institutions and were therefore easily manipulated by scheming office seekers. Protestant bigots claimed that Catholic immigrants owed a primary allegiance to the Pope and acted as Vatican foot soldiers in a plot to subvert American liberty. Xenophobes also believed that immigrants drank to excess, committed crime, and generally disrespected American cultural values. Know-Nothings addressed these concerns with proposals to extend naturalization to 21 years, restrict

KNOW-NOTHING PARTY

immigrant voting and office holding, teach Protestant values in public schools, disband immigrant militia units, and investigate allegations of sexual abuse by Catholic priests and nuns.

Earlier campaigns on these nativist issues had failed, but the Know-Nothings benefited from voter anger at established parties that made any alternative, even one as ethnically divisive as the American party, seem attractive. Simultaneous with increased immigration, conflict over the spread of slavery to lands recently conquered from Mexico had severely weakened voter allegiance to the Whigs and Democrats. Not only were parties unable to resolve the sectional conflict, but their lingering obsession with Jacksonian era economic fights about credit and currency failed to address new cultural concerns related to schools and alcohol as well as immigration. Voter dissatisfaction with the major parties also embraced a more general critique of party politics as inherently corrupt. Know-Nothings responded to this discontent by promising to safeguard the federal Union from extremists in either section, combat cultural anxiety by attacking immigrants, and replace venal office seekers with virtuous public servants.

For wage earners, political and cultural corruption mattered less than did immigrant competition for jobs and the impact that an influx of unskilled labor had on the trend toward division of labor and the replacement of the artisan shop with the factory assembly line. A drop in the roller-coaster business cycle exacerbated long-term economic forces that contributed to nativism. The 1850s witnessed the end of a long boom spurred by westward expansion, housing construction, and railroad building. Three times during the decade (in 1851, 1854, and 1857) economic panics closed banks, cut off employment, and ate up working families' meager savings. Amid these downturns employers continued to experiment with mass-production techniques in such industries as textiles, iron-making, and food processing, which lowered wages and lessened the need for skilled craftsmen. In this environment fear of foreign competition encompassed several issues: Head-to-head competition for jobs in an oversupplied labor market; competition with the foreign products imported from abroad; and the more abstract problem of the transition toward mass production and an increasing reliance on unskilled labor. In the early 1850s, the Order of United American Mechanics, a nativist trade union, supported strikes in industries pressed by hard times. Spurred by this activity, American-born skilled workers responded to Know-Nothing promises to reduce job competition by curbing immigration; protect American industry by raising the tariff; offset unemployment with public works; and at the local level,

bolster employee-negotiating power by supporting trade unions.

In 1854, the formal American party emerged from secrecy to campaign for offices across the country. From 1854–1856, the American party elected seven governors, eight U.S. senators, 104 members of the federal House of Representatives, and took majority control of eight state legislatures. Although they had supporters in the countryside and small towns, Know-Nothings were particularly influential in cities. They won control of municipal governments in most of the country's largest metropolitan centers, including Baltimore, Boston, Cincinnati, Louisville, New Orleans, Pittsburgh, Philadelphia, St. Louis, and San Francisco.

The exceptions to Know-Nothing victory proved the rule of nativism's ethnic polarization of the electorate. Ironically it was the home of the OUA, New York City, where Know-Nothings failed to win a majority. That result reflected the greater share of foreign-born voters in New York's electorate, where they made up half of those eligible to vote and could easily defeat a nativist candidate. Immigrant voters in the other major cities quickly banded together with Democrats and wealthy professionals alarmed at the labor militancy of some Know-Nothing partisans. Know-Nothings lost power the fastest in cities that resembled New York's demography; that is, places where the foreign-born comprised a majority or near majority of the electorate.

Political violence, a not uncommon feature of nineteenth-century urban politics, accompanied the rise of the Know-Nothings. The widespread nativist conviction that existing laws failed to stop foreign-born vote fraud encouraged some Know-Nothings to use force against immigrants who tried to cast ballots, lawfully or not. Street gangs affiliated with the rival political factions as well as partisan police joined in these election riots. Among the worst was Louisville's Bloody Monday riot in 1855, during which 22 people died, and the combined tally of 17 deaths and more than 250 injuries at Baltimore's municipal and federal elections in 1856. Violence distorted vote totals and further undermined public confidence in the political process.

In office the American party had difficulty enacting its agenda. In a few states, bans on immigrant militias and restriction of public-works employment to the native-born were put into effect. The Know-Nothing stronghold of Massachusetts enacted a 2-year delay on voting rights for naturalized citizens, but the law was quickly repealed by the next Republican party administration. More extreme proposals to outlaw Catholic convents and lengthen naturalization failed.

At the municipal level, Know-Nothings managed to deliver on many of their promises to native-born workers. American party administrations in cities across the country increased municipal spending on public works, created more working-class jobs in government by professionalizing police and fire departments, extended city services to newer, cheaper neighborhoods on the edges of growing cities, and permitted unions to wage strikes without police interference. In a few places, such as New Orleans where a stevedore won the mayoralty, Know-Nothings placed wage earners in positions of power, but most leaders belonged to the class of lawyers and business professionals who traditionally predominated in the high offices of all parties.

Know-Nothing success was cut short by controversy over slavery's status in the West. The 1854, Kansas-Nebraska Act spurred this conflict by lifting a 33-year-old ban on slavery in those territories and permitting voters in the new states to adopt slavery should they so choose. Like the Whig party, which provided the American party with many of its leaders, the slavery question bedeviled Know-Nothings, who would have rather talked about other issues. In the South nativists were staunchly proslavery, while in the North most Know-Nothings opposed the Kansas-Nebraska Act, and many had joined the party in 1854 and 1855 because at that point the Know-Nothings represented the most credible opponent to the spread of slavery. The fledging Republican party, created in the western states in 1854 and competitive across the North by 1856, made free soil its primary objective. The option to vote for a forthright antislavery extension party in the 1856 presidential election coincided with violence in Kansas and the caning of Republican Senator Charles Sumner by a South Carolina congressman outraged by Sumner's inflammatory free-soil speech, "The Crime Against Kansas."

Poised to expand on their victories of 1854 and 1855, the American party instead collapsed. At the party's presidential nominating convention in February 1856, northern and southern delegates argued over endorsing proslavery laws like the Kansas-Nebraska Act. A united southern delegation aided by a few northern conservatives resolved "to abide by and maintain the existing laws on the subject of slavery, as a final and conclusive settlement of that subject." Afterward 63 of 75 northern delegates repudiated the platform and began the American party's disintegration as a national force. The convention nominated former Whig President Millard Fillmore, a northerner who supported the Fugitive Slave Law and other pro-Southern elements of the Compromise of 1850. Fillmore ran on a platform that emphasized

nativism, sectional comity, and support for popular sovereignty in Kansas. Northern Know-Nothings tried to field an independent ticket but watched helplessly as most of their supporters transferred allegiance to the Republicans. Fillmore, who carried only one state (Maryland), finished a distant third behind victorious Democrat James Buchanan and Republican challenger John C. Frémont. Because Republicans had little support in the South and the increasingly proslavery Democrats were in decline in the North, the fall of the Know-Nothings alarmed Americans committed to preserving the Union.

The American party survived until 1860 and beyond in three of the slave South's three largest cities—Baltimore, Louisville, and New Orleans. In the urban South, the American party stood for a more conservative version of the free-labor politics that drew workers to the Republican banner in the North. Southern big-city Know-Nothings expanded their local support by playing on urban resentment against proslavery rural Democrats who dominated state legislatures. Although southern Know-Nothings did not explicitly attack slavery, they supported the concerns of free-wage labor and thereby posed a threat to the unity of southern whites in support of slavery. During the secession crisis many of these former Know Nothings backed the Union and volunteered for service in federal regiments.

The meteoric rise and fall of the Know-Nothings destabilized the established system of party competition and voiced skilled workers' concerns about immigrant competition and economic change.

KOHLER STRIKE (1954)

Lasting from 1954 to 1965, the strike of United Auto Workers (UAW) Local 833 against the Kohler Co. of Kohler, Wisconsin, stood out as the longest industrial dispute in U.S. history throughout the second-half of the twentieth century. The 1954 Kohler strike was notable for more than its extraordinary longevity, however. Undertaken against an adamantly anti-union employer, embroiled in congressional-level efforts to demonize UAW leaders, and marked by violence and profound community division, this strike expressed the confrontation between early twentieth-century welfare-capitalist strategies and the competing culture of union solidarity that had emerged within the unions of the Congress of International Organizations (CIO) in the 1930s as they clashed anew in the context of Cold War politics. The rhetoric of the strike also highlighted the significance to labor-management battles of competing labor geographies.

Kohler of Kohler is a family owned company, in business since 1873, most famous for its manufacture of plumbing fixtures. It was located in Sheboygan, Wisconsin, 50 miles north of Milwaukee on the shore of Lake Michigan until its founder, Austrian-born John-Michael Kohler, moved it four miles west to the relatively undeveloped community of Riverside in 1898. The firm passed to the founder's sons in 1900 and ultimately to Walter Jodok Kohler, the only remaining adult son by 1905 (his younger half-brother Herbert, who would be in charge of the plant in the 1950s, was still in school). Walter Kohler oversaw the new plant's expansion throughout the first decades of the twentieth century. He retained a series of planners and landscape architects to develop a residential community adjacent to the plant, featuring company-built homes available for purchase, the American Club dormitory for immigrant workers, and an increasingly elaborate array of clubs, sports, and uplifting recreation designed to enhance the daily lives of worker-residents. Incorporated as Kohler Village in the 1910s, the town had some 400 homes and duplexes in addition to the dormitory by the 1920s.

Though the Kohler Company had weathered strikes by skilled molders at its Sheboygan, Wisconsin, factory, there had been no signs of labor agitation in the Kohler Village plant prior to the 1930s. The first twentieth-century union at the Kohler Company was Federal Union Number 18545, chartered by the American Federation of Labor (AFL) in August 1933. Declining piece-work rates and hours, disputes over "cull" rates charged for defective products, favoritism to Kohler Village homeowners in the case of layoffs coupled with mandatory contracts pledging to use scarce wages to make mortgage payments

to the Kohler Village, and an accumulation of complaints about harsh working conditions were among the issues that motivated Local 18545. The recent passage of the National Industrial Recovery Act and its Section 7(a) providing federal endorsement, if not enforcement, for workers' unionization rights also inspired the new union's members: Indeed, as would be the case in the 1950s, workers' desire for the dignity of an independent voice in determinations of conditions became one of the strongest motivations for unionization at Kohler. Almost immediately the firm countered with the formation of the Kohler Workers' Association (KWA), a company union meant to give organized expression to Kohler officials' assertions of the company's willingness "to confer at anytime with any employee, group of employees, or their representatives..." (W. Uphoff, *Kohler on Strike*, 1966). When Local 18545's requests to discuss grievances with company officials met with repeated rebuffs, the union called a strike effective July 16, 1934. Eleven days later the tensions surrounding the strike led to a violent clash in which two workers were killed by "special deputies" protecting the plant and village. A (pre-Wagner Act) National Labor Relations Board (NLRB) hearing held in September considered complaints by the union regarding discharges for union activity, refusal to bargain collectively, and interference with the company's self-organization through the promotion of a company union. Though the NLRB found such interference, it decided that the wrong could be remedied by an election between Local 18545 and the KWA, which the KWA won with 62% of counted votes. Local 18545's strike dragged on until a quiet settlement was reached to permit wartime expansion of the company in 1941. The KWA remained the main organization handling Kohler employee grievances.

The 1954 Kohler strike developed out of growing dissatisfactions and aggressiveness on the part of KWA members in the 1950s. Both the UAW-AFL and the UAW-CIO had responded to continued interest among Kohler employees for an independent union, but the KWA continued to win NLRB elections through 1951. By then KWA officials had themselves become interested in possible UAW-CIO representation as they sought more substantial gains with regard to wages and work conditions and met with resistance from the Kohler Company. In 1952, the KWA membership voted to affiliate with the UAW-CIO, and won an election certifying itself to bargain as Local 833-UAW. The new union signed a first contract with the company in February 1953, bringing, among other things, a dues check-off,

arbitration, and a wage gain. However soon after bargaining began in 1954 for a new contract, the company proved unyielding on major issues, including arbitration, union security, seniority, pensions, insurance, lunch breaks for workers in units with continuous shifts, and wages. Bargaining broke down in April, and Local 833 struck the Kohler plant on April 5.

Union and company tactics early in the strike demonstrated the outrage and acrimony the company had inspired as well as the ferocity of its anti-union sentiment. Convinced that the company was determined to break the strike and destroy the union, and outraged at Kohler officials' allegations that the strike was engineered by militant outsiders, Local 833 rallied masses of 2,000 or more pickets to demonstrate support for the union and prevent the company from operating. The company stockpiled weapons and tear gas while its representatives grimly refused to negotiate on any of the union's demands on the grounds that the union's mass picketing and other strike strategies were illegal.

The company's complaints against the union reflected in part the opposing perceptions and uses of industrial, community, and private space invoked in the course of the conflict. For decades company publicity had touted the factory's idyllic village of proud home-owning employees as proof that the quality of Kohler products derived from a well-ordered balance of industrial and domestic life. Strikers upset this balance by blocking other workers' movements from home to factory, "disturbing the peace" with bullhorns and sound systems used for outdoor meetings, and intimidating those who crossed picket lines to work at the plant by taking industrial issues to their front lawns (thereby also disturbing prevailing gendered divisions of space between home and work promoted by the company). These actions formed the core of the complaints lodged by the company with the Wisconsin Employment Relations Board (WERB) charging the union with unlawful picketing and intimidation under Wisconsin law. The union's own publicity and legal maneuvers signaled the alternative geography in which members charted their affiliations. While the company labeled picketers as outsiders upsetting the friendly labor relations and locally oriented lives in Kohler, union publicity claimed that unionized workers nationwide, with the higher wages and benefits they had won through union contracts, represented the appropriate range of affiliation for Kohler workers. Union lawyers followed suit by filing a complaint against the company for failure to negotiate with NLRB and arguing that due to Kohler's considerable interstate commerce,

it was the NLRB and not WERB that held final jurisdiction. The union's tactics themselves acquired broader geographical reach after the strike had dragged on for a year with no signs of resolution. It pursued a nationwide boycott of Kohler products that often involved strikers following Kohler delivery trucks to distant destinations to picket their recipients. The boycott also relied on the expanded labor support available through the recent AFL-CIO merger.

Before the NLRB case could be heard, the Kohler strike came before another federal body—the U.S. Senate's Select Committee on Improper Activities in the Labor and Management Field, known as the McClellan Committee. Beginning in early 1957, McClellan committee hearings had exposed the corruption and intimidation rampant especially in the Teamsters' Union. Republican members of the committee, especially Senator Barry Goldwater, were determined to direct its investigations at the UAW as well, particularly its president, Walter Reuther, and saw the Kohler strike as the ideal vehicle. Along with right-wing, anti-Communist, and anti-union groups like Dean Manion's For America and *Manion Forum*, which Herbert Kohler, Jr., also supported, they were eager to undermine the higher expectations for wages and benefits that large industrial union contracts inspired among workers nationwide, boost the popularity of state-level right-to-work laws, and curb what they perceived as the growing political influence of big labor, all of which they associated with "Reutherism." The McClellan Committee's Special Counsel, Robert Kennedy, doubted that it could effectively uncover information on the strike that voluminous testimony already taken by the NLRB had not. But repeated news stories claiming that he and his brother, committee member Senator John F. Kennedy, were deliberately shielding Reuther by ignoring the situation in Kohler forced him to ask Committee Chair Senator John L. McClellan to approve an investigation and hearings. Months of mismanaged inquiry undertaken by Republican appointees and followed up by Special Counsel Kennedy himself managed to reconfirm before a national audience the profound local hatreds bred by the strike but no flagrant union corruption. Contrary to their instigators' intent, the McClellan Committee's Kohler hearings gave local union officials and UAW President Reuther a national platform to admit their mistakes and air their convictions, which proved more compelling than the company's intransigent anti-union stance and the accompanying tactics of spying and stockpiling weapons that the hearings exposed.

KOHLER STRIKE (1954)

The NLRB's extensive hearings on the union's charges of unfair labor practices had meanwhile stretched from 1955 to 1959. The board handed down its first ruling on the case on August 26, 1960. It found that though the Kohler strike began as an economic strike, which would not have entitled strikers to re-instatement under the Taft-Hartley Act of 1947, it became an unfair labor practices strike as of June 1, 1954, when the company gave a wage increase to nonstriking employees though it had refused demands for wage increases during negotiations. The company was therefore ordered to dismiss any workers hired on or after June 1, 1954, if necessary to re-instate strikers in their old positions. The board upheld the company's discharge of 77 employees for misconduct. Both union and company filed appeals to aspects of the ruling that favored the opposite side.

Negotiations between the company and the union finally resumed in June 1962, after the Supreme Court refused the company's appeal of a Circuit Court's decision upholding the August 1960 NLRB decision. A new contract, the first in 9 years, was reached on October 7, with modest but meaningful gains in the areas of dues check-off, arbitration, seniority, layoffs, insurance, and pensions, among others, though no general wage increase. But court appeals dragged on until, in October 1965, the Supreme Court turned back a second appeal from the company, this time regarding a Circuit Court ruling that effectively expanded the number of former strikers eligible for re-instatement under the August 1960 NLRB order. With the company and union engaged in negotiating a new contract that involved changes in the pension program, the issue of the former strikers' eligibility status became inescapable. A series of high-level negotiations between company and union officials ensued, culminating in the company's agreement to pay strikers \$4.5 million in back wages and pension credits and the union's agreement in return to press no further charges related to the strike.

The longest strike to that date in U.S. history was over. According to the strike's most assiduous scholar, Walter Uphoff, relations between the company and union improved from the early 1960s as they settled into a working routine of regular grievance adjustments and contract negotiations. This was itself an extraordinary achievement considering that only court orders had persuaded the company to comply with laws mandating good-faith bargaining. A two-week strike ensued in the 1980s when the company—like many others with UAW contracts—proposed a two-tier wage system in order to decrease its contractual commitments to employees. However

unlike so many unionized U.S. workers of the late-twentieth century, those at the Kohler Village plant have yet to see their unionized jobs disappear overseas. The company has established plants in an ever-wider global circle of less union-friendly locations—beginning with Spartanburg, South Carolina, during the strike and proceeding to Texas, Mexico, and China, among others. But it has also maintained employment levels at its plant in Kohler, and recently even announced plans to expand its Wisconsin plant. Ironically as jobs protected by the historic contracts pioneered by the CIO in the 1930s and 1940s have become ever scarcer, the Wisconsin plumbing factory once known for its steely determination to repel such contracts has become a most remarkable destination among union-recommended vacation spots—the location of a factory tour where union labor can be seen at work.

KU KLUX KLAN (RECONSTRUCTION AND WWI ERA)

In its successive incarnations since the 1860s, the Ku Klux Klan (KKK) has proven the most powerful reactionary movement in American history. Yet in each of the three eras in which its organizers worked, they recruited different social groups, identified different challenges, targeted different enemies, and had a different relationship to working-class Americans and the labor movement. The two constants over more than a century have been a commitment to white supremacy and an embrace of terrorism as a political tool.

The Reconstruction-Era KKK

The first Ku Klux Klan aimed to restore planter power and white supremacy in the South in the wake of emancipation and the awarding of citizenship rights to former slaves. The organization began in 1866, at a time when fraternal orders with elaborate secret rituals were a popular form of association for American men. It was established on this model in Pulaski, Tennessee, its name taken from a Greek word signifying a circle (*kuklos*). But the new order soon turned to vigilante activity as former Confederate leaders and such Democratic party stalwarts as Nathan Bedford Forrest realized the value its hooded costumes and strict secrecy could have for paramilitary activity. As congressional Reconstruction opened the way to new republican state governments, including African-Americans and those committed to democratizing the region's political economy, the KKK movement spread across the former Confederacy in 1867–1868.

In this era the movement was exclusively southern, largely rural, and its leaders came from the ranks of planters, merchants, and professionals, although the rank-and-file crossed classes. The KKK's primary objective was to reverse the revolutionary change wrought by the Civil War and radical Reconstruction: To restore as much of the prewar social order as it could manage to. Above all KKK leaders aimed to keep agriculture labor servile, if technically free, and to maintain white elites' control of government. For its part as a coalition between freedmen, free blacks, white small-holding farmers, and former Whigs devoted to a free-labor vision of the South's future, the Republican party threatened both agricultural employers' power and white supremacy. This dual challenge made it anathema to Klansmen and their allies in the Democratic party. The violence they inflicted on freedmen had no counterpart in the Western Hemisphere: One in ten of the black participants in the constitutional conventions of 1867–1868 suffered violent reprisals, in which seven were killed outright.

The KKK's signature practice was masked terrorism under cover of darkness. In a typical raid, a band of hooded KKK night riders abducted a local black Republican activist from his home at night, flogged, beat, or otherwise tortured him, sometimes killed him, perhaps also raping women in the family or burning it out of its home or destroying churches or schools. Sometimes Klansmen assaulted whites for Republican party activism or for affronting local moral codes in some way, but their main focus was the defense of racial hierarchy. The movement was

usually most active in communities where blacks and whites lived in relatively equal numbers and Republicans and Democrats were in sharp competition, such as the Upcountry. There vigilantism swung otherwise tight elections, decimated Republican party organizations, and weakened community institutions.

Because so many white southerners agreed with the KKK, its terrorism was nearly impossible to prosecute locally. At worst local law enforcement officials participated in the night riding; at best, they like other critics were intimidated by the KKK and unable to secure indictments and convictions from white jurors. This stalemate made federal intervention essential to suppress the widespread violence and lawlessness that threatened to undermine democracy. Congress carried out major investigations (also unintentionally creating rich documentation for later generations of historians) that led to legislation such as the Ku Klux Klan Act of April 1871, which enabled military arrests and federal trials. Thanks to them the KKK conspiracy was nearly overcome in the early 1870s, although freelance intimidation and violence resumed after federal troops were withdrawn.

The Second KKK

After the defeat of Reconstruction, leading white southerners promoted a mythology of the lost cause that lionized the KKK. In mass membership organizations, such as the United Sons of the Confederacy and the United Daughters of the Confederacy, they glorified the old South and secession and credited the KKK with saving southern civilization from the supposed peril of black rule. As elites reconciled across the Mason-Dixon line in the Gilded Age, the South's mythology became the nation's. Leading historians at premier U.S. universities pilloried Reconstruction such that the KKK appeared a salutary force. The most influential version of this revisionist narrative was the blockbuster film by D. W. Griffith, *Birth of a Nation*, released in 1915. After a private showing for Washington leaders in the White House, President Woodrow Wilson, whose historical writing was quoted in the film, described the racist epic as "history written with lightning."

In the same year the film was released, an Atlanta huckster and avid fraternalist named William Joseph Simmons revived the KKK and used showings of *Birth of a Nation* to recruit. The order's message of "100 percent Americanism" enjoyed wide approval thanks to the hyperpatriotic climate cultivated by the federal government to wage World War I.

But it was not until after the armistice that the second KKK really took off. In the nationwide unrest that followed in the war's wake, the KKK's message attracted a wide swath of native-born, Protestant, white Americans faced with bolder challenges from African-Americans; unprecedented labor struggle and radical mobilization following the Bolshevik revolution; feminist challenges to male power; and a younger generation disdainful of Victorian moral codes and determined to see salacious movies, patronize dance halls, and engage in other modern practices that shocked adults. The new KKK proved most popular in Indiana, where one in four eligible men joined, but it enjoyed great electoral success in places as far-flung as Oregon and Arkansas. Unlike the old KKK, this one did better in urban than in rural areas. The city of Chicago alone hosted 20 different klaverns (chapters) and claimed 50,000 members; in one 1921 march, 10,000 Chicagoans took part. Nationally the KKK is reliably estimated to have enrolled about two million dues-paying members in some four thousand local chapters over the decade.

The KKK of the 1920s had a more wide-ranging agenda than those of other eras. It joined the earlier movement's commitment to white supremacy with modern anti-Semitism; anti-Catholicism; anticommunism; hostility to immigrants; antipathy to liberals; support for old-time religion; and a defense of Victorian gender roles and sexual values. The KKK leaders denounced enlightenment thinking and the Protestant social gospel then popular for encouraging "alien ideas." Local purity campaigns joined all these causes together, often in extralegal Prohibition enforcement. Staking out a place as the most devoted defender of what today would be called family values in the face of what it called moral breakdown, the KKK became so popular that it was able to practice vigilantism with relative impunity in many small-town communities in the South and Southwest. Historians have estimated in fact that approximately half of the victims of KKK terrorism in the 1920s were whites accused of violating local moral codes.

Yet whereas in the Reconstruction era, extralegal violence was the KKK's sole activity of note, in the 1920s, members typically engaged in nonviolent practices common to many social movements, albeit with KKK content. They attended business meetings to discuss ideas and plan activities, campaigned for sympathetic political candidates or against offending businesses, worked for laws against interracial marriage and against U.S. participation in the World Court, came together for picnics and religious revivals, and mobilized for shows of strength in rallies lit by burning crosses. Through such practices, the KKK became a formidable force in American politics.

At least 75 members of Congress in the early 1920s were said to owe their seats to the KKK. In 1924, the national conventions of both major parties voted down resolutions condemning the KKK. By then the KKK also claimed to have recruited 30,000 Protestant ministers and three-quarters of the delegates to the Southeastern Baptist Convention.

Historians have divided over how to interpret this incarnation of the KKK. Riding the crest of the wave of social history in the 1970s that stressed demographic research, downplayed ideas, and sought to identify the real problems behind social movements and their rational answers, some scholars became self-conscious revisionists. Pointing to the KKK's broadly middle-class ranks and many of its leading activists' long records of civic involvement, they depicted members as populists concerned about elite domination of politics and threats to established community standards. Some other historians saw prejudices of various kinds as the core of the KKK's appeal but assumed local conditions determined activists' thinking: That, for example, blacks were the focus in Alabama and Catholics in Pennsylvania. Actually regardless of where they appeared, KKK publications and speeches usually discussed numerous targets and sought to connect issues by, for example, blaming Jews for hard times or Catholics for the failures of Prohibition.

Admittedly a movement this diverse in its antipathies and broad in its catchment poses interpretative challenges that defy conventional class analysis. But if we understand class as socially constructed and class identity as shaped historically by race and gender affiliations and understand middle-class people as having a kind of class consciousness of their own, then the catchment becomes more explicable. It embodied an American variant of reactionary populist politics akin to those developing at the same time in Europe; KKK leaders if not rank-and-file members sensed the family resemblance and expressed feelings of kinship with the Italian Fascist leader Mussolini in particular. No longer forcing the KKK movement into a Procrustean bed as either populist or racist, an approach employing this kind of class analysis can reveal how the two characteristics worked together to give the movement its powerful appeal.

The KKK spokesmen framed their cause in the kind of Janus-faced republican idiom popular in nineteenth-century America. Imperial Wizard Hiram Evans, for example, portrayed the KKK as "once more the embattled farmer and artisan"—now mobilized to fight off "radicalism, cosmopolitanism," and "the alien-minded 'Liberal'" along with other enemies. The republican tradition had long excluded most Americans from citizenship—whether slaves,

property-less labor, or women and children—so its assumptions proved congenial to KKK leaders, who ignored all that did not suit their purposes.

The KKK's class politics built on republicanism's basic distinction between property owners with a stake in society and others seen as objects of control. The movement attracted many skilled workers and seemed untroubled by the kind of racially exclusive business unionism practiced by most affiliates of the American Federation of Labor (AFL). Yet KKK leaders excoriated the majority of the contemporary working class, African-Americans, and the new immigrants. The KKK spokesmen construed these groups in biological terms as a threat to the nation, building on the antidemocratic theory of such racist writers then in vogue as Lothrop Stoddard and Madison Grant. Denouncing the militant labor organizations of the unskilled as the work of racial aliens—whether the Industrial Workers of the World or industrial unions more generally—KKK leaders also sometimes helped employers suppress labor struggle with vigilantism.

As powerful as it was at its peak in 1924, the second KKK faltered thereafter and was nearly moribund by the end of the decade everywhere but in the South, where it would continue for decades in numerous derivatives as a force for white supremacy. Historians have offered various explanations of the movement's demise. Some have pointed to the scandals that plagued its leaders, most dramatically in Indiana where the powerful DC Stephenson was found guilty of second-degree murder for the rape of a girlfriend that resulted in her suicide attempt and death. The widely publicized murder trial and ensuing revelations of Stephenson's empire of political corruption tarnished the movement irrevocably. Others have suggested that the rank-and-file recoiled once they realized the extent of the movement's authoritarianism. Still others have argued that the KKK

subsided when the threats its members perceived passed: as the labor movement ebbed, Congress enacted draconian immigration restriction in 1924, the NAACP lost its postwar *élan*, and so forth. With progressive activism on the defensive and conservatism triumphant in Washington, few felt the urgency they had in the early 1920s to pay dues and participate.

Whatever the precise causes of the movement's decline, the stunning power amassed by the KKK in its prime offers a chilling reminder of the indigenous American cultural traditions that have enabled terrorism when carried out by native-born white men styling themselves as victims and standing up for goals and values widely shared among their peers.

L

LABADIE, JOSEPH A. (1850–1933) **Knights of Labor**

The Detroit organizer of the Knights of Labor, the first president of the Michigan Federation of Labor, and ultimately a major influence on individualist American anarchism, Joseph A. Labadie contributed to numerous organizations and publications in one of the most turbulent and formative periods of American labor history.

Born in Paw Paw, Michigan, Joseph A. Labadie (commonly known as “Jo” Labadie) moved to Detroit in 1872, where he started working as a printer at the *Detroit Post and Tribune*. Joining the International Typographical Union proved to be the start of a long career in labor activism and organization. Six years later, in 1878, Labadie was among the founders of the first chapter of the Knights of Labor in Detroit, sanctioned by the Philadelphia-based organization. Although Labadie quickly became a key figure in the Knights’ Detroit organization, controversy existed from the very beginning. While wholeheartedly agreeing with the emphasis on education and the solidarity of the working class, Labadie criticized the Knights’ elaborate rituals involving secret handshakes, initiation ceremonies, and magnanimous titles, as noted in Carlotta R. Anderson’s *All American Anarchist*, calling them “excessive rigamarole” and “the habits and the fears and the ignorance of our barbaric ancestors.”

Labadie’s involvement in the Knights of Labor coincided with his interest in socialism. During the

1870s and early 1880s, socialism in Detroit attracted a majority of foreign-born immigrants, most notably from Germany. When Labadie decided to join the Socialist Labor Party (SLP) in 1877, he was one of the few native-born members of the organization in Detroit. One of the consequences of Labadie’s interest in socialism and the SLP was the publication of *The Detroit Socialist*, an English-language newspaper with Labadie as a major contributor. In addition to his activities with the SLP and the Knights of Labor, Labadie also served as the first president of the Detroit Trades Council, which was founded in 1880.

The break from socialism as well as the Knights of Labor for Labadie came in the 1880s. Labadie’s interest in anarchism, along with his long-lasting association with Benjamin Tucker, began in the early 1880s. The same period saw Labadie’s involvement in a variety of publications (including the *Advance and Labor Leaf* and the *Three Stars*) and movements, including his interest in Greenbackism and Henry George’s single tax movement. A frequent contributor to Tucker’s *Liberty*, Labadie’s decision to leave the Knights of Labor came after the Haymarket bombing of 1886 in Chicago. While the Knights of Labor became the target of accusations for having connections with anarchists and labor upheaval in general, its leader, Terence Powderly, determinedly denounced anarchism and refused supporting the Haymarket anarchists. Labadie challenged the Knights’ leadership for corruption and authoritarianism, visited the Haymarket anarchists in Chicago where they were imprisoned, and following a particularly vehement

and sharp clash in a Knights of Labor convention, decided to part ways with Powderly.

In 1888, Labadie appeared at the forefront of labor organization in Detroit once again, as he became one of the founders of the Michigan Federation of Labor, functioning as its first president. Labadie's involvement with anarchism intensified during the 1890s, as a wave of violent acts, including the attempted assassination of the Carnegie Steel Company's chairman Henry Clay Frick by Alexander Berkman in 1892 for his brutal tactics during the Homestead strike, and the assassination of President McKinley by Leon Czolgosz in 1901, brought anarchism and anarchists to the center of public attention and reaction. Labadie, while condemning the assassination of McKinley, diverged from many individualist anarchists of the time as he avoided the attempt to categorically distance anarchism from these acts, and explained them as natural consequences of the existing political system and the oppression of labor.

Despite his prolific output as an anarchist columnist and lecturer paralleling his vigorous involvement in labor and anarchist organization, which included arranging speeches by Emma Goldman in Detroit, Labadie's reputation in his home city never suffered. In fact, when his dedication and degree of radicalism were questioned by some anarchists as well as mainstream journalists, Labadie was dismayed. As much as Labadie might have resented such implications, his reputation as the popular "gentle anarchist" of Detroit proved to be helpful on several occasions: in 1908, when the city postal inspector banned Labadie's mail for featuring anarchist material and quotations, an immediate public outcry ensued. Following this incident, a few months later the water board commissioner attempted to fire Labadie for being an anarchist and faced a scathing response from the Detroit press.

Joseph A. Labadie's historical significance for the history of labor and anarchism has often been overlooked, despite his influence and achievements. A considerable part of his lasting legacy can be found in the Joseph A. Labadie Collection, donated to the University of Michigan in 1911. The Labadie Collection is still one of the richest resources for manuscripts and other primary sources on the history of labor and anarchism in the United States.

LABOR DAY

Labor Day was founded in New York City in 1882 and has been celebrated by workers in the United States on the first Monday in September ever since. Labor Day was born from the labor movement of the Gilded Age, which was diverse, national, and on the upswing. The first Labor Day celebration was called by the Central Labor Union of New York, a recently formed umbrella organization that included workers from different nations and with different political affiliations. Labor Day eventually became the first national holiday dedicated to a specific class or ethnic group, and its celebration and meaning have changed with the times.

Labor Day was initiated with two goals in mind. First, its proponents wanted to project an image of a united group of producers organized together against monopoly to the general public. Second, Labor Day was intended to be a festival that could bring together the various strands of the working-class movement, socialists, Knights of Labor, anarchists, craft unionists, Single Taxers, and Labor Party activists. The first Labor Day parade was organized to coincide with a Knights of Labor meeting, and it was followed by a picnic. Its organizers sought to create a festival that would have a very general political content that could appeal to as wide a range of workers as possible and that would send a message to the politicians without prompting repression or scaring off the middle class. These conflicting goals of uniting the working class while addressing the general public have been present in Labor Day festivities ever since.

The first Labor Day was a resounding success. As many as 250,000 New Yorkers turned out to watch from 10,000 to 20,000 disciplined paraders (mostly men and a few women) march in formation with floats, banners, and uniforms from Lower Broadway to Union Square. Typical banners read: "Labor Creates All Wealth," "Labor Built This Republic, Labor Shall Rule It," "The Government Must Own the Railroads and Telegraphs," and "Labor Will Be United." Members of each union carried the tools of their trade, a tradition that dated back to guild processions in the European Middle Ages. The parade was also full of patriotic imagery, including American

flags and a drum-and-fife corps; at least one speaker quoted Thomas Jefferson.

Labor Day quickly became part of the nation's working-class traditions. The following year, the Central Labor Union decided to repeat the affair. In 1884, the national Federation of Organized Trades and Labor Unions (the precursor to the American Federation of Labor, AFL) called on workers to participate, and by 1886, workers were celebrating Labor Day throughout the country.

Workers also pushed to have Labor Day recognized by state and local governments and by their employers. A number of cities passed municipal ordinances recognizing the holiday in 1886, Oregon became the first state to enshrine it in 1887, and by 1894, Labor Day was recognized by 24 states, most of which had strong Populist or labor movements. In general, these state and local laws recognized the holiday but did not enforce it as a day off for all workers. Employers were much harder to convince, and for two decades after the first Labor Day parade, the holiday was essentially a one-day general strike in many cities.

By the late 1880s, AFL unions had taken over the job of organizing Labor Day parades in most cities. In the aftermath of Haymarket and the ensuing repression and propaganda campaign against unions as a foreign ideology threatening American values, the AFL moved to strip Labor Day of any radical implications. Red flags and radical speakers were banned, and all marchers were given little American flags. While Labor Day had patriotic symbolism from the beginning, this symbolism was made more prominent at the expense of radical critiques of capitalism. In the 1890s, this pushed many radicals and immigrants to avoid Labor Day and to celebrate May Day instead, which had been born out of the struggles over the eight-hour day centered in Chicago in 1886 and had been celebrated as an international day for workers since 1890.

By the early 1900s, Labor Day had become a permanent part of the American calendar. While the AFL continued to organize Labor Day parades and picnics around the country, and while Samuel Gompers continued to stress the importance of Labor Day parades for demonstrating the strength and patriotism of the labor movement, many workers wanted to use their hard-won three-day weekend for a holiday with friends or family. This was the period when the tradition of the Labor Day barbecue was born.

In the ensuing decades, the AFL made great attempts to make Labor Day fit the mood of the day. In 1918, during World War I, with the labor movement under attack for being less than 100% American, Gompers even renamed Labor Day "Win

the War for Freedom Day." During the 1920s, Labor Day celebrations across the country adapted to the conservative mood of the times. In New York, Labor Day marches were abandoned in favor of celebrations at the Army's Fort Hamilton, where participants watched infantry drills and mock air battles. Labor Day celebrations were open to speeches by politicians, and their class character was diluted by the participation of many nonworkers.

In the 1930s, Labor Day celebrations were reinvigorated by the upsurge in the labor movement and attracted hundreds of thousands of participants in many cities. Labor Day marches once again took on a class character and incorporated images from the current popular culture. In Los Angeles in 1937, for instance, Popeye and the Keystone Cops chased away scabs, while an actor dressed as Abraham Lincoln declared all racial groups equal. Also in the 1930s, women were included in Labor Day celebrations on a more equal footing with men, especially in those celebrations organized by the Congress of Industrial Organizations (CIO) instead of the AFL. From 1942 to 1944, unionists stayed on the job during Labor Day and dedicated the holiday to winning World War II.

Since the end of that war, Labor Day has become a fixture of the American scene that is often celebrated like any other anesthetized American three-day weekend, with traffic jams and barbecues. At certain moments, however, union leaders will still call large marches or demonstrations of labor's power and organization on their traditional holiday. In 1959, for instance, over 115,000 New Yorkers marched down Fifth Avenue to protest the Eisenhower recession and the attacks on the labor movement. In 1982, 150,000 people protested Ronald Reagan's domestic policies in New York, and there were smaller marches in Chicago, Indianapolis, and Denver, among other cities. While Labor Day has lost much of its original vigor, it remains the only national holiday dedicated to the working class.

LABOR REPUBLICANISM

Labor republicanism developed from ideas about government and society that gained currency in the transatlantic world in the eighteenth century. In England, criticism grew within radical circles about the corrupting influence of self-seeking placemen and their supporters in parliament. In France, the monarchy became the target of opponents to an entrenched and unaccountable political and social hierarchy.

Republicans held that government rested on the consent of the governed, who through regular elections authorized their representatives to govern for the common good. The polity consisted of “free men” whose social and economic independence as property owners entitled them to the franchise. Citizens replaced subjects in republican discourse; rule by law instead of by men served as a republican benchmark; and civic-mindedness and not the pursuit of personal gain pervaded republican society.

Between 1763 and 1776, when American colonists grieved that British imperial policies infringed on their “rights as free-born Englishmen,” republican ideas were central to an incisive critique of British rule itself. In the Atlantic seaports, artisans joined tradesmen and merchants in defying colonial authority, and especially in Philadelphia from 1774 to 1776, tavern and coffeehouse customers debated the arguments for national independence.

Thomas Paine, a former corset maker and excise man who migrated from England to Philadelphia, popularized much of the emerging republican case for independence in a widely distributed and read pamphlet, *Common Sense*. Paine vehemently denounced monarchic rule as inimical to peace and prosperity and vigorously contended that Americans had an opportunity to erect a government on sound principles. Artisan readers of *Common Sense* and other tracts by Paine during the Revolutionary War imbibed an ethos of uncompromising egalitarianism and nationalism that helped to define their identity as Americans in the young republic.

Independence resonated with special meaning to master and journeymen craftsmen in the pre-industrial era. Just as the newly formed United States of America was free of foreign domination, artisans practiced their trades and earned their livelihoods, free of control by others. Their independence emanated from finely honed skills, breadth of knowledge, well-grounded experience, and personal initiative. Carpenters, cordwainers, and printers, among others, expressed pride in their labor, which they considered vital to the nation’s economic and social welfare. Indeed, artisans viewed themselves as the heart and

soul of a republic of “small producers,” essential to wise government and political stability.

Accordingly, they participated in debates over the ratification of the U.S. Constitution and generally endorsed the federalist case for a stronger central government. Enticed by Thomas Jefferson’s vision of a nation propelled by yeoman farmers and urban mechanics, artisans supported the Virginian planter’s successful candidacy for the presidency in 1800 and helped form the base of the Democratic-Republican Party for the next two decades.

Artisan Republicanism

Artisans not only marked their republicanism by exercising their citizenship rights in elections. Between 1788 and 1825, artisans in New York City used such occasions as Independence Day (4th of July), Evacuation Day (November 25, 1783, when British troops left New York), and the opening of the Erie Canal in 1825 to demonstrate their patriotism and celebrate their status as free men and independent producers. In orderly processions they carried banners and transparencies that displayed symbols of their trades and craft societies. These festivals featured an iconography that powerfully expressed values embedded in the artisans’ political and work cultures.

To artisans, the small independent workshop was the microcosm of a republican society. Masters, journeymen, and apprentices worked alongside each other in self-directed but interdependent activity. Mutuality, co-operation, and convivial relations bonded producers within a tightly knit community free of hierarchy and exploitation. Any suggestion that the calculus of economic efficiency should govern the organization of production met with hostility. Typical was the response of a journeyman drug maker in 1830, who dismissed the observation of an English immigrant that a more detailed division of labor would increase productivity: “This is a free country; we want no one person over another which would be the case if you divided the labor.”

That the process of industrialization by the 1820s and 1830s had manifestly rendered the republican imagery of the workshop as increasingly idyllic did not reduce the steadfastness or intensity by which artisans upheld republican values. Disputes between masters and journeymen, which prompted restrictive judicial interpretations of the common law and definitions of property rights at the expense of journeymen, compelled artisans to recognize the reality of social and economic divisions. Yet in doing so, they

re-affirmed the vitality of the founding principles of the American republic as expressed in the Declaration of Independence. Journeymen defended their militancy in the face of “haughty and overbearing” masters who in the pursuit of private gain sought to deny journeymen of their natural, inalienable rights as “free men” and thereby defy the republic itself.

Artisans’ republicanism was most manifest as they assumed leadership in the labor movement in the 1820s and 1830s. The growth of craft-based journeymen societies to achieve “just compensation” in the 1820s; the intervention of Workingmen’s Parties in Boston, New York, and Philadelphia (1828–1830) to contest the state’s promotion of “monopolistic privilege”; and the emergence of citywide general trade unions, which brought together craftsmen, outworkers, and factory operatives between 1833 and 1836 to halt the imposition of economic “vassalage” by employers keen to reduce labor costs signaled a shift in consciousness in recognition of the widening chasm between masters and journeymen and employers and wage workers.

Labor republicanism, as defined and understood by artisans in this sense, constituted both a language of class with its distinctive terminology, structure, and tonality as well as the rudiments of an ideological critique of the social relations of production that capitalist accumulation of wealth engendered. In this context, Ely Moore, the leader of the New York Workingmen’s Party, defended journeymen’s concerted activity at the workplace and in the political arena as an antidote to the corrupting influence of a “new aristocracy” of manufacturers and bankers. Addressing the New York General Trades Union in 1834, he warned delegates of the dangers posed by a “widening distinction between employer and the employed,” including the perpetuation of a “system that fostered dependency,” subverted “the natural rights of man,” and was “hostile to the spirit and genius” of republican government.

Labor republicanism as a body of thought was not without its anomalies and tensions. Despite offering an imprimatur to artisans to organize trade unions and political parties with aspirations to represent all producers, at times it existed more as a radical subculture in competition with evangelical Protestantism, which many Anglo-American workers in the 1830s and 1840s embraced. Consequently, its claim to encapsulate a vision of labor in a republican society rested on an appeal to a rationalist sensibility. Although republicanism possessed elements of a code of ethics in its critique of aggrandizing capitalists, it lacked the moral fervor of religious revivalism that

spoke to the emotional needs of artisans and other workers confronted with the insecurities and anxieties of a market-driven economy.

Moreover, republicanism’s emphasis on the rights and liberties of individuals was predicated on the existence of a durable political and cultural consensus. Yet economic changes attendant to industrialization bore witness, and the property rights of individuals became subject to redefinition. In part, republicanism did display an elasticity in this regard, as artisans asserted that their labor constituted a form of property that they “owned” just as much as a merchant owned his business or a yeoman farmer owned his land. However, master craftsmen increasingly were acting as incipient entrepreneurs who regarded the journeymen’s skills as a commodity to be purchased at the right price.

Labor Republicanism and Wage Labor

Concomitant to these different readings of property rights were conflicting interpretations of what wage labor signified. Informed by abolitionists’ critique of slavery in the South, wage labor was a form of “free” labor since wage workers were not bound to their employers in that they were free to seek other employment opportunities and could advance economically and socially. A more pessimistic interpretation stressed that wage labor constituted another and more insidious form of dependency that entailed a deterioration in workers’ position. Labor spokespersons sometimes referred to wage workers as “hirelings” who were shown scant respect by those who retained their services. In the 1830s, “wage slavery” entered republican discourse as an emotive term, indicating that manual workers were entrapped within an “iron chain of bondage.”

This metaphor was not coincidental, since “freedom,” “slavery,” independence, and servility were charged with racial meanings. For many antebellum white Americans, chattel slavery was the lot of African-Americans, who purportedly were “unfit” to act as autonomous agents. Any suggestion that white wage workers were being made slaves of any sort raised the fear that they were falling from republican grace and succumbing to a degradation associated with an inferior race.

Likewise, republicanism’s ethos was coded in terms of gender. Republican independence signified “manliness,” a set of traits that entitled some men to enjoy the rights and fulfill the responsibilities of citizenship. Personal integrity, honesty, native intelligence,

and self-respect were manly characteristics, cultivated in a republican society that did not tolerate social hierarchies based on inherited titles, imposed ranks, or permanent classes. That some seemingly acquiesced to if not accepted a status less than that of “free men” convinced many white workers that a “republican” labor movement justifiably had no room for “unmanly” African-Americans and Chinese immigrant “coolies.”

Notions of manliness, nevertheless, revealed ambiguities in labor republicanism. Republican thought traditionally deemed women as lacking the prerequisites for citizenship, although women served the patriot cause during the War for Independence and subsequently were expected to uphold the ideal of “republican motherhood.” In part, republicanism’s ambiguity paralleled the tensions in the legal code between women as “femme covert” and as “femme sole” whereby women’s status before the law oscillated between one absorbed with that of their fathers or husbands and one that deemed women as autonomous individuals capable of thinking and acting for themselves.

Women drew greater attention from the labor movement as their position in a market economy grew in the 1830s and 1840s. In some respects, the employment of women in mechanized factories and labor-intensive urban sweatshops epitomized the degradation of wage labor and the erosion of the artisans’ world, and as such became a target of approbation.

Yet, as women workers, especially in New England’s cotton textile industry, began to organize against wage reductions and long hours, they asserted their claim to a place within a republican society. Their language of protest—be it to justify their strikes to the general public or explain their petition for a 10-hour day—evoked images familiar with male artisans. Standing firm against the “oppressing hand of avarice,” female operatives in Lowell, Massachusetts, declared they remained “daughters of freemen” and possessed “unquestionable rights” as an inheritance of their “patriotic ancestors.” In short, by dint of their concerted activity and the meaning they attached to it, women workers helped to make labor republicanism less gender specific by the mid-nineteenth century.

Labor Republicanism in the Gilded Age

Labor republicanism’s “golden age” occurred during a period of accelerated industrialization, marked by sweeping technological innovation, the development of national capital, labor and consumer markets, and

the emergence of powerful corporations. This fundamental transformation of the American economy represented a challenge to the labor movement over the last quarter of the nineteenth century. Members from the National Labor Union, Knights of Labor, and individual unions upheld time-honored principles in their advocacy of workers’ individual rights and collective interests. Expressed in declarations, speeches, songs, and poems through such publications as the *National Labor Tribune*, the *Journal of United Labor*, and *John Swinton’s Paper*, an alternative value system and vision of American society were cultivated.

The attempts of industrialists to reduce labor costs and wrest control over the labor process from craft workers spurred trade unionists and labor reformers to re-affirm bedrock republican values. Puddlers in Pittsburgh’s steel mills referred to an “intrinsic customary value” of labor, independent of the interplay of supply and demand. Ideas about natural justice were prominent in a critique of industrial capitalism and underpinned arguments for workers’ claims to the product of their labor as a “competence” and “fair” or “living” wage. Labor, therefore, was construed in terms of equity as a means of securing a “dignified” life that allowed workers to own a house and sustain a family without wives/mothers and children having to work.

An emphasis on the distribution of wealth revealed a growing sensitivity to social and economic relations in a capitalist society. To advocates of the eight-hour day, such as Ira Steward, freedom from excessive toil and just compensation were two sides of the same coin, emblematic of full emancipation. Whereas Steward believed that wage labor did not prevent workers from “moving out of the slavery of poverty” into “the freedom of wealth,” spokespersons from the Knights of Labor, such as George McNeil and Uriah Stephens, regarded wage labor as part and parcel of inequality and the lack of freedom. McNeil categorically declared that “there is an inevitable and irresistible conflict between the wage system and the republican form of government.” Stephens called on Knights to fulfill their noble duty and oppose the usurpations of “an accursed slavery, a heaven denounced tyranny and a degrading atheistic idolatry.”

These different representations of wage labor suggest that labor republicanism was multivalent. For some, it provided the logical foundation for a program—setting out practical aims and objectives. For others, it supplied the labor movement with the moral energy and fortitude necessary to persevere in the face of intense opposition. In any event, republicanism permeated a movement culture that simultaneously

defended American values and dynamically recast them to contest the perceived threat industrial capitalism posed to American democracy. At a time when “self-made” captains of industry such as Andrew Carnegie lauded the pursuit of private interest and the acquisition of wealth as fundamental to a democratic society, Gilded Age labor activists spoke of promoting the “commonweal” whereby workers could “develop their intellectual, moral, and social faculties” and “share in the gains and honors of an advancing civilization.”

The Knights of Labor, in particular, envisioned a society in which cooperation, equality, and community defined social, economic, and cultural life in contrast to the egotistical individualism, the concentration of wealth and power, and the ethos of unbridled competition that industrial capitalism both fed on and encouraged. In a language that combined the temperament of a devout Christian and the clear-headed logic of a political economist, the Knights unreservedly launched a crusade to redeem the republic by nurturing the values and mobilizing for a program that would make “industrial and moral worth and not wealth the true standard of individual and natural greatness.”

The Knights’ appeal rested also on its inclusiveness. Membership in its assemblies and lodges was open to wage earners, farmers, merchants, doctors, and educators. The Knights drew from “producerist” precepts at the heart of artisan republicanism that validated the contributions of the producers of wealth at the exclusion of those who expropriated wealth, such as bankers and land speculators. Likewise, its program was comprehensive—aimed at redressing economic grievances, codifying the rights of labor, altering institutional arrangements, or otherwise checking unequal power relations.

The Knights rapidly declined in the 1890s, and concurrently much of labor’s crusading spirit ebbed. Concomitantly, republicanism’s compelling vigor began to wane within movement discourse. Its guiding principles and core values no longer were salient in labor’s program and strategic orientation. By the turn of the century, greater stress was placed on the nuts and bolts of organization at the workplace and political arena to wrest concessions from employers and the state and to establish the legal legitimacy of trade unions.

Even when there was no change in labor’s objectives, a shift in emphasis emerged. For example, advocates of the eight-hour day turned to arguments focusing on workers as consumers rather than on workers as producers. Workers were entitled to “an American standard of living” and not just the fruits of their labor. Proto-Keynesian assertions that a shorter

workday and higher wages would stimulate demand and thereby promote economic prosperity became more common.

In a sense, republicanism’s decline coincided with workers’ accommodation to the growth of industrial capitalism. Nevertheless, even as labor leaders assumed a business- and statesmanlike posture, the *raison d’être* of trade unionism in the twentieth century remained its pursuit of justice and equality, once at the heart of labor republicanism.

LABOR RESEARCH ASSOCIATION

The Labor Research Association (LRA) was founded in 1927 by Robert Dunn (1895–1977). It continues to this day as a New York-based nonprofit organization that provides research and educational services for unions. Today, the LRA is known for hosting an annual dinner that honors labor leaders. The LRA also assists unions in bargaining preparations and strategic planning. It is managed by a board of directors composed of union and other labor leaders.

Robert Dunn was born in Huntington, Pennsylvania, on June 1, 1895, and eventually graduated from Yale University. He began his career in 1918 as an organizer and economic researcher for the Amalgamated Textile Workers Union. He was also secretary of the New England Civil Liberties Committee, a division of the American Civil Liberties Union (ACLU) from the beginning of that organization in

1920. He served on the board of directors of the ACLU from 1933 to 1941. After founding the LRA in 1927, he served as its executive secretary until 1975. Dunn was interested in the Soviet Union and visited that country as the research director of the Quaker Relief Committee in 1922–1923 and as the secretary of the American Trade Union Delegation to Russia in 1927.

He founded the LRA in order to collect data on labor and the economy for unions. This data included statistics, general information, and analysis by the LRA. To this end, the LRA published the *Labor Fact Book* biennially. The *Labor Fact Book* contained a systematic analysis of the facts and statistics it compiled, including in its first decade such questions as the nature of the Great Depression, the relations of white and black workers, and the meaning of Fascism. The LRA was influenced by the Communist Party and took many of its definitions and questions from that organization's viewpoint. The LRA also put out a series of monographs, mostly written by Dunn, called the "Labor and Industry Series." These include *Labor and Automobiles* (1929), *Labor and Textiles* (1931), and *Labor and Steel* (1934).

The LRA continued to espouse a Marxian viewpoint and to publish books through International Publishers, the Communist Party's publishing house, into the 1950s. The book *Monopoly Today*, put out by the LRA in 1950, for instance, asserted that four hundred men ruled the American economy and analyzed the different groups of monopolies that dominated the nation. The LRA also published books on American imperialism and on theoretical questions such as wage determination (see *New Concepts in Wage Determination*, edited by George Taylor and Frank Pierson, 1957).

The LRA has continued to mount an intellectual critique of academic economics from the viewpoint of labor and the working class until the present day. While the openly Marxian perspective was less evident in LRA publications in the late twentieth and early twenty-first centuries, the organization still put out articles with titles like "'Invisible Hand' Not a Solution: Laid-off Workers Need More Protection" (November 15, 2001). The LRA's analysis of the Enron scandal, for instance, asserts that Enron illustrates the "inherent corruption in the system of capital accumulation itself" (Greg Tarpinian, "The Enron Collapse: Symptom of a Corrupt Economic System," Jan 21, 2002). In the early twenty-first century, the LRA began a new project, LRA Photography, dedicated to photographing working people. The LRA has continued the tradition of intellectual work in the service of the labor movement.

LABOR THEORY OF VALUE

The "labor theory of value," the doctrine that "labor creates all wealth" and that workers should therefore receive the "full fruits of their labor," had broad support in nineteenth-century America. Rooted in ancient notions of justice, the labor theory of value was given modern legitimation in the philosophy of John Locke, who held that one's labor was a form of personal property, as inviolable as one's home, crops, or tools. Artisans, farmers, and politicians agreed, at least rhetorically, that the people who did useful labor were both morally superior to and more worthy of political power than the idle rich, the shiftless, and, in general, those who consumed wealth rather than produced it. Enslaved people also invoked the labor theory of value as a justification for the common practice of appropriating food and other items that, they believed, properly belonged to them by virtue of their productive labor.

The labor theory of value was the bulwark of "producerism," the notion that those who grew the nation's crops and produced its goods were the moral, economic, and political heart of the American republic. What made the labor theory of value so popular in the nineteenth century was that the concept of "labor" was very broad, and might include, depending on who was defining it—in addition to manual laborers, skilled workers, and farmers—merchants, entrepreneurs, and professionals. The first working-class organizations in the Jacksonian era endlessly repeated the claim that "labor creates all wealth" and, accordingly, demanded that workers both receive their fair share of that wealth and that they play a central role in the governance of the republic. In the 1870s and 1880s, America's first great national labor union, the Knights of Labor, embodied this broad definition of what it called the "producing masses" by welcoming—in addition to artisans and other manual workers—merchants and small businessmen, and explicitly excluding only those who "lived by the sweat of other men's brows."

The labor theory of value was central to labor and farmer discourse well into the late nineteenth century. The Knights of Labor used the phrase "full

fruits of his toil” in the preamble to their platform. Workers, it claimed, should be able “to secure to the workers the full enjoyment of the wealth they create.” Both the St. Louis and Omaha platforms of the People’s Party, the political offshoot of the Populist movement, declared: “Wealth belongs to him who creates it. Every dollar taken from industry without an equivalent is robbery” (Knights of Labor, pp. 22, 30; Destler, pp. 25–27). Many farmers and workers clung to the belief that they were entitled to nothing less than the “full fruits of their labor.”

Although they continued to embrace the labor theory of value, beginning in the late nineteenth century, American workers began to redefine its meaning, from an individual to a collective concept. Samuel Gompers, the leader of the American Federation of Labor, for example, insisted that living wages represented workers’ fair share of productive value. But Gompers and other advocates of high wages invoked “fair share” in a new way. Whereas earlier in the nineteenth century, proponents of “fair” or “honest” or “just” wages described them as a return for individual labor yields, in the late nineteenth century, advocates for workers described the fair share, often also called a “living wage,” in collective terms, as the worker’s rightful “share in the products of common toil” (Lloyd, 51). This redefinition was necessary as increasingly industrial workers labored alongside large numbers of other people, making it difficult to measure the value of individual labor. Instead, wages resulted from the aggregate claims of a group of workers to their rightful share of the social product that they collectively created.

These revisers of the labor theory of value refused to separate remuneration and production. Their claims for fair wages or living wages, however expansively construed, were a demand for wealth earned by the sweat of workers’ brows. This is why Samuel Gompers insisted that the living wage should be understood as an “entitlement” rather than “charity” (“Minimum Living Wage,” and *Lowell Mail*, pp. 432–435). These claims to economic justice depended on the labor theory of value; living wages came out of the reserves of wealth that workers themselves created. As the radical Bob Ingersoll framed it, the demand for a high standard of living was not a claim for unearned wealth but a way to establish economic justice in the classic producerist sense. “Why should labor fill the world with wealth and live in want?” he asked in 1882 (Ingersoll). Through the twentieth century, organized labor continued to make this argument about the collective value of labor as a justification for wage demands. For example, the socialist newspaper, the *New York Call*, described

a “Fundamental Principle that each worker has an undeniable right to enjoy the full benefit of all that he or she produces” (June 29, 1908).

Although workers continue to invoke the labor theory of value, since the late nineteenth century competing theories of value have emerged. Beginning in the late nineteenth century, the major challenge to the producerist moorings of the labor theory of value has been marginalism, the insight first promoted by economists in the 1870s that what is most important for decision making is the marginal or last unit of consumption or production. The marginalist revolution in economics suggested that value was best thought of as what consumers were willing to pay for a good or service. This meant that measuring the value of work could not occur outside of the marketplace; according to this theory, it was ultimately consumers who determined the value of labor. Marginalism challenged the notion that the absolute value of labor could be determined, even if one defined production in collective terms; they understood the determination of labor value as a relative process, shifting the meaning of value from the production to the consumption side, or in the language of economists, from the supply to the demand side.

As the marginalist revolution gained prominence, workers often phrased their wage demands in consumerist rather than producerist terms, weakening the hold of the labor theory of value. “The living wage is based, not on the value of a man’s work, but on his requirements as a man in civilized society,” one advocate declared (Crowther, p. 26). Rejecting the dogma that “wages must be proportionate to the value of services rendered,” another advocate of living wages argued that it was impossible to separate value from questions of power: “every one knows that there is little connection between value of services and wages paid; the employer pays no more than he must” (Sullivan, 284–289). “Under the present social system,” wrote the progressive reformer Scott Nearing in 1915, “there is no relation between the social needs of a man and the wage which he receives.” In a frontal assault on the labor theory of value, Nearing argued that the “the term worth should be abandoned.” For Nearing, a living wage should be “a return in proportion to social needs.” In 1915, Nearing denounced the “American Wage” as “anti-social” because it was “fixed wholly independent of social relations” (Lehrer, p. 91). In 1916, he condemned the view that the worker receives wages “in proportion to his product.” In truth, he wrote, wages “are never fixed on that basis” (Sherman, pp. 66–67; Nearing, 872–873).

Notwithstanding the acceptance of marginal thinking by many working-class organizations, organized

labor and many ordinary workers continued to posit a chastened version of the labor theory of value throughout the twentieth century, a belief that seems likely to continue to motivate manual laborers well into the future. Labor demands for good wages continue to be grounded in the idea that, even in a modern economy, the value of goods and services should be reflective of the labor that helped create the product. When Walter Reuther, the head of the United Auto Workers' Union in the post-World War II years, asked the big automobile companies to "open the books," he was making the case that workers, responsible for the profits of these corporations, deserved a share of the wealth they created. But even here, labor's claims rested less on the labor theory of value than on the claim that justice demanded that workers earn decent wages that would allow them to live with dignity. Many late twentieth-century and early twenty-first century "living wage" campaigns, for example, while stressing the productive value contributed by the labor force, have emphasized far more American affluence, social justice, and the benefits of extending mass consumption as justifications for paying workers livable wages.

LABOR'S NON-PARTISAN LEAGUE (1936–1944)

Leaders from the Congress of Industrial Organizations (CIO) created Labor's Non-Partisan League (LNPL) in April 1936 to increase organized labor's influence in American politics. The United Mine Workers of America (UMWA) president, John L. Lewis, and the Amalgamated Clothing Workers of America (ACWA) president, Sidney Hillman, played leading roles in the formation of LNPL. In an attempt to emphasize its independence from the CIO and its multi-union composition, the League's first president, George Berry, came from the International Printing Pressmen and Assistant's Union, an American Federation of Labor (AFL)-affiliated union. Eli P. Oliver, an organizer for the ACWA, became the vice president. In reality, LNPL possessed only nominal independence from the CIO, whose leaders, particularly Hillman and Lewis, created and controlled the organization.

Just a few months prior to forming LNPL, Hillman and Lewis had created the CIO to challenge the craft-oriented AFL. Upset with the AFL's refusal to alter its organization to accommodate the structural changes that had occurred in the workplace, they formed the CIO to organize these workers into industrial, rather than craft, unions. The CIO experienced substantial early gains, particularly in the fledgling United Auto Workers Union in the wake of the successful Flint sit-down strike. Legislation supported by President Franklin D. Roosevelt, such as the National Industrial Recovery Act (NIRA, 1933) and, after the Supreme Court ruled the NIRA unconstitutional, the National Labor Relations Act (1935), greatly improved the union-organizing environment. Encouraged by the support of Roosevelt and other labor-friendly Democrats, CIO leaders formed LNPL to increase labor's power and effectiveness in politics.

The formation of LNPL represented an important shift in organized labor's previous stance toward politics. It also demonstrated further differences between the AFL and the CIO. The AFL only occasionally became involved in electoral politics, proudly maintaining that it remained independent of either party by rewarding its political friends and punishing its enemies. LNPL activities represented a more expansive, organized, and partisan foray into electoral politics than AFL leaders had ever envisioned. Although its name suggested that LNPL would be independent of either political party, the League almost

immediately became closely aligned with the Democratic Party and rarely supported Republican Party candidates. The long political alliance between organized labor and the Democratic Party began in 1936 with the creation of LNPL and its support of Roosevelt.

The League provided Roosevelt's 1936 re-election campaign with substantial financial and institutional backing. LNPL spent around \$1,000,000 in its efforts to re-elect FDR, much of it going to the Democratic Party. Lewis's own UMWA contributed a large portion of the money. LNPL also provided important organizational assistance to Roosevelt and the Democratic Party. LNPL election activities included publishing and distributing pamphlets, organizing rallies, radio addresses, press releases, and public statements. In addition to its primary focus on the presidential election, state and local CIO unions that had political activists and increasing CIO union memberships organized support at both the state and local levels for other Democratic Party candidates. Roosevelt's landslide victory (532 electoral votes to the Republican challenger Alf Landon's 8) in 1936 and the election of a number of LNPL-supported governors, such as Frank Murphy in Michigan and George Earle Jr. in Pennsylvania, demonstrated to many CIO leaders that LNPL was a critical component of the new industrial labor movement and that organized labor should have a permanent presence in American politics.

Success in the 1936 elections encouraged LNPL's continued political activities. In early 1937, the national LNPL offices moved to become an integral part of the Democratic Party, the Roosevelt presidency, and the New Deal coalition. Its initial activities focused on supporting Roosevelt's political agenda. For example, LNPL supported the President's ill-fated Supreme Court packing plan. Although formed as a top-down organization interested primarily in national politics, local LNPL organizations in a number of cities, like Detroit, Pittsburgh, and Akron, ran and supported candidates for local offices, such as city council and mayoral races, in 1937.

The emerging alliance between LNPL and the Democratic Party also encountered difficulties. Some LNPL leaders, like the outspoken Lewis, rebuked Roosevelt for his lack of support of union efforts, particularly after the Little Steel Strike Massacre on Memorial Day in 1937, which left 10 strikers shot dead after confrontations with law enforcement. By 1939, Lewis, who now chaired and dominated the LNPL national offices after the ouster of George Berry in 1938, grew increasingly disenchanted with Roosevelt. Lewis supported Republican Wendell Willkie in the 1940 presidential campaign, while most CIO leaders, including Sidney Hillman, supported Roosevelt's bid for an unprecedented third

term. Lewis's support of Willkie created chaos in LNPL, particularly when Lewis ordered LNPL to stay out of the campaign. Some local and state LNPL offices disregarded Lewis's directive and supported Roosevelt. Lewis resigned as president of the CIO after Roosevelt's victory but maintained control of the national LNPL offices.

LNPL went in two directions after the 1940 election. The Lewis-controlled national LNPL offices struggled between 1941 until 1944. Its activities slowed considerably and focused primarily on lobbying Congress on labor-related legislation, such as antistrike bills and wage and price control legislation. In a few strong CIO cities, local LNPL offices developed into independent political arms of the local labor movement that no longer had a direct connection to the national LNPL. These local efforts remained close to the Democratic Party. The creation of the Congress of Industrial Organizations-Political Action Committee (CIO-PAC) in 1943 spelled the end of LNPL. The locally active LNPLs merged into the larger, more coordinated and directly CIO-affiliated CIO-PAC structure. The increasingly inactive Lewis-led national LNPL quietly shut its offices in 1944. The CIO-PAC built on the earlier success of LNPL and further tied organized labor to the Democratic Party as an integral part of the New Deal coalition, a process that LNPL had started when it supported FDR's re-election campaign in 1936.

LABORERS' INTERNATIONAL UNION OF NORTH AMERICA

In April 1903, Samuel Gompers, the president of the American Federation of Labor (AFL), called a meeting of all independent laborers' unions in Washington, DC. Gompers argued that the other construction trades often treated laborers—who performed unskilled, low-status work on construction sites (hod carriers, for example, carried mortar to bricklayers)—as

second-class members of the house of labor. Laborers, therefore, would be better able to protect their interests by consolidating all the independents into one international union. On April 13, 25 delegates representing over 8,000 workers formed the International Hod Carriers' and Building Laborers' Union of America (IHCBLUA). During its first decade, the AFL laborers' union survived challenges from two independent unions—the Building Laborers' International Protective Union of America and the Laborers' Protective Union of America. Thereafter, the leadership of presidents Domenico D'Alessandro (1908–1926) and Joseph V. Moreschi (1926–1968) created a relatively stable early history.

The AFL's Laborers' union grew unevenly but persisted through numerous jurisdictional and name changes. In 1912 alone, the Laborers' union changed labels twice, first to the International Hod Carriers' and Common Laborers' Union of America (IHCCLUA) and then to the International Hod Carriers', Building and Common Laborers' Union of America (IHCB & CLUA). The membership grew gradually until 1913, when the union appropriated its first funds for organizers, added road construction workers, and raised membership to nearly 25,000. During the building boom of the 1920s, the Laborers' grew to approximately 96,000. However, the Depression hit the IHCB & CLUA hard, and its numbers dropped to 27,000 by 1933. Although private construction did not recover until after World War II, the Laborers' prospects gradually improved over the 1930s. In 1931, Congress passed the Davis-Bacon Act, which protected wage rates for construction workers on government-financed projects. In addition, public works projects during the second half of the New Deal years were good for the union, bringing the rank and file to over 101,000 in 1937 and 200,000 in 1942. Post-World War II organizing campaigns, combined with the addition of trades such as the National Association of Post Office Mail Handlers in 1958, added strength. In the 1950s and 1960s, the Laborers' International Union of North America (LIUNA) signed a number of agreements with national employers' associations, such as the National Pipeline Association, Association of Railway Track Contractors of America, Inc., Associated General Contractors of America, National Contractors' Association, Building Trades Employers' Association, and General Contractors' Association. In 1965, the union changed its name one final time to the Laborers' International Union of North America (LIUNA), reflecting the union's increased scope.

The Laborers' history is tied to the history of public works and government contract law. Laborers and other construction trades, of course, are essential to

public works projects. Consequently, they have been beneficiaries of the expansion of the nation's infrastructure. In addition to the Davis-Bacon Act, the Federal Highway Act (1944) was a great boon to the Laborers' union. Since the late 1940s, the Laborers have been at the center of lobbying efforts for occupational safety. The 1949 National Pipeline Agreement, for example, included groundbreaking safety regulations for thousands of workers. In addition, in 1962, the Laborers formed the AFL-CIO Building and Construction Trades Department Safety Committee, and a massive lobbying effort succeeded in prompting the creation of the Occupational Safety and Health Administration (OSHA). Laborers have also played key roles in safe removal of asbestos and in 1988 established a pioneering Health and Safety Fund.

As a union encompassing many low-skilled workers, the Laborers have had a problematic relationship to the history of trade unionism more generally. The conventional view of the AFL is that it was a bastion of "pure and simple unionism," providing a protective house of labor for skilled workers. The Laborers, however, represent Gompers's and the AFL's efforts to expand its jurisdiction to include lower-skilled workers in order to oppose competing unions. The Laborers' history with regard to racial discrimination fits squarely into the broader narrative of trade unionism. Despite the AFL's claims that it disavowed racist practices, contemporaries and historians have noted that African-Americans and Mexicans did not hold an equal place in the Laborers' ranks during the first half of the twentieth century. Well into the century, black laborers in the IHCB & CLUA were forced to reside in segregated locals.

Throughout much of its history, the Laborers' union has had notorious ties to organized crime. The construction industry's large and relatively constant revenue streams have made it an attractive target for organized crime. Additionally, once organized crime members infiltrated the construction trades, the unions' exclusivity facilitated their control over material flows and job distribution. The federal government began investigating these connections in the early twentieth century, culminating in the 1980s and 1990s when LIUNA was at the center of a national controversy over organized crime and unions, with significant implications for national politics. In 1986, the President's Commission on Organized Crime named LIUNA one of the "bad four" unions for its ties to racketeering, along with the International Brotherhood of Teamsters (IBT), Hotel and Restaurant Workers (HRW), and the International Longshoremen's Association. In 1994, after many successful efforts to clean other unions of organized

crime elements, the U.S. Department of Justice (DOJ) presented LIUNA with a 212-page complaint against the Laborers' president, Arthur A. Coia. In an unusual settlement, the DOJ agreed to leave Coia in office and put LIUNA in charge of cleaning its own ranks of organized crime. Republican members of Congress charged that LIUNA received a "sweetheart deal" because Coia had strong connections to the Democratic Party and President Bill Clinton and Hillary Clinton. In 1996, the House Committee on the Judiciary's Subcommittee on Crime heard two days of testimony on the Justice Department's handling of allegations that labor was connected to organized crime. In turn, labor leaders such as Coia and the AFL-CIO head John Sweeney rejected the 1996 hearings, arguing that they were merely partisan efforts to undercut organized labor's newly energized organizing campaigns. In 1999, Coia stepped down from the union's presidency, and a year later the federal government gave up its option to take charge of LIUNA. By 2000, LIUNA's self-policing ousted at least 220 corrupt officials, 127 of whom had proven connections to organized crime.

While LIUNA dealt with allegations of corruption, the Laborers saw two distinct movements to increase the numbers and power of rank-and-file members. In 1994, Coia established a new organizing department, which included the Volunteer Organizer in Community Empowerment (VOICE) program. New organizers increased the Laborers' numbers to over 800,000 by focusing on low-skilled workers in new sectors. In 2003, LIUNA also joined the Immigrant Workers Freedom Ride Coalition. In addition, Laborers members led an unofficial grassroots movement to democratize the union. The Laborers' history reveals the ambiguities of the American union movement. Throughout its history, the Laborers' union's various incarnations have represented sectors of the working class that other trade and industrial unions often overlooked. Yet, the Laborers' history also highlights American unions' struggles with corruption and imperfect union democracy.

LABOR-MANAGEMENT COOPERATION

"Labor-management cooperation" (LMC) is a rather complex concept in the labor relations lexicon, as its meaning changes depending on who is using it and for what purpose. In the early twentieth century, it denoted key ideological splits within both management and labor. By mid-century, that version of the issue had been settled in favor of a specific form of cooperation. Subsequently, either unions or managements periodically employed the concept, or invoked the sentiment, whenever they were feeling particularly weak—or particularly strong. In the last quarter of the century, when unions still had substantial, if eroding, strength in many important sectors, labor-management cooperation enjoyed something of a fad among management for motives that were decidedly mixed. By the beginning of the twenty-first century, however, with unions representing less than 10% of private-sector workers, the concept faded, as did the entire field of "labor relations" in favor of "human resources" in nonunion workplaces.

In the early years of the last century, key proponents of labor-management cooperation formed the National Civic Federation (NCF) with hopes of preventing class divisions from "dissolving society" by addressing "industrial problems through evolutionary rather than revolutionary processes." Samuel Gompers, the president of the American Federation of Labor (AFL), and John Mitchell, the head of the United Mine Workers (UMWA), were key labor

spokespersons for this view, while corporate and political leaders associated with the NCF included Andrew Carnegie, William H. Taft, Alton Parker, George Perkins, and August Belmont.

The issue for the labor movement then was whether to use trade unions to negotiate a better deal with capitalist employers or as but part of a larger effort to replace the capitalist system with a “cooperative commonwealth”—that is, one form or another of socialism. Eugene Debs, a railroad unionist who ran for U.S. president as a Socialist from 1900 through 1920, and William (“Big Bill”) Haywood of the Industrial Workers of the World (IWW) condemned Gompers’s and Mitchell’s participation in the Civic Federation. Haywood claimed unions that took this approach were “poisoned and polluted with the virus of the pure and simple trade union that . . . proclaim [ed] the identity of interests of capital and labor.” In 1911, a dissident group within the AFL and the UMWA scored labor leaders’ membership in the NCF as “class collaboration” designed “to chloroform the labor movement into a more submissive mood.”

On the business side, the primary focus was on whether to accept labor unions as institutional representatives of workers. Business advocates of labor-management cooperation argued that negotiating some terms and conditions of employment with AFL-style unions was preferable to the potential social and political upheavals that would result if there were no mechanism for workers to articulate their grievances and improve their conditions. This view was anathema to most employers at the time, even those who were forced by strikes and boycotts to bargain with unions occasionally. Many corporations, as Debs and Haywood were quick to point out, wanted to have it both ways. U.S. Steel, for example, was a prominent member of the Civic Federation, extolling the virtues of “cooperation” in speeches and documents but going to great lengths to systematically suppress any and all union activity in its mills and mines.

Cooperation Wins as Collective Bargaining

With the National Labor Relations Act (NLRA) and other labor legislation in the 1930s, the federal government weighed in strongly in favor of a specific form of labor-management cooperation—government-regulated collective bargaining. By legislating certain rights and protections for workers, the government required private employers to recognize and bargain in good faith with duly elected unions. Responding

to the social and economic upheavals of the Great Depression, the NLRA channeled worker activity into a very specific form of labor union defined nearly exclusively as an institution for collective bargaining. Though communists, socialists, and other revolutionary unionists were prominent in organizing millions of workers into unions within this government-regulated system, the system decisively ended the internal labor movement debate over whether to negotiate with capitalists or to replace them with an altogether different, socialist system. Legally sanctioned strikes forced powerful corporations, one by one from 1937 to 1941, to recognize and bargain with unions.

In the new system, labor-management cooperation was conceived of as necessarily adversarial. That is, though areas of common interest between workers and management were recognized, it was assumed that there would always be deep and abiding differences in real material interests. The way to reconcile these differences was through negotiations, enforced by (peaceful and legally regulated) economic strikes and lockouts or the threat thereof, and by what became elaborate systems of mediation and arbitration by third-party, often government, agencies. Labor-management cooperation, in other words, was seen as enemies negotiating with each other rather than going to war to eliminate each other. Employers, when they had to, recognized and negotiated with unions. Unions abandoned the revolutionary socialist option in favor of negotiating better and better terms and conditions of employment with capitalist employers.

Legally inscribed as an adversarial system, in the immediate post-World War II period it was open as to what all would be covered by the legal requirement to negotiate “terms and conditions.” The principal AFL unions that had formed the Congress of Industrial Organizations (CIO)—the miners and the clothing unions—had long traditions of offering highly competitive employers what amounted to business plans for limiting competition to protect prices and profits. This was also part of the traditional “sales pitch” of the AFL building trades unions: that by cooperating with workers through their unions, employers could stabilize (and thereby increase) the quality and quantity of their production and, thus, their profits. Postwar CIO unions employed similar appeals to “labor-management cooperation” in a different form, proposing tripartite Industry Councils where government, employers, and unions would cooperate to ensure profitability, increased wages, and better conditions within a regime of stable prices that would stimulate economic growth. Employers almost uniformly saw this form of labor-management

cooperation as an illegitimate challenge to their “right to manage.” Both through negotiations and legislative restrictions, this wider participation of unions in “managing” entire industries was rejected by business and government. Though there were occasionally echoes of this broader approach, for the most part unions subsequently narrowed their focus to wages, benefits, and shop-floor power through what became highly elaborate grievance-ending-in-arbitration systems.

Cooperation as Unions Decline

Faced with declining productivity growth and economic stagflation in the 1970s, many unionized employers turned to a shop-floor form of labor-management cooperation for a variety of reasons. Likewise, as plant closings began to proliferate in the late 1970s and early 1980s, some unions broached the idea of “industrial policy” modeled on the CIO’s Industry Councils, while others traded contract concessions for investment guarantees and seats on companies’ board of directors. In general, management was most interested in greater “cooperation” at the shop-floor level, while unions often emphasized “cooperation” at higher levels where companywide decisions were being made.

Labor-management cooperation in the workplace itself came in a variety of forms with an even greater variety of names and emphases. “Quality of Work Life” (QWL), for example, emphasized a joint process of improving workplace amenities, morale, and productivity. “Employee involvement” focused more on gaining worker input and insight into how to improve specific work processes in order to improve product quality and/or productivity. These programs were usually initiated by management in union workplaces, and unions had a variety of responses to them. Most unions were suspicious of them, fearing they would undermine the steward and grievance systems that enforced contract provisions concerning job classifications and work rules. Some, most importantly the United Auto Workers (UAW), embraced the concept at the leadership level and experimented with various forms of cooperative shop-floor improvement processes, but not without both explicit and tacit resistance on the part of local UAW leaders and workers. Even well-defined programs, like those at General Motors at various times, played out very differently division by division and plant by plant. Local management, particularly at the departmental and front-line supervisor levels, were generally unenthusiastic, and even where elaborate programs had seemed to foster a more co-operative environment with tangible

improvements in product quality or productivity, they could be rapidly eroded by labor-management disputes at higher levels.

As union-heavy industries restructured—not only manufacturing with its plant closings and severe downsizing, but telecommunications, airlines, trucking and others—these programs were sometimes forced upon and other times advocated by union workers as efforts that could improve the prospects of their company or industry. Though the overall record of these “labor-management cooperation” programs is mixed at best, there were some dramatic success stories of plants or companies being turned around. These successes, however, typically involved crisis situations, and while some analysts credited labor-management cooperation for these turnarounds, others saw “worker participation in management” as the moving force.

As union power has eroded in industry after industry and as nonunion employers in growing economic sectors have greatly improved their ability to resist union organization, some form of LMC program has become a standard, but unimportant, element in most union workplaces. In nonunion workplaces, an entirely different terminology is used because workers have no collective power to cooperate or not. Though many large employers devote substantial resources to “human capital development” and other efforts to maintain “employee morale and commitment,” others deliberately churn their workforces, accepting high levels of worker absenteeism and turnover in return for a complete absence of any threat of worker organization. From the beginning, the concept of labor-management cooperation assumed a certain level of collective worker power that made cooperation a necessary or appealing option for management. In the private sector in the United States, worker power has decreased to well below that level.

LABOR-MANAGEMENT RELATIONS ACT

See Taft-Hartley Act

LAFOLLETTE CIVIL LIBERTIES COMMITTEE

Strikebreakers and labor spies harassed American workers and subverted labor organizations from the earliest days of industrialization. The LaFollette Civil Liberties Committee paraded these shadowy figures before the nation in dramatic hearings from 1936 through 1939, exposing employers' anti-union tactics and affirming the need for federally protected labor rights. The Committee's hearings built public support for the National Labor Relations Act and hamstrung employers from openly attacking workers organizing unions. Reactionary labor leaders opposed to state oversight of labor allied with congressional conservatives in 1938 to undermine the Committee.

American workers won sweeping new federal rights to organize and bargain collectively with the 1935 passage of the National Labor Relations Act. However, employers ignored the law, expecting the Supreme Court to invalidate it along with other New Deal legislation. As the National Labor Relations Board (NLRB) prepared its test cases for the Supreme Court, Heber Blankenhorn, an NLRB staffer and former aide to Senator Robert F. Wagner, argued that the NLRB needed a public relations strategy as well. Blankenhorn had organized the Army's first military propaganda unit during World War I and also investigated the steel industry's use of spies and strikebreakers during the 1919 steel strike. Blankenhorn outlined his strategy in a 1935 letter: "Tear open the whole infamous system which rules labor relations in steel, auto manufacture, rubber, much of textiles, much of mining and general manufacture. Let the country, through public hearings, judge what these great industrialists really want when they declare the Labor Relations Act 'unconstitutional.'" After Blankenhorn lobbied leaders of the AFL and CIO along with members of Congress, Senator Robert M. LaFollette Jr. agreed to chair the hearings.

The Committee on Education and Labor opened hearings in April 1936 to investigate "violations of free speech and the rights of labor" and received an appropriation for a full investigation that fall by a subcommittee including LaFollette and Senators Elbert D. Thomas of Utah and Louis Murphy of Iowa. Subpoenas summoned the heads of major detective firms, including the Pinkertons and Burns, to testify about their business and clients. Company

presidents, spies, and strikebreakers were also called. Committee staffers seized the trash cans of recalcitrant detective agencies and laboriously pieced together shredded documents to produce client lists, revealing that storied firms like Studebaker, Endicott-Johnson, and Pennsylvania Greyhound all used undercover operatives. The CIO, just beginning its massive drives in auto and steel, invited Committee staffers to witness strikebreaking on its picket lines, and the Committee held hearings on the strikes at Republic Steel and the Harlan County coal mines as they happened. The Michigan governor, Frank Murphy, said the hearings greatly assisted negotiations during the General Motors sit-down strikes. Lengthy investigations of employers' associations like the National Metal Trades Association and the National Association of Manufacturers exposed their reliance on blacklists and professional armed strikebreakers. The Committee was far from impartial and functioned more as a propaganda agency than as a disinterested enquiry.

A congressional hearing on employer violations of labor rights was not a new idea; the LaFollette Committee mirrored earlier congressional investigations, such as the Homestead hearings of 1893 and the Commission on Industrial Relations in 1913. The Committee's findings were not new either—progressives and trade unionists had complained of spies and blacklists for 50 years, and a synthesis of those earlier accounts formed the initial basis for the Committee's work. The Committee's findings resounded less because they were revelatory, but rather because they were suddenly relevant. Unionists who suspected spies in their ranks or endured strikebreakers' attacks could call in Senate investigators to subpoena their enemies before Congress.

Blankenhorn, hoping to eradicate labor espionage and strikebreaking, tried to require agencies to turn over lists of all their undercover operatives. When the agencies refused, the Senate declined to prosecute them for failing to comply with subpoenas, permitting spies the protection of secrecy. But employers feared bad publicity and rapidly stopped using detective agencies and strikebreaking firms. Both industries began to wither. LaFollette drafted a bill titled the Oppressive Labor Practices Act that would have prohibited employers from using strikebreakers and labor spies and from stockpiling weapons. (The NLRA did not specifically prohibit these acts.)

However, a backlash had begun. Leaders of the AFL resented the Committee's close alliance with CIO unions that had bolted the federation. Moreover, the AFL saw the NLRB's endorsement of industrial organizing as a fulfillment of their worries about state involvement in labor relations. In the summer of

1938, the NLRB ruled against the AFL and for the CIO in a case involving West Coast longshoremen. Outraged AFL leaders began a concerted attack on the NLRA, allying with employers to roll back key provisions of the law, and they began working with Representative Martin Dies, the chair of the newly created House Un-American Affairs Committee (HUAC) investigating Communism. Among HUAC's first targets was the LaFollette Committee. An AFL official, John Frey, testified in August 1938 that Communists were working closely with LaFollette investigators. (Indeed, several LaFollette staffers turned out to be avowed Communists.) A strange and bitter conflict developed between the two committees, with the HUAC threatening to hold hearings on the LaFollette Committee. President Roosevelt publicly supported the LaFollette Committee, and it received enough funding to conduct a major investigation into California agricultural labor. But its bill died in committee, and the LaFollette Committee folded in 1941.

The battle over the LaFollette Committee shows the schism within the labor movement over its relation to the state in the 1930s. The CIO embraced an expansive state regulatory regime, and its collaboration with the LaFollette Committee revealed the potential for a state alliance to discipline employers and shift power to workers. The AFL feared state control and CIO ascendance enough to sabotage this alliance, despite the benefits all workers enjoyed from impairing employers' anti-unionism. Meanwhile, as strike-breaking and labor espionage waned, employers developed new tactics to defeat unions. A labor spy told Congress in 1938 that lawyers were taking all the union-busting business, since attorney-client privilege shielded them from Congressional subpoena.

LAFOLLETTE SEAMEN'S ACT (1915)

On March 4, 1915, President Woodrow Wilson signed the Seamen's (aka LaFollette) Act, best known for

having secured the "sailor's freedom," that is, the right to quit a ship at port without incurring criminal charges of desertion. Within a comprehensive and complex piece of legislation (requiring 21 pages of dense, single-space type to enumerate its 20 sections), legislators attempted, among other ends, "to promote the welfare of American seamen. . .abolish arrest and imprisonment as a penalty for desertion. . .and to promote safety at sea." What might be considered the "free labor" provisions of the act centered on the decriminalization of desertion (now reduced to a forfeiture of wages earned), formal abolition of flogging and other forms of corporal punishment (replaced by a graduated code of punishment of disorderly conduct), an anticrimping ban on advance wages or the allotment of wages to any but the sailor's immediate family, and a "half-wage clause" allowing the sailor to depart at any port during a voyage with half his earnings to date. Second, the act set firm controls on the hours and conditions of labor. In particular, these work-related measures divided sailors into two and firemen into three watches at sea and limited all seamen to nine-hour days in port; in addition, they specified minimal requirements for shipboard diet, sleeping space, and adequate toilet facilities. Third, explicit concern for passenger as well as crew safety mandated lifeboat design, access, and certified emergency training by the crew. Fourth, the act ventured into the arena of hiring and skill restriction: within five years of the passage of the act, 65% of the deck crew were to be rated as "able seaman," defined by three years' service at sea or on the Great Lakes; in addition, English-language requirements—justified by concern for communicative safety—also clearly intended to shift crews toward higher native-American quotients. Finally, in perhaps its boldest move, the authors of the act specified its application not only to "all vessels of the United States but also, and within a year, to "foreign vessels."

The political history of the Seamen's Act is reasonably well documented. Behind the eponymous author of the legislative act, Senator Robert LaFollette, the real father of the maritime labor reforms was the Seamen's Union leader, Andrew Furuseth. An Oslo-born sailor and fisherman, who jumped ship in 1880 to make his home in San Francisco, Furuseth was a self-taught exponent of sailor union federation, craft unionism, and ultimately, political regulation of the waterfront. In the wake of the *Titanic* disaster of April 1912, the force behind maritime labor and safety reform gained inexorable logic. A less-trumpeted source of support for the bill was anti-Asian racism; both the language and skill requirements in the bill aimed to reduce international maritime traffic

LAFOLLETTE SEAMEN'S ACT (1915)

in “cheap labor” and thus promote the return of “Caucasians” to the industry. By 1912, both major party conventions had adopted resolutions sympathetic to the sailors’ cause. When the Democrats not only retook the White House and control of both houses of Congress in November 1912, but also the bill’s former cosponsor, William B. Wilson, was named Secretary of Labor, labor reform forces gained the edge they needed.

LANDRUM-GRIFFIN ACT (1959)

Officially titled the Labor-Management Reporting and Disclosure Act, this law resulted from the McClellan Committee hearings (1957–1959) on union corruption. Those hearings offered opponents of organized labor an opportunity to pass new restrictions on unions’ ability to organize new members. But the legislation also represented efforts to empower the rank-and-file union membership in hopes that they could police their own unions.

This legislation emerged at a time of strength for organized labor. Unions had grown during the early 1950s, reaching a peak of membership in 1956 that included roughly one third of the nonagricultural workforce. The merger of the AFL and CIO in 1955 allowed organized labor to present a united front that should have strengthened their political hand in Congress. The off-year elections in 1958 demonstrated organized labor’s apparent strength as efforts to pass right-to-work legislation in several states, including California, went down to defeat. However, the revelations of union corruption presented by the McClellan Committee undercut public sympathy for labor unions. Even those congressmen who had been elected with the support of organized labor in 1958 felt pressure to support anti-union corruption legislation, regardless of whether or not a bill was harmful to unions.

Meanwhile, business interest groups had been rallying support for amendments to the Wagner Act that would strengthen employers’ ability to resist

union-organizing efforts. An employer counteroffensive to union growth had been gaining strength in the 1950s. The economic downturn in 1957 combined with the growing presence of foreign competition bolstered employer efforts to resist further union gains. The U.S. Chamber of Commerce and the National Association of Manufacturers both sought legislation that would curb unions by restricting organizational picketing and banning secondary boycotts. Their efforts received support from the White House, where the Eisenhower Administration led a Republican Party committed to supporting business interests and hostile to organized labor.

For these groups, the McClellan Committee hearings represented an opportunity to achieve their legislative goals. As one member of the Chamber of Commerce observed, “The McClellan hearings gave us the train to ride on; they were the bulldozer clearing the path.” In particular, the McClellan Committee hearings provided the public with a powerful new symbol of the danger presented by union power, in the form of James R. Hoffa and his apparently corrupt administration of the nation’s largest union, the Teamsters. Congressmen invoked Hoffa’s name in their legislative proposals. For example, Senator John F. Kennedy, who had served on the McClellan Committee, told Congress that his proposed bill would “stop those practices [upon] which, based upon the testimony before our committee, it would appear Mr. Hoffa’s career and power are based—and will in short, virtually put Mr. Hoffa and his associates out of business.”

Key provisions of the Landrum-Griffin Act reflected the ways in which anti-union forces seized the opportunity provided by the McClellan Committee hearings by placing new legal barriers in the path of union-organizing efforts. In particular, it imposed restrictions on using pickets in organizing efforts, and it closed a loophole that had allowed the continued use of secondary boycotts, a practice that the Taft-Hartley Act (1947) had attempted to end.

But many other aspects of the bill had little to do with the priorities of business groups; instead, these provisions regulated union governance in the interest of protecting the democratic process within labor organizations. Business groups had feared that such proposals might justify similar new regulations on corporate governance; moreover, an empowered rank and file could encourage union militancy. But Senator John L. McClellan, whose committee had helped create the opportunity for this legislation, championed these union governance proposals. He depicted the effort to empower union members as a kind of voluntarist solution both to the problem of union corruption and to the growing power of organized labor.

Members would police their own organizations by booting corrupt officials out of power. And an empowered membership would restrict the authority available to union leaders, thus offering a natural break in the aggregation of power by individuals such as Hoffa.

To achieve this goal, Landrum-Griffin sought to protect union democracy by setting up new standards for union governance. It drew on the revelations of the McClellan Committee to impose new regulations on union officeholders. The law specified that union officers held a position of fiduciary trust with regard to their members. Legally, this meant that actions in violation of that trust, for instance, misappropriation of union funds or engaging in conflicts of interest, were now violations of federal law. Certain persons were now barred from holding union office. Individuals convicted of certain crimes, including murder, assault, and extortion, were banned from holding union office for a period of 13 years. The law also barred anyone “who is or has been a member of the Communist Party.” It was decreed that unions must make their finances transparent. Officers were required to file annual public reports on the internal finances of their organizations, including information on the officers’ salaries. Finally, a number of provisions sought to guarantee democratic union elections. New guidelines regulated election procedures and provided avenues for appeal in cases of intimidation or fraud. The law created a “Bill of Rights of Members of Labor Organizations” that protected members’ ability to speak out on union affairs and guarded them against unfair disciplinary action.

Union leaders at the time argued strongly against these union governance proposals, claiming that they would hamstring effective union government. But the initial predictions that the law would foster instability by encouraging frequent turnover in union officeholders have not been borne out over time. Instead, critics have frequently argued that the law has not offered enough help to insurgent movements within unions. Thus, although the law proved helpful to reform efforts in the United Mine Workers Union in the early 1970s, insurgents in the Teamsters Union had less success in using the law to unseat their leadership. Ironically, the law designed to put Hoffa out of business had little impact on him or his union in subsequent years.

LAUNDRY

Laundry workers have always done some of the hardest and most necessary work in society. Nevertheless, laundry work has almost always been considered a low-skilled, menial job ideally suited to women, often women of color. The term “laundry worker” hides a multitude of tasks and identities. “Laundry worker” has been used to refer to laundresses or washerwomen who washed clothes and flatwork (sheets, tablecloths, and other flat pieces) by hand in private homes; steam or power laundry workers who labored in highly mechanized industrial settings; Chinese hand laundry workers who operated small neighborhood laundries; and industrial or linen supply laundry workers who cleaned linens, uniforms, and newly manufactured garments. The post-World War II popularity of dry cleaning and coin-operated laundries expanded the category to include new groups of workers. Although working conditions have varied considerably across time and place, laundry workers have almost always earned abysmally low wages, and at no time in history have a majority of the workers labored under the protection of union contracts.

Pre-Industrial Laundry Work

The occupation of laundress has deep roots in European culture. In pre-industrial Europe, laundresses washed garments by trampling them underfoot in a tub or shallow stream or by pounding them with a wooden bat or against rocks at the edge of a stream or well. While neither method required soap, some laundresses added a cleaning agent to the water, usually made of urine, dung, or lye. Like their European counterparts, colonial and nineteenth-century Americans with the economic means employed laundresses or domestic servants to do all or part of the family wash. In the pre-Civil War South, slaveholders often removed their female slaves from the fields to do the household laundry on the weekend. In 1870, there were close to 60,000 laundry workers in the United States. Gender ideologies associating laundry work with domesticity meant that almost all of these

LAUNDRY

workers were women, significant numbers of whom were African-American.

Pre-industrial laundry required significant physical strength and endurance. Before the advent of private plumbing and urban water systems, laundresses had to collect water from springs, wells, creeks, or pumps and transport it home over what were often considerable distances. Using a stove, open hearth, or boiler, the water was boiled and transferred into wooden or galvanized washtubs, where the laundress scrubbed the pieces on a washboard or by hand. In the nineteenth century, most laundresses made their own soap and starch from lye, animal fat, and wheat bran. After rinsing the soapy garments in boiling or bluing water, the laundress rubbed boiling starch into the shirts, linens, and other pieces that had to be ironed. Excess water was squeezed out with a small hand-cranked wringing machine that pressed the articles between two parallel rubber rolls or by hand. Using heavy flatirons that weighed as much as 12 pounds, ironing, the final part of the job, brought no reprieve from the arduous labor involved in washing. Although by the 1850s laundresses could purchase small household tools such as wringers, the work remained hard. While many laundresses took in the washing of two or three families a week, in the nineteenth century, most laundresses earned no more than \$4 to \$8 a month, out of which they were expected to provide their own soap, starch, and wood.

While laundry work paid relatively little, it offered some advantages over household service work, one of the major occupational fields for women in nineteenth-century America. Unlike domestic servants who worked in their employers' homes, most laundresses worked in the privacy of their own homes, where they could set the pace of work and rely upon family members for help. Tera Hunter's study of African-American laundresses in the urban South (census data reveals that in the nineteenth century, laundresses were more numerous in the South than the North) reveals that laundresses often allocated space within their communities to do the work collectively, taking care of one another's children, pooling their resources, and engaging in community-building activities. Hunter's analysis also reveals that black laundresses engaged in acts of resistance ranging from "borrowing" their employers' garments to creating trade union-like organizations.

Industrialization and Laundry Work

By the 1860s, industrialization had created a wide divergence in how, where, and why people washed

clothes for money. While the overwhelming majority of laundry workers continued to wash garments by hand at home, by the 1860s a growing number of women and men were seeking employment in one of the nation's new steam laundries (by 1920 the U.S. Census had replaced the title steam laundry with power laundry; steam and power laundries have also been called commercial laundries).

In her comparative analysis of steam laundries in the United States and Britain, Arwen Palmer Mohun argues that technological and cultural factors facilitated the growth of the laundry industry. By the late 1800s, mechanized washing machines, flatwork ironers (large ironing machines that pressed flatwork between padded rollers and steam-heated chests or cylinders), extractors (centrifugal drying machines that expelled water from clothes by spinning them at high speeds), and steam presses could wash, dry, and iron clothing and flatwork in a portion of the time it took the laundress or housewife. The earliest machines were operated by hand cranks, foot treadles, or hand levers; by the 1920s, many of the machines were operated by pushing a button. The introduction of laundry machinery facilitated the move of the work from the home to the factory, where the labor process was broken down into increasingly smaller parts, and where the site of skill was transferred from the worker to the machine.

The proliferation of washable fabrics also played an important role in the emergence of the laundry industry. The development of manufactured cloth and the growth of the ready-made clothing industry in the nineteenth century meant that for the first time, most Americans could afford to own many articles of clothing, most of which were made of cotton, a fabric that was easily washed. Growing fears about the spread of germs and new middle-class social mores that condemned the wearing of smelly or dirty clothing contributed to the demand for laundry workers, and for new methods of laundering. Between 1860 and 1890, the number of laundry workers (both hand and steam) in the United States jumped from 38,633 to 246,739, a more than 600% increase.

Carole Turbin's examination of Troy, New York, the capital of the nation's shirt, collar, and cuff industry, and home to some of the nation's first steam laundries, reveals the impact that mechanization would have on the American laundry worker. In the mid-1800s, collar laundries in Troy typically employed 20 to 30 women who washed, starched, and ironed collars and cuffs by hand. Because the work required familiarity with different ironing techniques and starching, as well as manual dexterity, Troy's laundry workers were considered highly skilled. As skilled workers, the women, the vast majority of whom

were Irish, were among the first women laundry workers in the United States to establish formal trade unions. Under the able leadership of Kate Mulaney, in 1864, the women organized the Troy Collar Laundry Union and within a year had increased wages from \$2 to \$3 a week to \$8 to \$12. The activities of Troy's laundry workers challenged widely held beliefs that women made poor trade unionists.

In an attempt to increase productivity and reduce their reliance on women's traditional skills, as the nineteenth century progressed, Troy's collar laundry owners implemented ironing and starching machines and cut wages. Mechanization was accompanied by an increased division of labor, and the women found themselves confined to one part of the laundering process. Once considered skilled workers, mechanization transformed the women into machine tenders who could be easily replaced.

Laundry Workers at the Turn of the Twentieth Century

Although until 1909, the U.S. Census aggregated hand and steam laundry workers, evidence suggests that in 1900, the vast majority of the nation's 385,000 laundry workers were still employed in private homes. As before, the majority of the workers were women. Between 1870 and 1910, women composed between 87% and 99% of the nation's laundry workforce. Census data reveal that laundry workers were on average older than women employed in most other occupations and were more likely to be married. As work that could be done at home using home-based skills, laundry work attracted women with families, who were able to combine paid work with domestic responsibilities such as child care.

Laundry work was not only gendered, it was also racialized. Between 1890 and 1910, approximately two thirds of the nation's laundry workers were African-American; in the southern United States, close to 90% of the region's laundry workers were black. Laundry work ranked third in importance in the employment of black women, preceded only by agricultural laborers and servants and waitresses. Conversely, relatively few native white women of native parentage were employed as laundry workers. In 1900, 2.4% of these women were employed as laundry workers, compared to 19.2% of all wage-earning African-American women. Of the approximately 75,000 women laundry workers of foreign parentage (many of whom were also of foreign birth), the predominant groups were Irish and German. Evidence suggests that at the turn of the twentieth century,

steam laundry jobs were open only to white women of native or foreign birth.

Alongside the more than 300,000 women employed as laundry workers in 1900, 50,000 men worked as launderers, half of whom were Chinese. Racially discriminatory hiring practices and exclusionary trade union tactics confined Chinese men to low-paying service work traditionally performed by women. Many of the laundries run by Chinese men were referred to as hand laundries, small, neighborhood businesses where clothes were washed and ironed by hand. By the 1910s, hand laundries (which by this time could be found in most large cities except those in the South) used either a combination of hand methods and electric appliances to wash the clothes on site, or sent them out to be washed in a steam laundry, after which they were returned to the hand laundry for ironing. Throughout the twentieth century, hand laundries remained small-scale establishments, often consisting of little more than two or three rooms where the owner and a few paid employees lived and worked. Although most hand laundry workers labored between 10 and 16 hours a day in hot, wet, and steamy conditions, wages were typically low.

The Ascendancy of Power Laundries, 1900–1950

While a relatively small number of cities had steam laundries as early as the 1850s, it was not until the early 1900s that the power laundry industry really took off. The dirt and grime that accompanied urban industrial living, the increased number of people living in apartments (many of which provided no washing facilities), the rising numbers of women working outside the home, and the decreased availability of household servants fueled the expansion of the industry at the turn of the century. In 1909, the first year in which steam laundries appeared in the census, 5,186 establishments employed close to 125,000 workers (called laundry operatives), over two thirds of whom were women. The steam laundry was one of the few industries in which the number of female employees exceeded that of males. The growth in the power laundry industry did not lead to the immediate elimination of hand laundering. In 1910, half a million laundry workers continued to work in private homes, using hand methods or an electrically operated washing machine. Thirty years later, the ratio between steam and hand laundry workers had reversed. By 1939, approximately 7,000 power laundries employed 249,000 workers, close to two thirds of whom were women. Conversely, by the 1950s, only

LAUNDRY

75,512 laundry workers labored outside of commercial laundries.

In the early 1900s, power laundries could be found in every state of the union. They were, however, most numerous in large cities such as New York and San Francisco, and were less common in the South where technological developments lagged and where the abundance of poorly paid black washerwomen acted as a disincentive to industrialization. As an industrial job, increasing numbers of both native white women and men entered into the laundry trades. By 1930, 30% of the nation's power laundry workers were men, and over one half of the women were native white. Power laundries were also one of the first industries to employ significant numbers of African-American women. By 1930, close to 50,000, or one-third, of the nation's female power laundry workers were black, and an additional 10,000 African-American men were employed in power laundries. A U.S. Department of Labor Women's Bureau survey found that four in five power laundry workers in the South were African-American. In cities such as New York and Chicago, most power laundries had ethnically and racially diverse workforces. As in the nineteenth century, laundry work continued to be done by women who were on average older than women employed in other industries and who were more likely to be married.

Most power laundries were relatively small operations employing between 20 and 50 workers. In their early years, power laundries received the bulk of their business from commercial establishments such as hotels, and from the laundering of men's shirts. To increase sales from families, in the 1910s power laundry owners implemented cheaper semifinished services such as wet wash, in which garments were washed, but not dried or ironed. The wet-wash family bundle was a huge hit. By the 1940s, approximately half of the commercial laundry business came in the form of family service work.

In addition to power laundries that catered primarily to families and individuals, institutions such as hospitals and hotels sometimes built their own laundries. Linen supply and industrial laundries provided and laundered (usually on a rental basis) linens such as work uniforms, towels, bed linens and protective apparel to service, industrial, and government users. Alongside power laundries, in the early 1900s, in New York, Baltimore, and a number of other cities, social reformers and public health officials constructed public laundries where the poor could wash their clothing at a fraction of the cost of a commercial laundry.

In commercial laundries, approximately three quarters of the employees were productive workers,

defined as workers engaged in the actual laundering process. Under this broad heading fell the markers, washers, dryers, flatwork ironers, press operators, starchers, sorters, and checkers. Men were employed as washers and dryers, while women performed all the other jobs, usually composing over two thirds of all productive workers. Markers undid the soiled articles, marked them, and sent them to the washroom, where washers placed the articles into large cylinder washing machines. Next, garments were sent to the extractors or dryers, while sheets, pillow cases, and other flat pieces went to the flatwork department, where workers fed the pieces into moving rollers. At the other side of the machine, a group of workers caught and folded the hot, freshly ironed pieces. Flatwork ironing, which usually employed the largest group of women workers, was described as one of the hottest and hardest jobs in the industry. Articles that could not be handled by the flatwork machines, such as shirts or suits, went to the pressers or shirt finishers, who ironed the pieces on pressing machines. A small laundry would likely have a few general, multipurpose presses, while large laundries would have dozens of specialized pressing machines. In the early 1900s, starchers starched by hand or machine collars or other such pieces. Many laundries also employed hand washers or ironers to handle delicate pieces that could not be put through the machines. Finally, sorters or checkers collected all the articles and packaged them for return to the customer. Not all laundry workers were productive workers. Non-productive workers included routemen or drivers (who delivered laundry and engaged in sales work), repair maintenance or mechanical workers, office workers, and foremen. With the exception of office workers and sometimes foremen, most of these workers were male.

While the use of power-operated machinery increased daily output, it did not significantly lessen the workload, as power laundry workers spent long hours operating heavy presses and carrying bundles of heavy clothing in a hot, wet, and noisy working environment. As many of the machines lacked proper safety guards, mechanized laundry work was also extremely dangerous; workers regularly burned their fingers on the machines or chemicals, or worse, got a finger, hand, or arm caught in one of the revolving rollers or extractors. Unlike laundresses, who were usually self-regulated, in an industrial setting, laundry workers had to contend with the direct supervision of the owner or foreman, frequent speedups, and excessively long working hours. In 1909, 75% of the nation's power laundry operatives worked 54 hours or more a week. Despite laws prohibiting women from working

more than 10 hours a day (the constitutionality of which was upheld by the Supreme Court in 1908 in the famous *Muller v. Oregon* decision involving an Oregon laundry owner), 12- and 13-hour days were common.

Tainted by its association with women's domestic labor, power laundry work quickly became one of the lowest-paying industrial jobs. In the early 1900s, many workers earned as little as \$3 or \$4 a week. Labor investigations reveal that there were significant wage differentials between workers. Like most industries of this period, the laundry was organized along racial and patriarchal lines, with black women confined to the lowest-paying jobs of flatwork ironing and pressing, while men were employed as washers, drivers, and mechanical workers, the highest-paying jobs. A 1930 Women's Bureau survey found that median earnings for white women laundry workers were \$16.10 a week, and for black women workers \$8.85 a week.

Laundry Unions and Legislation, 1900–1960s

In 1900, in Troy, New York, the American Federation of Labor (AFL) chartered the first international union of laundry workers, the Shirt, Waist and Laundry Workers' International Union. With jurisdiction over all the workers involved in the making and laundering of shirts and collars (the union never tried to organize home laundry workers), the new union quickly spread to San Francisco, where in 1901 a group of workers organized a local of 1,000 laundry workers. Although the majority of laundry workers were women, most of the union's leaders were men, and union contracts tended to institutionalize existing sex-based wage differentials. In 1909, the AFL limited membership in the union to those engaged in laundry work and changed the union's name to the Laundry Workers' International Union (LWIU). Drivers were to be organized separately by the AFL-affiliated International Brotherhood of Teamsters. By 1930, the LWIU had only 6,000 members, and most of its locals were disorganized and poorly funded. Wages in the industry remained low and working conditions bad.

The New Deal ushered in the first national effort to regulate laundry workers' hours and wages. Under the National Industrial Recovery Act (NIRA), in 1934, a nationwide laundry code established a maximum 40-hour workweek (with an allowance of overtime) and minimum hourly rates of pay that varied according to three population groups and five geographic

regions. Rates were set lowest in the South, where in many places a 14-cent hourly wage was established, and highest in Boston, New York, Los Angeles, and San Francisco, where a 30-cent rate was established. As most of the workers in the South were African-American, the code formalized existing wage differentials across racial lines. In 1938, like other service workers, laundry workers were exempted from the Fair Labor Standards Act (FLSA), which established minimum working conditions for workers in interstate production. It was not until 1967 that amendments to the FLSA finally brought laundry and dry-cleaning workers under its umbrella, establishing a minimum wage of \$1 per hour, in many places well below a living wage.

The New Deal labor legislation with the most impact on laundry workers was the 1935 National Labor Relations Act (Wagner Act), which granted workers the right to organize and bargain collectively. The mid-1930s witnessed a wave of strikes and organizational activities among laundry workers across the country. By 1950, the LWIU had over 50,000 members and was no longer the only major union organizing laundry workers in the country. In 1937, laundry workers in New York City withdrew from the AFL-affiliated LWIU and affiliated with the Amalgamated Clothing Workers of America (ACWA), one of the founding Congress of Industrial Organizations' (CIO) unions. By 1941, almost all of NYC's approximately 30,000 laundry workers, significant numbers of whom were African-American, were organized under the ACWA. The new union secured major wage increases and established a health center and benefit fund for its members. Outside of New York City, Washington, and Detroit, most of the workers continued to organize under the AFL-affiliated Laundry and Dry Cleaning Workers' International Union (LDCIU), and in 1947, an estimated 30% to 40% of laundry workers labored under collective bargaining agreements. Unionized workers were concentrated in large cities in the Pacific region, Northeast, and Middle Atlantic. In the South, most laundry workers remained outside the trade union fold.

In 1957, the AFL-CIO expelled the LDCIU and its approximately 75,000 members on corruption charges and a year later chartered the Laundry, Dry Cleaning and Dye House Workers International Union (LDDIU). In 1961, 128,000 or 23%, of the workers in the laundry and dry-cleaning industry were covered by contract under the LDCIU, the LDDIU, or the ACWA. Most of the organized workers continued to be located in large cities in the Middle Atlantic, East North Central, and Pacific regions of the country.

The Laundry Industry and Laundry Unions, 1960–2004

By the 1960s, the laundry and dry-cleaning industry had become one of the major service industries in the United States. Well over half a million workers, two thirds of whom were women, were employed in power laundries (catering to families), linen supply and industrial laundries, hand laundries, diaper service laundries, dry-cleaning businesses, rug cleaning plants, cleaning and pressing establishments, laundry and garment service plants, and coin-operated laundries. In the 1960s, the rapid proliferation of coin-operated laundries, new fabrics which required little or no ironing, and improved and affordable home washing and drying machines forced power laundries to diversify and offer new services such as dry cleaning, carpet cleaning, and alterations. Many power laundries also implemented labor-saving technologies such as automated wash systems and automatic flatwork processing machines. While power laundries struggled to maintain sales, in the 1960s and 1970s, industrial and linen supply laundries capitalized on the increased construction of hospitals and nursing homes, institutions that produced large amounts of laundry. In the 1960s, laundry workers continued to be among the lowest-paid workers in the country. In 1961, gross average hourly earnings of workers in laundry and dry-cleaning plants were \$1.27, compared with \$1.70 for workers in the retail trade and \$1.49 for workers in general merchandise stores.

By 1987, of the approximately 400,000 workers employed in the laundry, dry-cleaning, and garment service industry, close to two thirds of whom were women, only 33,180 were employed in power laundries, compared with 45,416 workers in coin-operated laundries and a little over 100,000 in linen supply or industrial laundries. The largest group of workers in the industry now worked in dry-cleaning establishments, establishments that employed more men than women. In the 1960s, 1970s, and 1980s, most power laundry workers continued to labor in relatively small plants that employed around 20 employees, while linen supply and industrial laundry workers were employed in larger plants that were often part of multi-unit chains. In the 1990s, the largest private industrial laundering companies in the United States were California's Aratex, the National Linen of Atlanta, and Cintas, a uniform supply outfit headquartered in Cincinnati, Ohio. At the turn of the twenty-first century, many laundry workers employed in the public sector saw their jobs outsourced to private companies such as Cintas.

At the end of the twentieth century, laundry workers across the nation complained of poverty wages, dangerous and oppressive working conditions, and inadequate benefits. Workers described being forced to work in sweltering plants, denied water or bathroom breaks, and being forced to handle bloody sheets with little to no sanitary protection. Women earned less than men, who continued to work as washers and drivers. In cities such as New York and Washington, Hispanic workers, some of whom were undocumented, joined the already large numbers of black workers in the laundry industry. At the turn of the twenty-first century, undocumented Mexican immigrants were found working 72 hours a week in NYC laundries for as little as \$3.00 or \$4.00 an hour (in violation of minimum wage laws).

By the end of the 1990s, laundry and dry-cleaning workers in the United States were represented by the Union of Needletrades, Industrial and Textile Employees union (UNITE), an AFL-CIO-affiliated international union representing workers in apparel, textile, and industrial laundries, and by the LDCIU (then affiliated with the Service Employees International Union). With only 8,000 members across the country, in 1998, UNITE began a massive campaign to organize the nation's industrial laundry workers. In November 1998, nearly 3,000 National Linen laundry workers in the South voted to join UNITE. Sparked by low wages, unaffordable health insurance, and unfair treatment, in the late 1990s, laundry workers in NYC, Baltimore, Washington, Chicago, and a host of other cities went on strike and secured what were in many instances groundbreaking contracts (including features such as immigrant rights protection and protection against sexual harassment). In April 2001, the nearly 9,000 members of the LDCIU voted to affiliate with UNITE, bringing the total number of laundry workers in UNITE up to almost 40,000, representing 90% of the unionized laundry workers in the United States.

In 2004, UNITE-HERE (UNITE merged with the Hotel Employees and Restaurant Employees International Union in 2004) began a major organizing effort among the mostly unorganized workers in the uniform laundry industry. With over 27,000 employees, in 2005, Cintas was the largest uniform rental provider and industrial launderer in North America, and, according to UNITE-HERE, was responsible for keeping wages low and working conditions bad in the industry. In 2003, current and former Cintas employees filed class-action charges with the Equal Employment Opportunity Commission, alleging widespread discrimination against people of color and women in hiring and promotion policies, job assignments, and work environment. Despite the efforts of

UNITE-HERE and the nation's laundry workers, in the early twenty-first century, many laundry workers continued to labor under highly exploitative conditions without union protection.

LAW AND LABOR

Law has profoundly shaped the experience of American workers both individually and collectively. Since the first European settlement of North America, an array of rules has governed the employer's authority, the labor market, workplace conditions, social insurance, equal employment, and perhaps most significantly, the legitimacy of protest. Given coherence by the status of its subjects rather than by a specific form or jurisdiction, the set of regulations we call "labor law" crosses traditional legal boundaries, touching on contracts, torts, association, antitrust, criminal law, regulation, and civil rights. Throughout this history, the state confronted workers most spectacularly during strikes, boycotts, and other disputes. Yet, in some periods, the law governing employment focused less on class conflict than on the free movement of labor,

the health and welfare of workers, and the rights of employees.

During the last four centuries, this mix of traditions, judicial precedents, statutes, and administrative interpretations traced an arc from the oppressively paternalistic laws governing colonial servitude to the free-labor precedents of the antebellum era, from the reactionary rulings of late nineteenth-century judges to the relatively proworker regulatory legislation of the twentieth century. Rather than evolving steadily, law changed dialectically, first strengthening employer authority, and then eroding traditional bonds; constructing new worker rights, and then weakening those protections.

Law profoundly influenced the trajectory of the American labor movement. The state's harshness alienated workers, severing organized labor's roots in antebellum reform and making its leaders skeptical toward the government. Only during the Great Depression, when lawmakers appealed to labor by guaranteeing the right to organize, did union workers fully embrace the law as a vehicle for improving their condition. Though labor's marriage to the state forced workers to suppress their most radical tendencies, the relationship proved fruitful into the 1970s, when an increasingly hostile government sped a decline in union fortunes.

Though the law gradually ceased supporting collective action, the government continued to shape the workplace in powerful ways into the twenty-first century. In particular, the civil rights legislation enacted between the 1965 and 2000 promised workers fair treatment regardless of race, creed, sex, or physical impediment. Such laws offered employees significant benefits, but required them to petition the government as individuals, not as members of a broader class.

Colonial governments of the seventeenth and eighteenth centuries regulated work by applying European (primarily British) precedents to the novel circumstances they found in North America. The colonies inherited long-standing doctrines giving masters authority over their employees. Moreover, while the shortage of labor in the colonies could have empowered workers, it instead led employers to use the law to secure their control over human capital. Thus, a large percentage of American settlers worked under some form of legal coercion, either as indentured servants, as sailors, or as slaves.

At first, the hazards of settlement prompted harsh laws compelling workers to labor. In 1612, the Virginia governor, Sir Thomas Dale, implemented "Laws Divine, Morall and Martial," which punished idle colonists by forcing them to lie all night with neck and heels together. Repeat offenders could be

whipped and eventually sent to a year's service in English galleys. As the colonies grew more secure, they adopted the more moderate British common law, but the courts still reserved harsh sentences for recalcitrant servants and slaves.

For the most part, colonial laws neither stipulated, nor enforced, specific codes regulating the workplace, but rather guaranteed the authority of the master and defined his responsibilities to his servants. The loose principle underlying such rules was paternalism. The law used the family as a metaphor for the workplace, identifying the employer as father and the employees as his offspring. By this logic, the law obliged servants to obey their master's will as the Bible commanded children to honor their parents. The government granted masters the right to physically punish refractory servants, and constables assisted employers seeking to recover runaway apprentices. In return, the law required the employer to provide room and adequate food for the worker. Economic realities seemed to affirm the familial analogy, as many employees were young, worked for blood relatives, and lived and labored in their master's home. Yet, the law of master and servant offered workers little protection, obliging the employer to provide only minimal provision for his employees. Without the emotional bonds that stilled the parent's switch and filled the child's bowl, many servants found paternalism miserable rather than comfortable.

For white workers, this wretched dependency was both temporary and contractual. Servants (or their parents acting on their behalf) consented to their condition by signing indenture papers and offering bonds against their disobedience. In return for years of toil, apprentices received training and access to a trade. Some indentured servants labored to repay the cost of their passage from Europe. Others were teenage girls, who worked for their keep while awaiting marriage. Sailors submitted to more extreme discipline than ordinary servants, but received wages and served only for a much shorter time.

By contrast, colonial law denied slaves brought from Africa the protections afforded by time-limited contracts. Because slaves did not negotiate legal agreements with their masters, their rights were subject to the continual depredation of legislatures. Beginning in 1661, colonies like Virginia expanded the master's authority, making enslavement a permanent inheritable condition and slaves a form of salable property. Laws gave the master the almost absolute right to punish his slaves as he saw fit, reserving only the power of execution to the state.

The law further bolstered slavery by enforcing severe punishments for resistance. When New York City slaves rebelled in 1712, killing nine whites, courts

ordered the execution of 21 insurrectionists by burning and the wheel. Moreover, such protests often encouraged newly repressive laws. After the 1739 Stono rebellion, South Carolina enacted the severe "Negro Act," which barred slaves from growing their own food, assembling in groups, earning their own money, or learning to read.

Though the War of Independence promised law more favorable to the laborer, the new republic quickly disappointed workers. Thousands of journeymen, sailors, apprentices, and slaves had fought on the colonial side, inspired by the rhetoric of social upheaval and democracy. Yet, the new government denied the franchise to men without property, while expecting these workers to pay for the war through excise taxes. The Constitution of 1787 not only greatly strengthened the position of creditors, but also guaranteed the slaveholder's right to human property.

Most significantly, early American courts re-implemented the common law, defying those workers who hoped the revolution might sweep away the oppressive vestiges of British rule. Early national magistrates not only guaranteed masters their traditional legal authority over servants, but also enforced employer control. Sheriffs routinely jailed irresponsible sailors, runaway apprentices, and fugitive slaves pending the return of their masters.

Courts also used common law to suppress the earliest American labor unions. In England, the doctrine of conspiracy had long prohibited journeymen from organizing. Though guilds and corporations could obtain charters from the crown granting specific rights and duties, independent journeymen's associations were seen as threats to the authority of the sovereign. Over the angry denunciations of workers, who felt the First Amendment to the Constitution guaranteed freedom of association, early American courts applied this principle to unions. The first such trial, *Commonwealth v. Pullis*, occurred in 1806, when the Philadelphia court convicted journeymen cordwainers (that is, shoemakers) on charges of conspiracy for seeking higher wages. Referencing British common law, the presiding judge, Recorder Moses Levy, condemned the defendants as dangerous outlaws. Later verdicts in cities like New York, Boston, and Pittsburgh affirmed this notion.

In the 1830s, three main factors—the market revolution, the establishment of universal white male suffrage, and the construction of a transformative liberal ideology—combined to shatter the common-law rules governing work in the North. Improvements in transportation, the specialization of labor, and the introduction of machinery eroded the economic basis for paternalism. Manufactories employing bands of independent operatives replaced master craftsmen

with dependent apprentices and journeymen boarding in their households. As white workers won the vote, they demanded the courts cease harassing their unions. And finally, with the rise of the antislavery movement, many Americans questioned the contradictions between Enlightenment individualism and traditional forms of authority.

Influenced by these forces, northern judges began undermining paternalism and offering workers an ambiguous new freedom. The foremost figure in this transformation was Lemuel Shaw, the chief justice of the Massachusetts Supreme Court. A Whig dedicated to market liberalism, Shaw made the worker's consent the basis for the labor agreement. Moreover, Shaw's rulings replaced asymmetrical relationships based on status, such as master and servant, with legally enforceable contracts between officially equal parties. Such decisions denied not only the master's special authority over his servant, but also the employer's responsibility to care for his employees. Finally, Shaw proposed abstract rules to govern these contracts and the rights of the individuals who made them.

In the year 1842, Shaw rendered two judgments that redefined antebellum labor law: *Farwell v. Boston & Worcester Railroad Co.* and *Commonwealth v. Hunt*. The *Farwell* decision is best known for limiting the employer's responsibility for workplace accidents, but it also enunciated Shaw's notion of the wage bargain as a contract between equal partners. The plaintiff, a railroad engineer, sued his employer after a switchman's negligence resulted in an accident that left Farwell's hand crushed. Shaw ruled in favor of the defendant, holding that the employer's liability for accidents was not implicit in the labor contract. Farwell might win damages from his "fellow servant," but not from the railroad, which was responsible only for mishaps caused by its overt neglect. Shaw further ruled that workers assumed the risks of employment upon accepting work. Employees who deemed a job dangerous might either demand higher wages, seek a contract explicitly indemnifying the employer, or quit. The *Farwell* decision thus also enunciated the principle of employment at will, which gave workers and businesses the equal right to make and terminate labor contracts.

Shaw's second key ruling, *Commonwealth v. Hunt*, also affirmed employment at will, this time giving workers the right to strike to protest labor conditions. The case arose when members of the Boston Society of Journeymen Bootmakers left their jobs, refusing to work alongside Jeremiah Horne, a former associate suspended for violating union rules. A jury convicted the society's members, including John Hunt, of criminal conspiracy. But what the trial judge saw as an

unlawful boycott, threatening to the peace and welfare of the community, Shaw interpreted as men exercising their constitutionally protected freedom of association. Denying the master's right to compel labor and affirming the worker's right to quit, Shaw could only view strikes as mere agglomerations of lawful individual decisions. By this logic, the bootmakers' union was no different from the fire companies, temperance societies, and party organizations that constituted the primary mode of self-improvement and political participation for millions in the Jacksonian Era.

While Shaw overturned Hunt's conviction, he did not give unions free rein. Rather, he subjected associations to a rigorous "means-ends" test. Workers could coordinate walkouts as long as their practices and goals were legal. Strikers could exercise their freedoms of contract and association by withholding their labor until they received a specific wage. But unionists could neither use threats, force, or violence (unlawful means), nor seek to injure an employer or nonunion worker (an unlawful end) through otherwise legitimate economic pressure. In essence, Shaw sought to make the conspiracy doctrine consistent with the Bill of Rights, while channeling collective protest into what he saw as socially productive forms.

These two decisions had a profound, if mixed, effect on workers. Shaw liberated Massachusetts laborers from the burdens of obedience imposed by master and servant law. Under employment at will, the state could no longer imprison employees who declined to fulfill their labor agreements. Shaw legalized the strike, offering labor unions a legitimate means of raising their members' wages. Yet, Shaw also eradicated the protections that paternalism had offered servants and greatly reduced the employer's implied responsibilities to his employees. Shaw left laborers liable for the exploding number of workplace accidents. Workers were free to quit but still financially responsible for the damages they caused by breaking contracts. And while the means-ends test legalized the wage strike, it barred a range of other union tactics, such as picketing and boycotts.

During and after the Civil War, lawmakers applied the principles of market liberalism to new regions and expanded their meaning for the American worker. But doctrines that had freed antebellum laborers increasingly confined the workers of the late-nineteenth century. The employee's formal equality in court merely accommodated the employer's superior power to set the terms of labor contracts. Moreover, the war initiated an economic transformation that only increased the scale, scope, and technological sophistication of American enterprise. Laborers

quickly found themselves free either to accept corporate terms, or to starve.

Workers in the former Confederacy found the end of paternalism liberating but not entirely emancipatory. With the end of slavery, the authors of Reconstruction sought to replace the old regime with a contractual scheme of northern origin. But the balance of power that emerged during Reconstruction greatly favored employers, for the new system offered freedpeople few special protections in acknowledgment of their poverty. Moreover, the white “redeemer” governments of the 1870s and 1880s further skewed the scales by passing laws restricting the southern worker’s ability to exploit his market value. Legislatures enacted statutes barring vagrancy, seeking to tie workers to their old masters. They made laws prohibiting northern agents from recruiting workers, protecting southern employers from the pressures of the national labor market. Southern states used the criminal law to maintain a pool of coerced labor, sending poor whites and blacks to chain gangs and prison farms for petty offenses including debt and breach of contract. And looming over all was the threat of white violence, which discouraged not only African-American protest, but also dissent, and even hard negotiation.

During the late-nineteenth century, labor law became increasingly pre-occupied with unions and worker protest. The law itself had provided a major impetus for the development of the labor movement. Beginning in the 1870s, workers bitterly dissented not against the degradation of their skill wrought by the second industrial revolution, but also the eclipse of antebellum republicanism, which had promised white male producers control over American government. As railroads, refiners, and manufacturers came to dominate the Gilded Age political system, unions like the Knights of Labor grew rapidly, promising to build a “cooperative commonwealth” that recognized workers’ rights.

Rather than accommodating this political dissent, the post-Reconstruction state acted to suppress the emerging movement. Faced with unprecedented worker activism, public officials concluded that normal legal institutions were insufficient to maintain the social order, and they asked the army to crush strikes. In 1877, for instance, President Rutherford Hayes called on troops to suppress “The Great Upheaval,” a nationwide railroad walkout. Firing indiscriminately into crowds of protesters, soldiers killed over 30 workers. Though politicians were generally reluctant to deploy the military in this fashion, federal troops or state militias crushed a number of major uprisings, including the Homestead Steel strike of 1892 and the Pullman boycott of 1894.

As workers adopted more aggressive methods and radical goals, they ran headlong into the conspiracy doctrine enunciated in *Commonwealth v. Hunt* (1842), which still barred boycotts or strikes designed to punish an employer. Moreover, many state legislatures superseded common law by passing criminal conspiracy statutes not only defining many forms of collective protest as unlawful, but also making union officials criminally liable for the actions of their constituents. Labor leaders found themselves subject to regular criminal conspiracy indictments, trials, fines, and imprisonment.

Most significant, Gilded Age unions had to overcome court orders restraining picketing, some strikes, and even speech itself. Before the Civil War, injunctions were uncommon; courts expected businesses injured by workers to either sue for damages or file a criminal complaint. Judges reserved their equity jurisdiction—the term for their authority to issue writs—for cases involving imminent and irreparable harm, such as the felling of an ancient tree.

Yet, late-nineteenth-century employers increasingly viewed traditional criminal and civil remedies as insufficient. Criminal trials were slow, and juries were sympathetic to labor. Suing a union for damages proved nearly impossible, for unincorporated unions had no legal standing in a court of law. They could neither sue, nor be sued, except in the name of their individual members, most of whom had few financial resources. Charging that labor’s legal incapacity made it impossible to seek redress through normal means, employers asked the court issue injunctions barring strikers from committing any act that might damage their trade or property.

Courts eagerly embraced these arguments, enjoining innumerable strikers over the course of the following decades. Painting themselves as defending civilization against barbarism, judges wrote expansive orders, barring even speech encouraging protest or educating the public about labor disputes. Additionally, judges often considered employers’ complaints *ex parte*, that is, without evaluating the union’s side of the story. Finally, judges often fined and jailed violators for contempt upon the mere allegations of the plaintiff. Thus, unions found themselves subject to serious punishments without any of the normal protections constitutionally guaranteed to criminal defendants, such as trial by jury.

The combination of indictment and injunction seriously hampered labor activism. The constant threat of prosecution restrained union ambitions, and the costs of defending members drained union treasuries. Courts played an active role in suppressing the most dramatic protests of the era, especially the Pullman boycott of 1894. When members of Eugene Debs’s

American Railway Union decided to honor striking workers at the Pullman Palace Car Company by demanding their employers uncouple Pullman sleepers from trains, federal courts sprung into action. Claiming authority under the Interstate Commerce Act of 1887—a recent law intended to regulate the power of railroad corporations—judges issued injunctions prohibiting continued protest and then jailed violators for contempt of court. Debs himself received a six-month sentence for violating a federal injunction.

Meanwhile, Gilded Age judges used their authority as interpreters of the Constitution to thwart the popular demand for legislation shielding workers from the market. Courts rejected statutes barring child labor, setting wages and hours, and ordering factory inspection, charging that these regulations interfered with a worker's right to make his or her own bargains. Such rulings radically expanded Lemuel Shaw's market liberalism, for these judges used the doctrine of "freedom of contract" not to alter common-law precedent, but to void acts of the legislature. Judges also developed new interpretations of the Fourteenth Amendment (1868), charging that regulatory legislation denied citizens their "life, liberty, and property without due process of law" while statutes giving workers special rights deprived employers of "equal protection." In the landmark case *In re Jacobs* (1885), the New York Court of Appeals used these arguments to invalidate a law barring the manufacturing of cigars in tenements, a provision meant to discourage sweatshops. Harkening back to Lincoln's free labor ideology and the powerful image of the independent artisan living in his shop, Judge Robert Earl construed the reform as an unconstitutional infringement upon the right to property.

Frustrated with such decisions, many workers abandoned their faith in government. While the Knights of Labor had lobbied for new law protecting the rights of producers, its rival, the Federation of Organized Trade and Labor Unions (later renamed the American Federation of Labor), aggressively enlisted craftsmen in trades like construction, obtained exclusive "closed shop" agreements with employers, and directly imposed their terms through strikes, boycotts, and fines. Contrary to common belief, AFL unions rejected legally enforceable contracts, asserting their own jurisdiction over the labor market, making their own private laws, and enforcing them through internal disciplinary procedures. Craft unions rooted their power in the skill and loyalty of their members, competing with, rather than capitulating to, the state. In doing so, they solved a problem long plaguing unions, namely, how to maintain a labor agreement without relying upon hostile courts.

Though private governance—often misleadingly termed "voluntarism" or "business unionism"—allowed unions to survive, it encouraged craft labor's ugliest tendencies. The emphasis on internal discipline and market control prompted unions to exclude perceived outsiders, not only African-Americans, women, and some immigrants, but also members of competing trades. For almost a decade, beginning in 1903, the United Association of Plumbers and the International Association of Steamfitters fought a pitched jurisdictional battle over who might install steam heat in the nation's buildings. The closed shop alienated middle-class observers, who saw the private enforcement of agreements, especially when violent, as a serious threat to the social order and rule of law. Union delegates often succumbed to the immense temptation to accept bribes offered by employers seeking to circumvent work rules.
