Finally, the repudiation of the state made the AFL an inconsistent partner in reformers' efforts at gaining legislation sheltering all workers. Craft unions spent much of their considerable political energy seeking either license laws for specific trades like barbering, or statutes exempting unions from antitrust prosecutions and prohibiting judges from enjoining peaceful picketing. Seeing the courts as irretrievably biased, workers used their political influence to shelter themselves from judicial power.

Nevertheless, a coalition of professionals and some unions renewed the push for protective legislation during the Progressive Era (1900–1919). Reformers carefully constructed new statutes restricting child labor, setting maximum hours, and implementing minimum wages to survive judicial scrutiny. Lawmakers addressed the problem of workplace accidents through social insurance programs, such as workers' compensation, and by expanding the employer's legal responsibility for safety. By 1906, 25 states had modified or abolished Shaw's fellow-servant rule, while almost as many had revised the doctrine of assumption of risk.

Progressive Era judges slowly and intermittently warmed to such legislation, rejecting some statutes, but allowing those protecting populations deemed deserving public support. Most infamously, the U.S. Supreme Court's *Lochner v. New York* (1905) decision invalidated a New York state law limiting the baker's workday. But just three years later, in *Muller v. Oregon* (1908), the same court upheld the state's authority to set maximum hours for women, a group of workers judges deemed worthy of public protection. The high court invalidated the federal child labor law, but affirmed similar state legislation. Though laws faced rigorous scrutiny, trends seemed to favor the reformers. For instance, in 1911, the New York Court of

Appeals voided that state's workers' compensation law. But in 1917, the U.S. Supreme Court issued decisions validating three different mandatory accident insurance schemes.

By contrast, the law continued to deny labor organizations legitimacy deep into the so-called Progressive Era. Judges still enjoined picketing and jail violators for contempt of court without jury trial. Grand juries still indicted union officials for conspiracy to boycott, restrain trade, and injure employers and nonunion workers. Meanwhile, criminal courts found ways to prosecute labor leaders engaged in graft, extortion, and embezzlement, responding to urban reformers who demanded that the state begin policing the internal administration of unions.

Similarly, Progressive Era appellate courts constructed new doctrines that affirmed employer prerogatives at the expense of unions. Adopting contemporary antimonopoly rhetoric to their own uses, "open shop" employers asked the courts to protect their authority to employ whomever they choose and to affirm the nonunion worker's right to choose his associations. Impressed by the arguments of new advocacy groups like the American Anti-Boycott Association, reputed reformers like the federal judge William Howard Taft turned restraint-of-trade laws against union pickets, boycotts, and exclusive agreements. Moreover, appellate courts affirmed open-shop premises, ratifying the worker's right to join an association and quit work, but severely limiting the union's ability to govern the economy. Most significant, in the series of decisions titled *Loewe v. Lawlor* (1903–1917), the United States Supreme Court ruled that the Sherman Anti-Trust Act of 1890 applied to labor unions, upholding a Danbury, Connecticut, milliner's lawsuit against the United Hatters Union.

These victories oddly disappointed many businessmen. Though injunctions forestalled the unionization of manufacturing, they failed to break labor's hold on trades like construction. Moreover, employers struggled to collect the judgments that courts awarded. Indeed, victorious hat manufacturer Dietrich Loewe went bankrupt waiting for unionists to obey the court, forcing him to accept charity from a collection of wealthy businessmen. Here open-shop employers found themselves hoist on their own rhetoric. Seeing unions as unlawful conspiracies, businessmen refused to offer labor any form of legal recognition. But without "standing" or state-sponsored corporate form, unions could only be sued as mere associations of individuals. Under these conditions, even a successful claim like Loewe's proved impossible to collect, requiring as it did thousands of lawsuits for nonpayment.

Modern collective bargaining emerged from this paradox, as many Americans began seeing legally

enforceable labor contracts as a middle ground between individualism and the closed shop. Reformers, stability-minded businessmen, and some unions began working to construct frameworks under which workers exchanged strikes, boycotts, and violence for arbitration, higher wages, shorter hours, and employer recognition. Such contracts had appeared in construction as early as the 1880s, but seldom in manufacturing until New York's clothing producers signed the famed "Protocol of Peace" of 1910.

New laws such as the Clayton Act of 1914, which exempted unions from federal antitrust law, validated such agreements. Called "Labor's Magna Carta" by Samuel Gompers, the Clayton Act expanded labor's legitimate space for the first time since *Commonwealth v. Hunt* in 1843. Almost immediately upon its passage, however, courts began limiting the range of acceptable strikes under the exemption. For instance, in *U.S. v. Norris* (1918), the federal judge Arthur Loomis upheld the conspiracy conviction of Chicago teamsters officials for boycotting a building material dealer. The Clayton Act thus did not legitimize unions as such, but instead offered a contractual ideal to which they could aspire.

During World War I, the federal government further enshrined what was called "responsible unionism," aiding unions that engaged in lawful collective bargaining. Seeking worker support for the war and an end to costly strikes, Congress enacted statutes creating extraordinary new agencies like the National War Labor Board, which arbitrated over 1,200 industrial disputes, often siding with workers. Trumpeted as "industrial democracy," these laws appeared to apply the war's principal ideological justification to economic life, formally ending the state's traditional hostility to labor. Indeed, under the new regime, both craft and industrial workers gained significant improvements in their condition, including the eight-hour day.

Yet, the wartime institutionalization of labor also resulted in the demonization of unions that opposed American entry into the conflict. Federal officials imprisoned Eugene Debs, accusing the Socialist Party presidential candidate of violating the Espionage Act of 1917 by giving speeches encouraging workers to resist conscription. Federal courts suppressed radical labor unions like the Industrial Workers of the World (IWW), arresting their leaders for espionage and sedition, crushing their strikes, and permitting vigilante violence against rank-and-file Wobblies. Moreover, when governments removed and even reversed their support for labor after the 1918 armistice, unionization drives collapsed. Most famously, in 1919, steel manufacturers suppressed a national strike by marshaling local police and state troopers against

workers energized by labor's recent successes in other industries.

During the 1920s, Progressive law grew still more stifling. The courts demanded that labor act "responsibly," but declined to reward obedient workers by legitimizing unions or validating protective legislation. On the ground, indictments and injunctions bolstered open-shop drives in construction, teaming, metalworking, and printing. The federal judge James Wilkerson's expansive court order severely impeded the enormous railroad shopmen's strike of 1922. Higher courts blessed such judicial interference in labor disputes. In *American Steel Foundries v. Tricity Central Trades Council* (1921) and *Duplex Printing Press v. Deering* (1921), the U.S. Supreme Court narrowed the scope of the Clayton Act's labor exemption, ruling that federal judges could still enjoin unions engaged in coercive picketing, sympathy strikes, and secondary boycotts. As justices expanded equity jurisdiction in labor cases, they also made unions more vulnerable to lawsuit. In *United Mine Workers v. Coronado Coal* (1922), the U.S. Supreme Court ruled that employers could sue unincorporated labor unions under the Sherman Act by name in court. This ruling effectively barred unions from presenting themselves as loose associations to avoid compensating individuals and firms injured by strikes. Finally, in *Adkins v. Children's Hospital* (1923), the Supreme Court revived the *Lochner* precedent, voiding a Washington, DC law creating a board setting minimum wages for women and children as an unconstitutional offense against freedom of contract. Under these conditions, union ranks shrank to pre-war levels.

The stock market crash of 1929 and the ensuing Great Depression transformed American law, unleashing an unprecedented wave of labor activism and broad improvements in the working lives of ordinary workers. Depression-era labor law continued long-term trends begun in the 1890s, but radically departed from the past in its overt sympathy for unions and its willingness to employ federal power. While prior reformers had urged that the state permit workers to strike, the law of the 1930s actively encouraged workers to organize and forced employers to collectively bargain. While Progressive lawmakers had offered support to unions that abided middle-class norms, the New Deal initially endorsed labor in almost all its forms. Finally, the Depression saw Congress establish a federal program of social insurance, not to mention national standards for minimum wages, maximum hours, and child labor.

As the Depression worsened, Americans demanded that government promote economic stability by fostering cooperation. The federal government

responded first by removing barriers to union activism. In 1932, Congress enacted the Norris-LaGuardia Act, which elaborated the worker's right to union membership. The law barred employers from forcing workers to sign yellow-dog contracts promising not to join a union. More significant, the law denied U.S. district and appellate court judges the authority to issue injunctions in nonviolent labor disputes. After years of fruitless lobbying, workers were finally free from constant federal judicial interference.

After winning election in 1932, President Franklin Roosevelt proposed New Deal legislation actually mandating various forms of economic organization, including labor unions. The centerpiece of Roosevelt's program was the National Industrial Recovery Act of 1933 (NIRA), which required businesses to organize "code authorities" and design industrial rules governing conditions in each field. Section 7A of the statute re-affirmed the worker's right to join a labor organization and required that industries permit unions to participate in the code-writing process. In theory, the federal government backed these provisions, giving union wage scales the force of law.

Many unions prospered under the recovery act. Even before the legislation became law, the United Mine Workers of America (UMWA) union appealed to prospective members by claiming, "the president wants you to join a union." Quickly organizing the bituminous coal miners, the UMWA gained employer recognition and a seat at the National Recovery Administration (NRA) code authority. Other unions found NIRA disappointing, and the experiment in cartelization was short-lived. In the *Schechter Poultry* decision of 1935, the U.S. Supreme Court ruled the recovery act an unconstitutional delegation of executive power. But the NIRA nonetheless represented an unprecedented peacetime intervention on behalf of unions that began a two-decade-long expansion of the size and power of the labor movement.

The void left by the death of the NIRA was filled by a still more radical piece of legislation: the National Labor Relations Act of 1935 (NLRA). Often called the Wagner Act, after its progenitor, New York Senator Robert F. Wagner Sr., the NLRA not only re-iterated the worker's right to join a union, but built a legal framework for collective bargaining that remains in place today. The law required employers to recognize unions winning certification elections as legitimate representatives of the workers. It created the National Labor Relations Board (NLRB) to oversee certifications and arbitrate labor disputes. Even more than the NIRA, the Wagner Act electrified the labor movement, enabling the long-awaited organization of basic industries like steel and auto.

The legitimacy offered unions by the New Deal was far less restrictive than any proposed before. Though the National Labor Relations Board used its power to favor certain unions over others, diverse organizations received state support. The federal government did take steps to ensure that labor's new power was not misused. Passing the Anti-racketeering Act of 1934 (ARA), lawmakers tried to protect workers from criminals like Murray "The Camel" Humphreys, who coveted unions for their treasuries and their power. Written in consultation with AFL leaders, the ARA reconfigured the relationship between labor and the criminal justice system. Rather than limiting worker protest, racketeering law aimed to limit the exploitation of labor by undefined outsiders. While this vagueness made unions susceptible to arbitrary prosecution in future decades, it represented a triumph for unions once buffeted by the simultaneous harassment of courts and gangsters.

Other New Deal programs and regulations similarly transformed the worker's experience. The Social Security Act of 1935 created a national, nearly universal, system of old age insurance, financed through a payroll tax. Retirement, once a luxury reserved for the wealthy, was now available to manual laborers. The Fair Labor Standards Act of 1938 abolished child labor and established the 40-hour workweek for many job classifications, overtime pay, and minimum wages. Moreover, the law replaced the patchwork of competing state provisions with a national standard, ending the statutory race to the bottom that had long stymied protective legislation in poorer regions of the nation.

Finally, the Great Depression saw the U.S. Supreme Court purge its lingering hostility to government regulation of the labor contract. In *West Coast Hotel v. Parrish* (1937), the court upheld a Washington law setting minimum wages for women. In *NLRB v. Jones and Laughlin* (1937), the court disappointed corporations by affirming the constitutionality of the Wagner Act. Taken together, the 1937 decisions overturned two generations of precedent invalidating protective legislation. The individual's right to "freedom of contract" would no longer trump the public will.

During World War II, the state revived the principle of "responsible unionism," helping unions that endorsed government policy, but repudiating those deemed too radical or independent, such as the West Coast longshoremen and even the United Mine Workers. Offering significant aid to workers who agreed to forgo strikes and raise productivity, the federal government helped many internationals grow rapidly during this period. But it also foreshadowed the use of ideological and tactical litmus tests to suppress labor's most aggressive tendencies.

By the end of the war, labor's growing power inspired politicians of both parties to favor new laws containing unions. The 1947 Taft-Hartley Amendment to the NLRA ended 15 years of comparatively unfettered union activism. Though the law continued to support collective bargaining, it made organizing far more difficult. Under Taft-Hartley, federal judges regained the authority to interfere in peaceful labor disputes suspended by the Norris-LaGuardia Act of 1932. Taft-Hartley required union officers to file affidavits swearing they were not Communists. The law barred unions from engaging in "unfair labor practices," including jurisdictional strikes and secondary boycotts. The amendment allowed states to pass "right to work" laws, enabling employees in unionized workplaces to decline union membership. These provisions had a profound impact on labor organizing, especially in the South, where CIO attempts to unionize the textile industry stalled.

In the 1950s and 1960s, lawmakers also placed new restrictions on the administration of labor unions. In 1957, the Senate held hearings to investigate charges of corruption and gangster domination in unions like the International Brotherhood of Teamsters, leading to the Labor-Management Reporting and Disclosure Act of 1959 (aka, Landrum-Griffin), which proposed to guarantee democracy, freedom of speech, and official probity in unions. Seeking to promote politically conservative and personally honest leadership, the law forbade former Communists and ex-convicts from holding a union office for five years. Moreover, federal prosecutors began aggressively pursuing union officials under the 1934 Anti-racketeering Act and its successor, the Hobbs Act of 1946. Though these prosecutions undoubtedly stemmed the movement's most violent, collusive, and corrupt elements, they nonetheless put labor on the defensive, undermining the movement's reputation without offering well-administered unions any additional support.

The civil rights revolution of the 1960s radically altered the trajectory of American labor law. Once focused on the legitimacy of unions and their tactics, the law grew increasingly concerned with the rights of individuals to employment, fair treatment, and a safe workplace. The Civil Rights Act of 1965 and its subsequent amendments prohibited employers from discriminating against prospective and current employees on the basis of race, creed, or gender. To help victims of workplace bias seek redress through the federal courts, the law created the Equal Opportunity Employment Commission. In 1970, Congress passed the Occupational Safety and Health Act, which set standards for safe work environments, protecting employees from hazardous materials, noise, machinery, temperature, or unsanitary conditions.

Though its support is often forgotten, the AFL-CIO lobbied hard for all these laws, occasionally over the objections of more conservative affiliates and their members.

By the end of the twentieth century, workers found their once-strong legal position under political assault. By filling the federal courts and administrative agencies with officials hostile to unions, Republican presidents like Ronald Reagan successfully vitiated the Wagner Act without amending it legislatively. Refusing to defend the right to join a union, the courts contributed to the decline of organized labor's share of the workforce. By contrast, employees actually gained new civil rights during this period. Despite business opposition, laws such as the Americans with Disabilities Act of 1990 and the Family and Medical Leave Act of 1993 retained the overwhelming support of both legislators and the public. It remains unclear, however, whether workers can retain these rights without a strong labor movement to lobby for their continuation.

LAWRENCE STRIKE (1912)

For nine weeks during the winter of 1912, more than 15,000 Lawrence, Massachusetts, textile workers, most of them Southern and Eastern European immigrants, waged a spirited strike marked by creative mass tactics, cooperation among a dozen or more ethnic groups, determined activism by women militants, and assistance from the Industrial Workers of the World (IWW). Several thousand more stayed off the job but avoided strike activities. Often called the "Bread and Roses" strike, the walkout was the high point of the IWW's efforts among eastern factory workers and led to pay increases for workers throughout the New England textile industry.

Dominated by the worsted and cotton goods industries, Lawrence was a city of crowded tenement districts and huge factories. Southern and Eastern Europeans, who were an important part of New England's mill labor force, were especially numerous in Lawrence, where the textile industry had added 10,000 jobs since 1905. The strike highlighted Lawrence's ethnic fault line. Most strikers were Southern and Eastern European immigrants and Franco-Belgians, with important support among the Germans. The largest groups were Italians, Poles, Lithuanians, and Syrians (Lebanese). There were smaller groups of Jewish, Armenian, Russian, Lettish, and Portuguese strikers, along with a scattering from other ethnicities. Despite the strikers' overtures, relatively few Irish, French-Canadian, English, or Yankee workers backed the strike committee.

The strike was sparked by a state law cutting the workweek for women and minors from 56 to 54 hours effective January 1. Because of the integration of men's and women's jobs, nearly every worker was placed on the 54-hour schedule. The owners' refusal to adjust pay rates to maintain take-home pay triggered the walkout, which was fueled by underlying discontent over working conditions. IWW Local 20, a tiny 300-member organization, was the key reason Lawrence was the only Massachusetts mill town where a major strike erupted over this statewide issue. By pressing mill officials about their plans and agitating on the job and in the neighborhoods, Local 20 activists built a loose strike movement. On January 10,

LAWRENCE STRIKE (1912)

Strike in Lawrence, Massachusetts, with many children posed on sidewalk. Library of Congress, Prints & Photographs Division [LC-USZ62-98168].

they convened a meeting of 1,000 Italians, who voted to strike unless they received their full wages. The next day, 300 weavers, mostly Polish women, struck the Everett Mill because their pay envelopes were short two hours' wages. On January 12, after paymasters distributed wages at the big mills along the Merrimack River, strikers ran down the aisles pressuring others to join them and spread the walkout by marching from mill to mill.

The national IWW had no role in the prestrike agitation; but once workers had walked off the job, the strikers sent for an IWW organizer, Joe Ettor, who helped them co-ordinate their efforts. An engaging speaker, Ettor encouraged the strikers by connecting local events to a broader social analysis and insisting that they would win because the owners could not "weave cloth with bayonets." With his assistance, the strikers refined their structure, which already included a multi-ethnic strike committee, set up relief and publicity subcommittees, and mobilized mass demonstrations. The strikers adopted demands that included a 15% pay hike, double time for overtime, elimination of the premium system under which some workers had to meet monthlong production or attendance standards to receive their full pay, and no discrimination against strikers.

After Ettor's arrest in late January, William D. ("Big Bill") Haywood became the IWW's lead organizer. Elizabeth Gurley Flynn also played an active role in the strike, working closely with women strikers, helping evacuate strikers' children, and assisting

with outreach. The IWW did not control the strike, but the strikers listened carefully to the organizers' advice. As many as 10,000 joined Local 20 before the strike's end.

The strikers promoted participation through mass meetings, parades, and open strike committee meetings. Carrying American flags and singing the "Internationale" and the "Marseillaise," thousands followed local Italian, Syrian, and Franco-Belgian bands in huge parades that wound through the tenement districts and the main business district. Hundreds packed daily strike committee meetings where delegates reported on developments in their communities and debated tactics and strategy. The strike's institutional core, however, was the committee's ethnic branches, which drew on individual groups' personal networks and institutional resources. Through these branches, strikers mobilized street actions, promoted solidarity, punished scabs, administered relief, reached out to fellow ethnics in other cities, and voted on policies proposed by the strike committee.

The strikers faced stiff opposition from civic leaders, the militia, and the American Federation of Labor (AFL), as well the mill owners. Despite their ambivalence toward the mills, municipal leaders like Mayor Michael Scanlon worried about the social order. In particular, they distrusted new-immigrant-led mass protests. In mid-January, a prominent local undertaker, John Breen, planted dynamite at a Syrian strike supporter's laundry and at a cobbler's shop next to the print shop where Ettor received his mail.

Only Breen's transparent bungling betrayed this scheme to smear the strikers and jail Ettor. Most local AFL leaders also opposed the strike. Although the AFL's United Textile Workers of America (UTWA) had few members in Lawrence, its hostility to the walkout re-inforced this opposition. Motivated by organizational jealousy and antiradicalism, the UTWA's national president, John Golden, denounced the strike, tried to undermine relief efforts, and supported a back-to-work drive.

Local officers and out-of-town police challenged the strikers, and the militia sealed off the main mill district. After two weeks, the authorities stepped up the pressure. On January 29, marchers attacked trolleys carrying strikebreakers. The police and militia monitored the confrontations but did not interfere. In response, Governor Eugene Foss sent more troops. That evening, a striker, Annie LoPizzo was shot to death when police broke up a street demonstration. Police quickly arrested Ettor and the Italian Socialist Federation leader Arturo Giovannitti, who they feared would replace Ettor. Although the two were speaking elsewhere in town when LoPizzo was shot, the authorities charged them with creating a violent climate that caused her death. Several weeks later, the police arrested the striker Joe Caruso as a third accessory. All three faced possible death sentences. Besides the arrests, Colonel Leroy Sweetser, who directed the militia's efforts, banned strike meetings on the Lawrence Common and ordered mounted troops and infantry to patrol city streets, including the tenement districts. On January 30, John Ramey, a teenage Syrian mill worker, died from a bayonet wound in the back.

Women's Strike Activism

To avoid more bloodshed, the strike committee suspended mass demonstrations for two weeks. When large protests resumed, women took the lead. Although underrepresented on the strike committee and bargaining team, they played a central role in the strike. Nearly every Southern and Eastern European woman had a direct stake in the strike, either working in the mills or running her household with mill earnings from boarders and family members. Strikers' wives, mothers, sisters, and daughters joined together with women operatives, who composed roughly 40% of the strikers. Women's militancy was hardly unique to Lawrence, but their high-profile involvement both as strikers and strike supporters and their sustained, large-scale participation set Lawrence apart. Like men, they drew on gendered social

networks of daily life to mobilize demonstrations, administer relief, and promote the strike in their neighborhoods.

Effective relief work was crucial to maintaining the strike. The IWW and strikers raised over \$72,000 through labor, radical, and ethnic networks across the Northeast and Midwest. Working through ethnic subcommittees, strikers and their families investigated needs, distributed relief goods, and ran soup kitchens. The strike committee evacuated more than 250 children to other cities. The IWW and out-of-town supporters made careful preparations, investigating prospective foster homes, giving physical examinations to the children, and requiring signed permission from the children's parents. On February 11, 119 children left for New York. In the following weeks, others left for New York; Hoboken; Philadelphia; Barre, Vermont; and Manchester, New Hampshire. The evacuations, which eased parents' concerns and provided valuable publicity for the strikers, outraged municipal leaders. Besides strengthening the strike, the departures portrayed Lawrence as a grim city with ill-clothed, malnourished children. On February 24, police clubbed and arrested women trying to put their children on a train. The authorities then charged several mothers with child neglect. The depot incident backfired, prompting a U.S. House Rules Committee hearing in Washington, DC, where young strikers presented dramatic testimony about their jobs and living conditions.

Continued mass picketing, publicity from the Washington hearing, and congressional threats to investigate the woolen tariff cracked the owners' determination. With American Woolen, the largest employer, wavering, the owners tried to establish the framework for a citywide settlement with minimal concessions at the Arlington Mill, a corporation that employed relatively large numbers of English and Irish workers. When the strikers defeated this back-to-work maneuver, American Woolen offered to negotiate. Convinced that an agreement with the largest employer would set the terms for every mill, the strike committee dropped its insistence on citywide negotiations and sent a nine-member committee to bargain with American Woolen officials. These were the first negotiations between the mills and the strike committee. On March 13, the strikers ratified the American Woolen agreement that included a 5% raise for pieceworkers; a 5% to 22% increase for those paid by the hour, with the highest raise for the lowest-paid workers; a two-week premium period; time and one quarter for overtime; and a no-discrimination pledge. The other mills granted similar terms, although several refused a formal agreement with the strikers. On Monday, March 18, the strikers resumed work.

LAWRENCE STRIKE (1912)

After the settlement, unrest swept New England's textile industry. Workers in Barre, Vermont, and in Lowell and other Massachusetts mill towns transformed Lawrence strike support work into agitation for their own raises. Once they struck, operatives called in the IWW. In April, the Lowell showdown prompted New England mill owners to declare a regionwide 10% raise that benefited over 125,000 textile workers.

Lawrence workers and managers continued to struggle over poststrike power relations. Walkouts erupted over discrimination and working conditions. Despite some gains, workers often found themselves outmatched as the owners resisted demands from one department or ethnic group. Local 20 members were unable to wage constant strikes or to focus their full strength on narrow demands involving limited numbers of workers.

During the summer and early fall, the movement to free Ettor, Giovannitti, and Caruso grew into an energetic campaign with huge demonstrations, ambitious speaking tours, extensive publicity, and threats of a general strike. This activism mobilized support across the United States and sparked large European protests. In November, jurors acquitted the three prisoners. By then, the defense campaign had become entangled with Local 20's fate and Lawrence civic leaders' battle against the IWW.

Frustrated by shop-floor conditions and swayed by calls for a general strike to save the prisoners, Italians as well as some Poles struck several mills on September 26–28. To gain control over the agitation, Local 20 called a one-day citywide mill strike for September 30, the first day of the trial. The divisive strike left Local 20 ill-prepared for the mills' counteroffensive, which included an aggressive blacklist.

The September turmoil also provided an opening for municipal leaders. Seizing on the "No God, No Master" slogan on a sign carried by out-of-towners at an Ettor-Giovannitti-Caruso demonstration, Mayor Scanlon and Father James O'Reilly, the dean of Lawrence's Catholic clergy, launched an anti-IWW "God and Country" campaign. With a Columbus Day parade by over 25,000 as its high point, the campaign combined boosterism, nationalism, inflammatory anti-IWW rhetoric, and intimidation. In this volatile atmosphere, Jonas Smolskas, a Lithuanian mill worker, was killed in a fight provoked by his IWW button. Although the God and Country campaign had limited appeal to former strikers, it became the template for municipal leaders' future efforts to quell labor militancy and their struggle to stigmatize the 1912 strike as an affront to Lawrence and to the nation.

Unable to counter the owners' power on the job, Local 20 unraveled. Lawrence workers abandoned

the IWW, but the 1912 strike left its mark on local labor activism. During the next decade, Lawrence workers drew on their 1912 experiences as they mobilized strikes that eliminated the premium system (1918), won the 48-hour week for 54 hours' pay (1919), and blocked a 20% pay cut (1922).

LEAGUE FOR INDUSTRIAL DEMOCRACY (LID)

The League for Industrial Democracy (LID), an educational group devoted to the ideals of social democracy and trade unionism, began its existence as the Intercollegiate Socialist Society (ISS), founded in New York City on September 12, 1905. The socialist novelist Upton Sinclair had drafted a call for a meeting to found a group for the "purpose of promoting an intelligent interest in Socialism among college men and women." At the founding meeting of the ISS, Sinclair complained that in his own years as a college student, none of his professors had ever discussed "proposals to eliminate poverty and social injustices." Accordingly, he decided that "since the professors would not educate the students, it was up to the students to educate the professors." Sinclair was just a few days short of his twenty-seventh birthday when he chaired the meeting, and he was by no means the oldest person present. The group was not intended to be restricted to currently enrolled

college students; any college graduate who supported its aims could join.

Only a tiny percentage of Americans enjoyed the privilege of higher education in the early twentieth century, and college and university students had traditionally been as conservative as their professors. The creation of the ISS, which would grow within little over a decade to include roughly a thousand members at 70-odd campus chapters, thus represented an important turning point in the history of campus politics and the American Left as the first national organization of radically inclined students.

The years leading up to the First World War were heady times for American radicals, on and off campus. The Socialist Party grew to over a 100,000 members, and its presidential candidate, Eugene Debs, attracted a million votes in the 1912 election. The ISS recruits included many students who would later make their mark on American politics. Walter Lippmann, perhaps the most influential political journalist of the mid-twentieth century, founded the Harvard University chapter in 1910. The ISS began publishing a quarterly journal, *Intercollegiate Socialist*, in 1913, and sponsored speaking tours and conferences that were attended by many students. John Reed, a member of the ISS Harvard chapter, who would later gain fame as author of *Ten Days That Shook the World*, an account of the 1917 Bolshevik Revolution in Russia, would write that the ISS's impact upon prewar campuses "was potent":

All over the place radicals sprang up.... The more serious college papers took a socialistic, or at least a progressive tinge.... It made me, and many others, realize that there was something going on in the dull outside world more thrilling than college activities.

Harry W. Laidler, a junior at Wesleyan University when he attended the founding meeting of the ISS in 1905, became the group's executive director in 1910; he would define the organization's purpose as "primarily a study, not a political propagandist organization." (Laidler remained in the leadership of the ISS, and its successor organization, for an astonishing five decades.) But it was not going to prove easy to separate the intellectual fortunes of the ISS from the political fortunes of the broader radical movement.

American entry into the First World War in 1917 took the bloom of the socialist rose. The Socialist Party and other radical groups like the Industrial Workers of the World (IWW) came under official attack for opposing the war; radical leaders were imprisoned, and radical publications banned from the mails. College and university campuses were as intolerant as the larger society; antiwar professors

lost their jobs, and the ISS shriveled. By 1920, few ISS chapters survived outside of New York City.

In 1921, the Intercollegiate Socialist Society changed its name to the League for Industrial Democracy (LID). By dropping the reference to socialism, the new name was intended to be more inclusive and less inflammatory. The change also reflected a shift in organizational perspective. The LID would increasingly function as a kind of think tank for trade unions under socialist or social democratic leadership.

Although Harry Laidler had defined the ISS and the LID's mission as primarily educational, the organization and its supporters played an increasingly activist role in the 1920s. In the early years of the decade, the LID encouraged the creation of the nationally organized Farmer Labor Party, and in 1924, it endorsed the independent presidential campaign of Robert M. La Follette. Despite the LID's efforts, the 1920s would not prove a propitious decade for any group that challenged the status quo from the left. Corporate-sponsored "welfare capitalism" schemes attracted far more attention from the general public than the League's advocacy of a worker-controlled "industrial democracy."

However, the onset of the Great Depression in the 1930s seemed to vindicate the LID's criticisms of capitalism, and the group's influence spread. In 1932, it organized a formal student affiliate, the Intercollegiate League for Industrial Democracy, in part to compete with the Communist-led National Student League (NSL). Chapters of the group were founded on over a hundred campuses, enrolling several thousand members who were active in backing Norman Thomas's presidential campaign on the Socialist ticket in 1932. In 1934, the LID's student affiliate adopted a new name, the Student League for Industrial Democracy (SLID). Meanwhile, the parent organization was also growing. LID's speakers were in demand in union halls as well as on college campuses, and the group's pamphlets circulated widely. Adopting a new form of communication, the LID sponsored a series of talks on current affairs on the NBC radio network.

In addition to its educational work, the LID plunged into social and political activism. The group published a magazine titled *The Unemployed* to spur the demand for unemployment insurance. LID members played a significant role in the revival of the labor movement in the 1930s; a Detroit LID member named Walter Reuther, for example, would make a name for himself in his efforts to organize an industrial union in the traditionally open-shop auto industry. The LID was also active in defending the civil liberties of workers and radicals, founding a legal defense group called the Workers Defense League (WDL).

But in the second half of the 1930s, the LID, like the Socialist Party, faltered. To the dismay of LID elders, its student affiliate SLID and the Communist-led NSL merged in 1935 to form the American Student Union (ASU). The Communists exercised effective control over the ASU until the group collapsed in disarray after the signing of the Nazi-Soviet Pact. Factional battles within the Socialist Party spilled over into and damaged the LID. And many LIDers disagreed with Norman Thomas's opposition to U.S. entry into World War II, leading Thomas to resign as LID's codirector.

In the aftermath of World War II, the LID shed much of its residual anticapitalist sentiments, supporting policies of liberal reformism at home, and anti-Communism abroad. Apart from reviving SLID in 1945 as a campus affiliate, the group undertook few new initiatives in the 1940s and 1950s. The LID was on its way to becoming an ideological retirement home for lapsed radicals, kept alive by the charity of a few leaders of the garment workers unions who retained a sentimental attachment to the socialist ideals of their youth.

Two political developments led to a brief revival in the LID's fortunes in the 1960s. One was the merger of a left-wing splinter group led by the former Trotskyist Max Shachtman with Thomas's Socialist Party at the end of the 1950s. The "Shachtmanites" included a number of talented and energetic young activists like Michael Harrington (soon to gain fame as the author of *The Other America*, the book that helped spark the "War on Poverty"). The Shachtmanites concentrated their political efforts within the LID, and in 1964, Harrington was elected the chair of the group. Writing in the *New York Post*, the journalist James Wechsler celebrated Harrington's new appointment and predicted that as a leader of the LID, he would emerge as a unifier of "the scattered legions among the liberal intellectual community, the civil rights activists and the more enlightened sectors of organized labor."

The other important development was the transformation of the largely moribund SLID into a new group called the Students for a Democratic Society (SDS) between 1960 and 1962. The SDS would soon emerge as the center of the New Left, a radical movement destined to have an enormous impact on American campuses in the 1960s.

But for a third time in the twentieth century, the LID's seemingly bright prospects proved chimerical. The "scattered legions" of American liberalism would end the 1960s even more scattered as a result of conflicts over the Vietnam War and American race relations. The SDS split with the LID in 1965, after a series of bruising generational confrontations, most

famously the battle at the SDS's founding convention between Tom Hayden and Michael Harrington over the issue of anti-Communism. Harrington found himself in the unenviable position of being attacked from his left by youthful radicals like Hayden, and from his right by his former comrades among the Shachtmanites, who were increasingly adopting a neoconservative worldview. By the end of the 1960s, he had been marginalized within the LID leadership, and resigned soon afterward. Although showing few signs of life after Harrington's resignation, the LID survived for the remainder of the twentieth century and into the start of the next century, as a front organization for the Shachtmanite-controlled Social Democrats, USA.

LEAGUE OF REVOLUTIONARY BLACK WORKERS

The League of Revolutionary Black Workers was founded in Detroit by a coalition of radical black autoworkers, students, and intellectuals in the early months of 1969. It was designed to serve as a coordinating body for numerous black revolutionary union movements that black workers had developed in the auto plants of Detroit in 1968. The League openly expressed a Marxist-Leninist orientation and focused its organizational efforts solely on black workers. The League contended that black autoworkers occupied a strategic position within the capitalist economy and should therefore be the primary focus of revolutionary struggle.

Detroit's black revolutionary union movement developed in the wake of the July 1967 uprising and was nurtured by a radical community that included prominent black Marxist writers C. L. R. James, James and Grace Lee Boggs, Uhruhu (a militant group of nationalist and socialist black students associated with Wayne State University), the Socialist Workers Party, and the Communist Party. In September 1967, caucuses of black autoworkers began meeting at Dodge Main (Hamtramck assembly plant) for discussions. Also that fall, *The Inner City Voice*, a radical black newspaper, began publication in Detroit. Its editors, John Watson, Ken Cockrel, and Mike Hamlin, would

later join with nine production workers from the Dodge Main plant in May 1968 to establish DRUM (Dodge Revolutionary Union Movement), the first of Detroit's black revolutionary unions. Founding members of the League included production workers Luke Tripp, General Baker, Chuck Wooten, Ernest Allen, and James Forman. The initial stimulus for the formation of DRUM was a spontaneous, interracial wildcat strike by 4,000 workers at Dodge Main on May 2, 1968. Chrysler responded by firing seven workers (five black, two white). Eventually, all but two (both black) were rehired. In the aftermath of the wildcat strike, DRUM began publishing a weekly newsletter and devoted its first issue to an assessment of the recent strike, which it argued was caused by a production speedup. In addition, the newsletter decried the unfair punishment administered to the striking black workers and accused Chrysler of racist labor policies.

After a series of more DRUM-inspired wildcat strikes, fund-raising, and a public attack on the Detroit chapter of the Urban League, the revolutionary union movement spread to other Chrysler plants, resulting in the creation of FRUM (Ford Revolutionary Union Movement) and ELRUM (Eldon Avenue Revolutionary Union Movement). As the black revolutionary union model spread throughout Detroit and the nation, the League of Revolutionary Black Workers was created in an effort to provide direction and coordination for the individual affiliates. The League briefly published its own circular titled *Spear*, but *The Inner City Voice* soon became the League's official newspaper. The League consistently demanded an increase in the number of black people employed at all levels of the auto industry, lobbied to get black workers' union dues channeled into the local black community for self-determination, and called for equal pay for black workers at Chrysler plants in South Africa.

Throughout its five-year existence, the League of Revolutionary Black Workers had a contentious relationship with the United Auto Workers International and Local 3. The League accused the UAW leadership of assisting Chrysler management in the maintenance of a racist system by failing to respond to black workers' complaints. The UAW and Local 3 considered DRUM a threat from its beginning. The UAW argued that DRUM would split the Dodge workers, rendering their union ineffective, and criticized the DRUM newsletter as extremist and hateful. Moreover, the League assailed the UAW for endorsing an annual Detroit police field day. Since the Detroit Police Department was widely criticized by the local black community for racist and brutal policing, the UAW's support for the Detroit police seemed

especially galling. The UAW's endorsement of the police field day was seen by many in the League as proof of an alliance between the UAW and the police department. The League intensified its confrontation with the UAW by calling for a demonstration and march on a UAW convention being held at Cobo Hall in Detroit on November 8 and 9, 1969. The League demanded that the purpose of the convention be changed to consider a complete restructuring of the UAW to a model that better reflected the needs of black autoworkers. The UAW chose to end the convention early to avoid an embarrassing racial confrontation.

The League made several attempts to gain control of local unions by running League candidates in official union elections. League members hoped that taking part in union electoral politics would lend them legitimacy in the eyes of nonaligned black workers, demonstrate black solidarity, raise worker consciousness, and ultimately increase League membership. Amid a massive turnout by retired white UAW members and accusations that local police assisted the UAW by suppressing the League's election-day carpooling efforts, the League of Revolutionary Black Workers failed to get any League members elected to a union office.

The pressures of national growth and intense internal dissension resulted in an organizational split in June 1971. The disagreements that contributed to the division included ideological differences concerning nationalist or class-based consciousness, cooperation with white radicals, whether the League's struggle should be national in scope or more local, and whether its focus should expand to include sexism and imperialism. Three of the League's seven executive board members left the League to work for the Black Workers' Congress, a national black Marxist-Leninist group. The various factions eventually decided that the League would be an affiliate of the Black Workers' Congress along with other worker organizations and student and community groups. But the intense debate exposed irresolvable tensions. Both organizations continued to exist in Detroit for a brief time. However, ideological tensions gave way to personal hostility and a battle over the League's Black Star Publishing company, Black Star Productions, and Black Star bookstore brought organizational activities to a minimum as the League gradually faded away. Many League members went on to join various other labor and political organizations.

Despite its ultimate demise, many Detroit observers credit the League of Revolutionary Black Workers for a significant increase in the amount of black foremen and union stewards in Detroit. The League's activities are often recognized as having resulted in

relatively safer and cleaner work environments. The League was also successful in establishing its own printing and film production facilities, which resulted in the production of numerous newsletters, a book on political theory, and a documentary film of the League's history titled *Finally Got the News*. In addition, several League members were actively involved in the Detroit chapter of the Black Panther Party.

LEGETT, WILLIAM (1801–1839) Labor Activist and Abolitionist

Born in 1801, William Leggett was a writer, journalist, and Democratic Party activist who advocated prolabor and antislavery positions through his editorials and the "Locofoco" wing of the New York Jacksonian Democracy. Born in Savannah, Georgia, Leggett grew up in New York City. After a truncated course of study at Georgetown College and an 1819 stay with his parents on the Illinois frontier, in 1822, Leggett entered the Navy as a midshipman, but was court-martialed for insubordination after four years at sea under the brutal and often arbitrary disciplinary regime typical of the British and American navies. He soon published two volumes of maritime poetry as well as quite a few short stories regarding the sea and the frontier life he had seen in Illinois, all of which earned him some renown. Foreshadowing his future political views, his fiction often condemned abusive ship captains, and one story set forth a sympathetic portrayal of a free black on the frontier. In 1829, after 10 months of editing his own literary journal, the *Critic*, he joined William Cullen Bryant's *New York Evening Post* as a part-owner and literary critic, eventually editing the paper himself for 16 months in 1834 and 1835. Leggett left the *Post* in late 1836 and edited two journals, the *Plaindealer* and the *Examiner*, until both failed toward the end of 1837. Leggett's main contributions to the history

of American labor lie in his intellectual leadership of the Locofoco wing of the New York Democracy, his opposition to government preferences and monopoly, his support of labor organizing and the right to strike, and his advocacy of abolition and universal manhood suffrage for blacks. In 1839, soon after being appointed by President Van Buren as diplomatic agent to Guatemala, Leggett died before his voyage to Central America.

Although he proclaimed a lack of interest in politics when he began at the *Post*, Leggett proved a quick student of Bryant's Jacksonian Democratic views. From June 1834 to October 1835, while Bryant was traveling in Europe, Leggett assumed the editorship of the *Evening Post* and wrote many of the fiery editorials upon which his reputation is based. Those editorials, however, so antagonized key advertisers and Democratic Party officials that the *Post* approached financial ruin, hastening Bryant's return to America and Leggett's eventual departure.

Leggett argued that the principle of "equal rights," derived from Thomas Jefferson, and the principle of "free trade," derived from classical political economy, should be the guiding precepts of the Jacksonian Democracy. Leggett was an ardent opponent of the "Money Power," that interlocking constellation of banks, merchants, and capitalists that derived their wealth from the labor of the farmer and urban worker, because it violated both equal rights and free trade. Leggett was particularly suspicious of government action that violated these principles by distributing benefits to some and not to others, and sounded this theme of "antimonopoly" throughout his career. In Leggett's able hands, these ideas became potent weapons against wealth and privilege, and he wrote blistering editorials on numerous subjects, including banking, the rights of labor, and abolition of slavery.

The bank issue was a prime exemplar of Leggett's equal rights and free trade philosophy. Supportive of Andrew Jackson's veto of the Bank Bill, Leggett opposed state-chartered banks as well, while most Jacksonian Democrats supported the so-called pet banks where the Jackson administration deposited federal funds. On this question, Leggett applied the same critique of federal monopoly charters to state monopoly charters. Leggett argued that legislatively granted bank charters were available only to the wealthy and politically influential, and hence violated the principles of equal rights and free trade just as the Bank of the United States had done. Rarely one to criticize without offering an alternative, Leggett became a prime exponent of general incorporation laws to make the process of incorporating a matter of complying with statutorily prescribed conditions

open to all. Such statutes were passed throughout the Union in the decades after Leggett's death.

Of course, the bank issue was not simply or solely of interest to antimonopoly ideologists. Small-scale artisans and others in the "laboring classes" had long argued that the banking system was rigged to hold down the honest mechanic by limiting access to capital to those with wealth or political connections. Further, employers paid wage laborers not in hard specie, but in bank notes that often proved to be fraudulent or worthless. Thus, the bank issue was a labor issue. On other labor issues as well, Leggett was very supportive of the nascent American labor movement. Leggett condemned the doctrine of labor conspiracy, which held the organization of labor unions to be a criminal act, and he supported the right of workers not only to organize but to engage in strikes as well, though he believed strikes to be, for the most part, an ill-advised attempt to get around the laws of free trade.

Indeed, when labor activists seemed to violate the principle of free trade directly, Leggett parted company with them. Leggett had only harsh words regarding the flour riot of 1837, when a large crowd, believing that several flour merchants were holding large stores of flour from the market during that hungry winter of high bread prices, stormed their warehouses and made off with the flour. To Leggett, the flour riot was an inexcusable violation of the principle of free trade. Carrying these principles to their logical conclusion as usual, Leggett subsequently opposed legislation to compensate the flour merchants for their losses, because that would improperly involve the government in insuring the property of merchants but not of others.

It was on the issue of slavery that Leggett most raised the ire of mainstream Jacksonian Democrats. By the mid-1830s, several slave states had passed legislation banning abolitionist literature from their mails, and antiabolition riots occurred in various cities, including New York. Though critical of these attempts to restrict the flow of ideas and use violence against abolitionists, Leggett initially opposed abolition on the ground that it would create ruinous competition for white wage workers. Over time, however, Leggett found it impossible to reconcile his beliefs in equal rights and free trade with the forcible compulsion of labor inherent to the peculiar institution, and he joined the abolitionist cause. Unlike some abolitionists, moreover, Leggett favored not only the end of slavery, but equal political rights for blacks (and women) as well. For these apostasies, he was denied a Democratic nomination to Congress in 1838.

Leggett's intellectual leadership of the Locofoco wing of the New York Democratic Party represented a chance to put his equal rights and free trade

principles into action. Originating during the state banking fights of 1835, the Locofocos advocated measures to ease the burdens of debt on the laboring classes and found their ideological leader and guiding light in Leggett, whose principles of equal rights and free trade became their own. In the Locofocos, the emerging labor movement found, for the first time, a sympathetic ear within the political party system, though a minority one at that.

Though his equation of equal rights and free trade would become increasingly difficult to sustain in the decades after his death, William Leggett's contribution to the labor movement was substantial. Along with George Henry Evans and a few others, he was among the first to present a critique of slavery rooted, at least in part, in labor ideas, and his advocacy of equal rights for blacks and women was certainly quite progressive for his day. His use of the antimonopoly tradition to serve labor's cause continued to resonate throughout the nineteenth century. Perhaps most important, Leggett saw that the labor movement, even in its earliest days, was a political force to be reckoned with by the major parties.

LEMLICH, CLARA SHAVELSON (1886–1982)

Clara Lemlich Shavelson (1886–1982) is best known as a leader of the *fabrente Yidishe meydlekh*, the fiery Jewish immigrant girls, whose militancy and dedication to the ideal of bread and roses helped

to galvanize the early twentieth-century U.S. labor movement. In 1909, the young shirtwaist maker delivered an impassioned speech in Yiddish at New York's Cooper Union that sparked an "uprising" of 30,000 garment workers—most of whom were East European Jewish immigrant girls between the ages of 15 and 25. The strike, which was the largest strike by women in the United States to that time, paralyzed New York's garment industry and set off a decade of labor militancy by garment workers across the country. Lemlich's role as the catalyst for the 1909 strike ensured her place as a bit player in histories of the early twentieth-century labor movement, East European Jewish immigration, and women's militancy before the 1960s. Lemlich even had a walk-on in the 1986 Broadway hit *I'm Not Rappaport* as the symbol of an idealistic generation of immigrants whose values had been abandoned in the materialistic frenzy of the 1980s.

While these mentions of Lemlich made her into an icon for her generation of immigrant women, telescoping her long activist career into one cameo appearance oversimplifies her complex legacy. Suffragist, communist, community organizer, and peace activist, Clara Lemlich Shavelson was active in revolutionary and left-wing politics from her teen years in the Ukraine until her last years in a California nursing home, where she helped organize the orderlies into a union and convinced the home administrators to honor the United Farm Workers' grape and lettuce boycott. She was also a dedicated promoter of Yiddish culture, cofounder and longtime member of the Emma Lazarus Federation of Jewish Women's Clubs, birth mother to three children who carried on her tradition of radical activism, and political mother to a generation of Jewish radical activists who came of age in the 1930s and modeled themselves on her example.

Lemlich was born in 1886 in Gorodok, Ukraine, to deeply religious Jewish parents. Like most girls in late nineteenth-century East European Jewish villages, she was taught to read and write Yiddish but was offered no further Jewish schooling. Breaking from the tradition of many of their Jewish neighbors—who distrusted everything associated with the Russian authorities—Lemlich's parents allowed her to attend the local Russian-language public school. When Clara was denied admission to Gorodok's only public school because she was a Jew, her parents reacted angrily, banning Russian language, books, and music from their home. Already a rebel, the young Lemlich refused to abide by her parents' prohibition. She had amassed quite a collection by the time her father found and burned her secret library of Russian classics. Undaunted, Lemlich began collecting again

and, now in her teens, she read and collected revolutionary texts by Lenin, Trotsky, and Marx, among others. By the age of 17, Lemlich was a committed socialist. She would remain so for the rest of her life. The violent Kishinev pogrom of 1903 convinced Lemlich's parents that the time had come to leave the Ukraine. The family moved to New York in 1905.

A highly skilled dressmaker, young Clara quickly found work in a Lower East Side garment shop. It took her little time to begin organizing her fellow workers to protest conditions that, she said, reduced human beings to the status of machines. Clara accepted the tutelage of older workers in the fundamentals of trade unionism, but she firmly rejected their insistence that women and unskilled workers could not be organized. Lemlich organized a series of strikes in garment shops around New York between 1907 and 1909, laying the groundwork for a general strike to improve wages, hours, and conditions in the shirt and dress trades. Despite the warnings of Samuel Gompers (the first president of the American Federation of Labor—AFL) and middle-class reformers in the Women's Trade Union League that young women workers could not sustain a general strike, Lemlich called on her fellow shirtwaist makers and dressmakers to attend a meeting in the Great Hall of the People at New York's Cooper Union in November 1909. After a series of labor leaders urged caution, Lemlich jumped on the stage and began exhorting the crowd of young women workers in Yiddish. "I am one of those who suffers from the abuses described here, and I move that we go on a general strike," she shouted. The New York garment uprising that followed sparked similar strikes in Philadelphia, Cleveland, Chicago, Iowa, and Kalamazoo, Michigan, resulting in an unprecedented 40% of women garment workers organized into unions by 1919.

After the 1909 strike, Lemlich was blacklisted from the garment trades. For a few years she channeled her considerable energies into suffrage activism, helping to found and sustain the Wage Earner's League for Woman Suffrage. Here again, Lemlich's uncompromising and fiery nature got her in trouble, this time with the historian Mary Beard, who controlled funds earmarked by more affluent suffragists to pay a working-class suffrage organizer. Beard fired Lemlich in 1912 for refusing to moderate her radical politics to suit the vision of cross-class sisterhood espoused by middle-class women reformers.

Retiring briefly into the role of wife and mother, Lemlich married the printer's union activist Joe Shavelson in 1913 and moved to the Brooklyn immigrant neighborhood of Brownsville, where she gave birth to three children: Irving, Martha, and Rita. Almost immediately, Clara Shavelson began organizing

wives and mothers around the primary issues affecting their workplace—the cost of food and housing. She organized kosher meat boycotts in 1917 to protest price increases in staple foods. After World War I, she led a rent strike movement that swept New York's immigrant neighborhoods, when a postwar housing shortage dramatically raised the cost of housing and inflation threatened the hard-won working-class standard of living.

In 1926, Shavelson joined the Communist Party USA and immediately began pushing its leaders to organize not only on the shop floor but in the sphere of working-class housewives—neighborhood markets, parks, and kitchens. That same year, Lemlich founded the United Council of Working Class Housewives (UCWCH). Like a women's union auxiliary, the UCWCH provided aid to striking workers by raising funds, opening community kitchens, and establishing collective child-care arrangements so that women workers could walk the picket lines.

The limits of such work quickly became clear, and in 1929, Shavelson and her neighbor Rose Nelson organized the United Council of Working-Class Women (UCWW) to organize around women's unpaid labor in the home. Shavelson and Nelson insisted that consumption was inextricably linked to production, making the working-class housewife as important a part of the class struggle as were her wage-earning husband, sons, and daughters. Through the UCWW, Shavelson led rent strikes; anti-eviction demonstrations; meat, bread, and milk boycotts; sit-ins and marches on Washington calling for controls on the costs of housing and staple foods, and the construction of more public housing and of more public schools. Over the next few years, she built a national working-class housewives movement. The UCWW changed its name to the Progressive Women's Councils and forged coalitions with a wide range of progressive women's groups, mothers' leagues, neighborhood groups, and union auxiliaries to protest "the high cost of living." In 1935, Shavelson and Nelson led a nationwide meat boycott that shut down 4,500 butcher shops in New York City alone. Though the strike began in Jewish and African-American neighborhoods in New York, it spread to Chicago, Detroit, Los Angeles, Minneapolis, Cleveland, St. Louis, and Seattle, soon involving women of many racial, religious, and ethnic backgrounds. The 1930s housewives' coalition alleviated the worst effects of the Depression in many working-class communities by bringing down food prices and rent and utility costs; preventing evictions; and spurring the construction of more public schools, housing, and parks.

After World War II, housewife organizers conducted two more nationwide meat boycotts, and led

annual marches on Washington to lobby elected officials on matters of concern to working-class housewives. Through her decades of community organizing, Shavelson and the housewives' organizations she organized and spurred to action convinced many municipalities to pass rent-control laws. The housewives' movement increased support in Congress for federally funded public housing. It also paved the way for the modern tenants' and consumer movements. Finally, Shavelson and the housewife activists she inspired brought gender politics into union and working-class homes, illuminating previously hidden power relations between husbands and wives, parents and children. Long before the 1960s women's movement, Shavelson knew and made sure that other working-class activists understood that the personal was deeply political.

Shavelson returned to the garment shop floor in 1944, when her husband Joe became too ill to continue working. She quickly became active in a range of union causes, serving on the American Committee to Survey Trade Union Conditions in Europe. As an organizer for the American League Against War and Fascism, she spoke regularly against nuclear weapons and the intensifying arms race. Her passport was revoked after a visit to the Soviet Union in 1949. In 1951, the year her husband, Joe, died, Shavelson was subpoenaed to testify before the House Committee on Un-American Activities. Her husband had been under investigation before his death. Her son remained the subject of FBI surveillance for the next two decades. Government harassment did not silence Shavelson, however. Shavelson maintained a vigil in front of the Foley Square Courthouse and later in Washington, DC to protest the arrest, trial, and execution of famed "atom spies" Julius and Ethel Rosenberg. She also actively protested the U.S. role in the 1954 coup in Guatemala that overthrew democratically elected President Jacobo Arbenz Guzman. Her daughter Martha recalls Shavelson's courage in the face of government harassment during the 1950s. "Others burned books from their own shelves," Martha remembers. "Not Clara." She grew more stubborn and more certain. In 1954, when Shavelson retired from the International Ladies' Garment Workers' Union (ILGWU), the unrepentant radical was denied a pension on a technicality. After a long battle, she was awarded two honorary stipends by the ILGWU president, David Dubinsky, but she never did receive the pension she had earned from the union she helped to found—and which hailed her as a pioneer on every major anniversary.

Nine years after the death of her husband, Shavelson fell in love again and married an old labor movement acquaintance named Abraham Goldman.

She lived with him until his death in 1967. At age 81, beginning to suffer from Alzheimer's, Shavelson moved into the Jewish Home for the Aged in Los Angeles. While the home was located in Boyle Heights, Shavelson enjoyed a wide circle of friends among the area's Jewish radical community. When the home moved into the San Fernando Valley, she was cut off from her accustomed political and ethnic atmosphere and began to withdraw into herself. Still, Shavelson remained feisty into her 90s, advising and helping to organize the home's orderlies into a union. She also shamed the home's administrators into honoring the United Farm Workers' boycott of nonunion grapes and lettuce by reminding them how many of the home's residents were former union activists themselves. Even if they no longer understood, she insisted, they would be very upset to know they were eating "scab" grapes and lettuce. Shavelson died on July 12, 1982, at the age of 96.

Clara Shavelson was once described by her friend and political collaborator Rose Nelson as a "spark plug" who set off conflagrations wherever she was. Sparks and spark plugs are fitting metaphors for the life of this explosive woman revolutionary.

LEWIS, JOHN L. (1880–1969) Founder, Congress of Industrial Organizations

John Llewelyn Lewis served as the president of the United Mine Workers of America (UMWA) for four decades and was a founder and first president of the Congress of Industrial Organizations (CIO), from its origins in 1935 until 1940. During his tenure as a labor leader, he earned a contradictory reputation, both as an autocrat who repressed those who

challenged his authority in the UMWA and, later, as the militant voice for America's industrial working class during the massive CIO organizing drives of the New Deal era. Always controversial, Lewis later broke ranks with the CIO, became a strong opponent of President Franklin Roosevelt, and led coal miners during a series of national walkouts during World War II. Following the war, Lewis negotiated a groundbreaking pension and health-care system for union coal miners, but faded into obscurity as the coal industry and his union went into steep decline.

Early Career

Lewis, the son of Welsh immigrants, was born in 1880 in Iowa. While much of Lewis's early life remains sketchy, his family moved frequently, leaving the coalfields on at least one occasion. By the late 1890s, Lewis had followed his father underground, and he became the secretary of his local union in 1901. Lewis, however, had other ambitions. He managed the local opera house and performed in several productions. He ventured west from 1901 to 1905, where exactly and what he did remain a mystery. Lewis returned to Iowa and resumed work in the mines. He also ran unsuccessfully for local political office and failed in his efforts to establish a grain and feed business. Lewis married Myrta Edith Bell in 1907 and relocated with his extended family to the coal-mining town of Panama, Illinois.

Lewis soon rose to prominence in the UMWA in Illinois, where he caught the eye of the American Federation of Labor (AFL) president Samuel Gompers, who appointed him to various organizing posts and helped launch his career as a labor leader. Lewis continued his involvement in internal UMWA politics, however, and he remained a close ally of the then-president John P. White, who appointed him "international statistician" in 1917. Lewis soon became business manager of the *United Mine Workers Journal* and then vice president of the union after White resigned to take a post in the Wilson administration. Lewis quickly edged out the president, Frank Hayes, and became temporary head of the UMWA in 1919. The following year, Lewis won a bitter election to become the international president of the miners' union, a position he would hold until 1960.

Lewis spent his first decade as the president of the UMWA, consolidating his control over the union by eliminating his political rivals. Building on his victory in the UMWA, Lewis challenged Gompers for president of the AFL in 1921, presenting himself as a radical and more militant alternative. But Lewis was

soundly defeated at the AFL's national convention when opponents from within the UMWA openly opposed him. Lewis later had one of his UMWA lieutenants, William Green, named the AFL president after Gompers died in 1924. Lewis spent the rest of the decade running those who had opposed him in the 1921 election out of the miners' union, shrewdly pitting his more opportunistic opponents, like the Kansas militant Alex Howat and the Illinois leader Frank Farrington, against each other, isolating them, and using their own mistakes to eliminate them as political threats. Most of them were eventually expelled from the UMWA.

With his more principled opponents, like the Pennsylvania socialist John Brophy, Lewis often resorted to red-baiting to marginalize them within the UMWA. When that failed, he employed repressive tactics against his opponents. While Lewis became the best-known labor Republican in the 1920s, many of his specific political beliefs remained vague and ill-defined, perhaps because he had to contend with a substantial leftist challenge within his own union during his first decade as president. Brophy and many other UMWA activists supported mild efforts to nationalize the nation's coal industry, and the union had endorsed such proposals at some of its conventions. Lewis, a shrewd political operative, used their politics against them. He appointed Brophy and other leftists to a Nationalization Research Committee to study the issue. He then worked to undermine and demonize the committee, portraying the committee as the tool of outside liberal and socialistic interests bent on controlling the UMWA. When Brophy ran against Lewis for UMWA president in 1926, he faced the full wrath of the UMWA president's well-oiled political machine. Lewis closed the pages of the union's journal to Brophy, and then portrayed the District 2 president as a communist and socialist stooge. Lewis, in full control of the UMWA's electoral system, soundly defeated Brophy in the election. Like Lewis's less principled opponents, Brophy also found himself expelled from the UMWA.

Though Lewis emerged from the 1920s in full control of the UMWA, the union was just a shell of its former self. Throughout the 1920s, the coal operators mounted a concerted campaign to roll back union gains while nonunion companies continued to expand. The operators succeeded in banishing the UMWA from most of the southern and outlying districts in the years after World War I. The union's "Jacksonville Agreement," negotiated with federal help in 1924, sought to preserve wages and working conditions with large operators in the northern coalfields. The agreement proved unenforceable, and the companies that had signed it openly violated it. Without

federal support, UMWA membership declined from 400,000 to under 80,000 at the end of the 1920s, as the onset of the Great Depression ravaged the nation's coalfields. The economic crisis produced a final round of dissent, centered in Illinois, the only viable region left in the UMWA by the late 1920s. Heavily divided, the dissidents, who called themselves the "True" UMWA, met the same fate as those who had earlier tried to oust Lewis. They were red-baited and denounced as "dual unionists," and their attempt to wrest control of the UMWA from Lewis failed miserably. Lewis remained atop the union in the early 1930s, but the UMWA lay in tatters.

The CIO Era

At this low point, the miners and their president stirred to action, and they transformed the labor movement in the United States in the process. Though Lewis, a Republican, had endorsed Herbert Hoover for president in 1932, Franklin D. Roosevelt and his New Deal helped bring the UMWA back. Encouraged by Roosevelt's programs, particularly section 7a of the National Industrial Recovery Act, miners flocked to the UMWA in 1933 and 1934, and the union and its president returned to national prominence. The UMWA controlled nearly 90% of the country's production in 1934, once again emerging as a powerful force in the nation. Lewis, meanwhile, reached out to his former opponents on the left, including the talented Brophy. He restored their union membership and drew on their organizing skill to expand UMWA influence. The UMWA president became increasingly disillusioned by the lackluster efforts on the part of the AFL, then headed by his old ally William Green, to organize workers in the automobile, rubber, and steel industries. Poor tactics by the craft union-dominated AFL had left these workers unorganized and disillusioned during the early years of the New Deal. The UMWA, which functioned on an industrial basis, had thrived with its aggressive organizing programs.

Events transformed Lewis into the most important voice for the millions of unorganized workers in the United States, and he embarked upon the most dramatic and successful phase of his long career in the labor movement. In his criticisms of the AFL, Lewis found important allies in Sidney Hillman, the president of the Amalgamated Clothing Workers of America (ACWA), and David Dubinsky, the head of the International Ladies' Garment Workers' Union (ILGWU). Together with other industrial union advocates, they began to push for reform

within the AFL, urging the organization to embrace the opportunities the activist federal government presented. Their efforts to encourage more aggressive organizing in heavy industries failed, and by the mid-1930s they were ready to branch off from the AFL. After a dramatic confrontation between Lewis and the carpenters' union president, William Hutcherson, during the AFL convention in 1935—Lewis punched him in the face after the two men quarreled—Lewis, Hillman, Dubinsky, and other industrial union supporters created the Committee for Industrial Organization. Though the industrial unions essentially functioned independently of the AFL, they would remain within the umbrella organization until 1938, when the Congress of Industrial Organizations officially separated itself from its old parent. Dubinsky and the ILGWU, however, would remain in the AFL.

Lewis dominated the CIO in its early years, drawing on the UMWA's treasury to finance the organization's activities and staffing it with his miners' union allies. Brophy became the CIO's director, and Adolph Germer, a former miner who also had opposed Lewis, was named field representative. Even Powers Hapgood, a UMWA militant who had opposed Lewis and suffered beatings at the hands of his thugs, was brought into the CIO fold. Along with Lewis, these organizers demonstrated a stunning amount of skill that led to early organizing victories. In the winter of 1936, Lewis and the CIO staff encouraged the militance demonstrated by rubber workers at Goodyear's operations in Akron, Ohio. Thousands of workers idled the company's operations through March, when the CIO reached a settlement with management that resulted in modest changes. Most important, however, the workers and their union, the United Rubber Workers (URW), had survived.

Later, in December, workers at Fisher Body plants in Flint, Michigan, owned by auto giant General Motors (GM), shut off their machinery, forced company guards and foremen out of the shops, and took control of the plant, initiating a major sit-down strike. They refused to leave until the company agreed to recognize their union, the United Automobile Workers (UAW). Lewis initiated a complex series of negotiations that involved the company, the federal government, and state officials. The workers, boldly defying the company's efforts to evict them, remained inside the plant for six weeks, providing Lewis and the CIO with the support they needed to force an agreement with GM. Lewis, with the workers flocking to the CIO banner, refused to back down from his demand for union recognition through the winter months of 1937. Finally, under pressure from Lewis

and federal officials, General Motors agreed to recognize the UAW in February. It was perhaps Lewis's greatest moment as a labor leader, and he watched as other major automakers began to sign agreements with the union in the months that followed. CIO membership swelled.

Lewis and the CIO enjoyed less success in their attempts to organize the steel industry, a key sector of the economy, with close ties to the coal industry. The Steel Workers Organizing Committee (SWOC) was formed in June 1936, after the AFL's attempts to organize the steel industry faltered. The CIO put 200 organizers into the campaign, and Lewis installed his trusted UMWA ally Philip Murray as the president of SWOC, but the efforts made only limited headway. The CIO's victory at General Motors, however, convinced management at United States Steel, the industry's leader, to compromise. Lewis and the U.S. Steel head, Myron Taylor, began a series of negotiations in January 1937, after they famously met at the Mayflower Hotel in Washington, DC. Near the end of February, the two leaders reached a deal that granted a 5% wage increase, a 40-hour week, overtime, a grievance procedure, and, most important, recognition of the United Steelworkers of America (USWA). Lewis and the CIO ran into stronger opposition with the smaller "Little Steel" companies that made up the rest of the industry, however. The organizing drive in the spring of 1937 was met with violence, most prominently in Chicago, where 10 strikers were killed and dozens wounded in a brutal attack on Memorial Day. The drive to organize these companies had faltered by the middle of July.

The industrial organizing tactics pushed by Lewis and the CIO signaled a major shift in the manner in which labor unions sought to bring workers into the movement. This was particularly true with regard to African-American workers, who had largely been ignored by AFL unions, many of which practiced segregation or refused to allow black workers to belong to their organizations at all. By contrast, Lewis and his supporters in the CIO proved among the strongest advocates for the rights of African-Americans in the mainstream labor movement. When the UMWA moved into the southern coalfields in the 1930s, it reached out to black coal miners, welcoming them into the same local unions as white miners without hesitation. The UMWA did conform to many of the requirements of Jim Crow—in particular, African-Americans were relegated to secondary status in terms of leadership positions in the union, and many locals initially adhered to segregated seating arrangements—but in other ways, Lewis and the miners issued strong challenges to southern norms.

Lewis sought to equalize wage rates among black and white miners, and African-Americans participated in union grievance committees and were brought on as paid staff members.

The efforts at reform reached outside the workplace as well. Lewis and other UMWA officials denounced the disfranchisement of African-Americans in the South. Lewis addressed both the National Association for the Advancement of Colored People (NAACP) and the National Negro Congress conventions in 1940, where he spoke strongly in favor of black rights. Brophy, in a 1938 address to the National Negro Conference, denounced lynching and stressed the interracial organizing efforts of the CIO. The UMWA secretary-treasurer, Thomas Kennedy, a close Lewis ally, sharply criticized racial discrimination in the labor movement at the same convention. These strong words resonated with African-Americans, who embraced the cause of industrial unionism and provided the foundation on which the movement rested in most parts of the South.

Going It Alone

At the height of the CIO's influence, however, Lewis did an about-face, and he began to clash openly with many of his former allies. His actions grew increasingly secretive and arbitrary in the late 1930s. He removed CIO staffers like Brophy and replaced them with family members or allies he could control. Tensions within the CIO grew between Lewis and Hillman, particularly after the ACWA president took a job in the Roosevelt administration. Hillman agreed with Roosevelt's foreign policy direction, which increasingly moved the United States toward intervention in World War II. Lewis, an isolationist, was staunchly opposed to the administration on this issue. Hillman also believed that co-operation between labor and government was positive, while Lewis worried that the increasing federal presence, and the defense industry buildup in particular, was a threat to the labor movement. Increasingly, Lewis began to issue a series of sharp attacks against Hillman for his support of administration policies.

Tensions came to a head in the fall of 1940. Lewis reverted to his Republican sentiments and endorsed Wendell Willkie for president, sharply denouncing Roosevelt and vowing to resign as CIO president if workers did not follow him into the GOP. While the CIO made no formal endorsement, most officials in the organization and its membership supported Roosevelt in the election. Lewis resigned soon after,

handing over the CIO presidency to his former UMWA lieutenant, SWOC head Philip Murray.

As the CIO president, Murray attempted to move the organization away from UMWA domination. Lewis responded with a series of harsh attacks on Murray, and he attempted to put the CIO president through a series of humiliating punishments for his independence. Lewis publicly advanced the idea that the CIO and AFL should re-unite, with both Murray and the AFL president Green retiring. He then billed the CIO for \$1.6 million that the UMWA had loaned the organization during its early days. When Murray suggested that Lewis was spreading chaos in the CIO, the UMWA president threatened to charge him with slander and had Murray's membership in the miners' union revoked. The UMWA formally left the CIO in 1942, closing the door on the most remarkable phase of Lewis's career.

The UMWA would mostly pursue an independent path in the years that followed. It briefly re-united with the AFL after World War II, but left again in 1947, after Lewis refused to comply with provisions of the Taft-Hartley Act. Increasingly, the UMWA and its president became isolated from the currents of the mainstream labor movement. Lewis, in fact, would finish his career in relative obscurity.

Lewis first led the miners in a series of walkouts during World War II, defying both the federal government and public opinion. The war caused demand for coal to grow, and it took a toll on the miners as they struggled to meet production demands. Deaths in the mines increased, outpacing combat casualties during the first year of the war. As inflation surged, meanwhile, pay remained stagnant, due in part to the federal government's "Little Steel Formula," which attempted to control wartime inflation by limiting increases in wages and benefits. Lewis alternately led the miners and followed their lead in a series of walkouts during 1943 that idled the nation's coalfields. Eventually, the federal government intervened, seizing the coal mines and raising wages under a plan to pay workers for the time they traveled to and from the coal face (called "portal to portal" pay). When the government returned the mines to private hands, however, the strikes resumed. Eventually, the miners won a wage increase with the help of the Roosevelt administration, though not as much as they had initially hoped for. Meanwhile, the UMWA and Lewis became national pariahs. Congress passed the Smith-Connally Act in the midst of the UMWA's strikes. This measure made it a crime to encourage workers to go on strike during the war and required notices of the intent to strike, secret ballots on the issue, and a 30-day "cooling off" period.

The Final Battle

Beginning in 1945, Lewis began the last major initiative in his career as a labor leader when he pushed for the creation of a health and pension system for UMWA members that would be financed by a royalty on every ton of coal produced by union miners. In the spring of 1946, after another round of walkouts, the federal government imposed a settlement on the operators that included a jointly administered Welfare and Retirement Fund for injured, sick, and retired miners and their families. But it would take years of fighting and negotiations before the coal operators would actually agree to the proposal. In the meantime, they fought Lewis and the UMWA every step of the way. The opposition of the operators provoked a series of strikes throughout the remainder of the 1940s, culminating with the 1949–1950 national walkout, which saw the permanent establishment of the system.

After the 1949–1950 strike, Lewis established dominance over the board that oversaw the Fund when he engineered the nomination of his close ally, Josephine Roche, as a “neutral trustee” in 1950. Though Lewis realized his dream of a health and pension system for coal-mining families, the industry’s persistent economic problems led to rounds of cutbacks in the 1950s and 1960s. A series of hospitals constructed by the Fund that served isolated communities in Appalachia had to be sold or closed to keep the system solvent. Since the Fund was bankrolled by production, the UMWA encouraged mechanization, which cost miners jobs, and discouraged walkouts, including those over safety issues. Meanwhile, non-union production began to rise in the 1950s and 1960s, at the same time that the coal industry entered a deep recession. Miners responded with a series of violent organizing drives, particularly in parts of Tennessee and Kentucky, where the coal-purchasing policies of the Tennessee Valley Authority had encouraged the creation of small, nonunion operations. Despite these occasional violent episodes, Lewis became known more for his co-operation with the industry than for his confrontation with it during the 1950s. He grew increasingly close to Cyrus Eaton, a financier based in Cleveland, Ohio, and George Love of Consolidation Coal Company, the industry leader.

When Lewis finally retired in January 1960, both the Fund and his union were on shaky ground. The UMWA president spent his last years continuing to oversee the Fund, but overall, he faded into obscurity. The union, meanwhile, suffered under the leaders that followed Lewis. Thomas Kennedy succeeded him as president, but died three years later. W. A. “Tony”

Boyle became the UMWA president in 1963, but he lacked Lewis’s charisma and his talent for managing the union. Though Lewis had brought Boyle out of the union’s obscure Montana district, the new UMWA president had learned little from his mentor, and Lewis eventually repudiated him in private. When Joseph A. “Jock” Yablonski, a former Lewis loyalist, challenged Boyle for the UMWA presidency in 1969, many hoped the former president would endorse the insurgency. Though Lewis indicated his support, he died on June 11, 1969, before a formal meeting with Yablonski could take place. Yablonski lost the flawed election to Boyle—the UMWA president’s political machine made sure the results were favorable—and assassins later murdered the insurgent, his wife, and daughter. Boyle and several other UMWA officials eventually were convicted of arranging the killings. Many speculated whether the system within the UMWA that Lewis had built over the preceding decades had created the atmosphere that allowed such brutality and corruption to flourish.

Ultimately, John L. Lewis left a mixed legacy. In his early career as a labor leader, Lewis suppressed rank-and-file activism in the UMWA and solidified dictatorial control over the organization. Then, in the wake of the economic collapse of the Great Depression, Lewis emerged as a militant unionist and eloquent spokesman for the unorganized, creating the CIO and transforming the American labor movement in the process. In the midst of this effort, he suddenly reversed course, turning on his union and political allies and taking the miners down an independent path that ultimately left them on the margins of the American labor movement. In his final years, Lewis forced the coal operators to agree to a groundbreaking health and pension system for miners. But this, too, proved an elusive dream, as cutbacks and financial problems, the product of the problematic economics of the coal industry, continually plagued the program.

LIBERAL PARTY

Formed in 1944 after a clash with American Labor Party (ALP) leadership, the Liberal Party of New York State sought to continue the ALP formula of supporting President Roosevelt's re-election while endorsing liberal Democrats or Republicans (typically the Liberal Party endorsed Democrats) and occasionally fielding its own candidates. Although the Liberal Party consisted of a small membership compared with the major parties, Democrats and Republicans recognized the Liberal's Party's significance in deciding close elections. Although the ALP counted more registered voters than the burgeoning Liberal Party, the ALP grew steadily isolated during the late 1940s and early 1950s from the mainstream labor movement as communist influence within it increased. When the ALP ceased to exist by 1956, the Liberal Party became the sole labor party in the state and grew to increase its influence over the next three decades.

The International Ladies' Garment Workers' Union president, David Dubinsky, and the United Hatters, Cap, and Millinery Workers' International Union vice president, Alex Rose, led many labor leaders and rank-and-file members out of the ALP due to the increasing communist influence within the party. In many respects, the Liberal Party was a non-communist replica of the ALP, led by trade unionists but also including liberal thinkers and activists such as the theologian Reinhold Niebuhr. Therefore, it competed for many of the same voters as the ALP during its early years, typically trailing behind in members. The Liberal Party's first attempt to make a splash in New York politics occurred in its incipient year when Dubinsky and Rose wanted the party to endorse the former Republican presidential candidate Wendell Willkie for mayor of New York City. They presumed that Willkie would be endorsed by the

New York Republican Party, making him a fusion candidate with support from the Republican and Liberal Parties. However, Willkie died of a heart attack shortly before the campaign commenced. Nonetheless, the Liberal Party persevered, supporting a number of liberal Democrats as well as liberal Republicans such as Jacob Javits, beginning with his first election to Congress in 1946. Over the next few years, however, the party worked diligently to develop a base and came to play a major role in the 1948 presidential election.

In early 1948, Liberal Party leaders recognized Truman's need to win New York, and they believed he would consider changes in his policies if those alterations would win him the state. New York State's 47 electoral votes offered a potentially decisive number of votes in a close election, and Truman appeared to be heading into a tight finish with the Republican nominee, Thomas Dewey. In 1948, an extraordinary division within the Democratic Party occurred, threatening to cost Truman crucial votes and tip the election to Dewey. To the political left, Henry Wallace of the Progressive Party threatened to carry off liberal votes. On the political right, Strom Thurmond endangered Truman's ability to win traditionally Democratic votes in the South. Winning New York offered a way to compensate for these likely lost votes.

Ostensibly, this led Truman to seek backing from Liberal Party voters. New York offered any presidential candidate the greatest number of electoral votes in the country. During the 1944 and 1948 presidential campaigns, the Republicans nominated Dewey, the governor of New York, specifically to win his own state. In the previous 70 years, only Woodrow Wilson had won the presidency without winning New York. With this in mind, Truman recognized the importance of securing as many New Yorkers' votes as possible.

Truman needed the votes of New York trade unionists and liberals to carry the state. He wanted the help of a political apparatus capable of publicizing his message among these union members and liberals. New York Democratic leaders did not have the same level of influence with this crucial voting bloc and more important, they believed Truman had no chance to win New York. The Liberal Party offered an organization with prominent labor leadership and an ability to galvanize labor and liberal voters through a party structure. It maintained a prominent position within the state electorate, its leadership enjoyed wide access to the local media, and its organizational and financial resources promised a candidate mass exposure to New York voters.

LIBERAL PARTY

By September 1948, the Liberal Party, satisfied with Truman's stances on issues important to it, including labor, housing, foreign policy, and civil rights, put its weight behind his candidacy. While the New York Democratic Party leadership distanced itself from Truman and focused on assisting local candidates, the Liberal Party provided Truman his most organized support system in the state. This was most evident when the Liberal Party sponsored a rally for Truman at Madison Square Garden. Typically, a presidential candidate's own party sponsored such an event, but only the Liberal Party offered Truman this promotional event in New York.

Ultimately, Truman lost New York in a close finish, but the Liberal Party had established itself as a player in national and state politics. With the ALP's demise and eventual extinction in 1956, the Liberal Party became the most important third party in New York State politics. In 1960, the party once again played a crucial role in a presidential campaign. The Democratic candidate, John F. Kennedy, sought support from the Liberal Party, and he gained crucial votes he needed to secure New York with much assistance from Liberal Party supporters. In 1965, the Liberal Party endorsed liberal Republican John Lindsay for New York City mayor. Again, the party put a candidate over the top, and Lindsay won the mayoralty. By 1969, New York City appeared on a downturn, and Lindsay lost the Republican primary for mayor. The Liberal Party offered Lindsay the opportunity to run as the Liberal Party candidate, and he won re-election with the backing of his new party.

With Dubinsky and Rose's deaths during the 1970s, the Liberal Party lost momentum. It drifted through much of the 1980s and 1990s. The party's support of Rudolph Giuliani in his three elections for mayor angered many of its constituents, leading to the formation of a rival party, the Working Families Party. By 2002, the Liberal Party failed to get the required 50,000 votes to qualify for the New York State ballot. This marked the first time that the Liberal Party failed to make the state's ballot since the party's inception in 1944. Accordingly, the party shut down its headquarters in late 2002 and ceased its existence in January 2003.

LIPPARD, GEORGE (1822–1854)

Writer

George Lippard contributed to the imagination of the nineteenth-century American labor movement, through his journalism, his fiction, and his invention of rich and ritualistic culture of the American labor secret society, the Brotherhood of the Union. A romantic and eccentric figure, so self-denying that he could be seen walking around Philadelphia in clothes tied together with twine, he balanced dark thoughts about machinery enslaving the working man against his optimism that "The Continent of America is the Palestine of Redeemed Labor."

Early on, George Lippard had social and educational advantages over his eventual working-class audience. Born into a prosperous German farming family near Yellow Springs, Pennsylvania, in 1822, he was the son of a schoolteacher, Daniel Lippard, and his wife, Jemima. Due to a series of deaths in the family, George was raised by maternal aunts and educated with an eye toward first the ministry, and then the law. By 1840, he was beginning to write his first novel and, bored with the law, joined the Philadelphia newspaper *The Spirit of the Times*, covering the police beat.

Over the next decade, Lippard worked as both a fiction writer and a journalist, serving as chief editor of the *Citizen Soldier* and eventually founding his own newspaper, *The Quaker City*, in 1848. As a journalist, George Lippard covered labor issues, writing floridly about the dehumanizing power of machinery. As an author of sensationalist novels that first appeared in serialized form in "story papers," Lippard specialized in a form of the Gothic that drew on his experiences as a crime reporter, mixing pornographic levels of violence with patriotic narratives. His work reveals a strong sense of place, evoking the sights of Pennsylvania—from the woods of his boyhood to the teeming streets of Philadelphia—in his narratives. Unlike his contemporary and friend Edgar Allan Poe, Lippard created fictional worlds predicated on the idea that cities had secret lives and that working people were dogged by great, corrupt conspiracies. Although panned by contemporary critics, his novels hit a nerve and were best sellers with an avid working-class readership.

Lippard's concern for the "lower ten thousand" had appeared before his official involvement with the labor movement. In 1848, he found an outlet for his social reformism when he attended one of the annual Industrial Congresses then being held in cities up and down the East Coast. Like many labor reformers of his day, Lippard both feared and thought it possible to avoid the importation of European class differences. In a milieu in which Fourierism, land reform, the ten-hour day, and various other prescriptions swirled, Lippard proposed a harmony of interests between employer and employee. This would be achieved through the fraternity of a secret society, the Brotherhood of the Union. Founded September 1, 1849, the Brotherhood of the Union eventually had "circles" or locals in 20 states. According to Lippard's own statement of purpose for the organization, it took for its basis "the principle of Brotherly Love in the Gospel of Nazareth, and the affirmation of the Right of Man to life, liberty, land and home in the Declaration of Independence." This combination of patriotism and Christianity was intended to have the widest possible appeal to native-born artisans. Lippard also endorsed the popular movement, led by the National Reform Association, to secure a homestead for every working man—but by 1852, he had become convinced that the Industrial Congresses were nothing but a sham and that his Brotherhood was the only route to the regeneration of mankind.

Given the high profile of the secretive Masons in antebellum politics, Lippard emulated that group by using ritual and theatrics to bind the members of his union together. Initiates in the Brotherhood of the Union could buy, or have their wives sew, regalia for their meetings according to patterns that Lippard created. The speeches and initiation ceremonies that characterized the order were all written by Lippard himself. Dressed in their robes, members of the Brotherhood could eventually aspire to be leaders, the leadership positions having been named after great American patriots: not only the expected George Washington, but also Robert Fulton, who inaugurated the age of steam travel on the waterways, and Stephen Girard, the Philadelphia philanthropist who endowed a secondary school for the orphaned sons of industrious mechanics. Lippard himself was repeatedly elected to three-year terms as Supreme Washington of the Brotherhood of the Union—the highest possible leadership position—until his death.

The success that Lippard enjoyed as a journalist, popular author, and labor reformer was not mirrored in his home life. He had married Rose Newman in 1847 and fathered a son and a daughter, but between 1849 and 1851 both children died in infancy, and his adored young wife succumbed to tuberculosis. The

Brotherhood of the Union was the only bright star in his firmament, and he continued to promote it, traveling around the country giving speeches, and keeping in contact with local leaders by letter. Lippard died—reportedly of "a heavy cold"—at the age of 32, on February 9, 1854. He left behind not only his corpus of writings, but also an enduring legacy of labor activism in Philadelphia. The Brotherhood of the Union helped to unify labor reformers through some lean years of unionism and to provide a model for the ritual, the reformism, and some of the rhetoric of interclass harmony of the Knights of Labor. In a testament to the popularity of Lippard's blending of working-class patriotism and religiosity, the Brotherhood of the Union persisted as an organization into the twentieth century, describing itself as a friendly society based on the teachings of the Gospel of Nazareth and the Declaration of Independence.

LIVING WAGE

The concept of the "living wage" has been central in the ideology of organized (and unorganized) labor since the 1870s. Generally defined by its working-class promoters as a wage sufficient to allow workers and their families to live in comfort, the living wage linked earning levels with contemporary standards of appropriate consumption. The British labor radical Hugh Lloyd Jones popularized the term in 1874, which was first used in the late 1860s, in a series of articles in *The Beehive*. Across the Atlantic, at roughly the same time, the Boston labor leader Ira Steward used the phrase "living wage" several times in his unpublished manuscript, "The Political Economy of Eight Hours," which was written between 1872 and his death in 1883. After the 1877 national railroad strike, "living wage" became a key word in American labor rhetoric. It remains so today. The key reason

for the popularity of the phrase “living wage” is that it provided a means for American workers to make the system of wage labor, which was becoming dominant in late nineteenth-century America, consistent with republic ideals of free labor. According to labor advocates, living wages could provide workers with the ability to maintain their position as key citizens of the American republic, a position previously ensured only by independent proprietorship.

For most of the nineteenth century, American workers decried wage labor. They claimed that wage labor denied workers the “full fruits” of their labor and reduced the proud American citizen-worker to a “wage slave,” a term of derision popularized in the Jacksonian era as the incipient crisis of wage labor led to the rise of the organized labor movement. Free workers did not want to be identified with lifelong “hirelings,” whom they condemned as emblematic of slavery. The very word “wages,” one worker in the 1850s declared, was “odious.” Wage work was a form of compulsion, the opposite of the free labor system that they valued. In a society that, until 1865, countenanced chattel slavery, these were serious charges.

In the decades after the Civil War, however, a striking transformation began, as many workers for the first time pondered the possibilities of wage labor. In coming to accept the necessity of wages, workers also redefined wage earning to make it consistent with their vision of a just world. They began to interpret wages not as slavery but as a potential means of escape from slavery. George Gunton, a pamphleteer for the American Federation of Labor (AFL), declared, “Wages are not a badge of slavery but a necessary and continual part of social progress.” While not all labor leaders shared Gunton’s optimism, almost a vast number of them participated in the redefinition of wage labor from slavish to liberating.

The linchpin of this transformation was the demand for a “living wage,” usually defined as remuneration commensurate with a worker’s needs as citizen, breadwinner, and consumer. Most workers closely paired the living wage with the idea of an “American Standard of Living,” a related idea that developed at approximately the same time. Indeed, proponents often defined one in terms of the other, as in John Mitchell’s comment that, “The living wage means the American Standard of Living.” The AFL president, Samuel Gompers, declared in a well-publicized 1898 debate that a living wage should be “sufficient to maintain an average-sized family in a manner consistent with whatever the contemporary local civilization recognizes as indispensable to physical and mental health, or as required by the rational

self-respect of human beings.” Although others put forth very different definitions, most proponents of the living wage shared a new, positive vision of wage labor, one that linked it to an expansive and expanding standard of living.

Living wages, proponents held, should offer to wage earners in the post-Civil War years what independent proprietorship had promised in the antebellum era: the ability to support families, to maintain self-respect, and to have both the means and the leisure to participate in the civic life of the nation. In this worldview, the level of wages became what Gompers called “the barometer which indicates the social, political and industrial status” of a society. Advocates of the living wage described it in explicitly political terms as a “right”—often they used the phrase “inalienable right”—the violation of which made republican citizenship impossible. Living wage advocates merged wage labor with citizenship rather than defining the two as incompatible. Workers “have burned the new words of the living wage into the bill of rights,” Henry Demarest Lloyd announced in a pamphlet published by the American Federation of Labor in 1893, connecting the economic realm of wages to the political realm of citizenship.

Labor was not alone in constructing the living wage discourse. Not all business leaders and politicians accepted the idea of the living wage. Many of its enemies associated the living wage with the rejection of the “natural” economic laws of supply and demand, freedom of contract. But from the start, a large number of reformers, politicians, and business as well as religious leaders joined labor in debating the meaning of the living wage. Pope Leo XII’s 1891 encyclical *Rerum Novarum* advocated that “remuneration must be enough to support the wage earners in reasonable and frugal comfort.” An American priest, John A. Ryan, published *A Living Wage* in 1906, a book that helped shift the living wage discourse away from its working-class roots and toward a broader, societywide issue. Protestant ministers, influenced by the Social Gospel, also described living wages as a social obligation of employers. The idea was closely tied to Progressive Era minimum wage legislation and New Deal economic policy. Many of these middle-class promoters of the living wage endorsed it as a way to minimize working-class protest and to incorporate organized labor into the political system. In 1921, the Anthracite Coal Commission endorsed the living wage as a bulwark against revolution: “all American wage earners have a fundamental economic right to at least a living wage, or an American Standard of Living....Failure to realize this right-breeds revolutionary agitation, and prevents our self-governing Republic from being what it should be.”

Yet in the process of the broad diffusion and acceptance of the living wage, the working-class notion of a consumerist living wage was redefined downward. Many Progressive supporters of the living wage did not have in mind what Ira Steward and Samuel Gompers did when they endorsed a living wage, but rather what they called a “minimum wage,” a bare subsistence amount that fell far short of the consumerist ideals posited by workers. State minimum wage laws, first passed in Massachusetts in 1912, reflected the ideal of subsistence rather than abundance. Many politicians and commentators conflated this minimum wage with the much more robust living wage.

While use of the term in the expansive working-class sense had diminished, a consumerist complex of ideas flourished and became central to New Deal political economy, and indeed through the post-World War II years. The working-class and middle-class visions of the living wage occasionally found common ground in the 1920s, when prominent business leaders and politicians supported the living wage and policy makers began to promote the benefits of working-class consumption. In the next decade, a marriage was sealed; in the consolidation of the New Deal Order, the rival versions of the living wage ideology converged in public policy and political economy to become accepted as economic common sense. In language recalling labor’s consumerist turn, Franklin Roosevelt declared in a Fireside Chat of 1938, “We suffer primarily from a failure of consumer demand because of a lack of buying power.” By the post-World War II years, the living wage had become so integral to the American social contract that some commentators viewed the payment of living wages as a problem solved by the post-New Deal political economy. In these years, labor’s demands for high wages, purchasing power, and an American Standard of Living gained a receptive public reaction. The living wage was a central part of the “social bargain” of the post-World War II decades, in which business leaders and politicians accepted the existence and claims of organized labor in exchange for a reduction in shop-floor militancy.

With the economic turmoil of the 1970s, however, and the rise of global competition in many industries, many businesses once again rejected the ideal of the living wage. The weakening of organized labor in this period meant that the main champion of living wages had lost its bully pulpit. Discarding their faith in the broadening of mass consumption as the key to a modern economy, business leaders and their trade organizations argued that the only way for companies to compete was to keep labor costs to a minimum. Throughout the 1970s and 1980s, the federal

minimum wage, first set at 25 cents an hour with the Fair Labor Standards Act of 1938 and subsequently increased to account for inflation, stagnated in real dollars. In this period, as the “New Deal bargain” crumbled in the midst of neoliberal market forces, the living wage lost its hold on the popular imagination as an essential element of labor relations.

In the 1990s, the living wage idea was reborn, as an alternative to the legal minimum wage, which had dramatically declined in real dollars in the last third of the twentieth century. Advocates of the revived living wage brought back two related arguments of the idea’s originators. They claimed that the payment of living wages would improve, not weaken, local economies, and they argued that living wages were a political and moral necessity. As the Association of Community Organizations for Reform Now (ACORN), an activist group that has promoted living wage campaigns, notes on its Web site (www.livingwagecampaign.org/): “The concept behind any living wage campaign is simple: Our limited public dollars should not be subsidizing poverty-wage work. When subsidized employers are allowed to pay their workers less than a living wage, tax payers end up footing a double bill: the initial subsidy and then the food stamps, emergency medical, housing and other social services low wage workers may require to support themselves and their families even minimally. Public dollars should be leveraged for the public good—reserved for those private sector employers who demonstrate a commitment to providing decent, family-supporting jobs in our local communities.”

The living wage campaigns of the 1990s and early 2000s generally sought to pass local ordinances requiring private businesses that benefit from public money to pay their workers a living wage, generally defined as the equivalent to the poverty line for a family of four (currently \$9.06 an hour), though ordinances that have passed range from \$6.25 to \$13.00 an hour, with some newer campaigns pushing for even higher wages. In 1994, Baltimore became the first city to pass a so-called living wage ordinance, raising the minimum wage for city workers and those businesses that did business with the city to several dollars above the legal minimum. By the end of 2004, more than 100 living wage ordinances were on the books in cities and counties across the country. In addition, students at many American universities have demanded living wages for university employees and for those who make the goods that bear their school logos. Furthermore, the living wage idea has been exported to other countries. Campaigns for living wages have been waged in countries ranging from South Africa to Canada. In an era of capital mobility and plentiful cheap labor, advocates have

LIVING WAGE

even promoted a “global living wage,” as an attempt to ensure that global capital pays livable wages wherever it employs workers.

LIVING WAGE CAMPAIGNS

In 1994, faith-based, labor, and community activists in Baltimore, Maryland, pressured their city council to adopt a living wage ordinance, a law that required any firm holding a service contract with the city to pay its workers a wage high enough to allow a full-time worker with a family of four to meet the federal poverty line. The campaign was launched for several reasons. First, the federal government had been slow to raise the national minimum wage for the previous two decades, so in real terms its current value had fallen well below its historic peak. In 1994, the federal minimum wage was \$4.25 per hour: 38% below where it should have been if it had kept pace with inflation since 1968. The living wage ordinance was designed to begin raising the minimum wage for at least some workers.

Second, living wage campaigns built on the concept of prevailing wage laws, which set wage standards for government construction contracts. The Davis-Bacon Act, passed in 1932, was created in part to establish government as a model employer. Third, local efforts to revitalize urban centers had not resulted in living wage employment for the bulk of urban residents. In the late 1970s and 1980s, cities like Baltimore pumped millions of public dollars into economic redevelopment projects. Even when these efforts resulted in increased employment, residents found that the jobs tended to be low-wage, service-sector positions without benefits. Concerns shifted from simple job creation to the need for a living wage.

Finally, the living wage campaign built on a historical use of the term. In the late nineteenth century,

most workers in industrializing countries realized that they would not be able to stop the growth of wage labor. They then demanded that they be paid a living wage that would guarantee their subsistence and reduce their exploitation. Early advocates of a living wage for industrial laborers included Catholic priests, trade unionists, and women's movement activists.

Since the Baltimore victory, other coalitions formed around the United States to campaign for living wage ordinances in their cities and counties. As more and more campaigns were successful, the scope of the ordinances expanded. Soon, cities were passing living wage ordinances that applied to not only service contractors, but recipients of economic development assistance, firms operating food and beverage concessions on city-owned property, and direct employees of the city or county. The ordinances were also expanded in terms of content. In addition to mandating a higher hourly wage, new ordinances tended to include automatic indexing (so that the wage would increase each year with the rate of inflation) and a requirement that employers either provide health insurance or pay a higher wage to cover the cost of health insurance. Some ordinances also mandated paid days off and required local hiring from community hiring halls, and included language that assisted unions (such as giving employers with a history of labor law violations lower priority for receiving contracts or subsidies).

Living wage supporters then broadened their efforts in an attempt to cover more workers by launching campaigns to establish citywide minimum wage laws under the living wage banner. For example, in 2002, voters in New Orleans, Louisiana, passed a ballot initiative that would require all employers operating within city limits to pay their employees \$1 more than the federal minimum wage of \$5.15. This measure was eventually overturned by the State Supreme Court, but subsequent efforts are still on the books in several cities. Santa Fe, New Mexico, and San Francisco, California, set citywide minimum wage rates of \$8.50 per hour in 2003, indexed to rise with inflation. The Madison, Wisconsin, City Council also established a citywide minimum wage, starting at \$5.70 per hour in 2005, increasing to \$7.75 plus indexing in 2008.

In the late 1990s, the living wage concept also spread to college campuses. In the most publicized effort, students at Harvard engaged in a three-week sit-in during 2001, occupying an administration building. They had been calling on Harvard University to pay its direct and contracted employees a living wage for several years but met with no success. After their sit-in, the university agreed to convene a task force to

develop solutions. In the end, they agreed to several of the students' demands, including raising contracted workers' wages to the level of unionized direct employee wages.

Opposition and Support

By 1998, based on the popularity of the living wage concept and the rapid spread of campaigns, journalists and academics began to refer to a living wage *movement*. The concept of a living wage has generally received significant public support: for example, polls over the last several decades show that a majority of Americans favor an increase in the minimum wage. Nonetheless, the movement has, at times, faced strong opposition. This has included local and national business associations, most notably the Employment Policies Institute; many city administrators, particularly from economic development departments; and some academics. In the late 1990s, when it became clear that most living wage ordinances were passing at the local level, employer associations worked to pass state-level laws that would pre-empt local living wage ordinances. As of 2004, 12 states have laws that pre-empt various forms of living wage ordinances.

In addition to general public support, the list of living wage advocates includes a variety of community, faith-based, and labor organizations. Most prominent is the community-based ACORN (Association of Community Organizations for Reform Now), which runs a national Living Wage Resource Center. Also very active is the Brennan Center for Justice, at the New York University School of Law, which provides legal and technical support for campaigns around the country. Other groups that have been involved in a number of campaigns include Jobs with Justice, the Industrial Areas Foundation, and local legal services offices. Unions have also been involved in the movement, particularly locals of the Service Employees International Union (SEIU) and the Hotel Employees and Restaurant Employees Union (HERE). These unions already represent some of the low-wage workers covered by the ordinances, and have been active in organizing new members through the living wage campaigns. The AFL-CIO endorsed the living wage movement at the national level, and local labor councils have provided support in many cities. Academics such as Robert Pollin from the Political Economy Research Institute at the University of Massachusetts-Amherst have been very involved in the movement as well.

Relevance of the Movement

Judged as a social movement, the campaigns for a living wage have enjoyed much success. Ten years after the initial ordinance was passed in Baltimore, more than 120 local governments have passed a living wage law. Few campaigns have been defeated. In numerous cities, unions and community organizations have achieved a variety of goals through the living wage movement, such as building new labor-community coalitions and organizing workers into unions.

Judged as policy, the outcomes are less clear. First, critics have noted that ordinances cover only a small proportion of low-wage workers. The Economic Policy Institute estimates that in 2000, approximately 38 million workers were earning wages below the living wage level. Even a generous estimate of the number of workers receiving a raise through a living wage ordinance would suggest the campaigns are only providing living wages for fewer than 5% of these workers.

Second, some living wage advocates have discovered that getting the ordinances implemented can be more difficult than getting the law passed in the first place. Research by Stephanie Luce shows that cities are unlikely to rigorously enforce the laws on their own. However, she finds that living wage advocates who have become involved in implementation have had success in significantly improving monitoring and enforcement. Still, implementation remains an issue in many cities.

Third, debate is ongoing about whether living wage ordinances lead to lower employment. Research by the economists Scott Adams and David Neumark concludes that living wage ordinances do result in a modest reduction of employment, and these authors and others conclude that other policy tools such as the Earned Income Tax Credit are more effective methods to reducing poverty. However, these claims are disputed by economists such as Mark Brenner, Peter Hall, Ken Jacobs, and Michael Reich, who find in their empirical work little evidence of negative outcomes. Rather, they find that employers are able to absorb the costs of the living wage through other means. This includes savings achieved through lower turnover and absenteeism as well as reduced profits. It also includes "cost pass-throughs": in some cases, cities are paying a higher amount for their contracted services in order to ensure that workers are getting a living wage. In other cases, employers are able to raise prices for their goods or services.

LLOYD, HENRY DEMAREST (1847–1903)

Social Reformer

Henry Demarest Lloyd is not well known today, but during the nineteenth century, he was one of the most influential of American social reformers. His voluminous writings earned him the label of "the first muck-raker," and his screed against Standard Oil, *Wealth against Commonwealth*, has arguably become one of the masterpieces of the American reform tradition. Lloyd also played an important role in most of the critical events of labor turmoil in the United States from the late 1880s until his death in 1903.

Lloyd's relatively genteel background made it difficult to predict his eventual turn to radicalism. Yet, as was so common in the annals of nineteenth-century reform, Lloyd's strenuously Protestant background helped nurture a desire to improve the world. His father, Aaron, was originally a Dutch Reformed pastor, although when Henry was young, Aaron gave up the ministry to work in a customs house and operate a small bookshop. Henry got through Columbia College on a scholarship, and he also graduated from that institution's law school. Soon afterward, he became the public relations agent for the American Free-Trade League.

Decisive to Lloyd's political blossoming was his move to Chicago in 1872 to become the *Chicago*

Tribune's literary editor. Marriage to the wealthy daughter of one of the paper's owners, William Bross, followed the next year. He and Jessie went on to have four children. Lloyd worked his way up the ranks to chief editorial writer for the *Tribune* before resigning in 1885, the result of political conflicts with the newspaper's chief owner, Joseph Medill.

Lloyd had already turned his attention to pressing Gilded Age political matters while at the *Tribune*, but he gained national attention with the 1881 publication of "The Story of a Great Monopoly" in *Atlantic Monthly*. Here Lloyd explored the corrupt connection between railroads and corporations, particularly the ties between the Pennsylvania Railroad and Standard Oil.

The next 20 years of Lloyd's life would witness an astounding literary output as well as the cementing of his position as one of the age's most important allies of the labor movement. Always prone toward mental fragility, Lloyd suffered a nervous breakdown while traveling in Europe after leaving the *Tribune*. Lloyd's studies during his recovery pushed him far enough to the left that, upon his recuperation, he became one of the primary advocates for clemency for the Haymarket anarchists. This in turn led to his disinheritance from his father-in-law, but Lloyd's many real estate investments allowed him to continue his career as an agitator based out of two elegant homes in Winnetka, Illinois (his main residence), and Sakonnet Point, Rhode Island (his summer abode).

Lloyd's pre-eminent standing in the labor movement came with the publication in 1888 of his "The New Conscience; or, The Religion of Labor" in the *North American Review*. Standing firm against social Darwinism, Lloyd instead foresaw the coming of the co-operative commonwealth. Lloyd, however, never ascended to a purely philosophical plane. The following year, for example, Lloyd learned of the very concrete situation of coal miners in Spring Valley, Illinois, who had been locked out by a company with connections to the rapacious financier Jay Gould. Using to great advantage his background in public relations, Lloyd brilliantly exposed the plight of the miners in his 1890 *A Strike of Millionaires*.

The exploitation of labor was always one of Lloyd's main reasons to indict the large corporations inhabiting the new economic landscape of the Gilded Age. Yet one of Lloyd's strengths was his ability to also consistently keep his feet in the world of middle-class reform. Few works were more important to developing a joint labor/middle-class indictment of big business than Lloyd's magnum opus, *Wealth against Commonwealth* (1894). Here Lloyd accused John D. Rockefeller's Standard Oil of being an enemy of consumers as well as a menace to representative government.

The same year as the publication of *Wealth against Commonwealth*, Lloyd threw himself insistently into the nitty-gritty of radical political affairs. Never comfortable with the stringent emphasis on class in both Gompersite and Socialist rhetoric, Lloyd believed it necessary to bring both farmers and the urban working class together before the age of the cooperative commonwealth could be declared. And this alliance did make it further in Chicago, and in Illinois, than anywhere else in the country. Yet soon the Populists embraced the cause of free silver, which alienated most urban workers, who then turned even more emphatically to the building of defensive craft unions—of which most farmers were suspicious. Lloyd's own overwhelming defeat for Congress on a Labor-Populist ticket portended the split in an alliance that, arguably, never had more than a small chance of success.

After the 1896 Populist debacle, Lloyd gave up his hopes of transforming the national political scene. In his final years, Lloyd grasped after a number of non-conventional reforms that might empower labor and bring about true social democracy. He first turned to producer and consumer co-operatives, writing *Labour Copartnership* in 1898. Two years later, he penned *Country without Strikes* to celebrate New Zealand's effective and just application of compulsory arbitration. Lloyd also threw himself into campaigns for municipal ownership of utilities—particularly, public transportation in Chicago.

A good part of the reason for Lloyd's eclectic reforms, and, in the end, for his ineffectiveness, was his attraction to but ultimate discomfort with much of the militancy and uncompromising nature of the socialist spirit. Lloyd hoped ultimately for a more broad-based political philosophy that could bring together citizens and create social harmony (and he did to some extent find this in the Christian and Fabian branches of socialism). While scholars have often viewed such dismissal of social conflict as a bourgeois fantasy, the overall historical failure of socialism might help us to rethink the value of Lloyd's often radical and staunchly democratic middle-class reformism.

Lloyd died young, broken in spirit and in health. The previous year had, ironically, seen his greatest conventional acceptance into the mainstream when he joined Clarence Darrow and the United Mine Workers president John Mitchell to successfully argue labor's cause before the commission set up by President Theodore Roosevelt to arbitrate the great 1902 Pennsylvania coal strike. Lloyd's memorial service brought 5,000 labor and civic reformers to Chicago to celebrate the life of this unconventional but most steadfast ally of workers.

LOCHNER v. NEW YORK (1905)

One of the most infamous cases in the history of the Supreme Court, *Lochner v. New York*, has, in many circles, a reputation close to that of *Dred Scott* or *Plessy v. Ferguson*. In striking down almost all forms of protective labor legislation in *Lochner*, the court majority seemed to go out of its way to sanction the most extreme form of laissez-faire capitalism. The case, however, had surprising complexities, and *Lochner's* legacy cast an incomplete shadow for American workers.

Although Supreme Court justices receive most of the attention of historians who study *Lochner*, the origins of the case lie in the agitation of workers seeking to create better work conditions. Concerned about low wages and long work hours, bakers in postbellum New York state formulated a two-prong response. One was unionization, which proceeded steadily but in an incomplete fashion through to the end of the century. The other was agitation for shorter hours, which began in earnest during the 1880s. By the end of that decade, employees of union bakeries were working 10 hours a day, but Italian and Jewish immigrants often labored up to 14 hours a day in nonunion shops.

In 1890, Henry Weissman, a German immigrant, took over editorship of the *Baker's Journal*, the voice of the Journeymen Bakers Union. Weissman turned the organ into an effective mouthpiece for protective labor legislation. By 1893, the New York legislature limited bakery work to 10 hours a day and 60 hours per week—although the law offered no sanction to employers who violated the limit. Such penalties came in 1895, and the legislature ratified the law in 1897.

For its first few years, the law was largely ignored, with employers little concerned about enforcement and employees themselves either intimidated or themselves ambivalent about a law that prohibited

overtime. Around 1900, at least one third of bakeries were apparently still working their employees longer than 60 hours per week. And while bakers were launching a major unionizing offensive, their employers were also organizing—to fight the rise of organized labor.

In the midst of these hostilities, conditions for bakers in New York City were generally improving, but employers held the upper hand upstate. There, in 1901, Joseph Lochner, a bakery owner in Utica, committed the offense that led the way to the Supreme Court. Lochner “permitted and required” Aman Schmitter to work more than 60 hours in a week. Moreover, Lochner had already been convicted of the same offense in 1899. He refused to offer any defense before the Oneida County Court, and upon his conviction, the Master Bakers Association announced a constitutional appeal.

The bakeshop employers argued along several main lines. First, they denied that the statute was a health measure, a purpose that courts seemed to be requiring of protective labor legislation before declaring such laws a legitimate exercise of the government’s police powers. Bread made by overworked employees did not represent a menace to the public health, and there seemed to be no convincing reasoning that overwork affected the health of the employees themselves. Second, the law was illegal “class legislation” because there was no compelling reason to single out bakers over other kinds of employees. Third, the statute restricted the liberty of employees to make their own full and free contractual arrangements, a right supposedly guaranteed under the Fourteenth Amendment.

Lochner lost his case in close split decisions through the New York state court system, with the majority of justices arguing that the legislature, and not the courts, was the proper body to decide such matters. The case then ascended to the Supreme Court, where the employers picked up a key ally: none other than Harry Weissman, the former editor of the *Baker’s Journal* as well as the secretary of their union, and arguably the key figure behind the passing of the New York law in the first place. Weissman had left the union in 1897 and, in a move common at the time, set up his own bakeshop. After that enterprise failed, he earned his law degree and entered politics. Weissman’s motivations for his ideological turnaround remain unclear. Indeed, after the Supreme Court made its decision in the case, he announced his actual support for the law—stating curiously that his only concern had been the statute’s outlawing of overtime pay.

The Supreme Court heard arguments in the case in February 1905. Initially, a majority of justices were

set to uphold the law, but a mystery justice (likely Joseph McKenna or Henry Billings Brown) switched and created a new 5-4 majority to strike down the statute. Accepting all of the key arguments of the bakeshop owners, Rufus W. Peckham composed the majority opinion. In turn, two separate dissents offered stinging rebukes to the majority. John Marshall Harlan argued that workers could not “voluntarily” agree to labor for long hours because they had so little power in relation to employers. Harlan also cited medical evidence to argue that the health hazards of long bakeshop work were indeed substantial enough to sanction legislative regulation.

The opinion of Oliver Wendell Holmes was even more emphatic, and it has become a classic in its own right. Holmes accused the majority of allowing reactionary economic perspectives to override the clear legitimacy of such legislation. The Court had no right to override the wishes of the majority of citizens as expressed through the legislature, and he decried the interpretation of the Fourteenth Amendment as supposedly enacting “Mr. Herbert Spencer’s Social Statics”—a key text of the era’s social Darwinism.

Public outcry against the Court’s decision came fast and furious, and scholars have largely agreed with Holmes and the other dissenters. Indeed, much of the period from Reconstruction to the New Deal is known as the Supreme Court’s Lochner Era—an age that supposedly witnessed the Court mandating an unrelenting conservatism. Yet while there is much truth to this portrait of the case and the era, other historians have noted that *Lochner* was a strange precedent, applied in a quite haphazard manner as the Supreme Court took up other related cases. Indeed, as early as 1908, the Court seemed to retreat significantly from *Lochner* when it upheld female protective labor legislation in *Muller v. Oregon*, and Holmes and others believed that the Court had effectively overturned *Lochner* in the 1917 case of *Bunting v. Oregon*. Yet, the Court re-affirmed *Lochner* in 1923’s *Adkins v. Children’s Hospital*, and it was not until the New Deal that the New York bakeshop case finally became a dead letter.

LOCOFOCO DEMOCRATS

The term "Locofoco" was used first to designate the radical wing of the New York Democracy, then to refer to radical Jacksonians in other states, and finally as a synonym for the entire Democratic Party. The Locofoco Democrats flourished between 1835 and the early 1840s. Labor unions and labor activists provided much of the leadership, and working-class districts regularly voted more heavily for Locofoco candidates than more affluent areas. The rise of the Locofocos in New York was a direct result of Andrew Jackson’s Bank War, which the future Locofocos had strongly supported. Jackson’s 1833 decision to move federal funds from the Bank of the United States to state banks made banking a more attractive investment opportunity nationwide. In early 1835, the newly elected Democratic majority in Albany, despite heated opposition from Democrats like the newspaper editor William Leggett and various labor leaders, wasted no time in rewarding their friends and supporters with new state bank charters. To their critics, the same political, social, and economic problems would arise from New York’s grant of state banking charters as resulted from the Bank of the United States, namely, the corruption of the political process by cronyism and monopoly power, the raising up of a social elite composed of those able to secure charters, and the inflation and outright fraud suffered by wage laborers owing to the effects of the note-issuing powers of the banks.

At the October 1835 Democratic nominating meeting, the regular Democrats of Tammany Hall forced through their pro-Bank slate of candidates despite the opposition of many at the meeting, whose attempt to offer an alternative ticket was ignored and then cut short when the gas was turned off and the

room plunged into darkness. Ready for this tactic, the insurgents proceeded to light candles with new friction matches, known as locofocos. The Locofoco Democrats then nominated candidates opposed to the rash of state-chartered banks and supportive of hard money, antimonopoly, and labor union rights in general. Though these candidates lost to their regular Democratic opponents, the Locofoco wing of the party had been born.

William Leggett, the editor of the *New York Post* during William Cullen Bryant’s absence, became the tribune of Locofocoism by means of his vitriolic and cogent editorials during the spring and summer of 1835 attacking the charters and other policies of the legislature. Though he was an important intellectual inspiration of the Locofocos, a severe illness in late 1835 sharply curtailed his direct participation in the movement. Instead, the actual leadership was provided by the politician Alexander Ming Jr.; labor union leaders John Commerford, Levi Slamm, and Robert Townsend Jr.; former Workingmen’s Party activists George H. Evans, John Windt, Gilbert Vale, Isaac Smith, and Joel Curtis; and the political economist Clinton Roosevelt.

In January 1836, the Locofocos organized a separate party, the Equal Rights Party, which ran its own candidates as well as fusion nominees with the Whigs. In local elections in April 1836, the Locofocos defeated Tammany nominees for city office and in November elected two candidates to the state assembly. They also elected at least one congressman. However, the Locofocos never intended to build a new party, but to bring the rest of the Democracy around to their way of thinking. After Martin Van Buren’s administration adopted a large part of the Locofoco program, especially its hard-money financial policies, Tammany went along, and after 1838 the Equal Rights Party ran no further separate tickets.

Outside of New York, the term "Locofoco" was used to describe the left-wing tendency within the Jacksonian Democratic Party, particularly in the states of the Northeast, where the labor movement was strongest and bank issues most salient. Throughout the region, attempts at the state level to issue new state bank charters were met with criticism and hostility from those radicalized by the Bank War. In Pennsylvania, for example, Locofocos favored hard-money state-banking reform. Leadership of the Pennsylvania Locofocos was provided by the union leaders John Ferral, William English, and Thomas Hogan; the radical editor Thomas Brothers; and Congressman Henry Muhlenberg, who ran for United States Senate as a Locofoco.

The Locofocos were supporters not only of hard money, but also of antimonopoly generally, and of

the rights of labor in particular. The bank issue itself was a labor issue. Small-scale artisans and others in the “laboring classes” had long criticized the banking system, which they said unduly restricted their opportunities by limiting access to capital to those with wealth or political connections. Further, employers paid wage laborers not in hard specie, but in bank notes that often proved to be fraudulent or worthless. Locofocos believed that a hard-money policy that curtailed the issuance of bank notes, especially in small denominations, would cure these ills. The Locofocos also supported labor’s efforts to attain the 10-hour workday and the right to organize labor unions and strike.

By late 1837, the Locofocos had largely won over the Van Buren administration to their way of thinking, as demonstrated by Van Buren’s presidential message advocating the independent treasury plan, under which the federal government would no longer deposit its funds in private banks, but in its own treasury. Locofoco sentiment was at its high point through 1840, when the independent treasury plan was finally approved by Congress and Van Buren issued an executive order mandating the 10-hour day on federal public works. After the Whig victory in the 1840 elections, however, the radicals gradually lost power in the Democratic Party, owing in part to the issue of slavery, on which the Locofocos split, some calling for abolition while others rejected it.

The Locofoco Democrats are important to labor history because they represent the first instance of a major political party taking the labor movement and its ideas and interests seriously. The Locofocos advanced a broad agenda that was generally very sympathetic to the labor movement, and spoke a language of equal rights and popular democracy that struck a responsive chord in the working class. Their hard-money, prolabor, and antimonopoly policies continued to provide a wellspring of ideas and policies for left-leaning Democrats through the remainder of the nineteenth century.

LONGSHORING

For the most part, longshoring work has been site- and job-specific. At first glance, it appears that longshoring is merely the loading and unloading of ships, whether sail, steam, or diesel. But at each port in the United States and throughout the world, the work has unique qualities and a distinct tempo. Some of this uniqueness is determined by the cargo that is being discharged. Whether it is cotton in New Orleans, iron ore in Detroit, or lumber in Portland, each in its own way prescribes a certain form of labor. Longshoring in various locales has also been affected by the ethnic and racial profile of the men engaged in the work. For every port along the incredible length of the U.S. coastline, there emerged a distinct but fluid racial and ethnic patterning. As the process of longshoring was changed by technological development, new groups undertook the work. In many cases the changing composition of the workforce was a bilateral process, whereby the men decided for themselves who should do what in and around the ship; at other sites it was employers who determined who should work and where.

Just as vital in this evolving story has been a collective sense of community. Unlike many other occupations, longshoring necessarily encompassed gang labor. Such labor created and re-inforced a group ideal, a sense of collective not always experienced by other workers. As will be seen, working in gangs encouraged a form of trust and dependency that could overcome ethnic, and at times, racial differences.

When examining longshoremen chronologically, one is struck immediately by the nearly total absence of colonial or early nineteenth-century studies. Historians have tended to focus their attention on the twentieth century, and such emphasis has left the earlier period relatively unstudied. What is certain is that longshoremen played an invaluable role in the emerging colonial economy and culture. Trade was the lifeblood of the British imperial system. The ports of Boston, New York, Philadelphia, Baltimore, and Charleston were dynamic lynchpins in the economic

and financial success of colonial development. What is evident is that longshoremen held a tenuous social status. Surrounding communities long regarded longshoremen as brutes with no regard for long-term welfare for themselves and their families. They were stereotyped as short-tempered, quick to use their fists, and constantly in a state of near or total drunkenness. Such a perception would continue up to and throughout the twentieth century.

These colonial longshoremen generally lived close to their work, which necessitated obtaining cheaper lodgings along the waterfront. Such living arrangements forced longshoremen to work close in to the bustling environment of a port. Thus, incorporated into the longshoremen's world were heavy and exhausting work, and physical surroundings marked by taverns, brothels, gambling, and opium dens. Many of the longshoremen moved easily to and from laboring jobs along the waterfront. They also moved back and forth over the water's edge. Many were former seamen who wanted to enjoy a spell onshore or because of family circumstances needed to be close to home. Indeed, the job of longshoring has always constituted an entry point for seamen. Crispus Attucks, the first casualty of the American Revolution, was both a seaman and a longshoreman. Killed by British troops during the Boston Massacre of 1770, Attucks had been protesting British soldiers doing jobs normally done by dockside laborers.

Longshoring throughout the United States was structured as casual employment. That is, the men lined up for work every day and were then allocated jobs. Such a casual hiring system was rife with exploitation and danger. It was common to pay a kickback to obtain a job. Other than insecurity of employment, longshoring was an occupation that encompassed diverse job categorization. A myriad of jobs came under the rubric of longshoring. In New Orleans, for example, the job was broken down by skill and race. The highest skilled job was that of cotton screwman. These men packed the cotton bales into the ships' holds using specialized machinery that literally screwed the bales into place. The cotton screwmen's skilled status was predicated on judgment and strength. Each ship had a different size hold, and in some cases, a different shape. The ability of the screwmen to adjust to the differing hold designs ensured their skilled status. Elsewhere in the hierarchy labored longshoremen who loaded agricultural goods. Many of the latter jobs were held by slave and freed blacks.

Each group suffered from the same structural constraints, however. Although pay could vary widely, it was the unpredictability of work that was feared the most. Unlike factory work, the availability of work varied from day to day. The arrival of ships has

always been dependent upon the weather and the tides, and more crushing was the loss of a ship at sea, which reflected back at the dock with a loss of work. It was also a seasonal trade, as in the case of cotton in New Orleans.

Irregular work was a constant theme for longshoremen throughout the United States and the world—they were victims of the vagaries of the sea and weather, and trading patterns. International shippers were always looking for ways to cheapen the costs of transporting their goods. For longshoremen then, work was conditioned by insecurity.

Another common trait of longshoring was that it was an entry job for first-generation immigrants. In San Francisco, for example, Irish immigrants made up the majority of longshoremen at the end of the nineteenth century. Although the dominant group, the Irish composed just 25% of the total workforce. Other principal groups were Scandinavians (17%), Germans (14%), British (6%), and Italians (6%). African-Americans were not a presence at this time, but during World War I and II, their numbers exponentially increased. On the Great Lakes, a similar immigrant profile was clear: Irish immigrants predominated, joined by Swedes, Germans, and French-Canadians.

In New York, African-Americans constituted the largest group of longshoremen up until the 1840s. Once the Irish diaspora grew as a result of the Great Famine, African-Americans were displaced in Manhattan. The Irish then came to dominate the piers along the west side of Manhattan. In Brooklyn, large numbers of Norwegians and Swedes controlled the docks, although there was an Irish presence there also. Immigrant entry to the work was influenced by employer strategy. Beginning in the 1870s, a fledgling union was formed in the Port of New York. To counter this development, shippers and stevedores imported large numbers of Italian-Americans and African-Americans as strikebreakers. Such a tactic dramatically transformed the ethnic and racial profile of New York's longshoremen. By the beginning of the twentieth century, Italians had an entrenched hold on the docks in Brooklyn, Staten Island, and in Jersey City and Hoboken, New Jersey. African-Americans were not so fortunate in establishing control over certain docks. Unable to control a pier or piers, they were left to function as a floating pool of labor. Not for the first time, employers played a significant role in influencing the racial and ethnic makeup of its workforce. A similar racial and ethnic makeup was present in Boston, where Irish dominated, followed by Italians, and a small percentage of African-Americans.

African-Americans were a much larger presence in Philadelphia: by 1910, they composed nearly 50% of

the workforce. Many of these black longshoremen had migrated from North Carolina, Virginia, and Maryland. Following World War I, blacks increased their numbers to over 60%. Some of this increase can be attributed to the Great Migration, during which southern longshoremen migrated to Philadelphia from New Orleans and Mobile, Alabama. The Philadelphia port became a magnet for first-generation immigrants also. The largest ethnic group was the Poles, followed by Lithuanians, Italians, Irish, and Jews.

In the South, however, an ethnically diverse labor force was generally absent. Reflecting a distinct absence of mass migration into the region, the work was dominated by native-born whites and blacks—although in Galveston, Texas, workers of Hispanic origin were present.

In the early twentieth century, most longshoremen worked with little or no union protection. This lack of institutional protection ensured that erratic employment became the norm. Symptomatic of this insecurity was the method of getting work—the “shape-up.” The shape-up was a simple method whereby hiring foremen would pick the men who would work that day from the crowd. Such a system made for rank favoritism and discrimination. It was common on most of the nation’s waterfronts to pay a bribe or kickback to obtain a job. Such a system bred insecurity but also had another effect: it helped maintain a union-free environment. Anyone judged to be a union agitator or sympathizer could easily be ignored at the shape-up, effectively removing them from work and ultimately the docks.

At the beginning of the twentieth century, only a small number of longshoremen had won union recognition. They included Gulf Coast men in New Orleans and Galveston, Great Lakes longshoremen, and a few locals on the eastern seaboard and the West Coast. The principal union at this time was the International Longshoremen’s Association (ILA). Its power base was the Great Lakes, and its first leader was Daniel Keefe. Keefe was instrumental in capturing most of the longshoremen working the ships along the Great Lakes, including Chicago, Cleveland, Detroit, and smaller ports like Marquette and Escanaba. Keefe and his successors were conservative in their dealings with employers and shippers. Reflecting the dominant ideological stream of the American Federation of Labor (AFL), the ILA leaders rarely challenged the status quo. Indeed, Keefe’s comfortable posture when dealing with employers was reflected in his membership in the National Civic Federation. By World War I, the ILA’s center of strength began to shift toward the eastern seaboard as union locals were established in Boston, New York, Philadelphia, and Baltimore.

During this period, the ILA was directly challenged by the Industrial Workers of the World (IWW). Philadelphia longshoremen overwhelmingly supported the IWW. Not until the 1920s was the ILA able to break the IWW’s hold, after importing ILA strikebreakers from New York. On the West Coast, the situation was just as volatile but did not have such a sanguine result for the ILA. The West Coast men vacillated between creating their own organization or a tenuous alliance with the ILA. After a failed strike, a company union was installed. A similar defeat occurred on the Gulf Coast. For decades, longshoremen in New Orleans, for example, had practiced a successful form of biracialism. But a strike defeat in 1923 ended years of union strength and racial compromise. Union strength of the longshoremen fluctuated between union stability on the Great Lakes and expanding representation on the Atlantic seaboard to outright defeat on the West and Gulf coasts.

The 1929 stock market crash and accompanying Great Depression would help transform the situation. The turning point for the nation’s longshoremen came as events unfolded on the West Coast. Longshoremen in San Francisco had long bridled at their lack of trade union protection and being forced to join a company union, the Longshoremen’s Association of San Francisco. A combination of forces transformed the situation in the early 1930s. The passage of the National Industrial Recovery Act (NIRA) gave the longshoremen at least a semblance of maneuverability. The ILA began to challenge the company union, and finally, communists, supported by seamen in the Marine Workers Industrial Union (MWIU), began to actively organize. The key to success, however, was the men themselves and their rank-and-file leaders. Most notably, Australian-born Harry Bridges took the helm. With the issue of union recognition uppermost, San Francisco longshoremen went out on strike in 1934. The strike was a bloody affair resulting in the violent deaths of two strikers. Other San Francisco unions pledged their support for the longshoremen, and threats of a general strike were made. With such an outpouring of support, the strikers won union recognition, but the victory also unleashed a battle within the ILA. The established leadership, dominated by the New York office, preached caution and patience. Led by Harry Bridges, West Coast longshoremen viewed such directives as superfluous. Suspicious of ILA intentions, the men decided to form their own union, the International Longshoremen’s and Warehousemen’s Union (ILWU). This break from the ILA was to become permanent; in the twenty-first century, the ILWU continues to represent West Coast longshoremen.

The example set by the likes of Harry Bridges encouraged others to challenge the conservatism of ILA officials. In New York, for example, members of the rank and file emerged calling for greater democracy within the ILA. Led by Brooklyn longshoreman Pete Panto, the men challenged the ILA leadership of Joe Ryan. Mysteriously, Pete Panto disappeared in 1939, and not until after World War II would the true story of Panto's disappearance become public knowledge. He had been kidnapped by members of Murder Inc., strangled, and dumped into a lime pit in New Jersey. The removal of Panto effectively ended the rank and file's challenge. Unlike their cousins on the West Coast, New York longshoremen would continue to labor without effective union protection. By World War II, the ILA had been captured by rogue criminal elements resulting in poor wages and working conditions.

World War II transformed the work relations on the New York waterfront and elsewhere. Young longshoremen left the docks in droves to join the armed forces. But as the U.S. Army and Navy took ever-increasing control of loading and unloading in the port of New York, a more steady form of employment became the norm. Regular gangs were recognized as being far more efficient than individuals occasionally hired from a shape-up. By the end of the war, over 60% of longshoremen were laboring in regular gangs. Regular employment took away from the ILA and the shippers the power to hire and fire. Gaining expertise on certain cargo lines, the longshoremen in turn could now demand and receive on-the-spot wage awards.

The speed and rhythm of work had, however, increased. Sling loads became heavier, and thus the job was more hazardous. In terms of hours lost due to disabling injury, longshoremen outranked coal miners and were only slightly behind loggers. The most dangerous jobs involved working in the hold: falling objects were one of the major killers of longshoremen. Working on the deck or the dock was also dangerous, where common injuries included crushed hands, feet, and ankles.

Longshoremen throughout the United States adopted a fatalistic attitude toward the hazards of their job. While on the West Coast the ILWU worked hard to improve safety on the job, such activity was noticeably absent on the East Coast and Gulf.

Pilfering cargo was just as common. On ships and docks throughout the United States and the world, longshoremen routinely took possession of such things as candy, liquor, tools, and even food from the ships' galleys. The longshoremen had a sense of entitlement when justifying such action. Contraband was either consumed on board ship or taken off the

waterfront to either be sold or consumed at home. Nicknames tended to be correlated to place of origin, or related to form of dress or food eaten. So, for example, nicknames such as Staten Island Joe and Hoboken Harry were used to identify someone by their place of origin. Others pertained to the food eaten by longshoremen such as "Chicken" and "Cheese," or by their dress; for example, the man who always wore a red shirt to work was labeled as the "bullfighter." The common form of dress, uses of nicknames, and pilferage activities became identifying markers. Such clear markers ensured that longshoremen could recognize one another, both on the job and off.

The longshoring workforce was traditionally an older one. In most of the ports, older men dominated the work. By the late 1940s and early 1950s, the nation's longshoremen still labored with their hands. Winches on board the ships still carried the cargo to and from the hold, but the men continued to use the hook to fill or empty the sling. Younger men did play a large role in changing the trade union culture. This was especially true in New York. Longshoremen returning from the war challenged the established ILA hierarchy and unleashed a series of wildcat strikes that resulted in the end of the shape-up and the establishment of medical centers in Manhattan and Brooklyn. For the ILWU men, their focus was on the deportation hearings of their leader, Harry Bridges.

By 1960, the ILA and ILWU had become established entities in the lives of their members throughout the United States. The year 1960 also represented a turning point for longshoremen. Containerization had become a new phenomenon in their lives. The hand labor of the previous centuries had been replaced by the mechanized loading of vast tonnage. Both the ILA and ILWU negotiated deals with their respective employers guaranteeing protecting jobs while accepting the new technology. The introduction of containerization immediately transformed longshoremen's work. Smaller gangs were needed, and new skills were developed. The crane operator now became the lynchpin in the process. The longshoremen were able to barter certain arrangements where half the gang would work while the other half rested. Also, if the set work was completed before time, the gang was able to leave work but get fully paid. While able to negotiate a semblance of protection, the longshoremen witnessed women entering the job. In 1982, the first woman hired on the West Coast was the daughter of a longshoreman.

Containerization, then, dramatically transformed the longshoring process. Most dramatic of all was its effect on the numbers employed. The number of East

LONGSHORING

Coast longshoremens dropped from 51,000 in 1952 to 15,000 in 1972. Generous retirement payments and incentives convinced many on the West and East Coast to accept redundancy. The job, however, would never take on the earlier qualities of gang solidarity, and traditional longshoring communities faded away.

LORD DUNMORE’S PROCLAMATION

On November 15, 1775, John Murray, the fourth Earl of Dunmore and royal governor of the colony of Virginia, issued a proclamation concerning the ongoing military actions taking place in eastern Virginia. He demanded that all able-bodied white men in the colony rally to his banner immediately on pain of being declared a traitor. Further, Dunmore proclaimed that any able-bodied male indentured servant or slave who was owned by a rebel would be granted his freedom if he ran away to Dunmore and enlisted as a soldier in the loyalist cause.

Context

Colonial Virginia was a slave society, its economy dependent upon the racial and class-based exploitation

of African slaves for its continued existence. By the 1770s, there were close to 190,000 slaves in the colony, composing 42% of the overall population. These slaves primarily worked in the fields growing the staple crop of the Chesapeake region, tobacco. Though tobacco cultivation was becoming less lucrative in the long-settled Tidewater regions, white settlers from these areas were rapidly moving into the Piedmont and the backcountry. These settlers took slaves with them and began replicating the staple-crop, slave society of the Tidewater.

Earlier in 1775, during a period of heightened tension, Dunmore had threatened to grant freedom to the slaves. Slaveholding colonists were worried that slaves might be inspired to revolt anyway. Indeed, slave resistance and running away seem to have increased over the spring of 1775—one group even appeared on Dunmore’s doorstep at the Governor’s Palace in Williamsburg to offer its services. It was not, however, until fighting had broken out between royal troops and patriot militias that Dunmore seriously considered the idea. He signed the proclamation on November 7 but did not issue it until a week later, after his troops had defeated the Princess Anne County militia at the Battle of Kemp’s Landing in southeastern Virginia.

Slaves

Roughly 1,000 slaves escaped bondage by joining Dunmore. About half were women and children—expressly not covered by the terms of the proclamation. The freedmen and freedwomen served Dunmore’s army as sailors, foragers, and most notably as soldiers. A special “Ethiopian Regiment” was formed. The freedmen wore badges with the legend “Liberty to Slaves”—a direct response to their former masters, whose uniforms bore the slogan “Liberty or Death.”

The vast majority of slaves did not run away to Dunmore’s army. Many seem to have chosen instead to stay together with families and communities. Dunmore’s decision to offer freedom only to able-bodied men certainly caused fewer to join him than might have if emancipation had been offered to all slaves. Some, likely, were suspicious of such a limited declaration and chose the devil they knew over the one they did not. Dunmore’s influence was also largely limited to the Chesapeake Bay region—it would have been difficult for slaves from the Piedmont to have both heard about the proclamation and to have made their way across hostile territory to reach Dunmore’s camp.

Nevertheless, there is no doubt that Dunmore's proclamation influenced slaves both in Virginia and through the southern colonies to resist their patriot masters, lending outside support to an internal rebellion that the slaves had already begun.

Masters

On the other hand, the white population of Virginia found itself polarized by Dunmore's proclamation. The threat of a full-scale slave rebellion, while always in the background, now seemed closer than ever. Neutral and loyalist white Virginians quickly joined the patriot cause.

Whites in Virginia and beyond feared that slaves across the South would hear of Dunmore's proclamation and be inspired to revolt. Maryland cut off all communication with Virginia to prevent this event, while in North Carolina militias mustered with the dual objects of opposing a British incursion from the north and of apprehending Dunmore agents rumored to be working to incite slaves in that colony. In South Carolina, whites attributed the growth of a runaway population on Sullivan's Island to the effects of Dunmore's proclamation.

Significance

Across the colonies, whites assumed that Dunmore's radical proclamation would be rescinded by the Crown. When George III refused to recall the proclamation and remove Dunmore as governor, it became one of the final pushes toward independence. Indeed, the general complaint that the king had inspired "domestic insurrections"—a direct reference to the slave revolts of 1775—became the crowning grievance of the Declaration of Independence.

A historiographical shift in our understanding of Lord Dunmore's proclamation has taken place over the past several decades. The central point of this shift is the question of slave agency and slave resistance. Earlier authors (Selby, Quarles) have seen the proclamation as providing an inspiration for slaves to escape. More recent works (those by Frey and Holton) argue the reverse: slaves were resisting their masters before and during the events leading up to Dunmore's proclamation. It was this insurgency that persuaded Dunmore to issue his proclamation—he knew that slaves would respond to his call. Thus, slave resistance led to Dunmore's proclamation, not the other way around.

Further, this recent re-interpretation of Dunmore's proclamation supports a progressive reading of the Revolution. In Virginia, Holton and Frey argue, the Revolution was a class war: not between great planters and yeomen farmers but between slaveowners and slaves.

LOUISIANA FARMERS' UNION

The Louisiana Farmers' Union was an organization of small farmers, tenants, and wage laborers that sought to improve conditions for rural workers in the state's sugar and cotton plantation regions in the second half of the 1930s. Although the union achieved some gains, its interracial makeup, communist affiliations, and the threat that it posed to the plantation system provoked violent responses from landowners and local officials. This repression, along with changing economic conditions during World War II, contributed to the union's demise in the early 1940s.

In the early twentieth century, rural workers in Louisiana were among the most poorly treated laborers in the nation. Sharecroppers and tenants in the cotton-producing parishes worked land owned by their employers in return for a portion of the income from the crops they produced. They received payment only once per year, after the crops had been harvested and sold. Lacking cash, they relied on landlords or local merchants to provide them with seeds, fertilizer, food, and other necessities throughout the crop

season. The costs of these supplies (plus interest) were deducted from their payments at settlement time. In the sugar parishes, tenant farming was less common, and planters relied on wage laborers, who were paid more regularly throughout the year. However, payment was often in scrip redeemable only at the plantation store. Both systems were vulnerable to abuse by employers, and many planters used their control over prices, credit, and accounts to cheat workers out of their earnings. The housing provided for workers on most plantations was also substandard, often consisting of leaky shacks with no electricity or indoor plumbing. White supremacist ideologies and the South's Jim Crow system of racial oppression helped to justify and maintain the conditions endured by the predominantly black workforce. If plantation laborers complained, they risked economic or physical reprisals from landlords or police.

In 1931, the Communist Party began organizing black sharecroppers in the South in an attempt to transform them into a revolutionary vanguard. Party activists soon learned that the region's rural workers were more interested in gaining concrete improvements in their living and working conditions than in overthrowing the government. Organizers in Alabama encouraged local people to form the Share Croppers' Union (SCU) and use collective action to put pressure on plantation owners. Planters retaliated by evicting, beating, and lynching union members. Seeking a more hospitable environment, the union moved its headquarters to New Orleans in 1936. The New Orleans office was run by a small group of communist and left-wing activists that included Clyde Johnson, a Communist Party member from Minnesota; Gordon McIntire, a Texan who had attended the left-leaning Commonwealth College in Arkansas; Clinton Clark, a native of Louisiana and former sharecropper; and Peggy Dallet, another Louisianan who had helped to organize local chapters of other liberal and leftist organizations. Most of the group were in their early 20s, and Clinton Clark was the only African-American among them.

After the move, union leaders sought to further strengthen the organization by forming alliances with other farmers and workers unions. Johnson believed that joining forces with the larger National Farmers' Union (NFU) might provide some protection for union members, and in 1937, SCU locals began transferring into the NFU. The Louisiana locals became the Louisiana Farmers' Union (LFU), a state division of the NFU. Although the union welcomed white people as well as African-Americans, most of its members were black.

Local leaders and activists played important roles in the LFU. Organizers encouraged them to write to

the central office about their problems and published members' letters in the union newspaper. The union's rank and file frequently made suggestions for action and debated new policies at the local level before decisions were made at state conventions. Union activities addressed long-standing grievances of rural black people, such as low pay, unfair crop settlements, inadequate school facilities, and exclusion from political participation.

To combat planter abuses of the tenancy system, the LFU offered literacy and math classes for members and lobbied federal officials to require written contracts between landowners and their employees when they participated in the new farm subsidy programs established during the New Deal. Union representatives attended hearings held by the Department of Agriculture to determine wages and conditions in the sugar industry and persuaded government officials to require modest increases in pay for plantation workers each year. The union also helped members obtain loans and other assistance for low-income farmers offered by the Farm Security Agency (FSA), providing a chance for them to achieve farm ownership and economic independence. Many locals attempted to improve educational facilities in their communities by raising money for buildings and equipment and pressuring school boards to provide more funding. The LFU also joined with other rural unions in the 1930s to advocate greater participation by poor farmers in setting policy and administering government farm programs.

Like their counterparts in Alabama, plantation owners in Louisiana responded to union organizing efforts with intimidation and violence. Local newspapers accused the union of fomenting class warfare and highlighted the participation of black people and communists in an attempt to discredit it. Employers threatened to evict workers or physically harm them if they joined the union. Police and local officials arrested and harassed union members, and in June 1937, local leaders Willie and Irene Scott had to temporarily flee their home in West Feliciana Parish to avoid being lynched. Activists organized to protect themselves and fight back against the violence, forming armed guards to protect their homes and families. Nonetheless, repression took its toll, and fear of reprisals prevented many people from becoming involved in union activities.

After growing to about three thousand members by 1940, the LFU began to lose support and resources as the nation prepared for and then entered World War II. The poverty of its members and their irregular dues-paying habits meant that the union relied heavily on outside contributors to fund its activities. Most donations came from liberals and other

sympathizers with left-wing causes, many of whom were angered by the union's stance on the war in the late 1930s and early 1940s. In keeping with the Communist Party line, LFU leaders advocated neutrality in the European conflict until Germany invaded the Soviet Union in June 1941. Party activists then switched to all-out support for the fight against fascism, refocusing their attention away from the rural South and further undermining the LFU.

Economic changes wrought by the war also contributed to the union's decline. New jobs in construction and defense industries drew many of the LFU's rural poor constituents away from the plantations. Landowners responded to the loss of their cheap labor supply by mechanizing as many operations as possible or by switching to livestock farming and other activities that required fewer workers. In the next few decades, the old plantation system gradually disintegrated, displacing thousands of rural workers and leading to increasing out-migration from the rural parishes. The political and economic shifts of the 1940s left few active LFU members by the end of the war. Although some locals may have continued to hold meetings, official union activity ceased after the mid-1940s.

For a brief period, the LFU provided a vehicle through which black plantation workers in Louisiana challenged the power of their employers and struggled against the system of white supremacy that kept them poor and oppressed. It brought improvements in the lives of many of its members in the form of higher pay, increased access to educational opportunities, and political empowerment. Perhaps more important, union activity was part of an ongoing fight for freedom and justice by African-Americans that continued beyond the 1940s. In the 1950s and 1960s, former LFU members were among the black farmers, workers, homemakers, and students who participated in the civil rights movement in Louisiana and helped to bring an end to the Jim Crow system.

LOUISIANA SUGAR STRIKE (1887)

The Louisiana Sugar Strike was carried out by overwhelmingly African-American wage workers on sugar plantations in southern Louisiana, organized by the Knights of Labor, in November 1887. It resulted in the infamous “Thibodaux Massacre,” in which a large number of strikers and organizers were slain. Among the most violent labor episodes nationally during the Gilded Age, the massacre culminated labor conflict on sugar plantations since the abolition of slavery and precluded further efforts to organize sugar workers until the mid-twentieth century.

The strike's origins can be traced to the slave era. During the nineteenth century, sugar plantations dominated the alluvial lands along the Mississippi River and numerous bayous. Sugar production required large concentrations of land, labor, and capital, and sugar planters ranked among the South's wealthiest slaveholders. Sugar making also gave rise to large, complex slave communities and a well-defined division of labor. The fall harvest necessitated a disciplined labor force to toil intensively yet with clocklike precision. The uncompromising nature of sugar production, which was a semi-industrial endeavor, and the delicate equilibrium of plantation routine caused contemporaries to liken sugar plantations to “factories in the field” and gave them their well-deserved reputation as death traps for slaves.

The federal capture of New Orleans during the Civil War led to the implementation of monthly wage labor. Responding to the breakdown of plantation discipline following their arrival, federal officers improvised a system in which workers received monthly wages and basic necessities. By war's end, wage labor was firmly entrenched on sugar plantations, and former slaves continued to work in gangs under white supervision. During the war, half of workers' wages had been withheld until completion of the crop, in order to secure planters sufficient labor, and this practice continued into the 1870s, despite workers' objections. Conflict also arose over wage rates, working conditions, provisioning, and other matters. In constructing the new labor system,

workers benefited from the exigencies of sugar production, the emergence of a functioning labor market, and their own political empowerment during Radical Reconstruction, but conflict and occasional violence characterized relations between planters and workers.

Although workers by the latter 1870s had secured full monthly wage payment and other favorable terms, the end of Reconstruction in 1877 strengthened planters by placing the state's coercive power at their disposal. Responding to dramatic changes in the world sugar market and to their own economic woes, planters lowered wages during the early 1880s and replaced cash payments with nontransferable plantation scrip. By the mid-1880s, the Knights of Labor—which first began unionizing railroad workers in Morgan City, a transportation hub west of New Orleans—was tapping into sugar worker discontent and organizing locals along Bayou Teche in St. Mary Parish and along Bayou Lafourche in Assumption, Lafourche, and Terrebonne parishes. In fall 1887, predominantly white labor leaders called for wage increases and abolition of scrip payment, and they set a strike deadline for November 1, around the traditional start of the harvest. As former slaveholders and as men of property, planters adopted a hard line—refusing to negotiate, vowing to evict strikers from their estates, and calling upon local and state authorities for assistance.

On November 1, some 10,000 workers along Bayous Teche and Lafourche went on strike. Most plantations remained idle, although some operated with white labor from New Orleans. A state militia detachment and several paramilitary groups arrived in the Lafourche Parish town of Thibodaux. Sheriffs' posses were organized, and local white men deputized. Planters evicted strikers and their families, many of whom congregated in Thibodaux and other towns. During the next three weeks, as attempted negotiations failed, tensions increased and the situation became more volatile. Sporadic violence also occurred. Strikers in several instances allegedly shot into operating sugar mills. During a "riot" in one St. Mary Parish town, whites killed several strikers. Newspapers fanned the flames of racial and labor conflict. Since the state militia could not remain on duty indefinitely, it eventually withdrew and was replaced by posses and paramilitary groups from as far away as Shreveport. On November 21, in response to continuing "lawlessness" and to rumors of strikers' plans to attack Thibodaux, the parish judge, Taylor Beattie, a former Republican, declared martial law in the town. Pickets were established, but tensions further heightened.

In the early morning of November 23, shots were fired at a picket guard. This so-called attack

precipitated a frenzy of violence, which lasted for the next three days, by various white forces against black strikers and Knights organizers. "Instigators" were identified and singled out for especially brutal treatment. State militia units returned to Thibodaux but did little to stop the slaughter. By November 25, the worst was over, although whites continued to comb the woods and swamps for strikers and labor leaders. Shots rang out for several more days, and bodies turned up weeks later. There was no official estimate of the number of casualties. Press reports, which downplayed violence against blacks, conceded at least 30 black fatalities, although some local white residents privately admitted that more than 50 strikers died. It became part of the oral tradition of the black community along Bayou Lafourche that the total number of casualties—killed, wounded, and missing—numbered in the hundreds.

The massacre ended both the strike and the Knights of Labor's organizing efforts in the sugar region, as the defeated sugar workers returned to the plantations on their employers' terms. Although planters would continue in the years ahead to bemoan their inability to control labor, and although employers could not exercise the same authority over free workers as masters had over slaves, black people in southern Louisiana were left with few alternatives to the plantation economy. In a few short years, moreover, a white supremacist social order characterized by legal segregation, disfranchisement, and racial violence would emerge. The 1887 sugar strike was but one among a number of setbacks suffered by the Knights of Labor that contributed to its ultimate demise, and not until the 1940s did a national labor organization again attempt to unionize black workers on southern Louisiana sugar plantations.

LOVESTONE, JAY (1897–1990) Communist Party of America

Jay Lovestone, a leading Communist and then Communist oppositionist for nearly two decades before World War II, emerged in the postwar era as the major architect of the AFL-CIO's anti-Communist foreign policy through his leading of the federation's International Department until his retirement in 1974. Born Jacob Liebshtein in czarist Russia in 1897, his family immigrated to New York 10 years later, settling on New York's Lower East Side before moving to the Bronx. Graduating from City College after only three years in June 1918, Liebshtein had been radicalized in college, becoming the president of the Intercollegiate Socialist Society. Formally changing his name to Jay Lovestone upon becoming a naturalized citizen in February 1919, Lovestone, who had been an antiwar Marxist and identified with the Socialist Party of America's (SPA) left wing, expressed political sympathy with the Bolshevik Revolution. When the SPA split in late summer 1919, he joined the Communist Party of America (CPA) at its founding convention and was elected to membership on the party's Central Executive Committee.

Becoming a protégé of the CPA leader, Charles E. Ruthenberg, with the formation of the legal Workers Party, at the end of December 1921, Lovestone edited the party newspaper, *The Worker*, and quickly rose through the ranks, putting in countless hours under Ruthenbergs' tutelage. As one of the leaders of the American Communists and of the Ruthenberg Caucus, Lovestone traveled in January 1925 with his mentor and factional rivals, William Z. Foster and James P. Cannon, to Moscow so that the Communist International's American Commission could attempt to resolve the two groups' differences, which was not achieved. However, at the Workers Party convention in August 1925, the Ruthenberg Caucus, of which Lovestone was a main organizer, gained control of the party with the help of Moscow.

Throughout 1926, Lovestone worked diligently to bolshevize the American party. When Ruthenberg died in early March 1927, Lovestone was elected acting secretary, although the Foster-Cannon faction was not willing to concede the party's leadership to the young leader without a fight. After defeating his rivals at the convention in late summer 1927, Lovestone obtained strong control of the organization. Lovestone's leadership tenure would last less than two years. After the October 1928 expulsion of the Trotskyists from the party, Lovestone was expelled eight months later, with Moscow's blessing, at the end of June 1929 for supporting Bukharin and the policy of "American exceptionalism." Fellow Lovestoneites were purged by the end of August 1929.

Upon his expulsion, the inveterate Communist immediately organized a rival political organization in 1929, first named the Communist Party (Majority Group) and later the Communist Party (Opposition). In the organization's newspaper, the *Revolutionary Age*, later renamed the *Workers Age*, the Lovestoneites supported the Soviet Union while calling for more freedom for foreign Communist parties. Through Lovestoneite activity in the International Ladies' Garment Workers' Union (ILGWU) in the early 1930s, Lovestone developed close relations with and became an advisor of David Dubinsky, the union's president. Lovestone and his followers also became influential in the United Auto Workers, with more than a dozen serving in President Homer Martin's administration in the late 1930s.

Disheartened by Bukharin's execution in 1938 and disillusioned by Moscow's treatment of the Workers' Party of Marxist Unification (*Partido Obrero de Unificación Marxista*—POUM) during the Spanish Civil War, Lovestone formally broke with Communism and the Soviet Union in 1939. In response, he transformed his party into a democratic socialist organization, the Independent Labor League (ILL). However, the ILL survived for less than two years before being dissolved by Lovestone at the end of December 1940.

In 1941, without an organizational home or job, Lovestone was chosen by Dubinsky to run the labor division of the New York chapter of the Committee to Defend America by Aiding the Allies (which later changed its name to Citizens for Victory). This position, which he held through 1943, required Lovestone to get the U.S. trade union movement to support FDR's efforts in aiding the British; after Germany's invasion of the Soviet Union in June 1941, Lovestone was responsible for delivering labor support to Russia.

Introduced by Dubinsky to George Meany in 1941, the American Federation of Labor (AFL)

secretary-treasurer at the time, later to become the AFL president and the first AFL-CIO president, Meany selected Lovestone to run the federation's foreign affairs. Beginning in 1944 until his forced retirement in 1974, Lovestone led the AFL's, and then after the AFL-CIO merger in 1955, the combined federation's foreign affairs activities. As executive secretary of the Free Trade Union Committee (FTUC), formed at the 1944 AFL convention "with the mandate of assisting free unions abroad," Lovestone operated this group out of the ILGWU's headquarters in New York with only two assistants, working quietly behind the scenes becoming "one of the masterminds of the Cold War" (Morgan, p. 144).

In the immediate postwar period, Lovestone toiled diligently to prevent the European trade unions from becoming Communist-dominated. For example, in France, Lovestone attempted to split the Communist-led *Confederation Generale du Travail* (CGT) by financially supporting the anti-Communist *Force Ouvriere* and sabotaging CGT-directed strikes in 1947 and 1948. In Italy, Lovestone successfully adopted a similar strategy of dividing the major trade union federation, the CGIL, controlled by the Communists and Socialists, in the late 1940s. In addition, under Lovestone's tutelage, the FTUC promoted its anti-Communist agenda in the 1950s and 1960s in unions of African and Asian nations, such as Tunisia, Morocco, Algeria, and India, many of which were beginning to emerge from colonialism.

Not surprisingly, Lovestone strongly backed U.S. involvement in Vietnam throughout the 1960s and 1970s, working with and financially supporting the anti-Communist Confederation of Vietnamese Labor (Confederation Vietnamienne du Travail—CVT). He even helped to organize the prowar demonstration among 100,000 construction workers in New York in late May 1970. Although Lovestone supported Nixon's foreign policy, he would renounce him for his opening to Communist China later in the 1970s.

There is no doubt that Jay Lovestone was a controversial figure in the U.S. trade union movement. To those anti-Communist Cold Warriors found in the upper echelons of the AFL-CIO, Lovestone was undoubtedly viewed as an unsung hero for the role he played in combating Soviet influence in the world's trade unions. However, for others, his legacy is viewed considerably more negatively. By turning the U.S. trade union movement into an instrument of government policy and for sabotaging other nations' unions that derived legitimate support from workers, Lovestone's actions demonstrate how the Cold War divided the working class to capitalists' benefit.

LOWELL FEMALE LABOR REFORM ASSOCIATION (LFLRA)

The Lowell Female Labor Reform Association (LFLRA) formed in the winter of 1845 with 13 officers and two additional members drawn from the thousands of young women who then filled the textile mills of antebellum America's most famous industrial city. By spring, the association's ranks swelled into the hundreds, under the dual mottos of "Try Again" and "Union, for Power." Sarah Bagley, the association's president, stated that the organization's purpose was to give workingwomen a sense of both personal autonomy and collective responsibility to defend themselves from the increasingly exploitative conditions of factory labor. Workers needed not only to speak out against the injustices of the factory system, but also organize to fight those inequities and take back control of their labor. The association, clearly seeing links between gender and class on shop floors where male overseers always supervised female workers, insisted that female factory operatives had to challenge male corporate power, which had expanded virtually unchecked since the city began to produce cloth in the early 1820s. Yet, despite sometimes fiery rhetoric and bold assertions of women's rights to organize and agitate in public, this organization rarely made a sustained effort to confront directly the terms of industrial capitalism.

The LFLRA was one of the first stable organizations of female operatives in the nation. These women, who had often been excluded from workingmen's groups, helped publish the *Voice of Industry* and a widely circulated series of "Factory Tracts." The association also sponsored an industrial reform lyceum and various fairs and rallies to publicize its messages and raise money. Perhaps most important, this organization became an influential force in the campaign for a 10-hour workday through its publications, petition drives, and even testimony before the

Massachusetts legislature. In fact, the association's peak years of activism—1845 to 1847—parallel the high point of 10-hour agitation in that decade. The fortunes of both these crusades were intimately linked, and they rose and fell together.

The LFLRA, with Bagley at the helm, tried to steer a middle course between agitation and restraint in the campaign for labor reform. Unlike many antebellum craft unions, this association was filled with semi-skilled operatives who had little or no organizational experience or individual bargaining power, and hence received no meaningful recognition from management. Thus, the group did not propose any work rules to control production processes, or hiring procedures to regulate labor recruitment, or standard lists of piece rates to maintain wages. Moreover, the association's constitution called for strikes only as a last resort. The organization did not want to renounce this weapon, but there seemed to be a general agreement among most Lowell workers in the 1840s that strikes were not the most effective means to change the workplace. Therefore, the LFLRA, despite its frequent scorching public pronouncements against corporate abuses such as long hours, wage cuts, and increased workloads, did not direct any major walk-outs. Many women came to see the organization as a mechanism for airing their grievances forcefully and publicly and securing their rights through popular pressure and political activism, while at the same time avoiding direct conflict with overseers and mill owners.

Interest in labor reform associations spread to female operatives in other industrial cities. Larger factory communities may have been particularly conducive to organizing such groups because the sheer number of young female workers in these mills made collective protest a more realistic option for aggrieved employees. Workers in Manchester, New Hampshire, organized their own Female Labor Reform Association, as did operatives in nearby Dover and Nashua, and in the Massachusetts seacoast city of Fall River. The LFLRA's secretary, Huldah Stone, corresponded with these other groups and offered a vision of solidarity among women workers that transcended any one location, occupation, or industry.

Yet ironically, as the LFLRA and its sister organizations became better coordinated and perhaps better able to protest more forcefully at the point of production, they also remained cautious and continued to channel their efforts into petitions and publications. They still avoided strikes, perhaps because they now worried about compromising the very organizational structure they had built up. So, the LFLRA remained more outspoken than many workmen's groups in its written demands for significant

reforms in the factory system, but these women rarely engaged in direct confrontation with corporate power to press those demands.

As female operatives became more involved in these local labor reform associations, and eventually in regional organizations such as the New England Workingmen's Association (NEWA), they faced new challenges to their arguments for women's activism. Sarah Bagley, when she addressed the NEWA in May 1845, defended the right of women to speak publicly for themselves, even as she re-assured her mostly male audience that female activists would not threaten the men's sphere of power and politics. Bagley wedded her crusade for workingwomen to more traditional concepts of female nurturing and morality so as not to jeopardize the support of workingmen by making her demands seem too strident. She made the fight for labor reform, whether women acted on their own or in support of men, a key to protecting women's health and dignity. Those who protested did not violate ideals of female modesty; they defended women's true virtue from the encroachments of greedy factory owners.

By January 1847, just two years after its founding, the LFLRA transformed itself into the Lowell Female Industrial Reform and Mutual Aid Society. The association's name change was more than cosmetic; it reflected a deeper shift from a group centered on workingwomen's own agenda for labor reform, to an organization devoted to bringing middle-class notions of moral uplift to female operatives. The new society was not necessarily a wholesale capitulation to pressure from management, or to possible divisions within the women's own ranks. But the new group did prove to be even more cautious in its public actions and often quite limited in its critiques. The emphasis was now, more than ever, on ideals of female friendship and nurturing. Labor reform was now to be found in "the elevation and cultivation of mind and morals" and in this society's relief programs for destitute and lonely workers. The goal was to connect middle-class ideals of respectable womanhood with a working-class ideology of collective action and the dignity of labor. Yet this society never clearly explained how it would reconcile those divergent ideas into one unifying organizational philosophy. By the end of the decade, perhaps burdened by these internal contradictions, the society had disbanded.

LOWELL TURNOUTS (1834, 1836)

In the winter of 1834, and again in the fall of 1836, thousands of young women workers walked off their jobs to protest wage cuts in the textile mills of Lowell, Massachusetts. The sight of female factory operatives taking to the streets in protest over their working conditions, in the midst of antebellum America's "model" industrial city, sent shock waves through counting rooms and drawing rooms across the nation. Managers may have aimed deliberately at the reduction of women's wages because they assumed these women would accept such cuts meekly; these men were gravely mistaken. The walkouts, some of the largest yet organized by American workers, served notice that the Lowell "mill girls" were also the "daughters of freemen"—willing to stand up for what they saw as the very rights their fathers and grandfathers had fought for not so long ago. Without a personal artisanal background to draw on, these women tapped into the inheritance of their forefathers' republican status—they organized themselves as workers to protect the legacies of their middle-class family roots.

The 1834 turnout began on a Friday evening, February 14, with the dismissal of one worker. But she was no ordinary factory hand, and the strike was not an entirely spontaneous action. This woman had already spoken up at several meetings where workers complained about a 15% pay cut scheduled to take effect on March 1 and signed pledges to quit work when wages were cut, or pay a \$5 fine for going back on their word. She urged her fellow operatives to give their notice to quit, withdraw their savings from local banks, and return to their country homes (if they could). After she learned of her discharge (which she may have been expecting) and received her pay, she waved her bonnet in the air to signal other workers looking into the office windows. Her compatriots immediately left their looms and spindles, gathered round their fired comrade, formed a procession of nearly eight hundred workers, and marched through

the city drawing out other employees from all the mills.

By the following day (Saturday), the protesters' ranks were reported to be over two thousand strong. Strike leaders issued a proclamation rooting their actions in the traditions of the American Revolution and pledging themselves to the ideals of solidarity and mutual assistance. The issue at hand was more than a matter of wages and money to these women. Yes, they had to preserve their economic rights as free labor; they deserved to be treated with respect and paid a just wage for their daily toil. But they also believed that it was imperative for all of them to band together to guard their political rights as citizens of a free republic (though they could not vote); they deserved to be recognized as the moral equal of any male overseer or owner. Furthermore, a worker's fundamental equality and independence was a right due all honest American workers, not a favor to be bestowed or removed at management's discretion. And these women saw a clear connection between asserting their status as American citizens and preserving their respectability as women. For only a free female operative paid a just wage could hold herself above any potentially contaminating influences in the factory.

Although the strike began with bold assertions of workers' unity and appeals for respect, the protesters' fervor subsided quickly. Advanced planning and enthusiastic rallies were no match for corporate wealth and power. The overall economic climate was sluggish, and the corporations seemed in no hurry to make concessions to resolve this disruption in production. The operatives discovered, by Monday, that they were the ones who would have to move rapidly if they wanted to protect their jobs. New recruits already streamed into the city inquiring about the jobs left open by strikers, several leaders were summarily fired, and others returned to work at the reduced wages.

But life in Lowell did not return immediately to the status quo. Some strikers left the company boardinghouses and rented their own quarters; others demanded that the banks pay out their accounts in cash and made good on their plans to hire wagons that took them back to their rural homes. One former overseer recalled that in some mills there were looms that lay idle until September 1835.

In October 1836, operatives in Lowell again turned out over the issue of declining wages. Actually, in this instance, the workers' boarding charges went up without any corresponding raise in pay, and the net effect was a decrease in earnings. Harriet Hanson Robinson, who wrote a book about her childhood in Lowell (*Loom and Spindle*), reported that the strike spread from room to room, and mill to mill. Protesters again

tried to do some advanced planning and targeted vulnerable areas in the production process, knowing if they shut down particular rooms, then the whole factory would have to stop running. For example, weavers—though they were relatively well paid and felt the increase in boarding costs less—were also well organized and led many facets of the walkout. They urged other workers to leave their departments; if enough workers joined in, even if they did not compose a majority of the workforce, they could still shut down the mills. Eventually, 1,500 women walked out and formed a procession through the city streets. The marchers did not have banners or music, but they sang their own songs.

This walkout proved to be a harder-fought battle than the 1834 protest. Once again, thousands of women assembled to hear speeches about their rights as the daughters (or more likely, granddaughters) of revolutionary patriots. Many operatives held out for more than two weeks. There were reports that a “Factory Girls’ Association” had formed and quickly enrolled 2,500 members. The organization demanded that manufacturers communicate with its officers and that no sanctions be taken against any members. Yet some strikers did face corporate reprisals. And after a month of agitation, the strike concluded much as the one in 1834 had. Some workers left the mills altogether and returned to their families; other straggled back to their jobs under the new rates. But one observer did report a crucial difference: this time, the corporations rescinded the board increase for workers paid by the day. Thus, about 40% of the women employees (those paid a daily wage) did win their basic demand. In this instance, the mills were faced with thousands of strikers and a shutdown dragging on for weeks in the midst of a sales boom. So, the owners may have been more anxious to settle this dispute than they had been two years earlier, and more willing to show some flexibility in making modest concessions.

The mill operatives of Lowell, in the turnouts of 1834 and 1836, protested as workers, as women, and as the “daughters of freemen.” The strikers, usually living on their own away from their families, still invoked strong images of their personal heritage in defense of their bold actions. Their rhetoric and conduct displayed a radical new vision of women’s power through public protest, embedded in a language of traditional rights inherited through their patriarchal lineage. Patriotism meant fighting for fairness, not blind obedience to those in authority. Militancy was a necessary tool to secure liberty and protect status. The strikers demanded that the historical ideals of respect, justice, and equity be honored within the new factory system. And they insisted that they would not play the role of dutiful daughters for any

substitute father-manager in the scheme of corporate paternalism. Rather, they would take the lessons of discipline and interdependence learned in the mills and use those principles to build networks for collective protest. Thus, these strikers drew on the ideology of republicanism, citizenship, and self-determination—all patriotic, mainstream democratic themes—blended with the language of class- and gender-consciousness and solidarity to support their struggles as workers and as women.

LOYAL LEGION OF LOGGERS AND LUMBERMEN

The origin of the Loyal Legion of Loggers and Lumbermen began with the 1917 Pacific Northwest lumber strike. By August of that year, 50,000 lumber workers shut down approximately 75% of the industry region-wide. The primary issues for the workers involved their demands for an eight-hour day, wage increases, and improvement in living conditions in logging camps. Employers were most intransigent over the eight-hour day. Even though striking workers were forced to return to the logging camps and lumber mills, the Industrial Workers of the World (IWW) and American Federation of Labor (AFL)—both of which had competed for leadership of the strike—urged workers to “strike on the job.” This tactic of working only eight hours a day and intentionally slowing down on the job severely reduced production.

The federal government grew concerned over the low production of lumber and decided to act. Lumber, especially spruce, was a primary manufacturing material for building military aircraft. In early October, the War Department dispatched Colonel Bryce P. Disque to investigate the production problem and to find a solution that would meet the military’s needs. After consulting with members of the academic community, labor leaders, and lumber company owners in the region, Disque came to the conclusion that

the continuing problems of labor unrest were caused by difficult working conditions, low pay, and the lack of an eight-hour day among the lumber industry's workforce. Disque's plan was to use federal troops to begin logging operations in the spruce timber region of the Pacific Northwest and to create an organization to deal with the industry's labor-management problems. It was necessary for Disque to get as many lumber company owners to agree to this scheme as possible. With a sufficient number of them giving their approval, the War Department allotted him 100 officers and 25,000 troops to staff his Spruce Production Division (SPD). In order to solve the long-term problems of the industry as a whole, however, Disque established the Legion. This organization was designed to provide a forum for workers and employers to resolve disputes in the industry. The federal government and lumber company owners considered the SPD to be a temporary wartime measure. They considered the Legion as a possible permanent solution to industrial unrest. By December, the Legion grew in membership as loggers, mill and kiln hands, and employers joined. Its membership peaked by the war's end with more than 100,000 members and over 1,000 locals. The membership was primarily native-born men, though a small number of immigrants and women were also members.

Soon after the creation of the Legion, the issues that caused the strike and that continued to plague the industry were brought up at local meetings. In early 1918—at Disque's urging—employers began to implement the eight-hour day in an effort to bring their operations to normal production levels. On March 1, 1918, Disque, after receiving agreement from two hundred representatives of the Pacific Northwest lumber industry, declared the eight-hour day, the 48-hour workweek, and time and a half for overtime in effect throughout the Pacific Northwest. Living conditions and wages also improved over the course of 1918. These improvements in working and living conditions severely weakened the organizing efforts of the IWW and AFL.

At the end of the war, Legion locals overwhelmingly voted to continue the organization. Members elected delegates from each local to represent them at the district boards. Both worker and employer delegates were chosen by the boards to serve at the Headquarters Council, headed by Colonel Disque. Funding for the Legion came from member dues and contributions from employers. For several years, the organization remained a strong force in the region's timber industry. Locals could be found throughout the Pacific Northwest, including northern California. The Legion's constitution stipulated that locals elect a special committee for negotiations and grievance issues with

employers. The organization established a wage scale and continued to support the eight-hour day. It also published a bulletin and other periodicals.

Nevertheless, membership began to dwindle as employers grew less supportive of employee participation. The experiment in employer and employee collaboration in such an organization revealed its limits with workers' concerns over wages and working conditions in conflict with employers' concerns over profits and production levels.

By 1921, the Legion had a membership of just 10,000, never rising above that number throughout the decade. In 1935, a major strike again gripped the region. At first, the Legion opposed the strike but later demanded a wage increase, thus further alienating employer support. The final end came with the Supreme Court decision upholding the Wagner Act (1935). The act re-invigorated AFL organizing in the timber industry. The new Congress of Industrial Organizations (CIO) also proved too competitive for the Legion. Even the last-ditch effort to remove employer members, accept the right to strike, and change the organization's name in order to meet the recognition requirements of the National Labor Relations Board (NLRB) could not save the Legion from extinction.

LUCIA, CARMEN (APRIL 3, 1902– FEBRUARY 1985) Union Organizer

Carmen Lucia was a lifelong unionist who organized workers across the United States. Joining the Amalgamated Clothing Workers of America (ACWA)

at age 14, Lucia became a tenacious organizer for the United Hatters, Cap and Millinery Workers International Union (UHCMW), affiliated with the American Federation of Labor (AFL). While working for the UHCMW, Lucia led numerous organizing drives, became one of the union's first female vice presidents in 1946, was appointed a labor delegate to France in 1950, and participated in education, health care, women's rights, and other humanitarian causes.

Two years after her birth in Calabria, Italy, in 1902, Lucia's family immigrated to Rochester, New York, where several relatives had already settled to work in the city's thriving garment industry. Raised in Rochester, Lucia's worldview was shaped by her father's periodic layoffs at Stein-Bloch garment factory and, later, by his membership in the ACWA. Additionally, she was influenced by her older brother's experiences as an organizer for the Industrial Workers of the World (IWW) and, perhaps most poignantly, the death of a 17-year-old girl shot during a garment strike in 1913 while standing near Lucia, who had sneaked out of her house to picket with her father. Consequently, over the course of her upbringing, Lucia developed a hatred of poverty and a belief that unions could improve the lives of working people.

At age 12, Lucia dropped out of school to help raise her siblings, 13 in all, and two years later began working at Stein-Bloch as a machine operator. At Stein-Bloch she became chairperson of the ACWA local, in charge of roughly two hundred laborers. When tensions developed between the union and Stein-Bloch in 1924, Lucia was appointed spokesperson and in this capacity led her first strike. While the stoppage accomplished few gains, Stein-Bloch refused to rehire Lucia. However, Abraham Chapman, the vice president of Rochester's ACWA, was impressed by Lucia's charisma and at the time desired someone with Italian-language skills and hired her as his secretary. Between 1924 and 1930, Lucia worked for Chapman, became a valuable asset to the ACWA, and rose to the position of interpreter and director of complaints.

Although Lucia dropped out of school at a young age, her mother had taught her the value of a bilingual education by teaching Carmen to read through English and Italian-language newspapers. Thus, at age 25, upon learning that evening courses were being offered to female workers by the Industrial Department of Rochester's Young Women's Christian Association (YWCA), Lucia embraced the opportunity to participate. There, Lucia was mentored by Elizabeth Hiss, the department's director, who had Lucia take courses in labor history, debate middle-class university students on various topics, and attend

community functions at local churches and synagogues, where Lucia spoke out on behalf of Rochester's labor force. Through her friendship with Hiss, in 1927 and 1930, Lucia enrolled in the Summer School for Women Workers in Industry at Bryn Mawr College in Philadelphia, where she met Hilda (Jane) Worthington Smith (director of Bryn Mawr, 1920–1933), who further mentored Lucia. Soon, Lucia began writing labor and inspirational poetry that was published in *Shop and School* by Bryn Mawr; *Spring Magazine*, published by the Affiliated Schools; and the *Hat Worker*, the official newspaper of the UHCMW. In this context, Lucia befriended multi-ethnic Euro-American female workers, some of whom were Marxists. Later on she was appointed student representative for the Affiliated Summer Schools for Workers in Industry, Inc., a program affiliated with the Brookwood Labor School, the Barnard School of Columbia University, and the University of Wisconsin, where she would serve as secretary of the joint committee from 1934 to 1936. Lucia was also elected class president in 1930. Through these programs, Lucia developed a middle-class female support network and became a lifelong advocate of educational programs for workers and women in particular. In fact, Lucia would become the vice president of the National YWCA, a member of the League of Women Voters, and a board member of the Affiliated Schools for Workers.

In 1930, Lucia broke with the ACWA over a dispute concerning the treatment of Italian workers. However, through her studies at Bryn Mawr, Lucia met Louis Fuchs, of the Independent Neckwear Workers Union (NWU), who hired her as a full-time organizer, sending her to New Haven, Philadelphia, and then Chicago. In 1931, in New Haven, Lucia called a strike at the Seigman and Son Hat Company, during which she drew on her experiences at Bryn Mawr and obtained middle-class support from the broader community through connections to women activists and students attending the Divinity School of Yale. While the strike (which lasted from February to November) was ultimately lost, Lucia gained much respect from her union, given that during the ordeal she was beaten by three assailants, arrested, and boldly returned to the picket line.

During the Great Depression, Lucia married Leo Kowski, the financial secretary of the ACWA. She retained her maiden name as a marker of independence and delivered their first and only child, Margarita, in 1932. Due to illness, Kowski did not work, and when in 1934 the NWU asked Lucia to help organize workers in Philadelphia, she accepted. During a strike in Philadelphia, Lucia drew community support by highlighting the female members of the

labor force. Lucia asked women workers to picket while wearing white dresses with bright red sashes. After the strike was won, the NWU sent Lucia to Chicago, where another garment strike was in progress. While attempting to speak to a replacement worker, Lucia placed her hand on the female worker's shoulder and immediately after was dragged into an alley by a Chicago police officer, who beat her, pulled her arm out of its socket, and then arrested her. After she was bailed out of jail by the NWU, Lucia fearlessly rejoined the picket line. Embroiled in an internal altercation within the NWU, Lucia quit the union. In 1935, she met Max Zaritsky, of the Cloth Hat and Cap Makers of North America, who shared many of Lucia's ideals and hired her to organize West Coast garment workers.

Between 1935 and 1950, Lucia organized garment workers on behalf of the UHCMW in Los Angeles and San Francisco. She later went to Texas and worked in operations in Dallas, Garland, Longview, and Corsica. Upon briefly returning to Illinois (DeKalb), Lucia established herself at the union's central office in Atlanta (1944–1960), from which she led campaigns as far north as Norwalk, Connecticut, and Holyoke, Massachusetts. Lucia then chaired the union's southern organizing drive in Greenville, Alabama; Winchester, Tennessee; and Richmond, Virginia. In 1950, she was elected a labor delegate to France, under the State Department's Economic Cooperation Administration, in affiliation with the Marshall Plan. Upon returning to the United States, she continued to work for the UHCMW throughout the 1960s, by which time she was championing the Equal Rights Amendment. In 1974, at the age of 72, and after 39 years of union service, Lucia retired from the UHCMW. In 1980, she returned to Rochester, where several of her brothers and sisters still resided, and in February 1985, Lucia passed away.

LUDLOW MASSACRE (1914)

The 1913–1914 southern Colorado coal strike was one of the most violent labor conflicts in American history. The strike's denouement came on April 20, 1914, when 12 children, six miners and union officials, and one National Guardsman were killed in a day-long battle between the Colorado National Guard, which had been called to break the strike, and residents of a tent colony near the Ludlow, Colorado, railroad station. Ludlow was the largest of seven tent colonies that the United Mine Workers (UMW) had built to house the more than 9,000 mostly Southern and Eastern European and Mexican immigrant miners who were thrown out of company housing when they went on strike. The massacre set off a 10-day-long war between National Guardsmen and incensed miners, who were intent on exacting revenge for the Ludlow killings. Twenty-nine more people were killed during those 10 days, before President Woodrow Wilson sent the Army to restore order.

Like many well-known historical events, the Ludlow Massacre has been distorted by misstatement and exaggeration. Though some histories of the massacre contend that the Colorado National Guard planned an attack on the Ludlow tent colony, the truth was more complicated. Relations between Guardsmen and the striking miners were far from harmonious during the six months the Guard was on strike duty. The poisoned atmosphere that developed between the Guard and the miners created the preconditions for the Ludlow Massacre.

By the spring of 1914, the coal-mine operators, led by the Rockefeller family-owned Colorado Fuel and Iron Company (CF&I), had all but defeated the miners' strike. The National Guard had helped the operators import thousands of nonunion workers into their mines, leaving the UMW with little leverage to negotiate a settlement. The miners, however, refused to surrender. On Sunday, April 19, 1914, the day before the Ludlow Massacre, the Greeks in the Ludlow tent colony treated their neighbors to a celebration of the Greek Orthodox Easter. After roasting lamb, the tent colonists played baseball. In what was perhaps an apocryphal story, several women participating in the game said later that a few National Guardsmen showed up at the ball field. The Guardsmen and colonists exchanged insults, and as the soldiers left, they hinted that they would soon attack the

colony. It was this story that has probably left the impression that the Guard had planned an invasion.

Next morning, a detail of National Guardsmen came to Ludlow looking for an Italian miner. Louis Tikas, a Greek immigrant who had become a union organizer and then the popular leader of the Ludlow colony, said the man in question was not there and refused to allow a search. Tikas thought he had good reason to keep the soldiers out. Guardsmen had frequently used intimidation and violence against the miners and their families as they attempted to force the strikers back to work. The Guard had also torn down the nearby Forbes tent colony several weeks earlier. Most miners and their families already loathed the Guard, and after Forbes's destruction, they vowed that they would not allow soldiers into their camps again.

What followed was a series of misunderstandings and mistaken perceptions. It remains impossible to determine who fired the first shot, but by 10 a.m., the Guard and the miners were exchanging a torrent of rifle fire. Charlie Costa, an Italian immigrant and striking miner who would die that day along with his wife and children, led the miners out of the tent colony in an effort to draw the National Guard's fire away from the women and children still in the tents. Costa's plan failed. In addition to keeping the miners pinned down just outside the colony, the Guard poured rifle and machine gun fire into the tents. The women and children inside rightfully believed that fleeing would get them shot, but the canvas tents provided scant protection from the gunfire. With little choice, some women and children climbed into the pits that many colonists had dug in the earth beneath their tents early in the strike after the Baldwin-Felts detectives hired by the coal operators fired on the tent colonies. These pits served as hiding places.

By early evening, the Guard had succeeded in fighting its way into the tent colony. They set the tents ablaze, but also found women and children still hiding in the tents. Guardsmen had a very difficult time getting these colonists to come out because they believed that the soldiers were going to kill them. The soldiers eventually pulled more than a few women and children out of the fire that quickly engulfed the entire tent colony, but failed to find all who were still alive and hiding underground. It was not until the following afternoon that the bodies of two women and eleven children were found in the pit beneath a tent. The Guard had also taken Louis Tikas and two other miners prisoner. All three men were killed while in the Guard's custody.

The miners who escaped Ludlow could think of nothing but revenge. For the next 10 days, they

destroyed the mine companies' property while fighting the Guard. The army's arrival in southern Colorado ended the violence, but the strike eventually ended in defeat for the miners. This outcome was not unique for workers who faced hostile military intervention during a strike. The National Guard's court-martial acquitted all the men charged with crimes stemming from Ludlow, but the Ludlow Massacre did have some lasting impact. John D. Rockefeller Jr. introduced his Industrial Representation Plan at the CF&I's mines shortly after the strike ended. The plan instituted a system of company-sanctioned representation for the miners and became a model for company unions. Nevertheless, Colorado's coal miners struck eight more times during the following two decades, and the UMW won a contract with the CF&I in 1933. For students of labor history, the Ludlow Massacre vividly illustrates the volatile conditions that military intervention in labor conflicts often created and reveals the class, racial, and ethnic tensions that drove military strike-breaking.

LUTHER, SETH (1795–1863) Writer and Labor Activist

Seth Luther was born in Providence, Rhode Island. His father was a veteran of the Revolutionary War. His mother was active religiously. Trained as a

carpenter, Luther practiced a strain of Baptist egalitarianism that he preached in the streets of Providence and laced into the philosophy of the emerging national workers' movement in essays in the 1830s. These militant pamphlets in the Jacksonian Era extolled labor rights, like the 10-hour day, as well as the necessity for suffrage rights without property qualifications. Luther matched the ardor of his literary output with concrete union organizing on a local and national level. In Rhode Island, he was a key figure in a civil uprising in 1842—the Dorr War. He followed his own dictates and took up arms for the right of an unfettered franchise and landed in prison. Like many social pioneers he eventually suffered a nervous breakdown and was institutionalized until his death in an asylum.

His political career had its genesis in Providence's First Baptist Church, where Luther apparently offered his own take on Scripture not long after the War of 1812. At the same time he worked his trade as a carpenter, he also moonlighted as a bookseller and vendor of religious portraits. Despite his literary skills, Luther seemed to have little business sense and a host of medical problems that curtailed his activities. He went to debtor's prison in 1823, saddled with almost \$1,000 of liability. He successfully petitioned the General Assembly to release him later in the year. In 1824, the church expelled him for "disorderly walking," a catchall phrase that could include drinking, unsanctioned religious activity, or other problems.

Luther traveled frequently, allegedly walking hundreds of miles during various trips. He appeared in Rhode Island again in 1831 when he had an indirect experience in a racial riot in Providence. The state mobilized the militia, including Luther, who later complained that many male citizens had to serve as troops involuntarily without the right to vote due to a property qualification of \$134 of taxable realty. That seemingly small figure still disenfranchised about 60% of all white males in the state by 1840. Rhode Island, the most urban industrial state in the nation, soon had more propertyless factory workers than land-rich farmers.

The 1830s was an active decade in Luther's life and rise to labor prominence. He wrote his first pamphlet in 1833 about the voting situation in Rhode Island, *Address on the Right of Free Suffrage*. He agitated the question of the 10-hour workday—perhaps the linchpin of the era's workingmen's parties. He crisscrossed New England, hawking copies of a regional labor newspaper. He helped found the Trades Union of Boston and Vicinity and participated in the pioneering National Trades Union that flourished until the Panic of 1837.

Despite his broad, geographical labor career, Luther flexed his muscular efforts primarily in his home state. In the 1830s, he joined a band of skilled workers who challenged the role and rights of laborers throughout society and, in particular, agitated fiercely for local manhood suffrage. Employing the rhetoric of the American Revolution, these tradesmen joined forces with liberal-minded professionals in Rhode Island to boil the arguments into a material force in the upcoming Dorr War in 1842. In his quest for political freedom, Luther, who became a brilliant orator as well, often declared "Peaceably if we can, forcibly if we must!"

He was in a group of armed demonstrators who tried to capture the state arsenal in Providence in the year of the uprising, after his rebel cohorts used an extralegal election to bifurcate the state between reformers and the forces of the status quo. The ensuing insurrection, more smoke than fusillade, ended quickly when the ruling law and order group activated the militia and pursued the mutineers relentlessly but with only incidental violence.

Charged with treason under martial law, Luther spent a year in prison and published a rare poem of gratitude to the women who supported the campaign. After his release, he embarked on a tour to champion the uprising, which eventually became part of the 1844 Democratic presidential campaign. He spent time in Illinois recuperating mentally before rejoining his colleagues in Rhode Island and re-igniting the old labor quest of a 10-hour workday.

In 1846, he abandoned his usual tunnel vision for unions and suffrage by writing to President Polk, offering his patriotic services in the Mexican War. Apparently, on his way to the conflict, Luther entered a bank in Boston, brandishing a sword, and demanded a \$1,000 in Polk's name. He became a patient at two asylums in Providence before being transferred in 1858 to a facility in Brattleboro, Vermont, that charged less than its Rhode Island counterparts. The city fathers in Providence hoped to save scarce municipal funds in that depression year.

Luther died in 1863, unnoticed for the most part, in the midst of a much crueler civil war than the one he helped instigate. A local paper wrote that he led a useless life. He was buried in an unmarked grave at the Vermont asylum. He wielded the precepts of the American Revolution and natural equality more vehemently than his sword in the Boston bank. Louis Hartz wrote that Luther possessed a unique global consciousness in that era about the drive for class equality. The Rhode Island Heritage Hall of Fame inducted Seth Luther, the deranged bank robber, into its ranks in 2001.

LYNN SHOE STRIKE (1860)

The great New England shoe strike of February and March, 1860, led by shoe workers in Lynn, Massachusetts, involved town-centered artisan men, women stitchers working by hand in their homes or by machine in small factories, and rural outworkers in Massachusetts, Maine, and New Hampshire. The strike represented the most widely supported and powerful demonstration of American labor protest prior to the Civil War.

The 1860 strike was a response on many levels to the slow industrialization of New England shoemaking during the early nineteenth century. In the pre-industrial phase, artisan shoemakers produced the entire boot or shoe in small shops called "10-footers." As the market for their shoes expanded, daughters and wives in artisan families began to assist the shoemakers but did not enter the shops. In their kitchens, women hand-sewed the uppers for the shoes in a process called "binding." The female binders then passed that part to the artisans, who completed the shoe. A distinct gender division of labor became established. As demand for boots and shoes rose, shoemakers or the merchants, who handled the sale of the shoes and often supplied leather to the artisans, began to hire women as shoe binders. Their wages remained low. If possible, young women left their families to earn higher wages in New England textile factories.

The artisan system of shoemaking in New England became altered by centralization and mechanization. The shoemakers, now called "bottomers," began in the 1830s and 1840s to protest low wages and a lost independence. Merchants responded by hiring shoe bottomers in rural New England, linked by wagon. By the 1850s, the sewing machine was adapted to stitch leather. The merchants or shoe bosses brought sewing machines into their central shops, where they distributed leather and assembled the completed shoes for sale. Highly skilled leather cutters also worked in the central shops. At first, female stitchers

operated the sewing machines by foot power, but shoe bosses quickly attached the machines to steam engines. Meanwhile, shoe binders working at home in Lynn, Salem, and Marblehead had the chance to rent sewing machines. Their work remained in their homes, but the machines had to be laboriously hand-cranked, sometimes by children as their mothers or sisters stitched.

Machines run by steam power stitched uppers much faster, while the uniformity of machine stitching represented an improvement over hand work. Wages for stitchers in factories outpaced both machine work and handwork at home. Factory stitchers, usually young, unmarried women, worked for 10 hours a day, six days a week, under the constant discipline of centralized management. They earned high wages and did not, like shoe binders, have to provide or furnish their own thread, needles, and wax. All of these groups—shoe bottomers, shoe binders, home machine workers, and factory stitchers—participated in the shoe strike of 1860. The issues that arose during the strike revealed the opportunities and challenges of industrialization as it reshaped the work of men and women. The strike also featured the persisting values of artisan work culture and gender relations within the family.

Artisan shoemakers in Lynn launched the strike on February 22, 1860, the birthday of George Washington, to commemorate the link between their struggle for independence against the shoe bosses with the political rights of artisan men achieved in the War of the Revolution. Artisans in Lynn and Natick, Massachusetts, led the action. Male shoemakers sought the support both of other shoemakers throughout New England and of women workers in the shoe trade. Female moral support would blunt criticism of violence against teamsters taking materials to rural shoemakers and organize the support of families for the strike. But as the strike spread, conflicts began to emerge between men and women strikers and between factory stitchers and shoe binders.

Many shoe binders and factory stitchers saw the strike as an opportunity to advance their interests as workingwomen. A coalition forged between factory workers and lower-paid home workers held out the hope for higher wages for all women engaged in shoe work, whether married or single, family resident or boarder, and wherever they stitched. Higher wages for women's work in the home and in the factory meant that single women could anticipate—once they married—reasonable wages for homework. The factory girls occupying a strategic place in centralized operations could deny the shoe bosses sewn uppers to deliver to rural bottomers. Workingwomen organized

LYNN SHOE STRIKE (1860)

in early 1860 to demand higher wages for female factory workers and homeworkers.

Artisan shoemakers who had initiated and organized the strike objected, regarding men's rights and wages as primary. During the debates over the purpose of the strike, women homeworkers had to choose between supporting the strike as women workers with their own interests or as female members of artisan families. Many remained loyal to their husbands, fathers, and brothers, abandoning the coalition with factory stitchers and their wage demands. Women who supported the male strikers thus reflected gender relations within the artisan family, values that defined women as secondary earners in a family wage system within which they were socially and economically subordinate. The alliance of male bottomers and female homeworkers prevailed, and the factory girls deserted the strike.

Street processions and marches to other shoemaking towns featured the men and women strikers carrying banners proclaiming support for increases in male wages and female moral support for the strike. On March 7, one banner carried by women supporters summed up their position: "Weak in physical strength but strong in moral courage, we dare battle for the right, shoulder to shoulder with our fathers, husbands and brothers." The values of artisan culture shaped and dominated the 1860 strike, which represented the last stand of pre-industrial work against the emerging factory system. After the regional strike failed in March, the impetus of mechanization and centralization brought more male workers into the factory, eliminating both the work of artisan bottomers and shoe binders, the key supporters of the strike.

M

MAJOR LEAGUE BASEBALL PLAYERS ASSOCIATION

The most powerful labor organization in the United States at the turn of the twenty-first century was the Major League Baseball Players Union, an association of millionaire athletes who had turned the tables on management and seemingly had the upper hand in the sport, winning all eight negotiations since 1968. This was a dramatic reversal from the early days of baseball when players were described as chattel by shortstop John M. Ward of the New York Giants, organizer of the Brotherhood, the first baseball union in 1885. The Brotherhood fought against maximum salaries and the reserve clause (which restricted players to their teams in perpetuity), and established the short-lived Players' League in 1890. The next brief efforts at unionization were the Protective Association of Professional Baseball Players, formed in 1900, and the Base Ball Players' Fraternity in 1912.

In 1946, Robert Murphy, a Congress of International Organizations (CIO) lawyer, formed the American Baseball Guild to equalize the playing field between management and labor. He sought a \$7,500 minimum salary, an arbitration system for resolving contract disputes, replacing the reverse clause with long-term contracts, and insurance and pension benefits. He convinced the Pittsburgh Pirates, a team located in a strong prolabor city, to strike, but they backed down at the last minute under pressure from management. The owners did make concessions, including \$25 a week for spring training meals ("Murphy money"), a \$5,000 minimum salary, a small pension plan, and

representation on the owners' and league presidents' council.

In 1953, after Commissioner Ford Frick refused to give the players a full accounting of the pension fund and the owners refused to raise the minimum salary to \$8,000, team representatives, led by Ralph Kiner and Allie Reynolds, hired J. Norman Lewis as legal counsel. The owners excluded him from their meetings with player reps, and then the ballplayers founded the Major League Baseball Players Association (MLBPA). In response, owners agreed to fund the pension with revenue from the All Star game and World Series.

In 1959, the weak MLBPA replaced Lewis with Judge Robert Cannon, whose goal was to become baseball commissioner. Seven years later the MLBPA offered Cannon \$50,000 to become their full-time administrator, but he declined. The members, led by Robin Roberts and Jim Bunning, chose a new tactic, influenced by rising NFL salaries, fears about their pensions, the dual Koufax-Drysdale holdout, and the social activism of the 1960s. They hired Marvin J. Miller, chief labor economist with the United Steelworkers, as executive director.

Miller sought to destroy the paternalistic character of player-management relations by introducing an adversarial model, learning the players' main grievances, and shaping their collective consciousness to see themselves as professionals meriting proper compensation. Miller scared the owners, who established the Player Relations Committee (PRC) to deal with him through professional negotiator John J. Gaherin. In 1968, after Miller threatened to seek federal

mediation, the owners signed the first Basic Agreement of any sport. The path-breaking 2-year contract raised the minimum pay from \$7,000 to \$10,000, granted players the right to be represented by agents, and established grievance procedures adjudicated by the commissioner. Then in 1969, veteran players sat out spring training to secure higher pension funding.

A bitter fight emerged between the union and PRC in 1972. Owners were upset at rising payrolls and their declining power, while the players were still concerned about pension funding. The union voted 663-10 to authorize a strike in spring training that lasted until April 13 and got their pension contributions raised to \$5.9 million. The press attacked the players as spoiled, pampered, and irresponsible.

In 1973, the MLBPA focused on securing independent grievance arbitration and a breakthrough occurred when the owners agreed that players with 2 years' experience could request "final offer salary arbitration" after the expiration of their contract. The player and owner would each submit a salary to a board comprised of a representative from labor and management plus an independent arbitrator, and they would pick between the two proposals. This opportunity helped many players get big raises as teams became more responsive to their demands in hopes of avoiding final arbitration.

The MLBPA and Free Agency

The union supported players' rights to control their own destiny. In 1969, the MLBPA financed Curt Flood's suit to block his trade from the Cardinals to the Philadelphia Phillies. The case went to the Supreme Court in 1972, which rejected his complaint because baseball was exempt from antitrust law. Two years later, Catfish Hunter was declared a free agent by arbitrator Peter Seitz because annuity installments stipulated in his contract were not paid. Hunter then signed a 5-year, \$3.75-million contract with the Yankees, which opened the eyes of star players.

Miller believed a player who completed a season without a signed contract, would become a free agent. In 1975, two players completed the season unsigned—pitchers Andy Messersmith of the Dodgers and the injured Dave McNally of the Expos. After the season Seitz ruled they were now free agents. McNally retired, but Messersmith signed a multiyear contract with the Braves for \$1.75 million. The owners responded by locking out the players from spring training, but Commissioner Kuhn ordered the camps open under pressure from television and certain key owners. That summer negotiators agreed to grant

free agency after 6 years, but teams signing these players had to give the old team a selection in the amateur draft. Players also won many perks, including firstclass airfare, severance pay, and input on working conditions. Average salaries shot up to \$76,000 in 1977, the first year of widespread free agency, and \$143,000 by 1980.

In the early 1980s, when there was widespread union busting and forced givebacks throughout the United States, the baseball owners also fought back. They wanted better compensation in the form of a comparable player. That would discourage teams from hiring free agents, which resulted in higher salaries, lack of control over their players, uncompetitive play, and economic uncertainty. The union responded with a strike on April 1 that lasted 8 days. Shortly thereafter, a 4-year Basic Agreement was signed that did not alter free agency, while raising the minimum salary to \$35,000 in 1984.

The growing hatred and distrust of players and management propelled a major strike in 1981 that began on June 12 and lasted 7 weeks. The public was irate and blamed the players. By then the players' strike fund was nearly spent, while the owners' insurance was about to expire, and they would lose their television revenue. The settlement gave owners who lost a free agent protection of 26 of their 40 man rosters, leaving only journeymen and minor leaguers as compensation. A split season was declared, and the winners of the prestrike season and the poststrike season advanced to the playoffs.

Miller retired in 1982 and was replaced by Ken Moffett, a former mediator, who lasted less than 2 years. Miller temporarily "unretired," and gave way to his assistant, Don Fehr, a brilliant attorney, who led the MLBPA to great successes, protecting players' jobs and rights.

In the 1986 round of negotiations, the owners cried poverty, claiming a total loss of \$166 million although attendance was high and television revenue was up to \$200 million. The union authorized a strike date on August 6 after they had made most of their salaries but before the owner would get 80% of the national TV revenue. Two days later an agreement was reached that established eligibility for arbitration after 3 years, the salary minimum was boosted to \$60,000, and compensation for free agents through the amateur draft was restored. Thereafter owners then stopped bidding for free agents. The union sued, and arbitrators twice found the owners and the commissioner guilty of collusion to fix the player marketplace. The teams were fined \$280 million.

The 4-year basic agreement signed in 1990 called for two new teams, boosted salary minimums to \$100,000, raised the pension contribution to \$55 million, and

granted salary arbitration to the most experienced second-year men. Two years later the owners hired a new negotiator, Richard Ravitch, with the hopes of busting the union.

In 1994, with players getting 60.5% of total revenues, the owners proposed sharing revenue with the players, with salaries capped at 50% of revenues, ending salary arbitration, and granting free agency in 4 years. The MLBPA was prepared to go to the barricades to maintain the status quo, and with a strike fund of \$165,000 per man, called a strike for August 12. The owners responded provocatively, refusing to make a scheduled \$7.8 million pension contribution. The bitter and suspicious negotiations fell apart, and the strike followed. The players returned to work after 232 days following a court injunction that restored the old terms of the expired Basic Agreement. In 1996, a new agreement was reached. The players accepted interleague play, which began in 1997, two more teams in 1998, a minimum salary of \$200,000 in 1999, and a 35% luxury tax on at least five teams. The current Basic Agreement, signed in 2002, established revenue sharing among teams and raised the minimum pay to \$300,000. Since then the union's main concern seems to have become protecting players accused of drug usage. Random testing for steroids was agreed to in 2003, and in 2005, year-round testing for steroid use was introduced, with a 10-day suspension for the first offense.

The MLBPA's successes set a standard for labor relations in professional sports. Miller remolded a company union into a powerful collective that won major gains at the bargaining table, which the players, through a united front, have since maintained and expanded. The achievement of a grievance procedure in 1968 was the foundation for all future gains. Thereafter the union used the strike as a tactic to demonstrate the solidarity of the membership to secure even more gains.

MAQUILADORAS

Maquiladora is the name for a sector of the Mexican economy in which foreign-owned firms assemble products from parts and other inputs that come largely from outside of Mexico. Most of the assembled products are then exported from Mexico. The *maquiladora* sector's development has served as a model for similar activities in developing countries throughout the world. This type of development is an example of "flexible production" that has typified economic globalization. New technologies make it possible for the production of goods to be broken up into smaller parts so that the manufacturing of a product can occur in different locations.

The *maquiladora* sector has its origins before the birth of today's form of globalization. From 1942-1964 the United States and Mexico engaged in a cooperative venture known as the *Bracero Program* that enabled Mexican agricultural workers to enter the United States and help harvest particular crops during specified time periods. Once the crops were harvested, these workers were transported back to Mexico. The Mexican workers were needed in the United States initially because of labor shortages caused by World War II. Mexico for its part had a surplus of agricultural workers. But in 1964 the United States unilaterally canceled the *Bracero Program*, which caused a social and political crisis in the Mexican border towns. In response the United States and Mexico entered into a new agreement known as the Border Industrialization Program (BIP). It was designed to ease Mexican unemployment in the border towns. The United States and Mexico amended tariff codes to allow U.S. firms to export intermediate products to Mexico for assembly into finished products without paying Mexican tariffs. These products would then be exported from Mexico back to the United States with tariffs limited to the value added by Mexican assembly. Mexico at the time had a development strategy called "import substitution," which was geared toward promoting economic self-sufficiency. The BIP ran counter to this strategy because it relied on foreign investors. Nevertheless Mexico attempted to maintain its broader economic policy by placing restrictions on the BIP: Requiring dual U.S.-Mexican ownership of BIP plants, restricting their location to U.S.-Mexican border areas, and requiring that all BIP products be exported immediately from the country.

The initial size of the program was quite modest. By 1971, there were only two hundred *maquiladoras* employing about 30,000 workers. Working conditions in these plants were very bad and wages low. The government-controlled union, the Confederation of Mexican Workers (CTM), deliberately took a

MAQUILADORAS

hands-off policy in the *maquiladoras* in order to attract foreign investors. But they soon lost control, and militant independent union organizing ensued. As wages increased many owners threatened to pull out. When a major recession hit in 1975, employment actually declined in the *maquiladora* sector. In 1976, the CTM regained control over organizing in the *maquiladora* zones and allowed the Mexican government to take repressive measures against dissident worker organizations. Nevertheless from 1977–1981 continued militant worker activity enabled real wages to grow rapidly. But in 1981–1982, a severe recession and a drastic peso devaluation caused wages and employment to decline once again, and independent union activity ceased.

In 1982, there was a debt repayment crisis in much of the developing world, and Mexico was one of the first to declare its inability to pay off massive foreign loans. In response the International Monetary Fund (IMF) agreed to provide a bridge loan to Mexico so it could continue making payments on its debts. By 1985, IMF pressure resulted in the adoption of a structural-adjustment program that constituted a new economic development strategy. At this point Mexico officially abandoned its import-substitution strategy. The new development model aimed to achieve economic growth through exports, wage, and inflation reduction, privatization of state enterprises, lowering tariffs on foreign goods, and easing barriers to foreign capital. The old BIP was transformed into the *maquiladora* sector and became the centerpiece of this new strategy. During the next decade, restrictions on *maquiladora* development were greatly reduced, including ownership provisions, location, and even the requirement that the goods be exported. *Maquiladora* products could now compete directly with Mexican manufactured goods.

The Mexican government with U.S. approval also initiated an aggressive program to recruit U.S. firms to move production to Mexico. As a result of these efforts the growth of employment in the *maquiladora* sector took off, growing 17.5% from 1982 to 1990 to nearly 500,000 workers. Most of these workers were employed in electric and electronic equipment and products and transportation equipment, particularly automobiles.

In 1994, Mexico, Canada, and the United States entered into an agreement known as the North American Free Trade Agreement (NAFTA). The NAFTA greatly accelerated the developmental approach initiated in 1985. This included removing any further restrictions on *maquiladora* activity. Militant labor activity had largely been eliminated at this point as well so that *maquiladora* wages and working conditions were generally poor. This resulted in a large jump

in employment in the *maquiladora* sector so that by 1998, there were over 3,000 *maquiladora* plants employing over one million workers. Their location was concentrated in border areas, but there were now *maquiladora* operations throughout the nation.

Part of the significance of the evolution of the *maquiladora* sector is that it became a model for other parts of the world. Beginning in 1971, there began a period of rapid growth of similar assembly operations known as export-processing zones (EPZs), largely in Asia and the Caribbean. There are now more than 200 EPZs in such nations as India, China, Taiwan, Malaysia, South Korea, the Philippines, Honduras, and Columbia. Total employment in developing-nation EPZs is now more than four million.

The growth of EPZs generally has led to the displacement of many workers, contributing to the decline of union membership in the United States. It is part of the process of globalization in which capital has become highly mobile, which creates new challenges for organized labor. The EPZs have been controversial within the nations where they are located as well. This is due in part to the fact that wages, working conditions, and environmental impacts have been poor, and union activity has been suppressed by EPZ governments. But in addition there is considerable question of how great a positive impact they really have. In the Mexican case, *maquiladora* activity has ended up displacing more manufacturing jobs than it created. During the past decade, manufacturing employment has declined by nearly 10% even though output has increased by 38%. In part this is due to the fact that *maquiladoras*, like all EPZs, do not use goods produced nationally in the production process. The Mexican content of *maquiladora* products over the past decade is less than 3%. And the *maquiladora* operations have put some Mexican firms that had over 90% Mexican content out of business. Furthermore with the rapid growth of EPZs throughout the world, rising wages in one nation can result in firms leaving for lower wage locations. This is beginning to happen in Mexico as a number of *maquiladora* firms move to China's EPZs.

MARCH ON WASHINGTON MOVEMENT

The Negro March on Washington and its successor the March on Washington Movement were both efforts by African-Americans in the 1940s to mobilize around the related issues of racial and economic discrimination faced by African-American workers. Behind both efforts was A. Philip Randolph, a labor and civil rights activist, who by 1941 was a national African-American leader, who had led the Brotherhood of Sleeping Car Porters and the National Negro Congress. Randolph's lifelong political commitment was to convince Americans of all races of the interrelationship between economic inequalities and racial discrimination. Such a commitment inspired his efforts in the 1940s.

The Negro March on Washington for Jobs and Equal Participation in National Defense, 1941

The origin of the Negro March was in the preparedness efforts in the United States in the late 1930s. As European countries increased their demand for certain American products, many American workers began to feel as if the Great Depression was relenting. African-Americans were less likely to notice, because the companies supplying weapons, engine parts, and other products to the Allies were often the same companies who were least likely to employ many African-Americans in well-paying jobs. Likewise African-Americans also found less opportunity if they answered the call of recruiters from the armed services. All branches discriminated against blacks, and all segregated them from white members. African-American organizations, such as the National Association for the Advancement of Colored People (NAACP), the Urban League, and Randolph's National Negro Congress, took notice of this dual inequality and began to demand that the federal government intervene. But their testimony at congressional hearings, their leaders' meeting with President Franklin Roosevelt, and their reports had caused little change by the end of 1940.

Randolph resolved that different tactics were necessary. Inspired by his own involvement in mass marches and labor strikes, he called for other African-Americans to join him in a mass march on Washington to demand an end to segregation in the armed forces and equal access to defense jobs. He recruited the leaders of most major African-American organizations to lend their names to his efforts and began

recruiting marchers from cities with large African-American populations. Starting with a goal of 10,000 marchers, by late June he believed that 100,000 black men and women might attend the July 1 march. The march was to take place at the Lincoln Memorial and include addresses by all the major African-American leaders. In addition Randolph invited President Roosevelt and First Lady Eleanor Roosevelt to attend.

President Roosevelt, the first lady, and his aides did not believe the march was a good idea. They feared the march would be used by German officials to highlight the contradictions in U.S. racial policies. They also feared that a large mass of African-Americans in the nation's capital might result in rioting—of white people or black people. As a result they put pressure on Randolph and the other organizers of the march to cancel in June 1941. But these leaders refused to change their plans unless they received some significant action on the part of the president. The negotiations were tense and hurried, since the march was just weeks away. Finally on June 25, the president signed Executive Order 8802. This order did not address all the problems that had inspired the march; most noticeably, it did not directly address the segregation and unequal treatment of African-Americans in the military. Yet it did create a commission on Fair Employment Practices that had the power to investigate companies with defense contracts and punish those that discriminated on the basis of race, religion, or national origin. This commission had the most far-reaching federal powers to fight racial discrimination at the time. Its issuance was seen as a major victory of the Negro March leaders. And the march was canceled in response.

The March on Washington Movement's Successes and Failures

The problem of being a successful threat of a march but not an actual march struck the march organizers as soon as they had canceled. And this problem inspired the creation of the March on Washington Movement (MOWM)—a group that never marched on Washington but did train activists and keep African-Americans mobilized during the 1940s. In July 1941, Randolph and other leaders urged their supporters to stay mobilized to make sure that the president's executive order met their expectations. The American declaration of war in December 1941, however, made marching on Washington an even more radical act, since both Japanese and German officials might use such acts to publicize the pervasive

Civil rights march on Washington, D.C. Library of Congress, Prints & Photographs Division, U.S. News & World Report Magazine Collection [LC-DIG-ppmsca-03128 8].

discrimination African-Americans still experienced. Accordingly as Randolph organized the MOWM, he had to balance his desire to mobilize as many African-Americans as possible to work on both economic and civil rights issues with the need to remain patriotic. The need for the group became more obvious as it became clear that the Fair Employment Practices Commission held hearings but rarely invoked its powers to halt contracts with companies that continued to discriminate. The group sponsored a series of mass meetings in Detroit, New York, and St. Louis. Still Randolph found that leaders of other African-American organizations, such as the NAACP and the Urban League, were less inclined to support his efforts when they were associated with a permanent group rather than a single group. And without their support and funds, Randolph and his supporters began to foster protests focused on civil disobedience. Younger activists joined the organization because of this tactic of nonviolent direct action. For example Bayard Rustin, a former Communist, youth activist, and draft resister, became very influential in the group. The MOWM local groups and national conferences influenced such groups as Congress of Racial Equality (CORE), which soon used direct action to challenge segregated buses and services for interstate travelers. Though the March on Washington Movement did not last past the 1940s and never held a march in the nation's capital, its influence was profound. People involved with the MOWM in the 1940s went on to play crucial roles in organizing

subsequent efforts to win better treatment of black workers in both the North and the South.

MARINE TRANSPORT WORKERS' INDUSTRIAL UNION

The Marine Transport Workers' Industrial Union (MTW) was one of the largest, most important, and durable segments of the Industrial Workers of the

Marine truck transport units. Marine Corps transport workers study the assembly of one of the many weapons the leathernecks use in war exercises at New River, North Carolina. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USE6-D-005785].

World (IWW), commonly referred to as the Wobblies. The MTW organized sailors, longshoremen, and other workers in the marine transport industry—shipping—on an industrial basis. The MTW was the most international component of an organization ideologically committed to fighting global capitalism yet it was primarily a North American outfit. The MTW simultaneously engendered tremendous respect among many thousands of sailors and animosity from rival unions, employers, and governments.

Shipping, domestic and international, was—and is—essential to the global economy. There are few industries that better embody the market adage “time is money” than shipping. The knowledge that the ship must sail on time provided an opening for longshoremen and sailors to exert pressure “at the point of production” by declaring quickie strikes just before a ship set sail.

Shortly after its founding in 1905, the fledgling revolutionary union started organizing in marine transport. Wobblies first targeted the longshoremen of Hoboken, New Jersey, across the Hudson River from Manhattan. As the largest port in America by a large margin, organizing New York was essential to any maritime union. Interestingly the Irish immigrant James Connally spearheaded the effort. Connally

later took IWW ideals and tactics back to Ireland, where he organized simultaneously for the class struggle and Irish independence, ultimately martyred in the 1916 Easter Rebellion. The MTW remained active on the piers and aboard the ships that docked in Manhattan, Brooklyn, and Hoboken into the 1940s.

However as in most other U.S. ports, the MTW never supplanted its rivals, the International Longshoremen’s Association (ILA) and International Seamen’s Union (ISU), both of which belonged to the more mainstream and conservative American Federation of Labor (AFL). The AFL operated on a craft model, spawning more than a dozen maritime unions divided by region and type of work; by contrast the MTW was an industrial union, meaning that regardless of craft, all workers belonged to the same organization. Also the MTW never signed contracts, so that its members always could deploy workers’ ultimate weapon, their ability to strike. This tactic raised the ire of employers but won respect from many sailors in an often-brutal industry.

In 1912, the IWW created the National Industrial Union of Marine Transport Workers (NIUMTW) as part of its efforts to establish nationwide unions in important industrial fields. The NIUMTW was founded in part to convince certain AFL sailors to

re-affiliate. Engine room workers, who performed some of the dirtiest and hardest work on coal-fired steamships, were overwhelmingly dark-skinned, a huge percentage on Atlantic vessels being Spanish and Portuguese. These men were alienated from the AFL because of its racist tendencies and more conservative policies. Efforts to get the thousands of AFL firemen to join the IWW failed, though the MTW continued to command loyalty from these radical sailors, who often were dual unionists (paying dues into an AFL union and the MTW). Around 1917, the IWW created different MTW sections for the Atlantic, Pacific, Great Lakes, and Gulf of Mexico. Curiously its largest branch remained a separate entity.

In a real sense the history of the MTW is that of Local 8, though technically it did not originally belong to the MTW. In May 1913, several thousand Philadelphia longshoremen struck for higher wages and union recognition. The union that this diverse dock workforce chose to represent them was the IWW, chartered as Local 8. Local 8 did what no other MTW or IWW branch did: Line up thousands of workers and keep them for years. Simply put Local 8 was the most durable branch in the entire IWW, representing Delaware River longshoremen for almost a decade, dramatically improving their wage rates, work conditions, power, and prestige. Perhaps most noteworthy about Local 8 was that approximately half of its members, and its most important leader, Ben Fletcher, were African-American. Though ideologically committed to equality, in practice there were few nonwhite Wobblies. Thus the IWW celebrated Local 8 for proving that IWW vision and tactics could overcome the traditional bogeyman of (working-class) America: Race.

For decades the MTW proved itself to be thoroughly international, apropos of the industry. A quick perusal of its newspaper, the *Marine Worker*, indicates in how many different ports of call throughout the world the MTW organized. True the parent union's name suggested a global strategy, but in practice the IWW was mostly U.S. and Canadian. By contrast the MTW had branches across the seven seas. The MTW organized in numerous Latin American ports, for instance, in Valparaiso, Chile, that nation's largest port, and Tampico, Mexico, using its control of area sailors to create a wedge into that city's important oil industry. The IWW gained the loyalty of sailors based in Hamburg and other German ports, as in Sweden and Britain. Similar to other movements, Wobbly sailors proved instrumental in the distribution of IWW literature and ideas. Moreover it was in this industry that a transnational working-class identity fully revealed itself; during Local 8's

1920 strike, for example, British sailors and Spanish firemen refused to scab on Philadelphia longshoremen. Wobbly sailors later castigated AFL sailors for working ships that supplied the Fascists in the Spanish Civil War.

In 1917, when the IWW suffered from massive federal persecution, the MTW was well-represented. Five Philadelphia residents associated with the MTW were arrested (Walter Nef, Jack Walsh, E. F. Doree, and Fletcher of Local 8; Manuel Rey, a Spanish-born sailor, led the MTW on the Atlantic Coast; he was replaced by Genaro Pazos, another Spanish sailor based in Philadelphia). In the aftermath of this repression, the MTW, now numbered 510, struggled to survive. The MTW maintained an active presence along both coasts (Boston to Norfolk, Seattle to San Pedro) as well as in the Gulf (especially New Orleans, later Galveston and Houston). Local 8, still the largest and most important branch, maintained its impressive strength notwithstanding the loss of its entire leadership.

Despite repression the MTW joined the postwar wave of labor militancy that swept the nation and world, in part inspired by the nascent Soviet Union. In 1920, Local 8 called out its four thousand members and thousands of other workers in a failed 6-week strike for the 8-hour day. In 1922, sensing the weakness of the IWW and a turning tide away from labor, employers locked out Local 8 members and exploited growing racial tensions to tear the most important MTW outpost asunder. The IWW maintained its presence in Philadelphia for the rest of the decade but never asserted the authority that it commanded in the 1910s. The MTW also undertook major strikes in Portland, Oregon, in 1922 and San Pedro (an L.A. port) in 1923. This last strike agitated for the release of the remaining Wobblies languishing in state and federal prisons due to the Red Scare. This persecution continued unabated well into the 1920s, notably when the San Pedro hall was raided and members brutally beaten in 1924.

While most IWW unions emerged from World War I far weaker, such was not the case for 510. In fact amid a crushing depression across the Atlantic maritime world in the early 1920s, the MTW challenged the ISU for dominance. Each union claimed more than 5,000 members, and the MTW flourished as a massive ISU strike failed in 1921-1922 despite strong MTW support. Throughout the 1920s, even though Lenin ordered American Communists to "bore from within" the AFL, the MTW remained strong enough that Communists considered whether it should be the target for infiltration. Though the IWW repeatedly rejected such overtures, many in the MTW still flirted with communism.

The MTW maintained significant influence among sailors in the Atlantic, Pacific, and Gulf into the 1940s. It is clear that the insurgent sailor and longshore unions of the Congress of Industrial Organizations (CIO) drew much of their inspiration and ideology, as well as some members, from the MTW. By the same token, the Communist Marine Workers' Industrial Union (a clear rip-off of MTWIU) also were inspired by, and competed with, Wobblies. The MTW maintained halls in numerous ports on all four coasts into the late 1940s, so younger sailors in a second postwar world still encountered old-time Wobblies, but it faded by the end of that decade.

The legacy of the MTW is quite strong. Influential among sailors for more than 30 years, the MTW was a force to be reckoned with across the United States and the globe. Although rarely did the MTW command a majority of any ship's crew, it often was instrumental in securing gains for sailors—thanks to a militant and committed membership. And the story of Local 8 is among the most impressive in the entire IWW. The MTW also deserves notice for working tirelessly to challenge nationalist identities and create an international union.

MARITIME LABOR

Maritime labor gave birth to the American colonies. In 1773, Newburyport, Massachusetts, was home to 700 adult males, of whom the jobs of nearly 600 have

been determined. Among the business and professional men were 140 who described themselves as merchants, shipbuilders, distillers, or shipmasters linked to the sea. The town's 21 shopkeepers depended on water imports. Maritime artisans included shipwrights, boat builders, sail makers, coopers, mast makers, and caulkers. Over 50 were mariners, truck men, or laborers working on the waterfront. Nearly 60% worked with some link to the sea.

Privateering, in contrast to piracy, was a legal trade in which warring states granted permits to loot enemy shipping. These permits were called Letters of Marque, and although the state often took a share, it was more profitable than service in the regular navy and attracted the best seamen. American fortunes were thus made during both the Revolution and the War of 1812. Privateering was the merchant sailor's main opportunity for earning income until it was ended by the Declaration of Paris in 1856. In New York City the roster of privateers was known as "the social register" by their wealthy heirs. Robert Randall, the conscientious son of a privateer captain, established Sailor's Snug Harbor "to support aged, decrepit and worn out seamen." Snug Harbor still serves Randall's intent, and over 14,000 older seafarers have passed through its eighteenth-century halls. Many of these were foreign-born, as were many American merchant sailors.

Most seamen were tied to ships like medieval serfs were tied to the land. The independent-minded United States ironically made this servitude into law in its first statutes in 1797 by outlawing resignation from merchant ships for the duration of the voyage. This law was in effect until phased out in the late nineteenth century. If a sailor left a ship, he could be apprehended by shore-side authorities and returned—or his pay could be forfeited and his belongings confiscated and sold in the captain's "slop chest." The nineteenth century saw the evolution of the "land sharks," the combination of boarding house owners, "runners," and saloon owners, who could bind a man in cycles of debt.

Brave sailors went on strikes even before they had unions. Indeed many mutinies might be considered strikes. Mutinies on merchant ships were single-ship actions and might be short and unrecorded, and unless they became violent, they were often successful. The first recorded strike was in 1803 in the port of New York City, as a result of which the men won an increase from \$10 a month to \$17 a month. The next portwide strike was in Boston in 1837, when pay was only slightly higher than 34 years previously.

The search for speed under sail created beautiful tall ships, but it also created more hazardous working conditions aloft, and perhaps it made the seafarers

more assertive. Strikes appeared early in the nineteenth century, and wages rose as did the length of the topmasts, although the unhealthy conditions remained stubborn. The glory days ended in the Civil War, as British steamers took over, and American crews were left on the beach. Further the Confederate raiding ships burned many of the beautiful clipper ships of that era of wood and sail.

The Search for Speed under Steam

In 1850, the Collins Line pioneered government subsidies to steam shipping—these totaled \$385,000 per year without any stipulations for labor conditions—although there was a safety clause that all Collins ships must be built to pass naval standards.

Labor unionism proceeded fitfully and by discreet maritime regions. One early organization of maritime labor was the Stewards' and Cooks' Marine Benevolent Society formed in New York in 1837. The first sailors' union was organized in New York by black Americans in 1863 as the American Seamen's Protective Union Association. In this same year Great Lakes' sailors came together in Chicago as the Seamen's Benevolent Union, which in 1892 became part of the International Seamen's Union (ISU) of the East Coast and the Gulf ports. The Great Lakes' men also established the Lakes Seamen's Union in 1878.

The first sailors' union on the West Coast was organized in San Francisco in 1866 as the Seamen's Friendly Union and Protective Society, but it did not collect dues and was replaced by the Seaman's Protective Association in 1880. This combination was founded to block the hiring of Chinese sailors, but it collapsed when its treasurer absconded with the union funds. Steamship sailors started their own union and opposed the radical Coast Seamen's Union until the two united under the conservative leadership of Andrew Furuseth in 1891 as the Sailors' Union of the Pacific. "Andy" Furuseth was so conservative that he quizzed prospective members on the elements of sailing ship rigging. Radicals at the turn of the last century were good organizers, but their appeal for violence may have cost public support. The modern Marine Transport Workers' Industrial Union still has a logo of a fist holding up a cargo hook.

The Anglo-American-owned *RMS Titanic* went down in 1912 in an accident that seems to grow ever more complex in its causes because modern divers are still making discoveries. The contemporary British and American court proceedings found no liability, and so the owners went unpenalized for the problematic

design of the ship, marred by a slow rudder and short water-tight bulkheads. Captain Smith was drowned and could not testify about his errors of speed and observation. However just 3 years later, the capsized of the Great Lakes' excursion ship *Eastland* started a 20-year court battle over corporate responsibility.

The U-Boat Menace and Nationalized Shipbuilding

World War I brought on government shipbuilding by the Emergency Fleet Corporation, which built 2,382 ships in 18 months. These were the well-riveted "Hog Islanders," which gave good but slow service in both world wars. Seamen on these chartered ships were able to earn \$90 a month plus a dollar an hour overtime—the best wages in merchant history. Certainly there were hazards, like U-boats and the fatal influenza and the delayed enforcement of the LaFollette Seaman's Act. At the end of the war, the Merchant Marine (aka Jones) Act of 1920 added workmen's compensation to sailor welfarism. After the war the shippers, and Admiral W. S. Benson of the U.S. Shipping Board, beat down wages, and the International Seamen's Union membership dropped from 115,000 to 16,000.

Diversity afloat was partially and temporarily realized in the 1921 achievement of the Black Star Line, created by black Americans to promote trade with Africa. Black nationalist Marcus Garvey in 1921 raised money from black Americans to buy the ships, but Garvey was not a businessman, and the line was finally bankrupted by his incompetence and fraud—or perhaps by sabotage. Still the short career of the Black Star Line drew worldwide attention.

Radicals in Power

The 1930s saw competition between conservative and radical union factions, but there was still an advance in unionization. The radicals were often the most active in recruiting and particularly contributed to sympathy strikes. On the West Coast the venerable conservative Furuseth held on to power, along with his associate Victor Olander, national secretary of the ISU, through a combination of deference-from-below and highhandedness-from-above. They opposed radical leader Harry Bridges who wanted a federation of sailors with longshoremen. Olander asserted that this was a tactic to destroy the International Seamen's Union, and the conservatives prevailed.

In 1933, the crew of the *Diamond Cement* participated in the first U.S. sit-down strike. It succeeded with support by East Coast waterfront workers. On the West Coast, the *S. S. California* crew struck for parity of pay with East Coast scales. By striking in place in a sit-down strike, they kept nonstrikers from moving the cargo ship. The owners threatened to bring charges of mutiny until President Franklin D. Roosevelt's Secretary of Labor Frances Perkins intervened on behalf of the men, but Secretary of Commerce Daniel C. Roper supported the firing of strike leaders. Failure of the ISU to support the men weakened that union, while another sit-down strike on the *S.S. American Trader* divided the ISU and led to the rise of Joe Curran, a leftist disciple of Harry Bridges.

In 1937, Joe Curran and Jack Laurenson left the International Seamen's Union (ISU) to form the National Maritime Union. An election led to the fall of the ISU and its absorption into the American Federation of Labor (AFL). Harry Lundeberg, head of the Sailors' Union of the Pacific helped reorganize this into the AFL Seafarers' International Union (SIU), which rapidly assumed a more activist stance with its drive for hazardous—duty pay in war zones—achieving a 33.3% bonus for African runs. The SIU's bold actions before the war gained both bonuses and a mediation procedure that helped smooth the path to victory at sea.

During World War II, the American Merchant Marine went from 55,000 men to 215,000. Of these 6,830 were killed, about 11,000 were wounded, and 604 became prisoners, of whom 10% died in prison. The percentage of Merchant Marine deaths during the war was greater than the percentage for any other service, yet they were denied the benefits granted to other services. They did not get draft deferments until mid-1942. Their Liberty ships were often ill-equipped, lightly armed, and slow targets for the numerous U-boats—if they did not first burst their welded seams.

Hollywood gave the unsung merchant mariners public recognition in 1943 when it made the film *Action in the North Atlantic*, but otherwise the merchant mariners suffered from the stigma of radicalism. This film began in a union hiring hall and followed the all-star crew along their hellacious passage to Murmansk, where they met a beautiful woman line handler as the other dockworkers shouted "*tovarich!*"

The New Internationalism

In 1961, American freighters usually had a young crew of 45 men, with an average age of 30 plus.

By 1991, a similar ship carried 22. Maritime unions had their largest memberships in the 1970s. But now a union member's working time may be limited to a half a year to give more members a chance at the better jobs. After the voyage the seaman goes to a union hall and gets a dated National Shipping card, whose date determines the priority of that man—or since 1964—that woman. The person between ships then must drive from one port to another in search of a berth. The average age of persons in this system is now over 55.

Containerized cargo, which started replacing break-and-bulk cargo in the 1950s, dealt a heavy blow to the longshoremen's union, which had often supported seamen's unions in the past. Seamen themselves also suffered work loss from new labor-saving technology: Better metal finishes reduced the need for the constant chipping and painting of iron ship technology, frozen meals and microwaves needed only one cook, and the simple installation of a toilet near the bridge saved one person per watch. Electronics saved the time of the navigation officers, and the worried radioman was replaced by a few small boxes. The need for human observation with binoculars has been reduced by position-plotting radar.

The post-World War II emergence of Flags of Convenience (FOC) has dealt a further blow to the leverage of maritime labor. This practice of hiding ownership under weak-state flags has led to human rights' abuses, ecological abuses, and contractual abuses that are difficult to prosecute. Ship maintenance, crew training, paperwork, and crew communication can easily be skipped over and concealed. Mariners may be stranded in foreign ports, and marginal owners may simply cut all resources from a worn-out ship and let it drift, as in the case of *Mercedes I*, which went ashore at the Florida estate of Mollie Wilmot in 1984 and drew brief public attention. The best real hope for FOC seamen lies in the coordinated, global campaigns of the International Federation of Transport Workers.

Although the U.S. Merchant Marine has withered under international competition, there are still good careers available. The Merchant Marine Academy at Piney Point, Maryland, now accepts international students and places its graduates internationally. A union-run school is the Seafarers Harry Lundberg School of Seamanship of the SIU that trains beginning and advanced students in U.S. standards, also at Piney Point, Maryland. There are many regional and state schools in shipping, fishery, oceanography, and related seamanship studies, such as Maine Maritime Academy at Castine, Maine. Sailing-ship experience is still widely respected for its instinctive feeling for wind

and wave and its bravery. The American Sail Training Association can still teach tall-ship skills to students who dare.

MARX, KARL (1818–1883)

Few have left so massive and complicated a legacy as Karl Marx. He wrote voluminously, politicked incessantly, and long after his death, his name and his thought—and all manner of variations on them, to various and hotly contested degrees of fidelity—continue to exercise an enormous influence on intellectual and political life across the planet. He vigorously denounced any "great man" theory of history, but for present purposes, it is difficult to avoid if for no other reason than his significance for labor history

and labor historians is virtually unparalleled. Marx never visited North America, but he wrote a great deal about the New World and the United States, and in addition to the global influence of his thought, there are two other main ways in which this significance relates to the American context. First his occasional reflections on the United States throughout his theoretical works and his many journalistic contributions analyzing the Civil War, indicate that the United States played an important role in the formulation of Marx's critical theory. Most notably it frequently serves as a counter-example to Europe in his analysis of capitalist development. Second his thought is enormously important to the practice of labor history in the United States and to American labor radicalism.

Life and Work

Marx was the great historicizer, and it is a crucial lesson of Marx's work that it is only comprehensible in light of the specific histories that produced it, especially the larger context of nineteenth-century European radicalism. He was born in Trier, Prussia, in 1818, the *petit bourgeois* son of a lawyer. The family was of Jewish heritage but converted to Protestantism when Marx was a young boy. He attended the gymnasium in Trier and studied philosophy at universities in Bonn and Berlin. While in Berlin he became associated with the so-called Young Left Hegelians, a group of thinkers interested in the revolutionary and atheistic possibilities they read in Hegel's idealist philosophy. He would later break with them, but he never let go of Hegel, whose *Logic* (1830) would prove essential to his critical dialectical method.

In 1841, Marx left Berlin for Bonn, but the political climate prevented him from finding the university post he sought, and he accepted an offer to help run the *Rheinische Zeitung*, a radical newspaper published in Köln. Not long after he was appointed editor-in-chief. The radical-democratic turn the newspaper took under Marx's leadership led to its official suppression in early 1843, and Marx moved to Paris to publish a similar journal, the *Deutsche-Französische Jahrbücher*. Only one issue of the *Jahrbücher* was printed, but in Paris Marx met Friedrich Engels (1820-1895), his life-long collaborator, friend, and financial supporter. With Engels he developed the materialist political philosophy they outlined in *The German Ideology* (1845), which denounced the Young Hegelians' idealism as blind to the true forces of history: the "mode of production," the historically specific manner in which real

individuals produce and reproduce their material life. He extended the materialist argument in his 1847 excoriation of Pierre-Joseph Proudhon's utopian socialism, *The Poverty of Philosophy*.

At the request of the Prussian government, Marx was expelled from France for his revolutionary writing and political activity, and in 1847, he and Engels moved to Brussels. There they joined the Communist League, at whose request they cowrote the *Communist Manifesto*, which appeared in February 1848. The Manifesto develops a materialist theory of revolutionary social change from the contradictions and antagonisms immanent to the productive structure of bourgeois-capitalist society. Even if it is necessarily among his more programmatic, less subtle works, the *Manifesto* presents some of Marx's best-known ideas and commitments in their early stages of development. These themes include a materialist political economy, the movement of class and class-consciousness, a progressive-revolutionary theory of history and the proletariat, and internationalism (that is, "Workers of all countries, unite").

With the failure of the German revolution of 1848, for which he and Engels had returned to Prussia, he fled again to Paris but almost immediately went in exile to London, where he remained until his death. In England Marx and his family lived in poverty, often supported entirely by Engels, and for a time his political activity slowed. Eventually however London proved the stage of his most lasting political and intellectual contributions. On the one hand, in 1864 he helped found and lead the International Workingmen's Association (IWA)—the so-called First International, a worker's movement that helped plant the seeds of Communist internationalism. On the other hand, it was during this period of more than 30 years of relative sedentariness that Marx produced, with the exception of the *Manifesto*, his most influential works, among them the unpublished notebooks published as the *Grundrisse* (1939), written between 1857–1858, the *Contribution to a Critique of Political Economy* (1859), and his *magnum opus*, *Capital: A Critique of Political Economy*.

Capital is Marx's greatest intellectual and political legacy. He only succeeded in completing and publishing the first of four projected volumes in 1867. Nonetheless since the end of the nineteenth century, *Capital* has been published as a three-volume critique of the capitalist mode of production. Volume 1 is primarily an analysis of the social relations of production under capitalism, Volume 2 (1885) discusses the process of circulation, and Volume 3 (1894) is presented as a consideration of capitalism in general. It is important to note however, that what stand today as Volumes

2 and 3—and as *Theories of Surplus Value* (1861–1863), sometimes described as Volume 4—were compiled by Engels and others from notes left by Marx after his death. Indeed the chronology implied by the volumes' ordering obscures the fact that despite much of interest therein, most of the material was written before Volume 1 appeared in print and represents in many cases early, and often presumably incomplete, formulations of the arguments in Volume 1.

Volume 1 develops in detail the critical theory of capitalism and its constituent concepts and methods. These provide the foundation for all subsequent Marxisms, of which there have been many (a short list might include Kautskian, Leninist, Trotskyist, Maoist, Gramscian, and Althusserian, among others). Common to virtually all of them however is Marx's fundamental historicization of capitalism. In contrast to those he called *bourgeois* political economists, who naturalize capitalism and its attendant individualism and competition as either a state of nature or as the realization of historical progress—thus the subtitle *A Critique of Political Economy*—Marx argues that capitalism is one historically contingent "mode of production" (and thus mode of social organization) in the trajectory of human development. Basing his analysis on the experience of industrial revolution in Europe, England in particular, he considers the evolution of capitalism from previous modes, particularly feudalism, and thus demonstrates that capitalism is neither natural nor an historical end point but a mode from which others will inevitably emerge.

His method of analysis was dialectical, derived from Hegel's theory of historical movement stripped of its idealism; as Engels later wrote, the materialist dialectic showed that Hegel had the form of movement right but that the relation between ideas and material life was "placed upon its head"—what was needed was to turn Hegel on to his feet. It suggested that the contradictions implicit in the struggle between the various classes capitalism produced, and in the inevitable conflict between humans' emancipatory desires and the increasing material and political burdens of life under capitalism, would lead to the supersession of capitalism by revolutionary forces with great liberatory potential. Although Marx does not suggest in his later work the precise forms the future will take, his critique is nonetheless based on the fact that if workers were to act, to determine the shape that revolutionary potential, then subsequent modes of production would increasingly provide for greater freedom, greater security, greater wisdom for all.

Volume 1 also contains many of Marx's most influential theoretical contributions. For example the

book begins with a discussion of the commodity, which Marx argues is the fundamental unit of capitalist production. In the often-cited passages on the “fetish of the commodity,” he argues that the relations of production under capitalism hide its fundamentally social basis, leading both capitalists (those owning and controlling access to the means of production) and workers (those without means of production, thus forced to sell their labor power to gain access) to imagine life under capitalism as constituted by the relations between things (inanimate objects are thus fetishized or accorded the qualities of living things), as opposed to the relation between people. It also presents, among other ideas, his theory of money as the standard equivalent (one commodity that over time emerges as the standard of measure), his explanation of the complex relation between use-value (qualitative value-in-use) and exchange-value (quantitative value-in-exchange), the distinction between labor and labor-power, and his outline of the labor theory of value (the hotly contested notion that all value is produced by labor, an idea he adopted from political economists David Ricardo and Adam Smith).

The importance of these ideas notwithstanding, Marx frequently described his discovery of the “law of surplus value” as his most important contribution. With the benefit of hindsight, it is hard to disagree. The concept is straightforward: Capitalist production is predicated on growth, but that expansion is impossible unless among the commodities mobilized by capitalism, there is one that is not only of value but produces value in excess of itself. The only such commodity is labor power, which produces surplus value, value that exceeds what is necessary for its reproduction. The ideological power of capitalist relations of production resides in the secret expropriation of surplus value in the “hidden abode of production.” There the wage-form, which represents the return to the worker for a specific amount of time and effort, conceals from the worker the fact that only part of the day is spent working to earn the means of his or her own reproduction, and the rest of the day’s value is appropriated directly by the capitalist. There is therefore no such thing as a just wage rate, for the wage form itself mystifies exploitation; capitalism is by definition exploitative. Even when the wage is high, constant agitation for better working conditions, better wages, and less work are always just and in workers’ interests. Wherever Marx’s legacy is heralded by wage earners, it is almost always with some reference to the idea of surplus value, and the critique of exploitation, politics, and theory of justice it generates. It is among his most direct influences on the politics and lives of working people, who even when

they have explicitly rejected Marx and Marxism, they have nonetheless often leaned hard on his concept of surplus value.

Marx and the United States

The meaning of the United States in the development of Marx’s critique of capitalism is underappreciated. For him and for other Europeans before and after, the United States was a crucial historical anomaly. Hegel called the United States “the land of the future”: “It is for America to abandon the ground on which hitherto the History of the World has developed itself” (*The Philosophy of History*, 1956). For Marx this land of the future was key to the process and analysis of capitalist development.

The United States thus stood as an instructive counterexample to the legacy of feudalism in Europe. It was a place “where bourgeois relations of production imported together with their representatives sprouted rapidly in a soil in which the superabundance of humus made up for the lack of historical tradition” (1970: 55). It was consequently a fascinating test case of the cultural and political-economic implications of unfettered capitalism: “The abstract category ‘labour,’ ‘labour as such,’ labour *sans phrase*, the point of departure of modern economics, thus becomes a practical fact only there . . . in the most modern society” (1970: 210). The transparency of the commodification of labor was part and parcel of American social relations’ bourgeois modernity: “Nowhere are people so indifferent to the type of work they do as in the United States, nowhere are people so aware that their labour always produces the same product, money, and nowhere do they pass through the most divergent kinds of work with the same nonchalance” (1977: 1014, note 23). Moreover in its struggle over the question of slavery, the United States suggested an analysis of the complex articulation of modes of production that characterized the capitalist world system. “The fact that we now not only call the plantation owners in America capitalists, but that they *are* capitalists, is based on their existence as anomalies within a world market based on free labour” (1973).

He followed the U.S. Civil War—“a world upheaval” (Marx and Engels, 1961)—with intense interest and wrote about it for the *New York Tribune* and the *Vienna Presse* (1861–1862). To Marx the war pivoted primarily on the increasing significance of the West in American national development (Marx and Engels 1961). He thus framed it as an historically determined destruction of slavery—and thus of its expansionary pretensions—by a bourgeois revolution, which despite

its contradictory possibilities, all workers had cause to celebrate. In the United States, as he writes in *Capital* (Volume 1) “Every independent workers’ movement was paralysed as long as slavery disfigured a part of the republic. Labour in white skin cannot emancipate itself where it is branded in a black skin. However, a new life immediately arose from the death of slavery. The first fruit of the American Civil War was the eight hours’ agitation, which ran from the Atlantic to the Pacific, from New England to California, with the seven-league boots of the locomotive” (1977).

Marx’s conclusions from his analysis of the United States were nevertheless far from salutary for American labor. He believed the political and demographic significance of the West was diminishing, stranding immigrants in the tenements of eastern cities. “The great republic has therefore ceased to be the promised land for emigrating workers. Capitalist production advances there with gigantic strides, even though the lowering of wages and dependence of the wage-labourer has by no means yet proceeded so far as to reach the normal European level” (1977). This only reinforced the fact that despite its relative lack of history, the United States was “economically speaking, still a colony of Europe” (1977). Indeed in many ways the postbellum era boded no better for American than for European workers, since it brought with it rapid concentration of capital in the hands of “speculative companies” and “a finance aristocracy of the vilest type” (1977).

The significance of Marx and his thought in American labor history is much more complex and diffuse. Marxism first came to North America with the political activities of German immigrants like Joseph Weydemeyer, with whom Marx corresponded frequently after 1848. Many of them joined the IWA, whose international headquarters were based in New York between 1872 and the organization’s collapse four years later. Marxism soon gained currency with many American radicals—prominent Socialists like Daniel De Leon, journalist, activist, and member of the Socialist Labor party; and Eugene V. Debs, trade union leader and member of the Socialist party, for example, both claimed a life-long reading of Marx had greatly influenced their work and ideas. De Leon, who emigrated from Germany, wrote an English translation of Marx’s best-known work of history, *The Eighteenth Brumaire of Louis Bonaparte* (1852). Activist-intellectuals like W. E. B. Du Bois (1935) and Oliver Cox (1959) developed brilliant Marx-inspired analyses of the nexus of race and class oppression in the United States. Many others, like William Z. Foster, labor and Communist party leader before World War II, or Elizabeth Gurley Flynn, activist and founder of the American Civil

Liberties Union, populate American labor history. Inevitably the extent to which any of these was Marxist (not to be conflated with Communist) is contestable, and a laundry list of great men and women who considered themselves Marxists obscures the profoundly subtle ways in which Marx’s thought articulates with, or informs much of, the activity and intellectual vigor of the American Left. Even in the case of anti-Marxists like Samuel Gompers, Marx’s shadow is cast over the working-class politics of the United States.

Perhaps the most obvious way in which Marx continues to play a crucial part in American labor however is in its historiography. Marx’s thought has significantly shaped the work of some of the most prominent U.S. labor historians, many of whom make it clear that their historical work is itself an explicit and radical political statement. The work of such seminal contributors as Philip S. Foner, Herbert Gutman, Ruth Milkman, David Montgomery, David Roediger, and Alexander Saxton is situated in this tradition. In addition much nonhistorical scholarship that is of continued significance to labor historians in the United States, like Harry Braverman’s labor process analysis (1974) or the segmented labor market literature, are more or less orthodox extensions of Marxist political economy. Indeed any understanding of American labor historiography demands an engagement with Marx’s thought in a manner he would probably never have anticipated. And his American legacy as such is perhaps less constituted by his role in U.S. labor history than by the force of his ideas and their persistent capacity to illuminate and historicize the American working-class experience.

MASON, LUCY RANDOLPH (JULY 26, 1882–1959) Southern Labor Organizer

The daughter of an Episcopal minister, Lucy Randolph Mason was born in Virginia. To be born a Mason in the Commonwealth of Virginia was no minor matter; one forebear wrote the Virginia Bill of Rights, and another cousin was Robert E. Lee. Despite her lineage, Mason’s family relied on her father’s small church salary. But they bestowed on Mason a commitment to community service. In 1903, in an early example of her interest in the rights of labor, she refused to ride Richmond’s trolley cars, in support of a strike by streetcar operators.

At 22 Mason taught herself stenography and found a job with a Richmond law firm that often handled large insurance casualty cases stemming from industrial injuries. Mason witnessed how little protection employers afforded workers injured on the job. She toured factories and saw first-hand poor working conditions. She was particularly struck by the effects of these conditions on female workers. In one instance a 17-year-old woman lost part of her hand on the job. A lawyer who employed Mason convinced the woman to accept a 75-dollar settlement. Mason’s outrage directed the rest of her life.

Mason became convinced of the need for labor unions to assist working people. She noticed that union workers were the best paid, 8-hour days, and time off. Two years into her employment at the law firm, she became a member of the Union Labor League of Richmond and began lobbying for an 8-hour working day for women. Mason gravitated toward protective legislation for women, a position that would later divide suffragists but that reflected Mason’s belief at the time that white, middle-class women must protect women less fortunate than themselves.

In 1914, Mason resigned to care for her ailing father. She remained there until 1923, when her father’s death allowed her to accept a full-time position as general secretary of the Richmond Young Women’s Christian Association (YWCA). Mason’s work with the association cemented her concern for the working class and her belief that labor unions were a way of alleviating some of the problems among working people. In addition a growing interest in securing aid for all of Richmond’s citizens, both black and white, led to Mason’s public disavowal of segregation. While religion certainly played a major role in Mason’s thinking, it seems likely that her experience with the YWCA contributed much to her radical thinking on race. Mason almost single-handedly defeated the Richmond city council’s segregation ordinance in 1929.

Mason's work in Richmond drew the attention of national women's groups. In 1932, she went to work full time for the National Consumers' League (NCL), devoted primarily to labor rights for women. The NCL produced several well-trained women, including Francis Perkins. Prior to Mason's appointment, the league advocated primarily for white, immigrant, working-class women, creating a pattern of interclass cooperation with middle-class activists acting as liaisons between the working class and the government. In part Florence Kelley, her predecessor, designated Mason her replacement to redirect the league's focus to the newly industrializing South.

As part of her southern strategy, Mason traveled throughout the region in the 1930s, establishing local branches of middle-class women and female workers. Mason worked especially to develop either inter-racial branches or white and black branches that would work together. Such a task was not surprisingly very difficult in the South. Inter-racial branches working for fair employment practices not only challenged industrialists' ability to gain access to cheap, unorganized labor, but also assailed the notion of white supremacy that undergirded that system. Southern manufacturers typically opposed the league's efforts, and such controversy made the organization of local branches almost impossible for Mason. Thus while she could win converts on issues like protective legislation, she was not able to change many minds on the issue of race. Despite her energetic direction of the league and a growing friendship with Eleanor Roosevelt, Mason seemed unable to build a viable southern initiative. The tension within the league finally came to a head in 1937 and Mason resigned.

Mason's desire to work in her home region in support of organized labor directed her next profession. In 1937, when the Congress of Industrial Organizations' (CIO's) John Lewis tapped Sidney Hillman to direct the energies of the newly formed Textile Workers' Organizing Committee (TWOC) to create a southern campaign, he sent Mason to Hillman to assist in the work. As the head of an organization with purported ties to communism, Lewis immediately saw the advantages of having a public relations representative with "blood in her veins bluer than indigo." Hillman assigned her to his Atlanta office where she remained the rest of her life.

Union activists knew that a southern strategy was necessary for the strength of unions as a whole. The growing textile industry in the South represented over 200,000 virtually unorganized workers alone, the largest industrial group in the region in 1934. The lack of organization in the South forced down wages, with repercussions in the North. But the South presented its own organizing challenges. Race was the fulcrum

on which the southern labor drama turned. Southern capital was notoriously anti-union and a confederation of politicians, ministers, and newspaper editors reinforced that fervor. Mason's appointment as a southern ambassador for the CIO was meant to mitigate the ire of factory owners, ministers, and editors, who used race baiting, charges of communism, and the specter of outside agitators to control cheap labor. Mason's job was to organize among elite white people like herself to accept labor unionism and inter-racialism in order to smooth the CIO's way in the South.

Mason was almost alone as a female organizer in a male arena. Yet she was highly effective. As with her work for the NCL, Mason used her identity, her status as a southern lady, to camouflage her radical actions; in short she used her image self-consciously to accomplish her goals. In many instances of potential violence, the presence of a soft-spoken, white-haired, elderly lady from Virginia calmed tensions. Certainly the fact that a person like Mason would attach herself to such a suspect cause diffused its threat for many southern officials. More importantly Mason's status paved the way for many southern editors to listen to labor's demands and to consider union organizing because it seemed less dangerous when supported by Mason. Thus Mason lent legitimacy to the labor movement.

In time civil rights cases constituted the bulk of Mason's work for the CIO. While her focus was on persuading elite whites either to aid labor or at least to step aside, she also responded to the concerns of workers whose rights had been violated as they tried to organize. She visited their homes and helped with leaflet distribution to protest their cases. As war loomed, factory owners manipulated the issue of patriotism to elicit any anti-union sentiment. Sixteen states in the South and Southwest passed sabotage and sedition laws to prevent union organizing, and this restrictive atmosphere circumscribed union activity until the country entered the war in 1941. Mason's work garnered much suspicion. She wrote Eleanor Roosevelt that "a friend heard I am a dangerous person, that I am down here to incite the Negroes to an uprising as part of the CIO program." And she was.

The CIO sought to organize the textile industry, which presented unique challenges. There were over 6,000 textile plants in 29 states, employing over one million workers. Each plant represented an array of economic situations and organizing challenges. Although the South represented one of TWOC's greatest challenges, Hillman allocated only 30% of the textile campaign organizers to the South, including Mason, in what would prove later to be a serious underestimation of the need there as well as a

harbinger of the CIO's postwar defeat. She set off on a letter-writing effort to win support for TWOC's efforts. Hillman appeared to heed Mason and "preached the virtues of moderation" to his southern TWOC representatives.

Mason informed President Roosevelt of her plans. She would call for his intervention in the years to come when resistance to a particular strike became violent or a union organizer disappeared; more importantly in some instances, she would receive his help. At other times Mason wrote Roosevelt regarding a particular situation but received no detectable reply from the president. She did however use that relationship to pressure local authorities. She also used the contacts she had made through the NCL to aid in the labor struggle in the South, writing to Molly Dewson, among others.

Letter campaigns helped Mason to develop working relationships with an important contingent of liberal newspaper editors. She corresponded regularly with Ralph McGill, Hodding Carter, and Virginius Dabney. She grew especially close to Jonathan Daniels; Daniels would write Mason often for clarification of labor issues, and he attempted to introduce her to other editors. Mason also maintained a close friendship with the journalist and essayist Lillian Smith.

Mason was careful to investigate the conditions of workers and the responses to their attempts to organize, so that accurate information appeared in the press. A favorite forum for Mason was the college campus. She believed that labor and the higher education community must collaborate to support the union cause. Mason also increasingly involved herself in national events and became tied to a variety of progressive efforts in addition to her work with labor. In June 1938, President Franklin Roosevelt convened the Committee on Economic Conditions in the South, and in the summer of that year, the president issued a 15-chapter report it had drafted. Its most well-known assertion was that "the South was the nation's number one economic problem." Lucy Mason compiled much of the information in the report and was the committee's only female member.

In 1942, Mason turned 60 and years of traveling and intervening in stressful civil liberties cases began to take its toll. Illness limited the last 10 years of her work for the CIO. She focused on encouraging inter-racialism. Mason could not have predicted the impact the Cold War would have on the American labor movement. However tentative the CIO's commitment to inter-racialism may have been, the CIO's small steps across the racial divide made it vulnerable to charges of radicalism, where in the context of the Jim

Crow South, it surely was. In mobilizing against union organizing in the postwar period therefore, employers were able to marry inter-racialism and anticommunism by literally conflating unionism and miscegenation.

Given the even greater obstacles to unionization in the postwar period, Mason's ability to appeal to owners, government officials, police, ministers, editors, and other opinion-makers was especially important and offered the greatest potential to southern labor organizing in the postwar period. Ultimately however few resources, pervasive racism, and anti-union fervor overwhelmed her contributions, and the CIO's Operation Dixie. Labor unions backed away from civil rights activity and inter-racial work as their southern members increasingly joined newly forming White Citizens' Councils. However as the CIO relaxed its commitment to racial equality, Mason redoubled hers. Race relations captured her attention most fully at the end of her life. She participated in a variety of initiatives dedicated to eradicating racism and increasing inter-racial cooperation. She seemed to understand that education and intervention by whites were crucial to improved racial interactions.

Mason spent the last active years of her life writing a book that documented her experiences with the CIO. The process of writing the book was valuable but ultimately debilitating. With the book published in 1952, Mason was too tired to continue working. She retired from the CIO in 1953 and died in 1959.

Through moral suasion and an active campaign of publicity that used her access to an elite white base of power, Mason was able for a time to help aid the cause of labor and racial justice in the South. But it would fall to a new generation to enforce the truth of Mason's prediction that whites and blacks could work together.

MAY DAY

May Day is the international workers' holiday. It was celebrated in the Soviet Union and then in the Communist countries of Eastern Europe as a major national holiday, and it is still celebrated by unions and workers' parties throughout Europe, but it actually originated in the United States.

The Origins of May Day

May Day emerged in the late nineteenth century out of the struggle by American workers for the 8-hour day. Throughout the nineteenth century, workers fought to shorten the workday, first to 10 hours, then to 8. By the 1880s, these fights had generally been unsuccessful. A work week of 10 hours, 6 days a week was the norm, with many workers putting in 12-15 hours, sometimes 7 days a week. The Knights of Labor (KOL), which was the largest and most important workers' organization for most of the 1880s, called for the 8-hour day but did little on a national level to organize fights for it. The KOL pushed Congress to pass a law limiting the workday to 8 hours, but this never happened. The American Federation of Labor (AFL), founded as the Federation of Organized Trades and Labor Unions of the United States and Canada in 1881, also declared for the 8-hour day and at first also proposed legislation as the means to procure it.

The various attempts to get laws passed to limit the workday, going back to the original 10-hour movement in the first part of the century, had all been resounding failures. Even when specific localities did pass laws limiting hours, they invariably included the caveat that if workers contracted for a longer day, they could work it. A fight over just such a law in Chicago was actually the first May Day fight for shorter hours, though it was not yet called May Day. On May 1, 1867, workers paraded and struck throughout Chicago to try and enforce an Illinois law calling for the 8-hour day, but they were defeated. In the mid-1880s, a group of people within the AFL began pushing for militant action instead of legislation as the surest path to win the 8-hour day. To this end George Edmonston, founder and first president of the Brotherhood of Carpenters and Joiners, introduced a resolution in 1884 that from May 1, 1886, 8 hours would constitute a full workday. This resolution passed 23-2, and May Day was born, at least as an idea. This date was probably selected for two reasons. First it was traditional for carpenters to rally together and get employers to sign contracts on May 1. It is also possible that Edmonston chose May 1 to commemorate the Chicago strikes of 1867.

There was a long distance between declaring that from May 1, 1886, on 8 hours would constitute a workday and actually putting that demand into effect. The first problem was to enlist the aid of the KOL, much larger than the AFL at that time. While the national leadership of the KOL refused to support any kind of national strike wave for the 8-hour day, many local assemblies of the KOL supported the plan. Throughout late 1885 and early 1886, both local KOL assemblies and unions affiliated with the AFL held mass meetings, put out circulars, and prepared themselves for a fight. Workers rushed into the movement as it picked up steam and put more militant leaders at its head. Anarchosyndicalists organized in the International Working People's Association gained mass support, especially in Chicago, by advocating militant action to win workers' demands. In Chicago alone these anarchists put out five papers in three different languages, had perhaps 5,000 members, and were in the leadership of the biggest unions in the city. This mass movement was not centrally coordinated; in New York, craft unions did most of the work, in Chicago it was the anarchists and the KOL; in Cincinnati a Trades' Assembly and the local KOL predominated. Despite this lack of central coordination, by late April 1886, about 250,000 industrial workers were involved, and many employers granted the 8- or 9-hour day before May 1 to avoid strikes.

On May 1, 1886, perhaps 400,000 workers struck and demonstrated across the country. This strike wave was centered in Chicago, though it included smaller cities and towns like Mobile, Alabama; Galveston, Texas; Argentine, Maine; Duluth, Minnesota; and many others. In Chicago about 30-40,000 workers struck, with 45,000 having already won the 8-hour day. In the first May Day parade in the world, about 80,000 workers marched up Michigan Avenue. Railroads, stockyards, and many other industries were closed. From May 1 to May 3, the movement grew. A 7,000 additional strikers went out in Milwaukee on May 2; about 20,000 workers paraded in Baltimore on May 3. Then, on May 4, tragedy struck.

Haymarket

The seeds of Haymarket were planted at the McCormick Reaper Works, where a lockout and strike that had started in February continued into May of 1886. On May 3, the Lumber Shovers' Union held an 8-hour rally near the plant where August Spies, one of Chicago's main anarchist leaders, was to speak. When the shift change bell rang at the McCormick plant, about 500 people left the crowd to demonstrate

MAY DAY

against the scabs still working at the factory. In the ensuing scuffle, police fired into the crowd, immediately killing one demonstrator. Three more died later of their wounds, and many more were injured.

Spies called for a meeting in Haymarket Square the next day to protest police brutality. With rain threatening and competing demonstrations taking place throughout the city, only about 3,000 people arrived at the demonstration. During the speeches, it began to thunder, and by the time 180 police arrived to disperse the crowd, only perhaps 200 demonstrators were left. As the police encircled this small crowd, a bomb exploded in front of the police killing one instantly and wounding over 70. The remaining police fired indiscriminately into the crowd and at each other, killing at least one demonstrator and wounding many others. Six more police later died from the wounds, at least some of which were sustained from their fellow officers.

In the aftermath of this bombing, the city elites cracked down on the leaders of the working class movement. On May 5, the mayor of Chicago declared martial law. The main newspapers and business leaders of the city called for blood. The police arrested hundreds of people and finally prosecuted eight men: August Spies, Albert Parsons, Samuel J. Fielden, Michael Schwab, Adolph Fisher, George Engel, Louis Lingg, and Oscar Neebe. These were eight of the main leaders of the workers' movement, and none of them

could have thrown the bomb. Spies, Parson, and Fielden actually spoke at the rally. Fielden was the speaker when the bomb exploded. The others did not even attend the rally. At the same time, the elites of the other cities affected by the movement launched their own repression. Cincinnati deputized 1,000 special police. In Milwaukee militia fired on a crowd and killed at least nine workers. In the face of this repression, it was impossible to maintain the 8-hour day movement, and by mid-May the strikes were over. Some had been defeated, but almost 200,000 workers did gain the 8-hour day.

The eight Chicagoans were tried in June of 1886. The prosecution charged that they were guilty, not because they threw the bomb, but because the unknown bomb thrower was influenced by their ideas. Their trial was presided over by Judge Joseph Gary, future president of U. S. Steel and namesake of Gary, Indiana, who appointed a bailiff to select jurors who were evidently biased against the defendants. None were workers, and one was even a relative of one of the murdered police officers. After a farcical trial, all eight were convicted. Judge Gary condemned seven of the eight to be hanged, and gave Neebe 15 years of hard labor. Before sentencing, Spies and Parsons gave rousing speeches invoking the power of the workers' movement. After the verdict an international movement was launched to save the condemned men. Two of the condemned, Fielden and Schwab, had their

sentences commuted to life imprisonment. Lingg committed suicide, and Spies, Parsons, Engel, and Fisher were hanged on November 11, 1887. In 1888, Illinois Governor John Altgeld pardoned the Haymarket martyrs, one day after the Haymarket Martyrs' Monument was dedicated in Waldheim cemetery.

International May Day

The first international May Day was celebrated on May 1, 1890, in cities throughout Europe and the United States after a call from the AFL and the Paris Socialist Congress that also founded the Second International. May 1 was chosen for an international 1-day strike for the 8-hour day and to commemorate the Haymarket martyrs. In many countries workers demonstrated rather than striking, but across Europe and the United States, this first international May Day was greeted with such enthusiasm that May Day was celebrated again in 1891 and became an annual international day to demonstrate for the 8-hour day. In the United States, the peaceful enactment of Labor Day as a national holiday in 1894 took some of the steam out of May Day. The AFL decided to support Labor Day, and by 1901, it abandoned any mention of May Day.

In Europe workers organized massive demonstrations and strikes on May Day during the whole period leading up to World War I. In the United States, May Day became the holiday of the Left. The Socialist party and the Industrial Workers of the World organized the main May Day rallies, while the main unions did not participate. After the Russian revolution, when May Day became an official holiday in the Soviet Union, its celebration in the United States was repressed in the first Red Scare. During the Great Depression, the Communist party of the United States, sometimes in alliance with the Socialist party, organized large May Day rallies, but during the Cold War after World War II, May Day almost passed out of existence as an American holiday. In Europe and in much of Latin America however, May Day remains a major holiday of workers and the Left.

MCBRIDE, JOHN (1854–1917) President of Both the United Mine Workers and the American Federation of Labor

John McBride led the last and most substantial challenge to business unionism's domination of the American Federation of Labor (AFL), mobilizing forces that wanted to transform the federation into a partisan organization.

McBride was born in 1854 near Massillon, Ohio, to immigrants Thomas and Bridget McBride. Thomas McBride, a coal miner and part owner of a mine, served as an American Miners' Association official in the 1860s. McBride followed his father into the mines at the age of eight, working as a helper before becoming a full-fledged miner. He joined the local union and in the 1870s, became an officer in local and regional unions. By 1880, McBride had become the most important miners' union official in Ohio, leading the formation of the Ohio Miners' Union in 1882 and serving as president until 1889. McBride mixed trade unionism with politics, winning terms in the Ohio House of Representatives (1883–1887), receiving the Democratic nomination for secretary of state (1886), and losing an Ohio Senate bid (1890). He headed Ohio's Bureau of Labor Statistics from 1890–1892, when he became United Mine Workers (UMW) president.

In the 1880s, McBride insisted that market forces posed the greatest threat to the welfare of miners and that the fortunes of miners and operators were linked. With "too many mines and too many miners," the coal industry was suffering. McBride worked to eliminate this competition through the creation of a national miners' union and the negotiation of a nationwide agreement between miners and operators to set wages, divide markets, and establish price differentials based on costs. Without competition, coal prices would rise allowing operators to increase wages.

McBride's strategy was partly successful. He guided regional miners' unions through a series of mergers that resulted in the 1890 formation of the UMW and helped miners and operators forge an agreement on markets, wages, and prices covering much of the bituminous field stretching from western Pennsylvania to Illinois. Although the agreement probably improved conditions for miners and operators, too few operators respected the agreement.

The Panic of 1893 destroyed the union's agreement with operators. As demand for coal dropped, operators scrambled to find markets, cutting prices and wages. McBride (and many operators) thought that only the UMW could improve market conditions.

A strike would cut supply, increasing coal prices to enable operators to pay the negotiated scale. McBride convinced the UMW's annual convention to launch a nationwide strike on April 21, 1894.

The strike began well. By mid-May, about 180,000 of the nation's 193,000 miners were out. Initially there was cooperation between operators and miners, with some operators providing strikers with above-ground work. By late May McBride believed that market conditions would allow operators to pay the negotiated scale and met with operators in Cleveland in hopes of ending the strike. In Cleveland operators disagreed among themselves. Some were willing to pay the scale; others refused. McBride felt betrayed, charging reluctant operators with continuing the strike in order to unload stockpiles at inflated prices. Failure in Cleveland transformed the strike. Miners began disrupting shipments from nonstriking mines and stockpiles, and authorities in several states mobilized troops. The strike petered out.

The strike's failure and other events that year—Pullman boycott, Coxey's march, conviction of Eugene Debs—convinced McBride that cooperation between capital and labor was impractical, that state and federal governments had become tools of capital, and that only political action could help workers. In fall 1894, McBride, with support from Ohio's leading trade unionists and urban federations, engineered a state labor-Populist alliance. Ohio's Populist platform, written by McBride, demanded the "collective ownership . . . of all such means of production and distribution as the people may elect to operate."

McBride's support of Populism helped him defeat Samuel Gompers for the AFL's presidency that December. President McBride worked to expand the labor-Populist alliance, but his efforts were hindered by allegations of bribery, illness, the AFL's constitution, and business unionists on the federation's executive board. McBride's supporters and opponents saw the AFL's 1895 presidential election as determining the federation's political stance in 1896 and beyond. By a very small margin, Gompers defeated McBride.

The Populist nomination of William Jennings Bryan fragmented the coalition that had supported McBride's efforts to transform the federation, ushering in an era in which business unionism dominated the AFL. McBride campaigned for Bryan in 1896, and then disappeared from federation affairs. Returning to Ohio, he ran a labor newspaper and a saloon until his death.

McCARRAN-WALTER ACT (1952)

The Immigration and Nationality Act of 1952, or the McCarran-Walter Act, served to reaffirm the principles of immigration restriction and the national-origins quota system first set in place in 1924. In part a reaction to the Cold War concerns about subversion and in part an effort to codify and restructure the many existing statutes on immigration, work on the act began in 1947 and ended 5 years later with the passage of the bill over President Truman's veto.

Although the 1952 act was largely an affirmation of the status quo, it did depart from the previous acts in several ways. First although it continued the national-origins quota system that allotted 85% of the 154,277 visas available each year to residents of northwestern Europe, it did end Asian exclusion and racial restrictions against naturalization, allotting a minimum of 100 visas to each Asian nation each year. At the same time, not only were quota numbers for Asian countries kept very low, they were also allotted on the basis of race, not country of birth as in Europe.

Second the act instituted a system of preferences to help determine which applicants of countries with oversubscribed quotas would be given the right to immigrate. The first preference was reserved for workers with special training or job skills of use to the United States; the second through fourth levels were allotted to various relatives of American citizens and residents. For countries with surplus quotas, like Great Britain, such preferences would not be used, but for other countries with considerable waiting lists, like Italy or Greece, the preferences were intended to help consular officers sort through the applicants to find the most desirable.

Other innovations in the act included providing nonquota status to alien husbands of American citizens and residents and the introduction of a system-of-labor certification to prevent new immigration

from having an adverse affect on the work and wages available to American citizens, though this particular provision was rarely put into practice.

Although the act passed by an overwhelming majority and even over the president's veto, the debate over the act was quite heated, and several of its provisions fraught with controversy. The most fundamental debate was between those advocating continued restrictionism and those arguing for a more liberal policy. While those advocating continued restriction, led by Senator Pat McCarran (R-NV) and Congressman Francis Walter (D-PA), highlighted the importance of safeguarding national security and maintained that the national-origins system was vital to these efforts, those favoring liberalization, like Congressman Emanuel Celler (D-NY), linked American immigration policy to foreign policy, and declared that an equitable system free from the charges of racism and nativism to be needed to garner international support for American leadership of the free world. One proposal for making the act fairer and less overtly racist was to pool unused quotas for the use of countries with many would-be immigrants and small quotas, like those in southeastern Europe.

An important issue receiving much attention in the hearings over the proposed bills was the issue of Asian exclusion. Cracks had already emerged in the system with the repeal of the Chinese Exclusion Acts as a war measure in 1943 and the repeal of exclusion against Asian Indians and Filipinos in 1946. Although the McCarran proposal provided for the repeal of Asian exclusion, it did not mean equitable treatment of Asian and European immigrants, since it kept Asian quotas on a basis of race rather than one of nationality. Many witnesses, including a representative from the American Federation of Labor (AFL), advocated placing Asians on the same country-of-birth formula as Europeans, arguing that it would bolster American efforts to fight communism in Asia.

Another source of controversy in the debate over the bill was its provisions for restricting the immigration of subversives. The McCarran bill actually liberalized existing policies to allow former members of subversive parties to enter provided they had renounced their prior activities. Still some liberal reformers felt that these provisions were not open enough and moreover extended far too much discretionary power to the attorney general to make exclusion decisions without any provision for judicial review.

In spite of the controversy and extended debate, restrictionists won the day on all of these points. In the end the argument for protection of borders and

the importance of considering national security when determining immigration policy was paramount. Interestingly enough the economic argument was seldom raised by restrictionists although concern over immigrant competition with the American worker had been vital in past debates over immigration policy. A combination of the postwar boom, cold war security concerns, and a difference in opinion within organized labor over the act (the AFL was in favor of restriction, whereas the Congress of Industrial Organizations [CIO] was against it) lessened the impact of the economic factor in these proceedings.

Racial or ethnic considerations by contrast were vital, as can be seen by the final version of the act, which maintained the system of open doors for immigrants from northwestern Europe (and for non-Asian migrants from the Western Hemisphere, since the quota system was not applied in the Americas) and restriction against everyone else. Additionally in the final vote, the minority of senators and representatives against the bill were predominantly representing communities in the northeastern United States that had strong ethnic blocs opposing the bill. These concerns, when combined with the national mood of suspicion early in the Cold War, ensured that the Immigration and Nationality Act of 1952 did little more than maintain the status quo.

MCCLELLAN COMMITTEE HEARINGS

Formally the U.S. Senate Select Committee on Improper Practices in the Labor or Management Field, this body commonly was referred to by the name of its chairman, Senator John L. McClellan, a conservative Democrat from Arkansas. The McClellan Committee's hearings helped to make labor corruption a national concern at the same time as the committee's conservative majority promoted a broad interpretation of the term corruption, one that justified

efforts to curb organized labor. The result was the passage of legislation, the Landrum-Griffin Act (1959), which imposed new restrictions on union-organizing tactics.

The committee's formation grew out of hearings on corruption in the Western Conference of the Teamsters' Union held in late 1956 by the Permanent Subcommittee on Investigation of the Senate's Government Operations Committee. McClellan, who chaired that committee, asked Congress to authorize and fund a more in-depth investigation in labor racketeering, and the result was the formation of this new select committee with an initial 2-year mandate and preliminary budget of \$350,000. McClellan and the committee's chief counsel, Robert Kennedy, brought together the largest investigative staff of any congressional committee up to that time. Over the next 2.5 years, the committee questioned 1,525 witnesses in testimony that eventually filled over 50 bound volumes. These hearings and the committee's findings were widely publicized, and they drew public attention to the problem of labor corruption. In 1959, opinion polls revealed that Americans now listed labor union problems as one of the nation's most significant problems, equal in importance to concerns about education, the space race, and national defense.

But at the same time as the committee drew public attention to the phenomenon of union corruption, it also promoted a particular political agenda. Conservative senators hostile to organized labor dominated the eight-member committee. McClellan was joined by another southern Democrat, Sam Ervin, while the Republican members of the committee included long-time anti-unionists: Carl Curtis, Karl Mundt, and Barry Goldwater. The moderate committee members with more sympathy for labor included John F. Kennedy and Irving Ives. The only prominent pro-labor Senator, Pat McNamara, a Michigan Democrat, resigned after the first year to be replaced by Frank Church, a junior Senator from Idaho. The conservatives who made up the committee's majority asserted that organized labor had gained too much power and they hoped that the committee's revelations regarding union corruption would build support for new restrictive legislation. Thus although the original mandate for the committee involved looking at the activities of employers and their representatives, in fact the committee focused almost exclusively on unions. Blame for improper activities was assigned to union leaders. When employers paid money to union officials, the committee almost always depicted those payments as examples of union extortion even if the employers had initiated the arrangement in hopes of

achieving a more lenient contract. Moreover the hearings promoted a definition of corruption that included organizing tactics by unions, such as secondary boycotts, that were aggressive but technically legal.

In its efforts to focus public attention on the problem of union corruption, the McClellan Committee investigated a number of different unions, including the United Auto Workers' Union, the Carpenters' Union, and the Operating Engineers, among others. But by far the committee spent the most amount of time investigating the Teamsters' Union, making this organization and its leader, James R. Hoffa, into prominent symbols of the problem of labor corruption. Ironically the early McClellan Committee hearings, which had brought down Hoffa's predecessor as Teamster president, Dave Beck, made Hoffa's rise to the union's leadership possible. The committee demonstrated Hoffa's connections to organized crime figures and raised questions about his administration of the union. The hearings made Hoffa notorious, but they failed to shake his political strength within the Teamsters.

The committee's investigation was also shaped by the advent of a gathering of organized crime figures in Apalachin, New York, that the New York State Police stumbled on in November 1957. Apalachin appeared to confirm the existence of the Mafia as a nationwide organization, and the McClellan Committee held a series of hearings on the threat posed to the country by this criminal conspiracy. Criminal figures testifying at these hearings regularly invoked their Fifth Amendment privilege against self-incrimination, and their refusal to answer questions was depicted as confirmation of the existence of a tightly organized conspiracy. The committee argued that the existence of the Mafia combined with its ties to such labor leaders as Hoffa made the need to pass new restrictive legislation all the more urgent.

**McENTEE, GERALD W. (JANUARY 11, 1935–)
American Federation of State, County and
Municipal Employees (AFSCME)**

Gerald W. McEntee was born in Philadelphia, and educated at parochial schools before attending LaSalle College, where he graduated with a degree in political science in 1956. The son of William J. McEntee, the original organizer and leader of Philadelphia's Municipal Workers' Union, McEntee's early years were immersed in the world of labor politics. Following the completion of his college education, McEntee took a position as an organizer with the American Federation of State, County, and Municipal Employees (AFSCME) and was placed on staff with his father at Philadelphia's AFSCME District Council 33. From 1957 to 1969, he worked as one of the council's lead political strategists and as a negotiator in bargaining contracts with the City of Philadelphia.

Gerald McEntee's place within the labor movement centers primarily on his successes as an organizer. In the late 1960s, he helped boost District Council 33's membership in a series of aggressive campaigns that brought in new locals representing cafeteria and library workers at the University of Pennsylvania, employees at the Philadelphia Zoo, and over 1,000 women who served as school crossing guards. In the summer of 1969, with approval from AFSCME International President Jerry Wurf, McEntee shifted his organizing activities beyond Philadelphia toward an ambitious attempt to organize the over 75,000 state employees of the Commonwealth of Pennsylvania. Appointed director of the AFSCME's Pennsylvania Organizing Committee (POC), McEntee had just one other organizer assigned to work with him, Buck Martin, an AFSCME representative from Johnstown Municipal Employees' Local 630. Believing that a drive to organize all of Pennsylvania's state workers would take about 5 years, McEntee divided Pennsylvania's 67 counties between him and Martin and began making contacts with workers in union halls, private homes, and political gatherings in the last months of 1969. The success of the POC campaign would be based on two objectives: A political campaign to restructure Pennsylvania's existing public-sector labor laws and a simultaneous effort to secure support for AFSCME representation among the thousands of unorganized state employees.

The political climate for an overhaul of Pennsylvania's labor laws seemed promising in the late 1960s. Although Pennsylvania's laws officially recognized the right of state workers to join associations that advanced their position as government employees,

these laws stopped short of granting the right to bargain collectively. In the mid-1960s, however, challenges to state laws were initiated by Pennsylvania police and firefighter associations. With bipartisan support, Raymond P. Shafer, Pennsylvania's moderate Republican governor, approved of measures to grant collective-bargaining rights to uniformed personnel. Pennsylvania citizens voted in favor of the legal changes in a 1968 referendum, giving hope to nonuniformed state employees that they could gain similar rights. Soon after Governor Shafer formed a commission to review existing state labor laws, which ultimately recommended a complete overhaul of the Commonwealth's guidelines regarding public employees.

The AFSCME championed the committee recommendations and lobbied for the adaptation of a new law protecting the organizing rights of state workers. McEntee coordinated an extensive lobbying campaign in support of the newly proposed Public Employees Bargaining Law, also known as State Bill 1113, while also organizing activities among state workers to put public pressure on state legislators. A master of media relations, McEntee orchestrated a picket of 5,000 government employees at the state capital building in Harrisburg in April 1970, receiving much publicity across the state. In July 1970, such political pressures paid off with the passing of Act 195, providing Pennsylvania's government workers the legal right to organize and collectively bargain for the first time.

In the days immediately following the passing of Act 195, hundreds of state workers signed cards authorizing AFSCME to represent them in collective-bargaining sessions. Through early 1971, AFSCME continued to expand its membership among Pennsylvania's employees despite a crowded organizing field of competing unions. A key AFSCME victory came in March 1971, when the union gained exclusive bargaining representation for the Commonwealth's maintenance and trade employees, signing the first statewide unit contract covering approximately 17,500 members 8 months later. By July 1973, a master contract for 75,000 workers across the Commonwealth was signed, providing a 6.5% wage increase over 2 years. Soon after a new statewide organization Council 13, with eight regional district councils was established, with Gerald McEntee elected president. The success of McEntee's campaign became AFSCME's national model for similar organizing efforts, helping to expand its membership to the one million mark in 1978.

McEntee's success in organizing Pennsylvania—the largest and most successful organizing campaign in U.S. labor history—launched him into national

prominence. McEntee gained attention again in July 1975 when he led Council 13 in the nation's first strike against a state government, an action that resulted in substantial pay increases for Pennsylvania AFSCME members and underscored the union's militant stance. Following the death of AFSCME International President Wurf in December 1981, McEntee ran for the union's top position, challenging William Lucy, AFSCME's secretary-treasurer who many considered Wurf's handpicked successor. In a hard-fought campaign, McEntee won a narrow victory and has consecutively won re-election as AFSCME president since then. Among his innovations as national AFSCME leader was the establishment of labor's first in-house broadcasting studio, the Labor Network News, in 1982. Located in AFSCME's Washington, DC, offices, the network was equipped with television cameras, tape decks, and editing equipment for use in press conferences and panel discussions, with the capacity to broadcast to four million viewers.

McEntee has been an important voice in shaping debates over the goals and direction of organized labor in the twenty-first century. Most significant was his early involvement in the formation of the New Voice for American Workers' coalition in 1995. Formed in response to the failure of the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO) leadership to reverse downward trends in union membership, and in the face of such serious defeats of labor causes as the failure to stop enactment of the North Atlantic Free Trade Agreement (NAFTA), the inability to secure health care reforms with the Clinton administration, and most importantly the 1994 loss of Congress to the Gingrich Republicans, the New Voice coalition sought to recharge organized labor as a potent force in U.S. politics and culture. In October 1995, John Sweeney, the international president of the Service Employees' International Union (SEIU), was elected as a reform candidate to the presidency of the AFL-CIO. With McEntee's support, Sweeney encouraged new organizing campaigns in the American workplace, including service and retail sectors, to bolster labor power in the United States. Despite the initiatives of the New Voice platform, organized labor continued to decline through the first years of the twenty-first century, leading some prominent leaders of the AFL-CIO, especially SEIU president Andy Stern, to question the federation's commitment to organizing and its ability to represent the concerns of working Americans. Through these debates, McEntee was a staunch critic of Stern's efforts to restructure the AFL-CIO and supported Sweeney's re-election as federation president in 2005. In the summer of 2005, the SEIU along with seven other national unions broke with the AFL-CIO to

form a new national labor federation, Change To Win, a move that McEntee strongly opposed.

A proponent of socially engaged unionism that addresses social issues beyond the formal workplace, Gerald McEntee has been at the head of numerous progressive causes since the 1960s. In 1999, he was among the national labor leaders who urged the formation of a new progressive political coalition at the Seattle protests against the World Trade Organization. McEntee has played a powerful role as the primary spokesperson of the progressive wing of the Democratic party. In 1999, he cast AFSCME's support behind Al Gore, leading to labor's early endorsement, helping him to secure the Democratic nomination. McEntee has been an outspoken critic of the policies of the George W. Bush administration and an active antiwar voice in Washington. In 2003, McEntee was an early backer of antiwar candidate Howard Dean but broke with him following Dean's disappointing performance in the Iowa Caucus, eventually shifting AFSCME's support to John Kerry. At the dawn of the twenty-first century, McEntee remains the most vocal spokesperson for organized labor in the United States.

McENTEE, WILLIAM J. (JUNE 8, 1903–MAY 22, 1983) President of Philadelphia's AFSCME District Council 33

A native of Philadelphia, William J. "Bill" McEntee was one of the early pioneers of municipal unionism in the United States. In an era when public workers enjoyed no legal rights to organize, McEntee forged ahead in establishing a tradition of labor activism among this neglected segment of the U.S. labor force. His bold actions in organizing municipal workers,

especially in blue-collar divisions, and his success in gaining advancements in wages and job protection, set a precedent for big-city labor-management relations that would later emerge across the United States by the 1970s. As the original organizer of Philadelphia's Street Cleaning Bureau, which was one of the most ethnically and racially diverse workplaces in the city, McEntee helped forge a new tradition of interracial unionism in Philadelphia.

A sanitation truck driver who started with the City of Philadelphia's Street Cleaning Bureau in 1924, McEntee's union involvement began in the early 1930s when he initiated an organizing campaign among the city's sanitation workers, eventually securing affiliation with a chapter of Philadelphia's Teamsters' Union. In October 1938, McEntee led a week-long strike that stopped the city's trash services, securing an agreement with Philadelphia's Republican leadership guaranteeing wage increases and increased job security for 2,500 workers in the city's street-cleaning, highway maintenance, and water bureaus. During this strike McEntee allied the municipal workers with the new American Federation of Labor (AFL) union with jurisdiction over local government workers, the American Federation of State, County, and Municipal Employees (AFSCME). In July 1939, the City of Philadelphia signed a contract with AFSCME, accepting the union as the exclusive collective-bargaining agent for all of its blue-collar employees, the first major city in the United States to accord AFSCME such recognition.

In 1944, McEntee was elected the first president of Philadelphia's AFSCME District Council 33, a position he held for 24 years. Under McEntee's leadership, AFSCME expanded its membership there, with new locals established across city departments, reaching a membership of 12,000 by 1960. Philadelphia achieved important settlements with the city through these years, including wage increases, establishment of a civil service system, and the securing of a 40-hour workweek. In 1947, pay demands by District Council 33 led to the forming of a financial review committee that uncovered corruption and graft in key municipal offices, giving rise to a powerful political reform movement that McEntee placed AFSCME behind. Through the 1950s, McEntee secured a political alliance with the reform administrations of Democratic Mayors Joseph Clark and Richardson Dilworth and with their support, secured the nation's first municipal employees' health and welfare fund supported completely through city funding, which became the model for all public-employee health programs across the United States.

Besides his position as head of AFSCME DC 33, McEntee also played an important role as a leader of

both regional and national labor movements, serving as a vice-president of the city's AFL Central Labor Union and as a regional vice-president to the AFSCME international board, positions he maintained for almost 25 years. Through his years as a national AFSCME leader, McEntee was a supporter of the union's founder and president, Arnold Zander, and remained a staunch ally through Jerry Wurf's insurgency for the union presidency in the early 1960s. In 1964, McEntee was Zander's running mate at the international convention in Denver, losing in a close election to Wurf's reform coalition. Following this defeat, McEntee continued to serve as a national AFSCME leader, working with Wurf on the union's Constitution Revision Commission that implemented changes in union procedure and regional planning that heralded the most successful membership drives in AFSCME's history. In 1968, McEntee stepped down as president of Philadelphia's District Council 33. In 1981, McEntee's son, Gerald W. McEntee, who successfully organized 75,000 Pennsylvania Commonwealth employees in the 1970s, succeeded Wurf as international AFSCME president.

McGLYNN, FATHER EDWARD (SEPTEMBER 27, 1837-JULY 1, 1910)

Father McGlynn was pastor of St. Stephen's Church on East Twenty-Eighth Street in New York City from 1866-1887. His advocacy of social justice and defiance of ecclesiastical authority resulted in his excommunication in 1887.

McGlynn spent most of his formative years in New York's Lower East Side. His first assignment as a priest was as an assistant to Father Thomas Farrell, who was a vehement opponent of slavery and a staunch supporter of Abraham Lincoln. During the Civil War, he served as acting pastor in three churches in lower Manhattan.

McGlynn earned praise for his efforts in securing an orphan asylum within Stephen's parish shortly

after he became pastor. Yet in 1870, his refusal to establish a parochial school for Catholic children drew the ire of his superiors. Here he demonstrated a characteristic outspokenness that would lead to controversy. In an interview with the *New York Sun*, he recalled his own experience in local schools as he defended public education, rejecting the position of the church.

McGlynn became a centre of attention again when he enthusiastically embraced the views of Henry George, who proposed a single tax on land not used productively and advocated the cause of the Irish Land League in the early 1880s. In describing *Progress and Poverty* as “a poem of philosophy, prophecy and prayer” whose conclusion is “more like an utterance of an inspired seer of Israel,” he testified to the impact of George’s major work. Like many Irish Catholic Americans, he saw an intimate connection between the “struggle against landlordism” in Ireland and the antimonopoly movement in the United States inspired by Henry George.

Consequently Archbishop of New York Michael Corrigan demanded that McGlynn cease to espouse views that contravened church doctrine. Matters came to a head when McGlynn spoke at Chickering Hall in October 1886 on behalf of George’s independent candidacy for mayor, supported by a coalition of the city’s major unions through the United Labor party (ULP). Corrigan suspended McGlynn from fulfilling priestly functions for 2 weeks and extended the suspension when McGlynn in two interviews with the *New York Tribune* reiterated his support for the single tax. Then in January 1887, Corrigan named Arthur Donnelly as the new pastor of St. Stephen’s Church.

Neither Corrigan’s punitive measures nor the close defeat of George, who finished second to the Democratic party candidate, Abram Hewitt, dimmed McGlynn’s belief that the remedy to poverty remained “the abolition of private ownership of land and the restitution to all men of their rights in the soil.” He continued to insist that social and economic relations were accountable to a higher law than the rules of a free market. He quoted from the scriptures, especially Leviticus and Jesus’s Sermon on the Mount, to underscore his conviction that Christians had an obligation to seek justice for the less fortunate, which during an era of accelerating inequality meant opposition to the “monopolisation of land for profit.”

Encouraged by the support of parishioners who pledged not to contribute to the maintenance of St. Stephen’s Church until McGlynn was re-instated as its pastor and editorials in New York’s Irish press, including the *Irish World* and *Catholic Herald*, he remained unbowed. He was elected president of the

Anti-Poverty Society, formed in March 1887 to campaign for the single tax, and embarked on a hectic speaking tour that included Boston, Philadelphia, Washington, DC, and Cincinnati, among other cities. In June when Pope Leo XIII summoned McGlynn to appear at a tribunal to answer for his disobedience, the Anti-Poverty Society organised a march in his support estimated at 30-40,000 strong. In July the Vatican excommunicated McGlynn after he defiantly failed to appear at the tribunal.

Over the next 3 years, McGlynn dedicated himself to promoting the program of the Anti-Poverty Society, although his influence—as did the vitality of social reform—began to wane. During the 1887 state-wide elections, George ran for secretary of state as a candidate for the ULP, but a split between Socialists and the single-tax camp and the failure of the city’s unions to mobilise for the campaign resulted in a poor showing. Conspicuously such erstwhile supporters like the *Irish World* withheld its support from McGlynn and the ULP. Then in 1888 the alliance between McGlynn and George ruptured when the latter endorsed Grover Cleveland’s Democratic candidacy for president, an act that McGlynn felt sabotaged the integrity of the single-tax movement.

Meanwhile behind the scenes, McGlynn’s restoration within the church began. Mgr. Francisco Satolli on behalf of Pope Leo XII, conducted an investigation of McGlynn’s standing among Catholic parishioners and discovered the excommunicated priest had broad support among other clergymen and that the Vatican’s decision in 1887 continued to divide the Church. McGlynn helped his cause when he provided a lengthy statement explaining his views on the private property and the land question that appeared not incompatible with the sentiments expressed in Pope Leo’s Encyclical “*Rerum Novarum*” in 1891 that “workingmen have been surrendered...to the hardheartedness of employers and the greed of unchecked competition.”

Accordingly in 1892, McGlynn was re-instated into the church as a priest, and in 1894, McGlynn was appointed pastor of St. Mary’s Church in Newburgh, New York. Although he lectured around the country on the theme of social and economic justice, a chronic heart condition restricted his activities after 1899.

**MCGUIRE, PETER J. (JULY 6, 1852–
FEBRUARY 18, 1906)
Cofounder, American Federation of Labor**

Peter McGuire was a central figure in the labor movement during the Gilded Age. He served as the general secretary of the United Brotherhood of Carpenters and Joiners from its founding in 1881 until 1902. Along with Samuel Gompers, he helped launch the American Federation of Labor (AFL) in 1886.

McGuire cut his teeth as a labor activist at the onset of a protracted economic depression in 1873. He was elected as a member of the Committee of Public Safety, formed to press the authorities to provide public relief for the city's unemployed workers. He spoke, both in English and German, at impromptu street corner meetings and more formal rallies, culminating in the mass public meeting at Tompkins Square on January 13, 1874, which the police violently broke up, resulting in scores of injuries and the arrest of 35 demonstrators.

As unemployment and economic hardship mounted, McGuire increasingly became more involved in the nation's burgeoning socialist movement. In 1874, he helped to establish the Social Democratic party of North America (SDP), which was inspired by the writings of the German Socialist Ferdinand Lassalle. He contributed to the SDP's newspaper, the *Toiler*, which advocated independent working-class political action in pursuit of collectively owned and managed "productive associations in industry," and over the next 2 years tirelessly toured the country on behalf of the party. With the formation of the Workingmen's party, which encompassed the SDP, in 1877, McGuire's reputation as a rousing speaker and energetic organizer grew. He ran the party's election campaigns for local and state offices in Connecticut and garnered over 9,000 votes in Cincinnati's council elections that year.

Later in 1877, McGuire relocated to St. Louis, where he rose to prominence in the city's Trades' and Labor Assembly. He lobbied state legislators to

enact bills that would require adequate ventilation in mines, regulate child labor, and establish a State Bureau of Labor Statistics. For his efforts he was appointed deputy commissioner in 1879, but he quit after 6 months in post.

His remaining 3 years in St. Louis saw McGuire renew his commitment to independent political action. On his election as president of the Trades' and Labor Assembly, he was chosen as a delegate to the national convention of the Greenback-Labor party in 1880, and despite his vocal support of the party's election efforts, he refused the nomination to run for the office of secretary of state in Missouri.

By 1881, however, McGuire turned his attention to the nuts-and-bolts of trade unionism. The disappointing performance of the Greenback-Labor party led to a sober reassessment of the potential of independent political action. McGuire's intermittent stints as a carpenter gave him first-hand experience with the deteriorating employment conditions in the trade. Lastly his involvement in a wave of strikes by carpenters and railway workers in St. Louis convinced him that to sustain the momentum of labor militancy, effective trade union organization was necessary.

Accordingly McGuire directed his energies to building a national carpenters' union. In 1881, he was elected the general secretary of the United Brotherhood of Carpenters at its inaugural convention with a salary of \$15 per annum. He also became editor of the union's monthly journal, the *Carpenter*, where he gave practical council to newly formed locals as well as developed his vision of a transformative trade unionism that would uplift workers individually and collectively.

The union's formative years tested McGuire's organizing skills. Membership only incrementally rose in the first 3 years, since competition from three other unions, the United Order of Carpenters, the Amalgamated Society of Carpenters (ACS), and the Knights of Labor (KOL) forestalled the Brotherhood's progress. However McGuire's and the union's leadership in the 8-hour movement in 1886 became a turning point, as membership increased more than threefold to over 21,000. The Brotherhood's growth spurred McGuire's efforts to seek agreements with competing unions. The Brotherhood overcame threats posed by the KOL assemblies in Washington, DC, and Chicago by 1887, and in 1888 at a special conference in Philadelphia, the United Order of Carpenters and the Brotherhood agreed to merge and form the United Brotherhood of Carpenters and Joiners (UBCJ).

The UBCJ's continued growth and organizational stability represented a model for the AFL's leadership, which since 1886 had sought to promote

national unions representing distinct crafts or trades. In recognition of the UBCJ's achievements, the union agreed to spearhead a renewed drive for the 8-hour day at the urging of Gompers, the AFL's president, in 1890. The union's involvement in 141 strikes in 36 cities involving over 54,000 workers triggered another surge in membership, which more than doubled to 53,000 by the end of the year.

Nevertheless most of the 1890s presented serious challenges to the UBCJ. Firstly jurisdictional conflicts with the International Woodworkers' Union (IWU), which along with the UBCJ, claimed members in shops that made doors, blinds, sashes, and stairs, and with the ASC festered. Secondly McGuire and the union's General Executive Board discovered that their authority was contested by some districts dissatisfied with official union policies. Thirdly in 1893, and during the ensuing years of economic depression, pressure mounted at union conventions to join forces with the Socialist Labor party (SLP) in the political arena. Lastly McGuire, beginning in 1894, faced calls to loosen his grip on the union's operational affairs.

McGuire steadfastly faced these challenges. He was instrumental in negotiating an agreement with the ASC in 1895 that called for the mutual recognition of the membership cards of each union and used his diplomatic skills to prevent a breakdown in relations between the Brotherhood and the IWU. Likewise he steered the General Executive Board away from any direct confrontation with districts that did not consistently respect jurisdictional agreements. Although he remained a Socialist, McGuire's intervention in convention debates stressed that members' interests were not served by a political alliance with the SLP.

Ironically though in large measure because of the UBCJ's expansion in the 1890s, the General Executive Board sought to redistribute some of the general secretary's powers to other full-time, salaried officials. When attempts to modify the union's constitution failed, McGuire's opponents charged him with financial malfeasance, which initially resulted in his suspension in 1901 and his resignation in 1902.

Notwithstanding his anticlimactic forfeiture of leadership, McGuire could take a lion's share of the credit for the gains made by carpenters in the previous 20 years. Union membership rocketed to 122,000, the 8-hour day had been introduced in over 500 cities, and carpenters were among the highest paid manual workers in the nation. Whereas McGuire could envision only a national union capable of advancing carpenters' collective interests, by 1902 the UBCJ had become a flagship affiliate of the AFL at a time when

employers and the general public contested the very legitimacy of trade unionism.

McNAMARA BROTHERS

John J. McNamara and his younger brother James B. McNamara were union activists associated with the International Association of Bridge and Structural Iron Workers (BSIW) who were tried for murder after a dynamite bomb destroyed the *Los Angeles Times* building on October 1, 1910. The explosion caused the deaths of around 20 people and destroyed over half-a-million dollars in property. While many at the time considered the brothers' arrest to be a frame-up, and despite the retention of Clarence Darrow to head up the defense, both men pleaded guilty and served prison terms.

Los Angeles employers had long been hostile to unions, and Harrison Gray Otis, the owner and publisher of the *Times*, had helped organize the virulently anti-union Merchants' and Manufacturers' Association. When San Francisco unionists began a concerted organizing campaign in the Los Angeles building trades in the summer of 1910, Otis's *Times* served as a mouthpiece for the employers and goaded the metal trades workers who walked off their jobs on June 1. The metal trades' unions decided to engage in industrial terrorism in an attempt to better their bargaining position, a practice that had been effective in their struggle against the National Erectors' Association (NEA), an anti-union group fighting for the open-shop in the construction industry. In the period from 1908-1911, the BSIW had detonated 87 bombs in an attempt to gain union recognition from the NEA and its members. Most of these bombs were relatively harmless however, with no loss of life associated with any attack other than the October bombing of the *Times* plant.

When the metal trades strike began in June, the Los Angeles unions contacted John J. McNamara,

who was the secretary-treasurer of the BSIW, and requested the assistance of Herbert Hockin, who had been one of the leading dynamiters for the union. When Hockin was unavailable, John sent his brother James instead. James McNamara had been Hockin's apprentice since 1909 and was a skilled dynamiter in his own right. James set the bomb behind the *Times* printing plant, but he had only intended to cause minor damage to the building. Unfortunately he failed to notice the barrels of flammable ink that were stored in the alley where he had placed the bomb. After the building was destroyed, James was distraught and fled first to Salt Lake City and then to Chicago. Nevertheless by December, he appeared to have recovered, and he helped Ortie McManigal plant another bomb at the Llewellyn iron works on the West Coast. When that bomb injured a night watchman, plans for two more bombs, including one at the *Times* auxiliary plant, were scrapped. After a short break however, James and McManigal began bombing again, planting at least five bombs in March of 1911.

John J. McNamara was arrested on April 22, 1911 by agents working for William J. Burns, a private detective who had been retained by the mayor of Los Angeles to investigate the *Times* bombing. James and his partner McManigal had been arrested 10 days earlier carrying a suitcase full of explosives. McManigal agreed to cooperate in exchange for a lighter sentence, and the McNamara brothers were quickly extradited to California. The extradition was carried out with great secrecy and with minimal respect for due process, giving rise to the claim that the McNamaras had been kidnapped by the detectives, as had happened during the Haywood-Moyer-Pettibone murder case of 1906, when three leaders of the Western Federation of Miners were abducted by Pinkerton detectives so that they could be smuggled into Idaho to stand trial for the murder of governor Frank Steunenberg.

Samuel Gompers and the American Federation of labor (AFL) immediately began a campaign to free the two brothers. The labor movement maintained that the McNamaras were innocent and that the *Times* explosion was a result of Otis's negligence rather than a dynamite bomb at all. Labor Day 1911 was renamed McNamara Day, and massive crowds attended demonstrations across the United States demanding that the brothers be set free. Hundreds of thousands of dollars were raised for the defense fund, and the AFL retained Clarence Darrow to serve as the chief defense attorney.

Unfortunately the brothers were guilty, and Darrow knew it. He did everything in his power to ensure

that the McNamaras would be acquitted, going so far, it was alleged, as to bribe witnesses and jurors. The case against the brothers was too strong, and in order to prevent James from getting the death penalty, Darrow convinced the two unionists to plead guilty. James B. McNamara pleaded guilty to murder and was given a life sentence, while his brother John J. McNamara plead guilty to participating in the bombing of the Llewellyn iron works and was given 15 years. While the decision to plead guilty probably saved James's life, it had some harsh repercussions for the labor movement both in California and nationally.

Socialist labor lawyer Job Harriman was running for mayor during the McNamara trial, and when the brothers plead guilty, his campaign collapsed. Many on the Left criticized Darrow for his timing, since the lawyer chose December 1, four days before the mayoral election, for his clients to change their pleas. Before the McNamaras' confession of guilt, Harriman was the frontrunner for the upcoming runoff election. Moreover the guilty plea struck a blow at the reputation of Gompers and the AFL, which had protested so vigorously regarding the brothers' innocence. In the aftermath of the trial, Darrow was himself put on trial for the bribing of one of the jurors in the McNamara case, although he was eventually acquitted.

After his incarceration, James McNamara moved increasingly to the Left, eventually joining the Communist Party USA. He died in prison on March 8, 1941. His brother John was released from prison in 1921 but was shunned by the labor community. He died two months after his younger brother in May of 1941.

MCNEILL, GEORGE EDWIN (1837–1906) Eight-Hour Day Activist

George Edwin McNeill was born in Amesbury, Massachusetts, in 1837. His father was a Scotch-Irish immigrant who sent him to work in a local woolen mill

after he turned 15. There McNeill later remembered, he had his “baptism in the labor cause” when the factory’s workers unsuccessfully struck to retain the customary quarter-hour forenoon break.

After 4 years in the factory, McNeill moved to nearby Boston and soon became active in that city’s flourishing labor movement. There in a city known for its great orators and its radicalism, McNeill honed his elocutionary skills in both the temperance and abolitionist movements but gravitated to the 8-hour movement then being placed on a new intellectual footing by the self-taught labor economist, Ira Steward. Steward came to rely on McNeill’s organizing skills, later describing him as a “walking convention.” When Steward organized the Grand Eight-Hour League in 1863, an attempt to forge a union between elite reformers and trade unionists in the state, he tapped McNeill as its first secretary.

After the war McNeill’s scope of activities widened considerably. In 1867, he helped found and served as the first president of the self-improvement-oriented Workingmen’s Institute. Two years later he was nominated as the deputy director of the newly formed Massachusetts Bureau of Labor Statistics, a post that he made into a bully pulpit for his 8-hour, labor reform, and anti-Chinese ideas. In 1874, he wrote the charter for the Rochester Labor Congress that would later be adopted as the statement of principles of the Knights of Labor (KOL). When Boston’s 8-hour men and New York’s German Marxists combined in 1878 to form a short-lived Marxist-inspired labor union, the International Labor Union (ILU), McNeill was tapped as its first president.

After the demise of the ILU, McNeill continued his labor reform efforts through the KOL, quickly rising to become an officer of Boston’s district. McNeill aligned himself with the KOL faction that advocated the organization of national trade unions within the order. Later when this idea was more effectively carried forward by the American Federation of Labor (AFL), McNeill became an advocate of some sort of functional alliance between the two organizations; and when that idea proved unpopular, McNeill jumped ship and became an ally of Samuel Gompers.

Through these years he supplemented his small official salary by selling insurance and by taking on the editorship of the *Boston Labor Leader*, a labor weekly. In 1886, he agreed to place his name in candidacy for the office of mayor of Boston on a labor ticket but with little hope of success. The last decades of his life were spent primarily as a writer, authoring a number of pamphlets that were widely circulated by the AFL, including “The Philosophy of the Labor

Movement” (1893) and the “Eight Hour Primer” (1889). His best-known work was as the editor of the historically important volume, *The Labor Movement: The Problem of To-Day* (1887) to which many of the key figures of the labor movement of that time contributed, including both Gompers, and Terence Powderly, leader of the KOL.

MEANY, GEORGE (1894–1980) American Federation of Labor, American Federation of Labor-Congress of Industrial Organization.

George Meany today remains among the most controversial figures in American labor history. Arguably the debates about his legacy are a function of the tremendous power he wielded. In fact in many ways, he was the American Federation of Labor’s (AFL’s) (and later the American Federation of Labor-Congress of Industrial Organizations’ [AFL-CIO’s]) strongest, most influential boss, rivaling only John L. Lewis for his ability to project his will over others and over the American economic and political systems. As the leader of the largest labor organization in the United States, Meany used his office to transform and modernize the AFL so that it became more than just a bread-and-butter organization. Under President Meany’s administration, the AFL focused its political energies on improving the lives of workers and decreasing the pernicious influences of corruption and discrimination. Also under Meany the AFL (and AFL-CIO) increased its presence on the world stage, becoming a force fostering the growth of anti-Communist, pro-Western labor unions. What makes Meany’s career in labor politics all the more amazing is his circuitous and improbable rise to power.

Just weeks after the collapse of the Pullman Strike of 1894, a son was born to Michael J. Meany and Anne Cullen Meany. They named him William George Meany. The boy was known universally as George,

and in fact he only learned about his first name in his teen years. George grew up in a household that was infused with politics and religion. His parents were the American-born children of Irish immigrants who had strong feelings about Irish nationalism and Roman Catholicism as well as unions. As Meany later put it, workers in his neighborhood put labor “Organ-I-zation” on “par with their religion.”

Michael Meany was the president of a sizeable plumbers’ union in Bronx, New York, and a cog in the local Democratic political machine. George grew up aspiring to be just like this father. Specifically he wanted to be a plumber. But the craft that seemingly came naturally to his father did not for the son. In fact Michael did not want his son to follow in his footsteps. Perhaps he knew that George’s gifts did not relate to bending, fitting, and fixing pipes. Moreover the life of a construction worker was a precarious one, since lay-offs and slack times were unpredictable and potentially devastating. Against his father’s wishes, in 1910, George became a plumber’s apprentice working on various projects in the city. After 5 years of training, in 1915, he decided to take the test to become a journeyman plumber. Michael aided him as much as possible, handpicking the examining board. The help did not matter, since the 21-year-old apprentice failed his test. He did however pass the next year, sadly shortly after his father had died of pneumonia.

Despite how much Michael Meany was loved, George received a rude initiation into Plumbers’ Local 463 (later Local 2). The local of 3,600 plumbers was a closed local, meaning that it rarely accepted new workers in order to control the supply of labor and the availability of work. The introduction of new members always sparked fears in older unionists that there might be a glut of plumbers scrapping for a small number of jobs. At Meany’s initiation on January 17, 1917, five hundred angry plumbers showed up at the union hall to boo and harass their new brothers in a vain attempt to get them to quit before they went through the ritual. The rough treatment did not scare Meany away. In fact, 5 years later, he was elected to be the business agent of the union, checking wages and working conditions and ensuring that the plumbers honored their contractual obligations. Moreover Meany enforced the closed-shop arrangements on construction jobs, rooting out the nonunion laborers on job sites and sending them packing. The full-time post was a big step up for Meany, who now had more money to support his growing family.

Meany used his position as the plumbers’ business agent as a springboard to larger, more powerful bureaucratic positions. The 1920s and 1930s thus constituted the formative years in the development of not

only Meany’s power within the labor movement but also his political philosophy. With each step up the ladder in the labor movement’s hierarchy, Meany’s became more committed to certain ideological positions. For example in 1921, a major scandal was exposed in New York City. The city’s dock builders’ business agent, Robert P. Brindell, was sentenced to 10 years for taking a bribe during a strike. Needless to say Brindell lost his post on the citywide building trades council, a position that Meany filled in 1922. Meany’s hard-nosed political abilities along with his dedication to craft unionism and his unstinting probity caught the eye of his union brothers around the state, and in 1934, they made him the president of the New York State Federation of Labor. As NYSF president, Meany began to demonstrate the other major tenet of his labor philosophy. During the early 1930s, he became a strong proponent for governmental action to relieve the horrible effects of the Great Depression and to reform the economy in order to build more stability into the lives of workers. Specifically he backed state laws for unemployment insurance and for expanding prevailing wage protections. Meany’s lobbying also brought him in association with other labor leaders, most importantly the Teamsters’ Dan Tobin, who helped him get the post with the AFL that he held for 13 years: The AFL’s secretary-treasurer.

When he entered the office for the first time, Meany was quite disappointed. The secretary-treasurer had no power or duties. It was, as a Meany biographer once put it, like the U.S. vice-presidency, without the glory. William Green, the 72-year-old AFL president, liked it that way. Green had no compulsion to encourage the younger, more energetic upstart. Nevertheless within just a few years, Meany had transformed the post into a position of considerable power. His moment of opportunity came in heady months following the Japanese attack on the naval installation at Pearl Harbor. The AFL had been integrally involved in President Franklin D. Roosevelt’s defense efforts, and once the war formally started, the AFL role expanded greatly. Meany served as Green’s lieutenant on several wartime assignments, none more important than the National War Labor Board, a body that set wage, hour, and working conditions rules for the arsenal of democracy. Meany was also instrumental in President FDR’s attempt to bring the AFL and CIO together if only for the duration. Although this failed, Meany’s status as a powerful labor broker was nonetheless heightened.

After the war Meany’s power and influence within the labor movement continued to grow, especially during the disastrous fight over the Taft-Hartley Act. In early 1947, Senator Robert A. Taft (R, OH) and

Representative Fred Hartley (R, NJ) proposed a series of amendments to the Wagner Act designed to constrict the power of unions. Labor leaders and the rank-and-file unionists fought against the “slave labor act” tooth-and-nail but to no avail. To fight the law’s implementation and to ensure that organized labor developed a more potent political voice, Meany helped to form Labor’s League for Political Education (LLPE). The LLPE not only lobbied Congress for more favorable labor legislation but also got out the vote for labor-friendly politicians. The LLPE represented well Meany’s outlook on politics. More than other AFL leaders, he wanted to engage and influence politicians, elections, and public policy.

Meany had free reign to develop his political outlook when in 1952, he succeeded Green as the third AFL president. In his later years Green had become feeble and ineffective, but the new AFL president soon proved that he was a dynamo. Practically speaking Meany’s presidency had four central tenets. First Meany wanted the labor movement to become much more active in American and international politics. Second this new political influence was to be used to advance what one scholar has termed laborite Keynesianism, which called for government spending for jobs and economic security, not only in the United States but also elsewhere in the free world. Third Meany used his office to push out of the labor movement those he deemed as corrupt, particularly the racketeers and Communists. Fourth Meany sought to unite all workers under a single banner. Arguably this was Meany’s greatest achievement.

Partially the merger between the AFL and the CIO in 1955 was about timing. In 1952, both Green and Philip Murray died, and thus both the AFL and CIO gained new leadership. The CIO’s new chief, Walther Reuther, the former head of the United Automobile Workers, was no stranger to the labor schism that had divided the house of labor. And, yet like Meany, Reuther firmly believed that in the conservative 1950s the labor movement was stronger unified rather than divided. Almost immediately after entering their offices, Meany and Reuther started negotiating. In fact they restarted conversations begun during the Second World War when President Franklin D. Roosevelt had urged the labor federations to rejoin. This time however the old obstructions did not resurface. Within 3 years Meany along with Reuther had hammered out an agreement. Meany played a crucial role in getting his AFL colleagues to allow the new AFL-CIO to organize along industrial lines. As Meany explained later, he put down the “craft revolt” within the AFL that sought to prevent the new Industrial Union Department from operating.

The new AFL-CIO, whose formal marriage was consummated on December 5, 1955, indeed created a larger if not more powerful and more unified labor movement. As its spokesman Meany quickly used his new position to propel his agenda and philosophy on both a national and international stage. Among his first actions was to crack down on corrupt unions. As noted earlier Meany had long battled against corruption within the labor movement. As AFL-CIO president, he launched investigations into the worst offenders, namely, the International Longshoremen’s Association (ILA) and the International Brotherhood of Teamsters. Both unions were eventually expelled from the AFL-CIO. The battle against the grafters however exposed a weakness within the labor federation and with Meany’s leadership. In 1959, 2 years after the Teamsters were kicked out of the AFL-CIO, A. Philip Randolph, the Brotherhood of Sleeping Car Porters’ president and still the leading civil rights figure in the United States, demanded that the AFL-CIO’s leadership take the same pro-active stance on civil rights and expel the unions who had broken code of the AFL-CIO by segregating and discriminating against minority workers. In Randolph’s view employment discrimination was akin to the kind of insidious corruption practiced by the Teamsters and ILA. Such a proposal drew the ire of Meany who at the 1959 AFL-CIO convention denounced Randolph, belittling him viciously saying, “Who the hell appointed you as the guardian of all the Negroes in America?” The convention’s fiery exchange became legendary and a touchstone moment in the history of the labor and civil rights movements. Although Meany had helped to draft and pass the initial AFL-CIO resolution on civil rights, he did not pursue the issue so vigorously as he did the other initiatives, such as the anticorruption campaign.

Rather for nearly three decades, the Meany presidency was synonymous with bread-and-butter unionism, the global anti-Communist crusade, and the growth of the AFL-CIO’s influence in American electoral politics. In a way Meany’s business agent mentality never left him. He constantly looking to defend his organization and expand benefits for its members. By the middle-1950s, this meant that Meany became a regular in the hall of Congress and the Oval Office. Moreover Meany’s impact on politics expanded after he set up the Committee on Political Education (COPE), the get-out-the-vote arm of the AFL-CIO. With his political connections and with his ability to deliver votes, Meany became an important ally of presidents. It was often Meany’s endorsement that either cleared or blocked a candidate’s path to the White House. Ignoring decades of AFL tradition, Meany took very public stands in every presidential

contest from 1952 to 1976 (with the exception of 1972). He was perhaps closest to President John F. Kennedy. The AFL's chief looked on the young president as his adopted Irish nephew. However Meany's relationship with President Lyndon B. Johnson may have been the most productive. In addition to lending support for Johnson's war in Vietnam and his War on Poverty, Meany helped LBJ with the passage of the 1964 Civil Rights Act and the 1965 Voting Rights Act. To this day, historians argue how much Meany influenced the Civil Rights Act, particularly its fair employment provision. It is clear that Meany's support and suggestions did have some salutary impact on the landmark law.

President Meany's political efforts were not always successful, and his record as labor's power broker is decidedly mixed. He was not always very adept at stopping the advances of conservative political forces. For example he proved powerless to stop the passage of the Landrum-Griffith Act in 1959, which further curtailed the power of unions. He also failed to exert any influence over Presidents Nixon, Ford, and Carter. Nixon refused to listen to Meany's objections to the creation of the Philadelphia Plan, the first attempt at affirmative action. Ford ignored Meany's ideas on curbing inflation. However Carter's relationship with Meany was the most contentious. Carter had earned the backing of Meany and the AFL-CIO by promising a more labor-friendly administration and offering the opportunity for the passage of progressive labor legislation long blocked by Republicans. But once in office President Carter turned his back on Meany and reneged on pledges concerning wages, taxes, and inflation.

Although one can blame labor's troubles on the ascendancy of modern political conservatism, Meany's frustrations were partly his own fault. He rarely allowed anyone to join him in the public limelight. In essence he was the sole public face for the AFL-CIO. It was Meany who met with congressmen, various presidents, and the press. It was Meany who made the appearances on television, especially the important and popular Dick Cavett Show. Not allowing subordinates or even others in the labor movement to share this national stage created two problems. First since Meany did not in fact represent all opinions in the labor movement, his inflated public presence generated considerable tension among unionists. In order to get their messages heard, labor leaders like Randolph and Reuther had to establish their own organizations outside the AFL-CIO. Although consequential, necessary, and useful in their own right, at times these groups like Randolph's Negro American Labor Council and Reuther's UAW-Teamster Alliance contributed to the divisions within the labor movement at a

time when conservative forces were on the attack. Second the appearance of Meany as the AFL-CIO's sole leader made the issue of succession problematic. Like Green, Meany did not give many public duties to his lieutenants. As such when Lane Kirkland, Meany's alter ego, assumed the AFL reins in 1980, few unionists, politicians, or citizens knew him well. And, at the dawning of Reagan's years, the lack of a strong, popularly backed chief of the AFL-CIO did not make it easy for organized labor to survive the onslaught of modern conservatism in the 1980s and early 1990s. Thus labor's modern troubles as well as its organizational strengths are both legacies of Meany.

MECHANICS' LIEN LAW

Advocacy of stronger and more widely applicable mechanics' lien laws was a salient demand of the antebellum labor movement, starting with the Working Men's parties of the late 1820s and the Locofoco Democrats of the 1830s. The term mechanic meant a skilled artisan or craftsman, such as a carpenter, while a lien is a right or claim against property created by law as an incident of contract. Thus a mechanics' lien is a right or claim that secures to a craftsman a priority of payment for work performed or materials provided in the improvement of real property, for example, the construction or repair of a building. If the property owner fails to pay for work or materials used in improving his/her property, a mechanics' lien holder can file a lien against the property for the money owed. English common law did not provide for such a lien. Instead the mechanics' lien is a creation of statute whose origins are found in Roman law, which had a similar privilege.

The first mechanics' lien law in the United States was enacted in 1791 by Maryland. The statute applied only to master builders who provided labor or materials in the construction of buildings in the new capital in Washington, DC. Thomas Jefferson and James Madison were key members of the special commission that recommended adoption of the mechanics' lien law to speed construction of the capital by ensuring

builders that they would be paid. Neighboring Pennsylvania followed in 1803, and by 1855 at least 19 of the 31 states had passed mechanics' lien laws, but these often applied only to specified urban areas and only to the master builder who contracted with the property owner, not to subcontractors or employees, who were called journeymen in that period.

The mechanics' lien laws became a labor issue because journeymen artisans argued that they too should receive the protections of these laws. To them the main purpose of the lien law was to protect honest mechanics from insolvent or fraudulent master builders who refused to pay their workmen after construction was complete. The journeymen mechanics urged that in those circumstances, they should be able to file a lien against a property owner even if the owner had paid the contractor, concluding that this policy would not only serve the economic development goals touted by the master builders but also would ensure compensation to those whose labor actually created the wealth represented by the finished project. These nineteenth-century construction workers transformed a bourgeois legal innovation intended to encourage economic development into an engine of economic fairness and wealth redistribution. Indeed understood in the context of political economy, the mechanics' lien challenged the usual assumption underlying wage labor that the worker retains no interest in the product of his/her labor, which belongs entirely to the employer. Instead the mechanics' lien protects the wageworker by giving him/her a security interest in the product of his/her labor, even after it has become the property of the consumer.

Politically the Working Men's parties took up the cause of expanding the mechanics' lien and enjoyed considerable support from journeymen who worked construction like carpenters, masons, and laborers. The Jacksonian Democrats however were eager to lure journeymen away from the Working Men's parties and successfully made the issue their own by sponsoring laws to extend the lien to employees. Nevertheless the radical implications of the mechanics' lien law continued to rankle those who exalted contract and property rights over all else; they could not abide extensions of these statutes to cover entire states, to bind not only fee-simple owners of property, but also to those with any legal or equitable interest, including as early as 1836, a lessee. In 1848, Maine even extended the lien's protections to lumber workers who cut and floated logs down rivers to mills only to be refused payment by their employers.

The mechanics' lien law reforms of the 1830s were some of the first labor laws passed in the United States. The evolution of the nineteenth-century

mechanics' lien into the present-day contractors' lien, which is beyond the scope of this entry, would reveal much about the parallel development of the construction industry and the building trades, especially the struggle between employers and workers for control over wages and wealth. Despite the fact that contemporary contractors most often limit the property owner's liability to the contract price, the mechanics' lien laws constituted an important point of origin for the history of American labor legislation.

MECHANICS' UNION OF TRADE ASSOCIATIONS OF PHILADELPHIA

This association of trade unions emerged in winter 1827–1828 following a series of meetings held by Philadelphia tradesmen in spring and fall and led by William Heighton, the English-born shoemaker and

radical labor activist. Heighton had called for such a union in two speeches in April and November 1827, and in January 1828, a meeting of his fellow unionists formally endorsed the constitution and bylaws of the Mechanics' Union of Trade Associations (MUTA), launching what historians consider the first labor movement in the United States (and arguably in the world).

The MUTA was structured along the lines outlined by Heighton in his addresses. It was administered by executive officers and financed by dues of 10 cents per member per month levied by a finance committee composed of one representative from each affiliated union (nine at first, and then 15 at the height). The MUTA had a strike fund that was made available to unions on strike to raise wages or improve conditions. It also resolved disputes between unions and organized unions of skilled workers, bringing at least five trade societies and a benevolent society into the fold. Unskilled workers, female workers, and African-American workers did not belong to the MUTA as individuals or as groups even though Heighton sympathized with unskilled labor and personally supported the struggles of textile operatives in and around the city.

The vision of the MUTA reflected Heighton's ambitious vision of transcending the narrow concerns of trade unionists and the immediate interests of labor as a whole. It pursued the related objectives of raising the social awareness of workingmen and putting forth a program of economic reconstruction. The first of these gained expression in the *Mechanics' Free Press (MFP)*, the nation's first labor newspaper published and edited by workers for workers. The labor sheet, edited by a committee that included Heighton, covered the local and national economy, carried news of union and labor affairs, and offered editorial opinion on a wide variety of topics. It also founded the Mechanics' Library Company with reading and debating rooms that offered books and journals to subscribers and sponsored public debates on such propositions as "Should Money Be Eliminated from the Economy and Barter Stores Substituted Instead?" In a similar spirit, the paper reprinted texts otherwise inaccessible to struggling workers, most notably perhaps John Gray's, *Lecture on Human Happiness* (1825), the primitive socialist pamphlet that had strongly influenced Heighton's thinking. The MUTA members who took this doctrine more seriously could patronize one of several barter stores or a producers' cooperative-styled, "labor for labor," which used labor time as the medium of exchange.

The MUTA is perhaps best known for its precedent-setting foray into third-party politics under the banner of the Working Men's party. Such a step was

inevitable given the union's reconstructionist vision but still came as something of a surprise because of its timing. Heighton had hoped that the union's didactic organizations would prepare the membership for independent politics down the road, which is why the original constitution made no mention of political action. Nonetheless the MUTA was barely a month old when in January 1828, the membership passed a bylaw, clearly with Heighton's approval, stating that 4 months before the fall elections, the MUTA would nominate candidates for public office who reflected "interests and enlightenment of the working classes." The bylaw added that "party politics shall be entirely out of the question," indicating that the "workies" did not think of themselves as a party in the formal sense so much as an independent force out to run its own candidates and influence the regulars (L. Arky, "Mechanics' Union," 1952). Thus it reflected the aversion to "tyrant party" that would characterize third parties for the rest of the century. Indeed it was the mainstream press and the political regulars that called the MUTA's political association the Working Men's party, and it stuck.

Labels aside, the Working Men had no choice but to mimic the regulars of the new second-party system. They developed an ambitious reform platform headed by demands for tax-supported public schools (in favor of the state's spotty "pauper schools" for the poor), an end to chartered monopolies and paper money in small denominations, fairer taxation, and other planks reflecting popular needs and interests. They also nominated candidates every year from 1828 to 1831, concentrating on city races, and then including local races for the state senate and assembly as well as Congress, typically backing a minority of unaffiliated office seekers along with a majority of candidates on the slates of the regulars—usually more Democrats than federalists. The Working Men's amateurism proved harmful throughout but especially so in the initial campaign, as regulars disrupted nominating meetings and harassed their voters at the polls. Candidates endorsed by the Working Men mainly drew a disappointing 240 to 540 voters out of 9,000 cast. The party then ebbed and flowed over the next 3 years, in 1829 tripling its vote, helping elect over a dozen candidates, and boasting the balance of power; in 1830, the Working Men lost the balance of power despite increasing their tally by an average of 300 votes and electing about the same number of candidates as a year earlier. It then fared badly in 1831 and simply collapsed.

As for the MUTA, it faded and then disbanded in fall 1829. For his part Heighton went through a roller-coaster of feeling and emotion. Within days of the 1828 election, he called for disbanding the original

nominating machinery because it was too closely tied to the narrow base of the unions. Looking to expand the party's following, he restructured the political organization along geographic lines, starting with ward committees and building upward to district groups, mimicking the regulars. Though this reform increased turnout, the election of 1830 left Heighon bitterly disappointed. So much so that he turned on his own people, denouncing the "blindness" and "sappiness" of the workers and then leaving the city for good. (*MFP*, Oct. 29 1830 and Mar. 2, 1831.)

The MUTA was not simply the first of a long line of failed insurgencies that would litter the political terrain for the rest of the century. It essentially infused Jacksonian democracy with its popular agenda of educational reform and economic populism. Though President Andrew Jackson was no friend of the big banks, it is likely that when he declared war on the U.S. Bank in 1831, he was following the lead of the newly awakened workies of the city. The MUTA also established the organizational template and intellectual framework of reform unionism for the rest of the century. Its successors in Philadelphia and other cities after 1830 would establish their own presses, reading rooms, and other organizational forms of a "movement culture," inspired by the powerful idea that labor is the source of all wealth. It was those threads that bound the MUTA to the Knights of Labor in the last third of the century.

MEMORIAL DAY MASSACRE (1937)

On May 30, Memorial Day, 1937, outside the Republic Steel works in Chicago, a large crowd of workers and their supporters rallied to protest the decision by the Chicago police to ban picketing at the steel mill. The city's mayor had affirmed the right of the striking workers to picket, and legal precedent seemed to uphold the right to picket peacefully as well. The rally began as a picnic held nearby the Republic Steel works, but after a series of speakers, a large contingent of the crowd decided to approach the factory and try to picket. In their way stood over 200 police officers, who refused to allow the marchers to picket the steel works. As a group of marchers approached the police line, the Chicago police opened fire, killing 10 demonstrators. Most of the strikers were shot in the back as they tried to flee. The police also launched tear gas canisters into the crowd. After the barrage of gunfire and gas, the police moved through the crowd swinging clubs, beating several people senseless. The police also allegedly refused medical aid to the injured and flung demonstrators into overcrowded paddy wagons. In addition to the dead, nearly 60 lay wounded, from both gunfire and the beatings that followed. It was later discovered that Republic Steel had helped to arm the police for their confrontation with the strikers and their sympathizers.

The crowd almost certainly held no real armaments, though some observers would later claim that a few marchers were carrying sticks and rocks. The police may have begun their rampage after a demonstrator threw either a rock or a tree branch at them. Nevertheless there can be no doubt that even if the police were provoked by a few rowdies in the crowd, they reacted with indiscriminate and massive violence. The police were never held accountable for their actions either. The coroner who investigated the bodies of the demonstrators—shot in the back—ruled their deaths justifiable homicide.

The U.S. Senate's LaFollette Civil Liberties' Committee held hearings on the Memorial Day Massacre in June and July of 1937. The Chicago police maintained that they had intervened to prevent the striking workers from invading the plant. Police claimed that agitators and radicals headed the crowd, that the crowd was heavily armed, and that the police acted only in self-defense. One crucial piece of evidence negated all of the police claims. A filmmaker from Paramount Pictures had captured the massacre on a newsreel. The motion picture industry had not shown the film publicly, fearing that it would incite riots. Yet the LaFollette Committee obtained the footage and held a private screening.

The committee allowed one reporter, Paul Anderson, to view the newsreel. Anderson wrote a vivid account in the *St. Louis Post Dispatch* of July 17, 1937, recounting the violence in great detail. Anderson described the ordeal of a man who was paralyzed after being shot through the spine. The man struggled to rise as police dragged him toward a paddy wagon, then crumpled to the ground helplessly clawing at the grass. Anderson reported the beating of a young girl, shoved into a paddy wagon with blood streaming down her face. Perhaps most dramatically, Anderson revealed the singular shout that rose above the din on the sound track of the film, "God Almighty!" (R. Hostader and M. Wallace, *American Violence*, 1970). Anderson's article revealed to the public the injustice of the massacre. Until the *Post-Dispatch* printed his piece, most news organizations had either ignored the incident or congratulated the police for their heroism in defeating a revolutionary mob.

The LaFollette Committee concluded that the police had reacted with undue force. The committee held that the intent of the marchers had been to picket the plant, not to invade it nor engage in any sort of violence. The committee also found no evidence that revolutionaries had provoked the crown into a violent confrontation with the police.

The Memorial Day Massacre took place as the Steel Workers' Organizing Committee (SWOC) of the Congress of Industrial Organizations (CIO) undertook an organizing campaign in the "little-steel" sector. The SWOC had already organized the giant of American steel, U.S. Steel. Yet smaller steel companies remained unorganized. The name little steel was something of a misnomer; over 200,000 employees worked for the firms that made up little steel. The CIO leadership mistakenly thought that organizing these smaller companies would be easy. But little steel remained staunchly anti-union, using police and private detective forces to beat back picketing strikers. The Memorial Day Massacre was just the most severe incident in a long summer of violence at steel mills nationwide.

Ultimately the brutal methods used by little steel prevailed. Almost every company in little steel remained nonunion as workers returned to the mills in the face of employer intransigence.

The defeat of the little-steel campaign struck a heavy blow to the CIO's organizing hopes, although the CIO still grew dramatically for several years. The defeat of the little-steel campaign stood as one of the CIO's first major defeats after a series of decisive victories in organizing the core industries of the economy. The extraordinary violence that accompanied the organizing drive also alienated President Franklin D. Roosevelt, usually a strong supporter of labor. At a press conference during the little-steel campaign, Roosevelt famously told the labor movement and the steel industry, "a plague on both your houses."

MEMPHIS SANITATION STRIKE (1968)

The 1968 Memphis sanitation strike is most often remembered as the backdrop to the assassination of Martin Luther King, Jr. Yet the strike was much more than just a tragic setting. It represented a shift in the focus of the civil rights movement from a struggle for social and political change to a campaign for economic justice. The Memphis strike also embodied the promise and problems of coalition building between labor and civil rights activists who had long sought a more permanent alliance.

Historical Background

In the late 1960s, Memphis, Tennessee, was the perfect crucible for a labor-civil rights alliance. Mechanization of agriculture in the surrounding rural areas, especially the fabled Mississippi Delta, had pushed

MEMPHIS SANITATION STRIKE (1968)

thousands of black migrants off plantations and into the city over the preceding two decades. These migrants created a strong and vibrant community held together by the spiritual power of Christian faith and the cultural power of blues music. Economically however black workers in Memphis struggled for meager wages in a segregated job market. Though there was a relatively strong trade union movement in Memphis, it was dominated by white union leaders for whom civil rights were not a top priority.

The black employees in the Memphis Public Works' Department who handled the city's garbage collection were near the bottom of the labor ladder. The city openly discriminated against these men in hiring, promotion, and daily task assignments, sending them home without pay on rainy days, while their white coworkers remained on the clock. Until the mid-1960s, when the city grudgingly purchased pushcarts and mechanized trucks, Memphis sanitation workers had to carry leaky 50-gallon drums of garbage on their backs, suffering both humiliation and workplace injuries. In addition to discrimination and poor working conditions, the wages paid to black sanitation workers were so low that 40% of them still qualified for welfare even though most had a second job.

Workers had tried to organize a union in 1964 and 1966, only to see their efforts crushed by the city. Then in 1967 and 1968, a number of events galvanized black workers and the black community. First Henry Loeb, a conservative businessman and staunch segregationist, rode a white backlash against civil rights activism into the mayor's office. Then when a garbage truck malfunctioned, crushing two black workers to death, the city gave their families a month's salary and \$500 for expenses but sent no representatives to the funerals and offered no further compensation. Around the same time, white supervisors once again sent black workers home without pay on a rainy day. More than 1,300 black sanitation workers responded to these incidents with a strike on February 12, 1968. They demanded higher wages, an end to discrimination, recognition of their union, and dues check-off.

The Strike

Initially the American Federation of State, County, and Municipal Employees (AFSCME) provided most of the support for the striking sanitation workers. But on February 23, police attacked black ministers and community supporters as well as strikers during a march that followed failed negotiations with the city council. Within days black ministers led by James

Lawson organized a support group called Community on the Move for Equality (COME). This was now both a strike and a civil rights campaign. When a court injunction prohibited AFSCME members from leading marches and economic boycotts, leadership of the movement shifted increasingly to ministers and civil rights activists.

The AFSCME President Jerry Wurf came to Memphis within a week of the strike, but organized labor alone could not get the national publicity needed to win the strike. Roy Wilkins, the president of the National Association for the Advancement of Colored People (NAACP), and Bayard Rustin, the organizer of the 1963 March on Washington, both appeared in Memphis. On March 18, Martin Luther King, Jr., came to the city and spoke to an overflowing crowd of over 10,000 people. At the mass meeting he promised to return and lead a march to pressure the city to negotiate with the union in good faith. He called for a general strike of black workers, joined by black students in a school walkout that could shut much of the city down.

On March 28, King returned to Memphis and marched at the front of a throng of strikers and their supporters. Many of the strikers carried or wore placards bearing the slogan that had become the strike's rallying cry: "I AM a Man." Workers and most of the marchers faithfully followed King's call for a nonviolent demonstration, but by 1968, many black youth had grown tired of such pacifist tactics. A group known as the Invaders popularized the arguments of Stokely Carmichael and other Black Power leaders that power would never be given by white authorities; it had to be taken. With King at the front of the march, nonmarchers and unidentified youth in the rear ranks turned to violence, smashing storefronts and breaking windows. Lawson and other ministers, fearing for King's life, removed him from the march. Police attacked marchers and looters indiscriminately, wounding many and later killing a 16-year-old youth named Larry Payne. The black community angrily responded with more arson and looting, and Mayor Loeb and the state's governor brought in the National Guard to occupy the town.

King's visit to Memphis was part of a movement against poverty, racism, and war, called the Poor People's Campaign, aimed at creating an encampment in Washington, DC, similar to the Bonus Marchers protest of 1932. Segregationists, conservatives, and some liberals now attacked King, claiming he could not lead such a demonstration in the nation's predominantly black capital without setting off massive riots. King promised that he would return to Memphis, this time to lead a truly nonviolent protest in hopes of maintaining his campaign and

his credibility as a leader. The Memphis sanitation strike had now become a microcosm of the movement. Devotees of nonviolence like King vied with advocates of armed self-defense like the Invaders. Economic justice and cultural nationalism were becoming as important to civil rights and black union activists as social equality and political rights. Civil rights activists were moving northward and into urban areas to tackle housing, job and school segregation, institutional racism as insidious as and perhaps more resilient than that of the rural South.

The strike along with other events made 1968 a turning point for both the labor and the civil rights movements. Some union leaders hoped that the racial divisions and political conservatism that had kept southern states solidly anti-union for decades might be overcome with an organizing drive among the region's newly mobilized black working class. The fate of AFSCME, through no choice of its national leaders, was also on the line. Wurf and his regional director P. J. Ciampa had not done anything to instigate the Memphis strike and did not welcome it. They considered a garbage strike in the middle of the winter bad timing, and they did not want to take on an anti-union southern administration. Black workers themselves, led by former sanitation worker T. O. Jones, had decided to strike back at a city that had exploited and disrespected them. With King's entry into the Memphis strike and with the March 28 riot however, the issues became larger, and the outcome more charged with meaning. Wurf believed the fate of southern labor organizing and AFSCME's future among public employees hung in the balance. At the local level, there was a practical question of how long the strikers could afford to rely on their families and the union for sustenance and support. The sanitation strike had become a campaign that King, the workers, and AFSCME could not afford to lose.

The Mountaintop

King returned to Memphis on April 3 and gave one of the most powerful speeches of his career, hoping to fire up the crowd for the upcoming nonviolent march. Tired, but unbowed, King expressed a guarded optimism for the movement, even though he knew that he might never live to see its triumph. He began his speech by chronicling the black freedom movement's victories up through 1968. He thanked God for the opportunity to be present for such historical struggles. As he reached the climax of the oration, he

imagined the movement as having reached a metaphorical mountaintop, a great vista from which he and his followers could see the land of freedom. "I may not get there with you," he concluded prophetically, "but...we as a people will get to the Promised Land."

The next day, April 4, 1968, James Earl Ray shot and killed Martin Luther King, Jr., at the Lorraine Motel. Riots erupted across the country as black communities expressed rage and frustration at King's cold-blooded murder, creating the most widespread urban upheaval of the 1960s. The nation mourned, as did the sanitation workers, but in Memphis the movement redoubled its efforts. The 1,300 striking men refused to stop marching and meeting even though the National Guard once again occupied their town. Though the federal government had been unwilling to intervene earlier, President Lyndon Johnson finally sent Undersecretary of Labor James Reynolds to mediate the labor dispute, and he sent Attorney General Ramsey Clark to find King's killer and prevent more violence.

The movement continued, and the specter of King's death haunted the negotiations between city and AFSCME leaders until April 16. That day the mayor finally agreed to a 15% pay raise for the workers, a ban on racial discrimination in hiring and promotions, a step-by-step grievance procedure, a guarantee that union members and strikers would not be fired or discriminated against, within a memorandum of understanding that informally acknowledged the union. The AFSCME did not get a union shop, but the agreement allowed union members to deduct dues through their credit union. All of these measures stabilized the union's existence and at last guaranteed city workers the freedom to organize. It was a victory not just for the sanitation workers, but for police, firemen, parks, hospital, and other city workers who had been denied union rights in the past.

The AFSCME Local 1733 grew to become the largest single union in the city, as employees in various city departments, both blacks and whites, organized. The victory of the strike also spurred public-employee organizing throughout the South and the country, as AFSCME became the fastest growing and one of the largest unions in the nation. Wurf said it represented the triumph of the principle of labor, civil rights and community alliances, and he hoped it would lead to unionization of the South. Out of this struggle also came a heightened visibility for black workers. William Lucy, one of the organizers in the strike, became secretary-treasurer of AFSCME, and head of the Coalition of Black Trade Unionists. Others involved in the strike went on to play major

organizing roles. Lawson became a staunch ally of Justice for Janitors and other immigrant-organizing drives after he became pastor of a church in Los Angeles. King's organization, the Southern Christian Leadership Conference, joined with Hospital Workers' Local 1199 to organize black hospital workers in Charleston, South Carolina, in 1969, and for a time it appeared that a labor-civil rights alliance might indeed open the way to southern unionization.

Though the Memphis sanitation strike provided an inspiring victory, it came at a serious cost. King's death was only part of the tragedy. The promise of a lasting alliance between the labor and civil rights movements floundered, as growing militancy and separatism in the movement coincided with a backlash among working-class whites cultivated by conservative political leaders. Plant closings and attacks by conservative national administrations after 1968 decimated both workers and industrial unions. The labor and civil rights movements retreated from the mountaintop that King had envisioned, and the promised land of freedom, equality, and economic justice seemed ever more distant as anti-union governments and corporate power overwhelmed local movements. Still the Memphis strike exemplified the potential power of the labor, civil rights, and community alliance even if such a national coalition has not yet materialized.

MEXICAN AND MEXICAN-AMERICAN WORKERS

Mexican and Mexican-American labor history has its roots in the eighteenth century when the southwestern states were under the control of Spain and Mexico. In northern Mexico, many colonial settlers engaged in ranching and subsistence farming, while some managed large landed estates. This frontier period ended in the decades after the Texas Revolution (1836) and the conquest and annexation of northern Mexico following the U.S.-Mexican War (1848). By the late nineteenth and early twentieth century, this population became more diverse as Mexican immigrants entered the United States dwarfing the small colonial population of Californios, Tejanos, and the Hispanos of New Mexico and southern Colorado. Mexican-ancestry residents of the U.S. Southwest came from a variety of southwestern cultural groups, including mestizos (mixed Spanish, Mexican, and indigenous ancestry), former colonial settlers, U.S. citizens, immigrants, and aliens, with each of these mingling as they migrated across the North American continent beyond the confines of the U.S.-Mexico border or the American Southwest.

From Colonial Settlers to a Laboring Class: 1748–1890

In late colonial New Spain and Mexico, an estimated 100,000 colonials lived in northern communities stretching across the present day states of California, Arizona, New Mexico, Texas, Colorado, and other U.S. states. Although there were many large landholding families in California settled on relatively new grants carved from the large, indigenous mission-trust lands, the majority of settlers in the former Spanish colony of *Nuevo Santander* in present day Tamaulipas, Mexico, and Texas, for example, were small-to-medium-sized family ranchers who settled in 1748, living on both sides of the Rio Grande River. Like earlier settlements in New Mexico, community life was local and family-based. This was a military frontier defined by warfare with *indios bárbaros* (Spanish for indigenous peoples) where settler soldiers engaged primarily in ranching and livestock husbandry. These frontier folk engaged in seasonal labor

Mexican workers recruited and brought to the Arkansas valley, Colorado, Nebraska and Minnesota by the FSA (Farm Security Administration), to harvest and process sugar beets under contract with the Inter-mountain Agricultural Improvement Association. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USW33-031869-C].

patterns as groups of Hispanicized indigenous people, many of whom did much of the killing and stripping of the cowhides and sheering of sheep each year, came together in communal work crews that involved adjacent landowners and hired hands in the annual round up and processing of hides and wool.

This colonial-ranching frontier ended in the decades after the U.S. annexation of Texas and northern Mexico. In the years after the annexation, colonials tried to maintain their property and customs in opposition to the waves of Anglo-American migrants who entered the Southwest intent on building their own ranches, often by accumulating Spanish and Mexican deeds across the region. Throughout the nineteenth century, downward mobility and land loss defined the era for these newly incorporated Mexican-Americans as much as agricultural, economic, and transportation development defined this period for Anglo-American settlers and U.S. capitalists who developed and incorporated the region. Many former landowners and skilled workers in Texas and California were proletarianized in this period of rapid change and economic and cultural transformation just as the

ethnic make-up of Mexicans and Mexican-Americans was changing itself.

Mexican and Mexican-American Migrants and Workers: 1890–1945

The postannexation period was one of rapid regional development of the agricultural, transport, and extractive industries across the Southwest, each of which relied on Mexican immigrant workers. This dependence became more acute in the period of European and Asian immigration restriction after 1917 and 1924 as western and midwestern employers sought out an ever-larger reserve of Mexican immigrant workers. Beginning in the 1890s, the annual immigration of Mexicans into the United States increased yearly, reaching a high point in the period from 1920–1930 and bringing the total Mexican ancestry population to just under 1,500,000, with the largest number, nearly 700,000, living in Texas, although many scholars agree that the number may

have been higher. As of 1930, some estimate that nearly 10% of Mexico's population resided in the United States. The majority of those who would come to call themselves Mexican-Americans in the twentieth century entered the United States at this time in search of work and stability.

Many Mexican migrants entered the United States as they fled from rural poverty, exploitation, and the violence and chaos of the Mexican revolution after 1910. Although many professionals and artisans retained some of their status in the United States, most workers from Mexico entered the United States as common laborers and unskilled workers in a time of economic development and expansion. Migration was often a multistaged process. Many migrated first within Mexico, often working in U.S.-owned extractive and rail industries in their home country before entering the United States to work in these same industries. Others escaped the vast *haciendas* (ranches) of northern Mexico in the revolutionary period for border cities before moving on to permanent settlement in the newly established agricultural boomtowns and modernizing cities of the Southwest. These migrants built communities of workers as they settled near their workplaces in the agricultural regions of Texas, California, and other southwestern states. Mexican migrants lived in communities rooted in Mexican politics and folkways even as life in the United States and the establishment of community institutions increasingly tied them and their children to their new homes.

Once in the United States newly arrived Mexicans established or expanded communal and ethnic institutions, much like other immigrants, which allowed for the maintenance of community through such entities as mutual-aid societies, Catholic churches and other religious organizations, and informal networks of kith and kin. In the western states, community and ethnically based institutions provided a foundation for community mobilization that the region's weak labor unions, then often restricted to Anglo-Americans and perpetually under attack by state and employer coalitions, failed to provide. In some circumstances these mutual-benefit societies and religious community organizations established their own independent labor unions, sometimes confined to a single labor action. In other cases these efforts led to the formation of more lasting organizations, such as the *Confederación de Campesinos y Obreros Mexicanos* (CCOM) in 1928, which at its height organized over 3,000 workers into 50 locals. In the mining towns of Arizona, *mutualistas* provided key support to Mexican workers and the mining unionization efforts of the late nineteenth and early twentieth centuries.

Organized labor in the United States was not welcoming when it came to Mexican and Mexican-American workers. Throughout the 1920s and 1930s, despite several American Federation of Labor (AFL) organizing efforts in the Southwest led by Clarence Idar, high-level labor relationships with the Regional Confederation of Mexican Workers (CROM), Mexico's powerful labor organization, focused on convincing these Mexican unionists to support voluntary immigration restriction after the AFL had failed to restrict Mexican workers in the U.S. immigration acts passed following World War I. Prior to World War II, the AFL would not focus on organizing Mexican and Mexican-American workers in the United States as equals but rather on lobbying in the United States and Mexico to restrict Mexican immigration.

Although Mexican and Mexican-Americans labored in a variety of fields, many of these migratory workers began work in the United States in the years before the Great Depression as highly mobile railroad workers. Tens of thousands of Mexican immigrants worked for the railroads, often living in rail-car camps or in the urban neighborhoods of Kansas City, Milwaukee Chicago, Detroit, Minneapolis-St. Paul, or Pittsburgh, as well as Los Angeles, and the border city of El Paso and numerous other railroad towns across the Southwest. In some cases these camps became the nucleus for the establishment of Mexican *colonias* (colonies or neighborhoods), which led to the establishment of Mexican religious, cultural, and social institutions. These institutional developments were often supported by Mexican consular officials who sought to maintain an affinity for Mexico and Mexican citizenship on the part of these laborers. Railroad work often led these workers into other industries in the places they settled, including meatpacking and the expanding steel industry in cities like Chicago, East Chicago, and Gary, Indiana.

For the large number of Mexican immigrants who settled in agricultural areas across the Southwest and Texas in particular, where nearly 400,000 Mexican-ancestry residents lived, these agricultural communities often became a home base for what increasingly became a migratory labor work world. Like those who established the *colonias* of the urban centers, immigrants to the Southwest established new social and religious organizations as they also often encountered established Mexican-American residents. In the rapidly developing agricultural industries of the Southwest and West, many of these settlers established homes in the cities of major harvesting regions, where their work often focused on a single citrus, vegetable, nut, or fruit crop in southern California and south Texas. From the start however, many

Mexican workers supplemented these local wages by migrating to harvest other nearby local crops or were recruited to work at the state or regional level with many traveling across the United States by the 1930s. Migration grew increasingly sophisticated as organized groups first traveled by horse-drawn cart at the local level and later moved across the nation in a migrant stream powered by railcars, large trucks, and eventually personal automobiles. The work these migrants (increasingly whole families) did was specific to the crops they traveled to harvest, yet relied on the specific skills one gained with experience tending and harvesting crops for processing and family consumption.

In the early twentieth century, Texas migrants harvested cotton, moving with the crop as it ripened in an annual migration pattern known as the "big swing," with similar migration patterns developing with the maturation of cotton production in other southwestern states. In California migration brought workers north from southern California each season as they harvested trees and vines in one of the largest annual human migrations in North America.

For many of the migrants who began their journey in Texas, migration became an annual and circular labor migration. This migrant stream brought them from the U.S.-Mexico border region to the West, Northwest, and Midwest each year. From Texas migrants traveled to the central valley of California, the Pacific Northwest, Great Plains, and Midwest, often moving in extended-family- and neighborhood-based work crews. Although often considered an uprooted population, migrant workers often hailed from relatively stable local communities where they returned home each season. At these home bases in Texas, migrants often owned small homes, businesses, and increasingly sent their children to school.

Although there were many attempts to organize harvest workers in winter harvest areas of California, Texas, and Arizona after 1900, most of these efforts succeeded in organizing workers yet failed when it came to establishing a permanent union. Agricultural unionism often failed due often to the seasonal nature of the workforce, the perishability of the crops, as well as sustained employer and police harassment of radical organizers and workers. From the Imperial Valley of California to the urban processing facilities of San Antonio, Mexican, Latino, and Mexican-American activists successfully organized these workers even if the unions failed to survive. Militant unionists in the West almost perennially sought to organize harvest workers on the large industrial farms in California and other states, and each year faced grower opposition backed by the state police power. In 1933, several California-based unions merged to form the

Confederation of Mexican Farm Workers' and Laborers' Unions (CUCUM), combining 5,000 members into a single agricultural labor organization yet failed to establish a permanent trade union movement.

In southern California, Mexican immigrants settled near the expanding city of Los Angeles and in smaller agricultural towns in a region where Mexican colonials had long been a settled population in colonial cities. In Los Angeles Mexican immigrants joined the settled community near the *placita* (center of original Spanish city) and entered into the heterogeneous, east LA immigrant neighborhood, joining Jews, Asians, and other immigrants in Boyle Heights and surrounding areas. By 1930, Los Angeles had a Mexican-ancestry population of nearly 100,000 of a total county population of over 2 million people. Working in Los Angeles factories, construction trades, and the service industry, these immigrants became the nucleus for the nation's largest urban concentration of Mexicans and Mexican-Americans. Like other southwestern agricultural centers, greater Los Angeles and southern California generally witnessed the development of agricultural boomtowns and large-scale farming operations that resembled those in south Texas and Arizona. Growers recruited Mexicans as a labor and harvest workforce, segregating them from the Anglo ranchers and small businesspeople in small Mexican districts that often stood in stark contrast to Anglo-American neighborhoods.

In the midwestern United States, Mexicans often found better working conditions and higher pay in that region's booming industries. Although most of these workers journeyed north as male contract workers, families soon took root in the developing ethnic enclaves of large midwestern cities. Like other ethnics and immigrants in the Midwest, Mexican-ancestry workers lived in work-based, ethnic communities, founding and attending ethnic churches and sending their children to public and parochial schools near their places of employment, thereby establishing a community life that would continue for much of the twentieth century.

With the onset of the Great Depression, the United States, with the support of nativist groups and the Mexican government, repatriated several hundred thousand Mexicans from 1929–1932. After 1932, with the continued support of the Mexican government, the number of annual repatriations dropped to the tens of thousands. Despite this troubling policy, Mexican immigrant labor was soon in demand as employers recruited workers from Texas and Mexico once again.

With the passage of the National Labor Relations Act (NLRA) in 1932 and the formation of the Steel Workers' Organizing Committee (SWOC) by the

Congress of Industrial Organizations (CIO), Mexican-American workers joined the growing ranks of industrial unionists. The SWOC organized at U.S. Steel's Chicago South Works, where Mexican workers comprised 11% of SWOC membership. Mexican workers were also involved in the organization of "little-steel" plants on both sides of the Illinois-Indiana state line on Chicago's South Side. At a rally on May 30, 1937, commonly known as the Memorial Day Massacre, the Chicago police fired into a crowd of these Mexican and other ethnic union members killing and injuring several. When SWOC finally organized the mills of Chicago, Mexican immigrants across the region joined the ranks of the settled working class raising children who lived Mexican and American lives in the multiracial and multi-ethnic cities of these northern states.

Mexican-Americans in the midwestern and southwestern states were a largely working-class population engaged in migrant agricultural labor and settled industrial work, and in some cases both. The ties of ethnicity however allowed for the development of a small and often-unstable ethnic middle class that provided workers with Mexican foods, entertainment, as well as familiar social and cultural activities. The 1920s witnessed the birth of the League of United Latin American Citizens (LULAC), founded in 1929 as a departure from the often Mexico-oriented mutualist organizations of the late nineteenth and early twentieth centuries. Although considered middle class in orientation, LULAC pressed for naturalization and an embrace of U.S. citizenship as well as the maintenance of ethnic and cultural folkways, as they made social and civil rights claims as citizens and Caucasians within the United States. Granted the status of white ethnics by the naturalization provisions of the Treaty of Guadalupe Hidalgo (1848), LULAC used this legal status to press for an end to the segregation, discrimination, and other disabilities faced by Mexican-Americans in the Jim Crow era.

Mexicans and Mexican-Americans after 1945

From midcentury to the end of the twentieth century, Mexican and Mexican-American labor history witnessed the continued influx of documented and undocumented Mexican immigrants, leading to greater heterogeneity in the Mexican-American population. While some came first as guest workers and others came illegally, many became residents and later citizens. Moreover, Mexican-American workers and returning veterans grew more aggressive about

their rights as American citizens to claim a place in civil society.

As Mexican-American citizens were making increasing demands for civil rights, the United States established and then extended a wartime bilateral program to recruit temporary workers from Mexico. The *Bracero* guest worker program began as an emergency labor program during World War II. The United States had operated a similar program without much input from the Mexican government during World War I. In theory, *braceros* were guaranteed basic wage rates and healthy living and working conditions and were not to compete with domestic workers.

The *Bracero* Program had mixed results. What began as a wartime program to remedy a labor shortage created opportunities for Mexican workers and some Mexican-American entrepreneurs. Yet when this program continued in peacetime, it pitted *braceros* and Mexican-American workers against one another, since the program subsidized and helped to maintain a low-wage labor market in agriculture and related industries through 1964, when organized labor and Mexican-American activists brought the program to an end. Even with this bilateral agreement between the United States and Mexico, the *Bracero* Program itself accepted illegal entry and allowed for the conversion of undocumented entrants to *braceros* and the "paroling" of captured undocumented workers to employers. From 1947–1949, for example, more than 140,000 illegal Mexican workers were legalized through these procedures. Likewise the Immigration and Naturalization Service and the Border Patrol in some cases had a policy of lax enforcement during harvest seasons, and Mexico did little to stop or regulate the outflow. *Braceros* and undocumented workers displaced *Tejano* and other workers, since labor once done locally was now contracted to *braceros*. This competition, many Mexican-American activists feared, may have led domestic harvest workers to migrate to the midwestern and northwestern states in increasing numbers after 1940 in search of seasonal agricultural, food-processing, and cannery work, and higher wages.

The 1950s and 1960s witnessed increasing militancy and organization among Mexican-American workers. Union membership became a fact of life in the midwestern steel industry and the urban-industrial areas of the Southwest as Mexican-Americans continued to press for citizenship and civil rights in the United States. The perennial issue of agricultural unionism again gained prominence in the late 1950s as community and labor organizers sought to build harvest worker unions in California. In 1959, a coalition of Filipino, Mexican-American, and Anglo-American workers in California succeeded in organizing the

Agricultural Workers' Organizing Committee (AWOC) with support from the AFL-CIO. The organizing success of AWOC provided community activist Cesar Chavez with an opportunity to build his small United Farm Workers' Union in the mid-1960s as he joined the AWOC and eventually the two merged and formed the United Farm Workers' Organizing Committee (UFWOC). Chavez's leadership of this labor movement inspired the creation of similar agricultural unions in Wisconsin, led by Jesus Salas, and in Texas, led by Antonio Orendain, as well as a large number of community organizations and civil rights groups that also drew inspiration from Chavez. Until his death in 1993, Chavez's union was central to the Mexican-American community's effort to claim labor and civil rights in the United States. Together with Chavez's union, the only other union to maintain itself as a viable labor union into the twenty-first century was the Farm Labor Organizing Committee (FLOC) founded in Ohio by former Texas farm worker, Baldemar Velasquez, which by the end of the twentieth century was organizing immigrant workers in North Carolina and the American South and operating a joint FLOC/UFW union office in Mexican cities.

Conclusion

The history of Mexican and Mexican-American workers has been defined by the constant overlap of Mexican-American workers, Mexican immigrant workers, and undocumented workers, a process that has created a heterogeneous and often-splintered Mexican-American or Latino population in the United States increasingly diverse and separated by layers of acculturation, English language proficiency, nativity, citizenship, and immigration status. By 2000, the total Hispanic population of the United States had grown to over 35 million, with nearly 60% of this total being of Mexican ancestry.

At the close of the twentieth century, Mexican and Mexican-American workers continue to include millions of undocumented workers who increasingly labor in the nonunionized service, domestic, agricultural, meatpacking, and light industrial sectors, providing a reserve of cheap labor for the U.S. economy as the North American Free Trade Agreement (NAFTA) weakens the position of labor unions and the working class on both sides of the U.S.-Mexico border.

There are some late twentieth-century cross-border success stories, such as the Service Employees International Union (SEIU), which incorporated such organizers as Eliseo Medina, formerly of the UFW,

and immigrants to organize these often-transnational workers through the successful national Justice for Janitors campaign. For middle-class and mixed-ancestry Mexican-American workers, acculturation and prosperity have most prominently expanded in California and Texas, leading to rising income and education levels even as the majority of Mexican immigrants and Mexican-Americans remain an overwhelmingly low-income and working-class community today.

MIDWEST

The Midwest holds an enigmatic place in U.S. labor and working-class history. It is popularly regarded as the conservative heartland of the United States, a racially homogenous and culturally traditional region dominated by employers and middle-class ideology. In contrast labor historians know the region for its militancy and organizational innovation. Indiana was home to railway union leader and Socialist Eugene Debs; Mineworkers' Union leader John L. Lewis was

an Iowan. Chicago was the birthplace of the Industrial Workers of the World (IWW) and the American Communist party. The Congress of Industrial Organizations (CIO) emerged from the massive auto, steel, and meatpacking plants of Flint, Detroit, and Chicago, as well as from smaller industrial centers like Akron, Ohio; Anderson, Indiana; and Austin, Minnesota. Racially and ethnically diverse since the mid-nineteenth century, the midwestern working class has been created by waves of migration from Europe, Latin America, and the rural and southern United States.

The story of midwestern labor and working-class history follows closely the rise and fall of a regional, industrial network based in its earliest days on proximity to natural resources and transportation routes and in the twentieth century, on supplying national and global markets for manufactured goods and agricultural commodities. Spread out across hundreds of small industrial towns, as well as concentrated in metropolises like Chicago, Detroit, and Kansas City, midwestern industry sustained a working class that significantly shaped the political trajectory of the United States, especially in the mid-twentieth century. A period of decline and reconfiguration from the 1970s to the 1990s decimated many of these working-class communities as employers and the federal government shifted investment to the American South and West.

The region we now know as the Midwest was once part of a global trading network linked to the French, Spanish, and English empires. In the seventeenth century, the interior of North America was too remote for much direct European colonization, but the French in particular succeeded in building a profitable trade in animal furs. This trade was based on the personal and economic alliances between French men, Indian women, and their mixed race (*métis*) descendants. Working as indentured or contract laborers, and less frequently as independent contractors, French *coureur de bois* (runners of the woods) packed out from Montreal for years at a time, trading and living with American Indians and in some cases becoming permanent settlers. The Indian women who married these traders and laborers played a central role in the fur trade as the cultural bridge between French and Indians, as the embodiment of family-structured trading networks, and as agriculturalists whose produce was crucial to provisioning fur trade workers.

With the independence of the United States from Britain, the region began to take on its modern political form, splitting the trajectories of U.S. and Canadian workers, although migration across the border has been a constant. American leaders like

Thomas Jefferson looked to the territory north and west of the Ohio River to fulfill dreams of a democratic society built on the foundation of yeoman farmers. The Northwest Ordinance of 1787 stipulated that the region would be free of slavery and promised to treat Indian communities fairly. Most Euro-American settlers disregarded the latter promise, in large part because their ideas of private property and resource exploitation were at odds with those of Indians. After nearly a century of intermittent warfare, Euro-American settlers had succeeded in moving most American Indians out of the lower Midwest; however, a significant Indian and *métis* presence remains in the upper Midwest.

By the Civil War the region had a widely dispersed industrial network and working class. The first industrial centers of the region were Ohio and Mississippi River towns, and only later ports on the Great Lakes. Pittsburgh, Cincinnati, and St. Louis provisioned their agricultural hinterlands, processing raw materials into preserved meats, timber, and pig iron. But they were primarily trading entrepôts rather than industrial cities at this point. A network of canals and railroads began to take shape after the 1830s, opening the region's interior and linking it closer to national and global markets. Canals and railroads created a broad network of small industrial towns, each with manufacturers who took advantage of some local advantage, such as access to resources or skilled workers.

With the canals came the first large wave of immigrant wageworkers. Canal labor was primarily drawn from Irish and German immigrants, and especially in the early years, they faced horrendous conditions. During the building of the Illinois and Michigan Canal (completed in 1848), contractors routinely held back pay for their laborers, often because they had not been paid themselves by the canal corporation. Malaria, cholera, and other communicable diseases swept through the shantytowns that shadowed the path of the canal, their victims buried in anonymous mass graves. Although the first railroads started fast on the heels of canals, both forms of transportation co-existed for several decades, with canals offering a lower priced alternative to the railroad for crops, coal, and timber. By the 1850s, railroad building far outstripped the canals, and railroads would remain a major regional employer for the next century.

The quickly expanding regional economy nurtured a vision of shared interests among workers, farmers, and small business owners—what historians call “producerism.” Although this notion benefited those who were able to settle down in one place, the dynamic regional economy also encouraged the

“boomers”—highly mobile workers and speculators who followed each new economic boom—to see themselves as always on the verge of breaking through. It would take the economic crisis of 1873, and the long deflationary period that followed, to shake the labor movement of this producerism. But along the way, the philosophy shifted from one that supported the emerging market economy to an oppositional, even millennial critique of capitalism as a betrayal of the American democratic project. Although the Midwest was certainly not alone in this producerist outlook, the region produced some of the most vocal exponents of oppositional producerism through the populist and socialist movements of the late nineteenth century.

The great rail strike of 1877 announced a generation of militant strikes and equally militant employer and government opposition to unionization. Originating in the East, the strike spread through midwestern rail centers rapidly. In Chicago the rail strike spread to other industries, especially among immigrant workers, and led to the infamous Battle of the Viaduct, in which an armed militia fired on a crowd of workers and their families gathered near a busy rail crossing on the city’s Southside, killing 14 people. St. Louis workers declared a general strike paralyzing the city for nearly a week.

These first mass strikes were followed a decade later by the growth of the Knights of Labor (KOL) and the Eight-Hour movement. As in other regions, the KOL assemblies in the Midwest were spread evenly between small and large industrial towns and included all kinds of workers: Men and women, black and white, wage laborers and farmers. Chicago and Detroit witnessed mass demonstrations on May 1, 1886, in support of the 8-hour day. Shortly afterward Chicago anarchist labor leaders were caught up in a dubious prosecution, and eight were found guilty of conspiring to bomb police officers. The wave of anti-radical suppression that accompanied the prosecution of the Haymarket defendants weakened both labor and radicalism in the Midwest. In the years after, radicals celebrated the Haymarket martyrs as working-class heroes, while mainline trade unionists learned to shun radicalism.

Whatever their political orientation, workers in the Midwest would play a central role in the long struggle for industrial unionism and government social provision that culminated in the formation of the CIO and the New Deal, respectively. The employers they faced were among the nation’s richest and staunchly anti-union, the same corporations that were transforming the United States into a leader of the industrial world, including the Pullman Palace Car Company, U.S. Steel, International Harvester,

Ford, and the meatpacking giants Swift and Armour. These heavy industries relied on a new wave of southern and eastern European migrants who took semi-skilled jobs that had been routinized following the thinking of Frederick Winslow Taylor. In a series of major confrontations from the 1890s to World War I, these employers were able to defeat unionization and maintain the open shop. The shifting position of the federal government in this struggle would prove decisive.

Railroad industry workers first sought to bridge their many craft union rivalries in the American Railway Union (ARU) of the 1890s, led by the charismatic Hoosier Debs. In 1894, the ARU took up the cause of the workers who built and repaired Pullman sleeping cars, declaring a boycott on the handling of Pullman cars. Employers and their supporters in the press labeled the boycott an insurrection. The federal government sent troops to Chicago over the objections of Illinois governor John Altgeld. Debs and other ARU leaders were jailed, and within a decade, most of the major trade unions had been crushed in massive strikes, including the meatpackers and teamsters in Chicago.

The intensity of employer and government anti-unionism pushed some homegrown labor leaders toward radicalism, most notably Debs, who became a Socialist while in prison. Responding to labor’s crisis, a group of radicals and industrial unionists founded the IWW in Chicago in 1905. At its outset the IWW included the well-established Western Federation of Miners, and was supported by Debs and other well-known Socialists, suggesting the seriousness of the effort. By 1912, the miners’ union and the Socialist Party (SP) had officially parted with the IWW. But left-wing Socialists like those associated with the Charles H. Kerr Publishing Company of Chicago remained supporters of the IWW. From 1915 to 1924, the IWW had notable success in organizing agricultural workers in the Great Plains and far West despite intense local and federal repression.

The advent of war in Europe during 1914 began a fundamental re-orientation of midwestern working-class communities and industrial structure. First and foremost the war cut off the flow of new workers from Europe, prompting employers to scramble for new sources of labor. The wartime labor shortage created an opportunity for African-Americans, Mexican immigrants, Mexican-American migrants, and working-class women to enter industrial employment in large numbers. The war also created opportunities for unions: As inflation undermined workers’ standard of living, unionization and radicalism gained a new hearing. The frequency of strikes in the United States reached an all-time high during this decade, as

workers, unions, and working-class activists put into practice a form of unionism that was appropriate for the new scale of work. The American Federation of Labor (AFL) experimented with forms of industrial unionism, especially in Chicago's Stockyards' Labor Council and in the effort to organize the steel industry. In both cases former IWW and future Communist leader William Z. Foster played a prominent role. Success in meatpacking proved short-lived, with employer hostility on the rise with the end of wartime regulations. Whether the union's collapse was due to hostility among European ethnic groups, between Europeans and African-Americans, or because of the union's complex organizational structure is a subject of debate among historians.

Midwestern workers and farmers were also active in politics, forming important factions within the Republican and Democratic parties as well as in various third-party efforts. In North Dakota for instance, former leaders of the state Socialist party repackaged themselves as the Non Partisan League and in 1916 won a statewide election. They were able to pass profarmer and proworker legislation and in the war years prevented the passage of a criminal syndicalism law, the likes of which was used in other states to cripple the IWW. Socialist and prolabor mayors were elected in Milwaukee, Wisconsin, St. Paul, Minnesota, and Sioux City, Iowa. With the collapse of the union and left movements after the war, the Progressive party emerged as the last gasp of midwestern opposition. With Wisconsin's Robert LaFollette as its presidential candidate, the party advocated nationalization of railroads and a variety of proworker and profarmer reforms. LaFollette won more than 16% of the national vote in 1924, including a majority in Wisconsin and as much as 40% in several upper midwestern and western states.

The mid-1920s were a time of reckoning for the region. The expansive post-Civil War economy that incorporated the vast lands of midcontinent North America in the national and international economy had spawned a widely flung society of small towns with a mixed industrial and commercial base servicing the agricultural and extractive hinterlands. World War I had masked the extent to which this process had reached its end even before the war, as railroad construction ground to a halt and capital investment began a re-orientation toward urban-centered mass production, construction, and cultural industries. The extractive and transportation industries continued to be important economic power centers and large employers in the region, but after the mid-1920s, farming, timber, mining, and railroads were all in decline. The small industrial towns that relied on them would languish first in the hidden

depression of the 1920s and then openly in the Great Depression of the 1930s. The recovery of the World War II years for the most part simply siphoned off population and business away from these smaller towns. Only in the 1950s, as industries began the decentralization of production away the metropolitan areas with their militant unionized workforces, would the population and economies of the towns grow again.

The 1920s also marked a shift away from the highly fluid labor markets of Gilded Age capitalism. The high turnover rates typical of modern factories were sapping profits, and many large employers sought to stabilize their workforces through welfare and training programs. Although the employee welfare programs pioneered by midwestern employers like Ford, Pullman, and International Harvester were generally sacrificed during the lean years of the 1930s, employers' hostility to high-turnover rates remained constant. The increasing stability of working-class communities, especially immigrant communities, translated into political power in the 1930s as the Democratic party solidified its New Deal coalition with programs like Social Security and the codification of collective bargaining in the National Labor Relations Act (1935). Nevertheless unionization remained elusive in many industries until World War II.

Contrary to notions of a Golden Age of employer-union harmony, the region experienced major strikes throughout the 1940s and 1950s. Moreover despite their alliance within the Democratic party, white and African-American communities continued to struggle over urban neighborhoods, a conflict that would create opportunities for employers and conservative politicians. Already in the early 1950s, large manufacturers moved production out of metropolitan areas to newer rural and small-town factories where the workforce was overwhelmingly white. The jobs that were left in the big cities usually went to the workers with the most seniority. In many cases these were white workers who had been in the factories since the 1930s, and black workers who had landed jobs during the war were thrown into unemployment with devastating effects on their communities.

Beginning with the oil crisis of the early 1970s, midwestern industry went into a long decline, with the automobile and steel sectors leading the way. Turning their early twentieth-century strategy of consolidation on its head, employers now sought industrial decentralization in order to escape the high land, transportation, and labor costs associated with their metropolitan operations. Rather than upgrading their urban midwestern plants, employers built new factories in rural areas and in the South. In this way they hoped to escape the power of militant and well-organized union locals.

Although unions sometimes fought these relocations directly, the more common strategy was to work with employers to increase the productivity of the older plants. The result was an intensifying split between rank-and-file workers bearing the brunt of the speed up and their union officials who seemed sometimes to side with employers. In Detroit and other auto industry towns, this brewing dispute over productivity combined with racial and generational divisions resulted in some cases in open rank-and-file revolt, as in the case of the Dodge Revolutionary Union Movement. Workers at newer auto plants, like the Lordstown, Ohio, General Motors assembly plant opened in 1966, faced intense demands for increased productivity. With an assembly line timed to produce a record 100 cars an hour, workers at Lordstown launched a strike in 1972 that became a national symbol of the rebelliousness of young workers.

The conflict over productivity became more intense as a number of large employers threatened bankruptcy, and others, like Wisconsin Steel, simply closed shop. Federal loan guarantees designed to save the Chrysler Corporation, for instance, required massive layoffs, wage and benefit cuts, and work-rule concessions by the United Auto Workers (UAW). By the mid-1980s concessionary bargaining held sway, and unions generally fought to limit the erosion of wages and benefits. Labor's defensive position was manifested in a series of strikes and lockouts that seemed to foster as much conflict within the labor movement as between unions and employers. The strike of Austin, Minnesota, Packinghouse Workers' Local P-9 against Hormel ended in failure and trusteeship for the local after the Minnesota National Guard was called out to protect replacement workers. The boom economy of the mid-1990s did little for mid-western industrial workers. A long-running battle between the UAW and Caterpillar ended with a clear management victory. A 3-year lockout of workers at the A. E. Staley corn products plant in Decatur came shortly after the firm was purchased by a British-based multinational. The unions' feeling of embattlement was best illustrated by their billboard advertisements outside of Decatur and Peoria, Illinois, that announced to drivers "You Are Now Entering a War Zone." Facing de-industrialization and intense employer anti-unionism, once powerful industrial unions like the Packinghouse Workers, and the Rubber Workers were forced to merge with larger unions.

The declining power of unions undermined the power of prolabor Democrats, and the party increasingly sided with probusiness positions aligned

with the emerging global economy. The 1994 North American Free Trade Agreement (NAFTA), served another blow to the industrial base of the Midwest as employers transferred labor-intensive work to Mexico and capital-intensive work to Canada. The increasingly global outlook of midwestern industrial employers was illustrated best by a series of foreign buy-outs, most prominently the 1998 purchase of Chrysler by German automaker Daimler-Benz. In contrast to the manufacturing sector, public-sector and service-sector unions in the region experienced strong growth in the 1990s and 2000s, even expanding into previously nonunion workforces, such as home healthcare workers. However the vulnerability of public-sector unions was underscored in 2005 when Indiana's recently elected Republican governor revoked the collective-bargaining rights of state employees and canceled existing contracts.

MIGRANT FARMWORKERS

Workers who labor for wages on farms in the United States can be broken down into several groups: Year-round hired hands, local seasonal laborers, and migrant farmworkers—those who must leave their home for an extended period of time to work for wages on a farm. The first and second subsets of agricultural laborers were part of the American labor experience beginning in the colonial era. Migrant farmworkers however emerged later in time. The study of these workers poses unique problems for labor historians. Migrant farmworkers are ethnically and racial diverse, native-born and immigrant, men, women, and children, geographically mobile, lack long-term labor union affiliations and local community ties, and work in other nonagricultural jobs. These are only a few of the distinctive features of the migrant farm-worker

population that has evolved since the middle of the nineteenth century, making them a group of workers who do not fit neatly into any one, two, or even three areas of study.

Farmworker Origins

In the decades leading up to the Civil War, farmers began to specialize in commercial agricultural products, taking advantage of an advancing market economy and a revolution in transportation. In the old Northwest and prairie states, the first uses of migrant farmworkers took place, though on a scale much smaller than what would appear later in the century. With the introduction of the reaper and mechanical thresher in the 1840s and 1850s, western farmers could plant wheat and other grain crops on a much larger scale. Although farmers could plant and tend their crops with their own labor, that of their families, and perhaps with the help of a hired hand or two, the harvest of these crops required extra temporary labor. The sparsely populated countryside did

not have sufficient labor sources. Therefore, native-born men—white and black—and European immigrants from urban areas provided a migrant farm-worker supply for the crucial harvest period. These workers would migrate with the ripening grain from South to North in Ohio, Indiana, and Illinois. Out in California Gold Rush miners stimulated an expansion of the existing agricultural economy. Native Americans became a major source of seasonal and migrant farm labor.

After the Civil War, the need for migrant farmworkers accelerated, especially in areas of the West: the Great Plains, California, and the Pacific Northwest. The Great Plains are a more arid region than the Midwest prairies in that annual rainfall is on average 20 inches or less a year. Despite modest precipitation, grain crops, especially wheat, thrived. By 1900, the creation of five transcontinental railroad lines with their connecting lines helped farmers reach growing urban consumer markets. Just as with the Midwest farmers, Great Plains farmers could plant hundreds and even thousands of acres of wheat. Still the limits of technology required that they employ seasonal labor for the harvest. Again sufficient harvest labor could not be supplied by area workers. Therefore migrant labor was necessary. California agriculture experienced a similar phenomenon. Wheat and other grain crops predominated in the state and required extensive use of seasonal and migrant farm labor. Even when the state's farmers moved to truck farming, that is vegetable and fruit production for sale in urban areas, limits of agricultural technology compelled both large and small farmers to use temporary harvest labor. At the end of the nineteenth century, the Pacific Northwest developed both grain- and fruit-growing agricultural industries that could not rely only on local seasonal labor. Whether picking apples or harvesting wheat, migrant farm laborers were essential to the region's farmers.

Work-Life Culture

Migrant laborers at this point in their history tended to be young, native-born, white men, though African-Americans and European immigrants could be found in the harvest sites on the Great Plains and in the West generally. California was unique in that wave after wave of Asian and later Latino immigrants made their way into the few employment avenues open to them, namely, farm labor. Nevertheless until the advent of World War I, young, white, native-born men dominated the migrant farm labor workforce. Migrant workers as a group made up a substantial

portion of the 150 thousand agricultural laborers employed annually in California. On the Great Plains, the migrant portion of 200 thousand or so agricultural laborers could be broken down into three major groups. One cohort migrated to work sites throughout the West and lived on their earnings during the winter months in towns and cities in the region. The second were farmers who supplemented their annual income by working harvests. Out-of-work tradesmen, students, and young men out to experience the West made up the final group. Migrant farmworkers though also labored in nonagricultural jobs on a seasonal basis as well.

Migrant farmworkers developed distinctive cultures of work and life on the road in search of employment. Before the advent of the automobile, migrant workers had to travel by freight train. They would stop in area farm towns to find employment where they were usually tolerated only during the harvest period. It was customary for workers to go to the center of town and wait for farmers from the countryside to arrive and to offer employment. Workers would have to determine whether to accept the wages, room, board, and hours offered. Once workers completed the harvesting job, they had to move on to find other employment. Though some purchased tickets on passenger trains, others stole rides on freight trains. Between jobs workers stayed in "jungles." Jungles were temporary communities situated well outside of towns but near a railroad line and a stream or some other water source. In these camps, a worker could make a meal, sleep, socialize, and become informed about other employment. As these workers traveled from workplace to workplace, they carried their bedding and other belongings on their backs in the form of a bundle. Migrant farmworkers were commonly referred to as bindle stiffs.

The East Coast was another region of significant migrant farm-worker formation. As early as 1870, the Northeast, specifically southern New Jersey, developed a truck-farming industry that could supply the major cities of New York, Philadelphia, and Newark with fresh fruits and vegetables. Unlike California, which had much larger farming operations and a larger workforce that tended to be isolated from the local workforce, the East Coast had smaller truck-farming operations, and farms had to tap into existing urban labor sources. Therefore Italian tradesmen and their families supplemented their income by turning to summer harvests. These Northeast farmers also relied on African-American men from the upper South to migrate seasonally to perform a variety of farm labor tasks. With refrigerated railroad car connections established between the Southeast and Northeast, truck farming expanded in the South,

MIGRANT FARMWORKERS

with farmers turning to sharecroppers and their families to harvest crops seasonally.

Radicalism and Reform

The first successful effort at organizing migrant farm labor in the early twentieth century was by the Industrial Workers of the World (IWW). The IWW organized thousands of agricultural laborers with the Agricultural Workers' Organization (AWO), later renamed the Agricultural Workers' Industrial Union (AWIU). The strategy of the AWO and AWIU was to embrace the work life culture of migrant farmworkers. As long as these workers were predominately white and male, the IWW proved successfully. The AWO and AWIU job delegates rode the rails, lived in jungles, and worked the harvest job sites with the workers they sought to organize. From 1910 to 1925, the IWW had its greatest triumph in organizing workers on the Great Plains. As migrant farm laborers though turned to second-hand automobiles to search for work, the IWW lost its ability to bring new workers into the union. The AWIU job delegates failed to adapt an organizing strategy that could accommodate workers making their way through the harvest in small groups, living out of their cars and trucks, and soliciting farmers for work directly at the job site. Also changes in harvest technology of wheat and other grains crops, especially after 1930, eliminated the need for large numbers of migrant farmworkers on the Great Plains. In the second-half of the 1920s, farmers began to use the combine, which put into one mechanized operation harvesting and threshing wheat.

The federal government's interest in migrant farmworkers and agricultural labor generally began with the U. S. Industrial Commission (USIC). It met from 1898 to 1902 and determined that immigrant workers would benefit in the long run by taking up agricultural labor. The USIC believed that the agricultural ladder could provide agricultural workers with avenues to farm ownership and independence. First they would have to work as hired hands and seasonal workers, but eventually, the commissioners believed, they would be able to establish their own farms. Nevertheless the Division of Information, which was overseen by the Department of Commerce and Labor, was unable to arrive at an efficient distribution program. With the advent of the Wheatland Strike of 1913 and concerns about child labor, progressives sought to address the problems of migrant farm labor with reform of labor camps and improvement in working conditions. Another federal inquiry, the Commission on Industrial Relations

(CIR), investigated agricultural labor in the context of other industrial relations. The CIR focused on labor militancy, such as the success of the IWW, and the fact that armies of migrant laborers stole rides on freight trains to traverse major portions of the country searching for work. The CIR understood that the agricultural ladder had broken down in an era of industrial agriculture. Only with a national distribution system of labor could workers and employers have their needs met. During World War I, the Department of Labor created the U.S. Employment Service to deal with rationalizing farm labor needs. With several hundred free employment bureaus, the service placed tens of thousands of farmworkers. But with the end of war, Congress cut the service's funding.

Federal Intervention

The Dust Bowl and the Great Depression of the 1930s accelerated trends in migrant farm labor that had been developing for several decades. Even though single men, whether native-born or immigrant, dominated migrant farm labor through the 1920s, more and more families of harvesters made their way into the army of workers with the availability of cheap, second-hand cars and trucks. The Great Depression pushed farmers and their families into the ranks of migrant farmworkers due to the Dust Bowl and to other economic catastrophes. Urban families and single men were forced into farm labor as well. Streams of migrant farm laborers fed farmers' demand for workers. The most notable migrant stream was from the Great Plains to California. Workers from the plains though also trekked to the Pacific Northwest. Still other workers made their way from Texas to the berry harvests in Arkansas and Michigan. Other workers journeyed from the South to the Midwest and Northeast to find labor on truck farms and in sugar beet fields. These migrant streams were ethnically and racially diverse. Native-born blacks and whites, and immigrant workers, especially Asians and Latinos, could be found integrated into the same migrant labor streams and work places, but they could also be segregated in both labor streams and work sites.

At the end of the 1920s and through the 1930s, agricultural labor strikes erupted in California and in other farming areas of the country. Despite the effort of migrant and seasonal farmworkers to join unions—some of the most militant efforts led by Communists—their right to organize into labor unions was exempt in the Wagner Act (1935). Therefore subsequent efforts

by the Congress of Industrial Organizations (CIO) and the American Federation of Labor (AFL) were seriously hampered during the rest of the 1930s and into the 1940s. Still workers were able to improve wages and working conditions due to some strike actions despite the brutal reaction by farmers' associations. The poor working and living conditions that led to strikes attracted public sympathy for migrant farmworkers, especially when coupled with the writings of John Steinbeck and Carey McWilliams and by government hearings, such as those led by Senator Robert La Follette.

Unlike progressives, New Deal officials tried to make migrant farmworkers the responsibility of the state. New Deal officials in the Departments of Labor and Agriculture tried to find ways that the federal government could act to help but not empower farmworkers. Their efforts resulted in attempts to settle strikes and to create migrant labor camps in order to alleviate difficult living conditions. Within the Department of Agriculture, officials in the Resettlement Administration (RA) at the end of the decade were able to create labor camps on both coasts. Their efforts to alleviate the problems that migrant farmworkers experienced whether on the East Coast, West Coast, or anywhere in between, were thwarted by officials in the Agricultural Adjustment Administration, who were preoccupied with the interests of farm owners as opposed to migrant farmworkers, seasonal agricultural laborers, sharecroppers, or tenant farmers. Where farmers would not or could not provide farm labor housing, the RA's Migratory Camp Program did provide migrant workers a safe, clean place to live while working on truck farms. Employers though continued to complain about labor shortages and the fact that migrants organized successful strikes out of the camps. With the outbreak of World War II, the federal government transformed the camps into centers of labor distribution. A new agency, the Emergency Farm Labor Supply Program, brought agricultural laborers from Mexico and the Caribbean, along with over 100 thousand prisoners of war to meet the needs of farmers.

With war production moving into full swing in 1941, white, native-born agricultural laborers found more employment options. African-Americans, Latinos, and other minority groups found agricultural labor one of only several limited employment opportunities. The war though motivated government officials to focus their efforts on attaining sufficient farm labor for farm owners as opposed to assisting farm laborers in securing better working and living conditions. The Farm Security Administration, which succeeded the RA, created fixed and mobile farm labor

camps to facilitate the placement of farmworkers for employers. Eventually this commitment on the part of the federal government led to the Labor Importation Program, also known as the Bracero Program in the Southwest. Federal officials negotiated agreements with Mexico to bring thousands of Mexican nationals into the United States, to work as agricultural laborers. The program was extended to the East Coast, using workers from Puerto Rico and other Caribbean islands. Despite the introduction of foreign workers, domestic migrant workers continued to be employed as agricultural laborers. After 1948, the Bracero Program continued but by state government arrangements rather than strictly through the federal government and Mexico. Several hundred thousand workers were imported during the 1950s on an annual basis. This practice ended in 1964 due to a series of legal challenges.

Postwar Unionization and Advocacy

Efforts by native-born and immigrant agricultural laborers to organize into effective labor unions continued after the war. There are three phases of postwar farmworker organizing. The first phase, 1947–1955, was led by the National Farm Labor Union (NFLU). The AFL chartered the NFLU with an industrial model for its structure. The union focused on large-scale farming operations in California, initiated several strikes, and lobbied against the Bracero program. Nonetheless the leadership failed to understand the cultural attributes of the significant migrant, ethnic minority, and immigrant portion of the workforce. The second phase, 1956–1964, was led by the Agricultural Workers' Organizing Committee (AWOC). The AFL-CIO created AWOC, but again the organizational model was not well-suited to the migrant nature of the workforce. Moreover the leadership sought to organize white elements of the workforce and overlooked the strong presence of immigrant, Latino, and Asian farmworkers.

The third phase—beginning in the mid-1960s and continuing to the present—had its origins with the Cesar Chavez and other union and social reform advocates. A series of successful strikes in 1965 led to a grape boycott that galvanized critical nationwide support for migrant and seasonal farm laborers. The culmination of these efforts led to the formation of a union that both spoke to the economic needs and cultural attributes of a farmworker population that was primarily made up of ethnic minorities and immigrants. That union, the United Farm Workers (UFW), officially affiliated with the AFL-CIO in

MIGRANT FARMWORKERS

1972. With the passage of California's 1975 Agricultural Labor Relations Act (ALRA), the UFW had the right to organize farmworkers and collectively bargain with employers. The ALRA however could be compromised by powerful associations of farmers and by employer strategies to undermine the effectiveness of the law. Other states with an agricultural economy that required migrant farmworkers did not follow California's lead with such protective legislation for agricultural laborers. Moreover government officials have tended to view migrant farmworkers as a social problem and a labor-distribution issue. Such media exposes as *Harvest of Shame* at the beginning of the 1960s and decade after decade of state and federal governmental investigations have led to school programs for migrant children and some improvements in housing and working conditions. However such legislation has not led to political or economic empowerment for migrant farmworkers.

At the beginning of the twenty-first century, migrant farmworkers in the United States can be found in all 50 states, though most are concentrated in California, Texas, and Florida. A contemporary guest worker program, H-2A, allows employers to import immigrant workers when they can successfully argue that they are experiencing a lack of sufficient availability of laborers for their crops. Lack of available workers includes laborers unwilling to accept certain wages and working conditions. The result is to pit domestic workers against immigrant workers. Despite the current guest worker program and the lack of legal protection for organizing efforts among migrant farmworkers, agricultural laborers are still an active part of the labor union movement. The UFW in the West and the Farm Labor Organizing Committee in the East and such advocacy groups as Student Action with Farmworkers seek to empower agricultural laborers, placing them at the center of the struggle for economic and social justice.

MILLER, ARNOLD (1922–1985) President, United Mine Workers of America

Arnold Miller was president of the United Mine Workers of America (UMWA) from 1972 to 1979. He won his first term under the insurgent banner of Miners for Democracy (MFD) against Tony Boyle after a federal court overturned Boyle's fraud-ridden 1969 electoral victory over Jock Yablonski. Assassinated in December 1969, Yablonski had begun to unite the decentralized 1960s rank-and-file coal miners' movement around his candidacy. The MFD carried his fight to fruition with the election of Miller, who received 55% of the votes in December 1972.

A 1972 MFD convention had nominated Miller for president, Pennsylvania-based Mike Trbovich for vice-president, and Harry Patrick of northern West Virginia for secretary-treasurer. A southern West Virginia coal miner beginning at age 16, Miller was badly wounded in World War II, after which he returned to the mines as a repairman and electrician. He had served as president of his local for 1 year before black lung disease and arthritis ended his mining career at age 48 in 1970.

Miller had no connection to the old order (indeed he had never attended a national UMWA convention). However he was closely associated with the militant movement that won the landmark Federal Coal Mine Health and Safety Act (1969), establishing black lung benefits and federal responsibility for mine

health and safety. Miller had been president of the West Virginia Black Lung Association (BLA) and had supervised the association's widely circulated *Black Lung Bulletin*. Soft-spoken and modest in demeanor, he had a strong knack for the public relations side of organizing, which made him well-known among the networks of activist miners and organizers, and the media. He was also a newcomer to formal organizational leadership in a union that had long concentrated administrative power and responsibility at the top. Miller was about to take on the challenging task of restructuring and leading a union with some 140,000 members (down from over 400,000 a generation earlier) facing complex contractual and pension-related issues and difficult organizing tasks in a time of ongoing rank-and-file unrest.

The new leadership promptly carried out fundamental changes in the UMWA. Miller dismantled the corrupt Boyle apparatus. He removed both hired administrators and the 20 appointed International Executive Board (IEB) members and replaced them with people from the MFD's network of activists. Elections were held for the IEB positions within several months. The *UMW Journal* was transformed from a self-serving mouthpiece of the national leadership into a serious source of information for miners. The Miller administration cut salaries for top leaders and prioritized mine health and safety, securing the endangered Health and Retirement Funds, and organizing new members. It carried out the 1973 UMWA convention with unprecedented rank-and-file involvement and participation, and it implemented membership ratification of the 1974 collective-bargaining contract.

The new president, apparently fearful of organized factionalism and even "dual unionism," also hastened to abandon MFD as a rank-and-file vehicle. Furthermore Miller at times undercut the BLAs, which had spread from West Virginia to other states. However undermining the organized channels for the grassroots movement did not make his tenure any easier. A strong core of former Boyle supporters won IEB seats in Boyle's old strongholds and came to constitute a persistent base of hostile opposition to Miller. At the same time, rank-and-file protest continued in the mid-1970s. This included frequent wildcat strikes. With no unifying leadership or clear program, the unpredictable wildcats created legal problems and dilemmas for the reform administration. The wildcats also added pressure on the production-linked Health and Retirement Funds, which began making cuts in medical services. Increasingly isolated from the wave that had catapulted him to the presidency, Miller gradually became estranged from the network of activists, many of whom exited from his staff. The top three leaders split into hostile factions, and

Patrick opposed Miller for the presidency in a three-way race (1977). Miller won a second term, but his governance of the UMWA was becoming less effective.

The problems were most exemplified by the 1978 contract, signed after a 110-day strike, with few gains. The final agreement included replacement of the long-cherished across-the-board free medical care with company-by-company private plans, and the defeat of a hoped-for local right to strike between contracts. Many miners were disappointed. Fending off attempts to recall him and prematurely aging from the toll of work and war-related injuries, Miller suffered a stroke and resigned in 1979. Sam Church, a former Boyle supporter who had joined forces with Miller as the MFD leaders split apart, became president. Miller died in 1985.

Criticisms of Miller's shortcomings must be tempered by the fact that the weakening of the UMWA's bargaining power had deep historical roots that would have proved daunting for any leader. No one before or since has solved the problem of unionization in either the western states, where strip mines have continued to increase their proportion of production, or in the historically nonunion, small mines in Appalachia. But the UMWA's stubborn and often creative survival, furthered by the accession of a new generation of progressive leadership beginning with Richard Trumka and continuing with Cecil Roberts, certainly owes much to the election of Miller, to the reforms he implemented, and to the movement of which he was part.

MILLS, C. WRIGHT (1916–1962) **Sociologist**

As a sociologist and radical social critic, C. Wright Mills was one of the most significant intellectuals in the mid-twentieth-century United States. He was also one of the many American thinkers of his era to be profoundly shaped by an engagement with the labor movement. Born in Waco, Texas, Mills studied at the University of Texas before receiving his Ph.D. from the University of Wisconsin in 1942. Beginning in the early 1940s, Mills associated himself with a group of left-wing anti-Stalinist intellectuals centered in New York City and began to develop a radical critique of American society.

During World War II, Mills was pessimistic regarding the potential of organized labor to transform American society. However following the war, Mills was drawn to the upsurge of union activity and became hopeful that labor could serve as a radical agency of social change. In 1946, Mills joined the Inter-Union Institute for Labor and Democracy, a consortium of labor-oriented intellectuals headed by the venerable union journalist, J. B. S. Hardman. Mills also became a frequent contributor to the institute's magazine, *Labor and Nation*. Also in 1946, in his capacity as research associate at Columbia University's cutting-edge research bureau, the Bureau of Applied Social Research, Mills established a Labor Research Division of the bureau and began to conduct an extensive survey of American labor leaders. In 1947, Mills wrote an enthusiastic report on the United Automobile Workers convention for *Commentary* magazine.

Mills presented the results of this survey in his first book, *The New Men of Power: America's Labor Leaders*, published in 1948. The book alternated unevenly between the empirical results of Mills's study and his speculative analysis of the radical political potential of the labor movement.

MINERS FOR DEMOCRACY

From 1970 through 1973, Miners for Democracy (MFD) led a coalition of insurgent coal miners in electing new leadership for the United Mine Workers of America (UMWA), who then democratically restructured the union. The MFD was born literally at the funeral of Joseph A. (Jock) Yablonski, his wife, and his daughter, who were brutally murdered on December 31, 1969. A coterie of his followers and family agreed to carry on. Yablonski had mounted a strong though unsuccessful challenge to incumbent W. A. (Tony) Boyle for the presidency of the UMWA in an election tainted by massive fraud. Boyle's 1969 election was ultimately overturned by federal intervention, and he was later convicted of ordering the murder of Yablonski.

Origins: Militancy, Despotism, Crisis

The roots of the MFD, and the insurgency from which it grew, lie in the legendary yet contradictory career of John L. Lewis, who headed the UMWA for four decades, ending in 1960. Alongside his legacy as standard-bearer of the early CIO, for which the actions of militant UMWA miners prepared the path, stands a more complex and conservative Lewis. He supported, even demanded, modernization and corporate consolidation of the historically fragmented and competitive coal industry, with collective bargaining as the price. The mixed results included the unionization of large mines under even larger corporations, with historic gains for coal miners. Among those gains were, post-World War II, the pioneering UMWA Health and Retirement Funds, won by militant strikes, with a network of clinics and hospitals in the underserved Appalachian coalfields.

Modernization, along with competition from other fuels, also resulted in massive job loss from 1950 to 1970, leaving Appalachia's coal-dependent economy in a devastating crisis, and the UMWA weakened. Lewis's project was incomplete, since a cost-cutting sector of mostly nonunion, small mines remained, especially in eastern Kentucky and Tennessee. Lewis ran the UMWA itself as both a dictatorship, gradually removing district autonomy, and in some respects, as a business enterprise, with growing cronyism in the 1950s.

Boyle, a UMWA functionary, soon stepped into the magisterial Lewis's ill-fitting shoes. He took to greater lengths the suppression of internal democracy and the corruption, which extended to the cherished Health and Retirement Funds. Sweetheart deals with

operators signaled Boyle's retreat from the redeeming elements of militant struggle.

Challenge from Below

As the 1960s began union miners faced economic insecurity and life-threatening health and safety problems. They were further stymied by near absence of district autonomy, by "bogus" locals of retirees under the national leadership's thumb, and then by violence and intimidation at the 1964 UMWA convention. Without access to leaders or voting rights on contracts, insurgent miners tapped into both their militant traditions of direct workplace action and the democratic spirit of rebellion in the 1960s.

Wildcat strikes grew throughout the eastern coalfields. Miners from eastern Kentucky creatively deployed roving pickets. Local and district electoral challenges were mounted in Pennsylvania's District 5 and Ohio's District 6. The Disabled Miners and Widows of Southern West Virginia challenged inequities of the Health and Retirement Funds, with both direct and legal actions, and the Black Lung Associations (BLAs), won unprecedented federal legislation in 1969, aimed at workplace health and safety.

Forging Unity

The diverse rank-and-file movement began to coalesce around Yablonski's 1969 campaign. Yablonski was a veteran UMWA leader from Pennsylvania's District 5, among the few areas where district autonomy had survived. Although he had long ceased to be an active miner and had in fact been part of Boyle's machine, Yablonski had an easy rapport with miners. Moreover during his brief time as a reform leader, he seemed to grasp the historical moment that had arrived. He understood the issues facing miners and connected the demands for union democracy with substantive issues from black lung and mine safety to problems of poor services in coal field communities and in a visceral way, to national political issues.

Perhaps not surprisingly, the MFD, in carrying the fight to victory, tended to see unity overwhelmingly in terms of wresting power from the Boyle clique. However the potential of the coalition to connect the many demands of the rank-and-file movement, which involved sharp conflict with the coal operators as well as with Boyle, was partly lost.

MFD's Base

By the early 1970s, the contours of the rank-and-file coal miners' upsurge had formed around a cross-generational alliance. Many young miners were entering the industry as it began to recover from its long slump. Impatient with conditions, without ties to the old guard's patronage and intimidation, they formed a receptive base for the MFD, especially in larger unionized mines. Older, often disabled miners had taken initiative in forming the militant Disabled Miners and Widows group, and the BLAs. African-Americans, such as Robert Payne, Charles Brooks, and Bill Worthington, and women, such as Helen Powell, Anise Floyd, and Sara Kaznoski (widow of a miner killed in the infamous Mannington disaster) played important roles, though they were little known to the media.

Such organizations and leaders sparked wildcat strikes on broad health, safety, and pension issues that gave the movement much of its momentum, and they often made connections to community-based and poor peoples' struggles. Most of these "movement soldiers," notably the African-Americans, were not brought into the leading core of the MFD, which points to the nature and limitations of MFD unity. Boyle's strongest base was among another set of older and retired miners who were susceptible to his influence and control, especially at smaller mines and in areas where the union was relatively weak.

Legal and Electoral Victories; the End of MFD

The MFD's legal arm, led by Yablonski's sons, Ken and "Chip" Yablonski, and other attorneys, secured the intervention of the Justice Department and the judiciary, which previously had ignored the Yablonski campaign's complaints. They won court-ordered restoration of district autonomy (which signaled the end of dictatorial control), the overturning of the 1969 election, and federal oversight of the resulting 1972 election. Three miners headed the MFD ticket, chosen at a 1972 convention that was attended by over 400 activist delegates. Arnold Miller, West Virginia BLA president, ran for UMWA president. Mike Trbovich, MFD vice-presidential candidate from Pennsylvania, had chaired Yablonski's campaign. Harry Patrick, from northern West Virginia, had become the self-styled spokesman for younger miners and ran for secretary-treasurer.

The campaign tapped into networks built by the grassroots movement, for example, through rank-and-file publications, such as the *Black Lung Bulletin* that Miller had started. It was estimated that the three candidates visited 400 bathhouses and talked to 60,000 miners. The MFD ticket won, capturing 55% of the 127,000 votes cast. That margin, while impressive, revealed also a significant residual base of support for the old guard and perhaps a mistrust of the MFD attorneys and other outsiders against whom Boyle endlessly railed.

Following victory the MFD withered. Apparently swayed by old fears regarding dual unionism, the top MFD leaders made no secret before the election of their belief that once Miller was elected, the MFD would be redundant, since “we will have democracy.” Miller would have even preferred the abandonment of the BLA, which survived thanks to the determination of Worthington. Among the MFD’s leading core, only Patrick mourned its passing, but rank-and-file objections were heard. In District 5 and West Virginia’s District 17, candidates kept the MFD apparatus and name alive in the 1973 elections, brought about by democratization, for district officers and the International Executive Board (IEB). The planned demise of MFD may have contributed to the winning of several IEB seats by Boyle supporters, which was to be one source of the Miller administration’s many problems. The profound structural reform of the UMWA is a post-MFD story.

Politically the last direct traces of the MFD disappeared (late 1970s) when the Miller-Trbovich-Patrick troika split into hostile factions, none of which retained power. Although Miller was a sincere reforming champion of coal miners, his gradual isolation from the continuing 1970s rank-and-file ferment helped to limit the movement’s accomplishments in that era. Whether preserving the MFD would have by itself made a difference is uncertain given the organization’s own limitations.

Nonetheless MFD’s accomplishments in its short history were considerable. The MFD’s stirring grassroots victory over Boyle rescued the nation’s longest surviving industrial union, and UMWA militancy lived to fight again. The celebrated 1989 Pittston strike, under the presidency of the young and dynamic Richard Trumka, with its direct action and appeal to communities and progressive networks, is in part a tribute to the legacy of the MFD and the movement from which it grew. The MFD can also be credited with helping to inspire rank-and-file activism elsewhere, for example among Teamsters and Steel Workers. Thus the MFD is linked to successful reform of the UMWA and to a post-1960s history of

workers fighting uphill battles to revitalize the labor movement from below as the economic retrenchment that first struck the coal industry spread throughout the economy.

MINIMUM-WAGE LAWS

Labor reformers began to call for a legal minimum wage in United States in the late nineteenth century, arguing that those persons forced to sell their labor for a wage should be paid fairly for their work. Workers called for a “living wage,” which was understood at that time to mean a familywage—an amount necessary for a male worker to support a wife and children at home. These demands grew into an effort to institute minimum-wage laws. As these were passed, the courts limited their coverage to women and children, framing them as protective legislation for the most vulnerable workers. Despite the gendered connotations of the term and legislations, many women were among the leaders of the early fight for wage

standards. The first state minimum wages were passed from 1912–1923, but by the 1930s, due to new court rulings and shifts in the strategy of female reformers and the labor movement, states and eventually the federal government passed minimum wages for most workers, male and female.

In 1938, the federal government ratified the first national minimum-wage law, called the Fair Labor Standards Act (FLSA). In addition to setting a minimum hourly wage, it also required employers to pay workers working more than 40 hours per week overtime pay of time-and-a-half (this provision was amended significantly in 2004). The FLSA obviously had broader coverage than the patchwork of state minimum-wage laws, but it still included major coverage exemptions, such as domestic and agricultural workers. These exemptions particularly affected African-American workers, who were disproportionately represented in the exempted industries. The FLSA established a federal minimum wage of 25 cents an hour, to be raised to 40 cents by 1945. The law did not establish a formula for determining the wage level, and the wage was not indexed to inflation. This meant that future revisions were left up to congressional action. Over the years Congress revised the FLSA several times to raise the wage. Revisions also broadened coverage to retail establishments in 1961; to hospitals, nursing homes, schools and colleges, and laundries in 1966; and to domestic, and state and local government workers in 1974.

In the early twenty-first century, the minimum wage covers four specific categories. These include firms that have at least two employees and that do at least \$500,000 per year in business; government agencies, schools and preschools, and hospitals and businesses providing medical or nursing care for residents; individuals not covered in the first two categories but whose work regularly involves them in interstate commerce (for example, producing goods that will cross state lines); and domestic workers.

Several states have set state minimum-wage rates higher than the federal level at different times since the passage of the FLSA. As of 2004, 12 states had rates higher than the federal, ranging from \$5.50 in Illinois to \$7.16 in Washington. Only Washington state has a minimum wage that is indexed to inflation (Alaska passed but later repealed a law requiring indexing). Seven states, all in the south, have no state minimum wage. Two states—Ohio and Kansas—have state rates lower than the federal, although this affects only those workers not covered by the federal minimum wage.

The real value of the minimum wage (the value adjusted for inflation) rose relatively consistently from its enactment in 1938 to 1968, but it has fallen on average since then. By the end of the 1980s, the real value of the minimum wage was \$4.50 per hour (in 1999 dollars), the lowest it had been since 1955. By 2000, the real value had climbed slightly but was still far below its 1968 peak value.

As part of the national living-wage movement, local coalitions began efforts to pass citywide minimum wage laws in the late 1990s, searching for other ways to raise minimum wages besides waiting for a federal increase. (Before then only the District of Columbia had a citywide minimum wage, set at \$1 above the federal minimum.) As of 2004, Santa Fe, New Mexico; San Francisco, California; and Madison, Wisconsin had established citywide minimum wages ranging from \$5.70 in Madison (set to increase to \$7.75 plus indexing in 2008), to \$8.50 per hour plus indexing in Santa Fe and San Francisco.

The value of the minimum wage and the types of workers covered have always been hotly contested. Despite steady public support for regular increases to the federal minimum wage, employer lobbyists, particularly from such low-wage industries as restaurants and hotels, have been vociferous opponents. The issue has also been regularly debated among academics. While mainstream neoclassical economic theory predicts that an increase in the minimum wage leads to reduced employment, economists David Card and Alan Krueger gained attention in the 1990s with their research examining the real impact of minimum-wage increases in several cases. For example they compared fast-food restaurants on the New Jersey–Pennsylvania border after New Jersey raised its state minimum wage from \$4.25 to \$5.05 in 1992. Contrary to the conventional wisdom among neoclassical economists, Card and Krueger found that employers did not automatically reduce employment. Rather their findings suggest that several factors came together to pay the higher wage. First the fast-food restaurants were able to raise prices by a small amount. Second employers found that with the higher wage, they had higher productivity—perhaps due to lower turnover and absenteeism. These factors can allow employers to cover a higher minimum wage without reducing employment. However other economists, such as David Neumark and William Wascher, continue to challenge Card’s and Krueger’s findings, and there is no consensus within the field as to the merits of a minimum-wage increase. Even if political forces align to pass another increase to the federal minimum

wage soon, the lack of indexing assures the issue will remain on the agenda in years to come.

MINING, COAL

Coal is a fossil fuel that has been mined by working people, slave and free, in the United States since the colonial period. The labor of coal miners initially centered in the Appalachians and the Midwest provided the raw materials for heating homes, running the railroads, making steel, and keeping factories humming. Severe threats to miners’ lives and limbs, as well as economic hardships, were a regular feature of life for coal miners and their families. In response to these shared conditions, coal miners pioneered socially conscious industrial unionism. Coal mining became increasingly mechanized through the twentieth century. As a result employment of coal miners has dropped dramatically since its historic peak during the World War I era of more than 700,000 to some 74,000 today, though production of coal has doubled to over one billion tons annually.

Early Coal Mining Industry

The first recorded observation of coal by a European in what became the United States appears in the 1679 journal of Belgian-born missionary Louis Hennepin, who traveled with La Salle and noted deposits of coal on the Illinois River near modern-day Ottawa, Illinois. But long before Illinois coal miners were to begin digging in the early 1800s, colonists had discovered coal far to the east, and the coalfields of Richmond, Virginia, formed the first U.S. coal-mining region in the early 1700s. Early miners included European immigrant farmers who mined coal to use or sell to blacksmiths, as well as enslaved Africans, who were leased to owners of coal lands. Coal was discovered in western Virginia in 1742. By the early 1800s, mining in the Kanawha valley employed large numbers of enslaved workers, who mined coal for the booming salt industry of that region. Some slave owners who contracted out to the salt industry requested their slaves not be placed in the mines, so as to protect their investment in human chattel. In the United States as a whole in 1840, there were some 6,800 mine workers who produced less than 2 million tons of coal.

High-carbon, nearly smokeless, extremely hard anthracite coal was available in a six-county area of eastern Pennsylvania—Carbon, Columbia, Lackawanna, Luzerne, Northumberland, and Schuylkill—but iron makers preferred charcoal, since anthracite was difficult to burn. In 1840, however, the development of the hot-blast method for smelting iron, which successfully burned anthracite, boosted the value of hard coal. By 1853, anthracite miners brought up some 11 million tons, and until the 1860s, their region produced more coal than all other regions combined, which included bituminous or soft coal fields in Ohio, Indiana, Illinois, western Pennsylvania, Maryland, and Virginia. The baking of coal into coke as a fuel for the steel industry also expanded, with an annual production of three million tons by 1880, centered in the Connellsville region of southwestern Pennsylvania.

The spread of industry and railroads westward opened up new fields for soft-coal mining. In Illinois the completion of the Illinois Central in 1855 spurred coal development, and by 1879, the state’s miners had dug over 2.6 million tons. By 1907, the state was second only to Pennsylvania in coal production. Similarly in southern West Virginia, where Kanawha County operators had sent coal to their commercial customers down the Ohio River on flatboat, the arrival of the railroads in the 1800s transformed the industry. West Virginia coal production increased from a mere 489,000 tons in 1867 to over 89 million tons by 1917.

West of the Mississippi, in the Colorado and Wyoming coalfields, the Union Pacific, the Atchison, Topeka, and Santa Fe, and other companies wrangled over coal lands and employed miners in towns like Crested Butte, Colorado, and Rock Springs, Wyoming.

Mining Work: The Hand-Loading Era

Underground coalmines came in three basic varieties: Drifts, slopes, and shafts. Drifts were dug straight into a coal vein that was visible in the side of a hill or bluff. Slopes were dug on a gradual downward slant from ground level. Shafts were dug straight down, hundreds of feet in depth. Regardless of how miners entered the mine, the most common approach to getting coal out was the room-and-pillar method, still widely in use today. The mine was organized around a central transport tunnel called the main entry. Branching off from the main entry at right angles was a series of side entries. As one proceeded down a side entry along which coal was hauled, smaller tunnels branched off at right angles, like side streets, at regular intervals. Walking down one of these side streets, some 15–35 feet wide, depending on the quality of the coal, one sooner or later would confront a solid wall of coal, the “working face.” The side street, up to 400 feet long when the coal is fully mined or worked out was the room in which the miner worked. Along the side walls or ribs of the room, at periodic intervals, were cross-cuts. These were relatively narrow openings, equivalent to alleys between the side streets, which led to the adjoining room. The cross-cuts allowed the air to circulate up through each working room to the face and enabled miners to pass easily between rooms. Between two cross-cuts, stood a four-sided block of coal, the pillar, which served to hold up the roof of the mine. Coal veins varied in thickness from 2–25 feet. Lying both above and below the vein were layers of dirt, soapstone, and slate, which formed the bottom and roof of the mine.

The distinguishing characteristic of the early slope and drift mines was the multiplicity of roles taken on by the pick miner. On a typical workday, mine cap on and carbide lamp lit, he walked into the mine on his own power and headed toward his entry. As he arrived at his room, he surveyed the scene. There stood wooden mine props he had capped and pushed into place to support the roof. Next to the right rib sat his hand-cranked auger drill alongside a keg of black blasting powder, which he used to “shoot” the coal. Shooting involved drilling holes into the face of the coal, filling them with explosive, setting the fuses correctly, and then lighting the charges. Next to the

left rib, he spied his pick, which he had used for 3 hours the previous afternoon undercutting the coal-face. At times lying on his side, he had carved out a 6-inch-high and six-foot-deep empty shelf, so that the coal had room to fall. A length of wooden coal car tracks ran up the center of the room toward the face; he had just added the last section after undercutting the previous day. Sprawling across the front of his room were 5 tons of freshly cut coal he had blasted before leaving work the evening before. All he needed now was an empty coal car, which if the mine were small enough, he would fetch himself, fill with chunks of coal, and push to the mine bottom, perhaps towed by his trusty mine dog.

Until the mid-twentieth century, coal miners were paid by the ton. This meant that when a miner had dug enough coal for his own tastes, he put down his tools, walked out of his room and went home for the day. This miner’s freedom was the envy of many workers who labored under factory discipline and the bane of many a mine manager’s existence. The character of the pick miner as an independent contractor selling his services and product to the mine owner could also encourage divisions with other mine workers who were not, properly speaking, miners. In the anthracite fields in particular, it was common for pick miners to hire laborers as subcontractors. The nineteenth-century conception of the miner as an independent skilled artisan helps explain why early mining union leaders, such as Illinois’s Daniel Weaver, became small mine owners and did not see a conflict between their status as workers and businessmen.

As the nineteenth century progressed, the pick miner was joined by a growing army of mine workers, called company men, who were paid by the day. Trappers—often young boys—secured the doors. In anthracite boys also worked picking slate out of the coal in the aboveground breaker. Timbermen, mule drivers, and later locomotive motormen also took their place in the mines. With the introduction of shaft mining, a “cager” took charge of loading and unloading coal and miners between the bottom and the surface. A variety of general bottom laborers cleared coal and slate from the tracks, brought supplies to miners, built wooden “brattices” that kept the air course running correctly, and performed other needed tasks. With the proliferation of deeper and larger shaft mines in the late nineteenth century, the hoisting engineer became a regular addition to the mine along with the pumpman, who managed the process of forcing water hundreds of feet upward to the surface. Mine workers with a specialty in laying iron and then steel track were hired as tracklayers. They not only laid track on the entries, but gradually took over from the pick miner the laying of track in individual rooms.

While the pick miner held a special place in the more primitive mines, the development of new undercutting technology in the 1870s and 1880s began to eat away at the centrality of the miner's craft skills by providing a mechanical substitute for the miner's pick. Initial designs included a rotating cutter bar armed with steel teeth as well as a long cylindrical punch machine that repeatedly struck the coal like a jackhammer; both models were powered by compressed air. The preferred technology became the electric-powered chain undercutter, first sold in 1893, which worked like a wide chainsaw ripping into the bottom of the coalface. No longer did a miner need to be skilled with the pick—the machine did it for him. The widespread adoption of the undercutting machine heralded the entrance of a new brand of worker into the coalmines: The loader. Depending on the degree of mechanization and specialization in the mine, many loaders continued to timber their working places, lay rail, and set shots. Increasingly though loaders, who were often new immigrants from southern and eastern Europe and in the western mines, from China and Japan, spent their time on one task—shoveling coal.

In addition to facing the challenges of mechanization, coal miners, coal loaders, and mine laborers all had to contend with chronic underemployment. From 1913 to 1918 (a span that includes 2 years of economic depression as well as the war boom), the national average of coal-mining days worked was 206.5, or two-thirds of a possible 312. But this average conceals wide swings in employment over time. In Illinois for instance, in the year ending February 1919, mines worked an average of 256 days. But for the year ending June 30, 1924, the average dropped to 140. In local mines that produced fuel for home heating, miners were often laid off starting April 1. In shipping mines that sold to manufacturing companies and railroads, a number of factors limited regular work. The chaotic railroad system often left mines without cars to pick up coal, and the intense competition between mining companies operating at low margins meant that mines often shut down for lack of customers. At the same time, mines had to retain a skeleton workforce to maintain the mine physically and keep it safe, which encouraged overproduction, lowered coal prices, and created pressure to lower tonnage and day rates.

Coal Mining Hazards

From 1839 to 2006, there were 614 coalmine disasters killing five or more workers, totaling 13,805 deaths.

But the number of injuries was always far higher. During the 1930s, for instance, coal miners averaged annually 1,500 deaths and about 81,000 injuries. The dangers of coal mining stemmed from four main sources, described by miners as bad air, bad top, bad roads, bad shots. In the period following the Civil War, many relatively shallow mines were still ventilated by the natural method—that is, particularly in colder weather, the warmer air underground rose, pulling the colder air down the shaft and through the workings. Mine operators also commonly installed a furnace at the foot of the shaft, which had a similar drawing effect (and also tended to start mine fires, such as the landmark Avondale disaster that killed 110 miners in Plymouth, Pennsylvania, in 1869). Increasingly though as mines got deeper and miners demanded higher standards, coal companies installed large electrically powered drawing fans, which pulled the air through an intricate maze of entries, crosscuts, and doorways to provide air for every working area of the mine. Miners were particularly wary of methane gas, or “fire damp,” which is naturally emitted by coal, is colorless and odorless, hangs near the roof of the mine, and is highly explosive. Methane buildup caused many explosions, such as the Wadge mining disaster of 1942 in Mount Harris, Colorado, that killed 34.

Less dramatic but possibly even more deadly were a variety of gases that conspired to rob miners of their health over time. The primary two were black damp or choke damp (carbon dioxide), produced by burning black powder and given off by all organic matter, living and dead, underground; and white damp (carbon monoxide), produced mainly by powder explosions and fires. Odorless, colorless, and normally mixed in with healthy air, these two invisible poisons were slow and insidious underground killers. Coal dust as well posed a danger to the lives of mineworkers. Nearly every activity in the mine stirred up dust, from moving along the haulage ways by foot, car, or mule to undercutting, blasting, and loading coal. Not only did coal dust magnify the destructive effect of a gas explosion, but it killed miners “by the inches.” As late as the 1930s, while medical authorities had realized the dangers of silica dust, they failed to recognize the negative effects of plain coal dust on miners' health. Miner's asthma was not recognized by the federal government as pneumoconiosis, or black lung disease, until the 1960s, although doctors in the United States and England had identified the disease in the nineteenth century.

Roof falls, or bad top, killed more miners than any other mining hazard. A study of Illinois miners found that in 1916, for example, 63% of the mine deaths and 38% of the injuries in one region resulted from some

type of roof fall. Most of these incidents occurred in the miner's or loader's room. When coal companies were sued in court for injuries or death caused by bad top, they often claimed that the miner's inattention and irresponsibility had resulted in his death. In some cases miners had not taken full precaution in setting roof props, but one main reason for this was the piece-rate system of payment and miners' intermittent employment—if miners took more time to set props, they might miss the chance to load enough coal for the few days they were working.

Work on the haulage roads could also be a source of considerable anxiety. Rotten railroad ties, sagging rails, falling coal, failing entry props, lingering smoke from shooting coal, and above all, piled up coal-dust on the roads could make for treacherous conditions. The coal debris—known as “gob”—beside the tracks made walking hazardous. Mine managers did routinely order dusty entries sprinkled and cleaned, but state laws generally gave them wide legal latitude in deciding on the frequency of sprinkling.

Finally especially in mines where miners shot their coal “off the solid”—meaning it was not undercut, and they used extra powder to get the coal down—there was always the chance of a blown-out or “windy” shot, in which the deadly force of the explosion was directed outward into the room rather than into the block of coal. Such a mishap, perhaps combined with coal dust, is believed to be the cause of the worst mining disaster in U.S. history, the Monongah, West Virginia, explosion of 1907 that took the lives of 362 miners.

The Evolution of Coal-Mining Unionism

Anthracite miners pioneered the first short-lived union in the Schuylkill region in 1848–1849, when miner John Bates mobilized some 5,000 miners to fight for pay increases. Within another decade the first attempts at a national union of coal miners took root in the Midwest. Founded by British-born miners and former Chartists, Daniel Weaver and Thomas Lloyd, the American Miners' Association (AMA) emerged in the course of a successful 1861 strike in St. Clair County, Illinois. Strikers targeted mine operators who shortchanged miners on the true weight of coal they dug by claiming it was intermixed with too much slate. In response the AMA, and later unions, demanded that operators allow for a union check-weigh man, who would ensure that miners' daily tonnage was accurately weighed. Miners from Ohio, Pennsylvania, Maryland, and West Virginia joined Weaver and Lloyd in establishing the AMA,

which lasted until the economic depression of 1867 depleted its membership. As midwestern coal miners began to recover from the initial blows of the postwar economic depression, they formed in 1872 the Miners' Benevolent and Protective Association, which encompassed coal diggers from Illinois, Indiana, and Missouri. With a proven record of leadership ability and 23 years in the mines, Walton Rutledge was chosen first secretary, serving for 2 years until the organization became part of the Miners' National Association (MNA), established in 1874.

Meanwhile in 1868, led by Irish-born John Siney from St. Clair, Pennsylvania, in Schuylkill County, the anthracite miners struck to enforce a new 8-hour law. They then formed the Workingmen's Benevolent Association (WBA), which promoted cooperatives, sick and death benefits, trade agreements with employers, and arbitration of disputes. In 1870, its members signed the first written contract with coal operators. The price was the sliding scale of wages pegged to the price of coal. Strikes, in the WBA's view, were primarily for restricting the supply of coal to raise its price on the market, hence allowing employers to raise wages. This conception of the harmony of interest between coal miners and their employers, based on the model provided by famed unionist Alexander McDonald of the Scottish miners, would die hard, although the WBA lasted only until 1875. It was a casualty of the Panic of 1873 but also of an anti-union campaign unleashed by Franklin B. Gowen of the Reading Railroad, who bought up Schuylkill coal lands, lowered wages, and offered a benefit plan for miners to undercut the WBA. Gowen then collaborated with Allan Pinkerton to combat the Molly Maguires, whose brand of retributive justice Gowen linked in the minds of many with the cause of coal unionism.

For the next 15 years, a succession of national unions, none lasting more than a few years, followed the WBA. The MNA had limited participation from anthracite miners, though Siney served as its president and the group had 35,000 members spread across 12 states by 1875. But legal attacks on Siney and other leaders, as well as conflicts within the MNA over the utility of arbitration, severely weakened the group by 1876. Coal miners were also a large part of the Knights of Labor (KOL), often in mixed assemblies that contained a variety of types of workers, and sometimes in local trade assemblies of miners only. Complaints from coal miners about this situation led the KOL to establish National Trade Assembly (NTA) No. 135 in 1886. But just before the KOL acted, in 1885 prominent mining unionists John McBride, Chris Evans, and Daniel McLaughlin led the formation of the National Federation of Miners

and Mine Laborers. The federation called for the 8-hour day, state laws for miners' health and safety, an end to convict mining, mine run of coal (which meant miners were paid for the full weight of coal mined before it was run over screens), and an end to company stores. That year the federation's representatives from Illinois, Indiana, Ohio, and Pennsylvania—the Central Competitive Field (CCF)—met in Columbus, Ohio, with a group of coal operators and for the first time agreed on an interstate scale of wages. In 1888, some elements of NTA No. 135 left the KOL and merged with the federation to create the National Progressive Union of Miners and Mine Laborers (NPU). Formal rivalry with the KOL finally ended on January 22, 1890, in Columbus, Ohio, when 198 delegates of the NPU and NTA No. 135 joined together to form the United Mine Workers of America (UMWA).

The constitution of the new union set forth the UMWA's objectives: To secure decent earnings, to do away with payment in scrip to company stores, to advance mine safety, to win the 8-hour day, to obtain education for miners' children, to enact laws protecting miners' health and safety, and to adjust differences with employers peacefully, so that strikes would become unnecessary. A national coal strike in 1897 finally brought CCF operators and the UMWA agreement in 1898 on a union scale, the 8-hour day, and mine run of coal. While the agreement left out West Virginia, the anthracite miners, and miners in the South and West, it was a milestone for the new miners' union.

Mechanization of Mining

As the fledgling union began to flex its muscles and organize miners into a solid mass, coal operators were steadily mechanizing the mines. Undercutting machines were just the first step, as companies such as the Jeffrey Manufacturing Company and later, Joseph Joy and his Joy Machine Company, began to build and sell mechanical loaders. Joy's 4BU loader debuted in 1922 and was used mainly in non-union mines at first, given well-grounded expectation of opposition from UMWA members. The loader operated by means of rotating scooping arms that gathered the blasted coal onto a conveyer that carried the coal onto a shuttle.

As coal production plunged after World War I, UMWA President John L. Lewis championed the idea that there were too many mines and too many miners. A consolidation of the industry, with a higher degree of mechanization, would create long-term stable employment for the nation's miners. Indeed by 1948,

nearly two-thirds of all coal in the United States was mechanically loaded and 90% was mechanically undercut. All that remained to mechanize was the removal of coal still done by blasting. Jeffrey already had developed an entry driver, a machine that would cut through coal to create tunnels in the mine. The next step was the continuous miner, introduced in the late 1940s, which used a rotating drum equipped with steel teeth for cutting bits. By the early twenty-first century, the latest versions could mine coal at the rate of 38 tons a minute. Setting props was also mechanized by the introduction of machines that drill steel bolts into the mine roof. Not only were roof bolts safer, but they allowed mechanical loaders and continuous miners to move more freely through the mine.

Despite the overall decline in death and injury in the mines during the twentieth century, machinery introduced new dangers. From 1929 to 1944, for instance, explosions caused by electricity were responsible for the majority of mining deaths. Loading and mining machines kicked up a great amount of dust. And the huge capital outlay for loading machines put pressure to speed up production, to use more blasting powder to create more loadable coal, and to shoot coal with men in the mines. All of these combined to create the Centralia, Illinois, mine disaster of 1947 that killed 111 men.

The UMWA and the Changing Demographics of Coal Mining

Coal miners in the pre-Civil War era were overwhelmingly drawn from England, Wales, and Scotland. After the Civil War, they were joined by those of Irish and German extraction. As mechanical undercutters entered the mines, miners from southern and eastern Europe joined the mine workforce. In the West Union Pacific Railroad hired Chinese- and then Japanese-born coal miners in Wyoming. The early generations of miners often resented the new immigrant coal loaders, whom they viewed as interlopers, and in Rock Springs, Wyoming, in 1885 KOL miners rioted against Chinese miners, killing 28 and wounding 15. On the other hand, by 1907 in Rock Springs, Japanese miners became part of the UMWA local. Similarly starting in 1918, District 12 of the UMWA, covering the state of Illinois, printed its union constitution in English, Serbo-Croatian, Polish, Lithuanian, Italian, and French. And not surprisingly, in newly unionizing sections of the Pennsylvania coalfields, such as Windber in the 1920s, Slovak and Hungarian miners flocked into the leadership of the union. Unionized Mexican-born miners worked in the

mines of the Rocky Mountains and the southwest. A central leader of the Colorado miners was Louis Tikas, a Greek immigrant who was martyred in the Ludlow Massacre of 1914.

Negotiating the terrain of Jim Crow segregation was perhaps more difficult, and the extent to which the UMWA succeeded has been vigorously debated by historians. African-Americans were among the nation's first coal miners in the Chesapeake. After the Civil War, they continued to work privately owned mines in Tennessee and Alabama, hired out by prison officials to mine owners as convict laborers. A rebellion by black and white free miners in Tennessee helped put an end to private convict mine labor by 1896. At the same time, African-American miners also labored as free workers in the Alabama mines, where they formed over half of unionized miners by 1902, though they met in segregated locals. Similarly in West Virginia, black miners were roughly one-quarter of the coal-mining workforce in southern West Virginia in 1910, and by 1931 in some counties they made up one-third of the total.

While the image of coal mining as an exclusively male occupation persists today, female coal miners had toiled in British mines for centuries until forced out by an act of Parliament in 1842. Though they were kept out of American mines by custom, law, and union opposition, women did work sporadically in U.S. mines as part of a family labor system, primarily in small mines leased by coal miners in the Appalachian region. During World War II, the employment of women increased, as they took above-ground jobs working in mine shops and tipples. In the early 1970s, under the impact of the women's movement, affirmative action in the steel industry, which owned captive mines, and a spurt of new hiring due to the oil crisis, women were hired to work underground. They formed the Coal Employment Project in 1977 to advocate for women facing discrimination and sexual harassment from mine managers and male coal miners. By 1979, nearly 3,000 women had been hired as underground miners, mainly in West Virginia, Pennsylvania, Illinois, and Alabama. The UMWA women were coldly received by the international union leadership, but with the election of Richard Trumka as international UMWA president in 1982, they began to receive more official support.

Coal Mining and the Government

As early as 1870, reacting to the horrors of the Avondale disaster, Ohio miners proposed legislation regulating the mines. An act passed in 1874 provided for

two separate openings in mines employing over 10 miners, specified the volume of air to circulate in the mines, required daily inspection before work by a fire boss or fire viewer, gave miners the right to appoint a check-weigh man at the mine, and mandated the appointment of mine inspectors to enforce the law. With the help of Illinois miners' leader Daniel McLaughlin, later elected to the state general assembly on the Greenback-Labor ticket, Illinois passed a similar mining law in 1872. Other coal-mining states followed in rapid succession, though coal operators strenuously opposed legal regulation. Passage of laws did not guarantee enforcement however, and mine inspector services were generally underfunded and understaffed, with West Virginia the worst and Ohio the best.

Federal regulation began with an 1891 act of the U.S. Congress that regulated coalmines only in federal territories. Revisions in the early 1900s provided for specialized shot firers to shoot coal when miners were out of the mine and for watering down or removal of coal dust. As of 1902, the law applied only to mines in Indian Territory (Oklahoma) and New Mexico Territory employing 20 or more miners. Popular outrage over the Monongah disaster and the Cherry, Illinois, mine fire of 1909 that killed 259 miners helped propel Congress to create the U.S. Bureau of Mines in the Department of the Interior in 1910. Even though the bureau established mine-safety stations in the coalfields, conducted research on coal dust, and promoted rock dusting, now standard practice in underground mines, its dual commitment to boosting the mining industry and protecting miners limited its effectiveness.

Federal government involvement in the coal-mining industry expanded in 1902 when President Theodore Roosevelt personally intervened to mediate a strike by coal miners against the Pennsylvania anthracite operators. While only a third of the 150,000 anthracite miners belonged to the UMWA, nearly all the miners walked out over a range of issues including tonnage and daily pay rates and disputes over weighing of coal. The UMWA International President John Mitchell publicly faced off against Reading Railroad President and coal operator George Baer, whose J. P. Morgan-controlled company owned many mines in the anthracite region. After 6 months on strike, as operators refused to budge, miners refused to return to work, and cold weather was approaching, Roosevelt called representatives of the miners and operators to the White House for a historic meeting. While the deadlock remained, pressure from Roosevelt on J. P. Morgan, along with the continuing intransigence of the miners, resulted eventually in an agreement from miners and operators to submit their claims to an

arbitration board. Once the miners returned to work in October 1902, the Anthracite Coal Strike Commission, led by Roosevelt's Commissioner of Labor Carroll Wright, conducted 3 months of hearings involving over 500 witnesses. The outcome was a compromise on wages and hours and the establishment of an ongoing arbitration board to hear anthracite cases. While the UMWA was not recognized as a bargaining agent for the miners, Mitchell claimed victory, and some have viewed the settlement as a de facto recognition of the union. Though the anthracite miners were not solidly unionized by the UMWA for decades, the intervention of President Roosevelt is often seen to mark a progressive break in a long pattern of open federal strike breaking. The government was now in the mediation business, and a long series of federal coal commissions would follow.

It was not until 1941 that Congress empowered federal mine inspectors to enter mines in the states. In 1947, shortly after the Centralia, Illinois, disaster, Congress provided for the promulgation of a federal code of regulations on mine safety, Title 30 of the Code of Federal Regulations (30 CFR). Five years later, after the West Frankfort, Illinois, disaster that killed 119, Congress passed the Federal Coal Mine Safety Act. It provided for annual inspections of larger mines and gave the bureau the power to issue violation notices and imminent danger withdrawal orders. Civil penalties could be assessed against mine owners for violating such orders but none for violating safety provisions in the first place.

In 1966, the law was extended to cover all coal-mines. Under the impact of the Farmington, West Virginia, disaster in 1968, which killed 78, as well as grassroots pressure in West Virginia, powered by a broader Miners for Democracy movement against the Tony Boyle leadership of the union, Congress passed the Federal Coal Mine Health and Safety Act of 1969 (Coal Act). This law extended coverage to surface mines, required four inspections per year of every underground mine, initiated fines for company safety violations and criminal penalties for willful violations. It also for the first time provided compensation for miners with black lung. In 1973, the secretary of the interior created the Mining Enforcement and Safety Administration as a separate agency from the Bureau of Mines. Finally in 1977, Congress enacted the Federal Mine Safety and Health Act, establishing the Mine Safety and Health Administration (MSHA), which moved to the Department of Labor, enhancing miners' legal rights to report safety violations and consolidating all federal mining-safety regulations. In that year Congress also passed the Surface Mining Control and Reclamation Act. It resulted mainly

from concerns about the environmental impact of strip mining but also provided for federal regulation of coal-mining safety on federal land as well as on Indian reservations, where Navajo and Hopi people mine coal for Peabody Energy.

Coal Mining Today

Coal miners work today in 25 different states. The majority, some 41,000, still work underground and one-third of them are unionized. Workers in surface or strip mines are a growing minority of the mining workforce and only 22% belong to a union. They mine the majority of coal, which is mainly used to fuel electrical power plants. Though most coal is still mined east of the Mississippi, the top coal producing state today is Wyoming, including its Powder River Basin, where miners extract over one-third of all coal mined in the United States. Death and injury rates have fallen substantially. But the Sago Mine disaster in Tallmansville, West Virginia, in January 2006, killing 12 miners at a nonunion mine that had been cited for numerous serious safety violations by the MSHA, points to the challenges facing coal miners today.

MINING, HARDROCK

Hardrock mining—mining metals from ore-bearing rock—was practiced for centuries to glean copper, tin, and precious metals. The work processes and labor relationships of U.S. hardrock mining varied

over time and region and with the kind of ore being mined. Hardrock miners have been prominent in U.S. labor history for their militant industrial unions, for brutal confrontations with employers and the state, and for their leadership in founding the Western Federation of Miners (WFM), Western Labor Union (WLU), Industrial Workers of the World (IWW), and Congress of Industrial Organizations (CIO). This entry covers the California Gold Rush through the post-World War II period, concentrating primarily on the earlier decades.

Industrialization

From the 1848 discovery of gold at Sutter's Fort, a series of gold and silver rushes drew prospectors to the North American West. Small groups of placer miners panned or sluiced ore from California's streams and gravel beds and developed a system of law and custom that required work and occupation in good faith to own a claim. Placers were rapidly depleted, to be replaced by lode, or quartz, mining: Deep-shaft operations that removed the rock from which placer metals had eroded, in which the ore was not naturally separated but must later be milled or refined. Mining rapidly became an industrial enterprise requiring massive capital investment to sink shafts, purchase machinery, build railroads, and refine ore. Work and ownership became separate: Miners worked for wages; mines belonged to stockholders who neither worked nor occupied them.

Industrialization brought new demands for metals. Wisconsin's lead mines attracted an international workforce by the mid-nineteenth century, and steel production drove the development of the Minnesota iron range. By the late nineteenth century, a burgeoning electronics industry spurred copper mining in Arizona, Utah, Montana, and Michigan. Silver camps closed throughout the Rockies after the 1893 repeal of the Sherman Silver Purchase Act, but gold-based currency and new cyanide and chlorination processes for separating base from precious metals made it profitable to refine low-grade gold ores. The U.S. government closed silver and gold mines during World War II to divert labor to base metals. Then new atomic industries led to a postwar boom in uranium mining. By the late twentieth century, rising gold prices and new refining methods, like heap leach cyanide production, made it profitable to work low-grade ores and prompted an extension of open-pit mining from base metals to gold. Leadville, Colorado, represented in microcosm the trajectories of

hardrock development: A brief gold boom after 1858 was followed by extensive underground silver mining after 1876, and then in the twentieth century, by molybdenum for steel production.

Mining industrialization eroded some skills but demanded new ones to run hoists, set dynamite charges to break out the most ore and least waste rock, run tramming systems, and refine complex ores. Underground miners risked cave-ins and explosions. The dangers increased with dynamite, cyanide, power drills that spewed rock dust, inadequate timbering, improperly grounded electric hoists, and other technologies that increased both the profits and the hazards of hardrock mining. Mining communities have borne the environmental costs of heavy metals and dangerous chemicals in their soil and water tables.

Mining Workforces

The instabilities of an extractive industry—limited ore supplies, high recovery costs, and unstable markets—created boom-and-bust hardrock communities whose mobile workforces followed the changing fortunes of the industry. Hopes for wealth or decent wages drew diverse workers. The California gold rush attracted hopeful prospectors, particularly from the U.S. North and Midwest, Mexico, Chile, China, Ireland, Cornwall (UK), France, and Germany. Some doubtless dreamed of riches; they were pushed as well by drought, famine, revolution, factories that eroded artisans' skills and independence, and by worked-out mines where they had honed their skills. Subsequent booms and the pits and shafts of industrial mining attracted selectively diverse workforces. International migrations fed the processes of workforce and class formation that determined who worked underground for wages and who mined the short-lived placers; who sojourned in the diggings, and who stayed to labor.

After the gold rush, native-born Americans tended to move quickly and disproportionately out of mining, as industrial operations attracted more immigrants and skilled miners from eastern coal and lead mines. By 1870, in the industrial mining town of Grass Valley, California, only one workingman in four was a native-born American. While French gold seekers and New England craftsmen might sojourn briefly in the goldfields, the Irish potato famine, diminished Cornish tin reserves, famine and warfare in China's Guandong Province, and other dislocations propelled more permanent migrants, followed in the early twentieth century by more Slavs, Swedes, Finns, Italians, Japanese,

and Greeks. British miners came from Wales, from the Yorkshire coalfields, and especially from generations of Cornish miners who had dug tin, copper, and china clay. By the end of the nineteenth century, Cornwall lost at least a third of its population. Many migrated multiple times: To dig lead in Wisconsin, copper in Australia and Michigan, silver in Nevada or Idaho, gold in Colorado. Some Irish miners dug coal in Pennsylvania; their sons sought the relative safety and higher wages of hardrock.

The ethnic compositions of local workforces varied. Chain migrations might draw Cornish to Michigan's Upper Peninsula, Irish to Butte, Finns to Michigan and Minnesota. On Nevada's Comstock Lode, the Cornish and Irish each comprised a third of all miners. A majority of Idaho miners in 1870 were Chinese; almost half of the rest were immigrants. In 1900, Butte was 26% first- or second-generation Irish; in the Cripple Creek gold district, 70% of miners were native-born, but three in ten adults were second-generation immigrants.

Racial hierarchies and barriers divided the hardrock social landscapes. Ethnicity could operate positively for the Irish who worked in Marcus Daly's Butte mines, or for the Cornish, hired by foremen and shift bosses for whom Cornishness connoted skill regardless of actual experience. In contrast Mexicans, Chileans, and Chinese were run out of many hardrock centers and restricted to the placers. Subjected to a selectively enforced California Foreign Miners' Tax from 1852–1870, the Chinese were allowed underground only in deadly quicksilver mines. Comstock miners organized a Workingmen's Protective Union "to protect the interests of the white workingman against the encroachments of capital and Coolie labor." Miners supported enactment of the Chinese Exclusion Act of 1882 and led anti-Chinese riots throughout the West in 1885 and 1886.

A "white man's camp" was idealized throughout the hardrock West, but the meanings of whiteness varied. In Rossland, B.C., most gold miners came from Britain, the United States, or Canada and traced their ethnic origins to England, Scotland, Ireland, or Wales, but significant minorities of Swedes, Italians, and Germans also labored there. More Italians and Chinese lived in Rossland than in Colorado gold camps, but they faced heavy discrimination. In Utah native-born miners and immigrants from northern and western Europe tried to exclude Greeks, Japanese, and Mexican Americans from their WFM local. Italians and Finns mined in 1910. Ethnic tensions divided the Butte Irish and Cornish, and these old-timers from the newcomers. In 1912, 500 Finnish miners complained that the Butte Miners' Union refused to support Finnish members. In Arizona and New Mexico, a dual

labor system separated white workers from Mexicans and Mexican-Americans. In Colorado Mexicans, Italians, and Greeks worked in coal but not hardrock. The white man's camp of Cripple Creek excluded Mexicans, Asians, southern and eastern Europeans, but not African-Americans.

White men's camps enforced the local practices of racial exclusion and the assumptions of a mining industry that employed only men. Women were vastly outnumbered; California mining populations were 97% male in 1850. In Colorado a year after the Pike's Peak boom, women were outnumbered 17 to 1. But as the placers dwindled and quartz mining stabilized, the ratios became somewhat more balanced—in 1870, almost 4 Californians in 10 were female. By 1900, there were three men to each two women in the industrial mining centers of Cripple Creek and Butte. Placers and boomtowns attracted more young single men, while stable deep-shaft mining attracted older, experienced miners who married, bought homes, built schools, and organized.

Hardrock communities offered narrow options for women. As wives, mothers, and waged workers they supplied men's domestic needs, their social and sexual desires, cooking, cleaning, sewing, washing, and providing companionship for the male majority. Not until the 1970s did women join men underground, when enforcement of Title VII of the Civil Rights Act opened mining to a few women who often faced considerable male resistance.

Hardrock Unions

Hardrock miners organized to protect their health, their families, their wages, and their control of the workplace. The international migrations that brought experienced miners to North America brought with them histories of ethnic and racist antagonism but also the class analyses and organizing experience gained in the mines of Cornwall and Durham and all the underground workings where experienced miners taught younger men their mining skills and lore.

Miners' agendas and their calculus of success developed from what they had left and what they experienced in the rapidly industrializing U.S. mines. Keeping women out of the mines was an achievement for Cornishmen; keeping children in school was a huge gain for the sons of eastern coal miners. Women and boys worked underground in England until 1842, when the Mines and Collieries Act forbade the employment of boys under 10 and of all females in British mines, although "bal maidens" continued the arduous labor of breaking ore for little pay on the surface.

Hardrock miners organized their first U.S. union as Nevada's Comstock Lode industrialized, founding the Virginia City Miners' Protective Association on May 30, 1863. By the end of the decade, there were miners' locals in most of the major lode-mining centers, many formed by mobile Comstock miners who patterned their constitutions on the Comstock unions. The Working Men's Association of Butte was formed in 1878; it became the Gibraltar of unionism as Local No. 1 of the WFM. Leadville miners founded a Miners' Cooperative Union as a Knights of Labor Assembly in 1879, lost it in a bitter strike the following year, and then reorganized in 1885. By the early 1890s, miners had organized in most Colorado hardrock camps, many in Knights of Labor Assemblies that offered mutual aid and sometimes more militant resistance. Four Idaho locals formed the first association of hardrock unions in 1889, the Coeur d'Alenes Executive Miners' Union.

Confronting new technologies that eroded experienced miners' skills and the shared dangers of underground work, miners sought uniform minimum wages for all mine workers and organized industrial unions to match the growing power of an increasingly integrated mining industry. They based their organizing strategy on the mutual cooperation necessary for workers whose safety underground was interdependent and on a labor theory of value reinforced by the placer camp ethos that based ownership of wealth on the labor that produced it. The WFM's slogan was "Labor Produces All Wealth; Wealth Belongs to the Producer Thereof."

Hardrock unions fought often-defensive battles to resist wage cuts or stripping orders and to protect jobs and the right to organize. The first locals on the Comstock established a \$4 minimum daily wage for all mining labor. In 1883, southwestern Colorado mine owners formed the San Juan Miners' Association and broke the \$4 day in Telluride and Silverton. Coeur d'Alenes miners struck in 1892 to resist a wage cut from a uniform \$3.50 day to \$3 for miners and \$2.50 for surface workers. In 1894, Cripple Creek gold miners struck to maintain a \$3 day for 8 hours.

As mine owners organized to oppose their workers' demands, the miners' locals recognized the need for a central organization of their own. The Coeur d'Alenes Executive Miners' Union corresponded with unions in Montana, Colorado, and Idaho, and representatives of 15 local unions met in Butte on May 15, 1893, to form the Western Federation of Miners.

Known for its commitment to industrial unionism, its endorsements of the Socialist party, its role in founding the Western Labor Union in 1898 (which became the American Labor Union in 1902), and the

IWW in 1905 as alternatives to the conservative craft unionism of the American Federation of Labor (AFL), the WFM has engaged labor historians who debated the roots of its militancy and the violence of many hardrock strikes. The WFM won its first victory in the 1894 Cripple Creek strike, atypical because the state intervened to protect miners' rights and civil peace rather than mine owners' property. The WFM waged strikes in Leadville in 1896, the Coeur d'Alenes again in 1899, Telluride in 1901, throughout Colorado (including Telluride and Cripple Creek) in 1903–1904; in Goldfield, Nevada, in 1906–1907; Lead, South Dakota, in 1909; Calumet, Michigan, in 1913–1914; and Bisbee, Arizona, in 1917. Aptly called labor wars, the strikes often pitted unions, infiltrated by mine owners' detectives, against state force and organized mine owners. Yet the strikes were but one aspect of a union that provided health care, insurance, fellowship, and education for its members; that worked to extend union benefits to other workers; and that generated considerable internal debate about political and industrial strategies. It won a notable legal victory with a Supreme Court decision that legalized limiting hours of work underground.

The disastrous strike defeats in Colorado in 1903–1904 prompted the WFM to become the largest founding member of the IWW. In the 1904 strike aftermath, the Colorado legislature overturned the defeat of Governor James Peabody, who had sent troops to strike areas and used them to deport union leaders from the state, declaring him elected on condition that he relinquish the office to his lieutenant governor. This political manipulation led some miners to abandon politics in favor of industrial organization that might someday lead to workers' control of production. It convinced others to pursue political reform, and still others to continue to work for socialism.

The IWW seemed initially to offer an industrial alternative to the AFL; the WFM hoped that the United Mine Workers, who organized coal miners, might withdraw from the AFL and join the IWW, where the two miners' unions might merge. That did not happen, and political divisions within both the IWW and the WFM led the WFM to leave the IWW in 1908. Vainly pursuing a merger with the UMW, the WFM joined the AFL in 1912. In 1916, the union changed its name to reflect its industrywide jurisdiction and became the International Union of Mine, Mill, and Smelter Workers (Mine-Mill).

Like many unions, Mine-Mill lost members during the 1920s, and then regrouped as one of the nation's most militant industrial unions to help found the CIO

in 1936. Struggling with racist divisions, the WFM began organizing Mexicans, Japanese, Italians, and Greeks before World War I and continued after World War II to organize Mexican miners in New Mexico and Arizona, and African-American miners in the U.S. South. But in the Cold War backlash, Mine-Mill leaders and organizers were prosecuted for allegedly falsely signing the anti-Communist affidavits required under the Taft-Hartley Act. Mine-Mill was one of the unions expelled from the CIO for alleged Communist domination. Some union leaders had been Communist party members, a not-uncommon commitment during the 1930s and World War II. Some resigned their party memberships in order to be able to sign the Taft-Hartley affidavits. But the threat of the union in the 1940s and 1950s, as in the preceding decades, lay in the power to organize hardrock miners regardless of race or skill, not in an international Communist conspiracy.

One moving legacy of the postwar period was a film, *Salt of the Earth*, a cooperative production of blacklisted Hollywood filmmakers and Mine-Mill, based on the strike of Mine-Mill Local 890 against New Jersey Zinc in Bayard, New Mexico. Most of the actors were Mexican-American miners and their families whose stories powerfully linked the inseparable inequalities of race, class, and gender in hardrock mining.

Mine-Mill persisted throughout the 1950s and 1960s but lost ground to raids by other unions, particularly the United Steelworkers of America. Its support dwindled in the face of racist attacks, anti-communism, and new challenges from an internationally organized mining industry. Mine-Mill merged with the Steelworkers in 1967.

Labor historians have long debated the heritage of conflict in hardrock mining, locating its origins in frontier violence, the lack of a middle class, or the recklessness of an unstable and mobile workforce. Yet hardrock miners' strategies are more accurately located in the industrial conditions they faced and in histories of class-based cooperation. For most radicalism and reform were not opposed strategies. The most militant union leaders were married men who protected homes, families, and communities. Hardrock miners confronted conflict but wrote a heritage of industrial organizing and mutual protection and of an industrial landscape wrought from the metals they dug and refined. This heritage continues to be written from sources as complex and as rich as the changing workforces, work processes, and the ore-bearing rock itself.

MITCH, WILLIAM A. (1881–1974) President, United Mine Workers of America

William A. Mitch served as president of the United Mine Workers of America (UMWA) in Alabama for more than three decades, leading the organization back from a crushing defeat in the years after World War I and building District 20, as the southernmost

branch of the union is known, into one of its most solid strongholds. In the process he helped transform Birmingham into a center for industrial unionism, fighting to establish the United Steelworkers of America in the city's iron and steel mills and speaking out forcefully for the rights of African-American workers. Though he is best remembered for his efforts in the South, Mitch's union career actually began in Indiana, where he rose to prominence as an activist in the miners' union, supporting nationalization of the nation's coal industry and eventually becoming a close ally of legendary UMWA president John L. Lewis.

The Indiana Years

Mitch was born in Nelsonville, Ohio, in 1881, and he accompanied his father into the coalmines as a boy. He eventually settled in Indiana, where miners elected him secretary-treasurer of District 11 in 1915. Like many miners Mitch held socialist sympathies, and he unsuccessfully ran for Congress from the fifth district in 1920 as a member of the Labor party of Indiana. During the campaign Mitch garnered national attention for his denunciation of American Federation of Labor (AFL) President Samuel Gompers and his policy of supporting the friends of organized labor and opposing its enemies. Instead of supporting either Democratic or Republican candidates, as Gompers advocated, Mitch believed that workers should form their own party and use it to advance their interests. That same year Mitch helped deliver Indiana to John L. Lewis in the UMWA presidential election, cementing a political relationship between the two men that would last the rest of their lives.

In 1921, Lewis appointed Mitch to the union's Nationalization Research Committee, where he served with John Brophy, president of UMWA District 2, and Christ Golden, leader of District 9. Lewis, a conservative on economic matters, never fully supported nationalizing the coal industry, and though the concept had much support within the UMWA ranks, the union president merely used the issue to strengthen his control over the union. He and his supporters criticized the committee as a tool of union outsiders—"a bunch of Greenwich Village reds" in the words of Lewis's handpicked editor of the union's newspaper—and the other members soon resigned. Mitch managed to survive the crisis, distancing himself from Brophy, who emerged as Lewis's main rival in the UMWA. The nationalization effort faded away.

By the middle of the 1920s, Mitch was firmly in Lewis's political camp in the UMWA, but the Indiana branch of the union began to suffer. An employer offensive and the chaotic economics of the coal industry in the 1920s caused political turmoil within the national UMWA, and in the Indiana district as well. Though Mitch enjoyed enough support to remain secretary-treasurer throughout the decade, miners in District 11 regularly turned other state leaders out of office. Indiana remained one of the few regions with a viable union presence during the Great Depression, but the number of employed miners dwindled from 18,000 to just 7,500 in 1931. Mitch's support for Lewis eventually became a liability. He worked tirelessly to limit the spread of a rebellion against Lewis that swept through the neighboring Illinois district in the late 1920s. In response the rebels worked hard to unseat Mitch as an Indiana UMWA official. Their efforts bore fruit in 1931, when Mitch was defeated for re-election as secretary treasurer of District 11. Adolph Germer, a leader among the dissidents, proclaimed Mitch's defeat a success for Lewis's opponents in the UMWA. If so it proved one of the few victories ever recorded by the anti-Lewis bloc within the union.

The defeat caused something of a crisis for Mitch, who, after 16 years as a union officer had only limited options for employment in an industry ravaged by the Depression and declining union membership. He briefly considered practicing law, having been admitted to the Indiana bar after completing college extension courses. Lewis however rarely forgot his allies, and Mitch eventually landed a post as a "special representative" with the UMWA.

Out of this defeat however, Mitch was reborn. In the summer of 1933, Lewis sent Mitch to Alabama to head up the efforts to re-establish District 20, which had been destroyed in the wake of a disastrous strike in 1920–1921. The ravages of the Great Depression—Birmingham once was described as the worst hit city in the country—and the programs of President Franklin Roosevelt had dramatically altered the balance of power in Alabama. The coal miners of the Birmingham district meanwhile were ready to bring their old union back, and they enlisted in the ranks of the miners' union by the thousands. In Alabama Mitch joined his old friend William Dalrymple, a UMWA organizer and later, William Raney, a former Indiana associate. By 1934, the miners' union represented 90% of the miners in the state, and Mitch found himself president of one of the strongest districts in the UMWA.

Organizing one of the most important industries in an anti-union state however was not without

challenges. Mitch and the UMWA had a difficult time dealing with the local affiliate of United States Steel Corporation, called the Tennessee, Coal, Iron, and Railroad Company (TCI). Though the union signed its first contract with TCI in 1934, it would not enjoy exclusive bargaining rights with the company until 1941. The UMWA's battles with the notorious Alabama Fuel and Iron Company (AFI), headed by the reactionary Charles DeBardeleben, often resulted in violence and on at least one occasion, the outright murder of a union activist. The AFI remained unorganized until it closed in the early 1950s.

Mitch has been described as very conservative in his methods of organization. While there is a degree of legitimacy to this argument, on the issue of race, the District 20 president often defied southern customs. In particular the UMWA organized both black and white miners into the same locals in Alabama and often flaunted segregation ordinances during local meetings as miners of both races participated. Though the union remained in the control of whites like Mitch at a time when most observers believed it had a black majority, the UMWA provided a forum from which African-Americans could improve their standard of living and even stake a claim to limited leadership positions in the union. Mitch undoubtedly exercised caution when he confronted the color line in Alabama, but even his critics on the left recognized his ability to rally support among African-Americans. He fought against the poll tax and spoke out often for the rights of black workers outside the workplace.

As president of the state AFL, called the Alabama State Federation of Labor (ASFL), Mitch attempted to encourage craft unions to organize African-Americans, with mixed results. A former ASFL lawyer accused him of practicing "what the Communists preach on Negro equality in the ranks of the United Mine Workers of America and in Organized Labor." Later as president of the state Congress of Industrial Organizations (CIO), called the Alabama State Industrial Union Council (ASIUC), he supported the efforts of the Southern Conference for Human Welfare, a popular front group that sought to bring liberals and leftists together to campaign against the poll tax and other instruments of oppression against African-Americans. Mitch's views on race were complex, and he admitted to another union official "that I have always handled it with gloves on . . . and the Negroes have cooperated splendidly."

Mitch resigned as president of the ASFL after the AFL expelled industrial unionists from its ranks and became the first president of the ASIUC. Lewis

also tapped the District 20 president to head up the southern efforts of the Steel Workers' Organizing Committee (SWOC). Under his leadership the ranks of union members in the state swelled, and Alabama became a center of union activity in the South with large numbers of miners and factory workers opting for representation. Almost a quarter of the state's workers were unionized by the mid-1950s, a testament to his legacy.

When the UMWA and CIO split in 1942, Mitch resigned as head of the ASIUC. Mitch, who had often found himself the target of red-baiting attacks by industrialists and craft unionists, engaged in his own round at his final ASIUC convention. He denounced critics of Lewis at the event and branded the UMWA president's opponents as Communists. The miners' union left the state CIO a short time later. During World War II, Mitch led the UMWA in Alabama during bitter national walkouts in 1943 and 1945. He also helped establish the landmark health care and pension system the union negotiated with both the federal government and coal operators in the years after the war.

Later Career

But the decades after the war were exceedingly difficult for the aging District 20 president and the union in Alabama. The coal industry in Alabama suffered from declining markets, and the number of miners dropped dramatically from 21,975 miners in 1945 to 7,400 in 1960. Production plummeted from 18 million tons of coal to 12–13 million tons a year in the 1950s. The UMWA's influence in Alabama waned along with the declining fortunes of the industry.

Lewis retired as president of the national union in 1960, but Mitch, by this time an elderly man, continued as head of the Alabama branch for several years. New UMWA President W. A. "Tony" Boyle began to tighten his grip on District 20, appointing one of his supporters as secretary-treasurer of the Alabama organization. Mitch resigned as president in 1963 but continued to represent District 20 on the international executive board (IEB) until 1967, when he retired from that position. Tellingly Boyle replaced Mitch on the IEB with Albert Pass, one of his loyalists who was then also the secretary-treasurer from the union's District 19 in Tennessee. Pass would later be convicted along with Boyle and other UMWA officials of arranging the murder of union insurgent Joseph A. "Jock" Yablonski, his wife, and daughter in 1969.

Mitch died in a nursing home in Birmingham on July 12, 1974. He was remembered for his efforts to bring the UMWA back in Alabama as well as for his work with the steelworkers and the CIO. "His weight and influence were felt throughout the labor movement in Alabama," proclaimed Howard Strelvel of the steelworkers. Indeed Mitch had played a role in most of the major developments of the UMWA and the southern labor movement in the middle of the twentieth century, a time that saw workers in the South and the rest of the nation realize a standard of living they could not have imagined during the depths of the Great Depression. Near the end of his career, Mitch had been hailed as a "dyed in the wood Alabamian" and "a man of integrity and a born leader of men" by the state's largest newspaper. Sadly few outside of Alabama recognized Mitch's contributions to the labor movement in the region, including the UMWA, which devoted just four sentences to his passing.

MITCHELL, H. L. (“MITCH”) (1906–1989) Socialist Labor Activist

Harry Leland Mitchell devoted his life to organizing southern agricultural workers, a group often ignored by the mainstream labor movement and denied the protections of national labor law. Cofounder of the interracial Southern Tenant Farmers’ Union (STFU) in the 1930s, Mitchell can be considered a product of what historian James Green has called grass-roots socialism. The pre-World War I Socialist party had an especially strong presence in Oklahoma, Texas, Louisiana, and Arkansas, a tradition of agrarian radicalism rekindled by Mitchell and his fellow STFU organizers during the years of the Great Depression.

Born in Halls, Tennessee, in 1906, Mitchell spent his formative years in the small-town South during the first two decades of the twentieth century. Even then west Tennessee, the hinterland of Memphis, remained an area rooted in the plantation economy, cotton production, and the racial legacy of slavery. As a boy of 11, Mitchell witnessed a frenzied mob of 500 whites applaud the lynching of a black man in front of the courthouse in nearby Dyersburg, Tennessee. As a young man, Mitchell worked as a newspaper boy, a sharecropper, a deliveryman, and even a bootlegger.

His early experiences with hard work and witnessing racial injustice proved fertile ground for the ideas of the American Socialist party, which Mitchell first encountered in Eugene V. Debs’s 1920 presidential campaign. Largely denied the opportunity of formal schooling, Mitchell educated himself with the *Little Blue Books* published by E. Haldeman-Julius, editor of the Girard, Kansas, socialist mass-circulation newspaper, *Appeal to Reason*.

In 1927, Mitchell moved across the Mississippi River to Tyronza, a small town in the Arkansas delta, to join his father, Jim, who worked there as a barber. At first Mitchell tried his hand at growing

cotton but soon realizing that “the landlord got one bale, and the boll weevil the other,” he established a dry cleaning business and talked socialism to anyone who would listen.

By 1932, he and one of his local converts, gas station owner Clay East (their adjacent businesses in the center of town were known by community wits as Red Square), had chartered a Tyronza local of the Socialist party and invited Norman Thomas to the delta to address the area’s impoverished tenants and sharecroppers. While there Thomas conducted research for the Socialists’ pamphlet on cotton tenancy, *The Plight of the Sharecropper* (1934), which helped expose the planters’ misappropriation of Agricultural Administration Act (AAA) payments owed to sharecroppers under the New Deal.

Socialism was not entirely out of place in rural Arkansas in the 1930s. Mitchell, East, and Christian Socialist Howard Kester, who joined them in 1935, easily tapped into the dormant sentiments of southwestern agrarian radicalism, dating back to the Populists of the 1890s. From 1900–1920, the socialism of Debs had fired the imagination and expressed the aspirations of workers and farmers in Arkansas, Louisiana, Oklahoma, and Texas. Radical interracial unions, including the Industrial Workers of the World—affiliated Brotherhood of Timber Workers, had a presence in the region. By the 1930s, small farmers and migratory workers who had sought economic opportunity in this region had sunk into the status of dependent proletarians and peasants. In response to this transformation, Socialists like Mitchell revived the radical tradition as rural working people cast around for a political response to the depression. The STFU became their vehicle.

Mitchell is best known for his work with the STFU, first organized in Tyronza in 1934. Founded by a handful of black and white sharecroppers, the STFU initially sought to secure a fair share of government AAA payments for those who worked the land and to protect them from unjust evictions. Part agricultural labor union able to conduct strikes, part advocacy and lobbying organization, this interracial movement of the poor pioneered many of the tactics that would come to characterize civil rights and labor movements in the rural South in future generations. Despite his own devout atheism, Mitchell joined forces with Christian Socialists like Kester and Ward Rogers, and local African-American preachers like E. B. McKinney. The union also embraced the principle of nonviolence but more out of tactical necessity than fundamental principle. Finally Mitchell recognized that the powerless and isolated sharecroppers of the delta would have to call on more established and well-connected organizations

in order to succeed. Thus he readily forged alliances with friends in New Deal agencies, the National Association for the Advancement of Colored People (NAACP), liberal churches, backers of farm cooperatives, and by 1937, the industrial labor movement in the nascent Congress of Industrial Organizations (CIO).

The STFU's brief alliance with the CIO proved ill-fated however, in part because of the enmity between Mitchell and the Communist party leadership of the CIO agricultural workers union, UCAPAWA. During World War II many sharecroppers left the land to work in industry, further weakening the STFU. In the aftermath of the war, Mitchell took the STFU, now renamed the National Farm Labor Union (NFLU), into the Amalgamated Meat Cutters and Butcher Workmen of the American Federation of Labor (AFL). The NFLU retained its interracial leadership structure at a time when many AFL unions remained segregated or excluded blacks altogether.

As president of the NFLU from 1948–1960, Mitchell worked in Washington D.C., where he and his second wife, Dorothy Dowe, lobbied on behalf of farm workers' national interests and remained part of an active network of southerners attempting to liberalize their home region. Although unable to secure extension of NLRB coverage to agricultural laborers, Mitchell did help them win rights to social security benefits. Under Mitchell's guidance, the NFLU also spearheaded organizing drives in the late 1940s and early 1950s among fruit pickers in California's central valley and strawberry and sugarcane workers in Louisiana. Mitchell always claimed that the persistent efforts of the NFLU to turn organized labor's attention to the plight of agricultural workers helped pave the way for Cesar Chavez and the United Farm Workers in the 1960s.

During the late 1960s, Mitchell himself made efforts to bring student activists from the Southern Students' Organizing Committee together with trade union organizers in the sugarcane fields of Louisiana. In the last decades of his life, retired from organizing campaigns, Mitch continued to reach out to the younger generation. Traveling around the country to college campuses, he regaled students with the colorful history of union organizing among the dispossessed and made sure numerous libraries acquired the micro-filmed collection of the STFU's records. Through these activities Mitchell kept alive the memories of social activism that would help inspire a new cohort of students, scholars, trade unionists, and civil rights workers intent on bringing interracial social justice to the South.

MITCHELL, JOHN (1870–1919) President, United Mine Workers of America

Along with Samuel Gompers and Eugene Debs, John Mitchell ranks as one of the most influential figures in the U.S. labor movement during the period from the late 1890s to World War I. It was during the early years of his tenure as president of the United Mine Workers of America (UMWA), a position he held from 1898 to 1908, that the industrial union of coal miners, founded in 1890, emerged from years of depression and defeat to become the largest union in the American Federation of Labor (AFL) and a source of organized labor's new power during the Progressive Era.

After labor's debacles during the crisis-ridden 1890s, economic recovery and the political climate of the late 1890s brought about favorable times for the resurgence of the labor movement. The successful national strike that the UMWA launched in 1897, when it had less than 10,000 members, proved to be a turning point in its fortunes. Before the strike Mitchell had been relatively unknown, but his success in organizing southern Illinois miners during the conflict brought him attention and led to his election to the union's vice-presidency. The watershed strike resulted in the re-establishment of the joint-conference system, a system involving formal meetings and direct negotiations between the miners and the operators for the purpose of securing industrial peace. The unprecedented interstate agreement that followed in 1898 brought bituminous miners higher wages and the 8-hour day and stabilized the soft coal industry in the four key states that comprised the important central competitive field of production. Mitchell was a beneficiary of these events, and his meteoric rise to a position of power coincided with the UMWA's growth, newfound stability, and expanding influence.

Under his leadership the UMWA then went on to win prestigious victories in the hard-coal region during the strikes of 1900 and 1902, when the anthracite miners, mine workers, and breaker boys secured higher wages, shorter hours, and better working conditions. The victories won him the fierce loyalty of hard-coal miners, established the union in the district, and earned him widespread acclaim throughout the nation. Mitchell was lauded for his conservative rhetoric, his ability to unify the disparate nationalities and avoid serious violence, his ambitious efforts to garner broad public support, and his skill in mustering assistance from the nation's power brokers, including Senator Mark Hanna, President Theodore Roosevelt, and the financier J. P. Morgan, to win settlements from the virulently anti-union monopolistic coal-carrying railroads. Although the 1902 strikers did not achieve their most important demand—union recognition—they established a lasting tradition and proclaimed October 29, 1902, as the first Mitchell Day to honor the man and the union's achievements. The strikes had catapulted Mitchell into national prominence and increased middle-class support for the notion that conservative trade unions might be legitimate. By the end of 1902, the UMWA had over 300,000 members, the trade union movement was resurgent, and Mitchell was at the peak of his influence.

The UMWA president's greatest successes occurred during the general prosperity from 1898 to 1904, a time when he was as responsible as AFL President Gompers for eschewing radicalism and actively advocating a nonradical, pure-and-simple unionism course for the labor movement, a policy that many, then and since, have contested. Like Gompers, Mitchell accepted many of the basic tenets of capitalism and saw no irreconcilable conflict between capital and labor. In his view many employers were progressive, and contracts were sacred. He became an ardent champion of conservative trade unions and trade agreements with limited purposes. It was one thing for workers to seek to raise wages, end child labor, or eliminate the most exploitative working conditions, but it was something else for them to seek workers' control or challenge existing business prerogatives. In his speeches and writings, he ridiculed socialism and the radical political and economic alternatives of his day as unachievable dreams. Ultimately the complex and contradictory labor leader placed his faith for a solution to the labor problem more in the hands of prominent capitalists and powerful politicians than he did in the working classes. For such reasons he, like Gompers, readily joined the nation's power brokers and became a member (from 1899 to 1911) of the

National Civic Federation (NCF), a controversial organization of capitalists, labor leaders, and the general public that sought to avert socialism in the United States by promoting moderate reforms, business recognition of conservative trade unions, and acceptance of collective bargaining. The NCF and its goals were never accepted by the major coal corporations, the National Association of Manufacturers, or many other businesses.

Meanwhile the economic downturn that occurred in 1904 set the stage for Mitchell's undoing and revealed the shortcomings of his policies. The sentiment for radical political and economic alternatives was growing throughout the country. Union miners reluctantly accepted his decision to approve the operators' demands for a wage cut in 1904, but the failure of his 1906 strike policy to offset union defeat or even retain the much-valued interstate joint-conference system was decisive. Radicals and rivals combined forces against him, and he resigned the union's presidency in 1908. His questionable dealings with powerful class enemies, his ongoing participation in the business-dominated NCF, plus various shady business transactions had aroused serious conflict-of-interest issues and opposition. In 1911, a disgruntled UMWA convention forced the ousted leader to choose between membership in the UMWA or the NCF; he kept his union membership but retained his faith in the NCF and in conservative unionism. In the context of the changed times and the growth of radical movements, he became increasingly irrelevant to the labor movement.

Mitchell has been described as a complex man whose loyalties were divided, a miners' Moses, a failed labor bureaucrat, and the personification of all that is good and bad in the American labor movement. Perhaps the roots of his contradictory impulses lay in his early years. The son of an Irish immigrant coal miner, born in Braidwood, Illinois, in 1870, he had experienced a childhood fraught with family tragedy and extreme poverty. The difficult struggle for survival that he and working-class families endured in the coalfields left a deep and lasting imprint on him. That struggle prompted him to join the Knights of Labor in 1885, and then the United Mine Workers in 1890, and to become a fervent lifelong advocate of trade unions and trade agreements; but it also fostered his personal desire to escape the status of a permanent wage earner. When he died, largely unheralded, in 1919, he left a personal fortune worth nearly \$350,000. That money did not come from his employment on the New York Workers' Compensation Commission or the Industrial Commission of New York but from the dubious

investments he had made in notoriously anti-union corporations.

In many ways Mitchell was a tragic figure who embodied the greater tragedy of an American labor movement that once militantly challenged the capitalist system but eventually succumbed to the temptations of “business unionism.” Nonetheless to this day, union miners celebrate Mitchell Day to commemorate the historic contributions he made to the labor movement in 1900 and 1902 and to inspire contemporary generations to continue the broader struggle for workers’ rights.

MOLLY MAGUIRES

Twenty young Irishmen were hanged in the anthracite region of northeastern Pennsylvania in the late 1870s, and 20 more were sent to prison, convicted of a series of killings stretching back to the Civil War. They belonged to an ethnic fraternal society called the Ancient Order of Hibernians (AOH) and were convicted on the evidence of a Pinkerton detective and labor spy, James McParlan, who had infiltrated their organization. Because they left us virtually no evidence of their own, almost everything we know about the Molly Maguires was recorded by their enemies. At the showcase trials of the 1870s, the prosecution offered no plausible explanation of motive and nor it seems was one expected—for the explanation of Irish depravity was simply that the Irish were depraved by nature.

This argument, while perfectly circular, was surprisingly powerful in the nineteenth-century United States, and it laid the groundwork for a powerful and enduring myth. Nobody did more to articulate that myth than Allan Pinkerton, founder of the famous detective agency, whose ghost-written history *The Molly Maguires and the Detectives*, published in 1877 as the trials and executions were proceeding, celebrated McParlan’s triumph over Irish barbarity. Pinkerton’s highly pejorative account laid down a narrative line that would remain dominant for at least the next two generations, providing a staple plot for American dime-novel fiction and even for a Sherlock Holmes novel, *The Valley of Fear* (1914).

In certain Irish-American and labor circles meanwhile, a counternarrative flourished based on a notion of the Molly Maguires as innocent victims of oppression, whether economic, religious, or ethnic. This position however too often turned the dominant mythology on its head, retaining the central explanatory category of evil but transferring it from Irish workers to their nativist or capitalist enemies. Evil as a timeless attribute of individual or group character is not a useful category of historical analysis. The popular countermyth, while it was undoubtedly consoling and empowering, was ultimately as implausible as the pernicious narrative it arose to encounter. To state the matter bluntly, there were Molly Maguires in Pennsylvania, and they killed people.

The historian’s task is to explain why they did so. Clearly what is needed is an explanation that breaks free of the two extremes of interpretation—the Irish simply as savages or the Irish simply as scapegoats. Only in the 1930s did the task of historical analysis get underway when Anthony Birba (rather dogmatically) and J. Walter Coleman (with greater subtlety) pointed out what a handful of radical dissenting

Pneumatic steam hammer and forges, blacksmith shop at mines, Scranton, Pa. Library of Congress, Prints & Photographs Division [LC-USZ62-72474].

voices in the 1870s had tried in vain to explain: The Molly Maguires were one element in a concerted struggle between labor and capital for control of the lower anthracite region of Pennsylvania, and their story made no sense outside that context. If labor history provides one essential context for understanding the Molly Maguires, immigration history provides the other. Any account of the subject today must take as its starting point a precept widely accepted by American historians but difficult to put into practice, that is, we cannot make proper sense of the lives of immigrant workers in the United States without a detailed knowledge of the lands from which they came.

Irish Origins

To make sense of the Molly Maguires then we must begin with Irish history. In Ireland secret societies, generically known as Whiteboys and Ribbonmen had been waging a losing struggle against land enclosures, tithes, and rack renting since the 1760s, a

struggle that featured threatening letters (or “coffin notices”), beatings, burnings, and assassinations. The Irish Molly Maguires, who emerged toward the end of the Great Famine (1845–1851), were so-named because their members (invariably young men) disguised themselves in women’s clothing, used powder or burnt cork on their faces, and pledged their allegiance to a mythical woman who symbolized their struggle against injustice. Ireland in the first-half of the nineteenth century was notorious for its tradition of clandestine rural violence, of which the Molly Maguires were one of the last manifestations. In north-central Ireland, where many of the men involved in the Pennsylvania episode originated, the terms Molly Maguires, Ribbonmen, and Ancient Order of Hibernians were sometimes used interchangeably. Immigrant workers carried some of their traditions with them to the United States, and from the 1830s onward, faction fighters and Ribbonmen made their presence known on the public works, canals, and railroads of the United States, where Irish manual labor was in heavy demand. The Molly Maguires of Pennsylvania represented the most concerted, dramatic, and tragic

transatlantic outgrowth of this rural Irish tradition in the industrial United States.

According to the interpretation laid down in the 1870s, the Molly Maguires were a conspiratorial organization imported direct from the Irish countryside. There is however no evidence at all that anyone in Ireland conspired to export any such organization nor that any of the individuals convicted in Pennsylvania were involved in violent activities before they left Ireland. But they did arrive in the United States with particular forms of cultural memory and distinctive traditions of social protest; faced with appalling conditions in the mines of Pennsylvania, they responded by deploying a specific form of collective violence, rooted in Irish rural history, that featured the familiar tactics of coffin notices, beatings, sabotage, and assassinations. The Pennsylvania Molly Maguires do not appear to have worn women's clothing, but some of them reportedly "blacked up" for disguise. Like their Irish counterparts, they were led by tavern keepers, and they called on strangers from neighboring lodges to carry out beatings and killings, pledging to return the favor at a later date. There is no doubt then that the American Molly Maguires existed even if they never assumed the diabolical form depicted by contemporaries. They were not a figment of the conspiratorial imagination, whether nativist or capitalist; indeed if Irish immigrant workers had not been engaged in collective violence of some sort, the mythology created about them could never have carried the persuasive power it so evidently did.

But what was the institutional reality behind the exaggerated descriptions of contemporary observers? According to the prosecuting attorneys, the term Molly Maguires was just another name for the AOH, an assertion that made the Mollies appear like part of a vast national and international conspiratorial network. An otherwise peaceful Catholic fraternal society, the AOH had branches in Irish settlements across the United States as well as in Ireland, England, and Scotland. The local lodges in the hard-coal region of Pennsylvania, according to the prosecuting attorneys, acted as a cover for a group of depraved Irish killers. Some AOH lodges in Pennsylvania were undoubtedly used for violent purposes; yet that still begs the question of why the Molly Maguires operating within those lodges acted as they did and why contemporaries were so concerned about the threat they posed.

Labor Struggles

If the inherent depravity of Irish workers can no longer serve as an answer to this question, where do

the real answers lie? They are to be found neither in national character nor in individual pathology, but instead in the detailed history of labor and capital in Pennsylvania's lower anthracite region during the era of Civil War and Reconstruction.

There were two quite distinct, and only tenuously connected, waves of Molly Maguire activity in Pennsylvania, the first in the 1860s and the second in the 1870s. The first wave, which included six of the 16 assassinations, occurred during and directly after the Civil War. At the heart of this violence was a combination of resistance to the military draft with some form of rudimentary labor organizing by a mysterious group of mine workers, known variously as the Buckshots, the Committee, and the Molly Maguires. Nobody was convicted of any crimes in the 1860s; only during the trials of the following decade was the first wave of violence retrospectively traced to individual members of the AOH and hence to an organized conspiracy by the Molly Maguires. The violence abated after 1868, mainly because of the formation of a powerful new trade union, the Workingmen's Benevolent Association (WBA), which united Irish, British, and American workers across lines of ethnicity and skill. At its height in the early 1870s, the WBA enlisted some 30,000 members. Its rise and fall neatly divides the first wave of Molly Maguire violence from the second and much better known outbreak that followed the destruction of the union in the summer of 1875.

In the late 1860s and 1870s, the labor movement of the anthracite region took two distinct but overlapping forms: A powerful and inclusive trade union movement open to all mine workers regardless of ethnicity or skill; and a shadowy, sporadic, and exclusively Irish group, manned by unskilled laborers, led by tavern keepers, practicing violence, and known as the Molly Maguires. Favoring collective-bargaining, strikes, moral force, and third-party politics, the leaders of the WBA publicly condemned violence by labor as both inherently wrong and tactically counterproductive, singling out the Molly Maguires for repeated criticism. Yet Franklin B. Gowen, the president of the Reading Railroad, determined to secure his monopolistic goals, repeatedly insisted that the Molly Maguires were merely the terrorist arm of the union movement, whose claims to nonviolence were but a smoke screen. By collapsing the distinction between the two forms of labor organization, Gowen eventually succeeded in destroying the power of both.

Matters moved to their tragic climax after October 1873, when Gowen hired Pinkerton to gather information against both arms of the labor movement, and Pinkerton dispatched James McParlan to the

anthracite region. After infiltrating the inner circle of the local AOH with remarkable ease, McParlan spent 2.5 years working undercover among the mineworkers before fleeing for Philadelphia in March 1876 when his cover was blown. Several other Pinkerton agents infiltrated the WBA. In June 1875, after a desperate 6-month struggle against Gowen and his railroad (the legendary Long Strike), the WBA went down to its final defeat. In the disarray that followed, the Molly Maguires stepped up their activities, with the last six assassinations attributed to them taking place during that summer alone. In January 1876, the arrests began, and in the spring and summer, the famous trials got underway. With the labor movement in its various forms now utterly defeated, Gowen completed his conquest of the local economy.

The Trials and Executions

It was during the trials and executions that the myth of the Molly Maguires was perfected. The trials, conducted in the midst of enormously hostile national publicity, were in several respects a travesty of justice. The defendants had been arrested by the private police force of Gowen's private Coal & Iron police, acting in close cooperation with the Pinkertons. They were convicted on the evidence of an undercover detective whom the defense attorneys accused (albeit somewhat half-heartedly) of being an agent provocateur, supplemented by the confessions of a series of informers who turned state's evidence to save their necks. Irish Catholics were excluded from the juries. Most of the prosecuting attorneys worked for railroads and mining companies. Remarkably Gowen himself appeared as the star prosecutor at several trials, and his florid courtroom speeches were rushed into print as popular pamphlets. Mere membership in the AOH was presented as de facto membership in the Molly Maguires, which in turn was presented as evidence of guilt. Even by nineteenth-century standards, the arrests and trials were flagrant in their abuse of judicial procedure and their flaunting of corporate power.

The first 10 Molly Maguires were hanged on a single day, June 21, 1877, known to the people of the anthracite region ever since as Black Thursday or the Day of the Rope. Six men were hanged in Pottsville that day and four in the neighboring town of Mauch Chunk (now called Jim Thorpe), in a spectacle carefully choreographed to assert the outraged majesty of the law and the awesome might of

corporate capital. The Reading Railroad's Coal & Iron police patrolled the streets and guarded the jails; special trains were added to transport the coffins. Ten more men would die before the hanging was done. Some of those executed were no doubt guilty as charged; most of them were involved in some sort of Molly Maguire violence even if they had not committed the actual crimes of which they were convicted; all had fought for justice in their own way. Ultimately the Molly Maguires had no place in the industrial United States, and their rural-based tradition of direct, retributive justice died with them on the scaffold. Although the coalmines of Pennsylvania would see plenty of violence in years to come, the Molly Maguires were the last of their line.

MOONEY, TOM (1892–1942) Socialist Party Activist

Thomas Mooney was born in 1892 to Bernard and Mary Mooney, Irish immigrants in Holyoke, Massachusetts. Mooney's father was a miner and an organizer for the Knights of Labor, and Tom grew up in an atmosphere pervaded with labor violence. Tom became an apprentice foundryman at the Dean Steam Pump Company when he was 14, and when he was 20, he joined the International Molders' Union. In 1907, Tom went on a trip to Europe that he won by selling subscriptions to a socialist magazine; there he was converted to socialism. When he returned to the United States, he moved west to Stockton, California, where he joined the Socialist party. Along with his wife Rena, Tom began to sell socialist literature and

in the process, came to the attention of Eugene Debs, who enlisted Mooney in his campaign. As Mooney's commitment to socialism deepened, he also became an advocate of industrial sabotage and direct action.

After 1912, Tom and Rena moved to San Francisco where they became involved in organizing the workers at the Pacific Gas & Electric Company. Along with his partner, Warren Billings, Mooney began to steal explosives from rock quarries and work sites and use them to bring down electrical transmission towers in an attempt to force the utility's management to deal with the union. Mooney managed to win acquittal when accused by company detectives of involvement in the dynamiting. Billings however served time for transporting dynamite on a passenger train.

On 22 July 1916, a bomb exploded during the San Francisco Preparedness Day Parade, killing 10 and injuring 40 others. The bomb went off during a bitter organizing drive at the Market Street Railway, part of the San Francisco streetcar system. Less than a month before, three transmission towers providing power to the streetcars were dynamited, and Mooney and Billings were the prime suspects. When the Preparedness Day bomb went off, Mooney and Billings were quickly apprehended along with a number of their associates.

Mooney's wife and associates were eventually acquitted, but Tom and Billings were found guilty of setting the bomb. It quickly became apparent however that most if not all of the testimony used against Mooney and Billings in the trial had been perjured. Moreover it appeared that the District Attorney Charles Fickert and Mooney's prosecutor, Eddie Cunha, had bribed and coached witnesses to place Mooney and Billings at the scene of the crime. Evidence that would have provided an alibi for Mooney, including a photograph placing Mooney blocks away from the blast at the time of the explosion, mysteriously disappeared. All in all the district attorney's office had engaged in a massive frame-up against Mooney and Billings.

While the initial trial did not spark much interest or concern in the American labor movement, once it was revealed that Mooney and Billings were the victims of a frame-up, the case became an international cause. With World War I still in full swing, the Germans used pro-Mooney propaganda in an attempt to influence European and American workingmen against the U.S. war effort. President Woodrow Wilson became involved in the case, intervening on behalf of Mooney after a group of anarchists protested in front of an American embassy in Russia. None of this was terribly successful however. Governor William Stephens of California refused to pardon Mooney,

and the California Supreme Court remained staunchly hostile to appeals by the two prisoners. When the Wickersham Commission, a federal commission set up by President Wilson to investigate Mooney's guilt, concluded that the case against Mooney and Billings was a politically motivated frame-up, the state government took up the mantle of State's Rights and resisted calls for new trials or pardons.

Meanwhile the Mooney-Billings defense committees were hampered by political sectarianism and personal conflicts. The original head of the defense committees, Bob Minor, was forced out as a result of factional conflicts within the International Workers' Defense League. Ed Nolan, who succeeded Minor, left after strategic disagreements with Mooney. Tom's wife, Rena, then succeeded as the head of the defense committees. Unfortunately Rena began an affair with another Mooney defense worker, which ruined her relationship with her husband. While Mooney was unable to publicly break with his wife for fear that it would hurt his image, the betrayal was a severe blow to the defense committees. Eventually Rena's sister, Belle Hammerberg, took over as head of the defense. Together Mooney and Hammerberg managed to convince the judge at his original trial and all nine of the jurors still alive to publicly state that they believed Tom Mooney to be innocent. Once again however in 1930, the California Supreme Court refused to grant Mooney or Billings a pardon.

Mooney's defense was dealt another major blow when Billings, in an attempt to win parole from prison, revealed the truth about his and Mooney's involvement with industrial sabotage. Billings admitted that at the time when the Preparedness Day bomb went off, he was squirting varnish remover on high-priced automobiles in an attempt to coerce local repair shops (who were bound by a 1-year guarantee to fix paint jobs on certain brands of cars) to deal with the Machinists' Union. Even worse for Mooney, Billings admitted to working as a spy and saboteur for a number of different unions. Billings even named Mooney and other high-ranking figures in the labor movement as being involved in these plots. Once again however Billings was denied a pardon or parole.

Mooney and Billings were eventually released from prison but not until 1939. Mooney was pardoned at the time of his release, but Billings was not pardoned until 1961. The Depression, along with such activists as Upton Sinclair, had done much to change the tone of California politics. When State Senator and Socialist Culbert Olson was elected governor, it was clear that both men would soon be pardoned. Billings emerged from prison repentant. One of the top chess

players in the country, Billings eventually became a watchmaker and served as vice-president of the Watchmakers' Union. Mooney however was rendered bedridden soon after his release and died on 6 March 1942.

MORGAN, ELIZABETH CHAMBERS (JUNE 16, 1850–FEBRUARY 11, 1944) Women's Labor Organizer

Elizabeth Morgan was a pioneering women's labor organizer, radical reformer, and advocate for working children. She was among the first women who publicly illuminated the serious hardship working women and children suffered in manufacturing industries, and she was one of the leading female activists to use political action in efforts to better the situation of working women and children. An avowed Socialist, through legislation and organization, Morgan attempted to protect and promote wage earners who suffered from what she believed were the evils of capitalism.

Morgan's experiences as a laborer drove her work as an organizer. She began working in a factory in Birmingham, England, when she was 11 years old. When she was 17, she married machinist Thomas Morgan; together they were able only barely to get by economically. In 1869, the couple immigrated to Chicago, where they had two children. Although they hoped to find a better life in Chicago, they were instead confronted with similarly harsh working conditions. The Morgans became staunch Socialists and both began careers as labor activists.

Morgan's first organizing efforts produced fleeting results. During the 1873 depression, she helped establish a cooperative society, the Sovereigns of Industry, which lasted only a short while. In 1881, Morgan was one of the founders of a women's labor union, Local Assembly 1789, which affiliated with the Knights of Labor. The union advocated for wages for women that were equal to men's, restrictions on child labor, and suffrage for women and African-Americans. By the

end of the decade however, it fell apart over political and ideological differences among its members.

In 1888, Morgan helped found a much stronger organization, the Illinois Ladies' Federal Labor Union No. 2703 (LFLU). The LFLU affiliated with the American Federation of Labor (AFL) and the Chicago Trade and Labor Assembly (CTLA) as one of the few female labor unions in either organization. Morgan served as the LFLU delegate to the CTLA. Its membership included wage-working women from several different trades and middle-class reformers. Its mission was to protect laboring women and children from abusive employers through investigation, legislation, enforcement of laws, and organization. Toward this aim the LFLU organized 23 local craft unions for women, all affiliated with the AFL.

The work of the LFLU illuminated the need for an additional organization that would focus on reforming the social conditions that negatively affected most laboring women and children. Within months of its founding, Morgan and several other LFLU members, together with other female Socialists, union agitators, and settlement workers in Chicago, formed the Illinois Woman's Alliance (IWA). During its 6-year existence, the IWA fought for the elimination of sweatshops, compulsory education for children, and anti-child labor laws and worked to provide immediate relief for the poor through clothing drives and campaigns for public baths.

In the early 1890s, Morgan was a force in the antisweatshop campaigns in Chicago. In 1891, she investigated the working conditions in the city's garment industry for the CTLA and reported on the existence of sweating practices. She explained that women and children were hired to sew pieces of clothing for substandard pay and were required to complete the work either in their tenement or in overcrowded shops without ventilation for 10–14 hours a day, 6 days a week. Morgan's report demanded enforcement of the child labor laws and sanitation inspections of the shops.

In 1892, Morgan participated in additional local and national investigations of the sweating system. As a member of the IWA Committee on Child Labor, Morgan reported on the harsh labor conditions in a number of new sweatshops in Chicago. This and other reports prompted Congress to conduct its own investigation. Morgan was among those who testified and assisted in an investigation led by Florence Kelley and sponsored by the Illinois Bureau of Labor Statistics. Their report citing gross abuses prompted the state legislature to conduct its own investigation.

The Illinois legislature finally took action in 1893. Based on its own investigation of factory work

conditions, conducted by a committee that included Morgan and Kelley, the general assembly passed the Factory and Workshop Inspection Act. It established health standards for shops, set the minimum mandatory age to work in manufactories at 14, and limited the amount women could work to 8 hours a day, six days a week. Businessmen who opposed the act formed the Illinois Manufacturers' Association to challenge it. In 1895, the Illinois Supreme Court overturned the 8-hour day provision of the act.

In 1894, debates among IAW members over strategy caused divisions within the organization to intensify. Morgan and other socialist members of the alliance called for strikes and political agitations to secure their aims. Many of the IWA's middle-class members advocated less confrontational and more conventional means to effect labor reforms. Morgan left the organization when the IWA adopted the more conservative approach. Months later the differences resulted in the demise of the alliance.

Morgan's call for strikes and political action to support laboring women received a slightly better reception at the AFL. At its 1894 convention, the AFL approved Morgan's resolutions demanding the passage and enforcement of compulsory education laws, an 8-hour day for women and children, and abolition of the sweating system. The AFL's ambivalence toward women laborers however was reflected in its treatment of Morgan. Morgan's few supporters within the AFL nominated her for the office of first vice-president, the highest office a woman had sought within the federation. Despite her record of service, she resoundingly lost the election.

Morgan finished her career by assisting her husband in his new law practice, defending wage earners. When her final attempt to establish an organization of wage-earning women failed in 1894, she began to study law with her husband. Though she never sought her law license, Morgan spent 17 years providing legal assistance to workingmen and women.

Morgan retired in 1912 after almost 40 years of advocacy for laboring women and children. She was a leader who used radical strategies to expose publicly and alter politically the abuses laborers suffered in the industrial capitalist system. She was also one of the critical actors who attempted to build cross-class alliances among women to further the cause.

MORGAN, THOMAS J. (OCTOBER 27, 1847–DECEMBER 10, 1912) Socialist Trade Unionist

During the last quarter of the nineteenth century, the name Thomas J. Morgan became synonymous with the socialist movement in Chicago. Egotistical and combative, Morgan had a genius for organizing. He voiced the sentiments of the working class with personal knowledge, deep feeling, and stinging sarcasm. Morgan held a number of leadership posts and exuded enormous energy in his committee work, his editorial writing, and his fiery speeches. He possessed an uncanny gift for drafting resolutions. While holding fast to socialist principles, Morgan embraced immediate social reforms and sought short-term political alliances with progressive labor and farmer elements.

From Birmingham to Chicago

Born on October 27, 1847, in Birmingham, England, of English and Welsh parentage, Morgan was one of nine children. He began work alongside his poverty-stricken, nail-making parents at age nine. He obtained a rudimentary formal education in parochial and Sunday schools and later studied mechanical drawing in night school.

Morgan's father joined the Chartists, a political movement of reformers who would make Parliament

more democratic and responsive to the needs of workers. Young Morgan began reading Jeremy Bentham and John Stuart Mill and attending political mass meetings of workers. He joined the Brass Workers' Society in 1864 and 3 years later helped to organize a small cooperative grocery store.

He married Elizabeth Chambers Morgan on January 26, 1868. Born in 1850, Elizabeth came from a poor factory-operatives family of 10 children. Feeling trapped by the injustices of a society based on privilege and profits, the newlyweds decided to emigrate, seeking freedom and opportunity in the United States. Thomas Morgan arrived in Chicago on May 12, 1869, with 12 dollars in his pocket. He found work as a machinist and brass finisher, employed for most of his wage-earning career at the Illinois Central Railroad's Car Works.

Radical Political Activist

Morgan's political activities took him from a brief flirtation with the Republican party to independent labor and socialist political action. The turning point came with the onset of the national depression of 1873, when he endured 15 bitter weeks of unemployment. Disgusted by the major political parties' inaction and galvanized by the hard times, he marched with other jobless workers demanding the city provide direct relief and work projects. His experiences with labor activism brought him into contact with socialist ideas. Morgan's full commitment to socialism came after a Chicago address by P. J. McGuire in 1876.

During the nationwide railway strikes of 1877, he walked off his job at the Illinois Central railroad. Before the imposition of overwhelming force broke the Chicago general strike, he urged strikers to remain nonviolent as they pressed their wage and hour demands. He soon became a prominent figure in the Workingmen's party and its successor, the Socialist Labor party (SLP). In 1878, thanks in part to Morgan's leadership, the SLP elected Chicago's first socialist alderman as well as four members of the Illinois legislature and added three aldermanic posts in 1879. Despite Morgan's call for unity, friction between the SLP's political and trade union factions sapped the party's strength.

Following two local incidents that had a national impact, Morgan played the leading role in founding a new labor party. On May 3, 1886, strikers at the McCormick Harvester Works clashed with scabs and police, and the next day a bomb broke up a peaceful

protest meeting at Haymarket Square. Working with other labor leaders, Morgan channeled worker discontent into the United Labor party (ULP). Operating as a coalition of trade unions, the ULP became Chicago's most successful workers' party, winning eight seats in the state legislature and one aldermanic post. After 2 years however the labor party disappeared, a victim of factionalism, red-baiting, and the lure of the major parties.

Morgan also made common cause with money and agrarian reformers. In 1880, he supported the Greenback-Labor party and in 1894 joined Henry Demarest Lloyd in backing a labor-Populist alliance. His political action brought some notable legislative victories. Morgan authored Chicago's first factory inspection statute and assisted his wife in securing passage of similar legislation at the state level. He successfully spearheaded the long-standing labor demand for the establishment of an Illinois Bureau of Labor Statistics.

Trade Unionist and Labor Lawyer

As a militant trade unionist, Morgan left his imprint on several labor bodies. His affiliations included the Machinists' and Blacksmiths' Union, the Knights of Labor, the Chicago Metal Workers' Union, and the Socialist Trade and Labor Alliance. He helped organize the Chicago Trade and Labor Assembly and the International Machinists' Union.

At the 1890 convention of the American Federation of Labor (AFL), Morgan won approval of the first women's suffrage resolution in the federation's history, but the delegates refused to accept direct representation of the SLP. After contentious debate the 1892-1894 conventions turned down Morgan's socialist initiatives to endorse independent political action and collective ownership of all means of production and distribution. Morgan received only scant support in his quest for two AFL offices, president and second vice-president.

With the outbreak of the 1893 depression, Morgan quit his job at the Illinois Central, enrolled in the Chicago College of Law and was admitted to the bar in 1895. He saw the law profession as an opportunity to contend for both workers' rights and public ownership. He condemned the rise of Chicago's anarchist movement and led the political wing of the SLP into the new Socialist party (SP).

No longer a wage earner, alienated from the new, young party professionals, and outraged by

stock-jobbing schemes and what he considered leadership misconduct, Morgan's influence waned as he became half muckraker and half traducer. He stayed active by attending national conventions of the SP in 1901, 1904, 1908, and 1910, by editing a caustic little paper called the *Provoker* (1909–1911), and by organizing the Socialist Education League (1912). Headed for retirement in California, he was killed on December 10, 1912, in a train wreck in Williams, Arizona.

Often partnering with his wife, Morgan's activism spanned an era in Chicago of economic and political reform and radicalism. Morgan achieved national recognition as a militant trade unionist and a socialist firebrand.

Throughout his life Morgan retained his faith in political action as a remedy for labor's ills. He believed that immediate social reform could be achieved through legislative action. He ran unsuccessfully on socialist tickets for a variety of public offices, including alderman, mayor, and U.S. senator. He used independent labor parties as a vehicle for educating workers about socialism. An agitator rather than a theoretician, Morgan maintained a steadfast belief in independent politics and socialist principles.

MORRISON, FRANK (1859–1949) American Federation of Labor

Frank Morrison served as the secretary of the American Federation of Labor (AFL) from 1897 to 1935 and was its secretary-treasurer from 1936 to 1939. He was born in Frankton, Ontario. In 1865, his family moved to Walkerton, Ontario, where he became a printer. In 1886, he moved to Chicago, where he joined the International Typographical Union, Local 16. He studied law at Lake Forest University from 1893 to 1894, and became a member of the Illinois bar in 1895. From the inception of the AFL to his death, Morrison was a major political ally of Samuel Gompers. Among other posts, he chaired the wages and hours subcommittee of the Committee on Labor of the Advisory Commission of the Council of National Defense during World War I and attended the International Labor Conference of 1919 organized by conservative unionists at the same time as the Peace Conference that produced the Treaty of Versailles.

For his entire political life, Morrison stood for moderation and cooperation with the government as well as pure-and-simple unionism. Morrison was consistently opposed to socialism as well as to most strikes. Along with Gompers Morrison consistently argued that labor should win a place for itself as a conservative, responsible partner with business owners and the government. As a result Morrison often testified in Congress and played a role in much of the labor legislation passed during the early twentieth century. For instance he advocated in Congress for the creation of a separate Department of Labor, distinct from the Department of Commerce, in the hopes that such a department might regulate wages, hours, and working conditions from a friendlier standpoint than the Department of Commerce. In 1934, he testified before the National Advisory Council in favor of the creation of the Social Security System.

Morrison consistently defended the AFL's stance against organizing unskilled immigrants or black workers. During the McKees Rocks, Pennsylvania, steel strike of 1909, for instance, Morrison was reported to say of the strikers, "They are only hunkies." While the AFL did not officially exclude black workers, it did in practice, and Morrison was complicit in this position. In 1934, under pressure from the Brotherhood of Sleeping Car Porters, the AFL conducted an internal investigation of race discrimination in the federation, but it declined to present the results at the 1935 convention, though it did bring the Brotherhood of Sleeping Car Porters into the AFL.

Morrison was also opposed to the drive to organize the mass-production workers during the early 1930s. When John L. Lewis and other American Federation of Labor (AFL) leaders split from the AFL to form the Congress of Industrial Organizations (CIO), Morrison remained a staunch defender of the old union federation.

At times however Morrison's activity on behalf of the AFL got him into trouble with the system he tried so hard to win a place in, especially since before the New Deal, the government at all levels was generally opposed to any kind of union activity, no matter how moderate. In 1908, Morrison was sentenced to 6 months in prison along with Gompers and John Mitchell, another AFL leader, for violating a court injunction against boycotting Buck's Stove and Range Company, though he did not actually serve any time. He also presented Robert M. La Follette with the endorsement of the AFL as candidate of the Progressive party in 1924, an exception to the usual AFL policy of opposing working-class political action outside the two-party system.

MUSIC

Music has always been an integral part of work and the labor movement. Work songs are those sung during the process of work, and they refer to the job itself or attitudes toward work. Labor songs by contrast are used to exhort workers to join unions, to explain their circumstances, and offer a collective solution. Work songs can be traced back to pre-industrial society, while the tradition of labor songs developed along with the large-scale industrialization that took place after the Civil War.

Work Songs

The richest tradition of work songs in the United States comes from African-Americans. Slaves used music both to coordinate their work and to reflect on their fate. In use and style the songs they sang

reflected the African cultures they had been forced to leave: Music was a central element in daily life, involving verbal improvisation and participation. Songs had a variety of uses, among which was setting the tempo for work. Yet even in work situations, songs might comment on all sorts of issues ranging from gossip to protest against slavery itself.

Hymns and spirituals expressed the slaves' most profound hopes and concerns and like secular songs were subject to the folk process whereby old songs were constantly revised to fit new situations. These were not sung only in church but were used as rowing, field, and work songs, and their call-and-response patterns meant the individual participated in an ongoing dialogue with his or her community. Often the songs spoke of ultimate justice and freedom.

In the years following emancipation, black laborers continued to work to the accompaniment of song, increasingly secular rather than religious. Song leaders played an important role in setting the pace of work, communicating instructions, and providing diversion. Work songs described and commented on shared problems, including the foibles of white bosses. While such songs declined in the latter part of the twentieth century, from the 1930s to the 1960s, work songs could still be found in southern prisons, where working conditions most resembled those of slavery times.

Other categories of songs related to work include agricultural and pastoral, domestic, street cries, and chants. There is also a large volume of songs related to specific occupations. Sea shanties are the best example in the Anglo-American folk tradition, but such songs also encompass farmers, cowboys, lumberjacks, and prison work gangs. These songs also have historically served a variety of functions, from directing particular tasks to providing diversion from work itself.

Nineteenth-Century Labor Songs

Social movements have always used music to unite, encourage, and inspire participants. The labor movement is no exception. Music is less easily suppressed than political tracts; it appeals to emotion as well as intellect and does not require a high level of education for the listener to understand and be moved by it. In pre-industrial times work songs, spirituals, and ethnic music served important community-building functions. But the formative years of the U.S. labor movement in the late nineteenth century brought with it a tradition of songs and song-poems that directly addressed the dramatic changes in working conditions that accompanied industrialization and offered a simple solution: Join the union.

This tradition began with the struggle for the 8-hour day, but the songs associated with it also commented on working conditions, the experience of immigrants, and a common dislike for the boss. The rousing chorus of “8 Hours”—“8 hours for work, 8 hours for rest, 8 hours for what we will!”—one of the most popular song-poems in U.S. history, could be heard at rallies, demonstrations, and parades.

The most popular song-poem of the nineteenth century came from the Knights of Labor. Typical of the songs of this period, “Storm the Fort, Ye Knights,” based on the tune “Hold the Fort”) exhorted workers to participate in a moral crusade and projected a vision of an alternative republic based more on cooperation than competition. It offered an optimistic, determined working-class message, which was pegged to a melody borrowed from an evangelical hymn. From this came a long heritage of labor songs based on familiar melodies. Other songs from this period portrayed the United States as a land controlled by an aristocracy of wealth in which workers had lost the rights their forefathers had fought to achieve. These songs often offered alternative visions, especially a republic of and for workers. Poets used the terminology of the Revolutionary Era and the shared heritage of the idea of freedom as tools to criticize social injustice and keep up the spirits of struggling workers. In a later period recorded songs of work and the labor movement reflected a wide variety of musical styles and perspectives.

Songs by and about immigrants also emphasized issues of social justice, pointing out discrimination and calling for genuine equality of opportunity. For instance, “No Irish Need Apply” suggested that Irish immigrants sometimes had a difficult time finding employment because of the stereotypes about them. The Protestant majority questioned their loyalty and their work ethic, criticizing them for celebrating different holidays and drinking too much. The song asserts the pride of the Irish and their determination to make a place for themselves.

Labor Songs and the Left in the Twentieth Century

Some of the most well-known and long-lasting labor songs came from the Industrial Workers of the World (IWW), whose vision of “One Big Union” was relatively popular among workers in the early years of the twentieth century. The IWW (or Wobblies, as they were known) printed and distributed a *Little Red Songbook* that was used as an organizing tool.

“Songs to fan the flame of discontent” reached workers in mines and mills, lumber camps, and hobo jungles across the United States. Most often the songs were based on new lyrics written to a familiar tune, often a hymn. One of the most well-known Wobbly songwriters was Joe Hill, who was executed in Utah in 1915. His words, “Don’t mourn, organize,” and his songs left a significant and lasting legacy to those who continued to fight for workers’ rights. A song later written about Hill by Earl Robinson, set to a poem by Alfred Hayes, was sung and recorded many times.

Another Wobbly songwriter, Ralph Chaplin, penned the words to “Solidarity Forever,” generally considered to be the anthem of the labor movement. The melody came from “The Battle Hymn of the Republic,” which had already been transformed into “John Brown’s Body.” Instead of “Glory, glory hallelujah, his soul is marching on,” the chorus says “solidarity forever, for the union makes us strong.” The song was used not only by the IWW, but again in the organizing drives of the Congress of Industrial Organizations (CIO) in the 1930s.

Some immigrants to the United States brought with them a musical heritage that was qualitatively different than either the African-American or the Anglo-American folk and religious traditions. Urban European workers were used to singing in choruses, and those who wrote songs about their work and their labor-organizing efforts in the United States at first attempted to use this choral tradition. Thus such composers as Charles Seeger and Elie Seigmeister wrote art songs aimed at secular European immigrant workers. One problem with such songs was that they were difficult to use at a march or a rally because they were technically difficult. Thus writers concerned about workers’ fate turned to using a more indigenous, rural folk style in their compositions. The songs may not have been authentic folk songs, but they were more accessible; both words and melody were easily remembered, and a group could sing them on the move if necessary, without musical accompaniment. These labor songs, written and sung in a style loosely based on Appalachian folk music, served an important purpose in the 1930s when labor organizing was at its height.

The Great Depression brought enormous problems for working people around the world who struggled to make ends meet. In the United States, songs played an important part in calling attention to these struggles and encouraging workers to fight for their rights. Yip Harburg’s “Brother, Can You Spare a Dime” evoked images of people who had worked and fought for their country but were now going hungry. More commonly popular music denied that

problems existed—“Life is Just a Bowl of Cherries”—or at best offered escape—“No Depression in Heaven.” The tradition of labor songs thus developed outside the bounds of popular music, particularly in the hands of Communists and other left-wing writers who were critical of Tin Pan Alley for its avoidance of the most pressing issues of the day. The Communist movement drew on earlier traditions and materials to write and adapt songs addressing such working-class issues as unemployment and labor unions. In their preference for folk-style music, they intended to create an alternative musical tradition as well as an alternative vision.

Many of the songs written and sung during the Depression Era suggest that if workers joined unions, many of their problems would be ameliorated. In 1932, Florence Reece, the wife of a miner, wrote a song called “Which Side Are You On?” in the midst of an intense strike by the National Miners’ Union in Harlan County, Kentucky. Many prominent outsiders—artists, writers, and journalists among them—came to observe for themselves the events in “bloody Harlan,” and it was these observers who helped spread the song along with the issues raised in the strike.

The first distribution of such songs by a union was the 1935 recording of the International Ladies’ Garment Workers’ Union (ILGWU) chorus. The 12 songs on the two 78-RPM records included “Hold the Fort” and “Solidarity Forever.” The ILGWU also produced the popular labor musical *Pins and Needles*. Another musical that addressed workers issues in a more esoteric form, *The Cradle Will Rock*, based on Marc Blitzstein’s original music, had a big impact on labor theater if not on song.

Woody Guthrie, Pete Seeger, and People’s Songs

One of the most well-known singers and song writers from the Depression era is Woody Guthrie, whose many original compositions about labor and other issues left a lasting legacy. Guthrie was an authentic folk singer whose compositions came from personal experience—he hailed from Oklahoma and had seen the Dust Bowl firsthand—but he was also a member of a broad Communist movement that intended to use song as a weapon to help workers overthrow the capitalist system. Guthrie’s theory of songwriting was less crude than the phrase “song as a weapon” might suggest, and many of his songs continue to be recorded and sung, from “Pastures of Plenty” to “So Long, It’s

Been Good to Know You.” Guthrie’s “This Land Is Your Land” still is sung by school children all over the United States, but few people know the origins of the song as a critique of an economic system that, in Guthrie’s view, bred vast inequalities.

Songs were disseminated by performers such as Guthrie and Pete Seeger. They were also created, revised, and spread through the interactions of writers, singers, and labor organizers at such institutions as Commonwealth College in Arkansas and Highlander Folk School in Tennessee. “Roll the Union on” came from Commonwealth and “We Shall Overcome” from Highlander. The first album of general union songs was recorded in 1941 by the Almanac Singers. *Talking Union* consisted of class-conscious lyrics set to traditional folk tunes, many of which became classics.

After World War II Seeger began an organization called People’s Songs, Inc., with a vision of a singing labor movement. In its short-lived existence (1946–1949), People’s Songs disseminated songs on a variety of issues, including labor, racial equality, and peace. The work of People’s Songs carried on the links between labor and other movements for social change. Such connections are exemplified in the song that became the anthem of the civil rights movement, “We Shall Overcome.” Originally a hymn, “I’ll Overcome Someday,” the song was adapted by black textile workers and brought to Highlander Folk School. Zilphia Horton adapted it and taught it to others, including Seeger, who added more verses to it. When Guy Carawan sang it in the North Carolina sit-ins in 1960 to protest segregation, the word overcome took on new meaning.

Popular Music

By this period some labor songs had carried over into popular music. Merle Travis had already composed and recorded two of the most famous mining songs, “Dark as a Dungeon” and “Sixteen Tons,” but by the 1960s, country music regularly included commentary on work. In the late 1970s, “Take This Job and Shove It” was number one on the country music charts. In the 1960s and 1970s, songs also documented contemporary labor struggles, such as that of migrant farm laborers.

As the conditions of labor changed however, and sessions at the bargaining table became more common than picket lines, songs became less useful as tools for labor organizing and expressions of solidarity. As the context and the nature of work

changed, so did the songs, with less emphasis on accessibility and participation. The 1960s brought more attention to individual singer-songwriters who performed and recorded for a mass audience in contrast to the group singing and songwriting activities of an earlier era. Yet writers and performers, such as Bob Dylan, drew on the legacy of Woody Guthrie and the issues of the People's Songs era. Rock musician Bruce Springsteen carried on this tradition in subsequent years, writing and singing about the conditions of workers and promoting a vision of a more cooperative society. Harkening back to Guthrie as well, Springsteen argued that the point was not to write propaganda but to tell stories in order to enable a mass audience to walk in the shoes of the oppressed. While he did write and sing about his own experience, Springsteen was still an interpreter whose recordings differed, particularly in style, from those of workers who performed their own songs.

Singers and songwriters addressed new themes from the 1970s on, including the environment, women's liberation, consumerism, and jobs moving overseas. Their songs did not always comment directly on issues of work and labor organizing, but many writers continued to make these links. Dave Rovics for instance called one of his songs criticizing U.S. imperialism "Pray for the Dead and Fight Like Hell for the Living," evoking memories of the feisty Mother Jones, one of the most important and successful labor organizers in the early twentieth century. New occupational songs appeared as well, such as those about truck driving. Old and new songs commemorated heroes and heroines of the labor movement, such as Mother Jones and those who wrote and sang about them, including Joe Hill and Woody Guthrie.

MUSTE, A. J. (1885–1967) Pacifist and Labor Activist

Abraham Johannes (A. J.) Muste gained his greatest renown as a respected leader and public spokesperson for the radical wing of the post-World War II American peace movement, where he promoted militant pacifism's vision of a nonviolent world through the pursuit of social justice and peace. For almost two solid decades, from 1919 through the late 1930s, Muste worked to create opportunities for working-class empowerment. His grassroots organizing efforts, his work as director of an innovative program in worker education, and his promotion of a revolutionary model of labor action and politics emphasized the potential of militant protest and foreshadowed the radical democratic thrust of Depression Era industrial unionism. In the process Muste helped sustain a tradition of independent radicalism and militant democracy among the American working-class.

Accidental Beginnings: The Lawrence Strike of 1919

Muste began his career in the early 1910s as a sheltered and inexperienced Dutch Reformed Minister.

Born in the Netherlands and brought to the United States as a child, Muste initially adopted the orthodox Calvinist inclinations of his family and the west Michigan Dutch immigrant community in which they lived. He attended seminary in New Jersey and New York, where he gained basic theological training, and then accepted his first ministerial job in upper Manhattan. Life in New York City changed Muste's life. The activist members of Muste's congregation and the tumult of the city brought this novice minister into contact with the precepts of the social Gospel, the reform agendas of leading social welfare advocates, and the public struggles of local workers fighting to improve the conditions of their lives. By the time of U.S. entry into the First World War, Muste, who had moved to a new congregation in the Boston area, had thoroughly imbibed of these progressive impulses, and by the end of the war, he had learned both the perils and promises of taking a principled and nonconformist stance. His outspoken advocacy of Christian pacifism during wartime cost him his job, forcing him to seek work and build community with nearby Quakers and other Christian opponents to war. At the same time, Muste's growing commitment to socialist ideals and working-class struggles began to alienate him from the same liberal antimilitarists who had come to his aid. He emerged from the experience a committed radical and respected organizer of the unorganized working class.

A 1919 strike in the textile mills of Lawrence, Massachusetts, the site of an earlier general strike of 1912, became Muste's crucible. In February of that year, a renegade group of workers revolted against a pay cut instituted by Lawrence employers and agreed to by their union representatives and walked out on strike, bringing 15,000–30,000 workers onto the streets with them. As part of a small fellowship of faith-based activists then living in Boston, Muste and two friends traveled to Lawrence to observe the events and quickly found themselves swept into the center of events. The members of the strike committee, acting in opposition to the American Federation of Labor (AFL), were essentially on their own, with little experience, minimal command of the English language, an immigrant constituent base divided by ethnicity and language, and almost no contacts outside their limited circle. Aware of the obstacles they faced and their desperate need for help, they asked the visiting Muste to become their committee's executive secretary. Although he had no formal union training or working-class credentials, Muste accepted the invitation, stepped into the political vacuum, and helped lead these workers through 16 weeks of difficult protest to victory.

Brookwood Labor College: An Experiment in Worker Education

The lessons Muste learned from the Lawrence experience—the importance of having strong and capable leadership at the grass roots, the need to forge unity among disparate groups, and the ways in which principled risk-taking could foster solidarity and political power—shaped his activism and defined his work on behalf of the organized and unorganized working class. Muste immediately moved into the newly formed Amalgamated Textile Workers of America, where he worked for 2 years as the unions' general secretary. His more lasting influence came through his work with Brookwood Labor College in Katonah, New York, which he directed from its inception in 1921 until his departure 1933. At Brookwood Muste advanced a unique vision of worker education that helped shape a generation of militant labor organizers and union advocates.

Brookwood Labor College began, as did Muste's labor career, as an outgrowth of the progressive strain of politically engaged pacifism that ultimately moved in a more revolutionary direction. Its founders, William and Helen Fincke, were members of the pacifist Fellowship of Reconciliation who, like Muste, sought to link the quest for peace with the fight for social justice, a difficult quest during a time in which labor and progressive activists faced full-scale repression and attack. With Muste at the helm, Brookwood forged ahead, making strong connections to leading progressives and militant trade unionists and developing an innovative curriculum that linked intellectual development to organizing experience. The school's goal was simple: To create effective labor leaders at the local level. To achieve this goal, Brookwood recruited students from a variety of regions and occupations; taught classes that ranged from sophisticated studies of psychology and sociology to basic public speaking, writing, and organizing skills; and sent its students out to apply what they learned to real-world situations. It was a stimulating environment that built community and confidence and gave Brookwood and Muste strong reputations within the progressive wing of the American labor movement. Brookwood's pedagogical emphasis on worker democracy and militant action, which strongly encouraged its students to think outside of established bureaucratic and political frameworks, ultimately brought the college into conflict with the more conservative elements of organized labor. In 1928, the leaders of the AFL publicly condemned the college as antagonistic and subversive and instructed member unions to no longer supply Brookwood with students or funds. Ironically the school's nondoctrinaire approach to labor activism

also earned it the ire of the Communist party, which also denounced the school that very same year. Charting an independent radical course was no easy task during the tumultuous years of the 1920s.

The Era of the Musteites

Neither Muste nor Brookwood folded in the face of these attacks. According to Muste, the school maintained its vitality for several more years but ultimately closed as a result of Depression Era financial constraints and factional infighting. Muste in the meantime had begun to develop what he hoped would become a politically powerful revolutionary workers' movement. In May 1929, he founded the Conference for Progressive Labor Action (CPLA). Through the CPLA Muste and his cohorts, many of them graduates of Brookwood, advanced an explicitly Marxist but non-Communist agenda that presaged much of the later work of the not-yet-formed Congress of Industrial Organizations (CIO). Their efforts reflected the growing dissatisfaction felt by progressive and radical unionists with both the rightward-leaning AFL and the Soviet-dominated Communist party. The CPLA believed that it could encourage alternative forms of labor activism that better served the needs of the American working class.

The Musteites, as CPLA's followers were called, called for organizing the unorganized into broad-based industrial unions (a direct challenge to the bureaucratic trade unionism of the AFL); advocated wide-ranging nondiscrimination clauses; and worked on behalf of the unemployed. During their heyday the Musteites lent skilled and militant leadership to a number of important strikes, including a series of violent labor conflicts in southern textile mills in 1929 and a mass protest and picketing campaign among autoworkers at Toledo Auto-Lite in April 1934. The CPLA also made a strong impact by organizing jobless Americans into Unemployed Leagues in Ohio, West Virginia, Pennsylvania, and North Carolina. Seeking direct political power, the CPLA merged in December 1933 with the Trotskyite Communist League of America to form the short-lived American Workers' party. In all of these efforts, the Musteites displayed their commitment to increasing the power of American workers at the grass roots.

The Return to His Pacifist Roots

In the summer of 1936, Muste experienced a religious reconversion that brought him back to his Christian

pacifist roots. He reconnected with the pacifist Fellowship of Reconciliation (FOR) where he won election to the organization's National Council and found employment as chair of the FOR's Committee on Industrial Relations. There he continued his pursuit of social justice for working-class Americans and participated on the periphery of vanguard labor protests, including a 1936 nonviolent "lie down" strike at a textile mill near Reading, Pennsylvania. In May 1937, Muste took on the directorship of New York City's Labor Temple, where he preached a doctrine of Christian social responsibility that linked religious practice to the defense of working-class struggle. In April 1940, he returned to the FOR as executive secretary, beginning the next and final phase of an activist career that would not end until his death in 1967. Even with peace and nonviolence at the center of his political agenda, Muste retained his militancy, his belief in the importance of skilled and visionary leadership, and his dedication to economic justice as a fundamental part of his work for social change.

MYERS, ISAAC (JANUARY 13, 1835– JANUARY 26, 1891) African-American Labor Organizer and Activist

From the Civil War years until his death in 1891, Isaac Myers was one of Baltimore's most prominent African-American citizens. Over the course of three decades in public life, Myers wore multiple hats, including those of labor organizer, community activist and spokesperson, postal detective, businessman, newspaper editor, and church leader. During the

Reconstruction years, Myers emerged as perhaps the nation's most staunch and well-known advocate of trade unionism for black workers. By the 1880s, however, his commitment to labor organization had waned as he became embittered by white workers' reluctance to abandon their hostility toward their black counterparts. Business, Republican party politics, and the African Methodist Episcopal Church occupied his organization and emotional energies in the last decade of his life. Myers's transformation from a preacher of the gospel of trade unionism to full-throated opponent of organized white labor illustrates the contradictory impulses toward black advancement in the late nineteenth century and the persistence of racial barriers to labor unity.

Myers was born free in Maryland, a slave state with the country's largest free black population, in 1835. Little is known of his parents, who were reported to be poor, not unlike many other free blacks in the border states. Late nineteenth-century accounts of his life state that he attended a private religious day school—no public schools were open to free-black children at the time—where he received the equivalent of a common school education. At the age of 16, he apparently left school and apprenticed to a prominent local black caulker, James Jackson, and within 4 years Myers was reported to have been superintending the caulking of some of Baltimore's largest clipper ships under construction. In 1860, he left the ship yards to assume the position of chief porter and shipping clerk in the wholesale grocery of Woods, Bridges, and Company, where he would learn crucial business skills that he would shortly put to good use on behalf of the city's black community.

The outbreak of racial conflict in Baltimore's shipyards immediately following the Civil War pushed Myers into a public leadership role as a community activist. In September 1865, white caulkers engaged in a successful month-long strike against Baltimore's shipyards, resulting in an all-white employment policy requiring the eventual dismissal of black shipyard workers. Displaced black caulkers quickly mobilized community support on their behalf, winning local support for the creation of a Mutual Joint Stock Company that soon became the Chesapeake Marine Railway and Dry Dock Company. Myers, who local accounts named as one of the black caulkers' leaders, was the likely source of the proposal to form the all-black company; joining with other community leaders drawn from the ranks of the African Methodist Episcopal Church and the Methodist Episcopal Church. Myers became a founder and director of the new enterprise, which leased facilities and gave employment to as many as 300 black dockworkers before it closed its doors in 1883.

Active on behalf of the Republican party in Maryland in the years immediately following the Civil War, Myers also organized black workers in cities across the South, earning a reputation as a strong supporter of black labor activism. In 1869, he accepted the invitation of the National Labor Union (NLU), an assemblage of white craft unions, to address its delegates. Speaking on behalf of the small black delegation at the convention, Myers sought to transform the white labor federation's unprecedented invitation into a permanent interracial relationship. On a practical level Myers assured his white listeners that they now had "nothing to fear from the colored laboring man," who desired only to see "labor elevated and made respectable," just as whites did. But he did express concern with the racial division of labor that relegated blacks to unskilled work. "American citizenship with the black man is a complete failure," he concluded, "if he is proscribed from the workshops of the country," as had long been the case. Myers called on white workers of the newly reunited nation to follow the NLU's example by finishing "the good work of uniting the colored and white workingmen of the country." Notwithstanding Myers's endorsement of Republican President Ulysses S. Grant and his opposition to the repudiation of the national debt (positions white workers objected to), his address was apparently greeted with respect, punctuated by enthusiastic applause.

Although the NLU was not interested in pressing its constituent white unions to drop their policies of racial exclusion, black workers in the upper South pressed forward with plans to organize. In July 1869, Myers presided over a gathering of 30 black delegates at the Douglass Institute in Baltimore to establish a statewide black labor association. In December of that year, Myers, representing the Baltimore Colored Caulkers' Trade Union Society, joined with over two hundred black delegates in Washington, DC to spearhead an effort to establish a Colored National Labor Union (CNLU) aimed at fostering black trade unionism. In its brief existence, the CNLU served as a clearinghouse for black trade unionists and politicians. Preaching the fundamental unity between labor and capital, it opposed employment discrimination; endorsed cooperatives, vocational training, and public education for blacks; supported the Republican party; and memorialized Congress on behalf of black southerners seeking public land, low interest loans, and civil rights. As the CNLU's first president, Myers traveled widely to encourage black workers to organize in self-defense and avoid becoming "the servants of servants." The "watchword of the colored men must be organize!" he told a group of African-Americans in Norfolk,

Virginia. In 1871, the former slave and noted abolitionist Frederick Douglass succeeded Myers as CNLU president, a testament to the growing influence of black Republican politicians in the organization. The CNLU quickly faded from the scene.

Over the course of the 1870s and 1880s, Myers was active in his support for the Republican party. For his efforts he was rewarded with a patronage position in the U.S. Post Office as a postal detective. By 1879, he was operating a coal yard in Baltimore; in 1882, he became owner and editor of a political newspaper, the *Colored Proprietor*, and held another patronage job as a U.S. gauger, a post he held until early 1887, when a Democrat assumed the position as collector for the port of Baltimore. Myers remained active on behalf of the Republicans, organized a Colored State Industrial Fair Association in Maryland, and founded and led a Colored Business Men's Association.

By the 1880s, if not earlier, Myers's stance toward organized labor had turned decidedly negative. "All branches of the trades are governed by rules and regulations which are so framed as to exclude the colored man," he explained to the readers of the *Christian Recorder* in 1881. Myers attributed the greatest antiblack animus to working- and middle-class whites, particularly immigrants. "Everywhere, the white trades unions prohibits the admission of colored men as members, and white contractors, no matter how favorable, are prohibited from employing colored mechanics," he complained. With white oppression and black workers' own failure aggressively to embrace what few opportunities there were, he predicted that black "mechanics will gradually drop into obscurity and the grave." The evolution of Myers's perspective from pro- to anti-union reflected less an objective shift in the relationship between black and white workers—the white hostility he objected to had not changed considerably over time—than it did Myers's growing pessimism about

the realistic prospects of interracial labor collaboration. When the rise of the Knights of Labor in Baltimore in the mid-1880s temporarily united black and white workers, Myers was nowhere to be seen. This new opportunity to create an interracial alliance, which many Baltimore blacks embraced, failed to win back the man who had once been the country's most prominent black labor leader.

Myers's final years were devoted to politics, business, and the church. For 15 years he served as the Bethel A. M. E. School of Baltimore as superintendent, transforming it, one contemporary claimed, into "the banner Sunday-school of the world." In his final years, he had been elected president of a project to build a home for elderly A. M. E. Church ministers. He died of a stroke after a brief illness in 1891.

NATIONAL AD HOC COMMITTEE OF BLACK STEELWORKERS

The National Ad Hoc Committee of Black Steelworkers was founded in 1964 by African-American members of the United Steelworkers of America (USWA). The first nationwide African-American protest organization in the USWA, it waged major struggles against racial discrimination in USWA policies and practices. Although it did not achieve all of its goals, it succeeded in improving African-Americans' prospects within the union and the steel industry. Its struggles led to changes within the USWA that paved the way for its agreement to sign the Consent Decree in 1974. The Committee disbanded in the early 1970s.

At the dawn of the 1960s, African-American steelworkers faced significant barriers to advancement due to discriminatory policies and practices within major steel companies. Although African-Americans formed a significant percentage of the USWA's membership, they felt that their issues were not adequately addressed by the union. Departments were highly segregated by race, which affected the type of work performed as well as black workers' mobility within a company. In general, African-American steelworkers were confined to unskilled, dirty, dangerous, lower-paying jobs such as in blast furnaces and open hearths, and were denied access to cleaner, safer, and more highly compensated positions dominated by whites. They were able to rise to skilled positions only in so-called black departments and advanced into skilled positions in "white departments" only after years of hard work and persistence. Blacks' mobility

was further constrained by the fact that seniority was accrued within departments—that is, blacks who transferred to other departments risked losing their hard-earned seniority. The situation was worse at the executive level, as an exceedingly small percentage of leadership positions in both the steel companies and the USWA were filled by African-Americans. African-Americans were discriminated against in promotions, and their positions were the most vulnerable to automation and layoffs.

These disadvantages remained despite the existence of a top-level USWA Civil Rights Committee, union contracts that contained nondiscrimination clauses, fair employment committees at the local level, and public pronouncements by union leaders. The USWA president, David McDonald, promised to fight racial discrimination, and the union vowed to work with the federal Committee on Equal Employment Opportunity (EEO), but significant racial disparities persisted.

In the 1950s, organized labor and unions responded to McCarthyism by taking more conservative stances, as organizations that called for social justice and racial equality were increasingly branded as Communist and anti-American. By the early 1960s, African-American unionists in many industries, frustrated by barriers to progress and inspired by the growing civil rights movement, began to organize protest groups. Among these were the Negro American Labor Council (NALC), which brought together over one thousand union members from the steel, rubber, and auto industries, and the United Negro Protest Committee. However, organized labor was not

receptive—even unions considered to be progressive, such as the United Auto Workers (UAW) and the USWA, denounced the African-American activism as anti-union and counterproductive. This is the context in which the National Ad Hoc Committee of Black Steelworkers was founded.

The Ad Hoc Committee formed in the summer of 1964, when a group of African-American activists within the USWA called a meeting at the union's International Convention in Atlantic City. Important members of this committee included Curtis Strong, Rayfield Mooty, Aaron Jackson, and Hugh Henderson. Elections for key USWA offices, including the position of president, were scheduled for 1965, and the Committee members recognized this as an opportune time to organize and use the African-American vote as leverage to force changes in the union's racial practices. They agreed to present a three-point agenda to both presidential candidates: 1) the re-organization of the union's Civil Rights Committee into a full-blown department led by an African-American; 2) greater African-American representation on district and national staffs; and 3) the inclusion of an African-American on the union's international executive board.

In December 1964, the incumbent president, David McDonald, dismissed the demands of Committee representatives in a meeting that lasted less than 15 minutes. The Committee fared better with the challenger I. W. Abel, who recognized that African-Americans, then composing 20% to 30% of the union's membership, could swing the vote in his favor. Abel agreed to the first two of the Committee's three demands, contending that the third would require a change in the union's constitution, and thus won the support of the group. Abel defeated the incumbent McDonald in a very close election in which the northern black vote sealed Abel's victory.

As promised, Abel re-organized the union's Civil Rights Committee into a new department, led by an African-American. He appointed other African-Americans, including Curtis Strong, to the staff and addressed the 1966 conference of the NALC. However, Abel failed to fully integrate the union's decision-making bodies, and the union's system of delegating blacks to low-paid, unskilled "black jobs" persisted. In 1966, the group picketed U.S. Steel's Pittsburgh headquarters and openly criticized Abel at the USWA convention later that year.

The Ad Hoc Committee continued to fight for change, holding two national meetings in 1967. The meetings spawned demonstrations against major steel companies, letters of protest, and discrimination lawsuits against both the USWA and the larger steel industry. The Committee tried repeatedly to meet with

Abel to discuss the union's racial problems but was continually ignored. It decided to up the pressure by organizing a picket line protest at the USWA's International Convention in August 1968; this would be the group's first action that directly targeted its union. The Committee also agreed on three new demands: 1) elimination of all discrimination in the USWA; 2) full integration in policy-making positions within all levels of district and national offices (including the earlier demand of an African-American on the Executive Board); and 3) revision of the union's civil rights program. Abel and other USWA leaders tried to preempt the strike through various political means, but their attempts were ineffective—the picket line garnered national media attention. The Committee's resolutions were voted down, but after the convention, Abel responded by hiring more African-Americans in staff positions.

The Committee continued its organizing and recruiting efforts and began to include more women in its efforts. Responding to Abel's efforts to hire black staff after the 1968 protests and by his promise to fight for an African-American on the Executive Board, the Committee endorsed his re-election in 1969 and helped him win a second term. In 1972, the USWA agreed to appoint an African-American to the Executive Board. Committee members viewed it as a hollow victory, however, criticizing the appointment—in a new position of vice president for human affairs—as tokenism and yet another instance of institutional segregation.

By this time, black steelworkers were increasingly turning to the courts for help, as well as forming new organizations outside of the USWA. Committee members, recognizing the limitations of a black reform movement within a predominantly white institution and acknowledging the frustrations of its constituency, voted to disband. Some local chapters continued on but lacked the power of a national movement. African-American steelworkers never again achieved the level of power they held during the high points of the Committee's fight for equality. In 1974, the USWA signed the Consent Decree, agreeing to pay \$31 million in damages to minority steelworkers and promising more progressive hiring practices.

NATIONAL ALLIANCE OF POSTAL AND FEDERAL EMPLOYEES

The National Alliance of Postal and Federal Employees (NAPE) evolved over the course of the twentieth century, from an all-black industrial union to an interracial trade organization. Founded in Chattanooga, Tennessee, on October 6, 1913, by African-American railway mail clerks, the National Alliance of Postal Employees came into existence only after the American Federation of Labor (AFL)-affiliated Railway Mail Association adopted a Caucasian-only clause in its national constitution. At the time, the Railway Mail Service formed one of the central departments of the postal service, operating wooden cars that created hazardous work conditions, and subsequently large casualty numbers, for the black mail clerks who worked on them. Given the risks, whites were reluctant to work in these positions. However, when the major railroads replaced the cars with steel containers in 1913, the Railway Mail Association launched an effort to systematically remove black clerks from its memberships. Along with a racially discriminatory program implemented by President Woodrow Wilson's newly appointed postmaster general, Albert Burleson, to make the railroads' postal operations “lily white,” the black clerks faced dismal job prospects.

Led by Robert L. Bailey of Indianapolis, Indiana, Louis J. Harper of Atlanta, Georgia, and Henry Mims of Houston, Texas, representatives from railway centers in 13 states held a national convention to draft a constitution that advocated protective measures for

their families (such as the creation of a beneficiary and insurance department), established a national journal that advanced their common cause, and created an organization to represent black workers who wished to file grievances and petitions with the Post Office Department. Throughout its early history, the Alliance grew rapidly from its southern base, establishing branches in New York City, Detroit, Chicago, Cleveland, Pittsburgh, and Cincinnati. Between 1920 and 1939, 11 districts were formed and the number of Alliance memberships grew slowly.

District and local Alliance members engaged in a wide variety of civil rights issues affecting the employment of African-American postal workers throughout the 1920s and 1930s, such as: demanding equal promotion and pay raises for postal employees; calling for an end to the Wilson Administration's use of photographs to accompany civil service applications; and waging an extensive publicity campaign against the segregation of mail crews and sorting rooms in southern areas. Branches of the National Alliance also co-operated with other organizations working for the political and economic advancement of African-Americans, such as the antilynching campaigns waged by the National Association for the Advancement of Colored People (NAACP), the employment initiatives of the National Urban League, and the “Back to Africa” movement of Marcus Garvey and the Universal Negro Improvement Association.

In the Great Depression years of the 1930s, NAPE membership faced new challenges when the Postmaster General instituted pay cuts and furloughs without monetary compensation for mail employees. World War II witnessed the involvement of organization leaders in Fair Employment Practice Committee (FEPC) hearings throughout the country in response to complaints of job discrimination in post office hiring and the promotion of Africans as timekeepers, window clerks, and scheme examiners. The Alliance campaigned for the hiring of black women to permanent positions in federal service. In 1945, Alliance activism reached a high-water mark when NAPE leaders pushed for permanent FEPC legislation. Branch applications for memberships declined sharply after 1948, however, when black postal employees faced wholesale suspensions under President Harry S. Truman's Federal Employees Loyalty Program, most notably in Cleveland, Chicago, Los Angeles, New York, and Philadelphia. Postal Loyalty boards directed their investigation against black and Jewish employees, inquiring about the employees' attitudes toward topics ranging from interracial marriage and community activism to items relating to national security such as the Truman Doctrine and the Marshall Plan.

In addition, NAPE members faced increased scrutiny as a result of a measure stipulated in the Taft-Hartley Act of 1947. While much of the legislation focused on industrial-labor management relations in the private sector, a section of the measure barred Alliance employees and other postal union members who wished to exercise their right to bargain collectively in the workplace from doing so. By the close of the 1950s, however, the Alliance had succeeded in pressuring the U.S. Post Office Department to create a Board of Appeals and Review as an impartial body to adjudicate the grievances of postal employees. Throughout the nation, Alliance local representatives worked diligently to promote grassroots voter registration drives and civil rights issues affecting its membership.

In 1962, the Alliance was dealt an administrative blow when the union's industrial status prevented its rank-and-file membership from being included in Executive Order 10988 as a "national exclusive" craft entity and entitled to collective bargaining rights. However, the Alliance managed to reach new heights despite these administrative setbacks. In 1965, the Alliance opened its memberships to include all federal employees. Changing its name to the National Alliance of Postal and Federal Employees (NAPFE), the Alliance worked in collaboration with the leadership of the Manhattan-Bronx Post Union (MBPU) and the National Association of Letter Carriers (NALC) when New York's clerks, mail handlers, maintenance workers, and letter carriers walked off the job for higher wages in 1970. By the late 1970s, the Alliance had created a definitive public image, with its representatives making numerous visits to Capitol Hill to appear before committees of the House and Senate to discuss legislation affecting the Union's interests.

In the early twenty-first century, with over 70,000 members organized into more than 141 local chapters in 37 states, the Alliance was at the forefront of employee-management relations, addressing issues such as mail security, federal job privatization, and health care, not to mention the challenges of globalization. It held biennial conventions throughout its 10 districts and published the *National Alliance* and the legislative newsletter for all federal employees in every branch of government. Furthermore, it offered the Ashby B. Carter Memorial Scholarship Program and a host of grants to the dependents of its rank-and-file membership and hosted a number of fund-raising activities for community organizations and auxiliary affiliates. It also forged alliances with the World Confederation of Labor and the Leadership Conference on Civil Rights.

NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP)

One of the nation's most prominent civil rights organizations, the National Association for the Advancement of Colored People (NAACP) is most famous for its Supreme Court victories in the 1950s and 1960s. In cases like *Brown v. Board of Education*, the NAACP remade constitutional law. In particular, the NAACP successfully attacked racially segregated education, transportation, and housing, as well as racially discriminatory voting procedures. For much of its history, labor issues were peripheral to the NAACP's wide-ranging agenda. Nonetheless, the NAACP consistently struggled with whether, and how, it would represent poor and working-class African-Americans.

The Early NAACP

Founded in New York City on the hundredth anniversary of Abraham Lincoln's birthday, the NAACP emerged in 1909 in direct response to riots in Lincoln's birthplace of Springfield, Illinois. The increase in white-on-black violence after the turn of the twentieth century might have been the immediate catalyst, but the problems the new organization sought to challenge extended far beyond such incidents. As laws and customs pervasively established racial segregation and discrimination in the late nineteenth and early twentieth centuries, the Supreme Court largely eviscerated post-Civil War constitutional protections for the formerly enslaved. The founders of the interracial NAACP sought to reverse this negative trend by expanding legal protections for African-Americans.

Throughout its history, the NAACP struggled to develop a strategy for addressing the problems of African-American workers. One of the Association's

People marching with signs to protest segregation in education at the college and secondary levels. Library of Congress, Prints & Photographs Division, Visual Materials from the NAACP Records [LC-USZ62-116817].

original goals was to help African-Americans find employment. Early in the NAACP's history, however, it informally arranged with the National Urban League to divide the pursuit of African-American advancement into legal equality and economic advancement. The NAACP focused on the former through litigation efforts and lobbying, while the Urban League concentrated on the latter through social work and community organization.

The Association's peripheral treatment of economic issues reflected the elite status of its founders. Although they were well equipped to handle their mission, the founders were unrepresentative of the vast majority of African-Americans who sought to fulfill basic economic needs. As a result, the Association thought that attacking the segregation and discrimination that affected the race as a whole was the best way to represent working-class as well as higher-status African-Americans.

Despite its focus on racial discrimination in education and housing, the early NAACP did not entirely eschew economic matters. Legal and economic inequalities were often inextricably linked in a Jim Crow system that completely subordinated African-Americans. In the first two decades of its existence, the NAACP frequently struggled with how best to

incorporate workers' interests into its program. Theoretically, union organizing might have been the most effective way, but it presented major obstacles for African-Americans. Most unions in the early twentieth century were defined by the race of their membership—white—as well as by their class composition. Unions' exclusionary and discriminatory practices led many African-Americans to view employers as friendlier than fellow white workers. The twin problems of hostile unions and African-American views contributed to the NAACP's reluctance to embrace union organizing as an answer to black workers' difficulties.

Instead, as reflected by articles in *Crisis*, the official organ of the NAACP, the Association considered numerous, sometimes inconsistent ways to assist working African-Americans: promoting socialism, cooperatives, northern migration, and black-owned businesses. The NAACP advocated on behalf of southern agricultural workers by publicizing egregious incidents of racial violence and horrifying working conditions. The NAACP, usually represented by fieldworker Walter White, investigated and publicized lynchings, massacres, and widespread practices of peonage and involuntary servitude. In particular, it publicized the Elaine, Arkansas, massacre in 1919 and the peonage that followed the Mississippi River flood in 1927.

The NAACP in the Great Depression

During the Great Depression, the NAACP's labor-related activities greatly expanded as a result of several factors: the Depression's devastating economic impact on African-Americans, widespread criticism of the NAACP for its labor policies, discriminatory federal responses to the economic crisis, and competition for loyalty from other organizations.

In a nation pre-occupied with poverty and saturated with class politics, the NAACP realized that it could avoid economic issues only at its own peril. Stinging critiques came from a group of young Howard University intellectuals dubbed the "Young Turks." They criticized the NAACP for placing too much emphasis on racial discrimination and not enough on economic inequality and working-class solidarity. For them, the upper-class status of the NAACP prevented it from representing workers and seeking equality beyond that needed for elites.

With a myriad of left-leaning organizations embracing the more class-based strategies the Young Turks favored, the NAACP's claims to race leadership faltered. As the Communist Party, the International Labor Defense (ILD), the National Negro Congress (NNC), and other Popular Front organizations attempted to gain African-American members, the NAACP competed for loyalty and membership. The ILD notably challenged the NAACP when it battled to represent nine young African-American men "legally lynched" for rape in Scottsboro, Alabama.

As a result of these pressures to address labor issues, the NAACP took on a variety of projects targeted to help poor and working-class African-Americans. One of its main tasks was to address race discrimination in federal programs. It called on the Roosevelt administration to implement New Deal programs in a nondiscriminatory fashion. It also lobbied (albeit unsuccessfully) to require the withholding of federal certification under the National Labor Relations Act (NLRA) to any union that discriminated on the basis of race. Beyond these federal targets, the NAACP also adopted a grassroots approach to economic issues by supporting local boycotts of retail businesses that refused to hire African-Americans.

The creation of the Congress of Industrial Organizations (CIO) in 1935 offered the NAACP a more politically mainstream way of helping African-American workers—by allying with organized labor. Unlike the American Federation of Labor (AFL), the CIO officially opposed racial discrimination from its inception. Although in practice CIO member unions at the local level continued to exclude African-Americans, the

NAACP saw the CIO as a friend and began a long and ambivalent alliance with organized labor.

Overall, during the 1930s, the NAACP expressed a greater commitment to economic issues than it had in the past, and some branches and youth councils even more actively pursued economic goals. Nonetheless, the NAACP never adopted labor issues as part of its core litigation agenda. The NAACP's notable litigation successes were reserved for areas like equal pay for teachers and access to graduate education, which garnered more support from middle-class than working-class African-Americans.

The NAACP in World War II

During World War II, the NAACP broke with previous practice by including labor issues in its core litigation agenda. This decision stemmed from the growing political and economic power of African-American workers during the war. Economically, after the high unemployment rates of the Depression years, war production needs created an economic boom, a far tighter labor market, and greater market power for African-Americans. On the political side, African-Americans in the North became swing voters valued by the Democratic Party. They became increasingly vocal about their demand for victory over fascism not only abroad, but at home where discrimination still hampered African-American progress. In this context, African-American workers began demanding the same rights that white employees had insisted on during the Depression.

As employment discrimination became the most nationally prominent civil rights issue of the day, the NAACP saw political, economic, and institutional opportunities to attack the problems African-American workers faced. Although the NAACP occasionally intervened to assist agricultural workers suffering peonage and other egregious labor practices in the South, it usually limited such intervention to passing on the complaints of agricultural workers to the United States Departments of Justice and Agriculture.

In the main, the NAACP addressed black industrial workers' concerns in the North, Midwest, and West. Industries frequently excluded African-Americans from jobs altogether, segregated them into the lowest-paying jobs, and denied them promotions. Unions also discriminated against African-Americans by excluding them altogether or segregating them into largely powerless auxiliary locals.

Under Walter White's leadership, the NAACP made significant headway in the 1940s tackling labor

problems with political and legal tools. In the political arena, the NAACP joined A. Philip Randolph and his all-black Brotherhood of Sleeping Car Porters to compel the Roosevelt administration to end employment and union discrimination in war industries. They successfully pressured Roosevelt to create the Fair Employment Practice Committee (FEPC) in exchange for halting a massive protest march during the war. Following this success, the NAACP persisted in its efforts, lobbying to transform the FEPC into a more powerful and permanent administrative forum to redress race discrimination in employment. It joined lobbying groups such as the National Council for a Permanent FEPC to help in these efforts.

In the legal arena, the NAACP pursued litigation in three main areas during the 1940s. The lawyers Thurgood Marshall, Prentice Thomas, and Marion Wynn Perry brought lawsuits across the country against boilermakers' unions that excluded African-American shipyard workers and segregated them into auxiliary locals. It challenged union and employer discrimination in New York under a pioneering fair employment practice law. And it supported the lawyer Charles Hamilton Houston's efforts to end employer and union discrimination on the railroads.

These lawsuits frequently pitted the NAACP against discriminatory labor unions, but the NAACP managed simultaneously to strengthen its alliance with organized labor. Following a 1941 strike at Ford Motor Company's River Rouge plant in Michigan, unity grew between the NAACP and the CIO. Labor leaders increasingly spoke at NAACP annual conventions, and the NAACP represented itself at activities sponsored by organized labor.

The NAACP's World War II emphasis on industrial concerns reflected the Association's recognition that African-American workers might bolster the Association's membership. Previously, the NAACP sought support from middle-class blacks and wealthy, philanthropic whites. The NAACP had therefore focused on issues of middle-class concern like education, as well as on issues like lynching, whose shock value garnered support from whites. As black industrial workers earned wages in the 1940s that enabled them to afford NAACP membership dues, the Association began to consider working-class African-Americans fruitful targets for membership. In an attempt to attract such workers, the NAACP created a new staff position in its Washington office devoted entirely to labor issues. Clarence Mitchell, a political activist who had worked for the federal Fair Employment Practice Committee, was hired for the job.

The new attention to workers appeared to pay off in membership terms, as the size of the NAACP

expanded considerably during the 1940s. The NAACP grew from 355 branches and a membership of 50,556 in 1940 to 1,073 branches and a membership of around 450,000 in 1946. The Association's budget grew from \$54,300 in 1930, composed of a combination of contributions and membership dues, to more than \$319,000 in 1947, entirely from membership dues. This tremendous growth was due at least in part to the new membership of working-class African-Americans.

The NAACP in the Postwar Era

The NAACP continued to pursue labor activities in the decade after World War II ended, although its school desegregation cases overshadowed its other work. The NAACP continued its two-pronged attack on labor problems. First, the NAACP cooperated with other civil rights, labor, and religious groups in lobbying for civil rights and labor legislation. In 1950, the NAACP formed the Leadership Conference on Civil Rights (LCCR), which included over 30 organizations and a wide array of labor leaders, including the liberal Democrat Walter Reuther and the more conservative AFL leader George Meany. The NAACP-labor alliance lobbied for a permanent FEPC, the repeal of antilabor laws such as the Taft-Hartley Act, and an end to union and employment discrimination.

That alliance stood in tension with the NAACP's second labor program: challenging race discrimination in unions. Unions at local levels often remained uncooperative with their national leaders' efforts to end discrimination and ally with the NAACP. Some black unionists nonetheless cautioned the NAACP against prioritizing its civil rights agenda over labor policies. When the Association conditioned its support for a pro-union railroad law on a nondiscrimination requirement, one African-American union member warned the NAACP not to defeat the bill entirely.

The conflict between supporting and condemning unions took an institutional form. Clarence Mitchell, who graduated from labor secretary to director of the NAACP's Washington Bureau in 1952, not surprisingly emphasized co-operation with unions on a national level. His replacement as NAACP labor secretary was his institutional rival, Herbert Hill, who primarily attacked discrimination within unions. Roy Wilkins, who became executive secretary in 1955, frequently attempted to mediate between the two.

To challenge discrimination in labor unions, Hill used grassroots economic political pressure as well as

state and federal administrative tools. In 1953, he began conducting workshops to teach black union members how to wield power in discriminatory unions. After the AFL-CIO merger in 1955, the NAACP educated the labor federation's staff about race discrimination. Also among the NAACP's main goals during this period was targeting large corporations that adopted discriminatory labor practices when moving to the South to capitalize on cheap labor.

Hill also launched direct attacks on particular unions. In New York, he was instrumental in the desegregation of New York City's Sheet Metal Workers Local 28. In Atlanta, he targeted discrimination in the International Ladies' Garment Workers' Union, a longtime ally of the NAACP that did not receive the criticism well. Nationally, the NAACP challenged widespread race discrimination in the steel, oil, automobile, and airline manufacturing unions. Building trades unions were especially recalcitrant and opposed NAACP challenges to their racial practices. In 1969, Hill facilitated the creation of the National Afro-American Builders, Inc. to help African-American builders gain skills necessary to bid for larger construction jobs.

Under Hill's direction, the NAACP also addressed agricultural labor practices in the 1950s. Hill investigated the conditions of migratory farmworkers and wrote a compelling booklet on the subject titled *No Harvest for the Reaper: The Story of the Migratory Agricultural Worker in the United States*. In New York, the NAACP called for government reform of agricultural labor camps. Hill had exposed several upstate New York camps where African-American farmworkers recruited from the South labored in oppressive conditions. On the federal level, when the NAACP supported raising the federal minimum wage in 1955, it lobbied for inclusion of both domestic and agricultural workers.

Throughout the 1950s, the NAACP used federal and state administrative agencies to redress labor problems. Lacking a federal law to attack discrimination, the NAACP turned to state fair employment agencies as well as less effective federal agencies. It filed complaints of employment discrimination with the Office of Government Contract Compliance, an agency President Eisenhower created by executive order in 1954 to supervise businesses with federal contracts. It also filed complaints against segregated and discriminatory unions with the National Labor Relations Board (NLRB).

In the early 1960s, direct action protests by groups such as Martin Luther King's Southern Christian Leadership Conference and the Student Nonviolent Coordinating Committee spotlighted the concerns of

African-Americans. In December 1962, two civil rights leaders sought to capitalize on momentum from these protests. Known for their long-standing advocacy of African-American workers, Bayard Rustin and A. Philip Randolph planned the event with economic issues in mind. They decided to call the protest a "March for Jobs and Freedom." The NAACP was one of the many organizations that took part in the historic march, which is now remembered for Martin Luther King's antidiscrimination focus in his "I Have a Dream" speech. Other speakers, including Walter Reuther of the United Automobile Workers, focused on economic issues.

The NAACP Legal Defense and Educational Fund after 1956

After 1956, the NAACP and the NAACP Legal Defense and Educational Fund (LDF) became distinctly separate organizations with different agendas. The two groups had essentially served as a single organization since 1939, when the NAACP created the LDF largely for tax reasons. The 1956 split was apparent in the types of activities undertaken by the two groups. While the NAACP continued to pursue lobbying for pro-labor legislation, the LDF focused on school desegregation litigation.

The LDF turned its litigation focus toward labor issues after passage of the 1964 Civil Rights Act. Under the direction of Jack Greenberg, the LDF launched a plan to file 1,000 complaints after the law's equal employment section (Title VII) went into effect in 1965. The LDF targeted large corporations such as General Motors and U.S. Steel, which offered well-paying blue-collar jobs in areas with high black unemployment. Rather than seeking employment per se, the LDF aimed to perfect the law itself.

One of the LDF's first successful cases authorized the use of class-action suits. The case targeted discrimination in Tennessee's Werthan Bag Company, later mentioned in the 1989 movie *Driving Miss Daisy*. In another notable LDF victory, the Supreme Court established that job qualification tests must relate to abilities needed to perform a job. It accepted LDF arguments that a test by the Duke Power Company unfairly discriminated against blacks who were equally capable to perform a desired job.

The LDF successfully targeted discrimination in the federal government after 1972, when Congress amended Title VII to allow such suits. The LDF notably won discrimination cases against NASA, the Postal Service, the army, the navy, the air force, and the Immigration and Naturalization Service.

It also proved successful in discrimination suits against city and state governments involving teachers, police officers, and firefighters.

Since the 1990s, the Legal Defense Fund has won court cases against Shoney's Restaurant, the Nashville Banner, and Shell Oil Company. It has also pursued employment discrimination cases against Abercrombie & Fitch clothing retailers, AVX (a South Carolina-based high-tech components manufacturer), the City of Chicago's fire department, and the New York City Parks Department and Board of Education.

The NAACP after 1964

Like the LDF, the NAACP's labor activities changed with the passage of the 1964 Civil Rights Act. The law, a result of public pressure following violent demonstrations in the South, appeared to spell victory for the NAACP's years of efforts lobbying for such legislation. The NAACP leader, Herbert Hill, organized local committees to educate African-American workers about their rights under the statute. He helped numerous African-American workers file complaints against governmental and private employers as well as unions. Between 1965 and 1977, the NAACP filed several thousand complaints on behalf of African-American workers with federal agencies like the Equal Employment Opportunity Commission (EEOC) and the National Labor Relations Board. The same year the Civil Rights Act became law, the NAACP legal counsel, Robert Carter, finally convinced the NLRB to deny certification to segregating and discriminating unions.

Throughout the 1970s, the NAACP looked beyond workers to the poor more generally, lobbying for expanded assistance to the poor and pressing for higher minimum wages, welfare reform, and full employment.

Under Benjamin L. Hooks, who headed the NAACP from 1977 to 1993, Benjamin Chavis, who took over until 1995, and Kweisi Mfume, who led the organization from 1995 to 2005, the NAACP has continued to pursue litigation against companies when complaints are insufficient to redress employment discrimination. In 1996, the NAACP launched its Economic Reciprocity Initiative to publicize the practices of major American industries in areas such as hiring, job promotions, advertising, and charity work. The goal was to promote those companies with favorable practices toward African-Americans while economically harming ones with poor results. The NAACP successfully sued Cracker Barrel in 2001 for employment discrimination and intervened in a

lawsuit against Coca-Cola filed by current and former employees.

NATIONAL ASSOCIATION OF COLORED GRADUATE NURSES

There is no record of what prompted Martha Franklin, in the fall of 1906, to write about five hundred letters to other black nurses to find out about their work. She wrote to individual nurses, to directors of training schools for black nurses, and to members of black alumnae and other nursing organizations. Franklin must have known that their situations were difficult at best. Soon after formal nursing education appeared in the United States in the mid-1870s, scores of hospital nurse training schools sprang up all over the country. Students spent two or three years working in the wards until they graduated, when a new group of students were enrolled. Most hospital nurse training schools were segregated, and black graduates found particular difficulty finding employment where race, as well as gender and occupation, factored against them.

Franklin was a Connecticut native who graduated in 1897 as the only African-American in her class at the Women's Hospital Training School for Nurses in Philadelphia. Franklin was a private-duty nurse in Connecticut when she started her marathon correspondence. In August 1908, Franklin's letters resulted in 52 black nurses meeting at St. Mark's Methodist Episcopal Church in New York City. They gathered at the invitation of Adah Thoms, the president of the Lincoln School for Nurses Alumnae Association. During this three-day meeting, goals were developed to advance the standards and best interests of trained nurses, break down discrimination in the nursing profession, and develop leadership within the ranks of black nurses.

The black physicians' organization, the National Medical Association, was also meeting nearby, and various members lent their support to their nursing colleagues. At the close of the three-day meeting, Franklin was offered the position of president and Thoms was elected treasurer. Three days later, the National Association of Colored Graduate Nurses (NACGN) was formed with 26 charter members.

This first meeting of black nurses reflected the activism of the new profession of nursing as a whole. The Nurses' Associated Alumnae of the United States and Canada, known after 1911 as the American Nurses Association (ANA), was organized in 1897.

In 1909, 52 black nurses gathered in Boston for the first annual NACGN meeting. One member was Mary Eliza Mahoney, who had graduated in 1879 and was acclaimed as the first African-American graduate nurse in the United States. The early years of the NACGN continued with annual meetings in different cities at the invitation of local groups or alumnae associations. These early meetings were a testament to the dedication and strength of the membership. These women overcame the expense and physical and mental hardships inherent in forming and sustaining an organization of working black women at this time of Jim Crow laws and widespread racial discrimination. In turn, the organization gave black nurses a stronger professional identity and groomed them in organizational leadership while shielding them from "the excessive racism, hostility, and denigration of their white colleagues."

The meetings involved presentations on such topics as the high incidence of tuberculosis and the high infant mortality among blacks as well as the conditions that spawned them—poor housing and lack of health facilities and employment opportunities. The nurses also discussed the unfair practice of some southern states that barred black nurses from taking the national nursing examination.

The role of the NACGN assumed a new urgency when the ANA restructured in 1916. Membership in the ANA, previously through alumnae associations, now was available only with membership in state nurses' associations. Since 16 southern state associations and the District of Columbia denied membership to black nurses, they were now effectively denied membership in the ANA. The ANA allowed the Alumnae Association of Freedmen's Hospital in Washington DC to retain membership, but future black graduates from these southern states were effectively barred from joining.

The NACGN formed a national nurses' registry in 1918, much the same as the ANA operated, to help its members find work. Membership steadily increased. In 1920, when the NACGN became incorporated in the state of New York, there were about 500 members. In 1926, the NACGN borrowed space for a headquarters office within the offices of the National Health Circle for Colored People, in New York City, and in 1928, the first issue of the NACGN's organ, the *National News Bulletin*, appeared. Yet, as the Great Depression took its toll and strategies to achieve integration with white nurses floundered, membership in the NACGN dropped to just 175 in 1933.

From this low point, the NACGN somehow managed to regroup itself, as the historian Darlene Clark Hines has described, through a combination of

factors. In 1934, the first of a series of regional conferences, supported by the Rockefeller Foundation, was held. Attended by black and white nurse leaders, as well as representatives from other disciplines, the discussions included the relationship between the NACGN and the ANA, the NACGN structure, and the status of black nurses. The black nurse leaders Estelle Massey Riddle and Mabel Keaton Staupers became involved with the organization, along with Congresswoman Frances Payne Bolton and the Julius Rosenwald fund administration, while some key white nurse leaders expressed concern with the black nurses' *de facto* exclusion from the ANA.

Estelle Massey Riddle, the first African-American nurse to hold a master's degree, was the NACGN president from 1934 to 1939. Mabel Keaton Staupers was hired as the first executive secretary, a post she held for the next 12 years. Staupers proved a staunch and energetic supporter of the NACGN for many years, eventually serving as the NACGN's last president. Also in 1936, the NACGN moved into its own office, strategically located in the same New York building as the three main white nursing organizations. Over the years, Congresswoman Bolton and the Julius Rosenwald fund continued their support.

The NACGN consistently stood for improved education for blacks, along with improved, nonsegregated educational and work opportunities for black nurses. The thrust for better care for black patients was continued during these years, as the NACGN worked with the National Urban League and the National Association for the Advancement of Colored People to improve conditions in black hospitals. Additionally, the NACGN co-operated with other nursing organizations on a variety of fronts, including the national Fair Employment Practices Act and the Bolton Bill amendment, which created the Cadet Nurse Corps.

ANA membership for black nurses remained a thorny issue; in 1939, 16 southern state associations still denied membership to black nurses. The two other major nursing organizations, the National League of Nursing Education and the National Organization of Public Health Nurses, both granted individual membership to black nurses when necessary.

Following the war, the ANA's position changed, although this was not immediately reflected by the state associations. The ANA membership voted in 1948 to allow individual membership to black nurses who were barred from their state associations. By 1953, all the states, except Georgia, admitted black nurses. Mabel Staupers wrote in 1984: "The war did a lot towards bringing it about. When people are sick they know no prejudice . . . I also feel that the ANA grew up."

In 1950, with all black nurses now eligible to join the ANA, the NACGN leaders considered that the major charge of its later years was fulfilled—black nurses from every state could now join the ANA. Mabel Staupers was elected president of the NACGN and oversaw its dissolution. The final membership meeting was held in January 1951 at St. Mark's Methodist Church, the site of the NACGN founding over 40 years earlier.

Thus, years before the start of the civil rights movement, a group of black nurses joined together to work for improved health care for black Americans as well as racial equality within nursing. Disturbingly, in 1971, the National Black Nurses' Association was formed following concerns about a lack of black representation in the ANA leadership.

NATIONAL CHILD LABOR COMMITTEE

The National Child Labor Committee (NCLC) was formed on April 15, 1904, as an organization dedicated to the abolition of child labor and to promoting the well-being and education of children in the United States. The organization focused on raising public

awareness about the employment of children in the industrial, service, and agricultural sectors and on securing the passage of child labor regulations and compulsory education laws.

During the late nineteenth and early twentieth centuries, the United States witnessed an unprecedented period of industrial and urban expansion. With this growth came what many Americans saw as intolerable social problems. From the 1890s through World War I, years commonly known as the Progressive Era, large numbers of middle-class men and women established reform organizations meant to combat the nation's ills. They focused on myriad issues ranging from urban poverty, political corruption, and temperance to woman suffrage, immigration restriction, and industrial regulation. During this time, growing numbers of children in the United States worked in textile factories, coal mines, glasshouses, and food canneries, as well as in fields picking produce, in city tenements manufacturing piece goods, and on the streets as peddlers, newsboys, and messengers. These working children drew the attention of many middle-class social reformers. Shaped by a mix of humanitarian objectives and fears of social degeneracy and decay, a strong child labor reform movement emerged in the United States by the turn of the twentieth century.

In line with other progressives, child labor reformers looked to use the state to bring about change. As early as the 1820s, labor organizations pressed for state laws restricting the employment of children in mills and factories. In 1836, Massachusetts was the first state in the United States to enact such legislation, outlawing the employment of children in manufacturing establishments who were under 15 years old and did not attend school at least three months a year. Massachusetts passed another act in 1842 limiting the workday of children in mills and factories to 10 hours. In the decades that followed, other industrialized states passed similar statutes. By the turn of the century, numerous states in the North and Midwest had child labor laws applicable to a variety of occupations that set minimum ages of hire, established educational requirements, and prohibited night work by children.

Organized labor, as well as groups established by middle-class social reformers, including religious organizations, consumer leagues, and women's clubs, was integral in the passage of these child labor statutes. Yet, the laws and their enforcement were uneven, and as late as 1902, no southern state had a child labor law. Owners of industrial enterprises in the North, especially cotton textile manufacturers, argued that the absence of child labor legislation in the southern states gave unfair advantage to manufacturing enterprises located there. This led some northern

manufacturers to open and operate factories in the South to circumvent regulations in their home states.

This lack of uniformity among state laws highlighted the fact that child labor was not only a pressing social and economic problem, but that it also was national in scope and called for a concerted, coordinated nationwide effort to eradicate it. Leaders of child labor reform groups who worked at the local and state levels, therefore, created the National Child Labor Committee. Edgar Gardner Murphy, chairman of the Alabama Child Labor Committee, and members of the New York Child Labor Committee, especially Felix Adler, who was one of the New York group's founding members, spearheaded the 1904 formation of the NCLC. Edgar Gardner Murphy, a minister from Montgomery, organized the Alabama Child Labor Committee in 1901, and two years later, he and his organization helped secure the passage of a child labor law in Alabama, the first twentieth-century child labor law enacted in the South. Murphy sat on the NCLC's first board of trustees, as did Felix Adler, a Columbia University professor and the committee's first chairperson. The NCLC selected the University of Pennsylvania sociologist Samuel McCune Lindsay as its first general secretary and the southerner Alexander McKelway and the northerner Owen Lovejoy, both ministers and longtime child labor reform advocates, as assistant secretaries. Headquartered in New York City, about one third of the NCLC's first members were from the South, with the remaining two thirds hailing from northern states. The organization counted among its founding members some of the foremost social reformers in the United States, including the settlement house pioneers Jane Addams and Lillian Wald, and the general secretary of the National Consumers' League, Florence Kelley, as well as academicians, journalists, labor and religious leaders, and progressive politicians and businessmen.

The NCLC focused much of its early twentieth-century activities on collecting information about the employment of children and disseminating it to the public, with the intention of arousing widespread sentiment against child labor and support for legislative restrictions of it. The organization first sent investigators into textile mills, factories, and coal mines, where some of the most flagrant abuses of child labor occurred, and then focused on children who did industrial homework, worked in the street trades, and labored as itinerant farmworkers. The reports of these investigations often included graphic accounts of the realities, effects, and hazards of child labor and statistics documenting appallingly low education rates and literacy standards among the nation's child workers. The NCLC published these findings in its

quarterly publication, *The Child Labor Bulletin*, in the weekly social reform magazine, *The Survey*, as well as in book and pamphlet form, and in academic journals. It used the editorial pages of newspapers, leaflets, and mass mailings to reach an even wider audience.

It was the photographs of children working in a variety of industrial and agricultural settings, especially those taken by the NCLC investigator Lewis Hine, that had the most profound and lasting impact on public opinion. In 1909, Hine published the first of his photographic exposés documenting children at work, “Day Laborers before Their Time” and “Child Labor in the Carolinas.” Two years later, he began an extensive investigation and compiled a far-reaching photographic record of children at work, traveling throughout the eastern United States, from cranberry bogs in New England to oyster canneries along the Gulf Coast. The photojournalism of Lewis Hine, as did the written reports of NCLC investigations, thrust the issue of child labor into the national spotlight and political discourse.

In spite of advances made by state child labor committees and the NCLC in the passage of child labor laws at the state level, disparities continued to exist, and the NCLC increasingly focused on the enactment of federal child labor legislation that would apply to all states evenly. In 1906, Senator Alfred Beveridge of Indiana introduced into Congress a bill that would make illegal the interstate transportation and sale of goods produced by companies employing children under the age of 14 years. A heated debate ensued among the members of the NCLC’s board over whether the organization should endorse the Beveridge bill, and divided the NCLC between a faction preferring to continue lobbying for regulatory laws at the state level and another seeing federal intervention as the most expeditious, albeit constitutionally controversial, route to the eradication of child labor. The NCLC ultimately voted to endorse the Beveridge bill, a decision that led to the resignation of Edgar Gardner Murphy and other leading southern members from the organization.

The movement for federal child labor legislation faced staunch opposition from a number of fronts, including not only employers but also parents of working children who needed their income to keep the family economy afloat. Despite support from the NCLC and other social reform groups, the Beveridge bill failed to pass. It did, however, garner enough attention and interest to facilitate the creation of the U.S. Children’s Bureau in 1912. The Beveridge bill was also the basis of the Keating-Owen Child Labor bill, which NCLC endorsed and for which it actively lobbied. The Keating-Owen Act became law on September 1, 1916.

Although the U.S. Supreme Court declared the Keating-Owen Act unconstitutional in 1918, the NCLC continued to push for federal child labor regulations. In 1919, the NCLC supported the enactment of the Child Labor Tax Act, which levied a 10% excise tax on goods produced by children, and, after the Supreme Court deemed it unconstitutional in 1922, worked aggressively to secure a constitutional amendment that would give Congress explicit constitutional authority to regulate child labor. Though approved by Congress in 1924, the states failed to ratify the amendment. In 1938, the NCLC finally saw its goal of the enactment of a permanent federal child labor law realized with the inclusion of minimum age provisions within the Fair Labor Standards Act.

The National Child Labor Committee continued to work for improvements in federal child labor legislation, especially to extend the protections afforded by the Fair Labor Standards Act to children working as agricultural laborers, and in education requirements and standards. The NCLC continues to be a leading advocacy group for youth in the United States and is a clearinghouse for information relating to child labor law compliance and enforcement, education, and youth employment. The NCLC celebrated the centennial anniversary of the organization in 2004.

NATIONAL CIVIC FEDERATION

The National Civic Federation (NCF) emerged out of the era of “Great Upheaval” in labor relations between the mid-1870s and mid-1890s. It reflected the heightened anxiety of businessmen and the middle-class public over the growing polarization between labor and capital and the increasing power of unprecedentedly large corporations in manufacturing, transportation, and finance. Through a novel tripartite structure, some of the largest corporations crafted what they hoped would be an institutional forum for cultivating “responsible” labor and some measure of business accommodation to legitimate grievances of labor, while policing the competitive marketplace to reduce excessive and destructive competition. They recruited allies among civic leaders and the national officers of the American Federation of Labor (AFL). In so doing, they also incurred the wrath of left-wing labor leaders and what they termed “anarchists” among businessmen, their archrivals in the National Association of Manufacturers and its avowedly “open shop” movement.

The origins of the NCF lay in the depression of 1893 and the Pullman strike and boycott. Shortly after the closing of the Columbian World’s Exposition in Chicago, a coalition of civic and business leaders prompted by Rev. William T. Stead, the author of *If Christ Came to Chicago*, called a public meeting at which the assembled reformers, including Jane Addams, Henry Demarest Lloyd, the banker Lyman Gage, and others called for the formation of a “civic federation” to pursue the goals of social amelioration and class reconciliation. Months later, early in the strike of Pullman car shop employees, a delegation from the Chicago Civic Federation (CCF) tried unsuccessfully to persuade George M. Pullman to meet with his striking employees. In November 1894, following the collapse of the massive Pullman boycott itself, the CCF convened a Congress on Industrial Conciliation and Arbitration to re-affirm the goals of industrial mediation. Through the appointment of a National Commission, the CCF hoped to influence states and the federal government to pass new legislation establishing boards of arbitration and support a new national legislative initiative to resolve future railroad labor disputes. That initiative eventually took the form of the Erdman Act of 1898. In the context of the return of prosperity in 1897 and an accelerating pace of corporate consolidation in what came to be called the “great merger movement,” the CCF sponsored high-profile national conferences on foreign policy (1898) and the “trust problem” (1899).

During the CCF’s early years, a one-time Kansas City journalist and conservative civic promoter,

Ralph Easley, served as its secretary and chief organizer. Indeed, it was Easley’s vision of an influential national organization committed to industrial conciliation that precipitated the formation of an organizing committee for such a body at the National Conference on Trusts. Despite some opposition from within the CCF, Easley managed to call another National Conference on Trade Agreements in 1900, out of which a tripartite board was appointed for a National Civic Federation that, in its early years, would be committed to industrial conciliation. Included as members were Samuel Gompers, the president of the American Federation of Labor, and John Mitchell, the president of the United Mine Workers of America, whose organizations both experienced considerable growth and national prominence in that period.

Also recruited to the NCF in its first year were the Republican boss and former industrialist Mark Hanna and the corporate titans Charles Francis Adams, Andrew Carnegie, and key figures in the J. P. Morgan investment firm, including George W. Perkins. As the NCF’s organizational structure expanded into a series of functioning departments—Trade Agreements, Welfare, Immigration, Commission on Public Ownership of Utilities—its membership also reached deeper into the corporate and labor worlds. Other key members included, for business, Elbert Gary, Samuel Insull, Cyrus McCormick, and August Belmont and for labor, besides Gompers and Mitchell, William Mahon (Streetcar Employees) and Frank Sargent (Locomotive Firemen), along with public representatives, Easley, Seth Low, and John R. Commons. As the focus of the NCF shifted, so too did its membership, though Easley provided continuity as the perpetual hub of the organization.

In its earliest years, the NCF’s chief pre-occupation lay in labor conciliation. Although frequently operating behind the scenes, the NCF helped diffuse conflict or produce trade agreements that brought potentially disabling strikes to a conclusion. Most notable among these were the Steel Strike of 1901, the Anthracite Coal Strike of 1902, and the Machinists’ Strikes of 1901 and 1904. Emblematic of these efforts was the behind-the-scenes work of the NCF (notably Easley, Mitchell, and Morgan) to craft first a temporary agreement in the 1901 Anthracite coal dispute and then a resolution of the bitter five-month strike in 1902, through a presidentially appointed commission that left the miners without formal recognition but in possession of a trade agreement granting wage concessions and creating a board of arbitration that would hear future grievances. The NCF hailed the agreement as a model for future labor-management conciliation.

Officially committed to fostering labor-management peace through negotiation, the NCF approach did not in fact reflect the day-to-day practice of many of its most influential corporate members. This is perhaps most notably true in the case of the U.S. Steel Corporation and its president, Judge Elbert Gary, who like many of his colleagues, maintained a determined anti-union posture throughout the period of the NCF's greatest influence.

Almost from the outset, the NCF positioned itself as an alternative to the more aggressively anti-union National Association of Manufacturers (NAM), which after 1902 spearheaded an "open shop" campaign that sought to roll back trade union gains in cities across the country through locally organized Citizens' Industrial Associations (CIA). Its leaders, David Parry and James Van Cleave, also supported high-profile prosecutions in the famous Danbury Hatters' and Buck's Stove and Range cases of union officials, including NCF member Samuel Gompers, for backing trade union boycott activity. Quietly, some key corporate members of the NCF assisted in Gompers's legal defense.

Socialists and industrial union opponents of the AFL leadership consistently attacked Gompers, John Mitchell, and William D. Mahon for their participation in the NCF. Gompers saw such participation as the logical outgrowth of the stature the AFL had acquired in the buoyant years 1897 to 1904, and he regarded this position as a crowning personal and organizational achievement. His opponents viewed such participation as nothing short of class collaboration with fundamentally anti-union corporate elites.

After 1905, the NCF's focus shifted somewhat from direct mediation of labor-management disputes to promotion of corporatist measures that might ameliorate class friction in a number of areas: employee welfare, regulation of trusts (through amendment of the Sherman Anti-Trust Act), public utilities regulation, workers' compensation, child labor, and immigration. The NCF, and especially its secretary Ralph Easley and president Seth Low, played major roles in the efforts of corporate reformers allied with both Theodore Roosevelt and Woodrow Wilson to craft new regulatory legislation that would both limit the effects of unpredictable court decisions under the Sherman Anti-trust Act and move the federal government toward a greater administrative role in the trust-dominated marketplace. These goals came to be embodied to some degree in the Clayton Antitrust and Federal Trade Commission Acts of 1914.

Although its labor members did not always join wholeheartedly in its initiatives, the NCF pioneered some new legislation (such as state-level workers' compensation laws) and promoted new arenas of

corporate innovation (welfare capitalism of the 1920s). Some of these efforts bore fruit well after the NCF itself ceased to be an influential force in public life. During and after World War I, a cadre of "enlightened" businessmen continued to seek ways to secure the position of America's largest corporations against unnecessary competition, while at the same time limiting the growth of more aggressive forms of unionism and independent labor and socialist politics.

Easley and the NCF steadily lost influence in the postwar era. But the seeds of its corporatist vision had been planted and eventually bore fruit in the New Era and New Deal.

NATIONAL CONSUMERS LEAGUE

For over a century, the National Consumers League (NCL) has been a leader in the movement to improve the pay and working conditions of factory laborers. Throughout the twentieth century, it consistently believed that these reforms would ameliorate some of the negative effects of capitalism and lead to an increase in the working classes' economic and political power. Its operations employed a dual strategy, coupling its campaign to use consumers' economic power to persuade factory owners to improve working conditions for laborers with efforts to enact and enforce legislation that established safety standards, minimum wages, and maximum hours. Founded in 1899, the League began by uniting white, middle-class, women reformers with trade unionists to end the sweating system for women and children in cities throughout the United States. By the end of the twentieth century, the NCL employed a similar strategy in

its efforts to improve the working conditions for all laborers in factories throughout the world.

The NCL originated from the Working Women's Society (WWS), established in New York in 1886, and its successor, the Consumers League of New York (CLNY), created in 1890. The WWS was composed of both working-class and middle-class women who sought to improve the working conditions of laboring women. The working-class women attempted to organize workers into unions and advocated for protective legislation while the middle-class members worked to educate female consumers and use their purchasing power to end the sweating system for women laborers. After four years, the Society divided along class lines and dissolved. The middle-class members, led by Josephine Shaw Lowell and Maud Nathan, established the CLNY to enlarge their campaign.

The CLNY inspired the creation of other state consumer leagues and ultimately the formation of a national league. It borrowed the strategy of a similar organization operating in London that created a "white list" of businesses that maintained acceptable working conditions for their employees and did not use home manufacturing or child labor. Local leagues established throughout the North and Midwest each employed this strategy. By 1898, the local leagues sought to co-ordinate their efforts and founded the NCL to create a consumers' "white label," modeled after the union label, that it awarded to manufacturers who met its labor standards. The following year, the socialist and settlement worker Florence Kelley, who had been active in forming a league in Illinois and had proposed the label strategy, became the first secretary of the NCL.

Kelley served the NCL until her death in 1932. Throughout her tenure she attempted to arouse and exploit the moral conscience of women consumers through both economic and ethical arguments. She explained that when employers maintained unsanitary factories and used tenement manufacturing, they were both inhibiting the use and development of technological advances that could lower the cost of goods and were endangering public health through the sale of dirty products. Kelley also emphasized the human costs of hazardous work for long hours and low pay to the workers, their children, and their homes and asked middle-class women, as good citizens, to use their consumer power to help. Kelley used these arguments as the basis for the white label campaign.

The white label campaign required extensive field-work and a publicity operation. The NCL began by investigating and documenting working conditions for urban laborers throughout much of the country. Within five years, it awarded the white label to more

than 60 factories. It publicized its work, in part, through the manufacturers and retailers that complied with its standards. Most prominently, it forged an agreement with the garment manufacturer and department store tycoon John Wanamaker to create window displays that illustrated the contrast in working conditions between sweatshops and model factories and featured Wanamaker's clothes with a white label. For those companies that persisted in using the sweated labor, Kelley led the League in a legislative campaign.

The NCL worked with state leagues and numerous other organizations including trade unions, the National Women's Trade Union League, settlement house workers, and state and federal agencies to pass protective labor laws, establish agencies to oversee their enforcement, and defend them against legal challenges. In the first two decades of the twentieth century, the League assisted in the enactment of a number of state laws that limited child labor, established safety standards for factories, and set maximum hours for women workers. It played a critical role in defending the constitutionality of Oregon's labor law in a case that went to the United States Supreme Court. Kelley and her colleague Josephine Goldmark, through Goldmark's brother-in-law Louis Brandeis, submitted a brief to the Court that outlined the League's extensive evidence of the injurious results of sweated labor. When the Court upheld the maximum hours law for women in 1908 in *Muller v. Oregon*, more than 15 states enacted similar laws. In 1909, the NCL drafted a minimum wage law for women modeled after a British law. It was enacted first in 1912 in Massachusetts and subsequently in 14 additional states.

By the 1920s the NCL made its legislative work primary. In 1918, it ended its white label campaign without abandoning its belief in what it called "ethical consumerism." Florence Kelley explained that workers through their unions and collective bargaining were able to secure better working conditions than the standards set by the League at the turn of the century in its label campaign. Focusing on Congress and state legislatures, the NCL expanded its efforts to secure protective labor laws into the southern states, broadened its efforts beyond white women and children to include white men and black men and women, and sought health care for women and children outside of the factory. One of Kelley's greatest legislative efforts was the NCL's advocacy of the Sheppard-Towner Maternity and Infancy Act. Passed in 1921, it provided federal funds to states for maternity and child health programs.

The NCL's legislative campaigns suffered setbacks in the mid-1920s. In 1923, the Supreme Court struck

down the District of Columbia's minimum wage law. In 1926, Congress refused to continue to fund the Sheppard-Towner Act. The NCL also fought against the National Woman's Party's Equal Rights Amendment, believing that the amendment would undermine the protective labor legislation that remained. The NCL persevered and intensified its legislative efforts during the Great Depression, securing some of its most significant reforms during the New Deal era.

During the 1930s, the NCL assisted in the enactment of state and federal labor legislation and in operating the agencies created to oversee regulation enforcement. The NCL led efforts to allow state involvement in labor contract negotiations, worked with the National Recovery Administration during its existence (1933–1935) in setting and enforcing minimum wage and maximum hours codes, and was instrumental in securing wage and hours laws in several southern states. In 1933, President Roosevelt appointed the NCL member Frances Perkins as secretary of labor, and the NCL member Clara Beyer was a regional director for the National Labor Relations Board (NLRB). Most prominently, the NCL lobbied extensively for the Fair Labor Standards Act, which passed in 1938, codifying into federal law its labor reform efforts.

Beginning in the 1940s, the NCL once again faced external opposition. Professional male experts replaced NCL members in governmental positions who oversaw the new labor laws. NCL members were frustrated both because they were marginalized and because the labor legislation and its implementation left the wages and working conditions for countless laborers unreformed. The League struggled to maintain its mission, even temporarily changing its name during World War II to the National Consumers League for Fair Labor Standards, to distinguish itself from emerging groups that championed consumers' rights. During the 1950s, Cold War politics and antilabor forces required some NCL members to defend their activism. For the following 30 years, the NCL's influence significantly diminished.

In the 1980s, the NCL began to regain some public stature when it expanded its original program of using consumer power to improve working conditions for wage laborers beyond United States borders. The NCL was responding to the public exposition of deplorable working conditions in many of the factories in the global apparel industry. After World War II, a number of factors caused a rise in violations of the hard-fought protective labor laws, including a shift of production outside of the United States, a decrease in inspections of factories, rescission of some

labor restrictions in the United States and an absence of regulation in manufacturing sites outside the United States, an increase of poor immigrants in the United States, and a decrease in the power of labor unions. The NCL joined the antisweatshop campaigns led first by the National Labor Committee and then the Department of Labor, in a fight it had championed a century earlier.

At the turn of the twenty-first century, the NCL worked with the federal government, trade unionists, and other nongovernmental organizations to set labor standards for the global apparel industry and ensure their enforcement through public and private power. Once again, one of its primary tools to set and enforce a minimum wage, maximum hours, prohibitions on child labor, and health and safety standards was to appeal to consumers and use their economic power to persuade companies to improve their treatment of their workers. In 1995, it worked with Secretary of Labor Robert Reich as he set forth a "white list" of manufacturers that followed the government's labor standards. In 1997, it joined the Apparel Industry Partnership, creating labor codes and awarding "No Sweat" labels to companies that complied. Time will reveal the effect of these efforts, but at the turn of the twenty-first century, the spirit of the NCL persisted.

NATIONAL EDUCATION ASSOCIATION

The National Education Association (NEA) is a teachers' union that evolved from a professional association. Numbering 2.7 million members in 2005, the present organization developed from an 1857 meeting called by Thomas W. Valentine and Daniel B. Hagar, presidents of the New York and Massachusetts State Teachers' Associations, to form a National Teachers' Association (NTA). The meeting attracted about 100 educators who regarded themselves as "practical teachers," in distinction from the state officials, college presidents, and reformers who composed other educational associations. Working together, these founding members hoped to professionalize their occupation. They resented existing lay governance of education and sought to become a self-regulating profession with control over preparation, qualifications, and practices in the field.

Women soon outnumbered men in teaching, but only "gentlemen" qualified as full members according to the NTA Constitution. At the 1857 meeting, two women signed the Constitution; however, women were not accepted as full members until 1866, when the Association replaced the word "gentlemen" with "persons." Several women served as officers of the Association and addressed annual meetings in

subsequent years. Nevertheless, women's participation in the Association did not nearly match their proportions in teaching in the late nineteenth century.

The founders identified themselves as "practical teachers," but their annual meetings reflected their swift ascent to administration as men profited from the nineteenth-century bureaucratization of schools and moved into these newly created, better-paying positions. In 1870, the NTA changed its name to the National Education Association, after merging with the American Normal School Association, the National Association of School Superintendents, and the Central College Association, all organizations that brought more administrators into the membership. To re-inforce the national scope of their ambitions, leaders selected a different city to host the annual meeting each year. Addresses typically concerned developments in educational theory and federal aid to education. Annual meetings were also the venue for elections and important committee appointments, such as those to recommend curricular reform for secondary and elementary education.

Membership grew, but it did not keep pace with the soaring numbers employed in U.S. schools. Between the Civil War and 1900, the number of teachers tripled, but less than 1% joined the NEA. Focused on influencing educational policy and raising professional

Secretary, National Education Association (NEA), displays emblem to John W. Studebaker, U.S. Commissioner of Education. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USE6-D-005523-a].

prestige, the leadership showed little interest in the problems facing ordinary classroom teachers, whose meager salaries did not permit regular annual meeting attendance. The NEA passed occasional resolutions in favor of better pay, but for the most part, leaders expressed faith that professionalism would secure better salaries.

Seeking an infusion of members and activity, the NEA recruited as president Thomas W. Bicknell, editor of the *Journal of Education* and the former president of the American Institute of Instruction. A tireless promoter, Bicknell billed the 1884 meeting as “the greatest educational show on earth,” drawing attendance of nearly 5,000. Not only the NEA’s most successful, the program was also the NEA’s most inclusive to date, with two African-American men and five white women addressing the general assembly. The organization’s effort to appeal to women teachers and reformers succeeded; 54% of those attending were women.

Bicknell popularized attendance at the annual meeting, but he was also instrumental in creating an elite circle within the NEA, the National Council of Education. Formed in 1881, the Council consisted of 51 members appointed by NEA leaders to deliberate and hand down important decisions on educational questions. It soon became a lightning rod for concerns about centralized authority in education. Responding to members’ demands for more open discussion, the Council more than tripled in size during its 60-year history, while its mandate grew outmoded. The Council was created to deliver expert opinions; but the NEA Research Division, created in 1922, provided the data and expert analysis on which the Association came to rely.

Criticism of the NEA and the Council’s elitist orientation mounted as women classroom teachers struggled for representation. Women’s attendance at annual meetings grew in the 1890s, but their numbers did not translate to influence. Women teachers controlled their own urban associations, like the Chicago Teachers’ Federation, and local successes raised their expectations for a national organization that would pursue their priorities. Facing new demands from classroom teachers, established NEA leaders guarded their power. At the 1903 annual meeting, the NEA president, Nicholas Murray Butler, proposed narrowing the electoral process. Instead of the affiliated state associations selecting the members of the nominating committee, Butler suggested the president should appoint them. Infuriated by Butler’s grab for power, the Chicago Teachers’ Federation activist Margaret Haley turned the vote against him. She argued that his proposal would create an

undemocratic “self-perpetuating machine,” designed to block women from positions of authority.

Demanding that teachers share in the wealth they helped to create, Haley explicitly connected classroom teachers’ and workers’ rights. She galvanized a following at the 1904 annual meeting with her speech, “Why Teachers Should Organize,” in which she contended that schools were becoming too much like factories and urged the importance of teacher welfare and independence to the protection of the nation’s democratic ideals. The NEA leadership charged Aaron Gove, the Denver superintendent of schools, with responding to Haley’s address. Gove agreed that teachers deserved better terms and conditions of work, but he warned that organizing would lead to class division within the profession and harm the schools. Gove argued the efficiency of centralized authority, insisting that “despotism can be wielded with a gloved hand.” These and similar expressions of patronizing paternalism motivated classroom teachers to embrace Haley’s call to organize for better conditions of employment. The first known strike by NEA-affiliated teachers took place that same year in Saline County, Illinois, where teachers refused to sign contracts until the school board met their salary demands. Though strikes remained rare, issues such as salaries, pensions, and tenure began to show up on the NEA agenda.

Conflicts of Gender and Rank

When administrators dominated the NEA in the nineteenth century, organizational priorities emphasized educational policy and building a profession. As classroom teachers made their opinions known at annual meetings, teachers’ rights and welfare attracted new attention. They exposed how the NEA, boasting about 2,300 members in 1900, did not represent the tens of thousands of teachers in the nation. NEA leaders continued to consider professionalization their primary objective, but they no longer dismissed classroom teachers’ concerns.

Pressure from teachers produced significant changes in NEA activities and personnel. In 1903, the NEA undertook its first investigation of salaries, tenure, and pensions, steered by a committee which included Catharine Goggin, a Chicago Teachers’ Federation activist. The women teachers of Chicago and New York proved their growing power when they joined forces in 1910 to elect Ella Flagg Young, the superintendent of Chicago public schools, as the NEA’s first female president. Young instigated the

creation of the Department of Classroom Teachers, establishing a place in the administrator-dominated organizational structure for teachers, and she secured funding for further study of teachers' salaries. As a consequence of her leadership, the NEA endorsed women's suffrage, teachers' councils, and equal pay for equal work. It also adopted the practice of alternating the presidency between the sexes.

Attempting to blend administrators' priority on improving education with teachers' priority on improving the terms and conditions of employment, the NEA embarked on a massive re-organization in 1917. Leaders recognized that organizational growth depended on women teachers, but power in the organization remained concentrated among two groups of male administrators, superintendents and normal school principals. As the historian Wayne J. Urban has observed, neither group sought to make the NEA a teacher-driven organization, but normal school principals advocated greater consideration of classroom teachers' concerns. One of the most contentious aspects of the re-organization was the replacement of open-floor voting, by all members attending the annual meeting, with a new Representative Assembly, the representatives chosen by the state associations. As membership approached 10,000, leaders insisted that a Representative Assembly would make the organization more democratic. Teachers objected, having learned to mobilize their local associations for important votes at annual meetings. They anticipated correctly that the Representative Assembly would privilege administrator-dominated state associations and reduce the power of their own local associations.

Several other factors diminished teachers' influence within the NEA in the 1920s. The creation of the labor-affiliated American Federation of Teachers (AFT) in 1916, with its strong base of local associations, siphoned away some militant teachers' dissent. Electing women as NEA presidents in alternate years gave teachers representation at higher levels, but some of the power that had been vested in the presidency shifted to the new full-time executive secretary, J. W. Crabtree, hired to direct the re-organization in 1917. Most significant, however, was the impact of World War I. The war effort attached a sense of urgency to improving public schools, most evidently in the NEA's successful Commission on the Emergency in Education. After the war, the NEA capitalized on anti-union sentiment by advocating teacher councils as an alternative to teacher unions like the AFT. Teacher councils were simply advisory groups with no power to act, but with the postwar red scare and backlash against organized labor, the NEA's approach won widespread support. The administrator-dominated

NEA leadership overcame the AFT's challenge and formed an alliance with the veterans of the American Legion, cosponsoring patriotic publications and school events. Friend to the NEA, the Legion became a vocal critic of the AFT. In the 1920s, membership in the AFT declined while the NEA surged to over 220,000 by 1932.

Revenue from membership enabled the NEA to expand its Washington, DC, headquarters with the Research and Legislative Services divisions, bolstering the organization's ambitions for building the profession. In 1917, the entire staff consisted of the executive secretary and a few clerks; by the early 1930s, operations grew to occupy a staff of 140. The Research Division gathered information on education, mostly concerning salaries and school finances. Its publications supplemented the information collected by the small federal Bureau of Education. The Legislative Services Division lobbied Congress; its main focus was the creation of a federal Department of Education, an effort that continued until 1979, when President Jimmy Carter made Education a cabinet position. In the intervening years, Legislative Services built broad-based support for NEA initiatives, especially among state governors, women's clubs, and organized labor.

The Depression quelled lingering conflicts between administrators and teachers. Faced with salary cuts and job losses, both groups put a priority on preserving school funding. Nearly 25% of NEA members lost their jobs by early 1933, and the organization lost a similar percentage of members by 1936. NEA leaders staved off the decline in membership with attention to teacher welfare issues, advocating for gender equity through a single salary scale and better salaries for rural teachers. It also made new efforts to protect the rights of married women teachers. Conscious of Depression-era rises in AFT membership, the much larger NEA still maintained its commitment to educator professionalism, promoting its initiatives to benefit teachers as initiatives that in turn benefited children, schools, and American society.

With the coming of World War II, the NEA pushed toward becoming a significant voice in Washington. It created the Commission on the Defense of Democracy in Education, seeking to launch an offensive against ideological and financial attacks on public education and replicate its WWI public relations success linking organizational and military objectives. The NEA also strengthened its relationship to government by lending educational assistance to the reconstruction of Germany and Japan. After the Soviet Union launched the Sputnik satellite, Congress passed the 1958 National Defense Education

Act, providing federal funding to education. Though it might have represented a victory, the legislation disappointed NEA leaders because it did not give education professionals discretion in the way the funds were used. Decades of NEA lobbying finally paid off when President Lyndon Johnson, a former schoolteacher, signed the Elementary and Secondary Education Act of 1965, providing \$1 billion in federal subsidies annually.

On issues of teacher welfare and rights, however, the NEA took a conservative turn. A series of strikes erupted immediately after the war, but the NEA essentially ignored teachers' complaints about rising inflation and stagnant pay. NEA calls for gender equity also faded away. By the 1950s, most large school districts had adopted a single salary scale for men and women teachers, but NEA leaders did not promote this accomplishment. Instead, they celebrated the abolition of "the celibacy rule," noting that married women now outnumbered single women in teaching. Yet the message was not about winning greater freedoms; rather it re-assured members that work in schools did not make them less feminine.

In retreat on gender equity, the NEA also proved reluctant to confront racial discrimination. Segregated state and local associations existed across the South and in many border states. Despite having all-black affiliates, the NEA made little effort to serve those members, aside from cooperating with the all-black American Teachers' Association (ATA) to obtain the same accreditation for black high schools that white schools had. When the Supreme Court issued its 1954 decision in *Brown v. Board of Education*, the NEA responded cautiously. Southern politicians threatened to close the public schools, intimidating supporters of desegregation with a movement of "massive resistance," which put children out of classrooms and teachers out of work in several southern counties. While northern, western, and urban contingents of the NEA supported *Brown*, southern state associations opposed it, worried about alienating whites. Unlike AFT leaders, who were quick to advocate compliance with *Brown*, NEA leaders preferred the risks of stalling to those of acting.

Becoming a Teacher-Driven Organization

Conservative professionalism helped make the NEA the largest educator association in the nation, but competition with the labor-affiliated AFT was a persisting threat. Membership reached nearly 700,000 during the 1957 centennial year, though the goal had been one million. The NEA developed a strong base

among women and rural teachers, but leaders recognized their weakness lay among teachers in large cities, especially a new cohort of high school teachers whose numbers nearly doubled between 1954 and 1964. An NEA study titled "Angry Young Men in Teaching" identified these teachers as the primary source of growing militancy. Several teacher strikes in New York City culminated in a resounding AFT victory in 1962, prompting the NEA to reconsider its relations with city teachers and local organizations.

The NEA began to re-invent itself as a union in the 1960s, though its history as a professional association shaped the kind of representation it offered teachers. The NEA advocated "professional negotiations" as an alternative to collective bargaining, and in place of strikes, the organization placed "sanctions" on school districts, warning members not to accept positions in them. Though the national leadership was uneasy with language of unionism, the contracts that NEA locals negotiated did not differ substantially from AFT agreements. Yet NEA discomfort with unionism produced serious repercussions when the state association in Florida called a statewide walkout, following the lead of several city locals. Committed to its no-strike policy, the NEA encouraged Florida teachers to resign rather than strike. This strategy, as the historian Marjorie Murphy noted, asked teachers to break their legal contract of employment rather than the Association's policy of professionalism. The mass resignation prompted legislators to pass the desired education funding, but the problem of negotiating thousands of teachers' return to work, after they resigned, compelled the NEA to rethink the practical wisdom of its no-strike policy. The NEA soon joined the Coalition of American Public Employees, operating outside the umbrella of organized labor, but as a union nonetheless.

As the NEA blended its move to unionism with its long commitment to professionalism, the organization reached a more progressive position on race in public education. In 1964, the Representative Assembly voted to mandate desegregation within its affiliates and merge with the ATA. Concerns that black teachers would have little influence in the NEA stalled the merger temporarily, while efforts to desegregate state associations in Mississippi and Louisiana continued until the 1970s. In the meantime, however, the NEA went on record in support of desegregation, mandatory busing, and protecting black teachers' rights. Having taken strong positions in favor of racial justice, the NEA was able to rise above the highly publicized Ocean Hill-Brownsville conflict in 1968 between AFT locals and urban black communities regarding the community's prerogative to

force teacher transfers. While the AFT defended predominately white teachers' seniority rights, Elizabeth Koontz, the NEA's first African-American female president, invoked the NEA's ethos of professionalism, affirming the organization's commitment to building partnerships between teachers and communities of color.

Unionization and desegregation altered the distribution of power within the NEA structure. Administrator-dominated state associations, once the seat of organizational power, took a back seat to the more progressive locals and the national. As teacher support and services emerged as new priorities, locals assumed responsibility for negotiating contracts while the national organization concentrated on building political influence for teachers in Washington and creating the NEA's first Political Action Committee. Recognizing that women remain its largest constituency, the national resumed its advocacy of gender equity in the 1970s, endorsing the Equal Rights Amendment. With the organization focused on serving teachers, the organization revised its Constitution in 1973, substantively reducing the authority of the executive secretary and state associations and placing more power in the hands of teachers.

Immersed in collective bargaining and considerably more teacher-driven, the NEA at the turn of the twenty-first century shared much in common with the AFT. Both groups considered several proposals to merge the two organizations, none of them successful. In 2000, they entered into the NEA FT partnership, which facilitates collaboration between them. Though no longer dominated by administrators, NEA members, still largely women, continue to show some discomfort with the adversarial aspects of unionism. Today, the NEA prides itself on responding to teacher's concerns and makes the case that improved terms and conditions of work for teachers will reap broader social and educational benefits. This "New Unionism" represents a partial return to the NEA of the early and mid-twentieth century, when co-operation characterized the main thrust of organizational activities, while continuing to pursue goals adopted in the 1960s and 1970s to work toward improving teachers' welfare and securing their rights.

NATIONAL FEDERATION OF FEDERAL EMPLOYEES

When the American Federation of Labor (AFL) chartered the National Federation of Federal Employees (NFFE) in 1917, it took the unusual step of creating an early version of industrial unionization. Open to federal government workers in all agencies and in all occupations, it became the first general federal service union that was not organized around craft or government department. Prior to its creation, the most active unions with exclusively federal employees had been postal workers, and in 1904, the International Association of Machinists had established District 44 exclusively for civilian workers employed by the military.

NFFE emerged at a time when groups of government employees, including postal workers, were fighting for the right to lobby Congress on issues such as pay. The Lloyd-La Follette Act of 1912 recognized the right of postal employees to join unions without penalty and for all federal employees to petition on their own behalf, thus setting the stage for union organization outside the postal service. Several years later, the Borland Rider to an appropriation bill attempted to lengthen the workday for federal employees, encouraging the establishment of a number of small unions, including one in 1916 representing mostly women in the Treasury Department's Bureau of Engraving and Printing. A group of these government unions then organized into the Federal Employees Union. When the Borland Rider appeared, the Stenographers and Typists Union asked Samuel Gompers and the AFL to join them in opposing the law. AFL leaders did so, successfully defeating the

Group of federal employees waiting for treatment at the Public Health Service Dispensary #32, which has recently been opened for the exclusive benefit of government workers. Library of Congress, Prints & Photographs Division [LC-USZ62-108282].

measure while also seizing the opportunity to organize further federal workers. Using the Federal Employees Union as a core, the AFL formally chartered a new union, NFFE, at their September 1917 convention. Immediately flexing its muscle, NFFE helped defeat Democratic Representative William P. Borland in Missouri's 1918 primary race.

Open to all civilian employees of the United States government or the District of Columbia, NFFE started with over 60 locals and 10,000 members. Local 2 represented most Washington, DC, agencies with some exceptions. The Bureau of Engraving and Printing union, for instance, formed Local 105, and its president, Gertrude McNally, went on to become the secretary-treasurer of NFFE in 1925. She served in this post until 1953. Luther Steward became president in 1917, and remained in this office for 37 years. Together, they therefore had significant influence on the union's tone and direction.

Objectives and Tactics

Adamantly opposed to use of the strike, NFFE instead saw itself as a lobbying organization or pressure

group. Consequently, its strategies included petitioning Congress, generating positive publicity for its aims, and using union members to work with agency administrators to further a mutually beneficial agenda. Hence, it eschewed militant tactics in favor of parades and mass meetings to promote its cause. Its mission was "to advance the social and economic welfare and education of employees of the United States and to aid in the perfection of systems that will make for greater efficiency in the various services of the United States." Committed to raising salaries, it sought to eliminate inconsistencies in pay; support the reclassification of occupations, in order to provide uniformity within and across agencies; extend the merit system, thus eliminating patronage positions; and establish annual and sick leave, a Saturday half holiday, and retirement plans.

NFFE's efforts to extend the classification system to the field service (a reference to the federal workforce outside of Washington, DC) set the stage for its break with the AFL. From its inception, NFFE put much of its energy behind classification of government jobs, believing that greater uniformity in describing and classifying occupations would standardize pay across the federal service. Congress passed the Classification Act in 1923, but it excluded field service

and craft workers. The Welsh Act of 1928 called for a reconsideration of classification of these two groups of workers, an effort that NFFE leadership vigorously supported. A legislative measure considered in 1931 would have established a Personnel Classification Board to determine classifications and wage rates for all government positions, including crafts. The AFL's executive council, however, objected to this plan, perceiving it as an effort to undermine existing craft control over occupations and pay standards. Most craft workers had their pay set by wage boards, which used prevailing private-sector wages to set pay rates. Although the legislation would not have abolished wage boards, it would have made them subservient to the proposed Personnel Classification Board. AFL leaders sided with craft workers in rejecting the legislation. The NFFE president, Luther Steward, angered by the AFL's opposition to this classification measure, called for a vote on whether NFFE should disengage from the AFL and become an independent union. When the vote was held in December 1931, NFFE members narrowly voted to leave the AFL. Once NFFE became independent, the AFL took the unusual step of immediately establishing a competing federal government union, the American Federation of Government Employees, which siphoned off approximately one third of NFFE's members. In June 1932, NFFE was left with some 64,000 members. By 1937, the union had recovered some of its losses, with over 600 locals and 75,000 members in more than 35 federal agencies. NFFE remained independent until 1999. Faced with stiff competition from other unions in the 1980s and 1990s, it began to look for a partner that would help strengthen its finances and membership. A search committee recommended a partnership with the AFL-CIO's International Association of Machinists and Aerospace workers, which went into effect in 1999. Consequently, after a 67-year absence, NFFE returned to the AFL.

NFFE devoted most of its resources to bread-and-butter issues, including lobbying for overtime pay, revisions to the efficiency rating system, and of course, extension of the merit system. In 1937, NFFE formally affiliated with the primary pressure group for merit reform, the National Civil Service Reform League, with President Steward and Secretary-Treasurer McNally sitting on the League's council. Union leaders also continued to support vigorously the creation of a civil service court of appeals.

They remained adamantly opposed to striking and to any hint of collective bargaining, frequently criticizing the more left-leaning United Federal Workers of America, affiliated with the Congress of Industrial Organizations (CIO), for supporting collective

bargaining rights and for their more aggressive tactics in pursuing goals. Steward, for instance, played a key role in President Franklin D. Roosevelt's decision to issue a statement defining public employee union rights. NFFE's president had asked Roosevelt to speak at the union's Twentieth Jubilee Convention in 1937, but the President declined. Instead, Roosevelt drafted a letter to be read at the convention in which he clarified the differences between private- and public-sector unionization. Arguing that "collective bargaining, as usually understood, cannot be transplanted into the public service," Roosevelt noted that in the case of public employees, "the employer is the whole people, who speak by means of laws enacted by their representatives in Congress." He went on to emphasize that "militant tactics have no place in the functions of any organization of Government employees." Steward strongly supported Roosevelt's statement. In keeping with its desire to use collective weight to influence Congress, NFFE became a charter member of the National Legislative Council of Federal Employee Organizations, designed to coordinate lobbying activities of the general government unions.

NFFE's identity as a lobbying organization devoted to upholding the merit system was much in evidence when President John F. Kennedy issued Executive Order 10988 in 1962 granting limited bargaining rights to federal employees. His order established informal, formal, and exclusive bargaining rights for employees based upon the percentage of union employees in any given unit. NFFE's president, Vaux Owen, vigorously objected to the order's private-sector terminology, stipulating that collective bargaining did not belong in the public sector. He also opposed establishment of exclusive recognition for unions representing a majority of employees in a unit, arguing that it would curtail an employee's right to choose any union. Finally, he voiced opposition to the order's "conflict-of-interest" clause, which held that managers or supervisors could not hold office in a union. Owen complained that this provision created class distinctions and adversarial relationships in an environment otherwise free of these conflicts. Further, he noted that a number of NFFE members, who were supervisors, would be in violation of the order. To combat the order, NFFE initiated an unsuccessful lawsuit claiming that the executive order was unconstitutional because federal employees had been exempted explicitly from the National Labor Relations Act (NLRA), and yet Executive Order 10988 applied NLRA models to these employees. In 1965, the Washington, DC, District Court ruled that the dispute over the order should be settled within the

executive branch. After the ruling, NFFE's executive council, led by a new president, Nathan T. Wolkomir, voted to drop the suit. Eventually, the union came to embrace collective bargaining and saw its membership rise as a consequence of employees' expanded rights.

Yet even in the 1970s, NFFE hesitated to support reforms it perceived as threatening to the merit system. President Jimmy Carter's Civil Service Reform Act of 1978 abolished the Civil Service Commission, replacing it with the Office of Personnel Management (OPM) to handle personnel programs; the Merit Systems Protection Board (MSPB) to manage the merit system and protect federal whistleblowers from retribution; and the Federal Labor Relations Authority to oversee labor-management relations. The law also created a Senior Executive Service (SES), which enabled high-ranking supervisors to transfer from agency to agency without losing their rank. Finally, to make the bureaucracy more flexible, the measure loosened personnel rules, making it easier for agencies to hire, fire, promote, and discipline employees, and weakened veterans' preference. NFFE perceived the law as a presidential attempt to politicize the bureaucracy, calling the SES a haven for political appointees, the MSPB a tool of agency management, and the OPM an agency controlled by the White House. This concern with patronage and political influence was also clear in NFFE's opposition to efforts in the early 1970s to liberalize the Hatch Act of 1939, which had severely limited the political activities of federal employees. Not until 1977 did NFFE leadership, under pressure from members, favor some revisions to the law, including the ability of employees to run for local political offices. Nevertheless, the organization remained staunchly in favor of the Hatch Act's prohibition against partisan activity in federal offices and pushed for stronger penalties for those violating the law. While it favored further revisions to the law in the late 1980s, it continued to advocate for a civil service free of partisanship.

Membership

NFFE's conservatism may partially have been a reflection of its diverse membership, which included blue- and white-collar workers in occupations ranging from janitor to chemist. Among white-collar employees, the union had large numbers of clerical workers as well as mid-level administrators, and it tended to be stronger in old-line agencies, probably in part because

it was the first general public service union. For instance, among its members was Dr. Howard Edson, the president of Local 2 in 1937, and a scientist in the Department of Agriculture who had taken an active role in classification during the 1920s. Harrison E. Meyer served as the president of the Civil Service Commission branch of Local 2. He began his government career as a page, working his way into clerical positions, and eventually into mid-level administration. Meyer's upward movement reflected the experience of many NFFE members, and the union therefore remained a strong proponent of promotion from within. In its early years, members did not tend to be strong supporters of the private-sector organized labor movement, and into the 1970s, the union's constitution continued to bar communists from joining. Like many federal worker unions, NFFE had many female members and a strong advocate in longtime Secretary-Treasurer McNally. It did not, however, encourage black membership until after the civil rights movement.

As the first general union for federal government workers, NFFE broke new ground in organizing across occupations, pay grades, and gender. It represented an early version of industry-based organizing, and as such, its membership focused on improving pay and working conditions in federal agencies, largely through collective pressure on Congress and agency administrators.

NATIONAL FOOTBALL LEAGUE PLAYERS ASSOCIATION

The National Football League Players Association (NFLPA) was formed in 1956 during a meeting at the Waldorf Astoria hotel in New York City. Such notables as Don Shula and Frank Gifford were in attendance. The demands of the players upon the National Football League (NFL) owners were initially very basic: a minimum salary of \$5,000 per year, equipment and uniform allowances, and injury pay. The owners, however, rejected these demands. This early defeat of the NFLPA would illustrate the conflict between the owners of NFL franchises and the players. Over the next 50 years, issues such as free agency, salary caps, the college draft, and two major players' strikes would grab headlines and lead to the cancellation of both games and television contracts.

The players were resolute in their demands, despite their early snubbing by the NFL owners. The next step for the NFLPA was litigation. In the first of a series of court cases related to playing conditions and pay in the NFL, the Supreme Court ruled in 1957 (*Radovich vs. NFL*) that the NFL was subject to antitrust laws. Shortly after this decision, the owners gave in to the demands that the NFLPA had articulated in 1956. Once these demands were met, the NFLPA demanded even more from the owners. These new demands were related to pay for preseason games and medical and retirement benefits. The owners met some of the players' demands, but only modestly (the mandatory retirement age remained 65).

The players, looking to capitalize on their court victory, tried to join the AFL-CIO, but they were refused admission. After this, the players briefly considered joining the Teamsters, but the NFLPA did not join the union and thus remained an association and not a union. The next challenge to the NFLPA was competition from the American Football League (AFL). The players in the newer and smaller AFL had their own association. The NFL owners therefore could play one association off the other. This in effect was the case, even after the two leagues merged. These same dynamics would be repeated in the 1980s with the short-lived United States Football League (USFL). In 1968, the NFLPA threatened a strike, but the owners locked them out. A landmark collective bargaining agreement followed, with the players getting a lot less than what they originally demanded. Finally, the two players' associations merged, with John Mackey to head the new group. Shortly after this, the NFLPA was certified by the National Labor Relations Board (NLRB).

Recognition by the NLRB meant that the NFLPA was now a union, although an extremely weak one

with respect to the NFL team owners. In July 1970, there was another strike during training camp by the players. The agreement that ended the strike gave certain concessions to the NFLPA, including an increase in minimum salaries, pension and dental benefits, as well as agents being allowed for players. Despite these gains, many union reps were cut by teams. Another tactic used by owners was the "Rozelle rule," which prevented players from moving to other teams once their contracts were up. So, despite modest gains, the NFLPA realized it needed more clout and savvy if it was to beat the owners in the complex field of labor relations.

Toward these goals, the NFLPA moved its headquarters to Washington, DC, and began a program to educate players as to their rights with respect to the owners. The players' union then voted to file suit against the NFL again over the Rozelle rule in a case that came to be known as *Mackey vs. NFL*. In 1974, the NFLPA declared "No Freedom, No Football," and the players went on strike again. This time around, the demands on the owners were more ambitious: arbitration over contracts and an end to the college draft. Despite the fact that this new round of demands was unmet, the players ended the strike and played for the next several seasons with their disputes still unresolved. In 1976, the owners were found guilty of violating antitrust laws, and a new round of collective bargaining ensued between them and the NFLPA. Emboldened by its victory in court, the NFLPA made even more demands, which concerned free agency and a share of the revenues from TV rights and ticket sales. The irony in all of this was that union membership went down for the players' union despite league expansion during this time.

In 1982, the players struck again over the issues of modified free agency and the issue of revenue sharing with the owners. The NFL owners had a unique advantage in professional sports in that they shared the TV revenues and gate receipts among themselves. Therefore, they usually presented a united front with respect to the players. The NFLPA made a modest proposal that would allow the more talented players to get paid more, but the owners rejected this for two reasons. First, they did not want to give up their lucrative TV and attendance money. Second, because a new league was forming (that is, the USFL), the owners realized that the NFLPA would now be in an inferior bargaining position. Finally, a compromise was reached, and the regular season was resumed, with a modified nine-game season and a larger playoff format. The owners did agree to a percentage of their gross team revenues going to the players as a good faith gesture. As in the 1974 strike, the players were

still at a disadvantage, though. The NFLPA realized that it represented people in a very dangerous game that had short careers, so any future decision to strike would have to be weighed carefully. The owners, for their part, stuck together and rode out the competition from the rival USFL for the next few years. They could always raise the price of tickets or add more amenities to their stadiums such as skyboxes.

The leader of the 1982 players strike now became the executive president of the NFLPA. Gene Upshaw wanted to pride himself on truly representing the interests of the players and not the lawyers. The collective bargaining agreement after the 1982 season expired before the 1987 season and left many issues unresolved. The players voted to strike, and this time the owners meant business. They hired replacement players for three games. This promptly ended the strike, as the NFLPA “punted” because it realized that its bargaining position had deteriorated. Despite this, the owners refused to allow the players to return immediately, and the NLRB would later cite them for this. In the meantime, the NFLPA returned to court to fight on a more level playing field. In a case in Minnesota federal court, the NFL owners’ “Plan B” free agency was determined to be unfair. The owners appealed this decision and won. Despite this, the NFLPA did win back pay for the players who were not allowed to return immediately at the end of the 1987 strike. In 1989, the players met and agreed to end their status as a union.

A series of court cases, the first involving Freeman McNeil of the Jets, ended in a defeat for the owners—and again stated that “Plan B” free agency was struck down. Other settlements in the *Brown vs. NFL* and *White vs. NFL* cases resulted in clear victories for the players involved. These new court victories resulted in the players voting to make the NFLPA a union again in 1993. A new agreement after this with the NFL owners allowed a share of the teams’ revenues to go to the players. After many court battles, strikes, reversals, and broken promises by the owners, the NFLPA had finally won respectability for its players and had solid material results to prove it. Like the game of football itself, with its seesaw battles for mere yards, the struggle between the NFLPA and the NFL owners had been a hard-fought fight. In the end, the NFLPA definitely finished in the win column for the interests of the players.

NATIONAL HOCKEY PLAYERS ASSOCIATION

For nearly 40 years, the National Hockey League Players Association (NHLPA) has been the sole employee bargaining unit with the National Hockey League (NHL). Its creation came at a time of increasing awareness of the unequal power distribution between employers and employees in the professional sports industry. According to many critics, however, the NHLPA, until the 1990s, was no more than a company union that protected the interests of the employers rather than those of the union membership.

Early in the history of professional hockey, skilled players had many options that enhanced their bargaining power. Multiple professional leagues appeared in the early 1910s. Of importance were the National Hockey Association (NHA), created in 1909, and the Pacific Coast Hockey Association (PCHA), founded in 1911. Contracts were negotiated between individual players and management, often the owner of the club. Although professional in name, professional hockey seasons rarely lasted more than four months of the year. Thus, all players had other careers beyond and, sometimes, during the season. Unlike professional baseball, which had established a national commission by 1903 to oversee the industry, the NHA and PCHA in particular raided each other’s players for much of the 1910s. Highly skilled players also could choose to remain in the amateur leagues, where some top-level clubs provided players with jobs and/or under-the-table payment. These options gave highly skilled players leverage when professional clubs came calling and partly explained why players did not see the need to organize themselves.

Organizing a player union also had to overcome the culture of professional team sports. Ideas of team unity and loyalty were drummed into the players’ consciousness early on. For a team sport that had a great potential for violence amongst the participants, team members learned quickly to stick up for one another, especially during fights. Often a siege mentality existed within a team and, in turn, re-inforced and magnified the us-against-them mentality. It was not unusual for players to carry their animosities toward other teams’ players beyond the games. Management also cultivated a form of loyalty based on paternalism. Players were trained to follow orders of the coach and, by implication, management. The idea of loyalty, team unity, and submission to authority

made organizing on a leaguewide basis difficult. Indeed, the first organized effort to challenge management's prerogative did not come until after the NHL replaced the NHA as the major league in eastern Canada. Disputing the length of the season in their contracts, Hamilton Tigers players refused to participate in the 1925 playoffs unless they were paid an extra \$200 per person. In turn, the NHL president, Frank Calder, suspended the players and fined each \$200. The Hamilton owners then sold the entire roster to the new entry into the NHL, the New York Americans, for the following season.

The Hamilton players challenge, however, came at a period of major NHL expansion after its creation in 1917. Between 1924 and 1926, the league membership increased from four to 10 teams. Despite increased job opportunities with the expansion, the only other major league, the Western Hockey League, which had six franchises, went out of business in 1926, giving the NHL a monopoly in the industry. Furthermore, the Great Depression soon made jobs scarce when some NHL franchises faltered. By the end of the Second World War, the league had only six franchises left.

The first leaguewide effort to organize players did not result in a union. In 1946, a Detroit insurance agent, C. Jean Casper, convinced a group of players to form a pension society. The players then approached the owners for an additional contribution. Although the Detroit club had contributed into the plan, other owners, led by Toronto's Conn Smythe, disliked this act of independence and headed off the players' effort by establishing a pension society administered by the league, the National Hockey League Pension Society. Owners began contributing to the plan using portions of the revenues from the all-star and playoff games in 1957. Revenues from international exhibition games involving the NHL were added to the fund when the league began organizing these tournaments in the 1970s.

Whereas the NHL began to enjoy a period of stability and prosperity after the Second World War, player discontent surfaced. With the assistance of a New York attorney, Milton Mound, Ted Lindsey, a Detroit player, began secretly signing up players in the league and on February 12, 1957, announced the formation of the NHLPA. If the owners could not stomach a player-controlled pension society, the league had no wish to recognize this first player union. Owners and managers intimidated players by ridding those involved in the union. Under tremendous pressure, players from the Detroit Red Wings decided to leave the NHLPA on November 13, 1957, thus squashing the union.

The next effort to form a union came in 1967. On June 6, a group of players announced the new NHLPA, under the leadership of the Toronto attorney and player agent R. Alan Eagleson. Unlike the 1957 version, it was accepted by the owners, in part because of the league's concern that the Teamsters Union was considering organizing professional sports. Despite management's recognition of the NHLPA as a bargaining unit, the NHLPA did not initiate negotiation for a collective bargaining agreement (CBA) until 1975. Between 1967 and 1991, when Eagleson was the executive director, the NHL and the NHLPA concluded only four (1976, 1981, 1984, and 1988).

For a large part of the NHLPA history, Alan Eagleson was the lightning rod around whom praises and criticisms revolved. Despite improvements to the players' salaries and benefits and the elimination of the reserve clause, some players and player agents soon doubted Eagleson's effectiveness as a union executive director. They complained about conflicts of interests in Eagleson's multiple roles as union executive director, player agent, practicing lawyer, and, later, a director of Hockey Canada. They argued that Eagleson was often unresponsive to their queries on union business and that he seemed to favor those represented by his own player agency. Some retired players, led by Carl Brewer, also charged that Eagleson often sided with management in issues such as pension funds and disability insurance. Observers noted that the NHL players' gains lagged far behind those in the other professional sports, despite favorable bargaining positions—an investigation was conducted by the U. S. Justice Department on possible violation of antitrust laws in 1971 and the appearance of a rival league, the World Hockey Association (WHA), in 1972. Interestingly, Eagleson brokered the merger between the WHA and the NHL in 1979, eliminating jobs and the bidding war for players. A movement to oust Eagleson emerged around the 1980s and led to his resignation in 1991 when the FBI began investigating his affairs. In 1998, Eagleson pled guilty to charges brought by both the Canadian and American governments.

Between 1992 and 2005, Robert W. Goodenow, a Detroit lawyer and player agent, succeeded Eagleson as the executive director of the NHLPA. Goodenow's terms of employment demanded that he relinquish his other careers. Unlike Eagleson, Goodenow was much more militant. Indeed, the first player strike occurred a mere four months after Goodenow took office. Both sides reached a new CBA 10 days after the strike began. Negotiations for a new CBA broke down again before the start of the 1994–1995 season, and this time, the owners locked out the players.

On January 20, 1995, a new agreement was signed by both sides, and the league operated a shortened schedule. The 1995 agreement was extended to 2004, when the NHL owners insisted on and the union strenuously objected to a salary cap. United by a resolve to control salaries, the NHL owners locked out the players for the entire 2004–2005 season. In July 2005, a new CBA with a salary cap was agreed upon by both sides. Amid criticisms by a few players on how he handled the negotiations, Goodenow resigned as executive director on July 28 and was replaced by the NHLPA senior director of business affairs and licensing, Ted Saskin. The latest CBA was scheduled to expire after the 2010–2011 season, with an option for the NHLPA to re-open negotiation for a new agreement after the 2008–2009 season. Saskin is only the third executive director of the NHLPA. Whereas Eagleson was deemed too friendly to management and Goodenow the opposite, it will be interesting to see how Saskin guides the union after a substantial defeat in the last agreement.

NATIONAL INDUSTRIAL RECOVERY ACT

The National Industrial Recovery Act (NIRA) was the Roosevelt administration's signature economic revitalization act of the First New Deal. The bill passed during the first "Hundred Days" as a part of the crash legislation session passing laws designed to stem the tide of the Great Depression and restore prosperity and employment to the nation. The Act set up a complicated new bureaucracy, the National Recovery Administration (NRA), headed by the retired general Hugh Johnson. Most significant for labor organizations in the country, Section 7a of the Act provided the first federal recognition of the rights of employees to form unions.

The National Recovery Administration was charged with setting codes for major industries throughout the nation. The codes were to be agreed upon in council between government, industry, and to a lesser extent, labor representation. Economic advisers in the Roosevelt administration saw excessive competition as destructive to the economy and as one of the prime causes of the Great Depression. The administration hoped to use the NRA as a means of managing and reducing competition. In practice, however, the NRA was less than successful. Many businesses resented government interference of any sort in their affairs and refused to cooperate. Henry Ford, for instance, tried to steer the Ford Motor Company clear of any involvement whatsoever in the NRA. The NRA tended to benefit big business at the expense of small businesses; many small businesspersons and progressive-minded legislators saw the NRA as furthering monopolistic behavior on the part of big firms at the expense of consumers and small producers. The NRA did, in fact, encourage oligopolies in industry, as the committees writing codes were able to set quotas for production, prices, and wages.

The codes written by the NIRA brought stability to a few industries that had been decimated by cut-throat competition, but many of the codes proved unworkable. The NIRA did score one major achievement, writing a code for the textile industry that virtually eliminated child labor. Some of the codes established minimum wages in industries, and many unskilled workers saw real wage increases after their industries adopted NRA codes. Skilled workers, however, frequently saw their wages decrease. Overall, the NRA failed in its goals of increasing employment and purchasing power. After a temporary increase, real wages overall actually began to decline under the NRA.

NATIONAL INDUSTRIAL RECOVERY ACT

The NRA also had a difficult time selling its plans to the public and to local businesses. To counter this, the NRA devised a Blue Eagle emblem, with the slogan, “We do our part!” The NRA used the emblem along with several publicity stunts to try to build public support for the program. The Blue Eagle also served as one of the few real enforcement mechanisms of the program—businesses that refused to abide by their industry codes would have the Blue Eagle logo denied to them. Thousands of posters with the NRA eagle were distributed around the country to be hung in shop windows. After an initial period of public support, enthusiasm faded, and for most of its brief existence, American support for the program was tepid at best. When the U.S. Supreme Court declared the NIRA unconstitutional in 1935, most Americans were indifferent.

Business had always been lukewarm toward the NIRA. Some business leaders had seen government intervention in the economy as inevitable and urged the business community to act decisively in shaping that intervention, but many were unconvinced. Yet in the context of the Great Depression, the NRA seemed to be a reasonable compromise. In exchange for the ability to act collusively to fix prices and production schedules, businesses had to accept some sort of government oversight and involvement in the marketplace. The single provision of the Act that most angered business was Section 7A, which provided for collective bargaining for employees in industries covered by the Act.

Section 7a of the NIRA read, in part, “employees shall have the right to organize and bargain collectively through representatives of their own choosing.” Section 7a also prevented yellow-dog contracts and gave the executive branch authority through the NRA’s system of codes to set minimum wages and maximum hours by industry. The passage of the NIRA set off a furious organizing spree amongst the nation’s workers. Much of the organizing occurred at the grassroots level, as workers, frustrated by the grim economic conditions of the Depression, the legacy of 1920s union busting, and union ineffectiveness, began demanding organization into unions. Section 7a of the NIRA seemed to give not only government sanction for unionism, but for many workers, implied Roosevelt administration approval of their unionization efforts as a tool for economic recovery.

Yet the organizing efforts of 1933–1935 were only of limited effectiveness. The American Federation of Labor (AFL) proved largely incapable of accommodating the influx of workers, many of whom were unskilled or semiskilled. William Green, the president of the AFL, responded by trying to organize workers into a new system of federal unions, to keep the

traditional affiliates of the AFL skilled and free of unskilled immigrant labor. Industry signed on to the NIRA politically but balked at giving in to the new wave of organization. Employers held that the NIRA did not provide any structure for dealing with employee organizations. Specifically, they would claim that the law did not require an employer to recognize a union as the sole bargaining agent for all employees merely because a majority of workers supported it. This contention led to a resurgence of company unionism as employers attempted to thwart the wave of organization by bargaining with company-organized and financed unions that clearly represented a minority of employees. Many of the codes that the NIRA established in industries allowed employees to be arbitrarily dismissed; many union activists felt that this provided a method for employers to dismiss union sympathizers. Employers also resorted to cruder methods, employing labor spies, guards, and other methods of dubious legality to thwart the employee offensive. This led to a rash of strikes in 1934. Thousands of strikes brought out over 1.5 million workers in the year. Whereas workers had struck in past years over issues such as hours, wages, and working conditions, union recognition drove the strike wave of 1934.

The NIRA lacked any effective enforcement mechanisms to deal with the labor unrest of 1934. The Act provided for a National Labor Board (later the National Labor Relations Board, NLRB) to oversee the implementation of Section 7a. Robert Wagner, a senator from New York, chaired the board. From the outset, Wagner saw both the National Labor Board and Section 7a as insufficient to protect the interests of American workers. His experiences on the National Labor Board led him to begin considering new legislation to guarantee the right of American workers to organize. This legislation would emerge later as the National Labor Relations Act (or Wagner Act).

The experiences of the AFL during the regime of the NIRA brought major changes. The inadequacy of the AFL’s federal union strategy in organizing unskilled and semiskilled workers was apparent to insurgents like John L. Lewis within the union movement. Lewis led the UMW to massive organizing gains during the NIRA. Lewis used the increased pull that his successes granted him to force the creation within the AFL of the Committee for Industrial Organizing, which would later splinter into the independent Congress of Industrial Organizations. The AFL, too, would eventually be forced to back away from its strictly craft method of organization and adapt to the new regime of mass organization in large industry. Finally, the creation of the National Labor Board and

the federal guarantee of the right to organize unions convinced many in the labor movement of the need to turn to the federal state for progress in labor relations.

The U.S. Supreme Court declared the NIRA unconstitutional in 1935. In *Schechter v. United States* (or as it came to be known, the sick chickens case), a unanimous Court ruled that the Act had overstepped the bounds of the commerce clause of the Constitution. The Court also ruled that the NRA's system of codes was unconstitutional in that it usurped the legislature's power to create law. The Schechter Poultry Corporation had been convicted for violating the poultry codes of the NIRA, specifically for violating wage and hour provisions of the code and for selling diseased chickens. The invalidation of the law brought to an end the Roosevelt administration's most ambitious plans to reform the American economy. The ruling, coupled with the Supreme Court's invalidation of the Agricultural Adjustment Act (AAA), also seemed to threaten much of the New Deal.

The National Industrial Recovery Act left a mixed legacy. While the NRA largely failed to raise wages and therefore purchasing power of the working class in the United States, it did help to set in motion the 1930s union movement that would achieve a vastly increased standard of living for many American workers. As the centerpiece program of the Roosevelt administration's effort to end the Great Depression, it surely was a disappointment. But as with much of the New Deal, it did achieve some small successes in economic reform, even as it failed to fix the American economy overall.

NATIONAL LABOR REFORM PARTY

The National Labor Reform Party (NLRP) was the political organization of the National Labor Union (NLU). Officially established in 1870, the NLRP entered candidates in the 1872 elections.

The NLU represented a coalition of local trade unions, trade assemblies or citywide federations, and

a handful of national trade unions and Eight-Hour Leagues that emerged in the New England and mid-Atlantic states. Between 1866, when it was founded, through 1872, the NLU advanced a program that stressed the eight-hour day, producer co-operatives, the abolition of contract and convict labor, and currency reform. From its very conception, the NLU was politically orientated. At its founding congress, following a long and heated debate, the NLU endorsed the formation of an independent labor party "as soon as possible."

The NLU began to make headway following the election of William Sylvis from the Iron Molders Union as its president. He and Richard Trevellick, the president of the International Union of Ship Carpenters and Caulkers, devoted their energies to propagate the NLU's program at local meetings in 1868. By the end of the decade, there were more than 120 new affiliates, including 14 national unions.

Effectively, the NLU was a forum for the labor movement through which strategic objectives were identified, priorities established, and specific measures for action developed. For example, a centerpiece of the NLU's program was currency reform. Inspired by the theories of Edward Kellogg, who in *Labor and Other Capital* proposed that the government issue greenbacks (paper currency) at 1% interest, the NLU adopted the "interconvertibility plan."

This plan called for the abolition of the national banking system, the recognition of the federal government's exclusive authority to fix interest rates, and the reduction of interest on government bonds to 3% and their convertibility into greenbacks. In the eyes of William Sylvis and Andrew Cameron, the editor of the Chicago-based labor newspaper the *Workingmen's Advocate* and a founder of the NLU, implementation of this plan would foster the growth of producer co-operatives since they would have access to low-cost credit and enable small business to expand and thereby provide more employment.

Rarely did the NLU directly sponsor a campaign or provide leadership in implementing its program. In the movement for the eight-hour day, spokesmen such as William Sylvis exhorted local unions and state Eight-Hour Leagues to wage campaigns, but without any guidance, let alone co-ordination, from the NLU itself. Nevertheless, the CLU showed a capacity to engage in practical activity. In 1867, it successfully lobbied Congress to repeal the contract labor law, enacted during the Civil War, and matched this success in 1868 when Congress passed legislation introducing an eight-hour day for manual workers employed by the federal government.

The endorsement of currency reform and the eight-hour day led the NLU to place greater emphasis on

NATIONAL LABOR REFORM PARTY

political action. At the 1870 congress, the NLU, in the face of opposition from most national unions, split into two branches—one “political” and the other “industrial,” and established an executive committee of the National Labor Reform Party. In 1872, the NLU’s political branch officially changed its name and modified its program to include exclusion of Chinese immigrant laborers and reduction of the tariff.

Preparation for independent political action received a boost from the experience of labor politics in Massachusetts. Here the Knights of St. Crispin spearheaded the formation of the Independent Party in 1869, which gained more than 13,000 votes and elected one state senator and 22 assemblymen under its banner. Although the following year the newly named Labor Reform Party lost most of its seats in the state legislature, a vigorous campaign led by Wendell Phillips, who ran for governor, helped to secure the establishment of a state Bureau of Labor Statistics, one the party’s key proposals.

The NLRP’s campaign in the 1872 elections was ill fated from the start. Among much disquiet from labor leaders, Judge David Davis from Illinois, with no ties to the labor movement, became the party’s presidential candidate. Then within weeks, he withdrew his candidacy after dissidents within the Republican Party launched the Liberal Republican Party and made Horace Greeley its standard-bearer. The NLRP lost all credibility following the last-minute selection of Charles O’Connor, a former Tammany Hall Democrat from New York, to run for president. Consequently, the NLU collapsed, as only seven delegates turned up to its “industrial convention” that year.

Historians’ judgment of the NLRP and concomitantly the NLU has been mixed. At one extreme, the NLU and NLRP were deemed as misguided and ineffective, “led by labor leaders without organizations and politicians without parties” (Ware). Less severe was the verdict that the NLU and NLRP were inevitably enfeebled by an inability to reconcile two conflicting “philosophies”—one based on political and social reform and the other predicated on “pure and simple” trade unionism (Rayback). Another assessment stressed the bona fide commitment to equal pay for women workers and its fraternity with African-American trade unionists as well as its promotion of independent labor politics, although it criticized its muddled programmatic orientation (Foner).

Notwithstanding these different interpretations, the NLU and NLRP were significant in the development of the labor movement during the Gilded Age. Their leaders underscored the importance of establishing a national body by which organized labor

could articulate objectives and formulate strategies. At a time when wage labor became more embedded and economic inequality more manifest, they recognized that workers would need to organize politically *and* industrially. These lessons drawn from the short-lived existence of the NLU and NLRP would guide the next generation of labor activists.

NATIONAL LABOR RELATIONS ACT

See **Dunlop Commission**; *National Labor Relations Board v. Jones-Laughlin Steel Corporation* (1937)

NATIONAL LABOR RELATIONS BOARD

On July 5, 1935, President Franklin Delano Roosevelt signed the National Labor Relations Act (NLRA), or Wagner Act, which created the National Labor Relations Board (NLRB), an independent federal agency charged with protecting workers’ rights to organize and bargain collectively with their employers through representatives of their own choosing, or to refrain from such activities. The Wagner Act replaced the National Labor Board (NLB) (August 1933 to June 1934) and the original National Labor Relations Board (June 1934 to July 1935), which consisted of representatives from organized labor, industry, and the federal government and sought to mediate labor disputes to voluntary resolutions. Senator Robert Wagner of New York worked closely with the ineffective NLB and “old” NLRB, and in the 1935, legislation crafted a new NLRB to enforce rights rather than mediate disputes. The new NLRB’s responsibilities were to hold union elections and to prevent or remedy unfair labor practices (ULPs). Legal challenges to the NLRB began immediately after its creation and consumed most of the board’s energy until the Supreme Court affirmed its constitutionality in 1937. In the

decades after that ruling, legal struggles persisted, the NLRB grew increasingly unpopular, and Congress made the board friendlier to business interests through amendments to the NLRA in the 1947 Taft-Hartley Act and the 1959 Landrum-Griffin Act.

The NLRB consists of a central board in Washington, DC, and field offices (51 as of 2006) that handle approximately 90% of the election petitions and ULP complaints. The president appoints, with the consent of the Senate, five board members for five-year terms and one general counsel for a four-year term. The NLRB's field offices investigate and seek voluntary resolutions to ULP complaints. If the parties are unwilling to settle at that point, the case goes before an NLRB administrative law judge, who decides whether the case will go to the five-member board. The parties may appeal the board's decision to the U.S. Court of Appeals, and then to the Supreme Court. In order to separate the board's prosecutorial and judicial functions, Taft-Hartley made the general counsel independent from the five-member board. Subsequently, the general counsel investigated and prosecuted ULP complaints and oversaw the field offices, while the five-member board acted as an appellate court for cases decided by administrative law judges. In order to hold an election for union representation, or for decertification of an existing union, a union, individual, or employer must file a petition with the NLRB. The petition must have the support of at least 30% of the employees. If all criteria are met, the government-sponsored election is held within 50 days of filing the petition. The NLRB's jurisdiction extends to employers involved in interstate commerce, with the exception of airlines, railroads, agriculture, and public employees.

The board's structure insulates the vast majority of NLRB cases from direct influences in Washington, DC, while subjecting the highest levels of the board to partisan politics. The president holds the power of appointment and Congress influences the NLRB through Senate confirmation of appointees, appropriations, and oversight and investigation. Between 1935 and 1937, partisan disputes focused on constitutional challenges to the NLRB. Once the Supreme Court sanctioned the board in 1937, the NLRB's zealous legal staffers tackled a flood of new election petitions and ULP complaints. This period of aggressive enforcement ended in late 1939, when the House of Representatives' "Smith Committee," named for the committee chair, Harold Smith (R-VA), held special hearings on the NLRB. The Smith Committee focused on alleged communist influence on the board and the board's ostensible bias toward bargaining units defined by industry rather than craft, a charge that grew out of the rivalry between the American

Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO). The hearings turned popular opinion against the NLRB and began a movement for amendments to the Wagner Act that ultimately led to Taft-Hartley and Landrum-Griffin. From the early 1960s to the late 1970s, the board enjoyed relatively high esteem for its role in maintaining "industrial peace," but beginning in the early 1980s, persistent conservative attacks cut the board's budget and made Senate confirmation proceedings highly contentious. Partisan wrangling has often left the board without its full complement of five members. Labor relations policy changed most dramatically when parties brought NLRB cases to the Supreme Court or when Congress amended the NLRB's powers.

Through the NLRB, the federal government shaped four main areas of employer-employee relations. First, the Court has reshaped employers' traditional rights to hire and fire workers. In *NLRB v. Mackay Radio* (1938), for example, the Court decided that strikers maintained their status as employees, but employers were allowed to hire permanent replacements during a strike. In addition, in *Phelps Dodge v. NLRB* (1941), the Court found that workers could not be dismissed for union affiliation and that they had the right to be re-instated and to collect back pay. Second, in *Textile Workers v. Darlington Co.* (1965), the Court significantly limited an employer's right to close one operation of a multipart business if the closure meant to discourage unionization. Third, from 1935 to 1947, the NLRB considered virtually any employer's speech against labor unions or unionization campaigns to constitute a ULP. In reaction against this "totality of conduct doctrine," Taft-Hartley included a free speech amendment, Section 8 (c), which states that no written or oral statement regarding a union or unionization campaign "shall constitute or be evidence of an unfair labor practice . . . if such expression contains no threat of reprisal or force or promise of benefit." Finally, Congress has passed multiple measures limiting union activities. Picketing per se was never a central issue for the NLRB because the 1932 Norris-LaGuardia Act legalized peaceful picketing in labor disputes. However, Taft-Hartley charged the NLRB with enforcing its prohibitions against the closed shop, wildcat strikes, jurisdictional strikes (picketing against a rival union), and secondary boycotts (boycotting a company doing business with a struck company). Landrum-Griffin re-enforced these proscriptions on union practices and extended the NLRB's control over union financial practices.

Over time, employers and unions grew more sophisticated in their approach to the NLRB process. Employers have successfully used the NLRB to delay

organizing campaigns until worker fatigue set in and the campaign folded. Unions increasingly avoided the long NLRB election process, turning instead to “card check” agreements with employers, meaning that an employer recognizes and bargains with a union when a majority of employees have signed union cards. Unions have also taken advantage of the Supreme Court’s decision in *NLRB v. Town & Country Electric* (1995), which upheld the constitutionality of “salt-ing.” Especially popular in the building trades, “salts” are union workers who covertly or overtly apply for jobs at nonunion worksites in order to pressure nonunion employees to accept union workers or to drive nonunion contractors out of business.

Even as unions avoided the NLRB and the unionization of the private workforce has declined, the NLRB has maintained its relevance by ruling that workers employed by temporary agencies can join unions and that nonunion employees have a right to representation during disciplinary hearings.

NATIONAL LABOR RELATIONS BOARD v. FANSTEEL METALLURGICAL CORP.

See *Fansteel v. United States*

NATIONAL LABOR RELATIONS BOARD v. JONES-LAUGHLIN STEEL CORPORATION (1937)

In April 1937, the U.S. Supreme Court found in the *Jones-Laughlin* decision that the Wagner Act (or the National Labor Relations Act) of 1935 was constitutional. At issue was the reach of the commerce clause of the United States Constitution. The first attempt of the federal government to guarantee the right of workers to engage in collective bargaining, Section 7a of the National Industrial Recovery Act (NIRA) of 1933, had been invalidated by the Supreme Court in 1935. In *Schechter Poultry Corporation v. United States* (or the “sick chicken” case), the Supreme Court invalidated the NIRA, finding that Congress had overstepped its powers granted to it by the commerce clause. *Jones-Laughlin* established that the federal government could legitimately act to protect the rights of workers to unionize through the National Labor Relations Board (NLRB).

Opponents of the Wagner Act argued that the United States government and the National Labor

Relations Board had no power to regulate collective bargaining in industries that were not directly engaged in interstate commerce. Specifically, they argued that manufacturing was an industry of production, and not of commerce, so that the law should not apply to manufacturing industries. Further, they argued that the Wagner Act violated the due process clause of the Fifth Amendment to the U.S. Constitution by giving a regulatory agency arbitrary power over a private corporation. Finally, opponents of the Wagner Act complained that the bill delineated unfair bargaining practices for employers, and not for unions. Proponents of the Act argued that the government was acting within its legitimate constitutional authority to regulate and promote interstate commerce by ensuring stable labor relations. Proponents also argued that because corporations could redress their grievances to a court, the Wagner Act did not violate the due process rights of businesses. In a 5–4 decision, the court held that the Wagner Act was constitutional and could be broadly applied to private workplaces, manufacturing included, around the country. The Court also found that the Act did not violate the due process clause of the Fifth Amendment. The Court left the issue of unfair bargaining practices open, seeing it as a question of policy, not constitutionality. The Taft-Hartley Act of 1947 delineated unfair bargaining practices for unions as well.

In the short time between the passage of the Wagner Act and the *Jones-Laughlin* decision, many employers had chosen to defy the NLRB. The decision freed the NLRB from dealing with voluminous legal challenges to its authority and allowed the Board to effectively oversee union certification and collective bargaining disputes. The decision also impacted trade unions. In the wake of *Jones-Laughlin*, legal disputes over union recognition declined. Unions increasingly turned their attention to issues of working conditions, wages, and hours.

NATIONAL LABOR UNION

The Civil War, with its labor shortages, price inflation, and productivity increases, revived a trade union movement that had languished since the industrial depression of the 1850s. At the very peak of the war, new labor organizations formed at all levels, from new locals, citywide trades assemblies, and abortive national organizations such as the International Industrial Assembly of North America to international bodies such as the International Workingmen's Association, founded in 1864. However, it was not until after the war that a serious attempt at national organization, bringing representatives of the leading trade unions together, was successful.

The need for nationwide labor organization was the outcome of the increasing interconnectedness of markets both for goods and labor. Many trade union leaders realized that they could no longer rely on strong local organizations to protect their working conditions, and their dreams of winning greater victories, such as the eight-hour day, rested on the marshaling of labor's forces throughout the country. As early as 1860, the National Union of Machinists and Blacksmiths proposed establishing a national federation of all trades, though no action was taken as the war crisis engulfed the country. The Molders union revived the idea in early 1864, and the Bricklayers along with the Coachmakers endorsed it in 1866.

Originally, the concrete plan for a conference to organize a national union federation centered on the trades unions that had first proposed it. But after the call for both local and national trades unions to convene in Baltimore was published, objections by labor associations that were not organized on a trade basis, led by the New York City Workingmen's Union, pushed the Baltimore conference organizers to broaden their invitation to include all labor organizations, including those, such as the Eight-Hour Leagues, that did not specifically represent groups of workers.

In August 1866, 77 delegates met in Baltimore and founded the National Labor Union (NLU). It was, like the Industrial Congresses of the 1850s and the National Trades Unions of the 1830s, a cross-class organization with good representation of both social theorists and reformers and trade unionists, but unlike the older attempts at national union, it actually developed the beginnings of a permanent institutional structure of local corresponding secretaries, annual meetings, and a standing executive committee. Largely the doing of the Molders union president, William Sylvis, the NLU convened without him when he fell ill just days before the opening session.

Delegates readily agreed upon their goals of winning the eight-hour day, abolishing the wage system

through producer cooperatives and land reform, and increasing the power of trade unions, but they divided on the means of achieving their aims. Some conceived of the NLU as becoming a centralized union, others as a loose federation, and still others as a political party. In the end, those who believed the best way to achieve the eight-hour day was through legislative action carried the day, and the NLU resolved to take the form of a political reform organization rather than a strictly trade union federation.

Steady promotion of the NLU by the labor publisher Jonathon Fincher and the cajoling of William Sylvis succeeded in attracting delegates from a majority of existing national trade unions to a second convention of the NLU held in Chicago in 1867. This time, the able and popular Sylvis chaired the proceedings, but the convention was marked by the increasing strength of a vocal group of greenbackers who were determined to steer the NLU into the swamp of partisan politics. A few spokespersons, such as the German socialists, continued to champion the idea of making the NLU into a centralized national union, but they were thwarted by trade union leaders jealous of their own power and independence.

The majority, led by the greenback pamphleteer Alexander Campbell, and including two of the most influential delegates, the founder William Sylvis and the labor editor Andrew Cameron, supported currency reform because they were attracted to its promise of empowering workers, unifying workers and farmers (the conference began in this year to refer more to "industrial classes" than "workingmen"), and creating the basis for market prosperity for all Americans, all without substantially re-ordering or centralizing the American state. Following the teachings of Edward Kellogg first published two decades before, these delegates held that the "money power" used the gold standard and high interest rates to rob workers of the fruits of their labor. The remedy was to adopt paper or "greenback" currency and for the government to keep interest rates low through a complicated "interconvertible bond" scheme that would also finance the independent enterprises, farms, and cooperative ventures of "producers" throughout the nation.

Given the racially charged context of the times in which it operated, it was inevitable that the NLU would be forced to address the question of inclusion or exclusion of racial minorities in the ranks of organized labor. Like most trade unionists of his day, the NLU committee charged with drafting a statement of principles stressed the importance of facing the fact that slavery had ended, "unpalatable as the truth may be to many, it is needless to disguise the fact that they [African-Americans] are destined to

occupy a different position in the future, to what they have in the past," and that interracial cooperation was a policy about which they had little choice. The question, the committee concluded, was "shall we make them our friends, or shall capital be allowed to turn them as an engine against us?" Or as William Sylvis put it at the 1867 convention, "The negro will take possession of the shops, if we do not take possession of the negro."

However, when the principle of interracial organizing and cooperation was put to the next annual conference in 1867, the question exposed a deep split between the labor reformers, who largely came out of an abolitionist tradition, and the trade union leadership, whose organizations practiced racial exclusion. In the end, the question was deemed too problematic and was deferred as too difficult to resolve by two consecutive conferences. It was, finally, the standing executive committee that forced the NLU to confront the issue by inviting African-American delegates to its 1869 conference. Nine attended, including the eloquent Isaac Myers of the Colored Caulkers' Trade Union Society, who was made chair of the committee on cooperation. Under pressure from the labor reformers, the NLU then resolved that it knew "neither color nor sex, on the question of the rights of labor" and urged "colored fellow members to form organizations in all legitimate ways." Thus, the NLU endorsed the principle of racial equality without challenging the exclusionary practices of trade unions but rather urged that black workers be aided in forming their own unions that would be "invited to cooperate with us in the general labor undertaking."

Race was an issue underlying many of the NLU's concerns and one that further divided trade unionists and broad-minded labor reformers. In an early compromise that would come to characterize the general attitude of the American trade union movement, the convention denounced the American Emigrant Aid Society and the federal law of 1864 that established an enforcement mechanism for immigrant labor contracts, but studiously avoided condemning immigration itself. Such a posture of condemning "importation" but welcoming immigration conformed to prevalent economic thinking about wages and distanced the labor movement from the vicious nativism of an earlier day. A year later, after Congress repealed the 1864 contract labor law, the NLU turned its attention to what it perceived as a new and greater threat looming over the American worker—the importation of Chinese "coolies." This carefully drawn distinction between "importation" and immigration, meant to paper over the differences between labor reformers and union regulars, broke down by 1870, when the NLU declared that "the presence in our country of

Chinese laborers” was an “evil” and demanded its prevention by legislation.

The tensions between trade union interests and labor reformers took a more public form at the next NLU convention held in New York in 1868 with the appearance of Elizabeth Cady Stanton, who claimed admittance on the basis of her membership in the Woman Suffrage Association. Trade union delegates threatened to walk out until Sylvis, a strong advocate of women’s rights, worked out a compromise whereby Stanton took her seat, with the body voting to neither endorse nor condemn women’s suffrage. However, the following year, a similar attempt on the part of Susan B. Anthony for credentials was denied after the vigorous protest of New York’s Mike Walsh, who accused her of representing a scab union. However, none of this altered the NLU’s statement of principles, which included a demand for equal pay for equal work for women, a measure trade unionists endorsed both as a matter of justice and out of the hope that this would retard the expansion of female labor.

In spite of its impoverished finances and still shakily organized state, the NLU claimed some significant successes in 1868 and 1869. In June, after lobbying by NLU representatives, Congress voted to establish the eight-hour day for federal employees. One year after the NLU demanded the establishment of a federal Department of Labor, Massachusetts became the first state to establish a Labor Bureau. And in 1869, Andrew C. Cameron, the editor of the *Workingmen’s Advocate*, was sent as the official delegate of the NLU to the International Workingmen’s Association conference at Basle, Switzerland—the first time an American labor federation attempted to affiliate with an international body.

The NLU continued even after the death of its founder, William Sylvis, in 1869 under a new president, Richard Trevellick, to whom credit was given for winning passage of the federal eight-hour law and who was most closely allied with the labor reform rather than the trade union wings of the NLU. However, by this time, the decline of the organization was evident, as only half as many delegates attended the 1870 convention in Cincinnati as had met in Philadelphia the year before. Interest in the NLU flagged most among the leaders of national trade unions, who looked skeptically upon the political drift of the organization and desired to create a federation of trade unions separate from the labor reform elements that played such a prominent part in the NLU. As a means of addressing these concerns while at the same time moving forward with its political strategy, the NLU resolved to split itself into two organizations, one a political party to nominate candidates for office

and the other a conference to deal strictly with “industrial” issues.

As promising as this strategy sounded in theory, its realization was thwarted by the deep political intrigues it invited. The political wing of the NLU met in convention in Columbus, Ohio, in February 1872 (ironically where the strictly industrial American Federation of Labor would be founded in 1886), calling itself the National Labor and Reform Party, and nominated Judge David Davis, Abraham Lincoln’s former campaign manager and Supreme Court justice, for president. Judge Davis thanked the party for the honor but did not clearly indicate if he accepted or declined until months later after the Democratic and Republican conventions, when it was too late for the labor reformers to select someone else, thus derailing the labor party movement before it even began. The partisan taint of this affair further tarred the reputation of the NLU as an impractical debating society, and the “industrial” congress of the NLU that met in Cleveland that year attracted only seven delegates, and all recognized the need to make a fresh start under a new name and organizational scheme. The following year, the same national union leaders who had once been a part of the NLU began meeting under the new banner of the Industrial Congress.

NATIONAL MINERS UNION

The National Miners Union (NMU) had its origins in domestic and international developments of the 1920s, including a disastrous 1927 coal strike and the expulsion of virtually all radicals from the United Mine Workers of America (UMWA). The desire of radical miners to form a union outside the UMWA co-incided with the Comintern’s declaration of the Third Period in the summer of 1928, which called for the organization of independent communist unions within the United States. Organized in Pittsburgh in early September 1928 from the remnants of

Striking miners drawing rations, West Virginia. Library of Congress, Prints & Photographs Division, Theodor Horydczak Collection [LC-H823-1308-004-x].

the UMWA's "Save the Union Movement," the NMU affiliated itself with William Z. Foster's Trade Union Educational League (TUEL), which was re-organized into the Trade Union Unity League (TUUL) in late summer 1929. The program of the NMU advocated the six-hour day and five-day week (designed to distribute work among more miners), organization of the unorganized, the creation of a national labor party, nationalization of the mines, support of the Soviet Union, the release of all workers arrested for strike-related activities, the organization of women and children, and racial and gender equality.

National and regional NMU leaders were members of the Communist Party (CP). John Watt, William Boyce (an African-American), Patrick Toohy, Freeman Thompson, Thomas Meyerscough, and Frank Borich occupied the top national offices within the NMU; a number of important CP officials, including William Z. Foster, Jack Johnstone, and William Dunne, were closely involved in NMU actions. Although the union was officially charged with the building of the Party, rank-and-file miners viewed the CP as separate from the NMU and were far more likely to join the NMU than the CP, despite the fact that the NMU required its members to attend Party meetings.

Between 1929 and 1933, the NMU led strikes in Illinois, Pennsylvania, Ohio, West Virginia, Kentucky, Utah, and New Mexico. In the fall of 1929, the NMU conducted a strike in the central and southern

coalfields of Illinois. Although approximately 10,000 miners responded to the union's strike call, the UMWA issued a barrage of red-baiting propaganda, while the state police cordoned the area and arrested the strike's leaders, ending the strike after a week and establishing a pattern of opposition from the UMWA and state officials that plagued NMU organizing efforts.

In May 1931, the NMU launched a strike against wage reductions that spread rapidly through western Pennsylvania, eastern Ohio, and West Virginia, eventually involving 40,000 miners. Lasting 12 weeks, the ill-fated strike was marked by red baiting from the UMWA, police violence, a shortage of union organizers, and internal conflict over strike goals. In January 1932, the NMU entered the strike-ridden Harlan County, Kentucky, taking up a strike abandoned by the UMWA. The NMU was quickly met with extraordinary violence from armed vigilantes, who killed several miners and a young communist organizer. As relief workers were blocked from entering the county and miners were discharged and blacklisted, the strike collapsed. Although the strike failed to win union recognition, it brought national attention to the plight of the region's coal miners and produced a wealth of music, including Florence Reece's frequently adapted labor anthem, "Which Side Are You On?"

Following the defeats in Illinois, Pennsylvania, Ohio, West Virginia, and Kentucky, the NMU turned west, first waging an unsuccessful strike in Carbon

County, Utah, and finally turning to Gallup, New Mexico, in August 1933. In New Mexico, the governor declared martial law. The National Guard arrested NMU leaders and held them in a military stockade. Despite UMWA propaganda that divided white and Spanish-speaking miners, the NMU was able to thwart company attempts to force all miners into the UMWA by arguing that NRA Section 7a provided workers with the right to choose their union. Although technically a success, as the strike ended, the NMU was unable to prevent massive blacklisting and eviction of Spanish-speaking strike leaders. The NMU abandoned organizing after the Gallup strike and was officially decertified by the CP in early 1935, as the Comintern moved away from dual unionism toward a united front against fascism.

During its brief existence, the NMU was thwarted by a number of persistent problems. First, there were struggles over goals and tactics. The disparity in numbers recruited for the NMU as opposed to those joining the CP makes it clear that miners were vastly more interested in solving wage and workplace grievances than in building a revolutionary movement. The NMU also suffered from a persistent shortage of trained organizers and a lack of funding for relief and legal expenses, especially after 1931. Although most of the miners recruited by the NMU had been previously abandoned by the UMWA, the strikes led by the NMU raised fears of communist infiltration into the coalfields and had the ironic result of breathing new life into the UMWA. As Irving Bernstein wrote in *The Lean Years*, companies preferred UMW chickenpox to NMU smallpox.

Despite its organizing failures, the NMU did spotlight the plight of the nation's coal miners. In both Pennsylvania (1931) and Kentucky (1932), William Z. Foster called on Theodore Dreiser to generate positive publicity outside the coal region and provide relief through the National Committee for the Defense of Political Prisoners. The "Dreiser Committee," which included Malcolm Cowley, Edmund Wilson, John Dos Passos, Anna Rochester, and other left-wing writers, investigated conditions and held open hearings in both regions. Their interviews with miners in Kentucky were published as *Harlan Miners Speak*. The publicity generated relief donations and prompted a congressional investigation but did little to alter conditions or influence the outcome of the strikes.

The NMU also advanced the cause of racial and gender equality within the labor movement. Unlike the UMWA, the NMU insisted on equality for African-Americans, Spanish-speaking Americans, and resident aliens. The NMU also stressed the importance of women, employing them as organizers and looking to local women for strike leadership. NMU strikes

produced a number of remarkable women, including Florence Reece, Aunt Molly Jackson and her half-sister Sarah Ogan Gunning from West Virginia, and Dominica Hernandez from New Mexico.

NATIONAL NEGRO CONGRESS

In February 1936, over 750 delegates from 28 states registered their names at the Eighth Regiment Armory in South Chicago for the first conclave of the National Negro Congress (NNC). During the conference sessions, black intellectuals, labor leaders, artists, and clerics debated issues relating to trade unions, youth, women, churches, businesses, fascism, and interracial relations. The NNC hoped this cross-section of African-Americans would ignite a nationwide movement of New Deal activism that would expand democracy to include African-American workers. Over the next five years, the NNC became one of the most prominent black organizations to fight for racial equality. Its members organized thousands into unions, opened new sectors of employment to black workers, demonstrated against extralegal violence, and resurrected a proud African-American culture based upon the history of the Reconstruction Era.

A younger group of black leaders laid the groundwork for the NNC during the previous decade. In the early Depression years, economic hardship leveled race-based institutions in northern city neighborhoods, leaving a void in professional leadership. Black nationalists (splinter groups from Marcus Garvey's 1920s movement), Communists, Socialists, and others

filled some of this space by orating on street corners, forming unemployment councils, and marching against the immediate crises of hunger and homelessness. Before the first NNC conference, John P. Davis, a Bates College and Harvard-trained intellectual, formed the Joint Committee on National Recovery (JCNR) to testify in Washington on behalf of black labor at the National Recovery Act wage hearings. Davis pointed out that New Deal legislation omitted the largest sections of black labor and allowed for race-based differences in wages, giving African-Americans a “raw deal” rather than a New Deal. At a spring 1935 Howard University conference of black leaders, Davis, the socialist and union leader A. Philip Randolph, the liberal sociologist Ralph Bunche, and the Communist leader James W. Ford charted new ways to address racial discrimination. This meeting corresponded with the Communist Party’s shift away from a revolutionary strategy to one of a Popular Front alliance with liberals to fight fascism. In addition, a few maverick unions within the American Federation of Labor (AFL) had stormed out of the Federation’s 1935 annual meeting when the Federation voted against organizing industrial workers. These larger circumstances weighed heavily on the minds of the black leaders gathered at Howard; they concurred that black America needed to focus more on its working class through a united coalition that they bequeathed the National Negro Congress.

In its nascence, the NNC formed local councils in northern and western cities and fostered a vital partnership with the Committee for Industrial Organization (CIO). John P. Davis convinced national CIO leaders to hire several NNC organizers, who worked to persuade black workers to join these new unions. In the Great Lakes region, NNC leaders helped organize thousands of black steel workers, while NNC mass meetings and publicity on the West Coast brought co-operation between white and black workers during the 1936 maritime strike. In the South, black tobacco workers organized in advance of a CIO campaign. Over five hundred delegates traveled to Richmond in February 1937 to inaugurate the Southern Negro Youth Conference (SNYC), an offshoot of the NNC’s youth council. Three months later, black tobacco stemmers, soon to be joined by the SNYC organizers James Jackson and Chris Alston, went on strike there. Between 1937 and 1940, young SNYC activists in the South and NNC organizers in the North formed alliances with African-American industrial workers, organized them into unions, waged several successful strikes, and re-oriented many black middle-class community leaders to endorse these actions as respectable means of protest. Moreover, the NNC surmised that the

organization of millions of black industrial workers would leave the conservative American Federation of Labor no choice but to reverse its discriminatory practices. The NNC’s local councils threw their support behind the Randolph Resolution, named after its president, to provide equal access in all AFL locals or risk expulsion. While the AFL nonetheless evaded the resolution, Randolph’s own union, the Brotherhood of Sleeping Car Porters, secured a charter from the AFL and company recognition by 1937.

Meanwhile, the NNC combined this momentum in unions with local antiracist actions. The council in Washington, DC, for example, fought against police brutality, while the NNC’s national leaders agitated for federal antilynching legislation. In Detroit, the local council rallied against white supremacists to minimize racial tensions between the city’s automobile workers. Other actions taken by the Congress included campaigning for jobs on public utilities, creating tenant councils to improve housing conditions and eliminate restrictive covenants, organizing domestic workers, and supporting international antifascist campaigns in Ethiopia and Spain. Seeking to elect sympathetic government representatives, NNC leaders allied with Labor’s Non-Partisan League in 1938 to promote progressive candidates. While the NNC aided certain local candidates to win elections, they encountered a tougher road within the Democratic Party. White supremacist representatives blocked antiracist legislation, revealing the Janus-faced nature of the Democratic Party’s “New Deal.”

During the late 1930s, the NNC proved very effective in allying liberal and left organizations (both in black communities and interracial Popular Front networks) in pursuit of progressive goals, but by 1940, international political developments split this unity. The NNC increasingly cast its lot with two larger forces: the CIO and the Communist Party. The CIO (with NNC assistance) ushered hundreds of thousands of African-Americans into unions for the first time in American history. As members of these unions, NNC activists hope to push them to endorse antidiscrimination within their own ranks, with their employers, and in local and national political matters. The Communist Party (CP) also became an important source of militancy for the NNC. Some key Negro Congress members had ties to the CP, but as the NAACP and other liberal groups affirmed, the CP did not control the NNC. During this first Popular Front period (1936–1939), mid-level Communists in the NNC ranks had a remarkable degree of freedom to act without national CP leaders interfering, and dedication to the black freedom struggle made them vital members of local NNC councils. In the summer of 1939, however, after Josef Stalin signed a

nonaggression pact with Adolph Hitler, tensions that had been manageable exploded into controversy. Top Communists now made demands upon local NNC leaders to switch from antifascism to an antiwar stance (calling it imperialism) in foreign policy. This switch meant that Communists in the NNC suddenly took a defiant stance against President Roosevelt and others who increasingly supported armed intervention against the Nazis. Conservative forces within government and labor circles, especially the congressional committee chaired by Martin Dies of Texas, attempted to use this political turmoil to derail the CIO by exposing Communists and fellow travelers within its ranks. Meanwhile, John L. Lewis, though not a Communist, also opposed intervention in the Second World War because he believed it would sacrifice working-class men at the behest of elites. Thus, the two most effective NNC allies demanded a drastic shift in foreign policy matters that affected domestic ones. The conflict enervated local NNC councils, and by its 1940 convention in Washington, the organization suffered a national split when A. Philip Randolph resigned his post as president.

This break hampered the NNC's membership as a mass-based organization, but it did not destroy it. After leaving the NNC, Randolph and his allies began the March on Washington Movement that resulted in President Roosevelt issuing Executive Order 8802 in June 1941 that established the first federal Fair Employment Practice Committee (FEPC). That same month, the unpalatable alliance between Hitler and Stalin ended abruptly when the Nazi army invaded the Soviet Union. Now, the NNC became the leading critic of antiwar leaders like John L. Lewis, who had already been discredited by supporting the Republican candidate, Wendell Willkie, in the presidential election of 1940 and had resigned his post as leader of the CIO.

During the Second World War, a remarkable group of young women assumed leadership roles at the NNC's new headquarters in New York and SNYC's in Birmingham. With most men in the armed services, Thelma Dale Perkins, a Howard graduate student and Washington Youth Federation and SNYC leader, became acting executive secretary of the NNC. Alongside Max Yergan, the NNC's new president, Dale and other female leaders pressured the FEPC to act against discriminatory employers and secured jobs for blacks in war industries jobs (like the Glen L. Martin aircraft plants) as well as in public utilities employment. While the NNC and SNYC honored the no-strike pledge of the CIO and prioritized winning the war (echoing the Communist Party's policy), they also embraced the "Double V" campaign to eliminate fascism abroad alongside racism at home. SNYC

leaders like Augusta Jackson (Strong) and Esther Cooper (Jackson) put women at the center of an Abolish the Poll Tax week (in May 1941) as well as protests against military inequality and police brutality. Both the NNC and SNYC began to publish monthly magazines (the NNC's *Congress View* and the SNYC's *Cavalcade*) that featured a creative mix of politics, poetry, and black history. Through these publications, their editors evoked a black oppositional culture that highlighted slave rebels of the past, compared the Second World War to the Civil War as a new emancipation, and deemed the postwar reconversion as a second Black Reconstruction for American democracy.

At the end of the war, the NNC and SNYC took on new life. Re-organized local councils thrived in states like New York, Michigan, California, and South Carolina. The NNC, now led by Revels Cayton, a black Communist who had ties to the maritime unions on the West Coast, re-oriented the NNC's leadership by forming a black labor council to recruit thousands of black CIO members and returning veterans as their troops to fight Jim Crow. As its Detroit Council pronounced in 1946, the NNC would seek to remove the barriers of second-class citizenship in America by enforcing Roosevelt's "Four Freedoms." Freedom from fear meant freedom from lynching; freedom from want meant freedom to work and join unions at all skill levels. To enact this vision, NNC members helped organize veterans into the United Negro and Allied Veterans of America, while the SNYC established special veterans councils and became less youth-oriented. In the fall of 1946, they helped bring two thousand delegates to Washington for the American Crusade to End Lynching. This coalition sought to shame leaders in the nation's capital into punishing those responsible for lynching blacks (often returning veterans), enacting a federal law against lynching, and ending the disfranchisement that allowed southern white supremacists to remain in office and filibuster such legislation. Thereafter, the NNC sponsored a tour of Paul Robeson, while the SNYC invited the historian Herbert Aptheker to speak to local councils, black colleges, and labor unions about their agenda for postwar reconversion. Through these tours, they hoped to inspire local councils by promoting militant versions of black history and culture that they compared to their contemporary local struggles.

The postwar NNC and SNYC refused to believe the United States had to return to its laissez-faire approach to white supremacy or that the United States and Soviet Union had to devolve into Cold War hostility. Due to what the NNC considered U.S. government hypocrisy in speaking of freedom

without supporting civil rights, it petitioned the United Nations in June 1946 on “behalf of the 13 million oppressed Negro citizens of the United States” to expose the housing, health, education, civil liberties, and violence that violated the U.N.’s charter. By 1947, these African-American activists threw their support and energies behind former Vice President Henry Wallace, whose Progressive Party featured a strong antiracist platform and neutrality with the Soviet Union. Antagonism by both the United States and the Soviet Union, however, offered little room for middle ground. Wallace’s integrated tour of the South turned violent and Wallace garnered fewer votes in the 1948 presidential election than NNC and SNYC leaders expected.

More than any other measure, the passage of the 1947 Taft-Hartley Act (over Truman’s veto) destroyed any hope the NNC and SNYC had in generating an immediate and militant working-class movement among African-Americans. The Act forced national CIO leaders to choose between government protection and keeping Communist and other left forces within their ranks. Much to the dismay of NNC leaders, the CIO chose the latter option. Beginning in late 1946, the CIO harassed and eventually purged NNC and SNYC allies from their positions, and the attorney general listed both organizations as “subversive.” In this new Cold War atmosphere, the NNC merged into the newfound Civil Rights Congress in 1947, and the SNYC regrettably folded two years later.

While their members did not succeed in enacting their postwar motto, “Death Blow to Jim Crow,” the NNC and SNYC generated much more than a seedbed for the civil rights movement that followed it in the 1950s and 1960s. The NNC and SNYC cultivated black working-class leadership and focused upon economic issues as the principal means for racial advancement. As the organizations struggled against Jim Crow policies, their alliance with leftist CIO unions and the Communist Party became their most important sources of power but also increasingly compromised their ability to lead a mass movement. The NNC cultivated an oppositional black culture and fostered militant antiracist campaigns that forced American institutions to enact racial and labor reforms for the first time since Reconstruction. During the Cold War, however, these leaders would be relegated to the background of mass movements of southern students and church members. The demise of the NNC and SNYC decoupled collaboration between labor and antiracist activists that had flourished during the late 1930s and 1940s. The legacy of this uncoupling became visible again in the late 1960s, when, after black activism dismantled Jim Crow

barriers in the South, black workers still lacked access to unions and skilled employment.

NATIONAL NEGRO LABOR COUNCIL

In 1950, African-American workers, determined to resist discrimination in the workplace and defend their civil rights within the larger community, prepared the way for the formation of the National Negro Labor Council (NNLC). More than 900 delegates met in Chicago in June not only to discuss the status of black workers since World War II but to create an entity to fill a void. At the time, there was no national organization dedicated to securing rights for African-American laborers. The Chicago gathering established a permanent organization, and on October 27, 1951, more than one thousand black workers, representing tens of thousands more, met at the first convention of the NNLC in Cincinnati, Ohio. Although the delegates were largely black, whites were welcomed and present at the founding convention. One third of the delegates were women. The NNLC was primarily concerned with realizing full citizenship rights within the workplace. To that end, the NNLC pledged to fight for full economic opportunity and to end discrimination in the workplace and in the unions. The centerpiece of the NNLC’s political platform was its resolve to incorporate a Fair Employment Practice Committee (FEPC) clause in every union contract. Within a year, 23 Negro Labor Councils had been established in major industrial areas. The NNLC, branded by mainstream labor organizations as a tool of the Soviet Union and a creation of the Communist Party, was a victim of the anti-Communist crusades of the early 1950s and dissolved in 1956. Nevertheless, the organization presented

a significant challenge to the institutional racism embedded within organized labor and provided a model for labor activists who carried the legacy of the NNLC forward into the 1960s.

The predominately black labor activists who attended the National Labor Conference for Negro Rights in June 1950 in Chicago mobilized around the issue of the backsliding that had occurred since the end of World War II in terms of equal economic opportunity for black workers. Black workers who had made substantial gains within industry during World War II blamed both management and union officials for lack of progress in terms of job opportunities for African-Americans less than a decade after the end of the war. Nevertheless, delegates to the Cincinnati convention pledged to remain within their respective unions even as they built local councils of the NNLC, which functioned as independent black caucuses within established unions. Mainstream labor officials tried to dismiss NNLC councils by charging the organizers with fostering dual unionism. The NNLC challenged dependence on white control both within the workplace as well as the community; indeed, black autonomy was a hallmark of the organization.

The most active local—the Detroit Negro Labor Council—included several key black activists from United Auto Workers (UAW) Local 600, the largest local in the world, with the largest black membership in the union, representing thousands of black workers at the River Rouge Plant of Ford Motor Company. Two leaders from Local 600, who had locked horns with Walter Reuther, the president of the UAW, on several occasions, helped lead and shape the NNLC. William R. Hood, the president of the NNLC, was the recording secretary of Local 600, and Coleman A. Young, a militant UAW organizer and the former director of the Wayne County (Detroit) CIO Council, was elected executive secretary. Hood etched the theme of autonomy on the NNLC convention by drawing from a speech written by Vicki Garvin, the executive secretary of the NNLC in New York City, which sent a message to white America—white trade union leaders and other white leaders—declaring they should no longer assume that they can tell African-Americans what they should do to attain their rights and how they should do it. White leaders were on notice that henceforth, while black Americans would like the cooperation of whites, they no longer felt the need to ask for permission from liberal whites before proceeding in their struggle.

With that as a preface, the UAW officials clashed with the Detroit chapter of the NNLC over several issues. The NNLC structure was criticized for weakening the union and its leaders were portrayed

as Communists. Reuther directed autoworkers who had signed a petition brought forth by the Detroit NNLC for a local FEPC ordinance to withdraw their names. Although the petition campaign was not successful, the 40,000 signatures showed there was a reason for union officials to take the NNLC seriously.

The NNLC's agenda included a fight for 100,000 new jobs for African-Americans, a focus on securing the right of black women to equal job opportunities, a commitment to securing an FEPC clause in every union contract, and a pledge to work for civil and human rights of African-Americans. The NNLC lobbied for and secured positions that had been denied black workers. One campaign targeted clerical and administrative positions in the Sears-Roebuck chain, another concentrated on discrimination in hiring and promotion within the hotel industry, and yet another focused on breaking down exclusion of black pilots and stewardesses from the airline industry. The NNLC also had a southern strategy, designed to open up factory production jobs to African-American men and women throughout the South even as it challenged the AFL and the CIO to unionize unorganized southern black and white workers. Initiating its southern campaign in Louisville under the banner, "Let Freedom Crash the Gateway to the South," the NNLC made a few inroads at the General Electric, Westinghouse, and Ford Motor Company plants. The NNLC never was able to replicate its limited success in Louisville in other areas of the South for lack of resources.

The NNLC's struggle was against union politics as much as it was against industrial management. The strength of its largest chapter in Detroit depended on the members from Local 600. Tensions between the militant activists and Reuther, which predated the formation of the NNLC, continued to plague the young organization. Reuther played the red card with abandon. His charges were re-inforced when the House Un-American Activities Committee (HUAC) accused the NNLC of Communist domination. The NNLC won a few battles against the HUAC, but the politics of the McCarthy era won the day by putting the NNLC on the defensive. The organization finally disbanded when faced with the enormous costs connected with its defense in 1956.

NATIONAL RIGHT TO WORK COMMITTEE

Dedicated to weakening federal and state labor law, the National Right to Work Committee (NRWC) coordinated legislative campaigns and court challenges to dismantle the legal protections unions won in the New Deal. Initially formed to lobby for state “right-to-work” laws, in the 1980s the Committee expanded its purview to include attacks on public-sector unionism, union political activity, and “card check” agreements. The Committee achieved only moderate success in winning state right-to-work laws but established itself as a brain trust and institutional center for conservative antiunion strategy.

Fred A. Hartley, a retired New Jersey congressman and cosponsor of the Taft-Hartley Act, founded the NRWC in 1955 with financial backing from business interests. Eighteen states already had right-to-work laws, and the NRWC aimed to increase that number by helping co-ordinate state-level campaigns. In its first big push, the NRWC got right-to-work measures on the ballot in six states; labor’s superior political power prevailed in five states. Backed by business groups like the U.S. Chamber of Commerce and the National Association of Manufacturers as well as dues paid primarily by small businesses, the NRWC shrugged off the defeats with new referenda in 1961 and 1966. The NRWC ran sophisticated and well-financed campaigns, many featuring disgruntled current or former union members decrying corruption in their own unions. *And Women Must Weep*, a 1963 NRWC film depicting picket-line violence, became a staple of employer antiunion campaigns. Nevertheless, 50 years of concerted effort resulted in victories in only four states. By 2005, 22 states had right-to-work laws. The NRWC’s signal victory in this era was defensive: in 1966, the NRWC helped beat back a federal amendment to Taft-Hartley that would have outlawed state right-to-work laws.

This victory exposed the NRWC to attack, however; unions and congressional allies demanded an IRS review of the NRWC’s tax-exempt status, arguing that its lobbying activities should invalidate the privilege. In 1968, the NRWC was obliged to create a separate advocacy foundation and restyle itself as a lobbying organization. While the NRWC continued to push for state right-to-work laws (winning in Oklahoma as late as 2001), the NRWC and its

foundation devoted increasing resources to related but distinct campaigns. The NRWC took up legislation and court cases focused on the boundary between the rights of individual union members and the autonomy and authority of their unions. In this realm, the NRWC registered real gains.

A signal victory concerned unions’ use of dues revenues for political lobbying. Beginning in the 1950s, the NRWC brought lawsuits on behalf of union members who argued that their First Amendment rights to free speech were violated when their unions lobbied for political causes to which they were opposed, using dues collected under closed-shop contracts. These arguments made little headway until the 1970s. In a series of cases culminating in the 1988 ruling *Communications Workers v. Beck*, the Supreme Court prohibited both public- and private-sector unions from using dues for purposes other than union representation and collective bargaining without the permission of each union member. The NRWC vigorously enforced the new rule by soliciting and representing plaintiffs alleging union breaches of the law. The ruling burdened unions with added reporting requirements but did not seriously hamper lobbying, as most members neither knew about nor exercised their right to retrospective dues rebates. Still, the NRWC and its allies used the principle for new state referenda in California, in 1988 and 2005, requiring unions to obtain prospective permission from members before spending dues on lobbying. Labor defeated both, at great expense.

In the late 1990s, the NRWC began challenging neutrality and card check agreements. Unions frustrated with the byzantine bureaucracy of the National Labor Relations Board turned to negotiating private agreements that obliged employers not to fight workers’ organizing attempts and to recognize the union based on a majority of signed union cards. (Employers agreed to these terms only under duress, usually from pressure at the bargaining table or from a sustained pressure campaign by the union.) Workers represented by the NRWC argued that these agreements constituted an improper collaboration between employer and union, and only a secret ballot election supervised by the NLRB could ensure workers’ freedom to choose or reject unionization. As of late 2005, the Supreme Court had not ruled on these cases.

NATIONAL UNION OF MARINE COOKS AND STEWARDS

An excellent historical example of the melding of workers into a functional union is the National Union of Marine Cooks and Stewards (NUMCS). At first glance, it seems logical that cooks and stewards would be in the same union. After all, cooks make the meals and stewards serve them. Since the word “marine” is in the title, this implies the workers are on ships. But the formation of this particular union was both long and arduous. It is also a symbol of how far unionization has come, and changed, since the 1930s.

Historically, some of the strongest American unions have been located on the waterfront. This is partially because the area where the work is to be performed is so confined. Longshoremen, teamsters, and stevedores work on the waterfront, a strip of land dockside where everyone knows which ships are coming in, how much cargo they are carrying, what outbound containers have to be loaded, and when the ship is leaving.

Because of the tight fabric of union cooperation on the waterfront, management forces have found it very difficult to break the hold of the unions on the docks. One of the largest strikes that affected the waterfront came in 1934, when the Teamsters precipitated a nationwide strike that drew more than 100,000 workers off their jobs nationwide. It was in this melee that the National Union of Marine Cooks and Stewards—originally the Marine Cooks’ and Stewards’ Association of the Pacific—was formed.

What made the NUMCS different was that its members were primarily black. Prior to 1934, blacks were considered second-class citizens, particularly on the docks. This was partially because in the early days of unionization there were so few of them that could work on the docks. The NUMCS had a number of other distinctions that set it apart from other unions. Because the socialist movement had made inroads into the black community, many assumed that the union was “red” as well as black. Additionally, since the NUMCS readily admitted gays, it was referred to as the “Red, Black, and Gay” union.

The General Strike of 1934 was a turning point in American union labor race relations. The West Coast ILA (International Longshoremen’s Association) president was Harry Bridges, an Australian-born activist. Bridges understood that the ILA needed black workers for both solidarity and membership. So he opened the doors of the ILA on the West Coast to black members. It was a risky move, as many union members did not trust the blacks because they had not participated in previous strikes—and many blacks

did not trust that their union brothers and sisters not to be racist.

What tipped the balance was the ILA demand of what is now known as the “hiring hall” system. Before 1934, almost all union labor on the waterfront was done on the basis of who the employer wanted to hire. The unions were looked upon as providers of labor in the generic. Then the employers would hire the specific laborers they wanted. This, naturally, led to a situation where certain union members got the lion’s share of the work and the others got what was left. Being black had meant that you were not hired at all, the reason there were few blacks in the unions at that time.

The “hiring hall” system was a significant change in the way members were hired. Instead of having the employer choose which specific person it wanted—and to keep the union hierarchy from doing the choosing—union members were hired on the basis of which member had the most seniority who was in the union hall at the moment the job was available. Blacks viewed this as the best possible mechanism to parcel out work, as it had nothing to do with race.

When the strike was over, the hiring hall system was implemented. Overnight, blacks flooded into the union. The system was color blind, so blacks believed they had an equal chance of getting jobs and moving up in seniority. Another result was the formation of the National Union of Marine Cooks and Stewards. With the implementation of the hiring hall system, there was finally a mechanism to ensure fairness in hiring.

Created at the dawn of the hiring hall system, the National Union of Marine Cooks and Stewards was instrumental in spreading the concept to other coastal communities. This is significant because the ILA strike that had created the new system only affected West Coast cities. But the establishment of the National Union of Marine Cooks and Stewards necessarily meant that the hiring hall system had to be implemented nationwide for that union. It did not take long for other coastal cities to see the merit of the new system. The result is a national union database that uses the hiring hall system.

But the history of the NUMCS has not been without controversy. It was a very vocal, Communist-led union until the 1950s, when it came under scrutiny during the witch hunts of the McCarthy era. The subsequent investigations almost destroyed the union. By 1952, many of its leaders were imprisoned or blacklisted. The CIO, seeking to put as much distance as possible between itself and the radicals of any union, purged itself of the NUMCS and eight other unions. It was not until the death of Joseph McCarthy

in 1957 and the end of the Red Scare that the NUMCS was welcomed back into the CIO, which by then had merged with the American Federation of Labor (1955) to create the AFL-CIO.

In the final analysis, the national significance of the National Union of Marine Cooks and Stewards is not so much what the members do as what the union did. By recognizing the importance of the hiring hall system, it formed and was one of the first—if not the first—union to use the concept nationwide. Its pioneering effort has proved a benefit to all unions. Very few unions can make that claim.

NATIONAL UNION OF TEXTILE WORKERS

The National Union of Textile Workers (NUTW) was formed in 1890 as the American Federation of Labor's (AFL) primary vehicle for organizing textile workers. Initially, membership in the NUTW was limited mainly to skilled workers in northern textile mills. But the NUTW ran into immediate difficulties because there were already separate unions for most of the textile industry's skilled positions, including loom fixers and weavers. The NUTW also contended with the ongoing migration of textile production from the North to the South. Therefore, the union's long-term prospects depended on making inroads among southern textile workers.

The AFL had shown no previous interest in organizing southern mill hands. The Knights of Labor had paid some attention to the growing number of cotton-mill workers, but the Knights had a much broader focus and did not target any specific industry. The Farmers' Alliance and the People's Party (Populists) of the late nineteenth century both recognized the necessity of forging connections with industrial workers, but these organizations were concerned mainly with the issues bedeviling agriculture. Ironically, many Alliance members and Populists saw cotton mills as examples of society's decline, even as many farmers fled their fields for work in the fast-growing industry.

The NUTW's attempt to organize textile workers, particularly in the South, was motivated in part by a struggle between the AFL and Socialists for

leadership of the American labor movement. The AFL emphasized its relatively moderate agenda of organizing skilled workers to improve their wages and working conditions, contrasting these goals with the inflammatory anticapitalist rhetoric of the Socialists. Socialists, however, had gained notoriety and no small measure of support through their high-profile leadership in particular labor conflicts, particularly that of Eugene Debs in the Pullman Strike of 1894. Daniel De Leon's Socialist Trade and Labor Alliance (STLA) challenged the AFL in key northern industries, including textiles, and the deep depression of the mid-1890s enhanced the appeal of more radical unionism. Since textiles continued to be a major industry in the Northeast, the NUTW and the STLA locked horns in that region. Both organizations, however, also had an eye on the South.

Moving South

In 1895, the AFL head, Samuel Gompers, toured the South and reported on the rapid growth of cotton mills, which seemed immune to the national depression. Despite the southern textile industry's relative good fortune, there was evidence as well of widespread discontent among its workers, who disliked their long hours and low pay but had few options given the state of agriculture. From the perspective of northern labor leaders, whether moderate or radical, the race was on to see which union would reap the harvest of discontented southern mill hands. Ironically, southern unionizing efforts gained some vocal support as well from northern textile industrialists, who hoped that the organization of southern workers would diminish the regional wage differential that gave the South a competitive advantage.

The realities of southern organizing, however, quickly complicated these northern dreams. The NUTW's first campaign started in 1896 at the Eagle and Phoenix Manufacturing Company in Columbus, Georgia, a booming textile town. The union gained popularity when Eagle and Phoenix management ordered a 10% wage reduction. In response, over 1,700 workers, skilled and unskilled alike, went on strike and formed the NUTW's first southern local. While a boon for the fledgling union, this influx of new members also revealed what would be one of the organization's persistent weaknesses. The NUTW had meager financial resources and could offer little assistance to striking workers. When the company held out and refused to bargain, workers had no way to replace their paychecks. Eventually, many striking employees along with a number of outside strikebreakers

returned to work, production resumed, and the strike crumbled. Eagle and Phoenix magnanimously offered to rescind the wage cut when, in management's opinion, conditions allowed.

Failure in Columbus sparked further conflict in the South between the NUTW and the Socialists, complicated by a temporary fusion of the unions when the NUTW's general secretary, a Socialist, created a new labor organization. Gompers, however, cracked down and purged the NUTW of any outward Socialist influences. In the North, this resulted in the defection of many locals from the NUTW to the STLA. The South still seemed, at least on the surface, to be up for grabs. But no matter what the outcome of the inter-union squabbling in the South, the Eagle and Phoenix strike suggested that southern mill owners wanted no meaningful unionization, whether conservative or radical.

Focusing on urban areas, the NUTW found ambiguously advantageous circumstances in Atlanta in 1897. Black men had been allowed to work in southern cotton mills only as menial laborers, and few black women had ever been hired, despite large numbers of white women mill hands. But the huge Fulton Bag and Cotton Mills broke the color line by hiring 20 black women. White workers protested by walking off the job and joining the NUTW. Once again, however, lack of money undercut the local union. The strike fizzled as workers struggled without their paycheck and union leaders were fired. Without power or influence and committed to a segregated workforce, the NUTW local clung to existence.

Persistence and Futility

Despite these setbacks, the NUTW persevered. Between 1898 and 1900, organizers claimed to have chartered 54 locals in Virginia, North and South Carolina, Alabama, and Georgia. Yet it was unclear how a "local" was defined. It could be a few sympathetic workers in a Piedmont mill, or a few hundred in Atlanta. In any event, it seemed clear that these new locals were not generating much in the way of dues, which limited the power of each of them. Although in 1900 the NUTW claimed 5,000 dues-paying members, mostly in the South, the union never generated a significant strike fund, yet found it impossible to function without one.

Management bodies responded to NUTW campaigns by claiming that organizers were foreign-influenced "outsiders" who favored race mixing and that disgruntled employees showed ingratitude. The union's national leaders lent credence to the

race-mixing charge, offending many white members, by opposing grandfather clauses that prevented blacks from voting. Top NUTW leadership also supported child labor legislation, which management saw as an infringement on its rights and which many workers, who appreciated their children working beside them, also viewed with skepticism.

Lack of finances, however, continued to be the NUTW's main liability. In an effort to conserve money, the union offered strike relief only to locals that had been chartered for six months. However, most workers appealed to the NUTW for recognition and support only in the midst of strikes. Rejection of requests for strike assistance discouraged union membership, but so did unfulfilled promises of relief. Mill owners tightened the screws with selective firings, lockouts, evictions from company housing, and blacklisting. The NUTW did win some specific demands, usually small wage increases for specific workers in various mills. But most of the union's efforts in dozens of textile communities ended in disaster, fueling cynicism among mill hands about the value of organization.

In 1900, the NUTW appealed to southern mill workers by promoting the 10-hour day. This campaign was hotly contested by mill managements, in part because the market for southern textiles had been undercut by the Boxer Rebellion in China, the destination for much southern production. In the summer of 1900, there were nearly 30 strikes and lockouts in North Carolina alone. The biggest, involving over 1,000 workers, arose from the arbitrary dismissal of an employee at the Haw River Mills in Alamance County. Management responded by firing anyone who admitted membership in the NUTW, hiring strikebreakers, and holding out against initially unsympathetic local public opinion. Once again, however, strikers had minimal resources, could not hold out, and were blacklisted when seeking employment elsewhere. The NUTW offered little financial relief, and the workers ultimately conceded. Some version of this story was repeated in nearly every case. For example, for a major strike in Danville, Virginia, the NUTW had a strike fund of \$2,700 to support some 2,000 workers. The AFL eventually sent another \$4,000, but this still could not offset even a week's worth of pay.

At its peak in 1900, the NUTW might have claimed 6% of the southern textile labor force as members. A year later, the remaining southern NUTW locals merged with a number of northern locals, ones that had left in the mid-1890s, to form the United Textile Workers of America. The NUTW had few tangible successes, but in its brief existence it did manage to bring into focus many grievances held by southern

mill workers. There was certainly widespread discontent, and mill hands were not reluctant, at least initially, to strike in pursuit of their goals. The lessons learned during those conflicts, however, heightened skepticism about the usefulness of unions and reinforced the high stakes of labor activism. These themes would recur in later textile conflicts. Mill owners, especially those in hundreds of tiny Piedmont communities, ultimately held much more power than did the NUTW.

NATIONAL URBAN LEAGUE

The National Urban League (NUL) was founded in 1911 in New York City. The League was the product of the merger of three social work agencies: the National League for the Protection of Colored Women (founded by Frances Kellor in 1905), the Committee for the Improvement of Industrial Conditions Among Negroes (1906), and the Committee on Urban Conditions Among Negroes (1910). Originally the National League on Urban Conditions Among Negroes (NLUCAN), in 1920, the name was shortened to the National Urban League (NUL). From the outset, the NUL focused on black migrants’ acculturation, jobs, and housing. The League taught lessons in everything

from choosing a vocation and job-search strategies to cooking, cleaning, and personal hygiene. The League also sought to shape policy with empirical research and provided social services such as job placement, education, and health care. Finally, the NUL built training centers and provided fellowships to encourage young African-Americans to enter professional social work.

The League’s programs of “interracial co-operation” originated in the Progressive Era’s emphasis on rational solutions to social problems and top-down reform. The League’s founders included white philanthropists and reformers such as Ruth Standish Baldwin, the wife of railroad magnate William H. Baldwin; L. Hollingsworth Wood, a Quaker involved in the New York Colored Mission; and the Columbia University professor E. R. A. Seligman. The NUL’s African-American founders were members of what W. E. B. DuBois called the “talented tenth.” The Howard University dean Kelly Miller and the physician and civic leader George Cleveland Hall exemplify the League’s roots in higher education and social reform. The League’s first two executive directors, George Edmund Haynes and Eugene Kinckle Jones, were both college-educated black professionals. These leaders built NLUCAN on the model of prominent agencies that worked to assist transnational immigrants to New York City.

The NUL added affiliates in cities across the country. For most of the century, local chapters were relatively autonomous compared, for example, to NAACP chapters and achieved uneven success. Although some white officials in southern cities did attempt to set up NUL chapters, creating organizations based on the principle of interracial co-operation was especially difficult where “social equality” was anathema. The most notable southern affiliate was in Nashville, Tennessee, and was led by the sociologist George Haynes. Haynes met the challenge of interracial work in the South by concentrating on professional social work training at Fisk University. Although Haynes sought to connect the university to the broader community, it was in New York City that the League’s attention to urgent social problems took shape. In the national office, Eugene Kinckle Jones worked with relative autonomy and with the greater resources available in the city to shift the center of the League’s activities away from Haynes’s educational approach.

In addition to the affiliates work, the NUL’s influence spread through its journal *Opportunity*. In 1923, the Fisk University sociologist Charles S. Johnson founded the League’s alternative to *The Crisis*, the organ of the National Association for the Advancement of Colored People (NAACP). Together, they provided widely read platforms for black poets,

novelists, and intellectuals. The League's magazine did not match the distribution of *The Crisis*, but *Opportunity* provided an outlet for the League's substantial research and drew a larger white audience.

The NUL included an executive director, a board of directors, field organizers, and professional staff. A president, largely a figurehead, ran the interracial board, which was generally the most conservative element of the organization. For the most part, the League's executive directors shaped the organization's programs. George Haynes led the League from Nashville during its first eight years. His partner in New York City, Eugene Kinckle Jones, was the NUL's executive secretary from 1919 to 1941. Jones's tenure coincided with the Great Migration, Harlem Renaissance, Great Depression, and the onset of World War II. It was an achievement just to keep the League alive, especially when donations virtually dried up in the 1930s. The longtime League organizer Lester B. Granger led the League from 1941 until his retirement in 1961. Granger struggled to raise money for the League, but under his leadership, the NUL did expand its Vocational Opportunity Campaigns. Whitney Young replaced Granger and served until he drowned while on a trip to Lagos, Nigeria, in 1971. In an era of increasing conservatism, Vernon E. Jordan (1972–1981), John Jacob (1982–1994), Hugh Price (1994–2003), and Marc Morial (2003–) have attempted to sustain the League's dramatic revitalization under Young.

Controversial History

The NUL sits at the center of controversies over the character and effectiveness of liberal reform in African-American history. Some students of the Progressive Era's legacy for African-American reform movements argue that the NUL was a regressive institution of social control. Others insist that the League has been a necessary supplement to organizations with different approaches. Finally, historians point out the mediating role the NUL has played between revolutionaries, liberals, and conservatives.

The NUL and the NAACP provide a convenient point of comparison for this debate. The NAACP, founded by W. E. B. DuBois and others in the Niagara Movement just two years before NLUCAN, also developed programs based on Progressive Era liberalism. For many years, historians argued that the NUL and NAACP exemplified a split between Booker T. Washington and W. E. B. DuBois. Those who equated Washington's industrial education and the League's vocational guidance argued that the NUL

represented an urban version of Washington's accommodationist self-help ideology. The NAACP, on the other hand, was said to reflect DuBois's more confrontational politics. This comparison ignores a number of key points. Washington played little role in the League's founding and later was only peripherally connected to the NUL's work. In addition, the NUL's vocational guidance programs trained African-Americans for industrial and white-collar work. DuBois did have a central part in the NAACP's origins and probably did more to shape the NAACP's public image than any other individual through his *Crisis* articles. However, DuBois never held unchallenged control over the NAACP's programs. Most important, historians have pointed to the overlaps and ambiguities in the two organizations' ideologies and programs, concluding that the NUL and the NAACP often enjoyed a complementary and supplementary relationship. Leaders in both organizations believed in the power of public education, but neither was originally a mass-based civil rights organization. During their first two decades, the major difference between the NUL and the NAACP was that while the NUL focused on social work and vocational guidance, the NAACP concentrated on reform via pressure on government institutions and legal strategies to fight discrimination.

Still, the NUL's history raises debates over the strengths and weaknesses of the NUL's cooperation with the white power structure. Numerous scholars argue that the NUL's reliance on funding from white philanthropists such as Ruth S. Baldwin, John D. Rockefeller, and Julius Rosenwald of Sears, Roebuck, and Co. prevented the League from pursuing fundamental social or economic change. From this point of view, the NUL has been at best a paternalistic, reformist organization.

The historiographical debate over the League's effectiveness has been most pointed in biographies of Whitney M. Young, the NUL executive director from 1961 to 1971. In 1970, the *New York Times* columnist Tom Buckley voiced the popular critique of the NUL as an organization of lackeys to the white power structure in his article "Whitney Young: Black Leader or 'Oreo Cookie'?" Nancy Weiss's 1989 biography rehabilitated Young's image by highlighting achievements. Young turned the League into a premier civil rights organization and secured funds from corporations, foundations, and the federal government. In 1998, Dennis C. Dickerson revised Weiss's portrayal, adding that Young's work with white business and political leaders was grounded in activism in working- and middle-class black circles. In these biographies, Young's attempts to mediate between civil rights activists and elite whites represent the NUL's

dilemma more generally, especially the difficult middle ground the agency attempts to hold between antagonistic groups of different races and classes.

Another controversial aspect of the League's history is its relationship to trade unions and strikebreaking during its first two decades. During the Great Migration, the NUL's job placement services engendered criticism from both white employers and trade unions. The NUL responded to African-Americans' employment demands and during World War I assisted the United States Employment Service (USES) in recruiting African-American workers. Many employers (some of whom relied on black labor when it was convenient) saw the NUL-backed USES as an incursion into their right to choose workers based on race. For their part, white trade unions perceived NUL job placement, and black workers in general, as real threats to their jobs and unions. Worst of all, black workers carried the stigma of strikebreakers. During the massive 1919 steel and packinghouse strikes, the League jumped into the middle of this controversy. At a Detroit conference that year, the NUL declared its position on unionization: black workers should join unions and bargain collectively when unions did not discriminate. However, if excluded, black workers should form their own collective and negotiate with white employers and unions. At the same time, the NUL actively pursued job placements throughout the 1919 strikes. According to the historian James Grossman, in 1919, in Chicago alone, 14,000 blacks found jobs through the League. By straddling the middle of the strikes and continuing to place thousands of black workers in jobs, the NUL exacerbated tension with trade unions. However, historians point out that for African-American laborers, who were last hired and first fired, accepting a strikebreaking job was a pragmatic choice in a hostile economic environment.

A New Context

In 1961, the League's new executive director, Whitney M. Young, reshuffled the League's national office and began a fund-raising campaign that ultimately created the League's most dynamic period. As the historian Nancy Weiss points out, between 1961 and 1970, the League's budget increased significantly, from \$340,000 to \$14,279,000; the number of affiliates increased from 63 to 98, and its professional staff expanded from 300 to more than 1,200. Although some League affiliates had already taken on projects for civil and legal rights, the NUL remained committed to social service, education, and research

activities. This began to change during Young's tenure. Young reformed the League's popular image by working closely with groups such as the Southern Christian Leadership Conference, the Congress of Racial Equality, and the Student Non-Violent Coordinating Committee. Young used his charisma to forge lucrative connections with corporations, gain access to the highest levels of the federal government, and make the Urban League one of the primary civil rights organizations. According to his biographers, Young played important intermediary roles throughout the decade—between leaders of the 1963 March on Washington, between corporate and government officials and the other major civil right leaders, and between black and white liberals and the increasingly radical youth-based movements of the late 1960s.

Young was not alone in his desire to revise the League's programs. The general political climate of the 1960s included greater federal and private resources for fighting racial discrimination. In addition, after 1966, the Black Power Movement brought a newly energized commitment to black nationalism, self-determination, and in some cases, racial separatism. This rapidly changing political context caused many inside the League to move away from its traditional emphasis on interracial co-operation and appeasement of the white power structure.

For Young and the NUL, the resurgent popular emphasis on self-determination and racial pride did not translate into racial separatism. Instead, Young and his allies in the NUL moved toward racial pluralism while constructing innovative programs targeting social problems in the ghettos. The NUL created a National Skills Bank that connected black workers with jobs that fit their skill levels; on-the-job training programs in concert with the Department of Labor; a Broadcast Skills Bank to direct African-Americans into radio and television; and a Secretarial Training Project. These new programs dramatically increased the number of people who received job training and placement from the NUL. No longer was progress measured in terms of "pilot placements," jobs secured by an individual black candidate for the first time, which had been the Industrial Department's standard for so many years. In addition, as part of the "New Thrust" mass organizing in ghettos that began in 1968, many League affiliates moved their offices from central business sections of their cities to the center of black majority neighborhoods. The League created voter education and registration, labor education, and youth development programs. Clearly, though the NUL now focused its attention on centers of black life rather than interracial co-operation, the organization remained committed to the transformative power

of jobs, education, and the democratic process. The League's persistent faith in reform paid off in grants from philanthropic groups such as the Ford Foundation and the federal government.

After Young's death, League leaders remained committed to providing social services and funding research projects in majority black communities. The NUL has maintained its nonpartisan, interracial social work. In addition to its traditional employment and education services, the League assists black veterans, fights for open housing and consumers' rights, and helps find adoptive houses and tutors for inner-city children. Since the mid-1970s the League has also produced an annual report, *The State of Black America*, carrying on its tradition of using scientific social research to influence public policy.

NATIONAL WAR LABOR BOARD (WWI)

Created by presidential proclamation in 1918, the National War Labor Board (NWLB) served as the primary U.S. government agency for resolving labor disputes during World War I. The 12-member body

was cochaired by Frank Walsh, a prolabor Kansas City attorney who had gained fame as chair of the U.S. Commission on Industrial Relations, and William Howard Taft, a former Republican president of the United States. By the time it ceased operations in August 1919, the Board had handed down nearly 500 rulings in disputes over pay, hours, and employee representation.

The origins of the NWLB are rooted in the strike wave that swept the country once the United States declared war on Germany in April 1917. In the first six months of the war, more than 280,000 workers engaged in over 1,100 strikes, substantially impairing the U.S. war effort. Initial government efforts to achieve labor peace relied on a patchwork of industry-specific boards in army barracks construction, shipbuilding, coal, and railroads. In January 1918, President Wilson assigned Secretary of Labor William B. Wilson to establish a unified labor policy. The resulting War Labor Conference Board (WLCB), with five members for labor, five for management, and Walsh and Taft representing the public, reported to the president in late March 1918. On April 8, Wilson created the NWLB, with a nearly identical membership.

Representing labor on the new Board were Frank Hayes (the president of the United Mine Workers of America), William L. Hutcheson (the president of the United Carpenters), Thomas Savage (a member of the Executive Council of the International Association of Machinists), Victor Olander (the secretary-treasurer of the Illinois Federation of Labor and the top official of the International Seamen's Union), and Thomas A. Rickert (the president of the United Garment Workers). The employer representatives were L. F. Loree (the president of the Delaware and Hudson Railroad), C. Edwin Michael (the former vice president of the National Association of Manufacturers and an iron manufacturer), Loyall A. Osborne (the vice president of Westinghouse), W. H. Van Dervoort, (an East Moline, IL manufacturer), and B. L. Worden (the head of the Submarine Boat Corporation and the Lackawanna Bridge Co). Members also had seconds, who served in their absence.

The mission of the Board was to keep war industry workers on the job. Its guiding principles aimed at balancing the needs of business and the demands of workers. Workers had the right to organize unions without management interference as long as they did not use "coercive" tactics. "Existing conditions," whether union or open shop, were to be maintained. Women and men were to receive equal pay for equal work, though women were not to be assigned work "disproportionate" to their strength. The right to the

eight-hour day would be upheld where it was legally required by state law. Workers and managers would co-operate to avoid production delays and to provide information about available skilled workers to the government. Wage levels should be based on prevailing local standards. And finally, for their part in the Great War, workers were entitled to a living wage.

Each case that came before the NWLB was assigned to a "section" of the Board consisting of one management and one labor member. The pair relied on information provided by impartial staff investigators sent into the field. The section could also choose to dispatch a pair of partisan investigators. If the section could not agree on the case, the full Board would decide it. In the event that the full Board could not reach unanimity, the case went to one of 10 presidentially appointed umpires who alone issued a decision. Umpires included prominent politicians and business leaders, such as Henry Ford, Walter Clark, the chief justice of the North Carolina Supreme Court, and the U.S. Housing Corporation president, Otto Eidlitz.

Since the Board did not result from an act of Congress, its rulings did not have legal sanction, unless both employer and employees had jointly submitted the case. In its very first case, members of the Commercial Telegraphers Union of America (CTUA) working at Western Union asked the NWLB to intervene when the company president, Newcomb Carlton, fired workers for joining the union. When Carlton refused to comply with a Board compromise proposal, thus exposing the Board's weakness, President Wilson convinced Congress to nationalize the telegraph and telephone lines and appointed Albert Burleson as administrator. The strongly antilabor Burleson stalled on implementing the NWLB's subsequent award of a wage increase to Western Union workers, but Wilson's action gave the NWLB some teeth.

Though the Board was split evenly between labor and employer representatives, the pressures of labor unrest, the need for uninterrupted production, Wilson's strong stand in the Western Union case, plus the moderating influence of Taft on the employer side resulted in a series of prolabor rulings. In a case brought by striking foundry workers in Waynesboro, Pennsylvania, the Board raised the minimum laborers' hourly wage from 22 cents to 40 cents, which became a precedent for further rulings. After labor and employer members of the Board deadlocked on eight-hour cases from Wheeling, West Virginia, and Bridgeport, Connecticut, a major munitions production center, umpires Ford, Clark, and Eidlitz awarded the eight-hour day to workers. Women employees, including Schenectady electrical workers,

were also awarded wage increases, though the Board accepted lower minimums for women than for men. Low-paid black laborers in New Orleans and elsewhere made wage gains; similarly, though, when black Birmingham steelworkers encountered vigilante racist violence in the course of an organizing campaign, the Board failed to intervene.

In its attempt to maintain "existing standards," the Board dealt with the sticky issue of employee representation by recommending, in a majority of collective bargaining cases, that shop committees be established in plants throughout the country. While the committees were meant to postpone the issue of unionism, in Bridgeport, radical leaders of District 55 of the International Association of Machinists led a strike against an inadequate Board ruling and then swept the shop committee elections. Union activists at General Electric employed NWLB hearings to win new members and then used shop committees to organize the Electrical Manufacturing Industry Labor Federation, uniting electrical workers from Pennsylvania to New York to Massachusetts. After the Armistice, however, as the leverage of Board labor representatives evaporated, employers such as Eugene Grace of Bethlehem Steel successfully flouted Board authority and used NWLB-recommended shop committees as a barrier to unionization. Considering that these committees became a primary vehicle for companies to avoid unions in the subsequent decade, historians have differed on whether Board policy should be seen positively as providing the basis for later prolabor New Deal reforms or viewed as a kind of Trojan horse for the open shop.

NATIONAL WAR LABOR BOARD (WWII)

As the United States edged closer to involvement in and then entered World War II in December 1941, organized labor, management, and the government each maneuvered to protect their interests. Labor hoped to consolidate the membership gains and legal legitimacy secured by the New Deal and to extend its collective bargaining victories into nonunion shops and industries, particularly those that benefited from defense production. For its part, big business wanted to hold the line against further union advances. Government, interested foremost in uninterrupted defense production, sought to create mediation mechanisms that would settle any labor disputes to both parties' satisfaction with a minimum of disruption. All looked to the state-mandated industrial relations pioneered during the First World War, characterized by a tripartite mediation War Labor Board, for guidance.

When defense production for the Allies increased in 1940 and 1941, Congress of Industrial Organizations (CIO) unions tried to win concessions from recalcitrant employers with large government contracts, most notably Ford Motor Company, Bethlehem Steel, and Allis-Chalmers. Organized labor's representatives on the National Defense Advisory Commission failed to get the government to deny defense contracts to corporations that violated the National Labor Relations Act (NLRA), and the resulting strikes began to retard defense production by the spring of 1941. That March, President Roosevelt established the National Defense Mediation Board (NDMB) to help resolve these defense industry labor disputes. The 11-member NDMB had a mandate to "exert every possible effort to assure that all work necessary for national defense shall proceed without interruption and with all possible speed" but was handicapped by its inability to compel arbitration that would be binding on both labor and management.

The NDMB collapsed in November 1941, when its two CIO members resigned over the Board's refusal to grant a closed shop to the United Mine Workers in its ongoing dispute with U.S. Steel. Only a month later, however, with U.S. entry into the war, President Roosevelt issued an executive order reconstituting the Board as the National War Labor Board (NWLB).

Like the NDMB before it, the NWLB's 12 members were drawn evenly from representatives of labor, business, and the "public" (in reality, seen as representing the interests of government). Labor members included Philip Murray, the president of the CIO, Thomas Kennedy of the United Mine Workers, and two representatives from the rival American Federation of Labor (AFL). Business sent representatives of large

corporations accustomed to negotiating with unions, such as U.S. Rubber's Cyrus Ching, who had long advocated co-operation with organized labor. William H. Davis, the one-time head of the New York state mediation service, chaired both the NWLB and its predecessor. Davis was joined by men with extensive experience in mediating labor disputes and balancing competing interests in public life, including Wayne Morse, who had arbitrated the fierce West Coast longshore strikes during the 1930s, and Frank Porter Graham, the liberal president of the University of North Carolina. No women sat on the Board, though the NWLB did issue rulings that enforced equal pay for equal work done by men and women in war production. Graham, in particular, also helped the Board lend a sympathetic ear to black workers who demanded equal treatment in the wartime workplace, and sought to abolish racial inequities in wage structures.

Unlike the National Defense Mediation Board or its World War I predecessor, the NWLB had the power to decide disputes in a legally binding manner and to bring sanctions to bear against both unions and businesses that refused to abide by its decisions, including plant seizures. The major tasks of the NWLB, in the words of its final report, consisted of "the settlement of labor disputes which endangered the war effort and the stabilization of wages as an integral part of the over-all program to prevent inflation." Between 1942 and 1945, the NWLB decided over 17,000 disputes involving over 12 million employees, which impacted a majority of unionized workers in the United States. In only 40 cases did the NWLB call on the government to seize defense plants to compel adherence to its rulings. The NWLB's strongest sanctions against organized labor came in its power to revoke union security provisions, fringe benefits, or collective bargaining contracts that it had helped unions secure. Thus, more often than not, the Board proved able to enlist union leaders in heading off unauthorized disputes or quelling wildcat strikes.

If the NWLB carried out its mediation function effectively and protected workers' right to organize and bargain collectively, its efforts to stabilize wages proved far less satisfactory to labor. In an effort to restrain rapidly advancing wartime inflation, the NWLB laid down a policy in July 1942 that capped wage increases at about 3%, a figure the Board claimed matched the gap between the increase in cost of living and wage gains over the past 18 months. This so-called Little Steel Formula of wage stabilization placed the burden of inflationary restraint on wage earners and proved immensely unpopular with rank-and-file workers, who regarded it as a wage freeze. Nevertheless, increased overtime and more

NATIONAL WAR LABOR BOARD (WWII)

elaborate fringe benefits compensated in part for the artificial ceiling on the pay packet.

The mandated wage restraint notwithstanding, of the many wartime administrative agencies designed to oversee war production, the NWLB was the only one in which organized labor proved able to wield some influence. Despite grumbling by workers about limited wage increases, restrictions on labor mobility, and the no-strike pledge, the NWLB placated labor leaders by granting “maintenance of membership” to the unions. Under these agreements, all newly hired workers in a union shop would be automatically enrolled in the union after a 15-day waiting period. The union security thus gained proved instrumental in encouraging the growth of organized labor during the war. For unions, this proved an essential component of the wartime industrial relations regime because of the enormous influx of unorganized workers into the defense industries; for big business, “maintenance of membership” represented a major capitulation to labor’s historic quest for the universal closed shop. As the NWLB noted in its final report, “no issue presented to the War Labor Board precipitated more furious debate than union security.”

Some scholars argue that the NWLB, despite its brief existence, had a long-lasting effect on the shape of American labor law. The basic structure of collective bargaining agreements as overseen by the state, the means of arbitration and mediation of disputes, and a sharply delineated arena of managerial prerogatives, as well as the requirement that trade unions police the behavior of their members, can all be seen as significant legacies of the Board’s decisions.

NATIVE AMERICANS

American Indians worked for wages since their earliest encounters with the developing capitalist economy. They cleaned homes and minded children for colonial officials, picked crops and herded cattle

for frontier farmers and ranchers, and scouted out their enemies for the U.S. military during the nineteenth-century Indian wars. When the transcontinental railroad brought industrial development to the western landscape, American Indians found work in industries that drew other migrants to the region from across the globe: in mining, lumber, railroads and large-scale commercial agriculture.

While they labored alongside Asian, Latino, and Euro-American migrants, their specific experience under U.S. control set American Indians apart from other workers. U.S. policy and treaties dictated the terms of American Indian existence to the most intimate detail. Federal bureaucrats in what would become the Bureau of Indian Affairs (BIA) would attempt to control every aspect of their daily lives, including where Indians would live, how they would make a living, what they learned in school, and how they would engage their spiritual worlds. Non-Indian workers faced similar types of federal intervention and assimilationist programs, including initiatives that transformed the slave labor system in the South and legislation that regulated working conditions and restricted immigration. But the history of treaty making between American Indians and the U.S. government established the precedent of indigenous people asserting their rights to sovereignty, not simply the civil rights of fully enfranchised citizens demanded by other racialized minority groups.

During the course of the nineteenth century, when other American workers faced problems of mechanization and industrialization, and fought for control over the workplace and the eight-hour day, American Indians were engaged in a life-or-death struggle to hold on to their homelands. This history of armed conflict, colonial control, and dispossession would profoundly determine how American Indians would be incorporated into the capitalist market as well as what types of individual and collective strategies they would develop to survive and persevere.

Indian land was pivotal to American expansion and the pursuit of “Manifest Destiny” in the nineteenth century and made possible the development of intercontinental railroads and extractive industries that formed the backbone of the U.S. West’s economy until World War II. By the beginning of the twentieth century, American Indians lost most of their land in a series of wars, treaties, and congressional actions. By 1887, American Indians held approximately 136 million acres of land, 6.8% of what they occupied prior to European contact. The 1887 General Allotment Act (the Dawes Act) further reduced their holdings by two thirds, carving up tribally held territory into individual homesteads and opening up the remaining land to white settlement.

Reformers saw the Dawes Act as the best solution for the “Indian Problem.” By “killing the Indian to save the man,” it was supposed to transform Indians into yeoman farmers and help them achieve a level of civilization (as defined by federal lawmakers) necessary for incorporation into American society. Some took advantage of this mandate and became successful farmers and ranchers. But for the most part, the Dawes Act dealt a decisive blow to their subsistence cultures, rendering many American Indians landless and homeless.

Boarding Schools and the “Making” of Indian Workers

For reformers, civilizing the Indians required more than assigning them allotments of land. Assimilation required American Indians to abandon their cultures, languages, and tribal affiliations. With these goals in mind, Richard Henry Pratt founded the Carlisle Indian School in 1879, a boarding school for Indians that emphasized a vocational rather than an academic curriculum. Far from home and forbidden to speak their native languages, American Indian students learned the social expectations of industrial society. They marched in military formation, donned Victorian-era clothing, and marked their time according to the bells of a clock. Mostly, they learned about wage work from the “outing system,” an apprenticeship program at the heart of assimilationist curriculum. Students performed a variety of jobs in this program, but they primarily found themselves doing unskilled, agricultural labor or domestic work for western employers. According to Lewis Meriam, the author of a major exposé on Indian Policy in 1928, these schools were not preparing students to land lucrative, skilled jobs. They were simply supplying the schools and surrounding employers with a source of cheap labor. As a result, according to the anthropologist Alice Littlefield in *Native Americans and Wage Labor*, such an education “was not so much assimilation as proletarianization.” Even with useful vocational training, Indians would find little access to well-paying jobs once they left the boarding school environment. Racism that barred other workers of color from access to the skilled trades applied to Indians as well.

The Indian New Deal

During the New Deal era, American Indians experienced a brief reprieve from the draconian

assimilationist programs of the previous 50 years. Under John Collier, the commissioner of Indian affairs, American Indians saw an end to allotment, the development of day schools, and increasing support for tribal identity. For Collier, Indian culture was something to be preserved, not extinguished. The 1934 Wheeler-Howard Act, the hallmark of his administration, authorized tribes to set up their own governments and created programs that encouraged craft production and other forms of cultural expression.

Commonly known as the “Indian New Deal,” the legislation also extended Depression-era work and relief programs to American Indian communities. Ironically, while many American workers were losing their jobs as the economy crumbled in the 1930s, many American Indians were experiencing wage work for the first time. They found jobs in the growing BIA bureaucracies and in the Indian Civilian Conservation Corps clearing trails, building campgrounds, and working on reservation land conservation projects. And in one short-lived experiment, Indian women were put to work in small, reservation-based mattress factories.

But for the Navajos, meager wages did not make up for the New Deal’s unwitting assault on their cultural economy. According to conservation specialists, Navajos’ sheep, goats, and cattle were overgrazing their rangelands, and the resulting erosion threatened the economic viability of their livestock industry. The BIA’s answer for repairing and preserving those rangelands included reducing Navajo livestock holdings by more than 50%. It was a harsh measure—a long-term solution that threatened the short-term survival of their pastoral culture. It firmly embittered a generation of Navajos, many of whom would subsequently vote against the ratification of the Indian Reorganization Act. After livestock reduction, many had to abandon their families and herds to look for other ways to earn a living, including railroad maintenance, agricultural labor, and assorted domestic jobs in reservation boarding towns. As the Navajo example suggests, Collier’s policies, while anti-assimilationist, may have done as much to pull American Indians into the capitalist marketplace as boarding schools and allotment had accomplished in the generation before.

World War II halted the New Dealer’s efforts, redirecting people and resources away from Indian conservation and labor programs. Like other Americans, native people joined the war effort, enlisting in the military and finding work in defense-related industries. According to the historian Allison Bernstein, 44,000 American Indians served in the armed forces, and many more worked in weapons depots,

NATIVE AMERICANS

mining, and other heavy industries. American Indian women joined up as nurses and members of the Women's Army Corps. Soldiers and workers sent a substantial percentage of their paychecks home to their loved ones on the reservation, supplying those communities with a new and significant source of income. When the war ended, these veterans would return to their homes with cash in their pockets and heightened expectations about their rights and responsibilities as citizens. They would be part of a new generation of American Indian leaders who would begin to establish new tribal governments and test the boundaries of sovereignty promised by New Deal-era reforms.

Termination and Relocation

After the war, the mood in Congress shifted once again toward a more assimilationist Indian policy. In 1953, legislators were determined to "get out of the Indian business" once and for all, and passed a series of laws, including Concurrent Resolution 108 and Public Law 208, that enabled states to extend their jurisdictions over Indian land, thus terminating their federal reservation status. Not all states exercised this option, nor did all tribes find their reservation status terminated. This was a devastating blow to nascent tribal governments, such as the Menominee in Wisconsin, who had been somewhat successful in developing a relatively small, yet viable, lumber industry. Still, without federal support they could not compete with large-scale corporate operations. For many tribes, termination meant further loss of their land base as well as a direct attack on their political and economic sovereignty.

Like other federal policies, termination did not turn out as legislators expected. Coupled with this legislation was a voluntary federal program that offered to relocate reservation residents to urban areas such as Denver, Albuquerque, San Francisco, and Phoenix as well as Midwestern cities such as Minneapolis and Chicago. Many American Indians took advantage of this project, hoping to find a way out of the poverty they faced at home on the reservations. But migration did not mean that American Indians would completely abandon their reservation communities, as policy makers had hoped. Since at least the late nineteenth century, native people ventured beyond their reservation's boundaries to find work; but they would also come back, contributing their earnings and labor to the survival of their families. Picking carrots for commercial growers in Phoenix, repairing railroad tracks near Kansas City, or packing produce

in Oakland did not necessarily mean that American Indian workers would completely assimilate the values and culture of the dominant society. Nor did it mean that they would lose their connections with their kin at home. The result was not necessarily assimilation, but what the historian Eric Meeks terms "resistant adaptation." American Indians did not choose between their cultures and their jobs. Instead, they developed strategies that enabled them to make a living in ways that resonated with their own cultural practices and responsibilities.

In the 1950s and 1960s, sizable urban Indian communities emerged in Los Angeles, San Francisco, Phoenix, and other western cities. But many native people returned to the reservation or created broader urban/reservation migration streams of relatives and friends who might come and go as needed. New social movements grew from these urban enclaves that would demand significant reform in U.S. Indian policy, including the repeal of termination and legislation that afforded greater respect for cultural, political, and economic sovereignty.

Native Americans and Labor Unions

The history of Native Americans and organized labor in the United States reflects considerable tension and ambiguities, mirroring the experience of other workers of color. Like Mexican-Americans and African-Americans, they confronted racial discrimination at work and in the union hall, where white union members denied them access to the building trades and other highly skilled jobs. In fact, labor unions that traditionally organized workers in Arizona and New Mexico mining districts, in towns that bordered reservations, have been at best ambivalent toward American Indians. At worst, unions were outright hostile, viewing Native American workers as potential strike-breakers who depressed wages and working conditions for the rest of the membership. In mining towns such as Ajo and Bisbee, Arizona, or even Gallup, New Mexico, American Indians were not even afforded conventional company housing. Instead, they lived in segregated areas on the margins of those communities called "Indian villages" and performed jobs that were designated "Indian work." Union members would do little to challenge such discrimination until the 1970s, when they found themselves competing with Indians for jobs in large-scale, extractive industries and other corporate operations on reservation land. After that, Indian workers would demand access to those jobs, not as a civil right, but as a right to tribal sovereignty.

Since 1958, when workers at the Texas Zinc uranium processing mill tried to organize a union on the Navajo Reservation, the status of unions on reservation land has been in question. With the development of Indian gaming, this issue remains a difficult problem between trade union activists who assert their rights under federal labor law and tribal authorities who insist on their sovereign jurisdiction. In some cases, native labor activists have successfully bridged this divide by demanding that their tribal governments enact guidelines to promote safer working conditions and cooperate with unions to develop apprenticeship programs for young American Indian workers. In 1977, Native Americans throughout the United States developed the Tribal Employment Rights Ordinance, an initiative independent of other federal programs that gives hiring preference to Native American workers in non-tribally operated companies on reservation lands.

Other workers of color, Mexican-Americans and African-Americans in particular, transformed their unions into social movements that advocated broad, civil rights agendas. Many American Indians eventually joined unions such as the United Farm Workers, United Mine Workers, and Laborers' International and significantly improved their wages and working conditions as a result. But unions themselves did not serve as vehicles for social justice, as they had under César Chávez and A. Philip Randolph. American Indian working-class history is complicated by a long-fought struggle over land and sovereignty, treaties, and armed resistance. A civil rights agenda, one that ensured equal rights for all American citizens, did not adequately address the demands of indigenous communities that also wanted power over their own lands, cultures, and economies. Labor demands might translate well into civil rights, but not into treaty obligations.

NESTOR, AGNES (JUNE 24, 1880–1948) Progressive Era Trade Unionist

Agnes Nestor, a self-described pioneer woman trade unionist, was a groundbreaking labor leader and political activist during the Progressive Era. Nestor dedicated her life to the promotion of workingwomen's needs. To this end, she advocated for women's unionization, protective legislation, and woman suffrage. Her successes make Nestor one of the most influential and significant female labor leaders of the early twentieth century.

Agnes Nestor was born in Grand Rapids, Michigan, on June 24, 1880. Her mother, Anna McEwan, suffered a lifetime of health problems after working in the cotton mills of upstate New York as a child. Agnes's father, Thomas Nestor, was a machinist by trade and active in machinists' unions and the Knights of Labor. In Grand Rapids, he managed a grocery store and served several terms in the city government. In 1896, an economic depression drove Thomas to seek work in Chicago. His family followed several months later in 1897.

Agnes began working for wages when she moved to Chicago with her family. She found a job as a glove maker at Eisendrath's Glove Factory, where she stayed for the next nine years. Almost immediately,

Nestor realized the disadvantages of the piecework system. She shared grievances with the women in her department, such as having to purchase their own needles and oil for the sewing machines, having their pay docked for the cost of power to run their machines, and dealing with disrespectful foremen. When the male glove cutters at Eisendrath's went on strike in the spring of 1898, Nestor and the glove makers followed suit in order to make their own demands on management. Nestor quickly assumed a leadership role amongst the women workers, and with the support of the Chicago Federation of Labor (CFL), the strikers won. As a result of her experiences organizing on the picket line, Nestor became convinced that women required separate all-women's locals in order to see their interests properly served. She went on to organize the Glove Makers' Local 2 at Eisendrath's in 1902 (Local 1 was all men). During this time, Nestor also published the first of her many written pieces, "A Day's Work Making Gloves." Nestor's early commitment to workingwomen's self-organization shaped her political approach and activity in the labor movement.

As Nestor agitated for workingwomen's needs, she encountered an extremely supportive environment, both from her family and the labor movement. The experiences and pro-union stance of her parents supported Nestor's ideology from the days of her first strike. Her father, in particular, applauded his daughter's unionism, and he instructed her from his own experiences in the labor movement. The strike at Eisendrath's allowed Nestor to work with the Chicago Federation of Labor Organization Committee. Sophie Becker, the only woman on the CFL Organization Committee, particularly inspired Nestor. In addition, Nestor regarded John Fitzpatrick, the head of the CFL Organization Committee at this time, as a great mentor and friend. Over the next few years, she often sought his advice and received his support. This network shaped Nestor as she rose to become a great labor leader.

As the first president of her Glove Makers' local, Nestor served as a delegate to a 1902 American Federation of Labor conference in Washington, DC, to organize the International Glove Workers Union of America (IGWUA). Nestor acted as an officer of the IGWUA from 1903 until her death in 1948. At the second IGWUA convention, held in Gloversville, New York, in 1903, Nestor made her first public speech and was elected vice president on the executive board of the union.

The summer of 1904 brought a great strike in the Chicago Stockyards, including some three thousand women workers. The Chicago branch of the National Women's Trade Union League (WTUL), formed in

1903, actively supported the strikers. The WTUL interested Nestor because it was the only organization of its time that sought to unionize women as a mechanism for social reform. As president of her local, Nestor attended a meeting of the Chicago WTUL at Hull-House, where she met Mary McDowell, Jane Addams, and Ellen Gates Starr. Nestor joined forces with the Chicago branch of the WTUL in 1904. She served on the national executive board in 1906 and also held the office of president of the Chicago branch from 1913 until her death in 1948.

In 1906, Nestor became the secretary-treasurer of the IGWUA, a full-time, paid position. This appointment marked Nestor's transition to full-time labor organizing. She continued to lead and organize women workers in various industries, including involvement in Chicago's first large strike for garment workers in 1911.

In addition to promoting women's self-organization, Nestor sought to support women workers through legislation. Beginning in 1909, Nestor and the WTUL lobbied every session of the state legislature for an eight-hour day for women until the bill finally passed in 1937. Nestor believed that protective laws would ensure greater security for workers than unions alone could provide. She stood against the National Woman's Party (NWP), which argued that protection for women would jeopardize the passage of the Equal Rights Amendment. In opposition, Nestor wrote a scathing critique of the NWP platform in her 1926 report of the Women's Industrial Conference.

Throughout her career, Nestor supported women's suffrage. Her experiences as a worker and organizer led Nestor to see suffrage as a key to better working conditions for women and children. She pointed out that the ballot ensured women's vote for worker safety and the appointment of female inspectors in the factories. In addition, women voters would have a voice in the appointment of police and court positions, two institutions that often turned against strikers. In 1910, Nestor outlined her position in her published piece "The Working Girl's Need for Suffrage."

Nestor's influence reached both the local and national levels. In 1914, President Wilson appointed Nestor to the Vocational Educational Commission, out of which came the 1917 Smith-Hughes Act, which offered federal aid to vocational education. Nestor ensured that women would properly benefit from this act, advocating that women needed support for technical training in addition to domestic science. Additionally, Nestor served on several wartime labor commissions and played a crucial role in the 1920 creation of the Department of Labor's Women's Bureau.

Nestor died on December 28, 1948. Eulogized as the workingwoman's best friend, Agnes Nestor helped to shape the role of women in the labor movement. Her commitment to workingwomen's needs informed her political approach and strategy for reform. As an early twentieth-century woman's trade unionist, Agnes Nestor stands out as a pioneering and prominent labor leader.

NEW ENGLAND ASSOCIATION OF FARMERS, MECHANICS, AND OTHER WORKING MEN

On February 16, 1832, more than 80 men gathered at the Marlborough Hotel on Washington Street in Boston's central commercial district to form the New England Association of Farmers, Mechanics, and Other Working Men (NEA). The NEA did indeed encompass farmers, mechanics, and other workingmen from the across the region, but the Association's leaders also included men who earned their living from "mental labor." Charles Douglas, the first president and editor of the organization's newspaper (*New England Artisan*), was a physician, and Jacob Frieze, the founding secretary, was a Universalist minister.

The NEA was distinct from—though certainly cognizant of—the trade unions and workingmen's political parties also active in the early 1830s. The Association addressed issues of immediate import to

workers such as the demand for a 10-hour workday and broader topics such as the morality of child labor and the need for wider access to public education. The organization reached deliberately across occupational categories and class lines to build a coalition to improve working conditions and elevate workers' status. The NEA saw political action as an essential component of this struggle for labor rights but tried to avoid plunging into the hurly-burly of parties, campaigns, and electioneering.

The NEA's constitution, ratified at its first convention, included a public pledge that all its members work a 10-hour day—or risk expulsion from the organization. Moreover, the assembly set March 20 as the date to put the 10-hour workday into effect. No one mentioned the word "strike"; nevertheless, on March 20, 1832, ship caulkers, carpenters, painters, masons, and other tradesmen in Boston walked off their jobs and demanded the 10-hour day. Employer associations quickly countered with denunciations and lockouts; soon each strike collapsed. Though the NEA did not play a prominent role in leading these protests, the organization never denied that its call to action helped to inspire the work stoppages.

The Association also issued a report on education that focused on children in textile mills, their long hours of labor, and their lost opportunities for schooling. The report offered a disturbing account of young workers being exploited and kept in ignorance; of children growing up with stunted bodies and minds unprepared to assume the duties incumbent upon citizens in a republic. The authors recommended that "a committee of vigilance be appointed in each State" to publicize abuses at the workplace and petition legislatures for the 10-hour day and mandatory education for all children employed in factories. Thus, the NEA was one of the first labor reform organizations to insist that government had the right and the duty to regulate the conditions of labor, especially by legally limiting the length of the workday for those who could not secure such protections for themselves through negotiations or contracts. Here again, the Association never pursued this political petition drive with much consistency or vigor, but labor reform groups in the 1840s picked up on this campaign and often made legislation for the 10-hour day a centerpiece of their public pronouncements.

The NEA continued to press for a 10-hour workday and the education of factory children at its next convention in the Representatives' Chamber of the Massachusetts State House on September 6, 1832. Those assembled re-elected Charles Douglas as president; and taking note of the recent wave of failed strikes in Boston, the delegates retracted any plans

to expel members or local affiliates who were compelled to work more than 10 hours a day. The Association learned quickly that public declarations had limited effect on recalcitrant employers and that workers should not be punished further for losing a courageous battle to limit working hours.

The Association returned to the Marlborough Hotel for its annual meeting on October 2, 1833. The organization's new president—William Thompson, a farmer from the western Massachusetts town of Northampton—was urged to appoint traveling lecturers who could help distribute copies of newspapers and convention proceedings across the region. At this same meeting, delegates from New Haven, Connecticut, noted the absence of representatives from factory towns and villages—despite the Association's sympathetic reports on the plight of industrial operatives. Thus, the NEA's ranks were missing an essential component of the emerging antebellum working class: textile operatives and urban women workers such as seamstresses and domestics.

This failure to bring women into the fold may have been a key reason why the Association disintegrated after one final lackluster meeting in the fall of 1834 in Northampton. By this time, the NEA was pursuing a strategy to recruit more members from rural areas. The organization published an address that never mentioned the 10-hour workday but focused instead on financial problems plaguing farmers. The Association demanded the repeal of what it proclaimed were unjust laws regulating mortgages, debt, banks, public education, and criminal courts and urged all its members to go to the ballot box to gain redress. The new emphasis on agrarian politics, despite the organization's insistence that it was still distinct from any political party, further marginalized factory operatives and other wage-earning women and made the NEA a close adjunct of the Massachusetts Workingmen's Party. The descent into the electoral maelstrom of Jacksonian Era politics may well have sealed the Association's fate—after the 1834 campaign season concluded, the NEA was never heard from again.

NEW ENGLAND LABOR REFORM LEAGUE

The New England Labor Reform League (NELRL) held its first convention on January 27–29, 1869, in the Melodeon Theatre on Washington Street in Boston's central commercial district. The league was essentially the brainchild of Ezra Heywood, a 40-year-old Congregational minister turned Garrisonian abolitionist, pacifist, philosophical anarchist, and advocate of both "free love" and his own version of labor reform. Heywood's abiding commitment to the NELRL—calling meetings, renting halls, writing resolutions, and publishing pronouncements—kept the organization going for nearly two decades. However, his idiosyncratic definition of labor reform also triggered irrevocable splits with other activists and advocates and relegated this organization to the sidelines in the broader movement for justice at the workplace.

When Heywood wrote his call for the League's founding convention, he had the support of local Boston labor newspapers, such as the *American Workman* and the *Daily Evening Voice*; unions, such as the Knights of St. Crispin (shoe workers); and activists, such as Ira Steward and George McNeill. He believed that this new organization would embody his vision of a truly classless movement, dissolving differences between working-class activists and middle-class reformers and restructuring relations between labor and capital. To realize this bold ideal, Heywood insisted on opening the speaker's rostrum to a range of nostrums on taxes, tariffs, and currency, as well as discussions of working hours and wages. He placed great emphasis on debate and public edification, and not on specific plans for collective action. If Heywood showed any preferences among the cacophony of competing schemes, he opted for a broad individualistic, antimonopolistic, philosophically anarchistic critique rooted in currency reform.

Once Heywood let his preferences be known, activists such as Steward and McNeill—outspoken proponents of the emerging postwar eight-hour movement—quickly sought to extricate themselves from any alliances with the mercurial ex-minister. By the end of the League's second convention, in May 1869, hopes for a stable coalition between eight-hour advocates and Heywood's supporters were dashed in a series of bitter floor debates. Steward's camp insisted that labor reform had to be both pragmatic and programmatic—workers could not waste their time debating monopoly power in the abstract; they had to restrain corporate power at the point of production by first limiting the hours of labor. Heywood clung to his definition of the League as a forum where

many visions of labor reform could be discussed (including his own preference for currency reform). Yet, even as he insisted that the meeting was open to all opinions, Heywood tried to control the agenda through prewritten resolutions. Many workers left the conclave bitterly resentful of what they saw as Heywood's high-handed and hypocritical tactics.

Steward and McNeill's departure meant that Heywood no longer had to deal with organized opposition to his leadership of the League or to his policy of free-ranging (some would say unfocused) debate. The few workers who turned out for the League's fall 1869 meeting left before adjournment, grumbling about the gathering's antilabor tone and the constant chatter concerning party politics. Thus, within less than a year of its inception, the League lost most of its initial support from working-class men and women in Boston. Despite its name, many workers concluded that this organization simply had no idea what labor reform meant to people on the shop floor. The League's resolutions continually subordinated basic workplace demands to vague schemes for financial transformations that were supposed to cure all social ills. In reality, however, such ideas often benefited only those with far more money than the workers whom the League professed so much sympathy for. Workers insisted that labor reform was not an abstract set of propositions to be bandied about; social change had to be rooted in a clearly defined course of collective action to secure specific improvements in working conditions. The growing rift between Heywood's remaining supporters in the League and the broader labor reform community in Boston revolved around two competing maps of social change—one started with theories about financial reform and their dissemination through public debate; the other began with improving conditions on the job as a way of liberating workers to become agents for broader economic and political transformations. The fight in this League was seen by many participants as a contest for the ideological soul of labor reform itself.

Whatever the NELRL's faults and fault lines, the treasurer's report at the January 1870 convention revealed that this league was financially robust compared with most other reform groups of the early postwar period. The organization collected nearly five thousand dollars in its first year from book sales, membership dues, and donations. Most of the funds were expended to distribute 30,000 books and pamphlets, sponsor lectures, and rent halls for meetings. Clearly, the League was spending a substantial amount of time and money to promote its brand of labor reform, but the group's strategy remained rooted in conventions, resolutions, and publications. The organization continued to frown on actively

organizing workers or working to rebuild its tattered alliances with other labor reform groups. In fact, the more that eight-hour associations and trade unions dismissed the league as irrelevant to their campaigns for workers' rights, the more the NELRL rejected these groups as narrow-minded special interests that underestimated their own constituents' intelligence.

To their credit, Heywood and his wife, Angela, frequently criticized the exploitation of women in the urban economy, especially those working in the garment trade and in domestic service. The Heywoods shared a conviction that equitable pay for workingwomen was part of a much larger crusade to gain full economic, social, political, and sexual equality for all women. They also believed that equal rights should be extended to all people regardless of race, nationality, or religion and that universal equity lay at the heart of a truly reformed society. Yet, here again, the Heywoods stopped at grand pronouncements and rarely offered any concrete strategies for achieving social equality.

By the mid-1870s, Heywood's antimonopoly rhetoric became so pronounced that his convention resolutions lacked even a veneer of sympathy for basic workplace reforms. He publicly condemned the entire movement for a shorter workday because he saw it as inextricably linked with party politics and a corrupt state. Furthermore, he proclaimed that employers deserved the League's "full sympathy in resisting legislative or trade-union interference." Heywood's aggressively individualistic, antistatist, and now avowedly anti-union pronouncements signaled his and the League's nearly complete break with every other labor reform organization. The League became a hollow shell with few if any working-class members, content to preach its own negative version of labor reform to a rapidly diminishing circle of adherents. Yet the group continued to meet, at least on an annual basis, well into the 1880s. It even pointed to its own longevity as proof that its antagonistic definition of labor reform was actually the most accurate assessment of social conditions in Gilded Age America, though few others cared to listen to such claims.

For most of its nearly two-decade existence, the New England Labor Reform League sought to liberate all individuals from what the organization defined as unnatural legal, political, economic, and social constraints. Many workers embraced antimonopoly arguments—especially those criticisms directed at manufacturing corporations and financial institutions. But Heywood insisted that his philosophy of individual freedom also compelled him to condemn trade unions, producer co-operatives, and legislative limits on the workday—the very institutions and ideas that many other labor reformers considered essential

building blocks for workers' emancipation. Heywood often spoke with conviction and sympathy about the injustices heaped on American workers and the need for equity and fairness in American society. But the organization he led became a labor reform group opposed to virtually all popular ideas for labor reform. Thus, the NELRL doomed itself to irrelevance within the campaign it claimed to be championing.

NEW ENGLAND WORKINGMEN'S ASSOCIATION

Organized labor in New England all but disappeared following the Panic of 1837, but as the economy began to revive in the early 1840s, so too did labor agitation. New England workers experienced industrial life in ways that varied by industry, sex, and skill. But widespread complaints of low wages, long hours, weak control over apprenticeship, and intensified labor conditions brought on by the speedup, stretch-out, and premium system reflected rising discontent. In Fall River, Lowell, Manchester, Dover, Milford, Woonsocket, and throughout New England during the early 1840s, workers responded by waging petition campaigns and organizing community-based associations to improve labor conditions. In June 1844, one such organization, the newly organized Fall River Mechanics' Association, issued a call to New England workers to assemble in convention. The "prevailing system of labor," they charged, was "at war with the . . . physical, intellectual, social, moral and religious" well-being of labor. A convention, they suggested, would bring together "the united wisdom and judgment of various Mechanics' Associations," creating a force of "incalculable benefit." On October 16, 1844, delegates convened at Boston's Fanueil Hall to create the New England Workingmen's Association (NEWA).

Hoping to maximize participation by the region's workers and their supporters, NEWA delegates set an inclusive course for the organization. After a heated

debate about participation, delegates ruled to open their doors to "all those interested in the elevation of the Producing Classes, and Industrial Reform, and the extinction of Slavery and Servitude in all their forms." Thomas Almy, the editor of *The Mechanic*, the Fall River newspaper that issued the call, observed that perspectives on reform were "as dissimilar as are the conditions of society." Women did not attend the founding convention, though a "ladies association" from Fall River provided a banner proclaiming "Union is Strength." Despite their initial absence, women played a vital role in NEWA, marking a radical departure from previous labor organizations.

Opening itself to widespread participation also meant dealing with competing visions of labor's interests. Mechanics made up the majority of the 207 delegates present, but the large numbers of reformers in attendance aggressively pushed their own reform agendas. Representatives from Brook Farm, such as George Ripley, Parke Goodwin, and L. W. Rychman, used the convention to convince delegates of the virtues of Fourierism, while George Henry Evans, Thomas Devyr, and Alvan E. Bovay tried to win converts to their ideas on land reform. Working-class delegates objected to both of these grand utopian undertakings, though not vigorously enough to derail them. Many workers were interested in the idea of establishing producers' cooperatives, in which labor, not capital, would be rewarded with the fruits of its own labor. Working-class delegates expressed universal support for the 10-hour workday.

Advocacy for a 10-hour workday had deep roots in the region, though the movement in the 1840s took a new and decidedly political direction. In the 1830s, the New England Association of Farmers, Mechanics, and Other Workingmen had tried unsuccessfully to secure such ends by organizing regional strikes. But NEWA eschewed strikes in favor of petitioning. The political emphasis of NEWA was no doubt influenced by President Martin Van Buren's executive order of March 31, 1840, establishing a 10-hour workday for all federal employees. Unable to secure protection under this federal legislation, New England workers stressed the need for state legislatures to take up the 10-hour challenge. The political emphasis of the movement for the 10-hour workday limited female participation in some respects, most notably at the ballot box, but the commitment to petitioning state legislatures centered on tactics and skills familiar to female members, particularly those engaged in raising abolitionist petitions. Women in Lowell, Manchester, Dover, and elsewhere organized Female Labor Reform Associations (FLRA) that operated under the

umbrella of NEWA, providing energy, organization, and moral authority to the movement.

One of the most effective organizing tools for NEWA was the newspaper *The Voice of Industry*, initially published in Fitchburg by William F. Young. In April 1845, *The Mechanic* ceased publication, but by October, NEWA made *The Voice* its official organ, moved the paper to Lowell, and appointed Sarah Bagley, the president of the Lowell FLRA, to its three-person publishing committee. Huldah J. Stone, the secretary of the Lowell FLRA, served as a correspondent to the paper. In early 1846, the Lowell FLRA purchased the paper's press and type and, over the next couple of years, held numerous fund-raising activities to pay for it.

Throughout its brief existence, groups vied for influence over NEWA. NEWA held its second convention in Lowell in March 1845. Horace Greeley, Robert Owen, Albert Brisbane, and other Associationists spoke, dominating the meeting, leading the president, W. H. Channing, to note: "Much complaint was made by the members about the want of interest felt by the workingmen for the cause of reform." At the third convention in Boston, May 1845, Associationists again dominated the convention with extended discussion of Fourierism. Associationists and land reformers were largely absent from the fourth convention in Fall River, September 1846, leaving working-class members to re-assert more immediate and practical labor reforms, such as the 10-hour day. Members of NEWA assembled in convention in Lynn in January 1846, Manchester in March 1846, and in Nashua September 1846. At the Nashua convention, the New England Workingmen's Association renamed itself the Labor Reform League of New England.

The League met in Boston in January 1847 and remained under the influence of the Associationists until the organization's disappearance. In July, however, 10-hour advocates scored a victory when the New Hampshire legislature, under the weight of a statewide petition drive, passed the first state law limiting the workday to 10 hours. It was a hollow victory. The law contained a clause limiting the workday to 10 hours, "unless otherwise agreed by the parties." Many manufacturers merely issued their employees new contracts containing the clause, with a simple command: sign or be blacklisted. Workingmen and workingwomen gradually lost interest in NEWA. Members who had earlier advocated cooperative stores became involved in the New England Protective Union movement, while other elements became involved in the Industrial Congresses of the 1850s. By 1849, the entire Association disappeared.

NEW LEFT

The New Left was a movement of white, college-educated youth that stood for radical democracy in the United States and around the world. The American New Left existed from around 1960 into the early 1970s. The idea of a "New Left" originated in Great Britain in the 1950s. This term was associated there with young Marxists unhappy with existing left-wing politics. The radical American sociologist C. Wright Mills, author of *The Power Elite* (1956), brought the term "New Left" to the U.S. scene, penning a "Letter to the New Left" in 1960, published in *New Left Review*, the journal of the British New Left, and then republished in the United States. Besides straddling the Atlantic, Mills offered a connection to an earlier era in American radicalism, having published political writings since the 1940s, a time when the labor movement stood at the center of the American left.

The relationship between labor and the New Left was far weaker, although not nonexistent. The young American radicals' thinking echoed the argument Mills had made in his first book, *The New Men of Power* (1948), that union leaders had become absorbed into the "power elite." The young leftists, like many liberals, were persuaded that the United

States in the 1950s had become, as John Kenneth Galbraith put it in the title of his 1958 book, *The Affluent Society*. Economic inequality persisted, as the continued presence of the poor attested. But the industrial working class, most young radicals feared, had become comfortable enough that they were “part of the system,” no longer natural rebels. Members of the New Left saw a need for a challenge to this system if its flaws were to be rectified, but they expected that, with perhaps a small number of exceptions, that challenge would not come from labor. Instead, they looked to African-Americans, who were rising up against the Jim Crow system of white supremacy in the South, to youth in general, and to the poor. From the beginning, the New Left’s strategic thinking about change in America was tied to a hope for insurgencies and a determination to support, and perhaps to help guide, such insurgencies.

Post-Scarcity Radicalism

The New Left had several sources and inspirations, in addition to Mills’s writings. These included the civil rights movement, especially its youth wing, as embodied in the Student Nonviolent Coordinating Committee (established in 1960); the pacifist radicalism of the 1950s, as encountered in the pages of *Liberation* magazine (founded in 1956); the journal *Studies on the Left*, published in Madison, Wisconsin, starting in 1959 under the influence of the historian William Appleman Williams, which indicted American liberals for their collusion with capitalism and imperialism; and even critical religious thought such as that encountered in university YMCAs and YWCAs (Young Men’s/Women’s Christian Associations) across the country. Marxism and other traditional economically oriented leftist perspectives were present in this mix of influences, but other moral and analytical perspectives predominated.

The young radicals began by thinking that university-educated people like them would pioneer new ideas that would make life worth living in the America of the future, even as they would fight rearguard battles against the remaining vestiges of unfairness and authoritarianism, which they saw epitomized in southern segregationism and the power that its representatives wielded in the U.S. Congress. All of this they promoted under the slogan “participatory democracy.” They pictured organized labor as a potential partner in pursuing this agenda, but not as moral leaders of a New Left alliance. New Left activists formed their main organization in 1960 when they changed the name of the Student League for Industrial Democracy

(SLID), a small union-funded group, to Students for a Democratic Society (SDS). The name change indicated a shift away from economic issues to a less class-oriented focus on issues of power. Yet the young activists hoped to retain their ties to sympathetic labor unions. Their 1962 manifesto, the “Port Huron Statement,” in which they advanced an agenda focused on the imbalances of power that they discerned in the U.S. political system—imbalances that, at that date, they connected only obliquely to economic power relations and inequalities—was adopted at a Michigan retreat owned by the United Auto Workers (UAW). SDS sought to point the way toward a newly meaningful life in a society whose material wealth held the capacity to provide the essentials of physical existence to all. New Left thought reflected a belief that the United States had entered a “post-scarcity” age, when the basic struggle for survival need not dominate people’s lives. Ever fewer person-hours were required to produce the economic value needed to sustain the country’s population. While labor leaders in the 1960s tended to worry over the prospects of increased unemployment that this trend augured, New Left radicals, as well as many liberals, thought that the coming challenge was to find ways of making increasing amounts of leisure time meaningful, to enhance one’s “quality of life” rather than merely piling up ever greater quantities of goods. The New Left did not grapple seriously with the question of how to ensure a sufficiently broad dispersal of the country’s growing wealth so as to make this “leisure problem” the salient one for all Americans.

In keeping with its theme of honoring and promoting democracy, the New Left took a “plague on both your houses” attitude toward the Cold War between the United States and the Soviet Union. The young radicals saw neither superpower promoting democracy around the world; instead, both sides simply pursued power and sought to make pawns of peoples in the Third World. Moreover, members of SDS felt that the intellectual and political battles over communism had wasted the energies of the previous generation in America and that the harsh anticommunism that had dominated political life in the 1950s had done much damage to the cause of democratic progress by stifling dissent and promoting conservatism. The New Left’s announcement that it intended to stay on the sidelines of the Cold War was controversial and earned them accusations of naïveté about communism, or worse, from the start. The young radicals, while they had no use for the Soviets, sympathized with Third World revolutionaries, thinking that such forces might represent a middle way between the dogmas and corruptions of the United States and the USSR. They took an admiring view of the Cuban revolution

in particular, even viewing the youthful cadres of nationalist movements of Africa and Latin America as models they might emulate in the United States. Still, early SDS activists sometimes indicated they wished to moot international issues, to place them on the back burner so that they could focus on the issues of power and authenticity within the United States. The escalation of the Vietnam War in the 1960s would make that impossible.

A Host of Challenges

The environment in which the New Left operated changed drastically in the second half of the 1960s, and the movement was transformed in turn. Soon the slogans changed from “protest” to “resistance” and on to “revolution.” Several factors converged to create a maelstrom of political change.

First, the New Left could not help but oppose the U.S. effort to vanquish the Vietnamese revolution. In the early 1960s, the young radicals already had developed a critical view of U.S. actions in the Cold War. Their anti-imperialism made the war, after it was expanded dramatically in 1965, come to seem like their most urgent business. It also fed the New Left’s galloping estrangement from the U.S. social and political system, in its mind’s eye changing the insurgencies it always had wished to sponsor from levers for social reform into battering rams that might bring down a violent system. The structures of that system closest at hand for the young radicals were the universities themselves. The radicals became increasingly knowledgeable about the involvement of U.S. universities in doing war-related research, and this prodded the New Left to view universities in a new light: as agents of social repression, hostile to social change, and logical targets of leftist agitation. The New Left’s absorption in the war issue spurred the development of a set of critical perspectives on the U.S. role in the world that had a strong and unprecedented influence upon U.S. intellectual life.

Second, the African-American movement turned away from the doctrines of nonviolence and interracialism that had characterized its early years, and its increased militancy affected the New Left, just as the black movement had inspired the New Left in earlier years. White leftists no longer could entertain notions of enlisting the black or the poor as the shock troops, figuratively speaking, in New Left scenarios of social change. Some white radicals envisioned the relationship working the other way around, with them in a supporting role. In part, the message of the new “black power” movement among African-Americans

was that white radicals should organize among whites to advance the cause of social transformation and should cease involving themselves in the affairs of people of color.

Third, the counterculture of white middle-class youth, associated with the use of hallucinogenic drugs, the loosening of customary sexual mores, communal living, and a rejection of acquisitive consumerism, gained a legion of followers across the country in the late 1960s and early 1970s. The New Left felt it had to respond to this movement, for it was a momentous development among the only constituency the New Left had—white college-educated youth. Many young leftists became deeply involved in the counterculture, both out of such strategic considerations and because they were moved by the same yearning for a more authentic life that moved their nonpolitical peers. Leftists involved in the “hippie” counterculture hoped that such an alternative culture could have a profound political impact. By winning ever more members of the educated young away from loyalty to the dominant social system, a politically conscious counterculture might provide the key to a bloodless revolution.

A fourth development of the post-1965 years was the rise of a new feminist movement, which spread from its initial reform constituency to young firebrands, most of them in the New Left or the black movement, who promoted more total change in social practices. This emergence of “radical feminism” had a profound impact on the New Left. Many of the men in the left derided it as unimportant, but resisted it fiercely, thus betraying the centrality of its concerns to the youth culture in which the New Left was deeply implicated. But feminism’s disintegrative impact on the New Left arrived only after the radicalizing effect of the three developments mentioned above had taken hold. The trajectory of the New Left in its second phase—changing from a reform movement with some daring ideas to a revolutionary movement experimenting with different strategies for promoting a political upheaval—resulted from these other developments, not from the rise of feminism. The rift between men and women in the movement over gender issues shaped the final years of the New Left, after 1968.

The New Working Class

The post-1965 phase of the New Left’s existence featured one important intellectual development that bears special relevance to the question of the New Left’s relations with the labor movement. That is the development of what was dubbed “new working-class

theory.” Since the New Left’s membership was college-educated and largely “raised in at least modest comfort,” as the “Port Huron Statement” put it, it is widely and correctly viewed as a middle-class movement. Yet education and standard of living are not the only ways to define one’s class location. Some New Left radicals, starting in 1966, asserted that college-educated young people formed a new working class, one whose future occupations might be salaried and would require bachelor’s degrees, but an exploited set of employees nonetheless. This emphasis on one’s relation to the means of production basically expressed an updated Marxist analysis.

The appeal of this analysis to New Left radicals stemmed from the dawning realization within the movement that its only base of support lay in the college-educated white youth that populated this new working class, a realization that the black movement drove home with its assertion that radicals within each major social group in U.S. society should organize among their peers alone. New working-class theory was a way of understanding and justifying the simple fact that white middle-class youth were basically on their own in the New Left. This theory said that this relatively privileged youth was not a parasitic social class, living off the surplus created by truly exploited people and out of touch with the experience of oppression. It said that New Left radicals and their peers were, instead, central to the unfolding drama of social as well as cultural change in the United States and morally justified in trying to bring down a system that oppressed not only others but them, too. Morally it did not matter that the New Left had weak and conflicted relations with the labor movement, if the New Left actually spoke on behalf of a new segment of labor, one unrepresented by the trade-union movement.

The vogue of new working-class theory passed by the end of the 1960s, as the war and the worsening racial conflict in the United States commanded immediate attention from the New Left. It became harder to assert that the New Left should content itself with tending its own fields. Many New Left radicals after 1968 departed into desperate, if usually feckless, efforts to support the struggles of African-American militants and Vietnamese revolutionaries. Yet, at the same time, many others in the New Left immersed themselves further in counterculture and feminist activities, announcing in deeds if not in words that they would continue to work for the development of a dissident consciousness within the white middle class/new working class of which they were members. These two different emphases, which sometimes overlapped in the lives of individual activists who maintained multiple commitments, were the lasting legacies of

the New Left. New Left radicals sided with domestic and foreign insurgencies by palpably subordinate peoples against the U.S. power structure, and they sided with themselves, nurturing seeds of dissidence among the white college-educated population. Because the New Left in general did not view organized labor as representatives of an oppressed minority poised for insurgency, because the early leaders of SDS, who had at least hoped to maintain an alliance with liberal union leaders, had been eclipsed by younger radicals with less interest in labor, and because initially sympathetic labor officials had been estranged by the New Left’s increasing radicalism, the traditional labor movement never attained a central role in New Left thought.

NEW ORLEANS GENERAL STRIKE (1892)

This strike came two months after the Homestead Strike in Pennsylvania and two years before the great Pullman Strike of 1894. As Roger Shugg wrote in a 1938 article in *The Louisiana Historical Quarterly*, it was “the first general strike in American history to enlist both skilled and unskilled labor, black and white, and to paralyze the life of a great city.” The strike involved at least 20,000 workers in 49 AFL unions. Two delegates from each union orchestrated

the strike in a Workingman's Amalgamated Council that represented black and white alike. Their demands included union recognition, the 10-hour day, and a preferential closed shop. Workers from every trade and skill level participated in the strike, including the organized hatters, shoe clerks, and musicians, but the powerful waterfront unions did not play an active role.

The strike began because the employers refused to grant union recognition. On November 5, 1892, all of the Council's member unions—including the streetcar drivers, the electric, light, and gas workers, and the marine and stationary firemen—responded to the general strike call. The mass walkouts happened at a peak time in seasonal business and shut down the city for three days. No violence was associated with the strike, even though the pickets left the city in darkness for three nights. Mayor John Fitzpatrick, a former longshoreman, supported the workers and resisted sending out the police against them, but Governor Murphy J. Foster backed the business interests. His threat to call out the state militia and impose martial law broke the strike. In poststrike arbitration, the workers won the 10-hour day and overtime pay, but the united employers refused to grant union recognition. After the strike, a lawsuit filed in Federal District Court charged 44 union leaders with conspiracy to restrain trade, but the Federal Circuit Court postponed indefinitely this first effort to invoke the Sherman Anti-Trust Act against labor.

In *Origins of the New South*, C. Vann Woodward argued that the New Orleans general strike of 1892 challenged the “Old South labor philosophy of the New South doctrinaires.” Two years after a state law pioneered Jim Crow on Louisiana railcars, the Workingman's Amalgamated Council certainly demonstrated that the many races of workers could join to resist the exploitation of organized labor. Both the Council and the strike represented the peak of a remarkable era. Since at least the 1870s, strong black unions and the structure of segregation had forced the organized workers to find terms to accommodate all. The results were profound. Eric Arnesen noted that by 1886, most New Orleanians in the trades commanded the same wage scale for the same work, regardless of race. In the next four years, the craft unions outpaced the Knights of Labor throughout the state. Between 1891 and 1892, more new AFL unions were chartered in Louisiana than elsewhere in the South, a handful fewer than Ohio, Indiana, and Illinois. The general strike was a product of that momentum, but it also marked the end of the era.

Scholars estimate that half the population of the city supported the Council, but the allied business interests presented an even more formidable front.

The united employers were represented by the Board of Trade and commanded support from most newspapers in the city, the commodity exchanges, the railway lines, and the governor of the State of Louisiana. When state power decided the strike, the employers learned an important lesson. Partly as a result, they determined they must develop an alliance with the leaders of the Choctaw Club, a new political machine on the rise in the late 1890s. Meanwhile, labor's biracial alliance collapsed. After a devastating 1894 strike, competition for work and white-on-black violence destroyed the structure of co-operation, and organized labor did not recover for almost a decade.

NEW SOUTH

In the wake of the Civil War, an emerging cohort of business entrepreneurs and newspaper editors advocated the building of a “New South” based on the growth of southern industry, the diversification of agriculture, and the attraction of northern investment. It was time to “put business before politics,” proclaimed the editor of the *Atlanta Constitution* and New South booster Henry Grady, in a famous 1886 speech urging sectional reconciliation and southern economic development. “The Old South rested everything on slavery and agriculture,” he continued. “The New South presents a perfect democracy...and a diversified industry that meets the complex needs of this complex age.”

The “New South” did experience economic growth and attract outside capital. Between 1869 and 1899,

the region's manufacturing output and value of products multiplied six times, and capital investment increased 10-fold. Nevertheless, the South continued to lag behind the rapidly expanding manufacturing base of the northern states; with nearly a third of the nation's population in 1900, the region was responsible for only 10% of national nonagricultural income. Much of the South's economic development rested on extractive industries like timber, naval stores, and mining or low-wage manufacturing based on agricultural products, like tobacco and cotton textiles. Indeed, in the latter case, low wages and a manufacturing environment with little threat of labor organization or state regulation represented the region's primary competitive advantage over the North, establishing a pattern that would attract capital and bedevil labor reformers and organizers for decades to come.

Meanwhile, despite the calls for diversification, the agricultural sector stagnated. The price of cotton, the South's main commodity crop, failed to increase sufficiently in this period to permit investment and modernization of southern agriculture. Low prices and steep mortgages drove many small landholders into the ranks of tenants and sharecroppers; by 1900, two thirds of all southern cotton producers worked land owned by someone else. With limited urbanization, a weak home market for foodstuffs made agricultural diversification difficult. In the words of the historian James C. Cobb, in the last three decades of the nineteenth century, "southern agriculture and southern industry remained locked in a mutually dependent relationship in which the weaknesses of one reinforced the weaknesses of the other."

The persistent gap between optimistic rhetoric and economic reality that characterized the New South proved perilous to the region's working class. For rural workers, African-Americans in particular, the system of sharecropping meant dependence on landlords, little income, and no possibility of upward mobility. Others fell into debt peonage and found they had to work out a debt to a landlord or turpentine camp operator in perpetuity or be sent to a chain gang or convict camp. Coal miners competed against the forced labor of convicts, leased by southern states to mine owners for a pittance. The South's most impressive industrial success, the rapid expansion across the Piedmont of textile manufacturing from 10,000 employees in 1870 to 100,000 30 years later, drew on the cheap and unskilled labor of displaced white tenant farmer families and almost entirely excluded blacks. Nearly a quarter of southern textile workers in the 1880s and 1890s were children, and over 40% were women. Textile workers, scorned as

lazy and uncouth, lived and labored in mill towns completely dominated by the textile owners.

Both black and white southern workers attempted to better their condition during this period, sometimes in concert with one another. The interracial United Mine Workers successfully organized the coalfields of Alabama and Tennessee, the Knights of Labor made inroads in Richmond and other cities, and dockworkers in New Orleans built a successful union, to name but three examples. However, the New South's largest industry, textiles, remained impervious to organization. Despite these occasional successes, however, most southerners continued to labor long hours, under difficult conditions, for low wages or, in the case of sharecroppers, peons, and convicts, no wages at all. If some blacks joined unions to improve their conditions, other African-American leaders, most notably Booker T. Washington, urged black workers to accept their degraded place in the labor market and make their peace with the economy of the New South in lieu of pursuing political or civil rights.

Historians continue to debate the nature of the New South's political economy, a discussion that mirrors ongoing debates about globalization and the developing world in the twenty-first century. Some argue that the South followed the best path of economic modernization possible under the circumstances, making the most of limited resources and an economy devastated by the Civil War. Others maintain that deeply engrained patterns of economic dependency, labor exploitation, employer control, and racial domination set the New South on a peculiar path of growth that continued to deny the fruits of the region's wealth to its working people well into the twentieth century.

NEW YORK CITY FISCAL CRISIS (1970s)

The 1970s New York City fiscal crisis began in the spring of 1975, when the city lost its ability to borrow money in the private market and teetered on the edge of bankruptcy. It was a key turning point in the city's history. The fiscal crisis led to a rapid dismantling of the city's liberal political and social order, which had originated during the New Deal period of the 1930s and 1940s, and had developed even further during Mayor John Lindsay's two terms (1966–1972), and its replacement with a new political order based on fiscal austerity. New York's 1970s fiscal crisis had national significance given the importance of the city, how its fiscal crisis was seen as an example of the failures of liberal social and economic policies, and how the solution to the crisis (the imposition of fiscal austerity and demands for givebacks from its unions) would soon be replicated in other U.S. cities and in the nation's private sector.

The fiscal crisis was a particularly significant moment for New York's working class because of the central role played by the city's municipal unions during the crisis and the impact of the fiscal crisis on all working-class New Yorkers. The municipal unions were a central political actor during the fiscal crisis and played a central role in keeping the city out of bankruptcy by investing close to \$3 billion of their members' pension fund assets in city securities. At the same time, they were forced to accept wage freezes and the firing of thousands of their members. Also, it was the city's working class and middle class that bore the brunt of the cuts in social services and layoffs that the city imposed during the fiscal crisis.

The city's fiscal crisis had several causes. One was the loss of tens of thousands of city jobs (particularly in the manufacturing sector) during the 1960s and early 1970s. During the same period, the city went through a significant demographic shift, as over 300,000 New Yorkers, many of whom were middle class, left the city to move to the suburbs or other areas of the country and were replaced with a massive influx of poor African-Americans and Puerto Ricans. The onset of the worldwide recession of 1973 further weakened the city's economy.

While New York City was hemorrhaging jobs and its tax base was declining, the city's municipal expenditures increased significantly. During Mayor John Lindsay's two terms (1966–1972), spending on welfare, higher education (particularly after the creation of an open admissions policy at the City University of New York), and health care skyrocketed. One cause for the increase in city expenditures was rapidly growing labor costs as the city's municipal workforce grew in large numbers and these workers won significant wage increases and better pensions. Between 1961 and 1975, the city's labor costs quadrupled. These increases in labor costs were not out of line with increases in most of the nation's other major cities. These gains were won by militant municipal unions. Led by such men as Victor Gotbaum of District Council 37 of the American Federation of State, County, and Municipal Employees (AFSCME) and Al Shanker of the United Federation of Teachers (UFT), the city's municipal unions went on a series of strikes during the second half of the 1960s that gained national attention.

In order to pay for these increased expenditures, the city needed more revenue, but only rarely did the city raise taxes to pay for these increases (one of the few exceptions was a commuter tax enacted in 1966) because of growing opposition to any tax increases by the state legislature and the city's City Council and its Board of Estimate, which were increasingly influenced by middle-class homeowners in Brooklyn, Queens, and Staten Island, who opposed any tax increases. Instead, the city chose to issue increasingly large amounts of short-term debt to raise needed revenue. By 1974, the city, under Mayor Abe Beame (1973–1977), was issuing over \$7 billion in short-term debt a year. Considering that the city's operating expenses in 1974 were only a little over \$10 billion, the city had reached a point at which it was covering over 70% of its operating expenses with short-term debt.

During the 1960s and early 1970s, the nation's large investment banks, which functioned as both underwriters and major purchasers of this city debt, were quite happy to go along with this policy, since they made significant profits from it. However, by late 1974, banks such as Chase Manhattan and Citibank began to reconsider their role in the city's financing. Many were reeling from significant losses from domestic and international investments and were increasingly worried about the city's ability to honor its debt and the Beame administration's willingness to rein in city spending. Therefore, they quietly began to sell their own city notes and bonds, and in March 1975, they informed the city that they would no longer underwrite the sale of New York City securities. This decision by the banks cut the city off from

private capital; without this money, the city moved quickly in the direction of defaulting on its loans and having to declare bankruptcy.

The city managed to avoid bankruptcy, but only after a series of actions were taken that significantly limited the elected city officials' control over the city's finances and budget, and the city was forced to make large cuts in its budget and lay off tens of thousands of municipal workers. Perhaps the most significant step was taken by Governor Hugh Carey and the state legislature during the summer and fall of 1975, when they created the Municipal Assistance Corporation (MAC) and the Emergency Financial Control Board (EFCB), which were given enormous power over the city's finances, budget, and collective bargaining power.

Blamed for being one of the main causes of the fiscal crisis by the banks, the Ford administration, and the city's newspapers, New York's municipal unions faced their worst crisis since the Great Depression. Despite their insistence that their members' wages and benefits were not out of line with municipal workers in other cities (which was accurate), the city fired approximately 25,000 municipal employees and reduced its municipal workforce by an additional 40,000 through attrition by 1980. Also, the municipal unions were forced to make a series of major concessions, such as agreeing to the deferment of an already-negotiated wage increase won in 1974, a wage freeze for the duration of the fiscal crisis, and less generous pension benefits for new members.

Faced with this crisis, as well as wildcat strikes by members of several unions in protests over the layoffs, Gotbaum of District Council 37 and the majority of other municipal union leaders developed an overall strategy in the summer of 1975 that would determine, to a great extent, what they would do for the duration of the crisis. Having concluded that striking was futile and determined to maintain their institutional power, they chose a strategy based on not directly opposing fiscal austerity, but on using their political power and their control of their members' pension fund assets to maintain some degree of institutional power and to protect their members as best as they could within the context of fiscal austerity.

To a certain extent, this strategy was successful. Using their control over the assets of their members' pension funds, which the city desperately needed access to in order to stave off bankruptcy, and the threat that they would go on strike if too many givebacks were demanded, the municipal unions remained an important player within the new political environment created by the fiscal crisis. Also, there were no more significant layoffs after 1975. Moreover, in

1977, in what was most likely a reward for their agreement to accept significant concessions, to keep strikes to a minimum, and to not directly oppose policies of fiscal austerity, the state legislature granted the city's municipal unions the right to an agency shop. Agency shop, which had been one of the municipal unions' main legislative goals since the mid-1960s, allowed the unions to automatically collect union dues or an amount equivalent to union dues directly from the paychecks of all workers covered by the union contract regardless of whether the worker was a union member. It is important to note that the state legislature chose not to make agency shop permanent. Instead, it granted the unions agency shop only for two years and made it clear that it might not be renewed for unions that went out on strike.

However, their membership did suffer significant layoffs, wage freezes in a period of galloping inflation, and significant givebacks concerning pension plans and work rules. Also, the municipal unions' acceptance of fiscal austerity put considerable limits on their power and their actions during the fiscal crisis and made them less inclined to work with, in any significant way, other groups in the city that were attempting to contest the imposition of a new political regime based on fiscal austerity. For example, despite their intense dislike of Mayor Edward Koch because of his actions during the 1980 transit strike and at the bargaining table, the municipal unions chose not to oppose his re-election by joining a broad coalition made up of most of the city's labor movement, liberal Democrats, and activists within the city's African-American community that supported State Assemblyman Frank Barbaro during the 1981 mayoral campaign.

However, it is not clear that the municipal union leadership had other viable alternatives under the circumstances. The 1970s were a remarkably difficult time for municipal unions in most of the nation's cities. A combination of fiscal crises at all levels of government, a conservative taxpayer revolt, and high inflation led elected city officials to turn against municipal unions that had emerged in the 1960s as a major political force. In cities across the country, elected city officials began to lay off municipal workers and demand significant wages cuts. Municipal unions found that striking, which many had used to great success in the 1960s, was no longer an option as much of the public had now turned against them and city officials proved willing to take strikes and, in some cases, permanently replace striking workers.

The city's working and middle classes bore the brunt of cuts in spending and government programs that were imposed during the 1970s fiscal crisis, given that it was these groups that most relied upon city

services. From the layoff of municipal workers to the imposition of tuition at the previously free City University, to a subway fare increase and increases in class sizes in the already troubled public school system, the city's working and middle class made tremendous sacrifices and confronted deteriorating city services.

While New York's 1970s fiscal crisis ended in the early 1980s, its legacy continues to this day. Wages, work conditions, and fringe benefits for the city's municipal employees have never totally recovered from the hit they took during the 1970s fiscal crisis. New York City's municipal unions have continued to pursue a relatively conservative and narrow interest-group strategy into the post-fiscal crisis period, as their endorsement of Mayor Rudolph Giuliani in his 1997 re-election campaign demonstrated. New York's once robust liberal political culture, which rested on a strong labor movement, has never totally recovered from the blow it suffered during the 1970s fiscal crisis.

NEW YORK CITY HOSPITAL STRIKE (1959)

The seven-week strike by maintenance and service workers at six New York City nonprofit hospitals, which began on May 8, 1959, proved a signal breakthrough for hospital worker unionism in the United States. Organized by Retail Drug Employees and Hospital Workers Union Local 1199—a maverick outfit with roots in the Communist-led fringe of 1930s-era CIO industrial unionism—the “battle of ‘59,” as it would later be known by insiders, was one of the first northern conflicts effectively to draw on the emergent energy of the civil rights movement,

even as it also relied on the peculiar labor politics of New York City for victory.

On the heels of a collective bargaining settlement at Montefiore Hospital the previous year, Local 1199 demanded union recognition from 40 voluntary, nonprofit institutions represented by the staunchly anti-union Greater New York Hospital Association. Strategically selecting six Jewish-endowed hospitals where the union, itself led by the Jewish pharmacists Leon Davis and Elliott Godoff, had amassed its strongest cadre, the union struck in defiance of both the law (nonprofit-sector workers were not included in national or state labor laws) and the convention of selfless service on the part of health-care employees. President Davis himself was forced to hide out from process servers during much of the strike.

The prolonged conflict challenged the political values and loyalties of a city and public accustomed to think of itself as a relatively “liberal” oasis. In the workplace, the union tapped pent-up demands for dignity and self-respect within a low-wage, largely black and Latino labor force that had shared neither in the postwar boom nor in the city's otherwise powerful labor movement. By organizing themselves, the nearly 3,000 workers who walked picket lines in 1959 added a new and increasingly powerful voice to the city's public face. In particular, two African-American strike activists—Lenox Hill diet clerk Doris Turner and Mt. Sinai orderly Henry Nicholas—would attain future prominence (and some notoriety) within the union.

Outside the workplace, Local 1199's public relations director, Moe Foner, assembled an impressive political coalition behind the strikers. In addition to donations from 175 local unions and critical support from the city Central Labor Council chieftain Harry Van Arsdale, Foner enlisted the black socialist and civil rights activist Bayard Rustin to coordinate community support for the strikers. Soon, Eleanor Roosevelt, Congressmen Adam Clayton Powell and Emanuel Celler, and other liberals had joined forces on a Committee for a Just Settlement cochaired by A. Philip Randolph and the theologian Reinhold Niebuhr.

With union pressure unavailing on hospital trustees, the strike ended in a compromise settlement arranged by Mayor Wagner and the veteran mediator William H. Davis. Instead of direct union recognition and an official presence in the hospitals, the workers formally gained only a Permanent Administrative Committee (PAC) of hospital and “public” representatives who would themselves try to resolve future labor grievances. Formally, neither the union nor the strikers had achieved their goals; on the ground, however, the militant self-organization of hospital

NEW YORK CITY HOSPITAL STRIKE (1959)

workers had forever changed social relations in the affected institutions. Within a year of the creation of the PAC, some 3,000 workers were enrolled in collective bargaining agreements at seven New York City hospitals, and in 1963—thanks to another massive political campaign and a sympathetic response by Governor Nelson Rockefeller—city hospital workers were officially given the right to organize. Henry Nicholas could thus justifiably look back on the 1959 strike as “a defeat, but the greatest defeat the union ever encountered.”

Despite several years of internal turmoil, by the late 1980s, Local 1199 had grown into a national presence of some 200,000 workers; in 1989, it formally joined the Service Employees International Union, where it continued to function as an aggressive, grass-roots-oriented force within the labor movement.

NEWMAN, PAULINE M. (1890–1986)

Pauline M. Newman (1890–1986) was a labor pioneer and a die-hard union loyalist. In 1909, when she was not yet out of her teens, she became the first woman appointed general organizer by the International Ladies' Garment Workers' Union (ILGWU). That labor union was so heavily influenced by Jewish immigrant socialists that Newman referred to it as “the Jewish movement”—and saw it as both a cultural and political foundation for Jewish progressivism in the United States during the first half of the twentieth century. Despite ongoing battles with the men who ran the ILGWU, Newman worked for that union for more than 70 years—as an organizer, labor journalist, health educator, and liaison between the labor movement and elected officials in Albany, New York, and in Washington, DC. A leader and inspirational figure in the early twentieth-century tenant, labor, socialist, and suffrage movements, Newman's influence on labor politics and the emerging welfare state was deep and lasting.

A tough Lithuanian Jewish immigrant with an acerbic tongue and a penchant for tweeds and slicked-back hair, Newman was described by male colleagues in the labor movement as “capable of

smoking a cigar with the best of them.” In an era when the idea of unionism was synonymous with notions of brotherhood and masculine bonding, Newman questioned accepted norms of gender for both men and women in the trade union movement. She bonded with hard-boiled male unionists, who accepted her as one of their own, even as she helped to create and sustain a woman-centered trade union federation through the New York and National Women's Trade Union Leagues (NYWTUL and WTUL). Throughout her 80 years in the labor movement, she pursued a difficult balancing act—negotiating with male unionists, middle- and upper-class women reformers, and government officials to improve the lives of working women. She left a lasting imprint on each of these very different worlds.

Newman was born into a world in transition, that of poverty-stricken but deeply religious Jews in Kovno, Lithuania, around 1890. (The exact date of her birth was lost with the family bible when she emigrated.) The youngest of four children, three girls and a boy, Newman was launched on her activist career at a tender age when she demanded to know why girls did not receive the same religious education as Jewish boys. Her father, a Talmud teacher, accommodated her desire to learn, teaching her to read Hebrew and Yiddish. (She taught herself Russian and, later, English.) Newman would later claim that her childhood resentment at the privileges accorded men and boys in Jewish education and worship sparked a lifelong commitment to fight sex discrimination wherever she found it.

When her father died in 1901, Newman, her sisters, and her mother left Kovno for New York, where her brother had settled a few years earlier. There Newman began work at a hairbrush factory and moved soon to the infamous “kindergarten” at the Triangle Shirtwaist Factory in Greenwich Village. She found herself powerfully drawn to the labor socialism espoused by older workers in her shop and by the Yiddish language *Jewish Daily Forward*—the most popular Jewish immigrant newspaper of her day. Ever hungry for education, Newman organized reading groups for the teenage girls among whom she worked. Teaching themselves English by reading Dickens, Thomas Hood, and other literary exposés of nineteenth-century English industry, Newman and her friends soon felt “ready to rise up” against the long hours, low pay, and miserable conditions in which they lived and worked. These young immigrant girls sparked a series of strikes and walkouts. Then, in 1907, they planned and organized a rent strike on Manhattan's Lower East Side that involved more than 10,000 families. It was the largest rent strike

New York had yet seen and began decades of tenant activism in the city.

Hailed by newspapers as the Lower East Side Joan of Arc, the young Newman came to the attention of the Socialist Party, which nominated her for New York secretary of state. She campaigned along the leader of American Socialists, Eugene Victor Debs, and used the election season as a time to proselytize for woman suffrage. At the same time, she was organizing young women garment workers, paving the way for the 1909 general strike that came to be known as the "Uprising of the 20,000." During the long, cold months of the strike, Newman played two important roles. Through inspiring speeches at street corner rallies and in the union halls of Lower Manhattan, she kept up the spirits of the strikers. She also fund-raised among New York's wealthiest women, drawing upon her readings of English literature to win their support for the strike. Newman was even able to draw some of these women out onto picket lines, hoping by their presence to diminish police brutality against the strikers. These "mink brigades" won the strike its first positive press in the city's mainstream newspapers.

In recognition for all she had done, the ILGWU appointed the 18-year-old as its first female general organizer. She spent the next four years traveling the country, organizing garment strikes in Philadelphia, Cleveland, Boston, and Kalamazoo, Michigan. By decade's end, these strikes would bring upwards of 40% of all women garment workers into trade unions, a remarkable percentage for workers in any trade and a clear refutation of union leaders' oft-repeated assertions that women could not be organized.

Still, the years on the road were lonely for Newman as one of the only women in a male world of labor organizers, and deeply frustrating since she felt that the male union leadership undermined and undervalued her work. Seeking other avenues for her activism, she also stumped for the Socialist Party in the bleak, freezing coal-mining camps of southern Illinois. And everywhere she went, she preached the gospel of woman suffrage, for she saw women's right to vote as an essential part of the working-class struggle.

Newman nearly collapsed under the weight of her grief when the Triangle Shirtwaist Factory burned on March 25, 1911, in which 146 young workers lost their lives, most of them Jewish and Italian women, and many of them friends Newman had come to cherish in her years at Triangle. Desperate to do whatever she could to prevent such disasters in the future, Newman accepted a post in 1913 inspecting industrial shops for the Joint Board of Sanitary Control—established by New York State in the aftermath

of the fire to improve factory safety. At the same time, Newman worked as a lobbyist for the New York Women's Trade Union League, pushing for passage of wage, hour, and safety legislation for women workers. Through this work, she met Frances Perkins, then an activist for the Consumers League, later to become Franklin Roosevelt's secretary of labor. She also met the future New York governor, Al Smith, and the future senator, Robert Wagner. These friendships convinced Newman that working through government was as important to the future of working women as grassroots organizing. She never abandoned union work, but she now divided her energies between organizing, education, and lobbying.

In 1917, the Women's Trade Union League dispatched Newman to Philadelphia, to build a new branch of the League. There she met a young Bryn Mawr economics instructor named Frieda Miller, who enthusiastically left academia to join Newman in "the movement." The two were soon living together. It was the beginning of a turbulent relationship that would last until Miller's death in 1974. In 1923, the two women moved to New York's Greenwich Village where, as part of a community of politically active female couples, they raised Miller's daughter, Elisabeth. Happy to take a job that would allow her to stay close to New York after more than a decade of traveling, Newman became educational director for the ILGWU Union Health Center, the first comprehensive medical program created by a union for its members. Newman would retain that position for the next six decades, using it to promote worker health care, adult education, and greater visibility for the concerns and needs of women workers.

Newman continued to organize into the 1930s, reaching out to African-American and Afro-Caribbean women through NYWTUL campaigns to unionize laundry, hotel, and domestic workers. She also continued her government work, consulting for New York State on minimum wage and safety standards and serving as a member of the U.S. Women's Bureau Labor Advisory Board, the United Nations Subcommittee on the Status of Women, and the International Labor Organization Subcommittee on the Status of Domestic Workers.

Through the WTUL, Newman was part of a community of women that sustained her, providing essential support for a working-class immigrant who had chosen to forgo the traditional protections of marriage and family. Theirs was a multi-ethnic and cross-class circle. It included the Irish-Catholic labor activists Maud Swartz and Leonora O'Reilly; the Jewish immigrant garment organizer Rose Schneiderman; and affluent native-born Protestant reformers,

among them Eleanor Roosevelt and Newman's partner of 56 years, Miller. (Miller served in the 1930s as industrial commissioner for New York State and in the 1940s as director of the U.S. Women's Bureau.)

These women were regular guests at Val-Kill, the home that Franklin Roosevelt built for Eleanor near the family mansion at Hyde Park. And during the Roosevelt presidency, Newman visited the White House with some regularity, making national headlines in 1936 when she accompanied a delegation of young garment and textile workers invited by the First Lady for a weeklong stay. After World War II, Newman and Miller were called on by President Truman to investigate postwar factory conditions in Europe. Newman also addressed the White House Conference on the Child and consulted regularly on labor safety issues for the U.S. Public Health Service. During the early decades of the twentieth century, Newman and her WTUL circle had played a vital role in sparking and sustaining women's labor uprisings across the country. During the 1920s, 1930s, and 1940s, they shaped new government agencies and labor laws that guaranteed a minimum wage and minimum standards of safety for all American workers.

Newman continued to work for the ILGWU into the 1980s, writing, lecturing, and advising younger women trade unionists. In the 1970s, Newman was hailed by the feminist labor federation, the Coalition of Labor Union Women, as a foremother of the women's liberation movement. Newman spoke regularly through the 1970s and 1980s, to historians, reporters, and groups of young women workers.

Newman also left an important legacy through her writings as one of the few working-class women of her generation to chronicle the political activism of immigrant and native-born workingwomen. Labor journalist, essayist, and poet, Newman contributed to the *New York Call*, *Progressive Woman*, the WTUL magazine *Life and Labor*, the *Ladies Garment Worker*, and the ILGWU newspaper, *Justice*.

Newman died in 1986, at approximately 96 years of age.

NIXON, EDGAR DANIEL (1899–1987) African-American Labor Organizer

Edgar Daniel Nixon, a civil rights activist, was born in Robinson Springs, Alabama, near Montgomery. His father was a tenant farmer and Primitive Baptist preacher. His mother died when Nixon was nine, and he was brought up in Montgomery by a paternal aunt. With little formal education, Nixon possessed an inquiring mind and a strong personality. After leaving school at the age of 13, he took a variety of menial jobs and then became a baggage handler at the Montgomery railroad station. In 1923, he became a Pullman porter, making regular trips outside the South. These journeys widened Nixon's horizons and stimulated his developing class and race consciousness. Although Pullman porters were considered as the elite of the African-American working class, Nixon resented the degrading treatment they received from the Pullman Company and white passengers. Impressed by the oratory and social vision of A. Philip Randolph, the organizer of the Brotherhood of Sleeping Car Porters (BSCP), Nixon joined the union, became president of the Montgomery chapter in 1938, and served until 1964. When the union finally secured a contract with the Pullman Company in 1937, Nixon memorized every section of the personnel rules and used them to advantage. Active involvement in the BSCP increased Nixon's standing in the city's black (and white) communities.

Nixon first became engaged in community action in 1925. When two black children drowned while swimming in a drainage ditch, he organized an unsuccessful petition to build a swimming pool for Montgomery's black residents. In 1934, he founded the Montgomery Welfare League, which attempted to secure access for African-Americans to assistance from the federal government. During the 1930s, Nixon worked with Myles Horton of the Highlander Folk School in Tennessee to organize Alabama's cucumber pickers. During World War II, Nixon supported A. P. Randolph's March on Washington Movement (MOWM), a threatened mass march on the nation's capital by 100,000 African-Americans

that forced President Franklin D. Roosevelt to issue an executive order banning discrimination based on color, creed, or national origin in the federal government and defense industries. Following a meeting with Eleanor Roosevelt while she was a passenger on his train, Nixon secured the construction of a United Services Organizations Club (USO) for black military personnel stationed near Montgomery. Always sensitive to the practices of racial discrimination, during the 1950s, Nixon went for three years without a telephone in Montgomery rather than accept one on a four-party “all colored” line.

Nixon also became prominent in the Montgomery chapter of the National Association for the Advancement of Colored People (NAACP) and was elected its president in 1945 and 1946. In 1947, he became president of the state organization and successfully protested against segregated admission to the “Freedom Train”—a touring exhibition of such notable historical documents as the Declaration of Independence and the original manuscript of the “Star Spangled Banner”—when it visited Montgomery. The national leadership of the NAACP, embarrassed by Nixon’s radicalism and bluntness, engineered his re-election defeat in 1949. In 1950, he also lost the presidency of the Montgomery chapter.

During the 1940s, Nixon also headed voter registration and school desegregation campaigns in Montgomery and pursued many cases involving the rape of African-American women, police brutality, murders, and lynchings. He organized the Montgomery Voters League in 1940, and in June 1944, he led 750 African-Americans to the board of registrars, demanding to be registered to vote. At this time fewer than 50 Montgomery blacks were on the electoral rolls. Nixon himself had paid the \$36 poll tax in Montgomery and tried to register to vote for 10 years. Only after filing one lawsuit and threatening another was he finally registered in 1945. Nixon became the first African-American candidate to seek public office in Alabama since Reconstruction, when he ran (unsuccessfully) in 1954 for election to the Montgomery County Democratic Party Executive Committee.

A leading figure and tactician in several protests against Montgomery’s segregated public transportation system, Nixon, through his friendships with Rosa Parks, the liberal white attorney Clifford Durr, and Jo Ann Gibson Robinson, an English professor at Alabama State College and a leading activist in the Women’s Political Council (WPC), was instrumental in planning and sustaining the 381-day Montgomery Bus Boycott (1955–1956). This grassroots protest against segregation on the city’s buses was sparked off by Mrs. Parks’s refusal to relinquish her seat to a

white passenger. Nixon secured her bail and urged Parks to use her arrest as a test case for the city’s segregation laws. It was Nixon who forcefully persuaded the city’s African-American ministers to lend their support to the protest after it was decided to extend the one-day bus boycott indefinitely. He also acted as the treasurer of the Montgomery Improvement Association (MIA). Through his contacts with organized labor, Nixon disseminated the MIA’s objectives at union meetings and conventions across the country and raised thousands of dollars for the protest—notably from southern branches of the BSCP. According to his own account, Nixon quickly perceived the worth and potential of a young African-American Baptist minister newly arrived in Montgomery, who was to assume leadership of the MIA: Martin Luther King Jr.

A lifelong spokesman for the working class, Nixon criticized the influence and conservatism of Montgomery’s African-American, college-educated elite. He also resented their failure to accord him proper recognition for his role in the boycott and the subsequent inflation of King’s leadership role. Following his resignation as MIA treasurer in 1957, an embittered Nixon remained active in the Alabama Democratic Party and worked for better facilities for Montgomery’s African-American children and the elderly. An uncompromising advocate of racial integration, Nixon rejected the separatism of the Black Power ideology of the 1960s. To the end of his life, Nixon asserted that the BSCP, under the leadership of A. P. Randolph, had not only empowered black workers but also inspired his own resolve to remain in the South and challenge the degradations and lunacies of racial discrimination and segregation.

In 1986, the Alabama Historical Commission—with the endorsement of Governor George Wallace, no longer a symbol of southern white resistance to desegregation—registered Nixon’s modest home on Clinton Street as “a significant landmark.”

NORRIS-LAGUARDIA FEDERAL ANTI-INJUNCTION ACT

The Norris LaGuardia Act, passed by the U.S. Congress in 1932, represented the culmination of a decades-long struggle by American labor organizations to prevent federal courts from issuing injunctions against strikes, boycotts, and other labor actions. In the late 1870s, federal equity courts began the practice of issuing injunctions against unions engaging in strikes and boycotts against railroads in federal receivership. Federal judges then used the Sherman Antitrust Act of 1890, conceived as a means of controlling predatory business monopolies, instead as a means to issue injunctions against striking labor unions, whom judges found to be restraining commerce by monopolizing the supply of labor, deemed to be a commodity.

The Norris-LaGuardia Act was conceived as a replacement for the Clayton Act of 1914. The Clayton Act, which Samuel Gompers had proclaimed to be labor's "Magna Carta," was the first attempt by the U.S. Congress to prevent federal courts from issuing injunctions in labor disputes. But federal courts themselves largely gutted the law. The U.S. Supreme Court, in the 1921 *American Steel Foundries* case, held that courts could lawfully limit labor unions to one picket per plant entrance during a strike, effectively making picketing useless. The court also ruled in the *Truax* case in 1921 that a strike could be enjoined if it interfered with the ability of an owner to operate a business at a profit. Essentially, the courts ruled that the judiciary had the power to enjoin strikes, as owners were deemed to be deprived of their property rights; owners were deemed to have a property right in the labor of their employees. The Court's decision gave federal courts broad powers to enjoin strikes, which they did with alarming regularity in the 1920s.

The judicial destruction of the Clayton Act outraged the labor movement, and labor leaders once again threw themselves into organizing political power to write a new law that would prevent the courts from intervening in strikes. By 1932, the cause had gained significant support from others as well, including many reformers, who had come to believe that the system of labor injunctions clearly turned the federal courts into an ally of management during strikes and had actually contributed to increased labor unrest. The spectacle of the Great Depression also convinced many lawmakers that reform was needed in the nation's economy and that a revitalized labor movement might be a necessary stimulus for recovery. Thus, George Norris of Nebraska and Fiorello LaGuardia of New York introduced a bill, authored by Felix Frankfurter and Donald Richberg, reforming the

federal judiciary's role in labor disputes. The Norris-LaGuardia Act received bipartisan support, passed a Republican legislature by a massive majority, and Herbert Hoover approved the Act.

Norris-LaGuardia accomplished several tasks that were critical to the success of labor unions in the United States. First, it was the first act that stated that collective bargaining was necessary in a modern industrial economy. The Act stated that freedom of contract was meaningless to an individual worker in a modern corporate economy and that collective bargaining was a way for workers to achieve a real parity in bargaining with an employer. This did not amount to a federal guarantee of the right to unionize—this would not be suggested until Section 7a of the National Industrial Recovery Act and not firmly established until the National Labor Relations Act (Wagner Act). The most important part of Norris-LaGuardia decreed that federal courts could not issue injunctions in labor disputes. The only exception allowed by the law was if a strike could be determined to promote violence or property damage. Even in these circumstances, the law limited courts to issuing a temporary restraining order. The law also granted unions the right to employ picketing as a means of publicizing a strike, as well as to convince workers to join a strike or not cross a picket line. Picketing also could be used to encourage consumers to boycott a business. Norris-LaGuardia also put an end to baseless conspiracy charges against unions, establishing that workers could not be charged for doing in combination things that would be legal for a single worker to do. Minor rights granted to unions by the legislation included the right to a jury trial for workers charged with violating an injunction, a guarantee that unions could provide strike benefits to workers, and the right of workers to pool resources to defend members of the union charged with a crime during a strike. Finally, Norris-LaGuardia prevented the federal judiciary from enforcing yellow-dog contracts—a critical section, since employers had used the yellow-dog contract as one of the most effective anti-union measures of the 1920s.

Norris-LaGuardia gave the labor movement its first impetus to the massive organizing successes that it achieved in the 1930s. Free of the labor injunction, unions and workers undertook a massive grassroots organizing campaign throughout the 1930s and 1940s. The U.S. Supreme Court, after the Roosevelt administration had appointed several new liberal members, upheld Norris-LaGuardia in 1938.

The Taft-Hartley Act, passed in 1947, restored some limited injunction powers to federal courts. Taft-Hartley allowed that the president could order

a 60-day halt to a strike if it were determined that the strike constituted a threat to national security or well-being. The new law also allowed the National Labor Relations Board to order a cooling-off period for both sides of a dispute. But Taft-Hartley fell far short of overturning Norris-LaGuardia; Taft-Hartley allowed the issuance of an injunction only in a narrow range of circumstances, and employers could not individually petition courts.

Norris-LaGuardia remains more or less intact today. Because Norris-LaGuardia removed the power of the federal judiciary to break strikes and boycotts by fiat, it allowed unions to operate for the first time without fear of legal retribution. This, as much as later laws that established a federal presence in collective bargaining, made possible the development of the modern labor movement in the 1930s. In this regard, Norris-LaGuardia can arguably be called the most important piece of labor legislation in United States history.

NORTH AMERICAN FREE TRADE AGREEMENT

The political battle over the North American Free Trade Agreement (NAFTA), which entered into effect on January 1, 1994, brought U.S. organized labor from the political drift of the Reagan-Bush years (1980–1992) to the center of a nationwide debate about the U.S. role in the global economy. On June 11, 1990, the opening of negotiations for a Mexican-U.S. free trade agreement was announced by the U.S. president, George Bush, and the Mexican president, Carlos Salinas Gotari, and joined by Canada in February 1991. After a contested May 23, 1991, congressional vote on “Fast Track” negotiating authority, NAFTA emerged as a defining issue in the 1992 presidential election between the Republican George Bush, the critical but supportive Democratic

candidate Bill Clinton, and a strongly anti-NAFTA third-party candidate, H. Ross Perot. Despite the addition of side accords on labor and the environment under Clinton, NAFTA’s fate was uncertain until the eve of the November 17, 1993, vote in the House of Representatives, where Clinton prevailed by 34 votes, with 132 GOP representatives in favor to 43 opposed, while losing the vote of his party by 156 to 102.

NAFTA’s near defeat required an unusual degree of unity among the member unions of the AFL-CIO, a weak confederative apparatus. Not only did the AFL-CIO successfully focus the energies of diverse organizations of workers on NAFTA, but its anti-NAFTA campaign did not remain solely at the level of paper resolutions and backroom arm-twisting by professional labor lobbyists in Washington, DC. Instead, leaders of national unions mobilized the lower ranks of their organizations, including many members, while reaching out to potential allies. At local and regional levels, this popular mobilization found an outlet in innovative forms of grassroots activism that opened outward toward allies on the left that, less than a decade earlier, would have been suspect to the long-standing Cold War leadership of the AFL-CIO president, Lane Kirkland.

As its opponents were quick to point out, the 2,000-page NAFTA treaty was far from being a “free trade agreement,” since trade barriers between the three countries had already been largely dropped—through the Canada-U.S. Free Trade Agreement of 1989 and by Mexico unilaterally. As much an investment as a trading agreement, NAFTA codified a common set of rules, especially in Mexico and Canada, that liberalized access for foreign financial, service, agricultural, and industrial investors and producers—primarily to the benefit of U.S.-based capital. NAFTA sought to achieve a *de jure* and not just a *de facto* integration of North American markets, but only for trade and investment since it accelerated capital mobility while leaving the free movement of labor untouched. In the end, the inclusion of labor and environmental side accords, however inadequate, did symbolically point toward a different future path in an increasingly globalized world.

Labor’s Anti-NAFTA Strategy: “NAFTA Math” and “Job Body Counts”

The fate of a proposed bilateral and eventually continental free trade agreement depended upon the extension of Fast Track negotiating authority by the U.S. Congress, which was scheduled to expire in June

1991. Fast Track allowed the U.S. president to submit implementing legislation, such as a trade pact or treaty, leaving Congress 90 days to vote it up or down with no possibility of amendments. In January 1991, the AFL-CIO formally demanded "Full Debate: No Fast Track: Fair Trade," although even the House Democratic leader Richard Gephardt, one of labor's most articulate congressional supporters, in the end sided with the Bush administration. Although 170 Democrats broke with their leadership, the final vote in favor of Fast Track on May 23, 1991, was 231 to 192.

With Fast Track approved, organized labor's job became clear: defeat NAFTA. At its November 1991 convention, NAFTA was denounced as "an agreement based solely on exploitation," and the AFL-CIO declared "that a new trade agreement with Mexico, unless carefully structured, will only encourage greater capital outflows from the United States, bring about an increase in imports from Mexico, and reduce domestic employment as the United States remains mired in a recession. . . . A bad trade agreement for the United States would result in less job creation, less productivity increases, and regression in environmental and other social standards. For Mexico, it could well reduce that country's comparative advantage to simply cheap labor, turning Mexico's economy into one large export platform, sacrificing balanced and equitable economic development" (AFL-CIO, "North American Free Trade Agreement," *Proceedings of the 1991 Convention*, Detroit: AFL-CIO, 1991, p. 145).

The touchstone of the unfolding NAFTA controversy was potential job losses to Mexico, the single most potent political obstacle to congressional approval. With even President Bush's Secretary of Labor Lynn Martin conceding 150,000 U.S. jobs would likely be eliminated, pro-NAFTA analysts and policy makers sought to diffuse the issue by aggressively trumpeting statistical studies that claimed that U.S. exports to Mexico post-NAFTA would produce a net gain of 175,000 to 200,000 U.S. jobs. Speaking at the 1992 Republican National Convention, the U.S. special trade representative, Carla Hills, would hail NAFTA as above all else a jobs agreement. Moreover, the creation of better-paying jobs in Mexico, it was said, would reduce the number of Mexicans illegally seeking jobs in the United States. "Create jobs there," it was said, "so they won't come here," a claim echoed by the Mexican president, Carlos Salinas, who told a U.S. newsweekly, "we want to export goods and not people" ("Mexico according to Carlos Salinas," *U.S. News & World Report*, July 8, 1991, p. 41). If this "NAFTA

math," as it was dubbed by the U.S. senator Carl Levin, simply did not add up, due to the arbitrary nature of the modeling exercises, this did not diminish the ubiquitous circulation of such claims, especially once the Business Roundtable had launched an active and well-financed lobbying campaign through USA*-NAFTA.

With NAFTA supporters on the defensive, U.S. organized labor sensibly placed the intensely emotional issue of job "losses" at the center of its anti-NAFTA campaign. In doing so, it successfully moved the insecurity of the U.S. worker to the forefront of domestic political debate. In touching a nerve in mass public opinion, jobs gave substance and resonance to the anti-NAFTA campaign by pointing effectively toward the suffering, uncertainty, and anxiety of U.S. working people over the previous two decades. While pro-NAFTA forces had difficulty crafting convincing images of U.S. workers who, were it not for exports to Mexico, would otherwise have been unemployed, there was no shortage of workers who could personally relate the negative impact of plant flight to Mexico. Interviewed by the *Wall Street Journal*, Bernie Leonka explained that the workforce at his General Electric plant had shrunk to 450. "We've lost 1,200 jobs," the union official said, because "they're going to Mexico for cheap labor." With unionized workers making an average \$12.67 an hour, "at 50 cents and 60 cents an hour down there, we can't compete." (Jackie Calmes, *Wall Street Journal*, May 22, 1991, p. A16).

For workers, residents, and local politicians from traditional manufacturing regions, now dubbed the "rust belt," the most potent anti-NAFTA image was the shuttered factory, the "runaway shop" of labor and community lore. The emphasis on jobs also rallied some who were unsympathetic to organized labor, while blunting the charge that a privileged minority, the unionized 11% of the private-sector workforce, was seeking to protect itself from a salutary global competition that would reduce consumer prices for all. The contrasting anti-NAFTA image was one of trade unionists who stood up to defend their families and communities from harm, in the form of imports and capital mobility, and thus championed the very living standards that made mass consumption for all possible in the United States.

The jobs argument advanced by the AFL-CIO operated on several interconnected levels that paralleled the tactics of pro-NAFTA forces. It argued that liberalized trade, foreign imports, and the lack of controls over capital investment had already produced a significant loss of U.S. jobs. It also used academic and legislative analyses that attempted

to predict, in quantitative terms, the heightened negative impact that NAFTA would have on gross and net U.S. employment. In disputing the job gains trumpeted by NAFTA supporters, the AFL-CIO cited studies that projected 130,000 to 550,000 in net job losses (AFL-CIO Task Force on Trade, "North American Free Trade Negotiations, The Jobs Debate: Fiction and Reality," no. 21, 1992; "North American Free Trade Agreement, The Jobs Debate: Part II," no. 22, 1993). Others invoked the dramatically higher estimate of 5.9 million U.S. manufacturing jobs at risk of being moved to Mexico as a consequence of NAFTA. Drawn from a study conducted by the Manufacturing Policy Project, this figure was based on tallying all U.S. manufacturers in the low- to mid-technology range with a labor content equivalent to 20% to 30% of sales (Pat Choate, "Jobs at Risk: Vulnerable U.S. Industries and Jobs under NAFTA," Amherst: The Manufacturing Policy Project, April 1993).

The economic frustration that fed the revitalization of labor's public role was equally conducive to other NAFTA opponents, including the billionaire Republican H. Ross Perot, who made NAFTA the defining issue of his 1992 third-party presidential campaign. Author of *Save Your Job, Save Our Country: Why NAFTA Must Be Stopped Now* (New York: Hyperion, 1993), Perot was also responsible for the single most memorable NAFTA sound bite, "Let's go to the center of the bull's eye—the core problem," he said during the third presidential debate. "And believe me, everybody on the factory floor all over the country knows this. You implement that NAFTA—the Mexican trade agreement where they pay people \$1 an hour, have no health care, no retirement, no pollution controls, etc., etc., etc.—and you are going to hear a giant sucking sound of jobs being pulled out of this country" (Frederick Mayer, *Interpreting NAFTA: The Science and Art of Political Analysis*, New York: Columbia University Press, 1998, p. 229).

In opposing NAFTA, Perot was joined by a minority of other conservatives, including the Republican Pat Buchanan, who combined an anti-NAFTA stance with a heightened defense of national sovereignty, which they identified with restrictions upon immigration, especially the "illegal alien" problem posed by undocumented Mexicans in the United States. Yet, such anti-immigrant and anti-Mexican arguments were rejected by labor and its allies in the Afro-North American community, a powerfully anti-NAFTA constituency of the Democratic Party (Latinos were more divided). In his testimony before Congress, the prominent civil rights leader Jesse Jackson observed

that "right now many Americans are screaming that Mexicans are taking our jobs, which is not true. And the more they say it, the more racist it sounds. Racist. Mexicans are not taking jobs from us. United States corporations are taking jobs to Mexico to exploit them and undercut our own workers. . . . We have a point of view different than Mr. Perot's point of view, different than Pat Buchanan's point of view. And ours is not narrowly nationalistic. It is not building a wall. It is not racist. It is not protectionist. . . . That is why, when people start talking . . . some narrow nationalism, about America first and isolation, we are not talking about the same thing" (Jesse Jackson, testimony transcribed in *NAFTA: A Negative Impact on Blue Collar, Minority, and Female Employment?* Hearing before the Employment, Housing, and Aviation Subcommittee of the Committee on Government Operations, U.S. House of Representatives, 103rd Congress, First Session, November 10, 1993, Washington, DC: GPO, 1994, pp. 61, 64).

In deploying its own NAFTA math in leaflets, articles, speeches, and testimony, the labor movement faced certain fundamental difficulties. The "job loss" argument was fundamentally defensive in nature and operated on the unfavorable terrain defined by its pro-employer opponents. The anti-NAFTA jobs argument was not, after all, about creating needed new jobs, but about preserving those that still existed. Moreover, the "jobs body count" approach had difficulty grappling effectively with the overwhelming global trend toward international capital mobility and further reduction of barriers to trade, both of which negatively impacted the bargaining power of nation-specific labor relative to transnational capital. As pro-NAFTA analysts were quick to point out, the hypothetical jobs "lost" or "gained" through NAFTA were insignificant given total U.S. employment, with its enormous fluctuations given the weakness of job security guarantees. "With almost 120 million people currently employed" in the United States, noted the Congressional Budget Office, the expected contributions of NAFTA to total employment either way was "negligible," and the *New York Times* noted that an estimated 20 million U.S. workers would suffer future displacement, for various reasons, even without NAFTA (Congress of the United States Congressional Budget Office, *A Budgetary and Economic Analysis of the North American Free Trade Agreement*, Washington: July 1993, p. 84; "Demythologizing the Trade Pact," *New York Times*, July 25, 1993). Finally, voting down NAFTA would not, in and of itself, prevent a single "runaway shop," restore a single job, or raise the wages of a single worker in the United States.

Electoral Politics, Bill Clinton, and NAFTA's Environmental and Labor Side Accords

The groundswell of debate about NAFTA showed deep concerns within the U.S. public about the place of their country in the global economy. "To those who believe that average Americans don't know their own interests, or fail to appreciate the benefits of free trade theory, you are wrong," declared the House Democratic leader Dick Gephardt in September 1992. "The American people get it, this issue resonates with them, and the NAFTA agreement is rapidly becoming, substantively and symbolically, representative of everything that is wrong in their lives economically" ("North American Free Trade Agreement [NAFTA]: Update on Recent Developments," SourceMex, September 16, 1992). Given these political realities, congressional Democrats inclined to vote in favor of NAFTA believed that the only way they could explain a "yes" vote to their troubled constituents would be if the "Bush NAFTA" was reshaped to include labor and environmental concerns.

The Democratic presidential candidate, Bill Clinton, who backed Fast Track in 1991, delayed taking a clear position on NAFTA until a month before the November 1992 elections. Speaking in Raleigh, North Carolina, Clinton declared NAFTA to be beneficial for all three countries, but pledged *not* to sign it "until we have reached additional agreements to protect America's vital interests." While disclaiming any intention to renegotiate the basic agreement, Clinton said we must "reaffirm our right to insist that the Mexicans follow their own labor standards, now frequently violated, and that they do not aggravate the wage differentials which already exist." We need an agreement, he said, "that permits citizens of each country to bring suit in their own courts when they believe their domestic environmental protections and worker standards aren't being enforced."

In publicly backing the highly controversial NAFTA, Clinton broke ranks with many of his fellow Democrats, as well as important Democratic constituencies such as labor, the African-American community, and the environmentalists (who would later split on the final vote in 1993). To mollify criticism from these groups, which were campaigning vigorously for him, the candidate had pledged that, if elected, NAFTA would go into effect only if accompanied by strong side agreements to protect labor rights and environmental standards. In doing so, he also suggested that the unfettered "free market" was not enough to protect workers and the environment from potential abuses or to equitably distribute the fruits of North American trade.

Bill Clinton's strategy for converting NAFTA into a politically palatable trade policy led organized labor to hold back from overt anti-NAFTA mobilization in early 1993. Although facing some internal dissent, the decision by the AFL-CIO leadership reflected its strong ties to the Democratic Party, as well as the belief that its access to the White House might secure strong enough side agreements and other changes in the basic pact as to be opposed by Canada, Mexico, or the congressional Republicans. While labor called for a side accord "with teeth," the Clinton administration had opted by March 1993 for the weakest of three policy options: national enforcement of national laws, exclusion of important labor rights from effective coverage, and weak oversight and enforcement mechanisms. Finalized on August 13, 1993, and released one month later, the "North American Agreement on Labor Cooperation" did little to assuage the opposition to NAFTA. The AFL-CIO judgment was emphatic: "Because our trade negotiators have produced labor and environmental standards that are just political window-dressing on a bad agreement, we will vigorously oppose NAFTA before Congress," the AFL-CIO president Lane Kirkland pronounced ("AFL-CIO News: AFL-CIO Finds NAFTA Terms Unacceptable," August 13, 1993). Labor's negative reaction was re-assuring to NAFTA's vigorous and mobilized business supporters, who were opposed, in principle, to legitimizing any linkage between workers' rights and trade.

Seeds of the New

Labor's response to the changed circumstances of the United States—as they came to be symbolized by NAFTA—was necessarily multiform and heterogeneous. "Old" approaches and mind-sets were changing, but slowly and unevenly, within the mental universe of U.S. trade unionists. If anything, the U.S. labor movement was less monolithic in the early 1990s than it has been at any point since the AFL-CIO was created in 1955. Even the right and center-right forces that controlled the AFL-CIO apparatus had moved, if only grudgingly, somewhat to the left. There was also much that was "new" within the ranks of U.S. labor, although its contours were still foggy, as generational shifts and the harsh attacks of the 1980s created a groundswell of change that began to blossom in the freer ideological atmosphere of the post-Cold War era. The fight against NAFTA from 1990 to 1993 united both old and new, traditionalists and reformists, the more conservative and the more radical. The fight against NAFTA proved a period of

rich experimentation and learning as the U.S. labor movement and its allies grappled with how to confront the problem of transnational capital. It also marked the beginning of a new era of grassroots mobilization and cross-border coalition building with a transnational flavor. Direct forms of labor transnationalism, such as transnational coalition building, cross-border solidarity actions, and grassroots union linkages grew in number and frequency. Among the more exciting were cross-border tours of Mexican *maquiladoras* sponsored by unions whose companies had plants in the border zone. These forms of grassroots mobilization stimulated new reflection on the differences and similarities across the divide between NAFTA North (the United States and Canada) and NAFTA South (Mexico). These bold and exciting initiatives inspired activists as they worked to build a common terrain beyond the narrowly restrictive conceptual space of national identity and interests. Most significant, work was begun on carefully constructing transnational arguments against NAFTA, all of which went beyond U.S. protectionist paradigms and inherited nationalist reactions to the encroaching global economy.

While seeking allies across borders was symbolically important, the search for domestic alliances was an equally significant dimension of the anti-NAFTA fight. Significant segments of U.S. organized labor reached out toward other nonlabor coalitions, such as the Alliance for Responsible Trade (ART, formerly MODTLE), the Citizens' Trade Campaign, and the Coalition for Justice in the Maquiladoras (CJM). These groups brought together religious organizations, environmental groups, consumer advocates, and policy research organizations to develop sophisticated critiques of and alternatives to NAFTA and, in the case of CJM, to perform important community work and watchdog functions directly at the U.S.-Mexican border. Organized labor's role in these groups—with the exception of the CJM, which received official support from the AFL-CIO—was largely limited to a small number of committed individual union leaders, staff, and activists, but it represented a step forward.

The 1995 election of the “New Directions” leadership of Sweeney was one legacy of the fight against NAFTA, as was organized labor's presence in the tens of thousands at the 1999 protests against the ministerial conference of the World Trade Organization in Seattle. The subsequent years of economic globalization have also weakened the illusions of labor leaders, still vibrant in 1993, about a golden age of capital, labor, and government cooperation. And the existence of the North American Agreement on Labor Cooperation, although deeply flawed, left

an institutional space through which to denounce violations of labor rights, however fruitlessly. By injecting the issue of labor rights into a trade agreement, the NAFTA labor side accord embodies a hope for future progress in the fight for a meaningful social dimension for an increasingly integrated global economy.

NO-STRIKE PLEDGE

Few moments reveal the gap between union leadership and rank-and-file workers more than national mobilization for war. Historically, wartime has brought enhanced bargaining power for labor as both production and labor demand increased; yet it also has brought patriotic appeals for organized labor and workers to set aside their narrow interests on behalf of the nation. During U.S. involvement in World War I and World War II, union leaders agreed to suspend all strike activity in exchange for basic concessions by employers, guaranteed by the enhanced power of the wartime state.

This no-strike pledge, however, did not always prove popular with rank-and-file workers, who feared they had abandoned the one tool they had to win concessions from employers. During both wars, the result was turmoil on the shop floor and unauthorized wildcat strikes. Organized labor itself often had to step in to discipline rank-and-file workers when they violated the no-strike pledge, exacerbating tensions between union leadership and members.

When the United States entered World War I in 1917, the labor committee of the Council on National Defense, chaired by the American Federation of Labor (AFL) president, Samuel Gompers, proclaimed that "neither employers nor employees shall endeavor to take advantage of the country's necessity to change existing standards." Met by a deluge of complaints from workers about this apparent binding of the AFL by a no-strike pledge, Gompers insisted that unions could still continue to use strikes as a last resort. Nevertheless, World War I proved a strike-prone era, with over 1,100 breaking out in the first five months of the conflict alone. Not only did AFL unions like the International Association of Machinists engage in strike action, but of course Socialist and Industrial Workers of the World (IWW) unionists had no interest in setting aside labor militancy on behalf of a war they opposed. Individual organizations, however, like the Stockyards Labor Council in Chicago, agreed to suspend strike action during the war in exchange for government mediation that would help labor win some major concessions on hours and wages from

employers. Finally, in March 1918, a year after American entry into the war, the War Labor Conference Board (the predecessor to the War Labor Board) secured an agreement from the AFL leadership that "there should be no strikes or lockouts during the war" in exchange for the right to collective bargaining, protection of existing union shops, the eight-hour day, and a "living wage."

Twenty-five years later, World War II brought an even more forthcoming, if just as weakly honored, no-strike pledge on the part of organized labor, which now represented many more workers than it had in 1918. One week after U.S. entry into the war in December 1941, the AFL president, William Green, promised that, for the duration, "labor will produce, and produce without interruption." The AFL executive board immediately embraced a no-strike pledge, as did its counterparts in the Congress of Industrial Organizations (CIO). Although these decisions reflected widespread patriotic sentiment among workers, they also represented a pre-emptive effort to forestall any restrictive legislation and a desire to secure beneficial arbitration on issues of wages and union security from the National War Labor Board (NWLB).

Since the no-strike pledge was a "pledge" rather than a formally binding agreement, the NWLB devised nonjudicial sanctions with which to enforce adherence to it. By threatening to withdraw the benefits it had granted in arbitrated union contracts, such as protection of the closed shop, the NWLB effectively recruited unions to police the widespread wildcat strikes of their own members. In the last two years of the war, union leaders proved especially anxious to enforce the no-strike pledge to defend against growing antilabor sentiment embodied in the Smith-Connally Act of 1943 and the danger that Roosevelt would enact a national service program, or "labor draft," to discipline unruly workers and shore up a chaotic labor market. The necessity of disciplining wildcat strikers enhanced bureaucratic tendencies in large industrial unions, strengthening the hands of centralized leadership at the expense of a less tractable rank and file. By 1944, the CIO president, Philip Murray, complained that a large portion of his union's treasury was "being used to enforce the WLB directives...which in the first instance we do not believe in."

Historians disagree about the relative gains and losses of wartime no-strike pledges. In both conflicts, organized labor made significant organizational and contractual gains by agreeing to suspend strike activity in exchange for increased federal intervention in labor-management relations. Patriotic allegiance to national war aims gained legitimacy for the trade

unions that supported the war effort, and destroyed those, like the IWW, that did not. At the same time, the no-strike pledge relinquished the one coercive mechanism available to unions, made workers' organizations dependent on the government, and put labor leaders in the uncomfortable position of having to quash, on behalf of the state, their members' grievances and strike actions.

NOVELS, POETRY, DRAMA

From the days of America's rural, agricultural economy to the current postindustrial period of service-sector work, American writers have chronicled the struggles of the nation's workforce with varying success. Much of a considerable body of novels, poetry, and drama plays that focused on work and labor struggles failed to attract a wide audience and fell into neglect. Still, several works successfully integrate the conditions of workers and strikes, providing important literary contributions and bringing inspiration to the American labor movement.

Novels

The novel emerged as a venue for working-class themes very slowly in the United States. Before the Civil War, most novelists had genteel backgrounds and produced texts with a middle-class readership in mind. Most plots featured characters struggling with questions surrounding property, inheritance, and Puritan virtues. If writers described the working class, they emphasized the nation's rural, small-town society and depicted workers as self-employed

craftsmen, shopkeepers, professionals, or farmers. In the 1840s, however, more novelists began using the city as a background for their narratives, calling attention to urban poverty and offering hints of the world of work as they described the streets of the city. By the next decade, some novels included more detailed descriptions of workers on the job. For example, Day Kellogg Lee's *The Master Builder; or Life at a Trade* (1853) features a protagonist who works as a sawmill operator. His next novel, *Merrimack; or Life at the Loom* (1854), depicts young women laboring in the textile mills of Lowell, Massachusetts.

The dramatic rise of industrialization in the middle of the nineteenth century coincided with the literary shift to realism. As writers strove for greater verisimilitude, it was inevitable that works would begin to include more specific information about the difficult workplace conditions faced by many workers. Rebecca Harding Davis produced what many consider the first full-scale industrial narrative when her *Life in the Iron Mills* appeared in the *Atlantic Monthly* in 1861. The novella focuses on a young immigrant ironworker, Hugh Wolfe, and the dangerous working conditions he faces as he stirs molten iron inside the choking atmosphere of the plant. More and more writers in the Gilded Age would follow this precedent and offer more detailed treatments of the American working class. Eventually, the rising labor movement and its struggles would work its way into fiction.

One of the earliest depictions of a strike in American fiction appeared in 1871 in Elizabeth Stuart Phelps's *The Silent Partner*. Significantly, the heroine of the novel is not a worker but a "silent partner" in the New England textile mill she inherited. Similarly, labor struggles play a significant role in the plot of the most influential novel of the period, Edward Bellamy's utopian novel *Looking Backward, 2000–1887* (1888). The novel's protagonist, the Bostonian Julian West, is frustrated that strikes have delayed the construction of his new home. In the utopian society of the year 2000, however, the elimination of classes has made strikes and labor unions obsolete. *Looking Backward* influenced subsequent generations of writers as it introduced the theme of socialism into American fiction. But as the nineteenth century drew to a close, it remained clear that the novelists addressing working-class life wrote from a middle-class perspective and drew a great deal of their information from secondhand sources. For the most part, industrialists were depicted admirably, the trade union organizer was the subject of suspicion, and foreign-born workers were the source of most problems.

The industrial scene and union activity were eventually drawn with greater insight as the Gilded Age

waned and the nation moved deeper into the Progressive Era. Many writers, either through their own work experiences or their investigations of labor struggles as journalists, developed deeper insight and understanding of the workers' perspective. For example, Upton Sinclair's investigation of conditions in the Chicago stockyards and events during the Chicago Stockyard Strike of 1904 led to his landmark novel of industrialization, *The Jungle* (1906). The Russian immigrant Theresa Serber Malkiel toiled in New York City's garment industry when she first arrived in the United States. She later became a labor activist, and the New York Shirtwaist Makers' Strike of 1909–1910 inspired Theresa Serber Malkiel to produce a highly detailed fictional treatment of the labor struggle, *The Diary of a Shirtwaist Striker* (1910). The gains made by the Industrial Workers of the World (IWW) and the Socialist Party also inspired many writers. The novelist Ernest Poole, for example, personally witnessed the IWW in action during the Lawrence Textile Strike of 1912 and the Paterson Silk Strike of 1913 and was moved to fictionalize the labor struggles in what would become one of the most popular books of 1915, *The Harbor*. The novel is notable for the insight it provides into the gains made by the Socialist Party and the IWW prior to World War I.

In the 1920s, the seeds of the proletarian novel and "strike" novel were sown as more writers attacked the idea of economic mobility and voiced a general repugnance for the state of American life. More novels featured worker-protagonists. In Elias Tobenkin's *The Road* (1922), the heroine works in the New York garment industry to support herself and her illegitimate son. She later becomes an effective trade union organizer. Occasionally, novels question the impact of the American business ethic on immigrants. *Haunch, Paunch, and Jowl* (1923) by Samuel Ornitz depicts an immigrant garment worker who eventually becomes an attorney for the textile industry. He abandons his family, friends, and fellow workers as he becomes more affluent and is lonely and unhappy by the close of the novel.

As the nation moved deeper into the Great Depression, the worker-writer began to emerge. Many workers in factories, mines, and farms were moved to record their experiences during their time away from their jobs. Firsthand experience led to highly detailed descriptions of the workplace and union operations. Because many of these writers participated in strikes, labor struggles in the novels are often developed through the eyes of the workers. The strike is also used symbolically to represent the struggles and the victories of the working class. Key proletarian and strike novels of the 1930s include Jack Conroy's *The Disinherited* (1933), Mary Heaton Vorse's *Strike!*

(1930), Thomas Tippet's *Horse Shoe Bottoms* (1935), and John Steinbeck's *In Dubious Battle* (1936). Fictional treatments of the struggles of African-American workers and their experiences during the Great Migration were also developed at around this time in such works as William Attaway's *Blood on the Forge* (1941) and Alden Bland's *Behold a Cry* (1947).

In the last decades of the twentieth century, plant-closing recessions, the loss of millions of manufacturing jobs, a steady decline in union membership, and an economy increasingly dependent on service-sector work led to a resurgence in working-class themes in literature. Writers with worker roots such as Raymond Carver, Joyce Carol Oates, Tillie Olsen, James Dickey, and Carolyn Chute often depict the problems, apathy, and discontent of workers, both working-class and blue-collar. The closing decades of the twentieth century also led to a resurgence in the theme of ethnicity, race, and working-class oppression. Chicano labor is fictionalized in works such as Raymond Barrio's *The Plum Plum Pickers* (1972) and Ernesto Galarza's *Barrio Boy* (1971). Similarly, the work situations faced by African-American women are addressed in works such as Gloria Naylor's *The Women of Brewster Place* (1988), Toni Cade Bambara's *The Salt Eaters* (1980), and Ramona Lofton's *Push* (1997).

Poetry

Working-class life has been a very significant subject for American poets, and many poetic texts provide important inspiration to the labor movement. Poets in the Early Republic often emphasized the American work ethic and the nation's rural, small-town society. For example, Henry Wadsworth Longfellow, in poems such as "The Village Blacksmith" (1841), presented the workingman as industrious, skillful, sober, and independent:

Under a spreading chestnut tree
The village smithy stands;
The smith, a mighty man is he,
With large and sinewy hands;
And the muscles of his brawny arms
Are strong as iron bands

In the age of Manifest Destiny, workers were celebrated as the builders of the expanding nation in poems such as Walt Whitman's "A Song for Occupations" (1855). Later, the Yiddish poet Morris Rosenfeld developed a reputation as the "poet laureate of labor" as his experiences as a presser and baster in New York's Lower East sweatshops inspired him to put pen to paper. Poems such as "In the Factory"

were noted for their realistic description of sweatshop life:

Oh, here in the shop the machines roar so wildly
That oft, unaware that I am, or have been.
I sink and am lost in the terrible tumult
And void is my soul . . . I am but a machine!

In many cases, many of labor's successes, defeats, or tragedies prompted poets to express their emotions. Rosenfeld, for example, wrote a requiem for the victims of the Triangle Shirtwaist Company Fire of March 25, 1911. Due to blocked exits and faulty fire escapes in the factory, a total of 146 workers, mostly young immigrant women, perished in the flames or jumped 10 stories to their deaths. Rosenfeld's poem, written four days after the fire and published in the *Jewish Daily Forward*, mixes fury and sorrow over the tragedy:

And Mammon devours our sons and daughters
Wrapt in scarlet flames, they drop to death from this
 maw
And death receives them all.
Sisters mine, oh my sisters; brethren
Hear my sorrow:
See where the dead are hidden in dark corners,
Where life is choked from those who labor.
Oh, woe is me, and woe to the world.

As unionization increased, more labor journals and newspapers were founded and became outlets for aspiring poets. Journals such as Edward Bellamy's *The New Nation*, Horace Traubel's *Conservator*, the *International Socialist Review*, *II Proletario*, the *Masses*, and the *Liberator* published verse. Noteworthy poets during this period who protested the struggles of the exploited laborer in the United States include Charlotte Perkins Gilman, Rose Pastor Stokes, Edwin Markham, Arturo Giovannitti, and the author considered the most active of the socialist poets, Carl Sandburg. In many of his poems, Sandburg expressed admiration for the toughness of the working class, as these lines from "Chicago" indicate:

Under the smoke, dust all over his mouth, laughing with
 white teeth,
Under the terrible burden of destiny laughing as a young
 man laughs,
Laughing even as an ignorant fighter laughs who has
 never lost a battle,
Bragging and laughing that under his wrist is the pulse,
and under his ribs the heart of the people,
Laughing!

Most poetry dealing with working-class themes has been sung, and as labor organizations grew, the song continued to be a popular form for rallying workers. The genre of the union song probably reached its height in the early twentieth century under the

organization described as the "singest union"—the Industrial Workers of the World (IWW). The IWW's leading troubadours were Joe Hill (1879–1915) and another IWW poet and artist, Ralph H. Chaplin (1887–1961). The union's songbook, *IWW Songs: To Fan the Flames of Discontent* (also known as the *Little Red Songbook*), was distributed, along with a membership card, to all who joined the organization. The songs could be heard at union meetings, on picket lines, and in jails, and they often parodied the popular songs and hymns of the period. Hill's "Pie in the Sky" is a cutting parody of the hymn "Sweet By-and-By":

Long-haired preachers come out every night,
Try to tell you what's wrong and what's right;
But when asked how 'bout something to eat
They will answer with voices so sweet:

CHORUS:

You will eat, bye and bye,
In that glorious land above the sky;
Work and pray, live on hay,
You'll get pie in the sky when you die.

With government crackdown on communist and socialist activities at the close of the Progressive Era and nationalistic sentiment on the rise as America entered World War I, the Wobblies and their music were largely silenced by repression. Persistent low wages and poor working conditions in the 1920s, however, continued to spur unionization and strikes. As the problems facing the working class intensified with the onset of the Great Depression, it once again became clear that songs were an effective tool for calling workers back into the labor movement. Labor militancy rose in the 1930s thanks to musicians such as Woody Guthrie, Huddie Leadbetter (Leadbelly), and Aunt Molly Jackson. In the 1940s, groups such as the Almanac Singers and the People's Songs formed in support of CIO organizing campaigns. "Talking Union," by the Almanac Singers, provides instructions about how to form a union local:

Now, you know you're underpaid, but the boss
says you ain't;

He speeds up the work till you're about to faint.
You may be down and out, but you're not beaten
You can pass out a leaflet and call a meetin'
Talk it over—speak your mind—
Decide to do something about it.

Folk groups produced a virtual library of protest songs that stressed unity and mutual assistance among the working class. In the 1950s, groups such as the Weavers, who continued to perform despite political pressure to disband, kept the tradition alive. Later, the popularization of folk groups led to music

styles that played a significant role in the Civil Rights Movement and the protest against the Vietnam War. Artists who successfully bridged the gap between folk music and popular taste include Bob Dylan, Joan Baez, the Byrds, and Peter, Paul, and Mary.

Contemporary poets explore the need for satisfying work and attempts to avoid dead-end jobs and alienating labor. For example, works such as Barbara Smith's "The Bowl" and Marge Piercy's "To Be of Use" give insight into the joy that can be found in physical labor. Social class, most notably immigrant labor, is the focus of poems such as Benjamin Aliere Saenz's "Journeys" and Jimmy Santiago Baca's "So Mexicans Are Taking Jobs from Americans." Some entire books of poetry are focused on workers in particular industries. For example, the poet Jim Daniels' book *Punching Out* focuses on the activities of workers on the assembly line of a Detroit auto manufacturer.

Drama

Theater for working-class audiences has a long history, and several productions have an important place in labor culture. Even in the formative years of the labor movement in the antebellum period, plays appealed to the spreading discontent among workers. In the 1830s and 1840s, some productions were blamed for the spreading of mob violence in major cities. *The Carpenter of Rouen* played in New York City's Bowery Theatre and dramatized the successful revolt against autocratic repression in the French Revolution. Eventually, as the shift from an agricultural to an industrial society continued, working-class culture grew and the local theater played an important place in meeting the entertainment needs of laborers who had free time on Saturday afternoons. Regional subjects and working-class themes were popular, and playwrights worked to adapt well-known dramatic formulas to local tastes. As more immigrants arrived in the United States in search of work in the mines, mills, and factories, ethnic characterizations also enjoyed tremendous appeal. A significant example of drama aimed at local audiences is found among the ironworkers and glass craftsmen in Pittsburgh in 1878 when a play, *The Lower Million*, proved to be extremely successful. The lavish production dramatized the Great Railroad Strike of 1877 and carried an increasingly popular theme: the skilled craftsman is the hero of the industrial system.

In the late nineteenth century, workers became more involved in theater productions. A key example is the development of workers' theater by German socialists in the 1880s. Socialists often wrote their

own festival plays to celebrate events significant to the working class. A leading figure in German-American socialist workers' theater was the anarchist Johann Most (1846–1906), who acted and produced successful versions of Gerhard Hauptman's naturalistic drama, *Die Weber (The Weavers)* in San Francisco, New York, and Chicago. At about the same time, there was an increase in the number of plays produced for immigrant, working-class audiences. Classical and foreign language plays were revised to fit into the urban, industrial setting of the Gilded Age. In New York's Lower East Side, for example, popular commercial productions used garment factories and sweatshops as settings.

In the opening decades of the twentieth century, radical organizations saw an opportunity in dramatizing labor struggles. The most significant example occurred during the Paterson Silk Strike of 1913. Strike organizers and the IWW hoped to rally workers and raise much-needed strike funds. Approximately 1,000 striking workers were part of the cast in the dramatization of the labor struggle. The production was mainly orchestrated by John Reed, the writer for the *Masses*, who experienced the strike firsthand and was jailed with the immigrant laborers. "The Pageant of the Paterson Strike" was divided into six major episodes from the strike. The mass actions by strikers were re-enacted, accompanied by excerpts from the stirring speeches made by strike leaders during the labor struggle. The cast also sang songs such as "The Marseillaise" and "The International." Prepared in only three weeks, the play was performed on June 7, 1913, before an audience of approximately 15,000 at New York's Madison Square Garden. The play won critical praise and by several accounts moved the audience deeply; it failed, however, to generate the desperately needed strike funds.

During the Progressive Era and into the late 1920s, companies expanded the use of theater as a venue to indoctrinate their workers with company ideology. Large corporations financed company auditoriums and subsidized company drama clubs and vaudeville acts. The productions not only entertained the workers but also limited outside influences such as saloons and dance halls. Company shows often involved workers and their families. Examples include the Goodyear Greater Minstrels and the *Hawthorne Follies* held at the Western Electric Company's Hawthorne Works in Chicago. Entertainers glorified hard work, exemplified the idea of positive relations among employees, or showed proper methods for selling merchandise.

Workers' education leaders and labor colleges also recognized theater's ability to instruct and inspire. Due to the unemployment, evictions, speedups,

and wage cuts brought on by the Great Depression, amateur workers' theater grew into a full movement as hundreds of troupes and tens of thousands of workers wrote, directed, and performed theatrical pieces. Notable examples include participation of members of the International Ladies' Garment Workers' Union (ILGWU) in the play *Pins and Needles*. Similarly, Local 65 of the United Wholesale and Warehouse Employees produced shows such as *Sing While You Fight*. In this play, the two main characters—Jean and Bill—find meaningful activities once they become union members. Jean enjoys duties with the union newspaper. Bill participates in union athletic teams. Ultimately, the two characters find each other at a Saturday night social sponsored by the union. They also find romantic bliss.

The 1930s produced very powerful protest dramas, due in large measure to the agitational performances produced by the Workers' Laboratory Theater (WLT) of New York. The most successful "agitprop" play of the period was the one-act *Waiting for Lefty*, which was written in three days by one of the left's most successful playwrights, Clifford Odets (1906–1963). The play was inspired by the New York taxi strike of 1934 and is set in a union hall where members of the taxicab drivers' union are waiting for the arrival of the popular committeeman, Lefty Costello. The progress of the drivers' union meeting is alternated with flashbacks of the frustrated lives of various workers and their financial difficulties. At the close of the play, a messenger arrives to report the news to the labor leader Agate Keller that Lefty has been murdered:

Man: They found Lefty . . .
 Agate: Where?
 Man: Behind the car barns with a bullet in his head!
 Agate (crying): Hear it boys, hear it? Hell, listen to me!
 Coast to coast! HELLO AMERICA! WE'RE THE
 STORMBIRDS OF THE WORKING-CLASS.
 WORKERS OF THE WORLD . . . OUR BONES AND
 BLOOD . . . [To audience] Well, what's the answer?
 All: Strike!
 Agate: Louder!
 All: Strike!
 Agate and others on stage: AGAIN!
 All: Strike! Strike! Strike!!!

Waiting for Lefty was widely performed by theater groups and amateur performers in union locals. The short play won Odets tremendous acclaim and is considered one of the most powerful protest dramas of the 1930s.

The counterculture movement beginning in the 1960s brought new theatrical forms that were suitable for outdoor demonstrations. Theater companies such

as the Bread and Puppet Theatre, San Francisco Mime Troupe, and Pageant Players in New York performed on city street corners, parks, parking lots, and inside businesses to rally opposition to the Vietnam War, the nuclear arms race, and homelessness. Labor organizations worked for support through theater productions. Unstable Coffeehouse Productions in Detroit, for example, presented an original play, *Sitdown '37*, to an audience of United Auto Workers members as part of the twenty-fifth anniversary of the major labor struggle that helped unionize General Motors. In addition, the San Francisco General Strike of 1934 inspired the playwright Jack Rasmus to write "1934: The Musical." The major non-English theater of the 1960s was El Teatro Campesino (Farm Workers' Theater). The group's productions aimed at recruiting farmworkers and promoting union activities.

NURSING AND HEALTH CARE

In the mid-nineteenth century, women reformers took a long-accepted female duty, nursing the sick, and fashioned it into paid women's work. One impetus for this came from England's indignation at the treatment of its wounded soldiers in the Crimea. The public outcry resulted in a group of religious sisters and lay women, led by Florence Nightingale, being sent to organize nursing care for these men. After the war, Nightingale led the incipient drive for formal nursing education. Whereas care for family members was an accepted province for women, institutionalized care in the battlefield and in hospitals was considered suitable only for the meanest levels of society. Progressive Era reformers, such as Nightingale and her U.S. counterparts, sought to impose order and moral discipline in hospital wards through their innovation of trained nurses. Indeed, with increasingly complex care following the introduction of anesthesia in the 1840s and the emerging scientific base of medicine, skilled nursing was essential.

Yet there were inherent barriers to instituting an educated nursing workforce, and these barriers have persisted to this day. Care by educated nurses is expensive and constitutes a more protracted expense for patients than physicians' isolated charges. In addition, society typically undervalues and under-rewards caring. Nursing care ranges from relatively unskilled domestic work to complex and specialized interventions, yet a clear line of differentiation is impossible to draw. Furthermore, nursing was initiated as a women's field—indeed, Nightingale introduced her 1860 *Notes on Nursing* with “Nursing is women's work.” Women were considered subordinate to men, and their occupations carried less esteem. Female nurses worked alongside male physicians within the paternalistic hospital environment, where physicians were positioned to demand medical authority over nursing practice, which was professionally inhibited because of its very femaleness. Addressing these difficult issues resulted in compromises in nursing education, conflicts among nurses, and conflicts between nursing leaders and physicians.

This essay opens with a description of hospital-based nursing training and the characteristics of the worker-students from the 1870s through to the post-WWII decline in the number of hospital training schools. The graduates of these schools, who initially worked as independent contractors for individual patients and later as hospital employees, will then be described. The education and work opportunities for nurses over the following decades of the twentieth century will be followed by a discussion of

the American Nurses Association's (ANA) involvement in shaping working conditions for nurses.

Setting the Stage

Florence Nightingale asserted that prior to trained nursing, hospital nurses were generally “those who were too old, too weak, too drunken, too stolid, or too bad to do anything else.” Her disparagement merits discussion. Hospitals were charitable institutions for the very poor, the dregs of Victorian society, who presented with noxious diseases and intimate needs. Their nurses were from similarly unfortunate backgrounds, often former patients themselves, who needed steady employment and a place to live. There is much evidence to show that many of these women and men were hardworking and caring of their charges.

With Nightingale's example from overseas, the first U.S. educational programs to train nurses and reform hospital nursing were opened in the early 1870s. These schools, like the hundreds that followed, sought to engender moral training as well as nursing techniques. The nurse historian Carol Helmstadter notes that moral discipline was the overarching concern of the Victorian age, particularly in relation to women. Additionally, the growth of women's wage labor threatened traditional patriarchal authority among all classes. Nurses were to express the Victorian concept of ideal womanhood—moral, submissive, and obedient. Student nurses were subjected to strict discipline within a hierarchical system that oversaw every aspect of their lives for their two or three years of training. Unquestioning obedience and deference were demanded. Helmstadter claims that the new trained nurse was subservient, dependent, and exploited.

Nurses' Training: 1880–1950

After the first handful of prestigious nursing schools opened, modeled after Nightingale's and with their own governing boards, the benefits that this hardworking, disciplined corps of young women could bring to hospitals became readily apparent. Scores of schools opened that were operated and controlled by hospitals. Hospital administrators appreciated that their own nursing schools could provide essentially free nursing care. To hospital management, it

Nurse preparing arm of prisoner, possibly for blood donation to aid the armed forces during World War II, San Quentin prison, California. Library of Congress, Prints & Photographs Division [LC-USZ62-97127].

constituted an astoundingly fortunate development, and they began to develop business strategies and court both patients and physicians to their facilities, based on provision of free nursing labor. Schools were essentially organized as nursing service departments within the hospitals and were governed by the hospital administration. Predictably, the number of nurse training schools mushroomed; in 1880, 15 were in operation, and in 1910, there were 1,129. The number of hospitals likewise increased rapidly along with the number of nurse training schools. In 1873, there were 178 hospitals in the United States; 50 years later, there were 6,830 and every fourth one had a nursing school. Most were small community hospitals, open to paying patients, usually admitted for a surgical procedure, who expected efficient and competent nursing care. Some of these hospitals were specialized, and their student nurses were exposed only to that specialty, while others were small with highly limited experiences for their students. Yet they still maintained their profitable schools. Instruction in many of these schools, particularly the smaller ones, was certainly poor. In 1932, 23% of schools did not have even one full-time instructor, while only 25% had two or more. In the mid-1930s, about 30% of the instructors had not themselves finished high school, while only 20% had as much as one year of college.

Yet it may be argued that this arrangement was not totally unfair to the student nurses. In return for two or three years of physical work, which was usually supported with a stipend and always included room

and board, graduating nurses received a diploma that offered, at minimum, the prospect of a career.

The lives of nursing students from the 1880s through to the 1940s and beyond were ones of unrelenting control and discipline. Every aspect of work, study, and recreation was subject to the authority of the nursing school. Nursing superintendents and hospital managers demanded total loyalty and obedience from the nurses and tolerated no infractions of their rules. Some students rebelled and left while many others found fulfillment in the total relinquishment of independent thinking and the boarding school-like environment that was demonstrated in their yearbooks and alumnae association activities. Inexpensive rewards for length of service, such as different-colored belts and stripes on caps, were coveted and worn proudly. Some writers have commented that students entered training as women and left as girls, while others discuss the subjugation of independent thinking and inquiry to the unquestioning obedience demanded.

Trained nurses were expected to belong to a superior social class, although the hard work and menial connotations associated with nursing made this type of applicant elusive. Most students came from farms or small towns. Those who were from socially higher families were targeted to become directors of training schools or hospital administrators—opportunities open to few women in the late nineteenth century. However, all students in the early public hospitals were expected to be of a higher social class than

their patients and were also counted upon to be pleasing to look at and to have appropriate social skills. By the 1920s, however, admission standards were lower. Concerns were raised about the inferior women entering nursing in the report of a major study of nurses commissioned by the American Nurses Association. Writing in 1928, the author (Burgess) voiced concern over the undereducated women entering nursing, who were of “inadequate social and academic background” and should really be kept out of the profession.

Nursing training has been likened to an apprenticeship system, since students essentially worked with patients for three years, gaining experience through work. However, the historian Barbara Melosh has argued that a true apprenticeship requires the presence of experts—in this case, graduate nurses—who were lacking in the hospital schools of this period. Student nurses in the 1890s were predominantly responsible for domestic chores as well as rapidly becoming totally responsible for the care of very ill patients, particularly when on night duty. There were few graduate nurses, and those were in a supervisory role. Students swept, dusted, and cleaned the lavatories, made the beds, and cleaned the bedpans. Yet they also assisted with dressing wounds and dispensed medications. In 1896, a survey of three hundred nurse training schools revealed that students typically worked 60 to 105 hours a week, with typical workdays or nights of eight to 15 hours. Many days after work, students were obliged to listen to lectures from physicians or nursing supervisors. At most hospital training schools, students were also sent out on private duty, to nurse patients in their homes. Students might stay on the case for days or weeks. The patients’ fees were pocketed by the hospital and were regarded as a major part of the income for many of the smaller schools. Students in 1934 worked more than 48 hours a week, working every day with two half days off a week. Yet this work could not be called an apprenticeship. In 1932, two thirds of the schools did not have even one graduate nurse employed for bedside work. In most schools, students received a small monthly allowance, although the more prestigious schools did not do this—wanting to maintain the image that their nurses were students rather than workers.

Training lasted three years in most schools, and a standardization of the curriculum was attempted through the first edition of the *Standard Curriculum* published in 1917. There were successful efforts throughout the country to mandate state registration of nurses, and nurses’ living conditions and hours of work eased considerably compared with earlier years. The quality of nursing education was also changing.

Ninety-nine percent of all nurse training schools required graduation from high school by 1935, and in 1937, the *Curriculum Guide for Schools of Nursing* recommended an increase in nurses’ theoretical education. The number of schools giving a university degree in addition to a nursing diploma was also growing; in 1935, there were over 70 such programs. These combined two or three years in the hospital with two years of college courses. There were also three nursing programs within universities, with school or department status.

This type of practical education rendered nursing students, and not graduate nurses, a valuable commodity. At graduation, following presentation of the school’s pin and laudatory speeches, the newly minted nurses were dismissed from the hospital and a new crop of students took their place. Most of these young women tried to find work as private-duty nurses, either in private homes or working for individual patients in hospitals.

Nurses’ Work: 1880–1950

Nursing rapidly became the second largest female-dominated profession, after teaching. In 1920, there were 635,000 school teachers and 144,000 nurses. Most nurses worked in private duty during the early decades of the century and typically connected with prospective private patients through registries—often operated by their hospital or its alumnae association. Registering on the hospital list sometimes meant competing with the hospital’s current nursing students for positions, and certainly placements were at the whim of the hospital’s nursing supervisors. By 1896, approximately 40 alumnae associations existed, and several of them operated registries. During the early years of the twentieth century, commercial employment agencies and some medical organizations operated nurses’ registries. For physicians, medical registries generated a convenient method of contacting nurses for their patients. Nurses paid a registration fee to be placed on a list of available nurses. A typical large agency, Chicago’s Nurses’ Professional Registry, was formed in 1913 by several local alumnae associations. By 1923, the Chicago registry was well established with around 950 members and annually received more than 11,000 requests for private-duty nurses.

Even with registries, private-duty nursing was an insecure means of earning a living. Private-duty nurses were isolated and unorganized and vulnerable to the idiosyncrasies of their patients and the market. Additionally, by the 1920s, there was not nearly

enough work for the numbers of nurses being produced by the nurse training schools. The private-duty fees barely generated enough to cover periods of unemployment, while saving for retirement was next to impossible. Unlike hospital nurses, who lived rent free in nurses' "homes," private-duty nurses needed their own place to live as well as a telephone for the registry to contact them. Following a period of employment, most registries ruled that nurses who had worked three or more days would move to the end of the list. The work, too, could generate different stressors from hospital nursing, as private-duty nurses worked in a social limbo, not at one with their patient's family or the servants. The hours of private-duty nurses were longer than for any other group of nurses; some nurses worked 24-hour shifts even as late as 1937. Also, the close and unremitting patient contact was difficult. Patients' illnesses also affected nurses' earning ability. If they nursed patients suffering from contagious diseases—including cancer, which for many years was considered contagious—they were barred from taking surgical or maternity cases for the following several weeks.

By the mid-1920s, the already limited market for private-duty nursing was saturated. When the Great Depression effectively crushed most opportunities for such nursing, nurses had been teetering on the brink of severe unemployment for years. In addition to diminishing work prospects, the number of nurses produced continued to increase. Nurse training schools had increased from 1,775 in 1920 to 2,286 just eight years later, and the number of nurses had doubled from 104,000 in 1920 to 214,000 in 1930. In 1920, the percentage of nurses who entered private-duty nursing was 80% but declined to about 55% in 1930. At the end of 1930, the registries reported that 25% to 40% of graduate nurses were unemployed.

This unemployment for private-duty nurses sparked a transition from private-duty to hospital nursing for the nation's trained nurses. This transition also significantly impacted nursing education. Hospitals, in desperate financial straits, capitalized on the nurses' unemployment and financial distress by hiring them for far lower wages than the usual rates or even paying them for merely room and board. By the late 1920s, most private-duty nurses worked as bedside—or staff—nurses in acute-care hospitals rather than for private patients. Restrictions on graduate nurses working in hospitals imitated the restrictions of student life. Hospitals routinely required graduate nurses to live in the nurses' dormitory, and they were subject to the same discipline and regimentation that had characterized their student life. They were hired for general ward work and dismissed or re-appointed based upon patient occupancy.

The rationale for operating schools of nursing faded in the face of this newly available and inexpensive corps of graduate nurses generated by the Depression, and many schools closed. This school closure was supported by the state nurses' associations and the American Nurses Association. Some members even donated one month's free nursing service to compensate the schools for the loss of student work. In 1936, there were 1,381 schools, compared with 2,296 just eight years earlier. The number of graduate nurses employed by hospitals rose dramatically from about 4,000 in 1929 to over 100,000 in 1941, about 46% of all practicing nurses. Graduate nurses became accepted as hospital nurses during this decade, and the importance of student nurses as primary caregivers receded. Although many schools of nursing closed during this period, the enrollment of those that remained went up, resulting in a net increase in the number of students and thus graduates. Yearly salaries were \$1,000 plus room and board for institutional work.

Nurses' work in hospitals in the 1930s was labor intensive. Nurses were involved extensively with caring for patients confined to bed and with preparing diets and pharmaceutical solutions. There were dozens of solutions to be prepared as well as different prescriptions for baby formula. Medications too were sometimes prepared by nurses, weighing drugs such as quinine and salicylates and making them into capsules. Complex diets were prepared, such as diets low in ions or high in alkalinity, diets low in bulk or high in fat. Remedies using applications of heat or cold, with their inherent danger of tissue damage, were frequently ordered although the temperatures were only vaguely prescribed. For example, vaginal douches to stop bleeding were ordered "as hot as the patient can stand," while stupes, poultices, and electric light baths all relied on indeterminate amounts of heat to generate the desired effect. Nurses were trusted with procedures that had previously been in the domain of physicians, such as blood pressure measurement. Enemas and laxatives stand out as frequent nursing activities of this period—cleansing enemas; carminative (gas-reducing) enemas; sedative and stimulating enemas; oil and nutrient, antihelminthic (antiworm), antiseptic, astringent, and saline enemas. In one public hospital, enemas were part of the standard care for patients with pneumonia.

Although most nurses found work as private-duty and then as hospital bedside nurses, there were other less common career opportunities. Nurses working in the community, known as public health nurses, experienced more autonomy and prestige than individual patient or hospital-based nurses. The first quarter of the twentieth century saw increasing numbers of nurses enter this field. In 1926, at the height of public

health nursing, nearly a fifth of all nurses were in public health. The maternity and child health programs of the 1921 Sheppard-Towner Act supported an increased role for these nurses.

Wars and other disasters provided more scope for the varied work of nurses and proved appealing for many with an adventurous, patriotic, and/or charitable bent. Twenty-four thousand nurses served in the First World War, 25% of all graduate nurses in the United States, and nearly three hundred nurses died. This effort severely taxed civilian nursing, which was exacerbated by the 1918 and 1919 flu pandemic. The nursing shortage prompted an Army School of Nursing, which was opened in May 1918. The Second World War saw about 74,000 nurses join the military services. Following the oversupply of the 1920s and 1930s, the 1940s was a time of nursing shortage. The return of peace enabled nurses to leave work for marriage and families, and younger women had an array of work options not available to the previous generation.

Nursing Education and Work after Mid-Century

Nursing education slowly shifted away from hospital training schools during the second half of the twentieth century, largely due to the use of trained nurses rather than students at the hospital bedside. The 1948 Brown Report, *Nursing for the Future*, also served as a catalyst for change.

Esther Lucile Brown, a researcher with the Russell Sage Foundation, had been charged with studying nursing education and nurses' work in the face of the critical postwar nursing shortage. The essence of her influential report was that nurses' training should move away from the confines of individual hospitals and into mainstream higher education. States and communities, Brown reasoned, supported the education of other professional occupations, while a non-educational entity—hospitals—provided for nursing training. Brown's report was derided by hospital administrators and the American Medical Association (AMA), both groups being apprehensive about loss of control over nursing education. The AMA had long held a paternalistic interest in nursing education. Many members were anxious that nurses' knowledge be strictly contained and not usurp any medical prerogative.

The ANA, however, fully supported Brown's findings, and some insurance companies and hospitals were also concerned with the inappropriateness of

patients' hospital fees also supporting charges for nurses' education. In the late 1940s, federal aid for nursing programs, through the Emergency Professional Health Training Act, was proposed but was defeated partially through the efforts of the AMA as well as a newly formed association, the National Organization of Hospital Schools of Nursing. A few years later, in 1956, the Health Amendment Act, which supported further education for graduate nurses, was signed into law. In 1964, the landmark Nurse Training Act was passed. This bill provided federal aid for nursing education through school construction grants and student loans and scholarships.

The few baccalaureate programs that were in existence at mid-century did not offer a typical degree but were essentially a regular diploma program coupled with additional college courses. These programs typically lasted five years. In contrast, associate degree nursing programs, which first appeared in 1952, took just two years. These programs rapidly expanded in number. The associate degree program was seen as a way to relieve the critical nursing shortage as well as moving nursing education into the mainstream. The programs were highly successful. There were 16 community colleges offering associate degrees in nursing in 1955, and by 1964, there were 130. Graduates from all types of nursing programs, diploma, associate degree, and baccalaureate, sat for the same nurse licensure examination. In 1965, the ANA produced a position paper on nursing education that mandated a baccalaureate degree for nursing practice, but this apparently did not impact nursing education. The following decades witnessed the number of associate degree programs increase with a commensurate decline in hospital diploma programs, but the number of baccalaureate programs remained modest.

The postwar years saw tremendous growth in the hospital industry, which exacerbated the nursing shortage. Hospital building was largely financed by the Hospital Survey and Reconstruction (known as the Hill-Burton) Act of 1946. In the first six years following the Act, about 88,000 new hospital beds were created. Meanwhile, technological and scientific medical innovations generated increased patient demand, and private insurance plans supported more patient business. Employer-provided insurance plans were in place for about 75% of the civilian population by 1960, up from 33% in 1946. As the nurse historian Victoria Grando notes, care of acute illness, surgery, the baby boom, a growing elderly population, and care of the war-injured all increased the demand for hospital nursing care. Hospital admissions rose by 25% between 1946 and 1952. The loss of nurses to industry and public health exacerbated the shortage.

The critical postwar nursing shortage continued. Nursing continued to struggle for students while competing with other employment opportunities. There were several reasons for this. Nurses returning from the autonomy of war service braced at the authoritarian restrictions prevailing in civilian hospital nursing. In addition, the 48-hour workweeks, the assignment of split shifts—where nurses worked the busy morning and evening hours with their time off during the slow afternoons—and mandatory unpaid “on call” hours were unappealing. Additionally, most nurses did not receive medical care or insurance benefits. The persistence of low pay, compared with other female professionals and office and industrial workers, coupled with more and more responsibility as the science of health care rapidly developed, all combined to keep women and men out of nursing. At the same time, many women who had nursed during the war years now left nursing for marriage and raising a family.

The low pay was in part due to hospital administrators and the public continuing to see hospitals as charitable institutions rather than businesses and nurses as having a vocation rather than needing to work for a wage. The need to adequately compensate nurses could be conveniently disregarded because of this excuse. More pragmatically, hospitals were hard pressed to internally justify paying nurses comparably with other female workers when for years they had enjoyed the benefits of cheap student labor. To the chagrin of nursing leadership, buildings and technologies were afforded but not attractive nursing salaries.

The nurse shortage created a unique situation for female workers in the immediate postwar years. Married and older nurses were asked to stay at work in nursing although they were not tempted with increased salaries, in contrast to other women who were encouraged to leave their jobs for the returning men. The nurse shortage was partially addressed through hiring untrained aides or lesser-trained “practical nurses.” Thus, the cheap nursing care formerly provided by students was now carried on by a second tier of lesser-educated nurses who were directed by licensed registered nurses. These nursing teams cared for groups of 15 to 20 patients. The nurse historians Joan Lynaugh and Barbara Brush have argued that nurses were unable to define their unique work, which led to the situation of low pay and substitution of lesser-prepared nurses.

In the 1960s and 1970s, sicker patients were admitted for shorter hospital stays. With Medicare and Medicaid legislation of 1965, there were increased pressures placed on hospitals and nursing services.

Nursing practice became more complex and diverse. To use nurses most effectively, the sickest patients were grouped together, under nurses experienced in their special needs—evolving into early intensive and coronary care units.

Nursing Organizations

Nursing leaders established four national organizations within a few decades of the inception of trained nursing in the 1870s. The first of these, the American Society of Superintendents of Training Schools for Nurses, was created in the wake of Chicago’s 1893 World Fair. The new society was seen by its founders as a vehicle to organize and professionalize nursing. In 1912, the name was changed to the National League of Nursing Education. In 1896, this group founded a second professional organization, the Nurses’ Associated Alumnae Association of the United States and Canada, later the American Nurses Association. The ANA was open to all graduate nurses, regardless of specialty, through their alumnae associations. The other nursing organizations were the National Organization for Public Health Nursing, founded in 1912, and the National Association of Colored Graduate Nurses, founded in 1908. The latter was instituted when some African-American nurses were essentially denied membership in the ANA because some state associations barred African-American nurses because of race. (See also the entry “National Association of Colored Graduate Nurses.”) This section deals primarily with the ANA as the dominant organization, as well as the group charged with being nursing’s collective bargaining representative at mid-century.

The first state associations of the ANA were formed in 1901 when the national body saw a need for more local organizations to co-ordinate activities within the state. By 1907, 28 state associations had been formed, although alumnae associations remained the primary basis for membership in the national organization. However, over the following years, membership in state associations became the only method of joining the national organization.

The ANA, through its state organizations, was early on involved in obtaining registration for nurses and in the formulation of acts to define nursing practice. Having invested three years in laborious hospital training, nurses were fierce in defending the title of “nurse” and restricting its use to themselves, both for their job security and for the protection of consumers. State registration of nurses was one way of achieving

this. North Carolina was the first state to pass such a bill, although it was weaker than the nurses wanted due to opposition from the state medical society. Later state acts included educational requirements as well as a licensure examination. Another early activity of the ANA was the publication of the first American journal owned by nurses, the *American Journal of Nursing*, which began publication in 1900.

The contact of the hospital nurse with the ANA, whether hospital or private-duty, was greatest through the nurse's alumnae association. Members of alumnae associations held regular meetings, usually in the nurses' residence where they had lived during training. The meetings kept nurses abreast of patient care advances or were of general interest. Care of sick and needy members was another traditional focus of alumnae associations. Many associations funded an endowed hospital bed for their members, which allowed a nurse needing hospital care to use the "alumnae bed" free of charge. Some associations made special arrangements for their members stricken with tuberculosis—an occupational hazard. In Chicago, the First District of the Illinois State Nurses' Association sponsored a six-room cottage for its members with the disease on the grounds of a suburban sanatorium. The ANA also served to identify employment opportunities for nurses through operation of nurses' registries. Probably because membership in the ANA registry was necessary to obtain work as a private-duty nurse, the ANA was the largest professional organization of women in the world in 1930, with 100,000 members.

During the late 1930s, the issue of whether the ANA should serve as nurses' collective bargaining agent was discussed. Economic conditions for nurses continued to be poor in the postwar years. In 1941, the California Nurses' Association successfully represented its members before the War Labor Board. Its success prompted the ANA to adopt a more extensive national program for nurses. In 1946, the ANA adopted an economic security program, which allowed state nursing associations to act as representatives for their members in employment concerns and as their collective bargaining agents. The ANA wanted a 40-hour workweek with no decrease in salary. Yet the ANA's efforts became moot for many nurses when the Taft-Hartley Act was passed in 1947. The bill exempted nonprofit hospitals from the 1935 Labor Relations Act, which obligated employers to bargain collectively with their employees. The ANA immediately worked to get this Act repealed, but was not successful. In 1974, an amendment was finally signed into law permitting nurses in nonprofit hospitals to engage in collective bargaining.

Leadership in the ANA came from a group of women who wanted nursing to be recognized as a profession, with professional education and professional commitment to practice. This was frequently at odds with the nurses, who were frequently lesser-educated private-duty nurses whose livelihood would be affected by nursing leadership's professional aspirations. Many activities of the ANA at this time were concerned with nursing issues at the national and legislative level, sometimes leading to professional status at the price of longer hours and lower pay.

In 1950, the ANA and the National Association of Colored Graduate Nurses began a process of merger, while the National League of Nursing Education, the National Organization of Public Health Nurses, and the more recently formed Association of Collegiate Schools of Nursing formed the National League for Nursing.

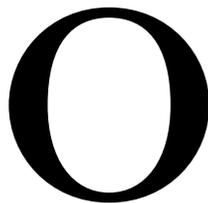

Nursing contributes several unique attributes to an examination of labor history. Nurses' professional aspirations were impacted and hindered by gender and class. Nurses' work ranged from providing comfort measures to instituting life-threatening interventions. Nurses, predominantly women, were not, historically, associated with women's suffrage, yet they represented a significant group of this country's workingwomen. Thus, a study of nursing may inform labor, medical, social, women's, and political historical analysis.

OAKLAND GENERAL STRIKE (1946)

In December 1946, a strike of predominantly female department store clerks sparked a citywide general strike in Oakland, California. More than 100,000 workers struck for 2.5 days, shutting down factories, shipyards, construction, most retail, and virtually all transportation in the city. Local working-class mobilization carried over into the municipal elections of 1947, when a slate of labor-endorsed candidates won four seats on the city council.

Before World War II, Oakland's business and politics had been dominated by a conservative, downtown, commercial elite, led by *Oakland Tribune* publisher Joseph Knowland. In the 1930s, insurgent Congress of Industrial Organizations (CIO) unions emerged in factories and along the waterfront, but much of the local economy remained concentrated in skilled craft production, and the American Federation of Labor (AFL) remained the larger and stronger union federation.

The war however brought thousands of new migrants to work in the defense industries, especially shipbuilding, while the number of employed women in Oakland nearly doubled. By 1945, the city population had increased by almost a third, and the African-American population more than tripled. Many of these workers, previously excluded by race, gender, or skill, suddenly became members of unions that often received them poorly or resisted them altogether. But by the mid-1940s, a more progressive leadership emerged in the local AFL, and the CIO also reached out to new workers in the community.

With mass layoffs in the postwar period and fears of a new open-shop and wage-cutting drive by employers, union leaders focused on organizing new members, including workers in the historically anti-union downtown retail sector. By the fall of 1946, the AFL Department and Specialty Store Employees' Union, Local 1265, had recruited a majority of workers at Kahn's, a large department store, and at Hastings, a men's store. After management refused to recognize the union, the employees at the stores, the majority of them women, voted to strike. Local Teamsters' Union drivers refused to transport goods to or from the struck stores, which soon ran low on inventory and faced serious losses of business in the Christmas shopping season.

The employers then turned to the local government. Downtown business leaders met with local law enforcement officials, who agreed to provide security to allow the stores to bring in \$500,000 worth of merchandise using an out-of-town, nonunion trucking firm. Union leaders got word of the plan, and on Saturday night, November 30, about 70 special pickets surrounded the stores. By Sunday morning, December 1, some 250 police arrived, equipped with shotguns and tear gas. Strikers and union leaders watched as police cars and motorcycles escorted convoys of strike-breaking trucks delivering goods to the stores.

The response on the streets was immediate: That morning a car men's union officer stopped a passing streetcar and removed its controls, halting traffic through the area. Crowds gathered downtown over

the next 2 days, as local AFL union leaders met and voted almost unanimously for a general strike. On Tuesday morning an estimated 100,000 AFL members from 142 unions walked off their jobs, and CIO members, though not called out, honored AFL picket lines (public utilities, organized by CIO unions, remained in service).

Crowds ranging from 5,000–20,000 people assembled downtown in largely peaceful demonstrations around the stores. Strikers and sympathizers sang and danced to guitars or music played from union loudspeakers in what was described as a carnival-like atmosphere. The unions officially referred to the strike as a holiday, while union picket captains kept order and exhorted people to remain nonviolent. For 2.5 days thousands of working people in Oakland, migrants, women, members of ethnic minorities, and veterans of economic depression and war, all came forward to claim their right to the city.

Meanwhile local AFL union leaders began negotiating with the city manager and the business elite. As the talks went on, the Oakland unions experienced mounting pressure from their international unions to end the general strike. On the second Teamsters' vice-president Dave Beck ordered his members to return to work, and with that the employers broke off negotiations. The unions settled with the city manager that the police would no longer be used to break legal picket lines, and each party issued separate statements. The AFL unions officially ended the strike on Thursday morning, December 5, and a CIO mass meeting, set for that evening to decide whether to join the strike, was never held.

In the general strike, the AFL unions successfully resisted the business elite's attempt to use police force to break their movement. However they were unable to resolve the Kahn's and Hastings' dispute, and the striking women clerks would remain out for several more months. As the limits of the initial settlement became clear, local AFL and CIO unions came together the following spring to endorse a slate of pro-labor candidates in the 1947 city elections. In a record voter turnout, four of the five candidates won election despite a vicious red-baiting campaign led by the *Oakland Tribune*.

Without a majority on the nine-member city council however, the new councilors failed to move much of their agenda. The progressive period in local politics ultimately came to an end on the issue of public housing. In 1949, the city council voted to approve a plan to build 3,000 units of federally subsidized public housing, backed by the AFL and CIO unions and the NAACP. Intense opposition from real estate, landlords, and property-owning interests however led to a

bitterly contested recall election in which only two of the progressive councilors survived. By 1951, the conservative majority on the council had rescinded the program of public housing.

In the immediate postwar period, citywide general strikes broke out in a number of American cities, including Pittsburgh, Houston, Stamford, Connecticut, and Rochester, New York. In Oakland the 1946 general strike represented a peak of popular class solidarity and action, but the union movement had yet to overcome gender and racial divisions or find ways of sustaining mobilization across a wider political arena.

OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA)

Since its creation in 1970, the Occupational Safety and Health Administration (OSHA) has significantly improved workplace safety. OSHA has also dramatically altered workplace dynamics by granting workers the right to participate in creating a safe workplace. Yet OSHA has also faced nearly constant attacks from employers and advocates of deregulation.

Workplace Safety before OSHA

Prior to OSHA workplace safety and health were regulated almost entirely at the state level. Factory inspections, workers' compensation, and other safety laws passed in the late nineteenth and early twentieth centuries were not only often relatively weak but also varied markedly from state to state. Inspectors could generally enter only after an accident had already taken place, or if a worker had filed a formal complaint, court orders were required to force companies to correct violations, and some state departments of labor refused to inform workers of hazards without

company authorization. Moreover even in 1969, state safety inspectors were outnumbered two to one by fish and game wardens. State safety and compensation laws also did not cover farm and domestic workers—which in effect meant that they did not protect many female workers—nor could they effectively track victims of occupational diseases when they moved, especially in the case of such diseases as silicosis that develop over decades.

The two major federal safety programs were similarly weak. The U.S. Bureau of Mines gained the power to inspect mines in 1941 and the power to set and enforce safety standards only in 1952, after decades of lobbying by the United Mine Workers of America (UMWA). Likewise under the Walsh-Healey Act of 1936, the U.S. secretary of labor could set safety standards for companies that did more than \$10,000 worth of business annually with the federal government; but even as late as 1969, the federal government was inspecting less than 5% of the 75,000 eligible workplaces annually.

Workers themselves had only a limited ability to improve workplace safety before OSHA. Occasionally skilled workers and unionized workers used wildcat strikes to demand safer working conditions, such as extra escape shafts in mines. Coal miners and lumber workers generally stopped working for the day when a fellow worker died in an accident, and miners also routinely left mines when they feared an explosion or a cave-in. But even unionized workers could not force employers to install safer technologies; for instance although hatmakers won rest breaks to limit their exposure to mercury salts, they could not change the work process to remove the salts entirely.

Workplace Safety Becomes a Public Issue

In the late 1960s, several different factors brought public attention to the issue of workplace safety. While union administrations continued to pay little attention to health and safety issues during the 1950s and 1960s, workers themselves became far more active in demanding a safe workplace. Rank-and-file workers in the United Auto Workers, UMWA, and the Teamsters led wildcat strikes over such issues as speedups, unsafe mine conditions, the lack of black lung compensation laws, and participation in contract negotiations. Workers' demands were further strengthened by the Farmington mine explosion of 1968, which killed 78 miners, and by a 29% rise in workplace injuries from 1961–1970. Increasing scientific knowledge about industrial hazards and the

newly formed environmental movement also helped raise public concern about industrial malfeasance and workplace hazards and mobilize support in Congress.

Public concern over workplace safety was strong enough in the 1960s that both Presidents Lyndon Johnson and Richard Nixon saw a federal occupational health and safety law as a key means of solidifying working-class support and introduced bills to Congress. Although the business lobby managed significantly to dilute the final bill signed by Nixon in December 1970 from the Democratic version introduced in 1968, the “safety bill of rights” still covered 56 million workers in 3.5 million workplaces: All workers except for those who are self-employed or work on their family farm, those who work in industries covered by other federal safety laws, or those who work for state or local governments.

OSHA Basics

The OSHA has two main regulatory functions: To set standards and to conduct safety inspections of workplaces. Under OSHA employers must provide workers with access to their medical records, information about exposure to toxic substances, and any necessary personal protective equipment; employers must also explain hazards to workers. Additionally employers with more than 10 employees must keep records of all accidents, treatments, hazardous situations, or other safety-related activities and promptly report to OSHA all fatalities or accidents that result in the hospitalization of four or more employees; OSHA then investigates the workplace for safety violations. During these inspections, OSHA can assess fines for willful violations (such as knowingly and intentionally committing a violation or making no effort to eliminate a known hazard), repeat violations, failure to correct violations, and falsifying reports.

Industry-specific standards have been one of the most effective yet controversial aspects of OSHA's work. Early on OSHA adopted consensus standards created by industry groups; unions unsurprisingly critiqued these standards as too lax. The OSHA also began work on specific hazard standards, such as asbestos, benzene, and byssinosis (a dust disease that afflicts cotton workers), but work on these standards progressed very slowly. Each standard begins with a proposal by the National Institute for Occupational Safety and Health (NIOSH) or a petition from outside parties, such as unions; OSHA then forms an advisory committee with representatives from labor, business, and the public. After publishing the proposed

regulation, taking comments, holding a public hearing, and accepting legal briefs, OSHA finally issues the new standard. The new standard can be appealed to an independent board or challenged in court, as in the case of the benzene standard, which was vacated by the Supreme Court in 1980 for failing to incorporate economic factors or address a “significant risk” to workers. Large companies, which hold most of the relevant data, have often withheld research from NIOSH and OSHA or successfully weakened the standard through the advisory committee or comment periods. Despite these challenges and frequent critiques from the labor movement, specific standards have greatly improved workers’ safety—for instance virtually ending byssinosis in the United States.

The OSHA’s inspection work has also faced intense criticism over the years. The OSHA has struggled with regulations that do not cover all potential safety violations and a limited force of inspectors—generally less than 2,000—that allows it to inspect only around 2% of workplaces per year. Labor unions have faulted OSHA for generally levying only small fines that do not serve as an effective deterrent and adhering rigidly to safety regulations, while employers have called for OSHA to focus on the most dangerous workplaces. Particularly in OSHA’s first decade, small businesses—which make up the majority of firms covered by the OSH Act and which rarely have the detailed safety programs of large firms—complained that they faced excessive scrutiny from inspectors. Yet the OSH Act has significantly changed the balance of power in the workplace by granting workers the right to complain confidentially to OSHA about workplace conditions, contest the amount of time OSHA allows employers to fix violations, and participate in OSHA inspections, all without the fear of retaliation by employers; employers also started incorporating health and safety provisions into contracts. Furthermore in 1990, Congress raised OSHA’s fines—from \$1,000 to \$7,000 for serious violations and from \$10,000 to \$70,000 for willful and repeat violations—to encourage employers to take safety more seriously.

Through OSHA unions have become much more engaged with health and safety issues. Several unions have written occupational health provisions into contracts—the United Rubber workers won a contract requiring management to help finance university research on benzene and leukemia, while other unions have won the establishment of union-management safety committees. Unions have also played a vocal role in fighting for specific OSHA standards, such as noise, vinyl chloride, coke-oven emissions, and cotton dust.

Attacks on OSHA

By the early 1980s, OSHA faced a storm of criticism from employers; in particular employers complained that OSHA did not focus its inspections on the workplaces where the most accidents occurred. Under pressure from the Reagan administration, Congress, and the Supreme Court, OSHA incorporated non-regulatory and voluntary approaches during the 1980s and 1990s and in particular limited its focus on small businesses and concentrated inspections on the most dangerous workplaces. The Voluntary Protection Program, which started in 1982, exempted firms with exemplary safety records from routine inspections and prioritized them for regulation variances. The Reagan administration also pressured OSHA to establish joint management-labor health and safety committees; some unions supported these committees, since they offered a means of addressing issues not yet covered by OSHA regulations.

During the Clinton and George W. Bush administrations, OSHA faced not only budget cuts but also repeated attempts to weaken the agency. In the mid-1990s, some congressional Republicans tried unsuccessfully to force OSHA to incorporate cost-benefit and risk-assessment analysis into existing and new standards, exempt most workplaces from inspection, ban unannounced inspections, and abolish NIOSH. Moreover despite OSHA’s nearly 20 years of research on ergonomics standards, Congress prohibited the agency from issuing either proposed or final standards for several years in the mid-to-late 1990s. After OSHA finally published the ergonomics standards in 2000, which covered more than 100 million workers at 6.1 million worksites and would help prevent 460,000 musculoskeletal disorders per year, George W. Bush signed a congressional repeal of the standards. Moreover although one of OSHA’s major contributions was to include workers in the safety process—an approach that has been very successful in improving worker health—this approach has been greatly weakened. Under the Strategic Partnership Program, OSHA has created over 50 advisory committees that entirely exclude labor unions. The OSHA has also continued to emphasize voluntary and cooperative approaches rather than inspections and enforcement, canceled work on more than 20 incomplete rules, and issued no major new standards since the overturned ergonomics standard in 2000.

The OSHA also faces challenges in protecting workers during the current era of labor-market restructuring and globalization. The decline of unions and the concomitant rise of telecommuting and subcontracting leave workers with less supervision and

training, fewer rights, poorer work conditions, and often little or no health care. Since most OSHA laws have focused on full-time workers in large workplaces, OSHA is somewhat ill-equipped to cope with this changing workplace. Moreover globalization has distributed dangerous work to ill-supervised workplaces in countries that have a weak or absent union movement, few worker rights, and weak safety and health regulations. Despite the profound challenges that OSHA faces, OSHA has undoubtedly greatly improved worker safety: By 2001, workers were 40% less likely to be injured on the job than in 1971, and 60% less likely to die.

Walsh-Healey Public Contracts Act

OCEAN HILL-BROWNSVILLE STRIKES (1968)

On May 9, 1968, a community school board in the predominantly black and Puerto Rican Ocean Hill-Brownsville section of Brooklyn, New York, seeking to test its powers, sent termination letters to 19 white educators, most affiliated with the union that represented the city's public school teachers, the United Federation of Teachers (UFT). The UFT's attempts to obtain their re-instatement would culminate in three racially divisive citywide teachers' strikes in the

OCEAN HILL-BROWNSVILLE STRIKES (1968)

fall of that year that left permanent scars on New York's racial landscape.

Origins of the Ocean Hill-Brownsville Controversy

The roots of the Ocean Hill-Brownsville dispute lay in the failure to integrate the New York public education system in the wake of the 1954 *Brown v. Board of Education* Supreme Court decision. By the mid-1960s, the city's schools were more segregated than they had been at the time of that decision, a result of racialized housing patterns and white resistance. In response black parents began to demand a greater voice in the operation of public schools in their neighborhoods. This movement for community control of education also drew support from Manhattan-based elites, including Mayor John V. Lindsay, and Ford Foundation President McGeorge Bundy. During the summer of 1967, the foundation provided funding for an experiment in community control of schools in Ocean Hill-Brownsville. A local board composed largely of black neighborhood residents was elected, but its powers were defined vaguely.

The local board quickly clashed with the UFT, and its president, Albert Shanker. The union was young, having been in existence only since 1960, and its leaders viewed community control of education as a threat to their hard-won collective bargaining gains. The UFT moreover was over 90% white, giving its disagreements with the local board over control of hiring, termination, and curriculum in the Ocean Hill-Brownsville schools an uncomfortable racial subtext. The power struggle between the union and the Ocean Hill-Brownsville local board escalated during the 1967–1968 school year. Middle- and working-class whites in the city, many residing outside Manhattan in the outer boroughs of the Bronx, Brooklyn, Queens, and Staten Island, began to voice support for the UFT, interpreting community control as an unwarranted special benefit accorded blacks. By the spring of 1968, the union and the local board were on a collision course.

In early May the local board met to select a group of white educators to be terminated. Many, including Fred Nauman, a UFT chapter chairman, were active in the union and/or critical of the Ocean Hill-Brownsville community-control experiment. None had received the notice and hearings that were customary in cases involving termination from positions in the New York City public school system. The letters were delivered to the educators on May 9.

The Ocean Hill-Brownsville Strikes

Shanker and the UFT sought to frame their battle to re-instate the terminated educators as one involving labor rights, and not race. The dispute, Shanker insisted, was solely about due process: Workers were entitled to fair hearings when their job security was threatened. He averred that the UFT would fight to protect the procedural rights of all members regardless of race. Supporters of the Ocean Hill-Brownsville local board in the black community however argued that substance, and not procedure, was at stake. They viewed community control of education as a civil rights issue and the UFT's invocation of due process as a canard. They blamed the terminated educators for undermining an experiment in educational reform that offered hope to disadvantaged minority children. Union bureaucrats, they claimed, were impeding the cause of racial justice.

On August 26, a trial examiner appointed by the New York City Board of Education ordered that the group of terminated educators, now reduced to 10 by voluntary transfers, be reinstated. After the Ocean Hill-Brownsville local board refused to comply and Mayor Lindsay declined to press the issue, the UFT struck all of the city's public schools on September 9, the first in a series of three strikes that would last until mid-November. Twice, on September 10 and 29, the union entered into agreements with Lindsay and the board of education under which the disputed teachers would return to their classrooms. The Ocean Hill-Brownsville local board, which had not been a party to the agreements, sabotaged them. During the summer the local board had hired a group of young, procommunity-control replacement teachers to take the places of the UFT teachers in the event of a strike in the fall. The two groups clashed in the Ocean Hill-Brownsville classrooms after the strike settlements brought them together. In addition community activists harassed the union teachers on their return to Ocean Hill-Brownsville. The settlement agreements broke down, and the strikes resumed.

By October Shanker was demanding not only the reinstatement of his teachers, but also the discontinuation of the Ocean Hill-Brownsville community-control experiment in its entirety. This stance inflamed the city's African-American population. Despite his *bona fides* as a supporter of civil rights—Shanker had participated in the 1963 March on Washington and Freedom Summer in 1964, and was a friend and ally of Martin Luther King, Jr.—the UFT president was denounced as a racist in black neighborhoods. For his part Shanker accused the local board of fomenting anti-Semitism when a flyer

defaming Jews was placed in the mailboxes of white Ocean Hill-Brownsville teachers. He had the flyers reprinted and distributed throughout the city in an effort to galvanize support for the UFT. Since most of the disputed teachers were Jewish, the flyers carried special resonance in that community and led to an upsurge in antiblack sentiment there.

The strikes were especially difficult for black unionists in the city, who were caught between the competing imperatives of race and class. The UFT's Black Caucus attempted to chart a middle course, affirming its loyalty to the union while also supporting community control, satisfying neither side. Black members of District Council 37, American Federation of State, County, and Municipal Employees (AFSCME); Local 1199 of the Drug and Hospital Workers; and District Council 65 of the Retail, Wholesale, and Department Store Union, criticized New York Central Labor Council President Harry Van Arsdale for his support of the UFT. On November 13, they staged a sit-in at Van Arsdale's office demanding that he use his influence to save community control in Ocean Hill-Brownsville. The protesters announced that they now identified as blacks first and unionists second, a painful reminder of the power of race to transcend even the most institutionalized class loyalties, both in the labor movement and the city at large.

Settlement and Aftermath

The black unionists' sit-in provided the immediate impetus to settle the third and final strike. By November striking white teachers and African-American counterdemonstrators were confronting each other daily in the streets surrounding the city's public schools, racial epithets flying. White middle-class opinion had swung sharply against Mayor Lindsay, who was perceived as an apologist for black militancy. Shanker, whose membership was beginning to feel the effects of almost 2 months without work, and who was facing a growing procommunity-control movement within his union, also had reason to seek a settlement.

The final strike ended with an agreement, reached on November 17, which generally favored the UFT. The disputed teachers were returned to their classrooms, and the Ocean Hill-Brownsville schools placed under the supervision of a state trustee. The settlement also continued the suspension of the local board that had begun during the strikes. By 1970, Shanker and the UFT had succeeded in ending the Ocean Hill-Brownsville community-control experiment.

The Ocean Hill-Brownsville strikes left a legacy of racial bitterness in New York that would linger for decades. It shifted the city's political culture rightward, helping to forge a race-based coalition of outer-borough white Catholics and Jews who elected Mayors Edward Koch (1978–1990) and Rudolph Giuliani (1994–2002); both had strained relationships with New York's black community. Outer-borough whites with memories of the Ocean Hill-Brownsville crisis provided the electoral support for municipal budget cuts, social service reductions, and anticrime measures during the Koch and Giuliani administrations that targeted black New Yorkers. These whites also appropriated the rhetoric of community control, which had been employed by African-Americans during the Ocean Hill-Brownsville strikes, for their own purposes. They defeated plans for integrated housing in the Forest Hills neighborhood of Queens (1972) and integrated education in Brooklyn's Canarsie section (1972–1973) with local-control arguments borrowed from Ocean Hill-Brownsville.

By the 1980s, the effects of residential, educational, and economic isolation had turned the Ocean Hill-Brownsville community inward. New black leaders like Al Sharpton, who had been a participant in the Ocean Hill-Brownsville dispute as a youth, were emerging to confront white New York across an urban chasm now defined almost entirely by race. The Ocean Hill-Brownsville strikes symbolized the angry intersection of labor and racial politics in New York and the failure of class-based interracialism to take hold in the city.

O'CONNOR, JESSIE LLOYD (FEBRUARY 14, 1904–DECEMBER 24, 1988) Labor Journalist and Activist

Born in Chicago, O'Connor grew up in the well-to-do Chicago suburb of Winnetka, heir to a considerable fortune of both money and liberal tradition. Her father, William Bross Lloyd, was known in the early part of the twentieth century as one of the millionaire Socialists. His family owned, among other profitable properties, a portion of the *Chicago Tribune*. Her mother, Lola Maverick Lloyd, was part of the Texas Maverick family, prominent in the cattle industry. She was also a founder of both the Women's Peace Party and the Women's International League for Peace and Freedom. O'Connor's paternal grandfather was Henry Demarest Lloyd, the nineteenth-century social critic and author of the 1894 classic, *Wealth against Commonwealth*.

In 1925, O'Connor graduated magna cum laude from Smith College with a degree in economics. While in London during the General Strike of 1926, she was greatly disturbed by the conditions under which workers labored and lived as well as by the inaccurate reports of the General Strike in the mainstream press. As she continued to travel around Europe, including several months spent in the Soviet Union, she began publishing articles as a freelancer.

Back in America by 1929, O'Connor signed on as a reporter for the left-wing news bureau, the Federated Press. One of her Federated Press coworkers was the young labor journalist Harvey O'Connor (1897–1987), later the author of several corporate exposes, including *Mellon's Millions* (1933); the two married in 1930 and spent the next 57 years working together for social justice.

As a reporter for the Federated Press, O'Connor covered the 1929 Gastonia, North Carolina, textile workers' strike as well as the 1931 coal miners' strike in Harlan County, Kentucky. The dispatches she sent

back were vivid but never patronizing descriptions of the grinding poverty and exploitative work conditions she saw during both strikes, a model of what was then known as “revolutionary reportage.”

The O'Connors moved to Pittsburgh in 1931, opening a branch office of the Federated Press in that notoriously anti-union city. A year later the couple went to the Soviet Union, spending several months assisting fellow American and radical journalist Anna Louise Strong in establishing a pro-Communist English language paper, the *Moscow Daily News*. They returned to the United States just as the New Deal got under way and turned their journalistic talents to covering the growing demands of organized labor.

In 1935, Jessie Lloyd O'Connor made headlines of her own and caused an uproar when she used her voice as a stockholder to denounce the unfair labor practices of U.S. Steel at the annual stockholders meeting—the same year that her husband Harvey O'Connor published *Steel-Dictator*, a critical examination of the U.S. Steel Corporation. She also became an active member of the American League against War and Fascism (ALAWF). Growing out of the World Congress against War held in Amsterdam in 1932, the ALAWF formed in the United States in 1933, speaking out against fascism as well as in support of labor during the heady days of the Popular Front during the 1930s.

By 1939, the O'Connors were living in the famed settlement Hull-House, which following the 1935 death of founder Jane Addams, was in the process of charting a new course under a series of head residents. During the tenure of the controversial head resident Charlotte Carr from 1937 to 1943, Hull-House activities were increasingly directed toward the concerns of labor.

On both the national and local levels, O'Connor was active in a number of organizations, including the League of Women Shoppers (LWS). Founded in New York City in 1935, the LWS was dedicated to using women's power as consumers on behalf of the interests of labor, a coming together of the middle-class base found in the National Consumers' League and the focus on union-made goods found in the Women's Union Label Leagues. The LWS opened a Chicago branch only a month after the Memorial Day Massacre outside of Republic Steel's Chicago plant in which 10 workers were killed and more than a hundred wounded during a peaceful demonstration in support of the Steel Workers' Organizing Committee. Thus when O'Connor joined the LWS and was elected as secretary of the Chicago branch, she was well aware of the limits of the Wagner Act in the face of police

brutality. Inspired by the organization's motto, “Use Your Buying Power for Justice,” the LWS supported a variety of labor actions around the country. To support their activities, they raised funds through rummage sales and in O'Connor's Chicago branch, a mink coat raffle. Secretary O'Connor relied on her journalism experience to churn out press releases, meeting notices, and letters of appeal to various constituencies.

As a resident of Hull-House during World War II, the lifetime pacifist O'Connor was like many torn between her pacifism and the fight against fascism. She increasingly directed her considerable energy and talents toward even more locally defined issues, such as affordable housing and safe streets in her immediate Chicago neighborhood while maintaining her active role in the LWS, serving as vice-president and president of the Chicago League until its demise in 1943. After a 3-year (1945–1948) stint in Texas while Harvey served as publicity director for the Oil Workers' International Union, the O'Connors moved to Little Compton, Rhode Island, where they opened their spacious oceanfront home to a variety of activists, offering respite and financial assistance in particular to several civil rights activists and the many victims of McCarthyism. They, too, felt the effects of the virulent anticommunism of the 1940s and 1950s. The FBI began active surveillance of the O'Connors in 1939, the same year that both denied any connection to the Communist party in official correspondence with the Dies Committee, also known as the House Un-American Activities Committee (HUAC), which in the early 1950s revoked the O'Connors' passports for several years. Nonetheless O'Connor continued her activism as part of the National Committee for the Progressive party (1949–1952) and as a cofounder of the National Committee to Abolish HUAC. Until her death in 1988, this tireless crusader for social justice continued actively to protest American corporate growth overseas, antilabor policies at home, and was an early opponent of the Vietnam War. Using her personal wealth and her journalism, O'Connor supported the cause of American labor for six decades.

**O'HARE, FRANK P. (APRIL 23, 1877–
JULY 16, 1960)
Socialist and Editor**

Francis Peter O'Hare moved to St. Louis from Iowa as a young boy with his family. He grew to maturity in the rough-and-tumble Irish ghetto of Kerry Patch, taking a job as a water boy during the building of the St. Louis railroad depot during the turbulent year of 1892, his only actual experience in the working class in a long life dedicated to the creation of a cooperative commonwealth. In the late 1890s, he fell under the influence of successive business mentors imbued with the spirit of Progressivism and then became a Socialist after studying popular works grounded in Marxism, the weekly *Appeal to Reason* newspaper, and material from a correspondence course on political economy.

While attending an *Appeal*-sponsored training school for socialist agitators, O'Hare wooed and wed fellow student Kate Richards. The happy couple spent their honeymoon and several years beyond making speeches and organizing locals for the Socialist party of America (SP). Studying the roots of injustice first hand in the American Southwest and Northeast interested them more than Marxist theories, which enabled them to communicate effectively with landless farmers, cotton pickers, miners, and other workers. They became proponents of an Americanized Marxism light on theory and passionate about a peaceful, evolutionary approach to bringing about a socialist millennium. After speaking at an experimental socialist encampment (derived from religious and Populist camp meetings) in Grand Saline, Texas, Frank O'Hare perfected the encampment idea, supervising huge weeklong gatherings between harvest and planting in rural Oklahoma and elsewhere. Such SP-orchestrated activities helped to set down socialist grass roots in the Southwest and recruited thousands of converts to party membership and even greater numbers who voted regularly for SP candidates. Under Frank O'Hare's leadership, Oklahoma became a bastion of socialist strength, with more members per capita than any other state.

In 1911, the O'Hares moved to St. Louis to revive a moribund socialist monthly tabloid, the *National Rip-Saw*. The paper began to feature original muckraking articles on the exploitation of workers, humorous

essays, and columns by the party's leading lights. Frank eschewed public speaking to oversee the *Rip-Saw* and the career of Kate O'Hare, who had become second only to perennial SP standard bearer Eugene Debs as a drawing card on the booming socialist lecture circuit. He sent his wife out on a punishing schedule of speaking engagements paid for by party locals with subscriptions to the tabloid, leaving him in charge of their four children for much of the time. After Debs joined the *Rip-Saw*, Frank O'Hare put the aging working-class hero on a schedule similar to his wife's, thus bringing relations to a boil with the two people he admired most in the movement. O'Hare did not hesitate to wield the editor's blue pencil (even on Debs's copy) to keep the paper neutral on such party controversies as the Barnes sex scandal and the expulsion of members of the Industrial Workers of the World for advocating violence and sabotage (direct action) in strikes. By 1916, the *National Rip-Saw* stood second only to *Appeal to Reason* in circulation among socialist papers.

American participation in World War I created a crisis in the SP with the overwhelming majority of members choosing to resist government mobilization. Frank O'Hare was one of the few party leaders to see that a revolutionary stand by an evolutionary organization in a wartime emergency would bring on a catastrophe. Seeking to spare his family from persecution, he moved them to Florida to participate in a communal scheme, only to have Kate take a high-profile tour of the country. Her principled and outspoken opposition to the war led to arrest and imprisonment after a patently unfair trial. With the SP press shut down by the government, the public came to view Socialists as disloyal. Hoping to counteract the drumbeat of hostility, Frank O'Hare published a newsletter dedicated to publicizing his wife's cause.

Once her sentence had been commuted by President Woodrow Wilson, the O'Hares moved to Girard, Kansas, to restart the *Rip-Saw*, an effort highlighted by a largely successful publicity campaign to embarrass the government into freeing other political prisoners. The Children's Crusade (as they called it) led to the O'Hares' expulsion from the SP because their campaign did not have the advance blessing of party leaders. In the changed atmosphere of the early 1920s, the *Rip-Saw* lost money. To save the tabloid Frank O'Hare renamed it *American Vanguard* and began to publish at New Llano Colony, a socialist commune in Louisiana. He and his wife worked at cross purposes there, with Kate choosing to focus on prison reform and Frank trying to renew his life-long commitment to publicizing socialism. Together they published a series

of articles exposing the scandalous conditions in American prisons and the exploitation of prisoners for private profit through sweatshops behind bars. While the campaign led to changes in prison labor, the colony pulled the plug on the *Vanguard*, and Kate O'Hare sued Frank for divorce.

Frank O'Hare returned to St. Louis in 1925, where he lived in poverty for most of 35 years. He worked for Federated Press in New York during the early 1930s and Oscar Ameringer's *American Guardian* later in the decade, but quarrels with his associates led to his dismissal from both concerns. O'Hare contributed to the book review section and the editorial page of the *St. Louis Post-Dispatch* on and off for years. He filled his time corresponding with old comrades and friends from the movement, writing a memoir that went unpublished, and working on fanciful inventions, all of which he failed to patent, since he wished to have nothing to do with the government. A passionate advocate of public housing and transportation, beautification projects, and above all civil rights in the 1950's, O'Hare defied segregation laws in St. Louis, insisting that the monthly civic luncheons he hosted be open to all, including African-Americans, a fitting climax to a lifetime of challenging social and political conventions.

OPERATION DIXIE

Operation Dixie was the name given by the Congress of Industrial Organizations (CIO) to the organizing drive that it conducted across 12 southern states from 1947–1953. The CIO made tremendous organizing gains in the 1930s and 1940s, but the South remained an area of low unionization in relation to the industrialized North. Low union density in the South was viewed as a significant problem for unions. Southern workers were generally paid less than their northern counterparts. Unions felt that the continued existence of a low-wage, nonunion region in the United States could lead to the transfer of work from the North to the South. Operation Dixie was conceived to address this issue.

United Mine Workers (UMW) veteran Van Bittner was appointed director of Operation Dixie by CIO president Philip Murray, with Textile Workers' Union of America (TWUA) official George Baldanzi appointed as deputy director. The organizing drive officially lasted until 1953, but it was beset by challenges that in many ways stalled it in its first year of operation. The South was not completely bereft of a union presence, and southern workers had engaged in forms of industrial action prior to Operation Dixie. The 1934 textile strike was an example of such activity. The strike occurred in states outside the South, but it was perhaps more important to the South, since the textile industry was the region's major industry. The strike has been viewed as a failure by various commentators. While hundreds of thousands of southern workers participated in the strike, many of them were blacklisted for strike activity. Indeed many commentators have attributed the reluctance of southern textile workers to unionize during Operation Dixie to memories of what they experienced during the 1934 strike. Southern capitalists were perhaps the most vehemently anti-union employers in the United States, and the pattern of opposition to unions exhibited in the 1934 strike would reoccur during Operation Dixie.

The CIO was run by people from the industrialized northern states, and many of the organizers used in Operation Dixie were from these states. This fact often meant that organizers were unprepared for the social and cultural realities of the South. For example issues of race were perhaps that greatest challenge faced by the CIO organizers. White textile workers showed a willingness to organize but were

often opposed to joining a union with African-American workers. Appeals to white racial identity—or whiteness—were an extremely effective method used by southern employers when challenging CIO organizing efforts. Employers produced misleading propaganda materials that implied that the CIO unions had a problack orientation and the threat that this orientation might pose for white workers. African-American workers in the South proved quite receptive to unionizing and joined unions in the face of considerable intimidation from both white workers and employers.

The South, while beset by racial segregation, was also divided by social class. Textile employers often exerted considerable influence over the lives of their workers beyond the workplace. Workers were expected to show a deferential attitude toward mill owners and others in the community who were in positions of authority. Local sheriffs and clergy helped ensure that textile mill owners were able to maintain a dominant position in their communities. Co-operation between mill owners, local politicians, and community leaders, such as the local clergy, proved effective in blunting the effectiveness of Operation Dixie. Northern union organizers were almost universally viewed as Communists, and joining a CIO union could be associated with godlessness.

The Democratic party was dominant in the South, but it was hardly receptive to the labor movement. Unions in the North had often made both organizing and legal gains with the assistance of Democratic legislators, and the labor movement was a key part of the Democratic party in northern states. In the South the party identified itself as being proworker but not necessarily pro-union. This meant that the CIO unions could not be assured of the assistance of Democratic politicians in the South and that they would indeed encounter some opposition from them. Workers in the South identified with the Democratic party, but their interaction with the party was informed by complex cultural and social norms—such as appeals to whiteness—that were not always well-understood in other parts of the United States.

Operation Dixie was also impacted by a number of difficulties within the labor movement itself. American unions, while often perceived by the public as a monolithic entity, were hardly unified in the immediate post-Second World War years. The CIO had been in existence only since 1935, and while it had made great strides with organizing industrial workers, launching Operation Dixie was a major undertaking for the organization. It hoped to organize 1 million southern workers in the first 12 months of Operation Dixie, which was a highly ambitious figure. The CIO

was not a single, large, industrial union; it was instead a federation of different unions that had their own organizing functions. Despite this the congress chose to use a centralized organizing structure during Operation Dixie.

The different unions that were part of the CIO and Operation Dixie had similarly differing experiences with the South. Of all of the CIO unions, the stakes were particularly high for TWUA. The TWUA had a presence in the South, and it participated in the 1934 textile strike. The union was aware that the low-wage South was a threat to its membership in the North, and the future viability of the union may have been dependent on the success of organizing southern workers. Other CIO unions supported Operation Dixie, but the immediate futures of these unions were not so closely linked to the success or failure of Operation Dixie as was the future of the TWUA.

The CIO was in competition with the American Federation of Labor (AFL). The AFL had also organized some textile workers in the South, but the federation did not feel that an industrywide campaign was necessarily the best method of organizing in the South. For the CIO the industrywide pattern of bargaining was the objective. The AFL leadership, including AFL President George Meany, was suspicious of the political leanings of CIO union leaders. It was not unusual for AFL leaders to associate the CIO with communism. American employers were well aware of the conflict between the two labor federations, and this unfortunate division in the crucial immediate postwar years contributed to the failure of Operation Dixie.

The CIO unions also had challenges with the message that they were conveying to southern workers. They emphasized the voice that workers could gain in the workplace through union membership, but they did not always suggest that southern workers would receive wages equal to those received by their counterparts in the North. This was perhaps a curious strategy, since workers were usually receptive to the idea that union membership would bring significant economic gains, and unions often emphasized that such gains could be had through unionization. Arguments in favor of workplace democracy and having a voice at work were consequently insufficient inducements to encourage more southern workers to challenge the obstacles that they faced and opt for membership in a CIO union.

While Operation Dixie officially lasted until 1953, its demise was evident by 1947. In that year Congress passed the Taft-Hartley Act. Among its provisions was Section 14b, which enabled individual states to pass right-to-work laws. Florida had passed such a

OPERATION DIXIE

law as early as 1944, but anti-unionism effectively became institutionalized in the South as successive southern states passed right-to-work legislation. The small gains that the TWUA made during the early stages of Operation Dixie were quickly diminished following the passage of Taft-Hartley. The CIO unions increasingly chose to devote organizing resources to states where there was a greater chance of success.

The failure of Operation Dixie had a major, long-term impact on the American labor movement. The South continued to be a low-wage, nonunion region in the years following the end of the organizing drive. Southern states consciously used this low-wage, nonunion status as a method of enticing northern employers to relocate to the South. This process was initially referred to in the South as Balancing Agriculture with Industry (BAWI), and it effectively drew industry to the South. The worst fears of the CIO were confirmed as well-paying, unionized jobs were lost to the southern states. Such unions as the United Auto Workers were ultimately affected by the failure of Operation Dixie, since new auto plants were eventually built in the South as employers, primarily auto manufacturers from other countries, sought to take advantage of the low wages and low union density in southern states.

The fact that the South continued to be a nonunion region meant that the labor movement was effectively constrained to a few states in the north and west. By the end of twentieth century, half of the union members lived in just over half-a-dozen states. The virtual exclusion of the unions from the South meant that they were not really a truly national movement but rather a regionally based movement that claimed a national mandate. This reality can be linked to the failure of Operation Dixie. Operation Dixie, though of relatively short duration, was consequently a moment of high but unrealized ambition for American labor.

ORDER OF UNITED AMERICAN MECHANICS

Founded in Philadelphia on July 8, 1845, the Order of United American Mechanics (OUAM) mixed trade union activism with moral reform and nativist politics. It sought to protect skilled workers' status and living standards by reinforcing mutual bonds between labor and small business and by combating foreign competition. The OUAM's links to evangelical moral reformers and political nativists undermined opportunities for cross-ethnic alliances among workers in the mid-nineteenth century.

The turn to nativism by American workingmen occurred as immigration from Ireland and Germany increased. In the industrializing cities of New England and the mid-Atlantic, immigrants competed for unskilled jobs in hauling and carting and in the sweatshops that cropped up next to traditional craft enterprises. By the mid-1840s, immigrants comprised a significant voting block in major cities. The OUAM fared best in large cities where sweatshops and immigration had visibly undermined the dominance of native-born craftsmen in work and politics.

The founders of the OUAM came from skilled crafts, such as carpentry and printing. They included several men, such as carpenter George F. Turner, who were active in the nativist American Republican party.

The American Republican party originated in 1843 in response to Catholic efforts to dilute Protestant religious instruction in the public schools. In the summer of 1844, Philadelphia experienced two riots against Irish Catholics. The riots grew out of the school controversy but also played on skilled workers' concerns about the role of immigrants in "de-skilling" the textile industry.

American Republicans exploited an anti-Irish backlash to win Philadelphia's 1844 municipal elections. American Republicans, like the later Know Nothing party, wanted to restrict immigrant-voting rights, lengthen the naturalization period, maintain Protestant ascendancy in public education, and otherwise curb the influence of Catholic immigrants in public life. Along with Philadelphia, American Republicans won elections in New York City and Boston, where they allied with the Whig party. American Republicans did best in Philadelphia, where they survived until the late 1840s.

Growing out of this surge in nativism, the OUAM restricted membership to American-born, white males aged 18 and up who belonged to productive trades. Those deemed nonproducers included merchants, bankers, and white-collar professionals. The order rejected foreign-born applicants and encouraged its members to boycott immigrant shops and the products of foreign labor.

Founded at Philadelphia's Jefferson Temperance Hall, the OUAM shared much in common with working-class evangelical reform organizations. Several OUAM founders also belonged to the Washingtonians, a workers' temperance organization that, unlike the more upper-class American Temperance Society, sought to reform hardened drinkers rather than outlaw alcohol entirely. Closely tied to evangelical churches, the Washingtonians and the OUAM tackled workers' insecurity over the decline of skills and living standards by encouraging sober habits and an industrious work ethic. Taking as its motto "honesty, industry, and sobriety," the OUAM penalized members for drinking, Sabbath breaking, patronizing brothels, swearing, and other perceived moral lapses. Members monitored each other's behavior and reported violations. The OUAM included liquor dealers in its category of nonproducers who were barred from membership. It also sponsored lectures and reading rooms for worker education. After the Civil War the OUAM's moral reformism, minus its nativism, found expression in the Knights of Labor.

The OUAM borrowed practices from an earlier nativist secret fraternity, the Society of Red Men, and from the Freemasons, to which several OUAM leaders belonged. The OUAM's initiation ceremony, elaborate rituals, and its sickness and burial plans resembled those of other voluntary societies. In its capacity as a trade union, secrecy helped protect OUAM members from anti-union employers and reinforced the solidarity needed to sustain strikes and boycotts.

Although it occasionally engaged in strikes, the OUAM emphasized the mutual interests between workers and businessmen, especially those uniting the masters of small workshops and skilled mechanics. Rather than conceive of labor as a class arrayed against capital, the OUAM thought of workers as members of a broad producing mass fighting self-seeking parasites who enriched themselves by violating ethical codes in the marketplace and politics. Encouraging members to restrict business to other members, or at the least to native-born businessmen, fit the producerist agenda of securing a fair return for labor and protecting avenues for advancement that

would enable wage earners to become independent proprietors in later life.

In 1845, the OUAM spread from Philadelphia to neighboring New Jersey and Delaware. Two years later it appeared in New York City. By 1850, the OUAM had at least 10,000 members in the Philadelphia area and claimed chapters throughout New England and the mid-Atlantic, with a total membership approaching 60,000.

In 1853, the order launched the Junior OUAM as a vehicle for training future members. Other offshoots included the Daughters of America, founded in 1875, and the Loyal Legion, a uniformed auxiliary, established in 1886.

Although never at the forefront of strikes, the OUAM supported turnouts by skilled workers. Among their most successful efforts was an 1853 strike for higher wages staged by 2,000 Baltimore ironworkers. Strikers affiliated with the OUAM staged rallies and organized pickets at those foundries refusing to increase pay. The OUAM chapters in other cities contributed to a strike fund that helped carry the day for Baltimore's iron molders.

The OUAM involvement came at the price of ethnic solidarity. Baltimore's German ironworkers, approximately one-third of the workforce, acted through a separate ethnic association and occasionally clashed with OUAM members. At the city's 1853 elections, temperance candidates who sympathized with the strikers and who practiced the OUAM's brand of moral reform won an upset victory. The next year the OUAM supported the nativist Know Nothing party as it swept to power in Baltimore, Philadelphia, and most other major American cities.

In the mid-1850s, the Know Nothings absorbed the energy of working-class nativists. Shortly thereafter nativism waned as sectionalism and free soil consumed workers' attention. Although the OUAM declined as an effective labor organization, it survived as an organization and overlapped with post-Civil War nativist societies.

**O'REILLY, LEONORA (FEBRUARY 16,
1870–APRIL 3, 1927)**
**Working Women's Society, Knights of Labor,
and Women's Trade Union League**

Leonora O'Reilly grew up in the last quarter of the nineteenth century on the Lower East Side of New York where she developed an activist spirit, became a member of the Socialist party, and dedicated her life to work for radical industrial reform. When O'Reilly was 1-year-old child, her father died. Her mother went to work in a factory, soon joining the Knights of Labor (KOL). At age 11 O'Reilly began working in a shirtwaist factory. In 1886, at 16 years of age, she also joined the KOL, becoming one of a small group of women who organized the Working Women's Society (WWS).

The WWS comprised both working-class and middle-class women seeking to improve the working conditions of laboring women. The members attempted to bridge their cross-class differences even as they focused their energies in different directions. The primary activity of the middle-class members was to educate female consumers and to influence them to buy goods produced by companies that paid their workers a fair wage. The work of the WWS laid the foundation for the National Consumers' League (founded in 1890). O'Reilly and the other working-class women in the WWS directed their efforts toward organizing workers, advancing protective legislation, and supporting strikes. O'Reilly did however take advantage of the educational and cultural opportunities offered by the middle-class members, including joining the Social Reform Club, a group comprising of upper-middle-class radicals who supported the labor movement. In 1894, several of these members, who were also associated with the Henry Street Settlement, offered O'Reilly the opportunity to stop working in the factory for a year to participate in settlement work.

At Henry Street, O'Reilly initiated a vocational skills program that she hoped would help younger girls avoid factory work. She taught girls in the settlement's model shirtwaist factory how to sew a complete garment and operated a cooperative where they could sell their results. The cooperative failed after a short time, unable to compete with the cheaper factory-produced clothing. O'Reilly completed a domestic arts degree at the Brooklyn Pratt Institute in 1900. For the next decade she taught sewing to garment workers, first at the Brooklyn settlement, Asacog House, and then at the Manhattan Trade School for Girls.

O'Reilly also worked to organize female laborers. In 1897, together with some of the Henry Street settlement reformers, she assisted female garment workers in forming the short-lived United Garment Workers' (UGW) Local 16. In 1903, O'Reilly joined the newly formed and American Federation of Labor (AFL)-affiliated Women's Trade Union League (WTUL) with the hope of continuing her organizing work.

O'Reilly, frustrated by the class tensions that plagued the WTUL throughout its existence, had a tumultuous relationship with the organization. The divisions over goals and strategies between the more conservative middle-class members and the more radical working-class members caused O'Reilly to resign for short periods on several occasions. Her initial dissatisfaction with the organization stemmed from her perception of its middle-class members' patronizing attitude toward female workers. She sought to change this dynamic by recruiting Asacog House reformer Mary Drier and her sister Margaret Drier (Robins) to join the league. Though both women were wealthy, O'Reilly believed they were true supporters of working women and the movement to organize. All three held leadership roles within the WTUL and helped shape its work.

O'Reilly worked earnestly for the WTUL for a dozen years. She served for a time as vice-president of the New York branch under Mary Drier and was one of the league's most dynamic speakers. For a number of years she traveled across the country, speaking for the cause of organized labor almost daily, including a talk at a mass meeting in support of the New York garment workers' strike in December 1909. After 146 workers died in the Triangle Shirtwaist Fire in 1911, O'Reilly served as chairman of the WTUL committee on fire protection, which conducted a study and made recommendations calling for the enactment and enforcement of laws to improve safety conditions in factories. In 1915, she served as the league's delegate to the International Congress of Women (ICW) meeting in The Hague, where she spoke about the experiences of female laborers. After her trip however, O'Reilly became frustrated with the class tensions within the league and with the male-dominated AFL's lack of support for the WTUL and female suffrage. As a result she reduced her involvement with the league.

O'Reilly had long coupled her work within the labor movement with agitations for female suffrage. As a Socialist she believed that giving workingwomen the vote would help to diminish the disparity of economic and political power in society. In 1907, she joined Harriot Stanton Blatch's newly formed

Equality League of Self-Supporting Women, established to persuade workingwomen to support female suffrage. She served as the league's first vice-president. Four years later in 1911, O'Reilly and WTUL colleague Rose Schneiderman organized the Wage-Earners' League for Women Suffrage (WELWS), creating a short-lived suffrage association that was exclusively comprised of workingwomen. O'Reilly served as its president.

While her health remained strong, O'Reilly was active in a number of social and political reform organizations during the early twentieth century. In 1909, she was one of the founders and first committee members of the National Association of Colored People. In 1914, she helped to establish the Industrial Section of the New York Woman Suffrage party as a cross-class alliance dedicated to female suffrage and trade unionism. O'Reilly served as its chair through 1916. The following year she worked for the Irish revolution. In 1919, she again served as the WTUL delegate to the ICW, this time held in Washington DC. During the congress Eleanor Roosevelt invited O'Reilly and the other U.S. delegates to lunch where they impressed Roosevelt with their views on labor reform. When O'Reilly's health began to fail in 1920, she retired from most public activity, though she did teach a course on the theory of the labor movement at the New School for Social Research in 1925.

O'Reilly died of heart disease at the age of 57.

ORGANIZED CRIME

The term organized crime refers to groups involved in criminal conspiracies marked by their scale of

complexity and their length of existence. The term is often used to describe the Italian-American mafia, but it also can refer to various other types of groups with a range of different ethnic backgrounds and types of structures, from outlaw motorcycle gangs to neighborhood street gangs. The nature of organized crime shifted dramatically in the 1920s, as a result of Prohibition and as the criminal gangs that emerged in that era began to assert influence over some union officials. The relationships that emerged between some union officials and organized crime figures were complex combinations of exploitation and cooperation. Certain unions operating in particular economic sectors were particularly prone to suffer from this kind of corruption. Finally the ability of organized crime groups to gain influence over some unions gave crime figures a new source of economic power and facilitated a range of profitable criminal activities.

The history of organized crime begins in the cities of the late 1800s and includes the activities of neighborhood-based street gangs, vice entrepreneurs, and political machines. Street gangs were loosely organized groups based on location and ethnicity. They had a fluid membership and a weak leadership structure. Though street gang members engaged in crime, much of it involved nonutilitarian violence, such as turf battles, whose goal was not profit but to demonstrate the toughness of the gang members. Another limitation of these groups stemmed from the fact that street gang members often moved on to other types of activity as they reached adulthood. Because of their nonprofit-centered focus, some have referred to street gangs as cultural gangs. Vice entrepreneurs in contrast engaged in relatively little violence and instead focused on profit-making crimes. They provided goods and services that were illegal but for which there still remained significant demand. Such victimless crimes, also known as moral crimes, have always been a central economic function of organized crime. Vice entrepreneurs ran houses of prostitution, gambling establishments, or provided illegal substances. They might hire individual members of street gangs for various kinds of tasks, such as debt collection or to work as bouncers, but the role of gang members in these enterprises remained limited. For vice entrepreneurs the main threat to their livelihood came from law enforcement, and so they paid protection to the police and by extension to the machine politicians who controlled the police. Thus this early form of organized crime, sometimes referred to as a syndicate of vice, was dominated by the machine politicians who played the dominant role. Essentially the machine politicians and the police levied an unofficial tax on the illegal activity of the vice entrepreneurs, who made payoffs in order to avoid arrest.

ORGANIZED CRIME

Prohibition (1920–1933) changed the dynamics of organized crime. The Eighteenth Amendment ratified in 1919 and enforced through the Volstead Act passed that same year made the production and sale of alcohol illegal. The law created a huge new illicit market in the United States, and liquor providers, known as bootleggers, proliferated. The profits involved in bootlegging also spurred a great deal of violence as groups and individuals struggled to control local markets in a lucrative business that stood outside existing avenues of legal adjudication. Prohibition created a new economic environment for organized crime.

It was the graduates of the street gangs, such men as Alphonse Capone, Arthur Flegenheimer (also known as Dutch Schultz), and Meyer Lansky, who proved most adept at seizing the opportunities offered by Prohibition. In an era of lawlessness and violence, they were specialists in violence, who created a new type of criminal gang. Unlike the street gang or cultural gang, these new criminal groups were profit-centered with a more permanent membership. Sometimes called entrepreneurial gangs, they strictly controlled nonutilitarian violence and maintained a more formal leadership structure. Ethnic divisions were often blurred; for instance Capone's gang included Jews, Italian-Americans, and even a prominent Welshman, Murray Humphreys, in a leadership position. After dominating the illegal alcohol market by driving out less-violent competitors, entrepreneurial gangs also came to demand protection payments from vice entrepreneurs. Before Prohibition vice entrepreneurs had paid politicians and police to avoid arrest; now they paid criminal gang leaders to avoid being killed. This kind of organized crime arrangement, where an entrepreneurial gang plays the pivotal role, is referred to as a syndicate of power. Violence or the threat of violence now gave the gangster the ability to tax illegal activity.

Capone's gang and others of its type established dominance over illegal activity in the territory that they controlled. The process of taxing and monitoring that illegal activity is referred to as licensing. Individuals engaged in illegal activity, from gambling to supplying illegal substances, cannot go to the police for protection, and so they are vulnerable to extortion by groups with a greater access to violence. But licensing also involves a form of extralegal governance. For instance a criminal gang provides a way to resolve disputes for parties who cannot turn to such conventional resources as the courts. These licensing arrangements can also involve protection from law enforcement. Often an entrepreneurial gang has established more effective relations with the civil authorities, perhaps through more consistent and larger payoffs than an individual illegal entrepreneur can

maintain. From the perspective of local law enforcement, it often makes sense to support a kind of long-term working arrangement with a group or an individual who can maintain order among illegal entrepreneurs. Thus someone engaged in illegal activity who seeks to avoid making licensing payments might face legal as well as extralegal punishment.

The Italian-American mafia represents a version of an entrepreneurial gang, and it emerged as a distinctly organized group during this Prohibition Era. The term mafia itself has its origins in Sicily, where it referred in general to a set of values that celebrated manliness and self-reliance. By the mid-1800s, men who were thought to embody those values and who established tightly knit groups of armed followers were known as *mafiosi*. In the lawless environment of Sicily, the *mafiosi* and their followers offered a form of protection and justice to the local population. Out of these groups emerged a secret society organization, the mafia, whose members took an oath of secrecy and pledged loyalty to their leader.

The term mafia began to appear more frequently in the United States at the turn of the twentieth century in Italian-American communities, where immigrants apparently recreated an organization that they had heard about in the old world. This early form of an Italian-American mafia was inward looking and traditionalist in outlook, dominated by conservative, older men, sometimes referred to as "mustache Petes." The opportunities provided by Prohibition helped change the character of this mafia, as a more Americanized generation took leadership positions in the mafia. In New York City for example Charles (Lucky) Luciano assumed control of the mafia after the death of two more traditionalist leaders in what was known as the Castellammarese War (1930–1931). Although born in Sicily, Luciano had come to the United States at the age of 10 and had acculturated to American society far more than previous mafia leaders. He also had strong connections outside the insular world of the Italian immigrant community; one of his closest associates was the Jewish organized crime figure Meyer Lansky.

Luciano changed the structure of the mafia in ways that facilitated profit-making criminal activity. Membership remained restricted to men of Italian descent, but the formal structure he created centered less on a celebration of traditional values and more on the need to avoid disputes and thus increase profits. Each mafia family was divided into several crews, each crew overseen by a *capo* or captain. Individual members of the crew developed a circle of associates and sought out whatever criminal opportunities they could. These members used their mafia status as a way to intimidate potential rivals and victims but also as a source for networks of potential, reliable contacts who could help

arrange more complicated schemes. The mafia's structure provided peaceful ways to adjudicate the inevitable disputes that emerged in such schemes and in this way protected their profit-making potential. In exchange a mafia member gave a share of his earnings to his *capo*, who in turn passed some of that share to the boss of the family.

A loose national structure for the mafia provided a way to facilitate even larger schemes. New York had five independent mafia families that co-existed, but in the rest of the country, there was one family per city. A group known as the Commission in New York helped coordinate endeavors involving different families from Cleveland to the East Coast. The Commission provided a peaceful way to adjudicate disputes that arose between families. The family based in Chicago, known as the Outfit, provided the same service for mafia organizations in the rest of the country. Periodically a national conference attended by mafia leaders from across the country would be held to address important issues. New York State Troopers stumbled on one such conference at Apalachin in 1957, and the publicity surrounding their discovery helped fuel public awareness about the mafia.

The mafia and other entrepreneurial gangs became involved in labor racketeering by the late 1920s. In Chicago, New York, and elsewhere some union officials described efforts by gangsters to gain control of their labor organizations through threats of violence. Vulnerable to kidnapping and assassination, with little hope of effective protection from the police, many union officials faced the choice of giving in to such threats or trying to fight back, and fighting back often involved making some kind of arrangement with a rival criminal gang. In Chicago for instance officials from the Teamsters and other unions facing threats from Capone's gang turned for help to another gang run by Roger Touhy. In New York City's garment district, locals in the Amalgamated Clothing Workers' Union made regular payments to a leading Jewish organized crime figure, Louis "Lepke" Buchalter.

But if some union leaders made deals with criminal gangs out of fear, others made arrangements with organized crime groups for more complex reasons. Testimony at criminal trials in the 1940s and much later highlights the ways in which some union officials turned to organized crime figures for support in organizing efforts and aid against political rivals in their own organizations. Roy Williams, president of the Teamsters from 1981–1983, cited many such benefits from his long relationship with the Kansas City *mafioso* Nick Civella. In such cases fear, ambition, respect, and a kind of friendship all might co-exist in a relationship that could span several decades. Perhaps

the best-known example of a union leader with mafia ties was James R. Hoffa, president of the Teamsters' Union from 1957–1971. An illegal FBI wiretap recorded his Detroit mafia contact, Anthony Giacalone, describing Hoffa less in terms of a victim than of an equal partner. "Listen, they ain't nobody sharp enough for Jimmy Hoffa. In this town or any other town. He's going to use everybody, every SOB in the world."

The influence of these organized crime groups has mostly been limited to particular unions in particular sectors of the economy. Typically organized crime has exercised a role in sectors marked by smaller, entrepreneurial firms, where the ease of entry for new firms had often brought fierce competition among the businesses. In these sectors there usually was a long history of corruption and collusion that predated the entry of organized crime. Unions whose jurisdictions cover such sectors suffered disproportionately from problems with corruption. This includes the four national unions, the Teamsters, the Laborers, the Longshoremens, and the Hotel and Restaurant Workers, which the President's Commission on Organized Crime (1983–1986) described as "substantially influenced and/or controlled by organized crime" (President's Commission, *The Edge*, 1986). However local unions operating in such sectors might be controlled by organized crime even if the national union to which they were affiliated maintained sterling reputations for honest, democratic administrations. For example organized crime groups allegedly controlled Local 102 of the International Ladies' Garment Workers' Union (ILGWU) in New York's Garment District even though its parent union championed anticorruption efforts in the American Federation of Labor (AFL).

Organized crime groups benefited in a number of ways from their ability to control some union leaders. Vincent Cafaro, a member of New York's Genovese Crime Family, explained to a Senate Committee in 1988, "We got our money from gambling, but our real power, our real strength came from the unions" (*Organized Crime 25 Years After Valachi*, 1988). In particular industries, such as construction or the garment trades, mafia control over some of the strategic unions gave organized crime figures an important economic niche. Companies with mafia connections could reap a number of competitive advantages by avoiding certain union restrictions. Or with mafia guidance, the unions could be used to enforce cartel arrangements that reserved the most lucrative business opportunities for certain companies. In New York in the 1980s, for example, a group of contractors with mafia ties monopolized concrete construction work worth \$2 million–\$15 million. Mafia-controlled union leaders ensured that if an outside company tried to take on one of

those jobs, it would suffer a range of crippling labor problems.

In addition organized crime groups found other ways to profit from their ability to control some union leaders. Sometimes union officials were required to pass on a share of their salaries to a mafia leader. In other cases money was drained out of union treasuries through a variety of devices, from no-show union jobs to padded bills and fake expense vouchers. New opportunities emerged with the proliferation of union pension plans and health benefits in the post-World War II Era. The ability to influence the management of those funds gave organized crime groups access both to new sources of revenue and potential investment capital. For instance the Teamsters' Union Central States Pension Fund made loans to individuals with mafia connections, and those individuals in turn gave mafia figures a share of the profits from their businesses. In one example money was skimmed from the daily take of several Las Vegas casinos that were built on the basis of such arrangements with Central States' Pension Fund loans.

O'SULLIVAN, MARY KENNEY (1864-1943) Cofounder, Women's Trade Union League

Mary Kenney O' Sullivan, a bookbinder, was the first female organizer for the American Federation of Labor (AFL), cofounder of the Women's Trade Union League (WTUL), and a factory inspector. O'Sullivan was born in Hannibal, Missouri, on January 8, 1864, the daughter of Irish immigrants, Michael Kenney, a railroad machinist, and Mary Kelly. She left school after the fourth grade and went to work as a dressmaker's apprentice. When she was 14, her father died, leaving O'Sullivan responsible for her invalid mother. She found work in a bookbindery, supporting both herself and her mother the next several years as they moved from Hannibal to Keokuk, Iowa, eventually settling in Chicago in the late 1880s.

In her unpublished autobiography, O'Sullivan makes clear her growing frustration with the conditions of labor faced by working women at the end of the nineteenth century. As in many skilled trades, improvements in technology allowed for the increased mechanization of bookbinding, thus increasing the employment of women. But like many women, as O'Sullivan became more skilled at her craft, she chafed at being relegated to the lesser skilled, lower paid jobs reserved for female employees in bookbinderies. Hoping to improve working conditions, O'Sullivan turned to trade unionism. She joined the Women's Federal Labor Union No. 2703, an AFL affiliate and was elected to the Chicago Trades and Labor Assembly. But there, too, O'Sullivan was frustrated as she confronted time and time again the ambivalence of many male trade unionists regarding the involvement of female workers in organized labor. Many male labor leaders advocated a family wage, claiming at the same time that women's increased participation in the workforce at lower wages drove down wages for all. But O'Sullivan knew that as the sole support of herself and her mother she was hardly atypical. She increasingly saw trade unionism for women as the remedy, arguing that the benefits of improved working conditions and higher wages for women could only improve conditions and wages for all workers.

However around 1890, when she formed the Women's Book Bindery Union No. 1, O'Sullivan found her greatest support in Chicago's growing social-reform community. A lifelong advocate of temperance, O'Sullivan was dismayed that the only place she could initially find to hold meetings for her fledging union was above a Chicago saloon. Jane Addams, cofounder of Chicago's legendary settlement

Hull-House, offered the young organizer meeting space as well as the money to print the first notices. Soon O'Sullivan and her mother moved into Hull-House, joining other working- and middle-class women in a cooperative housing venture known as the Jane Club. Within this supportive environment, she expanded her organizing efforts to include female garment makers as well as female bookbinders.

She soon came to the attention of AFL President Samuel Gompers, and in 1892 he hired O'Sullivan as the first female organizer for the AFL. After first organizing female collar makers in Troy, New York, she spent several months in Boston, Massachusetts, where she organized women in the shoe and garment industries and in the bookbinding trade. In Boston, as she had in Chicago, O'Sullivan quickly formed alliances with the male-dominated trade union movement, speaking before that city's Central Labor Union. She also found much support within the city's social reform community, particularly at Denison House, part of the College Settlement Association. Despite her commitment to trade unionism for women, O'Sullivan was nonetheless increasingly frustrated in her efforts to organize women. Social constraints of the day that deemed such activity as inappropriate hampered her work as did the continued ambivalence of many male labor leaders, and she was disappointed at the numbers of women she was able to organize. The AFL was disappointed, too, and 6 months after appointing her, decided it was not cost-effective to keep a female organizer in the field. O'Sullivan returned to Hull-House in Chicago and worked with social reformer Florence Kelley to secure passage of the 1893 Illinois Factory Bill that regulated the employment of women and children. Her 1894 marriage to local labor organizer and *Boston Globe* labor editor John O'Sullivan brought her back to Boston. Together the O'Sullivans had four children, one of whom died in infancy, and were active members in the Boston labor scene. O'Sullivan continued to focus on the organization of women and expanded her connections within the city's social-reform community, using both Denison House and the Women's Educational and Industrial Union, founded by middle- and upper-class women in 1878 to assist working women, as her bases of operation. Throughout the 1890s, O'Sullivan organized female shoe workers, garment workers, and weavers. However when her husband died in 1902, O'Sullivan had to support herself and her three young children, and she found work as the manager of a model tenement in Boston and as the director of a girls' summer camp sponsored by Denison House.

Even without the critical support of her husband, O'Sullivan was still determined to organize female workers into viable trade unions. In 1903, she and

several others came together at the annual AFL convention, held that year in Boston, and formed the WTUL, a cross-class alliance of trade unionists and social-reform workers, both men and women. The WTUL's stated mission was to organize female workers into existing trade unions, advocate for protective labor legislation, and provide education for female workers. Soon branches were established in Boston, New York, and Chicago. In its early years, O'Sullivan was secretary and vice-president of the National WTUL as well as a leader in the Boston branch. However this cross-class alliance was fraught with turmoil from the beginning, and O'Sullivan was soon dismayed both by the ever-present class tensions between the middle- and upper-class female allies and the working-class women and by the continued refusal of the AFL officially to recognize the WTUL. O'Sullivan resigned from the WTUL, primarily in response to that organization's refusal to support the 1912 Lawrence textile strike because the AFL had not sanctioned it. Two years later she became one of five female factory inspectors for the newly created Massachusetts Board of Labor and Industries, a post she held until 1934. She died on January 18, 1943 after a lifetime of working to improve the conditions of life and labor for workingwomen such as herself.

OWEN, ROBERT DALE (1801–1877) Worker's Rights Activist and Abolitionist

Born in 1801, in Glasgow, Scotland, Robert Dale Owen was the eldest son of noted Welsh textile magnate and social reformer Robert Owen, whose passion and originality regarding the uplift of the emerging industrial working class strongly influenced Robert Dale Owen's life and career. Educated at the New Lanark School his father had founded, as well as by

private tutors, Owen completed his education with 4 years of college-level work at the progressive school of Philipp Emanuel von Fellenberg in Hofwyl, Switzerland. He later credited his educational experiences at New Lanark and in Hofwyl for impressing on him the importance of education to any program of social reform.

Owen spent most of his adult life after 1825 in the United States and involved himself in political, communitarian, abolitionist, and other efforts to bring about reforms to capitalism and to ameliorate the harm it wrought on industrial workers. Owen was a leader of the Working Men's party in New York, an early feminist, a Democratic member of Congress, a diplomat, and an abolitionist. Owen largely retired from public life after the Civil War and died at his summer home in Lake George, New York, a year and 1 day after his second marriage.

Owen immigrated to the United States in 1825 and immediately began his career as an American reformer by helping his father create the Utopian community of New Harmony, Indiana. This communitarian experiment in cooperative production was based on the elder Owen's theories and experiences at New Lanark. New Harmony, only one of literally hundreds of such ventures during the nineteenth century, lasted until 1827, when it failed. At New Harmony Owen once again taught school, edited the *New Harmony Gazette*, and met the reformer and freethinker Frances Wright, with whom he enjoyed a close personal and professional partnership for some 10 years. After New Harmony Owen journeyed to Wright's Nashoba community, a Utopian experiment near Memphis, Tennessee, dedicated to racial equality and the emancipation of slaves. Following a brief return to Europe and a stint in New Harmony, Owen followed Wright to New York City and became the editor of the *Free Enquirer*, an anticlerical, free-thinking journal that he ran from 1828 to 1832. Like his father Owen had long disavowed religion; now, he argued against the institutions of church and marriage and in his book *Moral Physiology* promoted contraception, both as a way to relieve poverty and a means for the emancipation of women. Needless to say Owen became a *bête noire* of the conservative, evangelical establishment of the period.

Along with Wright, Owen soon became an intellectual leader of one faction of the Working Men's party of New York, through which he pressed his "state guardianship" plan for public education. In contrast to party founder Thomas Skidmore, who advocated radical measures to redistribute property, Owen urged the establishment of free boarding schools modeled after Hofwyl, where children of all classes would be educated in an atmosphere of social equality.

In addition to instruction in reading, writing, mathematics, history, and the like, Owen proposed that all students be trained in agriculture and a useful trade. This, Owen believed, would yield in the students an understanding of the dignity of labor and a reduction in class stratification. After the elections of 1829, when the Working Men won several races, Owen joined forces with two former Tammany Hall politicians, Noah Cook and Henry Guyon, to form an alliance that forced Skidmore out of the party. Much to Owen's chagrin, Cook and Guyon soon turned on him and ejected him from the party in 1830. This marked the end of Owen's participation in radical labor politics.

After a short stay in Europe, Owen returned to New Harmony, now a midwestern town rather than a Utopia, married, and began a reformist political career that lasted through the Civil War. Owen served three terms in the Indiana General Assembly, from 1835 to 1838, where he managed to secure increased funding for the state's public schools. After two unsuccessful campaigns, in 1842 he was elected to the U.S. House of Representatives as a Democrat and served in Congress from 1843 to 1847. While in Washington he drafted the bill for the founding of the Smithsonian Institution, and as a member of its organizing committee, he insisted that the institution engage in public education as well as scientific research. Elected to the Indiana Constitutional Convention in 1850, Owen played a key role in securing property rights for married women and widows and in the adoption of a common public school system. Returned to the Indiana Assembly in 1851, Owen introduced and succeeded in passing a state law liberalizing divorce in Indiana. In 1853, President Franklin Pierce appointed Owen as U.S. *chargé d'affaires* to the Kingdom of Naples.

After leaving that post and returning to the United States in 1858, Owen again took up the cause of working people and became a leading proponent of the abolition of slavery. His September 17, 1862, letter on the subject to Abraham Lincoln was credited by Treasury Secretary Salmon Chase as a key influence on the president's evolving thinking toward emancipation, which came a few days later. In 1863, Secretary of War Edwin Stanton appointed Owen chairman of the American Freedman's Inquiry Commission to investigate and report on the condition and prospects of the newly freed slaves. Owen's book, *The Wrong of Slavery*, was one result of that work. Though an abolitionist, Owen urged only gradual enfranchisement of the freed slaves and a reconstruction effort led by military officers that foreshadowed congressional reconstruction.

Though not himself a member of the working class, Owen's broad sympathies for the poor and exploited

were sincere and deeply felt. His reformist impulses, from advocacy of cooperative production to women's rights and emancipation, were consistently geared toward the amelioration of the living conditions of working people. His ideas regarding public education and feminism were especially prescient, and many of them became mainstream thinking in the decades after his death.

OXNARD STRIKE (1903)

The Oxnard Strike of 1903 was the first successful agricultural strike in southern California and was organized by the first biracial union in the state, the Japanese-Mexican Labor Association (JMLA). Following the strike the JMLA petitioned the American Federation of Labor (AFL) for a charter. The AFL issued the charter but forbade the union from admitting Asians. Refusing to join the AFL without their Japanese allies, the Mexican branch of the JMLA was denied AFL institutional support and soon disintegrated. Consequently the Oxnard Strike highlights the correlation between race and class in southern California's agricultural production, provides a window into European-Americans' distinct racial attitudes toward Japanese and Mexicans, and demonstrates that racial discrimination could divide workers within the American labor movement.

The town of Oxnard lies within Ventura County and was named after the entrepreneurs who established the American Beet Sugar Company (ABSC)

in 1898 and the Bank of Oxnard (1899), which loaned money to growers producing beets for the ABSC. Drawing first on Chinese and due to the Chinese Exclusion Act (1882), numerous Japanese and Mexican laborers, the ABSC refined nearly 200,000 tons of beets in 1903. Paralleling the rise of the beet industry was a class structure in which most racial minorities held undesirable occupations and earned little remuneration. Within Ventura County Euro-Americans owned 95% of the farms and held the highest paying labor positions; they were the only permanent workers within the sugar factory and tended to work as department heads, supervisors, and personal staff. Meanwhile 50% of Japanese and Mexicans and 65% of Chinese worked as farmhands, while another 18%–33% of these minorities worked as unskilled-laborers. Residential patterns further divided the lives of most Euro-Americans from racial minorities. Within Oxnard, Japanese and Mexicans tended to live in ethnic enclaves on the east side of town while German and Irish farmers and Jewish families lived on the west side. However while most minorities worked as laborers, a small but influential number of minorities were middle-class. Some of these minorities worked as labor contractors, obtaining workers for growers. In return for their services, minority contractors received a portion of their workforce's wages and thus profited from minority labor. Yet as a result of ethnoracial affinities, racial discrimination, residential separation, the correlation between contractors' and laborers' wages, and perhaps the influence of the Japanese Socialist Movement, minority contractors often demanded high rates of pay for their workforces.

Responding to these circumstances, the Bank of Oxnard, Bank of A. Levy, and the ABSC, organized the Western Agricultural Contracting Company (WACC) in 1902. Working with growers seeking to undercut minority contractors, by February of 1903, the WACC controlled 90% of the local labor contracts, reduced minority contractors' commissions, prevented contractors from negotiating directly with farmers, and required minority laborers to pay the WACC a contracting fee. In order to manage their diverse workforce, the WACC created a Japanese department under Inosuke Inose, a former contractor who managed a WACC affiliated store and held stock in the ABSC; and a Mexican department under Albert Espinosa, a skilled beet worker.

On February 11, 1903, roughly 500 Japanese and 200 Mexicans convened to form the JMLA. Composed of contractors, laborers, and Japanese students working as temporary laborers, the JMLA represented three segments of the agricultural workforce united against the WACC. Led by President Baba Kozaburo (a former labor contractor ousted

by the WACC); secretary of the Japanese branch, Y. Yamaguchi (a boarding student recruited from San Francisco); and secretary of the Mexican branch, J. M. Lizarras (perhaps a former labor contractor), the JMLA represented its biracial membership through its two branches, attention to linguistic needs (union meetings were multilingual), and creation of solidarity symbols (the union's emblem depicted a rising red sun, a pair of clasped hands, and the initials JMLA). Seeking to unseat the WACC, to bargain with farmers directly, and to raise wages, the JMLA agreed to stop working through the WACC and thus went on strike. By March hundreds of WACC laborers had defected to the JMLA, raising its membership to 1,200, about 90% of the agricultural workforce.

During the third week of March, the WACC facilitated the creation of a competing minority union, the Independent Agricultural Labor Union (IALU), which claimed to seek a congruent relationship between employers and employees. The IALU's board of directors included Inose and other influential Japanese residents who remained aligned with the WACC. Local newspapers, such as the *Daily Democrat*, commended the new union. To the JMLA's disdain, the IALU began recruiting workers on behalf of growers. Tensions erupted on March 23 when a group of JMLA workers attempted to place their union's emblem on an IALU caravan. Immediately after shots were fired from several directions, two Japanese and two Mexicans were hit; one Mexican, Luis Vasquez, was killed. Most local newspapers blamed the shooting on the JMLA. The *Los Angeles Times* suggested that Mexicans were the principal perpetrators of the violence. The JMLA issued a statement to the press claiming they had not been armed during the altercation, that WACC laborers were armed by local hardware stores, that no JMLA member had been arrested, and critiqued the police for failing to arrest the shooters. Only the *Oxnard Courier* and the *Los Angeles Herald* printed the statement; the *Times* refused.

After the shooting a Euro-American ranch owner was arrested for Vasquez's murder, tried, and after 2 days of contradictory testimonies, cleared of any wrongdoing. Incensed the JMLA's strike turned

militant. The JMLA unionists intimidated non-JMLA laborers and aggressively recruited others. By the end of March, the WACC, local growers, and the JMLA agreed to negotiate. Given the strength of the JMLA (their membership stood at 1,300; the WACC's at 60), after only a few days of debate, the JMLA gained control of over 5,000 acres of farmland, secured the right to negotiate with farmers directly, and obtained a minimum wage of \$5.00 per acre of beets (nearly double the WACC wage). On March 30, the strike ended. About 2 months later, Lizarras appealed to the AFL for a charter, inviting the most influential union in the United States to take a position on minority unionists. The AFL President Samuel Gompers granted the charter but stipulated that the union could not admit Asians. On June 8, the Mexican branch of the JMLA rejected the AFL's racist offer, exalted Japanese unionists, and stated they would accept only a racially inclusive charter committed to the abolition of racial discrimination. The Mexican branch never received this charter, and the JMLA later dissolved.

P

P-9 STRIKE

The pronounced downward slide of the U.S. labor movement that began with Ronald Reagan's firing of more than 10,000 striking members of the Professional Air Traffic Controllers Organization (PATCO) in the summer of 1981 has continued unabated for more than a quarter century. Declining in size, density, and influence, unions have appeared powerless to resist corporate decisions to close factories, outsource work, eliminate jobs, rewrite job descriptions, renege on pension commitments, increase workers' shares of health-care costs, slash wages, and more (or is it less?). Strikes have almost disappeared as an expression of workers' power, while unions' political clout is dismissed by Democrats and Republicans alike.

Alongside the PATCO disaster, for many commentators, the Austin, Minnesota, Hormel strike of 1985–1986 has come to symbolize these developments. In 1991, Barbara Koppel's film *American Dream* won the "Best Documentary" Academy Award, cementing the strike's iconic status. It told the story of how 1,700 workers, employed in a state-of-the-art plant by a profitable corporation untouched by foreign competition, were backed against a wall. Their refusal to knuckle under to their employer's demands for concessions led to a prolonged strike. When Hormel chose to re-open five months into the strike and the governor of Minnesota (a "pro-labor" Democrat) sent in the National Guard to breach the picket lines, the strike was broken. Faithful union members lost their jobs, their cars, their homes, even their families.

While this is all some commentators and filmmakers might see—or want audiences to see and students to learn—there was much more to the P-9 Strike that earns it its place in labor history. In the midst of the management push for concessions, what we can now recognize as the first stage of the corporate neo-liberal agenda, Hormel workers, members of United Food and Commercial Workers Union (UFCW) Local P-9 ("P" for "Packinghouse"), their families, and their supporters offered an embodiment of resistance, a living, breathing vision of a democratically controlled union, driven by its members, with a passionate commitment to justice, and a willingness to explore new, creative strategies and tactics. Inspired by their example, more than 3,000 local unions sent aid to P-9 and tens of thousands of activists made pilgrimages to Austin.

After having co-operated with Hormel management's demands for new job descriptions, payment systems, and chain speeds as the price for getting a new plant built in Austin in the late 1970s to early 1980s, P-9 members rediscovered their historical roots as the Independent Union of All Workers of the 1930s and drew their line in the sand when they were asked to accept a 23% pay cut. "If not now, when? If not here, where? If not us, who?" they asked. They reached out to their fellow meatpackers at seven other Hormel plants scattered around the country, they called on workers in other industries to support their campaign to bring labor solidarity and financial pressure (via a strategy developed by Ray Rogers and

his Corporate Campaign, Inc.) to bear on Hormel, and they called on each other to stand firm. Some became traveling speakers (the so-called road warriors), visiting unions, schools, and community organizations from coast to coast. Others made Christmas toys, wrote songs and poems, painted murals, walked miles on picket lines, and joined protests at other factories, in other communities, even in other countries. They found a stunning variety of ways to tell their stories, express their struggle for justice, and seek connection with other workers facing similar challenges.

And through it all, they learned about political economy, labor history, power, and most of all, about themselves.

Inspired by the P-9ers' examples, thousands of workers sent money, visited Austin, and committed to a boycott of Hormel products and the financial institutions that bankrolled the company. In 33 cities, they organized themselves into support committees. At some times, in some places, their networks of support were mobilized to help other workers in addition to the Hormel strikers. And at some times, in some places, encouraged by the Hormel strikers' example and emboldened by their new networks, they stood up to their own employers' demands for concessions and their own unions' insistence that resistance was futile. Rank-and-file militancy spread within many unions, taking a variety of forms—caucuses, election slates for local, even national, offices, new publications, and alliances with workers in other unions.

The United Food and Commercial Workers' national union leadership deepened its opposition to Local P-9 and its struggle. It urged meatpackers around the country to accept the necessity for a "controlled retreat," and as P-9's movement grew, so did the UFCW's determination that it had to nip this movement in the bud. It insisted that workers at other Hormel plants had to continue to work in the face of P-9's requests that they engage in sympathy strikes; they opposed the boycott of Hormel products; they urged unions that wanted to send aid to the strikers to send it to the national union rather than directly to the local or through one of the support committees; they did not organize political pressure on the governor of Minnesota when he began to consider sending in the National Guard. Finally, they put Local P-9 in trusteeship and called the strike off. Most important, they had signaled to Hormel from the outset of the conflict that if it could just outlast the local union, it would get to deal directly with the national union. With the support of other national union bureaucracies that also feared the threats posed by oppositional movements within their own organizations, the UFCW was able to strangle the movement that Local P-9 represented.

The defeat had high costs—the loss of jobs, pensions, homes, cars, and even families. But even in defeat, the P-9 strikers, the more than a thousand who had held firm, and their many supporters had written a chapter in labor history whose importance becomes clearer and clearer the more time passes. They demonstrated that the course of economic neoliberalism, with its skyrocketing inequality, terrifying insecurity, and competitive individualism, did not have to emerge out of Ronald Reagan's America. They showed that rank-and-file workers could run a democratic union; build a movement culture and a network of solidarity; threaten entrenched power in corporate boardrooms, state capitols, and union bureaucracies; educate themselves about the place of workingwomen and workingmen in U.S. history; and transform themselves into human beings for whom the idea that "an injury to one is an injury to all" could become a watchword for everyday life, even in the United States.

PACIFIC NORTHWEST

Work life in the Pacific Northwest in the nineteenth and early twentieth centuries was shaped by an economy based primarily on the production of a few basic commodities, geographical isolation from distant markets, and an enormous land area inhabited by a comparatively small non-Indian population that tended to concentrate its residence in a handful of urban areas. Even the largest population center, Portland, until surpassed by Seattle in 1910, was exceedingly small in comparison to San Francisco, Saint Louis, or Chicago. In 1880, at the beginning of a chaotic decade that witnessed dramatic expansion of the Pacific Northwest economy and the rising prominence of organized labor, Portland could boast of

8,000 residents (on a good day). That number compared to 149,000 residents for San Francisco, 299,000 for Chicago, and 310,000 for Saint Louis. In fact, the entire Pacific Northwest—Oregon, Washington, and Idaho combined—in 1880 had a population of just 282,000, or fewer people than resided in either Chicago or Saint Louis. It is little wonder that during its formative years, organized labor in the Pacific Northwest often marched to a different beat, one that might appear jarringly out of step with national trends and leadership.

Until completion of a northern transcontinental railroad in 1883 at last made long-distance travel relatively easy, the Pacific Northwest remained physically remote from the East Coast and Midwest and chronologically divergent from the nation's mainstream of history. When the nation's founders signed the Declaration of Independence in Philadelphia in July 1776, the Pacific Northwest remained a blank spot on the map of North America. Outsiders knew nothing about its high mountain ranges, dense coastal rain forests, and rolling interior plains. No one living in Europe or along America's East Coast could say whether woolly mammoths might still roam its bunchgrass prairies until the explorers Lewis and Clark entered the region in 1805 after a two-year trip from Saint Louis. Civil War battles had little direct impact on the Pacific Northwest or its sparsely populated landscape, though the region did welcome as new residents numerous refugees fleeing Missouri's own bitter guerrilla warfare.

To reach the Oregon Country during the decades of overland travel by wagon—from the 1840s through the 1860s—required four to six months of hard travel across the prairies and high mountains beyond the Mississippi River. The transcontinental railroad radically redefined the space separating the Pacific Northwest and Chicago or St. Louis to an easy journey of just five or six days, easy at least for affluent passengers easily able to afford a bed in a luxury sleeping car and dinner in the diner.

Driving the Pacific Northwest economy were the products of farm, forest, fishery, and mine. By contrast, local manufacturing, apart from the big-four industries, was of little importance economically. Commodities were god, beginning with the fur trade in the 1780s. Legions of fur traders and trappers revealed some of the treasures that Mother Nature had hidden within the Pacific Northwest, yet their contribution to settlement or economic development of the region was minimal at best. The men who depended wholly on Mother Nature to supply the commodity basic to their economic survival understood clearly that wilderness lands transformed into farms, ranches, and towns doomed any future

commerce in furs by forcing trappers and traders to retreat to an ever-shrinking wild domain. Thus, the fur trade belongs to the premodern regional economy that existed before the 1870s and 1880s and development of regional and transcontinental railroad connections.

From the 1880s until the 1930s, most jobs within the region involved harvesting grain and other products of farm and ranch, catching and canning fish, cutting and milling lumber, and digging and processing coal and various metals. Such jobs invariably placed a big premium on physical prowess and mobility and thus encouraged formation of a regional workforce composed to a large degree of itinerant single males who worked in gangs for a daily or weekly wage. The power of human muscle, rather than hard-won proficiency in a craft, was the attribute employers prized most. Most manual laborers acquired the needed dexterity on the job rather than through any formal program of apprenticeship or education. The number of workers engaged in skilled crafts was small by comparison.

It was not uncommon for an army of seasonal workers to follow the grain harvest across the rolling fields of eastern Oregon and Washington in late summer and then migrate to the busy wharves of Seattle and Portland to help load seagoing ships with grain and other commodities. Many men of muscle had no families and no permanent homes, other than the missions, flophouses, and saloons of the large cities in which they often spent the slack winter season. Hardscrabble mining towns and the meager timber camps located deep in the Northwest forests were often as isolated as the region's numerous sheep and cattle ranches, and a large portion of the population was seasonal and transient. Seattle in 1920 ranked at the top of the nation's list of cities of 25,000 or more with the greatest percentage of male residents. No wonder its shame (or badge of distinction) was a large, thriving, and notorious red-light district.

Child labor was never a serious problem in the Pacific Northwest, and that may have been related in part to the preponderance of adult males in the regional workforce, men who did not hesitate to prove their masculinity in a barroom brawl but feared and loathed the power of employers to reduce their wages by any number of tricks, including hiring child labor. Because the region's first intense phase of industrial development dated only from the 1880s, well after the East Coast and Midwest had begun flexing their bulging industrial muscle, organized workers and their territorial and state legislators were able to anticipate and address perceived mistakes made in the older states—but only to a limited degree and because so much work in the Pacific Northwest required far

more muscle than children possessed. Even with child labor laws and a few other basic labor regulations in place, life on the job in the Pacific Northwest was no better, and in some cases much worse, than in the states that industrialized earlier. Logging and mining, along with railroading, were three of the most dangerous industries anywhere—“more dangerous than war” was the way one scholar described the appalling rate of accidents and death in the Northwest timber industry.

A primary exception to a regional work life dominated by muscular and mobile males was the highly seasonal canning industry. During the summer fruit and vegetable harvest, the numerous canneries of the Willamette, Hood, Walla Walla, Yakima, and Wenatchee river valleys employed large numbers of women—workers prized less for their muscle power than for their manual dexterity and short-term availability. The same pattern defined the seasonal cannery work on the Columbia River, Pacific Coast, and Puget Sound required to process each year’s salmon catch. Again, these jobs required mainly manual dexterity and seasonal availability. The region’s early seafood canneries also employed Chinese males, who, beginning in the 1880s, were systematically excluded from jobs in most other Northwest industries.

The racial and ethnic composition of the Pacific Northwest workforce tended to fluctuate over time. Violent protests by Euro-American workers affiliated with the Knights of Labor in the 1880s dramatically reduced the number of Chinese males employed in Northwest industries. Many left the region to return to China or to seek a more congenial job climate in California, though some remained in domestic service or to grow plots of vegetables for sale to local purchasers. In the 1890s, Japanese workers migrated to the Northwest and found employment as maintenance-of-way workers on railroads, among other industrial jobs. Industrial workers in the twentieth century included immigrants from the Philippines and Mexico. Many of the first African-American workers in the Pacific Northwest were recruited from the East and Midwest as strikebreakers in coal camps that once dotted the foothills of the Cascades east of Seattle and Tacoma. As such, they often had to endure an ugly mix of racial prejudice and economic rage from Euro-American workers they displaced.

Organized labor in the Pacific Northwest tended to mirror the peculiarities and prejudices of the local workforce. Labor unions among locomotive engineers and other skilled workers dated back to the 1860s, but for the next two decades, they remained weak and confined largely to the region’s relatively small number of skilled workers, if they survived at all.

The decade of the 1880s witnessed the first large-scale unionization of workers in the Pacific Northwest. For a time, the Knights of Labor grew powerful and prominent, especially in the cities of Portland, Tacoma, Seattle, and Spokane. The local Knights built their imposing edifice primarily from the rotted timber of anti-Chinese prejudice. In mid-decade, the Knights’ regional leaders (who belonged to a secret West Coast radical organization) carefully orchestrated a campaign of violence that drove nearly a thousand Chinese residents out of Tacoma. It is unlikely that a single person of Chinese ancestry remained behind. The Knights sought, but failed, to do likewise in Seattle and Portland. Apart from their success in Tacoma and some of the outlying coal camps, the local Knights generated mostly bad publicity for themselves.

Out of the wreckage of the Knights of Labor’s debacle in the 1880s derived, nonetheless, some enduring features of the Northwest labor movement. Foremost was long-term bias against Asian workers. Second, and perhaps paradoxically, was a strain of economic and social idealism that influenced Northwest politics for decades—at least through the 1930s. In a related way, some disappointed but yet idealistic labor activists formed various socialist and anarchist utopian colonies on Puget Sound in the 1880s and 1890s. They believed that by example they could transform an ailing industrial society. Finally, the idea of organizing workers by industry at a time when the newly formed American Federation of Labor (AFL) promoted labor organization by craft remained very popular in the Pacific Northwest and led to numerous philosophical debates, if not outright clashes, among local labor activists.

There clearly was a tie between Knights of Labor idealism and activism in the mining region tributary to Spokane, Washington. In newly established metal mining camps east of Spokane and across the border in the rugged mountains of northern Idaho, conflict between mine labor and owners over wage reductions and worsening working conditions flared into open violence in 1892. In these isolated one-industry towns, as in the camps of the timber industry, conditions of life were harsh and employers ruled with iron-fisted autocracy. In such circumstances, workers sought economic security through exclusion of low-wage Asian labor and union membership and its promise of collective action. When violence in 1892 resulted in the jailing of local union leaders, they used their idle time in prison to organize a new regional union called the Western Federation of Miners. Later it became the International Union of Mine, Mill and Smelter Workers, or the Mine-Mill Union. But even after it merged with the United Steelworkers of America in

1967, many of its members never forgot that the Mine-Mill Union had been “born in jail.”

Because the number of craft workers remained low in the Northwest (with its emphasis on commodity production), skilled unions affiliated with the American Federation of Labor effectively ignored a large percentage of the region’s workforce. However, various industrial unions emerged from the wreckage of the Knights of Labor to address that need in the early twentieth century. By far, the most famous was the Industrial Workers of the World (IWW), organized in Chicago in 1905 by members of the Western Federation of Miners and other dissident industrial unions and federations.

Shaped by the rough-and-tumble world of commodity producers in the American West, the Industrial Workers of the World openly embraced radical solutions to the perceived ills of society and did not shy away from seeking to organize “the unorganizable”—the itinerant harvest hands, timber and sawmill workers, and any other vulnerable workers who supported its uncompromising mission to radically transform industrial society.

During the years from 1890s until the aftermath of World War I in the early 1920s, the Pacific Northwest witnessed several outbursts of industrial violence that tainted the way many people perceived organized labor. Twice in the 1890s, the Coeur d’Alene mining district of northern Idaho erupted in violence that resulted in military occupation and indiscriminate jailing of union leaders and their sympathizers. A violent postscript to the 1899 violence occurred in late 1905, when Harry Orchard assassinated the former Idaho governor Frank Steunenberg. When captured a few days later, Orchard claimed that top leaders of the Western Federation of Miners had hired him to retaliate for Steunenberg’s role in suppressing the 1899 violence. In a celebrated trial in Boise, the Idaho capital, the newly elected senator, William E. Borah, battled with the defense attorney Clarence Darrow. It became such a high-profile media event that even President Theodore Roosevelt weighed in with his opinions. In the end, Darrow won acquittal. Two of the defendants, Charles H. Moyer and George Pettibone, soon faded from public consciousness, but the third, William D. Haywood, who once worked as a metal miner in Silver City, Idaho, remained prominent as the leader of the Industrial Workers of the World, or Wobblies.

Industrial violence next erupted on the streets of Spokane in 1909, when Wobbly protesters engaged in illegal public speaking and were imprisoned. Soon, every train entering the city brought a fresh supply of speakers, and thereby the IWW flooded and overwhelmed the city’s jails. They focused their wrath on

the dishonest employment agencies in Spokane that found harvest jobs for itinerant workers but colluded with employers to keep a constant stream of workers churning through the system—all for a fee that enriched the agencies and their accomplices on the region’s farms and ranches.

The Washington legislature passed a law banning such practices, but it proved weak and poorly enforced. During World War I, the author Zane Grey visited the wheat fields of eastern Washington and wrote a potboiler called *The Desert of Wheat* that pits honest farmers against vile and incendiary Wobblies determined to undermine the nation’s fight against Germany and other enemy nations.

Even before Americans joined the fight in April 1917, anti-Wobbly violence boiled out of control in the sawmill town of Everett, Washington, in 1916. Again, on the occasion of the first anniversary of the end of the war, anti-Wobbly violence erupted in Centralia, Washington, in November 1919. Earlier that year, the Seattle General Strike of February 1919 had made the public edgy, and the “Centralia Massacre” further contributed to growing antilabor sentiment in the Pacific Northwest.

As elsewhere, the 1920s were lean years for organized workers in Washington, Oregon, and Idaho. The big-four industries loomed as large in the regional economy as ever, but something vital had changed when roads began to connect once isolated mine and timber camps to nearby cities and when itinerant harvest hands could purchase cheap used cars and motor to and from work. Apparently, to some workers “automobility” became an acceptable substitute for social mobility. The Wobbly message based on disinheritance seemed less compelling than before as workers were able to develop some semblance of family life where formerly that had been impossible. Throughout the 1920s, Wobblies still published updated versions of their little red songbook, and itinerants traveling by stealing aboard empty boxcars still gathered around hobo campfires to sing familiar refrains, but their numbers were shrinking because of the automobile and increasing miles of all-weather roads.

Because of its dependence on production of commodities sold to distant markets, the economy of the Pacific Northwest appeared to ride a roller coaster of boom and bust, one for which the operator was invisible or located in some faraway place. Maybe there was no operator. It was easy to think that way during the depression that lasted from 1893 to 1897, the worst the nation had ever experienced, or from 1929 to 1941, which was even worse.

During the widespread joblessness of the 1893 depression, workers of the Northwest found no

economic or social safety net in place to sustain them during the hard times. It was “survival of the fittest,” which sometimes meant relocating to the capacious shores of Puget Sound, building a hut of driftwood, and eating clams for free for the taking—for breakfast, lunch, and dinner. As one optimist phrased it, when the tide is out the table is set, though one worker claimed to have eaten so many clams he could feel the tide rise and fall in his stomach.

Other idled workers took a more direct approach and in Seattle, Tacoma, and Portland formed one of the industrial arms that organized around the United States in the spring of 1894. Popularly known as “Coxey’s Army” (for the original organizer in Ohio), the protest had elements of a media craze. But it had a serious side, too: to present a “petition in boots” to Congress on May 1, 1894, to urge members to pass legislation designed to put the jobless to work building good roads—something the nation greatly needed during the heyday of railroad domination of the means of transportation.

Coxey’s original army did march down Pennsylvania Avenue as promised, but police arrested him when he attempted to present his petition to Congress. Most of the armies from the West Coast never did reach the Capitol, though the one from Tacoma gave the nation a momentary scare when its weary members grew tired of walking and stole a train in Montana, racing off toward Capitol Hill with the United States Army in hot pursuit. Rounded up and herded into makeshift prison camps in Helena, the Montana capital, some determined members built rafts and attempted to continue down the Missouri River to achieve their original goal.

Nothing came of the Northwest’s Coxey protest, or did it? In 1944, on the fiftieth anniversary of his original protest, an elderly Jacob Coxey mounted the Capitol steps and finally read the petition he had been barred from presenting to Congress earlier. The document sounded both quaint and thoroughly dated. In the Northwest as elsewhere, the New Deal response to the Great Depression of the 1930s put the jobless to work building roads, beautifying parks, fighting insect infestations of the national forests, painting post office murals, and accomplishing a host of other assignments.

By far, the biggest New Deal projects were the building of the Bonneville and Grand Coulee dams on the Columbia River. These federal projects provided thousands of construction jobs and became showcases for the merits of managing the once wild river. The newly established Bonneville Power Administration hired the labor troubadour Woody Guthrie to compose a series of songs extolling the virtues of the big dams.

Organized labor, which struggled through the 1920s, gained a valuable boost in the 1930s from New Deal legislation that encouraged workers to organize. So many did organize that the House of Labor proved too small to contain both the craft and industrial unions, which had a strong base of support in the Pacific Northwest. A result was the formation of the Congress of Industrial Organizations (CIO). Labor rivalry and conflict erupted at several locations until the two overarching labor organizations resolved their differences and merged in 1954 as the AFL-CIO.

One of the most powerful leaders of an AFL union during the split was Dave Beck of Seattle, who rose with the trucking industry and the expanding network of good roads that fostered its growth to become the national head of the Teamsters’ Union. Alas, although Beck’s rapid rise gained him widespread fame as a tough and effective AFL union leader, his downfall was equally dramatic. He went to federal prison for income tax evasion in 1962.

At the end of the twentieth century and the start of the twenty-first, the industrial base of the Pacific Northwest looked dramatically different than it had a hundred years earlier: commodity production had been overshadowed by manufacturing, but not the region’s traditional manufacturing of heavy logging equipment and aircraft. Boeing, which rose to prominence as an aircraft manufacturer during the frenzied days of World War II production, continued to produce renowned aircraft, but by the 1990s, the Puget Sound region had become more clearly identified with Microsoft and its software programs than with Boeing’s jetliners. In fact, Boeing relocated its corporate headquarters from Seattle to Chicago in 2001.

This story had a parallel in the region’s once almighty timber industry. At various times during the twentieth century, both Oregon and Washington ranked as the nation’s top timber producers. Production remained high during the 1940s and 1950s, stimulated by World War II and the baby boom and the resulting new home construction afterward. Timber jobs were numerous and paid good wages. But then production leveled out before starting to decline. In a sign of things to come, one of the region’s top timber producers, Georgia-Pacific, relocated its headquarters from Portland to Atlanta in 1982, much as Boeing would do two decades later. Second- and third-growth trees matured faster in the moist, warm climate of the South—not to mention that unions were less powerful in the South than in the Pacific Northwest.

The 1980s were grim for timberworkers. Environmental restrictions made it more difficult and costly to harvest trees, and an economic slump and heightened competition from Canadian timber caused dozens of sawmills to close permanently—taking down with

them many a one-industry town. The mills that remained modernized with high-technology equipment (including lasers and computers) that greatly reduced the number of people needed to turn forest giants into two-by-fours.

It was the same story down on the farm in the 1980s. Where the annual grain harvest had once required two or three dozen itinerant harvest hands to run threshing machines, care for approximately 30 horses needed to pull each reaper, and then sack grain by hand, two or three people could do the job. The combine operator, usually the owner of the ranch, operated an air-conditioned, stereo-equipped machine, while one or two truck drivers (often teenagers eager for a good-paying summer job) drove the golden harvest to the local grain elevator.

In many places the traditional commodity-based economy simply vanished. Not a single fish cannery remained along the Columbia River. Once where dozens of them each year produced millions of cans of salmon to feed working people of Ireland, England, and many other distant places, not even the buildings remained. In some places only a few half-submerged pilings remained to mark the one-time site of busy production. The seafood industry, except for some small-scale shellfish canners, largely disappeared from the Pacific Northwest.

Gone, too, were the Cascade coal towns of Washington after a peak of production in 1919. Most of the once great silver mines of northern Idaho closed in the 1980s, and the former gritty smelter town of Kellogg struggled to re-invent itself as an Alpine ski resort to tap the almighty tourist dollar. With a Superfund site in the neighborhood, that would prove no easy sell.

Organized labor, which had been concentrated in traditional manufacturing industries, along with newer ones like Boeing, had yet to gain a real foothold among high-tech and tourist-industry workers that now accounted for a preponderance of Pacific Northwest jobs. Because organized labor tended to ally with the Democratic Party, the decline of its political clout was particularly dramatic in Idaho, which became perhaps the single most Republican state in the Union. The Democratic Party formerly found a congenial base in the state's once numerous mine and timber towns, but the currents of economic change eroded that base until scarcely a remnant remained.

At the turn of the twenty-first century, the Pacific Northwest still possessed two economies, as it had for at least two decades. The traditional commodity-producing and manufacturing economy in which organized labor once was strongest had declined at least since the early 1980s. At the same time, the

high-tech and tourist-based economy grew ever stronger, and here organized labor had yet to make significant inroads. Unless something dramatic changes, the future for organized labor in the Pacific Northwest should look like the immediate gloomy past

PAINE, THOMAS (1737–1809) Writer, Advocate for Democracy and Reform

Thomas Paine was one of the few leaders of America's founding generation who emerged out of and remained a hero for the Atlantic world's working class. Born in 1737 in Thetford, about 75 miles from London, the young Paine's formal education ended at the age of 12 when he followed his father into the staymaker's trade, making whalebone corsets for middle-class and aristocratic women. Paine briefly established his own shop in 1758, but when that failed, he spent most of the next 10 years working sporadically as a teacher, tax collector, and staymaker until he finally found steady work in 1768 as an excise officer in Lewes. Up until this point in his life, there is little evidence that Paine had engaged in any organized political activity.

That quickly changed when Paine joined the Headstrong Club in Lewes, a town with a tradition of political radicalism that extended back to the English Civil War of the 1640s. In this club, Paine was introduced to a tradition of English Republicanism that advocated sweeping reforms that would make the English government more representative and less corrupt. He became involved with the popular Wilkite movement in the late 1760s and wrote his first political pamphlet in 1772 calling for the rationalization of the system of excise collection. By 1774, however, his career as a budding reformer was cut short when he lost his job and declared bankruptcy. In the fall of 1774, he sought out Benjamin Franklin in London and secured his assistance in starting over again in the New World.

Soon after his arrival in Philadelphia, Paine found work editing the *Pennsylvania Magazine*, and through that employment he came into contact with a

flourishing and diverse community of political radicals. As the crisis with England intensified, a coalition of urban workers, Enlightenment scientists, and progressive-minded professionals took control of Pennsylvania's political system. These people found common cause in their opposition to British tyranny, and together they crafted a political persuasion that Paine would soon masterfully articulate in his first American pamphlet, *Common Sense*. In 1775 and 1776, the Philadelphia militia had been taken over by workingmen who radically democratized that institution. They insisted on electing their officers, and by making the hunting shirt their official uniform, they challenged the class hierarchies that had previously structured the militia's ranks. Paine's *Common Sense* echoed the anti-authoritarian populism of these militia men, sarcastically referring to the king as the "Royal Brute" and arguing that hereditary power often supplied "an ass for a lion." Many of Paine's working-class compatriots also took part in what historians have called "the artisan Enlightenment," a movement of self-educated workers who embraced the radical social implications of Newtonian science. Their study of science had taught them that the world operated according to a set of universal laws that any person, regardless of their social position, could discern through their faculties of reason. Where kings and aristocrats had traditionally claimed unique access to truth, an increasing number of Philadelphia's working people came to believe with Paine that the broad mass of the people, through their use of reason and common sense, could best generate the laws that governed their society. In a language that echoed the populist humor and assertiveness of the radicalized community around him, Paine's *Common Sense* funneled that community's resentments and aspirations into the growing movement for national independence.

Tom Paine's experiences during the War for Independence testify to the complexities of class in the late eighteenth century. Thanks in part to his support of the radically democratic Pennsylvania Constitution of 1776, Paine remained a hero for a patriot rank and file that appreciated his support for political measures that served their interests. And although the Patriot leadership class looked with suspicion upon the growing politicization of ordinary Americans, in the early years of the war, they embraced Paine as an effective spokesperson for their cause. At George Washington's request, for example, Paine wrote a stirring set of essays (*The Crisis Papers*) that strengthened public support for the war during those "times that try men's souls." By the 1780s, however, Paine's ability to bridge the leadership class and the patriot rank and file had dwindled. At the root of his political fall from grace lay an ideological divide between Paine and his

fellow Americans. Paine was unusual in the 1780s in that he endorsed both highly democratic political arrangements and free market economics. Most supporters of the free market were established leaders who resisted political democratization, while most supporters of a more participatory and inclusive political system advocated a "moral economy" that would use price controls and other economic restrictions to protect laborers from the vagaries of the market. Although Paine's 1780s amalgam of democracy and free market capitalism would become mainstream in America by the early nineteenth century, when he boarded a ship bound for England in 1787, he had ceased to be a major public figure.

Paine re-emerged on the world stage in 1790, when he wrote the *Rights of Man* (part 2 appeared in 1792) in defense of the revolution in France and in support of democratization in Britain. These pamphlets were perhaps the most widely read tracts of the 1790s, and the working-class political movements that emerged in Britain at this time embraced Paine as a leading spokesman for their cause. In part 2 of *Rights of Man*, Paine sketched out a plan for a welfare system that would supply pensions for elderly and injured workers as well as their widows. This plan was to be financed by a progressive tax system with a top tax rate of 100%. In 1794, Paine published the *Age of Reason*, a scathing attack on established religion that interpreted it as a way for elites to gain the allegiance and subservience of ordinary people. He followed this deist tract with his most radical piece, *Agrarian Justice*, which argued that commercial society had made poverty an increasingly "hereditary" state. To remedy this systemic inequality, Paine claimed that each person should have their natural right to property restored by the state in the form of monetary payments made to every person, male and female, when they reached the age of 21 and then for every year after they had reached the age of 50. Paine's unprecedented claim that this economic support from the government should be claimed as "a right" and not as a form of charity marked a major departure from his 1780s endorsement of the free market and gained him the admiration of working people throughout the Atlantic world.

Throughout the nineteenth century, various groups of American labor activists, freethinkers, and abolitionists joined together to commemorate his birthday and re-affirm their support for Paine's revolutionary ideas. Such supporters, however, were always a minority. His association with deism and the French Revolution earned him the powerful enmity of established leaders in both Europe and America. When he returned to America in 1802, he was pilloried in the press as the leader of an international conspiracy to

overthrow all religion, abolish private property, and destroy the American government. He was welcomed by a small community of Democrats in New York City, but the Americans who threw stones at his carriage as he rode through New Jersey best exemplified the extent to which the world's first self-proclaimed democracy had turned against the eighteenth century's most effective advocate of democratization.

PARSONS, ALBERT (1848–1887)

Albert R. Parsons was born in Alabama in 1848 to parents who had moved there from New England. Orphaned as a boy, he moved to Texas to live on his brother's ranch. He apprenticed as a printer and then talked his way into a Confederate cavalry unit after the Civil War started.

When it ended, Parsons returned to east Texas and started his own newspaper in Waco, which he used to advocate for the cause of the freedmen. In 1868, he began a dangerous career as a radical Republican politician and militia colonel until 1872, when Reconstruction effectively ended in Texas. In 1873, Parsons, who had wed a woman of color named Lucy, left Texas to ply his trade in Chicago.

The Texan found work as a printer at the *Chicago Times* and soon became interested in the controversy over unemployment relief; he decided that the city's socialists were valiantly fighting for the poor but were being excoriated by the press just as the Republicans had been condemned for advocating racial justice in Texas. This cause set Parsons on a course that would in the next decade make him an agitator of international renown until he was convicted and executed for being an accessory to the Haymarket bombing of May 4, 1886, an explosion that led to the deaths of seven police officers.

Albert Parsons began to win a hearing from Chicago's workers when he gave a stirring speech in July 23, 1877, a day before the great railroad strike erupted in Chicago.

His speech, calling for those in the "grand army of starvation" to join the "grand army of labor," was so

sensational that the newspapers and police blamed Parsons for the unrest and violence that followed the strike. Despite being fired, blacklisted, red-baited and threatened with lynching, Parsons persisted in his work, becoming the leading campaigner for the Workingmen's Party and the Socialistic Labor Party. Indeed, he believed he would have been elected to the city council as a socialist in 1879 but that he had been cheated out of office by a fraudulent count.

This experience was one of several that turned Parsons away from the electoral path to socialism. In 1881, he helped found the International Working People's Association after he had joined company with German immigrant revolutionaries like his fellow Chicagoan August Spies. In 1884, Parsons began to edit a paper called *Alarm* with his wife, Lucy—a paper that expressed the same call for social revolution and the same need for armed struggle Spies espoused in the German socialist publications he managed.

During the mid-1880s, Albert Parsons became a notorious agitator and orator in Chicago. His fame then spread to other Midwestern cities as well, where he was often asked to speak. By 1885, the Parsonses rejected the electoral path to socialism, embraced a homegrown brand of anarchism, and called for the use of guns and dynamite bombs in the coming struggle with the employers, the police, and the military.

At the same time, Parsons played an active role in the Knights of Labor and in various other movements aimed at organizing workers and gaining the eight-hour day. He viewed shorter hours as a reform the employers would never accept, but he also thought the demand had radical implications because the achievement of eight hours would offer workers the freedom to educate themselves and to conceive of a society based on co-operation instead of competition. Militant unions and a radical labor movement were essential in the process, as Parsons described it. Revolutionary workers' organizations would be the cells that would compose a new communal social organism without oppressive employers, laws, armies, and police forces.

In early 1886, Parsons emerged as a leading figure in the eight-hour strike movement that culminated on May 1 of that year and hit with the greatest force in Chicago. He had just returned to the city on May 4 when he was asked to speak at a rally called by the anarchists to protest the death of four strikers killed by the police the night before. He refused at first and then changed his mind. He delivered a rousing talk condemning the employers and the police and then left the area with his wife and children before the bomb exploded.

After the bombing, comrades persuaded Parsons to flee Chicago, fearing that he would be hunted down

and killed. He left for a two-month exile and then returned to Chicago to stand trial with the seven other anarchists accused of aiding and abetting the bombing. His lawyer, William Black, had convinced Parsons that he would be acquitted because no evidence connected him to the bombing. Black was wrong, however. Parsons was convicted of being an accessory to murder and sentenced to death.

In his final speech to the court, Parsons held forth for more than nine hours over a two-day period, offering a litany of complaints about his trial in particular and injustice in general. His words were published by his wife, Lucy, and circulated by anarchists and socialists around the world in working-class districts from Barcelona to Havana, where the name Albert Parsons became as well known as the names of Abraham Lincoln and John Brown.

While in prison, Parsons became a kind of celebrity, much quoted in the mainstream and labor press. His stature grew even greater when leading men in Illinois, believing Parsons was innocent of murder, urged him to beg the governor for clemency so that his sentence could be commuted to life in prison. But Parsons refused to serve jail time for a crime he had not committed—a stance that seemed heroic to many observers, especially to those active in the labor and radical movements of that time.

Albert Parsons was executed, along with three German comrades, on November 11, 1887, and buried next to them in Waldheim Cemetery outside of Chicago, a site that would become a hallowed one to radical pilgrims for decades afterward.

In the remaining years of her life, Lucy Parsons (who died in 1941) worked tirelessly to keep her husband's memory alive. During the Cold War years, Albert Parsons became a forgotten figure from a chapter in "labor's untold story" until the mid-1980s, when his story was revived and then featured in many historical studies, as well as in three plays and a novel.

PARSONS, LUCY (1853–1942) Anarchist

Lucy Parsons became the best-known anarchist speaker in the United States in the three decades after her husband, Albert, was executed in Chicago on November 11, 1887, for allegedly conspiring in a bombing plot that killed seven policemen in Chicago's Haymarket Square on May 4, 1886. During her husband's confinement on death row, Lucy Parsons traveled to cities all over the nation and spoke to many sympathetic labor groups; after his death, she traveled to England, where she was received like a celebrity by radical and union groups. In the next two decades, Parsons continued her speaking and publishing activities, reviving the memory of Albert Parsons and the four other anarchists executed for the bombing, men who came to be known as the Haymarket martyrs. In these years, only Emma Goldman rivaled Lucy Parsons's fame as an anarchist agitator and a champion of free speech.

Lucy Parsons said that she was born Lucy Gonzalez in 1853 to a Hispanic mother and a Creek Indian father and that she was raised on her uncle's ranch in Texas. However, neither her birth date nor her parentage can be confirmed, and it seems likely that Lucy was born on a plantation in Hill County, Texas, and that her mother was a slave of African descent.

In any case, it is clear that Parsons was living around Waco, Texas, during the violent years of federal reconstruction in that area and that she knew of atrocities committed against newly freed blacks. This is most likely the setting in which she met Albert Parsons, while he was active as a radical Republican fighting for the rights of emancipated blacks.

Albert Parsons and Lucy were married in Austin, Texas, in 1872. The couple left Texas the following year and settled on the North Side of Chicago, where she worked as a dressmaker.

During the last half of the 1870s, Albert Parsons became a noted labor organizer and socialist campaigner in Chicago, and during the early 1880s, as he moved toward revolutionary socialism and anarchism, Lucy joined him in a highly public career of radical education and agitation.

Soon after the birth of her first child, a boy, in 1879, Lucy plunged into organizing female workers in Chicago as an activist in the Working Women's Union, where she met other talented women organizers like Elizabeth Rodgers and Lizzie Swank. Lucy Parsons increased her involvement after she gave birth to daughter in 1881, the same year the International Working People's Association (IWPA) was formed by her husband and other social revolutionaries.

By 1884, Lucy Parsons was active in the Chicago IWPA's American Group while she wrote articles and helped her husband produce the paper *Alarm*, an ultramilitant publication in which the writers and editors advocated the use of force, including dynamite, as a means of abolishing what they called wage slavery. Indeed, she became an especially passionate advocate of "propaganda by deed"—the use of force by revolutionaries acting on behalf of the oppressed. Lucy Parsons was a prominent speaker at weekly rallies held by the IWPA, whose members called themselves anarchists, and in noisy street demonstrations such as the one on Thanksgiving Day in 1885, Parsons led a "poor people's march" into the neighborhoods of the wealthy shouting denunciations at the rich in the name of the hungry.

When the national movement for the eight-hour day gathered force in April 1886, Lucy Parsons joined the Chicago anarchists in mobilizing unskilled, immigrant workers into the anarchist-led bodies of the city's Central Labor Union. She was especially active in organizing the women workers in the sewing and tailoring shops of the North and West sides. Parsons was attending such a meeting on the night of May 4, 1886, when she and her husband left to go to Haymarket Square, where Albert was asked to address a crowd of workers assembled by the anarchists to protest the killing of four strikers by the police at the McCormick Works the night before. Lucy brought her two young children to the square that night and left together with Albert when he finished his speech and a rainstorm threatened. They were socializing in a nearby saloon when the bomb exploded on Desplaines Street and changed their lives forever.

Lucy Parsons's efforts to commemorate her husband's life and work took many tangible forms, including her publication of *The Life of Albert Parsons* and *Famous Speeches of the Haymarket Anarchists*, both widely disseminated around the world for 30 years after the anarchists' deaths on November 11, 1887, and her solicitation of funds for a monument on the grave site of Albert and his comrades in Waldheim Cemetery near Chicago, a memorial unveiled in 1893.

Parsons remained a militant anarchist until around 1900, at which point she no longer advocated the use

of force and joined other radicals who were attempting to create a revolutionary workers' movement based on nonviolent direct action.

For this reason, Parsons was a prominent speaker at the founding convention of the Industrial Workers of the World (IWW) in 1905. During the next decade, she was a prominent figure in the effort to gain free speech for workers and was arrested many times in her efforts to exercise that right.

During the 1920s, Parsons became active in the Communist Party's International Labor Defense group, taking up the cause of the radicals Sacco and Vanzetti. She lived to speak at the fiftieth anniversary of the anarchist hangings in 1937, when she connected those deaths to those of the 10 strikers killed by the Chicago police in the Memorial Day massacre earlier that year. Though blinded in her old age, Lucy became a revered figure to the radicals, organizing the new unions of the Congress of Industrial Organizations in Chicago during the late 1930s. On May Day, 1941, she waved to bystanders as she rode on a float constructed by the CIO Farm Equipment Workers Union. It would be her last May Day. She died on March 7, 1942, when her home caught fire. Lucy Parsons was buried next to her husband at Waldheim Cemetery.

PATERSON (NJ) SILK STRIKE (1913)

The 1913 Paterson, New Jersey, silk strike was the biggest and longest Paterson strike. Led by the Industrial Workers of the World (IWW), and aided by poets and artists from New York City, it demonstrated solidarity and discipline. The strike was a high-water mark of the pre-WWI American left, and its outcome contributed to the decline and breakup of the left.

The 1913 strike was one of a series by Paterson silk workers, stretching back to the 1880s and forward to the 1930s. Silk weavers, who constituted the majority

of the workforce in the silk industry, came from textile centers in Europe to Paterson, because the pay was better than in Europe. They brought pride in their craft with them, and experience in labor struggles and socialist and anarchist ideas.

Before 1913, strikes in Paterson were frequent and short. Typically, weavers in a shop would walk out, usually to protect their wages or working conditions. Sometimes, dyers helpers would shut down their plant, to raise wages. Occasionally, as in a 1894 ribbon weavers strike, a 1902 dyers helpers strike, and a 1912 broad-silk weavers strike, a whole branch would go on strike.

In 1913, for the first and last time in Paterson, the trades joined together. The silk workers had learned from their defeats in 1902 and 1912 that if they didn't stick together, they would lose. This lesson was re-inforced by IWW speakers—Elizabeth Gurley Flynn, Bill Haywood, and Carlo Tresca—who came to Paterson after a successful 1912 textile strike in Lawrence, Massachusetts.

The initial aim in 1913 was to defend the status quo in loom assignments. The Doherty mill had raised the number of looms assigned to each broad-silk weaver from two to four, and broad-silk weavers began the strike. When the dyers helpers joined, they brought an emphasis on an eight-hour day. Then the ribbon weavers also joined, to protest the tactics of the Paterson

municipal government in arresting IWW speakers and peaceful pickets.

Observers of the strike were amazed by the strikers' disciplined nonviolence, despite police provocations, which included over two thousand arrests and the closing of the strikers' meeting halls. Observers were also struck by the democratic spirit of the strike, the way strikers—including women—actively joined in decision making, rather than blindly following their local leaders or IWW speakers. Finally, observers were impressed by the solidarity among the different ethnic groups, the Italian, Jewish, German, and English silk workers.

The strike began on February 25; by mid-March, 23,000 silk workers (out of a total of 25,000) had joined the strike, and the silk mills and dye houses in Paterson were entirely shut down. But the larger Paterson silk mills and the dye houses had annexes in Pennsylvania. These annexes, which the manufacturers began building in the 1890s to escape the militancy of Paterson workers, enabled them to hold out in 1913, despite the fact that production was halted in Paterson. The Paterson silk workers and the IWW sent people to Pennsylvania to persuade local workers to strike. But the resulting strikes in Allentown and Hazelton were brief. The Paterson silk manufacturers, using the annexes in Pennsylvania, were able to limp through the strike.

Unable to win a quick victory, the Paterson strikers organized themselves for the long haul. Community organizations, especially the local chapters of the Sons of Italy and the (Jewish) Workmen's Circle, donated money and food. Socialists in New York and New Jersey aided the strike. With the help of the IWW, the strikers reached out to Greenwich Village writers and artists, who came to Paterson to see the strike and were moved by it. John Reed (later known for his coverage of the Bolshevik Revolution) came to Paterson and was arrested and sent to jail. Margaret Sanger (later known as the advocate of birth control) went to Hazleton and was also arrested and sent to jail. In Paterson, Sanger and Flynn talked birth control to the women strikers and the wives of the men strikers.

The most spectacular result of the cooperation between Paterson silk workers and New York artists was the Pageant of the Paterson Strike. The Pageant took place in Madison Square Garden on June 7. The Garden was sold out. There were 1,100 strikers who played themselves, the strikebreakers, and the police; many strikers, responding to Reed's questions, had previously helped develop the script. John Sloan, already famous as a painter of the "Ash Can" school, painted the backdrop, a giant silk mill. Robert Edmund Jones, later Eugene O'Neill's set designer, designed a center aisle through the audience, down which the strikers ran at the end of the first act, screaming, "Strike! Strike! Strike!"

The audience became passionately involved in the Pageant, and the press acknowledged its power. But in July, worn down by the long strike, silk workers began to return to work. The strike was lost. For the strikers, it was only a partial defeat. They succeeded in preventing the manufacturers from going ahead with four looms, and they lived to strike again, albeit in smaller numbers; in 1919, the weavers won an eight-hour day.

But left-wing supporters of the strike turned on each other after the 1913 defeat. Socialists blamed the IWW. The IWW, which had been on the rise in the eastern United States, was essentially finished there. Haywood and Flynn quarreled, with Flynn blaming the Pageant for the loss of the strike. Many historians have accepted her judgments. Others have argued that the Pageant succeeded in its original aim, which was to publicize the strike in New York, and that the strike was lost not because of the Pageant, but because the manufacturers, with their annexes in Pennsylvania, were even stronger than the strikers.

For a brief moment, in Paterson, the great hopeful energies of the strikers, the IWW, and the young radicals from the Village came together, creatively

and powerfully. Then, for Paterson and for the American left, the moment passed.

PATTERN BARGAINING

After a decade of massive organizing campaigns, the American labor movement emerged from World War II with secure national strongholds in the auto, steel, and meatpacking industries. Unions aspired to uniform bargaining standards with all the employers in each industry; recalcitrant employers in fragmented industries resisted. Thus, unions developed pattern bargaining as a hybrid strategy to enforce industry bargaining by presenting common contract demands at each company within an industry. Particularly in manufacturing, pattern bargaining became a defining feature of unions' collective identity, and the United Auto Workers (UAW) and the United Steelworkers (USW) waged strikes to "protect the pattern." But during the 1980s and 1990s, unions learned that the universal gains won during a flush economy could turn to collapsing dominoes of losses when ailing companies dragged down the pattern for entire industries.

Since the advent of collective bargaining in the United States, laborites had argued that unions could function as rationalizing agents in fragmented industries by harmonizing wages and work rules and forcing employers to co-ordinate with each other. Common contract standards would preclude ruinous wage undercutting as a competitive strategy for employers, and unionists hoped to help stabilize boom-and-bust cycles, particularly in industries like textiles and coal. In the 1930s, New Deal policy makers embraced this reasoning. The National Industrial Recovery Act (NIRA) created ad hoc industrial councils to set production, price, and wage standards, and a range of World War II-era federal agencies, from the National War Labor Board to the War

PATTERN BARGAINING

Manpower Commission, arbitrated disputes between unions and employers and promulgated shop-floor rules and wage settlements.

The apotheosis of this vision was multi-employer, industrywide bargaining. However, federal policy imposed industry bargaining only during crisis. American businesses, scarcely reconciled to New Deal legislation obliging them to recognize unions, tolerated industry bargaining but showed little interest in continuing it when federal mandates expired. A few industries stood out as exceptions: clothing manufacture, full-fashioned hosiery, and railroads sustained national bargaining between unions and industry associations for some years after World War II. The Teamsters came close to achieving a sectoral agreement. In 1964, solid organizing and strategic bargaining enabled the Teamsters to win a national master contract covering most motor freight carriers.

Thwarted at industry bargaining, unions came up with pattern bargaining. Obligated to deal bilaterally with individual employers, unions simply devised their own industry standards and then bargained for them. This required national co-ordination among locals and a centrally directed bargaining policy. To achieve a national pattern, unions generally selected the dominant firm in an industry as its target, negotiated the best possible settlement, and then turned to smaller competitors to insist acceptance of similar terms. The Steelworkers showed the way. After settling with industry leader U.S. Steel in 1937, the Steelworkers waged organizing campaigns at Little Steel firms like Bethlehem and Republic. After winning union recognition, the Steelworkers demanded and won similar contracts with Little Steel, in what came to be called "me-too" agreements. The potency of pattern bargaining is suggested by employers' efforts to ban it; in 1953, employers unsuccessfully lobbied to prohibit the practice in amendments to the Taft-Hartley Act. Congress of Industrial Organizations (CIO) unions embraced the tactic and pursued patterns in auto, rubber, farm equipment, aerospace, and meatpacking.

Features of pattern bargaining included master agreements with employers covering all plants and work locations; common expiration dates for each master contract; and successorship provisions binding the employer to include a union recognition covenant as a condition of sale for its plants and operations. Contracts generally required a master wage schedule, thus obviating regional wage variations. Unions needed strong centralized authority to enforce the pattern on locals; workers at a well-performing plant could be tempted to break off and bargain independently, while underperforming plants needed solidarity to sustain contract standards. Employers coordinated

closely as well, generally meeting privately to exchange notes and plot strategy, while maintaining a public façade of bilateral bargaining. Moreover, pattern bargaining required a high degree of unionization within an industry. By the 1960s, workers in auto and steel enjoyed a predictable cycle of steady contract improvements.

Pattern bargaining was most entrenched and sustained in auto and steel, with less durable instances in other mass production sectors like farm equipment and meatpacking. Workers in diverse industries adopted variants. Airline pilots established strong craft density within an incompletely unionized sector and achieved an industry pattern. New York City public unions representing workers from teachers to clerks to police officers formed a bargaining council to negotiate with the city and insist on the same percentage wage increase for all municipal workers.

As unionization rates nosedived across the economy beginning in the 1980s, the advantage in pattern bargaining shifted from unions to employers. In steel and auto, recession and overcapacity combined to bankrupt manufacturers, which promptly demanded contract concessions from their unions. Employers borrowed the unions' logic and insisted that concessions granted to one employer must be extended to all. Manufacturing unions faced a spiral of givebacks that dismantled contract edifices built over a generation. Further, the pattern disadvantaged entire industry sectors contending with nonunion competitors; thus, nonunion Japanese and European auto assembly plants in the United States all shared a widening competitive edge over Detroit's Big Three auto firms. In other sectors, different competitive pressures eroded union density and bargaining power. Deregulation of trucking swiftly produced a new low-cost nonunion trucking sector that undercut Teamster signatories and eviscerated the master freight agreement; in meatpacking, anti-union slaughterhouses gradually overtook the once dominant union firms. Janitors were a marked exception to the general decline. The Justice for Janitors campaign, launched in the late 1980s, systematically organized cleaning contractors in urban markets and, upon achieving market density, won marketwide agreements and in some cases forced contractors to bargain in industry associations.

PEONAGE

Peonage is a form of coerced labor that emerged in the southeastern United States after the emancipation of African-American slaves. The English term "peonage" originally derived from the Spanish *peon*, meaning foot soldier. Before being imported into the United States, peonage referred to a type of involuntary servitude based on a laborer's indebtedness to a creditor. This hybrid of free labor and chattel slavery was prevalent in European colonies in Latin America and the Philippines. In 1850, the first instances of such peonage arose in the United States with the conquering of the New Mexico territory at the end of the Mexican-American war.

After the Civil War ended in 1865, American peonage became most closely identified with the plight of indebted African-American farmworkers in the South. Although the Thirteenth Amendment to the U.S. Constitution outlawed slavery and involuntary servitude in 1865, white southerners attempted to return their former slaves to a system of labor as close to chattel slavery as possible. Southern legislatures passed so-called Black Codes to authorize peonage practices. Though varying by state, the Codes generally restricted the labor choices of freed slaves and ensured a steady labor force for southern landowners. They prohibited freedpeople from renting agricultural land and from working in nonagricultural trades. They also required blacks to carry written proof of lawful employment to avoid arrest for vagrancy. Although the federal Bureau of Freedmen, Refugees, and Abandoned Lands protected former slaves in many ways, its requirement that they sign yearly labor contracts with landowners who were often their former masters bolstered white power.

After Union military officials invalidated the Black Codes in late 1865 and early 1866, Congress passed a number of federal civil rights statutes and an antipeonage statute. Congress also proposed, and the states ratified, the Fourteenth Amendment in 1867 and the Fifteenth Amendment in 1870. A web of both social customs and racially neutral laws nonetheless emerged to strengthen involuntary servitude in the South. By

the late 1800s, a new system of labor had emerged. African-Americans seeking a modicum of autonomy rented land through sharecropper or tenant farmer agreements. Despite the improvement this represented over gang labor, the system remained oppressive as legal barriers severely hampered renters' profits. Losses fell disproportionately on tenants due to crop lien statutes, which funneled profits directly to pay white landlords and merchants who lent supplies. Sharecroppers, who paid landlords with shares of crops, had a more difficult time. Both tenants and sharecroppers were so indebted to landlords that crop profits did not even cover their debt, let alone the ability to forego additional loans.

Additional state legislation made it difficult for southern African-Americans to choose their employment freely. One common law among southern states prohibited an employer from enticing a laborer away from a job. Another—the criminal surety law—allowed courts to hire out African-Americans who failed to pay their fines. Employers had their own employees convicted of often trumped-up petty offenses in order to obtain cheap and guaranteed labor in return. Convict leasing, while not unconstitutional per se, was a publicly administered version of the surety system. Emigrant agent licensing laws required labor recruiters to pay exorbitant fees in southern states. By 1900, additional laws emerged to help entrench the peonage system. Modified contract labor laws made it a crime for a laborer to fraudulently sign and break a labor contract. Southern states inferred a fraudulent signing from the very act of breaking the contract.

In addition to labor-specific laws, many other laws encouraged peonage by curtailing the mobility of African-American workers. Hitchhiking laws, for example, forbade a free mode of transportation for workers to reach other sources of employment. Vagrancy laws afforded law enforcement considerable discretion to arrest African-Americans and put them to work.

The oppressive atmosphere in the South provided fertile ground for peonage and prevented simple legal solutions from eradicating the deeply rooted problem. In a society committed to defending white supremacy, southern landowners supported by white officials could effectively ignore federal laws that may have protected African-American laborers. By the 1890s, white southerners had largely disfranchised African-Americans, barring them from positions of power. White planters could also rely on rural isolation to prevent workers from discovering other sources of work and from asserting their legal rights. They could also resort to beatings, lynching, and property expropriation to instill fear in African-American laborers.

African-Americans attempted to escape their peon status by moving between farms or between states. They also resisted by shirking on loans, by resorting to violence, and by occasionally obtaining their own property. Legal challenges, however, were largely beyond their means.

Historians have long debated the extent of the southern peonage system in the late nineteenth century. Some argue that the tenant system did not operate to the detriment of African-Americans in some areas of the South. The evidence is clear, however, that a significant amount of agricultural peonage existed in the South before 1900. Peonage also flourished during this period in rural industries like turpentine, lumber, naval stores, and railroad construction.

The Progressive Campaign against Peonage

By the time the first public campaign against peonage emerged, the Thirteenth Amendment and the Peonage Act of 1867 had lain dormant for more than a quarter of a century. At the turn of the twentieth century, peonage caught the attention of American progressives bent on eradicating a bevy of social ills. Even as white progressives in both the North and the South tolerated increased white-on-black violence and the general deterioration of the status of African-Americans, they deemed peonage—with its overtones of chattel slavery—beyond the pale of a civilized nation.

In the North, a progressive press exposed the problem of peonage, portraying it as proof of the South's backward and pariah status. Progressives like Ray Stannard Baker wrote exposés on southern peonage, and Oswald Garrison Villard—grandson of the abolitionist William Lloyd Garrison—attacked peonage in the newspapers much as his grandfather had critiqued chattel slavery.

White southern liberals played critical roles in exposing Progressive Era peonage. Fred Cubberly, a Florida Commissioner, filed the first test case of the federal peonage statute. In Alabama, Erastus Parsons, the grandson of a former state governor, instituted habeas corpus proceedings to free a peon, and Judge Thomas Jones, a patrician former Alabama governor himself, impaneled a grand jury to investigate peonage.

In the African-American community, leaders united in their opposition to peonage despite differences on other issues. Even Booker T. Washington, usually seen as an accommodationist in contrast to such civil rights activists as W. E. B. DuBois, joined in

the antipeonage crusade. Washington secretly funded litigation and provided information about peonage practices to the northern press.

The federal government under President Theodore Roosevelt responded to public outcries against peonage with litigation. Not only was peonage the subject of much opprobrium, but it also enabled Roosevelt's Republican Justice Department to embarrass the largely Democratic white South. By 1905, the Justice Department had prosecuted more than 100 peonage cases.

The Justice Department's first test case reached the Supreme Court in 1905. Although *Clyatt v. United States* did not result in a conviction, the Court upheld as constitutional the Peonage Act of 1867. In 1911, *Bailey v. Alabama* struck down a contract labor law for violating the Thirteenth Amendment's prohibition on involuntary servitude. A third case, *United States v. Reynolds* in 1914, ruled unconstitutional Alabama's criminal surety system, whereby indigents convicted of misdemeanors were subject to criminal penalties if they ceased working for the sureties who had paid their fines.

Despite these decisions, the federal government ultimately did little to help black peons. Statutes limited the reach of federal law enforcement, as they only allowed for prosecutions of involuntary servitude based on debt. Although some state courts struck down laws facilitating peonage, other states took advantage of the narrowness of Supreme Court decisions to maintain peonage laws. Still other states, notably Florida and Georgia, defiantly repassed statutes virtually identical to those struck down. The juries of southern states were similarly recalcitrant. Almost always all white, most juries would refuse to convict local white planters of peonage.

Federal investigations after 1906 emphasized the plight of immigrants rather than that of blacks. Many immigrants were lured to the South by promises of high wages but found themselves in debt working as peons in railroad and turpentine camps. The United States sought to avert international embarrassment from these stories of European immigrants. Assistant Attorney General Charles Wells Russell and Mary Grace Quackenbos, a wealthy New York attorney and the first female special assistant U.S. attorney, traveled across the South to investigate peonage among immigrants.

Pressure from white southern congressmen contributed to the new emphasis on immigrants. These congressmen criticized the Justice Department's focus on African-American peonage in the South. Congress accordingly passed a bill calling for an investigation into nationwide peonage among immigrants.

The resulting Immigration Commission Report concluded that peonage had existed in the United States in 1907 but that it had largely been eliminated by 1911.

The belief that peonage was not a serious problem stemmed from two related impulses. The first, generally espoused by southerners, was that the South opposed peonage, viewing it as a vestige of the past and an outlier practice. The second was that, as a general matter, progressives in the North and South had faith in the power of public exposure. They believed changing public opinion—rather than battling to punish landowners—would easily end peonage. The Alabama judge Thomas Jones reflected this belief when he obtained several peonage convictions but gave light sentences and recommended pardons for some of the guilty.

Interwar Period

From the start of World War I through the 1920s, 1.5 million African-Americans escaped oppressive conditions in the rural South and headed to northern and southern cities. Their departure strengthened the resolve of many southern planters to retain remaining workers through oppressive peonage practices. Though peonage clearly endured in this environment after 1914, its exact scope was unknown. The remoteness of rural peonage practices made measuring the problem difficult. Although written complaints poured into the Department of Justice and the NAACP after 1909, isolated and often illiterate victims had difficulty making their complaints heard.

Sporadic exposés during the interwar period suggested the persistence of peonage across the South. The case of John Williams, the notorious “murder farmer” of Jasper County, Georgia, exposed a southern planter willing to murder laborers who might testify about peonage. Williams, who was sentenced to life in prison for the murder of an African-American laborer, inspired a former governor, Hugh Dorsey, to publish a pamphlet documenting a horrific picture of peonage across rural Georgia.

In another notorious incident, the federal government appeared to sponsor the establishment of peonage camps after the flooding of the Mississippi River in 1927. Camps providing shelter for those displaced by the flood forced African-American refugees to work on river levees and for white landowners. Secretary of Commerce Herbert Hoover and the Red Cross denied these allegations, which the NAACP documented through its own investigations.

During the Great Depression, farm mechanization and bankruptcies, a labor surplus, and federal agricultural policies decreased the need for farmworkers. Though peonage may have declined in the 1930s as a result, high-profile incidents of forced labor proved its existence. In Arkansas, Paul D. Peacher was charged in 1937 with slavery under an 1866 Slave Kidnapping Act for forcing 20 striking African-Americans to stay in jail-like conditions and work on his farm. Another infamous Depression-era case involved a Georgia farmer who chased escaped peons to Chicago in 1939. The African-American lawyer William Henry Huff interceded on behalf of the escaped peons. He created the Abolish Peonage Committee to publicize the case and pressure the federal government to prosecute. Ultimately, a federal judge threw out the charges against the farmer.

The World War II Campaign against Peonage

During World War II, southern planters renewed efforts to maintain coercive control over African-American laborers despite the many who fled north for lucrative industrial jobs. Landowners fearful of labor scarcity used coercion to force remaining workers to stay rather than higher wages to induce them to do so. As the rural South became less isolated, however, planters found it increasingly difficult to restrict worker movement and hide egregious practices from federal authorities.

Within this context, the federal government revitalized its antipeonage work. Building on the peonage and slave kidnapping statutes, the Thirteenth Amendment, and additional civil rights statutes, Justice Department lawyers in the newly established Civil Rights Section instituted numerous investigations. One particularly widespread incident occurred in 1942 on the United States Sugar Corporation’s Florida sugar plantations. The federal prosecution ultimately failed when an all-white grand jury refused to indict. As a general matter, the Civil Rights Section sought to expand the meaning of peonage under federal statutes to include cases that did not implicate a debt. Despite these efforts, the debt element of statutory peonage remained and limited some prosecutions.

The Supreme Court supported Justice Department efforts to eradicate peonage with its wartime decisions. In *Taylor v. Georgia* and *Pollock v. Williams*, the Court re-affirmed its 1911 decision striking down coercive contract laws. *United States v. Gaskin* ruled

that the arrest of a person with intent to force him into labor to repay a debt violates the Thirteenth Amendment, even if no labor is actually performed.

Other civil rights organizations contributed to federal efforts to end peonage during the 1940s. The Justice Department often received reports of peonage from groups that had conducted their own investigations. The Workers Defense League (WDL), for example, repeatedly exposed peonage in Florida, Texas, South Carolina, Georgia, and Tennessee. The NAACP also brought peonage complaints to the government's attention.

Peonage after World War II

Reports of peonage and federal prosecutions of the practice declined during the 1950s. Nevertheless, it is likely peonage changed in form rather than entirely disappeared. One sign that peonage persisted was the WDL's success in persuading the United Nations to create a Commission on Forced Labor. Another came in 1951, when a white social activist from Florida named Stetson Kennedy testified to that Commission about the problem of peonage in the United States.

Whatever the scope of the peonage problem since 1950, the types of victims and circumstances clearly changed. Peonage became more closely associated with immigrants, who generally replaced African-Americans as the poorest farmworkers. One study of peonage from 1961 to 1963 found the highest incidence in California, likely due to the prevalence of Mexican migrant labor in the state. The study also found incidents of peonage in 29 other states.

A tool used in this new type of peonage was the traditional one of the unconscionable labor contract. The United States government undertook to formalize the use of alien farmworkers in both the Bracero and H-2 workers programs. Despite these federal efforts, several exposés revealed the continued threat of peonage to foreign farmworkers. In 1961, Edward Murrow's CBS documentary titled *Harvest of Shame* focused national attention on the problem. In 1969, a *New Republic* article by Robert Coles and Harry Huge spotlighted peonage in Florida.

After the 1950s, peonage also changed by expanding to nonrural industries. Sweatshops, particularly in the garment industry, and prostitution rings became fertile ground for peonage and other forms of involuntary servitude. In the late 1980s, the Supreme Court clarified the definition of involuntary servitude under the Thirteenth Amendment. In *United States v. Kozminksy*, the Court said the law, though not requiring

a laborer to be indebted, did require an objective determination of coerced labor. The Justice Department continued to prosecute peonage and involuntary servitude under this definition into the twenty-first century. Newer laws protecting immigrants from peonage have augmented the federal government's ability to address the problem.

PERKINS, FRANCES (1880–1965) Department of Labor

Born in 1880, Frances Perkins attended Mount Holyoke College, graduating in 1902. After teaching for several years, the Boston native went to New York City in 1909 to study for a master's degree at Columbia University. Finishing her degree the next year, she joined the Consumers' League of New York, an organization devoted to raising labor standards for working women and children.

Perkins personally witnessed the Triangle Shirtwaist Factory fire on March 25, 1911, where 146 garment industry workers, mostly young, immigrant women, died trying to escape a factory fire. A determined Perkins went to work for the Factory Investigating Commission (FIC), created in June 1911 by the New York legislature to investigate working conditions in the state's manufacturing. While working for the Commission, Perkins became close friends with the FIC's two major political figures, State Senator Robert F. Wagner Sr. and State Assembly Majority Leader Alfred E. ("Al") Smith. Perkins also lobbied for the passage of a 54-hour workweek bill for New York's factory women workers, which became law in March 1912. These experiences convinced her that labor legislation constituted the most effective means of helping labor, although Perkins also supported trade unionism.

In 1919, the newly elected governor, Al Smith, appointed Perkins to New York's Industrial Commission. For the next 10 years (except from 1921 through 1923) Perkins gained invaluable experience overseeing New York's workers' compensation system, as well as mediating strikes.

When Franklin D. Roosevelt became Smith's successor in 1929, he appointed Perkins the state's first female industrial commissioner. Previously cool to Roosevelt because of his perceived superciliousness, a surprised Perkins soon formed a close working relationship with the new governor. She also provided subtle, but effective, assistance to reformers working

for a minimum wage bill for workingwomen in New York, which passed in early 1933. She also became a major critic of President Herbert Hoover's attempts to alleviate the growing depression and convinced Governor Roosevelt to form a governmental committee that sought to stabilize New York's unemployment situation.

Perkins became the first woman member of the U.S. cabinet when the newly elected President Franklin D. Roosevelt appointed her head of the nation's Department of Labor in March 1933. Confirmed by the Senate, Perkins faced widespread skepticism among both business and labor interests doubtful about a woman's ability to manage the nation's labor affairs. Within the next two years, however, Secretary Perkins won grudging admiration as an effective, if sometimes prickly, arbitrator between management and labor, helping to settle disputes in San Francisco and Minneapolis. Her attempt to reconcile skilled and unskilled laborers failed, however, and the American Federation of Labor (AFL) remained separate from the Congress of Industrial Organizations (CIO) until 1955.

While not directly involved with the Wagner Act, Perkins shepherded through Congress the passage of the Social Security Act of 1935 and the Walsh-Healey Public Contracts Act of 1936, which required federal contractors to meet minimum wage standards.

The passage of the 1938 Fair Labor Standards Act (FLSA) perhaps proved the most significant triumph for Perkins, since it provided the first federal floor wage requirements for workers in the United States. The secretary of labor prepared the groundwork for the FLSA by holding seven national minimum wage conferences from 1933 through 1937, which brought together business leaders, labor leaders, and government officials to discuss the issue. Perkins lobbied for the FLSA after President Roosevelt introduced the law to Congress in May 1937. A significant feature of the final bill, enacted in June 1938, gave the administration of the FLSA to Department of Labor officials.

Although organized labor never warmed to Perkins, business interests became increasingly hostile to her. When Perkins delayed the deportation of the controversial longshoremen leader Harry Bridges in 1938, the House Judiciary Committee considered a motion for impeachment. While Perkins testified before the Committee, the motion never reached Congress.

Perkins continued to serve as secretary of labor after President Roosevelt secured his third term in 1940. Her influence, however, diminished as President Roosevelt's tendency to create myriad administrative agencies during World War II meant that Perkins possessed little control over the United States'

wartime labor situation. The secretary of labor did ensure that labor standards established during the New Deal did not end.

Forced to resign by President Harry S Truman in July 1945, Perkins published her surprisingly balanced memoirs, *The Roosevelt I Knew*, the next year. The former cabinet officer continued her active career, most notably teaching at Cornell University's School of Labor and Industrial Relations until her death in 1965.

PERLMAN, SELIG (1888–1959) Labor Intellectual

Best known to labor historians for his collaboration with his mentor, John R. Commons, on the classic *The History of Labour in the United States* (1918), Selig Perlman emerged from Jewish immigrant origins to become one of the most influential labor intellectuals of the early twentieth century. Born to a small merchant family in Bialystock, Russia, Perlman passed from Jewish day school to a Russian gymnasium to a brief period studying medicine with other politically radical Russian émigrés in Italy before a fortuitous connection with the visiting American socialist, William English Walling, provided the invitation to emigrate to the United States and, shortly thereafter, enroll at the University of Wisconsin.

Combining a sharp-edged theoretical disposition with a commitment to empirical research, Perlman soon substantially advanced contemporary understandings of the workers' movement in America and elsewhere. His undergraduate thesis, "History of Socialism in Milwaukee," completed after one year of coursework, reflected an initial continuity of intellectual and political commitments. Espousing the revisionist "opportunism" of Eduard Bernstein, Perlman extolled Victor Berger and the Milwaukee socialists for the triumph of "realism" over "revolutionism" in labor and political circles. Pursuing graduate training at Wisconsin under Commons and Richard T. Ely, Perlman assimilated Commons's emphasis on the role of marketplace forces (as opposed to class conflict at

the point of production) as influences on workers' behavior. His dissertation, published as the last part of volume two of Commons' *History of Labour* (1918), emphasized the skilled worker's view of job control as a kind of property right. Next, Perlman's *A History of Trade Unionism in the United States* (1922), begun as an update of Ely's *The Labor Movement in America* (1886), continued this emphasis on trade unionism as a worker's form of market protection. Rather than contending over ownership of the means of production, Perlman insinuated, American workers sought to insulate themselves from cheap goods and cheap labor through the power of collective bargaining agreements.

Ultimately ensconced in his own teaching position at the University of Wisconsin's economics department and School for Workers, Perlman produced his most influential work, *A Theory of the Labor Movement* (1928). At once offering a summary historical reflection on worker movements in Russia, Germany, and Britain, as well as the United States, Perlman here developed the concept of "job consciousness—with a limited objective of wage and job control" as the characteristic way that American labor, in contradistinction to European "class consciousness," defended workers' economic security. The reasons that a European-style "class consciousness" continually failed to take root in the United States, enumerated Perlman, included the mobility of the wage-earning class, with outlets both in the "West" and in lower-level managerial positions; early access of workers to the ballot and identification with the larger public; and massive immigration, making for "the most heterogeneous laboring class in existence" (pp. 165–169). Another prominent theme of *A Theory* was Perlman's pointed reflection on the continual struggle of "organic labor" against "dominance by the intellectuals." Instead of an American exceptionalism, à la Werner Sombart, Perlman's intellectual-versus-worker paradigm implied a "Soviet" exceptionalism, with "backward" Russia the one country where the "will to power" of intellectuals within the workers' movement had prevailed. Outside the Soviet Union, he argued, built-in tensions between the two social groups persisted (with intellectuals weakest of all in the United States), but the trade unionists, mature and well-organized, tended increasingly to shape both industrial and political action in their own pragmatic, nonrevolutionary image. Perlman's personal experience had likely made him particularly aware of the social standing and role of the intellectual. An outsider both as an immigrant and a Jew to American academic culture, he also enjoyed relatively little direct contact with the American labor organizations—let alone the ordinary workers—he wrote about. In the circumstances, his

assimilation of American pragmatism (one combined with a particular reading of Jewish law) likely led him to a mistrust of all abstract faiths and utopian political projections. Always conscious of the anti-Semitic slights around him, in his later years, Perlman turned his focus to the plight of European Jews, and, but for health reasons, would have accepted a chair at Hebrew University of Jerusalem in the mid-1950s.

PERSONNEL MANAGEMENT

Broadly conceived, personnel management encompasses any effort by supervisors to direct employees, but the term is largely associated with the maturation of industrial capitalism and construction of formal employee policies. It involved the establishment of specialized activities within public and private institutions, which created rules and procedures for employee relations, including hiring, training, promotion, discipline, and dismissal. In the mid- to late nineteenth century, business firms blended informal employee relations practices with more formal employee policies, often relying on both personal decisions and impersonal rules to govern employees. By 1880, specialized personnel offices and staff positions began to appear in large corporate entities, such as John Wanamaker's department store, but few businesses followed suit until the 1910s and 1920s, and many of these offices remained small. Narrowly conceived, they often focused on record keeping. In 1883, the Pendleton Act created the U.S. Civil Service Commission to oversee implementation of a merit system in the federal government. Although hiring remained decentralized within agencies, the commission became the government's central personnel agency. During the Great Depression, the establishment of specialized personnel offices accelerated—perhaps in response to the expansion of unions—both in the public and private sector. One study estimated that the number of personnel departments doubled in companies employing more than 250 people between 1929 and 1935, and the Department of Agriculture established the first federal department personnel office in 1925, with

many agencies following in the 1930s. By 1939, the federal government had a Council of Personnel Administration consisting of agency personnel directors who discussed common issues, such as union relations, and sought to unify personnel practices.

Scholars offer myriad explanations for the creation of personnel administration. For some, the emergence of this field is largely a function of size; as organizations, especially corporations, grew larger and more complex, firm owners sought ways to standardize employee relations practices, standardizing them across far-flung divisions. Often drawing on theories articulated by the sociologist Max Weber, this view stressed the way that bureaucracies—with their functional division of labor, hierarchical organization, and impersonal rules—became the most efficient way of conducting business. Explanations placing more emphasis on human agency and internal pressures focused on the role that middle-level managers played in creating new functions as a means of expanding career options and their professional authority. Scholars influenced by Marxism argued that the emergence of personnel administration reflected a management effort to assert greater control and discipline over labor, particularly as a means of combating high employee turnover rates in the early twentieth century, strikes, and union power. Turning this interpretation on its head, some students of personnel management maintained that unionization and collective bargaining, with its reliance on contracts and rules, encouraged management to adopt more formal personnel management procedures. Harkening back to a Weberian model, those who attempted to blend these two interpretations suggested that both managers and workers desired a more predictable environment based on standard employee procedures and policies. Finally, some more politically inclined scholars asserted that government regulations and legislation, such as affirmative action, led firms and public agencies to develop personnel offices to administer these regulations.

Scientific Management, Welfare Work, and Gender

As an occupation, personnel management has strong ties to Progressive Era movements and deep roots in engineering and social welfare work. Like many Progressive Era reformers, some early personnel management proponents valued technical expertise, efficiency, and standardization. While others in the field prized these concepts, and demonstrated a characteristic Progressive proclivity to support intervention,

they were equally influenced by moral concerns. They conceived of personnel management as an opportunity to humanize industrial capitalism and improve the life of workers by stressing the personal, over technocratic, aspects of personnel work.

Frederick W. Taylor's influential scientific management theories, and the movement spawned by them, contributed to the early formation of a technically oriented form of personnel work. Drawing on the new field of engineering and its foundation in mathematics and emphasis on scientific method, Taylor and his followers sought to increase worker efficiency through the application of scientific principles to the management of labor. While not specifically designed for personnel management, Taylor's theories nonetheless encouraged devotees to apply scientific management to employee relations. Harlow Person, for instance, a member of the Society to Promote the Science of Management (renamed the Taylor Society after Taylor's death), devised the first college course for employment managers, offering it at Dartmouth College's Amos Tuck School of Administration and Finance in 1915. Frank and Lillian Gilbreth, members of the American Society of Mechanical Engineers and two founders of the Society to Promote the Science of Management, conducted experiments on how to reduce worker fatigue and increase productivity. One company, Plimpton Press, which had introduced Taylorism into its workplace, established a separate employment department in 1910 with Jane C. Williams as its manager. Her department had multiple responsibilities ranging from matching workers to appropriate jobs, training, orientation, and grievance work to maintaining a library, offering financial advice, and providing a lunchroom. These developments coalesced into an employment management movement, which gathered force in the 1910s and initially stressed the need to match workers' mental and physical traits with appropriate jobs.

Williams's diverse tasks suggested the welfare roots of personnel management. Sometimes referred to as "industrial betterment," this movement attracted reformers eager to soften the industrial experience. At times influenced by the Social Gospel movement, proponents focused on improving the lives and raising the morale of workers. To this end, they favored the implementation of recreation, health, and educational programs and the establishment of other employee services, such as dining rooms. Usually labeled welfare departments or offices, their heads perceived themselves as operating between line and staff positions and as mediators balancing the needs of management and workers. The National Cash Register Company established the first recorded welfare office

in 1897, with Lena H. Tracy as its head. Several other large companies, such as Filene's Department Store, Westinghouse Electric, and H. J. Heinz Co., subsequently created their own offices. A study by the National Civic Federation reported 2,500 firms with welfare offices by 1914, many of them headed by women. At about the same time, the term "employment management" began to replace the phrase "welfare work."

Notably, personnel work offered women access to white-collar managerial positions. Usually referred to as social or welfare secretaries, women who ran welfare offices frequently had backgrounds in vocational guidance, social reform, and teaching. Other women came to personnel administration through training in psychology. Lillian Gilbreth, for example, became an early advocate of applying psychology to management. Like Gilbreth, Person supported the blending of social and behavioral sciences, especially the emerging field of industrial psychology, with scientific management and its engineering emphasis.

Industrial psychology, pioneered by Hugo Münsterberg, who came to Harvard from Germany in 1892, suggested that mental tests could match the best person with the best job and that an ideal psychological environment could increase worker output. During World War I, the federal government significantly supported this program by hiring psychologists, such as Walter Dill Scott, who developed intelligence and occupation aptitude tests for both the military and industry.

This reliance on psychology served as a bridge between the hard scientific basis of personnel administration and its softer origins in welfare reform, a split that further revealed the gendered dimension of personnel work. Both men and women acted as proponents of the scientific and welfare versions of personnel management, but men and a masculine discourse generally dominated the scientific management movement, and women and a feminine discourse tended to be more prominent in welfare reform efforts. Scientific management's emphasis on rationality and efficiency was portrayed in masculine terms and contrasted to the more feminine versions of employee welfare work, which was conveyed as focusing on emotional well-being. Tensions over the masculine and feminine forms of personnel management, including ongoing efforts of women to break into management careers dominated by men and equally powerful attempts by managers to make the field more manly as a means of gaining professional legitimacy, led to significant fragmentation of the personnel movement in the early twentieth century. It also suggested the struggle this field and its

practitioners faced as it attempted to build professional authority.

Professionalization

In a sign of the field's desire to carve out a specific identity and to professionalize, employment management associations and journals began to appear in the 1910s. The National Association of Corporation Schools (NACS), created in 1913, became the first national organization to examine personnel management explicitly. It began publishing a bulletin in 1914. In 1922, NACS merged with the National Association of Employment Managers, to form the National Personnel Association, which eventually became the American Management Association (AMA). Ostensibly a neutral, professional organization, the AMA nonetheless had strong ties to large corporations, such as Standard Oil, DuPont, and General Electric, and in the 1920s showed a distinctively anti-union bias. Its journal underwent several name changes, calling itself *Personnel Administration*, *Personnel*, and finally *HR Focus* in 1991. In 1919, many of the same companies associated with AMA had organized a Special Conference Committee, chaired by the former personnel director for Standard Oil, to coordinate personnel policies and labor relations activities. A few years later, they formed the Personnel Research Federation to promote industrial psychology. The Federation's *Personnel Journal* (formerly the *Journal of Personnel Research*) was published until 1996. Although none of these associations called overtly for the hostile suppression of unions, they promoted employee representation plans, such as company unions, with a clear aim to undermine worker support for labor organizations.

In the public sector, managers, who generally did not deal with the same union issues as their private-sector counterparts, had their own professional organizations and journals. Public personnel managers tended to join the Society for Personnel Administration, which published *Personnel Administration*, starting in 1938. In 1972, the journal merged with *Public Personnel Review* to become *Public Personnel Management*. By the 1940s, journals with the term "human relations" in the title began to appear, and in the 1980s, "human resources" became more prevalent.

The human relations school of management, which many personnel administrators eagerly embraced in the 1930s and 1940s, provided personnel work with closer ties to the academy and cemented personnel management to the social and behavioral sciences.

It emerged from a series of experiments conducted by the Harvard sociologist Elton Mayo and others at Western Electric's Hawthorne plant in the 1920s. These experiments reflected the increased attention paid to management issues by academics and the desire by many in the field to marry psychology and sociology to personnel administration. Drawn to the writings of the German sociologist Emile Durkheim, Mayo believed that organizations should be viewed as social systems in which individual problems and group dynamics could easily undermine morale, and hence productivity. Supervisors therefore needed to recognize that worker behavior was often guided by emotional sentiments seemingly disconnected from the actual job performed. To maximize morale and increase productivity, line managers would need to diagnose and address workers' psychological and social problems. Mayo's more personal approach to management appealed to personnel specialists with a reformist orientation and those wishing to enhance the field's professional credibility. It also connected management studies more firmly to the academy, as evidenced by the University of Chicago's Committee on Human Relations in Industry (1943), which collaborated with Sears, Roebuck and Company on numerous studies. This management school also spawned a plethora of publications, including Fritz J. Roethlisberger and William S. Dickson's book *Management and the Worker* (1939), which became the most widely distributed text on Mayo's brand of human relations. Personnel offices often sought to train line managers in the art of human relations, which encouraged managers to improve their interpersonal skills so that they could counsel and communicate more effectively with subordinates. As part of a larger industrial democracy movement, human relations seemed to humanize management in a way that the technocratic Taylor system had not.

Critics complained that human relations merely masked power relations within firms and ignored legitimate worker complaints about work conditions and pay. Moreover, they argued, the underlying aim of human relations was to force the worker to adjust to a hierarchical work environment, rather than encourage a more democratic workplace. Many perceived it as an effort to undermine unions. A simultaneous stress, starting in the 1920s, on creating employee representation programs as a means of promoting industrial democracy often led to the establishment of company unions, which was further evidence to critics of the conservative aims of these efforts. Although some human relations experts sought to include unions in programs, labor organizations often expressed skepticism of its value as an empowering source for workers.

Personnel Management in the Post-World War II Era

Labor relations specialists often found themselves organized as a subset of a personnel office, particularly after passage of the National Labor Relations Act in 1935. Overall, however, personnel offices concentrated on training, benefits, job classification, and payroll. Developments in post-Mayo management schools reinvigorated the field's academic orientation but also put new emphasis on the growing white-collar workforce of the widening service sector. These theories included the management guru Peter Drucker's "management by objectives," Douglas MacGregor's "Theory Y," which stressed worker self-actualization, and "Theory Z," an American interpretation of familial management styles practiced in postwar Japan. Simultaneously, scholars sought to reconstruct a science of administration, using cybernetics, economics, and math. Although critical of Taylor's scientific management, the most prominent organizational theorist, Herbert Simon, applied mathematical and economic models and used theories drawn from political science, sociology, and psychology in an effort to construct an overarching theory of bureaucratic rationality.

The proliferation of new federal regulations regarding workplace equity also contributed to shifts in the field. In the 1970s, personnel departments began to take over administration of affirmative action programs and implement sensitivity training. They also acquired a new nomenclature, calling themselves "human resources" rather than personnel departments. A major exception to this occurred in 1976, when the government created the Office of Personnel Management to replace the U.S. Civil Service Commission.

Under increasing economic pressure to become leaner, many corporations began to lay off middle-level managers in the 1980s and 1990s, and human resource specialists found themselves particularly vulnerable. Weaker unions and a political environment less conducive to enforcing personnel regulations made it more difficult for human resource employees to justify their positions. In many cases, companies put more responsibility on line managers to oversee employment issues, suggesting a return to the more decentralized, less formal structure characteristic of nineteenth-century firms. Nevertheless, formal personnel functions continue to exist in large and small companies and in government agencies. The fluctuating fortune of personnel management suggests the ways in which this concept continues to make and remake itself as an integral aspect of an organizational society.

PESOTTA, ROSE (NOVEMBER 20, 1896–DECEMBER 7, 1965) Anarchist, Labor Organizer, Trade Union Officer

Rose Pesotta was born Rachelle Peisoty in Derazhnya, Ukraine, Russia. Her parents, Itsaak (Isaack) and Masya, were prosperous grain merchants, and Pesotta grew up in an Orthodox Jewish home relatively untouched by the vicious anti-Jewish pogroms so many experienced during this time in the shtetls of the Russian Empire. Educated at home as well as at a local private girls' school, by the time she was a teenager, Pesotta was fluent in Yiddish, Hebrew, Ukrainian, and Russian. She was also by her teens active in the radical Russian anarchist movement, well read in and heavily influenced by the work of Mikhail Bakunin, Peter Kropotkin, and Pierre Joseph Proudhon. Seeking to escape a planned marriage, Pesotta immigrated to America before the age of 17, joining her sister Esther in New York City just before Thanksgiving, 1913. During processing by immigration agents, her name was changed to Rose Pesotta,

and she soon found work in New York City's booming garment industry, a trade she returned to repeatedly for the next 50 years.

By the time Pesotta became a garment worker and joined the International Ladies' Garment Workers' Union (ILGWU), the union had endured the bitter strike of 1909–1910 known as “The Uprising of the 20,000” and the 1911 Triangle Factory Shirtwaist Fire with the tragic loss of 146 workers, most of them young women, barely out of their teens, and like Pesotta, Russian Jewish and Italian immigrants. While conditions within the New York City garment industry were still far from ideal, much needed reforms had occurred in the wake of the Triangle fire, and Pesotta credited the union for much of it. She was soon active in her local, part of a significant anarchist minority. In 1920, she was elected to the executive board of Local No. 22, and throughout the 1920s, she served on several strike committees at the same time that she attended various worker education programs, including the Bryn Mawr Summer School for Women Workers and Brookwood Labor College in Katonah, New York. For Pesotta, trade unionism was the most effective vehicle to not only improve workers' conditions but also to advance the principles of anarchism she held so dear. Since her arrival in America in 1913, Pesotta had also been active in the vibrant anarchist movement in New York City and suffered personally the government repression during the Palmer Raids of 1919–1920 when her then fiancé, a fellow Russian immigrant and anarchist Theodore Kushnarev, was deported along with hundreds of others. But Pesotta continued her active involvement in anarchists' circles and devoted much time and energy working during the 1920s on behalf of Nicola Sacco and Bartolomeo Vanzetti, two Italian immigrant anarchists charged with murder and robbery and executed in 1927.

As a committed anarchist, Pesotta was also virulently anti-Communist, and it was her efforts to expel Communist union members within her local, combined with her engaging personality, that brought her to the notice of the ILGWU leadership, who made her an organizer by the end of the 1920s. With the onset of the Great Depression in 1929, whatever gains the ILGWU had made were quickly eroded as the garment industry, too, felt the impact of this worldwide economic devastation. Pesotta would later remember this as a time when thousands of New York City garment workers went hungry for lack of work. Those who did find work experienced conditions similar to those in the sweatshops of the early part of the twentieth century. However, with the election of Franklin Roosevelt in 1932 and the New Deal reforms beginning with the National Industrial

Recovery Act that aimed at putting Americans back to work, the ILGWU seized the prolabor moment and increased its organizing efforts across North America. In 1933, the union hired Pesotta as a full-time organizer, and she was soon organizing Mexican women garment workers in Los Angeles as well as their counterparts in Montreal, Puerto Rico, Boston, and Cleveland. She also helped striking United Auto Workers in their 1936 sit-down strikes in Akron, Ohio, and Flint, Michigan. An effective organizer who spoke to the workers as a worker herself, Pesotta was equally adept at getting press attention during the numerous strikes she oversaw during the 1930s. News photographs from the time repeatedly show a smiling Pesotta, fashionably dressed, holding a picket sign in her white-gloved hands. Her success in the field brought her recognition within the hierarchy of the ILGWU, and at the union's 1934 convention, Pesotta was elected as one of 24 vice presidents, the only woman then serving, and the third woman ever elected to that position in ILGWU history. While she enjoyed a close, if sometimes volatile, working relationship with her mentor, the ILGWU president David Dubinsky, Pesotta was frequently frustrated in her role as an officer in a union in which the rank and file was predominately female and the leadership was decidedly male dominated. Her frustration was further compounded by the tension between her anarchist principles and her leadership role, however limited it was by her sex. In 1942, she resigned her position as a full-time organizer and returned to her trade, working as a dressmaker in a New York City shop. Two years later, she resigned from the ILGWU executive board—the same year she published her own account of her years as an organizer and union officer. That memoir, *Bread upon the Waters* (1944), was immediately well received, translated into several other languages, and remains a vivid look at organizing and union politics during the 1930s.

Although in her later years she worked briefly for the Anti-Defamation League of B'nai B'rith and the American Trade Union Council for Histadrut, the Israeli labor organization, it was through her work as a union dressmaker that Pesotta supported herself until her retirement in 1963. She spent her last years living in the recently opened ILGWU cooperative housing complex at Penn South in New York City and remained politically active until shortly before her death in 1965. Pesotta's biographers emphasize the apparent contradictions of her life—she was a warm and engaging woman, beloved by many in the rank and file, while in her personal life, she experienced several disappointing, even heartbreaking love affairs, including with Powers Hapgood. Although she initially welcomed the opportunity to join the

ILGWU, in doing so she often came into conflict with her strong anarchist beliefs at the same time she battled the male domination of the union she served for 50 years.

KATHLEEN BANKS NUTTER

Selected Works

Pesotta published two memoirs, the above-mentioned *Bread upon the Waters* (1944) and *Days of Our Lives* (1958), which focuses on her earlier years in Russia; her papers are held by the New York Public Library.

PETERSON, ESTHER (1906–1997) Labor Organizer, Educator, Lobbyist, and Political Activist

Working with a group of labor reformers in the 1940s and 1950s, Esther Peterson helped develop an economic agenda to enable women to achieve equality at work and accommodate responsibilities at home. Peterson skillfully moved this agenda forward at the U.S. Department of Labor, where she was the highest-ranking woman in the Kennedy administration. Her major accomplishments there included the groundbreaking work of the first President's Commission on the Status of Women and the passage of the 1963 Equal Pay Act, thus laying the groundwork for major shifts in employment policy and a renewed feminist movement that brought about fundamental changes in society.

The daughter of Anna and Luther Eggertsen, Peterson grew up in Provo, Utah, where her Danish grandparents had settled. She was raised in a strong Mormon community and graduated from Brigham Young University. In 1930, she moved to New York City, where she received a master's degree from Columbia Teachers' College and married Oliver Peterson, a socialist who introduced her to the labor movement.

During the 1930s, Peterson taught at a private girls' school in Boston, but also at the YWCA and the Bryn Mawr Summer School for Women Workers. She became an organizer for the American Federation of Teachers and in 1939 was hired in the education department of the Amalgamated Clothing Workers of America (ACWA). Peterson became the first legislative representative for the ACWA in 1944, working closely with then Congressman John F. Kennedy.

In 1948, her husband joined the Foreign Service as one of the new labor attachés. For the next 10 years, and now with four children, the Petersons lived in Sweden and Brussels, where Esther worked with European trade unions and the International Confederation of Free Trade Unions (ICFTU). In 1952, during the McCarthy Era, Oliver was accused of Communist activities. Although eventually cleared of all charges, he was soon diagnosed with cancer and never fully regained his health, shifting more financial responsibility to Esther.

The Petersons returned to the United States in 1958, and Esther became the first woman lobbyist for the AFL-CIO, in the Industrial Union Department. She renewed her working relationship with Kennedy and was an early labor supporter for his presidential campaign. She was appointed director of the Women's Bureau (1961–1964) and assistant secretary for labor standards (1961–1968), U.S. Department of Labor. Building on her trade union work, she then served in the administrations of Presidents Johnson and Carter as an advisor on consumer affairs and as a delegate to the United Nations in the Clinton administration. She also worked with private industry and helped develop the UN's Guidelines for Consumer Protection.

Esther Peterson's contributions to the labor movement and to workingwomen were firmly grounded in her family's commitment to education, hard work, and helping others and strongly shaped by her husband's progressive politics. Her leadership in what Dorothy Sue Cobble, in *The Other Women's Movement*, calls "labor feminism" further reflected Peterson's experiences with collaborative and cross-class organizations like the Bryn Mawr Summer School, where she was influenced by women and men from the Progressive Era and Roosevelt's New Deal. She never lost sight of workingwomen's needs as she struggled to balance her own work and family life. She strongly supported protective legislation for women, opposed the Equal Rights Amendment, and advocated for increases in the minimum wage and expansion of the labor laws to include domestic and other low-paid workers. She argued that women's lives were undervalued at home and in the workplace, and she

championed the union women's approach to solutions through both government and collective bargaining.

The President's Commission on the Status of Women (PCSW) was the culmination of union women's activities over 30 years. The commission was an idea discussed in the 1940s when Peterson served on a labor committee that advised the Women's Bureau on a range of workingwomen's issues. She wanted the PCSW's focus to be broad, covering employment as well as the civil and political efforts of women, and inclusive. The 26 commissioners came from all walks of life, chaired by Eleanor Roosevelt, and the advisory committees eventually numbered over 250 people. For the first time, federal attention focused on problems of African-American women.

The final PCSW recommendations were extensive but reflected the tensions of the time over women's multiple roles. They called for equal opportunity and protective legislation while seeking improvements for women in a wide range of areas including training, child care, and benefits for maternity, social security, and unemployment. The Commission brought together women from the many different feminist movements, who went on to work toward sex and race equality in a multitude of ways.

As the PCSW was getting under way, Peterson's backing was also important for the equal pay bill introduced by Congresswoman Edith Green. While union women had long advocated the idea of equal pay for comparable work, they compromised on this narrower legislation guaranteeing equal pay for equal work, which became law in 1963. The heated debate over the legislation opened a discussion on sex discrimination in employment that was greatly expanded by the 1964 Civil Rights Act and the decades of legislation and court cases that followed. As protective laws were dismantled under this new framework, Peterson no longer opposed the Equal Rights Amendment but renewed her commitment to improving labor standards for all workers. In her 90s, however, she was quick to note that the family problems of workingwomen had yet to be solved.

Peterson went on to bring her formidable political skills and her ability to reach across barriers of race, gender, and class to consumer issues. When she took these issues back to the labor movement, she found little interest, although she considered them important for working families. Internationally recognized for her work on behalf of consumers, she championed legislation for truth in lending, unit pricing, meat and poultry inspection, and occupational safety. In 1981, Esther Peterson was awarded the Presidential Medal of Freedom, the United States' highest civilian honor.

PETRILLO, JAMES CAESAR (1892–1984) President, American Federation of Musicians (AFM), 1940–1958

One of the most powerful and well-known labor leaders of his era, after World War II James Petrillo publicly exemplified the "labor czar." Petrillo's primary focus was ensuring jobs for musicians, and his battle against recording companies, radio stations, and movie theaters' use of recorded, or "canned," music was the defining issue of his career. While Petrillo helped solidify and extend the AFM's position as a strong, national union, his most pervasive legacy may be the Musician's Performance Trust Fund, which has employed musicians for free, public concerts since 1948.

Petrillo was born on the West Side of Chicago, and despite the lack of a formal education, he used a combination of toughness and talent to rise to influence in the musicians' union. As a youth, he began playing the trumpet in a Hull-House band, but he "lost his lip" early and was an undistinguished musician. He found his calling in union politics, however, after joining the Chicago Federation of Musicians (CFM), Local 10 of the AFM, in 1918. His first assignment for the CFM was to organize musicians playing in Chinese

restaurants, and his success and acuity at this difficult task propelled him to the local's vice presidency in 1919. The early 1920s were a period of intense factional fighting for control of the CFM. After Local 10's president was severely beaten, and a bomb exploded in the union's offices, Petrillo was elected president in 1922. The CFM remained a contentious organization, with in-fighting and strong disagreements expressed in violence. As president, Petrillo survived a bomb blast at his home, gunfire attacks on his car, and being kidnapped to hold office for 40 years.

Despite early violence and controversy, Petrillo was an aggressive and effective leader of the CFM. In 1927, he led Chicago theater musicians on the biggest strike in AFM history to date. Petrillo's attorneys, including Clarence Darrow, defeated an injunction in court, and the union won the strike only four days later. Petrillo also changed the union's relationship with radio stations, signing the first union contract with a radio station, forcing the station to pay musicians who had previously played without payment, and negotiating for stations to hire "standby" musicians. Petrillo also brought musicians working in Chicago hotels into the AFM, and by the 1930s, the CFM controlled most of the musical jobs in the city. After staving off a Congress of Industrial Organizations (CIO) organizing drive in Chicago by lowering CFM membership fees, Petrillo took on his next issue: battling "canned" music. In 1937, Petrillo made a move to ban CFM musicians from making recordings or transcriptions without the consent of the union's executive board. The ban never transpired; instead, radio stations using the recordings agreed to hire staff musicians. Petrillo's bold action was in sharp contrast to AFM leaders' policy regarding canned music, of which he was an outspoken critic. Technological displacement had been a major problem for the AFM since 1926, when the first "talking" movie appeared. During the 1930s, the AFM, under its president, Joseph Weber, fought the increased use of recorded music, with a publicity campaign claiming it "debased" musical performance. In contrast, Petrillo argued that musicians needed to fight for a cut of the recorded music business profits. He claimed that musicians were unique in creating the very product that made them obsolete and that they had the right to protect themselves and their jobs from technological displacement. By the late 1930s, Petrillo's message resonated within the AFM, and he became president in 1940.

In 1942, as AFM president, Petrillo announced a national ban on recording and transcription by AFM musicians, with the exception of recordings for the armed services. The aim of the ban was to force the

music entertainment industry to compensate musicians for their recordings. Record companies were difficult foes because they had large stockpiles of previously recorded material to turn to and also faced a shortage of resources for new recordings due to the war. By 1944, however, the AFM had won concessions from the record producers in the form of the Recording Trust Fund, in which every sale of recorded music included a small fee paid to the AFM. The AFM distributed this revenue to unemployed musicians to offer free public concerts. Although this practice was deemed illegal in 1946, Petrillo launched a second, similar recording ban in 1948 that resulted in a new fund, the Musicians' Performance Trust Fund (MPTF). Since 1948, the MPTF has provided millions of dollars' worth of free public concerts in cities throughout the United States.

Petrillo's successes made him a postwar icon: he was the highest-paid labor leader in the country, was featured on the cover of *Time* magazine twice, and played a widely publicized duet with Harry Truman at the 1948 AFM convention. At the same time, he became a target of Congress, and Petrillo and the AFM's bargaining tactics came under investigation. In 1946, Congress passed the Lea Act (commonly known as the "Anti-Petrillo" Act), a precursor to Taft-Hartley. The Lea Act barred musicians from collectively bargaining with recording companies, forcing radio stations to hire standby musicians, or receiving funds for recordings previously aired. After the Supreme Court ruled the Lea Act constitutional in 1947, the AFM leadership reluctantly accepted the law, but after membership pressure forced them to challenge the Act again in later years, it was repealed in 1980.

Although Petrillo's reign did survive congressional action, by the mid-1950s he was facing a number of new challenges from within the AFM itself. Some musicians, particularly those working in the California film industry, complained that the MPTF surcharge made them vulnerable to foreign competition. In 1958, they formed a rival union, the Musicians Guild of America (MGA), which threatened to split the union. In addition, black musicians, the vast majority of whom had historically been segregated in subsidiary locals, challenged the AFM to integrate the locals. Faced with a rebellious membership, Petrillo stepped down in favor of his handpicked successor, Herman Kenin, in 1958. Four years later, Petrillo was voted out of the Local 10 presidency when a group of musicians calling themselves Musicians for Democracy won the CFM election emphasizing issues of democracy, health plans, and racial integration. Petrillo survived to play an encore, however, when in 1964 he was anointed head of the

AFM's Civil Rights Commission. Over the next decade, the Commission oversaw the integration of AFM locals, although racial divisions within the union remained a problem. Petrillo retired from the union in 1975, and passed away in 1980.

PHELPS DODGE COPPER STRIKE (1983–1984)

When the Phelps Dodge Copper Strike began in the early morning hours of July 1, 1983, members of

organized labor were optimistic that they would prevail, as they always had in recent memory. Every time their three-year contract expired, they would walk out, shut down the mines for a few weeks, and ultimately force the company to grudgingly give organized workers what they had demanded in the first place. Everyone seemed to play by an unwritten set of rules. However, when the 1983 strike ended a year or so later, labor, including some of the largest and most powerful unions in the United States, was left licking its wounds and wondering how it had suffered one of its worst setbacks since the Great Depression. Some observers claim that the Phelps Dodge copper strike resulted in the largest decertification of union locals in American history, and they are probably right.

The coalition of 13 unions that represented workers employed at Phelps Dodge's massive Morenci and Ajo, Arizona, mines, mill, and smelter complexes had begun to informally prepare to negotiate a new contract to replace the one that would expire at midnight, June 30, 1983. Phelps Dodge had begun to

Production. Copper (refining). Copper ingots on conveyors at a large copper refining operation. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USE6-D-009687].

prepare, too. The copper giant publicly and repeatedly announced that because the price of copper had fallen so low in 1982, it would demand major changes in the workers' wage and benefits package, notably the elimination of the union's hard-won cost of living increase, or COLA.

For unions, COLA became a rallying cry. Give back COLA, labor warned, and you will return to the dark days of autocratic rule by copper bosses. For Phelps Dodge's senior management, desperate because it felt squeezed by runaway inflation on one hand and the plummeting price of copper on the other, eliminating COLA became the surest and fastest way to trim the cost of producing copper in the United States so that its big Arizona and New Mexico mines could compete successfully with low-cost copper streaming out of Chile.

Less publicly, Phelps Dodge leaders began to take formal steps to work through a strike of any length. Quietly, they were changing the rules of engagement, though periodically they publicly warned organized labor what it would do if workers refused to accept the elimination of COLA in the contract scheduled to be implemented on July 1, 1983. The company bible was a newly published compendium instructing management how to operate during strikes. The book was conceived and endorsed by the labor economist Herbert Northrup of the University of Pennsylvania's prestigious Wharton School of business. Richard T. Moolick, the company no-nonsense president, purchased paperback copies of the thick "how-to" guide and made certain they circulated among key personnel. Giving management an additional measure of confidence was President Ronald Reagan's recent firing of the striking airline controllers. The nation's conservative political climate definitely favored management.

One particularly dramatic event occurred in the spring of 1982 when Phelps Dodge temporarily closed its Arizona mines for several months, citing the abysmally low price of copper. During that same time, Chairman George Munroe toured the company's production sites and held open forums in which he used charts and graphs to lay out the company's dire economic predicament for its workers. Cynical union workers openly questioned the company's explanation, and the union protested that management should not speak to workers without going through union spokespersons. Decades of contentious labor relations made any dialogue between Phelps Dodge and its unionized workers difficult at best.

Labor did not believe that the economic picture was as gloomy as the eloquent Munroe made it sound. Further, with the mines remaining closed for several months, it was easy for labor spokespersons to

claim that the company was maneuvering to drain workers' bank accounts and thus make them lean and hungry to work through any call to strike. Phelps Dodge always denied that, but there is no denial that the company was quietly working to implement Northrup's suggestions of how to work through a strike. The company had in place a master plan to work through the strike if organized labor walked off the job as promised on July 1. Labor seems to have believed it was all a bluff.

Though workers struck on July 1 as predicted, nothing else went as predicted for organized labor. The company continued to operate its plants with supervisory personnel and a growing number of unionized workers who decided they needed the money to feed their family and pay bills. Some families split down the middle, with one brother defiantly crossing the union picket line while the other loudly cursed his sibling as a "son of a bitch."

The strike remained a standoff until one night late in July, when someone never identified fired a bullet through the side of the Ajo home of Keith Tallant, one of the union workers who conspicuously defied the union by crossing its picket line. The bullet lodged in the brain of his sleeping two-year-old daughter, who had to be rushed to a hospital in Phoenix for lifesaving neurological surgery. For the Democratic governor of Arizona, Bruce Babbitt, this was a wake-up call. He had tried to stay out of the conflict, but when he visited the little girl in the hospital, he felt new urgency to somehow mediate the mounting conflict.

The situation grew more tense in early August when Phelps Dodge announced that it would soon begin hiring permanent replacement workers and that the die-hard strikers would be out of jobs. It was one thing to use supervisory personnel, or even independent-minded union members, but to hire outsiders was more than strikers in Morenci and Ajo could take. A loud and menacing crowd of strikers converged on the Phelps Dodge general office building in Morenci and forced visibly-shaken managers to agree to a 10-day shutdown of Phelps Dodge's flagship property. President Moolick immediately flew to Arizona from the company's New York offices and angrily berated his Morenci managers for cowardly yielding to labor's threats. He publicly promised that the property would re-open at the end of the forced 10-day shutdown.

Working behind the scenes, Phelps Dodge managers pushed Governor Babbitt to be prepared for the worst when the Morenci complex re-opened. Babbitt, shaken by the course of events, publicly maintained that he was not in Phelps Dodge's employment, but behind the scenes he began readying the Arizona

National Guard for strike duty. The state's military rumbled into the mining town in a mighty show of force, and the plant re-opened as scheduled on August 20.

President Moolick always maintained that as far as he was concerned, the strike ended when the Morenci plant restarted. Labor would never concede that point. Instead, it launched several legal battles with the company, none of which ever forced the copper giant to yield anything in the long run. It also vented its wrath on Governor Babbitt, whom one prominent spokesperson for the Steelworkers union now referred to as "Governor Scabbitt."

According to federal labor law, workers on the job were eligible to vote on union representation exactly one year after the beginning of the strike. They did so under the watchful eyes of federal mediators, and the overwhelming majority of replacement workers at every facility voted the union out—more than 30 union locals died that day. It was a humiliating defeat for organized labor. But workers who had for the past year been cursed and spat at by union brothers and sisters on the picket line had no love left for the unions. At the beginning of the twenty-first century, the Morenci complex, with the largest open-pit copper mine in North America, still remained nonunion. Phelps Dodge shut down its Ajo complex in 1984.

Organized labor attempted for several more years to publicly shame and humiliate Phelps Dodge leaders, but it was to no avail. Phelps Dodge did not produce a product it sold directly to the public, and thus the public outside the Arizona copper towns took almost no notice of the struggle. Even the Steelworkers eventually gave up on the strike. Labor was left with nothing but bitter memories.

PHILADELPHIA JOURNEYMEN CORDWAINERS STRIKE (1806)

The Philadelphia shoemakers strike of 1806 resulted in the prosecution and trial of its leadership. Because the case involved the application of British common law in postrevolutionary America, Caesar A. Rodney, a prominent Delaware jurist and later U.S. attorney

general, defended the workers, in a case touching on the applicability of English common law in the United States.

The published proceedings of the trial offer a rare documentary snapshot of a vibrant labor organization early in American history. The union's origins and its name—the Federal Society of Journeymen Cordwainers—imply origins among those shoemakers involved in supporting the 1796 strike of the Federal Society of Journeymen Cabinet and Chair-Makers. Frequent labor disputes created well-practiced procedures; when the union voted to "strike" specific shops, it sent "tramping committees" to patrol those workplaces against "scabs." Several employers resorted to legal action to break the 1806 strike.

The legal foundations for *Commonwealth v. Pullis* grew from the definition of such associations as "criminal conspiracy" under English common law. In the late eighteenth and early nineteenth century, parliamentary "Combinations Acts" explicitly extended this to place workers' organizations beyond the law. Prosecutors believed that the parliamentary action had clarified the meaning of common law as prohibiting labor organizations, while the Jeffersonians doubted the applicability of the common law here. The strikers argued that the employers regularly made binding arrangements as to the price of the product and that workers should have an equal right to make similar arrangements as to the price of what they contributed to the process, their labor. The conviction of the strikers, though it only involved a nominal fine, established just such a distinction between the rights of capital and the rights of the only capital workers themselves controlled.

This 1806 strike cast a long judicial shadow. Although *Commonwealth v. Hunt* (1842) in Massachusetts accepted the legitimacy of unions, it left ambiguity as to strikes. Although the courts gradually accepted strikes, the *de facto* legalization of labor activities in the 1930s also implied the legal regulation of what would and would not be acceptable practices. More broadly, "criminal conspiracy" remains a legally ambiguous area by which the authorities have continued to take action against combination of citizens.

PHILADELPHIA PLAN

Named for the city where it was first put into practice, the Philadelphia Plan required contractors bidding on government construction projects to set goals and targets for the number of minority workers. Signed by Assistant Labor Secretary Arthur Fletcher on June 27, 1969, the administrative order was the product of decades-long civil rights agitation and policy innovation. The Philadelphia Plan was a significant chapter in the development of federal affirmative action legislation.

Background: Racial Discrimination in the Building Trades

With the Philadelphia Plan, the federal government targeted one of the most racially exclusive sectors of the labor movement. This was especially the case in the highest-paying skilled trades, in which contractors—especially in union strongholds in the urban North and West—depended on union hiring halls to furnish the best-trained workers for each job. Entrance to these trades required years of union-sponsored apprenticeship and technical training, and building trades unions preferred to fill these slots with family and friends. Thus, it was easy for unions in trades that had been white from the beginning, such as steamfitting, electrical installation, and sheet metal work, to reproduce a white membership. But even in older trades such as carpentry and masonry, which had a tradition of African-American craftsmen (especially in the South), whites were disproportionately represented. Jim Crow decreased the number of black craftsmen in the South, and labor unions ensured that subsequent generations of blacks would find it increasingly difficult to gain access to training and work in these trades in the North. By 1961, less than 1% of the nation's building trades apprentices were African-American. Instead, racial minorities were disproportionately concentrated in the lowest-paying trades that did not require tremendous skill—namely common laborers and hod carriers.

Before the 1960s, African-Americans had resisted organized labor's racial practices with little success. Prior to the World War I Great Migration, African-Americans responded to union exclusion on an individual basis, typically by strikebreaking and working for open-shop contractors. In the interwar years, however, resistance increasingly became a collective endeavor. Black craftsmen attempted to put pressure on white unions by forming their own unions, associations, and training programs. Whenever possible, they sought assistance from any organization that was willing to offer support—whether it came from moderate groups such as the Urban League or a radical organization such as the Communist Party. But these efforts were usually no match for powerful building trades unions, and African-Americans realized that their best hopes rested with state intervention.

The federal government meekly intervened on behalf of African-Americans on several occasions. From 1935 to 1937, the Public Works Administration (PWA) attempted to secure jobs for black construction workers by implementing a quota plan on its projects. But while the PWA produced short-term gains for a small number of blacks, the agency's program did nothing to address the issue of union membership and apprenticeships and therefore did not expand the black workforce in construction in the long run. The World War II Fair Employment Practice Committee (FEPC), with its weak enforcement mechanisms, produced similar results. Finally, the President's Committee on Government Contracts, established by Eisenhower in 1953, and the President's Committee on Equal Employment Opportunity, established by Kennedy in 1961, sounded good in theory but did little in practice to increase the number of minority construction workers.

All the while, union construction workers benefited from increased government spending in national defense and heavy construction. The Interstate Highway System, Housing Act, and Area Redevelopment Act, among others, helped provide steady jobs for union construction workers. Moreover, the unions' ability to restrict the labor supply ensured that these jobs would command high wages. This trend would continue with the construction boom of the 1960s.

The 1960s: Protest and Policy

The construction industry's long history of racial discrimination made it a prime target for civil rights activists and policy makers in the 1960s. Between 1963 and 1967, the Congress of Racial Equality

(CORE) and the National Association for the Advancement of Colored People (NAACP) staged protests and pickets at federally funded construction sites in Cleveland, St. Louis, Philadelphia, New York City, Newark, Oakland, and Washington, DC. These protests caught the attention of government officials. In 1963, violent protests at the site of a partially built school in Philadelphia prompted President Kennedy to issue Executive Order 11114, which ambiguously called upon contractors to take “affirmative action” with regard to black workers on government projects. In 1965, President Johnson issued Executive Order 11246, which shifted the development and enforcement of affirmative action programs to the Department of Labor’s Office of Federal Contract Compliance (OFCC).

For the next two years, the OFCC moved toward a workable application of affirmative action. In 1966, it took a major step when it established the pre-award program for construction, in which the OFCC would first review a contractor’s employment “system” *before* the government awarded a contract. The Department of Labor experimented with different pre-award affirmative action plans in St. Louis, San Francisco, and Cleveland before settling on the Philadelphia Plan in 1967. The Philadelphia Plan required contractors bidding on government jobs to submit “manning timetables” listing the number of minority workers they intended to employ on each aspect of the project. Before a contract was signed, a compliance committee examined the lowest bidder’s employment practices—including periodic on-site head counts and evaluations.

The Philadelphia Plan met immediate resistance. The AFL-CIO and its Building Trades Department protested the federal intervention. Organized labor claimed that they were being unfairly singled out by the government and that the plan would discriminate against deserving whites. For most of the twentieth century, labor leaders in the construction trades could accurately assert that their unions’ national policies did not condone racial discrimination. Instead, they attributed the paucity of minority workers in the skilled trades to economic realities and a general lack of interest. Nevertheless, building trades unions tried to head off government action by developing their own minority recruitment programs. In 1963, they teamed up with national contractor associations and established the Joint Committee on Equal Employment Opportunities to increase minority representation in apprenticeship programs on the industry’s, and not the government’s or civil rights movement’s, terms. In 1965, these efforts were intensified as local building trades unions began working with groups such as the Urban League to establish joint apprenticeship programs—special outreach

programs aimed at recruiting minority youths for union apprenticeship programs.

Unions and contractors were not alone in protesting the Philadelphia Plan. The National Association of Manufacturers and conservative Republicans objected to the Plan as well because they believed that affirmative action programs violated the Civil Rights Act of 1964. Dissent also came from within the ranks of the Johnson administration. The opposition proved to be too much, and in November 1968, General Comptroller Elmer Staats ruled that the Philadelphia Plan was illegal.

The Nixon administration revived the Philadelphia Plan. Scholars have debated Nixon’s motives in implementing a pioneering affirmative action program in federal employment. Most agree that support for the plan was in large part political—putting the Democratic Party in the awkward position of having to choose between the labor movement and the civil rights movement. The Nixon administration also had a keen interest in lowering construction costs. By the late 1960s, large corporations and open-shop organizations complained that building trades unions benefited from artificially high wages derived from their restrictive apprenticeship programs and the Davis-Bacon Act. Nixon could anticipate that the Philadelphia Plan would both expand the labor supply and enervate organized labor’s position in the industry. Finally, some have argued that Nixon was motivated by his opposition to discrimination and his hope to quell urban unrest.

Regardless of Nixon’s personal motives, his Department of Labor was largely responsible for the administrative order. Although his prime interest was increasing the construction industry’s labor supply, George Shultz, Nixon’s secretary of labor, also considered himself a supporter of African-American civil rights. In the spring of 1969, he re-organized his department and gave Assistant Secretary of Labor Arthur Fletcher, one of the administration’s highest-ranking African-Americans, his blessing in retooling the Philadelphia Plan. Meanwhile, a new wave of protests and counterprotests struck in Philadelphia, Pittsburgh, and Chicago—creating the added urgency of heading off potentially explosive racial conflicts in American cities.

Under Fletcher’s revised Philadelphia Plan, the OFCC surveyed local conditions and established a target range, expressed in percentages rather than numbers, for each trade. Contractors bidding on federal projects exceeding \$500,000 were required to meet these “goals” and “timetables.” Mindful of the first Philadelphia Plan’s fate, Labor Department officials took pains to emphasize that the Plan did not implement numerical quotas and that the revised Plan

PHILADELPHIA PLAN

simply required contractors to show good faith in hiring minorities. Although opponents continued to cry foul, this time the Philadelphia Plan withstood legal challenges. And although the Plan originally only applied to five counties in eastern Pennsylvania, it was extended in 1970 to cover all government contracts exceeding \$500,000. The Plan was amended again in 1971 to include women.

Ultimately, the Philadelphia Plan did little to increase the numbers of minorities and women in the building trades. Some black unionists and civil rights leaders criticized the Plan for not providing for adequate apprenticeships for black youths and for not upgrading older workers. The architects of the Plan underwrote it with the assumption that the construction industry would maintain the vitality of the 1960s boom. However, government construction spending plummeted throughout the 1970s, creating hard times for construction workers and framing civil rights employment legislation as a zero-sum game between blacks and whites. Indeed, the increase in minority and female construction workers since 1969 owes more to the weakened position of building trades unions than it does to the Philadelphia Plan.

The most significant legacy of the Philadelphia Plan is its contribution to affirmative action employment policies. Although Nixon distanced himself from anything that hinted at quotas shortly after approving the order, the Equal Employment Opportunity Commission built upon affirmative action tools such as goals, timetables, and quotas throughout the 1970s. The debates that engulfed the Philadelphia Plan continue to swirl around the issue of affirmative action.

PHILADELPHIA PRINTERS STRIKE (1786)

During the British occupation of New York City, journeymen printers there formulated a scale of

wages, but no job action seems to have taken place. In the spring of 1786, though, Philadelphia masters prepared to reduce wages, and 26 journeymen printers signed a formal protest to the plan coupled to an insistence that the old scale be maintained. They left work and refused to return until the masters agreed to pay the old scale, the equivalent of 20 shillings or one Spanish dollar per day. Participants included old colonial printers, former Continental soldiers such as Samuel Lecount, and future leaders of the local trade unions that began emerging a decade later.

The strikers seem to have acted with the tacit support of Benjamin Franklin, the aged but mentally alert and open-minded patron of the “art preservative” in the New World. Franklin had arranged a citywide scale of prices and wages in 1754 and favored a uniform scale. During the prerevolutionary resistance, the war, and the postwar conditions of the Confederation, real estate and rents had soared and food prices had risen steadily. Still, the strikers were not interested in a pay increase or a permanent trade union but in maintaining the scale of Franklin’s day and the legacy of master-worker fraternalism. The outcome of the strike is difficult to tell, but it did not result in a uniform citywide scale and surely varied from shop to shop.

In March 1788, a number of the veterans of this strike met with their employers in Franklin’s home to establish a more permanent society to cooperate in managing the local craft. Believing in a common artisan interest that united employers and employees, Franklin left a codicil in his will setting aside funds to loan enterprising journeymen to help them become self-employed. After his death in 1790, the association adopted the name of the “Franklin Society.”

Through the Franklin Society, the artisan standards of the 1786 strike continued to inspire the hired men. The expansion of the workplace and the introduction of boys and “two-thirds” journeymen eroded the quality of apprenticeship standards and craft labor, as well as wages. Increasingly, they imposed modern hierarchies in production that reduced hired craftsmen to a merely more skilled kind of wage labor. A defense of artisan standards became inseparable from the drive toward self-organization among the hired hands. After a short-lived Typographical Society in New York, journeymen there started a “Franklin Typographical Society” in 1798, and Boston journeymen launched a Franklin Society in 1802. Hired men in the Philadelphia craft formed a mutual aid Asylum Company in 1799 and the Philadelphia Typographical Society in 1802. By 1815, local printers unions had also appeared at Baltimore, Albany, New Orleans, and Washington.

PHILADELPHIA TRANSIT STRIKE (1944)

Philadelphians living on Broad Street would have seen a remarkable sight if they had peered out their windows at 4:00 a.m. on August 1, 1944. Buses, a dozen or more, stood idle in the middle of the street, some with their engines still running. Elsewhere, trolleys sat in their carbarns and subways at their stations, waiting for drivers who would not come. Thousands of people across the city stood at their trolley stops waiting, probably impatiently, before returning home to call City Hall and the Philadelphia Transportation Company (PTC) to ask what was wrong. Operators started off by telling each person that “No cars are moving anywhere in the city” but soon became so overwhelmed that they quit answering the phones. By noon, with the newspapers’ morning editions having hit the streets, everyone understood what had happened: PTC workers had gone on strike to prevent black promotions to the traditionally white position of driver, and the nation’s third largest war production center was at a standstill. The PTC strike, the largest racially motivated “hate” strike of World War II, ultimately lasted six days, ending only when the U.S. Army, following the orders of President Franklin Roosevelt, took over the transit system and ordered everyone back to work under penalty of conscription for failure to return.

The Philadelphia transit strike had its origins in the racial tensions that plagued urban centers across the United States during the war. From Mobile to Detroit to Philadelphia, American cities had to come to grips with migration patterns that drained the South’s rural population while adding millions of residents to ill-prepared metropolitan areas. In Philadelphia, the black population jumped from 250,000 in 1940 to 375,000 in 1950. New arrivals found the city inhospitable: they were forced into the city’s worst housing, their children attended segregated schools, and studies showed that as many as 90% of area businesses openly discriminated in their hiring practices. While any discrimination was bad, the company that disturbed black Philadelphians the most was the PTC. African-Americans had worked for the transit company for decades, but only in positions of menial

labor. They were not allowed to drive transit vehicles or interact with the public. This policy angered African-Americans because the PTC was a semi-public company that received taxes as well as fares from the black community. PTC discrimination was, according to the *Pittsburgh Courier*, “tantamount to discrimination by the City of Philadelphia.”

When black employees pressed PTC management to change its policies, they were told the company could not promote African-Americans without the consent of the Philadelphia Rapid Transit Employees Union (PRTEU)—a company union unaffiliated with the American Federation of Labor (AFL) or the Congress of Industrial Organizations (CIO). PRTEU leaders worked closely with the company, demanding the PTC reserve the best jobs for whites in exchange for wages some 10% below national standards. Management and its white workers were happy with this arrangement, and the black employees knew they would never overturn Jim Crow without help.

They found support in three places: the National Association for the Advancement of Colored People (NAACP), the Transport Workers Union (TWU—a CIO affiliate), and the Fair Employment Practice Committee (FEPC). The NAACP staged protest marches and petition drives and generally energized the black community so that all African-Americans saw their vital stake in overturning PTC segregation. The TWU, which had supported African-American access to transit jobs in New York City, won a representation election against the PRTEU in the spring of 1944 that guaranteed organized labor would no longer stand in the way of black rights. And the FEPC, which Roosevelt had established in 1941 to combat discrimination in war plants, held hearings that determined the company and the PRTEU were illegally imposing a Jim Crow system on the workforce. That system, the FEPC ordered, had to end by August 1, 1944.

White workers were angered by the campaign against their supposed right to control transit jobs and began a movement to stop integration at the PTC. They circulated fliers in the carbarns, telling white workers they had to form a “white supremacy movement” to protect their jobs and held meetings on PTC property, where they swore they would go on strike rather than work with African-Americans. The PTC happily allowed this movement to grow because it could halt the TWU. In contract talks, the CIO union had demanded a 15% pay raise and a better pension, which management knew would cost millions. But PTC leaders also knew the Smith-Connally Act forbade wartime strikes and gave the government the power to abrogate any contract and toss out a union if it led a strike against a war production

company. So management used its workers' racism to try to undermine the CIO union and consequently set the stage for the war's worst hate strike on August 1, 1944.

The strike itself was relatively short, lasting less than a week. Since Philadelphia was such a vital war production center, making everything from ammunition to uniforms, President Roosevelt could not let the stoppage drag on. He sent in five thousand heavily armed troops on August 5 to break the strike with force if necessary. The strikers, who knew they would be drafted if they stayed out, returned to work a couple of days later. African-Americans, with the support of the federal government, won their campaign to secure driving jobs at the PTC. Their victory cracked Jim Crow in an important local industry and opened the way for many African-Americans to get driving jobs. A month after the strike's end, the FEPC reported that blacks were doing well in their new jobs and that the company had two more trainees in the process of becoming drivers. By October, the number of black drivers had doubled from the original eight to 16, and within a year, the PTC counted some nine hundred black employees, including drivers, conductors, and a member of the publicity staff. The PTC became a valuable employer for the black community.

The Philadelphia transit strike was only one of many hate strikes that swept America during World War II. Tense race relations in the nation's cities led to walkouts at shipyards, aircraft factories, and transit companies across the United States. The Philadelphia strike stopped production for a week, slowing the war effort and costing the local economy some 4.6 million hours of lost production. But in the end, the strike failed as a combination of black activism, CIO support, and federal intervention ensured African-Americans equal access to the best jobs at the PTC.

PINKERTON DETECTIVES

Six railroad corporations financed the 1855 Chicago opening of Allan Pinkerton's North West Police Agency. Renamed Pinkerton's National Detective Agency three years later, it became the world's largest and most notorious supplier of paid labor spies and strikebreakers. Pinkerton's so dominated public imagination that the title "Pinkertons" was often used to denote any labor detectives.

Allan Pinkerton, a Scottish immigrant and abolitionist, pioneered spying on U.S. railroad workers in the 1850s. Called "spotters," the Pinkerton operatives watched workers, especially conductors, for offenses such as socializing with passengers, keeping ticket money from ticket sales, or sleeping on the job. During the Civil War, Allan Pinkerton worked undercover for General George McClelland and claimed to have foiled an assassination attempt against President Abraham Lincoln. Parlaying his wartime exploits into national fame, Pinkerton, with his sons Robert and William, added offices in New York and Philadelphia. In addition to general detective work for diverse clients, the agency provided three antilabor services to large employers: labor spies, strike guards, and strikebreakers. In 1873, the Pinkerton spy James McParlan infiltrated the Molly Maguires, a militant group of Irish miners in the Pennsylvania coalfields, and became a lodge officer. Exposed after two years, McParlan gave dramatic testimony that resulted in the execution of 13 men. Most spying was not dramatic, but Pinkerton's approach stressed the value of elaborate subterfuge and patience in labor espionage.

In addition to labor spies, Pinkerton's also provided strike guards and strikebreakers. The corporations claimed that the guards were to protect company property and prevent violence. In practice, the strike guards worked under the employer's direction to prevent picketing and embolden strikebreakers. Local officials often deputized private guards during strikes, but the guards remained accountable only to the employer. Pinkerton strikebreakers were often armed, too, and ready to club or shoot strikers.

When Allan Pinkerton died in 1884, his sons continued the agency. By then, many railroad and coal corporations had established in-house railroad police or coal and iron police. They still called on Pinkerton's, however, for undercover work and additional men during strikes. Many new strikebreaking agencies, such as Pearl L. Bergoff, Baldwin-Felts, and Waddell-Mahon, opened in the 1880s, and some, like Thiel's, were headed by former Pinkerton operatives.

Pinkerton's prided itself on the distinction between its detectives, who were said to be carefully recruited and trained, and its guards and strikebreakers, who

were hired hurriedly, selected mostly for strength, and employed only while disorder continued. According to Frank Morn, Pinkerton operatives may have been involved in the never-solved 1886 Haymarket bombing in Chicago, and there were increasing reports of Pinkertons shooting at workers in the late 1880s. In the 1890s, Pinkertons helped break mine strikes in Idaho, Arizona, Alabama, and Pennsylvania.

The best-known use of Pinkertons was at Homestead, Pennsylvania (1892), where the appearance of a barge of armed Pinkertons provoked a battle with unionists that left 13 people dead. The Pinkertons retreated temporarily, but lethal conflict at the formerly peaceful strike served as a pretext for mobilizing the Pennsylvania National Guard. Trade unionists, socialists, Populists and many others were outraged over the use of Pinkertons at Homestead and urged curbs on private police. The Knights of Labor had demanded the prohibition of detectives in labor disputes since 1885, and working people had campaigned for state Anti-Pinkerton Acts since 1886.

Anti-Pinkerton Acts typically prohibited the importation of armed guards or detectives for strike work. Private police, often deputized for strike work, were paid and directed by the employer. When a Pinkerton committed a crime, it was virtually impossible to prosecute him because he left town quickly. Private police removed the advantage won by unionists who had built local political power. Even when elected officials, as at Homestead, refused to mobilize armed force, the corporations could order it by telegraph. Congress passed an Anti-Pinkerton Act immediately after Homestead, and workers won Anti-Pinkerton Acts in 24 states by 1899. The agencies, however, easily circumvented the law by tactics such as transporting strikebreakers separately from weapons.

Allan Pinkerton had been a relentless self-promoter who wrote 17 books with lurid titles such as *Strikers, Communists, Tramps, and Detectives* (1878). Pinkerton amplified the hostile late nineteenth-century stereotypes of unionists and unemployed workers. These caricatures of subversive violence both emphasized the need for Pinkertons and justified what the public tended to see as corporate mercenaries. Pinkerton was also a founding member of the International Association of Police Chiefs (IACP), a professional association in which he advocated inculcating police leadership with the outlook and techniques of the detective agencies.

Pinkerton's expanded in the twentieth century despite union objections, newspaper exposés, and government investigations. Historians often attribute the rise of private police in the United States to the

relative weakness of public police. The private forces, however, continued to expand in the twentieth century despite the growth of additional public law enforcement bodies. In the 1921 paper workers' strike, for example, Pinkertons patrolled the village of Corinth alongside the recently created New York State Police.

Pinkerton's was the largest supplier of labor spies, with 27 offices and 300 clients for whom it did anti-labor work in 1935. General Motors was its largest client. From 1934 to mid-1937, 52 United Auto Workers members were Pinkerton spies. A Pinkerton was the president of the Chevrolet local in Flint, and another was vice president of the Fisher Body local in Lansing. General Motors also hired Pinkertons to spy on William Green, John P. Frey, Homer Martin, Walter Reuther, and others.

The National Labor Relations Act (1935) changed the legal context for private policing by legalizing unionization efforts. The La Follette Committee on Civil Liberties' exposure of private police in industry echoed many of the revelations of the earlier Homestead report and Commission on Industrial Relations report. In its early years, however, the National Labor Relations Board (NLRB) heard complaints of labor spying and sometimes ordered the re-instatement of workers who had been dismissed. In 1937, in response to the changed political climate, Pinkerton's board of directors formally ended industrial espionage.

NLRB regulations did not, however, put an end to either espionage or commercial strikebreaking. Private detectives and corporate police adopted new techniques using high technology, ingenious legal tactics, and public relations to defeat unionization efforts. Infamous in the nineteenth century, private police are even more pervasive in the twenty-first century.

PITTSTON COAL STRIKE (1989–1990)

In 1989–1990, Pittston coal miners waged a 10-month strike that galvanized the labor movement as striking miners engaged in the largest labor civil disobedience campaign in recent history, including a mine occupation reminiscent of the 1930s sit-down strikes.

The Pittston strike exemplified efforts by major American corporations to break out of traditional collective bargaining procedures that had been established in the post-World War II era. Pittston, in the late 1980s and early 1990s the leading U.S. coal exporter, sought to end pattern bargaining, common in auto, steel, rubber, earthmoving equipment, and mining, where one company would negotiate a contract with its union and other companies would follow the pattern and negotiate basically the same terms. Pittston refused to sign the contract the union negotiated with the Bituminous Coal Operators Association, demanding an end to company payments into the industrywide health insurance fund for retirees, cuts in pension and health-care coverage for working miners, work rule changes, and the right to open new mines without union representation.

In January 1988, Pittston terminated its health benefits to 1,500 retired and disabled miners and widows, ended pension contributions for working miners, and eliminated arbitration of unresolved grievances. The United Mine Workers of America (UMWA) miners worked without a contract for 14 months while continuing to negotiate, and then from April 1989 to February 1990, 1,700 workers struck Pittston mines in Virginia, Kentucky, and West Virginia. The retirees' health care became a galvanizing issue, creating a tremendous sense of unity among the miners—not a single miner crossed the union's picket lines throughout the strike—and fostering community support throughout the mine towns. Legally, the strike was an “unfair labor practice strike” called over company violations of labor law, which prohibited the company from permanently replacing the strikers.

The UMWA president, Richard Trumka, elected in 1982 with pledges to rebuild and unify the faltering, divided union, threw the resources of the international union behind the strike and turned it into a national cause célèbre within the embattled labor movement. The union declared that the Pittston struggle was more than just a strike but was a “people's movement.” The filmmaker Barbara Kopple produced *Out of Darkness*, which combined strike footage with a history of the mineworkers' union, and Anne Lewis produced the film *Justice in the Coalfields*.

The union determined to wage a sustained non-violent civil disobedience campaign, drawing on the lessons of the civil rights movement. Union staff,

trained by peace activists in the principles of nonviolent resistance, spread out across the eastern coalfields to train the Pittston miners. Richard Trumka declared in “Out of Darkness” in the midst of the strike, “Labor law is formulated for labor to lose. If you play by every one of those rules, you lose every time. So what it forces you to do, is to change the way you've operated.” Vice President Cecil Roberts echoed this sentiment, saying, “They didn't think that a predominately white, mountain, rural workforce would ever follow the teachings of Dr. King. But they did. Dr. King says there is nothing more invigorating than being in jail for a cause that you believe in. And I think that's absolutely right. There's nothing wrong with going to jail when you are trying to change an unjust system or an unjust law.”

The civil disobedience campaign was kicked off by women, calling their strike support group the Daughters of Mother Jones, who staged a two-day sit-in at Pittston headquarters. Subsequently, the miners began a series of sit-downs blocking the roads to the mines. In the course of the strike, over 3,000 people were arrested; many miners and family members were arrested multiple times for a total of over 5,000 arrests. The union formed Camp Solidarity, a tent city near Castlewood, Virginia, for the over 50,000 supporters who came to show their solidarity. The miners and family members wore camouflage to symbolize their resistance and to make it difficult for the police to identify protesters accused of picket-line violence.

On April 30, 1989, 12,000 miners and supporters rallied in solidarity, hearing speeches from UMWA leaders, rank-and-file miners, and Reverend Jesse Jackson. In June 1989, 46,000 miners in 11 states declared “memorial days” and struck in solidarity with the Pittston miners. The miners were forced to return to work when the international union was advised the strikes violated the Taft-Hartley Act's prohibition on sympathy strikes.

The union also waged a corporate campaign, picketing Shawmut Bank, which had the Pittston board member William Craig as its vice president, and influencing unions and supporters to withdraw deposits. A Pittston workers' solidarity committee in Boston succeeded in pressuring the Boston, Cambridge, and Somerville city councils to withdraw city funds. Craig was forced to resign his position with Shawmut Bank. The miners received additional moral support and publicity when an international delegation including a representative from Polish Solidarność (Solidarity) arrived in October 1989. At the height of the strike, the union received 15 to 20 requests for speaking engagements a week, and rank-and-file miners traveled the country publicizing their strike.

By July, union leaders had been thrown in jail for refusing to order the miners to end the civil disobedience campaign, and court fines against the union passed \$4 million. When the company refused to back off its demands, in September the union escalated its civil disobedience campaign. Dubbing their plan "Operation Flintstone" in tribute to the 1936–1937 UAW sit-down strike in Flint, Michigan, 99 miners and one pastor marched into the Moss 3 mine and occupied it. For three and a half days, thousands of miners and supporters demonstrated outside the mine, but faced with an imminent police assault, the miners ended their sit-in.

On New Year's Day, 1990, the union reached a tentative agreement that gave some concessions but saved the workers' pensions and retirees' health coverage, and on February 20, the Pittston miners ratified the contract, ending their 10-month strike. The company agreed to petition the courts to drop the \$64 million in fines, and the fine was tossed out in a unanimous decision by the U.S. Supreme Court in 1993.

UMWA President Trumka declared the union had overcome the combined efforts of the company and the courts to eliminate the union, and the entire labor movement celebrated its first major victory since President Reagan fired 11,359 striking air traffic controllers and crushed the PATCO union in 1981.

PLUMB PLAN

Named for the railroad union attorney Glenn E. Plumb, the Plan aimed to nationalize U.S. railroads in the aftermath of World War I. Railroad labor unions led the campaign for nationalization, and the Plan became a rallying point for broader progressive forces in the labor movement. Despite widespread support from railroad workers, who had seen benefits from temporary federal control of the railroads during the war, the Plan fell victim to the Red Scare that soon followed the Armistice.

During World War I, private control of the roads had seriously hampered the national coordination needed to boost industrial production and transport war supplies. Moreover, there was a labor shortage, as higher wages drew workers out of the largely non-union, low-wage railroad repair shops. These problems led the Wilson administration to seize control of the railroads in December 1917, temporarily putting them in the hands of the U.S. Railroad Administration (USRA). Co-ordination improved under federal control. Under pressure from workers, commissions set up under the USRA granted substantial wage increases and protection for union organization, which shot up during 1918. Late that year, the Railway Employees Division (RED) of the American Federation of Labor (AFL), which represented unionized shopcraft workers, conducted a referendum asking workers whether they wanted government control of railroads to continue after the Armistice: 99% said yes.

Glenn Plumb, who served as attorney for the four railroad operating brotherhoods, thought that public railroad ownership could deliver justice for workers, lower rates for shippers and passengers, and reduce class conflict. Under his plan, the government would charter a public corporation to run the railroads. It would buy out the current owners with a combination of cash and government bonds. The board of directors would consist of 15 members, five elected by railroad workers, five elected by railroad management, and five appointed by the president to represent the public. If revenue exceeded expenses, the surplus would be split evenly between the federal government and the employees. The 50%

“dividend” going to the employees, however, would be divided between the “operating officials” and the workers, and the former would receive twice the rate of the latter. The government would use its share to extend and maintain the roads and to create a fund to retire the bonds used to buy the roads. If the government share was more than 5% of gross operating revenue, the Interstate Commerce Commission (ICC) would be obliged to reduce passenger and freight rates by this amount. With lower rates and possibly lower revenue the next year, workers and managers would presumably be motivated to be more efficient; if they succeeded in lowering costs, they would continue to receive a dividend. It would be, as Plumb put it, “scientific management under democratic control.”

Since President Wilson pledged that he would return the roads to private control and a privatization bill sponsored by Senator Albert Cummins (R-IA) gained momentum in 1919, the Plumb Plan League swung into action. Led by Arthur Wharton, the head of the RED, the League included on its executive board officials of the railroad brotherhoods, who remained outside of the AFL. Its newspaper, *Railroad Democracy: The Plumb Plan Weekly* (later renamed *Labor*), eventually reached some 500,000 readers. The League charged one dollar per year for membership, organized six hundred local chapters, and sponsored speaking tours. In a bid to widen its base, League leaders named the AFL chief, Samuel Gompers, honorary president in the summer of 1919, though without his consent. While this move angered Gompers, who viewed nationalization as a dangerous move in the direction of Bolshevism, the League won a political victory when delegates at the national AFL convention in January 1920 passed a resolution that endorsed railroad nationalization. Their vote reflected the wave of working-class militancy that swept the United States after the Armistice, as an unprecedented four million workers went on strike.

It was in this heated context that in August 1919, Thetus W. Sims (D-TN) introduced a bill in the House of Representatives to put the Plumb Plan into effect. Though the Plumb Plan was far from Bolshevik, Plumb was attacked as a dangerous radical, and the Sims bill was buried. Meanwhile, the Senate passed the Cummins bill, with a provision outlawing railroad strikes, and in January, the House passed a similar bill, sponsored by John Esch (R-WI). The conference bill, without the antistrike provision, was approved in February 1920 as the Transportation Act, which formally returned the railroads to private control.

POLITICS AND LABOR, NINETEENTH CENTURY

To understand working-class politics in nineteenth-century America, we must understand how the American political and class systems changed. Contrary to De Tocqueville, mass democratic electoral politics did not emerge directly out of the American Revolution but slowly through struggles over generations. Indeed, suffrage did not become universal until the last third of the twentieth century. And a workforce in which the largest occupational categories in 1800 were slaves, farmers, farmhands, domestics and unpaid household workers, artisans, and sailors changed to a workforce with a majority of blue-collar wage earners. Working-class politics involved struggles for interests of an evolving working class within the polity and struggles to gain full inclusion in that polity.

Undemocratic America

In 1800, somewhat over half of the adult white male population (and perhaps one fifth of the adult population) could vote (Keyssar, p. 24). No other country had suffrage this wide, yet the United States was still profoundly undemocratic. The daily lives of a majority of the people violated basic criteria for democratic rights: proprietorship over the individual’s “own person and capacities” (Macpherson, p. 263).

Three categories of adults—composing at least two thirds of the adult population—could not expect American law to recognize their title to their persons

or their labor: slaves, Indians, and women. African-Americans—almost all slaves—composed nearly one fifth of the population. Indians, like African-Americans, had virtually no enforceable legal standing. Yet, native peoples still controlled more than three quarters of the territory of what would become the United States and may have still numbered as much as one fifth of the white population. While the law recognized white women, the doctrine of *femme covert* legally subsumed women under their fathers and husbands. Most women also did not own property or the products of their labor.

Even among white males, proprietorship over persons and capacities varied. Indentured servants, still numerous in the late 1700s, were short-term slaves. Free white males who did not own property (as about half of them did not) faced legal and customary restrictions. Many of their commonest occupations restricted the right to quit. Sailors could not leave their ship without permission of the captain and faced life-threatening corporal punishment if they questioned the authority of officers. Agricultural workers (the largest category of waged labor) often signed annual contracts under which their employer held their wages as a bond until completion of the contract. If they quit or were fired, they forfeited all of their accumulated wages.

Thus, the daily lives of a substantial majority of working Americans in 1800 did not match any substantive understanding of freedom. Directly or indirectly, much of nineteenth-century politics reflected the contradictions between that daily reality and the promises of our founding revolutionary documents.

Three underlying factors shaped how those contradictions would be translated into the formal political arenas of parties, elections, and policy making: the heritage of European colonialism, the rules for political activity set out in federal and state constitutions, and a highly tribalized religiosity.

Heritage of Colonialism

The United States would not have existed but for the world-changing impact of European colonialism. However, within the resulting Atlantic economy, British North America occupied a niche that shaped subsequent political development differently from the rest of the hemisphere. British North America contained no land appropriate for sugarcane and no precious metals, the two greatest sources of colonialist wealth and plunder. While slave societies developed around the Chesapeake and in the coastal Carolinas,

other parts of British North America had few slaves. North American slavery remained a sideshow to the sugar colonies until the nineteenth century cotton boom. Because slave owners did not dominate, British North America disproportionately attracted European immigrants. The northern colonies and some western parts of the southern colonies became the most substantial white majority societies in the hemisphere.

As a result, by the American Revolution a bifurcated political culture combined reverence for the rights of Englishmen with defense of undemocratic racial hierarchy in an uneasy co-existence of political tendencies representative of metropole and colonial periphery. This contradiction fundamentally shaped and eventually dominated antebellum politics and influences American political culture to this day. Working-class politics emerged in a society where racial hierarchy and regional alignments functioned (and still function) as crosscutting axes to political divisions based on bourgeois versus proletarian.

Rules of the Political Game

If the colonial heritage structured American political culture, the constitutional heritage structured party politics and electoral behavior. Our constitution drafters left us with a political system markedly different from most other electoral democracies.

Chosen in a winner-take-all election conducted separately from legislative elections, and holding power at the behest of this national electorate rather than by maintaining a parliamentary majority, the American president resembles a constitutional monarch more than a parliamentary prime minister. The president nominates key government personnel unilaterally (subject to congressional approval, rarely refused until quite recently), in contrast to the parliamentary alliance building typical of prime ministers. The president similarly operates far more unilaterally than a prime minister in setting policy goals, suggesting budgetary priorities, and conducting foreign policy.

The principle of separation of powers, of which the separate election of president and legislature is a prime example, also means that effective governance demands simultaneous majority coalitions in several political institutions and at several levels. Power in American government is decentralized as well as divided among three branches of the national government. States select congressmen and senators. Maintaining national legislative majorities in both houses

of Congress thus demands cultivation of political influence within the states. State constitutions, with rare exceptions, mirror the national constitution.

All successful American political parties have adapted to the logic of this constitutional structure. Since no party could remain politically credible for long without capturing the executive, and no party could actually govern without dual legislative majorities, parties defined themselves as engines for manufacturing and holding majority electoral coalitions, not as bearers of a coherent ideological vision. They became patchworks of constituencies. Most of what critics and reformers have lamented about American party politics ever since—the emphasis on personalities rather than issues, the intellectual shallowness and inconsistency of electoral appeals, and the preoccupation with winning at all costs—are a result of the strategic logic embedded in the constitutional structure.

This constitutional system presented working people with a double political dilemma. First, they needed to gain entrance. Second, they needed to negotiate within the party structures that constitutional rules dictated. Although activists frequently tried to flout the constitutional logic by organizing labor parties, such parties could never exercise significant political influence beyond the local level and could never sustain themselves for long periods. But working-class voters rarely had sufficient political clout to effectively pressure major party politicians to shape party programs around working-class demands.

Religious Identities

Finally, a distinctive religious heritage shaped cultural and political life. Many of the colonies had been founded by religious dissenters (Puritans in New England, Quakers in Pennsylvania, Catholics in Maryland) or attracted others (Baptists, Methodists, German Evangelicals and Lutherans). Several founding sects attempted to establish their denominations within their own colonies, aggravating conflicts between denominations. Well before mass party politics emerged in the nineteenth century, there had been a tradition of ethnoreligious conflict. Party coalitions developed in part around this tradition. As the Second Great Awakening stimulated both religiosity and the proliferation of religious sects, ethnoreligious identity became the most consistent determinant of partisan loyalties. Ethnoreligious and regional identities, which divided workers, frequently trumped other concerns.

Mechanics

Prior to the Jacksonian Era, formal politics had largely been a gentlemen's hobby, but in the major seaports, working people—who made up the overwhelming majority—exercised influence both through crowd activity and through organization among skilled workers. Enough artisans could meet the property qualification for suffrage to constitute a sizable constituency—a “Mechanics Interest.”

However, commercialization and industrialization divided the old Mechanics Interest after the 1790s. Journeymen began organizing separately from the Revolutionary Era Mechanics Societies. Journeymen's societies successfully pressured employing masters to raise wages, maintain customary work rhythms, and hire only union members. In response, masters locked out workers and took union leaders to court under British common law doctrines of conspiracy in restraint of trade. More than two dozen such trials took place between 1805 and the 1830s, accompanied with packed courtrooms, popular pamphleteering, mass demonstrations, and political debates in city councils and state legislatures. The controversies around these trials symbolized the increasing bitterness of the larger conflict that provoked them. After the verdict in an 1836 trial of journeymen tailors in New York City, activists plastered the city with a “coffin handbill” denouncing the judge for burying liberty and equality and implicitly threatening his safety.

Decades of such conflict politicized and radicalized urban artisans and laborers, a process heightened by the self-conscious agitation of a scattering of European political exiles—United Irishmen, Luddites, Jacobins—and native Paineite radicals. By the end of the 1820s, radical artisans attempted to organize the world's first labor parties.

Workingmen's Parties

Workingmen's Parties startled political observers in Philadelphia and New York City in 1829, despite their amateur leadership and rudimentary organization. The Philadelphia Party ran poorly in its first campaign in 1828 but garnered about 20% of the vote in Philadelphia County the following year. The New York City Party did even better, with 31% in the 1829 state assembly races electing Ebenezer Ford, a carpenter.

Publicity of these initial successes inspired a frenzy of imitators and opportunists. Working people

organized dozens of local Workingmen's Parties in the next year or two, and in some cities, ambitious politicians launched workingmen's tickets of doubtful authenticity, hoping to capture votes with the popular label. None lasted more than two or three years.

Yet despite their brief flare, they crystallized popular sensibilities about the implications of capitalist development and the potential of mass electoral mobilization. American politics would never be the same. The Workies made a larger public conscious of how commercialization, industrialization, and the transportation revolution had begun to alter the American political economy. A world of workers and bosses had started to replace a world of farmers, sailors, merchants, slaves, and planters. The Workies looked to the state to remedy their problems with the new political economy. The proper role of the state in economic life has been a staple of American politics ever since. The Workies also suggested that politics was too important to be left to gentlemen. Working people, who had often ignored elections even when they were eligible to vote, discovered politicians and voting booths.

The Workies also helped politicians discover the people. They demonstrated the electoral potential of a populist style pitting the People against the Enemies of the People—Tory bosses, Masonic cabals, the slave power conspiracy, and later economic royalists or secular humanist intellectuals.

Emergence of the Second American Party System

The Workies also benefited from fortuitous timing. Party competition had disappeared during the previous decade with the collapse of the Federalists. The Workingmen appeared just as political entrepreneurs sought new rhetoric and constituencies around which to build a second party system.

The Workingmen suggested possibilities both to incipient Jacksonian Democrats and proto-Whigs. Organizers of Jackson's 1828 presidential campaign successfully re-invented the wealthy and well-educated Tennessee military hero as a backwoods man of the people fighting for just plain folks against an Eastern establishment. Jackson—an Indian fighter, slave owner, and advocate of the creditor rather than the debtor faction in Tennessee politics—had no history of sympathy for the downtrodden, but he did harbor hostility toward the pretensions of seacoast elites, and he was willing to play the part. The Jacksonians won decisively amidst unprecedented turnout.

Both parties responded to this demonstration of how populist style could mobilize voters, and both also recognized that successful mass mobilization demanded a party organization run by political professionals. Their competition for voters undermined elite resistance to white manhood suffrage. By the 1840s, voter turnout reached the highest levels in American history, often topping 80% in national and state elections.

The Whigs defined themselves against Jackson by combining an economic program for capitalist development with an emphasis on respectability and Protestant morality. Their economic program anticipated the belching smokestacks and full dinner pails of late nineteenth-century McKinley Republicans: a national bank for monetary regulation and capital formation, a federally funded infrastructure to facilitate movement of goods, and high tariffs to protect American workers and manufacturers from foreign competition. The Whig formula: economic growth, prosperity for all, plentiful high-wage jobs plus moral stewardship with enforced Sabbath observance, prohibition, and Bible reading in the public schools.

Democrats built a coalition capable of winning national elections even after Jackson no longer headed the ticket by combining diverse groups repelled by the Whigs. The majority of slave owners opposed the Whig economic program. They feared that European nations that bought their cotton might retaliate against American tariffs, and protection for American industry meant higher prices for manufactured goods. A more fundamental concern intensified these objections: any program that strengthened the capacities of the national government strengthened the one institution that could threaten slavery.

Others threatened either by Whig economics or Whig morality joined slaveholder opponents of federal power: Catholics, Protestant sects that also feared persecution, secularists, drinkers and other enthusiasts of sensual pleasures, noncommercial farmers who viewed capitalist development as a threat rather than an opportunity, labor unionists embittered by conservative judges, and entrepreneurs who thought of themselves as outsiders or had local rather than national economic interests.

Two slogans—"personal liberty" and "white men's democracy"—united the diverse Democratic coalition around an assertively laboristic rhetoric. Not until New Deal Democrats did any major political party match Jacksonian claims as friends of labor or their appropriation of a language of class anger. Whigs countered that their formula for prosperity made them the true friends of labor.

That both major parties consciously competed so strenuously and self-consciously for a labor vote is

at first glance surprising. The emerging working class of industrial wage earners, journeymen, urban day laborers, and servants still constituted a small percentage of the national electorate—not much more than 10% in 1840—and that minority, divided like other Americans by region, race, ethnicity, and religion, could hardly function as a politically cohesive group. But laboristic rhetoric meant more than an appeal to labor as a potential constituency. It symbolized widespread concerns about capitalist development.

Working People and the Second Party System

Many labor activists responded skeptically to the laboristic appeals of Jacksonians and Whigs. The former Philadelphia Workingman William English complained how “once a year politicians call us *men*; ... once a year we are the *intelligent, virtuous, orderly working men*. But then they want our *votes*.” His colleague, John Ferral, accused both Democrats and Whigs of trying “to lure...working people into the meshes of their nets” (Pessen, pp. 123–124). Yet both, like most labor leaders, campaigned for the Democrats, attracted by antibank and antimonopoly diatribes, and by willingness of some urban Democratic politicians to defend workers’ right to strike and support legislative goals like 10-hour-day laws. President Van Buren’s 1840 executive order establishing the 10-hour day for workers in federally funded projects seemed like tangible evidence that Democrats’ proworker language had substance.

But while labor activists tended to support the Democrats, working-class voters divided their votes between the two major parties. In part, this reflected the regional and ethnoreligious identities of working people. That region, ethnicity, and religion are the most reliable statistical predictors of partisan behavior in this era makes it appear that class concerns were irrelevant to antebellum politics. But that argument is hard to reconcile with other evidence about antebellum politics and culture—the widespread labor unrest of the 1830s and the 1850s, the popularity of literature darkly critical of capitalist development, and the eagerness of political campaigners to use explicitly class-tinged rhetoric. After the Bible, the two best-selling books in the antebellum United States were both critiques of America’s labor systems: Harriet Beecher Stowe’s *Uncle Tom’s Cabin* and George Lippard’s surrealist denunciation of capitalist exploitation, *The Quaker City*. Or consider the response of an Ohio congressman to a Whig colleague’s speech about the harmony of interests between capital and labor (Ashworth, pp. 88–91):

Well this is very fine.... I suppose the capitalist will have no objection to exchanging situations with the laborer; that he will give up his capital to the laborer...his lands... the key to his costly sideboard, and the freehold to his rich wines, gold goblets, cut glass decanters...and he, the capitalist will enter the field of toil and sweat and there labor from morning till night.... And when shall such an example as this take place...when the lion and the lamb shall sit down in peace.

It seems more likely that class concerns mattered to working-class voters but that workers did not agree about which party best addressed those concerns. For example, Whig promises of tariff protection looked like job protection for some workers but higher living costs to others. In iron cities like Pittsburgh and in New England cotton mill towns, working people tended to vote Whig because tariffs offered protection from British competition threatening their livelihoods. In New England shoe towns, where tariff protection was less important, working-class voters were not as likely to vote Whig. In Philadelphia and Boston, both strongly Whig cities, correlations between the property values or wealth of each ward and the percent voting for Whigs or Democrats show a statistically significant tendency for voters in the poorer wards to vote more Democratic than the rest of the city, even when Whigs carried the cities overwhelmingly.

Overall, the Democrats’ proworker rhetoric may have given them a slight edge among working-class voters, especially where Democratic politicians went beyond laboristic rhetoric to actively support workers. But industrial workers represented too small a percentage of the national electorate and were too divided by region, race, religion, ethnicity, and sectoral economic interests to form a cohesive voting bloc, except in a few scattered local elections.

Politics of Race and Slavery

The second party system depended on a bipartisan evasion that eventually scuttled it. Whig and Jacksonian leaders agreed to keep discussion of slavery out of the electoral arena. Some did so because they valued preservation of the Union above all else; some because they hoped slavery might gradually disappear without conflict; some because they believed a successful national party needed to draw votes on both sides of the Mason-Dixon line and could only do so by avoiding the issue. The congressional “gag rule,” as its opponents called it—a procedural agreement to automatically table without discussion all petitions and proposals relating to slavery—symbolized the evasion.

But industrialization and capitalist development undermined this gentlemen's agreement. Mechanical production of cotton textiles produced an explosive worldwide demand for cotton. The American South was the best cotton-growing land on earth. King Cotton made southern slavery more profitable than it had ever been, dashing illusions that slavery might peacefully fade away. The cotton boom fueled the entire economy and stimulated westward expansion. In the first two hundred years of European settlement in North America, few Euro-Americans had moved more than two hundred miles west of the Atlantic coast. In the next 50 years, they would sweep across the continent. Each time a new territory petitioned for statehood, Congress had to revisit slavery. In an economy driven by cotton mills and cotton factories in the fields, slavery could not be kept out of party politics.

Repeated political crises over territorial expansion kept the issue of slavery in the consciousness of citizens, who also felt vaguely threatened by capitalist development. For example, leapfrogging slave territory threatened free white farmers' access to prime land (because slave owners could outbid them for the best acreage) when they were already nervous about the growing commercialization of agriculture.

The expansion of slavery also threatened to muddy the color line that had helped to maintain the loyalty of non-slaveholding and poor whites. The Jeffersonian ideal of a yeoman republic envisioned a society where a majority of white families owned land and those who didn't had reasonable hope of doing so. Within this ideology, whiteness corresponded with financial independence from the wills of others. The color line marked both a cultural and a material boundary. But with the rapid increase in waged labor that accompanied industrialization, an ever-growing portion of the white population faced what they insistently called wage slavery: lifelong financial dependence on employers and daily submission to the will of another, work regimes that uncomfortably mirrored the situation of chattel slaves. Both industrialization and the expansion of slavery thus served to intensify the racialization of American culture and the perception of slavery as degrading and threatening.

Working People and the Politics of Slavery and Race

Working people divided bitterly over slavery and race. For example, both the mobs who attacked abolitionist meetings and the victims of those attacks were disproportionately working class. On the one hand, many working-class radicals interpreted the

growth of wage labor as a Tory counter-revolution designed to undermine their revolutionary birthright. They argued that industrialists and slave owners—lords of the loom and lords of the lash—collaborated in this plot to expand exploitation. All working people, regardless of race, legal status, ethnicity, or religion, should unite against their oppressors. Yet, given the racialized nature of American political culture, it is not surprising that even many white workers who preached a radically democratic version of American republicanism saw potentially emancipated slaves not as allies but as a barbarian horde that would further weaken their position against industrialists.

George Henry Evans, a New York City printer, organizer of the Workingmen's Party, and editor of the *Workingmen's Advocate*, had been the only editor in New York to defend the slaves' right to revolution after the 1831 Nat Turner Uprising. White workers shared blame for the loss of life in Virginia, Evans argued, because they had allowed slavery to persist by not actively fighting for abolition. But by the 1840s, Evans had become an anti-abolitionist convinced that northern industrialists had joined the abolitionist movement to shift popular attention away from the white slaves of the North.

Other labor radicals went further than Evans, trying to ally with southern politicians against northern industrialists. Mike Walsh, an Irish-American union organizer, editor, and New York City congressman, sought an alliance with John C. Calhoun, whom he viewed as an American equivalent of the British "Tory Socialists" who had sponsored factory inspection and other reforms in Britain.

Slaves and White Southerners

Perhaps the only cohort of working people who had absolutely no disagreement or confusion over the slavery question were African-Americans. About one American in five was African-American in 1790, about one in seven in 1860. However, because nearly every African-American performed menial labor regardless of age or sex, African-Americans represented about twice as large a percentage of the labor force as the population. The cotton they grew was decisive to the growth of the entire economy. They literally carried the rest of America on their backs.

Slaves resisted in small and individual ways such as shirking and tool breaking, and in large, collective actions such as mass escapes and rebellions. Free blacks, often linked to slave rebels, organized annual race conventions, armed vigilance committees against slave catchers, and decisive support for white

abolitionists. William Lloyd Garrison's famous *Liberator* could not have gotten off the ground in 1831 without black support. When its first issue rolled off the presses, Garrison had only one hundred white subscribers.

During the course of the nineteenth century, slave rebellions also suggested a growing political self-consciousness among black working people. Many colonial slave revolts had been rooted in African cultural traditions and ethnic solidarities. They were as much mass escapes seeking refuge in Maroon communities as political assaults on the slave system. But the largest slave rebellions and conspiracies of the nineteenth century—the 1800 and 1802 Virginia conspiracies, the 1811 Louisiana revolt, Denmark Vesey's 1823 plot in Charleston, and the Virginia uprising of Nat Turner's followers in 1831—were all self-consciously revolutionary political movements seeking to overthrow the slave system. To a striking degree, the ideological visions of their leaders mirrored those of white labor activists—Paineite radical democracy and millenarian evangelical Protestantism.

Thus, despite their exclusion from formal electoral politics, African-American working people were self-conscious and decisive political actors. Their resistance made it impossible for other Americans to avoid recognition that slavery depended on systematic mobilization of coercive violence. Slave resistance undermined the moral claim of the United States as the democratic city on the hill and inspired other critics of the shortcomings of American democracy. The violence visited on slave rebels also dramatized the claims of antislavery activists trying to convince non-slave-owning whites that slavery threatened their liberties as well.

It is difficult to judge how consistently such arguments resonated with southern white working people. As W. E. B. DuBois noted, the "psychological wage" of white supremacy gave poor white southerners an emotional investment in slavery. Many poor white men wanted to join the planter class more than they wanted to overthrow it. But generations of conflict between Tidewater and Upcountry had also fostered a long tradition of class antagonism within the white South. Carriers of this tradition, such as the Kentucky abolitionist Cassius Clay or the North Carolina artisan Rowan Hinton Helper, who published an antislavery tract in 1857, tried to convince white working people that slavery robbed them of economic opportunity and liberty. Both had a following, especially in the Upper South and in cities with cohorts of immigrant workers and labor unions such as Baltimore, Richmond, and New Orleans. But proslavery mobs burned the printing presses of men like Clay who tried to rouse southern workers to fight

the planter class, threatened the lives of iconoclasts like Helper, and terrorized political activists who attempted to campaign for the Free Soil or Republican parties. While intense electoral competition between Democrats and Whigs gave southern politics a democratic appearance, in a region where black and white opponents of the slave regime faced overwhelming violence and terror, overt working-class political opposition to the slave regime had no chance of even getting started.

Free Soil and the Rise of the Republican Party

But a militarized South, with ubiquitous armed slave patrols pursuing runaway slaves into free territory, with militant advocates of slaveholder rights seemingly bent on nationalizing slavery, suggested to white northern workers that slavery no longer was someone else's problem. This sense that southern firebrands wanted to nationalize slavery enhanced the political capital of moderate antislavery politicians. While the abolitionists' moral critiques of slavery had never come close to winning a majority of the northern public, moderate antislavery politicians hoped to combine those who opposed slavery on moral grounds with those willing to fight the Slave Power—the slaveholding class—out of self-interest. As one Michigan Free Soiler put it, they had to show voters "that their *bread and butter* depends upon their doing right" (Formisano, p. 214).

The Republicans' 1856 campaign slogan—"Free Soil, Free Labor, Free Men"—embodied that strategy. Free labor, Republicans argued, could not compete with slave labor. Only in Free Soil states, states that outlawed slavery, could free labor thrive, and only where free labor thrived could workingmen be free. Recruiting savvy political veterans from both major parties, the Republicans combined what had been most appealing in both Jacksonian and Whig appeals to working people. They married the Jacksonians' paeans to honest workingmen and democratic self-reliance with Whig economics and promises of full employment and upward mobility.

Like all successful American parties, the Republican Party consciously built a diverse coalition. They cultivated nativists and prohibitionists, balanced tickets, and promised spoils. But they nonetheless conveyed a sense of idealism and integrity that perhaps made platitudes about honest labor seem meaningful. Republicans, after all, had done something unusual in American political history: they had taken an unequivocal position on the most controversial issue of their day.

Republicans did not run well among unskilled workers, disproportionately Irish Catholics and Germans (also two thirds Catholic). They carried too much of the scent of militant Protestantism and nativism. But they ran well among northern skilled workers. Lincoln got as many as two thirds of the votes of skilled workers in such industrial cities as Pittsburgh and Cincinnati, although he averaged only 40% of the national popular vote. Radical labor activists, from German Marxists to aging Workingmen, increasingly saw the abolition of slavery as a prerequisite to any successful response to the labor question of industrial capitalism.

Working People and the Politics of War and Reconstruction

Civil War draft resisters argued that the Civil War, like most wars, was a rich man's war and a poor man's fight. They objected to the draft law's provisions allowing the well-to-do to escape service by paying substitutes. Some objected to risking life and limb to free the Negroes. In New York City in 1863, where Irish and African-American workers had long harbored mutual hostility, draft riots became murderous pogroms against people of color.

But the war also kindled a remarkable surge of working-class political idealism, a sense that the working class was being called to a great moral purpose and that out of suffering would come a society that offered the working class something closer to the promises of its founding documents.

Perhaps the most startling evidence of political purpose was the conduct of African-American young men. Long before Lincoln had committed himself to emancipation, slaves became convinced that the war would usher in the day of Jubilee. Wherever Union lines moved close enough to suggest the possibility of successful flight, they abandoned the plantations. Men of military age begged a reluctant army to train and arm them so they could fight their oppressors. By war's end, perhaps a quarter of the male slaves of military age had escaped slavery to join the Union army, guaranteeing a ready supply of enthusiastic infantrymen just when draft resistance had seemed to threaten the war effort and withdrawing a pool of the most valuable labor power from the Confederate economy. W. E. B. DuBois called this mass flight the largest general strike in American history.

Lincoln, the first poor boy to reach the presidency, understood how to dramatize that sense of mission. His Gettysburg Address redefined the war for the Union as it was to a war for what it should be—"government

of the people, by the people, for the people." His second inaugural address clothed the political project he had posed at Gettysburg in the evangelical language of sin, suffering, and redemption.

In the mid- and late 1860s, this idealism of the War years, combined with an inflationary spiral, stimulated the greatest outpouring of labor activism since the 1830s. The Boston machinist Ira Steward, the theorist and promoter of the eight-hour day, summarized a widespread sentiment among northern workers at the end of the war: "the workingmen of America will in future claim a more equal share in the wealth their industry creates...and a more equal participation in the privileges and blessings of those free institutions, defended by their manhood on many a bloody field of battle." Steward urged radical Republicans to turn their eyes northward: "[L]et our dinner tables be reconstructed," he declared.

Steward helped to refine a working-class interpretation of republicanism that had been percolating among Paineite labor radicals, utopian labor reformers, and evangelical millenarians for much of the previous century: the political struggle for human rights and democratic government and the conflict between producers and nonproducers, who lived off the value produced by other men, were essentially the same. In the next generation, this producer republicanism would culminate in the national ascendancy of the Knights of Labor. Working-class political activists imagined that labor republicanism would politically unite an emerging working-class majority who would use the American political system to emancipate wage slaves just as they had emancipated chattel slaves.

Producer Republicanism and Gilded Age Politics

At the end of the Civil War, the prospects for restructuring American politics around the question of wage labor, as the Republicans had done around slavery, seemed much better than they would be in retrospect. Although still small and fragile, labor unions had expanded significantly. What had begun as a war to prevent secession had been transformed into a war to abolish an undemocratic labor system. Surely, labor activists believed, their fellow Americans could be made to see that liberty and justice for wage slaves was merely an extension of the principles for which they had just fought and died. Who could have imagined just 30 years ago that the small circles of abolitionists who risked their lives whenever they spoke in public would live to see slavery abolished?

Rising working-class discontent would make “the labor question,” as it came to be called, one of the central topics of public discourse for the next 50 years, but would-be worker politicians found it far harder to translate discontent into political power than to raise the question. Major parties occasionally selected labor leaders as candidates, a few prominent national politicians expressed sympathy for industrial workers, and some big-city machine politicians courted labor by restraining strikebreaking by police and local judges, but such pockets of support were too scattered and episodic to significantly shape national party agendas.

Discontented workers, disgusted with the unwillingness of the Republicans and Democrats to address their concerns, frequently tried to run labor candidates on Labor, Socialist, Greenback, and Populist tickets. Such efforts followed a recurring pattern. Following peak moments of industrial conflict, they often did surprisingly well, emerging out of nowhere with sufficient electoral clout to challenge the major parties and occasionally win a few offices. Thus, the Massachusetts Labor Reform Party elected 22 state legislators in 1869 and polled 15% of the state vote the following year. The Greenback-Labor Party received over one million votes in 1878, ran particularly strongly in industrial cities like Pittsburgh, and elected the union leader Martin Foran to Congress from Cleveland and the future Knights of Labor grand master workman Terence Powderly as mayor of Scranton. Socialists elected local officials and state legislators in Chicago, St. Louis, Milwaukee, Detroit, and Louisville during the 1870s. Local labor parties associated with the Knights of Labor also displayed electoral strength in the mid-1880s. Their 1886 mayoral candidates drew more than a third of the votes in New York and Chicago and won elections in several smaller cities. Populists in the 1890s ran competitive races in many industrial and mining towns.

Such surges of labor protest voting demonstrated that working-class discontent ran deep, but almost invariably such surges turned out to be one-hit wonders, quickly fading into insignificance in subsequent efforts. The labor organizations that spawned them could rarely sustain their own organizational base through fluctuations in the business cycle, so labor party resources frequently disappeared. Even at their peaks, the most powerful national labor organizations represented too few members to win elections outside their strongest bastions. The Knights’ peak membership reached over 700,000 in 1886, but nearly 11.5 million people voted in the 1888 presidential election. Even if turnout among Knights eligible to vote had been 100%, and even if they had all voted as a bloc, they could not have represented more than 5% of the national electorate.

Given the structure of American politics, minor parties, which might have slowly built support within a parliamentary system, seemed impotent after the initial flush of enthusiasm faded, even where they had local victories. Labor activists elected in local races found themselves undermined by incumbent opponents and officials and outflanked by hostile state and national governments. They could not deliver on the expectations of their voters. Accomplishing anything demanded compromise and political alliance, but skeptics about independent political action pointed out that this necessity suggested they should bargain for concessions within the major parties.

Finally, their electoral base usually had prior major party partisan preferences based on regional and ethnocultural identities. At peak moments of industrial conflict and agitation, significant numbers of working-class voters might put such identities aside temporarily, but as emotions calmed, and as third-party politicians could not deliver on millenarian expectations, let alone even minimal pork-chop benefits, the lure of returning to the power and security of a major party home became compelling.

A Century of Working-Class Politics in Retrospect

What did a century of working-class political action accomplish? For many activists and for many historians sympathetic to working people, the answer was frustrating. Explicitly prolabor parties went down to inevitable defeat, while joining major parties seemed at best to offer limited gains. The structures of political power seemed nearly as impermeable to working-class influence at the end of the century as at the beginning. Neither major party offered workers more than episodic support or more than occasional tangible material benefits—no social security, unemployment insurance, workmen’s compensation, food stamps, public housing, enforceable safety standards, enforceable statutory limits on employer demands, or right to collective bargaining. Indeed, by the end of the century, the rapid increase in such anti-union devices as court injunctions, yellow-dog contracts, and heavily armed private company armies made union membership more dangerous than it had been for the members of journeymen’s societies who had faced conspiracy indictments at the beginning of the century. Every year, police, troops, and armed company guards killed peaceful and unarmed strikers. Between the Gilded Age and the 1930s, more Americans died in the class war of the picket line than died in the shooting war with Spain. Not until

the New Deal would working people achieve significant influence on public policy or the right to organize without having to fear for their lives.

Yet in other ways, working-class political agitation had improved working-class life. Democratic values had become sacrosanct in American political culture—even though practices still didn't always match. Slavery had been abolished and de jure universal male suffrage achieved—although many African-American southerners would not have de facto voting rights until the 1970s. Women's suffrage would follow within the next 20 years. A century of agitation had lowered the length of the average working day by three or four hours. Workers would rarely tolerate forms of intimidation common in 1800: corporal punishment in the workplace, long delays in wage payment designed to make them compliant for fear of losing accumulated pay, restrictions on freedom of movement.

Working-class politics had also shaped American culture. By 1900, virtually everyone in America knew what people meant when they used words like union, strike, boycott, scab, picket line, or solidarity. Such cultural knowledge provided a basis for struggle by subsequent generations of American working people. The “labor question” would be at the core of Progressivism and the New Deal.

Yet, for all the benefits they provided, Progressive and New Deal reforms would certainly have disappointed such nineteenth-century labor activists as the Workingmen Thomas Skidmore or George Henry Evans or advocates of producer republicanism like Ira Steward. They would have recognized the value of these reforms. But they would have argued that the social bargain of the New Deal, while granting important social welfare benefits and the right to organize, still left working people in a subservient dependence on their employers. In a new century, with the victories of the New Deal era seemingly relentlessly rolled back, perhaps American working people need to relearn a key lesson of these nineteenth-century labor radicals: meaningful democracy is incompatible with sharply unequal economic power.

POLITICS AND LABOR, TWENTIETH CENTURY

In the first two thirds of the twentieth century, organized labor moved from the margins of American politics to a position of power and influence, its rise facilitated by a series of carefully crafted strategies and bitterly fought battles. As American public life shifted to the right in the 1970s, 1980s, and 1990s, labor's standing tumbled, so that by the end of the century, it was once again on the margins, seemingly incapable of influencing politics and policy in any significant way.

The late nineteenth century had been a particularly difficult period for the labor movement. Unprecedented economic change fostered profound conflict at workplaces across the nation. Yet when working people tried to protect or advance their interests through collective action, they often faced fierce resistance from the combined power of capital and the state. Employers regularly secured court injunctions declaring particular strikes illegal. When workers violated those injunctions, government officials enforced the court orders with massive shows of force. Time and again, federal troops and state militias intervened in strikes the courts had prohibited, shattering walkouts at gunpoint, arresting strike leaders, and even battling workers in the streets. “All the machinery of the state stands ready to protect and further the interests of capital,” complained a pro-union observer, “while labor is absolutely without law, a law unto itself, save when it commits some act, to be dealt with as a criminal.”

Unionists had no single solution to the dilemma they faced. Some argued that business and government were so hopelessly intertwined that only revolutionary action could tear them asunder. Others favored a democratic evolution to socialism, a perspective that was gaining a substantial following in the working class at the turn of the century, thanks in

part to the relentless agitation of the Socialists' dynamic spokesman, Eugene V. Debs. Still other labor activists favored government regulation of the capitalist economy and the creation of a welfare state. The fledgling American Federation of Labor (AFL), meanwhile, argued that there was no point in trying to restructure the American political economy. Instead, union members should adopt a more modest goal, pressuring politicians to rewrite the laws that constrained union action so that labor might pursue its self-interest as it saw fit.

The AFL president, Samuel Gompers, reduced his strategy to a simple dictum: "Reward your friends," he famously said, "and punish your enemies." In practice, however, the AFL did not maintain the nonpartisanship that Gompers claimed to favor. Although the Republican Party had a progressive wing, most of its major figures opposed labor law reform. In the Democratic Party, the balance was much the opposite. Democratic conservatives, such as Grover Cleveland, were more than willing to lend their weight to corporate interests. But by the first decade of the twentieth century, party leaders were willing to endorse the AFL's demands. In exchange, Gompers brought the federation into alliance with the Democrats. In both the 1908 and 1912 presidential elections, for instance, the AFL worked closely with the Democratic National Committee to mobilize the working-class vote, and federation officials campaigned on behalf of the Democratic candidates.

The AFL's mounting involvement in Democratic affairs brought Federation officials into contact with the Party's growing progressive wing. It was not always an ideal match. Gompers's primary political aim was to reduce government involvement in labor's affairs, whereas progressives generally supported greater government action, albeit on behalf of working people rather than on behalf of business interests. So Gompers opposed calls for a law mandating an eight-hour workday, state-supported health-care plans, federal mediation of labor conflicts, and a minimum wage, all reforms progressives strongly supported. But other unionists were drawn to the progressives' expansive view of government power. Many connections occurred on a local level, where labor activists joined with settlement house workers, socially minded lawyers such as Felix Frankfurter and Frank Walsh, ethnic politicians such as Al Smith, some socialists, and even a handful of liberal businessmen to promote progressive causes. In the course of the Wilson administration, however, the labor-progressive alliance shifted from the streets of Chicago and New York to the highest levels of government.

When Woodrow Wilson was elected president in 1912, he was not considered a champion of labor.

His first three years in office did little to change that impression. But as Wilson faced re-election and the possibility of war in 1916, he shifted his administration's labor policy dramatically. First came a burst of progressive reform, including a limited minimum wage law and a long-awaited prohibition on child labor. Then, after the United States entered World War I, Wilson launched what one historian has called "a mini-legal revolution" in collective bargaining. Desperate to bring order to a chaotic wartime economic mobilization, the president created a National War Labor Board (NWLB) to adjudicate industrial disputes. Directed by a cadre of progressives, the board used its power to support workers' right to unionize without employer interference, to promote workplace democracy through formal systems of shop-floor representation, to extend the eight-hour day and the minimum wage to more industries, and to provide women workers with equal pay for equal work. Such vigorous government policy helped to trigger a surge in union membership from 3 million workers in 1917 to over 5 million in 1920, a 70% increase in three years. Suddenly, Samuel Gompers's circumscribed vision of the state's proper role appeared hopelessly antiquated—a relic of another age.

But the bold experiments of the war years did not last. In 1919, businessmen and their conservative allies launched a political offensive that shut down the NWLB, reversed the labor movement's great surge forward, and triggered a Red Scare so ferocious that it eviscerated the radical left. By the early 1920s, organized labor was reeling, whipsawed by a Republican ascendancy that had no interest in its agenda, a judiciary once again willing to wield the cudgel of injunctions, and a business community determined to re-assert its absolute authority over the workplace. Badly battered by labor's dramatic turn of fortunes, Gompers drew the AFL back from its engagement with party politics, a policy endorsed by his successor, William Green, who assumed control of the Federation after Gompers's death in 1924. Labor's progressives, meanwhile, desperately tried to open new political avenues, but their most ambitious effort—Robert La Follette's 1924 third-party campaign for the presidency—ended in crushing defeat.

The severe setbacks of the 1920s did not destroy the progressive ideal, however. With the collapse of the NWLB, its advocates returned to their settlement houses, unions, law offices, college campuses, and congressional offices, policy makers in exile. But they maintained the network they had built during the Wilson Administration. And through that network they sharpened the ideas that had shaped the wartime labor program. In the midst of the 1920s boom, to talk of economic rationalization through federal

support of unionization, workplace democracy, and the expansion of the welfare state must have seemed like an academic exercise. When the boom gave way to a massive depression, though, the progressives were perfectly positioned to resurrect their program.

In the early days of the Great Depression—1930, 1931, and 1932—the progressive bloc promoted its ideas primarily through congressional allies such as New York’s Robert Wagner, Wisconsin’s Robert La Follette, and Nebraska’s George Norris. The 1932 presidential election shifted the balance of power from Capitol Hill to the White House. Like Woodrow Wilson before him, Democrat Franklin Roosevelt enjoyed substantial support from organized labor during the campaign. But that support was hardly decisive, and when FDR took office, he was not beholden to labor interests. He desperately needed a labor policy, however, and the progressives had one to offer. So Roosevelt integrated the network into his administration. The connections ran from Secretary of Labor Frances Perkins through the presidential aides Tommy Corcoran and Benjamin Cohen to Roosevelt’s informal advisor Felix Frankfurter, back to Senator Wagner and other New Deal congressmen and finally to select union leaders, most notably the United Mine Workers (UMW) president, John L. Lewis, and Sidney Hillman of the Amalgamated Clothing Workers of America (ACWA).

It took the progressive network almost three years to consolidate its position within the administration. Roosevelt endorsed the right of workers to form unions free of employer interference with Section 7 (a) of the 1933 National Industrial Recovery Act (NIRA), but weak enforcement undermined the measure’s effectiveness. By the winter of 1935, it was clear that Section 7(a) was not working. Senator Wagner therefore introduced a replacement bill designed to put the power of the federal government behind workers’ rights. In concept, the bill embodied the progressive idea that unionization would regularize industrial relations and thus help to rationalize the American economy. What’s more, progressives argued, unionized workers would have the leverage necessary to win higher wages, which would boost purchasing power and foster the economic growth an economy mired in depression so obviously needed. In practice, Wagner’s bill followed the model established during World War I: creating a federal agency—the National Labor Relations Board (NLRB)—empowered to protect workers as they organized unions.

At first, FDR did not endorse the bill. But as it moved through Congress in the spring of 1935, he added his support. The National Labor Relations Act (NLRA) became law on July 5, 1935. The progressives’ moment had arrived.

For the next two years, politics, policy, and direct action fused in a fashion it never had before. When AFL leaders refused to launch a nationwide organizing campaign to bring unionization to the nation’s core industries, Lewis and Hillman abandoned the AFL to create their own federation, the Congress of Industrial Organizations (CIO). To make sure that the CIO had the political support it needed to take on corporate America, Lewis and Hillman threw themselves and their unions into Roosevelt’s 1936 re-election campaign. Lewis funneled over \$500,000 of Mine Workers’ money—an unprecedented sum—into Democratic coffers. Union organizers worked tirelessly to bring working-class voters to the polls. And Lewis himself campaigned for Roosevelt across the country, his efforts capped by a joint appearance with the president in the heart of Pennsylvania’s coal country days before the election. When Roosevelt swept the election—carrying 46 of 48 states—Lewis knew the CIO was ready to move. “We...must capitalize on the election,” he told his executive board shortly after the votes were counted. “The CIO was out fighting for Roosevelt....We wanted a president who would hold the light for us while we went out and organized.”

That is precisely what they got. On the last day of December 1936, autoworkers in Flint, Michigan, began their epic sit-down strike. From that spark, the CIO fire spread across industrial America, its advance aided by sympathetic New Dealers such as the Michigan governor, Frank Murphy, who refused to use force to evict the sit-down strikers, and the progressives who staffed the new National Labor Relations Board. In the course of 1937, union membership increased by three million as the CIO organized workers in some of the nation’s most powerful companies, among them General Motors and U.S. Steel. There were also some stinging defeats that year. But by the beginning of 1938, organized labor had become a major power in the American economy, its dramatic rise—and future prospects—tied intimately to the New Deal state.

Just how intimately the two were tied became clear over the next decade. As the militancy of 1937 began to fade, the CIO came to rely more heavily on its allies at the NLRB to advance the union cause. There were still dramatic strikes—CIO unions shut down both Bethlehem Steel and the Ford Motor Company in 1941, for instance—but it was as much NLRB pressure as mass protest that forced the firms to recognize their workers’ right to unionize. The United States’ entry into World War II at the end of 1941 strengthened the connection. Patriotic fervor demanded that the labor movement pledge not to strike for the duration. In exchange for that critical concession,

the federal government guaranteed unions “maintenance of membership.” That is, if a union had a contract with an employer when the war began, all new hires would automatically become union members after 15 days on the job. As a result, union membership shot up by five million during the war, thanks not to union action but to government policy.

Both AFL and CIO unions benefited from the Democrats’ support for unionization; in fact, the AFL grew more quickly than the CIO in the late 1930s and early 1940s. Still, AFL leaders kept their distance from Roosevelt and the Democrats. The CIO, in contrast, strengthened the ties it had forged in the crucible of 1936. It was partly a practical matter, of course, a quid pro quo for all that the New Dealers had done for the labor movement. But it was more than that. The CIO had its share of bread-and-butter unionists, who wanted nothing more from their unions than higher wages and shorter hours. But the CIO was also home to a vast array of progressives who hoped that the labor movement might promote a range of reforms. National health care, public housing, federal aid to education, civil rights, national economic planning, even the nationalization of key industries: CIO activists supported these and many more causes. And at least as long as Franklin Roosevelt was alive, most of them believed that the Democratic Party offered the only real avenue for advancing their agendas.

So the CIO integrated itself into the Democratic Party machinery. Union leaders such as Sidney Hillman took seats on the Party’s policy-making committees, while local labor activists filled positions in the Party’s state and city councils. In the 1944 presidential election, Sidney Hillman built an elaborate campaign structure, the CIO Political Action Committee (PAC), that raised campaign contributions from every union local, produced reams of campaign literature, crafted radio advertisements, and sponsored get-out-the-vote drives—all on behalf of Roosevelt and the Democrats. Dissent was not an option. When John L. Lewis announced that he would not support FDR’s re-election bid in 1940, his fellow unionists abandoned him. Eight years later, the CIO’s left-wing faction rallied behind Henry Wallace rather than the Democratic nominee, Harry Truman; Lewis’s successor as CIO president, Philip Murray, responded by purging the leftists from the federation.

Many historians have concluded that the CIO’s commitment to the Democratic Party in the 1940s was a fundamental error. As they tied themselves to the Democrats, they argue, CIO leaders were forced to subordinate their agenda to that of the Party. This was particularly damaging by the late 1940s, when the Cold War forced mainstream politics to the right.

Party loyalty and political calculation demanded that CIO spokespersons back away from the most radical of their demands—such as the nationalization of industry—in favor of the Democrats’ increasingly watered-down reformism. Murray’s purging of the left was but one result of the Faustian bargain the CIO had struck, the historians say. And with that bargain, the great hopes of the 1930s simply faded away.

The argument has much to recommend it. American politics certainly did drift to the right in the years immediately after World War II, and as it did so, CIO leaders were forced to soften their militant edge. One example illustrates the point. In early 1949, Walter Reuther, the president of the United Automobile Workers, proudly told a union audience, “I am not particularly interested when people talk about free enterprise. I am a believer in a planned economy.” Two years later, as McCarthyism swept the nation, Reuther felt compelled to declare that he “believe[d] strongly in the free enterprise system.” Reuther had not changed, but the times had. Because the Democrats were sure of labor’s support, moreover, Party leaders did not have to give labor everything it wanted. Instead, they could treat unions as simply another constituent group, one part of a larger coalition whose expectations had to be managed.

But the argument can be taken too far. For all the limitations that post-World War II politics imposed, the unions of the CIO and, after their 1955 merger, the AFL-CIO wielded enormous influence in the 1950s and 1960s. Democratic presidents regularly consulted with union leaders. Labor officials held a number of important political appointments. Arthur Goldberg, for instance, moved from the staff of the United Steelworkers to become John Kennedy’s secretary of labor and from there to the United States Supreme Court, while Walter Reuther’s administrative assistant, Jack Conway, helped to direct Lyndon Johnson’s War on Poverty. Most important, labor lobbyists were instrumental in passing into law some of the most important reforms of the postwar era, including the creation of Medicare and Medicaid, the expansion of Social Security, and the destruction of the southern system of segregation, a triumph secured by the Civil Rights Act of 1964 and the Voting Rights Act of 1965. On its own terms, this is an imposing list of accomplishments. Given labor’s position at the start of the twentieth century, it is truly remarkable.

Despite its political sophistication, however, organized labor was ill-prepared for the shocks that shook the movement in the late 1960s and 1970s. Trouble began in the latter half of the 1960s, when the era’s searing political conflicts began to dissolve the electoral coalition that the New Dealers had

assembled in the 1930s. At the same time, a combination of war-induced inflation, rising foreign competition, and declining investor confidence loosened the United States' once iron grip on manufacturing. The problems deepened in the 1970s, as a series of unprecedented events pushed up prices on basic goods while an influx of foreign goods cut deeply into American corporations' market share. By the end of the decade, profit margins were tumbling. Desperate to reverse the decline, corporate executives began the restructuring that would strip the United States of much of its manufacturing base.

But the business community understood that restructuring alone was not sufficient. If profits were to be improved, they argued, the federal government had to abandon the New Deal system, which they insisted had become a drag on innovation and investment. To that end, the corporate elite allied itself with the growing conservative movement of the late 1970s, itself an amalgam of tax rebels, free marketers, supply-siders, religious and cultural conservatives, and aggressive cold warriors. Like the New Dealers of the 1930s, the conservatives traded on the economic crisis of the 1970s to take control of the federal government. In January 1981, Ronald Reagan took the oath of office as president of the United States—and the conservative revolution began in earnest.

For the next 20 years, the revolution pummeled the labor movement. The assault was multisided. As major manufacturing firms downsized their operations, unions lost thousands upon thousands of members. The Reagan and Bush administrations, meanwhile, turned government policy against unionization. Reagan signaled the shift during the famous PATCO strike of 1981, when the president fired 11,500 striking air traffic controllers. The more significant change resulted from Reagan and Bush appointing conservatives to the NLRB. The appointees greatly widened management's power to resist union organization and demands, stripping away many of the protections the New Dealers had put in place a half century earlier. Many corporations with unionized workforces used their new leverage to demand that their workers accept wage cuts and reduced fringe benefits. Companies without unions felt free to intimidate those workers who dared to consider organizing or even to complain about working conditions. According to one study, one of every 20 workers who demanded union representation in the 1980s lost his or her job.

Together, these blows crippled labor's political power. Obviously, the labor movement had no leverage with the Republicans, who now dominated Washington. But the problem extended to the Democratic Party as well. By the end of the twentieth century, only 13% of the American workforce was

unionized, down from its mid-1950s peak of 35%. With its base reduced so dramatically, the union movement no longer had the ability to marshal a huge bloc of voters or invest vast sums of money in political campaigns. Consequently, Democratic officials no longer believed it necessary to support even the most basic demands of the union movement, a point driven home in 1993, when the Democratic president, Bill Clinton, pushed the North American Free Trade Agreement through Congress, despite labor's vociferous opposition. That was perhaps the most telling symbol of labor's precipitous political decline. A movement that had once promised to reward its friends and punish its enemies found itself in the closing years of the twentieth century with far too many enemies to punish and few friends to reward.

POOR PEOPLE'S CAMPAIGN

While it is sometimes regarded as the disappointing final chapter of the civil rights movement, the Poor People's Campaign of 1968 signaled a shift in protest politics from legal reform to economic transformation. Frustrated by the limits of earlier civil rights victories and the government's flagging support for Great Society social programs, Martin Luther King Jr. initiated the Poor People's Campaign, which he envisioned as a series of disruptive protests in the nation's capital that would force Congress and the president to take action to end poverty. After King's April 4, 1968, assassination, his associates in the Southern Christian Leadership Conference (SCLC) proceeded with the campaign, and for six weeks, three thousand poor blacks, whites, Chicanos, Puerto Ricans, and Native Americans made their home in

Poor People's March at Lafayette Park and on Connecticut Avenue. Library of Congress, Prints & Photographs Division, U.S. News & World Report Magazine Collection [LC-DIG-ppmsca-04302].

Resurrection City, a symbolic protest community of plywood and canvas huts constructed near the Reflecting Pool at the Lincoln Memorial. Bogged down by mud and infighting, harassed and infiltrated by police and government agents, and largely ignored by the public, the SCLC disbanded the city and ended the Poor People's Campaign when its demonstration permit expired in June.

Origins of the Poor People's Campaign

From the earliest days of his leadership of the civil rights movement, King had been rhetorically committed to economic justice. As a young pastor of a middle-class congregation in Montgomery, Alabama, he provided leadership to the historic bus boycott that had its most direct impact on female domestic workers and laborers. Overseas visits to Africa and India in the late 1950s exposed King to the colonial dimensions of poverty and inequality, and his addresses at union conventions indicate that he valued the labor movement's role in bettering the wages and conditions for working people. But in the months following his unsuccessful open housing campaign in Chicago during the summer of 1966, King spoke more frequently and with greater urgency about the need for a redistribution of economic and political power. King believed that President Lyndon B. Johnson had sacrificed his War on Poverty and other domestic

reforms for an expanded war in Vietnam. He was also frustrated by the limitations of earlier civil rights victories that may have ended legal discrimination but did little to guarantee true equality. As dozens of cities erupted in spontaneous violence during the summer of 1967 and Black Power militants challenged his leadership, King spoke openly about the need for the movement "to find a kind of middle road between riots and timid supplication." What was needed was "a method of dislocating the functioning of a city without destroying life and property," he told the National Advisory Commission on Civil Disorders that fall.

King Proposal Meets Resistance

The Poor People's Campaign proved to be a tough sell, even among King's coworkers and closest confidants. In the weeks after he announced plans for the campaign at a December 4 press conference, SCLC staff grumbled privately that the goals for the protests were unclear and that a Washington mobilization would pull them from their ongoing work in Cleveland, Chicago, and Grenada, Mississippi. The longtime advisor Bayard Rustin broke publicly with King and warned that the demonstrations would damage the Democratic Party's showing in the 1968 elections and sink the pending civil rights bill banning housing discrimination. NAACP officials predicted

that the protests would lead to violence and even more repressive countermeasures.

In the early weeks of 1968, a more sinister opposition sprang into action, as the FBI stepped up its long-standing campaign against King. At the FBI director J. Edgar Hoover's urging, clandestine informants infiltrated SCLC regional offices, gathered information on the organization's supporters, and spread rumors intended to divide the movement. Welfare recipients considering the trip to Washington were warned that their benefits would be cut, and organizational allies of the SCLC were told of the group's alleged mishandling of funds. Agents leaked exaggerated threats of violence to panicky Washington city officials, fueling their deepest fears of an invading mass of poor people. As an overwhelmingly white organization with few agents who could convincingly pass as poor black people, the FBI welcomed the cooperation of military intelligence units that had their own extensive spy operations. With the important exception of the Community Relations Service Division of the Department of Justice, which provided SCLC leaders valuable advice and logistical assistance, a constellation of local and federal government bodies lined up to contain, if not destroy, the Poor People's Campaign.

On the Way to Washington

King's efforts to mobilize support for the campaign in the weeks before its scheduled late April kickoff stiffened his resolve. Traveling by chartered airplane and driving along backcountry roads, King delivered dozens of addresses at rural churches and community centers across Mississippi, Alabama, and Georgia. In the tiny Delta town of Marks, Mississippi, King spoke at a Head Start center that had received no federal assistance in its two years of existence. He repeated the campaign's demands that the federal government provide jobs or a guaranteed income for every adult, and he listened somberly as African-American women spoke of their need for shoes and better schools for their children.

Between scheduled stops in Mississippi, King addressed a rally on March 18 in support of the Memphis sanitation workers, who had been on strike for more than a month over the city's refusal to recognize their union. He was moved by the black workers' spirit. Their struggle reminded King of his early days in the civil rights movement and embodied the goals of the Poor People's Campaign. Despite the protests of SCLC staff, who feared that he was stretching himself too thin, King agreed to the strike

leaders' request that he return to the city to lead a nonviolent protest march. That march, on March 28, ended abruptly in violence. Acts of vandalism by youthful protesters were met with brutal retaliation by the police; one protestor was killed and dozens were wounded. King's FBI enemies and their media allies used the news to cast doubt on his reputation as a nonviolent leader and to suggest that the Washington protests promised more of the same, but on a larger scale. On his return to Memphis a few days later, King was felled by an assassin's bullet.

The Poor People's Campaign

In the wake of King's death, his close friend Ralph D. Abernathy assumed the leadership of the SCLC and the Poor People's Campaign. Ironically, the tragic events in Memphis re-energized the campaign; the number of volunteers pledging to come to Washington exceeded expectations and the SCLC suddenly found itself awash in donations. On April 29, Abernathy led an advance group of one hundred poor people to Washington, where they met with government officials and made their demands public. Following a meeting with Secretary of State Dean Rusk, Abernathy declared these initial efforts a success: "I think this is the most fruitful three days ever seen in the history of this city. The leaders here for the first time heard the cries and groans of the poor people speaking in their own language, unpolished—an outpouring from the souls of poor people. The poor are no longer divided. We are not going to let the white man put us down any more. It's not white power, and I'll give you some news, it's not black power, either. It's poor power and we're going to use it." Meanwhile, nine caravans of poor people from as far away as Seattle and Los Angeles prepared for their cross-country trips. From Marks, Mississippi, where King had spoken just a few weeks earlier, a 50-person delegation began its slow journey across the Deep South on several wagons pulled by teams of mules. Several hundred Mexican-Americans affiliated with the *Alianza de Pueblos Libres* and the Crusade for Justice traveled from New Mexico and Colorado, while staff members from the Highlander Center and the Appalachian Volunteers organized a contingent of white and black poor people from Tennessee, Kentucky, and West Virginia.

The Poor People's Campaign officially began on May 12 with a Mother's Day march cosponsored by the SCLC and the National Welfare Rights Organization. Coretta Scott King led demonstrators through Washington neighborhoods that had been

devastated just weeks before in the riots that followed her husband's murder. Speaking to an audience of five thousand people at the Cardozo High School stadium, she called for the repeal of recent amendments to the Social Security Act that had raised eligibility standards and cut benefits for women and children. The following day, Abernathy officially opened Resurrection City, and arriving protestors began moving in to their new homes on the National Mall.

Over the next five weeks, protestors took part in dozens of demonstrations around the capital, most of which targeted government agency heads and congressional leaders. Protesters were usually greeted by sympathetic officials who discussed pending legislation but offered no firm commitments or concessions. For fear of alienating white supporters, the SCLC had agreed to refrain from the disruptive protests King had promised the previous year, at least until the June 19 mass demonstration that was to be the highlight of the Poor People's Campaign. Billed as "Solidarity Day," the event drew more than 50,000 people to the foot of the Lincoln Memorial, where they heard speeches by Abernathy, the United Auto Workers president Walter Reuther, and Coretta King. Reporters drew comparisons to the 1963 March on Washington for Jobs and Freedom, contrasting the mood of frustration and anger with the earlier march's "exhilarating sense of hope and promise."

The momentum provided by the strong showing on Solidarity Day arrived too late to save the Poor People's Campaign. Resurrection City had descended into chaos, and SCLC failed to provide the camp with the necessary leadership. Paid provocateurs and gang members intimidated visiting journalists and protesters. Residents complained about poor food and muddy conditions created by many consecutive days of rain, and they noted that several of the SCLC's top leaders slept at the Pitts Motor Hotel. Untrained young men serving as marshals provided inconsistent security, and incidents of violence, though exaggerated by the dozens of clandestine operatives inside the City, grew more frequent. The Mexican-American leader Reies Lopez Tijerina criticized Abernathy and the SCLC for ignoring the nonblack coalition members and declined to move his delegation to Resurrection City, choosing instead to stay at a nearby private high school. The daily demonstrations at government offices grew progressively combative, but they were unfocused. In the days following Solidarity Day, police shot tear gas into the campsite in response to several incidents of rock throwing. With their permit from the National Park Service due to expire, SCLC and Justice Department officials devised plans for a face-saving retreat. On June 24, about 200 protesters, including Ralph Abernathy, were arrested at Capitol

Hill, while 120 more who remained in Resurrection City were arrested without major incident. Sporadic protests continued late into the summer, but the media turned its attention to the upcoming Republican and Democratic national conventions.

Though the SCLC left Washington without gaining any substantial concession from the government, the Poor People's Campaign marked a departure from earlier civil rights protests in that it placed economic justice at the center of its demands. In this sense, the campaign had much in common with the contemporaneous protests of African-American cafeteria workers at North Carolina universities, who went on strike for an end to racist employment practices, and black workers in Detroit, who launched a series of wildcat strikes that would hobble the auto industry during the late 1960s. The Poor People's Campaign also laid the groundwork for subsequent SCLC solidarity work on behalf of factory workers and municipal employees in Atlanta and hospital workers in Charleston, South Carolina. For nonblack participants, the Poor People's Campaign signaled the growing maturation of the Chicano, Puerto Rican, and Native American movements, all of which gained visibility in the 1970s. Their struggles, like those of the black workers, were built upon earlier civil rights victories, while aiming to complete the unfinished business of the 1960s social protests—a radical reordering of the U.S. economy.

POPULAR FRONT

Throughout its existence in the roughly 1934 to 1939 period, the Popular Front (also translated as "People's Front") promoted coalitions and fostered

organization building by the political left. Although not without problems, the resulting coalitions in the United States led to notable political achievements. Calls for a united front against fascism were raised in the early 1930s, but only with the Communist Party's official abandonment of organizing toward revolution and accompanying outreach to non-Communists was a movement against the growth of international fascism initiated. The Popular Front, which began as a diplomatic strategy by the Communist International (Comintern) to secure the Soviet Union against Nazi Germany and fascist Italy, grew outside the Communist Party's immediate control, although heavily influenced by the Party's cadres. Ultimately Communist in origin, the resulting Popular Front reached across party, class, and professional lines from working class to upper class, from labor to law. The achievements and shortcomings of this strategy and its effects remain disputed among historians.

The 1932 World Congress Against War in Amsterdam, where less than half the delegates were Communist Party members (830 of 2,196), was an early attempt to forge coalitions against the growth of fascism, but the Comintern only backed this effort in March 1933. The League's significance lies in its early appeal for united action against fascism. It took many more months to formalize the unity, but when it was codified, it assumed a Communist cast as the League Against War and Fascism became a vehicle for the Communist Party.

Student Communists and Socialists were also at the forefront of co-operation, uniting in organizing antiwar strikes. The Communist Party, though, continued to insist that only it held the model for realizing world socialism and fiercely attacked other opponents on the left even while working with them in the League Against War and Fascism. This marriage between leftist factions was always precarious, with frequent sniping and an eventual ban on party affiliation in League work.

Not until Hitler's seizure of power and suppression of the German left did the Comintern officially endorse a united effort against fascism. Previously, it had feared such a strategy would inhibit the revolutionary potential of a Communist movement stemming from the political right's accruing of power. The rise of the Nazis and their threat to left-wing parties shook the foundations of Communist initiatives. Adolf Hitler crushed the political left in Germany, where the strongest Communist movement outside of Russia had been seated, and the Comintern reconsidered its approach. French, German, and Polish Communist leaders issued a joint communiqué offering alliances to social democrats in mid-February 1933, two weeks after Hitler became chancellor.

Throughout 1933, the Comintern also observed capitalist opposition to President Franklin Roosevelt's New Deal programs.

Then at Nantes, France, on October 24, 1934, the Communists endorsed a Popular Front when the French Communist Maurice Thorez spoke before the French Communist Party. The Comintern approved of Thorez's plan in January 1935, and later in the summer at the Seventh Congress of the Comintern, the Bulgarian Georgi Dimitroff suggested the need for a people's front in order to combat the rising threat of fascism, which was promising to undo the Russian revolution. Dimitroff's policy was adopted officially by the Comintern for all Communist parties shortly after.

The new policy urged co-operation among left-wing parties in the defense of liberal democracy even while the Communist goal of monopoly over the left remained the same as before.

The coalitions resulting from the Communists' abandonment of revolutionary rhetoric and their co-operation with other left and liberal forces were loosely knit. Many activities in this period involving Communists remained informal alliances like the New Deal's center-left coalition of grassroots supporters in which the Communist Party spent more time building other pro-New Deal groups than building itself. The new strategy fostered Communist popularity as membership increased throughout the period, while other left-wing parties lagged behind. The apparent moderation and embrace of Americanism also made the Communist Party more palpable, or at least less subversive in appearance, to the mainstream. But despite these gains, turnover of party membership ran at 50% throughout the era.

The Popular Front never achieved the sort of critical mass the strategy hoped for, and it has even been suggested by some historians that the change to a more moderate united front strategy limited the possibility of making the types of political gains the Communists had achieved during the strike wave of 1934. Still, the Party secretary Earl Browder credited the Party's membership achievements to its work in American labor, which benefited greatly from Communist help after 1935, which placed communists at the forefront of the labor movement even when they faced discrimination. The three largest unions in the American Federation of Labor (AFL) all backed the formation of the Congress of Industrial Organizations (CIO) in 1935, and the CIO's John L. Lewis, an anti-Communist, tapped into Communist experience by inviting Party activists to organize for the new labor organization. Having backed off from creating their own union organization, the Trade Union Unity League, and opposing dual unionism, the Popular

POPULAR FRONT

Front Communists became valuable organizers for the CIO. A symbiotic relationship developed between Party members and unions. The strength of the steel and autoworkers unions, in particular, owed much to the Communists' Popular Front strategy. Hopes for a Farmer-Labor Party were not realized, but with the American Labor Party (ALP), the Communists attempted to build a powerful national force. While that also failed, the ALP, with Communist aid, played a pivotal role in the elections of Fiorello LaGuardia and Vito Marcantonio.

Another achievement of the Popular Front was the advancement of desegregation among the African-American community. The Communist Party stood at the forefront of black empowerment among organizations not officially affiliated with civil rights. In New York City, where the Communist Party was strongest, Communists permitted interracial couples in its co-operatives, integrated toilet facilities at Party functions, and racially mixed audiences at the Greenwich Village club, Café Society. The interracial environment benefited jazz culture with its many black performers and forged valuable ties within and outside the black community. The Communist Party was also the only major opponent to mobilize against the Italian invasion of Ethiopia. Many black non-Communist leaders, benefiting from the assistance of Party cadre, began to speak positively of Communist work.

Gender relations were far more contentious. By 1936, 25% of the Communist Party members were women, who reached around one third of the membership in 1940. Recent research by Kate Weigand suggests that women were also benefiting from the Communist work through "opportunities, education, and self-confidence they probably could not have found elsewhere" and also from the periodic defense of women's rights by the Communist Party secretary Earl Browder. Auxiliary organizations under women's leadership formed to bolster other Popular Front organizations, but as auxiliaries they also reflected the limits of women's participation. Through these experiences, women began to develop a more radical gender consciousness and criticize the Party's gender divisions, which eventually resulted in Party attempts to pressure male cadres to behave more generously toward their female equals. Still, the failure to commit to women's uplift also marked Popular Front practice.

The long-lasting legacy of the Popular Front period, however, was antifascism, which earned the Communist Party support from the left around the world long after the Second World War concluded. The fascism the Popular Front intended to confront is still not easily defined, but the Communist Party put

forth a Marxist reading that construed fascism as the dangerous and militant last gasp of capitalism. While the enemy itself remained vague, the initiative attracted many non-Communists into the coalition. In the United States, antifascist organization building was manifested as a series of campaigns and layers of coalitions. Antifascism offered the American left a unifying theme it had long desired. Divisions remained, but the Popular Front fomented a semblance of cohesion where there had been many fissures before.

No other event characterized this more than the Spanish Civil War (1936–1939), the era's most celebrated cause. The right-wing rebellion by Francisco Franco and half of the Spanish army against a Popular Front government provoked an international outcry among the political left. Communists, Socialists, anarchists, and many nonaligned individuals in the United States and elsewhere formed aid organizations in defiance of their governments and in cooperation with Spanish Republican leaders. A number of small strikes against freighters carrying alleged war material to Spain in late summer of 1938 were among the most obvious actions by American workers, but hundreds of unions across the country donated money, goods, and supplies to the ailing Spanish Republicans. The furriers union, for example, donated fur coats, and the International Ladies' Garment Workers' Union (ILGWU) donated clothing. Many more liberal Americans also rallied to the cause with donations and support. The Communist Party was central to the campaign, but it would have gone nowhere without broad support.

This Spanish aid movement was also instrumental in provoking a shift from the Popular Front to the Democratic Front. The difference was largely semantic, and few of the Popular Front's proponents even in the Communist Party understood the change, but the Comintern nonetheless issued statements altering the policy in early 1937. The main difference lay in monied opponents of fascism now being included in the People's Front coalition. Spanish Loyalist organizations had already brought out some of America's wealthiest scions to the side of Spanish aid. The change in Comintern policy caught up with then current practice.

Interest in Spain had waned by early 1939 as defeat loomed. The Spanish war ended in March, preceding the official end of the Popular Front by six months, a shift ushered in by the Hitler-Stalin Pact in September 1939. At that point, the Soviet Union, isolated by the western nations, submitted to a nonaggression pact with Germany as a measure of security in the coming world war. While this ended the Comintern's People's Front and led to massive resignations from the Communist Party, the Popular Front itself ceased to

disappear. Aid organizations that emerged out of the Spanish, Chinese, and Czech crises refocused on the growing refugee crisis rising from the onset of World War II, and unions built by the Party gathered strength. With the entry of the United States into the conflict as an ally of the USSR following Pearl Harbor, the Popular Front was renewed, albeit with bitterness against Communists for the 1939–1941 interval. Now, though, a virtual consensus on antifascism was reached. Communist Party membership never reached Popular Front levels, however, even as the new united front against fascism after Pearl Harbor became institutionalized in the culture.

The Communists themselves were never satisfied with the results of the Popular Front efforts and should not be the final judges of that movement's achievements or failures.

POPULISM/PEOPLE'S PARTY

“Populism,” in its historical American meaning, refers to the People's or Populist Party, which emerged out of a movement of farmers and workers in the 1890s. The Populist label has also been applied to

many popular movements or tendencies, both progressive and reactionary, in the United States, Europe, and Latin America. This essay focuses on the historical third-party movement and its antecedents.

To characterize Populism as a “movement” is to say it was not a spontaneous outburst in response to economic or social ills but rather an organized effort by people who considered themselves to be oppressed. The People's Party arose out of several organizations of farmers and workers in the 1880s and 1890s. These sometimes disparate groups shared the “common sense” of working people at the time that producers—anyone whose labor creates value—deserve to enjoy the fruits of their labor. Farmers, sometimes in collaboration with the Knights of Labor (KOL), established economic co-operatives, but they were also drawn to electoral politics, where they sought redress through legislation.

Birth of a Movement

Hard times made folks consider extraordinary measures. Although the health of the American economy was relatively good in the 15 years following the Civil War, farm commodity prices declined at a much steeper rate than the overall deflation rate. Between the 1870s and mid-1890s, the price farmers received for their wheat, corn, or cotton dropped by over half. Wages for workers outside of agriculture declined, but not so precipitously. Then the bottom fell out in 1893 with what contemporaries called the “Great Depression.”

At the same time, farmers and workers saw that a wealthy few controlled strategic resources such as credit, transportation, and wholesale trade, while federal monetary policies further depressed prices. If “producerism” gave them a way of expressing why hard work should be rewarded, the spread of monopoly and contraction of the money supply helped explain why that was not happening.

Hard times and the ideological “lense” of producerism made people angry, but the mobilization of millions into a national movement required more than strong feelings. In the 1870s and especially the 1880s, farmers and workers formed community-based organizations, adapting the organizing techniques of voluntary associations including churches, fraternal organizations, and early farmer and labor organizations. Women as well as men participated. In Kansas and elsewhere, women who had honed their leadership skills in churches and groups like the Women's Christian Temperance Union emerged as spokespersons.

POPULISM/PEOPLE'S PARTY

Farmers and workers met to discuss common problems, practice familiar rituals, and plan strategies. To offset the economic power of monopolists, they created marketing and purchasing cooperatives. Believing that their enemies controlled government, they pressed upon the major parties legislative demands to benefit the people.

Who and where were these people? They were, by and large, small property holders—farmers, mainly, but also artisans, railroad workers, miners, rural doctors, and preachers, and even some small-business owners. Their organizations were strongest in the South, the Great Plains (from Texas to the Dakotas), and the Mountain West. Ethnically, they were mainly of European descent, although in the South, black farmers joined racially separate organizations. Heroic efforts to unite southern producers across the racial divide had only limited success. Most black “farmers” were actually tenants, sharecroppers, or laborers, and those in the last two categories were employees of farm owners. In several states, the Knights of Labor made serious efforts to organize this marginalized group.

In the 1880s, farm organizations spread across the South and West, mobilizing an army of potential recruits for political insurgency. Several went by the name of “Farmers’ Alliance.” One began in upstate New York in 1877 but was transplanted to Chicago in 1880 by the farm editor Milton George, who used his newspaper to recruit members in the Midwest. The most successful group, commonly known as the “Southern” Alliance, began in central Texas, also in 1877. Its membership was restricted to whites. A parallel “Colored” Alliance began in Texas in the 1880s. A fourth group, the Agricultural Wheel, sprang up in the lower Mississippi Valley, led by the Canadian-born machinist Isaac McCracken. As a young man, McCracken had joined the Blacksmiths and Machinists’ Union, where he met Terence Powderly, later the grand master workman of the Knights of Labor. Upon moving to Arkansas, he worked as a railroad machinist and farmed. McCracken was an effective organizer and a forceful advocate of independent political action.

After a shaky start, in the mid-1880s, the Texas-based Alliance launched an ambitious program of centralized co-operatives and an equally ambitious plan to expand across the South and into the Plains states. The architect of these schemes was Charles W. Macune, a small-town doctor and editor. An inveterate joiner and organizer, Macune was at the right spot at the right time. By the end of the 1880s, his organization, now officially the National Farmers Alliance and Industrial Union, had over 1.5 million members in more than 20 states.

Traveling organizers were instrumental in the rapid spread of the farmers’ movement. While most were rural community leaders—often preachers or teachers—some had learned organizing skills in the union movement. Many of these were Knights of Labor, and membership overlapped between the Knights and the Alliance. Indeed, cooperation between farmers and workers in successful railroad strikes in Colorado (1884) and the Southwest (1885) swelled the ranks of both groups. The Alliance and Knights cooperated nationally to advance a common agenda, but relations between Alliance leaders and Powderly ranged from cool to hostile.

Toward the People’s Party

From its inception, the Alliance was political, though officially nonpartisan. Some of its earliest leaders were veterans of third-party movements of the 1870s. Their political program reflected a producerist tradition that affirmed private ownership of property but was grounded in the belief that monopoly power had stifled the fair working of capitalism. The legislative program they devised was intended to ensure access to land, credit, transportation, and an expanding money supply, thereby ensuring equal opportunity and abolishing special privilege.

The fullest development of the Populists’ agenda was the platform adopted at the People’s Party’s 1892 convention. While several streams converged in this document, its origin is traceable to the 1886 legislative demands of the Texas Alliance. That document was heavily indebted to the 1878 preamble to the Knights of Labor’s constitution, which in turn drew from 1867 manifestos of the National Labor Union.

This political agenda could not be easily implemented in a system where the dominant parties opposed even modest economic reform. Reformers faced a difficult choice: should they press their claims as a political interest group and force one or both parties to adopt their plan, or should they form a new party? The answer depended, in part, on how the major parties responded.

In December 1889, these choices were debated at a joint meeting of the Alliances and the Knights of Labor. Westerners, many of them veterans of earlier third-party movements, argued for a new party. Most southerners preferred to apply pressure within their region’s dominant Democratic Party. The St. Louis meeting adjourned with no consensus on strategy but with agreement on a platform that re-affirmed the unity of farmers and labor and demanded federal action to protect access to land, control monopolies

(in part through public ownership of railroads), and currency reform. There was also support for schemes to provide federal loans to farmers based on the value of their land (popular in the West) or their crops (the southern Subtreasury Plan).

In 1890, recent history and major party reaction dictated different strategies in the West and the South. Many key western leaders had long since left the old parties, and leaders of the dominant Republican Party scoffed at the demands presented to them. In the South, white reformers had to contend with the recent history of Reconstruction and Democrats' skillful use of the race issue. Nevertheless, the dominant reaction among southern Democratic officeholders to the "Alliance Yardstick" was to pledge their support, whether they meant it or not.

In 1890, both approaches seemed to work. In Kansas and elsewhere in the West, the Alliance and the Knights joined forces to create independent parties, and Colorado followed suit in 1891. Kansas independents won most of the congressional elections and controlled the legislature, where they elected the farm leader William Peffer to the Senate. In Colorado, the labor editor Davis Waite later won the governorship. Four southern states elected governors with ties to the Farmers' Alliance, and three fourths of the region's congressmen (all Democrats) endorsed the Alliance agenda. Much the same happened in Iowa, where because of close competition between Republicans and Democrats, *both* major parties pledged their support.

But pressure for a new party continued to build. Soon after the 1890 elections, southern Democrats reneged on their promises. Despite an Alliance directive not to join the caucus of any party that did not support its demands, all but one of the congressmen elected with Alliance support joined the Democrats in organizing the House. The exception was Georgia's Tom Watson.

When delegates convened again in St. Louis in February 1892, the stage was set for creation of a party with strong southern representation. The North Carolina Alliance leader Leonidas Polk chaired the meeting. A version of the now-familiar platform was adopted, including a stirring preamble written by Ignatius Donnelly of Minnesota. The People's Party was launched. Polk was the likely presidential candidate, but he died before the Party's convention in July. Instead, in Omaha the Populists nominated James B. Weaver, a veteran of the Union Army and of third-party campaigns (he was the Greenback Party's presidential nominee in 1880).

Weaver won 22 electoral votes, the first by any third-party candidate since the Civil War. But the prospects for future success were not encouraging.

His only victories came in the western heartland of third-party movements. In only one southern state (Alabama, with strong union support) did Weaver win even a third of the votes. The Party barely scratched in the Northeast and did little better in the industrial belt stretching from Illinois to Pennsylvania.

Clearly, the People's Party would be hard pressed to win national elections and implement its program. The American system of elections created huge obstacles for new parties. Populists were divided among themselves on issues such as prohibition and women's suffrage, and leaders of the old parties brought the weight of culture to bear on citizens who considered defecting. Also, in those western states where Populists had already won elections, they now had records to defend, some of them not attractive.

The depression that struck the nation in 1893 made President Grover Cleveland hugely unpopular, but the Populists could not capitalize on their position as champions of the downtrodden. Not even the Pullman Strike in 1894 galvanized the Party's potential base. Even in Illinois, where the American Railway Union leader Eugene V. Debs campaigned for the Party, Populists were badly beaten. So the Populists faced yet another decision: stick with their platform and stay in the field as an independent party, or cooperate with a major party.

In 1892 and 1894, Populists in some states had formed alliances with the weaker of the two major parties—Democrats in the West and Republicans in the South. North Carolina Populists successfully fused with Republicans in 1894, sending Marion Butler to the Senate. Co-operation or "fusion" with a major party was not unusual for third parties in nineteenth-century America, but for a movement that viewed itself as being above petty partisanship, such tactical shifts could confuse and demoralize grassroots Populists and leave fusionists open to charges of selling out.

Then there was the silver issue. The Populist agenda included aggressive proposals for an expanded and more flexible money supply. Elements in both major parties began pressing for coinage of silver as a means to the same end. It was a weak substitute but a strong political tactic, particularly after President Cleveland forced repeal of the Sherman Silver Purchase Act through Congress. By 1894, western Populists were increasingly drawn to the silver issue and to collaboration with Democratic silverites, including William Jennings Bryan of Nebraska. The silver craze also swept southern Democratic parties, but many southern Populists, having left the Democratic Party at great cost, were loath to rejoin the fold.

The issue came to a climax in 1896 when Bryan, having received the Democrats' presidential nomination,

was put forward for the Populist nomination as well. Neither Debs nor Peffer, though opposing his nomination, would agree to challenge him. In a highly charged convention, the People's Party nominated Bryan while rejecting his Democratic running mate in favor of Tom Watson. Although the convention endorsed the full Omaha Platform, by nominating Bryan, Populists conceded that silver was the issue of the campaign. National fusion with the Democrats meant local confusion. In the South, some Populists were simultaneously co-operating with Republicans, while most of their western counterparts were making common cause with Democrats.

Bryan carried the South and most of the West in a losing battle, but as a Democrat. Only in a few western states did the Populist contribution make a difference. Fusion agreements brought some local victories to the Populists in 1896 and 1898, but the Party's career as an independent force was over.

Bryan would dominate Democratic politics for two more decades, and when Democrats regained control of both Congress and the White House in 1912, he played a major role in passage of several bills that were heavily indebted to the Populist agenda, with former Populists in Congress in support.

PORTAL-TO-PORTAL PAY

Portal-to-portal pay is compensation from the time a worker enters the workplace until he or she leaves. It covers such "nonproductive" activities as travel, eating, resting, preparatory work, waiting, and sleeping. The issue originally arose in coal mining in the 1930s. Traditionally, miners were paid only "face-to-face pay" for the time they spent at the mine's face. However, in 1941, a federal district court held that travel from the mine's portal to its face constituted work. Thereafter, portal-to-portal pay became a key union demand in bargaining negotiations and a subject of litigation for nonunion workers. Key controversies arose from weaknesses in the 1938 Fair Labor Standards Act (FLSA). Although it set a minimum wage and required time-and-a-half compensation for overtime work, the FLSA did not define what constituted "work time" and gave the Wage and Hour Administration of the U.S. Department of Labor no power to resolve controversies. Thus, the FLSA opened the way for a series of court battles over what comprised compensable work. These cases and the Portal-to-Portal Pay Act of 1947 revealed conflicts between Congress, federal courts, employers, and unions regarding labor law, custom, and collective bargaining contracts.

In two key cases, *Jewell Ridge Coal Corp. v. Local 6167, UMWA* (1945) and *Anderson v. Mt. Clemens Pottery Co.* (1946), the Supreme Court extended the reach of portal-to-portal pay. *Jewell Ridge* arose from the bitter 1943 United Mine Workers of America (UMWA) bituminous coal strike. Desperate for a resolution that would raise miners' pay without undercutting the Little Steel Formula for collective bargaining agreements, the War Labor Board and the UMWA head, John L. Lewis, agreed that miners would be paid for travel time. Companies objected that the agreement voided both customary labor relations and collective bargaining agreements. In the resulting *Jewell Ridge* case, the Court held that its definition of work time superseded custom and contract.

In *Anderson v. Mt. Clemens*, the Court's three-part opinion created the conditions for a national controversy. The Court held that under the FLSA, travel and preparatory time were compensable unless the amount was very small; the Court's own standards for work time overwhelmed custom and contract; and employers bore the burden of proof for compliance with the Court's decision. Workers seized on this decision and on the fact that employers found in

violation of the FLSA were liable for back wages plus damages of 100%. A spate of lawsuits for unpaid portal-to-portal wages met objections from employers, which complained that the courts had illegitimately redefined “working time” and that portal-to-portal claims would amount to over \$5 billion in liability. In response, Congress passed the 1947 Portal-to-Portal Pay Act, which restricted judges’ jurisdiction in disagreements over the definition of “working time,” preventing them from contravening a labor contract or customary labor relations.

The Portal-to-Portal Pay Act highlighted a congressional movement to protect against employer liability and to emphasize collective bargaining. Thus, the law was a companion to the 1947 Taft-Hartley Act, which made illegal organized labor’s most effective direct-action tactics. The Portal-to-Portal Act also contributed to the growing distance between the fortunes of union and nonunion workers. Subsequently, workers traditionally unpaid for “nonproductive” duties could win portal-to-portal pay only through collective bargaining contracts.

POSTAL STRIKE (1970)

The national postal wildcat strike of March 1970 is one of the most impressive strikes in all of American history. Despite a multitude of obstacles, more than 200,000 postal workers not only successfully struck, but they also forced a significant change in their status, their rights, their working conditions and earning power, and their own collective organization. Their actions compelled every branch of the federal government (legislative, executive, and judicial) to recognize the legitimacy of union power. This strike was one of the key events that signaled the arrival of public employees into the ranks of organized labor.

What makes this strike and its success so surprising? It occurred in the midst of a war, with hundreds of thousands of American soldiers away from home and dependent on the delivery of packages and messages from their families. Likewise, their loved ones relied on the mail to receive messages from their sons and daughters in the military. Older Americans depended on the postal service for their social security and pension checks. A strike would have an immediate disruptive impact on the lives of millions. Any strike by postal workers, or other federal employees, would have been illegal. Postal workers were (dis)organized into nine different unions, seven of which were granted some degree of recognition (but not formal collective bargaining rights) and two of which were not. Most of the unions were not affiliated with the AFL-CIO, and some of them had openly hostile relationships with each other. Postal workers and their organizations were also legally prohibited from participating in organized political activity. Postal workers’ pay was so low that some of them qualified for food stamps and welfare assistance, hardly the basis for the building up of savings that might tide a worker and his family over during a strike. Last, postal workers were the most diverse workforce in the country, their ranks including urban African-Americans and small-town white southerners, veterans and college degree holders. That they would act in a unified, collective, militant fashion seemed—and seems today—amazing.

Yet many of the same factors pushed them in the direction of taking action. The Vietnam War itself,

opposition to the war, and debate over the war functioned to politicize everyday life in America, not just on college campuses but also in post offices and working-class neighborhoods. As energy prices and interest rates spiked upward, workers asked whether the war was bringing them economic security or increased risk. African-Americans, Chicanos, and women, their expectations and aspirations raised by the civil rights movements and seemingly historic pieces of legislation, chafed when they bumped into glass ceilings and limited opportunities. Postal workers knew that the vast American populace depended on their labor, and they felt empowered by that. While the multiplicity of unions made monolithic organization unlikely, the tight fit of particular unions to their members (such as specific crafts, on the one hand, or the all-black National Alliance of Postal Employees, on the other) gave rank-and-file workers a sense of ownership of their organizations, an access to direct voice. The low pay prompted postal workers to take risks, even to the point of possibly losing their jobs, while the diversity of the workforce brought the influence of progressive ideologies and social movements into the inner life of the unions. By the spring of 1970, only the lid of legal restriction seemed to hold down the bubbling cauldron of discontent and militancy.

On March 12, 1970, frustrated by continuing inaction by Congress on a series of proposals, New York City letter carriers at a regular monthly union meeting demanded that their leaders conduct a strike vote. Despite the opposition of both the national and local presidents of the National Association of Letter Carriers, five days later, on St. Patrick's Day, the New York local voted to strike and put up pickets. Although the local president had not even communicated with his counterpart at the Manhattan-Bronx Postal Union (which represented inside workers), the latter organization's leadership chose to encourage their members not to cross the letter carriers' picket lines. At 5 a.m. on Wednesday, March 18, the strike was on, and within a day, it was 100% effective in New York City. Over the next few days, the strike spread, first to the Northeast, then to the Midwest, and then to the West Coast, having its greatest strength in large cities. Court orders and injunctions were ignored, as some 200,000 joined the strike. Fearing that police action would only exacerbate the situation, the government and postal officials refrained from arresting union leaders. Their efforts to use National Guardsmen to sort and deliver the mail were disastrous. Finally, after a week, a combination of threatened fines and promises of wage increases and health benefits brought the strike to an end.

This strike brought profound changes to postal workers and the post office. Over the next month, union representatives and the postmaster general reached an agreement that included a 6% wage increase retroactive to December 1969, a commitment to encourage Congress to pass legislation enabling collective bargaining, with the promise of another 8% wage increase at that point, a compression of the wage schedule so that workers could reach top levels much more quickly, and a promise of amnesty for all strikers and union leaders. Congress then followed through with the sweeping Postal Reorganization Act, creating a quasi-corporate United States Postal Service (USPS) and providing postal employees with full organizational and collective bargaining rights under the National Labor Relations Act, except for the right to strike (replaced by binding arbitration). At the same time, some of the unions moved toward merger. In July 1971, five of the unions joined together to create the American Postal Workers' Union, the National Association of Letter Carriers and the Rural Letter Carriers Association merged, while the National Association of Post Office Mail Handlers, which had been within the Laborers' International Union, chose to remain so. For the next three decades, these three unions would approach the USPS from a position of consolidated strength, at times bargaining jointly, even if they remained organizationally separate.

Union cohesion and militancy in the Post Office were promoted by the generation that had lived through the 1970 strike. Many of them became the first officers of their local unions, bargaining local agreements and recruiting new members. As they moved into retirement, locals and the national union honored them and their recollections and stories would be told and retold at banquets and in local union publications. The national postal wildcat strike became the foundational narrative of postal workers' unionism, no matter which union they belonged to, no matter what town or city they worked in.

POWDERLY, TERENCE (1849–1924) **Knights of Labor**

Terence Powderly led the Knights of Labor (KOL), the largest working-class organization of the nineteenth century, for 14 years, from 1879 to 1893. His reign was defined by controversy, and many scholars have blamed him for the order's demise. Portrayed by some as moralistic, disloyal, dictatorial, and even pusillanimous, Powderly's detractors, then and now, argued that his commitment to acquiring a more equitable distribution of wealth did not match his dislike of strikes, distrust of political action, and opposition to radicalism. Essentially, this anti-Powderly narrative portrays him as increasingly out of step with the men and women he represented and thus unable or unwilling to fashion a powerful industrial union movement at the very moment corporate capitalism took off. Others have come to Powderly's defense, pointing out that he was well respected and labor's first media superstar, a man who built a diverse and strong organization. Powderly's character, and his perceived inability to lead, in actuality had little to do with the decline of the Knights of Labor. Rather, the organization declined as a result of divisions among workers on issues of race, ideology, and skill. The presence of powerful corporate foes who had the support of politicians, judges, police forces, state militias, and the army also hurt the Knights of Labor.

Born in Carbondale, Pennsylvania, on January 22, 1849, the deeply Catholic Powderly left school at 13, worked on the railroad, and in 1866 began an apprenticeship as a machinist in Scranton. Politics sparked his interests during the 1870s. Identifying with his Irish immigrant father, he joined the popular Irish Land League movement, which sent money across the Atlantic and lobbied U.S. leaders to defend the Irish people against British imperialism. Closer to home, Powderly often supported the Republicans but, in 1878, he did join the Greenback Labor movement. Beginning in 1879, he served six years as mayor of Scranton.

Powderly's career as mayor coincided with his election to the position of grand master workman of the KOL. He likely joined the Knights in the mid-1870s, but the exact date is difficult to pinpoint as the order was secret until 1882. Philadelphia tailors founded the KOL in 1869, and by 1876, it welcomed unskilled laborers throughout Pennsylvania. When Powderly won the order's top spot in 1878, he insisted upon abandoning secrecy and organizing as many workers as possible, and building a highly democratic organization. Power flowed from the bottom up, as

local and district assembly leaders ran day-to-day affairs. The Knights welcomed immigrants, African-Americans, and women into their ranks, although Chinese workers were excluded. Throughout its existence, the KOL claimed over 12,000 local assemblies in roughly 3,000 communities. At its peak, between 1885 and 1886, the order grew from 110,000 workers to 729,000. By the end of the decade, however, there were 250,000 Knights. Defenders of Powderly point to the lack of centralization, the emerging differences between skilled and unskilled workers, and simultaneous strikes as some of the reasons he cannot be blamed for the order's ultimate failure. No one person, they suggest, could have managed a relatively new national labor movement in this era of industrial expansion and class struggle with a small treasury and limited power.

Such a position makes sense when one considers that in 1885 alone the Knights were involved in a protest against Chinese immigrants in Rock Springs, Wyoming, engaged in a coal strike in Indiana, and embroiled in a confrontation with Jay Gould's railroad managers throughout the Midwest and Southwest.

Ultimately, the event that continues to define Powderly's career as a labor leader was his handling of the Haymarket Affair in 1886. On May 4, a group of citizens from the greater Chicago area gathered to protest acts of police brutality perpetrated against striking workers at the McCormick reaper plant. During the protest at Haymarket Square, four police officers died when a bomb exploded. The police responded by shooting into the crowd. Eight men were found guilty of conspiracy to commit murder, and eventually the state of Illinois hanged four of them. The state had little or no evidence to arrest the eight men; all eight were condemned, rather, for their anarchist beliefs. Although most Knights favored cooperativism, socialism, or a type of social democracy, as opposed to anarchy, they understood this trial as an attack on their right to protest.

Powderly chose to distance himself from those on trial, fearing that the KOL's public image would be injured. His decision came just as Knights started to lose strikes and skilled workers were considering whether or not they should join Samuel Gompers's new union for craftsmen. Under Powderly, the order had adopted the motto, "An injury to one is the concern of all." To many of his followers, he betrayed this guiding principle. In 1893, radicals defeated Powderly as their candidate won the office that had made the machinist from Scranton a national celebrity.

After losing his position as grand master workman, Powderly worked as commissioner general of

immigration and performed various tasks within the Department of Labor until his death in 1924.

PRESSER, JACKIE (1926–1988) President, International Brotherhood of Teamsters

President of the International Brotherhood of Teamsters (IBT) from 1983 until the time of his death in 1988, Presser's career highlighted the way in which corruption, organized crime, and government investigation combined to shape this union. Presser rose through the ranks of the Teamsters thanks partly to his ties to organized crime figures, but also through his role as an informant for the Federal Bureau of Investigation (FBI). In 1988, the federal government used both his election as IBT president in 1983 and his informant reports to support an effort to impose a trusteeship over the IBT.

The grandson of Jewish immigrants, Presser was born in Cleveland in 1926. His father, William Presser, had become a union organizer during the 1930s and eventually led an organization of workers who serviced vending machines. Through that organization, Presser's father developed relationships with Jewish and Italian-American organized crime figures; he would later be described as an associate of the Cleveland Mafia. In the early 1950s, James R. Hoffa helped bring the elder Presser's union into the IBT and then supported the Ohio Teamster leader's rise through the Teamsters hierarchy. As a Hoffa loyalist who also enjoyed strong ties to Hoffa's successors, William Presser held a number of important offices in the Teamsters, including serving as an IBT vice president with a seat on the General Executive Board. He was, therefore, well positioned to do favors for his

organized crime connections and to promote his son Jackie's career in the Teamsters. With his father's help, Jackie first became an organizer with the Teamsters in 1952, and then in 1966, he gained a charter for a new local, Local 507, which would organize industrial and warehouse workers. His father arranged to transfer members from other locals into Local 507, and it grew into the largest Teamsters local in Cleveland. Finally, the father provided his son with one final boost. In 1976, William Presser resigned his post as vice president of the IBT, and Jackie was chosen to take his place.

Having gained a seat on the IBT's General Executive Board, Jackie Presser sought next to become the general president of the union. In seeking that goal, he engaged in a dangerous but ultimately successful strategy. Publicly, Jackie Presser represented himself as part of a new generation of Teamster leadership interested in improving the union's public relations, but privately he cultivated the same organized crime connections that his father had developed. Presser assured prominent Mafia figures that they could gain more money from his leadership of the union, thus making them allies in his political efforts to achieve the IBT's top position. At the same time, beginning in 1974, Presser became an informant for the FBI, providing the Bureau with information about organized crime's influence in the union. Presser's relationship with the FBI brought him a measure of protection from prosecution. It also allowed him to sabotage his rivals within the Teamsters leadership by providing damaging information about their activities. In this way, the federal government developed a criminal case involving Roy Williams, Presser's predecessor as president of the Teamsters Union. When Williams resigned after being indicted, representatives of the Cleveland Mafia met with other Mafia leaders in Chicago and New York urging them to support Presser's election. To what degree that support played a pivotal role remains open to question, but the union's General Executive Board did vote unanimously for Presser to succeed Williams. Still playing a double game, Presser reported on the Mafia's support for his election to his FBI handlers.

Presser assumed the presidency of the IBT during a difficult time in the union's history. Congress had passed legislation deregulating the trucking industry, and the new economic environment undercut the union dramatically. Membership numbers declined as the union-organized proportion of the trucking industry shrank. The recession of 1981–1983 exacerbated these declines, and under Presser's leadership, members were asked to accept a series of concessionary contracts that proved very unpopular. Angry dissidents within the union depicted Presser, who earned

over \$500,000 a year from his various union positions, as out of touch with the needs of the members. For his part, Presser spoke of the need to move the union into new areas of organizing, calling for more vigorous efforts to bring in public employees and workers in high-technology industries.

Presser's position became more tenuous in 1986, when the Justice Department indicted him on charges of embezzling union funds through providing no-show jobs. The case brought to light the FBI's tangled relationship with Presser, when it surfaced that Bureau officials had misled their counterparts in the U.S. Attorney's Office and the Department of Labor about Presser's status. One FBI agent would later serve time in prison for perjury as a result of his efforts to shield Presser from prosecution. But less than a week after his indictment, Presser won re-election by a roll call vote of delegates at the IBT Convention, overwhelming the candidate supported by the dissident group, Teamsters for a Democratic Union, by a vote of 1,729 to 24. Nor were his fellow Teamster officials the only ones to rally around the embattled Presser. In the face of news of an impending federal effort to impose a trusteeship over the troubled union, the leadership of the AFL-CIO welcomed the Teamsters back into a labor federation from which it had been ousted in the 1950s because of its corruption. The recently indicted Presser was given a seat on the AFL-CIO's executive council.

A year later, in 1988, the Justice Department filed a civil suit using the Racketeer Influenced and Corrupt Organizations (RICO) statute and asking a federal court to impose a trusteeship over the Teamsters. The department claimed that organized crime controlled the union's top leadership. The suit drew on evidence that included Presser's informant reports and trial testimony by Mafia figures involving Presser's 1983 election to the union presidency. Less than two weeks after that suit was filed, Presser died from cardiac arrest, having been ill for some time with brain cancer.

PRINTING AND PUBLISHING INDUSTRY

Johannes Gutenberg introduced printing methods using movable type in Germany in 1440, while William Caxton imported the first printing presses into England in 1490. Together, these modern printing methods quickly spread throughout Europe's major cities. In Colonial America, the first independent weekly newspaper appeared in 1721, while the first daily emerged in 1783. By the end of the nineteenth century, newspapers were published in all major U.S. cities.

Technological developments could be characterized by stability and evolution during the industry's first 250 years. Printing presses moved from hand to steam power, and from single sheet to continuous roll, while the setting of type evolved from hand to mechanical typesetting, after Ottmar Mergenthaler invented a keyboard-based mechanical typesetter, the Linotype, around 1890. Additional developments in stereotyping (enabling multiple presses to produce a single copy of a newspaper) and photoengraving (reproducing photographs) enhanced both the productivity and physical appearance of printed matter, but together none of these processes radically departed from previous technologies—they still brought paper into contact with inked type. Aided by larger business, social, and demographic changes, they did, however, contribute to the rapid growth of the industry into the twentieth century.

For most of the nineteenth century, printing was concentrated in large cities, notably New York, Philadelphia, Chicago, and Boston. As late as 1900, they accounted for 40% of newspaper printing and 50% of all book and job work. Until 1880, book and job work (commercial printing) was only a small side business in newspaper shops. After 1880, commercial work became a distinct printing sector. Unlike newspaper offices that were larger, hierarchical, often monopolistic and, during the twentieth century, part of larger chain organizations, commercial shops were smaller, engaged in intense local competition, earned thin profit margins and produced nonstandardized batch work using skilled printers. Compared with the emerging mass production industries, printing industry firms were smaller in size.

Changes in industry structure by 1880 led to greater complexities in the production processes in newspapers and commercial shops. The labor process experienced a growing division of labor. These shifts went furthest in the larger newspaper offices. Moreover, aggregate changes in the industry and the larger economy created tensions between labor and management. Work relations became more impersonal, and journeymen printers experienced decreased mobility

owing to greater capital requirements, increased firm size, and capitalist control of resources. The historical pattern of reciprocity between labor and management had eroded.

Printers: Work Culture, Unions, and Control over the Labor Process and Labor Market

The vast majority of printers were native-born white men with German parentage. They were highly skilled. Their job duties—setting type by hand—required a high degree of literacy. Both craft workers and proprietors shared a common cultural heritage, with many proprietors starting out as journeymen printers. Women worked in the printing industry, but they were more likely to be employed in book binderies doing semiskilled jobs, and in clerical positions. Only 5.7% of the industry's manufacturing workforce was composed of women in the mid-twentieth century.

The printers' work culture was rooted in the nature of work and spread across the country by itinerant or "tramp" printers. At its core were the principles of mutuality, respectability, and independence. The culture promoted solidarity and control over work. Journeymen printers began organizing during the last quarter of the eighteenth century in support of "price lists" (unilaterally determined prices of labor accepted or rejected by employers) and benevolence. By the late nineteenth century, as industry and economic transformations altered the context in which printers lived and worked, a new work culture formed that resembled Selig Perlman's "job consciousness."

Until the mid-nineteenth century, printers' unions were highly unstable and short-lived, moving in lockstep with economic conditions. But printers had organized "chapels" during the 1830s as key workplace institutions that regulated the trade, adjudicated disputes, and imbued apprentices with craft values. Chapel governance gave printers considerable authority over daily affairs at the point of production and provided them with a strong institutional foundation that would eventually support permanent unionism by the mid-nineteenth century. Chapels also retained a high degree of autonomy from unions for many years. The "father of the chapel," later the "chapel chairman," presided over chapel affairs, which also included the regulation of personal and professional conduct. Workplace disputes over union-promulgated rules were adjudicated by peers and chapel chairs. Printers considered these disputes to be internal governance issues, such that most workplace

grievances were resolved inside the chapel and union free of employer involvement. Later, an "external" procedure, typical of modern grievance procedures, emerged as a complement to this "internal" one once collective bargaining emerged around 1900. Chapel chairs' roles expanded to include policing the labor contract.

Not until 1852 did local printing unions combine to create a national union, the National Typographical Union (NTU). In 1869, the International Typographical Union (ITU) replaced the NTU when it admitted Canadian locals to membership. The main purpose of national federation was to regulate travelers and uphold craft standards. Aside from a traveling card system, the ITU remained a decentralized union until the 1880s when, as a result of steady growth and activist locals, the ITU initiated a series of changes to wrest control from locals. Among the most significant institutional changes were the creation of a national strike fund; referenda voting procedures; a salaried professional staff, including organizers and district representatives; a benefit fund; and the negotiation of a series of arbitration agreements with the publishers' association between 1901 and 1922.

Inside the ITU, the compositors composed the majority of members and wielded great influence. This created tension and frustration among the other printing crafts inside the quasi-craft ITU. Between 1889 and 1903, five separate crafts split from the ITU to create their own national unions. Because they still shared common interests, these unions formed local allied printing trades councils to coordinate activities and cooperate in areas such as bargaining, union label enforcement, and concerted activities. Despite cooperative efforts, there existed sometimes bitter rivalries and other differences that made printing unions ill suited to deal with industry and technological changes after 1960.

Union democracy nonetheless was a key institutional characteristic of the ITU. Rooted in secret groups, factions, and cliques that formed in defense against employer blacklists, anti-unionism, and abusive foremen, the ITU's formal two-party political system debuted in 1912. The "Wahneta" party tended toward conservatism, while the "Progressives" were more militant. These different orientations were reflected in labor relations practices depending on which party was dominant. That is, when the Wahneta ruled, the ITU negotiated national arbitration agreements and maintained peaceful labor relations. On the other hand, when Progressives were in power, they took a more militant stand in labor relations and voted to end the arbitration agreements in 1922. Still, legacies of local union autonomy often protected local labor relations traditions.

The ITU sought to regulate the workplace and the labor market through a variety of policies and practices. Abusive foremen were problematic, so the ITU passed two significant “laws” designed to rein in their excesses. In 1899, it required that all foremen be union members (an ITU law that, in many places, continued after the passage of the Taft-Hartley Act in 1947), and in 1890, it promulgated the Priority Law, which limited foremen discretion in hiring and discharge and granted printers the right to choose their substitutes in their absence. In essence, Priority established a high degree of both job control and due process for printers. Combined with the closed shop and an ITU overtime law designed to spread work to other ITU members, these laws went well beyond other unions’ control over jobs. Moreover, they were part of internal union governance.

Printers’ demands for shorter hours were part of a larger process to gain control over the external labor market. The quest for shorter hours that began during the latter part of the nineteenth century came easier for newspaper printers than it did for commercial printers. The main reason was the mechanization of typesetting. Linotypes and similar machines reduced the need for certain tasks, facilitated a shift from piece rates to wage payments for operators, and reduced hours. National arbitration agreements contributed to labor peace. While there was some technological displacement, printers’ fears of widespread job loss never materialized owing to reduced production costs, increased productivity, especially at larger newspapers, and an overall increase in demand for labor. The ITU successfully won jurisdiction over these machines and encouraged members to acquire skills to operate them. While some additional divisions of labor occurred (for example, proofreader, advertising, and machinist classifications), the ITU preserved overall skill levels and jurisdiction, wages supplanted piece rates, and the workday was reduced without conflict.

In the commercial branch, the ITU’s drive for shorter hours was generally met with resistance. During the second half of the nineteenth century, in response to labor organization, printing employers formed separate local and national organizations. Even though these organizations operated in the same labor markets, their product markets were different. New York and Chicago were at the forefront of employer organization. The American Newspaper Publishers Association formed in 1887 but did not address labor matters until the Linotype’s introduction in the 1890s. In the commercial branch, the United Typothetae of America (UTA) formed in 1887 to fight unions and the ITU’s demand for the nine-hour day. Battles over shorter hours were episodic in

nature and lasted into the early 1920s. In 1898, the UTA and three major printing unions established the “Syracuse Agreement,” which initially created the 57-hour workweek but gradually reduced hours to 54 by 1899.

But as soon as the ink dried, the ITU began pushing for an eight-hour workday or 48-hour workweek. This action pushed the UTA toward an aggressive open-shop stance and led to a strike in 1906 in which the ITU succeeded and the UTA lost 45% of its membership. After World War I, printers again sought reduced hours. A joint labor-management conference agreed to a 44-hour workweek beginning May 1, 1921, with pay rates unchanged. Strikes broke out when some shops refused to accept these terms. This time, commercial employers were more successful; many shops became nonunion. Another significant outcome of these strikes was that, until 1935, the workweek in newspaper offices was shorter (44 hours) than in commercial shops (48 hours). Moreover, wages were higher in newspaper offices than in commercial shops, and higher in printing than manufacturing in general. Printing industry wages generally held firmer than manufacturing wages during economic downturns. In general, industry wages were locally determined and, given the decentralized nature of the industry, highly variable.

Between the Civil War and World War I, employers attempted to redesign the labor process to lessen costs, increase speed, raise output, and reduce union power. Employers subdivided tasks, tried different payment schemes, and implemented new machinery, but union compositors used their strategic position in the labor process to preserve their skill and control over the labor process. They formed strong unions, often allied with other printing trades, passed and vigorously enforced union laws and regulations, and bargained collectively for shorter hours, better working conditions, and higher wages. But after World War II, union fortunes began to change for the worse in the face of new technologies, industry restructuring, unfavorable public policies, and a climate that was becoming increasingly hostile to unions.

The Postwar Consolidation of the Printing Industry

The number of daily newspapers held steady between 1950 and 1980, at roughly 1,750, but reached an all-time low by 2000. The decline was largely the result of consolidations and the shuttering of afternoon papers. Independently owned newspapers declined

from 1,300 in 1953 to about 700 by 1980 and to fewer than 300 by 2000. Large, publicly traded media companies and chain ownership came to dominate the industry. By the late 1990s, chains controlled 77% of daily newspapers and over 80% of circulation. Over the course of the twentieth century, but with roots in the late nineteenth century, locally owned family ownership gave way to chain and publicly traded media corporations endowed with great amounts of resources.

In commercial printing, three significant industry changes occurred after 1960. First, there was a movement toward firm re-organization through chain ownership and mergers and acquisitions. This led to larger, multiplant operations and a move toward decentralization to avoid unions. Second, there was an outmigration of firms from traditional downtown printing centers. This trend spawned the growth in the number of nonunion firms operating outside city limits and the decline of master collectively bargained agreements. Third, and the most significant factor that impacted both the newspaper and commercial branches, companies rapidly introduced new computer-based technologies. These technologies, centered primarily in composing rooms, greatly increased productivity but also raised production costs. As part of this switch from “hot type” to “cold type,” employers searched for ways to lower production costs. They saw unions as both contributing to high costs and as obstacles to lowering production costs.

New Technology and Union Decline

The origins of the industry’s rapid technological transformation date to 1945, when newspaper employers experienced a surge in strikes for higher wages as wartime wage freezes were lifted. Higher wages and production interruptions caused costs to rise and led firms to find new methods to lower costs. One solution was a new composition technique called photocomposition, a revolutionary electronic technology that was four to six times faster than mechanical machines. Installed first at the Quincy (Massachusetts) *Patriot-Ledger* in 1953 to weaken the ITU, photocomposition machines automatically justified type and set it to film instead of lead. This cold type method employed less-skilled and lower-paid operators, many of whom were women. But because many employers feared the ITU, few photocomposition machines were installed until the early 1960s. This fear was justified in 1963 when an ITU-led strike over jurisdiction over these machines closed seven New York City dailies for 114 days.

Employers moved more aggressively toward cold type after a recession in the late 1950s and new competition for advertising revenues from television and magazines squeezed profits. Sandwiched between rising production costs and falling revenues, employers sought to reshape the labor process once more. With photocomposition, photoengraving and stereotyping became superfluous. Offset printing press technologies, however, maintained the skill levels of press operators. A technological revolution beginning in the early 1960s dramatically reduced production costs and the quantity and quality of labor demanded to manufacture newspapers. The center of this revolution was the composing room. Responses to the new technology ranged from controversy, conflict, and capitulation. By the early 1980s, the diffusion of the new technology was complete.

The most common responses to the new technology were workforce reductions by attrition and buyouts, and the decertification of bargaining units. The ITU negotiated an 11-year lifetime job security (automation) pact with New York City publishers in 1974. Similar agreements followed at other newspapers. In essence, these long-term contracts guaranteed jobs for printers doing other tasks in exchange for management’s freedom to implement new technology. Attrition would humanely eventually shrink the workforce.

The effect on ITU and union membership was severe and predictable. ITU membership was stable until about 1969, but between 1970 and 1982, active rolls fell by over 40%, while the ranks of apprentices dropped by over 70%. Despite these membership losses, total industry employment fell by only 13%. In absolute numbers, ITU union membership (including retirees and apprentices) declined from 90,000 to 43,000. The Graphic Communications International Union, a union of press operators and allied printing workers with the bulk of its membership in commercial printing, saw its membership fall from 220,000 to 154,000 between 1969 and 1983. Total printing union membership peaked in 1969 at 309,000 but fell by one third by 1983, while printing industry union density declined from 39% in 1959 to less than 20% by 1986. Newspaper industry union density dropped from about 18% in 1975 to under 10% by 2000.

Changes in the labor process have reduced skill levels for most printing crafts. Since the early 1930s, for those crafts that have not been obliterated by new technologies, there has been a steady convergence of skills toward the lowest-skilled mailer classification. The effect of this secular shift has been a re-ordering of power from craft workers and their unions to employers. Aside from falling union membership and density rates, other outcomes reflect this power shift.

Between 1964 and 2004, there were eight printing union mergers that have been completed and a handful of others that failed. The Communications Workers of America and the International Brotherhood of Teamsters are the two most significant international unions that represent printing industry workers, with many of the old crafts now divisions within these unions. Related to these mergers have been interunion jurisdictional rivalries that have historically hindered printing industry labor solidarity.

Strikes in the newspaper industry peaked in 1978 and, following larger industrial relations trends, have become quite rare. When they have occurred since then, as they did in New York, Pittsburgh, Detroit, and Seattle, they were often contentious and damaging to both sides. Unions also have made many numerous concessions in work rules and economics as a result of these strikes and contract settlements. For example, there have been reductions in “featherbedding” staffing levels, continuing implementation of new technologies, changes in the distribution and delivery of newspapers, an increased use of independent contractors, less lucrative retirement and health protections, and a movement toward merit pay systems in newsrooms. Since 1970, printing industry production workers’ wages have fallen relative to those of manufacturing workers in general, while newspaper production workers saw their wages fall below manufacturing wages for the first time in 1996.

Technology has always played a critical role in the printing industry. From Gutenberg’s press to the Internet, the communication of news and information continues to inform, educate, and entertain. But technological evolutions and revolutions also have reshaped the labor process, inverting power relationships on both the shop floor and in larger society. The once mighty printing unions have been weakened greatly, while the autonomous and high-skilled craft printer has become a wage worker with much less control over his or her work, and often employed in a large, publicly traded media corporation.

PROFESSIONAL AIR TRAFFIC CONTROLLERS ORGANIZATION

The Professional Air Traffic Controllers Organization (PATCO) was founded on January 11, 1968, when several hundred air traffic controllers from around the United States met at a hotel near New York’s John F. Kennedy International Airport. The controllers worked for the U.S. federal government’s Federal Aviation Administration (FAA). Their jobs were to direct airplane traffic into, out of, around, and between airports all over the United States. Their union grew out of their dissatisfaction with forced overtime, belligerent supervisors, inadequate equipment, and high stress. During the 1970s, PATCO became one of the most militant unions in the federal service. It led a strike in August 1981 that was ultimately broken by President Ronald Reagan in one of the most important events in late twentieth-century U.S. labor history.

The formation of PATCO owed to rapidly burgeoning air travel in the 1960s and the spread of union organization in the federal sector following President John F. Kennedy issuance of Executive Order 10988 in 1962, which cleared the way for limited collective bargaining for federal workers. After several false

starts, in the fall of 1967, controllers in the New York metropolitan region together with allies in Chicago, Atlanta, and later, Los Angeles, settled on a plan for a national organization of air traffic controllers. The leading forces in that effort were two New York controllers, Michael J. Rock and John F. Maher. Initially, Rock, Maher, and other controllers were divided over whether the new organization should be a union or an employees association. In a desire to build an organization with broad appeal, they opted not to place the word "union" in their organization's name. To help attract members, they invited the famous trial attorney F. Lee Bailey to serve as chairman of their organization. Bailey helped PATCO attract thousands of members in its first few months and gave the organization publicity. But Bailey never desired to lead a union, and his growing differences with the PATCO's board ultimately led to his departure from the organization in 1970.

Between 1968 and 1970, PATCO transcended its early ambivalence and developed into a militant union. Its first job action, a work-to-rule protest mounted in July 1968 called "Operation Air Safety," drew attention to controllers' chronic state of overwork. Snarling air traffic across the country, the protest attracted both public and congressional sympathy. A second job action, a sick-out launched in several key air facilities in 1969, led to worsening relations between PATCO and the FAA. The FAA's subsequent efforts to weaken PATCO triggered a 19-day national sick-out that began on March 25, 1970. The sickout amounted to a strike (privately, PATCO leaders referred to it as such) held in defiance of federal law. The sick-out never involved more than one quarter of the FAA's workforce, yet it led to weeks of chaos in the national air transit system before a federal injunction finally ended the job action. The FAA initially fired dozens of strike leaders. Significantly, however, the FAA later rescinded all but one of its firings as a part of President Nixon's effort to woo union leaders to support his policies and his re-election.

The deal between the Nixon administration and labor paved the way for PATCO's re-organization. John F. Leyden, who led New York area controllers during the sick-out, became PATCO's president in 1970. His rise coincided with PATCO's affiliation with the Maritime Engineers Beneficial Association (MEBA), a small but politically powerful affiliate of the AFL-CIO. Through MEBA's intervention, PATCO won recertification as a union eligible to represent federal employees. In October 1972, PATCO won election as exclusive representative for air traffic controllers and won its first collective bargaining contract in 1973.

In its early years, PATCO won significant victories for its members, including an early retirement/second career program that offered medically disqualified controllers to retrain for new jobs; an immunity program, which allowed controllers and pilots to anonymously report near midair collisions in hopes that such reporting would lead to safety reforms; a relaxation of the FAA's white-shirt-and-necktie dress code; and free familiarization flights in airline cockpit jump seats. Soon PATCO developed a loyal membership of over 13,000 members and enjoyed a higher dues-paying membership rate than any other union in the open-shop federal sector.

Yet controllers' gains were limited by federal law, which prohibited bargaining over wages and benefits in the federal sector. PATCO creatively circumvented the law by using a series of slowdowns to pressure the FAA to reclassify its members in 1976 into higher scales of the government service (GS) code. Yet, that strategy was not repeatable. In subsequent years, a series of developments placed PATCO under intense pressure. The organization saw an influx of militant Vietnam-era veterans who were disenchanted with the government. Inflation began to eat at the value of its members' salaries and benefits, and federal workers' wages and salaries began to fall behind rising prices. Meanwhile, government deficits made politicians increasingly tough negotiators. These developments came to a head in 1978 negotiations with the FAA, which yielded a three-year contract that deeply disappointed PATCO members.

The disappointment of 1978 led Leyden to initiate a strike-preparation program to give the union a stronger hand during its planned 1981 negotiations. That program saw PATCO create a strike fund and a network of anonymous strike leaders who could direct the organization should its elected leaders be arrested during a strike. Leyden was nonetheless reluctant to wage an illegal walkout. His well-known position was not shared by members of the union's executive board. In January 1980, a majority of his board announced that they would support the union vice president, Robert Poli, a former Cleveland area controller, against Leyden in upcoming union elections. Leyden angrily resigned his office, and Poli immediately acceded to the union's presidency.

During 1980 and 1981, Poli prepared PATCO for the 1981 negotiations and a potential strike. In hopes of strengthening PATCO's position, Poli endorsed Ronald Reagan in the waning days of the 1980 presidential campaign after Reagan promised PATCO members that he would consider their needs carefully if he were elected. Negotiations with the Reagan administration did not result in a contract acceptable to PATCO, however, and in 1981, the union led

an illegal strike against the federal government on August 3, 1981. When PATCO strikers did not return to work after two days on strike, they were permanently replaced and PATCO was broken. During its 13-year existence, PATCO helped illustrate what was possible—and impossible—for a militant federal government workers' union to achieve.

PROFESSIONAL AIR TRAFFIC CONTROLLERS ORGANIZATION STRIKE (1981)

The disastrous 1981 walkout by the Professional Air Traffic Controllers Organization (PATCO) was one of the most important strikes in American labor history, marking the onset of a period of virulent anti-unionism. The strike was staged by roughly three quarters of the largely white male workforce of nearly 16,000 air traffic controllers employed by the U.S. government's Federal Aviation Administration (FAA) and was held in defiance of laws that prohibit strikes by federal workers. It was broken when President Ronald Reagan issued orders to fire strikers 48 hours into the walkout. Reagan's act in turn helped legitimize the permanent replacement of strikers by private-sector employers in the 1980s.

The 1981 strike grew out of a decade of contentious relations between PATCO and the FAA that followed the founding of the union in 1968. Controllers, who provided guidance and coordination to the nation's air traffic system, objected to the stressful nature of their jobs and believed they deserved compensation comparable to that of airline pilots, who worked for private employers. The FAA, meanwhile, opposed PATCO's demands and strove for a regimented work culture that many controllers detested. In many ways, these adversaries had been on a collision course since 1978 when PATCO agreed to a contract that disappointed controllers and the FAA

began a more aggressive effort to weaken the union's power.

Still, the 1981 strike might have been avoided had not two developments occurred. First, PATCO's longtime president, John Leyden, resigned from office in January 1980 when his executive board decided to endorse a rival, the PATCO vice president Robert Poli, for the union presidency. Unlike Leyden, Poli was prepared to launch an illegal strike if his members saw it as necessary to achieve PATCO's bottom-line contract demands. Second, Ronald Reagan was elected president. In October 1980, PATCO endorsed Reagan's candidacy after Reagan promised to respond to controllers' job-related concerns. Ironically, this promise elevated controllers' expectations going into the 1981 negotiations and helped pave the way for the strike.

As negotiations began in 1981, controllers sought a shorter workweek, compensation for on-the-job training, and other improvements in their stress-filled working conditions. Importantly, they also sought higher salaries. Federal law prohibits unions from negotiating over wages, yet PATCO demanded a \$10,000 across-the-board wage increase for controllers. Ultimately, the salary demand proved to be a public relations blunder. At a time of rising unemployment, high inflation, and concession bargaining by industrial unions, even some in organized labor proved less than enthusiastic about defending PATCO's contract demands once the strike began.

The PATCO strike was initially set for June 22, 1981. But the strike was postponed on that day when the union was unable to muster 80% support for the strike among working controllers. Robert Poli thus accepted a tentative contract offer from Secretary of Transportation Drew Lewis that improved controllers' compensation, a precedent-setting concession by the government according to many observers since the government was legally forbidden to collectively bargain over salaries.

But the FAA's June 22, 1981, offer fell far short of PATCO's demands. After re-assessing the situation, PATCO's executive board recommended that the membership reject the tentative contract and hold a second strike vote. Controllers overwhelmingly complied with the board's recommendations and rejected the contract by a wide margin in a mail ballot. Negotiations between Poli and Lewis resumed on July 31, but quickly stalemated. The union held a strike vote on the night of August 2, 1981, meeting its 80% support goal. The walkout began at 7 a.m. EST on August 3, 1981.

The government and leading air carriers were well prepared for the walkout. Air traffic proceeded without major incident, though with thousands of flights

canceled in a pattern predetermined by the FAA and the airlines. Meanwhile, injunctions were issued in jurisdictions across the country, leading to the subsequent arrest of several strike leaders for contempt of court orders that demanded that controllers return to work. President Reagan issued a televised ultimatum that gave controllers until August 5 to reclaim their jobs. Failing to do so, they would be fired. More than 11,500 strikers ignored Reagan's warning and saw their employment terminated. The AFL-CIO protested this union-busting act. But threatened sympathy strikes by other unions in support of PATCO never materialized. Public opinion tended to support Reagan's hard-line response to the walkout. When no major midair collisions occurred, and air traffic volume began inching up, it became clear that Reagan had won, though at a considerable cost to air carriers, taxpayers, and the national economy. PATCO was subsequently decertified as a union.

Reagan's busting of PATCO reverberated widely through the American economy in the following years and marked a turning point in the history of U.S. labor relations. Although the courts had long ruled that the 1935 Wagner Act allowed the permanent replacement of economic strikers, few large employers had actually exercised this option before 1981. Flagrant union busting was widely viewed as unethical and un-American. Reagan changed that. In the years after the PATCO strike, Phelps-Dodge, Hormel, and other large companies joined a growing list of private employers that simply replaced strikers.

The rise of the permanent replacement tactic clearly dampened workers' willingness to strike. Between 1947 and 1980, the Bureau of Labor Statistics annually reported at least 180 strikes involving more than 1,000 workers each. Since 1982, the number of such strikes has never once reached even one half that level. Figures show a sharp decline from the 235 strikes involving roughly one million workers in 1979 to a record low of 17 walkouts involving only 73,000 workers in 1999. The PATCO strike and the use of permanent replacement workers that it legitimized were not alone responsible for this trend. The threat of plant closings and other factors also played a role in the diminishing use of organized labor's oldest weapon. But more than any other single event, the PATCO strike signaled a profound decline in organized labor's power in the late twentieth-century United States.

PROGRESSIVE ERA

The Progressive Era has the reputation for being one of the great eras of social and political reform in American history. While scholars debate the period's precise chronology, most historians pinpoint the age from the turn of the century to World War I as the high point of a progressive impulse that transformed the country. Historians argue vigorously over whether this impulse was unitary and coherent enough to be called "Progressivism," or whether it was a collection of related but fundamentally different political movements. Regardless of the terminology that might be used, the wave of reforms that came during or immediately after this period was indeed impressive and included—among many others—the first wave of constitutional amendments since the Civil War: the income tax, the direct election of senators, prohibition, and woman suffrage.

Traditional scholarly interpretations of Progressivism have placed the middle class at the center of these reform efforts—and with good reason, as reform efforts from antimonopoly efforts to prohibition had significant middling constituencies. However, historians have tried to situate labor more fully at the forefront of the period's most significant events. We can now see that workers were both the motive force behind and the subjects of crucial reform legislation. Moreover, much of what happened during "the Progressive Era" fell outside the dramas of Progressive reform—and this was particularly the case in relation to the lives of the mass of workers who lived during the first two decades of the twentieth century.

The Main Contours of Social and Economic Change

The primary social changes of the period were mass migration and immigration, and the rise of large corporations. We cannot tell the stories of these changes without putting workers front and center.

Numbers alone tell an important part of the story: Because these trends began in the late nineteenth century, it is best to discuss the period from roughly the end of the Civil War to the end of World War I. For example, from 1870 to 1920 more than 10 million Americans migrated from farm to city, while another

20 million—a great number, for the first time, from Southern and Eastern Europe—came to the United States as immigrants.

Most of these migrants ended up working within manufacturing, making the United States for the first time the most powerful economy in the world. The number of employees within the manufacturing sector skyrocketed from 2.5 million in 1870 to 11.2 million in 1920 (or nearly 40% of the workforce). An increasing number of these employees worked in gigantic factories owned by huge corporations like U.S. Steel. The growth of these big business behemoths was also explosive, with quasi-monopolies formed in industries ranging from meatpacking to textiles to tobacco—particularly during the great merger movement that swept the economy between 1897 to 1904.

Under a regime of laissez-faire capitalism, the lives of workers in corporate factories were often relentlessly bleak. Bells rang and whistles blew before sunrise to announce the start of what, not unusually, was a 10- to 12-hour workday. Work conditions could be extremely hazardous, with accidental death and dismemberment frequent and almost always poorly compensated. Although wages generally grew over the period, seasonal and cyclical unemployment made the lives of all but the most privileged workers insecure.

Despite the prevalence of this kind of work experience, however, it is incorrect to generalize too much about American workers during this period. While the above description fits the lives of millions of male immigrants, the single most numerous occupation during the period was actually that of domestic servant. Agricultural employment remained supreme in much of the South and West, particularly for African-Americans. And the majority of employees in the country actually continued to work in relatively small businesses.

Still, when commentators invoked the problem of labor in the early twentieth century, they spoke primarily of “what it meant to work in a large-scale, mechanized, rationally managed, corporate system of production.”

Growth of Unions: American Federation of Labor and Industrial Workers of the World

Workers responded to these conditions with the first sustained and long-lasting drive for unionization in American history. The primary organization vehicle for workers was the American Federation of Labor (AFL), although other more radical unions such as the Industrial Workers of the World (IWW) also played crucial roles in the era’s unionizing ferment.

The American Federation of Labor became the only truly national union in the country after the demise of the Knights of Labor during the 1890s. The AFL, however, had a distinctly different approach to organizing from that of the Knights. The Knights were, by philosophy if not always in practice, an industrial union that sought to include the skilled and unskilled, women and men, and workers of all races. The AFL, on the other hand, generally limited its recruiting to skilled workers; it also refused to admit the storekeepers and reformers who had provided much of the community-based support for the Knights of Labor. And while the AFL began with a commitment to racial egalitarianism, it quickly accepted the segregation common in the skilled trades. The AFL also poured out its hostility upon immigrants, particularly those from Asia; at the turn of the century, for instance, the Federation published a pamphlet titled *Some Reasons for Chinese Exclusion. Meat vs. Rice. American Manhood against Asiatic Coolieism. Which Shall Survive?*

Despite its severe limitations, the AFL brought genuine gains to many American workers during an era that witnessed one of the most virulent anti-union offensives on the part of employers. Between 1897 and 1903, its membership shot up from 400,000 to nearly three million. The AFL also began to admit some industrial unions, such as the United Mine Workers (UMW) and the International Ladies’ Garment Workers’ Union (ILGWU). The group’s expansion did temporarily come to a halt when corporate elites used violence and the power of the courts to launch an effective movement for the open shop. Yet the attempt to suppress the AFL ironically benefited the organization, providing legitimacy to its self-characterization as the primary voice for American workers.

Much of the AFL’s success was due to the tireless energy, ambition, and vision of Samuel Gompers. Gompers was elected annually to serve as the organization’s president every year, except one, from the group’s formation in 1886 until his death 1924. Born in London in 1850, the Jewish Gompers began his work life at the age of 10 as a shoemaker before taking on his father’s trade of cigar making. The family moved to New York City in 1863, and the following year Gompers joined the Cigar Makers’ International Union. He became president of his local in 1875 and vice president of the international union in 1886.

That same year Gompers also helped form the AFL. Throughout the 1890s, the moderate Gompers battled socialists for influence within the organization, although Gompers was himself actually never completely unsympathetic to socialism. Yet through

PROGRESSIVE ERA

the turn of the century, he decisively rejected not only that movement's radicalism but also its emphasis on political action. Although Gompers later brought the AFL into a close connection to the Democratic Party, he remained convinced that politicians were treacherous and that workers could ultimately only rely on themselves. By 1900, Gompers's position as AFL chieftain was firm.

Gompers and the AFL were class conscious, believing in a fundamental divide between workers and employers. Yet they accepted the prevailing economic structure, seeking to get—in Gompers's famous words—more and more and more out of the coffers of capitalists. The AFL's main rival to this “pure and simple” unionism, in contrast, sought an outright overthrow of capitalism.

Formed in Chicago in 1905, the Industrial Workers of the World made little doubt of its revolutionary commitments—and its disdain for the AFL. The IWW preamble declared:

The working class and the employing class have nothing in common....Between these two classes a struggle must go on until the workers of the world organize as a class, take possession of the means of production, abolish the wage system, and live in harmony with the Earth...

The trade unions foster a state of affairs which allows one set of workers to be pitted against another set of workers in the same industry, thereby helping defeat one another in wage wars....Instead of the conservative motto, “A fair day's wage for a fair day's work,” we must inscribe on our banner the revolutionary watchword, “Abolition of the wage system.”

It is the historic mission of the working class to do away with capitalism.

The Wobblies, as they came to be known—the origin of the label is unclear—had distinctive centers of regional strength. Growing out of brutal struggles in western mines, the IWW effectively organized many of the West's miners as well as the region's migratory labor stream of lumbermen and agricultural harvest workers. The Wobblies went out of their way to organize cross-racially, although their claims to speak for the entire working class were sometimes belied by the hyper-masculinity common in migratory work camps. Yet the IWW proved its success among women workers, too, claiming several remarkable successes among northeastern textile employees. In the process, the Wobblies became a cause célèbre among bohemian intellectuals, with the cross-fertilization between Greenwich Village rebels and organic working-class intellectuals producing some of the most interesting cartoons and songs of the entire American working-class tradition. The IWW also

became the object of often deadly and extralegal vigilantism from employers and local authorities who used jailing, murder, and terrorism to combat Wobbly fights for free speech and workers' rights.

The Wobblies always prided themselves on a decentralized, even anarchist organizational structure. Yet, like the AFL, they too had a guru. William Haywood was The Bad Man of the labor movement, especially compared to the clean and respectable Gompers. Born in Salt Lake City in 1869, Haywood began mining work when nine years old—the same age that he also lost use of his right eye while whittling a slingshot. He joined the Western Federation of Miners (WFM) in 1896, and by 1900, he had joined the WFM's executive board and was soon helping direct the union's response to violent warfare in Colorado's mining districts.

In 1905, Haywood helped found the IWW; the following year he was arrested along with two associates for his alleged involvement in the assassination of the Idaho ex-governor, Frank Steunenberg (authorities tracked him down in a brothel). In one of the most celebrated criminal court cases of the era, Haywood was declared not guilty—although the leading authority on the case, J. Anthony Lukas, has made a tentative case for Haywood's guilt.

In 1908, Haywood was ousted from his WFM leadership position and quickly gravitated toward the Wobblies' espousal of socialism and direct workers' action. By 1915, he had become the IWW's official leader. A large physique and a booming voice, along with a visceral fearlessness, enabled “Big Bill” to inspire followers and intimidate his enemies in the class struggle. Upset at the IWW's continued class warfare during World War I, the federal government lowered the boom, and Haywood served a year in Leavenworth on charges of violating the Espionage and Sedition Acts. While out of jail on appeal, the Supreme Court rejected his case, and Haywood fled to Moscow; many Wobblies believed that he had betrayed their cause to save his own skin. He died desperate and lonely in 1928. Half of his ashes were buried in the Kremlin, with the remainder making their way back to Chicago for interment near a monument to the Haymarket anarchists who had initially helped inspire Haywood's activism.

An Era of Great Strikes

Especially because of the efforts of Samuel Gompers and the AFL, during the Progressive Era the national union movement became institutionalized for the first time in American history. The AFL's moderate stance

often led to attempts at conciliation, with certain segments of labor and capital both recognizing the value of industrial peace. Such growing harmony, however, never solidified, and the first two decades of the twentieth century have instead a well-deserved reputation as an age of often-violent labor conflict.

The number of strikes dramatically increased between 1900 and 1917. Each conflict of course had its own texture and significance. Two particularly important strikes, however, well illustrate the differing approaches of the AFL and the IWW—as well as the growing political power of labor.

When the 1902 anthracite strike in Pennsylvania began, it appeared that powerful mine owners held all the cards in their attempt to beat back the largely Southern and Eastern European immigrant workforce. Yet by the end of the five-month strike, the president of the United States had broken a potent precedent to intervene on behalf of workers.

The United Mine Workers was the primary organizing force in the anthracite (hard coal) districts of northeastern Pennsylvania. While not recognized by the mine owners, the UMW had successfully pressed for a 10% wage increase after a brief 1900 strike. This settlement was extended through April 1902. At that time, the UMW insisted on a 20% wage increase, an eight-hour day, fair weighing of the coal its miners extracted, and recognition of the union. George F. Baer, the mine owners' representative, refused to bargain at all, despite the union's offer of arbitration.

In May 1902, 150,000 miners put down their picks and shovels. As the strike extended through the summer, the price of coal quadrupled, and citizens began to fret about their inability to heat their homes during the winter. As calls for presidential intervention mounted, Theodore Roosevelt and the Republican senator Mark Hanna convinced the mine owners to meet with union officials at the White House. John Mitchell, the UMW president, impressed the president, but Roosevelt was furious at the intransigent heads of the coal companies. Finally, with threats of violence in the air, Roosevelt made plans to send in federal troops to operate the coalfields. Just before the implementation of such radical—albeit temporary—nationalization, Roosevelt's secretary of war, Elihu Root, convinced J. P. Morgan, the New York financier who was effectively in charge of the mines, to get the mine owners to stand down. They agreed to arbitrate, and the miners returned to work in late October.

President Roosevelt then appointed the Anthracite Coal Strike Commission to investigate and work out a solution. With the skillful aid of Clarence Darrow and Henry Demarest Lloyd, Mitchell and the UMW successfully made their case that many miners lived

in abject poverty and that the companies did little to make this deadly occupation safer (513 miners were killed in the nine-county anthracite region in 1901 alone). Low wages made child labor a necessity for family survival. The Commission found this testimony compelling and, while it did not grant the UMW official recognition—a crucial blow to the union—it did significantly increase the wages and decreased the hours of the miners. Even more significantly, the president had, for the first time in American history, weighed in on a labor dispute—and vindicated the rights of workers.

There was, however, no such story of conciliation in the 1912 great uprising in Lawrence, Massachusetts. In January of that year, 10,000 women, men, and children left their jobs after 500 Italian employees of the American Woolen Company found their pay shortchanged. The IWW had previously not conducted any significant labor struggles in the East, but a fledgling Wobbly local gained leadership of the strike and created a festive culture of opposition. Four days into the conflict, police turned icy fire hoses on the workers, but this merely energized the strikers. Several weeks later, the police raided the train depot in Lawrence, where IWW “Rebel Girl” Elizabeth Gurley Flynn was organizing a transport of children out of the increasingly violent city. Officers attacked the women and children and then detained them at police headquarters. National public opinion was becoming riveted on Lawrence, although citizens found it difficult to figure out which side best exemplified law-breaking anarchism.

The root cause of the strike, as in the anthracite region, was simple: wages well below poverty level. Male breadwinners could not earn enough money to support a family in even the most rudimentary fashion, and the textile mills were full of women and children—without whose wages it would have been impossible for families to pay for food and shelter. When mill owners cut wages and hours after the state of Massachusetts passed a 54-hour-per-week work law for women, family survival was once again threatened. The mill owners held so much power that even AFL-affiliated skilled workers were unable to organize. Yet the solidarity that the IWW generated was impressive enough that, by mid-March, it enabled the workers to declare victory. Yet, because of the legitimacy they granted the system of capitalist wage slavery, the IWW would not authorize the signing of contracts. So although the Wobblies reaped a massive public relations triumph from the Lawrence strike, their local collapsed the next year, and there would be no further Wobbly contributions to the long and bitter struggle to organize the textile industry there.

The Realm of the Political

We should, however, resist the temptation to see such acrimonious strikes as the primary pattern of labor relations. Arguably of even greater significance was the increasingly friendly relationship between the house of labor and national political figures. While the federal judiciary retained a basic hostility to the organization of workers, Theodore Roosevelt and Woodrow Wilson increasingly courted “responsible” unionists. The result was the origin of the tight connection between unions and the Democratic Party that has continued to this day. While many critics have pointed to the great costs to workers of putting all their eggs in the Democratic basket, during the Progressive Era, the unions’ political strategy brought unprecedented legislative gains.

The roots of labor’s political activity were at the local level, where unionists, and even members of independent working-class parties, were elected to city councils throughout the country. Trade unionists became an important constituency for reform-minded mayors such as Hazen Pingree of Detroit and Tom Johnson of Cleveland. In San Francisco, the most powerful municipal labor movement in the nation took over city hall in 1901 and held power until a corruption scandal led to the mayor Eugene Schmitz’s downfall six years later. Workers produced a kind of working-class progressivism that focused on issues relating to the eight-hour day for public employees, fairer taxation, and municipal ownership of utilities.

The increasing success of working-class local politics in part flowed from the pressure exerted by the period’s powerful socialist movement. Indeed, socialism was more respectable and influential during the Progressive Era than at any time in American history. The charismatic presidential candidate Eugene Debs received nearly one million votes in the 1912 election—6% of the total. That same year, more than a thousand socialists won state and local office, while socialist members of Congress Morris Hillquit of New York and Victor Berger of Milwaukee helped ensure that at least a mild version of the class struggle appeared in a good number of the nation’s newspapers.

Although the mainstream of the American socialist movement was moderate by European standards, its potential radicalism helped pave the way for the relationship between mainstream politicians and members of the AFL. For instance, Theodore Roosevelt—who was, at best, suspicious of unions—warned that if business elites and members of Congress did not heed the legitimate claims of respectable workers’ advocates like Samuel Gompers, they would face the revolutionary specter of socialism.

The primary obstacle to such a rapprochement between labor and government was the federal judiciary. As Melvyn Dubofsky has noted, “it was unelected judges with lifetime tenure who determined national labor policy more often and more decisively than elected public officials did” (Dubofsky, 1994, p. 37). These judges, heavily influenced by a highly individualistic vision of political economy, by and large declared war on organized labor. Judges, declaring that unions violated the prohibition on restraint of trade found in the 1890 Sherman Act (which was designed to regulate monopolistic businesses), routinely used injunctions to cripple strikes. Nor could unions any longer use other effective weapons in their arsenals. In the infamous “Danbury Hatters” case of *Loewe v. Lawlor* (1908), judges effectively outlawed secondary boycotts, which were meant to pressure companies uninvolved in a particular conflict between workers and an employer not to purchase nonunion or “unfair” products. *Gompers v. Buck’s Stove and Range Co.* (1911) ratified this prohibition of boycotts and sanctioned the jailing of union leaders for daring even simply to speak out against an offending company. The Supreme Court also upheld the “yellow-dog contract,” which allowed employers to demand as a condition of hiring that workers never join a union.

This judicial hostility is what ultimately drove AFL leaders to embrace political activism. Gompers and his colleagues continued to retain deep suspicions about the federal government. Yet a “pure and simple” unionism that largely eschewed politics was proving more and more inadequate under the avalanche of unfavorable court decisions. As John Mitchell commented in 1903, “the trade union movement in this country can make progress only by identifying itself with the state.”

Starting in 1906 with the presentation of its “Bill of Grievances,” the AFL threw itself wholeheartedly into the national political realm. Promising to punish its enemies—and, secondarily, to reward its friends—the AFL attempted at first to maintain its nonpartisanship by supporting candidates who advocated the cause of workers. The result over the next decade was the election of an increasing number of friends of labor, including trade unionists themselves. For example, in 1910, 15 unionists were elected to Congress, including the former United Mine Workers official William B. Wilson, who would become the first secretary of the Department of Labor in 1913.

In 1908, Samuel Gompers made the fateful decision to all but officially endorse William Jennings Bryan, the Democratic nominee for president, after the Democrats embraced the AFL’s demand for reform of the injunction system. Bryan suffered defeat,

but four years later, the Democrat Woodrow Wilson was elected to the White House. Wilson had only a few years before been extremely antilabor; in 1909, the then governor of New Jersey declared, "I am a fierce partisan of the Open Shop and of everything that makes for industrial liberty." Yet, Wilson's ideology evolved as he recognized the value of the labor constituency. Despite the AFL's preference for Missouri's Champ Clark as the Democratic nominee, the organization fell in behind Wilson and played an active role in his campaign.

Initially, much of the support that Wilson provided to the AFL in return was symbolic, such as when he became the first president to address the organization's annual convention. Yet increasingly, organized labor expected concrete results and, in many ways, it received them. Secretary William Wilson was able to use his position in the Department of Labor to become a strong advocate for unions. President Wilson appointed a left-wing radical, Frank Walsh, to head the United States Commission on Industrial Relations (CIR). The CIR, which held public hearings from 1913 to 1915 in an attempt to solicit information that would lead to a reconciliation of labor and capital, issued a final report that was, in the words of the labor historian Melvyn Dubofsky, "perhaps the most radical document ever released by a federal commission." The report recommended strong governmental support for union organizing efforts, as well as for a variety of government programs to meet the crises of poverty and unemployment. Procapitalist and more moderate "public" members of the CIR wrote dissenting minority reports, however, and in the end, the cautious Wilson refused to embrace Walsh's call for social democracy.

What labor did get under the first Wilson administration, however, was first and foremost the Clayton Antitrust Act of 1914. While the Clayton Act had many components that had nothing to do with unions, its most important provisions, at least rhetorically, proclaimed that labor was not "an article of commerce" and upheld the legitimacy of unions and strikes. Because it also seemed to promise relief from judicial injunctions, Gompers declared the law labor's "Magna Carta." Yet in practice, the law was ambiguous enough to allow judges to continue to intervene in ways destructive to unions—an outcome that Congress and Wilson were likely comfortable with as they sought to please labor without making radical changes in the American political economy.

Still, labor could point to genuine reasons to be pleased with Woodrow Wilson. In 1914, the president sent the military to Colorado after the Ludlow massacre, one of the most infamous events in American labor history. After many violent interchanges with

the workers, militia and coal company police associated with John D. Rockefeller's Colorado Fuel and Iron Company raked a tent camp of strikers with machine-gun fire and then burned the camp to the ground. The 25 murdered workers included a dozen women and children who suffered a particularly horrifying death. In response, Wilson gave clear orders that the federal troops were under no circumstances to help the coal-mine owners protect strikebreakers as they sought to resume production.

Moreover, as Wilson looked toward a close re-election campaign in 1916, he put aside his concern with "class" legislation and signed into law progressive reforms such as the La Follette Seamen's Act of 1915. This bill for the first time regulated the work conditions of sailors. The following year, Wilson signed the Keating-Owens Act, outlawing child labor. In 1916, the president also appointed to the Supreme Court Louis Brandeis, one of the country's most powerful champions of protective labor legislation. Wilson culminated his courting of labor with his approval of the Adamson Act, which granted railroad workers the eight-hour day. Unionists avidly turned out to support Wilson's successful re-election bid, and according to Melvyn Dubofsky, "things had never looked better for organized labor."

Women Workers

While AFL political activism was designed primarily to aid skilled workers, by no means did all labor-oriented politics revolve around the agenda of privileged male workers. Indeed, at the very heart of middle-class as well as working-class Progressivism was the push for protective legislation for women workers, as reformers tried to fathom how to respond to the increase of female factory workers from 324,000 in 1870 to more than two million in 1920.

Those who concerned themselves with the plight of early twentieth-century labor often hoped to pass laws that would limit the hours and provide for a minimum wage for all workers. Yet the Supreme Court made clear in its infamous 1905 case of *Lochner v. New York* that such legislation was a violation of the individual worker's freedom of contract. Three years later, however, the Court proved willing to approve an Oregon maximum-hours law for women workers. In the case of *Muller v. Oregon*, Florence Kelley and Josephine Goldmark of the National Consumers' League joined with Louis Brandeis to argue that overwork not only harmed female employees but also endangered the propagation of the entire human

race because of their deleterious effect on women's maternal function.

The Triangle Shirtwaist Fire of 1911, one of the worst industrial disasters in American history—and certainly the most visible during the Progressive Era—tragically highlighted the necessity of such laws. The Triangle Shirtwaist Company employed approximately 600 workers, mainly young immigrant women, in its Greenwich Village factory. These workers generally labored for up to 14 hours per day for meager wages. The massive “Uprising of the 20,000,” a gigantic 1909 garment workers’ strike, had begun at Triangle; the company then refused to sign on to the collective bargaining agreement that other employers reached with the International Ladies’ Garment Workers’ Union.

Conditions in the factory well epitomized the dangers facing so many industrial workers—*The Jungle*, Upton Sinclair’s 1905 exposé of the Chicago meat-packing industry, being the most famous portrait of these hazards. Flammable textiles filled the factory, but despite the prevalence of smoking and gas lighting, the company did not have on hand any fire extinguishers. When a blaze began on the eighth floor of the building on March 25, 1911, workers from that floor and two floors above were generally able to escape. Those on the ninth floor, however, were trapped, at least partly because of a door that Triangle’s owners had locked to prevent theft or unauthorized breaks. New Yorkers looked on with horror as young women who were not incinerated inside the factory jumped to their deaths.

Public reaction to the 146 deaths at Triangle was swift, as was the passage of legislation mandating improved factory safety. Much of the powerful advocacy on behalf of women workers, including in the aftermath of the Triangle disaster, came from the Women’s Trade Union League (WTUL). More than any other national organization, the WTUL showed the promise of cross-class solidarity as wealthy women combined with their working-class sisters to support strikes and advocate for the cause of labor. The WTUL also injected a working-class spirit into the struggle for woman suffrage.

Along with a broad circle of female reform groups, the WTUL fought hard for protective labor legislation for women workers. Yet laws that capped hours for women and that mandated a minimum wage did not unproblematically assist their intended beneficiaries. The justification of such laws—whether for reasons of expediency or genuine concern—emphasized women’s status as powerless victims who desperately needed aid from the paternal hand of government. The laws at times seemed to sap the energy of female union organizing, and they also served to drive women

out of some previously mixed-sex occupations. Contemporary feminists, celebrating individualism, joined the Supreme Court in voicing their concern about the law’s stripping individual workers of full personal choice. The response of protective labor law advocates, in turn, emphasized that poor immigrant workers did indeed need protection from their much more powerful employers and that working-class women had needs genuinely different from those of middle-class or elite women. The conflicts over the gendered uses of government presaged the bitter conflicts between women activists that broke out during the 1920s over the Equal Rights Amendment.

Conclusion

Historians have traditionally marked American entry into World War I as the end of the Progressive Era. The fate of labor lends considerable credence to this chronology. Moderate unions entered a new era of official legitimacy as Woodrow Wilson enlisted Gompers and the AFL in the war effort. Yet the IWW, and many socialists, vocally opposed the war; in turn, the government launched an intense wave of repression against those it deemed disloyal. While radicals like Eugene Debs languished in prison, workers unleashed one of the largest strike waves during the bloody year of 1919. The birth of Bolshevik Russia and the entry of women into voting booths dramatically changed the political culture of American class relations.

The immediate aftermath of these conflicts was a renewed government and employer offensive that left organized labor reeling during much of the 1920s. Yet the reforms of the Progressive Era had planted seeds that New Dealers—many of them involved in these early twentieth-century struggles—would nurture as the United States entered the even more transformative 1930s.

PROSTITUTION Sex Work

Prostitution, to which the adage “the world’s oldest profession” has often been applied, has been practiced by women, and to a lesser extent men, in America ever since Europeans arrived on the North American continent. Perhaps ironically, because precontact Native Americans possessed strikingly different conceptions of sexuality and property than did their European counterparts, prostitution as we think of it today did not exist prior to European contact. Most Indians, although custom and practice varied from group to group, were relaxed about sex and sexuality, had few proscriptions on sexual experimentation and sexual choice for men and women, and possessed no concept of sexual ownership, making the sale of sex literally impossible. Yet early Western visitors to what would later become the United States often referred to so-called promiscuous Indian woman as whores, a term synonymous in the English language with prostitutes and other sexually immoral women. This assumption allowed white men to justify demands that they either be allowed free access to the Native American women’s bodies or be able to buy them as they could lower-class women or women of color in their own societies. It also allowed white women to assume a sense of moral superiority over the supposedly “heathen,” uncivilized women and men whose land they were overtaking.

The Puritan religion of a few of the northeastern American colonies condemned all forms of sexual excess and immorality and called on its followers to be clean in both mind and body. Puritan ministers likened the body of a debauched individual, whether man or woman, to the brothel, wherein all manner of unspeakable evils might occur, and redemption was surely lost as a result. Close-knit Puritan communities not only provided materially for their members, minimizing the economic factors that often lead to prostitution, and also ostracized those who crossed sexual taboo lines. A relatively even sex ratio helped channel sexual activity more often than not into

marriage. This combination of factors minimized the existence of prostitution in these small New England towns. However, the growth of smaller towns and the influx of new townspeople over the seventeenth and eighteenth centuries resulted in greater social heterogeneity, the fraying of social safety nets, and a decline of ministers' and familial moral sway. Concomitantly, prostitution and other forms of sexual immorality began to rise in these once "pure" communities.

The social and economic situation in the mid-Atlantic colonies, so markedly different from that in New England, ultimately also kept prostitution rates relatively low during the early colonial years. The Europeans who settled in such colonies as Maryland and Virginia held much the same views about sexual morality as did their neighbors to the north; however, skewed sex ratios and residence patterns based on a plantation economy created a situation wherein men vastly outnumbered women and close-knit communities were virtually nonexistent. The practice of indentured servitude drew many young women from Europe and placed them at the mercy of their masters, who often expected sexual favors from them at no cost. In addition to free sexual access to their white servants, white southern men perceived the growing numbers of women of African descent enslaved in these areas as legitimate, free sexual outlets. Although southern colonies banned interracial unions, miscegenation was common among white men and black women.

As urban areas consolidated in the mid- to late-1700s along the Atlantic seaboard, prostitution became an increasingly viable outlet not only for male lust but also for women looking for work. Expanding maritime trade and commerce at ports such as New York and mercantile hubs such as Philadelphia drew sailors and entrepreneurs alike looking for willing female company. Alexander Hamilton reported in 1744 that sexual commerce in New York City was rampant, especially near the battery.

During the French and Indian wars and as the colonies geared up for the War of Independence, soldiers became an increasingly common feature in late eighteenth-century colonial cities, providing a steady trade for prostitutes. During the latter conflict, female camp followers of all classes kept soldiers company and provided such services as laundry, nursing, and cooking; they also quite often worked as prostitutes for the troops, causing concern about the spread of venereal disease among the ranks.

After the American colonies won their independence from Britain and the new United States began its slow but inexorable westward expansion, urban areas such as Philadelphia and New York continued to

attract consumers and purveyors of sex. Indeed, sexual commerce exploded in these areas over the nineteenth century. Embracing the liberal and libertine ideals flowing in the young country, male citizens of the City of Brotherly Love during the late eighteenth and early nineteenth centuries frequented the many so-called bawdy houses that peppered the city; women, too, participated in the loose sexual atmosphere of the town. As a result of the promiscuous atmosphere of the time, which permeated all social classes, venereal disease and illegitimate pregnancies were rampant. However, lower-class women—some prostitutes, some not—especially suffered under a system that labeled them (but not the men with whom they had engaged sexually) immoral if they became diseased or pregnant and then abandoned them to an unmerciful urban welfare system. In this atmosphere, prostitution both exemplified sex as a recreational activity and symbolized the dangers of promiscuous sexuality for individuals and society. Prostitution for at least some women, however, remained a viable occupation at this time when wage work for women was sorely limited.

The years from 1820 to 1840 marked a change in the relative autonomy some prostitutes had by that time gained in such cities as New York City. This span of time coincided with a period in women's history that some historians have referred to as the Cult of True Womanhood, wherein respectable women were expected to be religiously pious, sexually pure, and socially subordinate to men in all dimensions of life. Between 1832 and 1838, a series of brothel riots occurred in the city, which, according to the historian Timothy J. Gilfoyle, represented an effort by disgruntled men to regain economic and sexual control over sexually and economically independent women in the city. In 1836, Helen Jewett (the alias of Dorcas Doyen, originally from Maine), an educated, successful, and sought-after prostitute living in a well-known brothel patronized by businessmen and politicians, was murdered by her lover, Richard Robinson, who then tried to incinerate her body to cover the evidence. The press sensationalized Jewett's murder, exposing all of the details of Jewett's life, both sordid and mundane, as well as those of Robinson, who was eventually acquitted of the murder.

Jewett and Robinson riveted public attention; each symbolized Americans' fears of the changing gender roles and relationships of the time. The murdered Jewett, on the one hand, epitomized the proverbial result of walking down the "primrose path," which, respectable folks warned young women, inevitably led to social marginality and, ultimately, death. Yet at the time of her death, Jewett owned clothing and jewelry worth more than \$1,500, lived in a fine house,

and possessed what most women did not, personal freedom. On the other hand, Robinson represented a new cohort of middle-class young men who were moving to urban areas and seeking employment, and hopefully their fortune, in the professions the city afforded them. Away from the watchful eyes of their communities of origin, supported in their sexual exploits by the homosocial groups in which they socialized, and with spending money in their pockets, these men were part of the newly emerging “sporting male” subculture that quickly thereafter came to be identified with urban life. Both Jewett and Robinson represented unfettered sexuality and the growing independence of young men and women, but the outcomes for their behaviors were radically different. Whereas through his acquittal Robinson received the ultimate validation of sexual license and economic independence, through her murder Jewett received the ultimate punishment for the very same behaviors. Although many New Yorkers clamored for Robinson’s punishment, a significant number of others supported Robinson, claiming that Jewett deserved her fate and that no man should be accountable for the death of a whore.

The question of why a woman from such an initially respectable and educated background as Jewett would choose to become a prostitute was one that has perplexed nineteenth- and twentieth-century Americans. William Sanger, the author of *The History of Prostitution* (first published in 1858 and remaining in print well into the twentieth century), asked just that question of over a thousand American prostitutes in the mid-nineteenth century. Expectedly, the largest number answered that economic hardship was the cause. What bothered Sanger and other social reformers of the age, however, was that women gave “inclination,” which Sanger explicitly defined to mean sexual desire, as their second most common response. Although, of course, many American women worked outside the home and also had enjoyable sex lives, this last revelation confounded most white, middle-class, Christian Americans who had embraced the domestic ideal of women. The possibility that some women were turning to sex work as a way to engage in sexual activity that they might both enjoy and profit from was a frightening possibility for these Americans, who believed a woman’s proper place was in the home (with a man providing for her economically) and that women lacked sexual desire.

The behavior of real American women, many of whom were not middle class, belied this supposed norm of dependence and frigidity. By the late 1870s and early 1880s, mining towns flourished everywhere

in the American West. Towns such as Butte, Montana; Cripple Creek, Colorado; Virginia City, Nevada; and Deadwood, South Dakota, grew overnight from small camps to booming cities. Mining was the magnet drawing people to these newly formed communities, and gender and age ratios in these new boomtowns often were skewed toward adult males, to whom canny prostitutes were quickly drawn. Women of all races, classes, and backgrounds headed west looking to make their fortunes (albeit in a bit different manner from the men who preceded them) in the goldfields of California, silver smelters of Nevada, and copper mines of Montana.

Families followed the gold-digging men and women a few years later, creating a more civilized feel and bringing with them the more respectable markers of community—schools, churches, and theaters—which co-existed alongside the less respectable—saloons, gambling halls, and brothels. This mix of frontier and civilization led often to antiprostitution campaigns, wherein respectable, pious men and women, many of whom were members of such reform groups as the Women’s Christian Temperance Union, did their best to eradicate prostitution from their midst. Such efforts were typically futile, however, until the Progressive Era. Indeed, western towns came to be known as much for their hard-drinking miners and loggers as for the “sisters of joy” who lived by their sides.

Although frontier life was often hard and many prostitutes died of disease and accidents or were murdered, some women who sold sex in western towns created a decent life for themselves. The truism promoted by social reformers that a prostitute’s life span was no more than five years, as she progressed from high-class whore to suicidal drunk, was the exception to the rule. Instead, western prostitutes followed a more common trajectory, entering prostitution when they were young and performing sex work, often in a transient manner, to make ends meet or to get ahead financially before moving on to another occupation or marriage. Some worked as prostitutes until they married and settled down, either in the same vicinity or another western community where their past was not so well known, and resumed a more “respectable” life. Others continued to work in the sex trade after marriage, sometimes as prostitutes, sometimes as madams. Still others, such as Nevada City’s Julia Bulette or Seattle’s Lou Graham, became prominent members of their communities, contributing time and money to philanthropic causes, business development, and political campaigns.

Just like in other groups of workers, prostitutes throughout the nineteenth and early twentieth centuries functioned within a hierarchy in very different

PROSTITUTION

kinds of work environments. The historical sociologist Marion Goldman, who studied prostitution on the Comstock Lode in late nineteenth-century Nevada, found that this stratification resulted from a number of conditions in these women's work lives: whether the unions were clandestine or flagrantly solicited; the subtlety with which a prostitute asked for payment; whether a woman had talents or attributes other than sexual ones; how many men a woman was involved with; whether she was expensive or cheap; and the social class of the men who patronized her. Goldman found that women perceived to be higher class were those whose services were clandestine; who did not openly ask for payment; who were educated or had some talent, such as acting or dancing; and who limited their encounters to one or only a couple upper-class men who could afford her expensive fee.

This hierarchy did not exist only in Nevada. Almost every study of prostitution has outlined a very similar kind of class distinction among sex workers, with local variations. Typically, madams and higher-class prostitutes, especially in the late nineteenth and early twentieth century brothels of New Orleans, New York, Chicago, or San Francisco, lived in sumptuous surroundings where men of means and power, often the most respected and connected persons in their communities, could not only have sex with a beautiful and often well-educated, accomplished woman but also socialize with other wealthy men, conduct business transactions, drink alcohol, dance, and sometimes just sleep. A famous example of this kind of establishment was the Everleigh Club, which was run by Minna and Ada Everleigh (aka Lester), two sisters from Kentucky who left acting careers to open a brothel first in Omaha, Nebraska, and then in Chicago. The Everleigh sisters' opulent house and wealthy clientele made them both famous and rich. When their doors finally closed as a result of pressure from the Chicago Vice Commission and the mayor, rumors circulated that they had made a million dollars in their chosen profession. The exact amount of their profits is unknown, but the sisters did live out the rest of their lives quite comfortably in New York City.

Some elite prostitutes were women who moved in and out of other more respectable occupations, such as acting, dancing, or secretarial work, whom a man might "keep" as a mistress by paying for her rent, clothing, and food in exchange for occasional sexual encounters. Middle-class prostitutes in urban areas often worked together out of apartments or furnished rooms, sharing expenses and arranging "dates" so as not to coincide with each other's schedule; others worked within the "call girl" system whereby a central

dispatcher took "orders" and sent the appropriate "dish" out to the client. Lower classes of sex workers typically worked out of small, dirty cribs, where they performed no-frills sex acts as quickly as possible for 50 cents to \$5; others walked the streets looking for johns, who would often receive sexual services in their cars or in taxis, or who would take the prostitute to a cheap motel or houses of assignation that rented by the hour.

Another hierarchy among prostitutes was based on race. African-American and other ethnic and immigrant women were at the bottom of the hierarchy. Many black prostitutes earned far less than did white prostitutes, were arrested more often than were whites, and had fewer options for leaving the business than did their white counterparts. Although they functioned at the bottom of the social hierarchy, black prostitutes sometimes were able to use to their advantage deeply held white stereotypes of black men and black women as hypersexual (a stereotype that served not only to justify white male access to black women throughout the nineteenth and twentieth centuries but also to justify white male persecution of black men whom they accused of raping "pure" white women). Vice investigators in both early twentieth-century Chicago and New Orleans, for example, found black women marketing their so-called heated sexual nature to potential white customers.

Althea, a mixed-race Chicago prostitute, promised that she and her colleague could give two undercover cops a better "jazzin" (slang for sex) than a white girl, and she savvily noted that their fee was less than that of white prostitutes. Although they typically made less overall than white women, evidence shows that black women often charged white men more than they charged black men for their sexual services and sometimes catered only to better-paying white customers.

Although African-American women in the United States have suffered sexual exploitation at the hands of white men ever since the first slave ships arrived from Africa, not all black women were at the bottom of the commercial sex work ladder in the nineteenth and twentieth centuries. In southern cities—New Orleans, for example—mixed-race women (typically referred to as octoroons or quadroons, depending on the percentage of African-American blood in their heritage) often commanded larger fees from white men than did their white counterparts. The brothels of such famous mixed-race madams as Lulu White and "Countess" Willie V. Piazza attracted high-class prostitutes and wealthy men and had reputations as being some of the best houses in the city. Perhaps ironically, at a time when racial segregation was becoming institutionalized in the Jim Crow South,

Piazza's house was a "whites only" establishment. Just as ironically, as the historian Alecia P. Long has noted, New Orleans's octoroon prostitutes were able to maintain their political clout through close contact with powerful white men. Many of these women were able to weather the growing storm of institutionalized racism and not only continue to move in high-class social circles but also acquire significant financial and material wealth because of (not in spite of) their mixed-race, prostitute status.

In the early twentieth century, an outcry from social reformers arose against the so-called white slave trade in the United States. Spurred on by anti-immigrant sentiment, most notably against Southern and Eastern European men, many of whom were Catholic or Jewish, white Progressive Era reformers, most of whom came from "old immigrant" families of Northern European, Protestant stock, published numerous tracts warning families to "protect" their young daughters who were coming to the cities from their rural homes. Unsuspecting young virgins were easy prey for the evil men who awaited their arrival in the city, men who would seduce them and then send them off to work as sex slaves, often drugged and always against their will. In response to the growing hysteria among social reformers concerned with white slavery, Congress passed the Mann Act in 1910, which banned the transportation of women across state lines for the purpose of prostitution. Although a sex trade undoubtedly existed, arrests made under the Mann Act turned on its head the belief that ethnic men were selling white women as sex slaves. Instead, more white, native-born men were prosecuted under the Act than any other ethnic group combined; furthermore, the women whom these men were convicted of trafficking in were more often than not women from immigrant ethnic groups or lower classes, not the white, middle-class farm girls reformers had worried about. Indeed, it was Asians who most often filled the ranks of the real sex slaves in American society in the late nineteenth and early twentieth centuries.

Most prostitutes fell somewhere near the bottom of the sex work hierarchy. But the dream of repeating the Everleigh sisters' success lured many women into the sex trade, while low wages and miserable working conditions pushed those same women out of more traditional lower-class jobs, such as domestic work, factory work, or the sewing trades. Indeed, a significant number of prostitutes had formerly been live-in domestic workers, a job that most women loathed because of the long hours and strenuous labor. Many domestic workers chose to become prostitutes, noting that the work was less demanding of their time and effort and that they at least got paid for what their

former male employers often expected for free. Although some reformers sympathized with the plight of such lower-class women, many of whom were African-Americans or other ethnic minorities, most of society castigated their greed and accused them of "sinning for silk," a veiled condemnation of their desire to gain upward mobility or cross entrenched color and gender lines through disreputable means.

Women's tenuous economic status outside of the family or marriage also created situations that forced them into prostitution. The death of a father, husband, or brother who had been the sole provider; one's own sickness or that of a family member; or divorce could easily send a middle-class woman from a life of leisure to one of prostitution. Madeleine, a nineteenth-century prostitute, was born into a middle-class family and was plunged into poverty and ultimately turned to prostitution when her father died suddenly at an early age.

The experiences of Maimie Pinzer, an early twentieth-century East Coast Russian Jew, provide other examples of factors leading to prostitution. Maimie, who by all appearances was an intelligent and motivated young woman, tried hard to be "respectable," even starting her own mimeographing business at one point with a female partner. Nonetheless, she faced constant barriers to landing or keeping a job: chauvinism, sexual harassment, employers' revulsion when they saw that she was missing an eye, and so on. As a result, Maimie often resorted to prostitution to supplement what income she could make through more respectable means or to enjoy a nice meal out when she was hungry. She was also financially hobbled by her unwillingness to remain married to a man for whom she felt no passion, simply because he loved her and usually provided enough income to keep her from needing to prostitute herself. Maimie felt guilty about selling sex for money and saw her willingness to do so as a moral flaw in herself, and yet she was also quite pragmatic about the inequities women like herself faced in urban America in the early twentieth century. Her experience was likely representative of many young women at the time, who blurred the lines between prostitution and what historians have called "treating," wherein a woman traded sexual favors for entertainment, food, or other goods and services. Like Maimie, these women crossed in and out of commercial sex as needed, and often held "regular" jobs and were married, separated, or divorced from men who knew about and accepted, if not promoted, their forays into prostitution.

Nineteenth-century municipal governments and state legislatures in the United States toyed with the idea of legalizing or regulating (and taxing) prostitution. New Orleans's city council, for example, voted

PROSTITUTION

in 1857 to tax its prostitutes and to establish a licensing system. The experiment was short-lived for ironic reasons. Madame Emma Pickett reluctantly applied in May 1857 for a license to operate a bordello; two years later, however, she sued the city to recover the fee she had paid for the license. The courts upheld her side of the case and declared the law unconstitutional. Although states such as New York and cities such as San Francisco debated off and on whether to legalize or regulate prostitution in the same manner as England or Paris had in the mid-1800s, only two American cities experimented with such legislation in the nineteenth century: St. Louis, Missouri, which enacted regulated prostitution in 1870 (but then quickly repealed), and New Orleans, which created two limited areas in which prostitution was legal (one that serviced predominantly white clients and one that serviced predominantly black customers). Although these attempts were short-lived, they indicate that many Americans recognized prostitution was a business and its practitioners performing a service, however distasteful middle-class Americans might find it.

The business of prostitution permeated nineteenth- and twentieth-century life much as did any other service industry of the time. Landlords generated huge incomes from properties rented to brothels, often charging exorbitant rents to their disreputable tenants on the one hand while participating in respectable religious, business, or political roles on the other. Additionally, prostitutes and brothels patronized local laundry services, grocers, florists, seamstresses, milliners, alcohol distributors, and many other merchants and service providers. Finally, the fines and bribes prostitutes paid to municipalities and police officers, along with the money they gave to their madams and pimps, rounded out the informal economy of sex work. Indeed, their financial contribution to local economies was often crucial to community development in some neighborhoods.

Prostitutes have lived by the adage, "Whatever you have to sell, it pays to advertise," doing so through such media as New Orleans's famous *Blue Books* and other such sporting guides to American cities, as well as by sitting in street-side windows displaying their wares, strolling down a boulevard exchanging coy glances with potential customers, or in later times, taking out ads in the *Yellow Pages*. Furthermore, many prostitutes and their panderers have realized that it takes money to make money, investing in clothes, props, and other tools of the trade with which to entice and pleasure their customers.

A major change in the history of prostitution occurred in the first and second decades of the twentieth century. With roots in the earlier purity crusades of

the late nineteenth century, Progressive Era antivice campaigns took a new, more scientific approach to eradicating what they now referred to as the "social evil." Reformers from various backgrounds—from fiery ministers to ardent feminists to shrewd politicians—joined together to investigate vice and promote "social hygiene" around the country. The vice commission studies of New York and Chicago were the most prominent, with both of those cities publishing famous reports, both titled *The Social Evil*, in 1902 and 1912, respectively. However, more than 40 cities around the country held their own investigations and published their findings in reports with smaller distribution but perhaps no less impact in their individual communities.

Although prostitutes are stereotypically female, men have also worked as prostitutes in the United States. In the late nineteenth and early twentieth centuries, especially, urban areas exploded in size, providing anonymity and a subculture for homosexual men and women. The presence of gay districts, many of which overlapped with sex districts on the edges of such minority neighborhoods as Harlem or Chicago's Black Belt, provided a new kind of sexual service for interested male customers. As the historian George Chauncey Jr. has revealed, straight male access to the sexual services of both gay-identified and straight-identified men had increased dramatically in New York City by the 1910s and 1920s with street-walking "fairies" and "wolves" frequenting such areas as Times Square and less conspicuous male prostitutes working out of brothels around the city. Far less common, but available for those willing to pay, male and female prostitutes sometimes serviced female customers. However, such cases were by far the least common. Then, as now, men have consumed the vast majority of sexual services available.

A result of Progressive Era vice reform, among its other municipal outcomes, was what has been called the "closing of the red lights." One of the most famous of these districts, in which the sex trade and other vices were tolerated, if not legal, was New Orleans's Storyville, a district named for the alderman Sidney Story, who proposed the ordinance creating the city's segregated sex district in 1898. The district was "named" in his honor, despite the vehement protests of Story, who was himself against prostitution but believed containment was the only remedy for a vice that most people perceived to be a "necessary evil" and that was unlikely to disappear. The name stuck, though, and Storyville was soon reported to have over two thousand prostitutes working out of over two hundred brothels, cabarets, and other such establishments. Just 20 years later, though, another city ordinance officially closed the district. Although

Storyville still boasted eight hundred prostitutes at that time, it had lost its former glory. The combination of this decline, Progressive Era vice campaigns, and wartime fears of soldiers contracting venereal disease from prostitutes were the nails in Storyville's coffin. Similar impulses nationwide led to widespread closures of vice districts both legal and illegal in just a few years. As a result, prostitution, in effect, went underground.

By 1920, although the red lights had effectively been extinguished, prostitution remained. The sex business, however, changed. Whereas before 1920 prostitution had been a predominantly woman-run and woman-staffed business (with a handful of male owners and male brothels thrown into the mix), after 1920, men increasingly controlled the sale of women's bodies through more organized groups, such as the Mafia, as well as through individual pimps, who provided protection to prostitutes made more vulnerable to prosecution as a result of the Progressive Era reforms. The advent of the automobile and the increasing availability of such technologies as the telephone also transformed sex work after 1920. So-called streetwalkers became more common as johns could pull up and pick them up on the street and either take them to hourly motels or houses of assignation or else receive their services in the privacy of their private vehicles or taxicabs. Call-girl services became more common, too, providing a central phone number to clients and then sending girls out to a home, business, or hotel in response to customers' requests.

Streetwalking, call-girl services, and a few remaining brothels predominated the sex trade throughout the middle of the twentieth century, with massage parlors, peep shows, and burlesque and strip clubs rounding out the kinds of sexual services available to customers. Autobiographies of madams and prostitutes published in the mid-twentieth century and Alfred Kinsey's controversial studies of male and female sexuality published in 1948 and 1953 attested to the continued existence of prostitution between 1920 and 1970, but researchers devoted little study to prostitutes or prostitution during those years, as the U.S. public worried more about the Cold War than about vestiges of the late nineteenth- and early twentieth-century heyday of commercial sex. However, events coalesced in the late 1960s and early 1970s to put prostitution back on the public radar screen. Legalization of the birth control pill in 1960 and then abortion in 1973, freer sexual attitudes surrounding the so-called second sexual revolution, and the "second wave" of feminism dramatically increased women's control over sexuality and reproduction. At the same

time, two events returned attention to prostitution in American society: the legalization of prostitution in the perhaps aptly named Storey County, Nevada, in 1971 (four other counties quickly followed suit) and the publication of Xaviera Hollander's *The Happy Hooker* in 1972.

Xaviera Hollander, a Dutch transplant to the United States who proclaimed that she made a fortune on her back and loved every minute of it, represented for many "liberated" women the epitome of a woman's control over her own body and her ability to gain economic freedom through sex work. Similarly, Nevada brothel owners capitalized on their ability to attract male customers and female employees to their establishments by claims to having disease-free, happy hookers who enjoyed all the benefits of more traditional employees. Such claims to prostitutes' choice and control over their work and bodies quickly led to a bitter division among feminists in the 1970s and 1980s. Whereas so-called sex-positive (or pro-sex) feminists usually agreed that not all prostitutes were victims and that some women found pleasure and power in performing sex work, other feminists vehemently denied the ability of any sex worker to claim that she had choice or control, arguing instead that prostitution was the ultimate symbol of men's sexual exploitation of women and therefore must be eradicated completely from society.

Although sex-positive feminists conceded that there was a wide spectrum of reasons that women (and men) chose prostitution—from coercion to choice—they nevertheless wished for prostitutes to be accorded the same status as other workers. Such activists wished to alter negative perceptions of prostitution, referring to the job instead as "sex work" and to its practitioners as "sex workers" and advocating for decriminalization and even regulation of the sex trade. In response to this shift in thinking about the nature of sex work and its practitioners, such organizations as COYOTE (Call Off Your Old Tired Ethics, 1973) and U.S. PROS (U.S. Prostitutes' Collective, 1980) formed to advocate for prostitutes' rights. COYOTE, for example, was founded by Margo St. James in 1973 to work for the repeal of the prostitution laws and an end to the stigma associated with sexual work.

Antiprostitution feminists formed other prostitutes' rights groups, such as WHISPER (Women Hurt in Systems of Prostitution Engaged in Revolt). These organizations coalesced around members who, in opposition to those in pro-sex and pro-sex work organizations, believed all prostitutes were victims and that all prostitution was an indicator of men's sexual exploitation of women.

Although each of these prostitutes' rights organizations had (or has) different—and sometimes oppositional—underlying ideologies and goals, the majority have approximated more traditional types of labor organizations. Legalization and decriminalization, such as had occurred in Nevada, according to U.S. PROS, created “the new sex assembly lines” of the world (West, p. 279) and actually deprived women of their rights by allowing employers and even the state to control their labor. Instead, COYOTE and U.S. PROS (which was formed as part of the larger International Wages for Housework Campaign) advocated complete abolition of laws against prostitute women in order to return women's ability to choose prostitution as a viable business option and maintain control over their working conditions and wages. Prostitutes' rights advocates clearly distinguished between voluntary and forced prostitution, and they also were adamantly against any use of children or unwilling individuals in sex work. However, they argued, adult women who chose to sell sex for money should be accorded the same rights as other service workers. The fact that prostitutes were providing sex instead of clean sheets or someone's dinner, prostitutes' rights advocates proclaimed, should not alter the simple fact that sex workers are workers.

Although the number of prostitutes' rights organizations exponentially increased in the 1970s and 1980s, COYOTE, U.S. PROS, and the like apparently were not, however, the first such organizations for prostitutes. Although the research to date is slim, evidence from late nineteenth-century New Orleans suggests that madams in that city formed a benevolent association, much like those formed for workers in other fields (firemen, police, insurance salesmen, and the like), called the Venus and Bacchus Society. Such formal or informal networks or organizations likely existed in other urban areas that contained large numbers of prostitutes and their affiliated businesses.

At the end of the twentieth century and the beginning of the twenty-first, sex work once again transformed. Traditional prostitution, escort services, stripping, massage parlors, and live sex shows still existed, but new technologies also fostered the rise of phone sex, Internet sex, high-definition pornography, and even virtual sex—all geared (perhaps ironically) toward facilitating solitary masturbation. Additionally, sex workers of both genders saw a rise in the business of bondage and other fetish-oriented services, both heterosexual and homosexual in nature. Transsexual and transvestite sex workers were increasingly obvious, perhaps most notably in their drag performances but also as streetwalkers selling sex to customers.

The Work of Sex

According to such English-language dictionaries as Merriam-Webster's, prostitution is the exchange of sex for money. Most dictionaries do not gender the act of prostitution. A “prostitute,” however, is first defined as a woman who sells sex for money. The second definition is a man who does so, especially those who engage in homosexual practices for pay. In both cases, the heteronormative implication is that men—often referred to as “johns,” a term that the dictionary defines specifically as coming from the masculine name John—are the customers. No word exists in the English language for a woman who purchases sex, whether it be from a man or a woman, although the term “gigolo” refers to a man supported by a woman, usually in return for his attentions, the nature of which the dictionaries never outline (although they explicitly refer to prostitutes as selling sex).

Thus, prostitution is an economic exchange in which women, and to a lesser degree men, provide services to male, and to an almost invisible degree, female customers. Just as, for example, waitresses provide food service to hungry customers or nurses succor suffering patients, prostitutes' labor is the performance of sex acts designed to produce orgasm in their aroused customers. However, despite the labor-intensive and service-oriented nature of sex work and the supposed truism that prostitution is the “oldest profession,” labor historians, even those who study women's labors, have devoted considerably less attention to prostitutes and prostitution than they have to other occupations.

Prostitutes engage in a wide variety of sex acts—sometimes pleasurable, often distasteful, meaningless, or violent—with multiple partners for pay on the job. Additionally, they construct a separate sexual persona when off the clock. By doing so, prostitutes are both agents and victims—agents in that they choose to perform certain sex tasks as part of their workaday life but also victims because they must also appeal to (and presumably sate) customers' desire in order to earn a living.

According to prostitutes' historical and contemporary accounts, the fantasies they appeal to and the sex acts they sell represent both savvy marketing and the limits of what they will and will not do as part of their daily work requirements. This might mean offering fellatio instead of intercourse, because the former is less work for equal or the same pay, while refusing to kiss her customer on the mouth, because it would allow him to cross a barrier she maintains while “on the clock.” She still must satisfy her customer's need

for orgasm by offering the service that will get the job done; yet, she finds ways to maintain her sense of self while doing so. Thinking about prostitutes' work as a task, rather than a value-laden sexual act, reveals that the binary of agent/victim does not necessarily hold up in the commercial sex environment. Sex as work complicates traditional distinctions between prostitutes and other women, most of whom sell or trade their services in some form.

Striking images of Nevada brothels taken in the late twentieth century "read" alongside prostitutes' and madams' autobiographical writing from the same time reveal to labor historians and historians of sexuality alike the importance of the quotidian nature of the work prostitutes perform. Examination of images and memoirs reveals that prostitutes surrounded themselves not only with the tricks of their undoubtedly skilled trade but also with the tools, marketing sexual allure and performance to each customer in assembly-line fashion. Nineteenth- and twentieth-century brothels alike created a fantasy environment for customers. Although fashions undoubtedly changed from the 1880s to the 1980s, the environment in which many prostitutes worked also provided the tricks—red velvet walls, mirrors, erotic images, heart-shaped beds, and an occasional S and M or fetish closet—while each sexual performance space also contained the tools—lotion, condoms, porn, plastic-lined trash cans, the requisite sink, and an occasional bidet.

Furthermore, sex workers saw themselves as business owners and workers, professionals in all senses of that term and with similar hierarchies as other professions. As such, prostitution has had a well-developed work culture and identity. Although sex work encompasses sex tasks and marketed fantasy, it is also on a daily level quite routine and repetitive and, at least internally, contains little of the stereotypical stigma that outsiders attach to the women who do the work. Indeed, most prostitutes view their work as simply a job, which, as does any job, has ups and downs, pluses and minuses, and ins and outs (pun fully intended). Like factory workers, prostitutes have been expected to maximize their labor costs by turning as many tricks as possible in as short a time as possible. Pictures of Nevada brothels, for example, reveal panels of timers with which to regulate exactly how much service a girl would provide for her fee. Although the tricks and tools of the trade have changed over time, the inextricably interconnected nature of sex/sexuality (be it fantasy, sexual performance, or a sexual/work identity in the more modern sense) and work tasks and culture have remained much the same.

PROTOCOL OF PEACE

On July 7, 1910, the cloakmakers' "Great Revolt" began, as almost 50,000 members of the International Ladies' Garment Workers' Union (ILGWU) in New York City walked off their jobs. As work ground to a halt throughout the city, diverse actors moved to reshape the future of industrial relations. Involvement came from many fronts. Meyer Bloomfield, a prominent Boston social worker and industrial reformer, began an effort to end the strike on behalf of A. Lincoln Filene, the owner of the Boston department store Filene's. Bloomfield, Filene, and others had been involved with "the labor question" for some time by 1910. Both had been active in the national and

PROTOCOL OF PEACE

regional National Civic Federation. Both had experience with the ladies' garment industry and Jewish labor. On July 21, Bloomfield met with manufacturers, to offer his services in settling the strike. The next day, Bloomfield met with Julius Henry Cohen, the lawyer for the manufacturers. On July 21, Bloomfield wrote to the famed Boston attorney Louis Brandeis and explained how he laid the foundation for talks and that Brandeis should come and lead them.

Brandeis left for New York on July 23, writing his brother Alfred that "I was called to N.Y. Saturday p.m. to try to settle the N.Y. Garment Workers' strike." He took with him a "draft of a proposed labor agreement." This draft included several ideas, the most important of which was the request that the union give up its demand for a closed or union shop. Brandeis told the 20 men assembled that they were witnessing an important moment in history, the birth of a new system of industrial relations. Brandeis's proposed settlement called for a novel approach: an industrywide agreement, a limited form of industrial democracy, a "preferential shop," health and safety regulations, a grievance mechanism, and an industry-standard wage policy.

The union at first rejected the new plan, holding out for a closed union shop rather than mere preference for union members. But an injunction barring picketing, coupled with the activities of Filene and Brandeis, forced the ILGWU's General Executive Board to rethink the strike. The union finally officially dropped its demand for the closed shop. And on September 2, the two lawyers for each side met to draw up a settlement. The Protocol established "a kind of industrial self-government" that Brandeis had been trying to establish for some time. There were three parts to the Protocol. First were the normal labor contract issues of hours, wages, and paid holidays. In this regard, the Protocol was better than most contracts of the day, clearly better than garment workers ever saw. The second part involved features unique to the garment industry: abolition of charges for electricity and supplies; the establishment of shop committees to establish a just piece rate; and most revolutionary, a Joint Board of Sanitary Control—a committee made up of representatives of both the union and the association who would oversee working conditions. The third and most important part of the Protocol was the implementation of Brandeis's conceptions of efficiency and industrial democracy.

The centerpiece of Brandeis's program for industrial democracy was clearly the preferential shop, the ban on all strikes and lockouts, and the establishment of grievance and arbitration mechanisms. Crucial was the last clause and agreement, on the preferential

shop, which, in effect, recognized the union shop indirectly. As the garment industry expert Benjamin Stolberg states, "The clause was as effective, for the union's purpose, as if the full closed shop had been adopted" because the union could always supply workers.

A central aspect of the Protocol was the attempt to rationalize, standardize, and Taylorize the garment industry. All work stoppages would be eliminated. Work would continue as grievances were arbitrated. As a tripartite agreement between labor, management, and the public, the Protocol steered the industry into the modernity of an industrial consumer society. In exchange for giving union leadership some authority, the Protocol mandated industrial self-management. In essence, the association expected the ILGWU to police its own members for the benefit of the industry. The union was to supply "efficient" workers and ensure continuous and rational production. If the union could do this effectively, workers would benefit. By controlling its own members, the union brought to industry what the manufacturers could not: stability and rationality. One measure for the Protocol's success could be seen in both the unionization that followed and by the new role for union leaders and outside arbitrators. Union leaders could be cheered by swelling membership rolls, as with the increased authority and respectability the Protocol vested in them. In 1910, the New York City cloakmakers represented three fourths of the entire ILGWU membership. The agreement covered 1,796 out of a possible 1,829 shops. By 1912, 90% of all cloakmakers were in the union. Manufacturers could take a measure of hope that the anarchy and chaos of the seasonal wildcat strikes were over as all garment workers were being brought into a disciplined and maturing labor union. The signing of the Protocol of Peace finally institutionalized for the cloakmakers, and then for the whole industry, some of the major features that the shirtwaist workers had struggled for in 1909.

The structure of the Protocol intended to impose efficiency and rationality on a chaotic industry. Bringing industrial hygienists, reformers, shop owners, and workers together, it sought to contribute to the larger discourse on the role of work in the newly forming consumer society and on the rights of management and workers in an industrial society. Most shared the opinion that the current situation was chaotic. The Protocol's answer was the principle of layered bureaucracy, which Protocolists envisioned as an industrial version of our nation's constitutional checks and balances.

At the top of this system stood the Board of Arbitration, which consisted of three members: one from

management, one from labor, and Brandeis, who represented the public. All decisions of the Board were binding. Below it was the Committee on Grievances, which consisted of four members, two from each side, which acted as a conciliation agency. This committee heard all grievances filed by either side. A majority vote brought settlement, meaning at least one member from the other side had to switch. Only if a deadlock occurred—which happened, as we will see, all too often—would it go to the Board of Arbitration.

Another remarkable feature of the Protocol was the Board of Sanitary Control. This was a prototypical Progressive Era reform effort. This Board consisted of seven members, two from the union, two from management and the remainder chosen by the four to represent the public. Its first order of business was a systematic investigation into the sanitary conditions of the cloak, suit, and skirt industry. This was one of the first full-scale public health surveys of the industry. The Sanitary Board did not, at first, have enforcement powers. Its power lay in its ability to marshal public outrage against unsanitary conditions. Members of this board had great faith in the public at large, believing that if they only knew the true conditions, they would become outraged and demand action. The most dramatic of these new sources was the authorizing of “sanitation strikes.” Under the sanitation provisions of the Protocol, workers would be allowed to strike over unsanitary conditions authorized by the Sanitation Board. In addition, the Board developed a sanitary certificate that shop owners had to hang in their shops to show they were in complete compliance with the sanitary features of the Protocol.

While the machinery of the Protocol was being put into place, Protocolists began to spread the agreement to other sectors of the ladies’ garment industry in New York City. To prove their thesis about the Protocol’s revolutionary potential, they needed to demonstrate its potential to bring peace to an entire industry. Thus, even before the bugs were worked out of the initial settlement, Brandeis and company were seeking to implement the Protocol in new sectors of the ladies’ garment industry.

The union and the association hit on a novel way to organize the industry and thereby spread the protocol to all sectors of the garment industry: an orchestrated general strike. Both sides embarked upon a co-ordinated effort to quickly and painlessly rationalize the industry. First, the association provided the union with a list of all member shops. The union, in turn, pledged to pressure all nonmember shops to join the association. Last, both agreed to a general strike to organize both workers and employers in the industry. The association stated that “unless the union . . .

as a result of the ‘general strike’ enroll[ed] in its membership the bulk of the workers in the industry” the agreement would certainly fail. It was clear, then, that these strikes were, from their inception, a tool to organize not just the workforce, but the entire industry. By the end of March, the Protocol had come to encompass the entirety of the ladies’ garment industry. Reformers and the press heralded these events, but few anticipated the problems that would soon arise. To many outside of the rank and file, the Protocol was a magic bullet, an inoculation against class disruption and an “uncivilized” economy. Blind to the realities of the day-to-day functioning of Protocolism, the public soon moved on to other concerns. While on the surface the Protocol seemed to be functioning as planned, problems were smoldering beneath. The Protocol mechanisms were bureaucracy embodied. The Arbitration Board sped up the centralizing mission of the new labor system that the Protocol had unleashed. It took almost all authority from workers and the shop floor and placed it in centralized and regulated bodies dominated by industrial experts. The Protocol officially ended with the settlement of the 1916 strike, though sections such as the Board of Sanitary Control lasted for decades more.

PUBLIC-SECTOR UNIONISM

From the early 1960s to the present, public-sector unions have been the major success story of American labor. From the early 1960s to today, public-sector union density rose from less than 12% to around 40%; meanwhile, from the mid-1950s to today, private-sector union density declined from more than 33% to less than 10%. Also, by the year 2000, about 40% of all union members were public workers. This counters some conventional wisdom about the American working class. Counting those who, for example, clean public schools as “workers” reveals an American working class quite receptive to the labor movement.

Yet the history of public-sector unions is studied much less than the history of private-sector unions.

Perhaps this is because government employees are still stereotyped as bureaucrats, not authentic “workers.” But public workers fought long and hard for the right to unionize and did so for the same reasons as private-sector workers. Also, despite their successes, public-sector unions have still not won even the basic right to bargain collectively on a national scale. A sizable minority of states still do not grant any public employees the right to bargain, and many states deny bargaining rights to significant categories of public workers.

Throughout American history, public workers have encountered the claim that governmental labor relations are entirely distinct from private-sector labor relations. In 1920, Senator Charles Thomas (D-CO) stated that the “fundamental idea lying at the foundation of organized labor . . . has been the assumption . . . of an antagonism of interest and of purpose between employer and employee. . . . That situation cannot be applied to public employment.”

Unionists articulated a different vision. Public workers had “grievances just the same as men in other walks of life,” insisted Boston’s labor newspaper in 1919. “Government workers who are unorganized can be and are exploited as cruelly as unorganized workers in private industry,” echoed the newspaper of the Transportation Workers Union (TWU) in 1942 (Slater, *Public Workers*, pp. 1, 27, 193).

Policy makers still treat public and private employees quite differently. Yet public employees have struggled for over a century to organize into unions to improve wages, hours, and conditions of work and to have an effective voice in their working lives. The question of how these desires should be balanced against concerns of democracy (determining policies based on public choices) and public budgets has been at the center of public-sector labor relations policies.

Studying public-sector unions provides a different picture of labor history, generally depicted solely as a rise and decline of private-sector unions. Further, it demonstrates another way in which American labor was “exceptional.” In comparable countries, public workers have long been accorded most or all of the same rights as private-sector workers. It also demonstrates a variety of political strategies and tactics labor has used, largely distinctive to the public sector.

The “False Dawn” and the Boston Police Strike of 1919

Public employees began forming unions in the mid-nineteenth century. Organized public employees were typically members of mostly private-sector unions, for example, skilled workers in naval yards. Public

workers in Philadelphia won the 10-hour day after a protest in 1835. In 1867, the National Labor Union unsuccessfully called for the closed shop in public employment. The different tactics public workers would use and the different responses those tactics provoked were highlighted in 1895 when the postmaster general, William Wilson, barred any employee from visiting Washington to influence legislation affecting his or her employment. In 1905, the Chicago Electricity Department signed the first known formal labor contract between a municipal public employer and a union. In 1906, the American Federation of Labor (AFL) created its first national union of government workers, the National Federation of Post Office Clerks.

Public-sector organizing began to take off around the time of World War I. The AFL chartered the American Federation of Teachers (AFT) in 1916, and in 1918, the AFT grew from 2,000 to 11,000 members. In 1917, the AFL established a union for employees of the federal government (the National Federation of Federal Employees), and in that same year, the National Association of Letter Carriers and the Railway Mail Carriers affiliated with the AFL. In 1918, the AFL created the International Association of Fire Fighters (IAFF); from 1918 to 1919 alone, the number of IAFF locals increased from 82 to 262. In 1910, union density in the public sector was around 3.5%; from 1915 to 1921, it went from 4.8% to 7.2%. Combined with an increase in the size of government, this meant that the number of unionized public workers nearly doubled in those years. The AFL welcomed these developments. In June 1919, for the first time the AFL agreed to charter locals of police and soon chartered 37.

But in September 1919, the Boston police strike occurred, a seminal and crippling event that cut short this first, false dawn of public-sector organizing. More than 1,100 police went on strike over wages, hours, working conditions, and the right to form a union. The consequences were devastating. The Boston police commissioner, Edwin Curtis, helped cause the strike by banning police from affiliating with the AFL, claiming that police officers could not have “divided loyalty.” Private employers also strongly opposed the police union. Police officers, who had seen almost no increase in pay in 20 years, insisted on their right to affiliate with the AFL and were suspended for so doing, thus triggering the strike.

The strike instantly provoked trouble. As the officers left their posts, crowds gathered to attack them, substitute police officers, and others. For three days, the city suffered from significant lawlessness and violence. A total of around 5,000 state National Guard troops finally intervened, killing nine and wounding 23 others. Although other Boston unions

had threatened a general strike in support of the police union, it did not materialize. In the context of other labor radicalism in 1919, the mainstream press opposed the union. Governor Calvin Coolidge capitalized on his harsh treatment of the strikers to launch a career in national politics.

Future public workers were especially unlucky that this strike involved police. In later years, it was used to argue against any public workers being allowed even the right to organize, on the grounds that such rights would lead literally to death and destruction. After the strike, many jurisdictions barred police officers from organizing unions (all police locals were soon destroyed), but further, many other types of unions, including teachers and street cleaners, would be banned. Public-sector union density stagnated through the 1920s. For decades to follow, arguments against public-sector unions echoed those made in Boston. As late as 1963, the Michigan Supreme Court upheld a bar on police unionizing, stressing the need for “undivided allegiance”; President Ronald Reagan cited the Boston strike as a precedent for firing striking members of the Professional Air Traffic Controllers Union (PATCO) in 1981.

Another lingering effect was that public employees now often sought to unionize outside the AFL. Indeed, at the beginning of the twenty-first century, some major public-sector unions remained outside the AFL-CIO: the Fraternal Order of Police, the National Education Association (NEA), and others, such as the National Treasury Employees Union.

Legal Status from the New Deal to the 1960s

America is unique among industrialized democracies in sharply differentiating legal rules for public- and private-sector labor relations, and these rules had a tremendous effect on public-sector unions. Before the 1960s, the law everywhere in the United States prohibited strikes and almost all collective bargaining in government employment, and courts routinely allowed public employers to bar union membership itself. While the National Labor Relations Act (NLRA) of 1935 gave basic protections to private-sector unions, no federal law has ever covered these public-sector unions. Nor, up to the 1960s, did any state laws. Prior to the 1960s, state courts made public-sector labor law, typically endorsing whatever rules public employers imposed. Federal workers were marginally better off, as the Lloyd-La Follette Act of 1912 gave federal employees the right to form unions, albeit not to bargain. This “pre-collective bargaining era” for public workers in the United

States lasted decades beyond when public workers in, for example, Britain and France won bargaining and related rights quite similar to those of private-sector workers in those countries.

Since the 1960s, a majority of states have passed laws allowing some public employees to bargain, but public-sector laws are more restrictive than the NLRA. And even in the twenty-first century, many states refuse to grant bargaining rights to most or all public employees, and only 11 states permit any public employees to strike under any circumstance. Thus, the rules governing public-sector labor relations have always been different from and less generous than private-sector law.

Why was the development of public-sector law so delayed and deformed? First, the Boston strike was a major blow. Second, judges who made the law until at least the early 1960s blended several types of concerns. They were, like many judges in those days, hostile to labor. They also promoted a particular vision of state structure and sovereignty in which judges gave considerable deference to local public employers, partly because courts did not want to be in the business of reviewing personnel decisions. Most broadly, the federalist structure of the American state, with its extreme division of power, had the practical effect of placing the power to make the “law” of labor relations squarely in the hands of local officials, themselves the actual employers. Finally, judges simply assumed that public workers would want to strike and bargain the full range of issues that private workers bargained, even though, from 1920 through the mid-1960s, all public-sector unions had waived the right to strike and in fact strikes by public workers were rare, small in scale, and short. Still, judges uniformly opposed public-sector labor rights, often in vitriolic opinions. Two separate court decisions in the 1940s, from Texas and New York, used the following quote: “To tolerate or recognize any combination of . . . employees of the government as a labor organization or union is not only incompatible with the spirit of democracy but inconsistent with every principle upon which our Government is founded” (*Railway Mail Association v. Murphy* [1943]; *CIO v. City of Dallas* [1946]).

Union Activities in the Pre-Collective Bargaining Era

Public-sector unions existed and were active before bargaining laws began being passed in the 1960s. Public-sector union density ranged from 9% to 13% from the 1930s to the early 1960s. This was a significant

total number, as by 1934 there were nearly 3.3 million government workers in the United States (12.7% of all nonagricultural workers). To break down the categories, between the world wars, civilian federal employees were about one fourth of all the public workers. Of state and local government workers, school employees constituted from 33% to 50%. In the 25 years after World War II, state and local governments expanded at up to twice the rate of the federal government. For this period, police and fire services were the largest category of municipal employees aside from school employees.

The period before the 1960s also created the central institutions and determined much of the basic character of the public-sector labor movement. The major players of today have been in place for a long time. In addition to the unions listed above, the American Federation of Government Employees (AFGE) and the American Federation of State, County and Municipal Employees (AFSCME) were formed in the 1930s; by the 1960s, the National Education Association had been converted from an employer-dominated group to a more traditional union. And public-sector unions, then as now, relied heavily on political strategies.

In this era, public-sector unions used various tactics to represent their members. First, they used politics. They supported sympathetic candidates in local elections. They lobbied and made appeals to the public, trying to enlist public pressure to influence public officials who were employers and those who could enact laws and regulations that would protect workers. Civil service and pension laws were major goals. Second, they represented workers in civil service or whatever other types of hearings were available. Third, they helped provide training, information, and other resources for their members. Fourth, they engaged in “informal” bargaining, which sometimes led to quasi-collective agreements.

Such practices were surprisingly common. A 1946 study found that 97 cities had written agreements with employee organizations. And these contracts helped workers: public school janitors represented by the Building Service Employees International Union were typically better paid than their unorganized counterparts. But these agreements were far short of modern, binding collective bargaining, both in their narrow scope and their dubious enforceability. Employers had no obligation—and in many cases arguably no actual legal power—to enter into them. Union efforts in these decades were creative and sometimes effective, but because they lacked institutional rights, they at best achieved mixed success.

For example, the powerful and militant TWU reacted angrily after its main local in New York

City was converted into a public-sector union when the city bought the subways in 1940. This act removed collective bargaining rights from thousands of workers. The TWU’s reaction included mass protests and huge publicity campaigns. It ultimately won a compromise: a system granting rudimentary bargaining rights, but still with significant restrictions based on its public-sector status.

Civil Service Rules

While unsuccessful in passing bargaining laws before the 1960s, unions did help pass civil service laws. Federal civil service rules originated in the Pendleton Act of 1883. Passed in response to an assassination attempt on President Garfield by a man allegedly disappointed by not receiving a patronage job, the Act attempted to decrease the role of political spoils and increase the role of merit in federal employment. It created civil service exams, barred dismissals of covered employees for political reasons, and created a Civil Service Commission to enforce these rules.

State governments adopted civil service systems for the same reasons as the federal government: to replace the spoils system with the merit system. Illinois actually adopted its law under circumstances remarkably similar to those that led to the Pendleton Act. The state passed the “Optional Civil Service Act for Cities” in 1895, after Mayor Carter Harrison of Chicago was killed by a disappointed office seeker. Illinois then passed a civil service law for state employees in 1905. Other early states included New York, which passed the first such law in 1883, Massachusetts in 1884, Wisconsin in 1905, New Jersey in 1908, California and Ohio in 1913, Kansas in 1915, and Maryland in 1920. By 1948, 25 states had adopted such systems, as had hundreds of cities. Today, essentially all public employers have civil service rules.

These laws initially offered only limited protection: many workers were excluded, and protections were often scant. Still, they brought some standards to hiring (requiring passing civil service exams) and provided some check on arbitrary firing. And today, such laws provide general “just cause” protection in discipline and discharge.

Wisconsin and the Beginning of the Collective Bargaining Era

The end of the old era began with the passage of the first state statute permitting public-sector collective

bargaining in Wisconsin in 1959 and 1962. This law was enacted after AFSCME had struggled for over a decade to pass such a bill, finally overcoming the entire history of objections and obstacles to public-sector unions: fears of police strikes; legal doctrines concerning government sovereignty; policy objections to unions bargaining with government; and opposition from private business interests and conservative political leaders.

The law, after the 1962 amendments, provided that covered public workers (most local government employees) had the right to organize into unions and to bargain. If bargaining reached an impasse, a state agency (the Wisconsin Employment Relations Bureau) could conduct mediation at the request of both parties and fact-finding at the request of either party. Later, the law was amended to provide, among other things, for binding arbitration.

The trend continued. Federal employees received limited collective bargaining rights for the first time just after the Wisconsin law was signed in 1962, when President Kennedy issued Executive Order 10988. In the 1960s, states began passing laws that allowed public-sector bargaining and created specific mechanisms to resolve bargaining impasses that did not involve striking. By 1966, 16 states had enacted laws extending some bargaining rights to at least some public workers. In 1978, the Federal Service Labor Management Relations Act of 1978 was adopted for most federal employees; it provides bargaining rights and binding arbitration at impasse.

In the late 1960s, courts finally accepted an argument that public-sector unionists had made for decades: that the First Amendment of the Constitution prevented a public employer from firing or otherwise discriminating against a public employee because of membership in or support of a union. Thus, while some public employees are still without a legal right to bargain, all have a constitutional right to form unions.

The public-sector laws that have developed since the mid-1960s vary tremendously. At the turn of the twenty-first century, there were more than 110 separate state public-sector labor law statutes, augmented by many local ordinances, executive orders, and other authority. Twenty-nine states and the District of Columbia allowed collective bargaining for all major groups of public employees; 13 states allowed only one to four types of public workers to bargain (most commonly teachers and firefighters); and eight do not allow any public workers to bargain. While only 12 states allowed any public workers to strike, 38 states provided some impasse procedures for unionized public workers. Thirty-six states used mandatory or optional mediation; 34 used fact-finding; and 30 had

arbitration as the final step, with 21 states using binding arbitration. Still, a significant minority of states ban bargaining as well as striking, and a few (for example, Virginia) bar any official recognition of a public-sector union.

Political fights over the rights of public workers have continued. In 2004, the governors of Indiana and Missouri unilaterally withdrew executive orders permitting state employees to bargain collectively. After the 9/11 attacks, the Bush administration would not approve a bill creating the Department of Homeland Security (DHS) unless administration officials were empowered to design a new personnel system that could vitiate collective bargaining rights and civil service protections for DHS workers (notably, about 48,000 of these workers had previously enjoyed bargaining rights in predecessor agencies). Even where collective bargaining is allowed for public workers, state legislatures have sometimes narrowed existing laws to restrict the topics over which some public workers can bargain. For example, in the 1990s, Michigan restricted the topics over which teachers' unions could bargain.

The Rise of Public-Sector Unions in the 1960s and Beyond

With a constitutionally protected right to organize, and rights to bargain in an increasing number of states, public-sector unions greatly increased in membership. In 1955, public-sector unions had about 400,000 members; by the 1970s the total was more than 4 million. From 1955 to 1991, the AFT increased its membership from 40,000 to 573,000; AFSCME grew from 99,000 to 1,191,000; and the IAFF grew from 72,000 to 151,000. The Service Employees International Union, which has a large public-sector component, grew from 50,000 to 108,000.

From 1955 to 1991, the total membership of the AFL-CIO only rose from 12,622,000 to 13,933,000. The growth of these unions thus had an impact on the labor movement. The number of public employees in the organization grew from 915,000 (about 5% of total AFL-CIO membership) in 1956 to 1.7 million (about 9%) in 1966. By 1993, around 40% of union members in the United States were in the public sector. By 1997, AFSCME's 1.3 million members made it the second largest union in the AFL-CIO, after the Teamsters. That same year, the AFT claimed 1 million members.

At the turn of the twenty-first century, the highest rates of unionization in the public sector were in local government employment (43.2 % in 2001), with

police, teachers, and firefighters leading the way. Notably, police and firefighters were not allowed to strike even where they could bargain and even where other public workers were allowed.

This boom—and the new state public-sector bargaining laws that were inextricably linked to it—had a variety of causes. The increased size of public employment likely played a role, although notably, levels of public employment were not growing much relative to the economy as a whole. The number of government workers nearly doubled in the 1960s and 1970s (with most of the growth in state and local government employment), bringing the total to more than 16 million in 1980. Still, in 1960, public workers constituted 15.4% of nonagricultural employees, and by 1991, this figure was still less than 17%. Continuing experience with stability in private-sector relations and the climate of social change of the 1960s and 1970s also contributed to the new toleration of public-sector unions.

There was also a brief period of relative militance in the public sector. In the later 1960s and 1970s, teachers, sanitation workers, and even police, among others, engaged in job actions and (often illegal) strikes. In some cases, unions won rights with those tactics; in other cases, the actions caused a backlash.

For example, the American Federation of Teachers became engaged in a bitter and divisive job action in the Ocean Hill-Brownville neighborhood of New York in 1968–1969. Civil rights activists and unionists, generally allies by this time, split badly over whether local community groups should be given more authority over schools, including over labor and personnel matters such as transfers.

Perhaps part and parcel of the general tenor of protesting social movements, illegal strike actions decreased considerably in the 1980s and beyond. The PATCO strike of 1981, involving air traffic controllers, was famous (and arguably was the symbolic start of a wider attack on unions), but it was the exception. Intriguingly, studies indicate that at least in many circumstances, passing laws that gave public workers the right to bargain collectively actually decreased the number of illegal strikes by public employees.

Conclusion

Public-sector unions contain a tremendous variety of types of workers: police officers, kindergarten teachers, road maintenance crews, and white-collar semi-professional and professional jobs, among others. Some of these jobs are unique to the public sector (firefighters); some are widespread in the private

sector (secretaries and janitors). Yet public workers remain a coherent category primarily for two reasons. First, they will inevitably behave politically in some way, because their employers are politicians. Second, in the United States, their bargaining rights are different from and more limited than bargaining rights in the private sector, both in what they can bargain over and what may happen when bargaining impasses arise. Although government workers have always had many of the same concerns as those in the private sector, their unions have had far fewer legal rights, and their range of practical action has been much more circumscribed.

Including public workers requires reconceptualizing the periodization of labor history. In the traditional view, 1935 to 1945 was the watershed, with a small core of unions before the New Deal and a mostly successful labor relations regime after World War II. The decline of private-sector labor has undercut this view. But further, the rise of public-sector unions now seems as meaningful as, say, the creation of the Congress of Industrial Organizations (CIO). The significance of the 1960s and beyond comes as much from the workers who entered the labor movement as from those who left it.

This history also shows that the attitudes of employers are crucial to unions. Modern public-sector employers are less aggressively hostile toward unionization than private-sector employers, possibly because of institutional concerns (they are elected) and possibly because civil service rules constrain them.

In 1942, the TWU's newspaper wrote that "government workers who are unorganized can be and are exploited as cruelly as unorganized workers in private industry. Whatever progress government workers have made in recent years they have made only through labor organization." That vision continues to motivate millions of public workers today.

PUEBLO REVOLT (1680)

The Pueblo Revolt of 1680 was a coordinated uprising on the part of Pueblo Indians and their Apache and Navajo allies, aimed at ousting Spanish settlers from the northern Rio Grande basin of the province of New Mexico in New Spain. Hundreds of Spaniards and Pueblo natives died, including 21 of the province's 33 missionaries. Nearly every Spanish building and church was destroyed or damaged. The revolt was initially planned for August 11, 1680, but the plot was discovered on August 9, and the general revolt was advanced on August 10. While both sides experienced losses, the Pueblo were the decided victors. For approximately three weeks, natives tortured and killed Spaniards, destroyed and appropriated Spanish property, and pushed the colonizers out of the upper Rio Grande. The rebellion allowed the Pueblo Indians to hold their land as undisputed rulers from 1680 to 1692 and caused a shift in Spanish power from Santa Fe to El Paso.

The revolt has often been referred to as Popé's Rebellion after a San Juan Tewa Indian leader, Pop'ay (Ripe Pumpkin) or El Popé, living at Taos pueblo in August 1680. Claiming that the god Poheyemo appeared to him from the underworld and appointed him as his representative, Popé spread word of his vision from the *kiva* (ceremonial structure) at Taos. His instructions were to kill all the Spaniards and missionaries, destroy all evidence of Christian religion, and return Indians to their former freedom. At the turn of the twenty-first century, historians have placed emphasis on the co-operation between multiple leaders and participants, rather than emphasizing one individual's agency in sparking the revolt.

Many additional explanations for the bloody revolt of 1680 have been offered. Religious disputes, disease, environmental changes, population decline, concentration of settlements, Spanish violence, increased land grants to colonists, disrupted trade, and coerced labor are cited for creating increased tensions

and a motive for the uprising. The revolt has often been characterized as a “holy war.” Most scholars agree, however, that it was finally the realization of lost territory, culture, and autonomy that created the conditions ready for the revolt of 1680.

Since the arrival of Juan de Oñate and a group of Mexican settlers to northern New Mexico in 1598, the Spanish asserted control over indigenous religion, economy, and culture. The colonizers applied the name Pueblo (referring to the permanent towns of stone or adobe) to native groups who shared an agricultural subsistence economy. This included groups with diversified languages and traditions including the Tewa, Hopi, Zuni, and Acoma. Often using force and coercion, the governor, soldiers, and missionaries exacted labor from the Pueblo people. Nearly every seventeenth-century governor abused power for economic gain. Native labor was used for weaving in workshops, gathering piñon pine nuts, building carts, and driving mules for trade caravans to Mexico City. Many natives also performed duties as servants. Most of this work was without compensation, but even those who received wages were paid well below the standard.

Under the *encomienda* system, the Spanish government granted citizen soldiers-for-hire labor and tribute in return for acting as the state’s police force. The Spaniards’ demands for grain, livestock, handicrafts, and other goods disrupted the traditional patterns of agriculture and work. Franciscan missionaries demanded indigenous labor for the construction and maintenance of the mission compounds and church structures. Toward the end of the seventeenth century, there were a number of minor and local revolts by the Pueblo in response to Spanish abuses. However, it was not until August 1680 that a full-fledged, coordinated response occurred.

Coordination was a feat in itself, for each Pueblo community was an independent political unit, and within the region native peoples spoke at least six different languages and countless dialects. Period accounts reveal that coordination for the revolt was made possible by close communication between Pueblo leaders. Calendars in the form of knotted cords, representing the days until the attack, were distributed throughout the native settlements. Each day a single knot would be untied, and when there were no knots left, that would be the day of the revolt. Messengers were also sent to spread word to kill all the friars and the settlers on August 11. Two such runners from the Tesuque pueblo were captured on August 9 and revealed the plan to the Spanish. Despite this setback, the Pueblo people were alerted and the rebellion ensued on August 10. Northern Pueblo peoples such as the Tewa, the Northern Tiwa, and the Pecos Indians were the most active in the revolt and suffered the

most casualties. Due to the lack of accurate records, the number of Pueblo killed is not known.

In the aftermath of the rebellion, many Pueblo revived native traditions and reconstructed *kivas* and shrines. While the Pueblo leaders maintained control of New Mexico for a decade, internal discord is cited for causing developing factionalism after 1680. A significant number of people residing in New Mexico at the time of the rebellion were *mestizos* who could claim both native and non-native ancestry, and intermarriage with the Pueblo was predominant by 1680. This acculturation and miscegenation blurred alliances both before and after the rebellion and caused additional unrest on the part of Pueblo leaders. In the early 1690s, the Spanish used the internal weaknesses to re-assume control and were largely successful despite a second revolt in 1696.

Sources for understanding the rebellion are contemporary accounts largely written or recorded by Spanish religious and political leaders. These provide an often contradictory and sometimes misleading picture of the events and require careful ethnographic reading. Adding to the written records, scholars have turned to archaeological remains, oral histories, and material culture to provide additional context.

Although interpretations of the rebellion differ, historians agree that it was one of the most successful revolts against a European power in the New World. Natives and non-natives lost their lives and had property destroyed. Yet for over a decade, the Pueblo people maintained control of their homeland. Many speculate that their success inhibited later Spanish attempts to eradicate their culture and forced government and religious officials to adopt less harsh policies toward natives after reconquest.

PUERTO RICANS

Puerto Ricans have immigrated to the United States primarily as working-class labor migrants. Economic change in Puerto Rico left many agricultural and other workers unemployed or underemployed. Men and women migrated in search of work. Meanwhile, U.S. employers recruited Puerto Ricans as a source of low-wage workers. The governments of the United States and Puerto Rico promoted migration through contract labor programs. Policy makers attributed unemployment and poverty to "overpopulation" instead of to economic development policies that provided jobs that were too scarce and wages that were too low. Puerto Ricans also came through networks of family and friends, helping each other to make the trip and to find work and housing. As a result of these labor migrations, predominantly working-class Puerto Rican communities have formed throughout the United States.

Since 1917, Puerto Ricans have come to the United States as U.S. citizens. In 1898, at the end of the Spanish-Cuban-American War, Spain ceded sovereignty over Puerto Rico to the United States, and the United States has retained that sovereignty ever since. Hence, Puerto Rican migration is within the confines of the colonial relationship between the United States and Puerto Rico. U.S. government policies and U.S. businesses have a pivotal impact on Puerto Rico's economy. Initially, Puerto Ricans coming to the United States had an ambiguous status, considered neither citizens nor "aliens." In 1917, the U.S. Congress declared all Puerto Ricans to be U.S. citizens. Although Puerto Ricans arrived in the United States entitled to full citizenship rights, they also arrived as a multiracial and mixed-race people, with a distinct language and culture, who were often recruited as low-wage workers.

Contract Labor and the Puerto Rican Diaspora

From 1900 to 1901, more than 5,000 Puerto Rican men, women, and children were transported from

Puerto Rico to Hawai'i to work on sugar plantations. The trip by boat and by train was grueling. Half of the passengers escaped en route, some abandoning ship in New Orleans and others refusing to get back on a ship in San Francisco. Those who landed in Hawai'i found harsh working and living conditions. Employers hoped Puerto Ricans would serve as low-wage workers and undermine the organizing efforts of Japanese workers. Puerto Rican migrants, however, included union activists. Although employers fostered conflict and competition among their diverse workforce along racial and ethnic lines, Puerto Ricans, Japanese, Chinese, Portuguese, Hawai'ians, and Filipinos forged alliances to improve conditions. Along the way, they formed a unique multiethnic local culture, as the anthropologist Iris López describes. In 2000, Hawai'i's Puerto Ricans marked the centennial of their arrival with celebrations.

This early contract labor initiative laid the foundation for future programs and highlights their key dynamics. Policy makers in the United States and Puerto Rico viewed "overpopulation" as the cause of unemployment. They viewed emigration and contract labor programs as a solution. Yet U.S. investments and economic development policies in Puerto Rico displaced workers, causing unemployment. Facing limited opportunities at home, Puerto Ricans migrated in search of work within Puerto Rico, to the United States, and to other countries. U.S. employers hoped to increase profits by lowering labor costs. Government-sanctioned contract labor programs linked workers and destinations, and covered transportation costs, which were then deducted from workers' wages along with other expenses such as food. While some workers returned to Puerto Rico when their contracts expired, others remained in their new destinations, sent for family and friends, and provided the foundations for the Puerto Rican diaspora.

Other contract labor initiatives followed. Although labor migration is often thought of as a male phenomenon, women were recruited as well. In 1904, 50 Puerto Rican women between the ages of 15 and 21 were recruited to work at the St. Louis Cordage Company in St. Louis, Missouri. In 1920, 130 women were recruited to the American Manufacturing Company, a rope factory in Brooklyn, New York. The Arizona Cotton Growers' Association recruited whole families in 1926, and 1,000 made the trip. Finding wages and living conditions far below their expectations and their contracts' provisions, workers protested, trying to force the company to uphold the contracts' provisions. They found support from the Phoenix Central Labor Council, which raised funds, had a bread line, and sent telegrams to the labor leaders Santiago Iglesias in Puerto Rico and William Green in the

United States. During World War I, thousands of Puerto Rican men, recruited to work in war industries and on military bases, found themselves in Louisiana, North Carolina, South Carolina, and Georgia.

These contract labor programs sparked widespread complaints from workers. Nevertheless, policy makers increased their involvement and the scope of contract labor programs. During World War II, the U.S. War Manpower Commission recruited men to work in war industries, including canning plants like the Campbell Soup Company in southern New Jersey, and on the B & O and Pennsylvania Railroads. After the war, a private labor agency brought men to work in agriculture and in the steel industry at the National Tube Company, a division of U.S. Steel in Lorain, Ohio. Puerto Rican women were brought to work as domestics in Chicago and Philadelphia. Policy makers briefly promoted labor contracts for domestics but then turned to labor contracts for seasonal farmworkers, especially along the eastern seaboard. The farm labor program lasted for decades and brought thousands of men each year.

Working-Class Communities between the World Wars

After World War I, New York City became the largest Puerto Rican community, as the population surpassed that in Hawai'i. By 1940, 88% of Puerto Ricans living in the continental United States made the city their home. Philadelphia's Puerto Rican community grew as well. These communities grew through social networks, as family and friends helped each other make the trip and get settled. The cigar maker Bernardo Vega left his hometown of Cayey in 1916 and headed for New York City. In his *Memoirs*, he recalled that aboard the steamship, "the overriding theme of our conversations, however, was what we expected to find in New York City. With our first earnings we would send for our nearest relative." Most came looking for work. When they arrived, networks continued, and both cities became home to vibrant, diverse, working-class communities.

Cigar makers and socialists figured prominently among the migrants to both cities. Many were politically active in Puerto Rico. Born in 1885, Vega participated in Puerto Rico's first large-scale workers' group, the *Federación Libre de Trabajadores*, started in 1899, and he was a delegate to the founding convention of the *Partido Socialista* in his hometown in 1915. Cigar makers labored while the lector read, contributing to an educated and politically active group. In his *Memoirs*, Vega wrote, "As socialists,

we dig our trenches everywhere in the world." He continued his activism in New York City, describing Harlem as "a socialist stronghold," with neighborhood clubs for political, cultural, and sports activities. Like Vega, Jesús Colón was a cigar maker and a socialist, who left Cayey for New York City. Between his arrival in 1917 and his death in 1974, Colón's leadership fostered 25 community organizations, as the historian Linda Delgado reveals. A prolific writer, he produced more than 250 essays and vignettes that depicted the economic and racial struggles of working-class Puerto Ricans and the need to work to improve conditions for the community. As the historian Ruth Glasser documents, working-class musicians also migrated to New York City between the World Wars, with many U.S. veterans among them. Puerto Rican musicians had been recruited for African-American regimental bands during World War I. After the war, many made their way to New York City, displaced from their other economic pursuits and searching for jobs and musical opportunities in the city.

In Philadelphia, cigar makers contributed to the growth of the Puerto Rican community. They constituted part of a pan-Latino, working-class community, as the historian Víctor Vázquez-Hernández portrays. Puerto Ricans found work in the cigar-making shops owned by other Spanish speakers, especially Spaniards and Cubans. Known for their political activism, cigar makers were founders of early Spanish language mutual aid societies, and they played important roles in labor movements. As early as 1877, Philadelphia was home to a Spanish-speaking local of the Cigar Makers' International Union (CMIU).

Farmworkers and Garment Workers

After World War II, Puerto Rican migration increased dramatically, and Puerto Ricans became the first airborne migration. Men and women came in search of work, and government-sponsored labor contracts provided transportation and placements for many. Puerto Ricans found work in areas where unions played a role—in agriculture and food processing, and in the garment and steel industries. As post-war strikes sought to improve wages and conditions, Puerto Ricans were among the labor activists. For example, one year after Puerto Ricans were recruited to Lorain, Ohio, to work in the steel industry, they participated in a strike by the Congress of Industrial Organizations (CIO). As Eugene "Gene" Rivera notes, Puerto Ricans were accused of meeting with Communists during the strike, and the broader

community's fears of Communist infiltration continued to affect Puerto Ricans' community-building efforts.

Puerto Rican men became farmworkers, either through the government-sponsored contract labor program or through networks of family and friends. Most worked in New Jersey, Pennsylvania, New York, Connecticut, and Massachusetts, with fewer in other states. Contracts guaranteed wages and specified allowable deductions, hours, and minimum standards for food and housing. Yet workers found contracts violated and conditions harsh, as they struggled to meet their immediate needs and often, to send money home. Some workers left in search of better options, and some sought to improve conditions through organizing.

In 1972, in Connecticut about 100 Puerto Rican tobacco workers formed the ATA, the *Asociación de Trabajadores Agrícolas* (Agricultural Workers Association). As the historian Ruth Glasser explains, the ATA, along with other groups, struggled to improve living conditions, wages, sick and overtime pay, and health care. They challenged the government of Puerto Rico's right to negotiate labor contracts on behalf of workers, and they sought unrestricted access to labor camps for visitors and organizers. During 1973, hundreds of tobacco workers struck to protest the food provided and the firing of workers involved in previous actions. Workers gained free access to the camps. The government of Puerto Rico agreed to stop using misleading radio advertisements to recruit workers, to revise the contract, and to provide more staff to address workers' complaints. Although the ATA affiliated with the United Farm Workers in 1975, the UFW was stretched thin by its efforts in the West, and the mobilization of tobacco workers in Connecticut waned. Still, in light of public scrutiny, the government's contract labor program dwindled from 12,760 workers in 1974 to 5,639 in 1975.

As Puerto Rican women became concentrated in the garment industry in New York City and other urban areas, many became members of the International Ladies' Garment Workers' Union (ILGWU), and some became union activists. By 1947, the ILGWU claimed 7,500 Puerto Rican members and estimated that another 4,000 to 8,000 worked in other small shops. Puerto Rican women found jobs mainly in the lower-skilled and lower-paid segments of the industry, especially dressmaking, skirts, and blouses. In Local 22 Dressmakers, Puerto Rican membership doubled from 8% to 16% between 1945 and 1953, while Jewish membership declined from 63% to 51% and African-American membership remained at 15%. Louise Delgado became a union activist with Local 22, first as a shop-floor representative,

then as an executive board member, and finally as a business agent. Born in Guayama, Puerto Rico, she came to New York City in 1923 at the age of eight, joining her family. Like many other Puerto Rican women, she started in the garment industry by helping her mother with homework. In 1934, she started working in a shop, and she continued in the industry until she retired in 1978. Delgado witnessed the dramatic increase in Puerto Rican women workers in the industry, as well as critical changes in the industry. Garment shops left New York City in search of low wages and higher profits, and the industry increasingly relied on contracting shops that competed for assembly work. The 1958 dressmakers strike addressed some of these industry changes. Puerto Rican women were among the 105,000 striking workers in New York and six nearby states.

Conclusions

The scholarship in Puerto Rican studies is largely interdisciplinary. Scholars have examined many dimensions of Puerto Rican working-class communities, especially in New York City, the largest Puerto Rican community. Writers have depicted Puerto Ricans' struggles for inclusion, the creation of community-based organizations, political activism, and other topics. Ethnographers have examined contemporary issues, including gentrification, identity, and family dynamics, especially focusing on Chicago. Other social scientists have focused on the economic restructuring and de-industrialization of urban areas in the Northeast and Midwest that affected communities where Puerto Ricans had settled. Puerto Rican workers were economically displaced again. Fewer works have explored the historical dimensions. Puerto Ricans' working lives and their interactions with labor unions have thus far received too little attention in both historical and contemporary accounts.

PULLMAN STRIKE AND BOYCOTT (1894)

A local walkout on 11 May 1894 by perhaps 2,800 railway car shop workers at Pullman's Palace Car Company south of Chicago, Illinois, expanded by early July 1894 to encompass more than 150,000 railroaders in a boycott of Pullman-built cars on at least 20 railroads across 27 midwestern and western states. The Pullman strike and boycott drew support from militant members of the fledgling American Railway Union (ARU), an industrial union that organized railroad workers across the range of craft lines and occupational hierarchies. Railroad officials whose indebted corporations had fallen into federal court receivership seized the opportunity of the American Railway Union boycott of Pullman cars to discharge and blacklist ARU members, obtain federal judicial injunctions against ARU actions, and use U.S. military force to re-open rail lines and protect strike-breakers. Although ARU supporters kept U.S. troops occupied along several western railroad lines until late August and September 1894, the combination of personal poverty, federal court injunctions, military force, and the imprisonment of ARU leaders and activists by U.S. marshals effectively ended the strike at the Pullman car shops near Chicago and the national boycott of Pullman cars by late July 1894. The Pullman strike and boycott of 1894 continues to hold historical significance not only for the unprecedented magnitude of government military and civil force employed to break the railroaders' industrial organization, but also for the questions it raised about the proper role of the state in labor disputes and the weighing of conservative trade unionism versus the more inclusive industrial unionism of the ARU.

The Pullman Palace Car Company, a manufacturer and leasor of railway sleeping, parlor, passenger,

freight, and electric street railway cars, opened car-building shops and an adjacent company-owned town 14 miles south of Chicago along the Illinois Central Railroad on January 1, 1881. Attractive brick row houses, wide streets, utilities, indoor plumbing, and nearby shops and parks offered clean, spacious, healthy rental housing for Pullman car builders, seamstresses, and car repairmen. The town of Pullman quickly attracted international attention as a "model" town that would improve the living conditions of working-class families, thereby raising the moral development and productivity of workers. One study found that the death rate in Pullman was one half the average of the urban slum districts of Chicago, while others lauded company officers uncritically for their apparent attentiveness to the well-being of Pullman resident-workers. A handful of observers during the 1880s and early 1890s, however, identified two fundamental flaws in "the Pullman system": the lack of home ownership and the company's exertion of social control through the invasive deployment of "spotters." A third complaint, mismanagement by foremen and lower-level managers, manifested itself in nepotism, favoritism, and abusive treatment of longtime workers during the late 1880s and early 1890s.

Despite the company's projected image of beauty and order, Pullman craftsmen and laborers employed strikes to protest the loss of subsidized streetcar fares in 1882, shifts from daily wages to piecework, and substantial wage cuts in 1884, 1885, and 1887. The walkouts were isolated in specific departments, failed to achieve their objectives, and betrayed the absence of a broader, sustained culture of organization across crafts. One exception, a May 1886 general strike for an eight-hour workday and a 10% wage increase, not only failed, but also provoked the company president and founder, George M. Pullman, to contribute funds toward the suppression and prosecution of labor activists such as the Haymarket anarchists and the Knights of Labor. In January 1888, wood-carvers struck to protest an abusive foreman, but company officials allowed the men to return. Three years later, freight car department workers struck in January 1891, but after managers ordered the men back, only one returned. A strike by 41 steamfitters and blacksmiths in December 1893 ended in defeat.

The economic depression that shut factory gates and plunged an unprecedented number into unemployment in spring 1893 only hit Pullman factory orders in late summer. Car works managers slashed wages in August 1893 and laid off 3,400 workers by November until just 1,100 remained. The layoffs adversely affected rent collection in the company town, though, so the company began bidding for new

construction contracts at a loss, rehired 2,000 shop employees by April 1894, and spread the work among 3,100 workers at the reduced wage rates.

Complaints about abusive foremen increased. In early April, Pullman workers began joining new American Railway Union lodges in Kensington and Grand Crossing. Eventually, 19 local ARU lodges enrolled 4,000 area men and women. An elected grievance committee of 46 members, headed by Thomas W. Heathcoate, identified the investigation and correction of shop abuses, the reduction of rents, and the restoration of pre-depression wage rates as three goals. On 7 May 1894, Heathcoate, the committee, and the ARU vice president, George W. Howard, met Pullman's second vice president, Thomas Wickes, to explain why reducing rents and raising wages would ease the crisis in unpaid rents. Wickes requested a written list of grievances and a second conference in two days. At that second meeting, George Pullman himself appeared after two hours to explain how the shops were operating at a financial loss. Pullman discounted the possibility of restoring wage rates and failed to understand the relationship of high rents to diminished household incomes by justifying the company's right to a reasonable profit from property rental. He did promise to investigate complaints about abusive treatment within the shops. The ARU vice president Howard also obtained a promise from Wickes that no committee member would suffer reprisal.

The following morning, 10 May, three committeemen were laid off by a superintendent, allegedly for lack of work. While Pullman and Wickes knew nothing of the layoffs and the claim of no work may have been legitimate, the workers viewed the layoffs as the latest act of betrayal. That night and into the early hours of the morning, Pullman workers met at Turner Hall in Kensington and authorized a strike. At work the morning of Friday, 11 May 1894, nearly all workers in all departments suddenly walked away from their jobs in a general strike, prompted by a rumor that the company would impose a lockout at noon.

The American Railway Union's vice president and general secretary had counseled Pullman workers that a strike would be premature, due to unfavorable economic conditions and Wickes's promise to investigate shop grievances. Local inexperience in sustaining labor organization also probably factored among the officers' concerns. During the American Railway Union's national convention in Chicago one month later, the ARU vice president Howard recommended that any additional actions be limited to strikes at the Pullman Company's shops at St. Louis, Missouri, and Ludlow, Kentucky, and that a boycott be avoided.

ARU convention delegates, however, were eager to exercise their perceived new strength after an April 1894 strike victory against the Great Northern Railroad. The union, founded in February 1893 by Eugene V. Debs and other former officers of the major railroad brotherhoods on a model of federation long promoted by the Knights of Labor, established many local lodges among western railroaders during the winter of 1893–1894, growing from 96 local lodges in mid-November 1893 to 125 by 1 January 1894 and 453 by early June 1894. Some routes, such as the Chicago, Rock Island, and Pacific Railway, were not well organized, though.

Despite the risks, ARU convention delegates voted 22 June 1894 to initiate a boycott 26 June of all Pullman-built cars and the trains that carried them. Since Pullman cars were pulled in passenger trains on nearly all midwestern and western railroads, a boycott would effectively stall all passenger traffic on most railroads from Ohio to Texas, California, and Washington state. The boycott began in the Illinois Central Railroad yards in Chicago on 26 June. The next day, 5,000 workers refused to switch, brake, or run trains with Pullman cars. Fifteen railroads were stopped. The following day, 40,000 men had shut down almost every line. By 29 June, an estimated 100,000 ARU members and supporters honored the boycott, halting traffic on at least 20 railroads. The Pullman strike and boycott eventually extended through 27 states and affected 41,000 miles of railroad routes.

In Chicago, the General Managers' Association (GMA) represented 24 railroad companies that employed 221,000 workers. Formed in 1886 but feeble until a January 1892 re-organization, the GMA coordinated wage scales for different railway trades and, beginning in March 1893, recruited strikebreakers, dealt with individual brotherhoods, and distributed "blacklists" of railroaders barred from employment. By 1894, the General Managers' Association was positioned to fight and defeat the American Railway Union.

Strike activity in Pullman itself remained remarkably peaceful and orderly, due largely to discipline exerted by strike leaders, a picket line that circled the car works, and material support from Chicago area merchants, politicians, and other sympathizers. Throughout the western states, the American Railway Union exhibited significant power because of widespread disaffection with the inflexible brotherhoods, a tradition of federation across craft divisions that originated with the Knights of Labor's District Assembly 82 on the Union Pacific Railroad during the 1880s, and support from local residents of railroad towns. ARU enforcement of the boycott by

interfering with trains carrying U.S. mail, freight, and passengers across state lines prompted the General Managers' Association to enlist U.S. government officials against the union. Limited injunctions against boycott activities were granted by federal judges in New Mexico Territory 27 June and in Chicago 29 June to protect individual railroad companies under federal court receivership protection. Near Blue Island, Illinois, a few miles west of Pullman, a crowd of rowdy, striking brickyard laborers blocked Rock Island Railroad yard traffic on 1 July. On 2 July 1894, the federal judges Peter Grosscup and William A. Woods granted a thorough injunction against all interference with railroad traffic. Later that day, the U.S. marshal John W. Arnold read the injunction twice to a gathering of perhaps 2,000 people at Blue Island. When they seemed unable or unwilling to comprehend the terms of the injunction, Arnold wired for U.S. army troops. In ARU boycott centers throughout the western states, similar confrontations between angry railroaders and incompetent deputy U.S. marshals prompted frantic telegraphs to Attorney General Richard Olney for U.S. troops.

Early in the morning of 4 July 1894, the Fifteenth U.S. Infantry entered Chicago from Fort Sheridan north of the city and took up positions in the railroad yards at Grand Crossing and Blue Island, while the cavalry and artillery occupied the Union Stockyards. Similarly, two companies of the Tenth Infantry entered Raton, New Mexico Territory, on 4 July to intimidate and restrain active ARU participants, while five companies of the Seventh Infantry accompanied deputy U.S. marshals in arresting 48 ARU boycott participants at Trinidad, Colorado. More than one thousand soldiers rode Northern Pacific trains between St. Paul and the Puget Sound 7–9 July to ensure their free passage and the transportation of strike-breakers. At Livingston, Montana, 10 July, a captain in charge of an all-black company of the Twenty-fourth Infantry quelled an especially threatening crowd of perhaps 600 townspeople by striking an aggressive local ARU leader on his head with the blunt side of the captain's saber. Federal troops, sailors, and marines also occupied Los Angeles, Sacramento, San Francisco, and the Central Pacific Railroad line to Ogden, Utah. Military forces compelled submission to the judicial injunctions and civil authorities. Arrests, imprisonment for contempt of court without jury trial, and criminal indictments for conspiracy decimated the union's national and local leadership. Debs, Howard, other union officers, and many ordinary railroaders served jail time.

The Pullman strike and boycott of 1894 brought about the central role of the state as regulator of labor-management conflicts and the submission of

labor organizations to state power. Beginning with the Erdman Act of 1898 (originally drafted by Attorney General Richard Olney), Congress would regulate labor relations between railroad workers and employers. Railroaders, long divided and thwarted by craft rivalries, lost a viable industrial union on the western railroads and were relegated to increasingly conservative brotherhoods. Blacklisting by railroad managers kept many ARU members unemployed for years and forced others to seek jobs using assumed names. Along the route of the Northern Pacific Railroad, for example, 1,944 ARU boycott participants were blacklisted by name. Personal sacrifices by those railroaders and Pullman shop workers exacted high prices lasting years after the Pullman strike and boycott ended.

**PULLMAN, GEORGE MORTIMER
(March 3, 1831– October 19, 1897)**

George Pullman did not invent railroad sleeping cars, as commonly reported, but his attention to the details of comfort and his technological improvements made sleeping cars economically viable beginning in 1859. Yet, Pullman's inability to recognize his dependence upon the contributions of carpenters, seamstresses, train porters, car cleaners, and others, coupled with paternalistic control of the inhabitants of his namesake company town, caused simmering worker discontent that eventually exploded in the Pullman Strike and Boycott of May–August 1894.

George Pullman was born south of Buffalo, New York, the third of eight children. His father, a carpenter during the Erie Canal's building boom, invented and patented a machine for transporting buildings about 1835. The evangelical fervor of late 1820s western New York pushed his Baptist father to convert to Universalism. Baptists commenced a boycott of the elder Pullman's carpentry business. The father's jobs along the Erie Canal caused frequent absences. Older brothers Henry and Albert began cabinetmaking in Albion, New York, about 1845, and George apprenticed with them and assisted in moving houses. After Albert moved to Grand Rapids, Michigan, in 1850 to manufacture furniture, George became a hands-on supervisor of workmen, unjamming mud-clogged rollers and energetically securing contracts during a canal-widening project.

A chance meeting in Albion in January 1859 with a former Illinois governor's wife drew Pullman into jacking up sections of Chicago's business district. Pullman traveled to Grand Rapids (where Albert was impoverished) and Chicago, where his partnership won the contract to raise the Matteson House Hotel, began ahead of schedule, and raised the five-story structure by five feet over 10 days. Albert joined George and worked alongside the laborers under the building as foreman. In spring 1860, George left Albert in charge of subsequent jobs, ventured out to the gold-mining region near Central City, later Colorado Territory, and bought and operated an ore-stamping mill, a store, and other ventures in partnerships between mid-1860 and spring 1863.

Pullman's entry into railroad sleeping car manufacture began in partnership with the New York State senator Benjamin Field in early 1859. Upon Pullman's

arrival in Chicago, he convinced Alton Railroad managers to adopt his innovations and hired a shop mechanic to rebuild two coaches into sleeping cars. The first ran 15 August 1859. His cousin worked as conductor on the cars. In 1867, Pullman's Palace Car Company was chartered and incorporated. Between 1870 and 1880, Pullman erected cars at an acquired factory in Detroit. Albert Pullman supervised craftsmen and laborers as general superintendent, and then second vice president.

Pullman exerted paternalistic control over his younger siblings with some success during the 1850s to 1860s but failed with his own children, wife, and workers during the 1880s to 1890s. The pressures of business, coupled with Pullman's own irascible personality, made him austere and unapproachable. In 1881, Pullman opened a newly built company-owned town and manufacturing plant 14 miles south of Chicago. Most observers lauded the new town, consciously designed to improve the living conditions of working families accustomed to urban slum tenements. In 1885, the economist Richard T. Ely credited Pullman with recognizing the "commercial value of beauty" in the luxurious cars built in Pullman's plant and the broad, tree-lined streets and ornamented red-brick row houses of the adjacent town. However, Ely also found that nepotism, favoritism, company spies, and the suppression of workers' grievances rendered residents silent and unattached and the town "un-American."

Workers did not always remain silent, however. Individual department strikes in 1882, 1884, and 1885 preceded a May 1886 general strike of the Knights of Labor for an eight-hour day. The Haymarket bombing and subsequent prosecution of anarchists prompted Pullman to donate for their conviction and execution. Albert Pullman left the company that same year. Strikes in 1888, 1891, and May 1894 were precipitated by heavy-handed foremen and wage cuts but reflected the underlying discontent with workers' inability to represent their interests collectively. The May 1894 strike, which prompted a 26 June national boycott of Pullman cars by railroad workers loyal to the American Railway Union, brought widespread criticism upon George Pullman for refusing to negotiate, reduce rents, or shift half the financial burden off of the workers. He suffered a "nervous depression" that left him bedridden and ill until autumn 1894 and caused severe strains upon his marriage and family life. Pullman died of a heart attack 19 October 1897. One son, George Jr., briefly worked as a Pullman car inspector in Chicago, and then in New Jersey after his father's death until June 1898. Pullman's enduring legacies more than one hundred years after his death are the National Historic

**QUILL, MICHAEL J. (SEPTEMBER 18,
1905–JANUARY 28, 1966)
President, Transport Workers' Union**

Michael Joseph Quill headed the Transport Workers' Union (TWU) from shortly after its founding in 1934 until his death in 1966. During those years he also held a series of positions in the Congress of Industrial Organizations (CIO), with which the TWU was affiliated, and he served as an elected member of the New York City Council. While the modest size of the TWU—at the time of his death it had 135,000 members—kept Quill from reaching the very top ranks of labor leadership, his radical views, outspokenness, and involvement in New York City politics often brought him into the spotlight of public attention.

Quill's political outlook was shaped by his youthful involvement in the Irish republican movement, which led him to question authority, embrace militancy, and become sympathetic to the political left. Born on a mountain farm in County Kerry, Ireland, to a family that supported the Irish Republican Army (IRA) during the struggle for Irish independence and the subsequent civil war, Quill served with the IRA during the early 1920s. In 1926, he immigrated to the United States and took a job with New York's Interborough Rapid Transit Company. Quill became well known among fellow Irish transit workers through his involvement in various Irish organizations. When an effort began in 1933 to unionize the city's transit industry, which brought together organizers from the Communist party (CP), various

groups of discontented workers, and IRA veterans working in transit, Quill joined early. His wealth of contacts in the Irish community, standing as a former republican fighter, and his gift for speaking quickly brought him to the forefront of the union group.

In 1935, Quill became the first elected president of the TWU (there had been an appointed president before him). Two years later when the TWU accepted a charter from the CIO to be a national mass transit workers' union, Quill was elected as the first president of the reconstituted union, giving up his post as head of the New York local though continuing to help lead it. Flush with recognition victories in New York, the TWU began transforming the lives of the city's transit workers, winning shorter hours, better pay, and new benefits, while slowly spreading to other cities.

During the organization of the TWU, Quill drew close to the CP, possibly joining it. Until the late 1940s, he worked closely with the party members who held the other top posts in the transit union and participated in various political campaigns supported by the Communists. (He also remained active in Irish republican causes.) With his sharp wit and position as the head of a national union, Quill emerged within the CIO as one of its best-known left-wing leaders. When in 1938 dissident transit workers charged in testimony before a congressional committee that Quill and other TWU leaders were Communists, Quill retorted in one of his best-known statements that he “would rather be called a Red by the rats than a rat by the Reds.” In addition to his union post, Quill served for 8 years on the New York

City Council representing the Bronx, elected twice as a candidate of the left-liberal American Labor party and once as an independent. With the onset of the Cold War, Quill broke ranks with the CP. The changing political atmosphere in the labor movement and the country no doubt influenced him, but two specific issues precipitated his 1948 decision, the insistence by the CP that its union backers support the third-party presidential bid of Henry Wallace in spite of the strong opposition of CIO President Philip Murray, and the party's continuing support for freezing the New York City transit fare, which Quill came to believe would undercut the possibilities for wage hikes. After a bitter civil war within the TWU, Quill succeeded in ousting the union leaders who remained aligned with the CP, retaining his presidency by constructing a new set of alliances that included centrists and conservatives as well as anti-Communist liberals.

In the decades after World War II, the TWU, under Quill, expanded into the airline industry; absorbed railroad workers who had been organized by the CIO; and continued to sign up mass-transit workers. In New York the union faced a series of challenges after its initial organization, including the 1940 city takeover of most private transit lines, which forced the TWU to fight for years to win back its status as an exclusive collective-bargaining agent. During the 1950s, Quill and other TWU leaders were criticized by skilled craft workers who felt they would do better with separate unions for their own groups and during the 1960s, by African-Americans who felt they had insufficient access to better paid jobs and union leadership posts.

Quill gave up his City Council seat in 1949, but he remained prominent in New York affairs as president of the New York City CIO Council. In 1950, he became a vice-president of the CIO as well. Even after his break with the CP, Quill stayed on the left of what became a narrowed spectrum of opinion within the labor movement and the country. In 1955, he was the most prominent critic within the CIO of

its decision to merge with the American Federation of Labor (AFL), charging that the constitution of the combined group would allow raiding, racketeering, and racial discrimination. In the 1960s, Quill actively supported the civil rights movement and was an early critic of the Vietnam War. He occasionally described himself as a Socialist and called for the New York subway system to be made free. Though Quill's fiery rhetoric had limited practical impact, it made him stand out in an era of increasingly bland labor leaders and helped keep alive a labor political tradition that openly acknowledged fundamental class conflict.

Though Quill often threatened to strike the New York transit system, he did not lead the TWU to do so until 1966, when he sought a major improvement in wages, especially for more skilled workers, and a militant fight as a way to reunify the union and cement his legacy. The strike, which all but shut down New York City for 12 days, ended in a substantial union victory. Quill, who was jailed, and then suffered a heart attack during the walkout, was the object of fierce public and political criticism as well as support from within the labor movement. He died of heart failure 2 weeks after the strike. Fittingly striking cemetery workers dropped their picket line so that he could be buried.

R

RACKETEERING AND RICO

The term “racketeering” came into popular use in the 1920s when it usually referred to the activities of a new generation of organized crime that had emerged during Prohibition. Racketeering often involved labor unions. Examples of labor racketeering included crimes such as extortion from employers and union leaders, embezzlement from union funds, and the creation of various kinds of anticompetitive cartel arrangements. But the word “racketeering” also served as a political tool and was applied by organized labor’s opponents to legal but aggressive forms of union activity. Thus, historically, public alarm about the danger of racketeering often has been used to justify new restrictions on organized labor. Concern about the growing economic influence of organized crime through racketeering has also justified significant extensions of the federal government’s role in law enforcement. One of the most prominent examples of that trend was the passage in 1970 of a broad, new federal conspiracy law, the Racketeer Influenced and Corrupt Organizations Act (RICO). This law gave federal prosecutors a powerful weapon with which to attack the leadership hierarchy in criminal gangs; it also included civil provisions that allowed the government to assume control of corrupt labor organizations.

Criminal gangs that emerged during Prohibition (1920–1933) became involved in labor racketeering by the late 1920s. They tended to exert influence over unions with particular kinds of jurisdictions—typically labor organizations that operated in economic sectors that had long been marked by anticompetitive forms of

collusion among employers and unions. At least since the 1890s, some unions in some sectors of the economy had engaged in such collusive arrangements with employers. In return for closed-shop contracts, unions in construction and the teaming trades and in some of the service sectors agreed to help employers control the level of competition in their industry. Typically unions in these sectors helped employers limit the entry of new firms and policed agreements on prices and customer allocation arrangements. These collusive arrangements tended to appear in industries where the initial start-up capital requirements were so low that new firms could easily enter the marketplace, creating a tendency toward cutthroat competition. Businesses in those sectors turned to organized labor in hopes that it could provide economic stability.

Often unions involved in such activity were also troubled by charges of corruption. To a certain extent, those charges reflected the ways in which union leaders in those settings could easily dominate their members; the union’s initial organization stemmed from the leader’s relationship with the employers, not on his ability to mobilize the membership. The employers supported the union because of what it offered them, and so there was rarely a need to rally the union’s rank and file to man the picket lines. Thus, these unions often lacked the basic democratic mechanisms that encouraged active membership, and that in turn made it more difficult for the members to police their leadership. But charges of corruption also frequently reflected the hostility of outside business interests, which resented the strategic power of unions in these

sectors. Indeed, the term “racketeering” itself first emerged in Chicago in the 1920s as a way for anti-union employers to condemn the kinds of collusive arrangements that had allowed some labor organizations to become powerful in certain areas of the city.

The new type of criminal gangs that emerged in the 1920s, during Prohibition, eventually began to assert a role in these kinds of collusive business environments. Union officials in these sectors faced threats of violence and demands for money. Given organized labor’s tenuous legal status, particularly in these collusive sectors, union officials lacked the kind of protection that law enforcement would have provided to businesspersons in an industrial sector had they faced similar threats. Also, in places like Chicago, union officials knew that the police regularly colluded with criminal gangs. Thus, typically the gangland murder of union leaders went unsolved and brought no crackdown by police. In such settings, some union leaders chose to make arrangements with criminal gangs. These arrangements might involve appointing gang members or their associates to lower-level union posts. They also might involve agreements to allow a gang to siphon off a portion of the union’s funds, perhaps by kicking back a share of the top officers’ salaries. With the emergence in the post-WWII era of various benefit funds, arrangements were made in unions such as the Teamsters for organized crime groups to benefit from the financial decisions of some of these funds.

In addition to drawing on the funds of a labor organization, members of criminal gangs found other ways to profit from their ability to dominate some union leaders. One type of racketeering grew out of changes in federal labor laws in the 1930s. In the new political atmosphere of that decade, employers lost two of their most important weapons for combating organized labor. The Norris LaGuardia Act (1932) placed new limits on the abilities of employers to use injunctions against organized labor, while the Wagner Act (1935) made company unions illegal. At the same time, employers faced a wave of militant union organization. Many responded by turning to organized crime groups, which offered them a way to meet this threat. Gangsters provided businesspersons with the opportunity to sign a collective bargaining agreement with a kind of captive union, one controlled by organized crime. Such a collective bargaining agreement would forestall the organizing efforts of legitimate unions while leaving the employer’s labor costs virtually unchanged. Workers covered by agreements with such captive unions saw no increase in their wages, no changes in their work conditions, and received no benefits. Indeed, because the employer now deducted union dues from their paycheck, these workers might

actually suffer a decrease in pay. The employer, on the other hand, received tangible benefits. In return for the employer deducting dues and providing other forms of compensation to the corrupt union official, organized crime muzzled any militancy by the workers and blocked efforts by other unions to intercede. The captive union functioned as a new kind of company union.

Even though employers often benefited from this kind of organized criminal activity, businesses were usually depicted by the press and law enforcement as the main victims of labor racketeering. Payments made by businesspersons to criminal figures or corrupt union officials were described as extortion, a legal term for money paid under threat of harm. This term, however, was applied even in circumstances such as the ones described above, or when an employer paid off a corrupt union official in order to gain a more favorable collective bargaining agreement. Using that definition of extortion left union officials appearing as the perennial villains and employers as the hapless victims. It also made labor racketeering appear to result from the ability of powerful unions to threaten the economic well-being of businesses. In this political context, the term “racketeering” itself became a kind of political weapon to use against the growing power of unions in the 1930s, 1940s, and 1950s. Critics of organized labor, such as the newspaper columnist Westbrook Pegler, described legal but aggressive forms of union activity, such as secondary boycotts or even organizational picketing, as forms of racketeering.

This biased depiction of labor racketeering meant that campaigns against organized crime often served as a pretext for efforts to limit the power of labor unions. The McClellan Committee hearings (1957–1959), for example, helped raise awareness about the existence of the Mafia and made labor racketeering an important public issue. But the Committee was dominated by conservative congressmen who used the hearings to promote an anti-union agenda. They sought to raise concern about the connection between organized crime and the Teamsters Union in order to promote anti-union legislation. To protect the nation from the threat of labor racketeering, the McClellan Committee urged Congress to enact new restrictions on the ability of unions to organize and picket. The result was the Landrum-Griffin Act (1959), which among other things banned secondary boycotts and put new limits on organizational picketing.

More recent efforts to confront the threat posed by organized crime and labor racketeering have involved the use of the Racketeer Influenced and Corrupt Organizations statute (RICO) (18 U.S.C. Sections

1961–1968). RICO was passed as one of the sections of the Organized Crime Control Act of 1970. This statute came as part of a wave of legislation at the end of the 1960s that aimed to give federal law enforcement the legal tools it needed to effectively combat organized crime. This same generation of legislation, for instance, created the Witness Protection Program and authorized the use of electronic surveillance by law enforcement. The legislation marked a new federal commitment to waging a war on organized crime. In passing such laws, Congress was responding to warnings about the growth of organized crime issued by the Task Force on Organized Crime of the President's Commission on Law Enforcement and Administration of Justice (1965–1967). The Task Force had specifically warned that the Mafia was using its ability to dominate some unions as a way to infiltrate heretofore legitimate areas of business. Robert Blakey, who drafted the RICO statute, had served on the staff of the Task Force, and he made sure that the new legislation included specific provisions for stopping organized crime's infiltration of the larger economy.

RICO made it a crime to use a pattern of criminal activity or the proceeds of such criminal activity to gain control over an organization (that is, an enterprise) or to run such an enterprise through a pattern of criminal activity. The criminal provisions of RICO function as a broad conspiracy statute that treats organized crime activity as an "enterprise." Originally, the law was understood to target only such criminal activity that brought criminal gangs into legitimate organizations such as unions or a business. But since 1981, the Supreme Court has held that the term "enterprise" can also refer to illegitimate groups, in effect making it possible for the government to prosecute individuals for participating in a criminal group, such as a Mafia family. According to the language of the statute, anyone who infiltrates, participates in, or conducts the affairs of such a RICO-defined enterprise through a pattern of racketeering activity has violated this law.

Establishing a pattern of racketeering activity forms the central part of a RICO prosecution. For the purposes of the statute, such a pattern must involve at least two racketeering acts, with at least one committed since 1970 and the last one occurring within 10 years of its predecessor. These racketeering acts, referred to as RICO predicates, include a long shopping list of federal and state felonies. In this way, the language of the act allows prosecutors to overcome the statute of limitations on crimes and to ignore the jurisdictional divisions between state and federal crimes. In effect, the government can present a jury with the whole career of an individual and a criminal

group, bringing together otherwise disparate acts into one large set of conspiracy charges.

The penalties for conviction under RICO are quite severe, another reason why prosecutors like this statute. Each RICO predicate charge carries a possible 20-year sentence, and a defendant can also be charged with participating in the enterprise conspiracy, a separate charge that also carries a 20-year sentence. As a result, organized crime figures convicted under RICO face lengthy prison sentences. To take one example, in *United States v. Salerno* (1986), the government convicted the leaders of several New York organized crime families on charges related to their role in the commission that oversaw Mafia operations along the East Coast. RICO's tough sentencing provisions made each defendant liable for up to 300 years in jail, and although the judge did not impose that full amount, the men were sentenced to 100 years of prison apiece. In addition, RICO includes a powerful forfeiture provision that allows the government to seize any assets gained as a result of the criminal activity engaged in by the defendant.

In the first few years after its passage, RICO went unused, but by the 1980s, prosecutors made it the workhorse in a campaign against organized crime. This campaign was marked by the FBI's effective use of electronic surveillance, which provided a persuasive new kind of evidence for use in organized crime trials. Similarly, the threat of RICO sentences and the availability of an effective Witness Protection Program led to the emergence of significant cooperating witnesses from within ranks of organized crime families. Aladema ("Jimmy the Weasel") Frattiano, who had been the acting boss of the Los Angeles Crime Family, was one of the first of these Mafia turncoats, but many others followed. Their testimony offered juries an insider's view of organized crime and helped bring about some of the most significant convictions in this law enforcement effort. As a result, hundreds of organized crime figures, including many of the top Mafia leaders, have been convicted and sent to jail.

This campaign against organized crime also took advantage of RICO's civil provisions. While the criminal section of RICO is meant to be punitive, the civil section aims to be preventative, to block organized crime's further use of a labor union or a business. To that end, prosecutors can draw on a range of potential remedies that include court orders barring individuals from having any further connection to an organization as well as court-imposed trusteeships.

Civil RICO offers the government a number of advantages. Civil procedure allows prosecutors to build up their case during the pretrial period by requiring the defendant to respond to the prosecutors'

requests for depositions and internal documents, providing evidence that the government can later use to demonstrate organized crime's control over the organization. A lesser standard of proof is required for the government to make its case in a civil proceeding, a "preponderance of evidence" as opposed to the requirement of "beyond a reasonable doubt" needed for a criminal conviction. Finally, defendants in such a suit face serious financial consequences should the government prevail. They are liable to treble damages as well as court costs and attorney fees, and that financial threat serves as a powerful incentive to reach a settlement with the government before the case goes to trial.

The Justice Department began to use civil RICO against union corruption in the mid-1980s. By 2004, it had filed a total of 21 civil RICO suits against labor organizations, and in several other cases it has used the threat of such suits to convince unions to make specific internal reforms. Only one case, the government's first suit against Teamsters Local 560 in New Jersey, has ever gone to trial. The government's victory in that case, combined with the consequences that defendants face should they lose, has meant that in all of the subsequent cases, defendants have agreed to settlements before trial. Three of the suits involved international unions, the International Brotherhood of Teamsters (IBT), the Laborers' International Union of North America (LIUNA), and the Hotel Employees and Restaurant Employees' International Union (HERIU). The bulk of the suits were filed against local affiliates of those three international unions and against local affiliates of the International Longshoremen's Union (ILA). The President's Commission on Organized Crime (1983–1986) had named those four internationals (ILA, IBT, HERIU, LIUNA) as the unions most dominated by organized crime. Three other civil RICO suits were filed against local affiliates of international unions with quite the opposite reputations. In those cases, though the international union's leadership enjoyed an honest reputation, the local affiliates in question had long been notorious for their alleged connections to organized crime. The civil RICO suit filed in 1994 against the New York City District Council of Carpenters was one example of such a case.

These suits have resulted in various types of trusteeship arrangements, which have ranged widely in terms of the length of their duration and the kinds of oversight exercised. The shortest trusteeship lasted for 18 months, but others have gone on significantly longer, as much as six years. Often, the consent decrees that result from civil RICO settlements call for some continuation of government oversight, on an open-ended basis, even after the formal trusteeship

comes to an end. In the case of the IBT, for instance, the terms of three court officers serving as trustees expired following the certification of the results of the union's 1991 elections. But government oversight continues in the form of an Internal Review Board, which pursues cases of corruption involving Teamster officials. The courts have granted some trustees great authority in conducting the affairs of a union under a civil RICO trusteeship—from negotiating contracts with employers to administering the organization. But other trustees have been limited to a narrower range of activity, from reviewing financial decisions to banning union officials with organized crime connections. In each case, the specifics of the trusteeship emerged out of a combination of what the particular U.S. attorney's office requested, what the union officials in question were willing to settle for, and the decision of the federal judge hearing the suit.

Critics of the use of civil RICO against unions have focused on several issues. Some have noted the apparent lack of a coherent strategy or direction in the government's use of this powerful tool. Individual trustees have operated in isolation from one another, and there has been no effort to develop any kind of guide to policies most likely to rid a union of organized crime influence. Union officials have complained about the costs of paying for government oversight. In some cases, trustees (almost always former federal prosecutors) have earned sums far larger than the allegedly corrupt and piratical union officials who were ousted by the civil RICO suit. Other critics have worried about the ways in which civil RICO challenges the traditional autonomy of labor unions. This threat appears more palpable in cases when a conservative administration filed suit against a national union, such as happened in 1988, when the Reagan administration's Justice Department sued the IBT, then the largest labor organization in the country.

RAILROAD BROTHERHOODS

The railroad brotherhoods are a historically significant but underappreciated set of unions that organized workers in the U.S. railroad industry for roughly a century from the 1860s through the 1960s. Probably because of the large number of brotherhood-style railroad unions and their complex interlocking jurisdictions, predominantly craft orientations, explicitly fraternal natures, and conservative (in some notable instances racist) policies, the railroad brotherhoods have not garnered labor historians' sustained attention. Yet, these unions defined the predominant model of unionism in one of the nation's most vital economic sectors, included among their number some of the earliest successful national-level unions, played vital roles in the development of American industrial relations machinery, and were party to groundbreaking social welfare legislation. In the process, four of them—the so-called Big Four brotherhoods of "train service" or "running trades" workers (engineers, conductors, firemen, brakemen)—became the most powerful set of unions in the United States by the era of World War I and remained among the most influential of unions through the first half of the twentieth century.

The railroad brotherhoods are also significant for their standing as "brotherhoods." More explicitly than most other American unions, the railroad

brotherhoods constituted themselves as fraternal bodies of workingmen. Borrowing from Masonic fraternalism, widespread in the nineteenth-century United States, the railroad brotherhoods practiced fraternal ritual, emphasized the principles of mutual aid and moral uplift, and made male gender and craft occupational identity central to their organizational cultures. Expressed in the ideals of manhood, brotherhood, and craft pride, this bundle of ideals and practices represented a fraternalistic/mutual-aid logic that helped these unions survive in the hostile political and economic climate of the late nineteenth century while meeting the very real material needs of men who labored in a hazardous industry. The Big Four brotherhoods pioneered this brotherhood style of unionism during the 1870s and 1880s. The rest of so-called standard railroad unions of nonoperating workers of clerks, telegraphers, car repairmen, signalmen, and maintenance-of-way workers and the like patterned themselves after the brotherhoods as they organized from the 1880s onward. Thus, the term "railroad brotherhoods" refers to both the operating and 16-odd nonoperating unions of railroad workers as well as to the distinctive style of unionism they practiced.

Origins and Early Development in the Nineteenth Century

The railroad brotherhoods became known for their conservative, mutual-aid-oriented unionism early on. The first successful national-level union of railway workers began in 1863, following a series of short-lived efforts dating from the mid-1850s, when engineers working on Detroit railroads founded the Brotherhood of the Footboard in response to wage cuts and the imposition of piecework. Led by William D. Robinson, the new union aggressively defended wages and work rules in the course of several strikes. However, in the face of the railroads' fierce opposition and division within the Brotherhood's ranks, the union shifted course in 1868, replacing Robinson with the cautious Charles Wilson as grand chief engineer, changing its name to the Brotherhood of Locomotive Engineers (BLE) and embracing benevolent work among railway workers instead of direct confrontation with capital. The Order of Railway Conductors (ORC), the Brotherhood of Locomotive Firemen (BLF, which changed its name to the Brotherhood of Locomotive Firemen and Enginemen—BLFE—in 1907), and the Brotherhood of Railroad Brakemen (later renamed the Brotherhood of Railroad Trainmen, BRT) followed the Engineers' example, organizing

Locomotive engineer, Saint Louis, Missouri. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USF33-003027-M4].

themselves in 1868, 1873, and 1883, respectively. The Switchmen's Mutual Aid Association, which came into being in the late 1870s and was succeeded by the Switchmen's Union of North America in 1894, organized brakemen whose duties were confined to switching yards, but it never achieved the kind of power that the Big Four came to enjoy. Competing claims inevitably led to jurisdictional conflict among these unions, most notably between the Trainmen and Switchmen. Nevertheless, all of the operating brotherhoods shared a common policy in their restriction of membership to white men "of good moral character."

During the 1870s and 1880s, the railroad brotherhoods perfected their approach to labor relations and mutual aid. The visiting of sick or injured members and the provision of death and disability insurance grew out of customary workplace mutualism, but the brotherhoods quickly institutionalized these traditions and by the early twentieth century boasted some of the largest union insurance funds. With moral uplift, which ranged from technical instruction to the inculcation of sober and industrious habits, brotherhood leaders emphasized the individual's self-improvement and upward mobility. Combining these fraternal practices, brotherhood leaders such as the Engineers' chief engineer Peter M. Arthur and the Firemen's secretary-treasurer Eugene V. Debs sought to recruit running trades workers while simultaneously presenting their organizations to railroad management as bulwarks against labor radicalism,

arguing that they in fact produced "a better class of railway men." In the aftermath of the railroad strikes of 1877, increasing numbers of managers came to see the brotherhoods of train service workers as plausible partners in labor relations. During the 1880s, with continued periodic labor upheavals and a tight railroad labor market due to rapid expansion of the national railroad network, the brotherhoods negotiated favorable agreements on a number of roads. Together with their craft orientation, this success encouraged the brotherhoods to chart a course separate from that of the larger labor movement, refusing protective alliances with other segments of organized railroad labor and declining affiliation with the American Federation of Labor (AFL).

The Big Four might have enjoyed a monopoly on train service unionism had it not been for continued dissatisfaction with conservative brotherhood-style unionism among segments of running trades workers, especially in the aftermath of the BLE's and BLF's near disastrous strike against the Chicago, Burlington & Quincy Railroad in 1888. Most acute on the frontier of railroad expansion where labor conditions were tightest, this undercurrent animated the rise and fall of industrially oriented railway unionism in the form of the Knights of Labor (KOL) in the 1880s and American Railway Union (ARU), which Eugene Debs led after breaking with the BLF in the 1890s. However, during these years both of these unions engaged in epic confrontations with capital and were

destroyed. Indeed, the Pullman strike and boycott of 1894 proved a turning point in railroad labor relations as the ARU buckled under the combined might of the railroad corporations and the national state, ending the possibility of industrial, all-grades unionism on the railroads.

The Big Four proved to be the beneficiaries of this episode as they avoided the boycott and in some instances helped to break it. In the aftermath of the conflagration, figures in the federal government and the railroads took favorable note of the brotherhoods' actions and set about including them in a state-sanctioned system of mediation and arbitration designed to prevent conflicts like the Pullman boycott and to ensure that the railroads remained free of "radical" industrial-style unionism. The ensuing Erdman Act of 1898 provided the framework for the nation's first real system of collective bargaining and the first, if de facto, recognition of the right of unions of the brotherhood variety to exist. Nevertheless, the dream of broader unionism did not die with the ARU, as into the 1930s minorities of running trades workers dissatisfied with the Big Four's conservatism periodically mounted rank-and-file rebellions and experimented with dissident union movements, sometimes uniting with nonoperating workers.

Brotherhood Power during the Progressive Era

With its mediation and arbitration machinery, the Erdman Act enabled the Big Four to wax powerful after 1900. The increasing volume of railroad traffic following the severe 1890s depression placed increasing strain upon railroad workers as they worked longer, more intensive hours and confronted a steadily rising cost of living. Rank-and-file pressure from below and recognition of the need to confront the railroad corporations on a broader basis prompted brotherhood leaders to pursue synchronized industrial action through a series of "concerted movements." However, while they became adept at the quasi-courtlike proceedings of the arbitration process and won important gains, they became ever more disappointed with arbitrators' awards. By 1916, the brotherhoods had sworn off arbitration altogether, choosing instead to band together in the presenting of demands for the eight-hour day in the train service to all the nation's railroads and threatening a national rail strike. The ensuing crisis, coming on the eve of U.S. entry into World War I, forced the intervention of President Woodrow Wilson and the passage of the Adamson Act, the first federally legislated eight-hour

day for nongovernment workers and a significant expansion of the federal government's ability to intervene in and regulate labor relations. While the brotherhoods' achievements during these years testified to their increased power and their ability to win appreciable gains for their members in terms of wages and protective legislation, they also used their power toward such decidedly less laudable ends as the eviction from the train service of black workers through legislative lobbying, contract negotiation, and a series of hateful "race" strikes.

If the period from the late 1890s through 1916 marked the waxing of the Big Four, it also represented a time of continued struggle for the rest of the railroad industry's unions. Never as strategically placed as the workers of the running trades, telegraphers, maintenance-of-way workers, car repairmen, and clerks found it difficult to command the respect of management. Beginning in the mid-1880s, a period of heady expansion and tight labor markets in the railroad industry, unions of nonoperating workers emerged as telegraphers, track foremen, and car repairmen formed local and regional associations oriented toward the provision of mutual aid. By the early 1890s, these organizations had formed into national-level unions: the Brotherhood of Railway Trackmen (later to become the Brotherhood of Maintenance of Way Workers), the Order of Railroad Telegraphers (ORT), and the Brotherhood of Railway Carmen of America. Following the 1890s depression, which severely tested all of the brotherhoods, the Order of Railway Clerks (later, the Brotherhood of Railway and Steamship Clerks, Freight Handlers, Express and Station Employees) joined these unions in 1900. Like the operating brotherhoods, these unions patterned themselves on the fraternal model, initially emphasized benefit work and insurance, and restricted their membership to white men. Unlike the Big Four, the nonoperating brotherhoods did not enjoy the provisions of the Erdman Act (with the exception of the ORT) and at one time or another affiliated with the AFL, a measure of their relative weakness. Thus, while the return of prosperity in the new century enabled the nonoperating brotherhoods to recoup earlier losses and to grow in size, they nevertheless faced an uphill battle in their efforts to win recognition and establish the principle of collective bargaining with railroad management.

In these circumstances, the federal government's World War I takeover of the national railway system catapulted unionism forward and transformed railroad labor relations. As the United States headed into the European conflict during 1917, the nation's railway system, which had failed to expand sufficiently over the previous decade, almost collapsed under

RAILROAD BROTHERHOODS

the weight of war-related shipping. From the beginning of 1918 through early 1920, as the Wilson administration sought to direct and rationalize railroad service through the United States Railroad Administration (USRA), it also worked to rationalize and stabilize railroad labor relations with the establishment of industrywide grievance and collective bargaining machinery and the explicit prohibition of employer discrimination against union membership. The USRA's impact upon nonoperating workers was particularly significant, permitting its brotherhoods to extend their membership, gain recognition for the first time in many instances, win important wage gains, and sign national agreements standardizing wages and working conditions. With these protections, new railroad unions such as the Railroad Yardmasters of America and the Train Dispatchers Association came into existence, and one insignificant union, the Brotherhood of Railroad Signalmen, which had existed since 1901 as only a local affair, expanded into a truly national union. While the benefits of federal control were not quite as dramatic for the Big Four, they nevertheless took note of the positive impact of the state, particularly as one of their number, William S. Carter of the BLFE, served as director of the USRA's Division of Labor. Concluding that it was in their interest to continue federal railroad control after the war, and moved by the World War I rhetoric of industrial democracy, in 1919 the railroad brotherhoods, led by such "progressives" as the Engineers' Warren Stone, mounted the "Plumb Plan" for permanent nationalization of the railways.

Political and Economic Action during the Interwar Years

Expansive as the brotherhoods' postwar plans for the railroads might have been, the heady World War I years sparked a reaction as both employers and conservative politicians, now in control of Congress and the White House, determined to roll back labor's wartime gains. The Transportation Act of 1920 thus not only returned the railroads to private ownership, but it also remade the structure of railroad industrial relations by introducing the Railroad Labor Board (RLB), a quasi-judicial body empowered to decide labor disputes by itself. Heavy-handed and inconsistent in its handling of arbitration cases, the RLB, together with a sympathetic judiciary, permitted the railroad corporations to beat back union advances through the introduction of company unionism and selective observance of Labor Board decisions. With

the depression of 1920–1921 and the railroad shopmen's strike of 1922, the railroads' "open shop" offensive precipitated a considerable decline in union membership among the nonoperating brotherhoods over the 1920s.

The operating brotherhoods also suffered during these years, but with their continued clout, they led railroad labor's counterattack not in industrial action but rather in the realm of electoral politics. While the Big Four had historically shared organized labor's reluctance to become involved in politics, their experience since the turn of the century had demonstrated the advantage of exercising union influence in the political arena. After Congress dismissed their plan for railroad nationalization, the brotherhoods formed the Conference for Progressive Political Action in 1922, an organization that became the focal point for a wide range of unionists, reformers, farm leaders, and intellectuals. This "progressive bloc" hewed to independent political action, succeeded in electing some labor-friendly congressmen, and in 1924, backed the Wisconsin senator Robert M. La Follette (R-WI) in his unsuccessful insurgent campaign for the presidency. While the brotherhoods failed to install their candidate in the White House, their efforts did pay dividends in revision to the railroad industrial relations statutes. As a part of their broader political action, the brotherhoods had sustained a campaign to abolish the RLB, winning passage of the Railway Labor Act of 1926. Marking the first time Congress recognized the right of workers to join unions without employer interference, the Act established the more cooperative framework that would govern railroad industrial relations into the post-World War II era and would serve as a model for industrial relations legislation in other industries.

As the brotherhoods entered into political action in the first half of the 1920s, they also embarked in a new direction: labor banking. The brotherhoods' foray into the financial industry may have appeared anomalous, but in fact it grew out of their tradition of fraternal mutual-aid unionism, the nation's cooperative movement as it quickened during the Progressive Era, and the World War I experience itself. Inspired by the idea that labor banks held the potential to democratize the American financial system, impressed with the possibility of translating workers' savings into economic and political power, and seeing in labor banks a means of blunting employers' open-shop drive, Warren Stone and the BLE founded the first of its 14 banks, the Brotherhood of Locomotive Engineers National Cooperative Bank, in 1920. The BLE's flagship bank achieved deposits of over \$26 million by 1924 and delivered a variety of financial services to union members. However, mismanagement

and ill-advised land investments in Florida drew the Engineers deep into debt and led to the collapse of its banks by decade's end. While the brotherhoods' banking ventures ended in disaster, their bold initiatives in the economic and political arenas revealed a real degree of labor dynamism often overlooked in the 1920s.

Dominated by the Great Depression and the New Deal, the decade of the 1930s marked the consolidation of railroad-industrial relations machinery with the Amended Railway Labor Act of 1934. As the Depression deepened, the brotherhoods used their political power to address the problem of railroad unemployment, supporting full-crew, train-limit, and six-hour-day legislation. The measure with the greatest significance was the Railway Retirement Act of 1937, which established a separate system of social security for railroad employees. Together, these railway laws represented important New Deal industrial relations and social welfare legislation that paralleled the better-known Wagner and Social Security Acts and enabled the brotherhoods to secure national agreements covering almost all the industry's operating and most nonoperating employees by the end of the decade.

Decline and Consolidation after World War II

The World War II period and the return of prosperity in the early 1940s enabled the brotherhoods to begin recovering the wage losses they had suffered during the Depression despite the no-strike pledge they adopted for the duration of the war. However, persistent rank-and-file discontent with the application of national agreements and wartime wage stabilization policies animated a series of short wildcat strikes, some resulting in the temporary government seizures of railroads. This undercurrent of wartime labor conflict burst into the open at war's end as the operating and nonoperating brotherhoods presented demands for increased wages, shorter hours, and work rules revisions. Most of these unions settled their issues through the Railway Labor Act machinery, except the BLE and the BRT, which had become frustrated by the tedious process of working through the Act's machinery. On May 23, 1946, after a series of strike votes and emergency conferences and in defiance of warnings from President Harry Truman, Alvanley Johnston of the Engineers and Alexander F. Whitney of the Trainmen led their unions in the only true national railroad strike of the twentieth century. Nevertheless, two days later, the unions capitulated in the face of Truman's seizure of the railroads and threats to draft striking employees into the military. Successive rounds of demands and presidential

seizures in 1948 and 1950 completed railroad labor's part in the broader post-World War II strike wave.

The postwar strike wave marked the railroad brotherhoods' last moment of true national prominence. In the 1950s, even as union membership peaked, the railroad industry entered a period of decline brought on by competition from interstate trucking, intercity busing, and the growth of the airline industry. Increased automation and rationalization of the industry resulted in steadily declining employment, an eroding membership base for the brotherhoods, and a corresponding reduction in union bargaining power. By the 1960s, the brotherhoods were fighting largely defensive battles, attempting to preserve jobs and maintain wages and working conditions. In 1969, with the exception of the Engineers, the operating brotherhoods merged to form the new AFL-affiliated United Transportation Union (UTU). The UTU aimed to end the craft rivalries that had dogged the brotherhoods through their histories and to increase the railroad unions' economic power. In practice, the UTU devoted most of its energies to political and legislative action, a direction suggested by its central role in the creation of the Congress of Railway Unions in 1969, a federation consisting of the UTU, the Maintenance of Way Employees, the Railway and Steamship Clerks, the Hotel and Restaurant Employees International Union, and the Seafarers International Union of North America. Through the 1970s, the UTU lobbied Congress and fought battles in the federal courts, winning from the Supreme Court the right of railroad workers to strike selectively. By the 1980s, reflecting the turning tide against organized labor brought on by Ronald Reagan's presidency, the UTU was focusing on stopping White House efforts to undo the landmark social welfare and protective labor legislation it had helped to bring about earlier in the century.

RAILROAD SHOPMEN’S STRIKE (1922)

On July 1, 1922, hundreds of thousands of railroad shopmen went out on a nationwide strike that directly threatened the country’s economic and social lifeline. The strike became a titanic struggle among union workers, railroad managements, local state authorities, and the federal government. The course taken by the strike was predicated on the relative strengths and tactics of both strikers and railroad management.

The strike began in protest against a wage cut imposed by a government agency, the Railroad Labor Board (RLB). The RLB had been established under the 1920 Transportation Act. Its major role was to oversee the working conditions and wages of the nation’s over 2 million railroad workers. Starting in 1921, the RLB handed down a series of decisions that adversely affected the wages and working conditions of the nation’s 400,000 shopmen. The shopmen were the men and women who built and repaired the country’s rolling stock. This included locomotives and freight and passenger cars. After the RLB handed down a further wage cut in 1922, the shopmen’s union organization, the Railway Employees’ Department (RED), ordered its members to stop work on July 1 in protest.

The strikers established picket lines in cities and towns throughout the United States. In railroad towns especially, the battle became one for the hearts

and minds of the local populace. Shopmen generally were respected members of railroad towns holding positions as mayors, chiefs of police, aldermen, and the like. With such control, they were able to effectively stop the importation of strikebreakers. In those locales where strikebreakers and armed guards were used, tensions mounted. Shootings became common as both strikers and guards were injured and killed. Such confrontations became common throughout the country. In these same communities, local merchants tended to side with the strikers. Thus, strikers and their families were given free groceries, complimentary tickets, and free rent. There was a darker side to this support where those shopmen who continued to work were marked for retribution. Some of the working shopmen (scabs) were verbally threatened, some were kidnapped and whipped or tar and feathered, and their houses often became sites of vandalism. Critical also to the strikers’ success was the support from their wives, daughters, and sweethearts, who gathered badly needed supplies and in some cases stood on the picket line in support. Such support was not universal, however. Some shopmen, especially in the Southeast, refused to let their female supporters get involved. Local police forces also played a supportive role. Armed guards were arrested for carrying concealed weapons. In many cases, such support was predicated on the fact that chiefs of police were trying to maintain their political links to the wider community. Actions during the strike would therefore be remembered during election time.

Community support also attracted the attention of state and federal authorities. Reports by U.S. district attorneys and U.S. marshals highlighted the growing tension. In response, railroad managements were encouraged to apply for injunctions against the strikers. Such injunctions or restraining orders were easily obtained. Once the restraining orders were handed down, U.S. marshals acquired large numbers of deputy marshals to enforce them. These deputy marshals became the protectors of railroad property and strikebreakers and helped escort replacement workers and food and provisions into the railroad shops. Thus, community support of strikers was neutralized by the U.S. marshals.

President Warren Harding and his secretary of commerce, Herbert Hoover, tried hard to mediate a peace agreement between the shopmen and railroad heads. Initially, he appeared successful after a break-away group of railroad managers agreed to negotiate. But a sizable section refused to sit down with the RED leaders. The most obstructionist were the Pennsylvania Railroad officials. Harding and Hoover were forced to back off and await events. By the second week in August (six weeks into the strike), Hoover

Chicago, Illinois. Grinding down a part of locomotive cylinder housing at the Chicago and Northwestern Railroad shops. Library of Congress, Prints & Photographs Division, FSA/OWI Collection [LC-USW3-012735-D].

reported to Harding that only two weeks of coal supplies were left. In addition, the nation's rolling stock was becoming increasingly dangerous as repairs could not keep up with demand. With little end in sight, President Harding consulted with his attorney general, Harry Daugherty. Harding's decision was to obtain a federal injunction against the strikers. On September 1, Daugherty obtained one of the most sweeping injunctions in U.S. history. The union leaders were enjoined from issuing strike instructions or funds to support the strike. In essence, the injunction destroyed the strike leaders' effectiveness. Facing heavy court fines if they ignored the injunction, the trade union leadership searched for railroads that would sign a peace agreement. Fortunately, a break-away managerial group had formed. Led by the leaders of the Baltimore and Ohio (B&O) and Seaboard Airline Railroads, a solution was hammered out that recognized the seniority rights of the strikers and allowed them to return to work without any discrimination.

The majority of the railroads, however, refused to bargain with the union leaders. Instead, these

railroads were determined to rid themselves of a union presence. Strikers could only return to work as new employees and nonunion members. Over the following months, many strikers were forced back to work under these conditions. But not until 1924 did the union leadership eventually admit defeat and order the remaining strikers back to work.

The shopmen's defeat was a major one. It ended their national power within the railroad industry. The strike also represented the last major industrywide strike until the emergence of CIO unions in the 1930s. Many reasons contributed to the shopmen's defeat. The shopmen were hampered by a lack of unity across race lines. Large number of African-Americans, Hispanics, and Asians labored in the railroad shops but were not allowed entry into the shopmen's unions. Such discrimination tactically weakened the strike because many minority shopmen reasoned that the unions were exclusionary and thus there was little incentive to support the strikers. The Harding administration also played a divisive role. Its appointees to the RLB and its eventual unleashing of a sweeping federal injunction sounded the death knell for the

RAILROAD SHOPMEN'S STRIKE (1922)

strike. Above all, though, it was railroad management that did much to defeat the strike. Its determination to push hard for wage cuts and thereby confront the shopmen set the tone for the upcoming battle. Managements were determined to return to the prewar period where union representation in the railroad shops was barely discernible. Management paid an enormous cost in defeating the shopmen, thousands of guards were hired, eating and sleeping facilities were set up in railroad shops across the country, and finally, hundreds of thousands of strikebreakers were recruited. Management obviously thought the cost was worth paying, but by the 1930s and World War II, unions returned to shops and this time they stayed.

RAILROAD STRIKES (1877)

In the spring of 1877, the United States was still in the grip of a major industrial depression that had begun four years earlier. The depression had devastated organized labor, but labor's demands for a living wage, the right to bargain collectively, and an eight-hour work day, among others, remained—and were even more salient in the midst of widespread unemployment and hunger.

The Railroad Strikes of 1877—known by contemporaries as The Great Strike or Great Upheaval—were one of the most spectacular episodes of urban violence in American history. Triggered by a 10% wage cut instituted by most railroad corporations on July 1, they began on July 16 at the Baltimore and Ohio (B&O) railroad yard in Martinsburg, West Virginia. In Martinsburg, railroad workers dismantled a cattle train upon its entrance to the yard. Uncoupling the cars, the men stated that no more freight trains would be allowed to travel until their wages were restored. This job action by railroad workers quickly elicited support from the Martinsburg community. That evening, a crowd gathered at the town depot and prevented the arrest of the strikers by the police; and the following day, freight traffic was disrupted or stopped by striking railroad workers, and more ominously for railroad companies and ruling elites

in general, people with no wage relationship to the B&O. The strike of railroad workers spread rapidly from Martinsburg, engulfing towns and cities throughout the Northeast and the Midwest, extending as far west as the Pacific coast.

The strike of railroad workers triggered a series of widespread, popular uprisings against the railroads—the nation's pre-eminent industrial enterprise after the Civil War and the symbol of the capitalist nature of the American industrial revolution. Though viewed by most people as the carriers of progress and prosperity, the railroads also engendered considerable hostility: their tracks and trains wreaked havoc in urban communities, obstructing the commercial and social uses of streets and killing and injuring thousands of people every year in various types of accidents. Consequently, crowds composed mostly of workers with no wage relationship to the railroad companies, sprinkled with substantial numbers of middle-class folk, joined striking railroad workers in stopping trains; they also engaged in violent attacks against railroad property.

Given Baltimore's proximity to Martinsburg and its status as the major rail nexus for the B&O Railroad, it was the place of the first major outbreak of violence. On Friday, July 20, the Great Strike erupted in Baltimore. Railroad and civil authorities had already filled Baltimore with hundreds of soldiers in expectation of "trouble," and trouble they got. On Front Street, at the armory housing a regiment of troops called out to protect railroad property, thousands of people collected. Women, children, unemployed men, and people from nearly all walks of life in the city gathered to voice their rage at the troops. Catcalls, threats, and brickbats were hurled at the armory. Fairly soon, portions of the regiment were ordered to leave the armory in order to march to the major railroad depot at Camden station. Their exit and the crowd's response were a deadly mixture: in response to a fusillade of stones, brickbats, and perhaps a gunshot or two, the soldiers opened fire upon the crowd. As different companies of the regiment departed the armory and marched through the streets to Camden station, battles broke out all along the route. Nearly a dozen people lay dead and a score injured (only one soldier suffered serious wounds). Not a single one of the dead or wounded was a railroad striker—testimony to the scope of the hostility big business, railroad corporations in particular, had elicited in the years since the Civil War.

As people in Baltimore and other cities experienced the Great Strike or its beginnings that July weekend, the seminal event of the Strike occurred in Pittsburgh, Pennsylvania. Pittsburgh was home to another railroad giant, the Pennsylvania Railroad Company, and the company held the nearly universal antipathy of the city's working class. Its monopoly on rail and

freight traffic into and out of the city had created a deep reservoir of ill-feeling. Antimonopoly sentiment, a set of values with roots stretching back to the eighteenth century, ran deep throughout the country, especially as industrialization created behemoth corporations that crushed small businesses as easily as hapless cows caught on the tracks. Nowhere was antimonopoly sentiment deeper and more widespread than in Pittsburgh. In addition to the city's industrial manufacturing establishments, Pittsburgh was home to the mighty Pennsylvania Railroad Company. Its rolling stock, roundhouses, freight houses, and switchyards covered a vast area by the Union depot, running alongside a ridge.

Pittsburgh's railroad workers knew of the strike in other cities, and they too had suffered a pay cut. The strike started on Thursday, July 19 when a group of trainmen refused to take out any freight trains. At approximately the same time, another event was beginning that was to prove pivotal in the city—and emblematic of the hostility railroad corporations had fostered in countless cities and small towns across the nation—a crowd composed largely of non-railroad workers began to form at the Twenty-Eight Street crossing about one mile from the Union depot. This crowd would play a signal role in what was to follow; indeed, they began to interfere with the movement of trains almost immediately. As trainmen refused to run freight trains and also refused to allow the use of strikebreakers—scabs—the crowd at the crossing grew in size. Indeed, striking railroad workers had to intercede to allow passenger trains to continue to run—a conscious strategy on the part of the strikers so as not to alienate public opinion. As the day ended, hundreds of incoming freight cars lay idle in the Pennsylvania yard. On Friday, July 20, no freight trains were moving into or out of the city. The situation remained the same the next day, July 21. Yet as elsewhere, railroad corporations were successfully soliciting the armed intervention of local, state, and federal authority. Local police forces, in Pittsburgh and other cities, were simply overwhelmed by the size of the strike and the crowds. State militias faced a problem, which was particularly pronounced in Pittsburgh: militiamen were drawn from the city, and they did not want to fire on people who might be their neighbors or coworkers. Efforts to get the Pittsburgh militia to control the strikers—and the ever-growing Twenty-Eighth Street crowd—generally failed. Militiamen either failed to show up when called or they fraternized with the members of the crowd. Consequently, militiamen from Philadelphia were rushed to the city via special trains provided by the railroad company. Of the many features of society revealed in stark relief by the Great Strike of 1877,

none was as apparent as the state's willingness to use armed force against ordinary people on behalf of the interests of private capital.

Strikers and the people of Pittsburgh knew that militiamen from Philadelphia were headed to their city. Arriving on Saturday, July 21, these out-of-town militiamen would prove to be the trigger for the most spectacular and violent episode in the history of the Great Strike of 1877. Unlike their Pittsburgh counterparts, the state militiamen from Philadelphia had few qualms about firing into crowds of people who were anonymous to them. By late Saturday afternoon, there were six hundred Philadelphia troops at the Union depot in the city. News of the arrival of the troops had brought even more people to the yards of the Pennsylvania Railroad. The troops had one goal: clear the tracks so that freight trains could run again. With fixed bayonets, they moved on the crowd of striking railroad workers, Pittsburgh militiamen who were openly fraternizing with their fellow residents, unemployed workers, iron and steelworkers, and women and children who blocked the tracks leading out of the freight yards. The crowd was frankly hostile and refused to be moved; a number of the militiamen charged the crowd, stabbing several people. A barrage of stones and rocks followed, people in the crowd even angrier from the sight of unarmed people being bayoneted by out-of-town soldiers. The command to fire quickly followed the hail of stones. When the firing was over, 20 people lay dead and nearly 30 were wounded. The crowd, numbering in the thousands, sent the six hundred troops fleeing back into the relative safety of a roundhouse. Crowd members began to empty the standing freight cars and then set on fire not only the freight cars, but railroad property in general. A three-mile stretch of railroad property—cars, workshops, lumberyards, and roundhouses—went up in a spectacular blaze that lit up the night sky for many miles. When it was over, 2,000 cars of every sort had been destroyed; nearly 40 buildings of various kinds lay in ashes, and more than 100 locomotives were ready for the scrap heap. The shock of the carnage, both material and human (another 20 people had been killed by the Philadelphia militiamen), was such that the city populace itself largely restored order to its streets by Monday morning.

News of what transpired in Pittsburgh shocked and terrified the nation. Newspaper headlines screamed that “the mob” had nearly burned the city to the ground in its fury to get at railroad property; insurrection threatened the nation and property everywhere was at risk. Yet the railroad workers' strike continued—as railroad workers in scores of other cities went out on strike during or after the events in Baltimore and Pittsburgh. The same weekend that

RAILROAD STRIKES (1877)

the western terminus of the Pennsylvania Railroad burned to the ground, the Great Strike began in upstate New York, as striking railroad workers in Buffalo, Albany, and elsewhere struck. As was the case nearly everywhere, their strike quickly caused strikes of workers from other economic sectors, as well as people from the middle classes.

Chicago and St. Louis experienced serious urban disorder consequent upon the Great Strike in those cities. In St. Louis, a general strike followed the strike of railroad workers—for several days, the city was ruled by the Workingmen's Party of the United States, as workers in virtually every industry struck and shut the city down. Chicago, the nation's slaughterhouse and a major nexus for all railroads headed west or east, had its own share of Great Strike violence, with at least one pitched battle between troops and working-class crowds claiming the lives of nearly 20 people. In Chicago, as in the nation generally, the Great Strike of 1877 was put down by the armed forces of the state, whether they were local or state militia, or federal troops called out by President Rutherford B. Hayes. Even San Francisco experienced civil strife as a result of the Great Strike, though the working class in that city vented its anger not on railroad corporations, but on the city's Chinese community.

The Great Strike facilitated the demise of Reconstruction. Waning northern interest in the southern "negro problem" was quickly replaced with the "labor problem" terrifyingly illustrated in northern cities during the strikes. The violence of the railroad strikes accelerated the development of the national state. In the years and decades after the strikes, state militias expanded in size and became more efficient, and National Guard armories were built (many of stone) or strengthened. The 1877 strikes both reflected and accelerated the growth of class consciousness among urban industrial workers, regardless of craft or skill. In many locales where the strikes were particularly pronounced, labor parties, albeit short-lived, formed for the fall elections.

RAILROADS

Work on the railroads was quite diverse, encompassing the most sophisticated industrial work of the nineteenth century as well as the most backbreaking menial labor. At the top of the industrial pyramid were the designers and mechanics who built the engines themselves. In the 1820s and 1830s, the manufacture of most American locomotives took place in England. But by the 1850s, Philadelphia, Baltimore, and Pittsburgh had emerged as locomotive manufacturing centers, largely because of their proximity to iron foundries. Until the 1870s, most locomotives were custom built in locomotive works and shipped to railway companies.

Because of the custom nature of locomotive construction before the American Civil War, every major railroad in the early nineteenth century required extensive repair shops for the rebuilding of broken locomotives and the building of railway cars. A foundry produced custom molds for railway parts. Carpenters, millers, and trimmers fashioned cars. Boilermakers, coppersmiths, tanners, and machinists repaired, rebuilt, and re-assembled these parts to keep railway cars running. After the Civil War, manufacturers' experience with interchangeable parts, particularly in steam engine design, led to a re-organization of repair shops. Manufactured engines in standard models emerged first from the Baldwin Works in Philadelphia. By the 1870s, in New England and the Midwest, and into the 1880s in the South, these standard-sized engines increased in popularity. Parts could be ordered and shipped, diminishing the need for custom-built parts and cheapening the cost of maintaining locomotives and railway cars. Increasingly, repair shops did less and less manufacturing, becoming holding pens for parts and diminishing the need for the diversity of skills in repair shops. By the 1880s, many railway repair shops became white-only enclaves, as black helpers, apprentices, and painters who had been a very visible part of southern shops were closed out of railway work. Conflicts over labor in repair shops were somewhat different than they were for workers who worked on tracks. Repair workers could not simply stop business by stopping work; they had to wait for broken engines and rolling stock to pile up to effectively stop a railway from operating. This inability to fully stop operations would prove crippling in the Shopmen's Strike of 1922. Repair shops were radically

altered again in the 1940s (the 1950s in the South) with the widespread adoption of diesel locomotives. Even more so than in the 1880s, repair shops became large repositories for parts, further decreasing the need for bespoke parts or re-engineering. Indeed, many steam repair shops were closed and demolished, replaced with streamlined diesel shops that housed spare parts and a staff of engine mechanics and oilers.

Next in order of skill were the operating brotherhoods: engineers, firemen, conductors, and brakemen. A loose system of apprenticeship governed these trades. Firemen, for example, in charge of keeping a fire in engines, acted as apprentice engineers. Through the 1870s and 1880s, as wood-fired engines were replaced with coal-fired engines, the physical demands of this job decreased while proper firing in these more efficient engines became a more delicate matter. Engineers and firemen were invariably the first to die from exploding boilers, “scalded to death by the steam” in the words of the railway song, “The Wreck of the Old 97.” Engineers, meanwhile, maintained control of the engine, setting speed and calling for brakes. Throughout the United States, the romance of railroading focused on the engineer and fireman. Dozens of mountain ballads like “Casey Jones” and “The Wreck of the Old 97” described their exploits, real and imagined. Engineers and firemen, as Walter Licht

has shown, came largely from the ranks of the repair shops and machine shops.

Next among trainmen were conductors and brakemen. A brakeman’s job in the mid-nineteenth century involved jumping from car to car to turn hand brakes when called to do so by the engineer. By the 1880s the Westinghouse air brake minimized the dangers of braking and made braking easier. Brakemen were considered apprentice conductors, as both positions involved the management of the train behind the locomotive. Indeed, conductors managed all parts of the train behind the locomotive, including taking tickets and ejecting passengers who tried to “ride the blind” by hiding in the folds of fabric that separated the passenger trains. Conductors often came from the ranks of stagecoach drivers, though many (perhaps most) came from rural backgrounds.

Perhaps because of the diversity of skills and the fixed nature of control of the parts of the locomotive, each of these skilled workers had their own unions, though the Order of Railway Trainmen and the Knights of Labor both sought to draw these workers into industrial rather than craft unions. A narrower craft consciousness may also have emerged from the peculiar industrial structure of early railways, in which rule books governing the behavior of workers became longer and longer, governing nearly every

RAILROADS

action of trainmen. While working to rule may have helped trainmen push back against the arbitrary power of foremen, it may also have fostered an over-emphasis on rules and order over solidarity and community. The very nature of early trainmen's unions may also have lent a certain closed character to their ideology. Early railway brotherhoods in the mid- to late nineteenth century resembled contemporary fraternities, in which brothers engaged in humiliating and secretive initiations that blended elements of Rosicrucianism and Masonic ritual. Brothers pledged secrecy and undying devotion to the group, exchanged secret handshakes, and pledged to work only with brothers. In a practical sense, these craft unions found it difficult to agree with each other when it came to collective action, most notoriously when engineers refused to support firemen and other trainmen in the Great Upheaval of 1877, and the Southwestern Strikes of 1886.

Railway trainmen have often been associated with radical politics. Whether engineers, firemen, conductors, or brakemen, trainmen saw themselves at the top of the labor hierarchy, both as representatives of labor and as uniquely responsible for the fate of the entire working class. In politics, many were socialists, anarchists, and later communists. Trainmen's constant mobility, both on the train and from job to job, made them particularly important for the growth of radical and working-class movements from the 1860s through the 1930s and 1940s. The Mexican historian Adolpho Gilly, for example, has argued that North American railway engineers and brakemen contributed in important ways to the intellectual ferment that created the Mexican Revolution.

Among railway trainmen, conductors faced the most direct scrutiny because they collected fares on passenger trains. Indeed, the infamous corporate spy (and bungler) Allan Pinkerton got his start spying on conductors to ensure that they did not pocket the fares collected from passengers. By the latter part of the 1850s, Pinkerton created a "detective agency" that promised to ferret out theft and eliminate emerging unions among railroad trainmen. Often the peculiar position of detectives led them to overstate the threat of workers' unions and their own importance in preventing violence. Indeed, during the Civil War, Pinkerton provided inflated figures for Confederate strength behind the lines in the Peninsular Campaign in the Civil War, leading General McClellan to delay his invasion of Richmond and extend the war by four years, a feat that ironically seemed only to expand the renown of the Pinkerton Agency. In 1878, Pinkerton published a highly colored account of railway unions in a book titled "Strikers, Communists,

Tramps, and Detectives," which purported to reveal some of the secret rituals of the railway brotherhoods in the wake of the Great Upheaval of 1877.

By the latter part of the 1870s, George Pullman created the Pullman car, a sleeping car that became a hallmark for luxury. African-Americans by this time had been excluded from the repair shops and from positions as firemen, partly through the actions of white railway brotherhoods. Some African-Americans, however, found positions as servants and cooks on the Pullman cars. Here, too, the connection between trainmen and radical politics was pronounced, as African-American Pullman car porters became important in the growing socialist movement of the early twentieth century, joining the Brotherhood of Sleeping Car Porters in great numbers. Pullman car porters, too, may have been influential in facilitating the so-called Great Migration of African-Americans to northern cities in the early decades of the twentieth century. By bringing black newspapers to the rural South, they may have encouraged thousands to leave the Jim Crow South for the less-segregated northern cities, where job opportunities and a thrilling, urban, largely African-American world beckoned.

The final and largest group among railway workers consisted of the maintainers of track, called section hands or track liners in the nineteenth century, and maintenance-of-way workers in the twentieth. Every railway in regular operation required approximately one worker for every mile of track. Usually gangs of five or more workers were responsible for a stretch of track five or more miles long. Most days, track liners relined track that heavy running or storms had driven out of line. A road boss received orders from the roadmaster, who regularly inspected the road from a hand-car. When the roadmaster noted problems on a road, he would drop a wadded note, called a butterfly, near the misaligned track. The butterfly would identify the source of the problem. Track liners relined or replaced track using railway spike hammers that resembled picks. Workers edged the longer, skinnier end of the hammer under the track to lift it. The shorter end would be used to shift the track over and to hammer down spikes. Until as late as the 1960s in the American South, African-American workers relined track by singing songs to co-ordinate the movements of track lining. Sometimes a caller would be appointed to set the pace for workers while workers sang the refrain; other times all workers would sing together. Among these songs was the folk ballad "John Henry," which told of a powerful black man who fought in a rock-drilling contest (or track-lining contest) with a steam drill. Though John Henry defeated the drill, he died

just afterward. Such songs co-ordinated labor so that workers jiggered their “dogs” or picks at the same time, but they also warned workers to slow down. The snatches of song sung by track liners (“I got a girl / She works in the yard / She brings me meat / She brings me lard”) had tremendous reach through the twentieth century, finding their way into jazz, blues, and rock and roll songs of the 1920s, 1930s, and 1960s. In addition, track lining, co-ordinated with song, may have been an important precursor to African-American step shows performed by black fraternities in the 1910s and 1920s. In modern step shows, five or more black performers hold sticks that they dance around in complex and precise lockstep formations.

African-American workers continued to work as firemen and engineers on timber lines in the South, while many continued as brakemen through the turn of the century. African-Americans served as yard workers as well. When the federal government assumed control over railways during World War I, they re-organized and streamlined routes, turning some positions back to African-Americans, who had been removed between Reconstruction and the turn of the century. After World War I ended, the federal government gave these much-improved routes to private hands. Violence ensued as white workers attacked black workers to regain their position, most visibly in the “race riots” of Memphis in 1919. Despite investigation by the Fair Employment Practice Committee during World War II, black workers were denied full seniority rights and equal opportunities for work. Only with the Civil Rights Act of 1964 were African-Americans accorded something approaching full rights to wages, benefits, and employment opportunities.

RAILWAY LABOR ACTS (1920–1934)

The Railway Labor Act of 1926 represented a breakthrough in state-labor-management relations. It served as a model for both section 7(a) of the National Industrial Recovery Act and the Wagner Act of 1935. Its genesis lay in World War I and the national railroad strike in 1922.

Transportation Act of 1920

American participation in World War I was a boon to the political and economic aspirations of the railway employees and their unions. On December 26, 1918, President Woodrow Wilson issued an executive order asserting federal operational control of the entire railroad industry. Forced to take this action because of severe railroad gridlock in the Northeast and significant rolling stock shortages nationally, the order also opened a new phase in efforts to mediate labor-management disputes in the industry. Under the auspices of the United States Railroad Administration (USRA), railway labor in general, not just the four brotherhoods, made significant advances in wages, work rules changes, membership, and state support in disputes with management. Consequently, they were loath to leave the protection of federal control

as Congress debated ending or extending the tenure of the USRA in 1919. Labor threw its considerable weight behind the Plumb Plan, a proposal for nationalizing the railroads. Instead, Congress enacted the Transportation Act of 1920 (also known as the Esch-Cummins Act) that returned the rail carriers to private operation. Though the Senate's version included both a prohibition on strikes by railroad employees and compulsory arbitration of disputes, the compromise arranged by the conference committee contained neither provision and instead represented a compromise between labor's desire to protect wartime gains and the carriers' demand for a return to prewar managerial authority.

For the first time in federal labor legislation, Title III of the Transportation Act included all employees of common carrier railroads operating in interstate commerce, not just the members of the four operating brotherhoods. It called for the creation of a tripartite United States Railroad Labor Board consisting of three members, each representing labor, management, and the public, all appointed by the president and subject to Senate approval. In practice, the public members often sided with the management representatives. The Board was empowered to act as both mediator and arbitrator concerning unresolved disputes over wages and work rules. Conspicuously absent was any power of enforcement beyond the weight of public opinion, a fact reinforced by the Supreme Court in *Pennsylvania Railroad Co. v. Railway Labor Board*. Subsidiary to the Board was a three-tier system of local, regional, and national Boards of Adjustment to hear grievances arising from disputes over the implementation of agreements. Though the Act required disputants to attempt reconciliation privately, in its five years of life, the Board heard some 13,000 cases. The large number of cases obscured a bitter reality: both unions and management intensely disliked the law. The carriers, especially after 1923, simply ignored Board decisions favorable to their employees. The four operating brotherhoods, with assistance from Secretary of Commerce Herbert Hoover, arrived at a private accommodation with railroad executives to bypass the Board altogether in 1922. Thus, many of the cases heard by the Board involved nonoperating employees, a group fragmented across many small unions, some affiliated with the American Federation of Labor (AFL) and others not, and consequently as a group susceptible to anti-union efforts by management. This situation, a privileged and minority group of employees generally unaffected by the decade's characteristic re-assertion of managerial authority and a majority that enjoyed far less stable wages and work rules, was ripe for a simultaneously catastrophic and transformative strike.

Shopmen's Strike of 1922

In early 1921 and 1922, the Railway Labor Board ordered two wage cuts that affected nonoperating railroad employees more severely than they did the members of the brotherhoods. This action, in combination with persistent management efforts to push company unions, contract shop work to nonunion firms, and install piecework pay schemes, led the leadership of the AFL's Railway Employees Department to call for a national strike by shop workers. They demanded the revocation of the wage reductions and piecework rates.

On July 1, 1922, over 400,000 machinists, boiler-makers, Carmen, and other railroad shop workers walked off their jobs in the first national railroad strike since 1894. The Railway Labor Board quickly branded the strike illegal in a 5-2 vote, simultaneously asserting that strikers had voluntarily forfeited their positions and seniority and that their replacements were entitled to all the protections of the law. The leadership of the operating brotherhoods sympathized with the strikers in the abstract, but beyond sporadic walkouts emanating mostly from the behavior of railroad guards, their membership stayed on the job. Widespread violence against persons and property by both sides characterized the strike everywhere. After two attempts by President William Harding to arrange a settlement compromise, rejected in turn by the railroads and then the unions, the weight of the federal government fell behind the carriers.

In September 1922, Attorney General Harry M. Daugherty sought and received from Judge James H. Wilkerson of the United States District Court of Illinois a sweeping injunction. Citing the Sherman Anti-Trust Act, Wilkerson branded the strike a criminal conspiracy and enjoined the unions, their executives, and membership from any strike activity whatsoever. The injunction, combined with the success of the carriers in obtaining strikebreakers and the poor finances of the shop unions, led the shopmen's leadership to reach a settlement with a coalition of moderate eastern railroad executives. The agreement guaranteed the positions and seniority of returning strikers and provided for the creation of a commission to negotiate problems between replacements and returning employees. Approximately 100,000 strikers returned to work under this agreement. However, many carriers, especially in the West, were not party to the agreement and were determined to break both the strike and the shop unions, a desire eventually realized, though in some areas strike activity lingered into 1928. The strike essentially destroyed the various shop unions, and even those strikers who returned to work faced an emboldened management.

Railway Labor Act of 1926

The strike, especially its widespread violence but also the frightening implications of the Wilkerson injunction, revealed the inadequacy of the Railroad Labor Board and the deficiencies in the Transportation Act. Between 1923 and 1926, a number of reform proposals appeared in Congress. The bill that eventually became the Railway Labor Act emerged from several meetings between union and railway leaders at the suggestion of President Calvin Coolidge. Passed with little debate, the bill became law on May 20, 1926.

The Railway Labor Act put the federal government squarely behind the principle of collective bargaining in the railroad industry. The Act eliminated the Railway Labor Board, replacing it with a five-member Board of Mediation, empowered to provide mandatory mediation but not compulsory arbitration. It specified the creation of emergency presidential commissions when disputes appeared intractable and specifically prohibited strikes during the 30-day period mandated for its investigations and deliberations and an additional 30 days thereafter. To speed the resolution of minor disputes—those concerning the interpretation of agreements—the Act instituted a series of adjustment boards, an idea borrowed from the period of federal control. Most important, the Act protected the right of railroad employees to bargain collectively and elect representatives free from employee coercion. For the carriers, the bill protected the company unions that had emerged after the 1922 strike, especially in the shop crafts, and limited the scope of collective bargaining to individual systems.

Railway Labor Act Amendments of 1934

Often ignored in the larger sweep of New Deal-era labor legislation, the 1934 amendments to the Railway Labor Act significantly expanded employee and union protections and gave visible indication of the power of the brotherhoods in the building of a New Deal coalition while simultaneously presaging many of the provisions of the Wagner Act. The amendments emerged amidst a railroad industry financial meltdown that left almost 50 major railroads near or in bankruptcy by 1934. The amendments extended to all railroad workers the employee protections written into the Bankruptcy Act of 1932 and the Emergency Railroad Transportation Act of 1933. Those laws had prohibited carriers in bankruptcy from using yellow-dog contracts, influencing employees in representation decisions, enforcing closed shops (often used to

protect company unions), or refusing to bargain collectively with certified representatives. To these provisions were added a new permanent and bipartisan National Railroad Adjustment Board to handle grievances relating to interpretations of agreements with neutral referees appointed in case of a deadlock. The Act also extended the cooling-off period by an additional 30 days and added specific language rendering the decisions of the Board enforceable in federal court and infractions punishable by fine or imprisonment. Last, it called for a reduction in the membership of the Board of Mediation, itself renamed the National Mediation Board, because it no longer handled grievances, but granted the revamped organization authority to conduct representation elections.

These amendments withstood constitutional challenge in 1937 in *Virginia Railway Co. v. System Federation no. 40, AFL*. Later amended in 1936, 1940, 1951, 1964, and 1970, the basic provisions of the Railway Labor Act remain in place. Though the Act served as a model for later legislation for all workers, its emphasis on arbitration, strike avoidance, and federal intervention continue to mark out railroad labor from the rest of the American union movement.

RAMSAY, CLAUDE (1916–1986) **President, Mississippi AFL-CIO**

Claude Ramsay was born in 1916 on a farm near Fort Bayou, Mississippi, eight miles from the Gulf Coast. He began work at the International Paper plant in Moss Point, Mississippi, in 1939, and advanced rapidly inside the mill until he was drafted in 1942. Ramsay's experience in the Army shook his faith in segregation, and he returned from the war interested in politics. He supported President Harry Truman in the 1948 elections, while the rest of Mississippi defected to the Dixiecrats, who bolted the Democratic Party over civil rights. He became active in his union and was elected president of Paperworkers Local 203 in 1951 and president of the Jackson County Central Labor Council the following year. Ramsay was elected the second president of the recently merged Mississippi AFL-CIO in 1959 because he was regarded as the only candidate who could bring former AFL and CIO local unions together. Both wings of the labor movement perceived him as capable, determined, and deeply committed to unions.

Ramsay made his mark as the president of the Mississippi AFL-CIO. He supported unions, civil rights, and the national Democratic Party in a state that reviled all three. Regarding unions, Mississippi was as hostile and forbidding as any state in the country. Ramsay confronted this anti-union sentiment immediately upon his election as president. Not content with having a right-to-work law on the books, the state legislature decided in 1960 to make the right to work part of the state constitution, which required a referendum by voters. Ramsay led a gallant but losing fight against the proposition. Defeat clarified for Ramsay that the Mississippi AFL-CIO was too weak to defend itself politically. In order to remove anti-union laws and defeat anti-union legislators, the Mississippi AFL-CIO would need allies.

Ramsay found his allies in the emerging civil rights movement. Despite the fact that Mississippi seethed with segregationist sentiment, Ramsay aligned the labor movement with black civil rights groups. Ramsay believed that unions in Mississippi could

prevail only if blacks were enfranchised. Antilabor legislators from agricultural Black Belt districts in Mississippi could be defeated only with the help of black voters who lived there. Simple arithmetic led Ramsay to form coalitions with the Mississippi NAACP, fund register-and-vote drives among blacks, and support local civil rights groups.

Ramsay was also deeply engaged in Democratic Party politics. The Mississippi Democrat Party (the Regulars) refused to support the Party's presidential ticket in 1964 because it opposed the national Party's strong civil rights planks. Four years later, in preparation for the 1968 elections, Ramsay and other liberal Democrats in Mississippi formed the Loyalists to challenge the Regulars for control of the statewide Democratic Party. The Loyalists sought to create a bona fide Democratic Party in Mississippi, one that was loyal to the national Party's platform and candidates.

Ramsay's support of unions, civil rights, and the national Democrat Party put him at odds not only with Mississippi's ruling class, but with his own members. Local unions protested Ramsay's stance against segregation, his support for the national Democratic Party, and his alliance with civil rights groups by disaffiliating from the Mississippi AFL-CIO. When they walked out, they took their dues money with them. The Mississippi state council stayed afloat financially only because of subsidies it received from the AFL-CIO in Washington, DC. Even more discouraging for Ramsay were the inroads white supremacy groups, such as the Citizens' Councils, the Ku Klux Klan, and the John Birch Society, made among his members and the public denunciations of the Mississippi AFL-CIO that issued from them. Local unions and their members publicly repudiated Ramsay's leadership because of his outspoken support for black civil rights.

The 1960s were a decade of trial for Ramsay as Mississippi was consumed with making a last, desperate stand to defend segregation. Candidates endorsed by the Mississippi AFL-CIO lost repeatedly, and Mississippi AFL-CIO membership declined precipitously. The ordeal even extended into Ramsay's personal life as his family was harassed and his life threatened. He kept a shotgun in his car and let it be known that he was armed at all times in order to discourage would-be assassins.

As the tumult of the 1960s dissipated, Ramsay began to see results from his efforts to alter the political climate in Mississippi. At the 1968 Democratic national convention, an integrated group of Loyalist delegates from Mississippi were seated in place of the Regulars. Membership to the Mississippi AFL-CIO began to recover as local unions that had disaffiliated in protest to Ramsay's alliance with civil rights groups now rejoined. In addition, Ramsay's alliance

with blacks began to pay political dividends. The Mississippi AFL-CIO found political allies among increasing numbers of newly elected black legislators and newly enfranchised black voters.

Ramsay died on January 17, 1986, just one month after retiring as president of the Mississippi AFL-CIO, a post he held for 26 years. In an odd way, his funeral vindicated and symbolized the principles for which he had fought. Black leaders, who would have been denied entry into the funeral home previously, were now in attendance and walked by his casket garlanded in flowers that spelled out "AFL-CIO." Mississippi politicians who did not even bother to solicit the state council's endorsement when Ramsay took office in 1959 now sat in the pews to pay homage to labor's fallen leader. And newspapers in Mississippi that had excoriated him mercilessly for his civil rights activity in the past now hailed him as a prophet and acknowledged in their obituaries that Mississippi was a better place for his courageous efforts.

RANDOLPH, A. PHILIP (1889-1979) President, Brotherhood of Sleeping Car Porters

Asa Philip Randolph was one of the most prominent black freedom fighters of the twentieth century. He became the editor of the *Messenger*, a black

Socialist weekly; a labor organizer; the president of the Brotherhood of Sleeping Car Porters, the first black labor union to be recognized by a major corporation; the head of the March on Washington Movement; and the convener of the historic 1963 March on Washington for Jobs and Freedom. Randolph was born in 1889 in Crescent City, Florida. His father was an ordained AME minister who, along with his wife, Elizabeth, also ran a tailoring business to help provide for his family. Asa was nurtured in the AME heritage. His father's ministry stressed a social gospel message, emphasizing racial justice. The Reverend James Randolph, Asa recalled, told his parishioners that the AME Church was a black independent institution whose mission, in part, was social. Along with stressing the social gospel, the elder Randolph also taught his son racial pride, informing him of the great black figures such as Nat Turner and Frederick Douglass. A. Philip Randolph was well acquainted with the religious teachings of the Bible. He noted that as a child he would sit and read the Bible, and his mother, Elizabeth, who was considered the disciplinarian in the Randolph household, was very devout. In fact, the church was the center of her world. All of her friends were members of the church, and all of her activities outside of the household were in the church. Thus, Randolph's parents had an important influence in shaping his religious beliefs. Although Randolph would later become critical of conventional religion and certain types of religious leaders, he would not abandon black church culture but incorporate its language in the battles he waged for social justice.

Labor Organizer and Socialist

When Randolph was very young, he and his family moved to Jacksonville, Florida, where the Rev. James Randolph became pastor of a local AME church. Asa and his older brother James would later attend Cookman Institute, one of the first high schools for blacks in Florida. Soon after graduating from Cookman Institute, Randolph worked at odd jobs, including selling insurance premiums and clerking in a grocery store. He eventually decided to migrate to New York City in 1911, seeking a career in acting. In New York, Randolph worked at several occupations, including working as a porter and a waiter on a steamboat. As a result of what he said was job exploitation, he attempted to organize the waiters and other workers on the steamboat. However, when management received wind of his activity, he was fired. He also created an Elevator and Switchboard Operators Union, thereby gaining early experience as a labor

organizer. Randolph also attended the City College of New York, where he took courses in political science, history, and economics, as well as other courses in the humanities and social sciences. It was at City College that Randolph first learned about Socialist and Marxist theory.

Randolph also received an education in politics on the streets of New York. There he heard “soapbox” orators such as Eugene V. Debs and the black Socialist Hubert Harrison preach the gospel of Socialism. Motivated by their class analysis, Randolph became convinced that there were numerous benefits for working-class African-Americans in industrial unionism. After meeting Chandler Owen and acquainting him with Socialism, both men became members of the Socialist Party, arguing that racism was rooted in capitalist exploitation and that Socialism was the best means of liberating the black masses.

In 1917, Randolph and Owen started the first black Socialist journal in the country, the *Messenger*. A number of Harlem radicals wrote for the *Messenger*, including the Rev. George Frazier Miller, the pastor of an Episcopalian church in Brooklyn, New York; W. A. Domingo and Lovett Fort-Whiteman, who would later be two of the first people of African origins to join the American Communist Party; and the journalist George Schuyler. During the early part of its existence, the *Messenger* celebrated the Russian

Revolution, supported Socialist candidates for office, pushed for industrial unionism, and advocated a Socialist solution to the race problem in America. One of the most controversial issues addressed by the *Messenger* was World War I. But after 1919, the *Messenger* became anticommunist in tone, indicating Randolph’s opposition to forces outside of the country attempting to give direction to the Socialist movement and his opinion that Communists were responsible for the schism within the Socialist Party.

Randolph and Owen opposed the war and used the pages of their magazine to publicize their opposition. They pointed to the hypocrisy of a country that claimed it was fighting to make the world safe for democracy but would not do anything to end the racial terror on its own shores. Randolph and Owen were both arrested for speaking out against the war and charged with violating the Espionage Act.

The Brotherhood of Sleeping Car Porters

During World War I, Randolph created the Brotherhood of Labor, an agency whose mission, in large part, was to educate new black migrants to New York City on the social, economic, and political conditions of the city. Randolph organized a number of

trade unions. However, despite his efforts in creating unions, these organizations did not have a long life. Because of his lack of success in creating and maintaining for any significant amount of time a labor organization, by 1924 Randolph decided to give up on labor organizing and instead dedicate his full attention to his magazine. However, he would change his mind about labor organizing when in 1925 he was asked to help the Brotherhood of Sleeping Car Porters (BSCP) in their fight to win the right to collectively bargain with its employer, the Pullman Company.

The Pullman Palace Car Company was created by George Pullman in 1867. The luxurious sleeper train cars consisted of red carpet, wood ornaments, and silver-trimmed oil lamps. On each train, there was a buffet sleeping car, smoking room, chandelier, and other items to make readers feel like they were in a hotel on wheels. Of course, the most important components of Pullman's operations were the porters. Pullman recruited former slaves to perform the various services required on the train to make passengers comfortable. The services included accepting and discharging customers, taking care of luggage, making the beds, changing the linen, cleaning the cars, and waiting on passengers. Apparently, Pullman came to the conclusion that former slaves were the best people to perform these tasks because of their time spent in servitude. Hence, from the start of the Pullman's Company's incorporation, black men were relegated to the job of porter. By the 1920s, the Pullman Company was the largest employer of black men in the United States.

Porters were paid poorly, worked long hours, and were treated badly by management. In fact, a porter's monthly salary was less than a New York City factory worker's. The company expected blacks to be grateful, loyal, and obedient to their employer and management, and they were required to be polite to the passengers regardless of the circumstances. In fact, because they depended on tips to supplement their meager wages, porters dared not challenge rude and disrespectful customers. One of the worst aspects of the job was when porters were compelled into "dead-heading" and forced to "double out." Deadheading meant they had to work many hours a month without receiving wages for that time. Doubling out meant that when a porter returned from a long run, he could be ordered to go out on the next train without rest. These and other practices reduced the porters to menial servants. Although the first generation of porters did not express their displeasure about their working conditions, the more educated black men who replaced the former slaves were more willing to articulate their dissatisfaction with their treatment.

Randolph at first was reluctant to get involved in the Brotherhood's struggle to win recognition as the collective bargaining agency for Pullman porters, but after he investigated their grievances, he decided to help lead the campaign for recognition. Under his leadership, several chapters of the BSCP were organized, including New York, Chicago, St. Louis, Kansas City, Seattle, Omaha, Los Angeles, Washington DC, Denver, Boston, Buffalo, and Oakland. The fight to win recognition was a 12-year struggle between the union and the Pullman Company. The company employed a host of intimidating tactics including creating and using a spy network, firing workers, persuading religious leaders and many of the black middle class to publicly denounce the Brotherhood, and organizing a company union to undermine the Brotherhood's legitimacy. The union's membership, which had reached a high of nearly 7,000 in 1928, fell to around 770 by 1932.

However, Randolph and the organizers and members of the BSCP persevered. Randolph and the BSCP did not only turn to porters to win recognition but relied on support from community, labor, and civic organizations. In particular, Randolph requested and received support from many in the various black religious communities. A number of black pastors allowed Randolph to hold BSCP meetings in their churches. When he addressed meetings of porters, Randolph did not speak of Socialism but used the religious oratory with which many in the black community were acquainted.

Finally, in 1937, the union won recognition after the passage of an amendment to the Railway Labor Act in 1934 giving Pullman porters and dining car cooks and waiters the right to organize and collectively bargain. Eventually, the Railroad Mediation Board ordered an election for employee representatives for the porters, and the BSCP overwhelmingly won. By the summer of 1935, the Brotherhood began formal negotiations with the Pullman Company. But it should be noted that while it was because of the Emergency Railroad Transportation Act (ERTA) and the National Industrial Recovery Act (NIRA) that the BSCP eventually received recognition, the fact that Randolph and the members of the BSCP "stayed the course" and did not fold led to the union's victory. Moreover, the BSCP should be seen as more than a labor organization. Randolph and the leaders of the organization interpreted their struggle as a civil rights one. Throughout his public career, Randolph argued that civil rights must be linked to the rights of working people, and in numerous speeches and letters, Randolph contended that the battle for recognition was to win dignity and respect for black people.

The National Negro Congress and the March on Washington Movement

Randolph remained active in the fight for labor and civil rights. In 1935, the National Negro Congress (NNC) was formed to help foster greater collaboration among black political, religious, and civic organizations. Some of the country's most important black leaders were involved in the new organization such as Lester Granger of the Urban League; Adam Clayton Powell Jr. of Abyssinian Baptist Church in Harlem; Alain Locke, a professor of philosophy at Howard University; and Randolph. Randolph was offered and accepted the presidency of the new organization. However, shortly after he accepted the leadership of the NNC, he became involved in a battle with the American Communist Party. The Party was an early supporter of the NNC and had sent a number of delegates to its opening convention. Randolph, in his first presidential address, warned against Communist attempts to take over the organization. Nevertheless, the Communist Party USA (CPUSA) was a major financial contributor to the NNC. In its determination to see that the NNC survive, the Communist Party also provided personnel, who moved into key positions. Eventually, Randolph resigned as president, citing many issues, including the Communist Party's influence over the Congress.

When Nazi Germany began invading and occupying countries in Europe, American industries began contracting with the government to increase production of ships, tanks, guns, and other items for defense. Despite the urgent need for tens of thousands of skilled workers to help in the production of these items, war production companies refused to hire blacks. Moreover, the federal government refused to take steps to end the racial discriminatory actions of these industries. In fact, the administration publicly announced that it would continue to segregate blacks and whites who enlisted in the armed services. In response to the blatant discrimination on the part of industry and the government, Randolph launched the March on Washington Movement (MOWM), which helped organized thousands of people of African origins in the United States to march on the nation's capital in 1941, demanding that President Franklin Delano Roosevelt issue an executive order banning discrimination in the defense industry. The March on Washington Committee was organized and headed by Randolph and consisted of prominent black leaders such as Walter White of the NAACP and Lester Granger of the Urban League. Although Eleanor Roosevelt met with Randolph and White to convince them to call off the march, Randolph refused, insisting

that the president agree to ban discrimination in the defense industry. The threat of thousands of black people coming to Washington DC to protest convinced FDR to hold a meeting with Randolph and other march leaders in June 1941. Although the president attempted to convince Randolph to call off the march, he refused unless an executive order was issued. Eventually, FDR agreed, and his close ally, Mayor Fiorello La Guardia of New York, Randolph, and others associated with the White House worked out a compromise. The compromise was Executive Order 8802, which banned employment discrimination in the defense industry and the government. FDR also created a temporary Fair Employment Practice Committee to help ensure that defense manufacturers would not practice racial discrimination. Because of a major victory in forcing the government to take action against discrimination, the first time since Reconstruction, Randolph agreed to call off the march.

Banning Discrimination in the Armed Forces and the Second March on Washington

Randolph's confrontation with FDR would not be the last time he clashed with a U.S. president. He believed that President Harry S. Truman's 1947 call for a peacetime draft was an opportunity to demand an end to discrimination in the armed forces. The leader of the MOWM helped establish the League for Nonviolent Civil Disobedience Against Military Segregation. The group announced a campaign of civil disobedience to force the president to issue an executive order ending segregation in the military. Truman responded by calling a meeting of prominent black leaders, including Randolph; however, nothing was resolved at the meeting. Testifying before the Senate Armed Services Committee considering the draft bill, Randolph warned that if segregation was not ended in the armed services, blacks would refuse to serve. Under pressure from Randolph and other black leaders and fearing losing the black vote in a close election, Truman decided to issue Executive Order 9981 ending discrimination in the United States military.

Randolph's prominence as a civil rights leader faded by the time the modern civil rights movement emerged. New leaders and organizations such as Martin Luther King Jr., Fred Shuttlesworth, and Ralph Abernathy of the Southern Christian Leadership Conference; James Farmer and Bayard Rustin of the Congress of Racial Equality; and John Lewis and Diane Nash of the Student Nonviolent Coordinating Committee moved to the forefront in the fight for

racial justice. In addition, Malcolm X and the Nation of Islam gained a great deal of attention, condemning white racism and calling for the separation of races as the solution to the race problem in America. However, Randolph remained a respected figure in the civil rights community. In 1962, Randolph and Bayard Rustin suggested that a march on Washington for Jobs and Freedom be organized. They met with black leaders, and Randolph was selected as the national director of the march while Rustin was chosen as the march's organizer. Civil rights groups, labor unions, civic organizations, and prominent individuals endorsed the endeavor. President Kennedy met with march organizers and expressed fear that violence was going to erupt in the streets, thereby harming the chances of his proposed civil rights bill of passing in Congress. Randolph responded to the president's concern by pointing out to him that blacks were already in the streets and that it would be better for them to come under the influence of civil rights leaders. Thus, the civil rights leaders did not back down from Kennedy.

To ensure a positive tone from speakers of the event, Randolph convinced John Lewis, the head of the Student Nonviolent Coordinating Committee, to alter his speech, which called for a scorched-earth policy to win civil rights. Despite Kennedy's reluctance, on August 28, 1963, 250,000 people came to the nation's capital, making the March on Washington one of the most memorable events in modern American history.

In 1964, Randolph created the A. Philip Randolph Institute to strengthen the ties between labor and civil rights organizations. He contended that the civil rights movement needed the help of labor to help advance economic justice for African-Americans. In 1965, the institute created the A. Philip Randolph Educational Fund to help establish a forum where people could discuss strategies for providing programs for social justice. The Fund was a think tank for the civil rights movement. Due to ill health, Randolph retired from his position as president of the BSCP and vice president of the AFL-CIO executive council. A. Philip Randolph died on May 16, 1979, at the age of 89.

RETAIL, WHOLESALE, AND DEPARTMENT STORE UNION

Since its establishment in 1937, the Retail, Wholesale, and Department Store Union (RWDSU) was the primary Congress of Industrial Organizations (CIO) union organizing in the distributive industry. Unlike its American Federation of Labor (AFL) counterparts, it focused on department store, wholesale, and warehouse workers, as opposed to food store workers. The RWDSU formed from a split within the AFL's Retail Clerks International Protective Association (RCIPA). It was centered in major metropolitan areas in the United States and Canada, with its strongest locals in New York City. Many of those New York City locals had strong ties with the left and especially the Communist Party. These connections led to conflict within the RWDSU during the Second Red Scare of the late 1940s and early 1950s. Some scholars maintain that these conflicts hindered organized labor's ability to keep up with retail expansion in the suburbs following World War II. The RWDSU also spawned the National Health Care Workers Union, Local 1199, in the 1960s. In 1993, the RWDSU combined with the United Food and Commercial Workers, AFL-CIO, Central Labor Council (CLC).

The Founding of the Union

Two New York City locals of the RCIPA, Local 338 led by Samuel Wolchok and Local 1250 led by

Clarina Michelson, formed the center of what eventually became the RWDSU. Wolchok had a socialist background and was a noted anticommunist. In contrast, Local 1250's origins lay with the Office Worker's Union, supported by the Communist Party-backed Trade Union Unity League (TUUL). These locals, and others, were dissatisfied with the RCIPA's lack of militancy, lack of support for new organizing, and lack of democratic representation in the international. They viewed the RCIPA as failing to take a strong stand on key workplace issues, including the seasonality of employment, late closings, and unpaid overtime. In 1937, the dissenting locals formed the New Era Committee, which presented an opposition slate for RCIPA elections. When this action failed to bring about reform in the union, the New Era Committee applied for and received a charter with the CIO, forming the United Retail Employees of America (UREA). Shortly thereafter, Local 65, representing garment district wholesale and warehouse workers, joined as well. Wolchok served as president of the new union until 1948.

The CIO charter coincided with a wave of sit-down strikes at various retail and department store establishments in New York City, Philadelphia, Providence, and elsewhere. Key demands included union recognition, a 40-hour week, and minimum wage increases. In this context, the UREA administered the CIO's Department Store Organizing Committee (DSOC), originally led by Sidney Hillman. Local 1250 was instrumental in organizing other major New York City department stores, which were chartered as locals of the DSOC. Macy's nonselling staff became Local 1-S, Gimbels and Saks 34th Street were Local 2, Bloomingdale's was Local 3, and Stern's was Local 5. While the union had most of its success in New York City, it also organized major stores in Pittsburgh, Providence, Boston, and Chicago. St. Louis, Toledo, and Detroit also had significant membership in the wholesale, warehouse, and dairy sections. The DSOC was officially dissolved in 1940, and the UREA became the United Retail, Wholesale, and Department Store Employees of America (URWDSEA). After World War II, the name was shortened to the RWDSU.

World War II

During World War II, like most unions, the RWDSU abided by the no-strike pledge. However, the union also saw during this period significant conflict, including a series of strikes, against Montgomery Ward & Co. The union had the support of both the National Labor Relations Board (NLRB) and the War Labor

Board (WLB) in its disputes with Montgomery Ward. After a 13-day strike in 1944, President Franklin Roosevelt ordered Montgomery Ward to sign the contract proposed by the WLB. The company declined, so the United States Army took over the company's property and removed the company president. Despite the union's support from the government, the Montgomery Ward strikes divided the union on political grounds. Arthur Osman and 500 stewards from the very left-wing Local 65 publicly criticized the RWDSU leadership for allowing strikes to go forward in violation of the no-strike pledge.
