Iwasaki Yataro (ee-wah-sah-kee ya-tah-roh) was born on January 9, 1835, in Tosa Province on the island of Shikoku, Japan. His grandfather was of samurai stock, but he sold his samurai status to pay his debts. Iwasaki's father was a farmer who owned some land and had tenant farmers. His mother, the daughter and sister of doctors, was literate and took an interest in the education of her son, and Iwasaki was a good student.

At age nineteen, Iwasaki worked in Edo (later renamed Tokyo) for the Tosa clan, which had business interests throughout Japan. His work was interrupted when his father was injured by the village headman. When his father's case was denied a court hearing, Iwasaki accused the magistrate of corruption, resulting in a seven-month jail sentence. During his time in jail, he mastered the use of the *soroban* (abacus). Upon release, he taught school for a year, and in this job he met another teacher, Toyo Yoshida, who introduced him to the idea that trade and industry could open up Japan to the outside world. On February 1, 1862, Iwasaki married a woman named Kise, and the couple had nine children, five of whom reached adulthood.

First Ventures

Soon after Iwasaki married, Toyo Yoshida was murdered. Iwasaki believed the custom of avenging death was pointless, even though some of his colleagues thought him cowardly. For three years, Iwasaki could find only menial jobs before finally becoming a clerk at the Tosa Industry Promotion Agency. A superior noted the quality of his work and took him to Nagasaki to work in the Tosa government's trading office in 1867. Because Tosa was revolting against the shogun, it amassed a huge debt by buying arms. Iwasaki managed to borrow money from an American trading firm and refinanced Tosa's debt. He was transferred to Ōsaka, but his dealings there were short-lived: The shogunate was overthrown and businesses were privatized.

Iwasaki agreed to acquire Tosa's debts in return for three steamships, six sailboats, and exclusive rights to sell Tosa's lumber, tea, silk, and coal. After a year, he bought more ships and established passenger and freight transport service between Tokyo and Ōsaka and between Kobe and Shikoku. During this time of transition from the Japanese feudal districts to prefectures, he also successfully traded in provincial currencies, enabling him to buy back the family's samurai status.

After the Meiji Restoration of 1868 abolished feudalism, Iwasaki went to Ōsaka, where he leased trading rights for the Tsukumo Trading Company, which became the Mitsubishi Commercial Company in 1870 and Mitsubishi Shokai in 1873. Iwasaki became the manager of the now privatized company. The fact that he took on the debts of the Tosa Province, a region controlled by the samurai, was noted by foreign merchants, who developed confidence in Iwasaki's integrity.

In 1874, Mitsubishi moved its headquarters to Tokyo and became the Mitsubishi Steamship Company. When the Japanese government needed ships to provide transport to Formosa (now Taiwan) for a military invasion, foreign shipping companies declined to help, as did the Japan National Mail Steamship Company. Mitsubushi, however, won the favor and protection of the now desperate Meiji government by agreeing to supply the needed ships and services.

Mature Wealth

Iwasaki's ability to gain the favor of the Meiji government became a springboard to his success. He quickly began to diversify, acquiring more ships and expanding the services of his company's passenger and freight services. He secured another military contract within Japan to provide the ships necessary to squelch a rebellion in Kyūshū. Iwasaki founded the Mitsubishi Transportation Company and was awarded a generous annual subsidy from the Japanese government to carry mail and supplies. This support enabled him to invest in more ships and to establish a Shanghai-Yokohama line; this venture was successful enough to outstrip two large foreign competitors. Iwasaki realized that whatever he did would not be effective if he did not provide excellent service to his passengers. By undercutting his competitors' prices and by offering more courteous service, Iwasaki continued to prosper. In true Japanese tradition, he also made it a point to entertain dignitaries lavishly and to cultivate business contacts and establish networks, and his favors were reciprocated.

Iwasaki began expanding and diversifying his business holdings in the early years of the Meiji era. The government decided to adopt the Western concept of joint-stock companies. Under the guidance and instruction of the government, Iwasaki participated in the early transplantation phase, during which the Kawase Kaisha (exchange bank) and the Thusho Kaisha (trade company) were restructured along the lines of Western banks. These businesses would eventually develop into the Mitsubishi Bank and the Mitsubishi Warehouse and Transportation Company.

In 1871, acting as both a public administrator and a private entrepreneur who owned the Tsukumo Shokai company, Iwasaki leased two coal mines; when their owners were unable to pay for a ship they had purchased from him, the mines were turned over to Iwasaki in 1874 as partial restitution. In 1873, he also acquired the Yoshioka copper mine for 10,000 yen. This mine was especially profitable, partly because it used prison laborers. In later years, when the shipping companies were struggling, more than 90 percent of Mitsubishi's earnings would be generated by the mines and a new shipping company. Venturing into the educational field, Iwasaki founded the Mitsubishi Nautical School in 1875; it became the Tokyo Nautical School in 1882, and in 1949 it was renamed the University of Mercantile Marine, offering both undergraduate and graduate studies in various aspects of marine science and technology.

Iwasaki was also part of a group of entrepreneurs who founded the insurance company that would become the Tokyo Marine and Fire Insurance Company in 1879. The firm had the distinction of being the first non-life insurance company in Japan. In later years, it would also provide automobile insurance.

By 1881, Iwasaki's business friends and supporters had been ousted from the government by his detractors, who established a rival company, the Cooperative Transport Company (KUK in Japanese). Mitsubishi and KUK became involved in a price war in 1883, resulting in severe financial losses. Realizing that if the companies went bankrupt the coastal shipping business could well revert to foreign companies, the two firms began negotiations that would result in a merger. Just days later, however, Iwasaki died of stomach cancer when he was only fifty years old. As he lay dying, he expressed his regret at having achieved only one-third of his goals, and he asked his brother Iwasaki Yanosuke to take the helm at Mitsubishi until Hisaya, his eldest son, was ready to take on the responsibility of running the company.

ZAIBATSU

While Iwasaki Yataro did not live to see the ultimate fruits of his ambition, his name is inextricably associated with the Mitsubishi *zaibatsu*. The literal meaning of the word *zaibatsu* characterizes Iwasaki's vision: *zai* means wealth and *batsu* means a powerful person or family. Iwasaki named his enterprise Mitsubishi in 1873 and began to acquire a variety of businesses that would be mutually beneficial. His admonition to "worship the customers" sometimes rankled his samurai workers, who were unaccustomed to bowing to others, but Iwasaki told them not to think of this act as bowing to inferiors but rather as bowing to money, or to the customers who provide revenue. Following this principle, his business thrived, and by 1895, he had outstripped two of the old and respected giants of the day—Mitsui, which was established in 1673, and Sumitomo, founded in 1590. The annual incomes of the major *zaibatsu* in 1895 paled in comparison to the income of Mitsubishi, which was 1,084,000 yen. This figure was far larger than the incomes of rival companies, with Mitsui earning 529,000 yen, Sumitomo earning 156,000 yen, Yasuda earning 94,000 yen, Okura earning 65,000 yen, and Furukawa earning 62,000 yen.

When Iwasaki died in 1885, having just lost control of his shipping company, he was succeeded by his brother, Iwasaki Yanosuke, who rebuilt the organization around mining and shipbuilding, while also expanding into banking, insurance, and warehousing. One of his most important transactions was the purchase of eighty acres of swampy land next to the Imperial Palace in Tokyo (now Marunouchi) for about the equivalent of $1 million. By the early years of the twenty-first century, his investment was worth many billions of dollars.

In 1893, Iwasaki's son Hisaya, who was educated at the University of Pennsylvania, became president of Mitsubishi. He restructured the company and continued to diversify its holdings, as did his nephew Koyata, who took the helm in 1916 and played a major role in modernizing Japanese industry. The conglomerate eventually created three entities: Mitsubishi Bank, which after mergers became Japan's largest bank in 2004 with assets of more $700 billion; Mitsubishi Corporation, Japan's largest general trading company as of 2007, with about twenty-nine core companies and more than twenty related organizations; and Mitsubishi Heavy Industry, which includes Mitsubishi Motors, Japan's sixth-largest automobile manufacturer, with 1.3 million cars in 2007; Mitsubishi Atomic Industry; and Mitsubishi Chemical, Japan's largest chemical company.

LEGACY

Iwasaki Yataro developed the skills of attracting, developing, and working with prominent men. He broke with traditional Japanese business practices by not assuming that seniority was always a determinant of power and by not automatically assigning teams to perform work at his businesses. He also did not approve of having managers but felt that the sole authority and responsibility rested with the owner of a business. These practices, to Iwasaki, were "progressive" and "Western." Using these principles made it possible for him to start out as a poor samurai and become the head of the leading industry in Japan within fifteen years, outstripping two powerful conglomerates that were two centuries older than his own company.

Daniel Willis James

American mining and railroad company executive

James was the senior partner of the Phelps, Dodge mining company and a director of the Great Northern Railway, owning a major stake in both firms. With his extensive fortune, he became one of the nation's leading philanthropists, making major benefactions to the Children's Aid Society of New York and the Union Theological Seminary.

Born: April 15, 1832; Liverpool, England
Died: September 13, 1907; Bretton Woods, New Hampshire
Also known as: D. Willis James
Sources of wealth: Mining; railroads; investments
Bequeathal of wealth: Spouse; children; charity

Early Life

Daniel Willis James was born in Liverpool, England, in 1832, the eldest son of Daniel and Elizabeth Phelps James, both Americans. His father Daniel was a partner in the major American metals firm of Phelps, Dodge and Company, and his mother Elizabeth was the daughter of Anson Phelps, who headed the firm. With the Industrial Revolution transforming the American economy, Phelps, Dodge became a leading metals trading company. While attending boarding schools in England and Scotland, young James was being prepared to take a position in the Phelps firm.

First Ventures

In 1849, at the age of seventeen, James moved to New York to begin work at Phelps, Dodge. In 1854, he married Ellen Stebbins Curtiss. That same year, he became a junior partner in Phelps, Dodge, with a 5 percent interest in the firm; by 1859, his interest increased to 12 percent. James also began investing in the burgeoning railroad companies of the West and South, becoming a leading shareholder in the railroads that would eventually comprise the Great Northern Railway.

At this time, James also began his extensive philanthropic endeavors, which he would continue for his entire life. In 1863, James became a trustee of the Children's Aid Society of New York, which sought to place orphaned and destitute children with families rather than in institutions. In 1867, James became a director of the Presbyterian Union Theological Seminary in New York.

Mature Wealth

In 1873, James's ownership of Phelps, Dodge had grown to 18 percent. By 1878, he was the senior partner of the firm and helped take it in a new direction. The focus of Phelps, Dodge's business shifted from trading in metals to mining and manufacturing them. In 1881, the firm took operation of a copper mine in Arizona and was soon one of the leading producers of the coal, copper, iron, and steel necessary for the rapid growth of the railroads. Operating mines and factories throughout the Southwest and Mexico, Phelps, Dodge became one of the nation's industrial giants, able to compete with mining conglomerates like that of the Guggenheim family.

James also became a leading investor and director of the Great Northern Railway, one of the most aggressive railway lines in the nation. James J. Hill, known as the "Empire Builder," was the head of the railway, and James became one of Hill's strongest supporters. In 1882, James joined the Great Northern board of directors, bringing to the railroad the expertise he had acquired in iron and steel manufacturing and in finance at Phelps, Dodge. He served on the board until 1889. James persistently counseled moderation and consolidation to the bold-minded Hill, but in the end he always supported Hill's ventures. When Hill, a Protestant, was criticized for making a large donation to a Roman Catholic cemetery, James staunchly defended him, even though James was a leading benefactor of Protestant seminaries. In 1887, Hill named the town of Williston, North Dakota, for Daniel Willis James.

In 1901, Hill made his most aggressive move yet, forming the Northern Securities Company with J. P. Morgan, Edward H. Harriman, and John D. Rockefeller. Northern Securities was a holding company designed to gain control of the nation's major railroads. James was appointed to the company's first board of directors and made a vice president. When President Theodore Roosevelt launched a prosecution of the holding trust, Hill and James came to its vigorous defense. Nevertheless, in 1904 the U.S. Supreme Court found Northern Securities to be in violation of the Sherman Antitrust Act, a major political victory for the trust-busting Roosevelt.

With his mining and railway investments, James was one of the wealthiest men in America. He lived with his wife and son Arthur in a Manhattan mansion at 40 East Thirty-ninth Street. He increased his philanthropic work, donating continually to the Children's Aid Society over a forty-year period. He was a trustee of the society from 1863 to 1907 and its president from 1892 to 1901. In the 1880's, the society developed Coney Island as a fresh-air site for convalescing children. James donated $10,000 to build the Health Home at Coney Island for mothers of sick children. He also funded the James drinking fountain in New York's Union Square Park. He made several donations to the town of Madison, New Jersey, where he had a summer home. He financed construction of a park there in 1887, since named for him, and a free library in 1899; the Madison James Library, an outstanding example of Richardson Romanesque revival architecture, is on the National Register of Historic Places. James also became a trustee and benefactor of Amherst College, where his son Arthur was a student.

In addition, James served on the board of the Presbyterian Union Theological Seminary for more than forty years. In the last years of his life, he gave $2 million to the seminary to enable it to relocate near Columbia University in Manhattan's Morningside Heights neighborhood and to become a nondenominational institution. At the time it was the largest gift ever made to a school of theology.

James died of a heart attack in 1907 while vacationing at the Mount Washington Hotel in Bretton Woods, New Hampshire. His estate was appraised on March 28, 1908, at almost $27 million (approximately $3 billion in 2010). The estate consisted of about $14 million in shares of mining stock, about $9 million in Great Northern and other railway shares, about $2 million in shares of Phelps, Dodge, and about $1.5 million in New York real estate. His will left equal shares of $12.4 million to his widow and son and almost $1.2 million to various charitable and religious institutions. He was eulogized as the "merchant philanthropist" by *The New York Times* and other newspapers. In contrast, the muckraking journalist Gustavus Myers in his *History of Great American Fortunes* (1910) attacked James for building his fortune through "incessant frauds."

James's son, Arthur Curtiss James, expanded his inheritance into a $60 million fortune by 1918. At his death, he left the bulk of his estate to found the James Foundation. During the foundation's twenty-five-year

Children's Aid Society of New York

Daniel Willis James did not found any major philanthropic enterprise but he was critical to the success of many. Perhaps the charity to which he was most attached was the Children's Aid Society, founded by Charles Loring Brace in New York City in 1853. Brace was a progressive minister who believed that the institutional care then provided to orphans and abandoned children stunted their emotional and physical development. He believed that children benefited from a strong family connection, not from being institutionalized, a theory since embraced by modern practice. Brace organized an Orphan Train to transport New York's street and orphaned children to family farms across the United States. The Orphan Train movement is considered the forerunner of the modern foster care system and served more than 200,000 homeless children from 1853 to 1929. In the 1850's, the Children's Aid Society established the first free school lunch program in the United States, the first industrial schools for boys, and an educator-family collaborative program that was the forerunner of modern parent-teacher associations.

James was involved with the Children's Aid Society from 1863 until his death in 1907, and he was helpful to its success. He was a generous benefactor throughout the years, and his terms as trustee and president of the society no doubt attracted gifts from like-minded businessmen and philanthropists. James also founded the society's Health Home on Coney Island for mothers of sick children. After his death, his widow continued supporting the society, and in 1913 she donated $300,000 for a school in the Little Italy neighborhood of New York.

Over the course of the twentieth century, the Children's Aid Society continued to pioneer new efforts on behalf of children. It opened numerous schools with such innovative features as school nurses, free dental clinics, nutrition programs, day care nurseries, kindergartens, and teen counseling centers. It ran the first schools for disabled and convalescent children, established family homemaker services to assist ill mothers, and operated fresh-air camps for urban, ill, or special-needs children. The first Head Start classes were conducted in the society's centers in 1965. During the 1980's, the organization began offering services to children and homeless families in New York's welfare hotels. The society established its first community schools in 1992, providing a wide range of community and government services to its students.

In the twenty-first century, the Children's Aid Society remained one of the most important private child service agencies in the country. At any one time it served more than 150,000 children at more than forty-five sites in New York. It continued to offer comprehensive services in prenatal care, health and nutrition, adoption and foster care assistance, family education, recreational opportunities, housing assistance, and jobs and college preparatory training.

history, it is estimated to have granted more than $144 million to philanthropy.

Legacy

The career of Daniel Willis James reflects the great wealth and controversies created by the leading American industrialists of the late nineteenth century. Phelps, Dodge began as a mercantile trading firm, dependent on trade with Great Britain. With James's guidance, it transformed itself into an industrial powerhouse, mining and manufacturing copper and other metals. With his capital, James became a major financier of railroad growth, supporting Hill and other so-called robber barons in forming the largest railroad trust, broken up by President Theodore Roosevelt to the great enhancement of Roosevelt's reputation and popularity.

Whatever the sources of James's fortune, it cannot be denied that he was one of the great American philanthropists in the late nineteenth and early twentieth centuries. The Children's Aid Society and Union Theological Seminary in particular counted him as one of their major benefactors.

William Jardine

British trader and politician

Jardine amassed vast wealth in the China trade during the early nineteenth century, founding a company that would eventually become a major Hong Kong-based conglomerate. As a member of Parliament, Jardine successfully lobbied to involve Great Britain in the First Opium War (1839-1942) and to establish Hong Kong as a British colony.

Born: February 24, 1784; Lochmaben, Scotland
Died: February 27, 1843; London, England
Sources of wealth: Trade; narcotics trafficking
Bequeathal of wealth: Relatives

Early Life

William Jardine (JAHR-deen) was born in Lochmaben, Scotland, on February 24, 1784. Although his family was not wealthy, funds were available for Jardine to attend Edinburgh Medical School, from which he was graduated at the age of eighteen. Jardine impressed his instructors as a quick learner gifted with energy. These characteristics rendered the young Jardine highly suitable for employment in the British East India Company, and he began working there after acquiring his surgeon's certificate from the Royal College of Surgeons. Initially serving as a medical officer, Jardine soon took advantage of opportunities afforded by his employment with the world's premier trading firm. He leased cargo space aboard the company's ships for his initial forays into trade, and he quickly secured friendships with other energetic young men who were also keen to learn the business of trade and make their fortunes.

First Ventures

For the next fifteen years, Jardine remained in the employ of the British East India Company. During this time, he established friendships with the most able men throughout the company's tea, silk, and opium routes in Asia. His constant attention to the wisdom of more seasoned traders, along with his own ability to plan his business transactions, enabled Jardine to amass considerable wealth.

In 1817, Jardine resigned his position with the British East India Company in order to start his own business. His first venture was to form a trading partnership with two other men, Thomas Weeding and Framjee Cowasjee. Although Jardine, Weeding, and Cowasjee were partners in the firm, the success of their company depended heavily on the numerous contacts and trading agents with whom Jardine had formed alliances during his early career.

Mature Wealth

Jardine's phenomenal success in trade can be traced to two skills: First, Jardine's ability to keep his assets liquid permitted him to take advantage of opportunities that required substantial capital at the beginning of a venture. Second, Jardine's contacts and the boundless trust that they placed in him gave him access to the most important opportunities in the world of trade. Thus, Jardine was soon invited to join Hollingworth Magniac and James Matheson, two of the most formidable traders in China. In 1832, their firm was renamed Jardine Matheson & Company, and the company would be the foundation of Jardine's future success.

In 1836, Jardine and Matheson began to advance the idea that Hong Kong should be established as a British colony. Their company purchased land in Hong Kong and built offices there. When the China trade was threatened by Chinese isolationist policies in the late 1830's, Jardine realized that the survival of his company required his direct involvement in politics. In 1839, Jardine left China to convince the British to employ force against the Qing emperor in order to open trade, especially the importation of opium from India. British ships began hostilities with the Chinese in 1839 during the First Opium War.

Although Jardine's health failed rapidly in the last year of his life, he worked ably until his death to secure a profitable future for the company he had founded. In 1841, he was elected to the House of Commons, representing Ashburton in Devon. In 1842, only months before Jardine died, the Chinese signed the Treaty of Nanjing, ending the First Opium War with China, opening China trade, and making Hong Kong a British colony. The future of Jardine Matheson & Company was secure.

Legacy

William Jardine's foresight assured the success of his company. Childless, Jardine willed his shares in his company to his nephews, who became important members of the corporation. Jardine Matheson & Co. focused on diversifying its holdings. Increasingly, the company built infrastructure in Hong Kong and mainland China, becoming a leader in construction, engineering, and agriculture, as well as other fields.

In the twenty-first century, the Jardine Matheson Group is a large conglomerate with highly diversified companies, including such well-known interests as Astra International, an Indonesian-based company involved in the automotive, financial services, heavy equipment, mining and energy, agribusiness, and information technology businesses, and Mandarin Oriental, an international hotel investment and management group. Members of the Jardine family are still involved in various aspects of the company.

STEVE JOBS

American computer and media magnate

Jobs is one of the pioneers of the personal computer industry, cofounding Apple Computer, Inc., with Stephen Wozniak. He was also the principal owner of Pixar, a computer animation company, and after the Walt Disney Company acquired Pixar, he became the single largest stockholder in the Disney company.

Born: February 24, 1955; San Francisco, California
Also known as: Steven Paul Jobs
Sources of wealth: Computer industry; investments
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

After the biological parents of Steve Jobs gave him up for adoption, Paul and Clara Jobs of Mountain View, California, became his parents and named him Steven Paul. In 1967, his family moved to nearby Los Altos, where Jobs met Stephen Wozniak, who was five years older.

Jobs attended Cupertino Junior High School and Homestead High School in Cupertino, California. After graduating in 1972, he attended Reed College in Portland, Oregon. Although he dropped out of Reed after only one semester, he was allowed to audit classes there.

FIRST VENTURES

While he was still in high school, Jobs attended after-school lectures at the Hewlett-Packard Company in Palo Alto and worked there with Wozniak as a summer employee. In 1974, Jobs returned to California, where he attended meetings of the Homebrew Computer Club with Wozniak and became a technician at Atari, one of the first manufacturers of video games. After a trip to India, he returned to Atari, where, with Wozniak's help, Jobs worked on his most important project, a circuit board for the game Breakout.

Jobs and Wozniak started Apple Computer, Inc., in 1976. Their first product was the Apple I, a circuit board for home computers that they sold for $500 apiece. Apple I was designed for hobbyists, who were required to supply all the other parts for their home computers.

MATURE WEALTH

Jobs and Wozniak introduced the Apple II personal computer in 1977, and it became the first successful mass-market computer. In 1984, Jobs introduced the Macintosh, the first successful personal computer with a graphical user interface.

Jobs lost control of Apple in 1985 and sold all but one of his shares in the company by 1986. He used much of the proceeds to start another computer company, NeXT, Inc. This company's primary products, the Cube and the NeXTStation, were technologically advanced but never succeeded as business computers because they were too expensive. NeXT later became a computer software company.

In 1986, Jobs used his severance package from Apple to buy The Graphics Group (later Pixar) from film director George Lucas. Pixar, a computer animation company, contracted with the Walt Disney Company in 1991 to produce computer-animated feature films in return for financing and distribution from Disney. The first film produced by this partnership, *Toy Story* (1995), was both a

commercial and critical success. Over the next decade, Pixar produced *A Bug's Life* (1998), *Toy Story 2* (1999), *Monsters, Inc.* (2001), *Finding Nemo* (2003), *The Incredibles* (2004), and *Cars* (2006). All were hits. In 2006, Disney acquired Pixar, and Jobs became the Disney company's single largest shareholder with about 7 percent of the firm's stock.

Apple acquired NeXT in 1996, and Jobs became Apple's chief executive officer six months later. Apple adopted much of NeXT's software, especially NeXTSTEP, which became the Macintosh operating system. Under Jobs's leadership, Apple produced the iMac computer, introduced in 1998; the iPod, a portable device for storing and playing audiofiles, introduced in 2001; the iTunes media player software, also introduced in 2001; the iPhone cell phone, introduced in 2007; and the iPad, a thin, 9.7-inch, tablet-like computer, introduced in 2010.

LEGACY

Steve Jobs headed companies that revolutionized their industries by creating innovative new products. The Apple II, when combined with Visicalc, the first spreadsheet, was the first personal computer to become widely used in business, and when educational software became available, Apple II was the first personal computer to become widely used in education. The Macintosh was the first personal computer to use a graphical user interface, and the Macintosh combined with Aldus Pagemaker software to create the desktop publishing sector of personal computing. Pixar was the first computer animation company to produce feature-length films, and the iPod was the first portable device to store thousands of songs digitally. Although Apple did not invent the concept of downloading music from the Internet, by 2003 the iTunes Music Store was responsible for 70 percent of legal music downloads. *Fortune* magazine selected iTunes as the product of the year in 2003. In 2007, *Fortune* named Jobs the most powerful person in business and two years later named him the chief executive officer of the decade.

John of Gaunt

English aristocrat, military leader, and landholder

Born into the English royal family, John of Gaunt gained vast expanses of land by marrying a duke's daughter and eventually inheriting her father's property. Thus, by birth and marriage, he became the richest Western European who was not a monarch.

Born: March, 1340; Gaunt, Flanders (now Ghent, Belgium)
Died: February 3, 1399; London, England
Also known as: Duke of Lancaster; Earl of Richmond; Earl of Derby; Earl of Lincoln; Earl of Leicester; Duke of Aquitaine
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Spouse; children; government; church

Early Life

A younger son of King Edward III of England and his wife, Philippa of Hainault, John of Gaunt (gawnt) was born in the Flemish city of Gaunt in March, 1340, and moved to England with his mother that November. After his early childhood, he came under the guidance of his beloved older brother, Edward, the Black Prince, who probably trained him in knighthood. Gaunt took part in a military campaign in France as early as 1352.

First Ventures

The most significant financial event in Gaunt's life, besides his birth to a king and queen, was his marriage in May, 1359, to Blanche, a daughter of Henry of Grosmont, the first duke of Lancaster. With her married sister Maud, Blanche was the coheir of her father's enormous English estates, the majority of which were located in the north of the country. In the fall of 1359, Gaunt was in France because his father, a member of the French-speaking house of Plantagenet, continued to assert a claim to the French throne, and it was probably at this time that Gaunt first led troops in battle. His father-in-law died in 1361, and through Blanche, Gaunt obtained the earldoms of Lancaster, Derby, and Lincoln. In April, 1362, Maud died childless, and Gaunt, as Blanche's husband, inherited Maud's portion of his father-in-law's property. Seven months later, King Edward installed Gaunt as the new duke of Lancaster.

Mature Wealth

Gaunt continued to manage property and wage war. He used a hierarchy of assistants to help him manage his landholdings, and some of these employees kept detailed records of his income and expenses. His annual income from various sources, including rents and taxes, was enormous, and at one time was as high as £7,000. Gaunt's expenses, however, were also enormous. He paid wages to numerous servants and, in accord with custom, entertained lavishly. He also spent huge sums as a wartime commander. Although the Crown pledged to send him money from collected taxes, reimbursements were usually slow, and he often had little cash.

In 1368, Blanche died, ending a happy marriage. Three years later, Gaunt wed Constance, a daughter of the deposed and murdered king of Castile. Through her, Gaunt claimed to be the Castilian king, thus increasing his unpopularity among many English commoners, who objected to his adultery with Katherine Swynford during his marriage to Constance and thought he epitomized aristocratic oppression.

During the Peasants' Revolt of 1381, a mob destroyed Gaunt's palace just outside London and would likely have killed him had he been there. Later in the 1380's, Gaunt tried but failed to take possession of Castile. However, he arranged for Catalina, his daughter by his marriage to Constance, to marry King Henry III of Castile, and he received a monetary settlement. In 1390, King Richard II, Gaunt's nephew and the son of Edward, the Black Prince, named Gaunt the duke of Aquitaine. In 1396, two years after Constance's death, Gaunt married his longtime lover, Katherine Swynford, in the hope of having their children retroactively legitimized. Gaunt died on February 3, 1399.

Legacy

Through his will, Gaunt left bequests to King Richard II and the Church and provided amply for his widow and children. The largest beneficiary was Henry Bolingbroke, Gaunt's oldest son, who inherited the dukedom of Lancaster and three earldoms. In 1398, King Richard had exiled Bolingbroke for six years. Two days after Gaunt's burial, Richard declared Bolingbroke's exile lifelong and seized his estates. Bolingbroke responded by leading retainers from France to England, where they landed in July, 1399, and soon, having gained support, overwhelmed Richard's force. Capturing Richard (and eventually, it seems, having him murdered), Bolingbroke declared himself King Henry IV. Thus, Gaunt, who during his life was a powerful nobleman, a protector of the proto-Protestant John Wyclif, and a patron of the poet Geoffrey Chaucer, became a king's father after his death. Since 1399, every English monarch, through one line or another, has been a descendant of John of Gaunt.

John H. Johnson

American publisher and businessman

Johnson turned a $500 loan into a $300 million fortune, eventually becoming one of the most successful African American businesspeople and one of the wealthiest people in the United States. His business ventures created new opportunities for African Americans and helped establish a more positive image of black people.

Born: January 19, 1918; Arkansas City, Arkansas
Died: August 8, 2005; Chicago, Illinois
Also known as: John Harold Johnson
Sources of wealth: Media; manufacturing
Bequeathal of wealth: Spouse; children; charity

Early Life

John Harold Johnson, the son of Leroy and Gertrude Johnson, was born in rural Arkansas City, Arkansas, in 1918, a third-generation descendant of slaves. His father died in a sawmill accident when Johnson was six years old. His mother, who later married James Williams, worked as a washerwoman and a cook for the laborers in the levee camps along the Mississippi River. After finishing eighth grade at Arkansas City Colored School, Johnson chose to repeat it because there was no high school for African Americans in his community. In 1933, his mother decided to join the migration of southern blacks to the North, hoping for a better life during the Great Depression. The family settled in Chicago and found themselves dependent on welfare for two years. His mother subsequently worked in a New Deal public works program, and Johnson found a part-time job in the National Youth Administration.

First Ventures

Johnson attended Du Sable High School, where he made the honor roll and served as student council president and editor of the school newspaper and the class yearbook. Graduating in 1936, he was offered a scholarship that would pay his tuition to attend the University of Chicago. He was invited to speak at an Urban League dinner, where he met Harry H. Pace, the president of the Supreme Life Insurance Company. Pace offered Johnson a job that would pay his living expenses, and Johnson accepted. Johnson worked as a part-time office boy for the *Guardian*, the company's in-house newsletter. Within two years he became the newsletter's editor. One of his duties was to look for newspaper articles concerning issues of interest to the black community and report what he found to Pace. It was this job at the large African American-owned business that gave Johnson the dream of starting some kind of publishing business.

Johnson attended college part time, but after a while he decided to discontinue his studies. In 1941, he married Eunice Walker. Having no children of their own, they later adopted two children: a son, who died of sickle cell anemia at the age of twenty-five, and a daughter named Linda. Johnson finally came up with the idea of publishing a magazine called *Negro Digest* patterned on the *Reader's Digest*. When none of the banks would lend him money, his mother let him use her furniture as collateral. As a result, the Citizens Loan Corporation agreed to lend him $500. With this seed money to buy postage and with Pace's permission to use the Supreme Life mailing list, Johnson asked twenty thousand insurance policyholders for $2 each to subscribe to what was still a nonexistent magazine. After three thousand people subscribed,

The Johnson Publishing Company

Johnson Publishing Company was created by John H. Johnson with the launch of his first magazine, *Negro Digest*, in 1942. This publication had been discontinued by the twenty-first century, but some of the company's other magazines continued to exist, notably *Ebony* and *Jet*. Started in 1945, *Ebony* was a monthly publication about African American life and achievements presented in both words and photographs. Its first press run of twenty-five hundred issues sold out within hours, and another twenty-five hundred copies had to be immediately printed in order to meet public demand.

While *Ebony* had a healthy circulation, it suffered from lack of advertising. Many black-oriented magazines that were founded before *Ebony* had quickly failed because they lacked revenue from both subscriptions and advertising. Together with William P. Grayson, who had sold advertising for the *Baltimore Afro-American*, a black newspaper, Johnson managed to secure advertising accounts with major corporations, such as General Motors, Chrysler Corporation, and Sears, Roebuck and Company. The advertisements in *Ebony* featured black models in order to appeal to African American customers. In 1964, *Ebony* grossed $5.5 million in advertising revenue. *Ebony*'s success led other American businesses to realize the importance of the multimillion-dollar African American consumer market, which has grown from about $15 billion during the 1960's to $773 billion in 2010. In another effort to improve *Ebony*, Johnson hired administrative staff, as well as journalists and photographers, from other black periodicals. The magazine's press run gradually grew from twenty-five hundred to more than two million, and its readership grew from 125,000 to more than 9 million per issue.

In 1951, Johnson started publishing *Jet*, which remains the country's only news-oriented weekly for black Americans. In its early years, the magazine aimed at covering world and domestic events that affected African Americans. Like *Ebony*, its first issue was an instant success, and it quickly sold 300,000 copies a week. *Jet* evolved into a general interest magazine, with black entertainers featured on its cover and plenty of celebrity gossip within. When Johnson died in 2005, *Jet* had a circulation of almost one million and more than nine million weekly readers.

---

the first issue of *Negro Digest* was published in June, 1942.

Johnson's office was located in a room in the private law office of Earl B. Dickerson on the second floor of the Supreme Life building. Since his magazine was unknown, he turned to his friends and fellow workers for help. They went to newsstands on Chicago's South Side and kept asking for the magazine, convincing distributors to take on *Negro Digest*. When the magazines appeared at the newsstands, Johnson's friends and colleagues returned and bought all of the issues with Johnson's money, thus creating another cycle of supply and demand. Johnson repeated this scheme in other cities, such as Detroit, New York, and Philadelphia. Articles in *Negro Digest* were concerned with racial issues and provided aspiring African American writers the chance to contribute and be published. Later on, the magazine published a series of articles, "If I Were a Negro," written by whites. After First Lady Eleanor Roosevelt contributed to the series, *Negro Digest*'s circulation rose to 50,000 a month, eventually reaching a maximum of more than 100,000.

Mature Wealth

After founding *Negro Digest*, Johnson published a number of other magazines during the following decade. *Ebony*, founded in 1945, and *Jet*, first published in 1951, continued to be widely read into the twenty-first century, but some of his other magazines—*Hue*, *Copper*, *Tan*, *Ebony Africa*, and *Ebony Jr.*—enjoyed only temporary success and were eventually discontinued. *Negro Digest*, which became *Black World*, was also discontinued when its circulation declined to fifteen thousand a month. In 1985, Johnson founded *Ebony Man*, or *EM*, which covers men's fashions, grooming, and fitness. Johnson published not only magazines but also books by African American authors. His company's first book was published in 1963, and he eventually issued more than forty titles in various genres. His autobiography, *Succeeding Against the Odds*, published in 1989, was a best seller.

In addition to *Ebony* and *Jet*, two other important products helped contribute to Johnson's wealth—the Fashion Fair shows and Fashion Fair Cosmetics. Fashion Fair, which for many years was directed by his wife Eunice Johnson, is considered the world's largest traveling fashion show and continued to be staged into the twenty-first century. Johnson produced his first fashion show in 1956, when he was asked to sponsor a mini-fashion show fund-raiser for a New Orleans hospital. He created Fashion Fair two years later, and the fashion shows eventually traveled to almost two hundred cities every year, with more than four thousand shows presented in the United States, the Caribbean, Jamaica, and

London. The show attracts hundreds of thousands of people every year.

Fashion Fair Cosmetics originated because there was a need for makeup for the dark-skinned models who participated in Fashion Fair. Since such companies as Revlon and Estée Lauder were not interested in manufacturing makeup for women of color, Johnson turned to a private laboratory that created the first chemical formulas for the models. To sell his cosmetics to the public, Johnson promptly produced a mail-order package called the Capsule Collection in 1969. Fashion Fair Cosmetics was established four years later and remained the world leader in makeup and skin care products for women of color. In 2010, the firm's products were sold in fifteen hundred stores in the United States, Canada, France, the Caribbean, and other countries. Johnson also launched Supreme Beauty Products, two hair care products for men called Duke and one for women named Raven.

Johnson increased his wealth by investing in the communications business. He acquired three radio stations: WJPC-AM in Chicago, Illinois, in 1972; WLOU-AM in Louisville, Kentucky, in 1982; and WLNR-FM in Lansing, Illinois, in 1985. His radio broadcasting company, Johnson Communications, had estimated annual sales of $1.6 million. Johnson also was a major shareholder in *Essence*, a magazine for African American women. In 1974, he acquired a majority interest in Supreme Life Insurance and later became chairman and chief executive officer of the company.

Thanks to his prosperous businesses, Johnson was able to buy an office building on Michigan Avenue, a prestigious location in Chicago, becoming the first black businessman to be located in the city's "loop." After forty years in business, Johnson became the first African American to appear on the *Forbes* magazine Rich List in 1982, with his fortune estimated at about $500 million. He never disclosed his personal holdings, but he was estimated to have about $150 million in 1990. Some trappings of his wealth included a Rolls-Royce; a mountaintop home in Palm Springs, California; and a condominium on Chicago's Lake Shore Drive. Johnson was the recipient of numerous awards and honors, and he held a number of positions in civic and business organizations. Besides being inducted into several halls of fame, he received the Medal of Freedom Award for giving black Americans a voice through his publications. In 2003, he donated $4 million to Howard University, which named its school of communications after him. Since their founding, his Fashion Fair shows have provided more than $50 million worth of scholarships for African American students.

Johnson died in 2005 of congestive heart failure at the age of eighty-seven. He was survived by his wife Eunice Johnson, who died in 2010, and his daughter Linda Johnson Rice, who serves as chair and chief executive officer of Johnson Publishing, which remained a family-owned business.

Legacy

John H. Johnson's life was truly a rags-to-riches story. He had the courage to dream and the intelligence to accept the opportunities that made his dream come true in the face of segregation and racism. With creativity, determination, and business savvy, he developed a leading black-owned publishing company and other successful businesses, all of which were privately held, family-owned, and family-operated. He blazed the trail for other black-oriented magazines, such as *Black Enterprise*, *Essence*, and *Emerge*. He also played a key role in launching and promoting the careers of a large number of African American professionals in publishing and advertising. By showcasing black culture in a positive light through *Jet* and *Ebony*, he created a legacy that celebrated the achievement and beauty of African Americans.

Robert L. Johnson

American media and entertainment mogul

Johnson's entrepreneurial success earned him the distinction of being the first African American billionaire, making him a model for other black Americans and demonstrating the opportunities for success that are open to African Americans.

Born: April 8, 1946; Hickory, Mississippi
Also known as: Robert Louis Johnson
Sources of wealth: Media; entertainment industry
Bequeathal of wealth: Unknown

Early Life

Robert Louis Johnson was born on April 8, 1946, in Hickory, Mississippi, to Edna and Archie Johnson. There were ten children in the family, and he was the ninth. Shortly after his birth, Johnson's family moved to Freeport, Illinois. He graduated from Freeport High School in 1964. Johnson was the only child in his family who attended college. He studied history and political science at the University of Illinois and received a B.A. degree in 1968. In 1969, he married Sheila Crump, whom he had met while studying at the University of Illinois. He attended graduate school at Princeton University and received an M.A. in public affairs in 1972. After completing his education, he moved to Washington, D.C.

First Ventures

Johnson began his career by working for the Corporation for Public Broadcasting and the National Urban League. In 1973, he became press secretary to Congressman Walter Fauntroy, who was the first representative from the District of Columbia. In 1976, Johnson accepted a position with the National Cable Television Association, becoming a lobbyist for the cable television industry. He soon realized that the industry lacked programming for the African American audience. While continuing to work as a lobbyist for the next three years, he began developing a business plan aimed at providing cable programming for African Americans. Through his work as a lobbyist, he met an individual who was trying to establish a cable network that targeted elderly viewers. Johnson became convinced that a specialized cable network for African Americans had enormous possibilities as a business venture. In order to finance his project, he obtained a bank loan of $15,000.

In 1980, he founded Black Entertainment Television (BET) with his wife, Sheila Crump Johnson. Using cable television slots loaned to him by Bob Rosecrans, the president of UA-Columbia Cable Vision, Johnson broadcast his first program on January 8, 1980. At first, the single cable network aired only two hours of music videos every day. Johnson realized that for his cable network to be successful he would need to invest $500,000 in his company. He obtained additional funding from his friend John Malone, who at the time was the chief executive officer of Tele-Communications, Inc. Malone invested $180,000 in BET and loaned Johnson $320,000. Johnson retained control of BET and followed a business plan based on keeping operating expenses as low as was reasonably possible while continually expanding the company. By 1985, his cable network was a profitable business. BET provided twenty-four-hour programming aimed specifically at African American households. By 1991, the company was so successful that it became the first African American-owned company to be listed on the New York Stock Exchange, with Johnson offering stock in his company to the public.

Mature Wealth

In 1996, BET became the first African American-controlled network airing films. In 1998, Johnson bought back all of the publicly traded BET stock at a premium, and the company returned to private ownership under the name BET Holdings, Inc. From the small cable company broadcasting two hours of music videos per day, BET had grown to an enterprise with five major cable channels and an audience consisting of 90 percent of all of the African American households in the United States. In 2001, Johnson sold BET Holdings to Viacom, an entertainment corporation, for $3 billion in stock; he remained chief executive officer and chairman of BET Holdings, the parent company of BET. Johnson divided the $3 billion worth of stock equally with his then-wife and business partner Sheila Crump Johnson. The sale of BET made them the first African American billionaires.

During the time that Johnson owned BET Holdings, he had already begun to diversify his business activities by acquiring a significant interest in the publishing firm Vanguard Media. After the sale of BET, Johnson continued to expand his involvement in a wide variety of businesses by founding RLJ Companies, an umbrella group investing in media, entertainment, sports, real estate, the hotel industry, and gaming, as well as in retail automobile dealerships, banking, and private equity. Still acutely aware of the economic opportunities available in underserved and underappreciated markets, Johnson targeted the African American market in his various business ventures. RLJ Companies holds major interests in several companies, including Urban Trust Bank, RLJ Development, RLJ Equity Partners, Caribbean CAGE LLC, and Our Stories Films. In 2009, *Black Enterprise Magazine* cited Urban Trust Bank, which has branches in Washington, D.C., and Florida, as the fastest-growing African American-controlled bank in the United States. RLJ Development, a real estate investment company, has significant investments in 124 hotels located in major North American markets.

One of Johnson's most successful companies is Caribbean CAGE LLC, his gaming and lottery company, headquartered in St. Thomas, Virgin Islands. The company installs, manages, and operates video lottery terminals in the Caribbean and Latin America and is also involved in online lotteries. In an effort to increase its video lottery terminal business, Caribbean CAGE is affiliated with Hard Rock International, Inc., which is owned by the Seminole tribes of Florida. In July, 2009, the firm invested in the Hard Rock Café to be built at the Aqueduct Race Track in New York; four months later, Hard Rock became an investor in Caribbean CAGE.

Johnson further internationalized his business ventures with the establishment of RLJ Kendeja Resorts and Villas. This company owns a four-star hotel near

Black Entertainment Television

Robert L. Johnson acquired his initial wealth from the creation of Black Entertainment Television (BET), which targeted African American viewers. Johnson believed there was a market for a cable television channel that addressed the African American community as a specific group. Borrowing funds and convincing individuals to invest in his proposed business, he established a cable television entertainment network that produced the financial means for him to become a highly successful entrepreneur. By reinvesting his money in various business ventures, he became the first African American billionaire.

The founding of BET also created an entertainment venue specifically for the African American community. From its initial two-hour broadcast of music videos, the network expanded to provide twenty-four-hour programming, offering a range of music videos, films, situation comedies, fashion shows, talk shows, news coverage, and history programs. Since the establishment of the BET Awards in 2001, BET has recognized the achievements of African Americans and members of other minorities for their accomplishments in various entertainment fields, especially in music, acting, and sports. The awards program is broadcast on the BET channel.

Johnson expanded his African American-oriented entertainment business in 2006 with the creation of Our Stories Films. This company produces films of special interest to African American families. Each film has a production budget of between $5 and $7 million. Our Stories Films not only provides entertainment to the African American public but also creates an opportunity for African Americans to work both before the camera and behind the scenes in the entertainment field, which has become an area of both artistic and financial success for many African Americans.

Johnson's wealth has enabled him to provide entertainment beyond the confines of the African American community. In 2003, he purchased a professional basketball team, the Charlotte Bobcats, and the following year he created a cable television network providing sports coverage and entertainment programming to the Charlotte, North Carolina, area.

While Johnson's entry into the cable television market was based on his desire to achieve financial success, he has always been concerned with opportunities for the African American community, both as a market to be served and as a group seeking personal and financial success. His wealth has enabled him to respond to these concerns by creating venues for African American employees, as well as black consumers.

Monrovia, Liberia. This seventy-eight-room hotel situated on the Atlantic coast provides accommodations to both tourists and business travelers and is the first such hotel to be built in West Africa.

From his first venture with BET, Johnson has been involved with the entertainment business, and he has diversified his business to include a range of entertainment-related enterprises. In the 1990's, he became interested in sports and wanted to own a National Basketball Association (NBA) franchise. In 2003, he was able to purchase the Charlotte Bobcats, an NBA team that made its debut in the 2004-2005 season. In 2004, Johnson also began operating a regional cable sports and entertainment channel, the Carolina Sports Entertainment Network, or C-SET. In 2006, former basketball player Michael Jordan joined the Charlotte Bobcats as a part owner and manager of the team. On March 17, 2010, the NBA approved Jordan's offer to pay $275 million in order to own 80 percent of Bobcats Sports and Entertainment. Jordan's purchase price was less than the $300 million that Johnson had paid for the team, and by some estimates Johnson may have lost as much as $100 million on the basketball franchise.

In 2006, Johnson entered another area of the entertainment business. In partnership with film producers Harvey and Bob Weinstein, he founded Our Stories Films, the first film production studio with a majority African American ownership. The company targets the African American family market and produces family-oriented and urban comedy films. The company also provides jobs for African Americans in all areas of the film industry, from writing scripts and acting to technical production and a wide variety of support positions.

Legacy

Robert L. Johnson has made an important contribution to the African American community and to the larger American society through his own achievements and through the opportunities he has provided to other black Americans. His success in overcoming racial, social, and economic obstacles to become the first African American billionaire demonstrates what an individual can achieve through effort and perseverance. By targeting the black audience in his various entertainment-related businesses, he has demonstrated the significance of black culture and the economic importance of African American consumers. By providing employment opportunities for African Americans in his various companies, he has enabled black people to make a contribution to the entertainment industry and to attain their own wealth.

Early Life

Robert Wood Johnson II was the oldest of three children born to wealthy entrepreneur and druggist Robert Wood Johnson and wife Evangeline Armstrong Johnson. Young Robert was partially reared by a governess, and he attended the Episcopal Church with his mother and siblings, including an older stepsister. He and his father spent many hours together, going to business meetings at his father's company, Johnson & Johnson, and on hunting trips. By age six, Johnson wore a tuxedo to social functions with his father. Johnson was encouraged to be a role model for his siblings. He was a serious young boy and quick learner, attending Rutgers Preparatory School when he was five years old. At age sixteen, his life changed dramatically when his father died from complications of Bright's disease.

First Ventures

While in high school, Johnson visited his father's factories and offices in New Brunswick, New Jersey, studying the family business. Johnson's father and uncle founded Johnson & Johnson in 1886 to sell sterile sutures, dressings, and bandages to treat patients' wounds. In the summer, Johnson worked at the company factory, now managed by his uncle James Johnson. Rather than go to college, Johnson decided to join the company, though his mother objected. He agreed to compromise by attending school and working part-time but soon the work hours became dominant. Johnson started in the company's lowest job and worked his way up. On his twenty-first birthday, he was elected to the Johnson & Johnson board of directors, and the following year he was promoted to a supervisory role in the factory. In 1918, Johnson agreed to serve on the bureau council for Highland Park, New Jersey, and two years later he was the town's mayor.

Mature Wealth

As stipulated by his father's will, Johnson became a major shareholder in Johnson & Johnson at age twenty-five. When his Uncle James became president of the company in 1910, its sales revenue was almost $3.9 million. By 1920, that figure increased to almost $15.2 million.

The Robert Wood Johnson Foundation

Robert Wood Johnson II was a generous philanthropist. On Christmas Day, 1936, he established the New Brunswick Foundation with twelve thousand shares of stock in his company, Johnson & Johnson. The foundation initially assisted people in New Brunswick, New Jersey, during the Great Depression. In its early years, Johnson was the organization's president and its only contributor. With his interest in health care, Johnson mobilized the foundation to provide noninterest loans for young men in New Brunswick who wanted to become physicians. Not long after it was founded, Johnson provided $1.2 billion to the renamed Robert Wood Johnson Foundation (RWJF). He later bequeathed his shares of his company's stock, valued at $300 million, to the foundation, and by the time his will was out of probate, the value of these shares had soared to $1.2 billion.

By the twenty-first century, RWJF, based in Princeton, New Jersey, was the largest philanthropic enterprise dedicated to the betterment of health care in America. Its Web site states that it seeks to improve "both the health of everyone in America and their health care" by focusing on the way health care is delivered, paid for, and "how well it does for patients and their families." In accordance with its founder's vision of public service, the foundation describes itself as "stewards of private funds that must be used in the public's interest," adding that its "greatest asset isn't our endowment; it's the way we help create leverage for change."

RWJF makes grants available to individuals and organizations working in seven program areas. One area, described as "building human capital," seeks to attain a "diverse, well-trained" health and health care leadership and workforce "to meet the needs of all Americans." Efforts to alleviate childhood obesity, expand and improve health care coverage, create innovative ideas and projects that may lead to breakthroughs in health care, and improve the performance of public health services are also the focus of its grants, as are efforts to provide a higher quality of health care and to meet the emerging health needs of communities. In 2008, RWJF provided almost $523.3 million to finance one thousand grants and contracts in these program areas.

The foundation is particularly interested in health care reform, seeking to expand coverage, improve the quality of care, reduce costs, and emphasize prevention. In its 2008 annual report, physician Risa Lavizzo-Mourey, the foundation's president and chief executive officer, presented a Blueprint for Change, describing twelve symptoms of the ailing American health care system. The foundation's principles for health care coverage include affordable coverage for all Americans; appropriate and effective services to provide essential care; high-quality and cost-effective care; continuous care through the human life cycle; portable care that will enable Americans to retain coverage when they transfer to another job or move to a new geographic location; and a shared responsibility for coverage among the public sector, private industry, and individuals in the United States. RWJF does not suggest how lawmakers should act upon these principles. Instead, it sees its role as uncovering critical issues, such as health care coverage, and making sure these issues reach the political agenda, so the government and RWJF can move forward in national discussions for the good of the American people.

Johnson & Johnson continued to experience growth in its products and revenue. World War I brought additional business opportunities, with the company supplying bandage supplies to the American and Allied armed forces and to civilian hospitals. During the war years, the firm's factory operated seven days a week in order to keep up with the demand for gauze, bandages, and adhesive plaster, and new products were produced to treat war wounds and minimize infection. In 1918, a worldwide flu epidemic struck the United States, killing up to 675,000 Americans. In response, Johnson & Johnson manufactured gauze masks to minimize the spread of the deadly virus.

After James Johnson became ill with leukemia, Robert moved to gain control of Johnson & Johnson's common stock. The company continued to release new products to the market, such as toothpaste in collapsible metal tubes, baby cream, baby powder, and Band-Aid bandages. Johnson & Johnson aligned with drugstores in order to sell company products to consumers. Johnson dedicated more of his time to marketing and sales, and eventually he began marketing company products worldwide. In February, 1927, Johnson was elected to the company's board of directors. The company was careful not to overproduce its products, which helped it remain solvent during the Great Depression. While employees at many other companies lost their jobs, Johnson & Johnson was able to maintain its workforce during the economic crisis.

When James Johnson died in October, 1932, Robert took over as president and general manager of Johnson & Johnson. Johnson decentralized corporate management, allowing company divisions to exercise autonomy, and the firm changed its name to the Johnson & Johnson

Family of Companies. Johnson also declared that businesses had a moral obligation to serve society.

He sought to obtain higher wages and to reduce work hours for his employees at a time when many workers were underpaid and overworked. He warned that the only way to correct the economy was to put people back to work, which he maintained was more effective than government welfare programs. His philosophy of corporate social responsibility distanced Johnson from many other industrial executives. In May, 1938, Johnson assumed the chairmanship of Johnson & Johnson's management board. By then, company sales had risen from $11 million to $700 million under Johnson's leadership.

After the Japanese attack on Pearl Harbor in December, 1941, Johnson accepted a proposal from the New Jersey governor to assist the state's war rationing program for civilians. During World II, he was a brigadier general in charge of the New York Ordnance District, and he continued to be called "the General" for the rest of his life. Johnson resigned from the ordnance district after President Franklin D. Roosevelt named him the vice chairman of the War Production Board and the chairman of the Smaller War Plants Corporation.

By nature, Johnson was a generous man, known for making a lot of money and giving large sums of money away to good causes. Johnson & Johnson remained lucrative, diversifying into new product lines, such as personal care, surgical packs, and baby care. In 1936, Johnson gave twelve thousand shares of the privately owned Johnson & Johnson stock to establish the New Brunswick Foundation. A short while later, he gave $1.2 billion from his personal estate to this organization, renamed the Robert Wood Johnson Foundation (RWJF).

Johnson was a man of great stamina and energy. However, when he noticed he tired more easily and sometimes had pain in his shoulder blade, he went to Roosevelt Hospital in New York for a checkup. An X ray revealed a tumor in his left lung that was inoperable. He was treated with antitubercular drugs but did not improve. He then started a five-week course of radiation therapy for his cancer. He died on January 30, 1968, at the age of seventy-four.

The executor of his estate found a U.S. Treasury bond for $1 million in Johnson's safe-deposit box that was used to pay inheritance taxes, which obviated the need to sell Johnson's stock in Johnson & Johnson. Johnson had willed his stock, valued at $300 million, to RWJF, and the remainder of his estate went to his wife Evie and his children. By the time his will was out of probate, the value of the stock had grown to almost $1.2 billion.

Legacy

Robert Wood Johnson II came from wealth that his father had earned through hard work and ingenuity. Johnson spent his entire career working in the family business, Johnson & Johnson, starting at the lowest job and attaining the top leadership position. Johnson established the company credo—a belief that business should serve the customer, employees, and community before its shareholders so that all parties could benefit. During his career at Johnson & Johnson, Johnson brought many useful health and personal care products to the consumer market worldwide. His legacy, the establishment of the Robert Wood Johnson Foundation, continues to benefit Americans' health care.

OTTO KAHN

American banker, investor, and art collector

Kahn, an influential investment banker and generous supporter of numerous arts organizations and performers, was the model of an enlightened capitalist and an effective spokesman for Wall Street interests after the 1929 stock market crash.

Born: February 21, 1867; Mannheim, Baden (now in Germany)
Died: March 29, 1934; New York, New York
Also known as: Otto Hermann Kahn
Sources of wealth: Banking; investments
Bequeathal of wealth: Children; relatives; artistic patronage

EARLY LIFE

Otto Hermann Kahn (kahn), the son of Bernhard and Emma (née Eberstadt) Kahn, was born to a Jewish family in Mannheim, Baden (now in Germany), in 1867. His father was a prominent banker and industrialist who had lived in the United States for a time after fleeing a death sentence for his role in the 1848 revolts that had swept Europe. Young Otto, one of nine children, was brought up in a very comfortable and cultured household, and as a teenager he was apprenticed to a bank in the city of Karlsruhe. By seventeen he was a clerk there and could begin to indulge his love of music, theater, and art, which would become a lifelong passion.

FIRST VENTURES

A few years later, Kahn went to work in the Deutsche Bank in Berlin and was soon transferred to one of its London branches, becoming a naturalized British citizen. Five years later, in 1893, Kahn was offered a position in New York, and he immigrated to the United States, becoming an American citizen in 1917. When he was thirty he became a member of the private banking firm of Kuhn, Loeb and Company, considered second only to J. P. Morgan's company in its influence. In 1896, shortly before he joined the firm, he had married the wealthy daughter of one of the company's partners, Adelaide Wolff, and the couple ultimately had four children. Several of the partners in Kuhn, Loeb were of German-Jewish origin, and these socially prominent people referred to themselves as "Our Crowd."

MATURE WEALTH

Kahn rose in the company and befriended railroad tycoon Edward H. Harriman, whose ventures were largely funded by Kahn's firm. He helped Harriman finance the reorganization of several of his rail lines, and in return Kahn garnered much wealth for himself and his company. Kahn also participated in making loans to France for reconstruction of its cities after World War I. In addition, Kahn was a founding director of the American International Corporation, a worldwide trading, holding, and finance company.

Kahn was well on his way to becoming a great art collector and patron of the arts. In the early twentieth century, he became a majority stockholder in the Metropolitan Opera company, eventually serving as its president and chairman. He participated in reorganizing this company, which was doing poorly at the time, contributing some $350,000 of his own money to assist it. He also gave generously to other opera companies and was quoted as saying, "I must atone for my wealth."

By the time of his death, Kahn was a trustee of several universities and numerous other civic, business, and arts organizations. He owned fabulous homes filled with art in Manhattan and on Long Island that were compared to Renaissance palaces.

During the early days of the Franklin D. Roosevelt administration, Congress held hearings about the causes of the financial crash of 1929. Kahn, with his benevolent public persona, became one of the most prominent faces of the banking industry in his testimony before Congress in 1933. The following year, already in ill health, he died of a heart attack at the offices of Kuhn, Loeb.

Legacy

Although prominent in the banking world, it is undoubtedly as a patron of the arts that Otto Kahn will be most remembered. Besides his long years of service to the Metropolitan Opera, he brought many famous artists to America, including the Ballets Russes and conductor Arturo Toscanini; arranged for Americans to perform abroad; and encouraged the work of young writers, among them the poet Hart Crane. He was considered to have been a most enlightened capitalist and, as such, was a very effective spokesman for Wall Street interests.

George B. Kaiser

American oilman and banker

Kaiser attained his wealth through his businesses, the Kaiser-Francis Oil Company and the BOK Financial Corporation. Both his business ventures and his philanthropy have contributed greatly to the economy of the city of Tulsa and the state of Oklahoma.

Born: June 17, 1942; Tulsa, Oklahoma
Sources of wealth: Oil; banking; real estate
Bequeathal of wealth: Spouse; children; charity

Early Life

George B. Kaiser (KI-zuhr) is the son of Herman and Kate Kaiser, who fled Nazi Germany in 1940. Herman Kaiser and his brothers founded the Kaiser-Francis Oil Company after the Jewish family settled in Tulsa, Oklahoma, where George Kaiser was born in 1942. George attended Tulsa's public schools and completed his education at Harvard University, earning a B.A. degree in 1964. He remained at Harvard until he received his M.B.A. in 1966.

First Ventures

Unlike some of the world's wealthiest businesspeople, George Kaiser did not waste time making false starts before finding his true niche. Although he flirted briefly with the idea of entering the U.S. State Department's foreign service, he soon realized it would take too long to make the kind of impact he longed to achieve. After graduation from Harvard, he went to work in the family business, the privately held Kaiser-Francis Oil Company. He took over the company's management before the end of his first year, when his father was forced to step down after suffering a heart attack.

Kaiser married his first wife, Betty Eudene, in June, 1965, and the couple had three children, Philip, Leah, and Emily, and later fostered a son, Mony So. From the start, Kaiser was adamant that none of his children would ever feel pressured to go into the family businesses.

Kaiser-Francis Oil was a typically small, family-run operation until George Kaiser's management drove it to prominence. Timing also played a role in the company's success, as the firm was poised to prosper during the American oil boom years. Because oil is a depletable resource, Kaiser was not content to rely on that industry alone, and he branched out into banking and real estate. These ventures also proved successful and contributed to his fast-growing wealth.

Mature Wealth

Kaiser's net worth, estimated at $10 billion, ranked him number sixty-four on *Forbes* magazine's 2010 list of the world's wealthiest people, and for many years he has been the richest individual in Oklahoma. He remains driven, though not to accumulate personal wealth for the wealth itself but to have more money to give away. Among other causes, he donates large sums to politicians and to political campaigns that he believes share his vision of creating opportunities for the disadvantaged.

Under Kaiser's leadership, Kaiser-Francis Oil has become one of Oklahoma's largest natural gas producers in the state, and it provides more than one-tenth of America's energy. His other business pursuits have also prospered. After a long tenure of board membership, Kaiser acquired the Bank of Oklahoma in 1990. He managed it with the style he perfected at Kaiser-Francis Oil, and he continued to participate in the many charitable and civic endeavors he has led over the years.

Effectively managing people to produce their best work has always been a key factor in Kaiser's ability to run the successful companies that in turn created his enormous personal wealth. He knows that self-motivated employees perform better and are far more likely to reach their full potential than people who are micromanaged by executives afraid to allow workers to make and learn from their own mistakes. He is a firm believer in choosing people with the right set of skills and then giving them freedom, as well as financial and other incentives, to succeed.

By delegating tasks to others, Kaiser can devote more of his time and energy to other worthy pursuits. Because he is convinced that education is the single best way to escape poverty, he has served as an Oklahoma State regent for higher education for a number of years, including a stint as chairman of the board of regents. He also has a passionate interest in the arts and theater and donates time and funds to those endeavors. Some of his money has also been allocated for environmental concerns, such as improving the Arkansas River Trails and beautifying the land along the state highways.

In 2009, Kaiser continued to serve as president and chief executive officer of the GBK (George B. Kaiser) Corporation, the parent company of Kaiser-Francis Oil. His portfolio includes nearly $2 billion worth of stock in the Bank of Oklahoma (forty-five million shares), along with other diversified financial and energy holdings. In 2008, he purchased gas tankers valued at more than $1 billion. Kaiser-Francis Oil continues to produce 12 million barrels of oil and natural gas per year, adding greatly to the Kaiser personal and corporate fortune. One of his few unmet goals is to help steer the nation on a course that will reduce American dependence on imported oil. He believes energy independence is attainable through the work of the National Energy Policy Institute, a Tulsa-based think tank funded by the George Kaiser Family Foundation.

After his wife Betty died, Kaiser married his second wife, Myra. Despite their privileged financial circumstances, the couple enjoy a relatively modest lifestyle. Although Kaiser is well known for his philanthropy, he is a private person who dislikes making public appearances.

Legacy

In 2008, *Business Week* magazine ranked Kaiser third on its list of the top fifty American philanthropists, behind investor Warren Buffett and Microsoft's cofounder Bill Gates and his wife Melinda. Kaiser is often quoted as saying, "We all got where we are by dumb luck," and he has made it his business to improve the luck of those who are less fortunate. He is also a firm believer in keeping his wealth in the community in which it was earned. Toward this end, he has made major con-

The George Kaiser Family Foundation

George B. Kaiser founded the George Kaiser Family Foundation for the primary purpose of breaking the cycle of poverty. According to its Web site, the organization seeks to attain this goal "through investments in early childhood education, community health, social services and civic enhancement." The Kaiser foundation is based in Tulsa, Oklahoma, and works with other charitable and service organizations, including the Tulsa Community Foundation, to serve this city's population.

The foundation seeks to help poor children by supporting early childhood education and by funding human social service organizations that are working to improve the lives of young people in Tulsa. Offering adequate medical care to the children of low-income families is of special interest to George Kaiser and a primary concern of the foundation. The organization has helped develop projects in community health, including the University of Oklahoma School of Community Medicine and the Community Prenatal Project. In addition, the foundation has provided grants to create parks, recreational venues, and cultural amenities in order to enhance the lives of Tulsa's residents. The city's Jewish community has also benefited from the foundation's largesse.

tributions to Tulsa's parks, museums, schools, and entertainment venues. His passion for "giving back" was instilled in him by his parents, who were also tireless in their efforts to make the world a better place. In 2008, the Herman and Kate Kaiser Library opened in Tulsa, an acknowledgment of Kaiser's parents' many contributions over the years.

In 2009, Kaiser spent about half of his time on his philanthropic endeavors, primarily through his foundation, and looked forward to retirement, when he planned to devote all of his time to charitable work. He has said that at the time of his death, he hopes that only one dollar will remain of his fortune, with the rest donated to charity.

Adam Kazanowski

Polish aristocrat and government official

Kazanowski was a powerful noble of the Polish-Lithuanian Commonwealth and a friend, adviser, and sometimes financier to King Władysław IV Vasa. He hosted sumptuous entertainments, designed and built magnificent palaces, governed villages, and enjoyed everything his money could buy.

Born: 1599; Polish-Lithuanian Commonwealth
Died: 1649; Polish-Lithuanian Commonwealth
Sources of wealth: Inheritance; real estate; government
Bequeathal of wealth: Spouse

Early Life

Adam Kazanowski (ka-za-NAWF-skee) was born into Poland's landed gentry during the reign of Sigismund III Vasa, a time when the Polish-Lithuanian Commonwealth reached its greatest territorial size and power. Throughout Europe, the nation was considered prosperous, but in reality it was divided by extremes of wealth and poverty. The Kazanowski family was very wealthy.

Kazanowski and his brother Stanisław grew up as companions of Władysław Vasa, who would become King Władysław IV Vasa. The friendship lasted throughout their lives. In the royal company, Kazanowski received an excellent education in the arts, literature, history, science, and several languages. He also learned self-indulgence, arrogance, pride, and some say greed. Perhaps prophetically, the Kazanowski coat of arms is topped by three strong turrets supporting seven lavish peacock feathers. The family were *szlachta*, members of a powerful ruling class in which, according to British writer Daniel Defoe, the "Vanity of Birth is carried to a monstrous extravagance."

First Ventures

As a young man, Kazanowski accompanied Władysław Vasa in his travels, including Vasa's failed attempt to become a Russian czar, his service in the Siege of Khotin (1621), and his explorations of the European continent, with visits to several royal courts. In 1631, Kazanowski began his political career as the *starost* (royal official) of Barcko. In 1634, he married Elzbieta Sluszczanka.

Before and after his coronation, King Władysław Vasa showered Kazanowski with powerful titles and lavish gifts. The extravagant spending of the two men brought outcries from the commonwealth parliament, called the *Sejm*. However, nothing came of the protests, even when the royal treasury ran dry and Kazanowski volunteered to mortgage some of his property to quickly raise funds for his friend the king.

Mature Wealth

As a Polish magnate, Kazanowski subscribed to a knightly code that upheld brotherly love and equality among the *szlachta*. The code also spoke for the superiority of their social class, however, and most magnates held many commoners in serfdom. Most also hired Jews to work as estate managers and tax collectors on their lands.

Kazanowski held many governing titles and positions granted him by the Vasa kings. He, like other magnates, wielded absolute mastery over his estates and the localities he ruled. The aristocratic Pole was a *pan sobie*, a lord unto himself. In his role as crown marshal, however, Kazanowski would have been required to deal with complaints about noblemen violating the gardens or the women of other noblemen. During his career as a statesman, most of the offices and titles he held were salaried and contributed to his wealth and power.

The most prominent symbol of Kazanowski's wealth was attained with the help of Władysław Vasa. In 1628, the future king commissioned Constantino Tencalla, the royal architect, to design a new palace in the Italian style. Tencalla created the most impressive building in Warsaw. In 1632, Władysław gave the building to Kazanowski. The gift was so immense that Władysław's father, King Sigismund III, objected and set up a *Sejm* commission to investigate the gift. The commission did not produce any results.

Kazanowski Palace was an enormous four-story structure with a garden, a large terrace, and a central courtyard. Contemporary reports describe gilded crowns decorating the alcove tops, opulent interiors, and lavish furnishings. Wooden beamed ceilings were also gilded and the spaces between the beams were filled with oil paintings. Kazanowski collected all kinds of art: marbles, tapestries, paintings, carved furniture, silverware, and treasures from the Orient. A bear lived in a gilded cage in the front courtyard. Wine was served at banquets in a cask of pure silver, rolled out on wheels with a large figure of Bacchus sitting astride it. Everything was the best and usually the most expensive available. Among the holdings was a collection of musical instruments for the use of Kazanowski's private orchestra.

Life in Warsaw was a succession of feasts featuring fine dining and heavy drinking, and the figure of Kazanowski gave witness to this abundance. Kazanowski's portrait by artist Peeter Danckers de Rij shows a handsome man of tremendous girth who probably weighed close to three hundred pounds. Kazanowski used his wealth to purchase beauty and pleasure of every kind. In the 1640's, in addition to the Kazanowski Palace, he owned almost half of the Praga district in Warsaw, the magnificent Krzysztofory Palace in Kraków, and estates that included whole villages in other areas of Poland.

Kazanowski died in 1649 and was buried in the crypt beneath the Cathedral of St. John in Warsaw. After his death, a contemporary wrote, "Never has Poland seen so much wealth in a private hand of a single man."

The Kazanowski Palace was plundered and burned by invading Swedes and Germans in 1656. It was never rebuilt. In the twenty-first century, the site was the location of a charity center.

Legacy

Unlike most of the countries in Europe in the seventeenth century, Poland allowed women to own property, and Kazanowski bequeathed his estate to his wife, Elzbieta. She became one of the few truly wealthy women on the Continent. After a time, she remarried, and she later sued for divorce, causing a great consternation in the *Sejm* and among the other nobles. In many ways, she was the archetypal figure of the strong-minded woman, secure in her own wealth and power, that runs throughout Polish history and literature.

In 1641, in seeming poetic balance to his hedonistic spending and entertaining, Kazanowski founded a Carmelite church and monastery in the village of Bielsk, where he was *starost*. The buildings were dedicated to Our Lady of Mount Carmel. The Carmelite Order is among the most austere in all Roman Catholicism, with its members withdrawing from the business of everyday life and emphasizing poverty, simplicity, and complete devotion to God. After her husband's death, Elzbieta

The Historical Museum of Kraków

The main building of the Historical Museum of Kraków in Poland is known as Krzysztofory Palace. In the 1640's, nobleman Adam Kazanowski created the palace by joining three medieval houses situated close to the Main Market Square. The palace was reconstructed and renovated in Baroque style by architect Jakub Solari in 1682-1684. The building was not bombed in World War II, and it retained the decorative stucco work created by Italian architect Baldassare Fontana.

The famous Kraków nativity scenes (*szopka*) are housed in the museum's palace building. This structure also displays sixteenth to twentieth century city maps, prints, and photographs; local paintings; portraits of the Polish nobility; fourteenth to twentieth century weapons of war; and memorabilia from the powerful guilds and fraternities. Especially notable is the Gun Cock Fraternity's silver cockerel prize, a royal donation from 1565. Among the most precious holdings are the early sixteenth century scepter and ring of the lord mayors of Kraków and the plaque of St. Eligius from 1609.

The museum became an independent institution in 1945, and it encompasses several buildings in addition to the Krzysztofory Palace. One of these structures is the nearby town hall tower of Main Market Square, which was built in the fourteenth century but destroyed by fire in 1680. The structure was then restored in the Baroque style with a square basis and a height of sixty-eight meters. Its cellars, once a prison and torture chamber, house a popular cabaret, and its highest story is available for views of the city.

The history of Polish Jews is memorialized in the Jewish Museum, established in 1959 and located in the fifteenth century Old Synagogue (*Alte Schul*), the oldest preserved synagogue in Poland. The Torah shrine in the wall is original. The museum's permanent collection includes heritage items of Jewish ritual art, regional paintings, prints, photographs, and memorabilia of Jewish family life. All were purchased or donated from Europe and Israel.

The Barbakan Museum is housed in a fortification built in 1498-1499 to protect the city from a feared Tartar invasion. The building is an excellent example of Gothic architecture, with circular brick walls that are three meters thick, seven turrets, and a twenty-four-meter-wide moat.

The Sign of the Cross House focuses on the history of Polish theater. The structure was built on the site of the sixteenth century poor scholars' hospital. With its Gothic cross vault preserved, the building was reconstructed and expanded after a fire in 1594 and again in 1834-1835. The permanent collection recounts the history of nineteenth and twentieth century theater, including cabaret and clandestine underground theater. Portraits of actors and directors, costumes, stage designs, posters, programs, and stage props are on display.

Hipolitów House is a three-story building connected to a two-story annex, both of which display re-creations of merchant and middle-class interiors of Kraków homes from the sixteenth to the twentieth centuries. The structure displays an extensive collection of clocks and watches.

continued to fund the religious community until her own death in 1671. The buildings were still in existence in the twenty-first century and were part of the historic character of the town of Bielsk Podlaski, which also had a large Jewish community that was eliminated in the Holocaust and is now memorialized in the Book of Memory.

During the 1640's, Kazanowski also created the Krzysztofory Palace in Kraków by joining the homes of three burghers near the Main Market Square. The building's architecture and interior were so grand that it rivaled the royal Wawel Palace on a nearby hill. In the twenty-first century, the palace housed the Historical Museum of Kraków.

W. K. Kellogg

American food manufacturer

Kellogg and his brother, doctor John H. Kellogg, discovered cold, dry, flaked cereal while experimenting with healthy foods to serve the patients in John's sanatorium in Battle Creek, Michigan. Kellogg launched the company that bears his name, which would become the world's largest cereal manufacturer. His resulting wealth allowed him to fund the W. K. Kellogg Foundation.

Born: April 7, 1860; Battle Creek, Michigan
Died: October 6, 1951; Battle Creek, Michigan
Also known as: William Keith "Will" Kellogg
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Relatives; charity

Early Life

William Keith Kellogg was born in Battle Creek, Michigan, in 1860, the seventh of sixteen children born to John Preston and Ann Janette Kellogg. The family, staunch Seventh-day Adventists, firmly believed in the correlation between diet and health. Kellogg failed to distinguish himself as a student and dropped out of school at age fourteen to work in his father's broom factory. He sold brooms for eight years and then returned to school to study business. After completing a year's course work in three months, he dropped out again to work for his brother, John H. Kellogg, at the Battle Creek sanatorium. John was a medical doctor, but some of his treatments bordered on quackery and often included daily enemas, cold showers, and health food. In 1880, Kellogg married Ella Davis, with whom he had five children.

First Ventures

One of America's favorite breakfast cereals came into being when the Kellogg brothers made a mistake. They insisted upon a healthy diet for sanatorium patients, and they wanted to improve upon shredded wheat, the only cold cereal available in 1894. W. K. Kellogg worked long days, sometimes staying late into the night to experiment. One day he prepared cooked wheat to be processed through rollers. He and his brother had urgent business to attend to and forgot about the wheat. When they came back to their experiment two days later, the wheat had completely dried out, leaving them with flakes of wheat, not sheets of dough. After toasting the flakes, they poured cold milk on them, and their taste tests demonstrated that they had created a viable method for making cereal. If this method worked with wheat, they assumed correctly that it would also work with corn. From that mistake came Kellogg's Toasted Corn Flakes.

W. K. Kellogg recognized the potential of corn flakes as a mainstream breakfast food. His brother, however, wanted the flakes to remain a health food ordered only through his sanatorium's catalog. After working for his brother for twenty-five years, Kellogg decided to start his own company and sell cereal by the carload, not the carton. A court battle with his brother over the right to market the cereal was ultimately decided in W. K.'s favor, but it caused a permanent rift between the brothers. John later wrote a conciliatory letter to W. K.; unfortunately, W. K.was near death and was never shown the letter.

Mature Wealth

Although Battle Creek had more than thirty companies producing cereals, the Kellogg Company, originally called the Battle Creek Toasted Corn Flake Company, outpaced them all and in the twenty-first century still commanded more than 40 percent of the world market. General Mills, for years the company's closest competitor, surpassed Kellogg in 2001.

Although Kellogg was a perfectionist and demanded the same from his employees, he was by all accounts a fair and consistent boss. He expected his business to excel, and he made sure it did. Under his leadership, the Kellogg Company posted profits, even when other consumer product companies suffered bad times or failed. World War I caused shortfalls of railcars and some of the necessary production ingredients, causing the company to sustain the only loss in its history in 1920. During the dark times, both W. K. Kellogg and his son John L. Kellogg worked without pay. Their sacrifice paid off. Soon earnings again soared and Kellogg's personal wealth grew proportionately.

The company he founded continued to grow. During the Great Depression of the 1930's, his company helped reduce unemployment in the Battle Creek area by instituting six-hour factory shifts, thereby creating additional jobs for community residents. Kellogg also converted ten acres of his factory's property to a park, where local residents also found work.

The Kellogg Company's industry domination from its earliest days can be credited to W. K. Kellogg's mastery of the art of promotion. In 1906, he spent one-third of his initial startup capital on an advertisement in the *Ladies' Home Journal*, the most popular women's magazine of the day. Because there was an abundance of cereal makers, he made sure people bought his brand by making certain that his signature was prominently displayed on the package. He created demand by hiring people to visit

THE W. K. KELLOGG FOUNDATION

W. K. Kellogg laid the groundwork for the foundation that bears his name when he told foundation organizers, "I don't want to restrict you in any way. Use the money as you please so long as it promotes the health, happiness, and well-being of children." With these words, a multibillion-dollar foundation was established in 1930 and continues to operate into the twenty-first century from its headquarters in Battle Creek, Michigan.

Born of W. K. Kellogg's conviction that with wealth comes social responsibility, the foundation since its founding has worked to improve the lives of disenfranchised children and their families. Kellogg later gave the foundation his majority interest in the Kellogg Company in order to finance its efforts to improve education, medicine, and agriculture in the geographic areas he had preselected: the United States, southern Africa, and Latin America, including the Caribbean.

The 2008 annual report states that the net assets of the combined W. K. Kellogg Foundation and the W. K. Kellogg Foundation Trust are just under $8 billion, of which almost $5 billion is in Kellogg Company common stock.

Among its initiatives, the foundation operates the Food and Society program. This program, as explained on the organization's Web site, "Supports the creation of locally owned food systems that strengthen local businesses while promoting a safe and nutritious food supply." Another project seeks to connect residents and organizations in Battle Creek in order to help at-risk kids succeed in school and to increase economic opportunities for their families.

In 1997, the foundation launched a multiyear initiative, Engaging Latino Communities for Education (ENLACE), that aims to increase opportunities for Latinos to enter and complete college. ENLACE has partnered with universities, community colleges, public school systems, community-based organizations, students, and parents in seven states to attain the program's goals.

One endeavor outside of the foundation's original geographic parameters is the Kellogg College in Oxford, England. Kellogg, the thirty-sixth college at the famed Oxford University, is a graduate-level institution of lifelong learning. Many of its enrollees are part-time, nontraditional students. The college was established in 1990 and was named for W. K. Kellogg in recognition of the financial support that the university had received from the foundation.

grocery stores and ask for Kellogg's Toasted Corn Flakes even before the product was commercially available. In 1912, he mounted a sign on a Times Square rooftop in New York City that measured 50 by106 inches—the largest electric sign that had ever been displayed. Other marketing ploys included advertisements and packaging with "spokesanimals" and other trademarked characters, such as Cornelius the Corn Flakes rooster and Snap, Crackle, and Pop, the elflike creatures that touted Rice Krispies, in order to enhance brand recognition. Premiums in the cereal boxes further drove sales. In the 1960's, Tony the Tiger joined the lineup to sell Frosted Flakes, and later Toucan Sam was the mascot for Froot Loops. Children loved the television advertisements and demanded that their parents buy the cereals.

W. K. Kellogg took pride in the fact that his son John was actively involved in the company and had acquired nearly two hundred patents, including one for package liners that kept the products fresh. These patents added to the company's wealth and to the wealth of its founder. Although Kellogg became one of the world's richest men, attaining wealth was never his goal. His money meant nothing unless he could use it to improve the lives of others. He cared about the most vulnerable of the world's citizens—its children—and determined to improve their lives, choosing to focus on the United States, Africa, and Latin America.

Most of his money came from his equity in the Kellogg Company. He provided his family with the lifestyle appropriate for a man of his position, and he then made arrangements for a foundation to carry on the work he held dear: helping the less fortunate by making better use of agricultural resources to ease hunger, expanding access to health care in Third World regions, and fostering education as the way out of poverty.

One venture not initially associated with the cereal company was the Kellogg Ranch in Pomona, California, where Arabian horses were bred. By 1932, the ranch had doubled its size to encompass 750 acres, and it became part of the Kellogg Foundation in 1949.

On October 6, 1951, W. K. Kellogg died of heart failure in Battle Creek, Michigan, his hometown and the site of his phenomenal success. He was ninety-one years old.

LEGACY

One of W. K. Kellogg's legacies is found on breakfast tables around the world. He revolutionized the morning meal. In a rapidly changing world, where men left the farms for city work and women entered the workforce in ever-increasing numbers, heavy, cooked morning meals became a weekend treat, while cold cereal was the weekday ritual. By the twenty-first century, Keebler, Nutri-

Grain, Healthy Choice, and Kashi were part of the Kellogg family of foods. The company has facilities in more than 170 countries and employs more than sixteen thousand people worldwide.

Michigan State University operates the Kellogg Biological Station on a site that was once part of Kellogg's vast property near his beloved city of Battle Creek. The Kellogg Community College in Battle Creek bears his name and honors his contributions to the region.

Kellogg's sense of responsibility for the underprivileged members of society led him to say, "It is my hope that the property that kind Providence has brought me may be helpful to others, and that I may be found a faithful steward." That belief motivated his greatest legacy, the W. K. Kellogg Foundation, at one time the second largest charitable foundation in the United States.

Joseph P. Kennedy

American businessman, investor, and diplomat

Kennedy enjoyed success in multiple fields, including banking, the stock market, real estate, and liquor importation. He imbued his children, especially his sons, with the understanding that their wealth and privilege came with the expectation that they would become national and world leaders.

Born: September 6, 1888; Boston, Massachusetts
Died: November 18, 1969; Hyannis Port, Massachusetts
Also known as: Joseph Patrick Kennedy, Sr.; the Ambassador
Sources of wealth: Liquor importation; banking; investments; real estate
Bequeathal of wealth: Children; relatives; charity

Early Life

Joseph Patrick Kennedy, Sr., was born in 1888 in Boston, the son of Patrick Joseph "P. J." Kennedy and Mary Augusta Hickey Kennedy. His father was a popular saloon keeper who drank sparingly, a banker who was loved by his clients even as he became wealthy, and an East Boston Democratic ward boss who served in the state legislature. Joseph would follow his father in all three traditions, becoming a liquor importer, serving as a bank president by the age of twenty-five, and becoming deeply involved in local, state, and national politics.

First Ventures

Kennedy had a remarkable, lifelong sense of timing and insight concerning the accumulation and maintenance of wealth, beginning with his presidency of Columbia Trust Bank in 1913 and continuing with his management of the Bethlehem Steel shipyard in Quincy, Massachusetts, during World War I. He made millions of dollars in the unregulated stock market of the 1920's, but he pulled his money from the market before the 1929 crash. Kennedy directed the reorganization of several smaller film studios to become RKO (Radio-Keith-Orpheum) Pictures. In 1928, he began a decade-long affair with film star Glo-

ria Swanson. During the Depression, his wealth increased exponentially as he bought distressed real estate, both commercial and residential.

Mature Wealth

Kennedy was accused of bootlegging during Prohibition, but these charges have never been proven. However, it is undeniable that Kennedy, anticipating the repeal of Prohibition, procured a "medical license" to warehouse large amounts of Dewar's Scotch, Gordon's gin, and other Somerset Importers brands, thereby creating new liquor distribution networks on and after December 5, 1933—the day Prohibition was repealed. He bought and developed the Hialeah Park Race Track in Florida and blithely mixed business with pleasure, pursuing both his business interests and various affairs with both famous women and personal secretaries throughout the United States and Europe. Although he never personally ran for office, Kennedy served as the first chairman of the Securities and Exchange Commission from 1934 through 1935 and as the American ambassador to Great Britain from 1938 through 1940.

During World War II, Kennedy became a major figure in the New York City real estate market and then branched out to Chicago in 1945, when he bought the Merchandise Mart, which at four million square feet was then the largest office building in the world. His oldest son, Joseph, Jr., died in a plane crash in 1944 over the English Channel, leaving Kennedy's second son, John F. ("Jack"), to assume the family responsibility for public service. Kennedy knew that his isolationist philosophy, charges of bootlegging, underworld connections, and considerable wealth could adversely affect not only Jack's political hopes but also the political careers of his other sons, Robert ("Bobby") and Edward ("Ted"), so Kennedy excused himself from any public connection with his sons' campaigns.

Legacy

Kennedy's wealth, combined with the inculcation in his children of the responsibility of public service for those born into opportunity and privilege, has made the family name synonymous with liberal service in America. The creation of the Joseph P. Kennedy Foundation has helped to fund a number of initiatives in the area of mental illness and treatment, a testimony to Kennedy's lifelong concern about his daughter, Rosemary, who was lobotomized in 1941 and in 1949 was institutionalized for the remainder of her life.

Kirk Kerkorian

American investor and hotel developer

Kerkorian has gained much of his fortune by buying large blocks of stock in corporations, seeking to influence the operations of the companies and then making large profits from his investments. He was one of the pioneers in developing Las Vegas luxury hotels, thus helping to popularize the city as a tourist attraction and gambling mecca.

Born: June 6, 1917; Fresno, California
Also known as: Kerkor Kerkorian (birth name)
Sources of wealth: Investments; real estate
Bequeathal of wealth: Charity

Early Life

Kirk Kerkorian (kihrk kehr-KOR-ee-uhn) was born Kerkor Kerkorian in 1917 in Fresno, California, the center of a large population of Armenian Americans. His parents, Ahron and Lily, were immigrants and English was his second language. His barely literate father was a farmer who raised watermelons and grapes for raisins and at one time owned a considerable amount of land. However, the family was plunged into near-poverty during a severe recession in the early 1920's, and young Kerkorian helped by selling newspapers and watermelons. As a result, his education was often neglected, and he drifted into unfortunate company, apparently engaging in street fights. He left school after the eighth grade and put his pugilistic abilities to use by becoming a successful amateur boxer. He then turned to doing odd jobs, including the installation of furnaces. It was during this time that he discovered a love for flying that would eventually lead to the beginning of his great fortune.

First Ventures

In 1942 Kerkorian married Hilda Schmidt, and this marriage lasted for ten childless years. After taking flying lessons, he spent World War II piloting bombers from Canada to Scotland as a civilian working for Great Britain's Royal Air Force. He was well paid for this task, and after the war he bought a small airplane for a reputed $5,000, intending to give flying lessons and operate a charter service. He also bought and sold surplus airplanes. The charter operation became successful when he offered flights from Los Angeles to Las Vegas, Nevada, which just then was becoming an increasingly popular tourist destination. Kerkorian discovered the lure of gambling about this time and began losing and winning large amounts of money. In 1947, he bought a small charter airline, grandly renaming it Trans International Airlines (TIA), and was ostensibly the first person to offer charter jet service.

Mature Wealth

By the early 1960's, Kerkorian was already quite prosperous and had married his second wife, Jean Hardy. This marriage lasted until 1983, at which time he paid a reputed $200 million divorce settlement. The couple had two daughters, one of whom was adopted, and whose names, Tracy and Linda, were combined to form Tracinda Corporation, the name of his powerful holding company. The beginning of his great wealth came from the 1962 sale of TIA and the reinvestment of the proceeds in Las Vegas land. A few years later, he repurchased TIA and issued stock in the company. A portion of his landholdings became the site of Caesar's Palace Hotel, from which he earned some $4 million in rent and another $5 million when he sold the land. In 1968, he

The Lincy Foundation

In 1989, Armenia was devastated by a major earthquake in which an estimated twenty-five thousand people lost their lives and two cities and perhaps one hundred villages were destroyed. In line with his continuing interest in the country of his forebears, Kirk Kerkorian established the Beverly Hills-based Lincy Foundation that year to financially assist in Armenia's recovery. Some $20 million was donated to this cause, and with the foundation's help thousands of homes were rebuilt, along with much of the country's infrastructure. To show its continuing gratitude, in 2005 the president of Armenia awarded Kerkorian the country's most important medal, the Medal of the Fatherland, which bestowed upon him the title of "National Hero."

High-level contacts continue to be made between the government of Armenia and the foundation's administrators. Like Kerkorian's holding company Tracinda Corporation, Lincy is an amalgam of the names of his daughters Linda and Tracy. During its twenty years of operation, the Lincy Foundation, which is entirely funded by Tracinda, has continued to finance many humanitarian efforts in both Armenia and the United States. Among the recipients of foundation awards have been hospitals and persons conducting research about eye diseases. The University of Nevada, Las Vegas, received a $14 million award to establish the Lincy Institute at the university. The institute's stated aim is to provide a central hub that can interface with governmental and private agencies across state lines in order to promote regional planning and economic growth throughout the "Southern Intermountain West."

sold TIA to Transamerica for an estimated $85 to $100 million in Transamerica stock.

Now well on his way to vast wealth, Kerkorian built hotels in Las Vegas and formed the International Leisure company. By 1970, he had become enamored of the film business and with some $650 million, much of it borrowed funds, he gained control of the MGM (Metro-Goldwyn-Mayer) Studios. MGM was to become a veritable "cash cow" for him, although during his tenure there he was criticized for neglecting the artistic side of the business. His sale of one-third of the MGM lot in Culver City, California, and of such revered MGM icons as the ruby slippers from *The Wizard of Oz* caused a prominent executive to lament that under Kerkorian's ownership the studio was always for sale. One of Kerkorian's Las Vegas hotels was the MGM Grand.

Kerkorian also acquired the United Artists (UA) Studio, merged it with MGM, and sold the combined company in 1985 to fellow entrepreneur Ted Turner for $1.5 billion. After Turner experienced financial problems, Kerkorian repurchased MGM/UA for $780 million and promptly resold it to Italian financier Giancarlo Parretti for $1.3 billion. Yet again, after Parretti encountered legal problems, Kerkorian repurchased the studio and sold it to Sony Corporation for $2.9 billion. Despite his making a huge personal fortune from MGM, the studio's financial status was apparently not much improved during his ownership.

In 1990, Kerkorian turned his sights on the auto industry. He acquired shares in Chrysler Corporation, and he eventually teamed with its former chairman Lee Iacocca in an attempt to gain control of the company by a hostile takeover. Although this maneuver failed, Kerkorian garnered billions of dollars in profits from various stock sales in Chrysler. He also realized another huge profit when Chrysler was acquired by the German company Daimler-Benz in 1998. Kerkorian subsequently filed a lawsuit challenging this merger, alleging that he had been misled about its terms, but an appeals court finally ruled against him in 2008.

Now well into his eighties, Kerkorian next turned to General Motors (GM) Corporation, in which his Tracinda Corporation holding company held almost 10 percent of the stock. His large holdings enabled him to place one of his associates on GM's board of directors, and he attempted to broker a merger between GM and Nissan Motor Company, which had already partnered with French automaker Renault. GM's management team successfully countered his attempted merger, and in 2006 Kerkorian sold most of his GM stock.

His next venture was with the Ford Motor Company, of which he purchased some 120 million shares. By 2007, Kerkorian was estimated to be the forty-first-richest person in the world, worth an estimated $18 billion. However, his financial worth suffered as a result of the recession that began at the end of 2007, and his Las Vegas holdings declined steeply in value, leaving him with a debt load of about $600 million. As a result, he sold most of his Ford stock at a loss in 2008. He also controlled a large stake in an oil exploration company that appeared to be having some financial difficulties.

In his personal life Kerkorian appears to be a modest man who is spartan in his personal habits. He stands in line at film theaters and pays for his own tickets, even for films made by MGM. Although he has donated vast sums of money to various causes, including the country of Armenia, as of 2009 he had not allowed anything associated with these causes to be named in his honor. However, he has been less magnanimous in his relationships with numerous women, most much younger than he, and in his failed marriages. In 2002, he was embroiled in a messy divorce and paternity trial involving his third wife, Lisa Bonder, who demanded more than $300,000 per month for alimony and child support. Kerkorian has always denied that the young daughter in question is his.

Kerkorian by nature is a reclusive man, who almost never grants press interviews. His reputed beneficence stands in sharp contrast with his superaggressive business practices, which have been the cause of numerous lawsuits against him. It has been speculated that as an inveterate gambler, Kerkorian is as interested in the art of the deal as he is in potential profits. He has been accused of the practice of "greenmail," whereby a corporation pays off a troublesome investor to cease what it considers his hostile actions toward the company. Among the companies that allegedly have paid off Kerkorian in this manner are Western Airlines and Columbia Pictures.

Legacy

By 2009, Kerkorian, who was in his nineties, was still somewhat active in business, and it seemed clear his legacy would be a mixed one. On one hand, his challenging of established corporate management has sometimes shaken the status quo and led to some positive changes in operations. However, his maneuvers often have seemingly enhanced only his own financial position, with little benefit to the corporations in which he has taken an interest. Based on his numerous donations to worthy causes in the United States and Armenia, it is probably in his charitable work that his legacy will be most valued. In 2008, *Business Week* magazine named him to its Fifty Top American Givers list.

RICHARD KING

American rancher

Born into poverty as the son of Irish immigrants in New York City, King, through determination and an innate sense for innovation, business, and commerce, became one of the wealthiest Americans who ever lived and amassed one of the largest landholdings on Earth, the legendary King Ranch in south Texas.

Born: July 10, 1824; New York, New York
Died: April 14, 1885; San Antonio, Texas
Sources of wealth: Real estate; ranching
Bequeathal of wealth: Spouse; children

EARLY LIFE

Richard King was born in New York City in 1824 and apprenticed to a jeweler there at the age of nine. Next to nothing is known of his parents, not even their names. A little more than a year after beginning his apprenticeship, he stowed away on a riverboat to Mobile, Alabama, where he became a cabin boy. A kindly steamboat captain, Joe Holland, seems to have unofficially adopted the boy, and for less than a year King attended school in New England with Holland's biological children. This brief period seems to be the only time that King ever received a formal education. King showed great skill at navigation, though, and he eventually became the pilot of a steamboat before he had reached his seventeenth birthday.

Fighting in the American army during the Second Seminole War, King befriended a fellow soldier, Mifflin Kenedy, who would become his primary business partner. After piloting riverboats in Florida and Georgia for a while, in 1847 King responded to an invitation from Kenedy to move to Texas, where Kenedy was now aiding American troops in the Mexican War. Setting up operations on the Rio Grande, King used a transport ship, the *Colonel Cross*, to move men, ammunition, and goods for General Zachary Taylor. Showing great skill as an inventor, King quickly and expertly devised boats specially adapted to the demands of the narrow and fast-moving waterways of inland south Texas.

FIRST VENTURES

After the war was over, King and Mifflin went into partnership in a steamboat company on the Rio Grande. Soon, however, King became more interested in land than in water and began to use funds from his shipping enterprises to purchase property in numerous tracts and parcels throughout the southernmost region of Texas. Not all of King's early purchases of land were successful: He was once duped into "buying" part of what later became the popular vacation site, Padre Island, from confidence men who had no legitimate title to the property. Chastened by this debacle, King became very cautious in his purchases, relying heavily on the advice of a team of lawyers led by Robert J. Kleberg, who would later marry his daughter Alice and give his name to his former boss's principal heirs.

In 1854, King married Henrietta Chamberlain, a well-to-do young woman from Brownsville, Texas. She was a source of both wealth and sound advice to King, and with her help and that of Kenedy and Kenedy's equally aristocratic and perspicacious wife, Petra, King began to establish a Texas rancho of truly kingly proportions.

MATURE WEALTH

Having already bought a tract of more than fifteen thousand acres near Corpus Christi the year before his marriage, King purchased a nearby land grant known as the Santa Gertrudis de la Garza, consisting of more than fifty thousand acres of grassland. This nexus of properties would evolve into the King Ranch. Initially consisting of more than sixty thousand acres, by the end of King's life his ranch's property holdings had increased tenfold. Although the story may be exaggerated somewhat, King supposedly hired an entire town from Mexico, specifically the village of Cruillas in Tamaulipas State, to come and work for him. These villagers became an integral part of the King Ranch and were called Los Kineños, a hybrid coinage of Spanish and English based on King's surname. Descendants of the first Kineños were still working on the King Ranch in the early twenty-first century.

King did not refuse the amenities that wealth provides. He built a lavish ranch house in the Mexican hacienda style, and he and his family dressed and dined well. In fact, as various critics have pointed out, his way of life was in some ways medieval: a revival of feudalism in the nineteenth century Wild West of the United States, with his workers dependent on his patronage, much as serfs in the Middle Ages had relied on the lords in the manor houses. However, as others have pointed out, the landholder-worker relationship had been long established by Spaniards in Mexico, with the *patrones* (aristocratic landowners) hiring and overseeing the *peones* (peasant agricultural workers), who enjoyed their protection and tutelage only as long as their work and behavior were deemed pleasing or satisfactory. In short, this employer-employee relationship, archaic or not, unfair or not, was typical of the era and the region.

King's business endeavors were interrupted by the Civil War, during which Texas was part of the Confederacy. King, whose ranch was the major center of the cotton trade in Texas during the war, found himself the target of an assassination attempt by Union troops in December, 1863. He happened to be away from home at the time, although his property suffered much damage at the hands of the Union soldiers. In the time-honored tradition of Texans in disgrace, King fled to Mexico after the war to escape arrest and imprisonment. When President Andrew Johnson later granted him a pardon, probably because of his wealth, King returned to Texas and his ranch. At the conclusion of the war, King was worth about $300,000, an astronomical sum for the time, and he and his family owned almost 150,000 acres of ranch land.

Although the social structure of King's ranch may seem old-fashioned to later generations, he was an innovator in other ways. In fact, many of the traditions that Americans learn about the Old West from popular culture, such as Western films and television series, can be traced to practices that King pioneered. For example, he was one of the first ranchers to promote the arduous cattle drives during which thousands upon thousands of cows were herded to the Midwest and northern regions of the United States for sale during the 1800's. He fenced in his land and asserted absolute claim to it, thus helping to end a long-standing tradition in which grazing land was considered communal property. He also invested money in what were in his day state-of-the-art technologies, such as railways and production plants for ice, and he lent funding to the Texas Rangers during their early years.

In 1885, King died of stomach cancer in San Antonio at the age of sixty.

The King Ranch

Encompassing almost 830,000 acres and sprawling across parts of six south Texas counties, the massive King Ranch is the largest cattle ranch in the United States and one of the biggest landed estates in the world. Now almost as large as the entire state of Rhode Island, the ranch grew out of two only barely contiguous tracts of land and two other divisions of property wholly separate from these conjoined land parcels. The ranch is headquartered in the college town of Kingsville, Texas, in Kleberg County, about forty miles from Corpus Christi.

Soon after the death of the ranch's founder, Richard King, in 1885, King's widow, Henrietta, entrusted the role of ranch manager to her husband's former chief legal adviser, Robert J. Kleberg, and a year later Kleberg married King's daughter Alice. Through the 1920's, the trio of widow, daughter, and son-in-law ran the ranch, continuing King's legacy of expansion and innovation. After Kleberg became too old and ill to continue, his son, Robert J. Kleberg, Jr., and later scions of the family took over the ranch.

Some of the innovative ranching practices instituted by the family from the late nineteenth through the twentieth centuries included digging artesian wells for the first time in the region, constructing dipping vats for cattle to battle infestations of ticks and other parasites, and interbreeding various species of cattle in order to develop cows especially adapted to the climate and terrain of south Texas. This latter program eventually resulted in the introduction of the Santa Gertrudis breed in the early twentieth century, and this breed quickly became popular among farmers and ranchers living in dry, hot regions similar to South and West Texas.

In addition to cattle breeding, the ranch is also famous for the King Ranch Quarter Horse program. A number of the ranch's quarter horses have gone on to win major racing competitions. In the late twentieth century, the ranch began to breed more exotic animals, such as the nilgai, an antelope-like mammal from Asia.

Like many wealthy Texans, the King and Kleberg families became involved in the oil and gas business by leasing parts of their vast landholdings to oil companies, especially to Humble Oil, which eventually became Exxon-Mobile. Not unexpectedly, the enormous ranch is also a thriving center of agribusiness. Among the many crops that have been grown there are wheat, cotton, sugarcane, sorghum, oranges, and grapefruit. In the early twenty-first century, the ranch became a major source of turfgrass, much of which was found on private lawns and in various sports venues in the South and Southwest. In addition, the ranch bought the Young Pecan Company in the early twenty-first century and soon became one of the largest processors and distributors of pecans in the country.

Another important industry in which the King Ranch is involved is tourism. With a posh gift shop in downtown Kingsville, as well as a visitor center and a museum of ranch memorabilia, the ranch annually attracts more than ten thousand tourists from all over the world.

Legacy

As befits a legend, Richard King continues to haunt Texas folklore and American popular culture. A longstanding urban legend insists that his specter appears periodically in the room in which he died in the venerable Menger Hotel in San Antonio. His epic story of wealth and power survives in print and film through the success of the novel *Giant* (1952) by Edna Ferber and in its screen adaptation, released in 1956, which starred Elizabeth Taylor, Rock Hudson, and James Dean. Ferber had spent long periods of time at the King Ranch as part of her research for the novel, and much of the plot is based on King and Kleberg family history. However, King's greatest legacy continues to be the King Ranch.

John Kluge

American media and telecommunications executive

Kluge accumulated wealth by investing in and developing broadcasting and cellular telecommunications companies. A risk taker, Kluge bought and sold various types of businesses, even when such decisions seemed unwise, and by 1989 he had become the wealthiest person in America.

Born: September 21, 1914; Chemnitz, Germany
Died: September 7, 2010; Charlottesville, Virginia
Also known as: John Werner Kluge
Sources of wealth: Media; telecommunications; investments
Bequeathal of wealth: Charity; educational institution; medical institution

Early Life

John Werner Kluge (KLOO-gee) was born in 1914 at Chemnitz, Germany, to Fritz Kluge and Gertrude (née Donj) Kluge. His father, an engineer, died while serving in World War I. In 1922, Kluge, listed in passenger records as Johannes Kluge, departed Bremen on the *George Washington* and arrived at New York City on September 15. He settled in Detroit, Michigan, where his mother's new husband owned a painting business. His stepfather pressured him to work rather than attend school, but Kluge was determined to acquire an education, and he left his family to move into a teacher's home.

After his 1932 graduation from Northwestern High School, Kluge secured employment on the Ford Motor Company assembly line. The next year he enrolled in the College of the City of Detroit (now Wayne State University). A scholarship enabled Kluge to transfer to Columbia University in 1935. He excelled academically, receiving a $2,000 history prize. By 1937, Kluge had earned a bachelor of arts degree in economics.

First Ventures

After graduating from college, Kluge negotiated an offer to work as a shipping clerk for Otten Brothers, Inc., a Detroit business that produced paper. He suggested to the company's management that he should be compensated with shares of stock, in addition to his salary, if he doubled the corporation's sales. Kluge focused his attention on his job, working every day, including weekends and holidays, and learning about the responsibilities associated with all the jobs at Otten Brothers, from stockroom duties to office positions. After three years, Kluge's efforts resulted in his being named the vice president of Otten Brothers, and he was given one-third of the company's stock.

Kluge remained at Otten Brothers until late 1941, when the United States entered World War II. Throughout the war, Kluge served as an intelligence officer in the U.S. Army. His service took him to the Aleutian Islands, where instead of socializing with other soldiers during breaks he contemplated possible postwar business endeavors he could pursue. Kluge was promoted to captain by the time he was honorably discharged and returned to the United States in 1945.

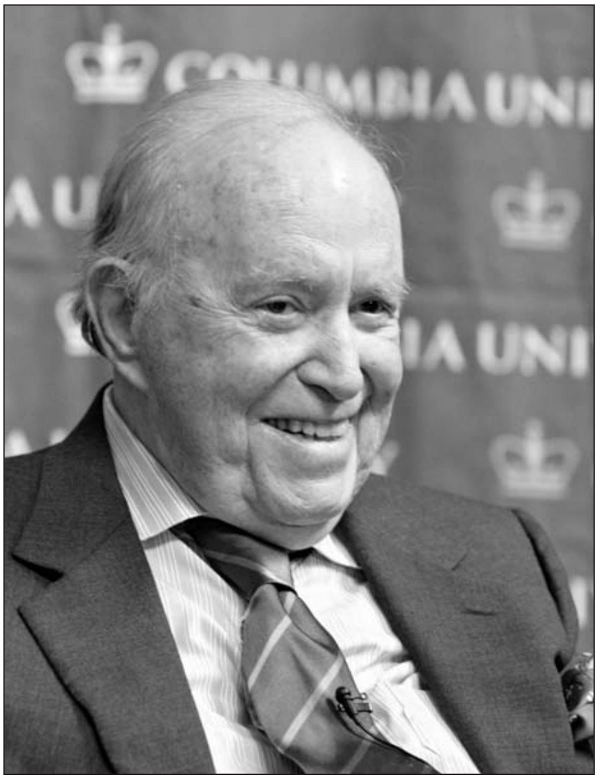
Mature Wealth

After the war, Kluge decided to invest the money he acquired from selling his stock in Otten Brothers. *The Wall Street Journal* alerted him to investment possibilities associated with radio broadcasting. In 1946, Kluge and Joseph Brechner, a Detroit friend, combined financial resources to purchase WGAY, a Silver Spring, Maryland, radio station. Aspiring to transform this station into a profitable business, Kluge developed promotions to attract listeners. During the first year he managed WGAY, he spent $50,000 on advertisements.

Eager to try another business venture, Kluge decided to be a food broker, distributing corn chips to grocery stores throughout New England. His radio station experiences influenced how he presented food products to consumers. Kluge's promotion ideas incorporated such strategies as giving shoppers free chips in grocery stores. He also purchased other radio and television stations in large cities throughout the United States. Kluge perceived himself as a businessman who shaped the companies he bought and then sold them instead of being complacent about his investments.

By 1958, Kluge's investments enabled him to attain multimillionaire status. He aspired to achieve greater success and bought approximately 24 percent of the Metropolitan Broadcasting Corporation (MBC). His shares enabled him to control MBC. Kluge applied his advertising strategies to transform MBC's radio and television stations, many of which had not been profitable and had operated in debt. His methods converted these faltering stations into thriving businesses and models for how broadcasting properties could generate income. During 1959, MBC earned approximately $1.5 million, with Kluge serving as its president and board chairman.

Kluge devised the term "metromedia" to describe using diverse media for advertisements, renaming MBC as



John Kluge. (Bloomberg via Getty Images)

Metromedia, Inc., in 1961. He expanded Metromedia to sell outdoor advertising on thousands of billboards in the United States. Kluge bought the Ice Capades in 1963 for Metromedia and acquired the Harlem Globetrotters thirteen years later. He secured syndication rights for television shows and films. Despite fluctuating economic conditions, Kluge sustained financial growth for Metromedia, establishing it as a powerful broadcasting conglomerate. By 1981, Metromedia employed more than four thousand workers and generated net revenues of almost $462 million, of which almost $59.7 million was net income. Recognizing the potential of cellular technology, Metromedia invested $281 million in paging businesses in the early 1980's.

A risk taker, Kluge bought available Metromedia stock in 1984 with a $1.2 billion loan in order to privatize the company. He then sold some of his media and cellular properties, using the proceeds to repay the loan and to accumulate wealth, eventually earning a profit of more than $8 billion. In 1985, Rupert Murdoch paid $2 billion to buy seven Metromedia television stations for the Fox Network. General Electric Capital Corporation purchased Kluge's billboard company. Kluge gained control

Morven Farm

Morven Farm in southeastern Albemarle County, Virginia, consists of rural land located on Carter's Mountain close to Presidents Thomas Jefferson's former estate, Monticello, and James Monroe's home, Ash Lawn. In 1796, Jefferson bought land referred to as Indian Camp for diplomat William Short, who had been Jefferson's secretary. A small house was built on the property that year. Because Short infrequently visited his land, Jefferson leased it to agriculturists.

David Higginbotham, a merchant, purchased the land in 1813. Higginbotham and his wife Mary used a Scottish term, Morven, referring to the land's hilly terrain, to name their farm. By 1821, a brick house and numerous outbuildings were constructed. Renovations of this house and grounds continued through the next century as different owners designed structures, including a chapel and barns, for various social, religious, athletic, and agricultural needs. The vast acreage contained fields for livestock, crops, timber, and orchards.

By 1926, Morven Farm had become the property of Charles A. Stone, who bred racehorses on the land. His heirs, Whitney and Anne Stone, continued Morven Farm's reputation as an elite stud farm producing champions. The Stone family was especially interested in improving Morven Farm's gardens, which had originally been planted in the late nineteenth century, and the family hired landscape architect Annette Hoyt Flanders. In 1929, the Garden Club of Virginia began hosting an annual garden week at the estate and expanded its programs in the following decades. Morven Farm was named to the National Register of Historic Places in 1972 and the Virginia Landmarks Register. The Historic American Buildings Survey cataloged the property's outbuildings.

John Kluge purchased Morven Farm and began raising thoroughbred horses in the 1980's as the owner of Morven Stud, eventually selling his broodmare and foal herd in 2000. Kluge also financed research evaluating the genes of cattle in order to strengthen the farm's livestock. He enhanced the estate's grounds, arranging for construction of a Japanese garden with native plants and a tea pavilion and buying sculptures by such renowned artists as Auguste Rodin for Morven Farm's gardens. Social events at Morven Farm included Kluge's daughter Samantha's wedding in April, 1997.

In the late 1990's, Kluge discussed donating Morven Farm to the nearby University of Virginia with the university's president, John T. Casteen III. Kluge envisioned that Morven land and buildings would offer educational sites and resources for students, faculty, and visiting scholars and artists. Kluge suggested that some of the farmland should be leased or sold in order to create an endowment that would generate money for the university. On May 25, 2001, an announcement described Kluge's gift of 7,378 acres worth $45 million to the university. He emphasized the farm's value for architectural and ecological research.

The university adapted structures and roads on the grounds to meet its needs for transportation, communication, and accessibility. School officials described Morven Farm as a village where people with diverse interests and expertise could interact. Students earned academic credit for landscape architecture and other courses taught at the Farm.

of Orion Pictures in 1988, initiated and achieved numerous profitable company mergers, and accumulated income from diverse technology, hotel, and restaurant investments.

In 1989, *Forbes* magazine listed Kluge as the wealthiest person in the United States, estimating he was worth more than $5 billion. Kluge continued to be the wealthiest American in 1990 and 1991 before Bill Gates, cofounder of Microsoft Corporation, acquired that title. Kluge was included on subsequent *Forbes* lists of both wealthy Americans and world figures.

Kluge sold his cellular properties for $3.4 billion in 1992. His fortune was worth $8.8 billion the next year. In 1993, Kluge formed LDDS Metromedia Communications, which later became the telephone company WorldCom and paid him $1.2 billion in 1995. He established Metromedia International Group, Inc., that year, providing cellular communications technology in Asia and Eastern Europe.

Kluge resigned as Metromedia International Group chairman in 2002 because of pressure from unhappy shareholders. That year Metromedia Fiber Network declared bankruptcy, and Kluge provided $150 million to the company, confident its fiber-optic technology would rebound. In the early twenty-first century, Kluge was selected for the *Forbes* list of international billionaires, with the magazine assessing Kluge's net worth at $10.5 billion in 2003 and $11 billion two years later, acknowledging his status among the world's twenty wealthiest people. Kluge's net worth dropped to $6 billion by 2009 after his restaurant investments lost money because of increased food costs and worldwide food shortages. In 2010, *Forbes* magazine estimated his net income at $6.5 billion.

Kluge's wealth enabled him to buy luxurious properties, including a Scottish castle on seventy-eight thousand acres, and residences in Manhattan, Munich, and London. Kluge married four times; he has one daughter and two adopted sons. His three divorces attracted publicity for the large alimony sums, such as $2 million weekly, he paid his former wives. In 2009, he lived primarily in Palm Beach, Florida. Kluge estimated he had purchased and then sold approximately two hundred companies.

Legacy

Starting in 1987, Kluge expressed his gratitude to his alma mater, Columbia University, by contributing several multimillion-dollar donations, ranging from $25 to $60 million, to help both students and faculty. Kluge stated that he wanted his gifts to provide scholarships to minority students and to enable Columbia University to attract more minority professors. By 2007, Kluge's wealth had helped five hundred students pursue their educations. That year he declared that his estate would give Columbia University $400 million after he died.

Promoting cultural and intellectual endeavors, Kluge presented $60 million to the Library of Congress for the John W. Kluge Center for Scholarship. He financed a $1 million award to honor individuals, such as historian John Hope Franklin, for their overall accomplishments in the humanities. Promoting health advances, Kluge's philanthropy supported research on cerebral palsy and oncology and financed University of Virginia Medical School scholarships, faculty positions, and treatment programs for children.

David H. Koch

American industrialist

Brothers Charles G. and David H. Koch built a family business, Koch Industries, Inc., into the second-largest privately owned firm in the United States. David Koch has been a leader in the Libertarian Party, using his vast fortune to fund conservative causes and many medical, educational, and arts institutions.

Born: March 5, 1940; Wichita, Kansas
Also known as: David Hamilton Koch
Sources of wealth: Inheritance; oil; real estate
Bequeathal of wealth: Spouse; children; charity

Early Life

David Hamilton Koch (kohk) and his twin brother, William, were born in Wichita, Kansas, on March 5, 1940, to Frederick "Fred" Chase Koch and Mary Robinson Koch. Fred, the son of a Dutch immigrant, grew up in Texas and graduated with a degree in chemical engineering from the Massachusetts Institute of Technology (MIT) in 1922. In 1925, he moved to Wichita and made the city his home. By the late 1920's, Fred had cofounded an engineering company that developed an improved method for converting crude oil into gasoline. Fred took this new technology to the Soviet Union, returning to the United States as a fervent anti-Communist who would become a charter member of the John Birch Society.

In 1932, Fred married Mary Robinson. The daughter of a Kansas City surgeon, Robinson had also been educated in the Boston area, at Wellesley College, and at the Kansas City Art Institute. She was an accomplished silversmith and had a lifelong interest in drawing and painting. Just as Fred would pass his abilities in engineering and business and his commitment to conservative politics to three of his four sons, Mary instilled a love of the arts in all four boys.

David, his twin brother Bill, and older brothers Fred and Charles G. grew up in Wichita in a large, elegant home across the street from the Wichita Country Club, but they spent much of their summers on family ranches in Montana and Kansas, where their father insisted they learn the value of hard work. David attended preparatory school at Deerfield Academy in western Massachusetts and then followed his father and older brother to MIT, from which he earned bachelor's (1962) and master's (1963) degrees in chemical engineering. While an undergraduate at MIT, the tall Kansan was a basketball star and captain of his team, scoring a three-year average of twenty-one points per game.

First Ventures

In the mid-1960's, Rock Island Oil and Refining Company, which David's father ran, was rapidly expanding its holdings in ranch land in Montana and Texas and its co-ownership of refineries, and the firm was introducing new industrial products in its manufacturing units. Charles joined the company in 1961. The twins, David and Bill, five years younger than Charles, soon followed suit and took executive positions in the family company. In 1967, Fred C. Koch named his second son, Charles, the chief executive officer, bypassing the eldest son, Fred, who had majored in liberal arts in college, had no interest in engineering projects, and had become estranged from his father. Fred C. Koch died the next year and soon after his death the company's name was changed to Koch Industries, Inc. David would become executive vice president of the company. In the 1970's, Koch Industries diversified into petrochemicals, real estate, oil trading services, oil exploration, and drilling. By 1974, company sales exceeded $2 billion.

David's brother Charles cofounded the Cato Institute in 1977, and since that time David has been a generous donor to the conservative think tank, serving on its board of directors. In the 1980 presidential election, David Koch was the Libertarian Party candidate for vice president. Koch and his running mate, California lawyer Ed Clark, received slightly less than one million votes in the popular election, making the Clark-Koch ticket the most successful Libertarian candidacy in American history. Koch broke with the Libertarian Party in the mid-1980's, but he has continued to be associated with and financially supportive of conservative advocacy groups, including Americans for Prosperity, the Reason Foundation, and the John M. Olin Foundation. In 1986, he helped found Citizens for a Sound Economy.

Mature Wealth

By1979, David's twin brother, Bill, had become increasingly displeased with his role in the family business, which continued to expand and diversify. Bill wanted freer access to company information and some means by which a fair market price could be assigned to Koch Industries' stock. Joined by the eldest brother, Fred, who had been relatively removed from company affairs, Bill launched a proxy fight intended to remove Charles from his position of leadership. David sided with Charles in what became a family feud that would be litigated for decades and would cause a permanent rift among the brothers. In 1983, Charles and David Koch, the majority owners of Koch Industries, and other company officials bought Bill and Fred's shares in the company for approximately $1.1 billion in cash. Later, Bill would return to court, claiming that he and his brother had not received a fair price for their interests.

By 1996, Koch Industries had revenues approaching $30 billion. The firm had become an international company, adding offices in London and Singapore to the corporate headquarters that remained in Wichita. (By 2009, the company employed eighty thousand people in sixty countries.) In 2004-2005, the firm made international business news with two huge acquisitions: the INVISTA textile unit from E. I. du Pont de Nemours and Company for $4.2 billion and Georgia-Pacific Corporation for $13.2 billion in cash, plus the assumption of $7.8 billion in debt. With these massive additions, Koch Industries' revenues reached $98 billion in 2007, making the firm the second-largest privately owned company in the United States. In March, 2010, *Forbes* magazine estimated David Koch's personal wealth at $17.5 billion, making him the twenty-fourth-wealthiest man in the world.

David Koch has been a benefactor of cancer prevention causes since his successful bout with prostate cancer in 1995. In 2006, he endowed the David H. Koch Cancer Research Building at Johns Hopkins University with a donation of $20 million, and he served on the board of directors of the Prostate Cancer Foundation. A $100 million gift to his alma mater, MIT, was used to construct the David H. Koch Institute for Integrative Cancer Research. Another alma mater, Deerfield Academy, received a $68 million gift to finance the construction of the Koch Center for mathematics, science, and technology. The philanthropist is a major contributor to the Public Broadcasting Service (PBS) science program *Nova* and donated $20 million to the American Museum of Natural

The David H. Koch Theater at Lincoln Center

David H. Koch, co-owner and executive vice-president of Koch Industries, in 2006 announced a gift of $100 million to be allocated over a ten-year period for renovation, operation, and maintenance of the New York State Theater at Lincoln Center. Subsequently, the theater was renamed the David H. Koch Theater in honor of the billionaire industrialist's gift. The theater, which occupies the south side of the main plaza at Columbus Avenue and Sixty-third Street, is home to both the New York City Ballet and the New York City Opera.

The New York State Theater was designed by influential American architect Philip Johnson, with the assistance of Richard Foster, as part of New York State's participation in the 1964-1965 World's Fair. The state and the city each made contributions estimated at $15 million for the theater's construction. The building ultimately took two years, fifty-two subcontractors, one thousand construction workers, and $19.3 million to complete. After the fair, ownership of the theater was transferred from the state to the city of New York.

The beaded curtain covering the glass windows at the front of the theater contains eight million metal balls, one for every New York City resident at the time of its construction. Examples of modern art, including works by Jasper Johns, Lee Bontecou, and Reuben Nakian, decorate the theater lobby. The theater accommodates 2,575 in a continental-style seating arrangement on the orchestra level, four main balconies, and a small balcony ring.

The New York City Ballet (NYCB) was founded in 1948 by George Balanchine and Lincoln Kirstein, with Leon Barzin as musical director and Balanchine and Jerome Robbins as founding choreographers. In 1964, the company took residence in the New York State Theater, which architects Johnson and Foster had designed to Balanchine's specifications. NYCB has a second permanent venue at the Saratoga Performing Arts Center, in Saratoga Springs, New York. Under the decades-long inspiration of Balanchine and Robbins, NYCB introduced innovative works and expanded its repertoire, which became the largest of any American ballet company. Peter Martins, who began his association with NYCB as a dancer in 1967, shared ballet master duties with Balanchine, Robbins, and John Taras in the 1980's and became sole director of the company in 1990.

The New York City Opera since its inaugural performances in 1964 has offered its audiences a wide-ranging repertory from many periods of music history, including twenty-nine world premieres and sixty-one New York or American premieres of notable operas. A leading advocate of new talent, the opera company has helped launch the careers of thousands of singers, including José Carreras, Plácido Domingo, Renée Fleming, Bejun Mehta, Beverly Sills, and Tatiana Troyanos. In 1983, the New York City Opera became the first American company to use supertitles, opening the opera experience to a wider audience. The company's education programs introduce students to English-language versions of operas.

History in 2006 to finance construction of the David H. Koch Dinosaur Wing. His gift of $100 million to the New York State Theater at Lincoln Center was the largest single donation in the performance site's history. The David Koch Hall of Human Origins at the Smithsonian Institution opened on March 17, 2010.

In May, 1996, longtime bachelor David Koch married thirty-two-year-old Julia Flesher, originally from Conway, Arkansas, at his home in Southampton, Long Island, New York. The ceremony was performed by the dean of the Cathedral of St. John the Divine. The bride, a former model, who, as an assistant to fashion designer Adolfo had dressed First Lady Nancy Reagan in the designer's clothes, is known as a fashion leader. Julia Koch joins her husband in frequent and successful fund-raisers for cultural events and charitable causes. In 1998, the Kochs moved into the Fifth Avenue apartment previously owned by Jacqueline Kennedy Onassis, for which Koch paid $9.5 million; in 2003, the family, along with Julia's mother and three nannies, moved into a $17 million apartment at 740 Park Avenue. David and Julia Koch have two sons and a daughter and maintain additional homes in Palm Beach, Florida, and Southampton.

Legacy

Koch Industries, Inc., for which David Koch serves as executive vice president, has grown from a small engineering and oil company cofounded by his father in the 1920's into a multibillion-dollar international enterprise with dozens of subsidiaries and tens of thousands of employees in scores of countries. Koch has championed conservative causes for decades and was a vice presidential candidate on the Libertarian Party ticket in 1980. Since then, the billionaire has influenced the political agenda of the Republican Party. His gifts to medical, educational, and arts institutions have broken previous records and often shaped the futures of recipient institutions.

Uncovers the workings of the "Kocktopus," David and Charles Koch's network of organizations supporting libertarian and conservative causes and ardently opposing President Barack Obama's health care, environmental reform, and economic stimulus policies. Describes how the brothers have often covertly poured hundreds of millions of dollars into this network.

Ivar Kreuger

Swedish industrialist

Kreuger was one of the richest men in the world during the early twentieth century. His wealth, derived primarily from international match monopolies, was several hundred million dollars, equal to about $75 billion in 2010. However, he dissipated his personal fortune and that of his companies by perpetuating one of the largest financial frauds in history.

Born: March 2, 1880; Kalmar, Sweden
Died: March 12, 1932; Paris, France
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Dissipated

Early Life

Ivar Kreuger (EE-vahr KREW-gehr) was born on March 2, 1880, in Kalmar, Sweden. After high school, he studied engineering in Stockholm. Attracted by the wealth of New York City, Kreuger moved there in 1899 and worked for a construction firm. He helped build many city landmarks, including Macy's department store, the Flatiron Building, and the Plaza Hotel. Tired of enriching others, Kreuger returned to Sweden and formed a construction company with Paul Toll in 1908.

First Ventures

Kreuger & Toll incorporated in 1911 and contracted to build Stockholm's first skyscraper, a six-story department store. They committed to pay $1,200 per day if the work was not finished in four months and to receive $1,200 per day if completed early. Kreuger arranged a system of tarpaulins, searchlights, and heating facilities, letting work proceed around the clock. The project was completed in two months, generating a $70,000 bonus.

To expand his wealth, Kreuger became involved in his family's safety match business and began acquiring competing firms in 1913. In 1917, he purchased his main competitor and developed a match monopoly in Sweden.

Mature Wealth

Competition from countries with cheap labor was a perennial problem, so Kreuger sought to obtain an international match monopoly. His agents posed as buyers, making low bids for companies. Kreuger then made a better offer, which was usually accepted since it looked good in comparison. When he owned several factories in one country, he would shut them down, building one efficient factory to destroy the remaining competition. Frequently, Kreuger paid royalties to governments in return for a match monopoly. Usually, he also lent the government money by purchasing its bonds, and he would pay for the bonds by borrowing from banks and floating stock. Kreuger formed two holding companies—Continental Investment Corporation and the International Match Corporation. In the 1920's, the companies owned plants that produced two-thirds of the world's matches and their stock was among the most widely held in the world.

Sadly, Kreuger's empire rested on shaky foundations. His accountants knew little accounting, and Kreuger refused to let them audit his books. There were no independent directors to supervise his activities, so Kreuger was able to overstate sales and buy his own stock to support its price. He made a deal with the Polish finance ministry, and when the nation's legislature rejected it, Kreuger pretended that the deal went through, giving investors an overblown picture of company earnings potential. After a deal with Italian leader Benito Mussolini fell through, Kreuger counterfeited forty-two Italian bonds, each with a face value of £500,000 and a forged signature of the Italian finance minister.

In 1929, when the stock market crashed, Kreuger's stocks kept their price because they paid high dividends and he bought his own stock on margin. However, these tactics required new money, and banks and investors had little money available. To obtain funds, Kreuger used his government bonds as collateral for loans and then as collateral for additional loans.

In late February, 1932, Kreuger had debt payments due, and he had to make stock dividend payments on March 1. His employees pressed Kreuger to sell the phony Italian bonds for cash.

With his empire collapsing, on March 12, 1932, Kreuger committed suicide in his Paris apartment by shooting himself. Stock in Kreuger's companies plummeted after he killed himself and was soon selling for just pennies.

Legacy

Shortly after his suicide, an audit uncovered the counterfeit Italian bonds and revealed that many assets on Kreuger's books were worth less than their stated value. His companies were $1.2 billion in the red and they declared bankruptcy, which at the time was the largest bankruptcy in history. Kreuger himself was $265 million in debt.

It is still unclear where all the money went. Kreuger spent money lavishly on others, attempting to impress them. He had mistresses in most major European cities, and he wined and dined famous women, such as film star Greta Garbo. However, this accounts for just a fraction of the losses. Attempting to prevent the sort of fraud that Kreuger perpetuated, Congress made the public accounting profession responsible for auditing the financial reports of companies, and the New York Stock Exchange requires audits of all new listings and periodic audits of all public companies.

Joan Kroc

American philanthropist

Kroc inherited her wealth from second husband Ray Kroc, president and owner of McDonald's Corporation. She used the money to fund antiwar, disarmament, social, and cultural institutions, primarily in the United States and focusing heavily on San Diego, California.

Born: August 27, 1928; West St. Paul, Minnesota
Died: October 12, 2003; San Diego, California
Also known as: Joan Beverly Kroc; Joan Beverly Mansfield (birth name); Saint Joan of the Arches
Sources of wealth: Marriage; sports franchise
Bequeathal of wealth: Charity; educational institution

Early Life

Joan Beverly Kroc (krahk) was born Joan Beverly Mansfield, the daughter of a railroad worker father and a musician mother. She studied at the McPhail School of Music in Minneapolis, Minnesota, and at the age of fifteen she began teaching music at the California State Capitol Museum. She married Roland Smith in 1945, and with him had her only child, a daughter.

In 1958, she was playing piano at a bar in St. Paul, Minnesota, when Ray Kroc came in. He found her beautiful, according to his biography, and allegedly they began a secret affair that lasted for six years. Neither Kroc nor Mansfield was willing to divorce until 1963, when Kroc finally divorced his second wife, expecting to marry Mansfield. Instead, she ended her affair with Kroc for the next six years. In 1969, Mansfield divorced Smith, went to a national conference of Kroc's company, McDonald's Corporation, and reconnected with Kroc, whom she married later that year.

First Ventures

Although Joan Kroc enjoyed the rich lifestyle afforded her by her husband's wealth, buying yachts, airplanes, and houses, she quickly turned her efforts to supporting and creating charitable institutions about which she felt strongly. However, in 1976, becoming bored with simply being on the boards of various charities, Kroc founded Operation Cork, designed to help family members of alcoholics, as well as the alcoholics themselves. The organization provided publications and access to information for people needing help dealing with the problems of alcoholism. In 1978, Operation Cork founded Project Cork at Dartmouth University. Project Cork is a clearinghouse for medical and professional information about alcoholism and drug addiction and is designed to maintain easily accessible, current information on treatment and pathology of these conditions.

Mature Wealth

Joan Kroc's charitable inclinations flourished in 1984, after Ray Kroc died and left her a fortune of approximately \$1.7 billion and ownership of the San Diego Padres baseball team, which placed her on the *Forbes* magazine list of the richest people in the world. Although she knew little about sports management, Kroc took over control of the Padres, and the team won its first National League pennant that year. After managing the team for six years and creating the first assistance program for baseball players and other team employees with addiction problems, Kroc attempted to donate ownership of the Padres to the city of San Diego, which would enable the city to use the money it earned from the team for civic uses. However, the baseball commissioner disallowed this donation, and Kroc sold the team in 1990 for $75 million. While owner of the Padres, Kroc funded many local San Diego and national charities, such as the Salvation Army, of which she was a loyal and generous supporter.

After selling the Padres, Kroc devoted her full time to philanthropy. Preferring to donate her money anonymously, she liked to surprise organizations with large sums of money. Many times she explained that giving away money made her happy and knowing that people did not expect it made it even more fun. Her style of giving was predicated on learning about and assessing people and organizations in need. She would not give funds to any organization that sought her out or tried to solicit money from her. Instead, she liked to be moved by a pressing need and try to help. For example, while watching the television news and learning of the devastating floods occurring in Grand Forks, North Dakota, she flew to the region and anonymously donated $15 million to be given directly to the citizens displaced by the floods.

Although she made donations to many groups, she had a particular interest in organizations involved in developing world peace, disarmament, cultural activities, and community-based facilities, especially for the disenfranchised and for children. She was a lifelong Democrat and donated money to candidates and causes affiliated with the Democratic Party, only once contributing to a Republican.

Joan B. Kroc Institute for International Peace Studies, University of Notre Dame

In 1986, Joan Kroc founded the Joan B. Kroc Institute for International Peace Studies at the University of Notre Dame, a predominantly Catholic institution. After meeting with the Reverend Theodore M. Hesburgh, who, like Kroc, was staunchly antinuclear and pro-disarmament, Kroc gave $6 million to enable Notre Dame to start a peace studies program. The program would eventually offer courses and degrees in peace studies for both undergraduate and graduate students. In 1970, Kroc gave another $6 million to build the Hesburgh Center for International Studies. Upon her death in 2003, she bequeathed $50 million to the program and institute—the largest single donation ever made to Notre Dame.

In 1998, Kroc founded the Joan B. Kroc Institute for Peace and Justice at another Catholic school, the University of San Diego, with a gift of $25 million. Like its predecessor at Notre Dame, this institute was designed to develop world leaders committed to a nonviolent future. It was Kroc's intention to provide an academic home for a facility dedicated to creating peaceful solutions to world crises. She wanted people to be educated, informed, and able to create actual change in the world. Her guiding principle was that people should first talk about peace and then go forth into the world to implement peace and justice. The institute began operating in 2000, featuring a lecture series, publishing opportunities, conferences, and educational experiences, all of which were designed to create future peacemakers. In 2007, the University of San Diego was able to open the Joan B. Kroc School of Peace Studies, which encompasses the Joan B. Kroc Institute for Peace and Justice and offers a master's degree program in peace and justice studies.

Although based in Catholic universities, both institutes are ecumenical, calling on people from all countries and faiths to join together to develop peace- and justice-based solutions for terrorism, armed conflict, the arms race, nuclear proliferation, and other problems derived from conflict. The institutes conduct studies of the effects of war and terrorism and grant degrees to students, who are required to serve a yearlong internship in a conflict-ridden area, such as Israel, Northern Ireland, Gaza, and South Korea.

In 1985, the Joan B. Kroc Foundation gave $18.5 million to create the San Diego Hospice, the first of Kroc's enormous long-term charity projects. In 2002, she endowed the Salvation Army in San Diego with $87 million in order to build the Kroc Center, a large educational and recreational facility in San Diego. Other San Diego organizations that experienced her largesse include the San Diego Zoo and the San Diego Opera, and she made funding available to the University of San Diego for student loans. Other groups, including the University of Notre Dame, the St. Vincent de Paul Kroc Center for the Homeless, National Public Radio, the Special Olympics, the Helen Woodward Animal Center, the Betty Ford Center, and the Salvation Army, also received substantial amounts of support from Kroc. She funded Ronald McDonald House Charities, in honor of her husband, and she is credited with a $50 million contribution, the largest single-source donation ever made to these charities. She also donated $5 million to acquired immunodeficiency syndrome (AIDS) research.

Joan Kroc died of brain cancer at her home in Rancho Santa Fe, a suburb of San Diego, California, on October 12, 2003. At her death, she left a long list of bequests to her favorite charities, including $225 million for National Public Radio (NPR)—the single largest gift ever made to a cultural institution. Not expecting the money, NPR officials were concerned that the size of this bequest would discourage regular listeners from donating, hurting the organization in the long run. Kroc left NPR an endowment in order to thank the radio network for its coverage of the Iraq War, which she strongly opposed; she believed that NPR was the only media organization telling Americans the truth about the conflict. She also left the Salvation Army $1.8 billion—the largest individual charitable contribution ever made. This bequest was intended to build more community centers based on the design of the Joan B. Kroc Center in San Diego; Kroc's will required that these centers be constructed throughout the United States. Kroc also endowed two major centers for the development of world peace and understanding, a cause dear to her heart: the Joan B. Kroc Institute for Peace and Justice, at the University of San Diego, and the Joan B. Kroc Institute for International Peace Studies, at the University of Notre Dame.

Legacy

Joan Kroc, affectionately known as Saint Joan of the Arches, was a generous benefactor to many organizations. She believed in supporting groups that worked to help people achieve balanced and productive lives. She allocated her resources to try to create world peace and improve world health. Although many benefactors have made considerable donations to these types of charities, Kroc's legacy is her special style of giving. She did not wait until her death to dole out her money. Insead, by giving large sums during her life, she ensured that the organizations did not have to pay inheritance taxes, providing them with the greatest use the donations could afford. She did not require that her funds be used to set up long-term annuities, which is a condition of most large donations. She gave her money for immediate use, so that the groups she supported could achieve concrete and immediate goals.

Ray Kroc

American fast food magnate

Starting in his fifties, Kroc built an international multibillion-dollar fast food company, McDonald's Corporation. The company took advantage of social changes in American life and grew so large that the company altered the nation's diet.

Born: October 5, 1902; Oak Park, Illinois
Died: January 14, 1984; San Diego, California
Also known as: Raymond Albert Kroc
Source of wealth: Sale of products
Bequeathal of wealth: Spouse; charity

Early Life

Raymond Albert Kroc (krahk) was born on October 5, 1902, in Oak Park, Illinois. He dropped out of high school to embark on a sales career in the food service industry. His career was marked by consistent success, coupled with a burning desire to take on new challenges.

First Ventures

As a young man, Kroc sold paper cups to restaurants and drugstores in the Midwest. He encountered resistance from store owners who had invested in glassware. In order to win them over, Kroc had to show them that paper cups were much more cost-effective in the long run. This began his fascination with cost analysis, which would be his major contribution to the fast food industry. He then went to work for a manufacturer of multimixers—products used to make several milk shakes at a time. He was such a successful salesman that he eventually bought the multimixer company.

Mature Wealth

By 1954, Kroc saw that the market for multimixers was in steady decline. His primary market, drugstore soda fountains, was quickly disappearing as the pace of American life changed. Independent drugstores had

been fixtures in cities and small towns, but post-World War II growth was occurring in American suburbs. Kroc constantly monitored his sales and noticed an unusual demand for his mixers from a fast food operation in San Bernardino, California. Kroc visited this restaurant, which was run by two brothers, Richard and Maurice McDonald. Kroc became convinced that their type of fast food restaurant had unlimited nationwide potential. He entered into negotiations with the McDonalds, whose efforts to expand had failed. Kroc opened a McDonald's restaurant in Des Plaines, Illinois, in 1955.

The early years were fraught with obstacles and setbacks. The McDonald brothers did not share Kroc's expansive vision and were careless about the legal intricacies of franchising. Kroc was a master salesperson, but he lacked the financial acumen needed for rapid growth. In a few years, Kroc had set up a leadership team headed by Harry Sonnenborn and Julie Martino, and steady growth began at the cost of major sacrifices by Kroc, including the end of his first marriage.

Kroc formulated the core values of McDonald's restaurant chain: The chain would provide inexpensive food in a family-friendly atmosphere, with high standards of service and food quality. His sales background prompted him to offer extensive support to his franchises, unlike most chains, which viewed franchises simply as a source of revenue. Kroc never hesitated to terminate suppliers who cut corners on quality. He was also intensely loyal to cooperating suppliers. Some of them, like Interstate Bakery and J. R. Simplot Company, an agribusiness company that supplied Kroc with potatoes, grew into major corporations in their own right as a result of their associations with McDonald's.

Along with product quality, Kroc made product innovation a key to McDonald's success. The chain's original hamburger, fries, and shake were joined by the Big Mac, Quarter Pounder, and fish sandwich. Kroc's major product introduction was the launch of a national breakfast menu in 1977. Since then, millions of Americans have made a morning trip to McDonald's to purchase the chain's breakfast items. Not all the new products caught on, and Kroc was personally responsible for some of the flops, such as strawberry shortcake and pound cake. However, his insistence that innovation was key to success became part of the McDonald's corporate culture.

After 1969, Kroc reduced his role in the corporation's day-to-day operations but never truly retired. He would watch a nearby franchise through binoculars, and his observations led the company to add a second drive-through window at the stores. He lectured frequently and embarked on charity work in the areas of diabetes and arthritis research. Well into his eighties, he was living an active life until two strokes finally slowed him down in the year before his death in 1984.

Legacy

Ray Kroc established a model for the fast food business that has been widely copied. For most of his adult life, his McDonald's Corporation was the face of fast food in America. The consistent growth of his restaurant chain continued after his death.

Pundits and historians will argue endlessly about the impact of Kroc's innovations on American lifestyle and diet. On the plus side, McDonald's provides inexpensive food and consistent quality. Although it was not a Kroc innovation, the Ronald McDonald House Charities, which began in Philadelphia in 1974, are a model of corporate service to the community. On the negative side, however, the nutritional value of fast food has drawn increasing scrutiny over the years, prompting the company to add healthier menu items and to work to change its image in the twenty-first century. The one thing that seems certain is that the McDonald's Corporation will continue to change in the spirit of its dynamic founder, Ray Kroc.

Alfred Krupp

German industrialist and steel magnate

Krupp expanded his father's small steel production shop into one of Germany's largest family-run industrial firms, which played a key role in the industrialization of nineteenth century Germany. Krupp also became a major supplier of armaments to countries in Europe and to other nations, and his company's munitions business increased dramatically under his successors.

Born: April 26, 1812; Essen, Grand Duchy of Berg (now in Germany)
Died: July 14, 1887; Essen, Germany
Also known as: Alfried Krupp (birth name)
Sources of wealth: Steel; manufacturing; sale of products
Bequeathal of wealth: Children

Early Life

Alfred Krupp (kroop) was born on April 26, 1812, in Essen in the Grand Duchy of Berg (now in Germany). He was the oldest of four children born to Friedrich and Theresa Krupp. Krupp was tutored by a private teacher until he entered the Gymnasium (humanistic high school), which focused on classical studies. In early 1826, his father, who was in ill health and struggling to save his small steel forge in Essen, took Krupp out of school and taught him about steel production. Krupp's father died six months later, and the fourteen-year-old Krupp had to assume responsibility for helping his mother salvage the bankrupt shop. Krupp wrote a letter for his mother, who could not write High German, in which she announced that her eldest son knew how to make steel and would continue the business. Later in life, Krupp noted that his mother taught him more about the steel business than his father.

First Ventures

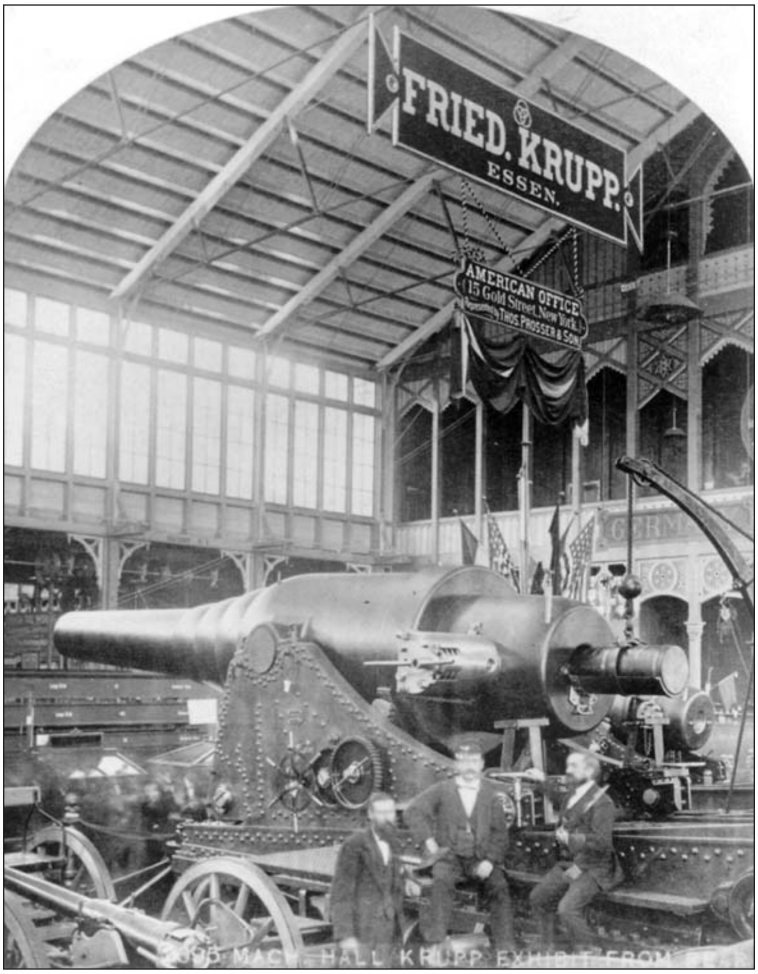
Friedrich had left a debt of 10,000 talers. With the help of her family, Theresa was able to save the steel forge for Krupp and his three siblings. With a workforce of seven people and the assistance of his brothers Hermann and Friedrich, Krupp was limited to the production of steel files, tools, and unfinished steel rollers. Krupp decided to focus on producing finished steel rollers for government mints and for fork and spoon production. In 1831, he visited the south German states and was able to sell his steel rollers to silversmiths. Four years later, he purchased a steam engine to ensure a steady power supply. Krupp was able to obtain small orders for steel rollers from French and Dutch mints. In 1834, the Prussian tariff union, a group of eighteen German states, also promised new markets for his products.

In 1838-1839, Krupp traveled to England and France for fifteen months in order to study steel production. Three years later he was able to establish a spoon and fork factory in Berndorf, Austria. His sales increased, but the economic crisis of 1846-1848, which affected all of Europe, threatened to destroy his accomplishments. His labor force decreased from 128 to 74 workers by 1848. In order to survive the crisis, he used his personal funds, and he received a Russian order for spoon and fork rollers. Theresa consolidated the management of the business by making Alfred the sole owner of the Friedrich Krupp steel factory in February, 1848.

Mature Wealth

Krupp was able to increase his workforce between 1847 and 1857 from seventy-six to more than one thousand employees. The key to Krupp's rapid expansion after 1848 was the massive railroad construction. Between 1852 and 1873, the German rail network increased from four thousand to twenty-four thousand miles. In the 1860's and 1870's, more than half of the Ruhr industrial region's iron and steel output was consumed by rail construction. Krupp was able to demonstrate the quality of his steel at the 1851 London World's Fair, where his two-ton steel ingot received a medal and newspaper publicity. This ingot also impressed Prince William of Prussia, the future Kaiser William I, who visited the Krupp works in July, 1853. The most significant development for the future of Krupp's business came in 1853, when Krupp obtained a patent for a seamless rail tire, or wheel. This invention became particularly important after the adoption of the Bessemer steel production methods, which made steel affordable for mass railroad construction.

Krupp's business was not much affected by the 1857 recession, since he had state rail contracts, and in 1859 he obtained his first Prussian order for steel weapons. In 1861, Krupp built a fifty-ton steam hammer named Fritz, and a year later he constructed the first Bessemer steelworks in Germany. By the 1860's, the Krupp firm had become the largest producer of cast steel on the continent of Europe. By 1864, the firm had sold twelve thousand steel axles for railroads, and after that year thousands of the axles were produced annually for German and world markets. The firm's rail tires were even more successful. Krupp started producing 7,800 steel wheels a month; by 1912, his factory turned out 2.75 million. Krupp



Krupp Works displayed its products at the 1893 Chicago World's Fair. The center of the exhibit was a massive wheeled cannon. (Library of Congress)

Krupp's Colonies of Workers' Settlements

Alfred Krupp was both an authoritarian and a paternalistic industrialist of Essen, his hometown and the headquarters of his company. In a letter written in 1866, Krupp noted that people would benefit from secure housing, and four years later Krupp wrote of the need to convince his workers that he was doing everything possible for them. His social programs for his workers, which included health and pension insurance and massive housing projects, were based upon three motives: He wanted to secure the recruitment of new workers for the Krupp factory. He wished to retain his trained, long-term workers (*Stammarbeiter*). Finally, he provided programs to ensure the loyalty of his workers and make them immune to pressures from a growing labor movement. He was particularly concerned about the influence of socialist organizations.

The housing issue was most crucial for Krupp, and the resolution of this problem was the key component of his welfare system for his workers. The population of Essen increased from seventy-two hundred to fifty thousand between 1850 and 1870, and much of the increase was due to Krupp's demand for workers. Krupp's firm hired more than seven thousand new employees in the 1860's, who together with their families totaled between twenty-five thousand and thirty thousand people. During this decade, living conditions for these workers were miserable. For example, in one district of Essen in 1864, about twenty-four people were crammed into each house. This congestion was unhealthy and contributed to a cholera outbreak in 1866. The Krupp firm noted that the workers and their families were most affected by the illness.

The city of Essen did not address the housing problem, but Krupp did. Krupp first constructed ten homes for his master workers, and beginning in 1856 he also started to provide hostels for single employees. Between 1870 and 1873, the Krupp workforce increased by forty-five hundred employees. In response, a massive workers' colony with twelve hundred apartments was constructed along the Freistattstrasse and additional colonies were built in the suburb of Altendorf. About 75 percent of the housing that Krupp constructed was located in Altendorf, and about one-third of his employees lived in this area.

The housing construction program was completed in 1876, and it resulted in 3,277 new homes and apartments, with an average of seven people living in each Krupp home. Krupp's housing projects also contained a company consumer store, post office, beer hall, and park. Hospital, school, and church facilities were also provided in order for workers to identify with the firm. By early 1874, the Krupp firm had spent $10.5 million marks on social programs for its workers. Krupp provided affordable and healthier housing, but he also used housing monitors to control the behavior of his workers. These monitors reported on the newspapers the workers read and whether they supported the socialists. Workers who were fired lost their housing privileges. Ironically, the Krupp housing project was praised by the socialist newspaper *Duisburger Freie Zeitung*, and Krupp faced comparatively fewer major strikes than other firms. Krupp, however, could not stem the tide of organized labor, which in 1877 elected a former Krupp worker from Essen to serve in the Reichstag.

not only supplied the German rail market with steel but also furnished the rail industries in the United States, Russia, China, Venezuela, and the Far East. The company in 1875 adopted as its firm's symbol three wheels placed on top of each other.

The firm's success was reflected in the growth of its labor force. Between 1861 and 1865, the workforce expanded from 2,108 to 8,248 employees and the company's gross production value increased almost fourfold. Krupp introduced new methods of making steel in order to meet various market demands, including the Siemens-Martin process, which produced better steel than that originating from the Bessemer process. To meet the various steel demands and remain aware of new discoveries, Krupp built four steel production works in fifteen years. He also retained his interest in armaments. Krupp sold fifteen hundred cannons between 1847 and 1877, but between 1877 and 1889 the number increased to nine thousand cannons sold to various countries. Already in 1864, a Berlin newspaper called Krupp "the king of cannons." However, Krupp never earned more than one-third of his total sales revenue from the sale of weapons.

Krupp also established a vertical and a horizontal monopoly by purchasing coal and iron mines, a shipping line to transport the raw material, and steelworks to control production and competition. The economic recession of 1873-1874 had a particularly harsh impact on Krupp because the firm had expanded too rapidly. To Krupp's consternation, he had to obtain a loan from a bank consortium organized by Prussian authorities. By 1887, he had repaid the loan, one year before it was due, and his labor force of twenty thousand made Krupp's company the world's largest steel-producing firm.

Krupp always subordinated his private life to his business activities. He married Bertha Eichhoff in 1853, but Krupp admitted that his real bride was his factory. His wife liked to live in resorts and spas outside Essen. The couple's only child, Friedrich Alfred, nicknamed Fritz, was born on February 17, 1854, in Essen, and he began participating in his father's business in 1875. Krupp was a stern and apparently cold father who would not allow Fritz to study science at a university. At age twenty, Fritz traveled to Egypt for his health, but his father was more interested in information about Egyptian railroads. In his will, Krupp stipulated that Fritz, his heir, could not use the firm's income for personal enrichment but had to use these funds to expand Krupp industries. Krupp built a mansion for his wife, the Villa Hügel in Essen, but his wife left him and moved to Leipzig in 1882. When Krupp died of a heart attack on July 14, 1887, he was alone, except for his valet.

LEGACY

Alfred Krupp created one of the largest family-controlled industrial firms in Germany. His company played a key role in the early industrialization of the Prussian Rhineland provinces and later contributed to the phenomenal economic growth of a united Germany after 1871. His son Fritz doubled the firm's labor force between 1887 and 1902 and increased the value of the company's transactions by almost 150 percent.

Because of Krupp's interest in selling his steel products to the military, the Krupp name became synonymous with the arms trade and with supplying Germany with armaments during the two world wars. Krupp's firm profited from arms production, but under Krupp's leadership only 36 percent of the total business depended on the sale of war material. Moreover, between 1875 and 1891, 82 percent of Krupp's war material was sold to foreign countries. The Krupp company survived Germany's defeat in two world wars and the trial and conviction of Alfried Krupp von Bohlen und Halbach for war crimes in 1948. However, because of major financial problems in the late 1960's, the firm was transformed from a family company into a public stock company.

Bertha Krupp

German industrialist

For nearly half a century, Krupp was the wealthiest person in Germany, inheriting her father's vast industrial empire when she was only sixteen. Krupp's company was the driving force in arming Germany in two world wars, and by the twenty-first century it had merged with Thyssen AG to become one of the world's leading steel producers.

Born: March 29, 1886; Essen, Germany
Died: September 21, 1957; Essen, West Germany (now Germany)
Also known as: Bertha Krupp von Bohlen und Halbach
Sources of wealth: Inheritance; steel; manufacturing
Bequeathal of wealth: Children; relatives

Early Life

Bertha Krupp (BUR-thuh kruhp) von Bohlen und Halbach was born on March 29, 1886, at the Villa Hügel, the three-hundred-room Krupp castle in Essen, Germany. The Krupps first settled in Essen in 1587 and made a huge fortune as arms manufacturers for the king of Prussia. Krupp armaments helped Prussia unite Germany under its auspices in 1871 following three different wars fought during the previous seven years. Bertha was the first child of Friedrich Alfred "Fritz" Krupp (1854-1902) and his wife, Margaret (1854-1931), the daughter of the Prussian baron August Freiherr von Ende. Bertha's sister Barbara was born in 1887. The family had no other children, and the lack of a male heir became a major problem for the Krupp industrial dynasty.

Friedrich Alfred Krupp, a financial genius, saw his business quickly increase, the result both of the rapid expansion of the German navy in order to challenge Britain's dominant position and of the royalties the Krupp firm received from the specialized armor plate produced by arms manufacturers worldwide. On November 22, 1902, after playing with his two daughters, Friedrich retired to his bedroom and put a bullet in his head. One week before, the Socialist magazine *Vorwärts* had written an article exposing Friedrich's sexual liaisons with local boys and men, as well as with boys obtained from Capri, Italy, and transported to the Bristol Hotel in Berlin.

After her father's suicide, almost all of the Krupp corporate shares were inherited by Bertha, who was now responsible for the more than sixty-three thousand workers who depended on Krupp armaments and steel manufacturing for a living. Bertha's sister Barbara received a large cash settlement but was accorded no ownership role in the company. As specified in Friedrich's will, the family business was converted into a stock corporation in 1903, when it became known as Friedrich Krupp AG. After the conversion, Bertha owned all but a fraction of the firm's shares. However, until she turned twenty-one, the company's profits would belong to her mother.

Although Bertha could own a megacorporation, it was not acceptable in early twentieth century Germany even to fantasize that a woman could direct one. It soon became the responsibility of Kaiser William II of Germany to find a suitable husband for Bertha who could manage the industry upon which much of German military power depended. In the spring of 1906, Bertha was sent to Rome to meet the counselor to the Prussian delegation at the Vatican, Gustav von Bohlen und Halbach (1870-1950). Gustav's mother was the daughter of Henry Bohlen, a U.S. Civil War brigadier general who was killed in battle in 1862. She had married a wealthy German aristocrat who made a fortune in Philadelphia and then decided to return to Germany. Bertha did her duty for country and corporation and accepted the rapid marriage proposal of Gustav, who was sixteen years her senior and a classic case of an obnoxious obsessive-compulsive personality, particularly as it related to punctuality and efficiency. He was also a head shorter than his wife, which made their appearance together in public a bit embarrassing.

First Ventures

Bertha and Gustav were married at Villa Hügel in a wedding presided over by Kaiser William II and attended by everyone who mattered in the German military. At the end of the wedding, the kaiser granted Gustav the right to bear the name Krupp von Bohlen und Halbach and to pass on this name to his successors as owners of the company. However, the kaiser challenged Gustav to be worthy of the name Krupp. After the wedding Gustav was appointed to the supervisory board of Krupp AG, which he chaired from 1909 until the end of 1943. Within a year after their marriage, a son, Alfried (1907-1967), was born to the newly married couple, and the kaiser gladly accepted the honor of being godfather. The couple had seven other children, but only Alfried was legally permitted to bear the surname Krupp.

During their marriage, Bertha functioned as a kind of queen of the Ruhr Valley, with her husband Gustav playing the role of prince consort. She presided over numerous honorary functions both in Essen and at the factory. An annual gathering of workers was held at Villa Hügel, at which Bertha pinned silver and gold trademark medals on the lapels of employees who had worked for the firm for twenty-five and fifty years, respectively. She conducted numerous factory tours to bolster morale and to remind the workers that she was the person for whom they actually worked. She also became famous in Essen for her charitable works, visiting hospitals and nursing homes to provide support for ailing workers. Although many of her actions may have been token efforts, Krupp workers and their families had genuine affection for Bertha.

Mature Wealth

The outbreak of World War I brought a huge increase in armaments production and a further expansion of the company. In order to fulfill government contracts, Krupp AG's munitions output was doubled in the first year of the war, and by the third year it had reached more than five times its pre-1914 level. The firm constructed many new factories, and the size of its workforce accelerated; by the end of the war, the number of employees totaled 168,000. One of the most famous products of World War I was a mammoth 16.5-inch siege cannon named after Bertha Krupp; Big Bertha could fire a twenty-two-hundred-pound shell with pinpoint accuracy of more than nine miles. A total of twenty-seven of these cannons were built, and at the beginning of the war they were used to decimate Belgian forts, as Germany launched its Schlieffen Plan to capture Paris. At the end of the war, the Allies named Gustav Krupp as one of the German industrialists to be tried as a war criminal, but these trials were never conducted.

Because the manufacture of war-related materials was prohibited under the 1919 Treaty of Versailles, the Krupp company was forced to change its production after World War I. Manufacture of locomotives, motor trucks, and agricultural machinery replaced armaments as the mainstay of the firm's business. The changeover was extremely costly and mandated drastic cutbacks in the company's workforce. However, under the surface the company secretly continued to manufacture arms, especially after the Allied Commission left Essen in 1926, and the firm also planned for a full-scale resumption of arms manufacturing.

During the French occupation of the Ruhr Valley in 1923, Gustav was imprisoned for resisting French orders. For the first time in his life he became a popular figure. However, Gustav was blamed for violent riots, fined 100 million marks, and sentenced to fifteen years in prison. Bertha, who had to suffer the indignity of the French occupation of the Villa Hügel, frequently visited Gustav, who was released after several months.

The Great Depression hit industrial centers hard. More than half of the forty thousand Krupp company workers were unemployed in 1931, and those who were employed usually worked only three days a week. The

The Lex Krupp

Following Gustav Krupp von Bohlen und Halbach's major stroke in 1941 and his evident decline into senility, Nazi Party leader Adolf Hitler began to be concerned about the stability of leadership in the Krupp family's company. With the active cooperation of Gustav and his wife Bertha Krupp, Hitler, Martin Bormann (the chief of the Nazi Party chancellery), and Hans Lammers (the German state secretary) drafted a law transferring ownership of the company from Bertha to her firstborn, Alfried Krupp, who would thereafter manage the company and take the name Alfried Krupp von Bohlen und Halbach. This law, known as the Lex Krupp and signed by Hitler on November 12, 1943, also provided for the conversion of the firm from a publicly traded company to an exclusively family-owned corporation. All of Bertha's corporate shares were transferred to Alfried, as was executive authority for running the company.

After the law was adopted, Alfried played an increasingly active role in the firm's management. He made extensive use of slave labor, closely coordinating his company's employee needs with the availability of workers who were imprisoned in Germany's concentration camps. After World War II, Alfried was tried as a war criminal, charged with engaging in the use and abuse of slave labor and thus of committing crimes against humanity. He was convicted of the offense and sentenced to twelve years' imprisonment, but he was released after only six years.

The Lex Krupp continued to operate as law after the end of World War II. In July, 1967, shortly before his death, Alfried announced that the company, which was heavily in debt, would again become a public corporation. His son Arndt relinquished both inheritance rights and the Krupp name. Hence, the Krupp family's management of the firm ended by 1968. When Arndt died childless in 1986, the Krupp line, established in Essen, Germany, four centuries before, died out as well.

Depression increased prospects for Adolf Hitler's rather obscure Nazi Party. In 1930, he toured the Krupp works without much fanfare. Both Gustav and Bertha regarded him as a lower-class upstart and were taken aback when their son Alfried joined the Nazi Party in 1931. By 1933, recognizing that Hitler was good for business, Gustav's sentiments dramatically changed. Bertha, however, continued to get upset whenever the name "Hitler" was mentioned. The remilitarization of Germany and the outbreak of World War II caused another boom in the Krupps' business, and the use of Jews and other persecuted persons as slave labor during the war dramatically cut labor costs. The Krupp company built a factory named for Bertha, the Berthaworks in Silesia, where Jews imprisoned at the Auschwitz concentration camp produced Krupp howitzer cannons.

During the war, the Krupps were evicted from the Villa Hügel. World War II resulted in the major destruction of the Krupp factories in Essen and of the city of Essen itself. Bertha's son Claus (1910-1940) died in battle during the first year of the war, while another son, Eckbert (1922-1945), died during the last year. A third son, Harald (1916-1985), was captured by the Soviets in 1944 and was held captive for the next ten years. Bertha's eldest son, Alfried, who in 1943 assumed ownership of the Krupp business, was later tried at Nuremberg for war crimes and sentenced to a twelve-year imprisonment. Her husband Gustav was saved from imprisonment by his senility and paralysis from a major stroke.

In 1951, a year after Gustav's death, Alfried was released from prison after serving only six years of his sentence, his early release due in large part to new priorities stemming from the Cold War. Alfried returned to Essen with Bertha, resumed control of the company, and rapidly restored its important role in German industry. Bertha died in Essen in 1957 and is buried next to Gustav in the family crypt outside the city.

Legacy

Bertha Krupp was heir to an industrial empire and the richest person in Germany for more than two generations. Directed first by her husband Gustav and then by her son Alfried, the Krupp corporation armed Germany to fight two world wars that caused the destruction of tens of millions of lives. A matronly and almost queen-like figure, Bertha is still highly regarded in Essen for her concern about the well-being of Krupp workers.

Kublai Khan

Mongolian ruler and military leader

Kublai Khan's name has meant opulence on a grand scale since Marco Polo visited Kublai's summer capital at Shangdu, which Polo called "Xanadu." In the nineteenth century, Samuel Taylor Coleridge added to the city's mystique in his poem "Kubla Khan," in which he describes the "stately pleasure dome" in Xanadu.

Born: September 23, 1215; Mongolia
Died: February 18, 1294; Dadu (now Beijing), China
Also known as: Kubla Khan; Khubilai Khan
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Unknown

Early Life

Kublai Khan (kew-bli kahn) was the second son of Tolui and his Christian wife Sorghaghtani Beki and the grandson of the Mongol emperor Genghis Khan. When Kublai's father, next in line for the throne, died in 1232, the power and accumulated riches from Mongol conquests passed to an uncle, Ogatai.

Kublai's elder brother Mangu succeeded as great khan (ruler) of the Mongols in 1251. Kublai meanwhile governed the empire's eastern territories in China, where he demonstrated great military skill in extending the empire and simultaneously became enamored of Chinese culture. When Mangu died, Kublai claimed the Mongol throne in 1260. Younger brother Arigböge challenged Kublai as ruler, and the siblings fought a four-year civil war until Kublai prevailed and became the great khan.

First Ventures

While Kublai was governing in China, he built a magnificent city called Shangdu, about 180 miles north of the current capital, Beijing. When Marco Polo visited China in the 1270's, he wrote of a palace made of marble and stone capable of housing six thousand guests, covered with gold and silver and decorated with pictures and costly silks. The city contained parklands, statuary, and a zoo.

In 1271, Kublai Khan relocated his capital from Karakorum, Mongolia, to China. The community he chose became known locally as Dadu (great capital) and in Mongolian as Khanbalik (city of the Khan), which grew into the modern city of Beijing. Kublai declared himself emperor of China, establishing the Yuan (Mongol) Dynasty. The last holdout of the previous Sung Dynasty surrendered in 1276, putting all of China in Kublai's hands.

Mature Wealth

As emperor, Kublai Khan lavished untold funds in creating a powerful, Chinese-friendly capital in Khanbalik. He constructed a grand canal, erected public buildings, improved highways, and built thousands of schools. He also passed laws, and he made paper currency the standard of exchange, supplanting coins as the usual medium. He patronized the arts, and he exercised religious tolerance. Eager to show off a Chinese empire that had long remained inaccessible, Kublai Khan encouraged visitors and welcomed travelers like Polo.

While Kublai Khan was an able, benevolent administrator, his ambitions caused disharmony and depleted the state coffers. To support his paper currency and to finance military campaigns, he confiscated gold and silver from private citizens. Hoping to add to his empire, he embarked on ruinously expensive invasions of Burma,

Vietnam, and other surrounding territories. He built gigantic fleets to attack Japan in 1274 and 1280 and Java in 1293, only to see these campaigns fail miserably. He was also forced to quell rebellions or repel hostile invaders in various parts of the empire. When money began to run out, Kublai Khan had more currency printed, a tactic that caused widespread inflation.

Because of his pro-Chinese stance, Kublai Khan lost control of the Mongolian portion of his empire, which would divide into separate clans. Late in his reign, he also lost control of his personal life. In 1281, his favorite wife died. Four years later, his son Zhenjin, successor to the Yuan Dynasty, also died. Kublai Khan, already overweight and plagued by gout from his love of rich food, fell into deep depression from the successive tragedies. He spent his last years in a drunken stupor before dying at the age of seventy-eight.

LEGACY

After Kublai Khan's death, the Yuan Dynasty survived for another half century before a series of rebellions brought the Ming Dynasty into power. In 1368, rebels burned Shangdu, and it remained in ruins until a reconstruction effort was initiated in 2002. Early excavations have unearthed the walls of a city more than sixty-six thousand feet on one side. In 2008, China submitted a proposal to the United Nations Educational, Scientific, and Cultural Organization (UNESCO) to make the ruins a World Heritage Site. While Xanadu has been reduced to ruins, the modern city of Beijing remains Kublai Khan's lasting legacy.

JACQUES LAFITTE

French banker, government official, and politician

Lafitte's wealth is significant historically, repeatedly helping to keep the French government solvent in times of crisis. The ascendancy of Lafitte, a carpenter's son, in French society as a result of his ability to become wealthy through his expertise in banking reflects the importance of affluence in France in the nineteenth century.

Born: October 24, 1767; Bayonne, France
Died: May 26, 1844; Maisons-sur-Seine, France
Sources of wealth: Banking; government
Bequeathal of wealth: Dissipated

EARLY LIFE

Jacques Lafitte (jahk lah-FEET) was born in Bayonne, France, on October 24, 1767. He was the son of a carpenter and had nine siblings. Lafitte began work as a clerk in the Perregaux Bank in Paris. He was particularly adept at his work, and in 1800 he became a partner in the bank.

FIRST VENTURES

In 1804, Lafitte replaced Perregaux as president of the bank. Under his leadership, the bank, Perregaux, Lafitte et Cie., prospered and was soon recognized as one of the major banks of Europe. Lafitte's successful management of the bank earned him the positions of regent of the Bank of France in 1809 and governor of the Bank of France in 1814. In the latter year he also became president of the Chambre de Commerce.

As a result of his financial expertise, Lafitte soon became more deeply involved in government affairs. In 1814, he played an important role in financially sustaining the government when Napoleon I abdicated on April 6. Because of his position in the world of banking and finance, Lafitte was able to secure the money needed to keep the government operational. Once again during the chaos of the Hundred Days, from March 20, 1815, to July 8, 1815, Lafitte raised the money that the government needed. By this time, Lafitte had become very wealthy through his astute management of investments. Thus, he made $2 million of his own money available to the government after the defeat of Napoleon at Waterloo.

MATURE WEALTH

As a banker, Lafitte continued to prosper financially. However, he became more involved in the political life of France, and this eventually led to his financial ruin. Lafitte's wealth enabled him to become a member of the Chamber of Deputies. Only individuals paying taxes of more than one thousand francs were eligible to be elected to the chamber. At first, Lafitte primarily made himself heard in regard to financial matters. However, he held liberal views, and as time passed he became more outspoken in defending laws and principles, such as freedom of the press. As a result of his views, Louis XVIII removed him from his position as governor of the Bank of France in 1819, even though in the preceding year Lafitte had averted a financial crisis for the government by purchasing a large amount of its stock.

France continued to be plagued by political turmoil during Lafitte's career. He opposed King Charles X and was a strong advocate of a constitutional monarchy. Consequently, Lafitte was instrumental in the Chamber of Deputies' decision to select Louis-Philippe as head of the government in 1830. Lafitte served as King Louis-Philippe's prime minister and finance minister for more than four months beginning on November 2, 1830. Political unrest continued in France, and Louis-Philippe proved to be more of an absolute monarch than a constitutional one. Disillusioned with the regime, Lafitte resigned his office on March 13, 1831.

Lafitte's political involvement brought about his financial ruin. He spent the next few years settling his accounts, and in 1837 he was able to open a bank. The bank prospered under Lafitte's direction, but he died in 1844, and four years after his death the institution failed.

LEGACY

Jacques Lafitte's expertise in banking and financial affairs strongly affected the government of France, which was in constant political turmoil during the first half of the nineteenth century. Lafitte repeatedly provided the funds necessary to sustain the government during successive crises. As a wealthy individual and a man devoted to his country, he twice achieved stability for the French government by drawing upon his own resources. Thus, he represents the French devotion to *la patrie* (the country).

Edwin Herbert Land

American inventor and industrialist

Land was the founder and major stockholder of the Polaroid Corporation, making him one of the ten wealthiest men in America in the 1960's. He established and endowed the Rowland Institute of Science at Harvard University to provide funding for basic research by a community of scholars.

Born: May 7, 1909; Bridgeport, Connecticut
Died: March 1, 1991; Cambridge, Massachusetts
Also known as: Din Land
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Charity

Early Life

Edwin Herbert Land's parents were second-generation Jewish immigrants from Odessa in the former Soviet Union. Land's father, Harry Land, had a scrap metal business in Norwich, Connecticut. The young Land was fascinated by optical toys, such as the stereoscope, which provides a three-dimensional image by looking through two lenses at two slightly different views of the same scene. While in high school, Land became engrossed by a stimulating book on optical experiments written by Robert Wood of Johns Hopkins University. When he graduated at age seventeen, Land became a student at Harvard University but dropped out after a short time to conduct research on his own.

First Ventures

Land decided to make an intensive study of polarized light, which consists of waves that oscillate in only one plane of vibration. Light was known to become polarized when it passed through a crystal prism, but Land had the idea of doing the same thing with a sheet of plastic embedded with tiny, elongated crystals. The crystals would act like a microscopic lattice fence that would transmit only those vibrations that were parallel to the openings. After many trials, he found that a flexible plastic sheet could be stretched mechanically to place the crystals in parallel rows. He filed his first patent application for this invention in 1929, when he was twenty years old.

To find a market for his invention, Land contacted the Eastman-Kodak Corporation to interest the firm in polaroid filters that would be attached over the lenses of their cameras. The filters would reduce scattered sunlight from the blue sky (which is partially polarized), making the clouds and scenery appear brighter by contrast. His first contract with Kodak, signed in 1934, was for $25,000. His second contract was with the American Optical Company to make polarized sunglasses. By 1936, Land and a business partner had more than fifty employees.

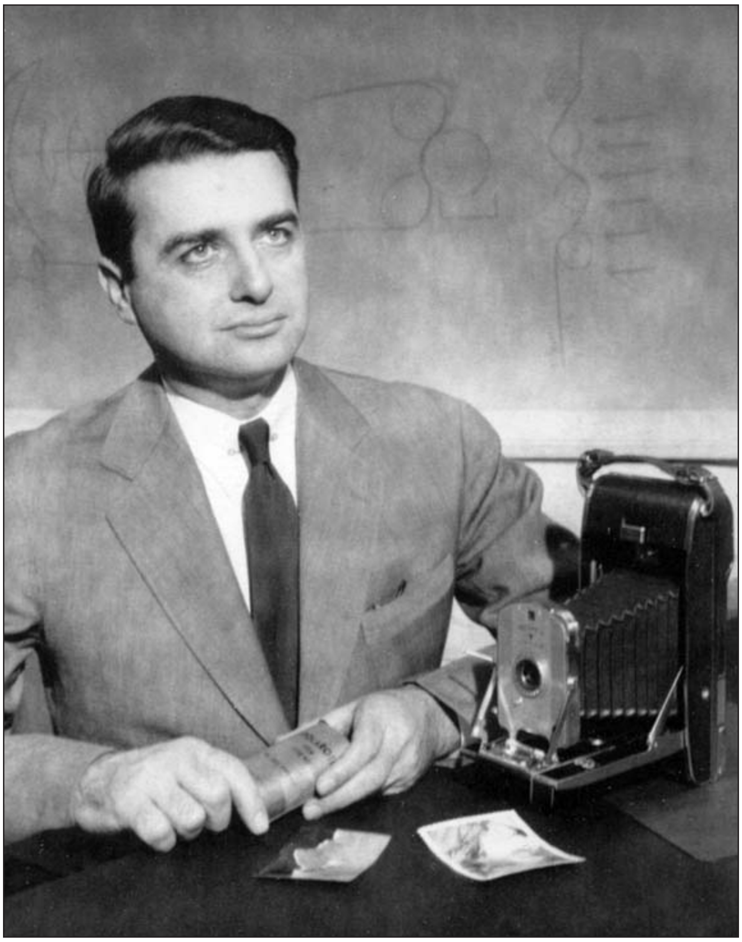
Mature Wealth

Land thought that polaroid sheets could be used to make night driving safer. Accidents often occurred when drivers were blinded by headlights from approaching cars. If polaroid was mounted over the headlights of one car and a second sheet with perpendicular orientation was laminated to the windshield of another car, the headlight glare would not be transmitted to the driver's eyes. To make use of this idea, Land founded the Polaroid Corporation in 1937. A group of Wall Street financiers, anticipating a large potential market, invested $750,000 in the fledgling corporation. However, car production stopped during World War II, and after the war new headlights with a low beam aimed away from oncoming drivers eliminated the need for polaroid filters.

Starting in 1939, American industry began to mobilize for the war effort. Notable contributions by the Polaroid Corporation to this effort included night vision goggles for aviators, lenses made from plastic rather than glass, and a three-dimensional camera for aerial surveillance of terrain for possible landing sites. Polaroid's sales to the military increased from $1 million in 1941 to $15 million in 1945. As the war was ending, Land knew that Polaroid had to come up with a new product in order to stay in business.

One day in 1943, Land had just taken a photograph of his young daughter, when she asked him why he could not show her the picture right away. As Land told the story later, within a few hours he had envisioned all the main components of instant photography. His key idea was to have two layers of film with a packet of chemicals between them. After a photograph was taken, the film sandwich would be pulled out of the camera between two rollers that released the chemicals in order to develop the image. The finished print would be ready in sixty seconds. When this camera went on sale in 1949, Macy's department store sold four thousand in the first week at $90 each. With further research, development time was reduced to ten seconds, the film speed was increased to ASA-3000, and intensive work on instant color film was started.

In the early 1950's, Land approached the film industry in Hollywood about the possibility of making three-dimensional films. To obtain the illusion of a three-dimensional view, two cameras would film the same scene from slightly different angles. The two films would be projected simultaneously through two polarizing filters, one horizontal and the other one vertical. When viewers saw the screen through a pair of oppositely polarized eyeglasses, each eye would see only the picture from one of the two films. The results of this process were spectacular. In 1953, Polaroid supplied more than seventy million pairs of glasses. However, some viewers complained about getting headaches and three-dimensional films were a short-lived novelty. By 1955, the craze was over.



Edwin Herbert Land demonstrates instant photography. Land's Polaroid Corporation began selling instant cameras in 1949. (AP/Wide World Photos)

During the administration of President Dwight D. Eisenhower in the 1950's, there was great concern regarding the Soviet Union's construction of long-range bombers and guided missiles. Information about the size of the Soviet arsenal was unreliable. Land was a member of the science advisory team that recommended high-altitude airplane flights over Russia with a surveillance camera to obtain hard data. He was instrumental in developing the camera that took high-resolution photographs from the famous Lockheed U-2 "spy plane" flying at eighty thousand feet. Land was one of the recipients of the Presidential Medal of Freedom in 1963 and the National Medal of Science in 1968 for his contributions to the U-2 project.

Instant Polaroid cameras with black-and-white film sold very well in the 1950's. Marketing was expanded into some forty countries. Color film, called Polacolor, first went on sale in 1963 with a $5 million advertising campaign. A new camera, with an electric eye to control shutter speed for best exposure, was manufactured for Polaroid by the U.S. Time Corporation (makers of Timex watches.) There was a rumor that Polaroid might produce color televisions or copy machines to compete with Xerox. Although this never happened, Polaroid shares rose to an all-time high on the stock market. In 1966, *Fortune* magazine reported that Land's personal fortune, consisting solely of Polaroid stock, was worth more than $500 million, making him one of the wealthiest men in America.

In 1972, Polaroid introduced an electronically automated camera called the SX-70 that provided photographs with more vivid colors than previous cameras. *Life* magazine published an article about the new camera and film, with Land's photograph on its cover. The company built a $60 million manufacturing facility near Boston and spent $20 million on advertising. However, sales were disappointing because of an economic recession in 1973-1974, and company workers had to be laid off. By 1976, when the recession ended, the SX-70 had become the most popular camera in Polaroid history, with six million sold in one year.

In 1976, Kodak introduced a competing Instamatic camera that sold more than a million units, and Polaroid brought suit for patent infringement. A trial took place in 1981, with Land as the primary witness. The judge ruled in favor of Polaroid, and in 1991 Kodak had to pay more than $900 million in damages, the largest award ever made in a patent infringement case.

After Land retired from Polaroid in 1981, he and his wife sold their four million shares of stock in the company. Most of the proceeds went to the Rowland Institute of Science in Cambridge, Massachusetts, which Land had founded in 1980. After a series of illnesses and heart bypass surgery, Land died in 1991. He was survived by his wife of sixty years and two daughters. He was remembered by his colleagues at Polaroid for his infectious optimism and belief that difficult problems could be solved by persistent effort.

Rowland Institute of Science

The Rowland Institute of Science was founded in 1980 by Edwin Herbert Land, inventor of the Poloroid camera. The institute was named for Henry A. Rowland, a respected experimental physicist at Johns Hopkins University in the late 1800's. Rowland was well known for his ingenuity in devising unique instrumentation, including a grating that spread out the spectrum of sunlight to more than thirty feet. Rowland was the mentor for Robert Wood, whose book on optics had been an inspiration to Land in his youth.

As director of research for the Polaroid Corporation for forty years, Land had developed firm ideas about how a creative invention could be developed into a successful product. The production of a camera and color film for instant photography required teamwork by people with expertise in several fields, including optics, mechanics, chemistry, and plastics. Land's vision for the Rowland Institute was to encourage similar interdisciplinary research, especially among young scientists who had untested, fresh ideas.

The Rowland Institute was the main beneficiary of Land's considerable fortune when he sold his Polaroid stock in the 1980's. The institute was founded to bring together a small group of promising young scientists studying chemistry, physics, biology, and engineering. Ten such Rowland junior fellows generally are chosen for a five-year term, during which they receive a full salary. There are several senior fellows and an advisory committee to provide advice and oversight. An electronics laboratory is available to help with instrumentation. Advanced computer facilities and a technical library provide additional research support. Numerous publications in major research journals have resulted from the institute's work.

In 2002, the institute merged with Harvard University, which has supplied a number of affiliated scientists to work with the junior fellows. The environment for the junior fellows is like an extended postdoctoral fellowship with secure funding, so the fellows can focus on research and not have to spend time writing grant proposals. Many junior fellows have gone on to careers at universities, industrial laboratories, and national research institutes.

Legacy

Edwin Herbert Land believed that a college education in science should extend beyond lectures, books, and exams to include individual research, starting in the freshman year. In 1968, he donated $12 million to Harvard University to establish an undergraduate science research center. In 1979, property was purchased in Cambridge, Massachusetts, for what was to become the Rowland Institute of Science. Land envisioned a research center for scientists from a variety of fields who would interact with each other to solve interdisciplinary problems. Land also was a strong advocate for the establishment of the National Science Foundation. In 1978, he donated $15 million to the American Academy of Arts and Sciences in order to construct a building to hold its meetings for distinguished scholars.

Ralph Lauren

American fashion designer

Lauren earned his vast wealth and built a fashion empire by marketing his fashions not as a mere clothing line but as a symbol of upper-class life. His product lines, which created a feeling of American classic timelessness for the consumer, made him one of the world's wealthiest fashion designers.

Born: October 14, 1939; Bronx, New York
Also known as: Ralph Rueben Lauren; Ralph Rueben Lifshitz (birth name)
Source of wealth: Sale of products
Bequeathal of wealth: Unknown

Early Life

Ralph Rueben Lauren (ralf ROO-behn LOR-ehn) was born on October 14, 1939, in a lower-middle-class neighborhood of the Bronx borough of New York City. He was the youngest of four children born to his Russian immigrant parents, Frank and Fraydl Lifshitz. His childhood interests included sports, movies, and clothing. He attended public school and then the Salanter Academy Jewish Day School. In 1955, at the age of sixteen, he officially changed his last name to Lauren.

As a teenager, Lauren worked part-time for Alexander's, a Manhattan department store. In 1957, he graduated from DeWitt Clinton High School and also became a full-time salesperson for the department store. Lauren continued his education by taking business courses at the City College of New York. He also briefly served in the U.S. Army Reserves.

First Ventures

Although Lauren never attended fashion school, he continued to follow his love of clothing. In 1962, he worked as a salesperson for Brooks Brothers, and in 1963 he became an assistant buyer for Allied Stores. He married Ricky Low Beer on December 30, 1964, and that same year he was hired to work in the sales department of Abe Rivertz and Company, a Boston tie designer. Lauren's enthusiasm for fashion led him to eventually design ties for the company. In 1967, he was hired by Beau Brummell Ties, Inc. The company agreed to produce and sell several of Lauren's contemporary tie designs.

Mature Wealth

In 1968, with the financial backing of Norman Hilton, Lauren founded Polo Fashions as a division of Beau Brummell Ties. Later that year, Lauren reorganized his fledgling company as a completely separate entity. Shortly thereafter, Bloomingdale's department store opened a Polo Boutique in its menswear department that featured Lauren's contemporary fashions. In 1970, he won the first of seven Coty American Fashion Critics' Awards for his men's clothing line. In 1971, Lauren successfully unveiled a line of women's fashions and his signature polo logo. He designed the clothing worn by actor Diane Keaton in director Woody Allen's film *Annie Hall* (1977), as well as the costumes worn in the film *The Great Gatsby* (1974).

In 1972, Lauren introduced a short-sleeve knit shirt adorned with his signature polo logo. The shirt became a classic style for men and became commonly known as the "polo shirt." Throughout the late 1970's and early 1980's, Lauren continued to build his fashion empire by marketing his products as part of a luxurious lifestyle. He also added children's clothing, eyewear, fragrances, and housewares to his product line. In 1983, he purchased the Gertrude Rhinelander Waldo Mansion in Manhattan, where the following year he opened the Polo Ralph Lauren flagship store. In 1992, he received the Lifetime Achievement Award from the Council of American Fashion Designers. By 1997, Lauren owned 116 stores, 62 outlet stores, and 1,300 boutiques. On June 11, 1997, Polo Ralph Lauren became a publicly traded company on the New York Stock Exchange. By 2008, the company's annual sales exceeded $4.8 billion.

Legacy

Ralph Lauren transformed his love of fashion into a billion-dollar business. He approached both his clothing designs and the marketing of his fashions as a lifestyle choice for consumers, positioning his clothing and accessories as part of an upper-class style of living that middle-class Americans could obtain simply by wearing his designs. The lifestyle marketing strategy in combination with Lauren's attention to detail and his business savvy quickly earned him an enormous amount of wealth. In 2008, Lauren continued to be a worldwide leader in the fashion industry, with his net worth estimated at $4.2 billion.

JOHN LAW

Scottish banker, gambler, and economic theorist

Law's accumulation of wealth is significant because of the economic theories he developed and implemented to acquire much of it. His theories, known as Law's System, remain among the basic tenets of modern capitalism. In addition, Law's System enabled France to avoid bankruptcy in the early eighteenth century.

Born: Baptized April 21, 1671; Edinburgh, Scotland
Died: March 21, 1729; Venice (now in Italy)
Sources of wealth: Banking; trade; gambling
Bequeathal of wealth: Dissipated

EARLY LIFE

John Law's birth date is not known, but he was baptized in Edinburgh, Scotland, on April 21, 1671. His father was a goldsmith and a moneylender, and his family was affluent. Law received an excellent education in mathematics. He became involved in the family business when he was fourteen years old.

FIRST VENTURES

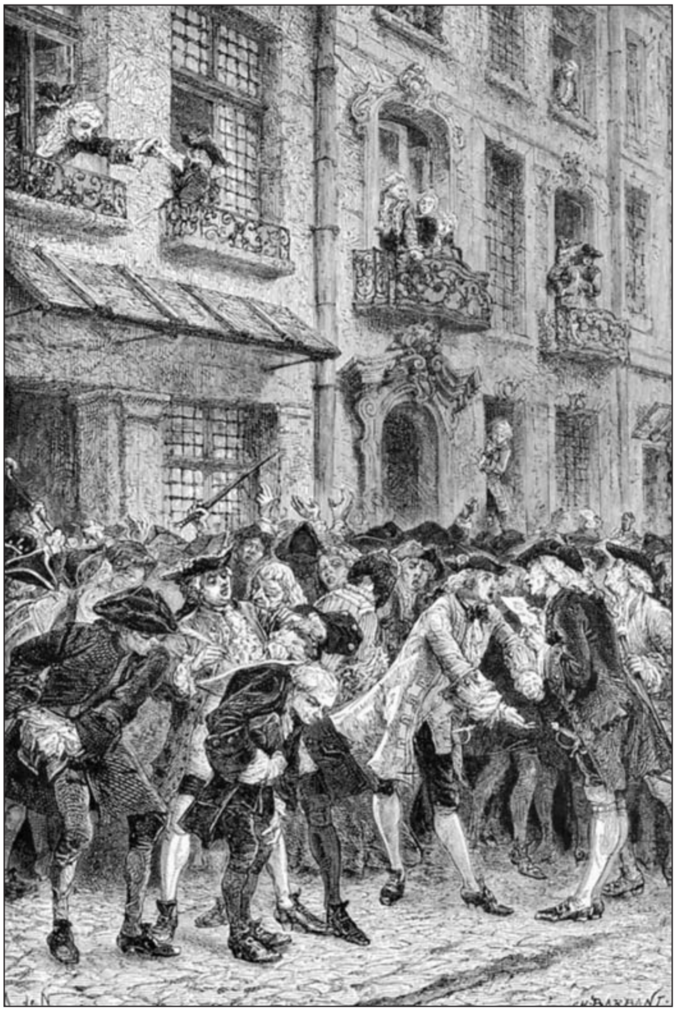
In 1688, Law went to London, where he studied mathematics, business, and economics. He socialized with affluent Londoners and regularly attended gaming houses. Law enjoyed success both as a gambler and as a speculator in government paper. On April 9, 1694, Law fought a duel with Edward Wilson, whom he killed. Law received a death sentence, which was reduced to imprisonment. He fled to Amsterdam.

In Amsterdam, Law made a study of banking practices, in particular those of the Bank of Amsterdam, and he began to develop his economic theories, or Law's System. Law observed how the bank served as a trade intermediary. Merchants deposited coins and paid bills by a transfer of credit. Law was particularly interested in the secret transactions, in which the bank issued credit without any coins being deposited. Law believed that an increase in money would increase trade. He advocated the creation of money by permitting banks to make loans, record deposits, but not receive cash for the loans. Law returned to Scotland in 1700 and again in 1705 with plans for ameliorating the Scottish economy, but his plans were rejected.

MATURE WEALTH

After his visits to Scotland, Law spent more than a decade traveling throughout Europe in a large coach with his family. He earned a living by gambling in the salons and gaming rooms of the wealthy. In 1708, Law was gambling in Paris, where he became friends with Philippe II, duc d'Orléans. Law attempted to persuade the government of Louis XIV to adopt his economic theory, but the king rejected it.

Law was exceptionally skilled at cards and other



Speculators frantically trade shares in John Law's Mississippi Company. Law's attempt to increase share prices resulted in financial ruin for thousands of speculators when the "Mississippi bubble" burst. (Francis R. Niglutsch) games of chance. His winnings were so large that they aroused suspicions of dishonesty. Others marveled at his luck; however, Law insisted that he won by using a mathematical system, not by luck or trickery. Law not only gambled but also explained his economic theories to his wealthy hosts. Suspicion persisted and the marquis d'Argensson, the chief of police, suggested that Law leave France. Law returned to his travels and amassed a fortune of 1,600,000 livres by gambling.

In 1715, Louis XIV died and the duc d'Orléans became regent of France. Law returned to France with a proposal for a royal bank, which was rejected. However, he obtained a patent for a private bank and financed the Banque Générale. This bank's enormous success enabled Law to purchase trading companies, including the Mississippi Company, which the government of France granted a monopoly on trade in North America and the West Indies. By 1720, Law's System was firmly in control of the French economy, Law had become comptroller-general of France, and he had monopolies on tobacco, salt. and money coining. He also controlled Compagnie des Indes, which included all the major French trading companies.

However, during the summer of 1720, the public lost confidence in Law, who had manipulated the market to increase the price of shares in his trading company. Financial panic ensued and Law's System collapsed. Law was dismissed as comptroller-general and fled to Venice, where he died in poverty on March 21, 1729.

Legacy

Although Law's career ended in financial disaster because of his speculation, Law's System established the basis of the modern banking system. Law determined that there was an inadequate amount of metal money to fund business and trading activities, which meant that the needed money could be created by recording deposits and making loans in excess of the cash that was actually deposited.

Lee Shau Kee

Chinese real estate developer

Lee Shau Kee recognized early in his career that the rapidly growing city of Hong Kong would require massive housing development, and he began buying government land to construct housing units. His development projects have had a lasting impact on the prosperity and livability of the city.

Born: January 29, 1928; Shunde, Guangdong, China
Source of wealth: Real estate
Bequeathal of wealth: Unknown

Early Life

Lee Shau Kee (lee shauh kee) is the second surviving son of Lee Kai-po, a small-town trader and merchant. Lee Shau Kee's and his elder brother Lee Siu-lun attended local private schools, learning the Chinese classics. As a teenager, Lee Siu-lun was sent to live with family friends in Guangzhou, where he would learn the silver business.

Lee Shau Kee at the age of six began to help his father in the Tin Po Wing Gold Shop, the family business. Lee Shau Kee was quickly able to grasp the complexities of the gold trade. Although quiet, he impressed his father with his ability to suggest markets for buying and selling gold objects and bars. Business was lively, especially after the Japanese invasion at the start of the Second Sino-Japanese War in 1937. At that time, with the value of Chinese currency in flux, families depended upon gold as a way of protecting their savings. Lee Kai-po responded by increasing his operations at both the Tin Po Wing Gold Shop and his other interest, the Wing Sun Silver Exchange. With the help of the young Lee Shau Kee, the family business exchanged huge quantities of precious metals and foreign currencies.

When his father left on a business trip in 1942, he entrusted the businesses to his son. During this time, Lee Shau Kee further increased the profitability of the two shops by trading currencies and by expanding his inventory through exchange of receipts from his shop. At the time, receipts could be used like modern bank checks, but their value was dependent upon the reputation of the gold shop that issued them. The Lee family's shops had such an excellent reputation that their receipts were almost as good as gold itself.

At the conclusion of World War II, China's economic problems were far from over, but it was safer to travel in the country. Lee Shau Kee realized that it was time for him to leave the gold shop and to start his own business in a place that would offer the most opportunities in postwar China. At the age of nineteen, Lee Shau Kee arrived in Hong Kong, which was then a British colony, with $1,000 in Hong Kong dollars.

First Ventures

Lee Shau Kee established himself as a gold and silver trader in the shops on Bonham Strand East. While he built his reputation and cash reserves, he also studied other businesses in Hong Kong. He expanded his operations to include trade in construction materials, such as steel. When the Communist Party took control of China in 1949, Lee Kai-po and his family were instantly rendered penniless. Lee Shau Kee began to send money back home to support his father, who was burdened with heavy fines imposed on him as a result of his landownership when the Communists took over.

At the same time, the trading business in Hong Kong blossomed. Most of the trade between China and other nations, including the United States and European countries, was now conducted through Hong Kong. Traders with an established reputation prospered. Lee Shau Kee obtained a loan from a friend of his in the banking sector and further expanded his already profitable materials import and export business. As opportunities grew in Hong Kong and conditions became more challenging in China, many people immigrated to the small and prosperous city, filling the burgeoning number of manufacturing jobs. Lee Shau Kee could see that if the economy continued to grow and if, concomitantly, the population continued to grow, Hong Kong would soon face a serious housing shortage. He realized that this observation presented an opportunity for profit and for service to Hong Kong.

Therefore, in 1958 Lee Shau Kee and a group of colleagues formed the Eternal Enterprise Company. By pooling their resources and connections, the members of the group were confident they had the capital to become successful in the competitive business of land development. The other prominent members, in addition to Lee Shau Kee, were Fung King-hey and Kwok Tak-seng. The first ventures of the Eternal Enterprise Company, including a hotel project, were highly successful. In 1963, Lee, Fung, and Kwok formed their own company, which was to concentrate solely on land development, especially the construction of residential units, for which there was a high demand. Their new company was called Sung Hung Kai. With the success of their company also came the owners' nickname: the Three Musketeers.

At the start of the Cultural Revolution in China in 1966, the previously robust Hong Kong housing sector experienced a sudden depression. Fearful of doing business in the increasingly unstable political atmosphere of China, investors slowed investment or emigrated. Some, fearing sudden devaluation in currency, withdrew all their money from Hong Kong banks, creating a banking crisis that took months to resolve. At this time, Fung King-hey left Hong Kong to seek other opportunities in Canada, but Lee Shau Kee would not abandon Hong Kong. He was confident that the city would thrive in the long term.

Although the business climate was not vigorous during this troubled time, Lee and his partners had enough equity to continue to seek opportunities. They acquired reserves of land at bargain prices, establishing a bank of property upon which Sung Hung Kai would draw when the market turned around. By the early 1970's, the investment climate was once again favorable in Hong Kong. The real estate and stock markets were booming and Sun Hung Kai was listed on the stock exchange. As a publicly traded company, Sun Hung Kai now had even more access to the huge cash reserves that were needed to drive the engine of real estate development. Shortly after the public listing of their company, Kwok Tak-seng became chairman of Sun Hung Tai, while the other two founders started new ventures. Fung established SHK Securities, and in 1973 Lee Shau Kee founded Henderson Land Development Co. Ltd. Henderson was first traded publicly on the Hong Kong Stock Exchange in 1981. After this time, Lee Shau Kee was generally recognized as one of the wealthiest persons in the world.

Mature Wealth

From the beginning, Lee Shau Kee managed Henderson expertly. His business model was to maintain a bank of land that was acquired at low prices and held until conditions were perfect for development. This strategy included buying large numbers of "Letters B" from citizens who had been reimbursed by the government for land that had been appropriated. The Letters B could be exchanged for reformed land, but they could also be sold for instant cash. Henderson would buy up the Letters B at fair prices and then exchange them in bulk for large tracts of land, which placed the company in a favorable position when developing new projects. Lee Shau Kee insisted on a factory style of land development. In order to maximize his profits, he kept his land development business in constant operation. He would build, market, and sell residential properties, while at the same time keeping his eye on the best time to start the next cycle of building. Among his early successes was the City One Shatin project, a massive residential center in the New Territories of Hong Kong. This sprawling complex took many years to complete and includes not only residences but also retail, recreational, and civic buildings such as schools. Lee Shau Kee was able to sustain his cycle of development through many fluctuations in the real estate market that broke other investors.

Colleagues in businesses other than real estate depended on Lee Shau Kee's help. In 1975, Lee Shau Kee agreed to buy a large block of shares in China Gas in order to avert the hostile takeover of the company by Jardine Matheson Group and Hong Kong Electric. Proving invaluable to the company, Lee would become the chairman of China Gas in 1983. Likewise, Lee Shau Kee became interested in the Hong Kong Ferry (Holdings) Co. Ltd. because it possessed land he believed would offer valuable opportunities for redevelopment. He began to buy shares in the company, shortly thereafter securing controlling interest in the firm and reorganizing its management structure. However, success would not always be easy for Lee Shau Kee. More sudden downturns in the market would create problems during his career, notably the lack of confidence that followed China's 1982 declaration of intent to take over Hong Kong in 1997 and the 1987 world financial crisis. It was Lee's steadfast dedication to a business model and to Hong Kong that allowed him to rise again after each of these challenges.

Lee Shau Kee Colleges

Lee Shau Kee has long been a leader in developing not only the land but also the intellect of Hong Kong. There are not one but two colleges (or Hong Kong secondary schools) named after him, and he was a founding supporter of both of these institutions.

In 1978, a redevelopment project on which Lee was working required the relocation of the Pui Kiu Middle School. Far from finding this a burdensome task, Lee concentrated his energies as fully on the rebuilding of the middle school as he did on any of his commercial projects. More than 70 percent of the funds required to obtain land and construct the school were donated directly by Lee Shau Kee, and this project was the start of his intense involvement in education.

Later in 1978, Lee Shau Kee worked with the Hong Kong Shun Tak Fraternal Association (STFA) to establish the STFA Lee Shau Kee College in Kwai Chung. In 2009, the college had an enrollment of more than one thousand students and a faculty of nearly seventy full-time teachers. The languages of instruction are both Chinese and English.

In 2006, Lee Shau Kee's signature educational task came to fruition, when, along with the Hong Kong Federation of Youth Groups (HKFYG), he established the HKFYG Lee Shau Kee College, located in the New Territories. Including both a primary and secondary school, this college emphasizes holistic education in a primarily English-language environment. The school occupies several modern buildings and boasts a vibrant student population. In addition to Chinese and English languages, mathematics, humanities, and science, the school also offers a full range of athletics and arts courses. The college continues to grow and anticipates reaching maximum enrollment in 2011. These schools, along with many educational scholarships and foundations that are Lee Shau Kee's work, make up an important part of his legacy to Hong Kong.

Legacy

Lee Shau Kee's business ventures in Hong Kong continued to thrive despite the city's 1997 takeover by China. In 2009, he was the chairman and managing director of Henderson Land Development Co. Ltd. and Henderson Investment Ltd.; the chairman of the Hong Kong & China Gas Co. Ltd. and the Miramar Hotel and Investment Co. Ltd.; the vice chairman of Sun Hung Kai Properties Ltd.; and a director of Hong Kong Ferry Holdings Co. Ltd. and the Bank of East Asia, Ltd. He was also the honorary president of the Shun Tak Fraternal Association and the vice president of the Hong Kong Real Estate Developers Association. *Forbes* magazine in 2010 listed Lee Shau Kee as number twenty-two on its list of billionaires, estimating his net worth at about $18.5 billion (in American currency). The Henderson Group of companies is among the largest in Hong Kong.

LEOPOLD II
Belgian king

Leopold was one of the wealthiest people in the world, but a large part of his fortune was obtained through his exploitation of the Congo Free State. His wealth was preserved both in the Royal Foundation of Belgium and in his bequest to his successor, Albert I.

Born: April 9, 1835; Brussels, Belgium
Died: December 17, 1909; Laeken, Belgium
Also known as: Léopold-Louis-Philippe-Marie-Victor; Leopold Lodewijk Filips Maria Victor
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Children; government

EARLY LIFE

Léopold-Louis-Philippe-Marie-Victor was born in Brussels, Belgium, in 1835, the second son of Leopold I, the first king of the newly independent kingdom of Belgium, and his wife, Louise, the daughter of King Louis-Philippe of France. Leopold I's first son had died in infancy. Therefore, Leopold II became Belgium's second king when his father died in 1865. Leopold II's marriage to a Habsburg princess, Marie Henriette, in 1853 produced three daughters, Louise, Stéphanie, and Clémentine, and one son, Leopold. However, the young prince Leopold died in 1869 at the age of nine. Leopold II, whose concern for building a dynasty was paramount, had to rely on Albert, the son of his brother Philip, to succeed him as monarch.

FIRST VENTURES

Leopold II was a man of great passion and ambition. His sexual appetite was unrestrained, as was his lust for wealth. He desired to transform the small nation of Belgium into a respected and redoubtable country. Leopold sought to enrich and expand his territorially constrained state and in the process modernize it. During his honeymoon, Leopold visited Egypt and the Middle East. There and on a subsequent trip to the Ottoman Empire and Greece his imagination was sparked. He was impressed by the state-sponsored program of modernization in Egypt. He was also inspired to follow in the footsteps of the Belgian crusaders Godfrey of Bouillon and Baudouin. He declared to his foreign minister that Belgium must have a colony. However, Leopold's aspiration was not to proselytize but to exploit. In addition to compensation for Belgium's constrained frontiers, a colony would provide markets for Belgium's industry and a destination for colonists. Leopold abandoned interest in a settler colony in favor of acquiring a vast holding that could be exploited for his own personal enrichment.

In his pursuit of access to the wealth of Africa, Leopold organized a congress of scientists and explorers and then founded and financed the International Association for the Exploration and Centralization of Central Africa. He thus manipulated reformist desires to suppress the remnants of the slave trade in Africa. Leopold hired Henry Morton Stanley, the journalist and explorer, to establish stations across the Congo region between 1877 and 1889. Stanley persuaded African chiefs, who had no idea of the implications of their actions, to cede their peoples' land in exchange for alcohol and wares. Leopold thus amassed claim to an expansive territory for which he asked international recognition.

In 1884, Leopold transformed his Committee for the Study of the Upper Congo into the International Association of the Congo. In deference to the purported humanitarian aspirations of this organization, the United States in 1884 recognized the association as the sovereign authority for the Congo. Leopold's machinations were facilitated by competition and jealousy between the great powers, none of which wanted to see the rich Congo claimed by a competitor. At a Berlin conference on the Congo in 1884, the participants agreed to the transformation of the International Association of the Congo into the Independent State of the Congo, or as it was known by the gross misnomer, the Congo Free State. Jealousy and competition among the major colonial powers played an important role in the decision, but it was justified as a humanitarian effort to end the slave trade. Leopold became the sovereign of the Congo Free State, which was his personal possession and not a colony of Belgium.

Leopold II. (Library of Congress)

The purported purpose of Leopold's venture was to end the slave trade, but in reality his goal was blatant exploitation. Military force was used to control the people of the Congo and extract forced labor from them. Much of the Congo was directly exploited by Leopold and his agents, and he received half of the profits from concessions granted to entities such as the Anglo-Belgian Indian Rubber Company. Agents of this company raided villages and held the women and children hostage to force the men to gather rubber. A rubber tax was imposed on the Congolese people. If the men refused to comply with Leopold's agents, they were hunted down by the Force Publique, a group of mercenaries whose members were compensated in return for the number of severed hands they acquired. In the meantime, immense profits flowed into Leopold's coffers.

Mature Wealth

This orgy of violence and exploitation was brought to an end largely by the efforts of Edmond Dene Morel. Morel was a clerk for Elder Dempster, a firm based in Liverpool, England, that carried cargo to and from the Congo to Antwerp, Belgium. Morel was struck by the fact that his firm was carrying rubber and ivory from the Congo but was returning with only arms and soldiers. The conclusion was obvious: Leopold was extravagantly taking advantage of the people and the resources of the Congo. In Great Britain, Morel organized the Congo Reform Association to expose Leopold's brutal treatment of the Congo and its people. A report by the British consul at Boma, Roger Casement, confirmed the horrors of the Congo Free State.

The number of people who died in the Congo as a result of Leopold's agents is debated, but many concede that a million Congolese people died because of the king's greed. A former Belgian foreign office official, who has done exhaustive research on the Congo Free State, and Adam Hochschild, the American author of *King Leopold's Ghost: A Story of Greed, Terror, and*

Heroism in Colonial Africa (1999), have concluded that Leopold's administration was responsible for the deaths of ten million people in the Congo.

When Leopold died in 1909, he was one of the richest men in Europe. Leopold's fortune derived from sources other than the Congo. He took charge of his father's bequest to his sister Carlota, who had sunk into dementia after the execution of her husband Maximilian, the emperor of Mexico. The Belgian government had loaned Leopold 25 million francs in 1890, and when Leopold had slyly indicated that another loan was needed to prevent the complete loss of that initial investment, the Belgian government provided him with an additional 7 million francs. Leopold never repaid the loans. Finally, he refused to share his wife's legacy with his two eldest daughters.

However, the majority of his wealth was produced by the exploitation of the Congo and its people and resources. He sold the rubber produced by forced labor for seven times what it cost him to extract it and then transport it to Antwerp. According to some estimates, Leopold personally amassed 220 million francs ($1.2 billion in 1998 dollars) from his Congo venture.

The Royal Trust

On his sixty-fifth birthday in 1900, King Leopold II wanted to ensure that the properties he had acquired and the buildings he had constructed to embellish his dynasty would be maintained and not be disposed of in the future. To this end, he donated specified buildings and land to the state but with very specific conditions. When he relinquished his control of the Congo Free State, Leopold transferred additional properties to the Royal Trust, which is also known as the Royal Donation. Leopold stipulated that the properties could not be sold. The state would have to maintain their original appearance and function. The properties, finally, would be at the disposal of Leopold's successors.

The properties set aside for the personal use of the royal family include the châteaus of Belvédère, Ciergnon, Fenffe, Stuyvenberg, and Villers-sur-Lesse; Villa Clémentine in Tervuren; the greenhouses which Leopold constructed at Laeken; and hunting rights on a large estate in the Ardennes. There were also a number of parks that were to be maintained and open to the public. These included the Aboretum in Terveuren, Dudenpark, Elisabethpark in Laeken, Maria-Henriettepark in Oostende, Leopold II Park in Nieuwpoort, and the Colonial Garden in Laeken. Finally, there were buildings, including a cinema, a yacht club, office buildings, and shopping centers, as well as agricultural land, golf courses, and wooded land, the income from which was to be used by the Royal Fund to maintain its other properties. The trust also possesses a portfolio, which was valued at 39 million euros in 2006. The total receipts of the Royal Fund in 2006 were almost 12.7 million euros (approximately $16.7 million). After expenses for the year, the fund maintained a balance of about 6.1 million euros.

The Belgian king appoints a ten-member board, which includes four members or former members of the royal court, to manage the trust. The head of the bureaucracy is an ex officio member. In addition, a former sovereign or the sovereign's surviving spouse, if he or she lives on property belonging to the Royal Trust, is entitled to personal representation on the board.

Legacy

Unlike their king, Belgians were not inclined toward imperialism. However, by the first years of the twentieth century the crescendo of international opprobrium had reached such a level that Belgium had little alternative but to assume control of the Congo. The international reputation of the entire country was at stake, and if Belgium did not take over this area, it was likely that some other country would. Although Leopold's authority as the king of Belgium was circumscribed by the Belgian constitution, the Belgian government had no control over Leopold or his behavior in the Congo, where he was the sovereign authority. Therefore, Leopold had great bargaining power, and he used it to the hilt. In March, 1908, a deal was finalized. Leopold agreed to turn the Congo over to the Belgian government if it would assume 110 million francs of debt, much of it in bonds that Leopold had freely dispersed for his own purposes and the rest in the form of the 32 million francs that the government had loaned him for his Congo venture. In addition, the government was required, at a cost of 45.5 million francs, to complete a number of the king's unfinished projects, including renovations to his estate at Laeken. The icing on the cake was a gift of 50 million francs ($250 million in 1998 dollars) in gratitude to Leopold for the "sacrifices" he made for the Congo.

Leopold felt his ability to influence the development of the Belgian state was constrained by Belgium's liberal constitution, which relegated the king to a relatively passive role in the political life of the country. He wished to have an impact upon the development of Belgium and to strengthen the foundations of his dynasty. To accomplish these goals, he sought to amass wealth that would free him and his successors from economic dependence upon the parliament. For Leopold, the Congo provided the opportunity to achieve this financial independence. He accomplished his goal, but his achievement was attained at an horrific cost to the Congo and its people.

Reginald F. Lewis

American industrialist and attorney

Employing the financial device of a leveraged buyout, Lewis became owner and chairman of the TLC Beatrice food conglomerate. The first African American to own a company with revenues exceeding $1 billion, Lewis generously donated to various charities.

Born: December 7, 1942; Baltimore, Maryland
Died: January 19, 1993; New York, New York
Also known as: Reginald Francis Lewis
Sources of wealth: Law practice; sale of products; investments
Bequeathal of wealth: Spouse; children

Early Life

Reginald Francis Lewis was born during World War II in a segregated neighborhood in Baltimore, Maryland. He was the only child of Clinton and Carolyn Cooper Lewis. When he was five, his mother left her husband, who was often absent from home, and moved in with her parents, Sam and Sue Cooper. His mother worked as a waitress and store clerk, and Lewis grew close to his grandparents. Lewis attended St. Francis Xavier Catholic elementary school. When he was was nine, his mother married Jean Fugett, who was a positive influence on young Lewis.

Lewis attended Dunbar Public High School, where he excelled in sports, earning varsity letters in baseball, basketball, and football. He received a football scholarship to attend Virginia State College, the oldest state African American university in the nation. Up to this point, Lewis seemed primarily interested in sports. In college, however, he developed two new aspirations: to improve academically and to become a millionaire, as he announced to his friends. Lewis became a member of Kappa Alpha Psi, a historic African American fraternity founded in 1911. Under a program for minority students, Lewis enrolled in Harvard Law School upon graduating from Virginia State in 1965.

First Ventures

After graduating from Harvard Law School in 1968, Lewis took a position as an associate lawyer with the prestigious New York law firm of Paul, Weiss, Rifkind, Wharton & Garrison, earning a salary of $10,000 a year. On August 16, 1969, he married Loida Nicholas, a Filipino American. After two years in the corporate law department of Paul, Weiss, Lewis left the firm to become a partner in a start-up law firm that focused on New York City's African American community. Several of the partners of Paul, Weiss were surprised that Lewis was taking what seemed to be a risk with his promising career. For Lewis, however, his new firm, Wallace, Murphy, Thorpe and Lewis, represented a chance to reengage with the African American community. He also sensed that the firm presented opportunities to make money in new entrepreneurial ventures, and that he was dynamic enough to take advantage of these opportunities. For example, through his new contacts, he was appointed to sit on the board of directors of the General Foods Corporation. While on the board, Lewis was involved in sixty-four business deals associated with General Foods. He also obtained the music rights to the film *The River Niger*, and he was instrumental in blocking the sale of *Essence* magazine to the Johnson Publishing Company.

Within two years of joining Wallace, Murphy, Lewis was so successful that he bought out his partners' shares for $32,000, assuming full ownership of the firm. Lewis hired two associates for the firm. Besides the work he was doing for the Urban Coalition and the Ford Foundation, Lewis began to aggressively attract corporate clients, such as Aetna Life, Equitable Life, and businessman Norton Simon. He also received steady revenue from working with the American Association of Minority Enterprise Small Business Investment Companies, under a program created by the U.S. Small Business Administration. With his firm prospering, Lewis felt secure enough to start a family. In 1973, he and Loida had their first child, Leslie, and their second daughter, Christina, was born in 1980. Lewis also purchased a summer home in the exclusive East Hampton section of Long Island, New York. He traveled in Bentley and Mercedes limousines.

MATURE WEALTH

Although by 1978 Lewis's law practice was increasingly lucrative, netting him as much as $100,000 profit per month, he made a pivotal decision. He would transition from being a lawyer for business owners to becoming a business owner himself. In 1982, he bought a radio station in St. Thomas, hoping to launch a Caribbean Basin

SPECULATIONS, BUBBLES, AND LEVERAGED BUYOUTS

Countless fortunes have been made by speculating in land and commodities. As new continents were discovered and developed, intrepid speculators purchased vast tracts of land, waiting for settlers to arrive and land values to appreciate. For example, thousands of square miles were purchased or wrested from Native Americans by European speculators, to be resold to pioneers at enormous profits. Commodities are often bought in bulk to be sold at great profit as the need for grains, metals, or raiment is recognized. Perhaps such speculation is necessary for the free flow of goods. Less justifiable is the profiteering that accompanies war, as the necessities rendered unavailable by battle are hoarded by speculators and sold to a desperate population at usurious prices.

As the wealth of humankind was gradually transferred from land and chattel into currency and stock shares, the opportunity for speculation increased and gave rise to that modern and apparently unavoidable phenomenon of modern economics—the financial bubble. Fortunes were made and lost in the infamous tulip mania in the Netherlands in the seventeenth century, as the Dutch genius for trade and finance was temporarily overwhelmed by a frenzy to purchase tulip bulbs at rapidly appreciating prices—until the bubble collapsed, bringing ruin. The notorious John Law brought a great fortune to himself and ruin to thousands of speculators in the Mississippi Company and South Sea Company bubbles of 1720.

All of the modern advances in technology have been accompanied by financial frenzy, none more so than the railroad. Even as profitable an enterprise as the discovery of massive amounts of gold in South Africa caused a bubble in the Kaffir stock panic on the London exchange in 1896. The greatest opportunity to create speculative fraud and financial bubbles is the pyramid scheme, perfected by Charles Ponzi in the 1920's and much-practiced by hucksters and scam artists—large and small—ever since.

The greatest vehicles for speculation are the world's stock markets, where fortunes are made and lost every day. The sudden rise and fall of the prices of securities—the "Nifty Fifty" in the 1960's, the dot-com boom and bust of the late 1990's, and the real estate collapse of 2008—combine both scandal and mania.

In the modern market, venture capital firms can raise funds for the leveraged acquisition of established companies, based on massive borrowing. In the 1980's, Michael Milken pioneered this method of acquiring debt to finance company takeovers. He was the catalyst that enabled Reginald F. Lewis to acquire the billion-dollar Beatrice Foods, while investing only a fraction of the purchase price from his own funds. In 1989, Milken was convicted of stock price manipulation and sentenced to ten years in prison. Although he was excoriated in the press as the symbol of Wall Street greed and corruption, Milken received support from Lewis during his criminal trial. Lewis may have been paying back a favor to the man who arranged his leveraged buyout of Beatrice Foods, or perhaps Lewis believed that Milken's innovative financing schemes were necessary to allow an outsider like Lewis to rise to the heights of the business world.

radio network, a project that never got off the ground. In 1983, he incorporated TLC Group L.P. as a venture capital firm to acquire and hold his businesses. In 1984, he bought the McCall Pattern Company, which sold home sewing patterns, for about $22.5 million. Lewis's intense management style proved to be profitable for the venerable company, and in a short period he doubled McCall's revenues. He sold the company in 1987 for $90 million. (He would later be sued by the company's purchasers, who claimed that Lewis misrepresented the company's assets; Lewis was eventually successful in refuting these allegations.)

A few months after the sale of McCall's, Lewis bought Beatrice Foods for $950 million, with financing provided by the well-known leveraged bond financier Michael Milken of the investment firm Drexel Harriman Ripley. Beatrice Foods was an international food conglomerate, with operations in groceries, beverages, snacks, and basic foods in thirty-one countries.

Having risen to the highest levels of international commerce, Lewis bought a 1916, twenty-five-room, Georgian mansion named Broadview in the East Hamptons for $3.6 million. He stocked his mansion with $1 million worth of Impressionist and surrealist paintings. The following year, Lewis and his family moved to Paris, the headquarters of TLC Beatrice operations, where they leased elegant quarters dating from the eighteenth century. Lewis increased the revenues of Beatrice International Foods to more than $1 billion, making it the first African American-owned company in history to exceed that plateau. He leased a private airplane at a cost of more than $100,000 a month to travel to his businesses, vacations, and homes. He enjoyed the finest of luxuries—Monte Cristo Cuban cigars, Dom Pérignon champagne, elegant furnishings, and gourmet dinners at the famous Maxim's restaurant in Paris with his wife.

In 1990, Beatrice generated $1.5 billion in sales, earning about $100 million in profit. In 1991 and 1992, Lewis made the list of *Forbes* magazine's four hundred wealthiest Americans. He established the Reginald F. Lewis Foundation in order to disburse more than $10 million to charity. He also donated $1 million to Howard University; gave $100,000 each to the University of the Philippines and Virginia State University; funded a scholarship for the New York chapter of Kappa Alpha Psi; made benefactions to his childhood church and to the Abyssinian Baptist Church in Manhattan; presented $1 million to various African American cultural institutions; and provided $250,000 for public television. Lewis's largest gifts were a $2 million endowment for the National Association for the Advancement of Colored People (NAACP) and $3 million to Harvard Law School, which named its International Law Center for him.

In 1992, at the height of his business success, Lewis received shocking news. Having been sick for several months, he was diagnosed with inoperable brain cancer. Lewis entrusted the management of TLC Beatrice to his stepbrother Jean Fugett. He died in January, 1993, at the age of fifty. He left the bulk of his personal fortune, estimated at $400 million, to his wife, Loida, who took over the management of TLC Beatrice International Holdings. In 2002, the Reginald F. Lewis Foundation provided funding to open the Reginald F. Lewis Museum of Maryland African American History and Culture in Baltimore.

Legacy

Reginald F. Lewis was an aggressive and successful entrepreneur, whose venture capital firm benefited from the newer forms of leveraged buyouts developed on Wall Street in the 1980's. Having acquired the Beatrice Foods conglomerate, he showed himself to be a shrewd and capable business executive. As the first African American owner of a billion-dollar company, he was described by his widow as the "Jackie Robinson of finance." He was admired by many for his hard work and shrewd business sense. He was a significant participant in the leveraged buyout innovations of the 1980's—to some, an achievement, to others, a fault. Despite his taste for luxurious living, he was a generous philanthropist, making significant gifts to African American institutions and Harvard Law School.

Liu Jin

Chinese eunuch and court official

A powerful eunuch of late imperial China, Liu Jin may have been the wealthiest man of his time. He dominated the court of the Ming Dynasty for five years in the early 1500's, amassing tremendous wealth through bribery and embezzlement.

Born: 1452; Xingping, Shaanxi, China
Died: 1510; Beijing, China
Also known as: Tan (birth name); Liu Chin
Sources of wealth: Government; embezzlement
Bequeathal of wealth: Confiscated

Early Life

Liu Jin (lew chihn) was born in Xingping, Shaanxi, China, in 1452. When he was six years old, he was adopted by a eunuch. He was then castrated, as was customary for Chinese court officials at this time, and he served in the inner palace of the court of the Ming Dynasty (1368-1644), one of the Chinese dynasties notorious for corruption by its eunuchs. Eunuchs like Liu Jin were a common feature of the imperial Chinese court, in which they served a wide variety of roles.

After several decades, Liu Jin was chosen to serve the crown prince, who would later become Emperor Zhengde. In 1505, when Zhengde became emperor at the age of fifteen, Liu Jin was quickly promoted to be one of the head eunuchs. He acquired additional imperial trust by arranging for exotic animals, acrobats, and dancing girls to entertain the young emperor, and he started to amass his spectacular fortune.

First Ventures

Liu Jin's wealth increased rapidly with the growth of his political power. He persuaded the emperor to order all provincial administrators to transport the silver preserved in local treasuries to the central court, a convenient place for Liu Jin's greedy embezzlement. He also suggested that the emperor establish more than three hundred imperial estates near the capital, which were allegedly intended to raise state income in order to cover the huge expenses of the inner palace. However, it was Liu Jin, the actual manager of these estates, who made huge profits in implementing this policy. Under the favor of the emperor, Liu Jin easily escaped the subsequent criticism and calls for his impeachment from civil officials, and he was promoted as the head eunuch in charge of the most important state affairs. To extend his control over the court, he sent his assistants to administer significant posts across the country, and he promoted more than fifteen hundred military officers, as well as several hundred civil officials, from his clique.

Mature Wealth

Liu Jin's wealth and domination of the court reached their summit in the few years before his death. Bribes from officials constituted the major source of his wealth. Nearly all the local officials visiting the capital for an annual imperial audience or reappointments had to send Liu Jin gift money, which ranged from several hundred taels of silver to 5,000 taels. Those who could not afford such sums had to get loans, popularly known among the officials as "capital debts."

With the power to appoint officials, Liu Jin never hesitated to sell positions for money. For example, a corrupt local official who bribed Liu Jin with 10,000 taels of silver was soon appointed the minister of the personnel department. Officials who were about to be impeached could retain their positions by sending money to Liu Jin. A group of corrupt officers guarding the borders was easily exempted from punishment for their malfeasance after bribing Liu Jin; some of the officers even received promotions because of their generous tributes to the eunuch's mansion. For those upright officials who refused to cooperate with Liu Jin, their ends were disastrous. Many were arrested and executed, and their properties were confiscated. The eunuch was so powerful in his heyday that people even referred to him as an emperor who ruled beside the real emperor sitting in the palace.

In 1510, Liu Jin finally lost favor with Emperor Zhengde when he was charged by some other eunuchs with plotting a rebellion against the emperor, and he was impeached from his position. The once-powerful eunuch was executed publicly, and all of his properties were confiscated. It was said that his total wealth exceeded 330 tons of gold and 8,050 tons of silver, which was the equivalent of forty times the annual income of the Ming government in 1644.

Legacy

Historical records of Liu Jin's wealth continue to astonish readers, and he is regarded as one of the wealthiest men in world history. Liu Jin's rise and fall in Ming China also reflect the interesting symbiotic relationship between the eunuchs, a special group serving in inner palaces who could easily acquire imperial favors on which their power and wealth relied, and the emperor, the real source of power in the imperial China.

Liu Yongxing

Chinese agribusinessman and investor

Liu Yongxing and his brothers started their family enterprises in the early 1980's and soon amassed great wealth by producing and selling feedstuff. As one of the richest men in China, he exemplifies the economic and societal changes in this country following the death of its leader Mao Zedong.

Born: June, 1948; Xinjin, Sichuan, China
Sources of wealth: Agricultural products; investments
Bequeathal of wealth: Charity

Early Life

Liu Yongxing (lew yong-sheeng) was born in 1948 in a poor county in the backward Sichuan Province in southwest China, the second of four sons. He received a precollege education after the Cultural Revolution of the late 1970's. Like his three brothers, Liu found a job in the local education bureau and lived a simple yet stable life until 1982, when the brothers decided to participate in the economic reforms initialized by Deng Xiaoping, the head of the Chinese government who succeeded Mao Zedong. In that summer, the four brothers quit their government jobs and with their combined savings of about $120 started a family business selling agricultural products.

First Ventures

The Liu brothers first earned money from selling chickens at the local markets in 1982. With the profits, about $1,200, they switched to raising quail in the impoverished village of Gujia near their hometown. By introducing scientific methods to the process of breeding, hatching, and feeding, the brothers succeeded in beating their competition, increasing their wealth to $1.2 million, a dazzling amount of money in China at this time. Their third venture, feedstuff producing, was even more successful and eventually became the major business among their family enterprises. With high quality and low prices, their feedstuff for pigs, sold under the brand name Hope, became the most popular product of its kind in rural China. By 1993, the brothers' Hope Group was the largest feedstuff manufacturer in China, with net assets of $120 million. Liu Yongxing, perhaps the most capable of the brothers, served as the head of the enterprise and led it toward a continuous accumulation of wealth.

Mature Wealth

After the brothers split the Hope Group in 1995, Liu founded his own feedstuff manufacturing enterprise with a new name, East Hope Group. Four years later, he relocated the company to Shanghai, where he continued to focus on the profitable feedstuff business with which he was familiar. This relatively conservative strategy helped Liu, who, unlike many other Chinese businesspeople, avoided the risks of amassing large debts as the result of misguided expansion.

Liu Yongxing. (©Ryan Pyle/CORBIS)

Liu Yongxing began diversifying his business in 2002. While maintaining feedstuff manufacturing as the focus of his business, he built a chain of aluminum industries in north China and the upper Yangzi River region, and he invested in a number of prosperous state-owned enterprises, such as the China Minsheng Banking Group and the Bright Dairy Group. His wealth steadily increased during the first decade of the twenty-first century. He was listed on *Forbes* magazine's China Rich List in 2001, with his wealth equivalent to $1 billion in American currency. Seven years later, the magazine ranked him as the richest man in the People's Republic of China, and his net worth jumped to $3 billion. In 2010, Liu Yongxing was number 154 on the magazine's list of world billionaires, with a personal wealth of $5 billion.

LEGACY

Widely viewed as the most successful entrepreneur in twenty-first century China, Liu Yongxing has continued to maintain his businesses and his income, unlike many other Chinese billionaires, whose wealth eventually vanished because of unwise investments or extravagant lifestyles. From a historical viewpoint, the growth of his wealth since the 1980's could be read as a chapter in the history of China's transition from an isolated planned economy to a flourishing capitalist market in the twenty-first century.

NICHOLAS LONGWORTH

American vintner and real estate developer

Longworth, who established his wealth as a major player in the early years of Cincinnati's development, later became interested in horticulture. After years of frustrating and expensive trial and error, he established the first successful domestic wineries in the United States.

Born: 1783; Newark, New Jersey
Died: 1863; Cincinnati, Ohio
Sources of wealth: Banking; real estate; agricultural products
Bequeathal of wealth: Children; charity

EARLY LIFE

Like many wealthy Americans who lived in the late eighteenth and early nineteenth centuries, Nicholas Longworth left few reliable records of his life. He was born in New Jersey in the last year of the American Revolution. He was trained to become a shoemaker, most likely his father's trade, and records indicate that Longworth briefly plied this trade in South Carolina. However, he was restless, aware of the opportunities for wealth available to those willing to head West. In 1804, he arrived at Cincinnati, then a small river port in a territory that had only the year before become a state. Recognizing the need for a stable income, Longworth apprenticed himself as a law clerk for Jacob Burnet, one of the wealthiest men in the city. For six months Longworth studied the law before setting up his own practice, as was the custom of the era. He married in 1807 and had five children by 1815.

FIRST VENTURES

Although a proficient lawyer, Longworth had a better understanding than most of his contemporaries of the potential for real estate development in Cincinnati, which was quickly becoming a major port city, offering critical access to the rapidly opening midcontinent and the central transportation system of the Ohio and Mississippi Rivers. Longworth became a land agent, and for relatively small sums of money he negotiated the purchase of vast lots of open woods all around Cincinnati. By 1819, his investments allowed him to retire from law in order to manage a considerable amount of prime land.

Longworth had long been recognized in Cincinnati for his interest in horticulture. His home near the Ohio River boasted one of the most meticulously kept landscaped gardens in the new American West. However, he was more interested in fruit cultivation. After initial ventures in strawberries and raspberries, he turned his attention (and his fortune) to grapes, specifically his dream of producing a domestic table wine. What few grapes were raised in America at this time were largely used for raisins. Part of Longworth's enthusiasm for winemaking came from his own moral objections to distilled liquor and beer, which he disdained as uncivilized. He was certainly not the first to venture into domestic winemaking, but the results, largely in Virginia, had failed. These wines proved too heavy, and the crops were susceptible to the erratic climate, infestations of vine mildews, and hordes of insects. In addition, wine struggled to find a market in the United States because of the appeal of hard liquor and beer, both much easier and far cheaper to produce.

MATURE WEALTH

Longworth began importing vines from European vintners because he could not find a domestic grape vine able to withstand Ohio's difficult winters and problematic springs. He planted these vines along thousands of acres near the Ohio River, but he had little success. Given his entrepreneurial savvy, he understood that only a domestically grown grape could become the foundation of an American wine industry. In the early 1820's, Longworth heard of a type of hardy Catawba vine, a hybrid of Lambrusco grapes that was indigenous to the piedmont regions of North Carolina, which was being cultivated in nurseries near Washington, D.C. This grape yielded a particularly sweet, light wine and peaked for harvesting in the middle of autumn, which would enable it to be grown in the Ohio climate. Longworth invested considerable capital in raising Catawba grapes, and the semisweet wine they produced brought Longworth his first success as a vintner. The local German immigrant population, pining for the wines of the Rhineland, enthusiastically embraced Longworth's affordable wines. Because Longworth was literally the only winemaker in the region, he quickly amassed a considerable fortune.

Longworth kept notes on his plantings, and his writings became a foundation for the new science of domestic vintners. However, it was the quality of his wine that earned Longworth both national and ultimately international recognition from some of Europe's most exclusive salons, and Ohio became known as the Rhineland of America. Longworth's wines were even the subject of a lavish celebratory poem written by American poet Henry Wadsworth Longfellow.

In 1842, when a batch of Catawba wine accidentally went through a second fermentation, thus fortifying its already high acidic content, Longworth was intrigued by the product, a sort of sparkling wine that reminded him of the champagnes of southern France. Drawing on his considerable resources, Longworth brought to Cincinnati some of the most accomplished vintners from France to advise him on the process of producing sparkling wines. The effort was expensive and time-consuming; the bottles, he recorded in his journals, exploded at the rate of thousands per week, and entire batches would be overfermented and ruined if not carefully watched. However, Longworth never abandoned his vision, and by the mid-1850's his sparkling wines commanded a significant percentage of domestic wine sales, with more than 100,000 bottles sold annually. Longworth was now among the wealthiest industrialists in the American West. The temperance movement responded to his success and the unprecedented rise in alcohol consumption by crusading in numerous states to ban all alcohol. In 1853, Longworth used his enormous influence to defeat such a prohibition in Ohio, where opponents accused Longworth of buying the referendum's defeat through his influence in Ohio's large German immigrant population, his first and most loyal market.

Just before the outbreak of hostilities in the Civil War, which would significantly alter the economic conditions of the Ohio River valley, Longworth's wineries produced 600,000 bottles of still and sparkling wine annually, more than one-third of the total amount manufactured in the now robust American wine market. The Ohio River valley at this time produced more wine than any other re-

The Taft Museum

Nicholas Longworth, Cincinnati's second millionaire, bought the spacious estate on Pike Street, on what was then the very eastern edge of the city, from Martin Baum, a German immigrant and entrepreneur, who had become Cincinnati's first millionaire, as well as its first mayor, through his dominance of the riverboat transportation systems along the Ohio River. However, in 1830 Baum was facing imminent financial ruin. Baum had built the house just ten years earlier with lavish specifications, a classic example of Federalist architecture, with its elegant mathematical balance and its carefully maintained symmetry. The Palladian style dominated architectural expression in colonial America, and Baum sought to bring a measure of civilization, taste, and classical refinement to the Western frontier.

It was not surprising that Longworth, just coming into the fortune that he would realize from his winery investments, would purchase the most notable home west of Pittsburgh. Longworth had long been proud that as the owner of a three-thousand-acre vineyard that employed largely immigrant labor, he had provided housing for his workforce as a way to guarantee its long-term commitment to an agricultural enterprise that required skill and experience. The Longworth family rechristened the estate Belmont, and for more than thirty years, until Longworth's death in 1863, the estate served as a social center for the rapidly expanding city of Cincinnati.

In that time, Longworth did little to change the house architecturally, save for making minor alterations to the doorways and the windows to improve the lighting. However, in terms of decorative arts, Longworth made a telling contribution to Belmont. A committed abolitionist, Longworth commissioned Robert S. Duncanson, a biracial landscape artist (his father was Canadian, his mother African American), to create a series of eight elaborate murals for the estate's spacious formal entranceway. Longworth had been entranced by the work of the self-taught Duncanson, which featured bold landscapes of the American frontier in the sweeping manner of the Hudson River School. The eight murals were begun in 1848 and were completed in 1852, with each mural more than 9 feet high and 6 feet across.

At Longworth's death, the estate passed to David Sinton, a first-generation Irish immigrant who had made his fortune in iron foundries. His daughter married into the Taft family, Cincinnati's most distinguished family during the Gilded Age. Indeed, it was her husband, attorney Charles Phelps Taft, the half brother of President William Howard Taft, who left the home and its considerable collection of art to the city upon his death in 1927. Following extensive renovations to restore the Federalist look of the building, the structure was converted to the Taft Museum, which opened to the public in 1932. The murals Longworth commissioned, restored to their original vivid colors, remained part of the building's exhibitions. In the twenty-first century, the museum remained a gem in the city's cultural reputation, with a small but exquisite collection of paintings, notably portraits by Thomas Gainsborough and landscapes by John Constable and Jean Baptiste Camille Corot, and decorative arts, notably Chinese porcelains, as well as classroom space and lecture and performance facilities.

gion in the nation, including the vineyards in the far more temperate climate of California. Vineyards could be found on thousands of acres along the Ohio River, contributing to the area's economic boom. Longworth, with his cultured lifestyle and his hands-on interest in the agricultural business, became a template as many gentlemen growers opened similar vineyards around Cincinnati, and, like Longworth, controlled both production and distribution of their products.

However, during the Civil War the Ohio wine industry that Longworth had so meticulously built began to decline, devastated not only by the loss of the workforce to the war but also by shortsighted planting techniques, such as overplanting and a lack of field rotation strategies, and massive crop failures from vine diseases, notably black rot. Longworth himself, because of his long career in the wine business, was able to maintain his wealth. When he died in 1863, he left an estate valued at more than $10 million. With Longworth's financial support largely gone, however, Ohio's burgeoning wine industry simply collapsed, and it would not return to any strength for more than a century.

Legacy

On the face of it, Nicholas Longworth might be seen as leaving little significant legacy; after all, the Ohio wine industry he pioneered and into which he poured millions of dollars and devoted more than thirty years barely survived a decade after his death. However, Longworth was a visionary. Following the War of 1812, when America was wrestling to define itself as a nation against the snobbery of a European culture that dismissed the new country as rough-hewn, Longworth envisioned a wine that would help establish an American presence in an industry long associated with taste and culture. In addition, given his devotion to the hands-on work of grape production and his own cutting-edge experiments in crop maintenance, Longworth left a legacy of horticultural achievement, a testimony to how dedication, as well as financial resources, can master the finicky processes of crop production.

ANTONIO LÓPEZ Y LÓPEZ

Spanish shipper, merchant, and banker

The main source of López's wealth was the Compañía Transatlántica, a shipping firm connecting Spain with its colonies. He made Spain's merchant marine a modern enterprise; created a diverse, widespread commercial empire centered on Barcelona; supported the arts and education; and transformed the village of Comillas into a seaside resort and architectural wonderland.

Born: 1817; Comillas, Santander, Spain
Died: 1883; Palau Moja, Barcelona, Spain
Also known as: Antonio Víctor López del Piélago y López de la Madrid; marqués de Comillas
Sources of wealth: Shipping; trade; banking; slave trade
Bequeathal of wealth: Spouse; children

EARLY LIFE

Antonio Victor López y López was born in 1817 in Comillas, Santander, Spain. His father, Santiago López del Piélago, and his mother, María López de la Madrid, were unrelated and from local nobility. His father died when Antonio was six, leaving his mother destitute. At age nine, Antonio moved to Andalusia to work for relatives in several locations. After a year and a half he returned to Comillas.

In 1831, he sailed to Cuba, where he resided until 1841, working in Santiago and Havana. He returned to Comillas, but in 1843 he went back to Cuba, where he sold manufactured goods, and in 1844 he opened his own secondhand shop in Santiago. He soon asked the shop's landlord, Andrés Bru, for permission to marry one of his daughters, Lluïsa Bru i Lassus. Returning to Spain in 1846, he married Lluïsa in 1848 in Barcelona and received a dowry worth 50,000 pesetas, which approximately doubled his wealth.

FIRST VENTURES

López first showed his entrepreneurial skills in Cuba. In 1841, he and Manuel Calvo used a small ship to transport flour from Santiago to Havana. The sale of this ship financed López's return to Spain. In 1848, while in Barcelona, López converted his secondhand shop into a general partnership known as Valdés y López. In 1849, the business was renamed Antonio López y Hermano after his partner, Domingo A. Valdés, withdrew from the business; however, López's father-in-law and brother-in-law, Andrés Bru i Lassus, joined the partnership.

With Lluïsa's dowry and her brother and father's capital, López returned to Santiago in 1849 and expanded his ventures. In 1851, he and Valdés started a steamship line operating between Santiago and Guantánamo; their one ship was likely used to introduce slaves illegally into eastern Cuba. Slaving profits enabled Antonio López y Hermano to buy four sugar plantations and at least two coffee plantations, which came with many slaves. Fleeing a cholera epidemic, López, his wife, and his young children Isabel, Antonio, and María Luisa returned to Barcelona in 1853, where another child, Claudio, was born on May 18. López began liquidating Antonio López y Hermano while looking for other investment opportunities that would permit him to remain in Barcelona. His attempt to start a maritime insurance company there failed. In 1857, he returned to Santiago to settle the estate of his deceased father-in-law and tried to start an insurance company for eastern Cuba, but it also failed.

Mature Wealth

With the profits from Antonio López y Hermano, which exceeded 500,000 pesetas, López and five partners founded the shipping company Antonio López y Compañía (abbreviated as A. López y Cía) on January 11, 1857. Having provided 40 percent of the total capital with 1 million pesetas, López was in charge of the firm. The company was always more than a shipping concern because it also lent money to companies and individuals and acquired property.

During the Spanish-Moroccan War (1859-1860), López ferried troops and supplies to Morocco. This wartime service to Spain enabled A. López y Cía to win at public auction in 1862 the sole right to transport mail between Spain (Cádiz and Santander) and Havana, Cuba, and San Juan, Puerto Rico. The first contract for five years was extended on various occasions to 1932, providing a steady stream of income, exemption from registration fees, the use of naval harbors, and exemption from quarantines. The mail ships also carried troops, civilian passengers, and valuable commodities, such as gold and tobacco. In 1876, López's company privately loaned 5.25 million pesetas to the administration of Spanish prime minister Antonio Castillo for the purpose of ending Spain's Ten Years' War (1868-1878) with Cuban rebels.

In 1878, Antonio made his sole surviving son, Claudio, an active partner in A. López y Cía. In 1881, the company was converted into a stock corporation that was renamed Compañía Transatlántica and valued at 19 million pesetas. To keep control of the firm, López stacked its board of directors with his associates.

The success of his shipping company permitted López to enter the fields of banking and real estate. In 1863, he was one of the founders of Sociedad de Crédito Mercantil, and he became its first vice president and, in 1881, its president. This bank was active in loaning money to businesses and industries and invested in railways; the bank also speculated in the extension (*ensanche*) of the city of Barcelona, making a profit of more than 2 million pesetas despite developing no properties there. In 1872, López joined a group of investors speculating in the extension of Madrid by building a new bullring and redeveloping land near the centrally located old bullfighting arena. The following year, he became a stockholder in José de Salamanca y Mayol's company, developing the area of Madrid's extension now called barrio de Salamanca. As Salamanca's company could not meet its obligations, its investors forced its dissolution and received valuable real estate in compensation. López also bought real estate in Barcelona, Santander, Cádiz, and Toledo.

In 1876, López was one of the founders of the Banco Hispano Colonial in Barcelona. This bank was to loan money to Spain to help finance the war in Cuba. Thanks largely to López, the bank raised 125 million pesetas. A grateful Spanish government in 1880 signed an agreement giving the bank 10 percent interest, a share in the increase in Cuban customs, and the right to deal in Cuban mortgage securities and invest in other ventures.

A devout Catholic, López supported the Catalan priest-poet Jacint Verdaguer and the Roman Catholic Church. Verdaguer served as chaplain for Compañía Transatlántica from December, 1873, to November, 1876, when he became the personal chaplain to López, who had just lost his oldest son Antonio and wanted his other son, Claudio, protected via daily masses. López underwrote the definitive Catalan edition of Verdaguer's epic poem *L'Atlàntida* (1876) and paid for its translation into Castilian. In 1881, López agreed to underwrite the construction of the Seminario Pontificio de Comillas, a seminary that was to prepare poor young men for the priesthood. He provided 500,000 pesetas for the seminary in return for picking its site and complete indulgence of his sins at death.

In 1878, King Alfonso XII awarded López the title of marqués de Comillas. The same year, López became vice president of Compañía de los Caminos de Hierro del Norte, a railroad construction company. He complemented his growing control of Spain's northern railways with investments in the coal company Hullera Española. In 1881, López founded the Compañía General de Tabacos de Filipinas, which soon controlled Philippine tobacco production. López's highest honor came on October 31, 1881, when Alfonso XII conferred on him, his

The Architectural Heritage of Comillas

A fishing village prior to the 1880's, Comillas, Spain, is a Cantabrian seaside resort known for its Catalan Art Nouveau architecture. The municipality owes this unusual distinction primarily to its native son, Antonio López y López. In 1865, he bought for his mother the Casa Ocejo, a cubic three-story house with a front facade of ashlars. His brother Claudio lived next door; Patricio Satrústegui, an old friend and associate, lived on the other side of Casa Ocejo.

As the summer of 1881 began, doctors recommended that the royal family bathe in Cantabrian seawater during several months to alleviate ailments. There were many offers of lodging, but King Alfonso XII asked López's permission to stay at Comillas; Antonio, Claudio, and Patricio's houses were used to accommodate the royal family and retinue. Many alterations were made to Casa Ocejo, where the king, queen consort María Cristina, and tiny princess María de las Mercedes stayed; the Casa de Ocejo's gardens were connected to those next door and were lit with electric lamps, and the rooms were lavishly redecorated. The king was so pleased that the visit was repeated in the summer of 1882.

Near Casa Ocejo is a pantheon-chapel that was inaugurated on August 28, 1881, with the royal family in attendance. In 1878, López commissioned the Catalan architect Joan Martorell i Montells to build it. The pantheon-chapel, in which López and his son Claudio are entombed, is a small version of a cathedral designed in the architectural style of Perpendicular Gothic. Famed Catalan architect Antonio Gaudí designed the interior furniture in a Gothic-modernist style, which pleased López so much that he asked Gaudí to design a pergola for Casa Ocejo's garden.

Next to the pantheon-chapel stands the Palace of Sobrellano, which López in 1878 also commissioned Martorell to build. The first stone was laid on July 29, 1881, on the site of López's old home and the building was completed in 1888. It is Perpendicular Gothic with modernist touches and has a front facade of open galleries with archways. The interior is spectacular, with a Great Hall containing eight frescoes by Eduardo Llorens highlighting the lives of López and his son Claudio. Nearby Sobrellano is Gaudí's El Capricho, a fantastical summer mansion in the Neo-Mudéjar architectural style, commissioned in 1883 by López's brother-in-law, Máximo Díaz de Quijano; in the twenty-first century, the mansion housed a fine restaurant.

On a hill west of Casa Ocejo, the huge Seminario Pontificio de Comillas complex was abandoned in the 1960's when the Universidad Pontificia Comillas moved to Madrid. This Jesuit seminary was built under the direction of Martorell in a Gothic-Mudéjar style. In 1899, the Catalan architect Lluis Domènench i Montaner added modernist decor.

The Comillas monument to Antonio López y López was built in 1889-1890 under the direction of the Catalan modernist architects Domènench and Cristóbal Cascante i Colom. It is a column rising from a ship's keel, with a statue of López atop and decorative elements that relate to maritime activities in the Antilles and the Philippines.

children, and legitimate successors a grandeeship, an award that came with a seat in the Spanish senate. The royal decree stated that the honor recognized López's patriotism and dedication to Spain's merchant marine.

López died unexpectedly in 1883 in his palace, Palau Moja, in Barcelona. News of his death produced a significant drop in the price of shares of his banks and companies. He was buried on January 19, 1883, and his funeral was celebrated at the Cathedral of Barcelona on February 28. Barcelona erected a monument with a statue of him atop; on its pedestal are engraved these words of Alfonso XII: "España ha perdido uno de los hombres que más grandes servicios le ha prestado" (Spain has lost one of the men who rendered it the greatest services). His personal property of more than 14 million pesetas was left to his spouse; after her death, the remaining wealth was to be divided equally between the two surviving children, Claudio and Isabel. In addition, a trust was established for Claudio stipulating that all landed property would pass to him and that he would manage López's commercial empire.

Legacy

Antonio López y López was a self-made magnate of nineteenth century Spain. He rose from poverty to make a fortune that was rooted in Cuba but blossomed in Spain because of his business acumen and skill in leveraging his own investments with those of family members and trusted associates, who usually were *indianos* (returnees from the Americas) like him. He is the prototype of a bourgeois who used his ties to the Spanish nation and to the industrial elite of Barcelona to develop a commercial empire that outlived him for many years. His evolution from individual capitalism to corporate capitalism was not matched by any other contemporary Spaniard.

Louis XIV

French king

King Louis XIV was the absolute ruler of the French people. Louis used the income of the French nation as his personal coffers, involving France in expensive wars to expand the nation's boundaries and building monuments to his glory, including the Palace of Versailles.

Born: September 5, 1638; Château de Saint-Germain, Saint-Germain-en-Laye, France
Died: September 1, 1715; Versailles, France
Also known as: Louis Dieudonné de France; Louis Auguste de France; the Sun King
Sources of wealth: Inheritance; government; real estate
Bequeathal of wealth: Relatives

Early Life

Louis XIV (lew-EE kah-TOHRZ) was the son of King Louis XIII of France and Anne of Austria, daughter of Philip III of Spain. Louis's parents married in 1615, but there was no heir for twenty-three years until Louis's birth in 1638. Queen Anne was regarded as too old to bear a child, and Louis XIII was too sickly and not interested in his wife. The birth of Louis XIV generated national rejoicing because a healthy heir was born. He was given the name Louis Dieudonné, which means Louis given by God.

The death of Louis XIII in 1643 elevated Louis Dieudonné to the position of king when he was not quite five years of age. For almost twenty years, Louis XIV allowed Cardinal Jules Mazarin to guide France. While growing up, Louis XIV felt humiliated by the French nobles and threatened by the people of Paris, significant factors in shaping future state policies.

First Ventures

In 1660, Louis XIV married Maria Theresa of Spain. The king had six children with his wife, but only the eldest son, Louis, Dauphin of France, survived to adulthood to marry and father children. King Louis was repeatedly unfaithful to his wife and had a number of illegitimate children. With Mazarin's death in 1661, Louis XIV assumed full control of the management of France. He never called into session the Estates-General, a legislative agency; he suppressed the *parlements*, which dispensed justice; and he sold the mayoralties to the highest bidder or made these positions hereditary. King Louis regarded himself as God's vicar on earth, and all his decisions were therefore purportedly made with the aid of God and therefore were of divine infallibility. He selected the image of the sun as his emblem because the sun, like the king himself, was the source of all light and life.

Louis XIV was poorly educated but usually made sound judgments. Under his finance minister Jean-Baptiste Colbert, the nation's finances were reorganized by mandating the collection of taxes from French citizens, except for the clergy and nobility, who were exempt from taxation. With the king's consent, Colbert supported old crafts and industries and encouraged new business ventures, such as the manufacture of silks, carpets, lace, tapestries, brocades, pottery, glass, porcelain, mosaics, and furniture. State inspectors ensured quality of workmanship. The nobles had been subdued by Mazarin before his death in the Wars of the Fronde (1648-1653). Louis eliminated another rival, the French Protestants, or Huguenots, by revoking the Edict of Nantes, which provided them with freedom of worship and the ability to fortify their own cities. By killing or expelling the Huguenots, Louis destroyed France's fledgling middle class, creating future financial crises.

Mature Wealth

As absolute monarch of France, Louis XIV had two primary goals: to make France master of Europe and to make French culture supreme. He spared no expense in financing wars to add more territory and in creating the Palace of Versailles as a suitable memorial to himself, the Sun King. France's wars drained the economy of much-needed money. He failed to seize the Spanish Netherlands (now Belgium) from Spain, and in backing his cousin James II, the deposed king of England, Scotland, and Ireland, in a restoration attempt, he ran afoul of the ruling monarchs, William III and Mary II. The only war that achieved a major result for Louis XIV was the War of the Spanish Succession (1701-1714), which was waged to place his grandson, Philip, duke of Anjou, on the Spanish throne. Louis's grandson was eventually recognized as King Philip V of Spain but at great cost in French lives, colonies, and money.

The construction of Versailles began in 1669 and continued until 1701. The true cost remains unknown because the account books were destroyed. Historian Will Durant surmised in 1963 that the cost of the gardens, buildings, furniture, decorations, and aqueducts was at least $500 million. Versailles's location kept Louis from the Parisians that he so despised. The creation of the *levée*, a ceremony performed when the king awoke, kept 150 nobles in attendance on Louis in the morning and again in the evening for the *couchée*, or putting the king to bed, These rituals humiliated the nobles, while keeping them under the king's roof and watchful eye. The French court's ceremonial system was the strictest in Europe, determining to whom the courtiers would have access, and when and where this access would occur. Language and gestures were codified according to circumstance. Courtiers entertained each other in conversation, gaming, reading, music, and amateur theatricals. The king offered a reception or show every evening in winter. Special festivals lasted for days and accompanied weddings, military victories, and the arrival of foreign royalty. From 1682 to 1715, twelve hundred tragedies and comedies were performed at Versailles. Meals were lavish displays of rare and exotic dishes that ran in successive waves but lasted only forty-five minutes. The film *Vatel* (2000), about a renowned French chef that Louis XIV wanted to serve him at Versailles, visually illustrates the complexity and expense of keeping Louis XIV entertained and well fed for each daily meal. The strain was too much for the chef, François Vatel, who committed suicide rather than serve his king at Versailles.

Legacy

Louis XIV failed in his attempts to make France the dominant power in Europe. His wars left the national treasury bankrupt. The extravagance in

Palace of Versailles

What became the Palace of Versailles began as a hunting lodge of brick, stone, and slate. Even with extensions, the building was too small. King Louis XIV of France made the decision to tear down the structure and build a new residence on the site. The original intent was for Versailles to be a temporary residence, but the congestion and perceived unhealthy climate in Paris eventually made Versailles Louis's permanent home.

The palace was located on an estate of eight hundred hectares (almost two thousand acres). Versailles had seven hundred rooms, with sixty-seven staircases covering a space of eleven hectares (about twenty-seven acres). The gardens had more than 200,000 trees with more than 210,000 flowers and shrubs and fifty fountains. The reflecting pool known as the Grand Canal covered twenty-three hectares (almost fifty-seven acres).

The Grand Apartments were designed to glorify Louis XIV, the Sun King. The decorative motif of the sun with the face of Louis XIV is found throughout the main rooms. Each salon led to other salons, with each dedicated to a heavenly body. The most famous chamber in the palace is the Hall of Mirrors, which measures 73 meters in length, 10.5 meters wide, and 12.3 meters high and has seventeen windows overlooking the gardens matched by seventeen arcaded mirrors along the wall. The ceiling of the hall shows King Louis XIV in various guises, including a Roman emperor, a victor over foreign powers, and the administrator of the kingdom. The queen's suite consists of the queen's guards room, the antechamber, the peers' salon, and the bedchamber. The king's suite includes the king's bedchamber, the council room, the king's guards room, the antechamber, and the *oeil-de-boeuf* salon (room of the bull's eye). Both the Chapel Royal and the Opera House remain two of the palace's most impressive rooms.

The gardens and groves were designed by André Le Nôtre, transforming hills and marshland into what became known as French-style gardens. The gardens follow a geometrical pattern around a main axis with secondary axes, radiating pathways toward circular pools or basins. Two parterres, the Parterre du Midi and the Parterre du Nord, are ornamental reflecting pools ringed with sculpture. The paths are designed to present new vistas, fountains, statues, trellised arbors, and trees trained and pruned into unusual shapes to remove the boredom of the aristocrats while walking the grounds. The most important of the fifty fountains at Versailles is the Apollo Fountain, with the god Apollo arising from the water on his chariot. A central fountain is named for Apollo's mother, Latona. Hidden groves contain a ballroom, a colonnade, and the baths of Apollo.

From King Louis's bedroom windows, the Sun King could awake and glance out to the gardens and the Grand Canal below, and along the horizon line an open space between tree groves allowed him to greet his counterpart, the sun, each morning. The Grand Canal was used for outings, concerts, and nautical festivities, creating a sense of Venice with its gondolas and yachts on the water. A perpendicular branch of the canal linked the menagerie to the Trianon Palace. Some of the parkland was used as a hunting preserve. The estate had an orangery, vegetable gardens, and an arboretum. Additional structures on the Versailles property included the palaces known as the Grand Trianon, the Petit Trianon, and the Queen's Hamlet (or farm).

the building and furnishing of Versailles and the lavish entertainments also contributed to the national debt. France's nobility was as bankrupt as the nation because the nobles attempted to compete with their king in building extravagant mansions and arranging lavish entertainments. When Louis XIV died in 1715, he left his great-grandson, Louis XV, a terrible financial burden.

To his credit, Louis XIV did make French the diplomatic language of Europe. The manufacture of French crystal, tapestries, porcelain, decorative arts, and furniture made France the center of craftsmanship and envy among Europe's other nations. For centuries, monarchs throughout Europe attempted to re-create the splendors of Versailles in their own palaces and to attain artisanal expertise either through importing goods from France or by developing similar industries in their own nations. The lasting legacy of Louis XIV was the development and export of French culture by impoverishing the French people.

Francis Cabot Lowell

American industrialist

A member of a distinguished family that made significant contributions to the law, the church, and the arts, Lowell established the family's reputation for financial acumen, wealth, and industry by building the first American textile factories and pioneering the mass production methods that initiated the American industrial revolution.

Born: April 7, 1775; Newbury Port, Massachusetts
Died: April 10, 1817; Boston, Massachusetts
Source of wealth: Manufacturing
Bequeathal of wealth: Children; charity

Early Life

Francis Cabot Lowell was the son of John Lowell, a highly respected jurist and a member of the Continental Congress. Francis graduated from Harvard College in 1793 with the highest honors in mathematics. He then embarked on a series of sea voyages to gain knowledge of the world and foreign trade. Setting up in business as a merchant, Lowell by 1802 had acquired more than twenty properties in the Boston area. As the most entrepreneurial member of his family, he looked for new ways to increase its wealth, prestige, and contributions to the welfare of his native land.

First Ventures

In 1810, Lowell traveled to England, where he visited the textile mills in Lancashire. Even though the British government forbade the export of machines or even plans for manufacturing equipment, the keenly observant Lowell put to good use his command of mathematics and memorized the mechanics of power looms. Thus he was able to reconstruct and improve the English industrial equipment used to manufacture cotton goods. By 1812, he had established the Boston Manufacturing Company in Waltham, Massachusetts. In 1814, this firm built the first textile mill in America, converting raw cotton into finished cloth.

Mature Wealth

Lowell's wealth was generated by his ability to take advantage of new technology (such as a new power loom invented by Paul Moody) and of new ways of financing and growing his business. He arranged to sell \$1,000 worth of shares in his company's stock to the public. In so doing, he helped to establish shareholder businesses and public stock offerings as one of the fundamental methods of expanding American industry and commerce. By 1815, shares in Lowell's company paid a 10 percent return, and by 1817 the return had doubled to 20 percent. This stock return was possible, in part, because in 1816 Lowell successfully lobbied Congress to impose a tariff on cotton, thus ensuring that his manufactured goods would be protected against imports from England and other countries.

At the same time, Lowell created a new workforce for his industry, employing farm laborers and young women as textile workers in what became known as the Lowell system. He was heavily criticized for paying low wages, especially to women, but he compensated his workers with subsidized housing in company boardinghouses, as well as providing them with religious and educational instruction.

Prone to ill health that was exacerbated by his penchant for overwork, Lowell died in 1817, just a few years after his breakthrough success. However, he had built his business on such a strong foundation that by 1821 his company was able to pay shareholders an astounding 27.5 percent in dividends. He was also fortunate in having a son, Francis Cabot Lowell, Jr., who was able to expand the family business, creating a new mill town in 1826 named Lowell, Massachusetts, after his father.

Legacy

As one of his biographers notes, Francis Cabot Lowell probably did more than any other individual to increase the wealth of New England and by extension improve the commerce of the entire United States, beginning the process of transforming America from an agricultural to an industrialized power. The factory system he pioneered, for better and worse, established the course of the American industrial economy. On one hand, he drove his workers hard (as he drove himself); on the other hand, he provided for their welfare, demonstrating a humanitarian concern for his employees that set a standard for other industrial enterprises. Writers like Henry David Thoreau criticized Lowell and his successors for suppressing American individualism, yet other writers like Charles Dickens, who could be highly critical of Americans and American institutions, visited the Lowell factories and found no fault with them.

Samuel Loyd

British banker and politician

Loyd built up a small private bank and by his prudent business methods amassed his own fortune. His understanding of the banking system was of invaluable assistance to the British government in formulating its banking laws.

Born: September 25, 1796; London, England
Died: November 17, 1883; London, England
Also known as: Samuel Jones Loyd; first Baron Overstone
Sources of wealth: Inheritance; banking
Bequeathal of wealth: Children; charity

Early Life

Samuel Jones Loyd, first Baron Overstone, was born into a wealthy banking family. Although his father, Lewis Loyd, had trained as a unitarian minister, he had married the daughter of a Manchester banker, John Jones, and had subsequently entered banking and prospered. Lewis had been sent to London to open a branch there when Samuel, an only child, was born.

Although his father remained unitarian, Samuel was brought up in the Anglican Church, which provided him access to Eton College, one of Britain's leading independent schools, and later to Trinity College, Cambridge University, from which he graduated in 1818. Two years earlier, he had joined his father's bank.

First Ventures

In 1819, Loyd was elected a Liberal Party member of Parliament for Hythe, Kent. He remained in this position until 1826, when his small majority of votes evaporated. He tried to reenter Parliament in 1832, this time seeking to represent Manchester, but he was badly defeated. In the meantime, he had married Harriet Wright, daughter of a Nottingham banker, in 1829. The couple later had one son who died in infancy and a daughter, Harriet Sarah.

At a time when many small private banks were failing, Loyd devoted himself to banking and to understanding banking theory. By 1832, he was an expert on money circulation, currency, and lending, and he was elected to the prestigious Political Economy Club. He opposed limited companies and decimalization (changing the prices at which securities trade from fractions to decimals). His policy of fiscal responsibility and cautious lending was in contrast to the fortunes of the Bank of England, which nearly failed three times in this period. By contrast, the banking firm of Jones, Loyd & Co. earned £2.2 million in profits between 1817 and 1848 (some $4 billion in 2010 currency), one-quarter of which went to Loyd.

MATURE WEALTH

The British government realized that the nation's banking system needed reforming and set up a series of select committees to consider the future of British banking. Loyd appeared before the first committee in 1832. In 1837, he began to publish a series of tracts on various aspects of banking, with special emphasis on the hotly debated topic of whether paper money should be tied closely to the amount of gold bullion that was held by any particular bank.

Loyd's closely reasoned conservative arguments for logical rules for banking were presented to the 1840 select committee, of which Sir Robert Peel, Great Britain's prime minister, was a member. Loyd's testimony was largely responsible for enactment of the Bank Charter Act of 1844. This legislation gave the Bank of England, though still a private bank, the monopoly on issuing banknotes in England and Wales. The amount of paper money in circulation was pegged to the amount of gold and silver that the bank held. This system stabilized British banking until World War I. As a result of Lloyd's efforts to adopt this act and his advice to the government on other matters, he was named first Baron Overstone in 1850.

Loyd's father had retired from the bank in 1844. After being promoted to the peerage, Loyd phased out his banking career, buying several large properties in the country, one of which, Lockinge, contained an extensive library. He devoted himself to working in the House of Lords, accumulating more books and paintings, improving his properties, and contributing to various educational and philanthropic institutions. Jones, Loyd & Co. began to decline, as its conservative practices were no match for some of the joint-stock banks, one of which eventually bought Jones, Loyd.

In 1858, Loyd's daughter married an aristocrat and received Lockinge as a wedding gift. The same year. Loyd's father died, and Loyd inherited his father's property of Overstone and a considerable fortune. After his wife died in 1864, Loyd become increasingly reclusive.

LEGACY

When he died in 1883, Loyd was one of the richest men in Great Britain, with personal wealth of more than £2 million and assets of more than £3 million. However, his real legacy lay not in the amount of fiscal wealth he inherited and accumulated but in his contribution to banking theory and the role of the Bank of England, which helped make London one of the world's banking centers.

Andrónico Luksic

Chilean investor and industrialist

Luksic parlayed his purchase of a copper mine in his hometown into one of the largest business empires in Latin America. The Chilean billionaire founded the Luksic Group, one of Latin America's most important industrial conglomerates.

Born: November 5, 1926; Antofagasta, Chile
Died: August 18, 2005; Santiago, Chile
Also known as: Andrónico Luksic Abaroa
Sources of wealth: Mining; banking; tourism; railroads
Bequeathal of wealth: Spouse; children; charity

Early Life

Andrónico Luksic Abaroa (uhn-DROH-nee-koh LEWK-seek ah-bah-ROH-ah), born on November 5, 1926, was one of two children of Policarpo Luksic and Elena Abaroa Luksic. Policarpo was an immigrant who arrived in Chile from Brac, Croatia, in 1910. Policarpo initially made a living in the nitrate business near Antofagasta, Chile, and later imported cattle from Argentina to feed Chilean miners in the Antofagasta area. Elena Abaroa Luksic belonged to a well-off Chilean-Bolivian family. Policarpo wanted his son to become a lawyer and sent Andrónico to the University of Chile, one of the country's finest institutes of higher education. However, Andrónico's inclination was to study economics and to improve his French and English skills. As a result, he moved to Paris to further his education at the Sorbonne, where he wrote a thesis about economic neoliberalism.

Luksic married twice. His first wife was Ena Graig, with whom he had two children, Andrónico and Guillermo. His second wife was Iris Fontbona, with whom he had three children, Jean-Paul, Maria Paola, and Maria Gabriela.

First Ventures

Luksic first showed signs of his sharp entrepreneurial skills when he began conducting profitable money exchanges with francs and pounds during his residence in Europe. He returned to Chile in 1952 with a small capital of $30,000 (in U.S. dollars) that opened the first door for him. His uncle, Juan Abaroa, made him a partner in his Ford concessionary in Antofagasta. Luksic's vision prompted him to convince his uncle, who already imported cars, also to import the heavy-duty machinery, which was much needed in the region.

In 1954, Luksic obtained 70 percent ownership of Portezuelo, a copper mine near Antofagasta. The same year Japanese investors approached him with a proposal to purchase the mine if geological studies produced positive results. The studies were positive, and as a consequence the investors asked Luksic to suggest a price for the mine. Luksic, who was new to the mining industry, thought it wise to invite the investors to state the mine's

The Andrónico Luksic Foundation

Andrónico Luksic had a long history of involvement in one of the most important charitable organizations in Chile, the Andrónico Luksic Foundation. The foundation has its roots in another Chilean charity, the Lota Schwager Foundation, which began operating in 1958. Four years later, the Schwager foundation obtained a subsidy from the government that permitted it to sponsor and upgrade a trade school in the city of Coronel. This sponsorship enabled low-income students to pursue vocational training at their local high schools.

In 1966, Andrónico Luksic became a board member of the Schwager foundation, and in 1992 he assumed the presidency. In the 1970's and 1980's, the organization concentrated its aid on schools serving impoverished students and on homes committed to assisting needy children. It also granted scholarships to exceptional low-income students, and in 1991 it facilitated the establishment of an agricultural school, the Pascual Baburizza Institute of Los Andes, located in northern Chile.

In 2000, the foundation was renamed the Andrónico Luksic Foundation. Luksic's daughter, Maria Paola Luksic, became vice president of the organization in 2004, and the following year she assumed the presidency because of her father's poor health. Maria Paola Luksic hired competent individuals and appointed new members to the board. This transformation permitted the foundation to get involved in new educational and cultural projects, as well as in novel community engagements. For example, the foundation has associated itself with important national charitable and educational groups, such as the Chile Foundation and the Mercator Foundation, two organizations devoted to implementing technology in education and business. The foundation also began working with Friends of Chilean Cultural Heritage and the Barnechea Learning Foundation.

According to its records, the foundation provides about $10 million worth of assistance annually. The organization continues to grant scholarships to underprivileged students, concentrating its grants in rural areas and small cities. Some of its most innovative projects have been the incorporation of classroom technology for reading and writing programs in country schools and the installation of a Wi-Fi system for the coastal town of Mejillones. Another important educational project is the Cybertrain, a refurbished antique train that rides through the city of Antofagasta, teaching children how to use computers. The Luksic foundation also invests large sums to upgrade and modernize school and university libraries.

In its efforts to advance culture, the foundation has created programs that seek to make indigenous Chilean children proud of their cultural backgrounds. The foundation has helped establish orchestras that play indigenous instruments and has created several traditional dance groups across the country. It has also granted scholarships to teenagers who have demonstrated talent in the arts. Some of the significant social programs supported by the foundation are the formation of workshops in high-risk neighborhoods; the provision of entertainment, such as circus performances, to these areas; and the use of aromatherapy and dog therapy for children with cognitive problems.

value. The Japanese offered $500,000. Luksic concluded that this amount not only covered the price he had paid but also made him a good profit, and he accepted the figure. He was pleasantly surprised at the closing of the transaction, when he realized that the Japanese paid him $500,000 in American currency instead of in the Chilean currency he thought he would receive. Obtaining this much larger amount signaled the first of a series of providential events for Luksic that also marked the beginning of many future economic successes.

Mature Wealth

Luksic not only was lucky but also was highly shrewd in his approach to business. He believed in never using his own money to invest, he was committed to diversifying his profits, and he trusted his instincts, taking risks when others did not. In an interview with *El Mercurio*, a major Chilean newspaper, he said that the first step he took after the sale of Portezuelo was to deposit the $500,000 in the Grace Bank of New York in order to use it as collateral. After that, he built his fortune with bank loans that he invested intelligently. At the beginning of the 1950's, he founded the Luksic Group, an industrial conglomerate based in Antofagasta. This company initially was a mining firm, but it soon began investing in metal processing, power distribution, transportation, timber, and agriculture. In 1957, Luksic created Quiñenco S.A., another business group that diversified into the industrial and financial sectors.

Luksic's investments nearly came to a halt during Salvador Allende's socialist government (1970-1973). Allende's policies of confiscating privately owned businesses meant that Luksic had to quickly liquidate his companies, and the Luksic Group had to pursue business in the Argentinean, Colombian, and Brazilian markets. It was at this juncture that Luksic demonstrated the frankness and ability to negotiate that members of the Allende cabinet later remembered as both cunning and effective. During a commemoration by the Chilean congress after Luksic's death in 2005, Fernando Flores, who was in charge of the expropriation process under Allende, recalled that he was impressed with Luksic's answer when Flores was called in to seize Luksic's businesses. Luksic told him that what really mattered were his workers, not his industries. The government reacted to Luksic's humanitarian response by allowing him to continue to operate some of his companies.

In 1974, under Augusto Pinochet's dictatorship, restrictions were lifted and the Luksic Group resumed its investments in copper mining. In the early1980's, in the midst of Chile's economic crisis, Luksic's investments expanded swiftly. He employed two very crafty business tactics: diversification and the purchase of ailing companies to turn them into profitable ventures. The first lucrative move based on these strategies came in 1980, when Luksic acquired the almost bankrupt Antofagasta and Bolivian Railway Company PLC. In 1982, the firm's name was changed to Antofagasta Holding PLC, and in 1999 it became Antofagasta PLC. The new holding company expanded its interests in railways, and although it did branch out into banking and manufacturing, its activities were concentrated in mining. In 1983, the company began underground extraction at the Michilla mine and started copper mining at Los Pelambres, one of the world's largest mines, located north of Santiago, Chile.

During the 1980's, the Luksic Group Quiñenco purchased a number of almost bankrupt businesses. Among the most important were Luchetti S.A., a pasta maker with branches in Argentina and Peru; Madeco S.A., a leading metal producer; Habitaria, a real estate development firm; and the Hotel Carrera, then the classiest hotel in Santiago. The hotel later became part of Hotel Carrera S.A., which in the twenty-first century provided tourism, recreation, and transportation services and invested in real estate, stocks, bonds, and debentures. In 1985, Luksic entered into partnership with Joseph Schoghuber in order to buy Compania Cervecerias Unidas S.A. (CCU), the largest brewery in Chile. The Luksic Group Quiñenco entered the financial services business in the 1980's by partnering with Banco Santiago and Banco O'Higgins. In addition, the Quiñenco Group was responsible for the merger of Banco Edwards and Banco de Chile, two major Chilean banks.

In 2009, Antofagasta PLC and Quiñenco S.A. were part of the Luksic Group, one of Latin America's most important conglomerates. Quiñenco's holdings include Banco de Chile, CCU, Telefonica del Sur, and Madeco S.A. The sales of this group of companies combined reached more than $4.1 billion (in U.S. dollars) in 2008. Antofagasta PLC continues to invest in the copper industry and is one of the world's largest producers of this metal. This corporation also operates the railway that services the mines in the north of Chile and is involved in the distribution of water in the Antofagasta region.

Luksic also owned the luxurious Grand Villa Argentina Hotel in Dubrovnik, Croatia. His personal fortune was estimated to be $4.3 billion when he died in 2005, making him the world's 132d-wealthiest individual in that year.

Legacy

In a commemoration by the Chilean congress after Andrónico Luksic's death, a senator said that history will remember Luksic as a central figure in the construction of Chile's strong economy. The Luksic Group is the fourth largest investment conglomerate in Latin America and has helped maintain Chile's economic stability as one of the nation's largest employers. Luksic not only left a financial legacy but also left a mark in the community. In Chile, he founded the Andrónico Luksic Foundation, which works to promote education, culture, and social programs for the needy. He also established the Luksic Fellowship for Croatia at Harvard University's John F. Kennedy School of Government.

Ma Yueguan

Chinese merchant

Ma and his brother were wealthy salt merchants in Yangzhou, China, during the Qing Dynasty. They employed their wealth to patronize Chinese scholars and artists and to create a renowned literary society.

Born: c. 1688; Yangzhou, China
Died: 1755; Yangzhou, China
Also known as: Ma Yueh-kuan
Source of wealth: Trade
Bequeathal of wealth: Children

Early Life

Ma Yueguan (mah yew-gwahn) was descended from a venerable but not wealthy family. His grandfather, Ma Chengyun, first entered the salt business, moving to Yangzhou from Anhui Province. Yangzhou was the center of the lucrative Chinese salt monopoly. Located on the intersection of the Yangtze River and the Grand Canal, near rich salt deposits, Yangzhou supplied salt for much of China. The salt trade was a monopoly of the Chinese government, which entrusted the salt business to Yangzhou merchants of the Lianghuai district. In exchange, the Lianghuai salt merchants delivered great sums of taxes from salt transactions to the Qing Dynasty.

In the eighteenth century, when the salt merchants of Yangzhou acquired wealth of legendary proportions, it is estimated that their annual profit was about 5 million taels of silver. (Silver taels were the currency of wealth in premodern China; 1 silver tael is estimated to have been worth about $40 in 2010 currency.) The income of the salt merchants was rivaled only by the equally famous Cohong merchants of the port of Canton. Ma Yueguan was raised by his family to play a leading role in the Lianghuai salt trade. His prominence was such that while still a young man, he met the Qing emperor during his visit to Yangzhou. Ma was also selected to present birthday congratulations to the empress dowager.

First Ventures

Ma Yueguan operated in the salt trade with his younger brother Ma Yuelu. They were among the wealthiest of the two hundred head merchants of the Lianghuai district, receiving special privileges from the Qing Dynasty. Because of the brothers' success, their biographies were written by prominent eighteenth century scholars Liu E, Chuan Zuwang, and Hang Shizhun. Although the exact quantity of their wealth is not recorded, it is indicated by their property and possessions. The Mas owned a garden estate called the Little Translucent Mountain Cottage in the fashionable northwest section of Yangzhou. This cottage was a multistory complex with rooms dedicated to the family's treasure trove of rare books and fine art. The family monastery, called the Temporary Retreat, was located on the outskirts of town. The Ma libraries, with more than 100,000 rare books, were considered the finest private collections in China. Their collection of rare Song and Yuan Dynasty scrolls was memorialized in an essay by Chuan Zuwang. The Ma brothers owned paintings and scrolls by some of China's leading artists and calligraphers. Their antiques included a famous lamp from the Han Dynasty, a silver wine cup made by the most celebrated silversmith of the Yuan Dynasty, a famous scroll from the Ming Dynasty, and the hanging scroll *Heavy Snow in a Gusty Wind* by the celebrated Song Dynasty painter Guo Xi. The Ma brothers were able to devote a large portion of their wealth to their literary pursuits in part because the size of their clan was relatively small.

Mature Wealth

The Ma brothers have entered history as the greatest patrons of literary and artistic culture in eighteenth century Yangzhou. According to historian Ginger Cheng-chi Hsü, the brothers may well have been the greatest private patrons in the history of China. The head merchants of the Yangzhou salt commerce had become so wealthy that their extravagance was notorious. The contemporary historian Li Dou recorded instances of salt merchants who spent several hundred thousand silver taels for weddings and funerals, who kept hundreds of horses, who dined on ten gourmet dishes at every meal, and who scattered gold foil in the wind to showcase their wealth. One salt merchant kept wooden nude female statutes in his hall, which his servants would operate mechanically to the amazement of his guests. Another collected large novelty dolls at the cost of 3,000 taels. Another merchant erected for himself a six-foot-tall bronze urinal.

The Ma brothers, however, used their accumulated wealth to patronize the arts of China. They paid for a restoration of the well-known Plum Blossom Academy, including three shrines, classrooms, and sixty-four dormitories. Their book collection was known as the Ts'ung-shu-lou chi studio. Consulting with scholars, the Mas gathered information about precious manuscripts and

The Salt Monopoly and Great Wealth

Salt has helped shape the course of civilizations and has been a generator of wealth for governments and individuals. Salt is an edible rock that is essential for human consumption. It is also vital as a food preservative and seasoning. Because salt is difficult to extract from rock, river, and lake beds, it is easily regulated by official administrators.

China established the first governmental salt monopoly in the third century B.C.E. For the next two millennia, the Chinese imperial administration collected enormous sums from its monopoly, sometimes as much as half of the total government revenue. The Roman Empire did not establish a salt monopoly, but it closely regulated its extraction and trade, taxing salt and distributing it to gain favor from citizens and soldiers. The African city of Timbuktu grew rich from the salt trade. Starting in the twelfth century, camel caravans carried salt from the Taudenni and Taghaza salt mines to Timbuktu, where it brought great wealth to the city. Timbuktu became fabled for its schools, mosques, and libraries that were financed by the salt trade. The famous French salt tax, the Gabelle, was levied from 1286 to 1790.

Some of the greatest salt fortunes were made by Yangzhou merchants, entrusted by China's Qing Dynasty to administer the salt monopoly. Yangzhou, a city in the province of Lianghuai, was strategically located at the center of China's strategic rivers and canals and nearby the rich salt beds of the Yellow River. The Chinese imperial government licensed merchants to engage in the salt trade; in exchange, these merchants remitted fixed sums of money to the imperial coffers. In times of prosperity, the revenues remaining to the salt merchants could be immense. While no individual salt merchant may have achieved the enormous wealth of the wealthiest of the Cohong merchants of Canton, collectively the Yangzhou salt merchants achieved greater wealth. The aggregate wealth of the salt merchants in the second half of the eighteenth century has been estimated at a staggering 250 million taels. In the summer of 1768 alone, the Lianghuai merchants spent 5 million taels entertaining the visiting emperor. The salt merchant Cheng Mengxing was famous for his bamboo garden. The libraries of the merchants Wang Qishu and Bao Tingbo were second only to that of the brothers Ma Yueguan and Ma Yuelu. The salt merchant Fan Huo of the distinguished Fan clan attained a great fortune, and he was noted for the exquisite rarities on his estate—fine silks and cotton and hairpins made of jade, tortoise shells, rhinoceros horn, and ivory. He also gave to charity in times of disaster. An Luzun, also known as An Qi, was the wealthiest salt merchant of the seventeenth century, noted both for his extravagant lifestyle and for subsidizing the scholar Zhu Yizun with a gift of 10,000 taels. Salt merchant Bao Zhidao achieved fame for building and repairing Confucian temples.

The revenues of the Lianghuai salt merchants declined with the decay of the Qing Dynasty in the nineteenth century. Many of the merchants went bankrupt, and their luxurious villas and gardens went into ruin.

then spared no expense in locating and acquiring them. For books they could not acquire, such as the twenty-thousand-volume encyclopedia of the *Great Canon of the Yung-Lo Era*, dating from 1407, they employed a small army of copiers. The libraries of the Ma family attained such fame that the Qianlong emperor personally examined their printed inventory in 1773, expressing wonderment at the contents. Their publishing house printed rare and contemporary books. Their personal *chop* (a personal seal, equivalent to a signature) was Ma Pan (Ma edition). Ma Pan became known in China for the superior quality of printing with which its books were produced, with each volume scrupulously examined to eliminate forgeries. The company's biographies of the authors Han You and Liu Zongyuan, published in 1729 and 1730, respectively, in antique Song Dynasty style, were particularly admired. The Ts'ung-shu-lou chi studio also contained antique scrolls, stone rubbings, and masterpieces of calligraphy.

The Ma brothers supported several of the finest poets, writers, and scholars of the period, providing them with room, board, and a stipend. For the most distinguished writers, such as Liu E, Ma Yueguan paid all expenses, including rental properties for his family, culinary delicacies, and a new concubine. Liu noted in one of his books that the work was composed at the Ma estate. The poet Chen Zhang lived in Ma's garden estate for twenty years, which enabled him to concentrate on composing his poems. It is recorded that Ma paid for the marriage, medical, and funeral expenses of several other writers, as well as publishing their works.

Ma also hosted the Hsing-an literary society, in which writers and artists would gather regularly in the Ma gardens. During these occasions, the Ma brothers would proudly look on as the guests were regaled with lavish banquets, fine wines, and musical entertainment while discussing poetry, calligraphy, and art. The artists Fang Shishu and Ye Fanglin painted a scene of such a gathering in the silk scroll *Literary Gathering at Hsing-an on the Double Nine* (1743), which was eventually acquired by the Cleveland Museum of Art. In this scroll, poets and painters are depicted in every mode of relaxation and contemplation in Ma's opulent gardens, while Ma oversees the entire convocation with delight.

It can be assumed that what remained of the Ma brothers' wealth was passed on to their descendants. In 1772, Ma Yu, the son of Ma Yuelu, submitted a large quantity of rare manuscripts to the Qing imperial manuscript library, of which 776 were copied.

The wealth of later generations of the Ma family declined, along with those of other Lianghuai salt merchants. The Little Translucent Mountain Cottage fell into ruin and was sold.

Legacy

The eighteenth century salt merchants of Yangzhou accumulated great fortunes, much of which was expended in conspicuous consumption and extravagance. Ma Yueguan and his younger brother Ma Yuelu used their wealth to become among the great literary and artistic patrons in Chinese history, collecting rare books and fine paintings and supporting a select group of scholars, artists, and poets. Their collection of books was second only to that of the imperial court.

The wealth of the Luanghuai salt merchants made Yangzhou a city of luxury shops, fine restaurants, pleasure barges, and musical theaters, as well as a literary and artistic showpiece. As such, Yangzhou deserves to enter the lore of legendary and historic cities, such as Periclean Athens, scholarly Timbuktu, Baghdad during the reign of Hārūn al-Rashīd, and Vienna and Paris during the years of the great salons and cafés. The Ma brothers contributed to the Yangzhou renaissance with their great wealth and discriminating tastes. The scrolls depicting their gatherings, the tributes paid to the brothers by their contemporaries, and the brothers' rare manuscripts and artwork demonstrate that they were among the few rich people who combined great mercantile wealth with unselfish devotion to civic culture.

JOHN D. MACARTHUR

American insurance executive and real estate developer

Through his ingenuity and capacity for hard work, MacArthur scraped his way through the Depression to become, at his death, one of the richest men in the United States. His immense wealth supports one of the largest American foundations.

Born: March 6, 1897; West Pittston, Pennsylvania
Died: January 6, 1978; West Palm Beach, Florida
Also known as: John Donald MacArthur
Sources of wealth: Insurance; sale of products; real estate
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

John Donald MacArthur was born in 1897 in West Pittston, Pennsylvania, the seventh and last child of William and Georgiana MacArthur. William, an evangelist, moved his family to Chicago in 1901 to serve in a supervisory position with the Christian and Missionary Alliance and also as pastor of the Gospel Tabernacle at Lawndale. A charismatic speaker who traveled a great deal, William was a harsh bully at home, where Georgiana and the children barely managed to get by. In his first year of high school, John, a prankster, did well in English, history, and algebra but made D's in deportment. At the beginning of his second year, Georgiana died, and John dropped out of school in 1915.

FIRST VENTURES

Following halfhearted attempts at selling insurance and working as a cub reporter, MacArthur served brief stints in the U.S. Navy and the Royal Air Force before being discharged as unfit for service. He returned to Oak Park to work for his brother, Alfred, selling insurance for National Life and working relentlessly to sell policies. He married Louise Ingalls in 1920 and the couple had two children, but the marriage failed.

In 1928, MacArthur met young, ambitious Catherine T. Hyland at National Life, and they both left to work for the State Life Insurance Company of Illinois. While the Depression was no kinder to insurance companies than to any other business, MacArthur's response was to work even harder. In exchange for release from his contract, State Life aided him in purchasing a small, failing firm that became Marquette Life Insurance Company and severely tested MacArthur's frantic efforts to keep it afloat during 1930-1931. Here MacArthur began the questionable practice of stalling the payment of claims in order to show a surplus for the insurance examiner, which enabled him to temporarily prevent insolvency.

In 1935, MacArthur borrowed $2,500 and purchased Bankers Life and Casualty, a small, bankrupt company. While Catherine ran the office, MacArthur sold policies and continued breaking the rules to keep the company alive. He sold policies for amounts below the $10 minimum premium, going as low as $1 or $2, and sold policies by mail. MacArthur sent a letter to one thousand potential customers a week, and the results were astounding. Before long, he had received $70,000, and by 1941, Bankers Life had $20 million of life insurance in force and assets of $404,598.

MATURE WEALTH

The success of Bankers Life allowed MacArthur to expand his company's home office and, through a series of mergers, acquisitions, and divestitures, to convert Bankers Life from a mutual insurance company to a stock company, with only one stockholder: himself. He bought up office buildings in New York and a hotel in Las Vegas, and he invested in *Theatre Arts* magazine, where his brother, Charles MacArthur, was the editor. Charles eventually became a famous playwright, and MacArthur also invested in theater productions by Charles and writer Ben Hecht.

MacArthur continued to be targeted by insurance commissioners who investigated his company's investment activities and policies—procedures that MacArthur found invigorating. He relished battling adversaries, and he pursued his own litigious inclinations by engaging in a three-year clash with the state of Georgia's insurance department. He also skirmished with Blue Cross and Blue Shield, when these companies complained that Bankers Life's white cross logo was similar to their blue cross logo. In taking on authoritative bodies and challenging them with his skill and energy, MacArthur was frequently found guilty and fined, but he enjoyed the fray.

In the mid-1950's, MacArthur's foreclosure on several thousand acres of land at Lake Park in Palm Beach County, Florida, led to plans for a $20 million real estate development to include hotels, motels, a yacht club, and a golf course along the oceanfront, as well as sixty-six hundred home sites, half of which were on the ocean. After World War II, Florida was ripe for a land boom, and MacArthur was a new type of entrepreneur whose wealth allowed him to develop cities and huge areas of the state. As Bankers Life continued its phenomenal growth, MacArthur continued buying millions of dollars' worth of property. He created a new Florida city, Palm Beach Gardens, that covered four thousand acres. He transplanted huge banyan trees from other areas to decorate the city and its new shopping center. To provide jobs for the families moving into MacArthur's city, RCA (Radio Corporation of America) announced plans for a $4 million electronic data processing plant in the area that would initially employ one thousand workers. MacArthur's development resulted in construction of schools and churches, and Palm Beach Gardens was cited in the 1970 census as the fastest-growing city in the United States. Its population in a decade had risen from 1 to 6,103, and by its twentieth anniversary the population was 15,000.

After failing to convince Disney World to locate in Palm Beach County, MacArthur settled for the headquarters of the Professional Golfers' Association of America (PGA), lending the association $1.5 million for an elegant new clubhouse. In 1963, MacArthur purchased the Colonnades Beach Hotel at the south end of Singer Island in Palm Beach County, extensively remodeling the slightly rundown hotel to include more than four hundred rooms, duplex apartments, restaurant facilities, tennis courts, and swimming pools, all on sixteen acres of private land. The resort proved to be quite popular with tour groups and celebrities. Against advice, MacArthur insisted upon renovating rather than rebuilding the Colonnades because he liked the hotel's "character." He closed deals from his office in the hotel's coffee shop, skillfully controlling his empire from the center of its bustling activity.

In addition to his own development projects, he served on boards of directors for numerous other real estate development companies in Florida. He owned a West Palm Beach television station, and when he was nearly eighty, he continued to buy hotels to add to his valuable ocean frontage. He donated one prized stretch of oceanfront property to the public.

MacArthur elected to live out his remaining years in Florida, while carefully maintaining his Illinois residency. His legendary rise to become the largest landholder in Florida and the nation's second-richest man

The MacArthur Genius Awards

The MacArthur Fellows Program, although accounting for only a small part of the John D. and Catherine T. MacArthur Foundation's annual grants, is widely known for awarding large sums of money to individuals who show "exceptional merit and promise for continued and enhanced creative work." Each year since 1981, the fellows program has bestowed between twenty and thirty grants, known as "genius awards," of $500,000 each to writers, musicians, scientists, artists, medical researchers, teachers, entrepreneurs, or any individuals approved by the board of directors. Given not as a reward but as an investment in individuals' further development, the awards are paid out in equal quarterly installments over a period of five years. There are "no strings attached" to the awards, and recipients are free to use the money as they see fit, with no obligation to the foundation. Between 1981 and 2008, around eight hundred awards were presented.

The genius awards cannot be applied for, nor can prospective awardees gain interviews. Nominations are made by a large panel of individuals representing broad areas of interest. Following a lengthy review of all nominees, the twelve-person selection committee makes its recommendations to the president and board of directors of the foundation. All individuals who are involved in the process function anonymously, and the process is confidential. The recipients never know who recommended them; their first contact with the foundation is a telephone call informing them of their award.

The award winners include computer scientist Timothy Berners-Lee; paleontologist Stephen Jay Gould; choreographers Merce Cunningham, Bill T. Jones, and Twyla Tharp; writers Octavia Butler, Sandra Cisneros, Edwidge Danticat, Guy Davenport, William Kennedy, Jonathan Lethem, Cormac McCarthy, and Thomas Pynchon; musicians Ornette Coleman and Regina Carter; historian Taylor Branch; architectural critic Ada Louise Huxtable; and literary critic Harold Bloom.

The MacArthur Fellows Program was guided in its infancy by William Kirby, John D. MacArthur's attorney and chairman of the board of directors until his death, and Roderick MacArthur, John D.'s son from his first marriage. Having complete freedom to design the philanthropic organization, they sought to realize a singularly audacious plan to champion individual initiative. The idea found support from journalists and scientists and became the basis of the fellows program's unique purpose: to support individuals in the process of creativity—of whatever kind, and without guarantee of success—with the hope of redirecting society toward the value of individual creativity.

was fueled by "hard work, luck, and opportunism" (his own assessment), guided by frugality, if not miserliness, and goaded by a fear of sinking all his capital into "one thing." With his wife, Catherine, who was also his business partner, he had witnessed the Florida development era come full circle in more environmentally conscious times, when legislation was passed to protect the state from real estate developers like himself.

On January 6, 1978, MacArthur died of pancreatic cancer in West Palm Beach, Florida. By the end of 1997, assets at Bankers Life and Casualty, the nation's second largest health and accident insurer, amounted to $1.04 billion, according to insurance examiners.

Legacy

In 1970, MacArthur established the John D. and Catherine T. MacArthur Foundation, with his Bankers Life fortune as its cornerstone. Having balked at the idea for years, he placed no restrictions on the use of his fortune, maintaining that as making money was his strong suit, he hoped the foundation's trustees would spend his money to "do more good for the country than [he] would." The foundation is one of the largest philanthropic organizations in the United States. Its first grant in 1979 went to Amnesty International, and it has continued to support human rights, affordable housing, community organizations, environmental causes, reproductive health, population control, public radio, and independent documentary film production. The foundation, famous for the grants it awards annually in the interest of human rights and individual efforts, is the culmination of the fortune of an enigmatic billionaire, who stubbornly refused to accept defeat during the Depression.

Cyrus Hall McCormick

American inventor and industrialist

McCormick's wealth was acquired primarily by his invention of the mechanical reaper, which reduced the labor-intensive demands of farm harvesting and dominated the market for such machinery for generations. The invention not only led to his own fortune but also produced much wealth for American farmers and farm commodity processors.

Born: February 15, 1809; Rockbridge County, Virginia
Died: May 13, 1884; Chicago, Illinois
Sources of wealth: Patents; manufacturing; sale of products; real estate
Bequeathal of wealth: Spouse; children; charity.

Early Life

Cyrus Hall McCormick (SI-ruhs hawl mak-KOR-mihk) grew up on his father's twelve-hundred-acre agricultural estate, Walnut Grove, in Virginia. His father, Robert McCormick, was interested in inventions and innovations, and as he became a prosperous farmer, he spent an increasing amount of time working on various projects in the workshops on his farm. In the 1820's, he built a prototype mechanical reaper, but it bore little resemblance to the one later invented and marketed by his son Cyrus.

First Ventures

Cyrus had little formal education, but in his early twenties he began to exhibit the creativity and resourcefulness that would lead to his success. He invented and patented a hillside plow in 1831. That same year, McCormick also built the first version of his mechanical reaper for harvesting grain. For several years, he continued perfecting the reaper while simultaneously pursuing other business interests. When inventor Obed Hussey began marketing a reaper in 1833, McCormick became more serious about bringing his machine into production. He received a patent for his reaper in 1837, and he offered the first machines for sale in December, 1839. By the mid-1840's, McCormick was licensing others to produce the reaper in several different plants around the United States. Eventually, McCormick became dissatisfied with these licensing agreements, and he concentrated the manufacture of his products in his own large factory, built in Chicago, Illinois, in 1847.

Mature Wealth

McCormick's wealth was based not only on his invention of the mechanical reaper but also on his understanding of the manufacturing and marketing aspects of the business. He faced fierce competition in manufacturing his mechanical reapers, but McCormick seemed to relish the struggles with his rivals, and he fought them ruthlessly. He bought reaper patents from competitors and purchased patents for related products, and he was engaged in endless litigation fighting patent infringement suits. He continually updated and improved his product. By the 1870's, his reapers were being marketed worldwide and his firm was one of the largest and most powerful in the industry. McCormick invested much of his personal profits in Chicago real estate and various other business ventures. At one point, he was the largest landholder in Chicago.

At his death in 1884, McCormick's estate was estimated to be between $10 and $20 million. He left the bulk of it to his wife and his children, although he had made numerous gifts to various charities throughout his life. McCormick gave approximately $500,000 during his lifetime to various Presbyterian schools. In 1859, he

trade in New Orleans was complicated because several countries, primarily Spain and France, owned portions of the city. McDonogh learned French and Spanish to help him conduct trade. He also traveled to Liverpool, England, where Taylor's brother, John Taylor, operated a trading house.

In the early nineteenth century, commercial ships traveling on the Atlantic Ocean and West Indies routes risked seizure by privateers. Taylor wrote McDonogh on January 14, 1801, that his ship *Montezuma* had been seized. Taylor directed McDonogh to sail another ship he owned, the *Dolphin*, to New Orleans and then return to England with a cargo of cotton, molasses, and wood. McDonogh completed this assignment by the summer of 1801. McDonogh continued transporting British goods to New Orleans to sell on consignment to merchants, and he received a percentage of profits with another Taylor apprentice, W. O. Payne. In August, 1801, the two apprentices established a partnership, McDonogh and Payne. Taylor authorized the pair to sell his goods directly to buyers or to arrange for them to be auctioned. On August 27, 1802, McDonogh bought Payne's share of the business for $10,000 when their partnership ended.

Mature Wealth

Later in 1802, McDonogh formed John McDonogh Jr. and Company with Shepherd Brown in order to provide European goods to American customers. That same year, McDonogh and Brown also established Shepherd Brown and Company to sell items transported on the Mississippi River to New Orleans from Pennsylvania, Ohio, Kentucky, and other places. The men traded such American goods as wheat, flour, bacon, lard, whiskey, and deerskins in exchange for manufactured European products. The pair benefited from expanded trade opportunities when more ships arrived at local ports after the 1803 Louisiana Purchase transferred this French territory to the United States. McDonogh wrote his father, stating that he was constructing warehouses to store his cargoes.

McDonogh compiled a list of rules in 1804 describing how he conducted his life, emphasizing a work ethic, morality, and spirituality. During 1804, McDonogh and Brown dissolved their companies. McDonogh decided to pursue business ventures for himself instead of working exclusively to sell Taylor's cargoes. He sought contacts with traders and commission houses in New England, Europe, and the Caribbean that were different from the ones he had dealt with while representing Taylor, resulting in increased trade and earnings. Taylor insisted McDonogh represent only his goods, but McDonogh refused.

While living in New Orleans, McDonogh retained ties with his family in Baltimore and supported his siblings' education. His father sent two of McDonogh's brothers south, where McDonogh taught them about his business.

When Taylor experienced extreme financial losses, McDonogh provided some funds to his former employer. Aware of his friends' business failures, McDonogh recognized that land retained its value and that possessing real estate was a more lucrative and reliable way to earn money than engaging in commerce. A letter from his father, written in the spring of 1803, had initially influenced McDonogh to invest in real estate, and he had bought land in west Florida, which extended west into Louisiana at that time. McDonogh continued to conduct some trading activities but concentrated on his land investments, increasing his holdings as he became aware of plantations and properties he wanted to acquire in New Orleans and the countryside. In addition to owning much of the land around New Orleans, McDonogh secured property adjacent to fifty miles of the Mississippi River. His properties generated ample income that enabled McDonogh to limit his mercantile activities by 1806 in order to manage his landholdings and conduct his duties as a director of the Louisiana Bank. He also financed the educations of his deceased friends' orphaned children.

During the War of 1812, McDonogh served in Beale's Rifles, defending New Orleans from a British attack that ended in early 1815. That same year he developed a plantation on the western side of the Mississippi River, creating a community that became known as McDonoghville (now part of the Algiers neighborhood in New Orleans and the city of Gretna). In June, 1817, McDonogh began residing on his McDonoghville plantation. Many of the properties McDonogh had acquired included slaves, and his slaves planted his plantation's fields with sugarcane and cotton, cultivated vegetables, and made bricks. Concerned for his slaves' morality and literacy, McDonogh constructed a church for them and provided Bibles. An American Colonization Society (ACS) member, he developed an emancipation plan in which his slaves could work on Saturdays in order to earn their freedom during a fifteen-year period. He arranged for two slaves to receive medical and theological educations at Lafayette College in Pennsylvania. In June, 1842, approximately eighty of McDonogh's former slaves sailed to Liberia, Africa, in an ACS ship. The next month, McDonogh published a letter in the *New Orleans Commercial Bulletin* describing how his slaves had obtained freedom.

The McDonogh Farm School

The McDonogh Farm School has educated children since 1873. By the early twenty-first century, the school's campus consisted of approximately 835 acres at Owings Mill, Maryland.

When John McDonogh allocated money for a school near his Baltimore birthplace, he envisioned that this educational facility would provide academic and agricultural training to boys who lacked financial resources. He especially wanted to benefit the Baltimore community because of his family ties to that area. The farm school emphasized McDonogh's principles of devotion to work, religion, and morals, expecting students to embrace these standards in their lives.

Initially, the McDonogh Farm School provided a curriculum that enabled white male orphans to acquire an education and learn trades, such as woodworking. Colonel William Allan was the first principal. The pupils performed tasks, such as cultivating crops and tending livestock, on the school's farm as compensation for courses and living expenses. In addition to classroom lessons, the students participated in military exercises to reinforce discipline.

By 1922, students able to pay tuition and boarding fees were permitted to enroll; five years later, nonboarding pupils from nearby communities were also allowed to attend. Despite McDonogh's interest in educating his slaves, no African American students were admitted to the McDonogh Farm School until 1960. By 1971, students were no longer required to perform the school's traditional military exercises; four years later, the first female students were admitted. Scholarships financed many students' tuition and fees. By 2008, the school provided almost $3 million worth of scholarships, with each recipient obtaining more than $10,000.

Since its founding, the McDonogh Farm School has consistently retained its benefactor's philosophy regarding labor, conduct, altruism, and community service. In 2009, the school had a total enrollment of 1,293 students in kindergarten through the twelfth grade. The campus includes buildings for lower, middle, and high school grades, with laboratories and libraries appropriate for each age group. Students have access to a chapel; a performing arts center for music, dance, and theater instruction; and an athletic stadium, a pool, tennis courts, and equestrian facilities.

The school's administration has encouraged interaction with the McDonogh-financed schools in New Orleans. After Hurricane Katrina struck in 2005, McDonogh Farm School's students and teachers traveled from Maryland to assist the McDonogh schools in New Orleans. In 2008, the farm school established McDonogh Roots, a program that involves students in agricultural activities in order to emphasize the school's origins and teach students to respect the land. Students grow pumpkins, tomatoes, and other produce to share with their community.

Some McDonogh Farm School students have studied in international exchange programs with Spanish, Ukrainian, and French schools or have attended Seijo Gakuen High School in Tokyo, Japan; students from the Tokyo school and the Faust Gymnasium in Staufen, Germany, have attended the McDonogh school. Prominent McDonogh alumni include John R. Bolton, the former U.S. ambassador to the United Nations, and Olympic gold medalists Pam Shriver and Bruce Davidson.

McDonough died at his McDonoghville plantation on October 26, 1850. Because he had not publicized how he wished to bequeath his estate, many people misunderstood his intentions, perceiving him as a selfish miser. People became aware of McDonogh's generosity when his will outlined how his wealth, estimated to be approximately $1.5 million in 1850 (more than $40 million today), was to be distributed. Throughout his adult life, McDonogh had pursued his investments with the primary goal of providing children with educational opportunities. Revenues from McDonogh's estate benefited schools in New Orleans. Some of his fortune was also used to build a farm school near Baltimore after his relatives unsuccessfully protested the legitimacy of McDonogh's will, with litigation reaching the U.S. Supreme Court in December, 1853.

Legacy

McDonogh's philanthropy shaped education in New Orleans. His wealth enabled the city to improve existing public schools and expand access to education for children from poor families who were deprived of an education because of racial or socioeconomic factors. McDonogh's money helped New Orleans construct additional public schools to accommodate the city's growing student population in the twentieth century. Often, schools financed by McDonogh's estate were identified with his name. Several schools, including McDonogh #35 Senior High School, retained his name into the early twenty-first century, although some buildings were stripped of McDonogh's name to protest his role as a slave owner. The McDonogh schools in Louisiana and Maryland provided students with the academic skills needed to secure admission to prestigious colleges and to become professionally competitive. Monuments and annual ceremonies in Louisiana and Maryland commemorated McDonogh's continued impact on children's education, and McDonogh was featured in Harnett T. Kane's novel *Pathway to the Stars* (1950).

John William Mackay

American mine owner, banker, and telegraph company owner

The most prominent of the Comstock Lode silver kings, Mackay is a major figure in Western history who ran silver mines and then used his money to start the Bank of Nevada and develop a worldwide communications network.

Born: November 28, 1831; Dublin, Ireland
Died: July 20, 1902; London, England
Sources of wealth: Mining; banking; telegraph
Bequeathal of wealth: Children; friends; charity

Early Life

John William Mackay was born into poverty in Ireland as the only son of a Scots-Irish father and Irish mother. The family, which included Mackay's younger sister, immigrated to New York City in 1840. The young Mackay attended school but quit when his father died about 1842, since the family needed the money that he could earn. Mackay sold newspapers and took odd jobs. He also came to identify more with his mother's Irish Catholic heritage in the absence of his father. Prejudice against the Irish persisted throughout Mackay's lifetime and he felt its sting.

In his teens, Mackay became an apprentice to shipbuilder William H. Webb. Mackay built clipper ships, and he apparently worked as a crewman on one of these ships to earn passage to San Francisco in 1852. He headed immediately for the goldfields.

First Ventures

As a placer miner, Mackay made enough money to support himself and his mother in New York City. His sister had joined a convent by this time. Mackay reportedly found gold where others believed the supply had been exhausted. The average amount of gold discovered by placer miners in 1853 was worth $5. When times were hard, Mackay worked as a lumberjack or a mine tunnel framer. Upon hearing of a silver strike in the Comstock Lode in 1859, Mackay headed to Nevada.

Mackay aimed to make $25,000 and retire. He soon changed his mind and began pursuing ways to develop his own deep, hard-rock mine. He earned ownership in mines by doing development work. He raised money to buy interests in other mines by digging or setting timbers. By 1863, Mackay had considerable interests in four mines. Other miners respected his frankness, abilities, and steady judgment, as well as his simple habits. In his spare time, Mackay learned to read Morse code messages while bettering his reading and writing skills. In 1865, Mackay and J. M. Walker bought the Kentuck mine to add to their holdings in the Yellow Jacket and Crown Point mines. Between 1866 and 1869, the three mines would produce $3 million in silver ore. Walker would later go broke as a real estate broker. Mackay helped provide for him and later supported his widow. Meanwhile, Mackay married Louise Bryant in 1867.

Mature Wealth

From the early 1870's until his death in 1902, Mackay was among the richest men in the world. After establishing a company with William S. O'Brien, James Clair Flood, and James G. Fair in 1870, Mackay acted as the firm's general manager. It is largely to his credit that all four men became the "silver kings" of the Comstock. The Comstock Lode served as a laboratory for mining, with Mackay pioneering practices that would transform mining into big business. Since hard-rock, deep-fissure mining required great amounts of capital, the first mining stock market started in San Francisco in order to provide the funds to develop the Comstock mines. Mackay participated heavily in the stock market, but unlike competitors he did not engage in stock manipulation. Mackay had a reputation for truthfulness, as well as an eye for detail. He used his reputation and skills to outmaneuver a rival mining group, known as the Bank Ring, in order to win control over the best Comstock Lode mines.

In 1875, the *San Francisco Chronicle* estimated Mackay's wealth at between $20 and $30 million. Of the silver kings, Mackay had the largest fortune. In that same year, Mackay and his partners decided to go into the banking business to topple the Bank of California. They formed the Bank of Nevada. A stock market crash in August, 1875, led to a run on the Bank of California that forced it to suspend operations. Mackay had won.

He had less success against businessman Jay Gould when in 1883 Mackay challenged Gould's telegraph monopoly. Mackay told essayist John Russell Young that he believed that his wealth was merely a trust and he owed it to the United States to use the money in some special service. Maintaining that power in the hands of the very few threatened the well-being of the country, Mackay decided to break up Gould's transatlantic telegraph business. Mackay and newspaper publisher James Gordon Bennett, Jr., founded the rival Commercial Cable Company.

Gould used every trick in his arsenal, including influencing a corrupt judge, to defeat Mackay and eventually succeeded to a degree. Mackay eventually dropped his focus on the telegraph business to concentrate on laying the first cable across the Pacific Ocean.

Mackay showed both generosity with his money and a reticence to be recognized for his kindnesses. While in San Francisco, he habitually carried thousands of dollars in large bills. He never explained the habit, leaving others to conjecture that he did so in case he ran across needy, old friends. When he spent on himself, he did so as a patron of the arts. He became known for his collection of paintings, on one European trip spending $150,000 for pictures in Rome and $50,000 in London. Otherwise, Mackay lived a fairly austere life.

Mackay never seemed entirely comfortable with his wealth and preferred to be treated as just one of the fellows. He also never forgot that he came from poverty. Mackay would routinely treat boys gathered outside a Virginia City, Nevada, opera house to tickets, and there are stories of Mackay buying boots for barefoot boys on the Comstock. A notoriously soft touch, he tended to give money to anyone with a hard luck story. He also apparently could not decline his wife's requests. Louise Mackay did not like the provincialism of San Francisco. She moved to New York City with the ambitions of joining the social elite and, apparently incidentally, obtaining a better education for their sons, John, Jr., and Clarence. Mackay remained in San Francisco. Foiled in her social climbing efforts, Louise headed to Paris with their sons. Housed in a mansion bought with Mackay money, Louise soon acquired a reputation for lavish entertaining. She became part of the fashionable Paris crowd. Mackay, who never hesitated to show his contempt for European gentry, visited often. In 1895, John, Jr., died in a horse riding accident in France. His death devastated his parents, with Mackay acquiring a habitual mournful expression that would last the remainder of his days.

By 1900, Mackay was giving about $250,000 to charities each year. Toward the end of his life, he asked the city recorder of San Francisco for a list of the most worthy charitable institutions in the city so that he might create a philanthropic organization to distribute his wealth. Mackay died before implementing his plan. While in London on business in 1902, Mackay became ill during lunch. His heart condition had worsened. A friend took him home. A few days later, Louise Mackay summoned a priest to perform last rites. Mackay died on July 20.

Upon his death, the obituaries and tributes to Mackay emphasized his wealth, his achievements in mining, his support of telegraph and cable use, and his philanthropy. Clarence Mackay took over his father's business.

Legacy

Mackay rose from being a penniless Irish immigrant to becoming one of the richest men in the world in the late nineteenth century. He has been described as the outstanding character of the Comstock Lode era. Unlike many of his wealthy contemporaries, such as John D. Rockefeller, Mackay did not suffer public antipathy. Amid rampant corruption, he was seen as an everyman who made good and who was willing to lend a financial helping hand to others. Few people in the nineteenth century viewed the extraction of mineral wealth as destructive to the environment; accordingly, Mackay had earned "clean" money. He harmed no one in his rise. To the contrary, Mackay challenged the consolidation of power in the Gilded Age by confronting the Bank Ring in the Comstock Lode and by challenging Jay Gould's transatlantic telegraph cartel. At the time of his death, few could be found to utter a bad word about the man.

The Mackay School of Mines

The Mackay School of Mines, part of the University of Nevada at Reno, began with a 1906 gift from John William Mackay's widow, Louise, and their surviving son, Clarence. Mining had become critical to the economy of Nevada, and the Mackays hoped to foster the development of scientific mining. The original building was designed by Stanford White, one of the leading architects of the day. Besides classrooms and offices, the structure housed a mining museum with a design based on the Peabody Museum of Natural History at Yale University.

As mining continued to play a significant role in the development of Nevada, the Mackay School soon outgrew its building. In 1926, the Mackay family donated funds for the expansion of the school's laboratories. In addition to the museum, the school now housed a library, the Nevada Mining Analytical Laboratory, the Nevada Bureau of Mines and Geology, and a host of academic departments related to the sciences. By the 1990's, the mining industry had lost most of its luster and the school suffered from low enrollment. As part of a reorganization, the Mackay School of Mines became the Mackay School of Earth Sciences and Engineering in 2004. It continued to be a mining school but several of its buildings housed a range of academic departments and government bureaus, including the Nevada State Climate Office and the Nevada Seismological Laboratory. The original building remained on the campus.

A larger-than-life statue of Mackay by Gutzon Borglum, the sculptor of Mount Rushmore, stands in front of the school. It is also a gift from the Mackay family. The state declared a holiday for the statue's dedication on June 10, 1908. The piece is a heroic portrayal of Mackay, showing him in miner's clothes and gazing into the distance. One hand is atop a pick, while the other clutches a piece of ore.

EVALYN WALSH MCLEAN

American socialite

McLean embodied the profligate lifestyle of the incredibly wealthy in America in the early twentieth century. She used the money acquired through inheritance and marriage to become the premier socialite in Washington, D.C.

Born: August 1, 1886; Leadville, Colorado
Died: April 26, 1947; Washington, D.C
Also known as: Evalyn Walsh (birth name)
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Dissipated

EARLY LIFE

Evalyn Walsh McLean was born Evalyn Walsh in a remote central Colorado mining town, the only daughter of Thomas Walsh, a first-generation Irish immigrant who initially settled in Massachusetts. Trained as a carpenter but gifted with business savvy and enormous self-confidence, Walsh headed west in the mid-1870's to learn the mining business. Initially, he provided equipment for mining enterprises, first in the Dakotas and then in Colorado. He developed a barter system in which he would accept deeds for land in exchange for supplies. For more than a decade, he accumulated titles to numerous productive mines. By the time of Evalyn's birth, the Walshes were comfortably settled in Colorado's middle class.

FIRST VENTURES

Restless over what he perceived to be sloppy prospecting techniques, Walsh was certain that there was more gold to be found, although most people believed the Colorado gold rush was over as attention was being redirected to the burgeoning silver boom. Walsh went out to the mining fields, and in 1896 he laid claim to the Camp Bird Gold Mine, the largest gold reserve ever tapped in Colorado, producing as much as $50,000 a week. His claim established Walsh as the richest miner west of the Mississippi and his family as one of the richest in America.

Within two years, Walsh, now a captain of the mining industry but hungering to exert political influence, moved his family to Washington, D.C. Evalyn was twelve. A headstrong tomboy, she was now to be the embodiment of the wealthy debutante. She studied French, art, and music. She was sent to study in Paris, where she developed a taste for expensive and often gaudy jewelry. Back home, Walsh's ambitions were calculated and successful. The Walsh mansion on Massachusetts Avenue, at the time the most expensive private home in America, became a showplace for gatherings of some of the most influential and powerful families during President William McKinley's administration. The Walsh family's name became synonymous with unrestricted spending, and they used their money for furnishings, parties, expensive clothes, foreign automobiles, artwork, and extended tours of Europe. The Hope Diamond

When it comes to the Hope Diamond, it is difficult to separate fact from fiction, particularly because a succession of people who owned the fabulous gem often contributed deliberately exaggerated accounts of its origins and supposed curse. The first reliable record of a massive, 112-carat, triangular blue-violet diamond extracted from the Kollur mines in southern India came from an unsavory itinerant French merchant, Jean-Baptiste Tavernier, who reputedly stole the stone to sell it to the court of Louis XIV in 1668. Until the diamond was lost during a week of looting in September, 1792, following the overthrow of the French monarchy, the recut diamond had served as the showpiece of the French crown jewels, known across Europe not only for its size but also for its stunning cobalt shine.

At this point the diamond's history becomes shadowy until some twenty years later, when a London diamond merchant recorded his coming into possession of a 45.52-carat blue diamond. The gem subsequently was purchased by England's King George IV, and when he died the diamond was sold in order to settle the king's massive debts. Some thirty years later, the diamond was recorded among the items in the renowned jewel collection of Henry Philip Hope, a member of a prominent Anglo-Dutch banking family, although how Hope acquired the gem is a mystery. The stone stayed in the Hope family until 1901, when it was sold against accumulated family debts. It passed between a number of legitimate owners, including the sultan of Turkey, until it was finally acquired by New York jeweler Pierre Cartier. Cartier sold the diamond to Washington, D.C., socialite Evalyn Walsh McLean in 1911, after he reset the fabulous gem as a pendant surrounded by sixteen white diamonds on a chain of forty-five diamonds.

The jewel played into Evalyn's reputation for flamboyance. She wore the gaudy diamond casually around the house, often losing track of it. She allowed drunken party guests to wear it during her extravagant dinners, even attaching it to her dog's collar. Evalyn enjoyed recounting lurid stories of how the diamond was cursed, tales which traced back to its original theft from India. During the heyday of her wealth, Evalyn owned not only the Hope Diamond but also the stunning pear-shaped thirty-four-carat Star of the East. Evalyn's family endured a succession of calamities in the twenty years after she purchased the gem, including the death of her nine-year-old son in a traffic accident, her husband's spiral into alcoholism and his eventual abandonment of their marriage, the dissipation of most of her fortune, and, most heartbreaking for Evalyn, the suicide of her only daughter. However, Evalyn never conceded that these events were part of the diamond's curse.

Upon her death in 1947, her estate was deeply in debt, and the Hope Diamond and the rest of her jewel collection were sold to the Harry Winston Company. The stone was shown only privately and at special exhibits until 1958, when the Hope Diamond was donated to the Smithsonian Institution National Museum of Natural History, where in the twenty-first century it remained the dominant attraction in the museum's Hall of Gems.

---

the death of Walsh's sixteen-year-old son in 1905, his beautiful daughter, who was not yet twenty, became the richest heiress in the nation's capital.

Mature Wealth

In 1908, Evalyn eloped with Edward "Ned" Beale McLean, the heir to a newspaper empire that included *The Washington Post* and the *Cincinnati Enquirer*, then the most influential newspaper in the West. McLean had a hard-earned reputation as a wealthy Washington ne'er-do-well, and the depths of his alcoholic addiction were not fully evident when he married Evalyn. The couple's marriage was a major news story, and newspapers followed their extended honeymoon tour of Europe and the Middle East, where they indulged every buying whim. They quickly went through the $100,000 that each of their fathers had given them for spending money, but their families happily wired them additional funds. During a stop in Turkey, the couple met Sultan Abdülhamid II, and Evalyn received her first look at the fabulous cobalt-blue Hope Diamond, then in the sultan's extensive jewelry collection.

Once the McLeans returned to Washington, they became the capital's most celebrated power couple, hosting lavish parties that routinely cost hundreds of thousands of dollars. Unable to forget the Hope Diamond, Evalyn made discreet inquiries about purchasing the fabled stone. After the sultan's death, the gem had passed into the hands of renowned jeweler Pierre Cartier, and after master gem cutters reset the stone because Evalyn thought the setting was too Old World, the couple bought the diamond for $180,000 in 1911.

In 1916, McLean's father died and control of the newspaper empire fell to his son. The couple established themselves in the McLeans' swanky country estate on Wisconsin Avenue, then in the fashionable outer environs of Washington. The estate quickly became the capital's social center. The couple's lifestyle demanded enormous security against the possibility of kidnapping, and the couple's four children were each assigned bodyguards. Ironically, in 1918 the couple's eldest child, Vinson (whom the press had dubbed the "Hundred Million Dollar Baby"), then nine, playfully eluded his bodyguard and ran out into Wisconsin Avenue, where he was killed after being hit by a passing car.

Throughout the 1920's, the couple's parties became legendary, and they sometimes entertained thousands of people at a time. Extravagance was routine. A birthday party for Evalyn's poodle cost more than $1 million, and the dog wore the Hope Diamond on its collar during the fete. Evalyn herself was a close confidante of President Warren G. Harding's wife, Florence, and both McLeans enjoyed close relationships with the Harding White House. Although Ned was a force in Republican politics, he never sought political office. (He would eventually be implicated in numerous influence-peddling investigations that dogged the Harding administration.) Ned's life fell into a downward spiral. His stewardship of his inherited newspaper empire was a disaster, and his alcohol abuse deepened. He had numerous affairs, culminating in a move to Hollywood in 1929 to take up with a starlet. Evalyn, who had begun taking morphine after she was in a 1905 car accident that killed her brother, developed a powerful addiction to the drug. During the 1920's, she increasingly immersed herself in a profligate lifestyle, and she was forced to sell off much of her jewelry to finance her extravagance.

The stock market collapse in 1929 ended the McLeans' flamboyant lifestyle. Estimates suggest that the couple had spent nearly $200 million of their shared inheritance. Facing the reality of exhausted accounts, Evalyn tried to regain control of her life. Despite her husband's abandoning her, Evalyn would not petition for divorce, although Ned secured a kind of legal divorce through a court in Latvia, which he delivered to his wife on Christmas Day, 1932. In time, Evalyn had Ned committed to a Baltimore sanatorium in order to treat his alcohol dependency. In 1932, she lost control of her husband's newspaper empire when it went into receivership and was sold.

Depression America had lost its taste for celebrity wealth, and Evalyn slipped into obscurity. She briefly made headlines in 1932 after the kidnapping of aviator Charles A. Lindbergh's baby, when she contacted the Federal Bureau of Investigation (FBI) and sold several lucrative real estate holdings to finance the $100,000 ransom, only to find that an FBI agent's information about the kidnapper was bogus. (The agent was later convicted of larceny.) Over the next ten years, Evalyn struggled with her diminishing fortune, and her husband languished in the hospital, where he would die in 1941. In 1946, her only daughter, who had married a much older man rumored to have been Evalyn's lover, committed suicide. A year later, struggling with depression, Evalyn died from complications of pneumonia after walking her dog in the rain, although friends suggested her daughter's suicide had taken away her will to live. What was left of her estate, including the Hope Diamond, was sold to settle her considerable debts.

Legacy

In her successful 1936 autobiography, *Father Struck It Rich*, Evalyn portrayed herself as a kind of Cinderella, a poor girl from the Western plains who came to Washington a wealthy heiress but never lost her frontier sense of independence and plainspokenness. However, it is difficult to see her story as anything but a cautionary tale of a spendthrift whose lavish lifestyle was uncomplicated by any interest in responsible money management. In exhausting two family fortunes, Evalyn, by her own admission in her autobiography, simply craved the thrill of reckless spending. For two decades, she lived a life shaped only by her determination to avoid boredom. She and her husband never added to their family fortunes through work or investment, never financed public charitable causes, and never endowed any institution. Rather, they simply spent money on a staggering scale, a fortune that by today's standards would total in the billions of dollars.

GAIUS MAECENAS

Roman aristocrat, diplomat, and literary patron

A nobleman of ancient Rome, Maecenas acquired great wealth, partly because of his close friendship with Octavian, the future Emperor Augustus.

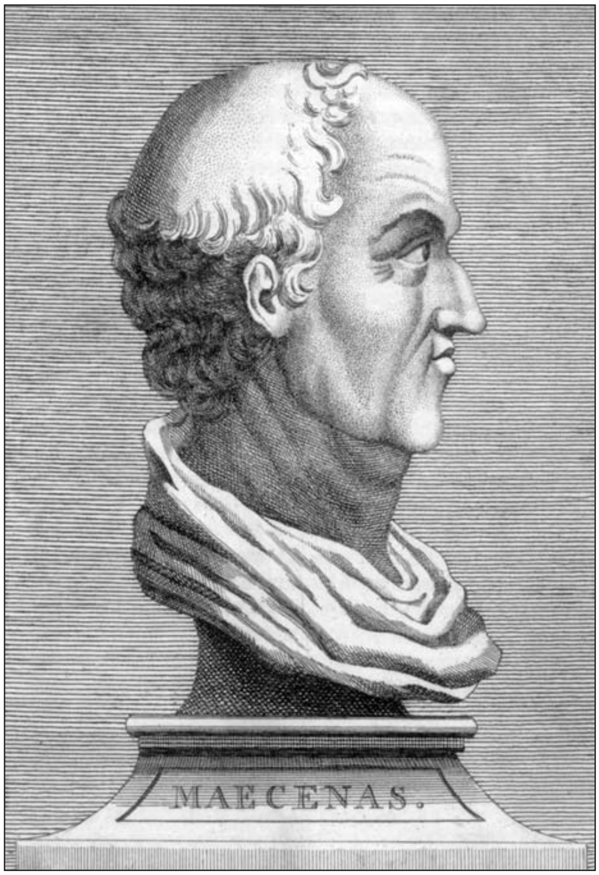
Born: c. 70 B.C.E.; Arretium (now Arezzo, Italy)
Died: 8 B.C.E.; Rome (now in Italy)
Also known as: Gaius Cilnius Maecenas; Cilnius Maecenas
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Friends

EARLY LIFE

Gaius Cilnius Maecenas (GI-uhs KIHL-nee-uhs meh-SEE-nuhs), whose family traced their origins back to the Etruscan king Lars Porsenna, lived during the first century B.C.E. Maecenas belonged to the wealthy Roman class called *equites* (knights), which allowed him to engage in commercial activity. Membership among the *equites* was based primarily on wealth, and these men ordinarily had to have at least 400,000 sesterces to qualify; in contrast, the senatorial class were required to have twice that amount of wealth. At this time, the typical Roman laborer earned about 1,000 sesterces a year; thus, to become an *eques*, one's holdings had to be worth at least four hundred times that of the laborer's annual income.

FIRST VENTURES

It is not known how Maecenas came to be wealthy enough to become an *eques*. Perhaps, like many Roman noblemen, he had inherited his wealth from his father's agricultural holdings. While historians can only speculate about Maecenas's early fortune, his later riches surely reached astonishing heights because of his connection to Octavian, the future Emperor Augustus. After the assassination of Julius Caesar in 44 B.C.E., his heir Octavian murdered dozens of his politically powerful enemies and confiscated their wealth. As one of Octavian's closest friends, Maecenas undoubtedly benefited financially from these actions.



Gaius Maecenas. (The Granger Collection, New York)

The first significant appearance of Maecenas comes in 42 B.C.E., when he joined forces with Octavian at the Battle of Philippi. After this, Maecenas gained increasing influence over Octavian. Historians Tacitus and Dio Cassius both report that during the civil wars, from about 36 to 29 B.C.E., Octavian put Maecenas in charge of Rome and Italy. Octavian placed such trust in Maecenas that by the time Octavian had defeated Marc Antony and Cleopatra VII at the Battle of Actium in 31 B.C.E., Octavian had granted Maecenas the privilege of reading and editing Octavian's most important correspondence before it was delivered to the recipients.

Mature Wealth

Having added to his fortune during Octavian's rise to power, Maecenas spent much of the last fifteen years of his life in relative quiet in a palatial garden residence on Rome's Esquiline Hill. A portion of one of the buildings from Maecenas's house remained standing in the twenty-first century. Known as the Auditorium of Maecenas, one end of this vast dining hall features a small semicircular theater where Maecenas and his guests could have witnessed various types of entertainment. Maecenas, who himself dabbled in poetry, served as a patron for about ten other poets, the most famous of whom are Horace, Sextus Propertius, and Vergil, whose *Georgics* (37-29 B.C.E.; English translation, 1589) mention Maecenas by name in their opening lines. Upon Maecenas's death in 8 B.C.E., he bequeathed all of his property to Emperor Augustus. In 2 C.E., the future Emperor Tiberius moved to Maecenas's gardens, and six decades later Emperor Nero connected his palace to these gardens. Nero is said to have watched the infamous fire of 64 C.E. from the Tower of Maecenas.

Legacy

The fact that a person of such prominence as Maecenas was able to survive one of the most tumultuous periods in Roman history with both his life and his wealth intact is quite remarkable. Maecenas emerged relatively unscathed from the fifteen years of uncertainty that followed Julius Caesar's assassination; moreover, Maecenas was able to move in relative quiet into private life during the last fifteen years of his life. His property provided residence for two subsequent emperors, and, most important, his wealth supported the literary efforts of three of Rome's finest poets.

Marduk-nāsir-apli

Babylonian banker, merchant, and landlord

Marduk-nāsir-apli was the heir to the business of the Egibi family, one of the great commercial dynasties in ancient history. Trading commodities, renting farms, and lending money, the Egibis were vital in the rapid economic growth of the Achaemenid Empire in Persia.

Born: c. 521 B.C.E.; Babylon, Persian Empire (now near Baghdad, Iraq)
Died: c. 487 B.C.E.; Babylon, Persian Empire
Also known as: Marduk-nāsir-apli Egibi; Sirku
Sources of wealth: Inheritance; moneylending; trade; real estate; slave trade
Bequeathal of wealth: Children

Early Life

The economic activities of five generations of the Egibi family are recorded on Babylonian tablets from 606 to 482 B.C.E., when they abruptly vanish from the historical record. Unusual for their period of history, the Egibis did not become rich from owning land or imperial administration. Instead, they derived their fortune from business, one of the first wealthy families in recorded history to do so. The Egibis ran a sophisticated business empire. They purchased staples in bulk from local markets, such as wheat, barley, beer, onions, dates, salt, cooking wares, and wool. Making use of Babylon's abundant rivers, they shipped this produce to the bustling markets of the capital cities, where the goods were sold to imperial and religious leaders for distribution to the growing population of the Mesopotamian region.

Marduk-nāsir-apli (mahr-DOOK nah-SEHR ahp-LEE) Egibi, also known as Sirku, was born in Babylon around 521 B.C.E. His father was Itti-Marduk-balatu, and his mother was Nuptaya Nur-sin. Marduk-nāsir-apli married Amat-Bau and received from her father Kalba a dowry of Babylonian currency consisting of 35 minas of silver, 2 minas of gold, a field, and two slaves. The Egibis were of Sumero-Babylonian origin; the suggestion of some earlier historians that the family had roots in the Jewish Diaspora has been shown to be incorrect. The Persian conquest of Babylon in 539 B.C.E. did not impede the Egibis' business activities; instead it spurred them to their greatest extent.

First Ventures

When Itti-Marduk-balatu died suddenly in 522 B.C.E., his son Marduk-nāsir-apli took over the Egibi business interests. With the rapid growth of the Achaemenid Persian Empire, several families rose to prominence in Persian banking and commerce, including the Murasus, a rival to the Egibis in extent and activity. Other prominent commercial dynasties included the Iddin-Nabu, Ea-iluta-bani, and Naggaru families. However, by consolidating and extending the Egibi line of businesses, Marduk-nāsir-apli was able to achieve the greatest penetration of Persian markets. With the profits from their trade in commodities, the Egibis purchased vast tracts of farmland, which they rented out to sharecroppers.

The Egibis were shrewd in all of their business dealings. For example, they encouraged their tenants to plant date palms, a very profitable fruit. Because of the long growing period of these palms, the Egibis would require little rent in the first years of tenancy. When the date trees matured, the family would reap the rewards of their patience, collecting a large share of the profits. The Egibis also established workshops and factories to manufacture products, and they purchased and sold slaves throughout the Persian Empire.

With these immense revenues, the Egibis became the leading bankers in Babylon and Persia, lending great stores of silver, usually at the rate of 20 percent per annum. The Egibis were not deposit bankers but lent money as partners in commercial projects, a business procedure that is similar to the modern practice of investment houses.

Mature Wealth

After their father died in 522 B.C.E., Marduk-nāsir-apli and his two brothers, Nergal-usezib and Nabu-ahhe-bullitt, argued about their inheritance. Their disagreement was not resolved until 508 B.C.E. Although Marduk-nāsir-apli was the head of the business house, the patrimony was divided among the three sons of Itti-Marduk-balatu, according to Babylonian custom. The Egibi family was inventoried as owning seventeen houses in Babylon, Hursagkalamma, and Borsippa; multiple fields; livestock; outstanding loans owed them; servants; and more than one hundred slaves.

The dates of Marduk-nāsir-apli's life roughly correspond to those of King Darius the Great, who brought the Achaemenid Persian Empire to its height. Darius constructed bridges, canals, and roads, including the famous royal road of Persia, to enable the flow of goods and merchants through his kingdom. He provided for a strengthened army and navy and organized more efficient forms of taxation. The Persians were able to take advantage of the economic expertise of families of conquered cities, like the Egibis. Marduk-nāsir-apli and his family also profited greatly from the accelerated economic growth of the empire. Marduk-nāsir-apli traveled to other leading cities of the Persian Empire to enlarge his businesses, staying in houses he owned in each city and conferring with his managers and imperial officials.

About two thousand Babylonian clay tablets, written in the Akkadian language and etched in cuneiform writing, have been preserved, documenting the Ebigi family's business activities. Approximately 430 of the tablets relate to Marduk-nāsir-apli and his numerous economic enterprises. They tablets show, as historian Kathleen Abraham writes in her study of the Egibi family, that they had "a finger in every pie." Marduk-nāsir-apli dealt extensively with public administrators of the Persian Empire. He became a financial intermediary for the Persian court, collecting taxes from his transactions and sending them to the government. According to this practice, known as tax farming, Marduk-nāsir-apli would collect taxes due from farmers and pay a lump sum to the government in exchange. The taxes were usually paid in the form of produce, which presented problems of transportation and delivery. The Egibis evolved a complicated but profitable form of tax farming, collecting revenues from farms along a river in order to benefit from easy transportation along the canals. They also arranged innovative forms of mortgages, in which they rented out houses to their creditors.

In all of his dealings, Marduk-nāsir-apli was solicitous of the royal administrators, receiving protection and lucrative contracts in return. He obtained fees for organizing pools of laborers to perform grand construction projects. His loans were registered in imperial courts. For example, a clay tablet records a loan of 45 minas of silver that Marduk-nāsir-apli extended before a Persian judge named Ummadatu. Marduk-nāsir-apli also supplied the military with goods. He collected rents and tithes from the temples of Marduk at Egasil, as well as the temples of Nergal, Ehursag, and Eigikalamma. He built and maintained state canals, bridges, and waterways, collecting tolls and revenues. Marduk-nāsir-apli was also dominant in the private sector, becoming the largest merchant in commodities, such as beer, crops, and flour. He supplied slaves throughout the empire, as well as "companions," probably prostitutes, to beer taverns. The Egibis expanded into international trade, and Marduk-nāsir-apli traveled to Medina to conduct business.

Wealth and the Invention of Writing

Historians believe that writing began as a means to record business transactions and the accumulation of wealth. The first genuine system of writing in world history is generally credited to be the Mesopotamian system of cuneiform that emerged in ancient Sumeria around 3500 B.C.E. With the rapid growth of Mesopotamian society, a system was needed to record increasingly complex economic activity. The Sumerians recorded business exchanges of wheat, barley, dates, beer, and other goods on clay tablets, into which they etched wedged-shaped signs with a reed stylus. These wedge-shapes, which were the first symbolic written forms, are called cuneiform writing from the Latin term for wedge.

Because of the complexity of memorizing the thousands of signs used for cuneiform, a class of scribes was intensively trained in schools and then employed by imperial administrators, priests, and merchants to make records and communicate messages. Although the first scribes were employed to record commodities and manufactured goods, they were soon accounting for the operations of the great Babylonian temples, the recruitment of corvée (conscripted laborers), and the levying of taxes. Eventually, cuneiform was used to record the sacred texts of Zoroastrianism and the literary classics of the Fertile Crescent. It is now believed that the idea of using written signs to record language spread from Mesopotamia to Egypt, which developed the use of hieroglyphics, and perhaps even to China, which devised its own pictographic script.

The preserved clay tablets that document the business transactions of the Egibi family of Babylonia represent one of the great treasure troves of cuneiform writing. The tablets were recovered by the British archaeologist George Smith in his travels to Iraq in the 1870's. Cuneiform had been fully deciphered by European scholars by the middle of the nineteenth century, and the Egibi tablets were translated within a few years of their transportation to England. The bulk of the tablets represent contracts between the Egibis and other merchants and records of loans of silver made by the Egibi family. The range of business activities and the wealth in land, houses, and silver accumulated by the Egibis, as revealed by the tablets, are truly astonishing. The tablets cover the activities of five generations of Egibis. Babylonian writing, recorded on clay tablets, is extremely durable. The Egibi tablets, now numbering more than two thousand, are housed in the British Museum in London.

When Marduk-nāsir-apli was about sixty-five years old, he ceded control of the Egibi business to his son Nidinti-Bel. He also willed instructions for a substantial marriage dowry for his daughter Eristu. Under Nidinti-Bel, the Egibi business empire and wealth began to decline.

Legacy

The Egibis are perhaps the first great house of advanced commercial wealth in recorded history. They are remarkable for the range, extent, and sophistication of their businesses. Their business methods are surprisingly similar to modern finance. Marduk-nāsir-apli oversaw the Egibi business at its height, and his leadership coincided with the expansion of the Achaemenid Persian Empire. The Persian court relied on the sophistication of business families for their extended empire, and the Egibis rose to the fore. Their intricate business methods helped the empire expand its construction of roads and canals, feed its burgeoning population, and supply its armies. Although an integral part of Babylonian temple economics, the Egibis appear to have been relentless in their pursuit of riches. Certainly their widespread slave trading, management of prostitutes, extension of credit on stringent terms, and sharecropping systems of tenancy speak to a consuming desire for profit.

First Duke of Marlborough

British aristocrat, military leader, and politician/statesman

Marlborough became wealthy from the largesse of individuals, government and military positions, rewards for military victory, contracts for military expenditures, and investments in land, stocks, and bonds. He was granted Blenheim Palace by the English government as a reward for his military victory at Blenheim in Bavaria.

Born: May 26, 1650; Ashe, Devonshire, England
Died: June 16, 1722; Windsor Lodge, Windsor, England
Also known as: John Churchill (birth name)
Sources of wealth: Government; investments
Bequeathal of wealth: Spouse; children

Early Life

John Churchill, first duke of Marlborough (MAHRL-bor-oh), was the son of Winston Churchill and Elizabeth Drake Churchill. He was born in western England and attended school in Dublin, Ireland, and at St. Paul's in London. Apparently his education was rudimentary, as his spelling as an adult was very original. In 1666, he became a page to James, duke of York, who was the brother of King Charles II and the future King James II. Thus began Marlborough's career as a courtier who eventually moved in the highest circles of power in England. This rapid rise in his career was helped by the fact that his older sister Arabella was James's mistress and bore him several children.

First Ventures

Marlborough served in an English regiment in Tangiers from 1668 until 1671. His first major source of income was a gift of £4,500 from Barbara Palmer, first duchess of Cleveland, one of Charles II's mistresses. After receiving this gift, Marlborough promptly purchased an annuity for a steady income, giving early evidence of the shrewd business sense that helped him amass his fortune. Additional income would come from his positions as gentleman of the bedchamber and master of the robes and his military service on the Continent during the Third Anglo-Dutch War (1672-1674).

In 1678, Marlborough married the beautiful, headstrong Sarah Jennings (1660-1744) in a match initially opposed by both of their families. Sarah served Mary of Modena, duchess of York, and formed a long-lived relationship with Anne, the duke of York's younger daughter from his first marriage. John and Sarah were a remarkable partnership, a "power couple," and both of them would take advantage of their connections and positions to advance their wealth, especially after Princess Anne became queen, ruling from 1702 through 1714. John's accumulation of wealth cannot be understood apart from Sarah's support and efforts.

Marlborough eventually became a brigadier general, and he undertook a diplomatic mission to William of Orange, leader of the Netherlands, and later accompanied the duke of York to Scotland during the Exclusion Crisis (1679-1681). Marlborough was elevated to the baronetcy in December, 1682, and received an additional income of £800 per year. Both John and Sarah were quite wealthy because of the income from their positions, annuities, and investments.

Mature Wealth

Marlborough was one of the most influential men in England during the period from 1685 through 1714, spanning the reigns of James II (r. 1685-1688), William III (r. 1689-1702) and Mary II (r. 1689-1694), and Queen Anne (r. 1702-1714), and he was at the center of momentous developments. He helped suppress Monmouth's Rebellion (1685), and his defection, with his troops, from James II during the Glorious Revolution (1688-1689) was a key element in James II's flight into exile. Sarah convinced Princess Anne to join her sister Mary and Mary's husband William of Orange in their opposition to James II. As a reward, Sarah received a pension of £1,000 per year from Anne in 1690, and John was made the earl of Marlborough and commanded a regiment in Europe during the Wars of the League of Augsburg (1689-1697).

Marlborough's influence lessened when William III became concerned about his loyalty, and Marlborough was briefly imprisoned on suspicion of treason because he had been corresponding with the exiled James II. Sarah's influence with Anne increased as she became the groom of the stole, mistress of the robes, and keeper of the privy purse, and she helped herself to funds from the privy purse. In 1698, Marlborough was made governor of Anne's son, the duke of Gloucester, at a compensation of £2,000 per year, but this was a short-lived post as the young duke died in 1700. Near the end of William III's reign, Marlborough returned to favor and was appointed commander of the British forces at a salary £10,000 per year at the beginning of the War of the Spanish Succession (1701-1714). In this conflict, he won several major military victories, becoming a statesman and arguably England's greatest general.

William III's death in 1702 brought Anne to the throne and additional preferments for the Marlboroughs. John became the first duke of Marlborough and a Knight of the Garter. The queen gave substantial payments toward the dowries of the couple's daughters. Marlborough worked closely with the first earl of Godolphin, who was the lord treasurer in charge of English domestic policy. Sarah managed the couple's financial interests, and John handled military and diplomatic matters on the Continent. Marlborough received additional honors as a reward for his greatest military triumph at Blenheim in southern Bavaria near the Danube River. In this battle, waged in August, 1704, Marlborough, with Prince Eugene of Savoy, routed French-Bavarian forces, relieving pressure on Vienna and the Austrian Empire and causing a grateful Holy Roman Emperor Leopold I to name Marlborough the prince of Mindelheim. In addition, the British Parliament granted Marlborough money to construct Blenheim Palace, a project fraught with difficulties and completed only after his death. In 1706, Parliament granted £5,000 per year to Marlborough's descendants through his daughters.

Marlborough continued to win significant victories in Europe at the Battles of Ramillies (1706), Oudenarde (1708), and Malplaquet (1709), which preserved the Netherlands from French conquest and eventually helped convince France to negotiate, albeit secretly, with England. Sarah, however, had lost the favor of Queen Anne. Before the complete and final breach in 1711, Sarah did manage to press the queen for additional favors, including a £5,000 pension per year for life and the properties of Windsor Lodge and Woodstock. Sarah also procured land in St. James's Park, where Marlborough House was later built.

Marlborough's push to continue the war cost him the favor of the queen, who had sought to retain his services

BLENHEIM PALACE

An example of English Baroque architecture designed by noted architect Sir John Vanbrugh, Blenheim Palace is located on about twenty-one hundred acres at Woodstock, Oxfordshire, England, and in the twenty-first century remained the residence of the Churchill family. The home was the birthplace of British prime minister and statesman Winston Churchill. Blenheim Palace also housed the family archives, which were often tapped by historical researchers.

Because of the victory of John Churchill, first duke of Marlborough, at Blenheim in 1704, the English government granted him the colossal sum of £240,000 to build this palace. Construction began in 1705, and like many large-scale projects, was fraught with controversy concerning funding, cost overruns, design, and the slow pace of the work. When John Churchill and his wife Sarah fell out of favor with Queen Anne, all government funding stopped, with £130,000 having already been spent. After John was charged with misappropriation of military funds, he and his wife were disgraced and went into exile in 1712. The work on the palace was halted, and Sarah referred to Blenheim as a "pile of stones."

After the couple returned to England with King George I in 1714, John was restored to his old position, and construction of Blenheim resumed in 1716 at John's expense. However, he became incapacitated after suffering two strokes, and Sarah assumed management of the building project. Her difficult personality and her dislike of Vanbrugh (she was thought to have favored architect Christopher Wren, who did design the library) led to a confrontation with Vanbrugh, whom she accused of extravagance and dismissed. At this point, about £250,000 had been spent.

The residence was completed by the architect Nicholas Hawksmoor, for whom Vanbrugh worked. Under the aegis of Sarah, the work continued with less expensive labor, cheaper materials, and some design changes, the most significant of which was the inclusion of John's tomb, which would house his body after it originally was interred at Westminster Abbey. The tomb cost £2,200 and featured figures of John and Sarah and their two sons, but not their daughters; it is the dominant feature of the chapel.

Blenheim contained private apartments, state apartments, a state dining room, a kitchen, servants' quarters, a long library with a gallery of paintings, and statuary throughout. The gates to the residence are monumental in scale, emphasizing John's importance. On the grounds, the most imposing features are Vanbrugh's thirty-room bridge over a stream and a 130-foot-tall column of victory topped by a statue of John. In 1987, the palace was designated as a United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Site.

even after she had dismissed Sarah. The queen's ministry, seeking to arrange a secret negotiated end to the war with France, saw Marlborough as an obstacle. Marlborough was accused of favoring the war in order to further enhance his considerable financial fortune, and on December 31, 1711, he was stripped of his command. In 1712, the Marlboroughs went into exile on the Continent, but not before Marlborough gave a close associate £50,000 to invest for him; Sarah later successfully sued this associate for misappropriation of funds. In 1714, the Marlboroughs returned to England with King George I (r. 1714-1727) and to partial favor, as John was restored to his position as captain general.

Marlborough suffered two debilitating strokes in 1716, which robbed him of his speech and isolated him politically and emotionally. He died on June 16, 1722, after suffering another stroke.

LEGACY

After her husband's death, Sarah underwent a period of mourning and grief before she continued to oversee the ongoing construction of Blenheim Palace. Marlborough's will provided for £10,000 per year for a period of five years to be spent on Blenheim. Sarah also had control of Marlborough's estate, which was worth about £1 million, as well as her own wealth, which she had been allowed to hold in her own name. Her shrewd business moves, assisted by advice from financial "insiders," helped her preserve and increase both her husband's estate and her own wealth. She made as much as £150,000 by selling her stock in the South Sea Company before the so-called South Sea Bubble burst. In addition, she acquired considerable real estate holdings.

Unfortunately, she used her vast wealth to manipulate her children and grandchildren. According to sources, Sarah changed her will twenty-six times, increasing or decreasing proposed bequests in attempts to procure favor or punish slights. Although she was a difficult, covetous, grasping woman, she did give about £250,000 to charities and was the richest woman in England. The Marlboroughs' descendants continued to occupy Blenheim Palace in the twenty-first century. Winston

Churchill, the prime minister of Great Britain, and Diana, Princess of Wales, are the two most illustrious of their descendants.

J. Willard Marriott

American hotel and restaurant executive

Marriott, who began his career with a nine-stool root-beer stand, built a $3 billion empire of food and lodging enterprises. A philanthropist and Mormon, Marriott donated generously to Brigham Young University, the University of Utah, and the Church of Jesus Christ of Latter-day Saints.

Born: September 17, 1900; Marriott, Utah
Died: August 13, 1985; Wolfeboro, New Hampshire
Also known as: John Willard Marriott
Sources of wealth: Tourism; real estate
Bequeathal of wealth: Spouse; children; educational institution

Early Life

John Willard Marriott (MEHR-ee-ot), the second of eight children born to Ellen Morris Marriott and Hyrum Willard Marriott, was born in Marriott, Utah, in 1900. Both of his grandfathers had immigrated to the United States from England and were converts to the Church of Jesus Christ of Latter-day Saints (LDS), more commonly known as the Mormon Church.

Young Marriott was a good student, but he never completed high school. He worked on the family farm and served the LDS church. From 1918 through 1920, he traveled as an LDS missionary to New York and New England. Upon his return to Utah, he found his father deep in debt. Marriott determined to get an education and to help his family. Despite his lack of a high school diploma, he attended Weber College and later the University of Utah, working his way through both schools. During his last year at the University of Utah, he met Alice Sheets, who would become his wife.

First Ventures

Marriott and Hugh Colton bought one of the first A&W Root Beer franchises in Washington, D.C., opening their nine-stool stand on May 10, 1927. This proved to be a good day for opening the business because it coincided with street celebrations for the transatlantic flight of Charles A. Lindbergh. Marriott returned to Utah to marry Alice on June 9, 1927, and they moved to Washington.

The young couple bought Colton's interest in the root-beer stand when he returned to Utah to practice law. With $2,500 in savings and loans, the couple later bought another stand.

Concerned about winter sales, Marriott received permission from A&W to add food to the menu. He later renamed his operation the Hot Shoppe, and it was one of the first establishments in the Northeast to offer Mexican food and drive-in service, with Marriott being the first person to obtain special approval for off-street parking in Washington, D.C. His wife was the bookkeeper and chief cook, while Marriott waited on customers.

The couple personally counted cars at intersections to determine where to set up new establishments, and they tried such innovative techniques as hiring people to pass out coupons for their restaurants on the streets. By 1932, they had seven establishments in Washington, D.C., and were expanding into Baltimore and Philadelphia.

In 1934, however, Marriott received a diagnosis of Hodgkin's disease and a prognosis of six months to live. He called on his family for help. Two LDS leaders gave him a priesthood blessing, and by the end of the year, he was free of the disease.

Mature Wealth

When Marriott observed that passengers at a Washington, D.C., airport were carrying food from a local Hot Shoppe on board the planes, he began negotiations with Eddie Rickenbacker, the head of Eastern Transport Company (later Eastern Airlines), to provide meals for passengers beginning in 1937. Using the name In-Flite Catering Division of Hot Shoppes, Marriott's company began to serve Eastern, American, and Capital Airlines and became the world's largest airline catering service. With a 1939 contract, Marriott was also able to cater meals to the U.S. Treasury building. During World War II, Marriott operated lunch-wagon canteens and opened cafeterias. In 1945, he began to provide food service at the Miami International Airport.

Marriott participated in many professional, church, and community activities. In 1948, he was president of the National Restaurant Association, and from 1948 until 1958 he was president of LDS's Washington, D.C., stake, which was comparable to a diocese of the Catholic Church. Marriott later served as an Aaronic priesthood adviser and Sunday school teacher for LDS.

The yearly sales of the Hot Shoppes averaged $20 million in the early 1950's. By then, these restaurants were operating in twelve states, as well as in the District of Columbia. Hot Shoppes, Inc., later renamed the Marriott Corporation, began selling its stock publicly in 1952; the first stock offering sold out in two hours.

Marriott found time in 1950 to serve on the committee that installed the statue of LDS leader Brigham Young in the rotunda of the Capitol Building, and he also helped restore the buildings in Nauvoo, Illinois, from which the Mormons fled in 1846. As an active Mormon, he continued to contribute 10 percent of his income to the church, and he gave generously to the University of Utah and Brigham Young University. He and Alice also supported the Republican Party's causes and candidates, with Marriott chairing both inaugural committees for President Richard Nixon.

In 1957, Marriott and his family opened the Twin Bridges Motor Hotel, his first hotel, and his company's profits increased. In 1958, his firm launched a multimillion-dollar effort to open additional motor hotels, and Marriott hotels could eventually be found in many American cities, including Dallas, Philadelphia, and Atlanta. By the 1950's, Marriott's sons were beginning to assume more responsibilities in the family's business.

Marriott's health eventually began to decline. He had hepatitis, survived an aneurism in the brain, and suffered four heart attacks from late 1975 through early 1976. Despite his poor health, he continued to serve others. He donated $1 million to the University of Utah in order to construct a library and contributed a similar amount to Brigham Young Uni-

GREAT WEALTH AND HOTELS

John Willard Marriott began building his first hotel in 1957. His son, John Willard Marriott, Jr., conceived the idea of building the facility, and the elder Marriott initially was reluctant because he remembered the failure of hotels during the Great Depression. Despite his concerns, the 365-room Twin Bridges Motor Hotel, located near a bridge and close to the Washington National Airport (now the Ronald Reagan Washington National Airport) in Arlington, Virginia, opened for business in 1959. Its location seemed ideal. The Marriotts reasoned that roads and highways might be rerouted, but it was less likely that bridges and airports would be relocated. The Twin Bridges competed with older, downtown hotels and catered to business travelers, which is why it was logical to locate it near the airport and to offer conference facilities.

Hygiene was a priority at the new hotel. The housekeeping staff received special training in how to complete a set of sixty-six tasks for each room in only thirty minutes. Father and son made surprise visits to their hotels and checked for cleanliness, and the name Marriott eventually became synonymous with quality lodging. The Marriotts opened other hotels, and many customers were willing to pay extra to stay at their facilities. By the early 1970's, Marriott lodgings were more profitable than the Hilton and Howard Johnson hotel chains. In addition, the Marriott Corporation obtained the Fairfield Inns, enabling the company to make lower-priced facilities available to guests.

In 1972, John Willard Marriott, Jr., became chief executive officer of the Marriott Corporation and began to diversify its operations. The firm began offering time-sharing facilities in resort areas, provided medium-priced lodgings under the name Courtyard by Marriott, operated facilities for extended-stay travelers, and managed living accommodations for senior citizens. Confidence in the Marriott name grew because the public liked the company's facilities and appreciated its service. As a result, occupancy rates for Marriott lodgings were 12 percent above the industry average. The company also opened hotels in foreign countries, which further enhanced its profitability.

versity for a basketball activities center. He chaired the 1970 Independence Day celebration in Washington, D.C., and the bicentennial celebration in 1976.

Marriott suffered a heart attack at his family's summer home in New Hampshire and died on August 13, 1985. He was buried in Parklawn Memorial Park in Rockville, Maryland. President Ronald Reagan eulogized Marriott as a man who exemplified the American dream.

Marriott's biography reads like the classic rags-to-riches tale. His is the story of a poor farm boy who was admitted to the university without a high school diploma, worked his way through college, and turned a nine-stool root-beer stand into a $3 billion food and lodging corporation. By the time of his death, the Marriott Corporation maintained operations and franchises in all fifty states and in twenty-seven countries and was valued at more than $3 billion. In 1997, the company was the nation's thirteenth-larger employer, with 225,000 people on its payroll. In addition, the corporation franchised 935 restaurants; owned 667 restaurants; and operated 78 airport food service facilities, 2 vacation resorts, 3 cruise ships, 19 shops, 90 flight kitchens for 150 airlines, and 2,097 catering accounts. Attempts by labor unions to organize Marriott Corporation's employees were unsuccessful during Marriott's lifetime.

The papers of John Willard Marriott and Alice Sheets Marriott from 1924 to 1984 are housed at the J. Willard Marriott Library, which Marriott had funded at the University of Utah in Salt Lake City. The university also maintains a collection of Marriott family photographs from 1890 to 1980. The Hot Shoppes founded by Marriott and his wife remained popular in the Northeast for several decades, with the last one closing in 1999; however, by that time neither the shop nor Marriott's original airline catering operation was owned by the Marriott Corporation.

LEGACY

J. Willard Marriott gave generously of his time and wealth to others throughout his life and after his death. He served his nation by organizing events, such as the bicentennial celebration in Washington, D.C. Most important, Marriott changed the face of the American lodging industry. Cleanliness, efficiency, and service were his bywords. He treated his employees with respect and secured a place for the disabled in his corporation. Through his family, his business continues and his name remains widely known.

CORNELIA MARTIN

British socialite, aristocrat, and landowner

Following a trend in which wealthy American women wed titled but impoverished Europeans, Martin married a British aristocrat. She received a considerable dowry and inherited fabulous jewelry and vast estates, but her wealth was dissipated through sales and gifts.

Born: April, 1877; New York, New York
Died: May 19, 1961; place unknown
Also known as: Countess of Craven; Cornelia Craven; Lady Craven; Dowager Countess Craven; Cornelia Bradley-Martin
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Charity; dissipated

EARLY LIFE

Cornelia Martin, countess of Craven, was one of three children and the only daughter of Bradley Martin, the son of a prosperous merchant from Albany, New York, and Cornelia Sherman, daughter of a New York financier and railroad man. Young Cornelia grew up in relatively modest circumstances until 1881, when her mother's father died, leaving an estate worth more than $5 million. The nouveau riche, newly named Bradley-Martins traveled abroad, purchased fabulous jewelry, and began social climbing by hosting ostentatious balls in New York.

FIRST VENTURES

Criticized for their decadent lifestyle, the Bradley-Martins spent time in Europe, especially at a Scottish hunting lodge. There fifteen-year-old Cornelia met her future husband, twenty-four-year-old Lord William, fourth earl of Craven, who was land-rich, with forty thousand acres, but cash-poor. The couple was married in 1893 in a lavish New York ceremony just after the bride's sixteenth birthday. Wedding gifts included tiaras, bracelets, necklaces, and watches dripping with diamonds, sapphires, and pearls. Cornelia, enriched by a gift of $1 million from her parents, took up residence in her husband's gigantic English mansion, Coombe Abbey. Lord William used his wife's wealth to remodel, repair, and electrify the estate. The Cravens spent liberally and were prominent in the best social circles at home and abroad.

In 1897, Cornelia Craven gave birth to William George Bradley, the future fifth earl of Craven. Her son later married and had a son before fighting in World War I, where he lost a leg. In 1920, Cornelia's mother died, and Cornelia inherited more than $2 million in cash and jewelry. The following year, her husband drowned in a yachting accident. The high costs of upkeep and staff salaries forced Cornelia to sell the heavily mortgaged Coombe Abbey in 1923. Sotheby's auctioned off more than twenty-two hundred heirloom items of furniture, silver, jewelry, tapestries, paintings, and other valuables.

MATURE WEALTH

Cornelia moved to Hamstead Lodge, another Craven estate. She lived there the remainder of her life, raising chickens and planting elaborate gardens. The Dowager Countess Craven, as Cornelia was known after her husband's death, continued to entertain royalty, European nobility, and other prominent members of high society. She still employed a large staff of servants, chauffeurs, carpenters, watchmen, and gardeners, more than forty people in all. She was generous at Christmas, hosting a village holiday party, handing out food baskets, and giving gifts of 7 shillings and 6 pence to every child.

Cornelia outlived her spendthrift son, who died in 1932. Although she kept up appearances with an active social life, increasing financial woes caused her to sell off more property. These sales started a trend that would eventually lead to the dissolution of the Craven ancestral estate.

After Cornelia's grandson, the sixth earl of Craven, came of age in 1938, he scandalized the family by marrying the daughter of a chorus girl, and he later dealt the Craven name another blow by divorcing. Cornelia's death at age eighty-four in 1961 precipitated further distress sales that scattered the Martin-Craven fortunes.

Legacy

With little property or wealth left after Cornelia's death, the "earl of Craven" became an empty title. Later titleholders fared poorly. The sixth, seventh, and eighth earls all died young. The ninth earl, Benjamin, was born in 1989.

Remnants of Cornelia Martin's Anglo-American wealth were later placed on public display. In the twenty-first century, Coombe Abbey was a 119-room luxury hotel furnished with antiques. Other former Craven estates in several English counties were also open to visitors. Inherited masterpieces of art grace galleries, including the Getty Museum. Some of the fabulous Bradley-Martin-Craven jewelry collection, including pieces from the French crown jewels, once owned by Cornelia and her mother, is on display at the Louvre Museum.

Francisco Matarazzo

Brazilian industrialist

An Italian immigrant to Brazil at the end of the nineteenth century, Matarazzo built one of the great industrial conglomerates of modern times, F. Matarazzo United Industries. A bold entrepreneur, he gained great wealth and an Italian title of nobility.

Born: March 9, 1854; Castellabate (now in Italy)
Died: December 10, 1937; São Paulo, Brazil
Also known as: Francesco Antonio Maria Matarazzo; Count Matarazzo; Prince of São Paulo
Sources of wealth: Trade; manufacturing
Bequeathal of wealth: Children; charity

Early Life

Francisco Antonio Maria Matarazzo, better known as Francisco Matarazzo (frahn-SEES-koh mah-tah-RAH-tsoh), was born in Castellabate in southern Italy, the eldest of nine children of Costabile Matarazzo, a lawyer. Because his family had some means, Matarazzo was able to receive a high school education, after which he began selling butcher's lard (pork fat) used for cooking. Seeking better economic opportunities, he immigrated to the New World in 1881, as did millions of Italians at the end of the nineteenth century. Two of his brothers, Giuseppe and Luigi, also immigrated to Brazil. Hoping to begin a business selling lard to Brazil's large Italian community, Matarazzo brought a supply of lard on the ship, but it did not survive the journey.

Settling in the commercial town of Sorocaba, Matarazzo worked as a plantation laborer until he had saved enough capital to open a store selling other Italian immigrants butcher's lard, as well as other necessities, such as farm implements, tires, clothing, rice, cheese, and pasta. Seeking to create a vertically integrated business, in which he would control products from raw inception through manufacturing, distribution, and sale, he started a hog farm in order to obtain lard and a flour mill to make spaghetti and macaroni.

First Ventures

In 1890, Matarazzo moved to São Paulo and started Matarazzo & Brothers with Giuseppe and Luigi. By canning rather than barreling lard, Matarazzo improved the product, which he sold door-to-door. As Brazilians switched from buying European lard to Matarazzo's domestic product, his business success was ensured. He established a new company for his growing enterprises, Matarazzo S.A. On March 15, 1900, he founded Brazil's first grain mill, innovatively using cotton sacks to bag the flour. As he became more successful, he brought more of his family from Italy to São Paulo.

Matarazzo continued to create a vertically integrated business, in which he took control of the production cycle from beginning to end. By producing his own raw materials, he eliminated the need for suppliers. By using his own factories, he lowered the cost of manufacturing. By selling his goods through his own stores and distributors, he eliminated middlemen. Matarazzo owned cotton plantations; he operated factories to thread the cotton and to extract cotton oil from the seeds; he used the cotton oil to make soap and skin care products that he sold directly to consumers. Using this same business model, Matarazzo began manufacturing foodstuffs, textiles, metals, cleaning products, and oils. He became a banker, helping to found the Banca Commerciale Italiana and the Banca Italiana of Brazil. He established the Cubatão refinery, the first oil distillery in Brazil. From 1887 to 1911, Matarazzo's capital increased to four hundred times its original size.

Mature Wealth

In 1911, Matarazzo established a conglomerate to hold all of his enterprises, Industrias Reunidas F. Matarazzo (F. Matarazzo United Industries). Although at this time coffee was Brazil's major export, Matarazzo found a niche in every other facet of the Brazilian economy. His conglomerate was involved in refining sugar and salt; weaving; distilling oil; making soap, fat, and candles; milling sulfide and carbonic acids; meatpacking; and producing matches nails, pottery, lime, film and paper. Industrias Reunidas also pursued business ventures in metallurgy, woodworking, and carpentry. Matarazzo owned a fleet of ships, a port terminal in Santos, and railroads to transport his goods. He was the acknowledged leader of Brazil's Italian community and was known as the Prince of São Paulo.

Matarazzo entrusted the leadership of his industries to his extended family, and he brought workers from his Calabrian homeland to Brazil to work in his enterprises. Matarazzo exemplified an old-fashioned, paternalistic form of capitalism. He built villages in which his workers could live. On his birthday, he distributed bonuses to his employees and extra bonuses if they married or had a baby on this lucky day. He donated to charitable causes in Brazil and Italy. He paid for a hospital in Italy that treated patients suffering from the ravages of World War I. In recognition, on June 25, 1917, King Victor

Federation of Industries of São Paulo

Francisco Matarazzo was the chief architect of an industrial association founded in 1928, the Federação das Indústrias do Estado de São Paulo (FIESP), translated as the Federation of Industries of São Paulo. The 1920's were a time of great labor turmoil in Brazil, and the nation's industrialists felt the need to band together in order to protect their interests. In his opening remarks at the meeting at which FIESP was established, Matarazzo commented that increased industrialization would benefit all of Brazilian society.

The FIESP worked to transform primitive business conditions into a more industrialized sector of the nation's economy, characterized by rationality, security, and efficiency. Management's relations with labor would be addressed in a hierarchical but benevolent fashion. The FIESP intended to woo workers away from radical ideologies by promoting social, recreational, and cultural events. The organization also played a role in trying to resolve labor strife. It is possible that the FIESP received some of its ideas from the corporatist philosophy of Portugal, the nation that had established a colony in Brazil. In the late 1920's, Portugal's dictator, António de Oliveira Salazar, was developing his ideas of a new state (*estado novo*), in which different associations would play key roles in organizing the economy. Unlike Matarazzo himself, the FIESP played a direct role in Brazilian politics.

As the Brazilian workforce is traditionally one of the more politically radical groups in the Western Hemisphere, FIESP's efforts can be assessed in either of two ways. It can be said that the organization's philosophy of management-labor relations and employee cultural programs did not succeed. On the other hand, it can be said that FIESP played a role in dissuading a workforce prone to radicalism from engaging in workplace violence or supporting revolutionary measures.

In the more than seventy years since its founding, the FIESP has been an important factor in the industrialization of Brazil. The offices of FIESP are located on the Avenida Paulista, one of the most expensive areas in South America, with lavish mansions, office skyscrapers, prestigious schools, and costly shops and restaurants. The FIESP has become a model for trade associations throughout the world. It has a membership of some 132 companies, equivalent to about 40 percent of the gross domestic product of Brazil.

Emmanuel III of Italy made Matarazzo an Italian count; on December 26, 1926, his aristocratic title was extended to his heirs. However, one of Matarazzo's sons and his heir apparent, Ermelino, died in a car accident in Turin, Italy. Matarazzo was also made a knight of several Italian orders.

Despite these honors, Matarazzo was criticized for not contributing enough money to the social and civic life of Brazil. An aggressive capitalist, he was viewed as an upstart by much of the nation's aristocratic elite. Nevertheless, he was known for his vigor, energy, and charm.

Matarazzo is alleged to have become an admirer of Italian leader Benito Mussolini during a visit to Italy in 1923. It was reported that Matarazzo had begun giving the Fascist salute and may have even joined Italy's Fascist Party. Perhaps inspired by the corporatist social model trumpeted by early fascism, he was one of the founders of the Federation of Industries of São Paulo (FIESP) in 1928, and he served as the organization's first president. In 1928, there was a strike at his Mariangela textile mill resulting from his automation of the factory. Although he purposely refrained from direct participation in Brazilian politics, Matarazzo was able to use his influence with the government to secure tariffs to protect his industries from foreign competition.

At its height, the Matarazzo conglomerate was the largest in South America and one of the largest in the world. It encompassed more than two hundred companies, with thirty thousand employees and a value of more than $20 billion in 2010 currency. Matarazzo owned vast estates in Brazil and Italy, and he was considered to be the richest man in Brazil and one of the richest in the world. His mansion, built in 1895, was located in a prominent, prestigious address on the Avenida Paulista. At his death in 1937, his fortune and enterprises were passed on to his family. Leadership of the Matarazzo industries was assumed by his son, Francisco Matarazzo, Jr., known as Count Chiquinho, and by his nephew Francisco Matarazzo Sobrinho, known as Ciccillo. In later years, Matarazzo's descendants fought over the family's industrial empire. The family's business ventures declined, with several companies declaring bankruptcy.

Legacy

Francisco Matarazzo is one of the most important industrialists in South American history. He built a conglomerate that spanned almost every industry in Brazil. His mansion on the Avenida Paulista, improved by his son, was the epitome of wealth. It housed a multimillion-dollar collection of art, including paintings by Flemish masters Jan Brueghel the Elder, Sir Anthony van Dyck, and Peter Paul Rubens. The hallways were lit by vast skylights; the floors were made of marble and carpeted with Persian rugs. Chinese vases, antique silver, and Roman tableware adorned the dining and reception rooms. Three cellars held the choicest wines.

In an indication of the decline of the Matarazzo fortune, the mansion became the site of a struggle between the government of São Paulo and Matarazzo's heirs. The mansion had been renovated in 1942 by Marcelo Piacentini, one of Mussolini's architects, and was later protected as part of Brazil's architectural heritage. Nevertheless, the Matarazzo heirs sought to demolish the structure in order to sell the valuable land on which it was located, estimated to be worth $150 million.

Giovanni de' Medici

Italian banker

The wealth that Medici accumulated assured his dynasty its place in Florentine Renaissance society. Although he avoided public displays of power, his sons and grandsons parlayed their wealth into political power.

Born: c. 1360; Florence (now in Italy)
Died: February 20, 1429; Florence
Also known as: Giovanni di Bicci de' Medici
Sources of wealth: Banking; manufacturing; real estate
Bequeathal of wealth: Children

Early Life

Not a great deal is known about the early life of Giovanni di Bicci de' Medici, better known as Giovanni de' Medici (zhyoh-VAHN-nee day MEH-deh-chee). Unlike other early figures of the Italian Renaissance, who left copious documentation about their lives, there are few personal documents about Medici. This absence of documents leaves unanswered questions about his rise and his political activities in Florence.

He was born around 1360, and his father, Averardo di Salvestro (called Bicci), died of the plague about three years later. Bicci left five sons, among whom he divided a meager estate of agricultural lands in the region of Mugello, north of Florence. His will also left money for restitution for usurious dealings, suggesting that he had some connection with small-scale moneylending.

First Ventures

The Medici family was moderately prosperous in the thirteenth century, but by the late fourteenth century their resources had declined. Relatively impoverished, Giovanni and his brother Francesco followed a career path common in early Renaissance Italy: They went to work for a relative, a distant cousin named Vieri di Cambio de' Medici. Vieri had banking interests in Florence and Rome, as well as abroad. Giovanni rose in the business, becoming managing partner of the Rome branch by 1385. That year he got married, and his wife's dowry may have bankrolled his advancement.

In 1386, he joined the Arte del Cambio, the guild overseeing international bankers. Vieri died about 1391, and his banking interests were divided between his sons and the two sons of Bicci. For a time, Giovanni remained in Rome overseeing papal investments, though he cooperated closely with the other family bank branches. In 1397, he moved his operations to Florence, for reasons that remain unknown. This move marks the foundation of the Medici Bank.

Mature Wealth

From 1397 until 1420, Giovanni was head of the Medici Bank, as well as the Medici family. His great wealth was acquired through his dealings with the Roman Catholic Church. He developed ties with the Papal Curia when he worked for Vieri. Giovanni's later relationship with Baldassare Cossa, a Roman Catholic cardinal, was also crucial. Giovanni may have met Cossa as early as 1399, and later events suggest that Giovanni was impressed with Cossa's real-world talents, not his religious vocation. Cossa became legate to the papal city of Bologna in 1402, and from that time until his investiture as Pope John XXIII in 1410, he played a major role in the chaotic events and shifting allegiances in Italy.

As defender of Bologna, Cossa required money to pay troops, and by 1404 he was financially supported by large Medici loans. The Medici family made very handsome profits on these loans. Their ties to Rome became even more important for the success of their bank when Cossa acceded to the papal throne. (He would later be considered one of the antipopes.) Now, Giovanni was the primary banker for the pope. Profits from the bank's Rome operations reached as high as 50 percent, and they were regularly 30 percent of capital investment each year. This was the time of the Great Schism, however, and in 1415 John XXIII was removed from office. Nonetheless, Giovanni remained Cossa's friend until his death in 1419.

For Giovanni, neither friendship nor politics would stand in the way of profit. Cossa's legitimate successor was Pope Martin V, and the Medici Bank established itself as the pope's banker during his reign. The Medici remained the primary depository bank of the Papal Curia for the next sixty-two years.

Under Giovanni's control, the Medici family developed other profitable interests. In the first decade of the fifteenth century, the family expanded into wool production, a mainstay of Florentine prosperity. Giovanni founded branches of the bank in key trading cities in Italy and had agents throughout Europe. By 1408, however, he sought no further expansion, preferring to maintain close control over what he had. He began to invest profits in land and acts of patronage.

Tax records demonstrate how Giovanni's wealth greatly increased. In 1396, his assessment was only 14 florins; in 1403, this rose to 150 florins. In the first *catasto* (tax) records of 1427, his assessment was 397 florins, the third largest amount in Florence.

During Giovanni's lifetime, Florentine politics were risky and fractious. For the most part, Giovanni stayed out of the public eye, and he recommended that his sons do the same. However, maintaining a low profile did not mean that Giovanni was without influence. He was named prior of Florence in 1402, and he served on several of the oversight boards for major civic projects, especially those associated with the cathedral precinct. Giovanni was at the center of a large network of reciprocal obligations of aid and service. He was recognized as the leading citizen in San Giovanni and San Lorenzo, the quarters of Florence in which the large Medici family and their dependents lived, and with or without his machinations he was the head of the Medici political party. His son Cosimo de' Medici would move this informal political power to formal leadership in the 1430's.

In 1420, Giovanni turned over the daily operations of the Medici Bank to his son Cosimo. He lived his last years quietly, enjoying his wealth and position and acting as patron of the arts. He was publicly responsible for rebuilding the sacristy of the Church of San Lorenzo, which was destined to be his burial place. Less publicly, he was the patron for rebuilding the entire church.

Giovanni de' Medici died on February 20, 1429. His funeral was a major event in the city of Florence, and his cortege was made up of twenty-six men from the large Medici clan. According to his son, his estate was valued at 180,000 florins. Giovanni refused to make a will, perhaps because he did not want to order restitution for ill-gotten gains.

The Medici Bank

The bank founded by Giovanni de' Medici functioned for almost a century, from 1397 through 1494. It prospered and expanded under Giovanni and his son Cosimo. Centered in Florence, it had branches throughout Europe. A combination of mismanagement and broad economic collapse resulted in its failure in the late fifteenth century.

The documents on which a history of the bank depend are relatively numerous. Confidential ledgers were discovered in 1950; they cover the period of 1397 to 1451 with great detail. However, documents for the remaining years of the bank's operation are less complete. Still, these are among the most complete archival records for this historical period. After the institution in 1427 of the *catasto*, or proportional tax based on stated returns, tax records are also an important source of information about the bank.

Currency exchange and credit were necessary for the functioning of long-distance trade, especially for the Roman Catholic Church. Income and currency received in a foreign country had to be transported to the home country and converted into the local currency. Money changers evolved into international banks through the institution of bills of exchange, drawn on the assets in one town and honored by a branch in another town. Travel was slow, and time was allowed between the creation of the bill and its execution, so these bills of exchange were actually a form of credit. Since the transactions were called exchanges instead of loans, profits evaded the church's sanctions against usury.

The organization of the Medici bank was not particularly innovative. As in the fourteenth century banks operated by the Bardi and Peruzzi families, partners in the Medici bank joined together to invest capital and reap rewards in proportion to their investment. Giovanni de' Medici had learned an important lesson from the collapse of the Bardi and Peruzzi banks. His one innovation was to protect the "home office" from the mismanagement and bad loans of the branches. In an arrangement that foreshadowed the limited liability holding company, primary partners in the Medici bank could be held responsible for losses only up to the amount of their original investments. Thus, these partners' accumulated wealth was untouchable.

The Medici bank is significant because it was the largest banking establishment of its time, though it probably never employed more than sixty-five people. The wealth the bank created was the engine propelling the Medici family's rise to power in Renaissance Florence. The operations of the bank add to the understanding of business history, and the problems that caused its collapse are similar to problems facing modern financial institutions.

Legacy

The wealth amassed by Giovanni de' Medici helped create the Italian Renaissance. During that period, the rich chose to use their wealth to fund public and private projects that beautified their cities and glorified their names. Giovanni worked closely with the architect and engineer Filippo Brunelleschi and the sculptor Donatello, two artists credited with the creation of the Renaissance style. His descendants continued and expanded this tradition of patronage.

Giovanni's wealth and the bank he founded also provided his heirs with the wherewithal to solidify their place of honor in Florentine society. His son Cosimo became de facto ruler of the city upon his return from exile in 1434, and other descendants become popes, dukes, and the consorts of kings.

Lorenzo de' Medici

Italian patron of the arts, banker, and politician

Lorenzo de' Medici headed the richest banking family in Italy. He used his wealth to maintain Medici control over the Florentine Republic, elevate his son and nephew to the position of pope, and become one of the leading Renaissance patrons of arts and letters.

Born: January 1, 1449; Florence (now in Italy)
Died: April 9, 1492; Careggi, near Florence (now in Italy)
Also known as: Lorenzo the Magnificent
Sources of wealth: Inheritance; banking
Bequeathal of wealth: Children; relatives; artistic patronage

Early Life

Lorenzo de' Medici (loh-REHN-zoh day MEH-deh-chee) was born on New Year's Day, 1449, into a fabulously wealthy Florentine banking family. The family fortune was established by his great grandfather Giovanni de' Medici (1360-1429), who created the Medici Bank with money earned from commerce and money-lending. The bank financed much of Florence's ever-increasing economic activity. Working with his son Cosimo (1389-1464), Giovanni invested time and money in supporting the return of the papacy from Avignon in France to Rome. In 1413, the Medicis became "God's bankers," performing financial transactions for the Roman Catholic Church, and were the leading family of

Florence. Under Cosimo's direction, the Medici bank created many European branches, quickly becoming the most profitable bank in Europe. Lorenzo's father, Piero I (1416-1469), though suffering from chronic illnesses and lacking in dynamism, was able to maintain Medici dominance after Cosimo's death in 1464.

As the eldest son of Piero, Lorenzo seemed destined to head the family dynasty. He lived in luxury in the sumptuous Medici Palace in Via Larga, Florence, which was completed about the time of his birth. Along with his two older sisters and brother Giuliano (four years his junior), Lorenzo matured surrounded by a multitude of relatives and doting parents. His formal education by leading Humanist tutors began at age five. Since the Medici Palace functioned as a salon, attracting the great artists and writers of the day, Lorenzo's informal education was also stimulating. He was gifted musically and in poetry writing, verbally expressive, and blessed with a photographic memory. Although suffering from asthma, eczema, and poor eyesight, he nevertheless was athletic and traveled widely. However, Lorenzo's youth was cut short when, at the age of seventeen, his father became critically ill.

First Ventures

In his mid-teens, Lorenzo had been sent by his father on special assignments as a trusted go-between to communicate information to Medici political allies scattered throughout Tuscany, as a dignitary representing the Medici family at ceremonial functions, and as a stand-in for Piero at city government meetings. Now with Piero's incapacitation, Lorenzo was sent to negotiate family business with dignitaries as important as the pope and the king of Naples. At the age of nineteen, in a carefully arranged marriage, Lorenzo wed Clarice Orsini, a member of one of the wealthiest, most powerful, politically well connected Roman families. Their marriage in Florence was celebrated during a three-day period at five major banquets. With the death of Piero the following year, the twenty-year-old Lorenzo became master of Florence, with his younger brother Giuliano as his closest associate. Lorenzo had to maintain his power in a Florence threatened by four rival Italian states and where a powerful rival banking family, the Pazzi, plotted continually to destroy the Medici. In addition, strong republican sympathies might explode at any time to launch a revolution designed to make Florence more than just a nominal republic.

Mature Wealth

Lorenzo would not become known for expanding Medici wealth, though he made some financially wise moves, such as establishing strong financial relations with the Ottoman Turks. Rather he is known for using the family's resources to maintain power and raise Medici prestige to great heights. He managed a network of many thousands of clients in Florence and other Italian states who looked to him for favors and granted their unquestioning loyalty in return. He became patron to many of the leading artists of the fifteenth century Renaissance, including Leonardo da Vinci, Sandro Botticelli, and the young Michelangelo, who lived at the Medici Palace for several years and was raised alongside Lorenzo's seven children. The works of these artists brought fame not only to Florence but also to the Medicis. Lorenzo was well aware that his grandfather Cosimo had earned great prestige for the family by becoming a patron of famous artists, such as Donatello and Filippo Brunelleschi, who achieved the greatest architectural feat of his time by constructing the magnificent dome of the Florence Cathedral. Lorenzo was also aware of Cosimo's close escape from death at the hands of the rival Albizzi family.

Lorenzo did not support artists for only political reasons. He truly loved the arts and became patron for leading Humanist writers, such as Giovanni Pico della Mirandola and Marsilio Ficino. He continued to write poetry in the vernacular of his native Tuscany. His agents scoured Europe searching for classical manuscripts to add to the Medici library. Politically, he negotiated agreements to keep the peace between Florence and its rival Italian city-states, and he made sure that members and associates of the Pazzi, a family of wealthy bankers and traders who rivaled the Medici, were kept out of political positions in Florence.

On April 26, 1478, in what has become known as the Pazzi Conspiracy, a group of assassins during the Easter mass entered the Florence Cathedral, stabbing Lorenzo in the neck and quickly murdering his brother Giuliano with nineteen stab wounds. Lorenzo disappeared in the confusion, but he soon showed his supporters that he was not mortally wounded. In rage, the crowd killed the assassins. The ringing of church bells brought out crowds of Florentines who murdered Pazzi family members and others involved in the conspiracy. Several hundred mercenary troops, about to invade Florence as part of a conspiracy involving Pope Sixtus IV and king of Naples, reversed course and headed out of Tuscany. All traces of the Pazzi family were wiped out in Florence.

Fearful of the next step, Lorenzo, loaded with gold and other gifts, traveled for nearly a month to meet with the pope. Although Sixtus was unhappy, he reached an agreement with Lorenzo that guaranteed the survival of the Medici family. However, Lorenzo knew that the only solid guarantee was domination of the papacy itself. His son Giovanni was marked for the church and Lorenzo's wealth was used to make him a cardinal at age sixteen. Giovanni went on in 1513 to become Pope Leo X, the first Florentine pope. Giulio de' Medici, the son of Lorenzo's murdered brother, was also designated for a church career. Medici influence made him the archbishop of Florence, then cardinal, and finally Pope Clement VII.

However, another church-related move, later in Lorenzo's life, would prove disastrous. Lorenzo became patron to a charismatic preacher named Girolamo Savonarola, bringing him to Florence in 1490. There, Savonarola railed against the paganism in Renaissance art and literature and the false materialism that was embodied in the Medici control of Florence. Economic crises, coupled with French involvement in conflict between the Italian states, caused many to respond to Savonarola's message. During this period, Lorenzo was stricken with gout similar to that which had incapacitated his father, and he also suffered from increasing depression. By Christmas, 1491, the pain became unbearable.

Lorenzo died on April 9, 1492, after being visited by Savonarola. It is still debated whether or not the puritanical preacher condemned or consoled him. Lorenzo was

The Laurentian Library

Clement VII, the second pope come from the Medici family, commissioned the building of the Laurentian Library in 1523. It was to be designed by Michelangelo in the cloister of the Basilica of San Lorenzo and to house the rare classical manuscripts and early printed books that were so painstakingly collected by Lorenzo de' Medici and his grandfather, Cosimo. Lorenzo's contribution was a large number of rare Greek texts. The library was meant to be a permanent reminder that the Medici legacy included not only commerce and politics but also intellectual and spiritual excellence.

Construction began in 1525 in order to build a library in the basilica atop a two-story cloister. Work proceeded at a snail's pace. Michelangelo departed from Florence in 1534, leaving his design to be completed by the architects Giorgio Vasari, Bartolomeo Ammanati, and Niccolò Tribolo. It was not until 1571 that the library was finally opened by Cosimo I, the Medici grand duke of Tuscany.

The library is viewed as one of Michelangelo's most revolutionary designs and stands as a prototype of mannerism. A unique staircase consists of three flights of stairs leading to the vestibule. The outer stairs are quadrangular in shape, the central ones are convex, and the bottom three steps are elliptical. The long reading room is lined with rows of light-producing windows; it is 152 feet long, 35 feet wide, and 28 feet high. Along the walls are two blocks of desks at opposite sides of the room. The floor consists of 8-foot-by-6-foot terra-cotta panels with geometric designs laid out in a sequence intended to exhibit basic geometric principles. Coupled with the design of the walls and ceiling, the reading room conveys a sense of order, concentration, and serenity. Additions were made to the library over the centuries. In the twenty-first century, this world-famous repository housed more than eleven thousand manuscripts and forty-five hundred rare printed books.

buried next to his brother Giuliano at the church of San Lorenzo, in a chapel designed by Michelangelo. Lorenzo was succeeded by his eldest son, Piero (1471-1503), an incompetent ruler who was driven out of power. Piero's son, Lorenzo, restored Medici rule in Florence in 1512, ruling until his death in 1519. His only child, Catherine (1519-1589), was in infancy; she would play an important role as queen of France, not ruler of Florence. The Medici name returned to rule Florence in the form of Cosimo I (1519-1574), the illegitimate son of another branch of the Medici family. He became the duke of Florence in 1537, and after conquering all of Tuscany he and his heirs were grand dukes of Tuscany until 1737.

Legacy

Lorenzo de' Medici became the embodiment of the Renaissance prince, not only to Niccolò Machiavelli, who dedicated his book *Il principe* (wr. 1513, pb. 1532; *The Prince*, 1640) to him, but also to historians. Financial power was translated into political power, as well as cultural power. In becoming a major patron of the arts, Lorenzo not only placed his family at the cultural center of Florence but also positioned Florence at the cutting edge of the Renaissance. He also placed a son and nephew on a course that led to the papacy.

Both popes followed his example and became major patrons of the arts to the point where Rome eclipsed Florence as the new center of the Renaissance. To bankroll his lavish spending, Pope Leo X sold high church positions and salvation on a large scale (indulgences), leading Martin Luther to launch what would become the Protestant Reformation. The other Medici pope, Clement VII, also had a corrupt and disastrous reign that saw Rome sacked and looted by its own Spanish allies. He was able to preserve the dynasty, however. by marrying his fourteen-year old-niece Catherine to the son of the king of France. As wife of the future King Henry II (1519-1559), Catherine would play an important role in French politics. She would bear ten children, three of whom would become kings of France.

SEVENTH DUKE OF MEDINA SIDONIA

Spanish aristocrat and military leader

Medina Sidonia, a Spanish noble, served as the commander in chief of the Spanish Armada, which was defeated by England in 1588. His appointment as a military commander is typically attributed to his wealth and family connections to the king of Spain, and therefore he was derided as a "general of gold."

Born: September 10, 1550; Sanlúcar de Barrameda, Spain
Died: July 26, 1615; Sanlúcar de Barrameda, Spain
Also known as: Alonso Pérez de Guzmán el Bueno y Zúñiga (birth name); Alonso de Guzmán
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Children

EARLY LIFE

The seventh duke of Medina Sidonia (mah-DEE-nah see-DOHN-ee-ah) was born Alonso Pérez de Guzmán el Bueno y Zúñiga in the ducal palace at Sanlúcar de Barrameda, Spain. His parents were Don Juan Claros de Guzmán, count of Niebla, and Doña Leonor Manrique de Zúñiga y Sotomayor, the daughter of the fourth duchess of Béjar and her consort, the count of Belalcazar. Alonso Pérez de Guzmán's paternal grandfather was Don Juan Alonso de Guzmán, sixth duke of Medina Sidonia, and his grandmother, Doña Ana de Aragon, was a granddaughter of King Ferdinand of Aragon. Medina Sidonia and King Philip II of Spain were cousins.

FIRST VENTURES

In 1556, Alonso Pérez de Guzmán's father died, and his father's title, the count of Niebla, passed to Guzmán. Guzmán's grandmother, Ana de Aragon, died later that year, and the sixth duke died in 1558. As a result of these deaths, Guzmán inherited titles and lands to become sev-

(Hulton Archive/Getty Images) enth duke of Medina Sidonia, fifth marquis of Cazaza in Africa, twelfth lord of Sanlúcar de Barrameda, and tenth count of Niebla. More than four hundred folio pages were needed to catalog the estates that he inherited and his properties, rights, and jurisdictions within each. His estates stretched from the Portuguese frontier to the mountains behind Gibraltar, covering half of the present Spanish provinces of Huelva and Cadiz, then part of the Kingdom of Seville, and a corner of the province of Málaga, then in the Kingdom of Grenada. His largest estate, the county of Niebla, included twenty townships. Altogether, about fifty-five hundred people lived under the duke's jurisdiction as his vassals.

Mature Wealth

On his estates, Medina Sidonia bore responsibility for the provision of local government, the administration of justice, and the maintenance of the militia, which included the collection of taxes necessary to support these functions. The land that he owned, combined with other income, reportedly earned him 60,000 ducats in 1572. From Sanlúcar alone, he received 80,000 ducats in 1582.

Since Medina Sidonia was the head of one of Spain's oldest and most illustrious families, it is not surprising that King Philip II appointed him the captain general of Andalusia in 1588. Medina Sidonia, known for a reflective temperament, had campaigned for the post. Upon the death of the marquis de Santa Cruz later that year, Medina Sidonia accepted Philip II's offer and became leader of the Spanish Armada. He had no naval experience, and he was aware of the fleet's deficiencies in supplies, arms, and crew. Nevertheless, Medina Sidonia felt duty-bound to try to fulfill the Spanish Armada's mission of covering Alessandro Farnese's land attack on England. Weather conditions and a running battle with the English fleet destroyed much of the Armada. Medina Sidonia returned to Spain with the remnants of his fleet in late 1588. Despite his loss, he remained a favorite of Philip II and continued to serve in high offices until his death. However, many of his contemporaries and subsequent historians have criticized him for his failure to defeat the English.

Legacy

The seventh duke of Medina Sidonia commanded the Spanish Armada largely because of his wealth, and he is largely blamed for the failed Spanish effort to invade England. As one of the wealthiest and most politically prominent individuals of his era, the duke bears some of the responsibility for the financial and military shortcomings of early modern Spain. However, he was a capable manager of his own considerable fortune. His descendants remained politically prominent and wealthy into the twenty-first century.

Frederik Meijer

American grocery and retail store magnate

With his father, Hendrik, Frederik Meijer built a grocery and retail empire consisting of almost two hundred Meijer Superstores throughout the Midwest and Kentucky. He has used his wealth to improve the quality of life in southwest Michigan.

Born: 1919; Greenville, Michigan
Also known as: Frederik Gerhard Hendrik Meijer
Source of wealth: Retailing
Bequeathal of wealth: Charity

Early Life

Frederik Gerhard Hendrik Meijer (FREHD-rihk MI-ehr) was born in Greenville, Michigan, in 1919, the younger of two children born to Dutch immigrants, Hendrik and Gezina Meijer. Hendrik Meijer was a barber before starting a dairy operation with only moderate success. When Hendrik turned to the grocery business in 1934, Frederik worked in the store, thus limiting his school activities to music and acting in school plays. Growing up poor, he once remarked that during his childhood he never spent a nickel on a soft drink because that was too much money to spend frivolously.

As a teenager, Meijer showed a knack for the grocery business and was given ever-increasing responsibility. He created advertisements, bought merchandise for resale, and negotiated with creditors. Although the country was in the Depression, the store flourished because the Meijer family always bargained for the best deals with suppliers and passed on the savings to their customers.

First Ventures

Meijer's first business venture was the family store in Greenville. Unlike some sons of entrepreneurs, Meijer did not easily fall into his fortune; he helped build it. He was fully involved in the store from the beginning, helping to rebuild it after it was destroyed in a fire and making the decision to open a second store. Hendrik made Meijer a full partner when Meijer opted to forgo college and make the family business his career.

Having two stores proved personally fortuitous. Meijer hired employees, one of whom was a cashier named Lena Rader, whom Meijer married. The couple later had three sons, Hank, Doug, and Mark, all of whom would become actively involved in the family business.

Mature Wealth

Meijer continued to expand his business. He was one of the first grocers to open self-service supermarkets. In 1962, Meijer Thrifty Acres (now simply called Meijer) in Grand Rapids, Michigan, became the template for the company's chain stores. The 180,000-square-foot building combined a grocery store with a department store, offering customers what the company described as "one-stop shopping." Meijer would later be given credit for opening the first "hypermarket" in the United States. (Coincidentally, another hypermarket pioneer was named Fred Meyer and opened similar stores in the Pacific Northwest, beginning in Portland, Oregon.)

By providing good prices and a high quality of customer service, Meijer's stores competed effectively with both supermarket chains and discount stores. He liked it when customers complained because he could address the problem and avoid a recurrence. By 2009, Meijer, Inc., employed more than eight thousand people in more than two hundred stores in Michigan, Ohio, Indiana, Illinois, and Kentucky. Meijer has said that one of the reasons his company succeeded is that he hired good people, trusted them, and, most important, allowed them to make mistakes.

Meijer's corporate stewardship is exemplary. He remembers where he came from and knows that with privilege comes responsibility. Although his sons became active members of the company's management team, he continued to visit the office nearly every day, simply because he loved his business.

Legacy

The Meijer legacy is visible throughout southwest Michigan. In addition to the Frederik Meijer Gardens and Sculpture Park and the Fred and Lena Meijer Heart Center at Spectrum Hospital, both in Grand Rapids, Meijer donated substantially to the Meijer Majestic Theatre. He also donated the land on which Grand Valley State University built its Holland, Michigan, campus. The Grand Valley State University campus in Grand Rapids is home to the Meijer Public Broadcast Center. His Dutch heritage remains such an important part of his identity that he funded the Meijer Chair in Dutch Language and Culture at Calvin College.

Despite having his name blazoned throughout the Grand Rapids area, Meijer remained a humble man. When the Meijer stores offered flu shots, he and Lena dropped into a store and waited in line with the other customers for their inoculations. To these customers he was just Fred, the store's founder but also the man who enjoyed giving them coupons for free ice cream cones at his in-store Purple Cow kiosks.

Andrew Mellon

American banker, industrialist, and government official

Mellon built a financial and industrial empire headquartered in Pittsburgh, Pennsylvania, including Mellon National Bank, Alcoa, and Gulf Oil. He also served as secretary of the Treasury from 1921 to 1932.

Born: March 24, 1855; Pittsburgh, Pennsylvania
Died: August 26, 1937; Southampton, New York
Also known as: Andrew William Mellon
Sources of wealth: Inheritance; banking; investments
Bequeathal of wealth: Children; charity

Early Life

Andrew William Mellon's father, Thomas Mellon, moved to Pittsburgh from rural Pennsylvania as a young man in 1834. A stern Presbyterian, Thomas became a successful attorney, served as a local judge for ten years, and built a thriving business that began in real estate management and expanded into banking and transportation. Bemoaning his inability to find competent and trustworthy business partners, he made his sons—Thomas, James, Andrew, Richard (Dick), and William—his primary partners. This worked especially well in the case of the introverted, taciturn (some would say icy), workaholic Andrew, who eagerly learned about loans, mortgages, foreclosures, and bookkeeping in his early teens while assisting his father. Andrew attended the Western University of Pennsylvania (now the University of Pittsburgh), but he left three months short of graduation.

First Ventures

In 1872, Thomas Mellon provided seventeen-year-old Andrew and his younger brother Dick with $40,000 to develop real estate. Andrew moved quickly and competently, building an office, sheds, and warehouses; shipping coal and lumber for sale; and surveying and laying out building lots. Sensing that Pittsburgh's economic boom would soon collapse, he leased the lumberyard he had developed to a fire-stricken competitor just before the economy fell into recession. Three years later, Andrew was given a one-fifth interest in his father's bank, T. Mellon and Sons, and by age twenty-one he was given power of attorney to run the business on a day-to-day basis. Early in 1882, Thomas Mellon turned the management of T. Mellon and Sons almost completely over to Andrew, and the entire family increasingly deferred to the young man, whose business judgments were almost unfailingly correct.

As he began to manage much of his father's business, Mellon moved to establish enterprises with other partners, initially focusing on banking and finance and then branching out into industrial concerns. In 1881, in partnership with Henry Clay Frick, he gained control of the Pittsburgh National Bank of Commerce. Frick became Mellon's closest friend and Mellon helped manage Frick's growing wealth. In 1883, Mellon acquired the Union Insurance Company, helped found the Braddock Bank, and assisted in establishing the Pittsburgh Plate Glass Company.

In 1886, Mellon acquired the City Deposit Bank and installed his brother James as the bank's president. That same year, Mellon and Frick founded the Fidelity Title and Trust Company, and with the help of James Guffey, Mellon created and oversaw two natural gas companies. In 1887, Mellon's brother Dick became vice president of T. Mellon and Sons and became Mellon's inseparable partner and collaborator. (The Mellon National Bank, run by Andrew and Dick Mellon and Frick, superseded and absorbed most of the previously mentioned financial firms in 1902.)

Mature Wealth

In 1892, at the age of seventy-seven, Thomas Mellon put the remainder of his assets into a trust to be managed by Andrew on behalf of Thomas's surviving sons, with revenues to be disbursed equally among them. Thomas had turned over about $2.5 million in assets (about $130 million in 2010 dollars) to Andrew and estimated that the wealth of his sons was of equal size. From this base, Andrew built one of the largest fortunes in the world over the next few decades, reaching $100 million in 1915 ($2.2 billion in 2010 dollars) and $300 to $400 million at its peak in 1929 ($3.8 to $5 billion in 2010 dollars). Mellon attained this fortune by using his position as a financier to get in on the ground floor of several extremely promising industrial ventures, often based on new technologies; by installing capable managers and partners to oversee these enterprises; and by reinvesting the subsequent profits to turn these businesses into closely held national and global economic powerhouses.

In late 1889, the owners of the fledgling Pittsburgh Reduction Company approached Mellon for a small loan. Mellon was impressed with them and the potential of their revolutionary new process for extracting aluminum from bauxite ore. He offered them a substantial loan, bought shares in the company, became a director a year later, and then urged and financed the company's relocation to a new facility where coal and gas were cheaply available. In 1894, Mellon proposed and financed a new plant at Niagara Falls, where inexpensive hydroelectric power was abundant. Pittsburgh Reduction (later renamed Aluminum Company of America) earned massive profits as it expanded, vertically integrated, and protected its monopoly position.

In 1895, Edward Acheson of the Carborundum Company, who had invented a powerful new abrasive called silicon carbide, approached Mellon when the initial backers of Carborundum Company pulled out. Mellon instantly saw the company's possibilities, and he provided a loan and purchased an ownership stake, but the company continued to lose money because of its chaotic management. Mellon then secured a majority position in the company, placed a protégé in charge, and turned the company into a moneymaker.

Five years later, the Mellons were approached by two engineer-inventors, Howard McClintic and Charles Marshall, seeking to borrow $50,000 for a new venture that would make structural steel for the nascent skyscraper market. After carefully examining their character and market prospects, the Mellons joined the men as partners in what grew to be the largest steel-fabricating business in the world, providing the steel for Grand Central Station and the Panama Canal locks. That same year, Mellon oversaw the merger of thirteen specialty manufacturers into the Crucible Steel Company, and he became an organizing partner in the New York Shipbuilding Company, which built the U.S. Navy's first dreadnought and earned considerable profits, especially during World War I. In 1902, Mellon sold the Union Steel Company (established in 1899) at a great profit to U.S. Steel and used the funds to launch the Standard Steel Car Company, which was managed by three executives whose company had been bought out by U.S. Steel. Standard Steel Car was an instant success.

In 1900, the Mellons' friend James Guffey and his partners uncorked the legendary Spindletop gusher while wildcatting for oil along the Gulf coast of Texas. Guffey had borrowed substantial funds from the Mellons and needed more to develop the oil field, but the Mellons were not initially impressed with the field's profit potential. After a personal plea they reconsidered, putting together a syndicate to finance wells, leases, pipelines, storage tanks, and a refinery. The company initially foundered because of a high sulfur content in the oil and poor management, but Mellon's partners took over the firm's management, unsentimentally squeezing Guffey out, and built it into a profitable multinational firm, Gulf Oil. Another of Mellon's profitable investments was the Koppers Company, which used recently developed German technology to reduce air pollutants by profitably converting coke oven waste gases into a wide range of industrial products, including benzene, toluene, and naphtha. Andrew Mellon's empire now stretched across a wide swath of the U.S. economy.

At an age when most men retire, Mellon stepped into the political arena in 1921, when he reluctantly agreed to serve President Warren G. Harding as the secretary of the Treasury, a position he held until 1932. (Mellon's marriage to Nora McMullen had collapsed, resulting in a nasty divorce trial, and his diary explains that he accepted the Treasury Department position so his nineteen-year-old daughter could enjoy the Washington, D.C., social scene.) Mellon nominally turned all his bank stock over to his brother Dick and resigned from his more than sixty corporate directorships, although considerable evidence confirms that he violated the spirit of conflict-of-interest rules by actively engaging in business affairs while in public office.

The National Gallery of Art

Andrew Mellon became interested in collecting art in the late 1890's while traveling in Europe with his friend, industrialist Henry Clay Frick. Mellon was an exceptionally careful collector, weighing each purchase, negotiating for lower prices with a poker face, and frequently returning works, while working most closely with art dealers Roland Knoedler and Joseph Duveen. During the 1920's, Mellon accelerated his collecting with an eye toward donating his works to the American people. His most spectacular purchases occurred in 1930 and 1931, when he secretly acquired twenty-one paintings from the Hermitage Museum in Leningrad (now St. Petersburg, Russia), when the Soviet Union sold the czars' heirlooms at rock-bottom prices during the Great Depression.

In 1937, the National Gallery of Art was created when Congress accepted Mellon's unexpected gift of his art collection. Funds for the construction of the gallery, which opened on March 17, 1941, were provided by the A. W. Mellon Educational and Charitable Trust. The total market value of these priceless gifts was at least $60 million ($900 million in 2010 dollars). Located on the Mall in Washington, D.C., the National Gallery (Mellon insisted that it not be named for him), was designed by architect John Russell Pope, who later designed the Jefferson Memorial. Reminiscent of the Pantheon in Rome, the original neoclassical building was the world's largest marble structure at the time of its completion.

Mellon handpicked the gallery's trustees, and his hope that his own donation would spur gifts from other collectors was soon validated with major donations from Samuel and Rush Kress, Joseph Widener, Chester Dale, Lessing Rosenwald, and Edgar W. and Bernice Chrysler Garbisch, as well as numerous individual gifts. Among the notable works donated by Mellon are Sandro Botticelli's *Adoration of the Magi*; John Constable's *Salisbury Cathedral from Lower Marsh Close*; Jan van Eyck's *Annunciation*; Francisco de Goya's *Marquesa de Pontejos*; El Greco's *Saint Ildefonso*; six works by Frans Hals; Raphael's *Saint George and the Dragon*, *Alba Madonna*, and *Niccolini-Cowper Madonna*; several Rembrandts, including *A Polish Nobleman*; Gilbert Stuart's *George Washington*; Titian's *Venus with a Mirror*; JanVermeer's *Girl with the Red Hat*; and Paolo Veronese's *The Finding of Moses*.

Mellon became one of the most influential Treasury secretaries and a leading figure in the presidential administrations of Harding, Calvin Coolidge, and Herbert Hoover. He is credited with taking the lead in renegotiating the payment schedule of the onerous Allied debts after World War I; adeptly refinancing a huge portion of the U.S. national debt at lower interest rates, saving taxpayers about $200 million per year; and successfully leading a move to reduce the top marginal income tax rates in order to encourage investment, while expanding the zero tax bracket to include the majority of Americans. Mellon warned that the country would eventually run into another severe industrial downturn, and he urged that "while we are prosperous we should put our house in order to meet subsequent difficulties," a goal he helped attain by paying down the national debt.

Legacy

After the stock market crash of 1929, Hoover moved to calm markets by announcing that Mellon would stay on as the Treasury secretary. Economic historians now blame the descent into the Great Depression primarily on misguided state-level banking regulations, the public's loss of confidence in banks, a rapid decline in the money supply, missteps by the Federal Reserve, and maladapted international monetary arrangements. However, at the time of the crash the public came to increasingly blame Hoover and Mellon for the financial crisis, seeing Mellon as the unsympathetic plutocratic embodiment of a collapsing presidential administration.

In 1931, Andrew and Dick Mellon refused to contribute their bank's funds to an effort to rescue the failing Bank of Pittsburgh because the deal did not give them a controlling majority of the bank's stock. When the Bank of Pittsburgh subsequently collapsed, Mellon's popularity sank irretrievably, and Hoover shunted Mellon to the position of ambassador to Great Britain.

As President Franklin D. Roosevelt came to power, Mellon was identified in the public mind as one of the "malefactors of great wealth" who had wrecked the economy, and despite a grand jury finding of insufficient evidence, Mellon was tried for income tax evasion. The politically motivated trial ended in Mellon's unequivocal exoneration. Despite the political acrimony, Mellon, who was dying of cancer, met with Roosevelt to reach an agreement about the bequest of his magnificent art collection to the nation and the establishment of the National Gallery of Art. This art collection became Mellon's primary legacy, along with the continued success of the companies he founded and a well-endowed philanthropic foundation established in his name by his children, Paul Mellon and Alisa Mellon Bruce.

RICHARD B. MELLON

American banker and investor

Through the Mellon Bank, Richard B. Mellon and his brother Andrew provided financial support and guidance for many major American corporations, including the companies that would later become Alcoa, U.S. Steel, and Gulf Oil. By the twenty-first century, Mellon Bank had become Mellon Financial Corporation, one of the world's largest money management firms.

Born: March 19, 1858; Pittsburgh, Pennsylvania
Died: December 1, 1933; Pittsburgh, Pennsylvania
Also known as: Richard Beatty Mellon
Sources of wealth: Banking; investments
Bequeathal of wealth: Spouse; children; relatives

EARLY LIFE

Richard Beatty Mellon was the fourth of six sons of Judge Thomas Mellon and Sarah Jane Negley Mellon. His early education was by private tutor, and he attended college at Western University, which later became the University of Pittsburgh. In his teens, Mellon partnered with an older brother, Andrew, in some moneymaking ventures, such as a lumber yard. In November, 1897, he married Jennie King, the daughter of Alexander King, a wealthy glass manufacturer. The couple had two children, Richard King and Sarah.

FIRST VENTURES

In 1883, Mellon's sickly brother George needed to move for health reasons, and Mellon was chosen to go with him. The brothers moved to Bismarck, North Dakota, and opened a bank, with Mellon serving as director. The bank was successful during the economic boom and growth of Bismarck. However, subsequent hard times caused the bank's business to decline in 1887, at about the time when George died. Mellon returned to Pittsburgh, the poorest of the five remaining brothers.

T. Mellon and Sons, the bank started by Mellon's father and managed by his brother Andrew, had prospered. Andrew made Mellon a vice president and then a full partner in the bank. The two brothers shared almost every aspect of business until Andrew became the secretary of the Treasury in 1921. The brothers invested in the Pittsburgh Reduction Company, which refined aluminum from its ore and later became Alcoa. The Mellons also provided financing for the Pennsylvania oil ventures of a nephew, William L. Mellon; this business was later sold to the Standard Oil Company. Richard and Andrew similarly invested in an oil venture in Texas which became the Gulf Oil Company. The brothers' successful investments enabled promising companies to receive needed funding, while enabling the Mellons to obtain ownership shares that would pay off profitably when these companies prospered.

MATURE WEALTH

An imposing list of companies was financed and guided by the Mellon brothers. Some of these firms included the Carborundum Company; the McClintic-Marshall Construction Company, a steel fabrication business that eventually became a part of U.S. Steel; the Pittsburgh Coal Company, which later became CONSOL Energy; the Standard Steel Car Company; the Koppers Company, which built coke ovens that recycled the gases emitted during the coke-making process; Westinghouse Electric

Company; and General Motors. Not every decision that the Mellons made was correct. For example, they did not provide financing to Henry Ford's automobile company.

After Andrew became the secretary of the Treasury, Richard directed the bank during its largest period of growth. He also formed Mellbank Corporation, a bank holding company that helped affiliated banks survive the Great Depression. As Mellon grew older, he became increasingly involved in philanthropy. He was a major donor for the Cathedral of Hope, and in 1926 he funded a pension fund for Presbyterian ministers.

Mellon caught pneumonia and died in December, 1933. His wealth at that time was estimated at $200 million, which would be more than $1 billion in 2010 dollars.

Legacy

Through Mellon Bank, Richard B. Mellon and his brother Andrew Mellon provided financial support and guidance for many of the companies that were founded during the Industrial Revolution of the late nineteenth and early twentieth centuries. The companies financed by the Mellons changed the lives of many Americans. Richard and Andrew also founded the Mellon Institute of Industrial Research in order to honor their father. The institute later combined with the Carnegie Institute of Technology to form Carnegie Mellon University.

Aleksandr Danilovich Menshikov

Russian military leader, politician, and aristocrat

Menshikov rose from obscurity to become Czar Peter the Great's closest adviser and companion, and under Peter's successor, Catherine I, Menshikov was the czar in all but name. Although he was awarded land and great wealth for his military service, he made a far greater fortune through his corrupt practices.

Born: November 16, 1673; Moscow, Russian Empire (now in Russia)
Died: November 23, 1729; Berezov, Siberia, Russian Empire (now in Russia)
Sources of wealth: Government; real estate; embezzlement
Bequeathal of wealth: Dissipated; confiscated

Early Life

Aleksandr Danilovich Menshikov (al-ehks-AN-dehr dah-NEE-loh-vihch MEHN-shi-kawf) worked as a stable boy at the imperial estate at Preobrazhenskoe, where his father, an army corporal of Lithuanian origins, was stationed. As a young boy, Menshikov supplemented family income by selling meat pies on the streets in nearby Moscow. He developed street smarts, wit, and an outgoing personality but remained illiterate until well into adulthood. One person whom he impressed was François Lefort, a young Swiss mercenary who served as an officer in both the Dutch and French armies and then sought opportunity as an officer in the Russian army. Alexander became Lefort's personal servant. Lefort was a close friend of Czar Peter the Great. Peter, who was a year and a half older than Menshikov, was impressed by Menshikov and made him his personal servant. When Peter formed his "toy regiment" (later to evolve into the elite Preobrazhensky Regiment), Menshikov was the first to join. Drilling and practicing war games with Peter under the command of European adventurers living in Moscow's foreign quarter, Menshikov became the czar's close friend.

First Ventures

Menshikov fought alongside Peter and shared the czar's tent when the czar used his toy regiment to seize sole power in Russia, driving his stepbrother Ivan and stepsister Natalia from the throne. The two also fought together to defeat Turkish forces at Azov. Menshikov accompanied Peter on a journey to Europe, where the czar sought to learn Western technology and to recruit talented Europeans for careers in Russia. Menshikov and Peter learned shipbuilding in Amsterdam. When the regular Russian army revolted against Peter's Westernization, Menshikov returned to Russia with Peter and played a major role in the mass execution of officers involved in the revolt.

Lefort died in 1699, and Menshikov became Peter's primary adviser. As the lengthy Great Northern War broke out with Sweden (1700-1721), Menshikov proved to be a capable commander in terms of organization and bold initiatives. As a reward, Peter granted him honors, titles, command positions, and land grants. He was made governor of Karelia, Ingria, and Estonia. After Menshikov's victory over the Swedes at Kalisz, Poland, Peter made Menshikov the prince of Izhora and granted him large estates. Soon after that, Menshikov was named the governor general of St. Petersburg, which Peter intended to transform as the new capital of Russia. Menshikov's positions provided him with an incredible range of opportunities. He freely sold government contracts, embezzled money intended to finance military operations, and extorted money from people living in the territories he governed.

Mature Wealth

For his command role in the decisive Battle of Poltava (1709), Menshikov was made a field marshal, adding to his previous titles of prince of the Holy Roman Empire, grand duke, and serene highness. He was also granted lands at Oranienbad, facing the Gulf of Finland, where in 1713 work was begun on a massive and elegant palace designed by renowned architects Gottfried Schädel and Giovanni Fontana, who at the same time were building an even grander palace for Menshikov in St. Petersburg. Such expenditures were a clear indication that something was amiss.

The first major allegations about Menshikov's corruption were made in March, 1711, when he was accused of extortion in Poland. His primary defense was that he took money only from the Poles. Peter, aware of a string of past abuses, lectured Menshikov and warned him to end such transgressions. In a major corruption investigation in 1715, Menshikov was accused of mismanaging more than 100,000 rubles in government funds and property, while at the same time making large and unlawful profits in awarding government contracts. He was sentenced to pay back the expropriated money. Others accused in the corruption trials received far harsher sentences. While making a few token repayments and apologizing for his transgressions, Menshikov eventually ceased repayment.

Although Peter was thoroughly disgusted with his closest friend, the czar took no further reprisals. Relieved, Menshikov continued swindling government funds. In January, 1719, he was convicted of embezzlement and court-martialed. He was sentenced to loss of all his honors and estates. However, in the end Peter lifted the sentence and imposed a heavy fine. In 1724, Menshikov was accused of illegally owning thirty thousand serfs on estates he had acquired near Baturin. These serfs had either fled their obligation for military service or escaped from their masters. Fearful that these accusations would finally result in harsh reprisals from Peter, Menshikov sought protection from Peter's wife, Empress Catherine. The investigation of Menshikov's alleged corruption was nearing a conclusion when on January 28, 1725, Peter died abruptly from pneumonia. This was a fortuitous development for Menshikov, who immediately moved to make Catherine head of Russia and to rule Russia through her. This plan not only would protect his fortune but also would provide him with numerous opportunities to become even wealthier.

Menshikov had much to fear from the traditional Russian aristocracy, jealous and angered by his meteoric rise to power, status, and great wealth. Catherine I was even more removed from traditional Russian society than was Menshikov. She was of peasant Lithuanian stock and was Menshikov's mistress before Peter became infatuated with her in 1703 and made her his mistress. After Peter divorced his wife, Catherine wed Peter in November, 1707. At critical junctures, Catherine intervened to assuage Peter's wrath about Menshikov's machinations.

After Catherine ascended to the throne, Menshikov, as head of the Privy Council, the first senator, and Russia's only grand duke, was czar in all but name. The traditional Russian aristocracy had much to fear from challenging him. Catherine I had little interest in or knowledge of state matters. This ideal situation for Menshikov came to a rapid end when Catherine died of pneumonia twenty-seven months after her accession.

In a panic to preserve his power and wealth, Menshikov rapidly worked to make Peter, the eleven-year-old grandson of Peter the Great, the new czar. To solidify power, Menshikov arranged to have his sixteen-year-old daughter, Maria, betrothed to Peter II; in this way, his blood would merge with that of future Russian czars. At the time of his short illness in July, 1727, the world seemed ideal for Menshikov. Recovering after a few weeks, however, his world had radically changed in a reversal of fortune. The government had run smoothly without his direction, and the old-line nobles were anxious to be rid of Menshikov and to marry one of their own daughters to the boy czar. Peter II knew that Menshikov was responsible for luring his father, Alexei Petrovich, from a secure refuge in Italy to Russia, where, by order of the czar, Alexei was tortured to death while his captors tried to extract a confession about his attempt to seize the throne.

On September 27, 1727, Menshikov was punished for his corruption by being stripped of his offices and honors. He was sent with his family, including his daughter Maria, to exile in an estate in Ukraine. By August, 1728, Menshikov was accused of treasonable contacts with Sweden. All of Menshikov's property and wealth were seized by the state, and the entire Menshikov family was then exiled to Berezov in northern Siberia. Menshikov died in November, 1729, three weeks before the death of his wife and eight weeks before the death of Peter II.

Legacy

Aleksandr Danilovich Menshikov's rise from the lower rungs of Russian society to the pinnacle of power, status, and wealth shows the extent to which Petrine Russia was open to the advancement of talented individuals, resulting in the emergence of a new aristocracy of merit based on service to the czar. Menshikov's career is also an extreme example of corruption and the substitution of self-service for state service. His reversal of fortune, taking him from the highest positions of Russian power and wealth to a spectacular plunge into poverty and banishment, could be the script of a Greek tragedy.

The Menshikov Palace can be viewed as a lasting monument to Menshikov's life and career. His family continued to be of significance in czarist aristocratic circles. For example, his great-grandson, Aleksandr Menshikov (1787-1869), served as admiral of the Russian navy and commander in chief of Russian forces during the first years of the Crimean War.

Menshikov Palace

The three-story Menshikov Palace was the first massive stone structure in St. Petersburg and the most luxurious residence in the rapidly growing new capital of imperial Russia. It far exceeded in size and splendor the palace built by Czar Peter the Great. The palace was built on Vasilyevsky Island for Aleksandr Danilovich Menshikov, the first governor general of St. Petersburg, and it combined elements of Russian and West European architecture. The structure was designed by the renowned architects Giovanni Fontana and Gottfried Schädel and was so elegant that Peter the Great used it for major state receptions.

The palace was famous for its grand oak staircase and theme-designed rooms, including rooms featuring Dutch,Venetian, and Chinese motifs. Menshikov's favorite room was a beautiful walnut study. The palace's roof was constructed of bright red iron plates. The interior featured wood paneling, sculptured molding, and gilded decoration. The palace was decorated with more than 140 major artworks by Dutch, Flemish, Italian, and French painters, as well as elegant furniture and ornate silver plate. Reputedly, it was also full of fine art that Menshikov looted from Polish castles during the Great Northern War. Menshikov's private church, with its own bell tower, was located behind the palace, as were houses for his gardeners and a farm intended to produce fresh food for the palace. Clearly, the palace flaunted Menshikov's status and wealth, but it also set an early standard of grandeur and elegance for both public and private buildings in Russia's new capital.

Menshikov Palace was confiscated by Czar Peter II in 1727. It was used as a military school from 1732 to 1918. In 1967, it became part of the Hermitage Museum complex, and its exhibits about eighteenth century Russian culture are open to the public.

Charles E. Merrill

American investment banker

Merrill obtained his vast fortune by reorganizing the business practices of his brokerage firm in order to tap into the wealth of the American middle class.

Born: October 19, 1885; Green Cove Springs, Florida
Died: October 6, 1956; Southampton, New York
Also known as: Charles Edward Merrill
Sources of wealth: Financial services; sale of products
Bequeathal of wealth: Charity; educational institution; medical institution

Early Life

Charles Edward Merrill was born on October 19, 1885, to Dr. Charles Merrill, a physician and drugstore owner, and Octavia Wilson Merrill. From 1901 to 1903, he attended a college preparatory school in Deland, Florida, and in 1903 he transferred to the Worcester Academy in Massachusetts. The following year Merrill enrolled in Amherst College in Massachusetts. In 1906, he quit school and returned briefly to West Palm Beach, Florida, where he worked for a local newspaper. Later that year, Merrill enrolled in the University of Michigan Law School. In 1907, he quit school again and moved to Mississippi, where he played minor league baseball for one season.

First Ventures

In 1907, Merrill relocated to New York City, where he was hired as an office boy at the Patchogue Plymouth Textile Mill. He quickly rose through the ranks, initially being promoted to credit manager and then to the position of assistant to the president. In 1909, George H. Burr & Company hired him to develop and manage its bond sales department. In 1913, he accepted a sales manager position at Eastman, Dillon and Company, an investment bank.

In 1914, Merrill established his own investment banking firm. Shortly thereafter, he brokered a partnership with Edmund Lynch, naming their new firm Merrill Lynch and Company. Together they gained a positive reputation for underwriting chain stores, including J. C. Penney, McCrory Stores, and S. S. Kresge Co. In 1926, Merrill found financial success when he not only underwrote Safeway, Inc., but also became the grocery company's largest shareholder. In 1928, he advised his clients to sell their stockholdings because he believed that the stock market was overpriced. His advice proved remarkably prescient when the stock market subsequently crashed in October, 1929. Merrill temporarily retired from Wall Street in 1930 and sold approximately $5 million of his firm's holdings to E. A. Pierce and Company.

Mature Wealth

In 1940, Merrill returned to the financial world. That year, he merged his company with E. A. Pierce and Company. In 1941, he facilitated another merger that created Merrill, Lynch, Pierce, Fenner and Beane, which at the time was the largest brokerage house in the world. As the firm's senior partner, Merrill instituted new policies and procedures aimed at attracting middle-class investors and making the company's business practices more transparent. He provided his sales team with training that emphasized low-pressure sales, conservative investment advice, and education for clients on the principles of investing. He offered his clients stock information and charged them reduced commission rates on small stock transactions. Merrill also began to recruit better-educated employees, whom he then trained in accounting and commercial banking.

Thinking beyond his own clientele, Merrill launched a national advertising campaign that not only encouraged middle-class Americans to invest but also explained the general principles of investment. In 1954, the New York Stock Exchange unveiled a monthly investment plan program aimed at assisting the small investor. Within a year of the program's inception, Merrill's firm held more than half of the nation's monthly investment plan accounts. At the time of Merrill's death in 1956, his company had more than 300,000 customers and employed more than forty-six hundred people.

Legacy

Charles E. Merrill's innovative business practices changed the financial landscape of America. His business methods enabled middle-class American to have the opportunity to invest in the stock market. By providing honest and transparent services to his clients, Merrill established loyal and long-term customer relationships and amassed a personal fortune. Most important, his personal success on Wall Street led to dramatic changes in the operations of the investment services industry.

André Michelin

French tire magnate and tourism promoter

In amassing his wealth, Michelin made a significant contribution to the acceptance of the automobile as a reliable and utilitarian means of travel. He also promoted tourism and created one of the world's most famous advertising and cultural icons—the Michelin tire man.

Born: January 16, 1853; Paris, France
Died: April 4, 1931; Paris, France
Also known as: André Jules Michelin
Sources of wealth: Manufacturing; sale of products; tourism
Bequeathal of wealth: Spouse; children

Early Life

André Jules Michelin (an-DRAY jewl meesh-LEHN) was born in Paris on January 16, 1853. He was the son of Adèle Barbier and Jules Michelin, an artist. Adèle was the daughter of Aristide Barbier, who with his cousin Édouard Daubrée had established a successful factory producing various kinds of machinery and a wide variety of rubber items. Michelin's younger brother, Édouard Étienne Michelin, was born on June 23, 1859. In 1877, Michelin graduated from the École Centrale Paris with a degree in engineering. He then enrolled in the Paris School of Art to study architecture, and his brother Édouard studied art there.

First Ventures

After working for five years in the cartography department of the Ministry of the Interior, Michelin opened a metal framework factory in Paris. By 1886, the company founded by his grandfather Aristide Barbier was in serious financial trouble and about to fail. Michelin was asked to go to Clermont-Ferrand and take over the company. After considerable deliberation, he agreed to do so. However, Michelin kept his framework business in Paris and soon found that he often needed to return to Paris to attend to his business there. Consequently, he and the rest of the family convinced his brother Édouard to join him in the effort to save the family business. Édouard agreed to abandon his art career and go to Clermont-Ferrand.

In 1889, both of the Michelin brothers went to Clermont-Ferrand, where they rebuilt the family's rubber products firm. A bicyclist who had a flat tire arrived at their shop and asked them to fix it; the Dunlop pneumatic tire was glued to the bicycle's rim. The brothers managed to fix the tire but spent some three hours detaching, repairing, and regluing it. Based on this experience, the brothers realized there was a need for a pneumatic tire that could be repaired or changed more quickly and easily. They began experimenting and in 1891 introduced a pneumatic tire for bicycles that could be repaired in approximately fifteen minutes.

On August 14, 1891, the Michelin brothers sponsored Charles Terront, a renowned racer, in the Paris-Brest-Paris bicycle race, equipping his bicycle with their pneumatic tires. The race turned out to be a true proving ground for their tires. One of the tires was punctured during the competition, but Terront repaired it and still won the race. The Michelins had such confidence in their tires that they were announcing the victory before Terront had actually crossed the finish line. After additional work, Édouard developed a tire that could be changed in about two minutes. In 1892, André set up another race, this time over a course littered with nails to demonstrate the ease of fixing the Michelin tire. The promotional campaign resulted in the sale of almost ten thousand sets of tires to bicyclists.

MATURE WEALTH

Their success with the pneumatic bicycle tire inspired the brothers to develop pneumatic tires for carriages. By this time, André was in Paris devoting himself to advertising and promoting the company's products, while Édouard stayed in Clermont-Ferrand and directed the research and development of the tires. In 1893, André presented his case for pneumatic tires to the Paris Society of Civil Engineers. Most of his listeners were skeptical, but André insisted that the tires could handle nails, glass, and other road hazards and if punctured were quickly repairable. Although there were very few automobiles in France at the time, the Michelins began developing a pneumatic tire for these vehicles. By 1895, the company had produced a pneumatic automobile tire. André advertised the tire by entering three cars with Michelin tires in a 750-mile race. The Michelin brothers drove one of the cars, an Éclair, which finished ninth.

The Michelins were not the only ones producing pneumatic tires in France. In view of this increasing competition, André saw the need to draw the public's attention to the company's tires. In 1894 at the Lyon Fair, Édouard, looking at a stack of tires, had remarked that it almost looked like a person. André took this idea and envisioned what was to become the Michelin Man. In 1898, he hired the French artist Marius Roussillon to draw a man made of tires. André had already described the Michelin tires as gobbling up obstacles, so a poster was created depicting a man made of tires raising a champagne glass filled with nails and glass. The poster's caption was the Latin phrase *Nunc est bibendum* (time for a drink). André's promotional tactic was extraordinarily successful. The tire man, referred to as Bibendum, became a folk hero throughout Europe and eventually throughout the world. In addition to the posters, at the 1898 Paris Bicycle Show there was a large cardboard Bibendum figure, behind which André had stationed a comedian, so visitors to the show were able to talk to Bibendum.

André also realized the need to promote increased use of the automobile for tourism. Greater use of cars meant more tire sales; therefore, in 1900, he began publishing the free *Michelin Guide* to aid tourists traveling in automobiles by providing useful information about restaurants, hotels, service stations, and mechanics. The restaurant feature of the guides was extremely popular, and in 1920, André began having anonymous inspectors make repeated visits to restaurants before includ-

The Michelin Guides

The first *Michelin Guide* was published in August, 1900. André Michelin was in charge of his company's advertising department and responsible for promoting the firm's pneumatic tires. He created the guide as a means of encouraging the use of the automobile for tourism.

The early guides were blue. Michelin's first guide contained maps, as well as information about hotels, restaurants, service stations, tires, their repair, and where to find mechanics. The first guide was approximately four hundred pages long, and thirty-five thousand copies were printed and made available free of charge. The famous pictographs giving pertinent information about hotels and restaurants were already a feature of the guide. By 1904, Michelin was publishing his first guide for tourists traveling outside France, the *Michelin Belgium Guide*. In 1908, Michelin added another service for travelers as the company opened a bureau of itineraries in its Paris office, where, in addition to the guide, a tourist traveling by automobile could obtain a free travel itinerary. In 1910, the company began publishing road maps. However, during World War I (1914-1918) no guides were published.

In 1920, the guide's color was changed from blue to red, a list of Parisian hotels was added, and the guides were no longer free. It is believed that Michelin began charging for the guide after he found a stack of his guides being used to support a workbench at a tire merchant's store. Michelin published an additional guide that year, the *Illustrated Michelin Guide to the Battlefields, 1914-1918*, with photographs of the areas damaged in World War I. In 1926, Michelin introduced the use of one star to indicate a good restaurant; three years later, a satisfaction questionnaire was included in the guide; and in 1931, Michelin initiated a three-star system for rating restaurants in the French provinces. After Michelin's death in 1931, the company continued to add features to the guide and eventually published other guides. In 1933, Paris restaurants were also evaluated by the three-star system.

During World War II, no guides were published; however, the Michelin guide played an important role in the liberation of France. In 1939, the Michelin company reprinted its annual guide in Washington, D.C., and these guides were distributed to military officers and marked "For official use only." These guides later helped military personnel identify towns and other geographical features when the Allied armed forces invaded France. After the liberation of Paris, Michelin supplied the Allies with more than two million maps of northern and eastern France, Belgium, and Germany in order to facilitate the Allied invasion. By the spring of 1945, Michelin was once again publishing the guide.

The Michelin guides contributed significantly to increased automobile tourism and consequently to increasing the market for tires, as André Michelin had intended. The guides were also the beginning of a profitable and significant supplemental business venture for the Michelin company. In the twenty-first century, the Michelin Group published the *Red Guide* for hotels and restaurants, the *Green Guide* for tourist attractions, *Bib Gourmand*, *Bib Hôtel*, and road maps. It also maintained viaMichelin.com, a Web site that assisted tourists with their travel plans.

ing them in the guide. André soon found additional ways to increase the visibility of the Michelin name and to encourage automobile travel. In 1908, he began funding a program to erect road signs. Michelin's enameled signs gave automobile travelers pertinent information, and all carried the Michelin name. He continued to improve the signs. In 1918, he erected the first *borne d´angle* signs; grouped together on one pole, these signs provided all the information the traveler needed. With his brother Édouard, André continued to head the Michelin company until his death on April 4, 1931.

Legacy

André Michelin was a creative and astute entrepreneur, who through his innovative advertising techniques contributed to the success of one of the major tire manufacturing companies in the world. Michelin was devoted to making the family business succeed and to selling tires. His marketing techniques made significant contributions to the development of France's tourist industry. His original *Michelin Guide* provided a new concept of traveling. People were encouraged to explore France in their automobiles with guidebook in hand. As Michelin used his wealth to expand the family business, he significantly enriched the daily life of French people, using his products to promote the French countryside, cuisine, culture, and history.

Midas

Phrygian king

Midas's legendary golden touch served to explain why the Pactolus River bore gold and came to be a moralistic example of how greed can ruin a person's life.

Born: 738 B.C.E.; Anatolia (now in Turkey)
Died: 696 /695 B.C.E.; Anatolia
Also known as: Mita of Mushki
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Unknown

Early Life

The Midas (MI-duhs) of mythology seems to be based on a real person, King Mita of Mushki, a kingdom located in Anatolia. Midas was believed to be either the son or the adopted son of the goddess Cybele; his father was named Gordias. The names Gordias and Midas alternated in the family. Nothing is known of the early life of either the historical or the mythological figure.

First Ventures

Midas appears to have been the founder of a dynasty in what is now central Turkey, known in antiquity as Phrygia. Assyrian records describe him as an upstart. The historian Herodotus mentions a grandson of Midas who was active in the Phrygian region around 600 B.C.E. and was known for his garden of roses. Midas was the first non-Greek ruler to make gifts to the sanctuary of Apollo at Delphi. Herodotus records that Midas gave the sanctuary his royal throne, which was an object well worth seeing.

Mature Wealth

The historical King Mita seems to have acquired a great deal of wealth through his conquests, as evidenced by the size and grandeur of his tomb. In the mid-1950's, a tomb near the ancient city of Gordion was excavated and is now thought to be the burial place of the historical Mita. The tomb is the earliest known intact wooden structure in the world. The body in the tomb is that of a man approximately sixty years of age, and the tomb dates from about 700 B.C.E. The rich contents of the tomb—although there is nothing made of gold—accord well with stories about the wealth of Midas's dynasty, and Assyrian records mention a "King Mita" living in that area at that time. The site of the tomb was staged as a funeral banquet, most likely re-creating the banquet that Mita's followers celebrated at the time of his death. More than 150 drinking cups of various sizes were arranged around a banquet table, the largest set of Iron Age drinking vessels ever found.

The mythological Midas was granted his golden touch by the god Dionysus. Dionysus wanted to show his appreciation to Midas for taking care of the old satyr Silenus, a companion of Dionysus, so Dionysus granted Midas one wish. Midas wished that everything he touched would turn to gold, and his wish was granted.

However, the gift of the golden touch proved disastrous when Midas's food turned to gold as soon as he laid hands on it. A much later version of the myth adds the detail that Midas's daughter became a golden statue when he touched her. Midas came to despise his golden touch.

In despair, he asked Dionysus to remove what he now saw as a curse. The god told him to bathe in the Pactolus River. The sands of the river took on the golden touch as it washed out of Midas.

After he lost the golden touch, Midas became a worshipper of the woodland deity Pan. When Pan challenged Apollo to a musical contest, all the judges except Midas awarded the prize to Apollo. For this insult to Apollo, Midas was given the ears of an ass. He kept his ears hidden under a turban, but his barber knew the secret. The barber finally could contain himself no longer and whispered the secret among some reeds, which revealed it every time the wind blew.

Legacy

The legacies of the mythological King Midas are the myths that surround his name. The legend of the king's golden touch is clearly an etiological myth, explaining the great wealth of Midas and his dynasty. Today, the primary association most people make with the name of King Midas is the moral of the cautionary tale of his "golden touch": that overvaluing material wealth can deplete life of what makes it truly worth living.

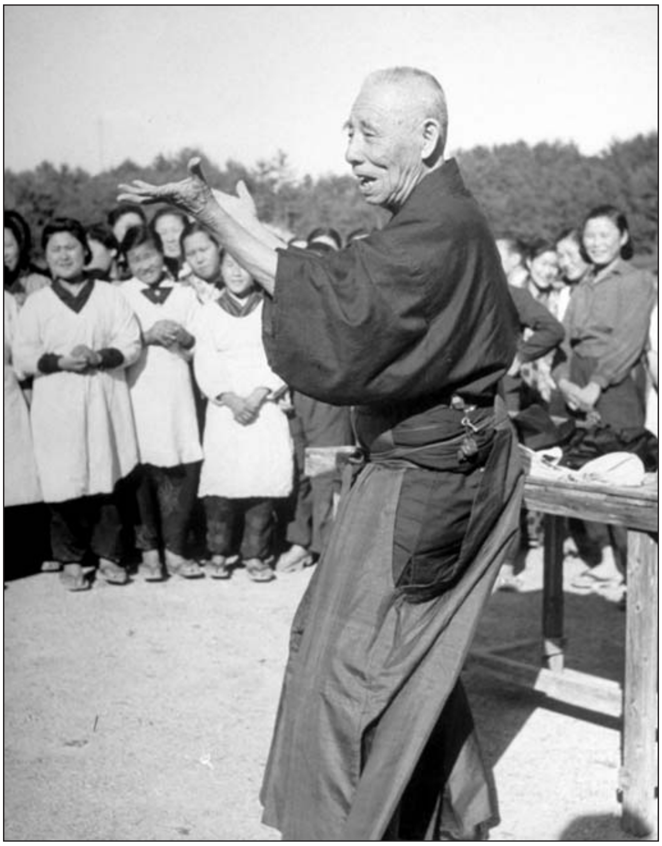
KOKICHI MIKIMOTO
Japanese inventor and jeweler

Mikimoto worked with infinite patience to develop a perfectly round cultured pearl in order to appeal to persons with a high degree of aesthetic sensitivity and appreciation of beauty.

Born: January, 1858; Toba, Shima Province (now Mie Prefecture), Japan
Died: September 21, 1954; Near Nagoya, Aichi Prefecture, Japan
Also known as: Mikimoto Kokichi; The Pearl King
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Unknown

EARLY LIFE
Kokichi Mikimoto (koh-kee-chee mee-kee-moh-toh) was born in January, 1858, in Toba City in the Shima Province (now the Mie Prefecture), Japan. The eldest son of a noodle shop owner, he dropped out of school at age thirteen and sold vegetables to help support the family. He became fascinated with pearls when he watched pearl divers at work. He married Uma, a devoted supporter of all of his ventures, even when the outlook was bleak; she died at age thirty-two.



Kokichi Mikimoto entertains workers at his factory in 1946. (Hulton Archive/Getty Images)

FIRST VENTURES
In 1888, at the age of thirty, Mikimoto used a loan to start a pearl farm on Ago Bay. Two years later, he met a marine biologist and professor at Tokyo University, Kakichi Mitsukiri, who introduced the idea of experimenting with artificially culturing Akoya oysters. At first, there was little sign of development, and, to make things worse, a dreaded "red tide" plankton epidemic struck, destroying almost all of his harvest. Although this disaster drove him close to bankruptcy, Mikimoto was doggedly determined to continue, and in July, 1893, his efforts were rewarded when he found a semispherical pearl. He had received patents for producing hemispherical pearls (mabe pearls) and for introducing the irritant into mantle tissue of the oyster, so he applied now for a patent for a technique to make round pearls.

MATURE WEALTH
In 1899, Mikimoto opened his first store on the Ginza in Tokyo, offering natural seed pearls and half-round pearls. His big break came in 1905, when he finally produced a perfectly round pearl. He never passed up an opportunity to enter exhibitions in order to give his pearls visibility. In 1913, Mikimoto began selling his pearls internationally when he opened stores in London. At the 1926 Philadelphia World Exposition, he displayed a pearl-covered replica of the Liberty Bell.

By 1935, there were 350 pearl farms in Japan, producing ten million cultured pearls annually, glutting the market and resulting in plunging prices. Mikimoto countered by seeking more European and American markets. To boost his reputation, he publicly burned tons of inferior pearls to emphasize that he sold only top-quality pearls and to let people know that economic declines would not deter his company from selling only the best merchandise. After World War II, shops opened in Paris, New York, Chicago, Boston, Los Angeles, San Francisco, Shanghai, and Bombay, making the Mikimoto cultured pearl among the first to gain an international reputation.

Around 1946, Mikimoto posted the largest income in Japan, having gained a profit of some 3 million yen ($200,000 in 1940's dollars); much of this revenue came from selling pearls to Americans who were stationed in Japan after World War II. He went on to become the third-wealthiest person in Japan. Shortly before his death, the Japanese government awarded him the Order of Merit (First Class), and he was posthumously granted the Grand Cordon of the Order of the Sacred Treasure.

Legacy

If one word could describe Kokichi Mikimoto's reputation and lasting legacy, it would be quality. Only about 5 percent of the pearls produced by the Mikimoto company measure up to the firm's standards. At times during Mikimoto's years of research to find a way to produce a perfectly round pearl, there were allegations that his pearls were not real but were imitations. French courts finally ruled that Mikimoto pearls, produced by scientifically stimulating oysters, were in no way imitations. His Mikimoto Pearl Island, with its forty-one thousand acres of oyster beds, became an internationally known and tangible reminder of the source of the vast numbers of pearls that grace the apparel of women or provide decoration on objects all over the world, all because the Pearl King refused to give up on his goal to promote the appreciation of beauty with only top-quality products.

Michael Milken

American bond trader and financier

Milken made a fortune promoting and selling junk bonds and pioneered the packaging of these bonds. Imprisoned for securities violations, Milken came to represent both the financial innovations and the greed of the 1980's.

Born: July 4, 1946; Encino, California
Also known as: Michael Robert Milken
Sources of wealth: Financial services; investments
Bequeathal of wealth: Charity

Early Life

Michael Robert Milken was born on July 4, 1946, in Encino, a Los Angeles suburb. He was enthusiastic and hardworking, and his mother pushed him to succeed. His father worked for an accounting firm, and at age ten, Milken watched his father prepare income tax returns. During tax season, he checked his father's math; later, he helped prepare tax forms.

Milken attended the University of California at Berkeley, majoring in business administration after transferring from the mathematics department. He graduated summa cum laude. He then married his high school sweetheart and pursued a master's degree in business administration at Wharton, the business school of the University of Pennsylvania. Milken chose Wharton because it let students substitute business experience for class work and offered him a $1,000 fellowship.

While Milkin was at Wharton, the investment banking firm of Drexel Harriman Ripley hired him to make its "back office" (or non-income-generating operations) more efficient. His efforts saved Drexel $500,000 annually. He was rewarded with a full-time job as a bond researcher in Drexel's Wall Street office when he graduated from Wharton in 1970. Because his wife was pursuing a degree at the University of Pennsylvania, Milken stayed in Philadelphia and commuted to New York. His preferred mode of transportation was the bus. Although the bus was much slower than the train, Milken could read company reports undisturbed by other Wall Street professionals during his commute. Soon he was named head of bond research at Drexel.

First Ventures

Milken first became interested in bonds while at Berkeley after reading W. Braddock Hickman's *Corporate*

Bond Quality and Investor Experience (1958), a study of bond yields from 1900 to 1943. The book influenced his work at Drexel. A bond is essentially an IOU (or an acknowledgment of debt) from a firm or a government that is sold to raise money for these entities. Bond-rating agencies, such as Moody's Investors Service and Standard & Poor's, give each bond a letter grade indicating its quality. The highest grades are generally given to governments and the major corporations that are flush with cash; lower grades mean that borrowers must pay higher rates to repay their debt obligations. Making things more difficult, in the 1970's there was no exchange market for low-grade or junk bonds and no published record of the bid and ask prices for these bonds. This made it hard to know the price for which these bonds should sell.

Milken's big opportunity came when Drexel gave him $2 million and the authority to trade bonds on the company's behalf. Milken would keep 35 percent of any profits from his department, which he would divide among his staff. In 1973, the other employees at Drexel broke even; Milken doubled the money the firm gave him and was responsible for Drexel's $2 million in reported profits.

In 1977, when his father was diagnosed with cancer, Milken requested a move to California in order to be near him, arguing he could do his job from there since most of his day was spent on the telephone. Drexel let him move his department to Beverly Hills. Milken would arrive at the office at three o'clock in the morning to prepare for the nine o'clock opening of the New York bond market and would stay at work until eight o'clock or later in the evening.

Beginning in 1977, several small and medium-sized firms approached Milken because they could not get an investment-grade rating, and without such a rating they could not sell their bonds and obtain the necessary capital to expand. Milken sold their bonds, claiming that high-yield bonds were less risky than credit raters believed. These sales of so-called junk bonds helped new ventures, like MCI and Turner Broadcasting, get started. Milken earned huge fees for each deal. Becoming even more aggressive, Milken argued that junk bonds were

The Milken Family Foundation

The Milken Family Foundation was established in 1982 by Michael Milken and his brother Lowell. It is a nonprofit organization based in Santa Monica, California. The mission of the foundation is to assist people so they are able to help themselves and lead productive lives. The foundation advances its mission mainly through projects in two areas, education and medicine. Its education work seeks to develop and reward outstanding educators and to stimulate creativity and productivity among young people. Its medical work supports basic and applied medical research and programs that promote basic health.

To further these objectives, the foundation funds a number of initiatives. The National Educator Award gives $25,000 to elementary and secondary schoolteachers who further excellence in education. Mike's Math Club uses cartoon characters like Detective Duck, Decimal Dalmation, and Professor Panda to show that math can be both useful and fun. The Milken Scholars Program provides financial assistance for undergraduate education to young men and women based on their academic performance, community service, and demonstrated ability to triumph over obstacles. The Teacher Advancement Program seeks to attract, develop, and reward high-quality teachers for U.S. schools.

The foundation also sponsors the Milken Institute, a nonprofit economic think tank chaired by Milken himself. Institute scholars publish papers on global and regional economics, human capital, and capital markets. The institute favors the "democratization of capital" and market-based solutions to the world's economic and social problems. For example, it has called for loan pools (similar to the junk bond pools that Milken developed) to buy loans made to minority businesses. Greater marketability of these loans would increase lending to these businesses, thereby expanding the ownership of capital. Each year, the institute sponsors a global conference in Los Angeles that attracts more than three thousand academics and decision makers from around the world.

relatively safe as part of a diverse portfolio, and that a portfolio of high-yield bonds outperformed blue-chip bonds by 4-5 percent a year, even allowing for defaults. Junk bonds would thus earn investors a greater return without greater risk.

Milken then began creating and selling packages of high-yield bonds. Pension funds and life insurance companies bought large quantities of these bonds, attracted by the high yields. So did banks after deregulation in the early 1980's allowed them to own more low-rated bonds.

Drexel sold $125 worth of new junk bonds in 1977, acquiring 25 percent of the market; the following year, Drexel old $440 million worth, $300 million more than its nearest competitor. By 1983, the firm's sales reached $4.9 billion, or 70 percent of the entire market.

In the 1970's, Milken also made a great deal of money for himself by personally investing in junk bonds. He bought Penn Central Railroad bonds for pennies on the dollar when it appeared the rail line would go bankrupt. When the company turned around, he redeemed the bonds for much more money than he paid for them.

Mature Wealth

In 1982 and 1983, Drexel decided to expand its junk bond business into mergers and acquisitions, thereby financing leveraged buyouts (LBOs) and hostile takeovers. Milken's view on this policy change is unclear. Some people claim he opposed it because he knew Wall Street would frown on corporate raiding. On the other hand, Milken was making more than $100 million per year and would do considerably better if Drexel's bond business expanded. In an LBO, a firm borrows money by issuing bonds and uses the proceeds to buy the stock of its target company. In a hostile takeover, investors issue bonds and buy enough stock in one company to become a nuisance to management, thus requiring that these investors be bought out at a premium. In both cases, the most difficult part of these transactions is selling the bonds.

Milken sold the junk bonds that sparked many takeovers during the 1980's. He financed T. Boone Pickens's attempt to take over Gulf Oil, Saul Steinberg's bid to buy the Walt Disney Company, Carl Icahn's takeover of Trans World Airlines (TWA), and Ronald Perelman's takeover of Revlon. Since Milken was the major junk bond dealer, he dominated the market, which gave him the power to fix prices. He also knew which companies would soon become targets of corporate raiders and see their stock prices soar, which led to charges of insider trading.

Milken had been under scrutiny from the Securities and Exchange Commission (SEC) since the late 1970's because of unethical and illegal behavior in his bond department at Drexel. Author James Stewart claims that Milken often received higher markups on bond sales than what was permitted at the time. In July, 1985, Drexel's main merger and acquisitions person was arrested for insider trading. Then in May, 1986, Dennis Levine, part of Milken's team, was arrested for insider trading. Levine told the SEC that he could deliver bigger players—

Milken and Ivan Boesky—who were engaged in insider trading regarding mergers and acquisitions. Boesky pleaded guilty to a single felony, was fined $100 million, and promised to testify against Milken. Finally, in November, 1988, two traders agreed to testify against Milken in exchange for immunity from prosecution.

The government prosecutor, U.S. Attorney Rudy Giuliani (soon to be mayor of New York), demanded that Drexel withhold Milken's 1988 compensation and pay a $750 million fine. Milken sought to keep Drexel from settling, but Giuliani threatened to indict Drexel under the Racketeer Influenced and Corrupt Organizations (RICO) Act. This statute would have allowed the government to freeze Drexel's assets and likely would have forced the firm into bankruptcy. On December 21, Drexel's board of directors voted to plead guilty and pay a $650 million fine. However, this created financial problems for Drexel, leading to its bankruptcy in February, 1990.

Once Giuliani settled with Drexel, he went after Milken, wanting him to plead guilty to two counts and pay a $250 million fine. On March 29, 1989, ninety-eight indictments were brought against Milken and his brother Lowell, including fifty-four charges for mail fraud, thirty-three counts for securities fraud, and additional allegations of filing false income tax returns, committing RICO crimes, and assisting in the preparation of a false tax return.

Although Milken was inclined to fight the indictment, two factors led him to agree to a plea bargain: First, the Federal Bureau of Investigation (FBI) interviewed his grandfather, who was badly shaken by the experience. Second, although his brother urged him to fight the government, Milken decided to plea bargain to save his brother.

On November 21, 1990, Milken was sentenced to ten years in prison and eighteen hundred hours of community service and was fined $600 million. Sentencing guidelines for his crime were three to four years in prison. Later, he agreed to pay $500 million to settle civil lawsuits, including one by the Federal Deposit Insurance Corporation (FDIC), which held him responsible for its having to bail out banks that bought failed junk bonds.

In March, 1991, Milken entered the Pleasanton, California, minimum security prison, where he worked mopping floors and tutoring other inmates seeking a high school equivalency diploma. Because he was a model prisoner, his jail time was reduced to two years. He was released from prison in September, 1992, after serving just eighteen months when he was diagnosed with prostate cancer.

Legacy

Milken remains one of the most controversial figures in American financial history. His defenders regard him as a financial genius for revolutionizing the use of junk bonds and believe he was made a scapegoat to further Giuliani's political career. Critics see in Milken everything that is wrong with Wall Street, charging that he is someone who used his financial knowledge and power to enrich himself and his associates, while ignoring the negative consequences of defrauded customers and firms destroyed by corporate raiders. Whatever one thinks, Milken will be forever associated with the go-go 1980's, when he made junk bonds popular and promoted them as a means of corporate raiding.

Mitsui Takahira

Japanese merchant and banker

Mitsui Takahira supported his father in building what became the wealthiest merchant and banking enterprise of feudal Japan. After his father's death, he diligently expanded the company and prudently organized it as an extended family venture, giving it a sound organizational structure that ensured its survival as a family business until 1945.

Born: 1653; Matsusaka, Ise Province (now in Mie Prefecture), Japan
Died: November 27, 1737; Kyōto, Japan
Also known as: Takahira Mitsui, Choshiro Echigoya
Sources of wealth: Inheritance; trade; banking
Bequeathal of wealth: Children; relatives

Early Life

Mitsui Takahira (miht-soo-ih tah-kah-hih-rah) was born in 1653 in the bustling port city of Matsusaka (also spelled Matsuzaka) in Japan. His father, Mitsui Takatoshi, and his mother, Jusan, ran a sake brewery and a moneylending venture. The Mitsui family were descendants of samurai, but Takahira's grandfather, Mitsui Sokubei, had become a merchant. From feudal times until 1868, the Mitsui family was publicly known as Echigoya, named for their original hometown. Thus, Mitsui Takahira, the oldest boy of eleven sons and five daughters, was first known as Choshiro Echigoya before he was given the adult name of Takahira, privately using the surname Mitsui.

At seven, the boy was enrolled in a *terakoya*, or private school, to learn arithmetic, reading, writing, morals, and manners for seven years. His father strictly evaluated the talents of his sons for business, accepting only six out of eleven for such a career. Takahira passed his father's evaluation. At age fourteen, in 1667, he was sent as an apprentice to the drapery store of his uncle Mitsui Toshigutsu in Edo (now Tokyo).

First Ventures

Takahira successfully learned the family business, which was based on buying valuable cloth, such as Nishijin brocade, in Kyōto for resale in the new capital of Edo. When Mitsui Toshigutsu died in 1673, Takahira's father moved to Kyōto with his six sons deemed fit for the family business and launched his own enterprise. To get a foothold in the competitive Edo market, Takahira advised his father to rent a house there and turn it into a shop later, and the plan succeeded. At twenty, Takahira became manager of his father's store in Kyōto. He was the buyer of Nishijin brocade and other silk fabrics that were sold in his father's new store in Edo that opened in 1673.

Takahira and his father developed the business strategy to buy cloth fabric in Kyōto whenever the prices were the lowest, regardless of how much fabric they maintained in their store. In Edo, they revolutionized the business by selling cloth for cash only, but in any size a customer wanted, rather than the standard full-size order. Father and oldest son worked together so well that Takahira acquired the honorific nickname of Hachiroemon, or helper of his father Takatoshi Hachirobei. Much later, this name became the official title of the head of the Mitsui family business.

Mature Wealth

In May, 1683, Takahira's father opened a full bank in Edo, called Mitsui Ryogayedana or Mitsui exchange house, and moved the drapery store to a better location next to the new bank. Soon, Mitsui bank branches opened in Kyōto, where Takahira worked, and Ōsaka. For political protection, in 1687, the Mitsuis earned an appointment as the shogun's supplier for cloth, which was prestigious but not necessarily lucrative as the shogun, Tokugawa Tsunayoshi, could be an irregular payer. Takahira was entrusted with managing this business relationship. He worked so well that in 1688, the Mitsui family became the purveyors of apparel, ornaments, and personal accessories to Tokugawa Tsunayoshi.

In 1691, Takahira and his brother managing the Edo bank were among the twelve fiscal agents, or *goyo shonin*, whom the shogun entrusted with handling his revenue flow. Takahira and his brother, like the other agents, accepted the taxes paid for the shogun in gold and silver in Ōsaka, and later paid the shogun this amount in cash in Edo. Rather than physically transferring the gold and silver along the three-hundred-mile-long bandit-infested Tokaido highway linking Edo with Kyōto through Ōsaka, the fiscal agents lent the tax money to merchants in Ōsaka. With this cash advance, the merchants bought wares in Ōsaka. When the merchants sold their goods in Edo, they paid back the fiscal agents there in cash, so the agents had gold and silver to deliver to the shogun. Takahira and his brother had to select trustworthy merchants to whom they would lend the tax money, and the brothers earned interest on these loans, which could be substantial. The shogun expected the cash payment in Edo within 60 days after tax collection in Ōsaka, later expanding the deadline to 150 days. This gave the bankers some time to make loans at interest on the money collected.

In becoming a fiscal agent of the shogun, Takahira reached the highest social position available to a merchant. He attended the shogun's family New Year's Day reception. With his brother from Edo, and later adding a brother from the Ōsaka bank branch, Takahira formed an association that became the Mitsui-gumi, or Mitsui union.

When his father died in 1694, Takahira became head of the Mitsui family at age forty-one. The cash part of his inheritance alone was 81,000 ryo gold coins. With one ryo containing about one-half of an ounce of gold, the almost forty-three thousand ounces would have been worth about $43 million in 2010 dollars. The purchasing power in Takahira's time was considerably larger than this conversion indicates.

Takahira fully agreed with his father's unusual decision to bequeath this impressive fortune not to his eldest son alone but to include next to Takahira, as head of the senior house, the families of the five other sons engaged in business and three associate families. Thus, Takahira headed a confederated family empire of nine "houses," as the families making up the Mitsui union were called. This enabled the Mitsui family to pool their resources and keep their fortune intact. In 1708, Mitsui Takahira also established trading relationships with the Dutch merchants at Nagasaki. These merchants' capital reserves saved Takahira in 1709, when the shogun suddenly demanded the immediate payment of all outstanding taxes collected in Ōsaka. Unlike others, Takahira could pay the shogun and avoided bankruptcy.

In 1710, Takahira acted on the advice of his young manager Sousuke Nakanishi and established the Omotokata system of an overall corporate headquarters for the separate family businesses of trading and banking. Corporate leadership lay with the three Mitsui family members heading the Kyōto, Edo, and Ōsaka branches, as well as with two nonfamily managers; they met once or twice a month and oversaw the semiannual and three-year settlement of corporate accounts. Takahira continued his father's system of division of labor and bonus payments for top employees.

Takahira also began work on house and company rules based on the ideas promulgated in his father's will. To his own son Mitsui Takafusa, who was born in 1684, Takahira told cautionary tales of fifty-five failed fellow businessmen, including two uncles. Takafusa wrote the stories down in the manuscript *Chonin*

The Mitsui Clan Rules

Like his father before him, Mitsui Takahira sought to keep intact for future generations the vast Mitsui family fortune that was earned through trading and banking. Mistakenly thinking he would soon die, in 1722 Mitsui Takahira wrote out an elaborate will, *Sochiku Isho*, that was really a kind of family constitution based on the house rules of samurai families, which the Mitsui family had been before becoming merchants. He based this will on that of his own father, Mitsui Takatoshi, who wrote his will in 1694.

Takahira's document stresses the importance of family unity for business success. Although the business has a senior house, the five main houses established by his brothers and the three associated houses each get a fair share of the overall wealth to avoid infighting. There are also provisions for worthy employees and dependents. An important provision stipulates that most of the accumulated wealth is to be kept intact and not distributed, in essence maintaining the capital stock.

Reflecting the insecurities of the Tokugawa feudal era in Japan, there is a large emphasis on keeping adequate fiscal reserves at various levels of security. The highest reserve is cash literally kept in the cellar vault. This emphasis on reserves more than once saved the Mitsui business from bankruptcy.

There are also provisions to deal with family members unfit for business for a variety of reasons, ranging from moral turpitude to profligate ways. In most cases, the penalty assigned to the offender is to join the Shinto priesthood, where he could not harm the family business and its reputation.

Mitsui Takahira's will ruled the relations of the vast Mitsui clan without any alterations until July 1, 1900, when it was slightly modernized. The Mitsui family kept the will secret but published an abridged and edited version of it in English in 1926 and 1933. In 1941, Baron Takaharu Mitsui published large excerpts of the will in German in a scholarly journal. His passages exceed the text of the will that the Mitsui family handed over to the Allied authorities in 1945, and also that of the supposedly complete version given to an American scholar in 1949 and published again in 1973. The family may have kept some portions confidential.

koken-roku (wr. 1719, pb. 1941; merchant's observations), which became popular among the Mitsui family and their business friends. Takahira's diligent leadership saved the Mitsui business during four challenging years from 1720 to 1724.

Believing his death was near, in 1722 Mitsui Takahira took the Buddhist name of Sochiko and wrote his famous will, *Sochiku Isho* (wr. 1722; will of Sochiko). This document spelled out the rules of conduct for the members of the houses of Mitsui, seeking to instill family harmony and building a cofraternal partnership among all family branches. The will also offered sound business advice, reminding the family they were in the business as merchants and admonishing them not to lend to daimyos, as these powerful aristocrats rarely paid back their loans.

Mitsui Takahira lived for another fifteen years after his will was written. He died on November 27, 1737, at age eighty-four. He greatly increased the Mitsui wealth. His tomb was erected in the Mitsui family graveyard at the Tendai Buddhist Shinnyo-do temple in Kyōto.

Legacy

Mitsui Takahira successfully consolidated and expanded the family business to conform with his father's wishes for permanence and flexibility. As Takahira shunned all ostentatious display of the wealth that made him one of the richest men in Japan, he also escaped the inevitable envy or persecution suffered by more flamboyant merchants at the hands of samurai, their masters the daimyos, or by shogunate officials. He successfully bequeathed the family business strategy of cooperation with the government while never forgetting the focus of a merchant's life—the earning of money.

Takahira's thoughtful organization of the family business contributed to the unbroken success of the Mitsui family enterprise until Japan's defeat in World War II in 1945. By 2009, the Mitsui Group was still a strong corporate entity in Japan, even though the Mitsui family no longer controlled its operations.

Mitsui Takatoshi

Japanese merchant and banker

Mitsui Takatoshi laid the foundations for what would become one of Japan's world-renowned zaibatsu, or large family-controlled conglomerates.

Born: 1622; Matsusaka, Ise Province (now in Mie Prefecture), Japan
Died: 1694; Edo (now Tokyo), Japan
Also known as: Mitsui Hachirobei Takatoshi; Takatoshi Mitsui
Sources of wealth: Trade; government
Bequeathal of wealth: Children

Early Life

Mitsui Hachirobei Takatoshi, better known as Mitsui Takatoshi (miht-soo-ih tah-kah-toh-shee) was the second of four sons of Mitsui Sokubei, a shopkeeper who sold sake (rice wine) and miso (fermented soy bean paste) in addition to running a pawn shop in Matsusaka. Mitsui Takatoshi's mother, Shohou, may be credited with much of the success of the family business. The daughter of a successful merchant, she was well acquainted with running a business. Mitusi Sokubei, however, who had been born into a samurai (warrior) family, is said to have had little interest in business matters.

First Ventures

When Mitsui was fourteen, the family moved to Edo (now Tokyo) and opened another shop. By this time, Mitsui had already proven to have an unusual talent for business. In time, two of his brothers, Mitsui Toshigutsu and Mitsui Shigetoshi, joined him. They established a *gofukuya* (kimono store) called Echigoya in the Nihonbashi area of central Edo. In the traditional kimono shops, employees called on customers in their homes, taking fabric samples and measuring the clients for custom-made kimonos, for which the shop was paid upon delivery of the product. Mitsui Takatoshi instigated a new practice of making and selling a selection of ready-made kimonos that customers purchased at his shop. During this time, the government of the city of Edo also gave Mitsui some business. Before long, the earnings of his company had increased sixteenfold. When he was twenty-eight, he had a falling out with his elder brother primarily because his brother was jealous of Mitsui's exceptional business acumen. The argument resulted in Mitsui returning to Matsusaka, where he married the fifteen-year-old daughter of a tradesman and cared for his ailing mother.

Mature Wealth

After his return to Matsusaka, Mitsui established a new business, biding his time until the day he could return to Edo. That opportunity came when his elder brother died in 1673. At age fifty-two, after spending twenty-four years in "exile," he returned to Edo and opened a store. His success enabled him to expand into various banking services. The regional feudal governments had been plagued by thieves, who stole cash tax payments while government officials were en route to Edo. Mitsui set up a chain of money exchange shops in which officials could safely transfer their tax revenues. By 1691, various members of the Mitsui family were being appointed *goyo shonin* (chartered merchants) by the Tokugawa shogunate. This appointment came with large-scale political influence, and the Mitsui-ke (house of Mitsui) grew to become the largest Japanese merchant company during the Tokugawa period (1603-1867). Mitsui died in 1694 in Edo.

Legacy

Mitsui Takatoshi exerted a profound legacy on the economic history of Japan and of other countries. While figures listing the dollar amount of his wealth are unavailable, his legacy goes far beyond these indications of wealth. He was influential in introducing into his company the practice of advertising and of giving promotions to employees. Not the least of his contributions to the future success of the house of Mitsui was his part in establishing regulations to ensure the survival of what would become one of the giant conglomerates in Japan. These regulations included limiting the number of beneficiaries who could share in the company, forbidding certain kinds of excesses, setting rules for choosing the wives of their offspring, limiting the amount of debt they could incur, and defining the profile for employees. Although tremendous changes took place after Mitsui's death, he undoubtedly provided the foundation for what would become, centuries later, a conglomerate of multinational corporations with a global network of more than 150 offices in sixty countries, with hundreds of subsidiaries.

Moses Montefiore

British banker

Montefiore's wealth enabled him to advance in English society further than any Jew had previously. He became one of the best-known Jews of the nineteenth century, and his example helped foster Jewish acceptance in Christian society.

Born: October 24, 1784; Livorno (now in Italy)
Died: July 28, 1885; near Ramsgate, Kent, England
Also known as: Sir Moses Haim Montefiore, Baronet
Sources of wealth: Banking; investments
Bequeathal of wealth: Charity

Early Life

Sir Moses Haim Montefiore, Baronet, better known as Moses Montefiore (mon-teh-FYOR-ee), was born in 1784 to London businessman Joseph Elias Montefiore and his wife Rachel, who was from the Moccata family of London-based Sephardic Jewish bankers. Montefiore was born on a family visit to Livorno, Italy, where his paternal grandfather had lived before moving to London around 1750. He was educated privately. Subsequent evidence of Montefiore's lax religious observance during his early adulthood indicates that his upbringing and education did not heavily emphasize Jewish piety. He worked for a tea company in London, and he was admitted to the London Stock Exchange in 1803.

First Ventures

Montefiore's early career on the stock exchange was not auspicious. In 1806, he was defrauded, incurring debts it would take nearly a decade to pay off. His fortunes began to improve after June 10, 1812, when Montefiore married Judith Cohen, the daughter of Levi Barant Cohen and the sister-in-law of Nathan Mayer Rothschild. These connections to London's Jewish business elite proved the making of his fortune. Montefiore was particularly advantaged because he was a Sephardic Jew, and his new wife was an Ashkenazic Jew, so the couple was able to move between London's Jewish communities. Montefiore became Rothschild's principal stockbroker and underwrote the loans Rothschild floated. Montefiore eventually began to speculate on his own account, with remarkable success. He became a director on many corporate boards, and he was a major stockholder in the Imperial Continental Gas Association, which helped install gas lighting in European cities.

Mature Wealth

In 1827, Montefiore visited Palestine. After the visit he became a strictly observant Orthodox Jew, who strongly opposed the spread of Reform Judaism in Great Britain. During the 1830's, Montefiore continued to shift his interests from business to philanthropy and Jewish communal affairs. Montefiore became well known for his charity to both Jewish and other beneficiaries, particularly in the town of Ramsgate, Kent, where he had his country estate. He was honored with the position of sheriff of the city of London (1837-1838) and was made a baronet in 1846.

Montefiore was best known in his time for his many journeys made on behalf of oppressed Jews in Europe and the Middle East. The first of these trips was to Damascus in 1840, where he secured the release of Jews held for the murder of a Catholic priest. Among the other places he went to assist Jews were the Vatican, Morocco, Russia, and Romania. He visited Palestine six more times and helped foster the economic development of the Jewish community there, hoping to render the Jews less dependent on foreign donations. He also helped establish the first Jewish community outside the walls of the Old City of Jerusalem and built a windmill to grind flour for the citizens of this community. This windmill remains standing in the twenty-first century and is a historical landmark. In addition to providing Montefiore with the time and transportation necessary for these trips, his wealth gave him access to many world leaders. Montefiore's efforts on behalf of persecuted Jews and his long life made him a hero among many Jewish communities.

Legacy

Montefiore left an estate of about £375,000. As he died without heirs, much of this money was left to charity or was bequeathed to servants. His landed property in Ramsgate was retained as a memorial to his wife, Lady Judith. Montefiore's wealth, generosity, and long life made him an international celebrity, revered by Jews and non-Jews alike. His many journeys helped spread awareness of anti-Semitism and fostered solidarity among Jews in different countries. Montefiore's concern for the Jewish community of Palestine contributed to the growth of Zionism after his death. His acceptance by the English elite demonstrated that an Orthodox Jew could be an English aristocrat and paved the way for closer ties between the Jewish and non-Jewish British upper classes.

Montezuma II

Aztec king and military leader

The ninth and final tlatoani *(leader) of the Aztec Empire, Montezuma II inherited the accumulated wealth of his predecessors and augmented it during his reign. The lure of this treasure proved irresistible to Spanish conquistadors, who deposed the emperor, destroyed his capital city, and obliterated his empire.*

Born: 1467; Tenochtitlán, Aztec Empire (now in Mexico)
Died: c. June 30, 1520; Tenochtitlán, Aztec Empire
Also known as: Moctezuma; Motecuhzoma Xocoyotzin
Sources of wealth: Inheritance; conquest; government
Bequeathal of wealth: Confiscated

Early Life

Montezuma II (mawn-tay-SEW-mah) was born of noble lineage into the Nahuatl-speaking Mexica culture, generically called the Aztecs. He was related to four previous rulers: He was the grandson of Montezuma I, the son of Axayácatl, and the nephew of Tizoc and Ahuitzotl. Montezuma grew up amid luxury in the empire's capital, Tenochtitlán, where he was well educated in science, religion, art, and military strategy. He became a devoted priest to war god Huitzilopochtli and proved himself often on the battlefield in Aztec campaigns of subjugation.

First Ventures

Upon ascending to the throne in 1502, Montezuma became heir to the Aztec fortune, a huge trove of gold, turquoise, and feathered and silver objects acquired during a period of domination and forced tribute that began in the fourteenth century. Early in his reign, he launched campaigns to increase his territory and wealth, and he expanded the size of the Aztec Empire to about 200,000 square miles.

Mature Wealth

In Tenochtitlán, a city resembling Venice, Italy, with a population of several hundred thousand people, situated on islands in shallow Lake Texcoco, Montezuma acted the part of the despot. He drank copious amounts of chocolate and ate rare delicacies from gold vessels. He had numerous royal concubines who bore him at least eleven sons and eight daughters. He dismissed commoners from his court and humiliated nobles by making them his servants. Montezuma raised taxes on local tradesmen, and he demanded additional tribute from conquered tribes and more victims for sacrifice to the war god. These measures eventually caused disharmony within his capital and rebellion throughout the empire.

Midway through Montezuma's reign, a number of omens appeared that signified to the superstitious em-

peror that great change was in the offing. A comet appeared in the sky. Lightning struck a temple. The shrine of the war god caught fire.

In 1519, the Spanish landing on the coast of Mexico coincided with prophecies that the feathered serpent god Quetzalcóatl would return in his human form as a light-skinned and bearded man. When fair and hirsute Hernán Cortés led his vastly outnumbered conquistadors and their Tlaxcalan allies (longtime enemies of the Aztecs) to Tenochtitlán, Montezuma did not resist. Instead, he meekly allowed himself to be held hostage for six months and permitted the Spaniards to plunder his treasure. His gold—considered common among the Aztecs and used primarily for decoration—was melted down and formed into chains that Cortés's soldiers wrapped around their bodies.

When the people of Tenochtitlán revolted against Spanish occupation in June, 1520, Cortés forced Montezuma to address his subjects in an effort to pacify them. However, the outraged populace showered the emperor with rocks and other missiles and severely wounded him. Montezuma died several days later, but it is unknown whether he succumbed to his injuries or was the victim of Spanish murder.

Legacy

Following Montezuma's death, the Aztecs with great loss of life drove the Spanish from Tenochtitlán; in fleeing, the invaders lost much of the booty they had stolen. Cortés soon returned with reinforcements and, aided by a smallpox epidemic and superior arms and armor, he decimated the empire by 1521. The Aztec capital was demolished, the people slaughtered, and the survivors enslaved to work in gold mines that produced enough wealth to make Spain a superpower during the sixteenth century.

In the years following the conquest, legends sprang up about a fantastic hoard of Montezuma's gold that the Spaniards had failed to find that was spirited away and hidden somewhere far to the north of the former empire. To this day, adventurers risk "Montezuma's revenge" (diarrhea) to search for the emperor's lost treasure.

GORDON E. MOORE

American inventor, computer engineer, and industrialist

Moore, a cofounder of the Intel Corporation, is a highly regarded figure in the history of the semiconductor industry. He is the author of Moore's law, a hypothesis about the cost and ubiquity of integrated circuit technology.

Born: January 3, 1929; San Francisco, California
Also known as: Gordon Earle Moore
Sources of wealth: Inheritance; patents; computer industry
Bequeathal of wealth: Charity; educational institution

EARLY LIFE

Gordon Earle Moore was born in San Francisco, California, in 1929. His father was a police officer in San Mateo County, California, and his mother was a homemaker. Both parents were born in Pescadero, California, where Moore grew up. His father, who never finished grammar school, worked continuously through the Great Depression. The household had electricity and a telephone, and the family kept a cow that was milked daily. The family moved to Redwood City, California, in 1939. Math was Moore's strong subject and chemistry was his hobby. He attended high school from 1942 to 1946 and San Jose State College (now San Jose State University) from 1946 to 1948. He transferred to the University of California at Berkeley, from which he graduated in 1950 with a degree in chemistry. In 1950, Moore entered the California Institute of Technology, where in 1954 he received his Ph.D. in chemistry and physics.

Moore met his wife, Betty, when they were students at San Jose State College. The couple wed in 1950 and had two sons, Kenneth G. Moore and Steven B. Moore.

FIRST VENTURES

Moore worked at the Applied Physics Laboratory, a U.S. government facility at Johns Hopkins University, from 1953 to 1956. In 1956, William Shockley, one of the three engineers credited with the invention of the transistor in 1947, sought Moore for a position in Shockley's new company. Moore accepted a job at the Shockley Semiconductor Laboratory, a division of Beckman Instruments, in 1956. While there, Moore met and worked with Robert Norton Noyce, who along with Jack St. Clair Kilby is credited with inventing the integrated circuit, a type of semiconductor device that combined several transistors and other components on a single chip of silicon.

Dissatisfied with management, Moore, Noyce, and several other engineers left Shockley Semiconductor in 1957 to form Fairchild Semiconductor, headed by Noyce, as a division of the Fairchild Camera and Instrument Corporation. Each of the founding engineers, Moore included, invested $500 in the new company. Moore served as head of engineering and then as director of research and development, focusing on the production of silicon-diffused junction transistors and the introduction of the planar process of silicon device manufacturing. In 1959, Noyce patented his ideas for making integrated circuits using the planar process, and Fairchild became the market leader in these devices in the 1960's, earning annual revenues of $150 million. Integrated circuits greatly reduced the size, complexity, and cost of computers and computer-powered equipment, and they were used extensively in the computer, defense, and electronic equipment industries. Fairchild pioneered other integrated circuit technologies, including the complementary metal oxide semiconductor manufacturing process. In 1965, while at Fairchild, Moore published an influential article titled "Cramming More Components onto Integrated Circuits."

MATURE WEALTH

Unsure of the direction of Fairchild's leadership, Moore and Noyce left to found the Intel Corporation in July, 1968, using personal money, as well as funding from the noted California venture capitalist Arthur Rock. Initially called N. M. Electronics, the company soon changed its name to Intel, created from a contraction of the two words "integrated" and "electronics." First year sales totaled only $2,672. The company began working on memory chips, semiconductor devices that store information, and soon introduced the first commercially available dynamic random access memory devices.

In 1971, Intel accepted a contract from Nippon Calculating Machine Corporation to develop specialized integrated circuits for a new desktop calculator. Instead of a set of twelve separate devices, Intel engineers created a set of four chips, including one that could be specifically programmed for different, custom computer applications. The Intel model 4004 device was the first general microprocessor, a computer chip that could be programmed with software to perform a variety of processes. Containing twenty-three hundred transistors and other components on a single chip, the microprocessor

Moore's Law

In 1965, Gordon E. Moore was solicited for a contribution to the thirty-fifth anniversary edition of *Electronics* magazine. Asked specifically for his ideas regarding the future of the semiconductor industry, Moore sought to explain the cost advantages of integrated circuits and how they would become much less expensive through time. By amalgamating multiple transistors and other devices in a single chip, integrated circuits were in theory cheaper than discrete, single-function transistors and other types of discrete semiconductors. In 1965, however, the price of integrated circuits remained high, limiting their use primarily to mainframe computers, defense electronics, and other capital-intensive equipment.

From his perspective as research and development director at Fairchild Semiconductor, Moore envisaged a regular decline in the cost of integrated circuits. He reasoned that as engineering prowess and manufacturing techniques became more sophisticated, more devices could be placed on a single integrated circuit, thus reducing costs, while simultaneously increasing the functionality of integrated circuits. Larger integrated circuits, Moore believed, would motivate greater cost efficiencies.

Reviewing the development of integrated circuits since their invention in 1959, and in particular since 1962, and examining the next generations of chips then in development at the Fairchild laboratories, Moore noticed that the number of discrete transistors and other components incorporated onto a single integrated circuit had increased at a regular rate, approximately doubling every year. He noted three technology advances that would enable this increase to continue: The first was the improvement in semiconductor lithography, the process by which tiny components were printed onto silicon wafers and a factor in decreasing component size, allowing more transistors on each chip. Second, the size of the silicon wafers, on which integrated circuits were printed, would become larger, allowing bigger chips and more integrated circuits to be manufactured on a single wafer. Third, advancements in forming components on integrated circuits would result in further miniaturization and integration. Such technological progress, combined with the inherent cost efficiencies of integration, would make electronics useful and available throughout society.

In 1965, Fairchild's most advanced integrated circuits contained approximately sixty components. Moore predicted that during the next ten years integrated circuits would contain sixty thousand components. Moore's prediction was remarkably prescient. His article also suggested that integrated circuit advancements would make possible home computers, electronics in automobiles, electronic wristwatches, personal mobile communications, and other future devices. In 1975, he revisited his original thesis and predicted that the rate of growth would slow to a doubling of component integration about once every two years. Again, Moore was correct.

In the first decade of the twenty-first century, microprocessors and other kinds of integrated circuits contain millions of components of smaller-than-microscopic dimensions, while the cost per function of each individual component has continued to decline. Moore's friend Carver Mead, a computer scientist at the California Institute of Technology, eventually coined the term "Moore's law" for the concepts that Moore set forth.

paved the way for desktop computing and for the rapid evolution of industrial, personal, and mobile electronics.

Intel began selling stock in 1971 at a price of $23.50 per share. The Intel 8080 microprocessor, introduced in 1974, became the industry standard, and in 1981 International Business Machines (IBM) chose the Intel 8088 microprocessor to run its first personal computer. In 1975, Intel's revenues were $130 million, and by 1992 the company had become the largest semiconductor manufacturer in the world. In 2008, Intel's total revenues exceeded $37 billion. Moore's personal wealth is estimated to be more than $4 billion.

Moore was elected president and chief executive officer of Intel in 1975. He retired to become board chairman in 1987 and served in that position until 1997, when he became Intel's chairman emeritus. Moore was a member of the board of trustees of the California Institute of Technology from 1987 to 1995, and he served as board chairman from 1995 until 2001. In 1990, Moore was awarded the National Medal of Technology by President George H. W. Bush, and in 2002 he received the Presidential Medal of Freedom.

In 2000, the Gordon and Betty Moore Foundation was established to fund efforts in environmental conservation, science, and initiatives in the San Francisco Bay area. The organization was then the eighth-largest private foundation in the United States. The foundation provides significant support to Conservation International, an organization that seeks to protect the Earth's biodiversity. In 2001, the California Institute of Technology received $600 million from the foundation and from Gordon and Betty Moore, at the time the largest private donation given to an institution of higher learning. In his retirement, Moore became a tireless campaigner for environmental conservation and an avid practitioner of the sport of fishing.

Legacy

Moore is known as one of the fathers of Silicon Valley, the high-technology industry area in California near the city of San Francisco. He is widely respected for his business acumen, though he calls himself an accidental entrepreneur, and his modest and gentle character. Moore's legacy includes creating and commercializing the semiconductor technologies that drove the computer, software, and Internet revolutions of late twentieth and early twenty-first centuries. He is also a founder of the modern semiconductor industry, which in 2008 had global revenues of $261 billion and supplied devices used in every imaginable electronic product. Moore's commitments to education and environmental conservation have set an example of philanthropy that is emulated around the world.

José de Moraes

Brazilian industrial conglomerate owner and politician

Moraes established the first major Brazilian industrial conglomerate, theVotorantim Group, integrating vertical and horizontal enterprises that produced aluminum, cement, hydroelectric power, iron, steel, and zinc and laying the foundation for the company's global operations.

Born: January 21, 1890; Nazaré da Mata, Pernambuco, Brazil
Died: August 9, 1973; São Paulo, Brazil
Also known as: José Ermírio de Moraes
Sources of wealth: Manufacturing; steel; metals refining
Bequeathal of wealth: Children; charity

Early Life

José Ermírio de Moraes (joh-ZEH ehr-MEER-ee-oo djee moh-RIHSH) was born on January 21, 1890, two years after the abolition of slavery in Brazil and a year after the monarchy was overthrown and replaced with a republic. Moraes was born in the state of Pernambuco in the impoverished northeastern region of Brazil. However, his father was a wealthy sugar mill and plantation owner. Moraes's father died while the boy was an infant, and his mother took over the plantation. Fulfilling his father's wish, Moraes's mother sent him, her only surviving son, to study at the Colorado School of Mines when Moraes was sixteen. To supplement his allowance, Moraes worked at odd mining jobs.

First Ventures

Returning to Brazil in 1921, he worked as an assayer in the mineral-rich state of Minas Gerais. He left that position in 1924 to work at the Votorantim factory in the industrializing state of São Paulo. Votorantim was the largest weaving and textile manufacturer in the country. In 1925, Moraes married the daughter of the company's owner, who was the son of Portuguese immigrants and who admired and mentored Moraes. Moraes and his father-in-law formed a synergic business partnership that was at the heart of the innovative and stable management of the Votorantim conglomerate.

In 1930, Brazilian president Getúlio Vargas began his authoritarian regime. In the midst of the worldwide Great Depression, with Brazilian coffee exports sinking, the country sought to increase the manufacture and sale of its industrial products. Brazil assessed tariffs on imported goods in order to stimulate domestic production. Moraes expanded Votorantim's operations into heavy industry, benefiting from new government projects for public works and new policies aimed at developing national manufacturing. Brazil possessed abundant mineral and other natural resources, and the United States supported the nation's industrial development in order to supply America during World War II.

Mature Wealth

Over the next quarter century, Votorantim expanded into numerous industries: iron, steel, cement, aluminum, zinc, chemicals, paper pulp, and hydroelectric power. The company's steel bars supported the war effort, and its cement plants built the metropolis of São Paulo and the new capital of Brasília. Votorantim's aluminum plants produced what was considered to be the construction metal of the future, and the conglomerate pioneered the production of rayon, initially creating this material as a substitute for the shortage of cotton. Votorantim's hydroelectric plants powered Votorantim's factories. Post-World War II Brazilian economists emphasized industrialization as the key to national development, with capital from foreign countries invested in Brazilian-owned companies. Votorantim had become the mammoth of Brazilian industry, and Moraes possessed one of the largest fortunes in the country.

In his late fifties, however, Moraes resigned from the management of Votorantim and dedicated himself to social and political interests. Sympathetic to workers and progressive social reforms, Moraes joined the Brazilian Labor Party, which was founded by Vargas after his government was overthrown at the end of World War II. Moraes's native state, Pernambuco, elected him a national senator in 1962. The following year, he was named minister of agriculture.

Conservative military forces, however, overthrew the Brazilian government in 1964, remaining in power for more than two decades. A proponent of land reform, Moraes did not enjoy the support of the new military government, and he left the senate in 1971. He then attempted to resume the management of Votorantim. However, debilitated by a stroke, he died in São Paulo in 1973.

Legacy

Moraes pioneered the birth of integrated heavy industry in Brazil. At the time of his death, his conglomerate, Votorantim, contained forty-six companies with thirty-three thousand employees. The conglomerate he established grew into a multinational corporation, strengthening Brazil's position in the global economy. In addition to his business activities, Moraes participated in his nation's political system. Sympathizing with urban industrial workers and the rural poor, he channeled this support through philanthropy and his membership and elected office in the Brazilian Labor Party. As of 2010, the wealth of Moraes's family was estimated at $3 billion, placing the family at number 316 in the *Forbes* magazine list of 1,011 world billionaires.

J. P. MORGAN

American banker and financier

By the end of the nineteenth century, Morgan was the world's most influential banker. He greatly advanced the field of investment banking by financing American railroad construction, managing some of the largest corporate mergers, and funding Thomas Edison's efforts to generate and transmit electricity.

Born: April 17, 1837; Hartford, Connecticut
Died: March 31, 1913; Rome, Italy
Also known as: John Pierpont Morgan
Sources of wealth: Inheritance; banking; financial services; investments; real estate
Bequeathal of wealth: Spouse; children; employees

EARLY LIFE

John Pierpont Morgan was born into a wealthy family with business acumen and social prominence. His grandfather, Joseph Morgan, was a very successful New England farmer and entrepreneur, who was probably a millionaire when he died in 1847. J. P.'s father, Junius Spencer Morgan, in 1854 became a partner in the London-based international banking house of George Peabody and Co. Young Morgan attended school in Vevey, Switzerland, from 1854 until 1856 and then spent two years at a university in Göttingen, Germany. In 1857, he became a clerk in a New York banking house. By age twenty, Morgan had traveled all over Europe and was fluent in French and German.

FIRST VENTURES

Beginning in 1860, Morgan, working through his New York-based firm, J. Pierpont Morgan and Co., acted as agent for his father's London firm, George Peabody and Co. Under Morgan's direction, the Peabody company began to make commercial loans to New York and New England merchants. During the Civil War, the company's trading in U.S. government securities largely replaced its financing of cotton exports and iron imports; the firm also bought and sold gold and foreign exchange. According to author Vincent Carosso, Morgan's share of the firm's New York earnings was $30,000 in 1862 and $58,000 in 1863, some of it undoubtedly a subsidy from his father.

In London, Junius Morgan's partner, George Peabody, retired in 1864 and the Peabody firm was reorganized as J. S. Morgan and Co. The value of the elder Morgan's stake in the firm was about $1.3 million. Junius presided over reorganization of the firm's New York branch, bringing in a new, older, and more experienced partner, Charles Dabny. Junius also provided $200,000 of the capital for the new Dabny, Morgan and Co., half of which was in the name of his son. New York and London operations continued to be closely coordinated.

In 1869, following an extended transcontinental rail excursion, J. Pierpont Morgan and Co. took on its first venture in marketing a new security issue—a bond sale for the Kansas Pacific Railway. In that same year, J. P. Morgan made his first active intervention in railroad management when he helped the conservative operators of a newly formed company, the Albany and Susquehanna Railroad, resist takeover efforts by the notorious speculators Jay Gould and James Fisk.

MATURE WEALTH

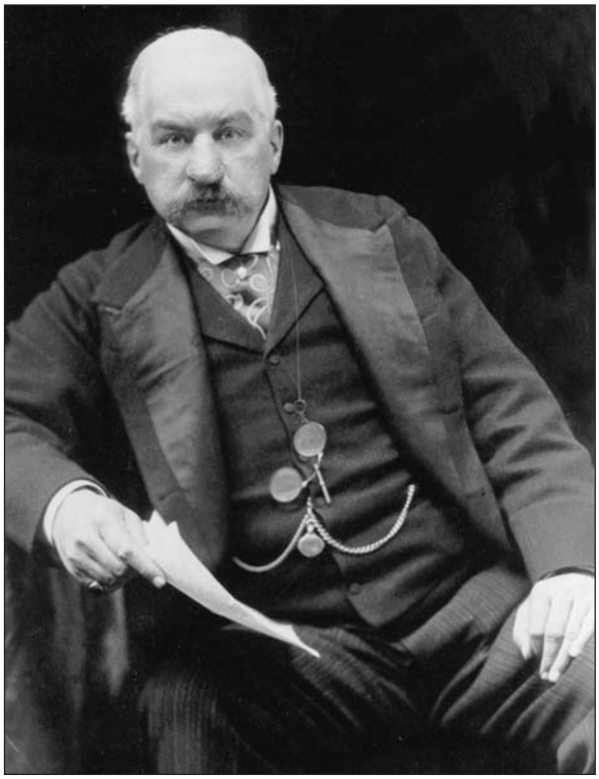
In 1871, J. P. Morgan reorganized his partnerships, joining forces with the prominent Drexel family of Philadelphia to form Drexel, Morgan and Company. At that time, Morgan's personal wealth was estimated at $350,000, and his father's wealth was about $5 million. In 1874 Drexel, Morgan recorded profits of $670,000, derived from commissions, interest, dividends, brokerage fees, and capital gains on assets purchased for resale. By that time, the Morgans and their partners had agreed to concentrate on marketing securities issues that would raise the necessary funding to finance expansion of their client companies.

Railroad financing was the principal challenge for investment bankers in the late nineteenth century. Between 1860 and 1900, America's railway mileage expanded from 35,000 to 190,000 miles. Railways became the nation's first giant corporations. The Morgan firms were involved in financing the Pennsylvania Railroad, the Louisville and Nashville Railroad, and the Lehigh Valley Railroad, and the firms began funding the Union Pacific Railroad in 1869, when the first transcontinental railway was completed.

In 1879, J. P. Morgan helped William Henry Vanderbilt sell off much of his vast stockholdings in the New York Central Railroad. Many of the buyers were English, and they gave Morgan their proxies in order to influence company management on their behalf. Morgan became a member of the New York Central's board of directors, taking on the role of protecting his investor clients. He subsequently became a major influence in the reorganization of such major rail firms as the Baltimore and Ohio (a longtime client), Reading, Chesapeake and Ohio, Erie, Norfolk and Western, and Northern Pacific. Morgan's 1880 syndicate to market $40 million of Northern Pacific bonds was reputedly the largest such transaction to date. A $20 million bond issue for the Reading Railroad in 1888 yielded Drexel, Morgan a $1 million commission. As the result of these railroad reorganizations, Morgan and his representatives became members of many of the railways' boards of directors. Morgan was instrumental in arranging collusive agreements concerning rail rates and coal prices before the passage of antitrust laws. These agreements gave way to the promotion of extensive consolidations. For example, more than thirty companies were brought together in 1893 to form the Southern Railway.

In 1878, Morgan was one of the earliest financial supporters of Thomas Edison's projects for electricity generation, transmission, and lighting. Four years later, Morgan's office and home were among the first to be lit by electricity.

Junius Morgan died in an accident in 1890. He left an estate valued at more than $9 million, of which his son received slightly more than $1 million. J. P. Morgan became the principal partner in his father's London firm. In 1893, Morgan's partner, Anthony Joseph Drexel, died, and the following year Drexel, Morgan was reorganized as J. P. Morgan and Company. In its last five years, Drexel, Morgan earned an average of about $1 million annually. By 1895, J. P. Morgan had emerged as the most prominent and influential banker in the world.



J. P. Morgan. (Library of Congress)

In 1889, the state of New Jersey amended its laws to permit one corporation to own stock in another. In combination with booming stock prices, this amendment helped spur an extensive number of corporate mergers. The Sherman Antitrust Act of 1890 was generally regarded as ineffective, and many of the mergers had the purpose and effect of decreasing competition and fostering monopolies.

Morgan and his firm were involved in some of these mergers. In 1892, Morgan's firm supervised the formation of General Electric, a company that combined Thomas Edison's electrical operations with Thomson-Houston, another major electrical manufacturer. J. P. Morgan and Company brought about a merger of major steel firms in 1898 to establish Federal Steel; the following year, Morgan was involved in the founding of the National Tube Company, a merger of fourteen manufacturers.

In 1901, Morgan engineered the most colossal merger yet seen—the creation of United States Steel, which was the world's largest corporation, capitalized at $1.4 billion. In all, fifteen companies were absorbed into the new behemoth, including Federal Steel and National Tube. A major goal of this merger was to remove Andrew Carnegie from the steel industry, where he was regarded as disruptive and uncooperative. Morgan became a member of the corporation's board of directors. In 1912, the government attacked U.S. Steel as an illegal monopoly, but company officials were not convicted.

Morgan and his firm continued to participate in corporate mergers, and some of the newly founded companies fared less well than U.S. Steel. For example, in 1901, Morgan was involved in the formation of the Northern Securities Company, which combined the Great Northern Railway and Northern Pacific Railway. This firm was later convicted of antitrust violations and was dissolved in 1904. In 1902, J. P. Morgan and Company helped to create International Harvester Corporation by merging the two principal makers of farm machinery. In that same year, Morgan organized the International Mercantile Marine Company, a giant shipping cartel. This firm was never profitable, and its reputation was harmed by the loss of its luxury liner RMS *Titanic* in 1912. The merger boom caused Morgan's income to skyrocket. Profits of his American partnerships rose from about $2 million in 1895 to more than $8 million in 1899, and his personal share was about one-third of these totals.

As the stock market boom moderated, the merger movement also declined. In the new century, J. P. Morgan and Company continued to be heavily involved with railroads. Morgan and his associates used their directorships to work toward consolidating railroads and avoiding cutthroat competition. The firm also continued to manage securities issues that financed railroad expansion and upgrade. Morgan's profits from these transactions were large but unstable. His firm recorded profits of nearly $25 million in 1902, the highest in Morgan's lifetime, but it lost nearly $22 million during the economic panic of 1907.

Morgan remained active in business until 1912, but he delegated increasing responsibility to his many capable associates, including his son J. P. "Jack" Morgan, Jr. Morgan's public reputation was greatly enhanced by his active intervention to help relieve the financial panic of 1907. However, he was heavily challenged by the "money trust" investigations of 1912-1913, in which a congressional committee examined allegations that a small group of Wall Street bankers were exerting control of the nation's finances. Morgan testified before the committee, and many believed the probe was specifically targeted at him and his investment banking business.

J. P. Morgan Library

In his lengthy European travels, investment banker J. P. Morgan accumulated a vast store of books and manuscripts. By 1900, his collection was so large that he decided to build a private library adjoining his home at 219 Madison Avenue in New York City. He engaged a noted architect, Charles Follen McKim, to design the library, though Morgan constantly intervened in the construction process. The library was completed in 1906, soon after Morgan had purchased a manuscript of John Milton's *Paradise Lost* (1667, 1674) and another of William Makepeace Thackeray's *Vanity Fair* (1847-1848). The library building was connected to Morgan's house by an underground tunnel. Its walls and ceiling were painted in Renaissance style. In the main room hung a sixteenth century tapestry illustrating *The Triumph of Avarice*.

Morgan hired a young Princeton University librarian named Belle da Costa Greene to organize and manage the enterprise. Although she did not acknowledge it, she was the daughter of the first African American man to graduate from Harvard University. One of her first major acquisitions was the 1908 purchase of seventeen fifteenth century items produced by pioneering British printer William Caxton. In 1909, Morgan bought manuscript copies of *Life on the Mississippi* (1883) and *The Tragedy of Pudd'nhead Wilson* (1894) directly from the author, Mark Twain. By 1911, the library held three Gutenberg Bibles. In that same year, Greene bought $100,000 of literary materials at auction, including Caxton's printing of Sir Thomas Malory's *Le Morte d'Arthur* (1485), which she purchased for $42,700. By then, Greene had gained a reputation for literary taste and good financial judgment. She remained at the library until retiring in 1948.

After J. P. Morgan's death, the library and its contents were left to his son Jack. In 1924, Jack donated the library's collection to New York City as a public museum, along with an endowment of $1.5 million. The library building was substantially enlarged in 1928, when the Morgan house was demolished. In the twenty-first century, the library contained drawings and prints, music manuscripts, and seals and tablets, as well as books and other print materials.

At his death in 1913, Morgan's estate was valued at $68 million, exclusive of his art and library collections, which were valued at about $50 million. Of the $68 million, about $30 million reflected his ownership interests in various partnerships, another $19 million was in securities, and $3 million was in real estate. His wealth was far smaller than the sums associated with the Vanderbilts and Rockefellers, for Morgan had made generous gifts throughout his prosperous years.

Legacy

J. P. Morgan's financial success was greatly facilitated by family wealth, education, and mentoring. However, he combined these advantages with his own exceptional intellect, energy, and strong commitment to honesty and fair dealing. He kept his promises and expected others to do the same. He was acutely aware of the importance of personal character. Morgan's emphasis on protecting stockholder value powerfully influenced corporate finance and the management of the financial services business, which helped the United States obtain foreign capital to achieve rapid industrial growth.

The partnership of J. P. Morgan and Company continued in operation after his death, becoming a state-chartered bank in 1940. In 1959, it merged with Guaranty Trust to form Morgan Guaranty Trust Co., which became J. P. Morgan Chase in 2000. Morgan's vast art collection was given to his son Jack, who donated much of it to the Metropolitan Museum of Art.

Taikichiro Mori

Japanese real estate developer

Mori changed the skyline of Tokyo with his development of prime properties near the Imperial Palace and government buildings, at one time becoming the world's wealthiest individual. The foundation he established in 1981 enabled later generations to continue urban development and improvement projects.

Born: 1904; Tokyo, Japan
Died: January 30, 1993; Tokyo, Japan
Also known as: Mori Taikichiro; Ooya San (Mr. Landlord of Tokyo)
Source of wealth: Real estate
Bequeathal of wealth: Charity

Early Life

Taikichiro Mori (tah-kee-chee-roh moh-ree), the son of a rice farmer who purchased two buildings that would provide a foundation for his son's real estate empire, was born in Tokyo, Japan. Mori grew up in one of the neighborhoods that he would later transform, an area of narrow streets with a few wider places where he played. He graduated from the Tokyo Shoka (College of Commerce, later the Hitotsubashi University) in 1928. After the end of World War II, he taught trade theory at Yokohama City University, eventually becoming the head of the school of commerce. He married Hana, and they had four children, sons Kei, Minoru, and Akira and daughter Aiko.

First Ventures

The Mori family began modestly to build what would become a real estate empire. When his father died in 1959, Mori inherited the two buildings that his father had acquired. His father had also managed thirty buildings in the Minato area. The real estate market had suffered tremendously after World War II, enabling Mori to begin to acquire plots of land in the Minato ward, located in central Tokyo. This area was where his family had lived for generations, working as rice and tobacco merchants. Mori sensed that the time was right for real estate investment. Now fifty-two years of age, he had just retired from his university teaching career. In 1959, he established the Mori Building Company along with his son Minoru, a student at the University of Tokyo.

Mature Wealth

Building by building, Mori began to make his mark on the city of Tokyo. His initial investment in buildings in Minato marked the area's third reconstruction. The area had been rebuilt after it was destroyed by an earthquake in 1923 and by American bombing during World War II. The buildings Mori constructed were steel-frame concrete structures that could survive some earthquakes. As new buildings were constructed, he labeled them chronologically as Mori Building One, Two, and so on.

For the next thirty years, including the period known as the great Japanese asset bubble of the 1980's, Mori continued to expand, until by 1989 the Mori family held real estate worth $14.2 billion. That figure increased to $15 billion in 1990, when *Forbes* magazine ranked Mori as the world's second-wealthiest man. In 1991 and 1992, he was named the wealthiest man in the world, having double the worth of America's richest man, Bill Gates.

Mori had a modest and unassuming manner about his wealth. He opted for an unpretentious life, wearing a simple kimono, carrying a lunch box to work, and living in a small apartment near his construction projects. Throughout Tokyo, he became known as Ooya San, an endearing nickname which is roughly translated as "Mr. Landlord of Tokyo." His modesty is reflected in his comment that he became the world's richest man only because the price of land in Tokyo skyrocketed, not because of his own accomplishments.

Legacy

One has only to look around the Minato ward of Tokyo to see much of the legacy of Taikichiro Mori. Over a period of some seventeen years, the Mori company enlisted the support of five hundred businessmen and other area residents for Mori's redevelopment project. Always solicitous of the residents, he quietly arranged for many of the company's employees to relocate in apartments constructed in this neighborhood. His sons would carry on his work, even though they had widely differing philosophies about how it should be done, resulting in their dividing the empire into two companies in 1999. The Mori Memorial Foundation, with assets of some 600 million yen, was established in 1981 to research methods for conducting and improving urban redevelopment.

Robert Morris

American merchant, financier, and statesman

Aided by a small inheritance, Morris became a highly successful merchant, and by 1775, he was one of the wealthiest Americans. Active in supporting the Revolutionary War, he served as the superintendent of finance for the national government from 1781 to 1784.

Born: January 31, 1734; Liverpool, Merseyside, England
Died: May 8, 1806; Philadelphia, Pennsylvania
Also known as: Robert Morris, Jr.
Sources of wealth: Trade; investments; real estate; government
Bequeathal of wealth: Dissipated

Early Life

Robert Morris, Jr., moved from his native England to Oxford, Maryland, in 1748, joining his father, a tobacco merchant. A year later, Morris was apprenticed to a leading Philadelphia merchant, Charles Willing. In 1750, Robert inherited an estate valued at about £2,500, but he had to pay some of this amount to other heirs. At a time when a skilled workman could earn perhaps £1 a day, this was a significant sum. Willing died in 1754 and his son Thomas Willing took control of his father's firm, which became a partnership with Morris.

First Ventures

In the mid-1750's, Morris made several voyages on behalf of the firm, and he sometimes was charged to sell both vessel and cargo. In 1756, he purchased a one-fourth interest in another firm that in May, 1757, was officially named Willing and Morris. This firm dealt primarily in imports and exports, necessarily supplemented by foreign exchange.

Mature Wealth

By 1775, Willing and Morris was a leading merchant firm in Philadelphia. The company owned ten ships. The American Revolution opened up a new opportunity to invest in privateering—legalized piracy directed against merchant ships of an enemy country. The firm also invested in land, including an ambitious southern plantation.

Morris was gradually drawn into opposition to the restrictive trade and tax measures of the British government. In 1775, he was elected to the Continental Congress. In 1776, he was chosen chairman of a secret committee to import military supplies, and much of that operation was conducted by the firm of Willing and Morris.

Morris reluctantly signed the Declaration of Independence, but once war broke out, he became a leader in organizing and helping to manage the financial and logistical operations of the Revolutionary War. His activities during the war primarily involved borrowing money at home and abroad to finance America's rebellion against the British. In January, 1777, Morris obtained a desperation loan of $50,000, which enabled General George Washington to pay his troops and to defeat the British at Princeton. Morris was designated superintendent of finance, serving in this position from 1781 to 1784. He was a U.S. senator representing Pennsylvania from 1789 to 1795.

Robert Morris. (Library of Congress)

Morris combined his commercial operations with his public responsibilities. He formed numerous trading partnerships, better described as joint ventures. In 1778, he joined with Jonathan Hudson of Maryland, each furnishing half of the capital of £20,000 (Pennsylvania pounds). In the fall of 1778, Morris received commissions of £7,500 from purchases on behalf of the French in a joint venture with John Holker. By 1780, Morris was involved in nine major partnerships and numerous lesser ones, and these business ventures engaged in privateering, commodity transactions, shipping, lands, securities, and foreign exchange. In 1784, he invested $60,000 in the voyage of the *Empress of China*, and he provided $12,000 of capital for a new partnership in Baltimore.

Beginning in 1770, Morris developed a three-hundred-acre country estate, called The Hills, along the Schuylkill River, with a mansion and numerous other buildings, where cattle, sheep, and hogs were raised. His various home properties were worth at least $300,000 in 1795.

In his role as superintendent of finance, Morris often pledged his personal credit to make payments, even issuing the equivalent of personal banknotes, which reached a nominal total of about $1 million in June, 1783. His wartime service diverted him from mercantile activities, and his wealth was significantly reduced, though he continued to enjoy a high income. His efforts to recoup his fortune led him into land speculation. By the mid-1790's, he owned millions of acres of land in seven states, as well as more than seven thousand building lots in the nascent District of Columbia. Morris had to borrow money to purchase these properties, and by 1797 he was unable to service his debts. His properties were foreclosed. On February 15, 1798, he was taken to debtors' prison, where he stayed until August 26, 1801. His debts were tabulated at nearly $3 million.

Legacy

Robert Morris's administrative skills and mercantile reputation and contacts enabled him to provide essential support for the American Revolution. He enjoyed a large income and lived on a grand scale for most of his adult life. His financial ideas anticipated many of the policies subsequently put in place by Alexander Hamilton, the first U.S. secretary of the Treasury.

James Morrison

British merchant, politician, and landowner

Morrison was a self-made millionaire whose fortune was the first to be made from low-profit mass-retailing in the early nineteenth century.

Born: c. 1789; England
Died: 1857; Berkshire, England
Sources of wealth: Manufacturing; sale of products; real estate
Bequeathal of wealth: Children

Early Life

Little is known of James Morrison's origins. It is generally supposed that he was born to humble yeomen (independent, small farmers) or innkeepers, around 1789. He began his career working in London warehouses, eventually employed in a warehouse belonging to Joseph Todd, who ran a general drapery business. Morrison appears to have been entirely self-educated.

Morrison showed unusual commercial acumen and worked his way up in the drapery business. Todd took him into partnership and allowed Morrison to marry his daughter, Mary Anne, with whom he had four sons. The business was renamed Morrison, Dillon and Co. after Todd's death, and it was then converted to Fore Street Ltd. when it was registered as a limited liability company as a result of new legislation.

First Ventures

Morrison saw that one way of realizing profits in a competitive market was to move toward mass production, selling merchandise cheaply but quickly. This "small profits and quick returns" principle was a new concept in the early nineteenth century, made possible by the Industrial Revolution.

In 1823, Morrison made a journey to the New Lanark Mills that Robert Owen had set up in Scotland in order to mass-produce textiles. Morrison was already estimated to be worth £150,000 ($600,000), and he was planning to invest £5,000 of this sum in the new mills. The growth of population in Britain's major towns and cities at this time produced new markets for textiles and other merchandise; the railroads being constructed provided newer and faster methods to distribute these goods.

Mature Wealth

Early in his career, Morrison had become interested in politics, especially as the old Whig Party was transforming itself into the Liberal Party, rallying on a platform of free trade and parliamentary reform. Morrison used some of his wealth to enter politics in 1830, becoming a Liberal Party member of Parliament for St. Ives in Cornwall. At this time, members of Parliament were not paid, and most of them relied on private sources of wealth. Morrison was part of what was known as the "Reform Parliament," which passed the Reform Bill of 1831. In 1832, he became a member of Parliament for Ipswich, serving in this position until 1837. He later returned to Parliament between 1840 and 1847. His primary parliamentary interest was the regulation of the new railroad system, and a number of his proposals were enacted into law.

However, Morrison's aim was not merely to acquire wealth or political influence. His ambition was to rise in Great Britain's tightly constructed social hierarchy, a goal that could only be achieved by becoming a landowner. He had been acquiring real estate all over Britain, including southern England, with properties in Buckinghamshire, Wiltshire, Kent, and Berkshire, where Basildon Park became his main residence. He also obtained real estate in Yorkshire in northern England and purchased a hunting lodge in the Scottish Highlands in Islay. His most famous acquisition was Sudeley Castle in the Cotswolds, which he bought from another self-made merchant. Morrison also acquired a town house on London's prestigious Harley Street. To fit the role of a gentleman, he built a large library and became an art lover, purchasing a number of Old Masters, especially of the Italian and Dutch schools. His choice of books and paintings showed an innate good taste and were commended by art critics of the day.

Legacy

On his death in 1870, James Morrison's assets were estimated at about £4 million (between $12 and 16 million in American currency) in Great Britain, with additional investments in the United States. These assets would be equivalent to £5.6 billion ($8.4 billion in American currency) in 2010. His properties were divided among his four sons, who were now part of Britain's upper class. His youngest son, Walker, followed him into politics.

However, Morrison's main legacy was not to move his family into the upper class but to demonstrate how commerce could be developed into discount retailing and how fortunes could be made in industrial entrepreneurship. His low-cost clothing made better apparel available to the masses and eventually opened up the way for today's mass marketing.

Samuel F. B. Morse

American inventor and painter

Although Morse began his career as a notable painter, his fame and fortune came from his invention of the single-wire telegraph and the Morse code, inventions that linked all of the continental United States and eventually other parts of the world.

Born: April 27, 1791; Charlestown, Massachusetts
Died: April 2, 1872; New York, New York
Also known as: Samuel Finley Breese Morse; The Lightning Man
Sources of wealth: Patents; telegraph
Bequeathal of wealth: Charity

Early Life

The son of Jedidiah Morse, a Calvinist pastor and prominent geographer, Samuel Finley Breese Morse spent his early years floundering until he settled upon an ambition to be a great painter. While Morse achieved some distinction in the genre of historical painting, he failed to secure the lucrative commissions and public recognition that he craved above all. Although the restless Morse did receive the respect of his fellow artists, who chose him to head the newly established National Academy of Design in New York City, by the mid-1820's he had resolved to find another way to make a living and to achieve distinction as an original mind.

First Ventures

On a sea voyage in 1825, Morse met Charles Thomas Jackson, an American with a keen interest in electromagnetism. After observing the operation of Jackson's electromagnet, Morse in 1832 conceived the idea of a single-wire telegraph, a means of communication via a code tapped on a keypad that could link cities and communities to each other and eventually connect the entire world.

What happened next is open to dispute. Like many nineteenth century inventors, Morse discounted his predecessors' and collaborators' accomplishments so he could claim title to patents that would allow him to assert sole ownership of his invention and the profits it generated. Morris stood accused of stealing their ideas, and thus began his arduous but successful lifelong battle to foster his fame and wealth.

Samuel F. B. Morse sends a telegraphic message during a ceremony honoring him at New York's Academy of Music in 1871. (Library of Congress)

Hoping to interest Congress in purchasing his single-wire telegraph (other inventors in England, for example, had devised much more complicated mechanisms using several wires), Morse decided on a pilot project that would link Washington, D.C., and Baltimore, Maryland, by telegraph wire. After several failed experiments over two years, he finally succeeded in 1844. Even so, Congress's slowness in appropriating funds for the telegraph and Morse's difficult dealings with businessmen and fellow inventors, several of whom claimed technological breakthroughs that enabled the steadily lengthening telegraph lines to transmit messages, cast doubt on his ability to profit from his invention.

Mature Wealth

Morse's financial fate improved in 1847, when he finally secured a patent for the invention of the single-wire telegraph. In 1851, he was able to triumph over competing companies and inventors when his system became the standard method of telegraphy in Europe. In 1853, the U.S. Supreme Court upheld Morse's claim to sole ownership of the telegraph patent, a decision that cleared the way for him to profit from his invention. In 1858, the French government paid him 400,000 francs (then worth about $80,000) for the use of his equipment.

Morse had trouble profiting from his dealings with telegraph companies, but in the end his various investments, principally his shares in Cyrus West Field's Atlantic Telegraph Company, yielded considerable wealth, which was valued at approximately $500,000 when Morse died.

Morse made contributions to religion-based charitable organizations. He also lavished his fortune on Locust Grove, his home in Poughkeepsie, New York, which he acquired in 1847, and was later declared a historic site. Morse designed his home as an Italian villa and furnished it with important collections of paintings, furniture, and ceramics.

Legacy

Morse's invention linked both coasts of the United States in 1861. He was often called the "lightning man" because he had made possible a swift communication system, utterly transforming the way Americans received their news in newspapers and the way public figures could disseminate information. The virtually instantaneous transmission of news reports, speeches, election results—all the events of modern life—made Morse a celebrated figure in his own time. His Morse code, a set of dots and dashes representing letters, numbers, and symbols, remains a permanent contribution to modern communications.

Clint Murchison, Sr.

American oil and gas magnate

Murchison was a Texas oilman who valued powerful associations and courted influence at the highest levels of business, politics, and organized crime.

Born: April 11, 1895; Tyler, Texas
Died: June 19, 1969; Athens, Texas
Also known as: Clinton Williams Murchison, Sr.
Source of wealth: Oil
Bequeathal of wealth: Spouse; children; charity

Early Life

Born in Tyler, Texas, Clinton Williams Murchison (MUHR-chih-son), Sr., grew up in Athens, Texas, and was educated at a private academy. Although his parents, John Weldon and Clara Lee Murchison, offered to pay his way through college, he refused in order to continue his work in the family-owned bank. He married Anne Morris and the couple had three children, two of whom survived into adulthood. Murchison performed honorably as a second lieutenant in the U.S. Army during the last years of World War I before returning to Texas and the full-time pursuit of his growing business interests.

First Ventures

Back in Texas, Murchison entered the cattle business and excelled at improving the quality of herds and knowing when to sell them. Murchison had been close friends for several years with another bright, wealthy, and ambitious entrepreneur, Sid W. Richardson. Richardson picked up Murchison when Murchison arrived in Fort Worth after completing his military tour, and the two men sped to the Texas oil boomtown of Burburnett. Using information-gathering techniques that would later be illegal, they made a fortune in the oil business. From Richardson, Murchison learned always to retain a minority interest in every oil well he sold, thus generating future earnings from property he no longer owned.

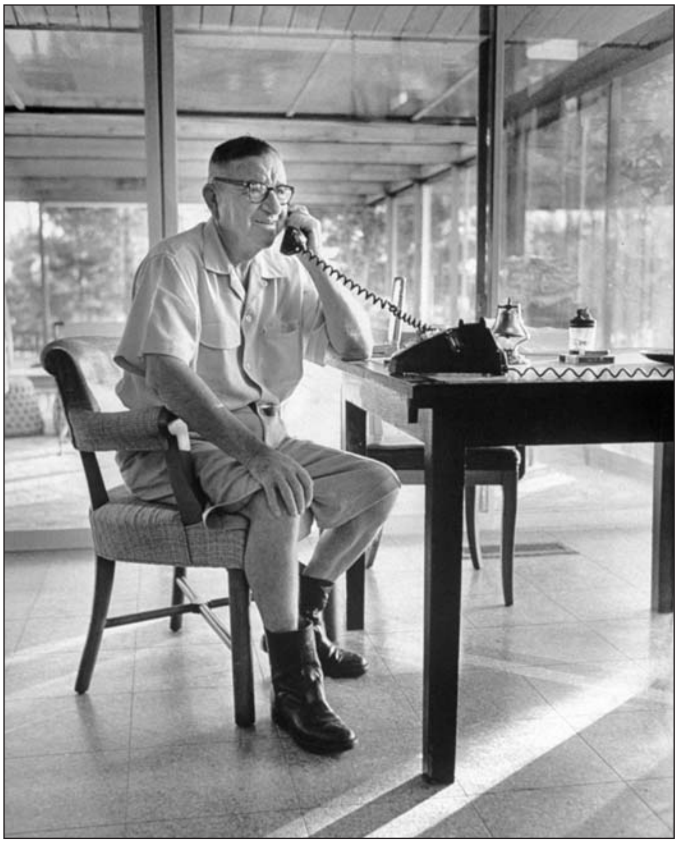
Murchison soon realized the potential for huge profits in another fossil fuel, natural gas. Moving quickly, Murchison bought the rights to supply natural gas in

Albuquerque and Santa Fe, New Mexico. By his mid-thirties, Murchison, through a variety of enterprises, had amassed a fortune conservatively estimated at tens of millions of dollars.

Mature Wealth

Murchison was not shy about bending the law when it came to making money. One common complaint was that he broke Texas law by ignoring production limits on the amount of gas that could be pumped, thus adding immeasurably to his fortune. He had powerful friends, however, and all of them understood that economic opportunity was the most important thing. Murchison built or acquired several successful enterprises and companies, such as Southern Union Gas Company, American Liberty Oil Company, Trans Canada Pipeline, Inc., and the New York Central Railroad.

Murchison used most of his vast wealth to finance a lavish lifestyle. He built a luxury resort at La Jolla, California, and used it to entertain his new Hollywood friends, including Frank Sinatra, John Wayne, and Elizabeth Taylor. A conservative Democrat, he understood the importance of strong political connections and accordingly developed friendships with politicians Lyndon B. Johnson, Dwight D. Eisenhower, Richard Nixon, and Sam Rayburn, and J. Edgar Hoover, director of the Federal Bureau of Investigation (FBI). Unfortunately, some of his connections were sordid and ominous, such as those with organized crime bosses Carlos Marcello and Vito Genovese.



Clint Murchison, Sr. (Time & Life Pictures/Getty Images)

Legacy

Murchison was and remains a controversial figure. He could be supportive and philanthropic, and he did donate substantial sums to various Texas charities and universities and often paid college tuition for promising young men. However, he could also be utterly ruthless in business and politics. Many believe that Murchison hosted a meeting in Dallas on the evening of November 21, 1963, which was attended by Johnson, Hoover, and Nixon, among others. The purpose of the meeting was supposedly to finalize plans for the assassination of President John F. Kennedy, a man Murchison intensely disliked, the following day.

Murchison should be remembered for his business skills and for being the embodiment of laissez-faire economics and politics during a largely unregulated era. The good things he did with a part of his wealth should also be noted. It is probable, however, that the less flattering aspects of his life will continue to interest both researchers and the public for years to come.

Rupert Murdoch

American media magnate

Murdoch, an Australian-born billionaire, transformed a relatively modest inheritance consisting of two small Australian newspapers into a multibillon-dollar international holding company that owns print and online newspapers, television and radio stations, and other media organizations across the world.

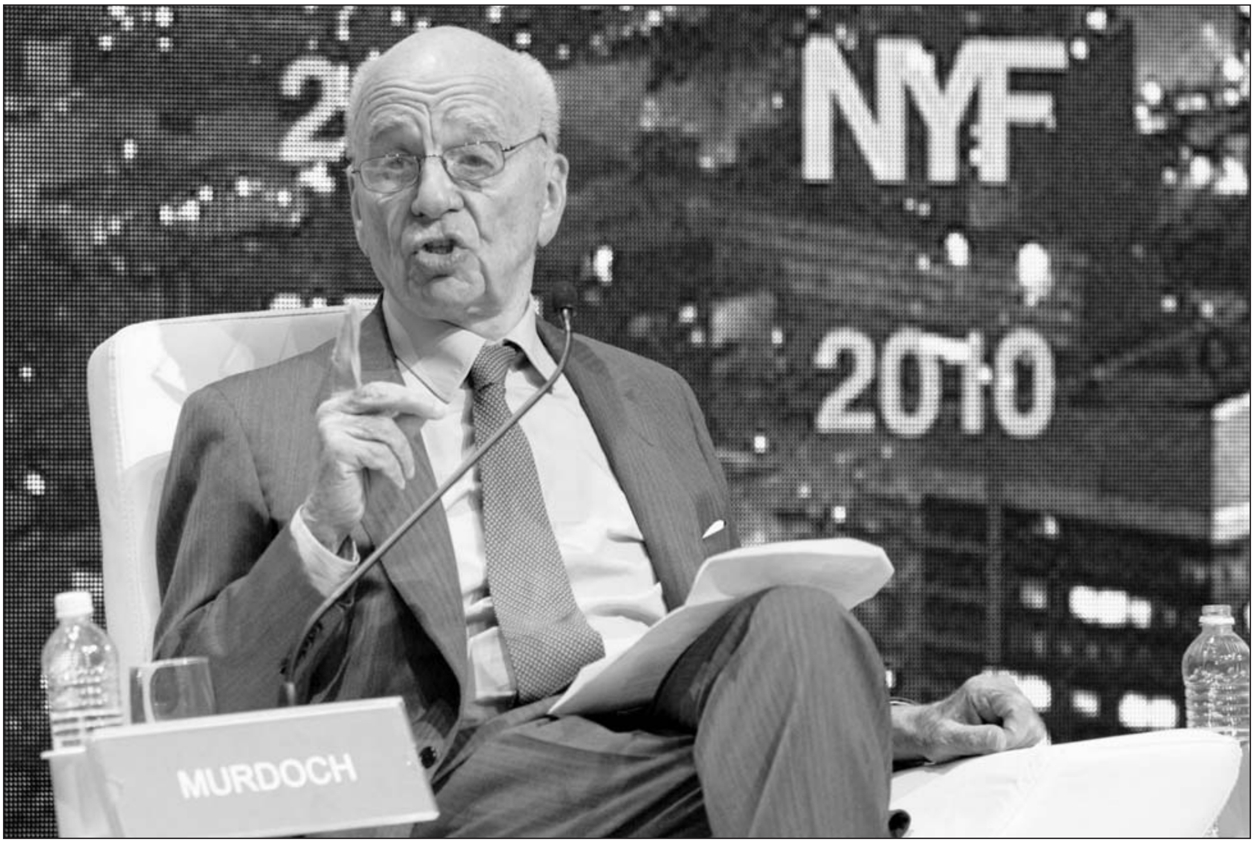
Born: March 11, 1931; Melbourne, Victoria, Australia
Also known as: Keith Rupert Murdoch; Rupert K. Murdoch
Sources of wealth: Inheritance; media
Bequeathal of wealth: Charity

Early Life

Keith Rupert Murdoch (REW-poort MUHR-dok) was born on March 11, 1931, in Melbourne, Australia, to Sir Keith and Lady Elisabeth Murdoch. His father, who ran a lucrative newspaper chain, died in 1952, and in 1954 the younger Murdoch returned from his studies in England to take over the two mediocre newspapers that were all that remained when his father's estate was finally settled. In just two years, Murdoch made the newspapers so successful that he was able to buy a Sunday newspaper in the western Australian city of Perth, laying the ground for global expansion that would eventually encompass England, the United States, and Asia.

First Ventures

Building on his initial success, Murdoch launched the first national Australian newspaper, the *Australian*, in 1964, employing a tabloid sensibility that serious journalists decried but readers loved. Before long, Murdoch was able to look beyond Australia to England, and within a year of purchasing the British newspaper the *Sun* in 1969, he doubled its circulation, in large part by making the controversial and now legendary decision to publish daily photographs of topless women. Murdoch made his



Rupert Murdoch addresses a business forum in 2010. (Bloomberg via Getty Images) first foray into the United States by buying the *San Antonio Express-News* in 1973, followed by the *New York Post* in 1976. In 1980, he created News Corporation Limited (or News Corp.) as a holding company for his expanding interests, and in 1985 he became an American citizen, primarily so he could legally own American television stations.

Mature Wealth

Murdoch's foray into American television catapulted his wealth and influence to dizzying new heights. In 1985, he purchased the film company Twentieth Century-Fox, as well as several local television stations that he ultimately combined into the Fox Network. In 1989, he launched Sky Television in England, admittedly a less successful venture that resulted in significant losses. Murdoch was able to restructure News Corp.'s debt, however, and continued to fund existing operations and launch new ones. In 1993, Murdoch acquired Star TV, one of the largest satellite television networks in Asia, in order to begin expanding into that part of the world. He became a household name in 1996 when he launched the Fox News Channel, a twenty-four-hour cable news station that quickly snared a significant market share. As with many of Murdoch's newspapers, Fox News' tabloid sensibilities drew much criticism, and the station has come under fire for biased coverage, but it retains a loyal audience.

Murdoch's personal life mirrored the fluctuations of his business. In 1999, Murdoch agreed to pay a divorce settlement of more than $1 billion to his second wife, only to marry for a third time a few weeks later. By 2003, he had six children with his three wives, and the elder of his children had varying degrees of involvement with News Corp.

While Murdoch has faced frequent opposition from traditional news companies, critics, and the U.S. Federal Trade Commission, his market savvy and risk taking have undeniably paid off. His 2005 purchase of the social networking site MySpace signaled his intention to tap into the Internet's vast potential, and his trademark perseverance resulted in his 2007 landmark purchase of Dow Jones & Company, Inc., the publisher of *The Wall Street Journal*.

Legacy

Rupert Murdoch's single-minded determination allowed him to expand his family's relatively modest newspaper interests into News Corp., arguably the world's most powerful media holding company from the 1990's through the first decade of the twenty-first century. He has been able to position his company on the forefront of new television technologies, and he boldly began exploring Internet-based news and entertainment from the inception of this medium. Murdoch's success may be attributed to his global outlook and his willingness to diversify from traditional newspaper publishing to television, film, and Web commerce. While his political conservatism and his apparent desire to influence global politics have been widely criticized, his business acumen is universally recognized.

Mansa Mūsā

Mandé royalty

Mūsā is remembered for spending rather than generating wealth. During his pilgrimage to Mecca and Medina, his entourage's display of wealth, his largesse in exchanging presents, and his spending spree were of such proportions that they established the empire of Mali as the fabled Land of Gold.

Born: c. 1280; probably Niani, Mali
Died: 1337; Niani, Mali
Also known as: Kankan Mūsā
Sources of wealth: Inheritance; trade; government
Bequeathal of wealth: Children

Early Life

The empire of Mali, the largest and most powerful state of its time in the western Sudan region of West Africa, originated with the conquests of Sundiata in the early thirteenth century. The line he established continued to rule as *mansa*, a title of sovereignty among the Mandé, for about a century but struggled to keep the empire together.

In 1312, the royal succession skipped to a descendant of Sundiata's younger brother. The first ruler of this line was Mansa Mūsā (MAN-suh MEW-suh), who is described by chroniclers as upright, godly, devout, pious, and equitable. Nevertheless, he somehow killed his mother, reportedly by accident (no details are available), for which he felt deep remorse. A holy man suggested he go on a *hajj* (pilgrimage) to atone.

First Ventures

Mansa Mūsā obtained his wealth by virtue of his position as ruler of Mali, a federated empire in which peripheral areas often broke away and had to be reconquered. Strong *mansas* like Mūsā kept the empire together, imposing security that encouraged trade and commerce. The most important long-distance trade commodity was gold. By the fourteenth century, West Africa was the Old World's major importer of gold. This gold came from several major deposits, but in Mansa Mūsā's time the main source was the region of Bure at the headwaters of the Niger River, where seasonal shallow pit mining was practiced. This was arduous, dangerous, and very labor-intensive work done in family groups. Contemporary accounts maintain that merchants engaged in the "silent trade" with the miners, a form of barter in which the exchanging parties were not in direct contact, although some modern scholars believe such stories to be spurious. In any case, the merchants benefited far more from this trade than the gold producers, and rulers like Mansa Mūsā, who taxed and controlled the trade, benefited most of all.

The African Gold Trade

The African gold trade established economic and ultimately cultural exchanges between West Africa and the Middle East and Europe. Sudanese merchants who dealt with the gold miners were known as *wangara* (or *juula*), a class of specialized long-distance traders. These traders also dealt in other products, chief of which were slaves; wild animal products like hides, ivory, and civet; kola nuts; and food products, including grains and dried fish, across the western Sudan. Gold, however, was the driving commodity of long-distance trade. It was carried to cities like Awdaghust, Jenne, and Timbuktu, where it was processed into bars, jewelry, and filaments. Almost all West African gold was exported, and of the little that stayed behind, none of it was minted into coins. One estimate puts the amount of gold exported per year at somewhat more than a ton, stretching across a number of centuries.

Gold headed north would enter the trans-Saharan trading system. Scholars disagree as to when this system was in place, with dates ranging from the fifth century B.C.E. to the eleventh century C.E. Crucial to the large-scale development of commerce was the introduction of the dromedary, or Arabian camel, as a pack animal and the creation of the caravan system, with its staging posts and refreshment stations. A single, well-marked, well-maintained highway did not exist. Rather, at any given time merchants led by guides could cross on several different trails ranging in parallel bands west to east from near the Atlantic Ocean to Lake Chad.

Among the major products that came south were textiles and other manufactured goods and metal products, in particular copper and its alloys. A load of salt was usually picked up along the way at mines located in the northern Sahara. As West Africa was a salt-deficient region, over the long run salt proved to be the most important commodity coming from the north, particularly in the trade for gold.

Ultimately, the huge influx of gold and silver from the Americas that began in the sixteenth century sent the West African gold trade into a decline from which it never recovered. Some gold continued to be sent across the trans-Sahara until at least the early nineteenth century. The caravan trade itself remained operational into the twentieth century fueled by the demand for salt.

Mature Wealth

Mansa Mūsā's pilgrimage was more than an attempt to atone. For his own people, a high-profile royal *hajj* was a conspicuous way of showing his piety and gaining *baraka* (spiritual power), as well as giving his rule legitimacy, an especially important consideration for the scion of a new royal line. A pilgrimage could attract scholars, merchants, and craftsmen and increase trade, diplomatic relations, and general contact with other Muslims in the lands through which it passed or in places where residents had heard about the trip. For his part, Mūsā was not reluctant to expend the resources of Mali. According to both Sudanese and Egyptian sources, the size of his procession was incredible, with estimates ranging from eight thousand to sixty thousand people. The logistics involved represent an extraordinary feat, as this was certainly the largest number of people ever to have crossed the Sahara at a single time.

Mansa Mūsā holds the record not only for traveling with the most people but also for transporting the largest amount of money. Pilgrimages were an important way in which Sudanese gold reached the Middle East, from where it was often funneled to Europe and other parts of Asia, particularly India. However, Mūsā's caravan was unique in the sheer quantity of gold it carried. On entering Cairo, his caravan is said to have been led by five hundred slaves, each carrying a rod of gold weighing five hundred *mithqals*, or about six pounds. The slaves were accompanied by eighty to one hundred camels, each laden with gold dust (a camel could carry up to three hundred pounds). From these reports, one scholar estimated that Mūsā traveled with between twelve and fifteen tons of gold, not including the pocket money of his followers. These figures, however, are improbable, and more recent estimates have been revised downward to around a ton. Still, this was an enormous amount of gold for the time.

In Cairo, Mūsā showered gifts of gold on the ruling sultan and his high officials. In Mecca and Medina, he gave large amounts of gold to be distributed as alms.

On his return trip through Cairo, the *mansa* seemed determined to spend what was left of his gold. He and his followers went on a buying frenzy that became legendary, purchasing clothes, books, Turkish slaves, singing girls, and anything else that caught their eyes. Cairene merchants made what was described as incalculable profits. Obsessed with buying, the Malians began reselling what they had purchased, getting back half of what they had paid so they could buy new items they wanted even more. When their money ran out, they began to borrow, and the biggest borrower was the *mansa* himself, who was royally fleeced by Egypt's most prominent businessmen. Lenders are said to have reaped a return of seven hundred dinars (a dinar was a gold coin) for every three hundred they lent. One merchant family alone lent Mūsā fifty thousand dinars. To raise additional cash, Mūsā had to sell a palace the Egyptian sultan had given him as a gift.

The Malians did have a revenge of sorts. They dumped so much gold on the Cairo market in such a short time that the gold became greatly devalued. Various estimates have been made as to the amount of inflation that resulted from the buying frenzy, but twelve years later the Egyptian monetary system was still in disarray. Nevertheless, the Egyptians came out better than the Malians in paying the price for this most spectacular of royal *hajjs*. Mansa Mūsā's pilgrimage has been hailed as one of the great events of West African history, but for all its splendor, its reckless extravagance must have put a great strain on the Malian economy, resulting in considerable hardship for the common people back home. Contemporary writers, however, did not notice.

Mūsā spent much of the rest of his life dealing with the repercussions of his trip. He sent gifts to the Egyptians who had accompanied him on the pilgrimage and a letter to the sultan, in which he included another large sum of gold. Whether Mūsā ever repaid the merchants who lent him money in Cairo is another matter. Three contemporary reports state that he did and two that he did not. Mansa Mūsā died, apparently of natural causes, in 1337.

Legacy

Mansa Mūsā's pilgrimage increased diplomatic relations and cultural exchange between Mali and the larger world of Islam, in particular Egypt and North Africa, and trans-Saharan trade was greatly stimulated, especially in gold. Whether an act of pious generosity, or irresponsible spending, Mansa Mūsā's pilgrimage was above all a public relations extravaganza that produced results. Word of Mali, Land of Gold, spread throughout the Mediterranean and into Europe, where Mali began appearing on maps along with a representation of Mansa Mūsā sitting on a throne and holding a gold nugget. The city of Timbuktu, said to have been the staging post for the trip (which actually may have been Walata), was rumored to have been paved with gold. In the century after Mūsā's trip, Portuguese ships began venturing down the African coast in the quest for gold, to be joined later by overland explorers.

In the meantime, Mali declined and was replaced by another empire, Songhai, while Bure gave way to an even richer goldfield, that of Akan. While the image of Timbuktu and the gold of Mali took on a life of its own (it was finally dispelled in 1828 by the explorer René-Auguste Caillié), there can be no doubt that between the eighth and fifteenth centuries Sudanese gold was a vital component in supporting the Islamic monetary and commercial system from Morocco to Iraq. This gold also made possible the great increase in international trade during the late Middle Ages, initially among the cities of Italy and later in other parts of Europe.

al-Mustanṣir
Egyptian royalty

Al-Mustanṣir inherited the prosperous Fāṭimid caliphate that flourished around the Mediterranean between the tenth and twelfth centuries. However, he was unwittingly responsible for losing much of the caliphate's fortune through the incompetence of his advisers, religious infighting, and bad luck.

Born: July 5, 1029; Egypt
Died: January 10, 1094; Cairo, Egypt
Also known as: Maʾad al-Mustanṣir Billāh
Source of wealth: Inheritance
Bequeathal of wealth: Dissipated; unknown

Early Life

Maʾad al-Mustanṣir Billāh, who came to be known as al-Mustanṣir (ahl-moos-TON-sihr), was the son of Caliph al-Ẓāhir and a dark-skinned Sudanese concubine named Rasad. At the age of eight months, he was declared successor to the caliphate. Al-Mustanṣir was raised in splendor and luxury at a palace in Cairo, a city founded a century earlier by the Fāṭimids, leaders of the then-dominant Shīʿite faction of Islam, who traced their descent from the Prophet Muḥammad's daughter, Fāṭimah. After his father died, al-Mustanṣir ascended to the throne in 1036, at the age of seven.

First Ventures

Although al-Mustanṣir was titular leader to millions of subjects across vast territory, his chief adviser (vizier), Ali bin Ahmad Jarjarai, made most decisions. When the vizier died in 1044, Queen Mother Rasad became her teenage son's closest adviser, assisted by a succession of mostly short-term viziers of varying degrees of honesty and capability.

In the decade of the 1040's, trouble arose with a schism in the Islam faith. Many Shīʿites converted to the more conservative, less tolerant Sunni branch. Natural disasters further complicated matters. The usually reliable Nile River ran low for several seasons, devastating crops. Famine was rampant for seven years. Amid the chaos and want, the caliph's army of mercenary soldiers, recruited from a dozen different territories, revolted. Light-skinned Turkish and Berber troops fought against dark-skinned former comrades from the Sudan. In pursuit of victory, the Berbers burned harvests and disrupted irrigation to worsen the famine and force their enemies to surrender. A plague swept through at the same time, decimating the weakened population.

Mature Wealth

The succession of tragedies affected the caliphate of al-Mustanṣir, and its territory of influence receded. Beginning in 1043, the Fāṭimids lost control of Algeria, Tunisia, Syria, and Sicily, and in 1099 would lose Palestine to the first wave of Crusaders.

In the 1060's, the Turkish mercenaries and their allies were victorious over the Sudanese and marched into Cairo. There, they sacked al-Mustanṣir's palace, making off with priceless works of art, jewelry, and other valuables sold for a fraction of their worth. A 600,000-volume library was wantonly destroyed. The caliph's stables, which once housed thousands of fine horses, were reduced to three scrawny nags. The Fāṭimid treasury, built up since the early tenth century, was quickly depleted. During their tenure in power, the Turks treated al-Mustanṣir with contempt, and the caliph had to rely upon charity to eat.

Although the Turkish mercenaries' revolt was suppressed in the mid-1070's, al-Mustanṣir never regained the power, wealth, or territory that circumstances caused him to lose. His mother was eventually removed from power, and viziers ran the government during the remainder of his reign. He died when he was sixty-four, having ruled as caliph in name, if not in fact, for fifty-seven years, longer than any other ruler of an Islam state.

Legacy

Al-Mustanṣir's second son, al-Mustaʿlī, succeeded his father as caliph in 1094. However, it was an empty title since the Fāṭimid caliphate had shrunk to roughly the size of modern-day Egypt. The caliphate collapsed in the 1160's. Saladin conquered Cairo in 1169, and Egypt was incorporated into a Sunni dynasty that would last until 1254, when the Mamlūks took control, continuing Arab rule until the advent of the Ottoman Empire in the sixteenth century.

With the passage of time, al-Mustanṣir's fame dwindled. The Fāṭimid fortune that had been acquired through tribute, taxes, and gifts was stolen and scattered. The Shīʿite-based dynasty that ruled for more than 250 years became extinct, and in the early twenty-first century the overwhelming majority of Muslims adhered to Sunni doctrines.

Samuel I. Newhouse

American media magnate

Newhouse rose from obscurity to build a vast, family-run empire of newspapers, magazines, radio stations, and television stations in eleven states. His reputation rests on his business acumen and attention to profitability much more than on his quest for journalistic excellence.

Born: May 24, 1895; New York, New York
Died: August 29, 1979; New York, New York
Also known as: Samuel Irving Newhouse; Solomon Isadore Neuhaus (birth name); S. I. Newhouse
Source of wealth: Media
Bequeathal of wealth: Children; charity; educational institution

Early Life

Samuel Irving Newhouse was the first of eight children born to two recent Jewish immigrants, Meier Neuhaus, a garment worker from Russia, and Rose Arenfeldt, a farm girl from Austria. When Newhouse was two, his family moved to Bayonne, New Jersey, where he started working at age twelve for Hyman Lazarus, a lawyer and judge. Although an eighth-grade dropout, Newhouse was an adept bookkeeper and subsequently an office manager, earning Lazarus's confidence. In 1911, at age sixteen, Newhouse started managing the *Bayonne Times*, a failing newspaper owned by Lazarus, and he quickly made it profitable by convincing local merchants to increase their advertising expenditures.

First Ventures

Newhouse purchased his first newspaper, the *Fitchburg News* (Massachusetts), in 1920 and sold it one year later at a significant profit. Although not a journalist, he understood the economic potential of newspapers, if managed efficiently. In 1922, Newhouse acquired the *Staten Island Advance* and established the pattern that became his hallmark: He found newspapers that were losing money, established control as the majority stockholder, but allowed local autonomy for the editors. He also promoted the benefits of his newspapers' advertising to local merchants; cut the costs of operation, in part by reducing staff; and then watched as the newspapers' circulation and profitability increased. During the Great Depression of the 1930's, Newhouse was able to expand his holdings, acquiring the *Long Island Daily Press* in 1932, the *Newark Evening Ledger* in 1935, and the *Syracuse Herald* and *Syracuse Journal* in 1939.

Mature Wealth

Throughout his business career, Newhouse never lost his thirst for purchasing new properties and maximizing profits. Starting in the 1940's and 1950's, his media empire broadened to include radio and television stations in Alabama, Missouri, New York, Oregon, and Pennsylvania. In 1959, he also entered the periodical publishing business, first by purchasing the Condé Nast chain of glossy magazines, including *Glamour*, *Vogue*, and *House & Garden*, and then the Street & Smith chain of similar magazines, including *Charm* and *Mademoiselle*. The consolidation of these magazines under one owner allowed Newhouse to offer better rates to potential advertisers.

No longer needing to find inexpensive bargains, Newhouse often paid top prices for some of the nation's most prestigious newspapers. For instance, he established new records with the acquisitions of the Portland *Oregonian* in 1950, *Birmingham News* and *Huntsville Times* in 1955, *New Orleans Times-Picayune* and *New Orleans States-Item* in 1962, *Cleveland Plain-Dealer* in 1967, and eight Michigan newspapers plus *Parade* magazine in 1976. With each new acquisition, Newhouse left the day-to-day operations in the hands of local editors, while ensuring that he and members of his family were the majority stockholders. Admittedly, not every attempt at expansion was successful; the *Baltimore Sun*, *Denver Post*, *New York Times*, *Omaha World-Herald*, *Philadelphia Inquirer*, and *Washington Post* all rebuffed his advances. Nevertheless, by the mid-1970's the Newhouse media empire encompassed some thirty newspapers with a total circulation exceeding three million, as well as twelve magazines, five radio stations, and six television stations.

In 1977, Newhouse suffered a slight stroke, and two years later he experienced a more serious stroke, from which he never recovered. He died in New York City on August 29, 1979.

Legacy

The extensive acquisitions made during Newhouse's sixty-five-year career elevated him and the holding company he established, Advance Publications, Inc., to the top rank of private media wealth. Moreover, his philanthropy established the prestigious Samuel I. Newhouse School of Public Communications at Syracuse University. However, the bulk of Newhouse's wealth was transferred to his heirs, primarily his two sons, Samuel I. Newhouse, Jr., and Donald E. Newhouse. They continued their father's legacy of paying record prices for lucrative properties and maintaining control of the business within the family, while still allowing editorial autonomy at the local level. The increased consolidation of the newspaper industry at the beginning of the twenty-first century, resulting in large media chains and fewer independent companies, owes much to the Newhouse family.

Stavros Niarchos

Greek shipping magnate and socialite

Niarchos led the way in modernizing Greece's shipping industry after World War II and assembled a larger merchant fleet than any of his competitors. One of the world's richest individuals, he pursued a lavish lifestyle, but he provided for the establishment of an international philanthropic foundation after his death.

Born: July 3, 1909; Athens, Greece
Died: April 16, 1996; Zurich, Switzerland
Also known as: Stavros Spyros Niarchos; The Golden Greek
Source of wealth: Shipping
Bequeathal of wealth: Children; charity

Early Life

Stavros Spyros Niarchos (STAHV-rohs SPEE-rohs nee-AHR-kohs) was born in Athens, Greece, after his naturalized American parents, Spyros and Eugenia (née Coumandaros) Niarchos, had returned to the land of their birth. He grew up in the nearby port of Piraeus and learned to sail at the age of nine. Niarchos was fourteen when his family went bankrupt, and although he studied law at the University of Athens, he eventually went to work at the flour-milling business owned by his maternal uncles.

First Ventures

An astute young man, Niarchos suggested that the Coumandaros brothers buy their own large freighters in order to cut the expense of shipping grain from Argentina. The Great Depression had made older ships available at bargain prices, and the move reduced the costs of importing grain by one-third. However, the brothers were reluctant to expand their fleet, and Niarchos left the firm in 1939, buying one of his uncles' ships through a London agent and creating his own company. He leased his small fleet to the British and American governments at the beginning of World War II and served in the Royal Hellenic Navy, although his growing wealth allowed him to spend most of his time in New York, London, and Egypt.

Mature Wealth

Several of Niarchos's ships were sunk during the war, but the insurance he collected for the losses allowed him to purchase American-made Liberty and Victory ships that had been mass-produced during the war. He set up a company involving his American-born sister in order to skirt laws regarding corporate ownership, and he registered the company in Panama to avoid American taxes, but he was nevertheless forced to pay $12 million in fines in 1953.

Niarchos also began commissioning oil tankers that were so large they would be dubbed "supertankers." During the Suez Crisis of 1956, which forced ships to travel around Africa rather than through the Suez Canal, he reportedly made additional profits of $1 million per day.

Niarchos had long been in competition with fellow shipping magnate Aristotle Onassis, and in the late 1940's the two had married the daughters of another important shipping figure, Stavros G. Livanos. Niarchos eventually triumphed over his competitor, and by the mid-1960's he owned some eighty vessels. After his wife

Eugenia died of an apparent overdose of sleeping pills in 1970, Niarchos married her sister Athina, who had earlier divorced Onassis. In 1974, Athina also died of an overdose of sleeping pills.

World shipping fell into a slump in 1972, but Niarchos, who had begun to diversify into such activities as oil refining and aluminum production, had already sold most of his fleet. He spent his remaining years collecting art, skiing in Switzerland, raising racehorses, and sailing on his 377-foot yacht, *Atlantis II*. He suffered a stroke in 1996 and died on April 16 of that year.

Legacy

Niarchos, whose name means "master of ships" in Greek, owed his success to his competitive spirit, as well as his keen business sense. After studying the practices of Norwegian shipping companies, he realized the possibilities of investing in fleets of large merchant ships, and he went on to pioneer the construction of supertankers. By the mid-1960's his fleet had become the largest in the world, and at the time of his death his family's wealth was said to be between $4 and $10 billion.

Niarchos had donated $5 million to the New York Hospital-Cornell Medical Center in 1979 to cover the costs of operating on Greek children, and he left the majority of his enormous estate to establish the charitable Stavros Niarchos Foundation, the administrators of which included his two eldest sons. His heirs began to dispose of the few remaining vessels of the Niarchos fleet in 2003, citing the increased risks involved in shipping.

Nicias

Athenian mine owner, military leader, and statesman

Nicias's wealth allowed him to play a major role in Athenian public life, both in politics and in military affairs.

Born: c. 470 B.C.E.; possibly Athens (now in Greece)
Died: 413 B.C.E.; Sicily (now in Italy)
Also known as: Nikias
Sources of wealth: Inheritance; mining; slaveholding
Bequeathal of wealth: Government

Early Life

Nothing is known about the early life of Nicias (NIHSH-ih-uhs). Although it is thought that he was born in Athens about 470 B.C.E., there is no factual confirmation of that date. His father was Niceratus.

First Ventures

Ancient Greece was a relatively poor land in natural resources. Mountains dominated much of the landscape, and good agricultural lands were limited. In addition, there were few minerals. However, around 500 B.C.E. significant deposits of silver were discovered in the district of Laurium near Athens. Nicias's father developed the mines, which were worked by slaves under horrendous conditions but were extremely valuable. At the time of his father's death, the date of which is unknown, Nicias inherited the mines with their one thousand slaves, becoming one of the wealthiest Athenians.

Mature Wealth

Because of the continued income from his silver mines, Nicias became a force in Athenian life. In fifth century B.C.E. Athens, wealthy individuals, such as Nicias, were expected to use their financial resources not only for personal consumption but also for the community as a whole. By the early 400's, democracy had taken root in Athens, and all free-born Athenian males whose parents were also native Athenians had equal political rights, including the right to participate in the *ecclesia*, or legislature, and to serve in administrative and judicial bodies. Of course, equality was not absolute, as there would generally be a certain amount of deference given to scions of the old aristocratic families and to those with more wealth. Nicias apparently was not a descendant of Athenian aristocrats, but his wealth gave him a significant presence in Athens.

The rich people of Athens used their wealth to become patrons of the arts, supporting painters and sculptors and providing prizes that were given to playwrights, such as Aeschylus and Sophocles. In addition, the wealthy were expected to pay for the naval ships that were crucial to Athens's glory and survival, both in war and in peacetime trade. According to the ancient Greek biographer Plutarch, Nicias was of the aristocratic party, the "good and the true," as opposed to the democratic faction led by Pericles, an Athenian statesman, who gained ascendancy over the city around 460 B.C.E.

Nicias constructed offerings to the gods, including one on the Acropolis, and he provided choral and gymnastic exhibitions for the general populace, including lavish gifts to the island of Delos, the supposed birthplace of the god Apollo. His gifts and donations were given in part to increase his political influence in Athens. Although praised for his virtue, Nicias was timid and possibly inhibited by the democratic faction. He held numerous military commands, but they were for the most part safe rather than adventurous. He was particularly pious and was constantly guided by heavenly signs and portents.

In 431 B.C.E., the Peloponnesian War began between Athens and Sparta and their numerous allies. After the death of Pericles in the great plague that struck Athens in 429, Nicias's political opponent and spokesman for the democrats was the flamboyant Cleon of Athens, who died in battle in 422. Probably never enthusiastic for the war, Nicias arranged a fifty-year peace in 421, named the Peace of Nicias, which essentially restored the city to the rule that had existed at the beginning of the war.

However, Alcibiades of Athens, the foremost democratic politician in this city-state, campaigned against the truce. War broke out again in 415, with Alcibiades advocating a campaign in Sicily, which he claimed would result in considerable loot that could be employed against Sparta. Nicias reluctantly accepted joint command with Alcibiades, but the latter was forced out because of a scandal. In a battle fought in Sicily against Syracuse, Nicias was too cautious and was outmaneuvered. In 413, according to the historian Thucydides, Nicias unfortunately postponed an Athenian retreat for twenty-seven days because of an eclipse of the moon. The surviving Athenians were forced to surrender, and Nicias was executed.

Legacy

As a result of his silver mines, Nicias was one of the wealthiest Athenians. As late as the fourth century B.C.E. the historian Xenophon wrote about Nicias's silver mines and their slaves.

He used his wealth to enhance Athens and to further his political prospects. Despite his fortune and power, however, he lacked sufficient military ability, and his reputation sank after the Sicilian debacle.

Alfred Nobel

Swedish inventor and industrialist

Nobel used the wealth accumulated from his patented inventions and business enterprises to establish the Nobel Prizes, which have been presented every year since 1901.

Born: October 21, 1833; Stockholm, Sweden
Died: December 10, 1896; San Remo, Italy
Also known as: Alfred Bernhard Nobel
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Nobel Prizes

Early Life

Alfred Bernhard Nobel (noh-BEHL) was born in Stockholm, Sweden, in 1833. That same year, his father, Immanuel Nobel, went bankrupt, and the elder Nobel then moved to St. Petersburg, Russia, to try to recoup his fortunes. Immanuel successfully established a factory for the manufacture of military land mines with which he supplied the Russian army, and in 1842 he moved his family to St. Petersburg, where Alfred and his siblings received excellent educations via private tutors. By age seventeen, Alfred was fluent in five languages, which served him well in his later business ventures. The tutors also instructed him in chemistry, physics, literature, and the classics.

In order to broaden the boy's education, Alfred's father sent him to study abroad in 1850. During a two-year period, Alfred visited France, Germany, Sweden, and the United States. While in Paris, he worked in the private laboratory of the noted chemist Théophile-Jules Pelouze, where he met the young Italian chemist Ascanio Sobrero. Three years earlier, Sobrero had invented nitroglycerin. Nobel became interested in the practical applications of this highly explosive liquid.

First Ventures

In 1852, Nobel's father asked him to return to St. Petersburg to work in the family business, which was booming because of the Crimean War. In Russia, Nobel and his father looked for ways to make the highly unstable nitroglycerin into an explosive that would be useful in warfare, mining, and construction. When the Crimean War ended in 1856, Immanuel Nobel's business in Russia began to fail and he once again went bankrupt. He returned to Stockholm, while Alfred remained in St. Petersburg and continued his experiments with nitroglycerin.

Alfred rejoined his father in Sweden in 1863 and devoted all his attention to turning nitroglycerin into a viable tool for mining and construction. After an explosion in 1864 killed several people, including his brother Emil, Alfred moved his experiments to a barge anchored in a lake. He developed methods for making nitroglycerin into a paste, which he patented in Great Britain in 1867 under the name of dynamite. He also invented a detonator ignited by lighting a fuse to set off the dynamite. These inventions greatly reduced the costs of many forms of construction.

Mature Wealth

By 1865, the factory Alfred established near Hamburg, Germany, exported nitroglycerin products to mining and construction enterprises throughout Europe, America, and Australia. His invention of dynamite coincided with a period of intense infrastructure expansion throughout western Europe and the rapidly industrializing world. In 1866, he established factories in New York and San Francisco. Nobel's products greatly reduced the cost of moving large quantities of rock, blasting tunnels, and other forms of construction work. In 1867, he patented dynamite in several countries and the following year obtained a patent in the United States. By the time of his death, Nobel owned more than 350 patents worldwide.

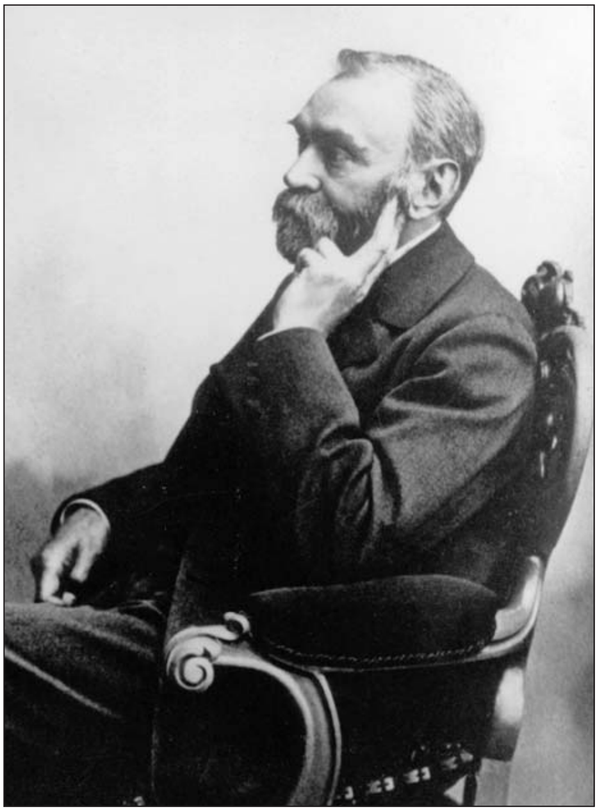
Nobel eventually established businesses in more than twenty countries, to which he constantly traveled, in part to defend his patents from those trying to steal his invention. Nobel spent most of his time working in his laboratories in Stockholm, Hamburg, and San Remo, where he devoted much of his attention to the development of explosives. Later he began developing other chemical inventions, such as synthetic rubber, leather, and silk. By age forty, Nobel had amassed a fortune and ran a successful international business empire.

In the 1870's, while traveling in Russia to seek sources of walnut for rifle stocks for his St. Petersburg arms manufacturing company, Nobel ended up buying potential oil-producing lands near Baku in Azerbaijan. He brought oil drillers from the Pennsylvania fields in the United States to modernize the Russian oil industry. By 1880, Nobel had completed the construction of the first oil pipeline to transport oil from Baku to Europe. With the profits from the pipeline, he built the world's first oil tanker and the first continuous-process oil-refining plant. The productivity of Nobel's Baku oil fields prevented John D. Rockefeller's Standard Oil Company from establishing the same monopoly position in Europe that it attained in the United States.

During the 1870's and 1880's, Nobel established a number of factories and companies throughout the world to exploit his explosives. He continued his own experiments to develop increasingly powerful explosives. In 1875, he invented a more powerful form of dynamite that he patented in 1876 under the name of blasting gelatin. He also invented a largely waterproof explosive he called nitrocellulose, and he marketed both this product and his blasting gelatin with great success.

In 1887, Nobel's laboratories developed ballistite, a smokeless, slow-burning projectile propellant, which was widely adopted by militaries around the world. Ballistite was Nobel's last major invention but one of the most profitable. Nobel subsequently founded a number of companies that continued to influence the world's economy into the twenty-first century.

Despite poor health, Nobel constantly traveled internationally long before the development of jet aircraft. His mastery of languages served him well in his business ventures. He made time in his busy schedule for an active interest in philosophy, natural sciences, and literature. He kept a journal in which he commented on the works of Greek philosophers, Voltaire, and Charles Darwin. He described himself as an idealistic misanthrope.



Alfred Nobel. (The Nobel Foundation)

Nobel never married. He did develop a close relationship with Bertha von Suttner, his housekeeper for a brief period. After she left his employ to marry, the two continued to correspond for decades. She became heavily involved in the international peace movement of the late nineteenth century, eventually writing an influential book *Die Waffen nieder!* (1889; *"Ground arms!" "Die Waffen nieder!" A Romance of European War*, 1906), which apparently had a profound effect on Nobel and his decision to include provisions in his will for a prize for persons or organizations promoting international peace. He had been interested in international peace for some time. He had optimistically predicted that his invention of dynamite would make war impossible because it contained the potential for mass destruction. Nobel was also enamored from an early age with literature. He wrote poetry and dramatic works. The other Nobel Prizes established in his will fulfilled his longtime interests in literature, chemistry, physics, and medicine.

In 1891, adverse publicity forced him to leave Paris, his residence of choice. He left after accusations of espionage by the French government concerning his sale of war matériel to the Italians. He moved to an estate he bought in San Remo, where he lived for the rest of his life. Nobel died of a cerebral hemorrhage on December 10, 1896, at his home in San Remo. He is buried at the Northern Cemetery in Stockholm.

Legacy

Nobel's will provided for the establishment of five international prizes to be awarded each year for outstanding accomplishments in physics, chemistry, physiology or medicine, literature, and peace. Many people consider these prizes the most prestigious awards in their fields. In addition to international recognition, the prizes carry a substantial cash award from the fund created by Nobel's considerable fortune, usually amounting to about $1 million each. The money not only rewards the recipients for their achievements but also allows them to carry on advancements in their fields. In 1969, the Bank of Sweden established a prize in Nobel's name in economics.

In the years since the awards were first presented in 1901, many famous people have received Nobel Prizes, including President Theodore Roosevelt, physicist Al-

Nobel Prizes

Alfred Nobel signed his last will and testament at the Swedish-Norwegian Club in Paris on November 27, 1895. In it, he left the bulk of his estate, 94 percent of 31 million kroner (about $186 million in 2008 U.S. dollars), to establish an endowment to award five prizes annually to individuals for outstanding achievements in physics, chemistry, physiology or medicine, literature, and the advancement of international peace.

The prizes were first awarded in 1901 for the equivalent of about $1 million in 2008 U.S. dollars. In 1969, the Bank of Sweden began awarding a prize in economics in Nobel's name. The prizewinners receive the awards each December 10, the anniversary of Nobel's death, in Stockholm, Sweden, except for the Peace Prize. The Norwegian parliament chooses the Nobel Peace Prize recipient and presents that prize in Oslo, Norway. Sweden and Norway were both part of the Swedish-Norwegian Union when Nobel wrote his will, and the will mandated that the peace prize be awarded by a Norwegian committee, while Swedish committees would present the other prizes.

The Royal Swedish Academy of Science selects five people to serve on each of the committees that choose the recipients of the prizes in physics, chemistry, and economics. A committee of four or five members of the Swedish Academy selects the recipient for literature each year. The Karolinska Institutet elects fifty members to the Nobel Assembly, which then chooses five members to serve on a committee to select the prize winner for physiology or medicine. The Norwegian parliament elects five members to serve on a committee to choose the recipient of the peace prize. These committees then ask several thousand people to nominate candidates for each of the awards. Experts in the disciplines then scrutinize the credentials and achievements of each of the nominees until only about fifteen names remain in each field. The respective committees then vote on the remaining candidates.

Each prizewinner (there are often multiple winners in physics, chemistry, physiology or medicine, peace, and economics) receives a medal made of eighteen-carat green gold plated with twenty-four-carat gold, a diploma, and a cash award worth approximately $1.2 million in 2008 U.S. dollars. The Nobel laureates often donate their cash awards to charity. In the event of two winners, the cash is equally divided; if three or more win, the cash may be divided according to the will of the committee. The king of Sweden presents the awards for physics, chemistry, physiology or medicine, literature, and economics in Stockholm; the king of Norway presents the prize for peace in Oslo.

From their inception, the Nobel Prizes have been marred by controversy. Candidates often have received awards for which they were deemed unworthy. President Theodore Roosevelt received the 1901 award for peace, even though he involved the United States in a war in the Philippines. Philipp Lenard and Johannes Stark received awards in physics in 1905 and 1919, respectively, although they were later associated with Adolf Hitler's National Socialist movement in Germany. Other people who many felt were worthy of awards never received them. For example, Mahatma Gandhi, a leader of the Indian independence movement, was nominated several times but was never presented a prize. Nevertheless, the Nobel Prizes remain perhaps the most prestigious awards in the world and their bestowal has come to have a social and political, as well as intellectual, significance. When, for example, the Peace Prize was awarded to U.S. president Barack Obama in 2009, many (including the president himself) saw the award as the expression of a hope in the promise of the new American administration after a period of war. That the Nobel Prizes—particularly the Peace Price—could have such symbolic impact is a testament to the stature they have attained since their establishment in 1901.

bert Einstein, and British prime minister Winston Churchill. The prizes have also provoked controversy about the omission of perceived worthy recipients and debate among experts in the various fields of the awards. Nevertheless, the prizes remain among the most prestigious and influential in the world.

Luis Noboa

Ecuadoran industrialist

Known as the Banana King, Noboa helped make Ecuador the leader in the export of high-quality bananas and built a worldwide conglomerate. He left a fortune estimated at $2 billion that became the subject of bitter rivalry among his family.

Born: February 1, 1916; Ambato, Ecuador
Died: April 28, 1994; New York, New York
Also known as: Luis Adolfo Noboa Naranjo (birth name); the Banana King
Sources of wealth: Agricultural products; trade
Bequeathal of wealth: Spouse; children

Early Life

Luis Noboa (loo-EES NOH-boh-uh) was born in Ambato in the Ecuadoran province of Tungurahua. Ambato was a picturesque town set in the mountains. Noboa's father, Luis Adolfo Noboa Ledesma, was a dentist; his mother, Zoila Villota Matilde Naranjo, worked as a seamstress. The family was of Lebanese heritage, an ethnic group that found great commercial success in Latin America. When Noboa was four years old, his father died in a horse-riding accident. His mother, Zoila, was left a widow with young children and three pounds of gold that her husband had saved from his business.

Zoila moved her family to Guayaquil, Ecuador's largest city. She was an enterprising woman, and she sold some of her gold to launch several commercial ventures. Noboa, known at this time as Adolfito, left school at eleven and became a salesman for the magazine *Savia*. At twelve, he began working in the Banco Sociedad General de Crédito, owned by Juan Francisco Marcos, Ecuador's wealthiest individual. In 1929, Noboa, who had a talent for math and numbers, a useful asset for a businessman, took courses in accounting at a local college.

First Ventures

With the money he saved from his various ventures, Noboa was able to set up his own shop in 1933 on a busy commercial boulevard in Guayaquil. Here he exchanged money and sold lottery tickets, souvenirs, hats, pens, and food items, in particular whole grain rice. He acquired a reputation for his hard work and business drive.

In 1935, the Standard Fruit Company set up operations in Ecuador. Noboa and Marcos's son, Juan Xavier Marcos, established the Compañia de Comercio y

Bequeathing Great Wealth

It is one thing to accumulate a vast fortune; it is another thing entirely to pass it on to the next generation. For better or for worse, great wealth is at its most vulnerable when its originator dies. Before wealth can be claimed by the next generation, it may have to escape confiscation by the government, estate and generational taxes, the grasping hand of the probate system, dispersal among many heirs, fraud, forged wills, and litigation spurred on by dissatisfied beneficiaries and avaricious lawyers.

Thomas Jefferson wrote that the wealth of the earth belonged to the living; at the conclusion of life, one's wealth should revert to society. After the Russian Revolution, the Soviets abolished inheritance in 1918; upon the death of a Soviet citizen, all of his or her property, including land, capital, and personal items, became property of the state. This law, forbidding the bequeathal of even toothbrushes and keepsakes, was found to be too onerous, and in 1922 it was repealed to enable personal items to be inherited. The Soviet experience, however, is the exception to the rule. The desire to bequeath wealth is a part of human nature, and it has been the common practice of most societies to allow the wealthy to leave their money to whomever they desire, with various incentives to ensure that this money is given to one's spouse, children, and charitable enterprises.

The way that money is passed on is a matter of great importance. The law of England and of many other nations was primogeniture, meaning that all of a man's property descended to his oldest son. As a result, the great estates of England were left intact for centuries. In addition, England employed the "fee tail" to prevent any of the property attached to great estates from being transferred outside the family. In contrast, property in the United States was evenly divided among one's children, a practice that Alexis de Tocqueville, in the third chapter of *De la démocratie en Amérique* (1835, 1840; *Democracy in America*, 1835, 1840), attributed to the egalitarian ethos of the new nation.

In most modern democracies, the wealthy are allowed to bequeath money as they desire, with a certain portion reserved for the government as an estate tax. Through tax laws, the wealthy are encouraged to make charitable gifts to foundations and other entities; with careful estate planning, such bequests more often preserve large fortunes rather than diminish them. Perhaps the greatest threat to large fortunes is litigation, as beneficiaries and those who feel they should be beneficiaries battle over distribution of the estate. Many great fortunes have dissolved in the rancor, expense, and legal fees of testamentary contests in court. Even the wealthiest individual can produce great bitterness with a poorly planned legacy. The Noboa family is certainly a glaring example, exacerbated by a contest between the children of Ecuadoran businessman Luis Noboa's first and second marriages. The Noboa heirs spent more than nine years and $20 million battling over Noboa's immense fortune.

Transporte S.A. with capital of 500,000 sucres to supply fruit to the Standard Fruit Company for export to North America. (The sucre, the Ecuadoran currency, was at this time valued at about $10 to 1 sucre.) Noboa and Marcos steadily increased their supply of bananas to Standard Fruit, and they also provided rice to the Argentinean firm of Bunge y Born for export to markets in Japan, South Africa, and India. In 1950, Noboa established the Industrial Molinera S.A. wheat flour company. Supplying the Quaker Oats Company, an American firm, with high-quality flour, Industrial Molinera soon became the largest wheat exporter in Ecuador. Noboa's Ultramares El Café company exported coffee and cacao around the world.

Noboa married Isabel Avila Ponton, with whom he had six children—Luis, Isabel, Diana, Álvaro, María Elena, and María Leonora—before divorcing.

Mature Wealth

By 1955, Noboa had become a multimillionaire. He was able to buy out Marcos's shares of Compañia de Comercio y Transporte S.A. for about $30 million. Noboa acquired the first of several agricultural farms, San Luis. He also established the Grupo Noboa as a holding company for his burgeoning line of businesses. The centerpiece of his conglomerate was Exportadora Bananera Noboa, S.A., one of the leading banana exporting companies in the world. On April 18, 1956, he led the Ecuadoran delegation to the International Conference of Banana Producers, lobbying against the assignment of export quotas by country. Ecuador became the world's leading banana supplier. By 1977, Exportadora Bananera Noboa, S.A. sold 47 percent of the bananas that were exported from Ecuador. Noboa's company marketed the Bonita brand of bananas, and he earned the nickname Banana King.

Practicing a business model of vertical integration, Noboa controlled his banana operation from top to bottom, owning twelve banana plantations covering thirty-five thousand acres; a company that provided aerial spraying of pesticides; Industria Cartonera Ecuatoriana, which produced cardboard containers for the bananas; and the shipping company Transportes Martimos Poultier, with a fleet of ships with refrigerated holds that exported the bananas without premature ripening. Noboa's conglomerate also included Ecuador's largest sugar mill, automobile factories, the Seguros Condor insurance company, and banking. His labor practices generated some controversy, and he was accused of mistreating workers and using child labor.

In 1971, Noboa divorced his first wife, granting her a large settlement. He married Mercedes Santistevan, who had divorced her husband, a business rival of Noboa. With the overthrow of President José María Velasco Ibarra, a Noboa ally, the following year, Noboa spent more time outside Ecuador. He continually denounced leftist economic reforms. Noboa learned English and located his corporate headquarters in New York City, where he oversaw his worldwide shipping and trading operations and other businesses.

In 1985, Noboa and his wife purchased an apartment in a building at 740 Park Avenue from billionaire Steven J. Ross for $4.1 million. The apartment house at 740 Park Avenue is renowned as the world's richest apartment building, and the Noboas settled into the rarefied and competitive social life of its fabulously wealthy residents. The Noboas lived in a gilded triplex penthouse, spanning the seventeenth to the nineteenth floors. Their apartment contained sixteen rooms and eight bedrooms, with seven bathrooms, terraces on every floor, and accommodations for a cadre of maids and servants. A huge media room featured theater seating for screening films. When Mercedes Noboa sold the apartment in 2004, its value had climbed to $28 million. The Noboas resided in the apartment for several months of the year, mixing with the elite of Manhattan and entertaining lavishly. The remainder of the year they lived in other luxurious homes they maintained in Southampton, New York, a summer retreat of the wealthy, in Lyford Cay in the Bahamas, and in Ecuador.

Noboa died in 1994, leaving a fortune estimated at $2 billion, including his operations in bananas, coffee, sugar refining, flour milling, soft drinks, shipping, banking, insurance, airlines, fertilizers, and industrial manufacturing. His widow Mercedes received 48 percent of his estate, and she held 4 percent in trust. The remaining 48 percent went to his children and grandchildren. The validity of his will was immediately attacked by a bevy of high-priced lawyers.

Legacy

Luis Noboa created one of the largest Latin American conglomerates. His foremost business was his Bonita brand of bananas, and he was one of the world's leading banana suppliers. In addition, he expanded into almost every other line of business in Ecuador. His will was contested upon his death, with his heirs spending more than nine years and $20 million fighting over his fortune. After a bitter court battle, his son Álvaro Noboa controlled the enterprises and rebuilt the family fortune.

A controversial figure in his own right, Álvaro Noboa ran twice for the presidency of Ecuador as a member of the National Institutional Renovation Action Party. He also built the Luis Noboa Naranjo Museum to commemorate his father. This museum, located in the center of Guayaquil, opened in 2006. A replica of Noboa's Exportadora Bananera office is on display, filled with keepsakes from his many businesses. The museum also showcases hundreds of works of art collected by Noboa.

MWENE MATAPA NYATSIMBA
Shona monarch

Nyatsimba founded a flourishing empire in southeastern Africa and was one of the greatest African monarchs. His kingdom engaged in industry and trade with the rest of the world in the last years before European conquest changed the continent.

Born: c. 1400; Kingdom of Zimbabwe (now in Zimbabwe)
Died: c. 1450; Kingdom of Mutapa (now in Zimbabwe)
Also known as: Nyatsimba Mutota (birth name); Mwene Mutapa Nyatsimba; Mutapa Mutota
Sources of wealth: Inheritance; conquest; trade
Bequeathal of wealth: Unknown

EARLY LIFE

Mwene Matapa Nyatsimba (MWEH-nay mah-TAH-pah nyaht-SIHM-bah) was born in southern Africa around 1400, the son of Chikura Wadyambeu, a prominent chief, or *mambo*. Nyatsimba is said to have descended from Mbire, the king who is credited with crossing the Zambezi River and conquering the land that is now Zimbabwe and Mozambique around 1000-1050, establishing the Mbire or Matapa Dynasty. The name Mwene Matapa Nyatsimba is composed of two Bantu words, *mwene*, meaning lord or chief, and *matapa*, meaning "the ravished lands" or "the conquered lands." Mwene Matapa, also known as Mwene Mutapa, and in Portuguese as Monomotapa, became the name of the Shona kingdom that rose in the early fifteenth century between the Zambezi and Limpopo Rivers in southeastern Africa. Nyatsimba, the first ruler of this kingdom, used the term Mwene Matapa to refer both to his kingdom and to himself, as did his successors. The Shona at this time had no written language, and so precise dates and names are difficult to determine.

FIRST VENTURES

According to oral tradition, Nyatsimba was sent by his father on an expedition to find a source of salt. To the north of his father's lands, he found the Tavara tribe, who lived on a bend in the Zambezi River that had good supplies of salt, as well as elephants and other game. Nyatsimba conquered the tribe and set himself up as king of Mwene Matapa around 1420 or 1430, establishing a capital in the middle of the Zambezi Valley in the ancient stone city known as the Great Zimbabwe (or "great stone city"). At its peak, this city was home to more than twenty thousand people.

Mwene Matapa became the first major civilization to become established in Zimbabwe, that is, the first state with permanent settlements, government, industry, and trade. The area was rich in natural resources, including salt, copper, and gold, and soon the kingdom had flourishing textile and ironwork industries, as well as agriculture and trade. Another important source of wealth was the plundering of neighboring lands.

MATURE WEALTH

By the time Nyatsimba died, around 1450, he had expanded the territory of his kingdom to include most of what is now Zimbabwe and Mozambique. Nyatsimba's personal fortune included gold, copper, jewels, elephants, and even Chinese porcelain. His capital city was located near Mount Fura on the Zambezi River. Many scholars believe that the Great Zimbabwe declined about this time because its gold was petering out and the environment had degraded from overuse and drought.

From this new capital, Nyatsimba continued to expand his territory through conquest. Nyatsimba was still the undisputed king, said to have a staff of one hundred female bodyguards and vassals ruling over smaller regions of the kingdom. The vassals' loyalty was bought, in part, with gifts of cattle herds, captured from other tribes. Nyatsimba had a large circle of advisers, made many decisions through consensus, and sent ambassadors to forge trust with trading partners. The kingdom by this time was involved in the copper trade and was a part of a network of gold traders that had extended its business to China.

LEGACY

Mwene Matapa Nyatsimba created one of the richest of the great African kingdoms, lasting from about 1420 to 1629. Under the leadership of his son, Matope Nyanhehwe, the state remained strong, but it began to decline with the next generation. In the seventeenth century, the kingdom was invaded and conquered by the Portuguese. Nyatsimba, or perhaps his son, was the last ruler to inhabit the Great Zimbabwe, an architectural marvel that had begun flourishing as one of the world's great cities in the eleventh century. The city was deserted by the end of the sixteenth century when Portuguese traders first saw it.

WILLIAM S. O'BRIEN

American silver mining magnate and banker

O'Brien is one of the four Comstock Lode silver kings, who worked with his three colleagues in such business ventures as Nevada silver mines and the Bank of Nevada. His partnerships with these men made O'Brien one of the richest people in the West during the Gilded Age.

Born: c. 1826; Ireland
Died: May 2, 1878; San Rafael, California
Also known as: William Shoney O'Brien
Sources of wealth: Mining; banking
Bequeathal of wealth: Relatives

EARLY LIFE

William Shoney O'Brien came to New York City from Ireland when he was a child. As a youth, "Billy" worked in a grocery store. Struck by gold rush fever, he landed in San Francisco on July 6, 1849. O'Brien planned to make money by selling merchandise to gold miners rather than mining for gold himself, but he initially was penniless and made a living by loading and unloading ships.

O'Brien then operated a tobacco shop with one partner before opening a ship chandlery with another. He also joined a volunteer fire company, California Engine Company No. 4, which served more as a social club than a public safety endeavor. In later years, O'Brien would be prouder of having once been foreman of the fire company than of being a member of the most powerful mining combine in the West. The engraved silver trumpet that he received as foreman became his most valuable possession.

FIRST VENTURES

In 1857, O'Brien joined James Clair Flood in opening a saloon, the Auction Lunch. O'Brien, always the sociable charmer, greeted customers on the sidewalk in a high silk hat, while Flood poured drinks. Both O'Brien and Flood profited greatly from the tips they received from stockbroker customers at their saloon. By 1867, the men had earned $60,000. They closed the Auction Lunch to concentrate on their stockbrokerage. The two stockbrokers met two Virginia City, Nevada, speculators, James G. Fair and John William Mackay, who were trying to take over a Comstock Lode silver mine. The four soon formed a partnership, with O'Brien as the least forceful but most popular member of the group.

MATURE WEALTH

When asked later in life how he had acquired his millions of dollars, O'Brien gave a stock answer that he had caught hold of the tail of an ascending kite and held on. O'Brien's value to the Comstock Lode group seems to have been that of a peacemaker. Respected by the others, he served as a mediating force when their sometimes volatile personalities clashed.

O'Brien paid $25,000 in 1875 for a seat on the San Francisco Stock and Exchange Board but seldom used it. He owned a 25 percent interest in the Bank of Nevada and served on its board of directors. However, he rarely was found in his office at the bank. O'Brien obviously had little interest in business. He spent most of his afternoons playing games of pedro in a San Francisco saloon with a group of friends. The stakes were always low, but O'Brien kept a tall stack of silver dollars at hand, and down-on-their-luck friends knew that they could help themselves. He also displayed considerable generosity to his widowed sisters and his nephews and nieces. A lifelong bachelor, O'Brien provided opulent homes, luxuries like the latest Paris gowns, and travel for his sisters and their families.

O'Brien never enjoyed robust health and built an elaborate mausoleum at Calvary Cemetery in anticipation of his death. He died in 1878 with a fortune estimated at $12 million, which he left to his relatives.

Legacy

O'Brien is an unusual type of Gilded Age multimillionaire. He largely made his money through luck and charm rather than hard work. He had little interest in ostentatiously displaying his wealth, and money apparently changed him not one bit. Of all the Gilded Age millionaires, he is probably the most shadowy. Nevertheless, he is one of the men who helped to build the city of San Francisco by channeling the profits of Nevada's Comstock Lode into banking. Through his partnership with the other silver kings, O'Brien helped the West grow.

Odo of Bayeux

Norman aristocrat, military leader, and churchman

The leading landholder in England next to the king, Odo of Bayeux wielded tremendous political power. However, his seemingly insatiable acquisitiveness and lack of moral principles made him many enemies, and in the end he fell from royal favor.

Born: c. 1036; Normandy, France
Died: February, 1097; Palermo, Sicily (now in Italy)
Also known as: Earl of Kent
Sources of wealth: Conquest; real estate
Bequeathal of wealth: Unknown

Early Life

Odo of Bayeux (OH-doh uhv bah-YEH) was the eldest son of Herleva of Falaise and her husband Herluin de Conteville. Reputedly the daughter of a tanner named Fulbert from the Norman town of Falaise (now in France), Herleva had previously had a son out of wedlock, Richard Fitz Gilbert, whose father was Gilbert, count de Brionne. She also gave birth to another son, William, whose father was Robert I, the duke of Normandy; William would come to be known as William the Conqueror. Robert I had Herleva marry Herluin, and Odo's birth was followed by that of his brother Robert, who later became the count de Mortain. Nothing else is known of Odo's life before 1049.

William, though illegitimate, was Duke Robert I's only surviving son and heir designate. When the duke died suddenly while returning from a pilgrimage to the Holy Land in 1035, William became duke. William had a perilous early reign, filled with opposition, plots, assassinations, and infighting. He survived and had won the power struggle by 1050. It was either in 1049 or in 1050 that William appointed his half brother, Odo, the bishop of Bayeux. This appointment was not an unusual course of action during the early medieval era. Relatives of rulers were often granted key ecclesiastical offices because these relatives were presumed to be loyal to the kings and would be in a position to help these rulers maintain power.

First Ventures

By 1066, it was evident that Odo had risen highly in his half brother William's favor. Odo was one of the major counselors for the duchy of Normandy, and he had already accumulated great wealth from the incomes of his ecclesiastical and feudal estates. William believed he was the rightful king of England. When William formed plans to invade England and overthrow King Harold II, Odo pledged to provide William's invasion fleet with 100 ships, second only to the 120 ships promised by Odo's brother Robert de Mortain.

However one may interpret the events of 1066 as depicted in the Bayeux Tapestry, it is obvious that Odo did play an active role in the Battle of Hastings. Knights who were later identified as his vassals certainly participated, and Odo himself is thought to have acted as a second-in-command. At a crucial juncture, brandishing a mace, he rallied groups of inexperienced, panicked Norman and

Breton knights and brought them back into the fray. To what extent, if any, he was involved in frontline fighting is conjectural. Following William the Conqueror's coronation as king of England on December 25, 1066, Odo was named the earl of Kent. This title came with extensive tracts of land and such power and responsibility that Odo was subordinate only to William himself.

Mature Wealth

The earldom of Kent was vast and lucrative, with at least 439 estates located primarily throughout England's eastern shires. Added to his Norman holdings, the net value of Odo's possessions probably exceeded $9.5 billion (in 2010 dollars). Whenever Odo went on a punitive military campaign to quell revolts or put down unrest, he took the opportunity to augment his wealth through pillage, plunder, and extortion. As the result of his actions, he developed a reputation as a demanding and rapacious overlord.

During the years immediately following the Norman Conquest, William's trust in Odo appears to have been absolute. Sometimes Odo would accompany William from England to Normandy and back. On those occasions when Odo stayed in England, he seems to have functioned either as the king's deputy (this position would shortly be called "lord justiciar") or as colieutenant with his brother Robert de Mortain.

The first challenge to William the Conqueror's kingdom occurred in 1067, when, for obscure reasons, the king's erstwhile ally at the Battle of Hastings, Eustace II, count of Boulogne, launched a surprise attack on Dover. Although Odo was miles to the north, the castle garrison held out and Eustace withdrew on Odo's approach. In 1075, the earls of Hereford, Northumberland, and Norfolk rose in an uncoordinated "Revolt of the Earls," and Odo swiftly maneuvered to crush Norfolk's forces and end the uprising. In 1080, a series of insurgencies broke out in northern England, probably abetted by King Malcolm III of Scotland. Odo, in tandem with King William's eldest son, Robert Curthose—with whom Odo developed a strong alliance—ruthlessly extinguished all resistance, kept Malcolm at bay, and ravaged the region. Odo personally pillaged the city of Durham in retaliation for the murder of its Norman bishop by the insurgents.

It is uncertain when, or exactly why, the relationship between Odo and William began to sour. Perhaps the first indication was a trial at Penenden Heath in the 1070's, when Odo was accused of appropriating estate income that should have gone to the archdiocese of Canterbury. Some, though not all, of the charges were substantiated, and Odo had to pay partial restitution. In 1082, when Odo was about to embark from the Isle of Wight, presumably on his way to Rome, William abruptly appeared and arrested Odo for corruption. Odo had undoubtedly intended to make a bid for the papacy, and he had been gathering a small army and setting aside funds for the necessary

The Bayeux Tapestry

The Bayeux Tapestry is a needlework-embroidered strip of cloth, 230 feet long by about 1.6 feet wide, that depicts a version of the events leading to and during the Battle of Hastings on October 14, 1066. The story is presented chronologically in a sequence of panels, beginning around the year 1064, with King Harold II's purported visit to Normandy, up to the final phases of the battle. The tapestry originally contained additional panels depicting subsequent events, which may have measured seven feet in length, but these panels have disappeared. Narrative captions are stitched above the pictures, and the tapestry contains rich and varied decorations on its sides that are said to have a deeper significance than mere adornment.

The tapestry's fabric, style, and internal details lead most scholars to believe it was stitched within sixteen years of the events it depicted, with 1077 being the most frequently conjectured date. The tapestry was almost certainly completed before 1082, the year that Odo of Bayeux, the bishop of Bayeux, was imprisoned by William the Conqueror.

The origins of the tapestry are debatable. The old story that William's queen, Matilda of Flanders, and her ladies embroidered it seems far less likely than the theory that women at Canterbury, who were renowned for their needleworking skills, fashioned it from a design by an unknown person. The conventional idea that Odo himself commissioned the tapestry and perhaps even contributed to its design so the work could hang in Bayeux Cathedral has been challenged but not disproved. The facts that Odo and his vassals Wadard, Vital, and perhaps Turold are given a degree of prominence in the needlework, and that Odo could well afford such an expenditure, speak in favor of this theory. However, there are also persuasive arguments that Eustace II, count of Boulogne, may have sponsored the needlework. Some have theorized that Eustace, desiring the support of his former antagonist Odo, had the tapestry fashioned as a sort of reconciliation gift.

An inventory of the contents of Bayeux Cathedral from 1476 is the earliest written reference to the tapestry. In the twenty-first century, the embroidered cloth was exhibited in a museum at Bayeux, France.

bribes. However, William had known about Odo's ambitions for some time, and it is not known why William suddenly intervened and had Odo arrested. Odo was kept in prison during the remainder of William's reign. Odo's earldom was suspended, but he retained his estates.

On his deathbed in 1087, William was prevailed upon to release Odo, who was restored to the earldom of Kent by William the Conqueror's second son, King William II. However, in 1088, Odo, Robert de Mortain, and others launched a rebellion aimed at ousting William II in favor of Robert Curthose (now Duke Robert II of Normandy). Quick reaction on William II's part and Curthose's delay in sailing across the English Channel stymied the rebellion, which was effectively over when Odo surrendered, after a siege, at Rochester Castle. Odo was exiled to Normandy and this time forfeited the earldom of Kent and his holdings in England.

Until his death, Odo continued in his capacity as chief lieutenant to Curthose. Odo was present at the Council of Clermont in 1095, when Pope Urban II delivered his sermon calling for the First Crusade. Odo decided to join this effort and accompanied Duke Robert southward on the journey. His motives, whether they included a desire for further plunder or an opportunity for demonstrating repentance, are a matter of some debate. Crossing from southern Italy to Sicily in 1097, Odo died at Palermo, and he is buried in the cathedral there.

Legacy

As a cleric, most of Odo's wealth in Normandy would have reverted to the see of Bayeux after his death. The lands and income associated with the earldom of Kent were redistributed by William II. Although Odo is alleged to have fathered many illegitimate children, he did not have heirs in the proprietary sense. One of his children, John of Bayeux, became a priest who was retained by King Henry I of England as one of the king's personal chaplains.

Odo squandered much of his fortune on pleasure seeking, but he is undisputedly credited with having rebuilt and modernized Bayeux Cathedral by 1077. He also sponsored promising young scholars, artists, and clerics. Less certainly, he may have commissioned the Bayeux Tapestry, and he also may have encouraged and financed a version of the epic *Chanson de Roland*, first published in the twelfth century and translated as *Song of Roland*.

ARISTOTLE ONASSIS

Greek shipping magnate and businessman

Onassis was one of the world's richest people, but his wealth brought him little solace as he aged. His only son was killed, and his marriage to Jacqueline Kennedy, the widow of President John F. Kennedy, soon foundered and ceased to be the loving relationship he desired.

Born: January 20, 1906; Smyrna (now Izmir), Turkey
Died: March 15, 1975; Neuilly-sur-Seine, France
Also known as: Aristotle Socrates Onassis
Sources of wealth: Shipping; real estate; trade
Bequeathal of wealth: Spouse; children; relatives; charity

EARLY LIFE

Aristotle Socrates Onassis (ar-ih-STOT-uhl SOK-ra-teez oh-NA-sihs) was born into a Greek family residing in Turkey. His father, Socrates Onassis, an affluent banker and merchant, married an eighteen-year-old Greek beauty, Penelope Dologlou. She gave birth to a daughter, Artemis, in 1904 and to Aristotle in 1906. Penelope died following surgery in 1912, whereupon her husband's mother, Gethsemane, came to Smyrna to care for Penelope's children. Socrates remarried eighteen months later, and Aristotle considered his stepmother an interloper.

Aristotle was bright but had a rebellious streak that frequently caused him to be suspended from school. Socrates worried about his son's education and finally prevailed upon an influential friend to gain his son's admission to the Evangheliki School, regarded as the best secondary school in Smyrna, if not in the entire Greek-speaking world. By the time Onassis was fifteen, he was relatively competent in Greek, Turkish, English, and Spanish. He later learned French and German.

FIRST VENTURES

Although Smyrna was Turkish, in 1922 it had a Greek population of 165,000, compared to a Turkish population of 80,000. On August 26, 1922, Turkish forces commanded by Atatürk attacked the Greek army two hundred miles east of Smyrna, defeating it in a single day. Greek soldiers killed many Turks they encountered as they retreated. When Turkish forces came upon slain compatriots, they mobilized the survivors to fight the retreating Greeks. As the Turkish soldiers advanced into Smyrna, the Greeks who lived there were treated brutally. Socrates, his house confiscated by the Turks, fled to Greece with his family, abandoning his considerable fortune.

Realizing the limitations that resettling in Greece imposed upon him, Aristotle decided to immigrate to Argentina and start a new life. Socrates at first resisted but later supported his sixteen-year-old son's decision to relocate in Argentina. Aristotle landed in Buenos Aires on September 21, 1923, and, after holding stopgap jobs as a hod carrier and a dishwasher, he found work with the British United River Plate Telephone Company. He became a night operator, leaving his days free to help revive his family's tobacco business.

After being turned away by most of the Argentinean cigarette makers to whom he tried to sell tobacco, Onassis set his sights on contacting Juan Gaona, owner of the most successful cigarette company in Argentina. He brazenly dogged Gaona's footsteps for days until Gaona finally agreed to talk with him. As a result of this conversation, Gaona immediately placed an order for $10,000 worth of Socrates Onassis's Turkish

Aristotle Onassis aboard his yacht. (©Bettmann/CORBIS) tobacco. Aristotle and Gaona continued to trade for some time, with Aristotle taking his 5 percent commission following each transaction. By the end of two years, he had earned more than $100,000 in commissions. He saved this money so he would have a nest egg to finance other enterprises.

After a disagreement with Gaona, Onassis launched his own cigarette manufacturing company, and by the time he was twenty-one his net worth exceeded $1 million. In 1925, Onassis received both Greek and Argentinean citizenship. Three years later, the Greek government commissioned him to execute a trade agreement with Argentina for the import of tobacco. Grateful for his success in negotiating this agreement, Greece named Onassis consul general. By now Onassis's enterprises had broadened from manufacturing cigarettes to trading in commodities.

Mature Wealth

In 1932, the world was suffering from the effects of the Great Depression. This was an ideal time for people with sufficient capital to make purchases at bargain prices. Onassis, who was not yet thirty, took full advantage of the economic downturn to purchase six freight ships from Canada, a plucky move because freight rates had dropped precipitously during the Depression. Realizing this, Onassis put only two of the ships he had purchased into immediate service and reserved the others for use when shipping rates improved. As his shipping business prospered, largely because he was operating under the Panamanian flag to minimize the taxes levied upon his fleet, Onassis offered the world's lowest shipping rates without stinting on the quality of the service his operation offered. He succeeded because he was a risk taker. The risks he took, however, were carefully calculated and proved to be profitable.

Onassis was a citizen of the world. He did not consider himself irretrievably bound by rules and regulations that might thwart his enterprises. He had a personal dynamism that worked to his advantage in business dealings. He was generous in dispensing favors to the people with whom he did business. He declared quite sardonically that he would not trust anyone who would not take a bribe.

With uncertainty engulfing Europe as war seemed inevitable, Onassis made a crucial decision. He would develop a fleet of tankers for the transportation of oil, a commodity that would be in demand if a war erupted. In 1938, he had his first tanker ship built, and this acquisition was followed by his taking possession of two more tankers during World War II. Onassis benefited financially from the war, as shipping fees escalated significantly. When the war ended, he realized that a world hungry for oil would be dependent upon tankers to transport most of this oil to the places where it was vitally needed.

The Alexander S. Onassis Foundation

The death of Aristotle Onassis's only son Alexander in an airplane accident in January, 1973, left Onassis so depressed that he found it difficult to function. He delayed the burial of his son, at one point seeking to have his remains frozen so that at some future date, with advances in medical science, Alexander could be revived.

Alexander's death had a profound effect on the physical condition of Onassis, who had always been remarkably healthy. Onassis was diagnosed with a degenerative disease, myasthenia gravis, for which he was being treated in Paris. In the course of this treatment, he contracted pneumonia and on March 15, 1975, died with only his daughter at his side.

In the will Onassis had drawn up two years before his death, he made provision to support an organization somewhat similar to the Nobel Foundation. The foundation was chartered in Vaduz, Liechtenstein, with its main offices in Athens. It grew into a multibillion-dollar organization.

Onassis's will stipulated that the foundation was to fund the work of researchers in eight specific areas: medicine, science, exploration, literature, art, religion, journalism, and education. Under the supervision of a board of directors, the Onassis International Cultural Competition Prizes, comparable to the Nobel Prizes in the level of support they provide for composers, painters, choreographers, and playwrights, were established in 1994. The foundation also established the Onassis Cardiac Surgery Center in Kallithea, some thirty miles south of Athens. Completed in 1992, the center cost $75 million to construct and boasts the most modern equipment and technology for cardiac treatment. The foundation also made possible the Onassis Library for Hellenic and Roman Art, a facility in New York City's Metropolitan Museum of Art that opened in 2000. The Onassis Home of Letters and Fine Arts in Athens was completed in 2010.

The directors of the foundation's two branches, public benefit and business, are elected every year to occupy one of the fifteen seats on each board. The business branch oversees the foundation's shipping fleet and extensive real estate holdings and generally operates at a profit that is given to the public benefit branch.

Onassis expanded his holdings substantially in the late 1940's and early 1950's. In the mid-1950's, he bought seventeen new tanker ships in a single year. He had become incredibly wealthy, and his fleet was larger than the navies of many nations. In 1953, he paid $1 million to buy a controlling interest in the Société des Bains de Mer, the organization that owned the Monte Carlo casino, as well as hotels, theaters, and other real estate in Monaco.

In 1957, he bought and operated Olympic Airways, the national airline of Greece. When Onassis took over this carrier, it had only prop-driven aircraft. Onassis knew the airline needed to switch to jet aircraft if it was to become a recognized international carrier, but this move would require at least five Boeing 727 jet planes and two Boeing 707's at a cost of slightly more than $53 million. Olympic Airways had experienced great difficulty in borrowing money, and obtaining the loans necessary to purchase these jets was a great challenge for Onassis, exactly the sort of venture he welcomed. He used his Panamanian connections to achieve his ends, and Olympic was able to rent the seven planes it needed for $60,000 a month each, a figure that made the airline competitive with other international carriers. Onassis eventually turned this airline over to the Greek government. He had relished the struggles of making it viable, but when the excitement was gone he was ready to pursue other interests and challenges.

Legacy

Most Americans remember Onassis as the Greek millionaire who married Jacqueline Kennedy, widow of the assassinated president of the United States. However, he will be remembered longer for establishing the Alexander S. Onassis Foundation in memory of his only son, who was killed in an airplane accident in January, 1973, leaving Onassis totally devastated.

When Onassis died in 1975, his estate had an overall value exceeding $500 million. His will, handwritten by Onassis on a private jet airplane when he and Jacqueline were returning from Acapulco, left Jacqueline a bequest of $150,000 a year during the lifetimes of her and her two children. The couple's already troubled relationship had deteriorated further during their time in Acapulco, so Onassis stipulated that if Jacqueline contested his will, she would be responsible for all of the legal fees resulting from this contest and would receive the minimal spousal bequest dictated by Greek inheritance laws, in this case 12.5 percent. After establishing annuities for his sisters, other relatives, and friends, Onassis left his daughter Christina the assets of the first of two companies he created, a bequest amounting to about 45 percent of his total assets. A comparable amount was left to finance the Alexander S. Onassis Foundation.

Osei Tutu

Asante king and military leader

Osei Tutu united several clan states in West Africa, establishing the Asante Empire in an area rich in gold and at the crossroads of major trade routes. His personal and state wealth secured an important position for the Asante Empire in the history of West Africa.

Born: c. 1660; possibly Akroherri (now in Ghana), West Africa
Died: 1717; near the Pra River, east of Kumasi (now in Ghana), West Africa
Also known as: Osei Kofi Tutu I
Sources of wealth: Inheritance; trade; government
Bequeathal of wealth: Relatives; government

Early Life

Osei Kofi Tutu (oh-SAH-ee KOH-fee TOO-too) I was born around 1660. The place of his birth is unknown, but he could have been born in Akroherri, now in Ghana. In the 1600's, this area was a vast source of gold and was at the crossroads of major trade routes. Osei Tutu was the son of Owusu Panyin and Manu Kotosii, the sister of Obiri Yeboa, who became the ruler of Kwaman. As the clans were matrilineal, Osei Tutu stood first in line to succeed his uncle.

Osei Tutu received a royal education, first from his father and uncle and then in the court of King Boa Amponsem I of Denkyira. When relations between Denkyira and Kwaman deteriorated and war seemed imminent, and after Osei Tutu had impregnated Boa Amponsem's only daughter, Osei Tutu fled to Akwamu. There he was joined by Okomfo Anokye, who became his priest and counselor and had a major role in Osei Tutu's rise to power.

First Ventures

When Obiri Yeboa died, Osei Tutu and Okomfo Anokye returned to Kwaman. A massive, golden stool—the symbol of royal power—was constructed for Okomfo Anokye, who explained to the people that the stool descended from the skies as a blessing of the gods, making Osei Tutu both their political and religious leader. Osei Tutu organized an army and proceeded to bring neighboring clans into his growing empire, either by peaceful alliances or by force. As the smaller states were incorporated into the growing Asante Empire, Osei Tutu collected yearly tributes from them, thus increasing his wealth and the wealth of the empire.

Mature Wealth

Osei Tutu's biggest conquest was the kingdom of the Denkyira, where he had spent part of his youth. The king of the Denkyira had died and his daughter's child, Ntim Gyakari, who was Osei Tutu's son, was named the king's successor. Ntim Gyakari sent an envoy to Osei Tutu with a large pan, demanding that Osei Tutu fill the pan with gold tribute. Osei Tutu's council chiefs were insulted by this demand, killed the messenger, filled the pan with stones, and prepared for war. After their victory, it took the Asante warriors fifteen days to bring the spoils of the war home to Osei Tutu, who kept a large quantity of the looted gold, adding to his personal wealth.

Along with the annual tributes that Osei Tutu collected from the states now joined with the Asante Empire, he received taxes and duties from caravans traversing the trade routes that passed through the empire. He also sold some of his adversaries into slavery to be taken on European ships to the New World and traded with the Europeans for guns and other weapons. According to some accounts, when Osei Tutu held court, he had boys stand at his sides to help support his arms, which were heavily laden with gold bracelets.

In 1717, Osei Tutu went to war against a tribe that had taken the side of the Denkyira—the Akyem. He underestimated the Akyem's fighting ability, and he went into battle with only a small entourage of troops. He and his party were ambushed by snipers, and he was shot. His dying words were "Ankah me nime ya" (if only I had known).

Legacy

Osei Tutu began the unification of the Gold Coast of Africa, building one of the richest empires in the continent. Through his political skills and military prowess, he was able to bring many of the different tribes and clans of the area into a unified state. He more than tripled the size of the kingdom that his uncle had ruled. His successor, Opoku Ware I, continued expanding the empire. The Asante Empire continued until 1874, when Great Britain conquered the gold-rich territory and placed it under British rule.

Osman Ali Khan

Indian prince

The most powerful of the native princes of preindependence India, Osman Ali Khan, the nizam of Hyderabad, has been called the wealthiest person of the twentieth century, with riches reminiscent of the Mughal emperors.

Born: April 6, 1886; Hyderabad, India
Died: February 24, 1967; Hyderabad, India
Also known as: Seventh Nizam of Hyderabad; Usmān ʿAlī Khān; Asaf Jah VII
Sources of wealth: Inheritance; government
Bequeathal of wealth: Children

Early Life

Osman Ali Khan (UHZ-mahn ah-LEE kahn) was born to the Asaf Jah imperial throne of the princely state of Hyderabad, one of the native kingdoms of India. The Asaf Jah Dynasty had been founded by Qamar-ud-din Khan, who ruled as Asaf Jah I from 1724 to 1748. Osman Ali Khan's father, Mir Mahboob Ali Khan, or Asaf Jah VI, was the sixth nizam (ruler) of Hyderabad; Osman's mother was Amat-uz-Zehra Begum. Osman was the couple's second child; their oldest child died in infancy.

The princely states of India were the remnants of the Mughal Empire and other Indian kingdoms previously conquered by Persian, Turkish, and Mongolian Muslims or ruled by Hindu maharajas. In the nineteenth century, these states were recognized under the sovereignty of Great Britain and became part of the British Empire. Of the approximately six hundred states ruled by the native princes of India, Hyderabad was the largest and the wealthiest. Located in central India, Hyderabad had thirteen million inhabitants at the time Osman was born. Hyderabad was traditionally a dominant power in the Deccan plateau. Although most of the inhabitants were Hindu, the nizam rulers were Muslims, recognized as descendants of Abū Bakr, successor to the Prophet Muḥammad as ruler of the Muslim community and the first of the "rightly guided" caliphs of Islam. As such, the Asaf Jah Dynasty was commonly recognized as the leader of Sunni Islam in India. Osman was raised in the Purani Haveli and King Kothi palaces. He was educated by tutors in the Qurʾān and Islamic studies; the Persian, Urdu, and English languages; and administration.

First Ventures

Upon the death of his father, Osman became the seventh nizam, Asaf Jah VII, in August, 1911. He was inaugurated with all of the ceremonial pomp of his ancestors. As ruler, the seventh nizam inherited a throne that had formerly exercised absolute power over the kingdom's subjects. However, while he was an absolute monarch in name, in reality he was not the ruler of Hyderabad. The British governor-general was the ultimate ruler of all of India. In addition, Indian nationalists were seeking to establish an independent India that would assume control of the princely kingdoms, and pan-Islamists were attempting to bring Indian Muslims into a united *ummah* (Islamic community). Faced with these challenges to their power, many of the native princes retreated into their own world of extravagant spending and courtly pleasure.

Osman, however, was determined to exercise his authority as a capable and benevolent ruler, despite his relative ignorance of the modern world. The Hyderabad nobility was accustomed to living extravagantly, with their lifestyles funded by the nizam, and these expenses strained the state's finances. In response, Osman reduced the budgets of the nobility. He occasionally interceded on behalf of the slave women who were scandalously kept in the homes of the ruling elite. Although he did not stint on his own expenditures because he did not want to diminish his princely heritage, he nevertheless implemented various reforms designed to place Hyderabad's finances on a sounder footing.

The nizam spent as much money on public edifices as on his princely prerogatives. He built the Osmania Gen-

Silk

Silk is synonymous with luxury, sumptuous clothing, and wealth. Silk is the product of the caterpillar of the silkworm moth, *Bombyx mori*, and was first cultivated by the Chinese around 2500 B.C.E. The cultivation of silk worms is known as sericulture. It is a difficult and labor-consuming industry, which was monopolized by the Chinese government; trading in the secrets of the industry was punishable by immediate decapitation. The finest silk was reserved for the Chinese emperor and his court, and only the emperor himself could wear yellow silk.

With the rise of the Achaemenid Empire in Persia in the sixth century B.C.E., the first overland trading routes were established, linking the far reaches of the Chinese Empire with markets in India, Persia, Arabia, and the Mediterranean. This was the forerunner of the famous Silk Road, over which the goods of Asia, Africa, and Europe would be exchanged for two millennia. The importance of this road, actually a network of routes through central Asia with bypaths, would be hard to overestimate. The Silk Road was the link between Europe and the highly developed societies of the Near and Far East. The overland trading routes were often attacked by nomadic tribes.

In the reign of the Emperor Augustus (r. 27 B.C.E.-14 C.E.), silk became treasured in Rome. The great empires of Persia—Parthian, Sāsānian, and Seleucid—traded silk through much of the known world. In Byzantium and Persia, silk was woven into exquisite carpets, shrouds, and tapestries. Despite the best efforts of the Chinese, the secrets of silk-making spread. Sericulture developed in Byzantium, Korea, Japan, and the Muslim empires.

The silk industry of Western Europe began in the Middle Ages. In the thirteenth century, Lucca, now in Italy, was the first European city to gain renown for silk production. Venice became a center for both silk weaving and the silk trade. Although velvet was an ancient Chinese invention, Venice also excelled in its production, producing gold piqué and cisele velvets that were particularly shimmering and luminous. In the fifteenth century, France developed a silk industry centered in Lyons, where weavers created the most exquisite silk finery for royalty and aristocrats. In the famous meeting of King Henry VIII of England and King Francis I of France at the Field of Cloth of Gold in June, 1520, both kings attempted to outdo each other with the magnificence of their silk raiments. In the seventeenth century, the Dutch and British East India Companies launched a vast maritime trade in silk. Silk embroidered with lace was a staple of haute couture (high culture) as it developed in Europe during the eighteenth and nineteenth centuries, and this embroidered fabric was nowhere captured more beautifully than in the paintings of French artist Jean-Auguste-Dominique Ingres.

The silk trade made fortunes for people in all of the known continents. The maharajas of India drew riches from the silk trade; they draped themselves, their possessions, and their apartments in the most exquisite silks, encrusted with precious metals and jewels.

eral Hospital, a magnificent town hall, roads, railways, post offices, a hall for the state's assembly, courthouses, and other structures. He introduced a measure of parliamentary rule. On September 22, 1918, he established Osmania University, the first university in India to provide instruction in native languages.

World War I brought a challenge to Osman's reign. The Ottoman sultan was the nominal leader of the world's Sunni Muslims, holding the office of the caliphate that had been established after the death of the Prophet Muḥammad in the seventh century. Nevertheless, the nizam gave his full support to the British during the war, although the Ottomans were allied with the Germans. Osman even provided as much as £25 million to the British army. As the prince of Hyderabad, he was already considered first among the "twenty-one gun salute" states—the states of Hyderabad, Mysore, Gwalior, Baroda, and Jammu and Kashmir which were at the top of the British hierarchy of the Indian princely states. As a reward for his allegiance, the British awarded him the unprecedented title of His Exalted Highness.

In 1926, the nizam commissioned the British architect Edwin Lutyens to design a new palace, Hyderabad House, built in the shape of a butterfly, with a domed roof, combining the architectural styles of the Mughal and British Empires. It was one of the grandest and most expensive palaces in the world. During Osman's reign, the Nizamsagar Dam was completed in Hyderabad in 1931.

Mature Wealth

Although some people were wealthier than the native princes of India, there have been few people who have exceeded the princes' love of riches and display. The native princes inherited ancient Indian kingdoms that were revived during the decay of the Mughal Empire. The princes claimed the wealth of their principalities as their own, clothing themselves in silk and gold and collecting treasuries of the most exquisite diamonds and jewels. However, none of India's princes approached the nizam for sheer wealth or extravagance. His personal fortune was estimated at $2 billion, which during his lifetime earned him the distinction of being the wealthiest man in the world. Osman lived in the opulent King Kothi Palace and built the equally imposing Hyderabad House. He owned more than four hundred motor cars. He possessed one of the greatest jewel collections in history, valued at more than $400 million, which included the 185-carat Jacob Diamond. He collected Mughal and Deccan paintings, miniatures, illustrated Qurʾāns, and ancient Indo-Islamic manuscripts. He also took opium daily.

The Muslim religion allows a man to marry four wives and have many concubines, provided he can afford to maintain them. The nizam had unlimited resources and followed in the footsteps of his princely ancestors by taking four official wives, as well as a harem of forty-two women. On April 16, 1906, he married Azam-un-nisa Begum, and they had three children. His three other wives were the daughters of the nobility. His favorite woman in his harem was Leila, a singer of exceptional beauty with whom he had seven children. In all, Osman was the father of one hundred children, and he employed thousands of servants to wait upon his family.

Great Britain granted independence to India in 1947, but the British were careful to preserve the rights and privileges of the native princes. Nevertheless, the newly created nation of India claimed sovereignty over the princely states and issued proclamations of annexation. The nizam resisted these orders, unrealistically insisting that his state would be independent. In response, Indian military forces moved into Hyderabad and forcibly annexed it. The Indian government granted the nizam an annual salary of 5 million rupees (about $25 million), free of all taxes. Indian officials also allowed him to retain full, personal ownership of his jewels, gold, palaces, securities, real estate, and other wealth. The nizam exchanged a personal estate worth 30 million rupees for an additional annual payment of 2.5 million rupees.

Relieved of governmental responsibilities, Osman spent his last years making arrangements for the fifteen-thousand-person retinue of his vanquished court. He created numerous trusts for his children and for the relics of his kingdom, paid for with millions of pounds of gold bars literally lying around his palaces. The nizam retained his royal kitchen with its antique porcelain and gold dining service for 150 persons; his concubines; his Purani Haveli, King Kothi, Chaowmahol, Goakhana, and other palaces; his jewelry collection; and his charitable religious endowments.

Legacy

Osman Ali Khan can be considered the last of the great princes of ancient India, whose exercise of power and wealth was both astounding and offensive to modern sensibilities. Unlike Osman, most of the world's monarchs have not held their wealth as entirely their own. The native Indian princes, however, were able to accumulate—and flaunt—their great wealth because they were under the protection of the British government. Osman was not willing to part with any of these ancient privileges, and he continued to possess an excess of palaces, wives, concubines, and gold. However, he also used his wealth to finance public improvements in Hyderabad, and he was the most civic-minded of the nizam rulers and the other maharaja princes. While the nizam maintained his fortune, his political power gradually diminished in India, and the title "nizam" was extinguished in 1974, seven years after his death.

DAVID PACKARD

American industrialist and computer industry pioneer

Packard helped establish Silicon Valley by cofounding technology giant Hewlett-Packard in Palo Alto, California. At the time of his 1993 retirement, Hewlett-Packard was the world's second largest computer company.

Born: September 7, 1912; Pueblo, Colorado
Died: March 26, 1996; Palo Alto, California
Source of wealth: Computer industry

EARLY LIFE

David Packard was the son of Sperry S. Packard, a lawyer, and Ella Graber Packard, a high school teacher. Set on a career in engineering from an early age, Packard also excelled in athletics. As a freshman at Stanford University, the six-foot-five-inch Packard set records in track. He later lettered in varsity football and basketball while serving as president of Alpha Delta Phi fraternity. He possessed both an iron will and such great physical strength that later in his life, employees of his company said they were a little frightened of him. During summer breaks in his college years, Packard hauled ore at a mining camp, built roads, and delivered huge blocks of ice to taverns. He graduated Phi Beta Kappa in 1934 and went to work at General Electric in Schenectady, New York. In 1938, he married Lucile Salter, whom he had first met at Stanford.

The David and Lucile Packard Foundation

David Packard and his wife Lucile created the foundation named for them, the David and Lucile Packard Foundation, in 1964 in order to complement government efforts to serve the needs of American society. Both Packards believed they had an obligation to give back to the country that had enabled them to prosper, and the couple had long supported charitable efforts. While David served on the Palo Alto, California, school board and the President's Council of Advisors on Science and Technology, Lucile chaired the board of the Children's Health Council and supported the Stanford Convalescent Home, which treated children with tuberculosis. When David died in 1996 (Lucile predeceased him in 1987), forty-six million shares of stock in his company, Hewlett-Packard, were given to the foundation.

The foundation is headquartered in Los Altos, California, and its activities are based on the belief that private organizations can affect social, cultural, and environmental change in ways that government and other public entities cannot. At the end of 2008, the organization had an investment portfolio of about $4.5 billion, and that year it issued grants of approximately $342 million. It provides national and international grants but is specially focused on bettering life in the Northern California counties of San Benito, San Mateo, Santa Clara, Santa Cruz, and Monterey. In keeping with this mandate, the foundation has provided major funding for the establishment and upkeep of the Monterey Bay Aquarium.

In 2009, the foundation gave sixteen researchers an unrestricted grant of $875,000 each to be used over five years as part of the Packard Fellowships for Science and Engineering. This program, which has distributed more than $274 million since it began in 1988, originated from David Packard's commitment to strengthening university-based science and engineering programs. It seeks to encourage graduate students to pursue university research in the United States, and it is one of the largest nongovernmental programs to support research in such disciplines as physics, chemistry, mathematics, biology, astronomy, computer science, earth science, ocean science, and all branches of engineering. The fellows include Xin Chen, a biologist at Johns Hopkins University who is identifying the molecular characteristics essential for normal stem cell functions; Peter Huybers, a Harvard University geoscientist who is focused on climate change predictions; Holger Mueller, a physicist at the University of California at Berkeley who is introducing new tools to the field of particle physics; and Seth Sullivant, a mathematician at North Carolina State University who is using tools from algebraic geometry and other branches of mathematics to address problems in evolutionary biology. The foundation also supports advocacy organizations that work at the statewide level to increase health insurance coverage for children, including Finish Line Project and Consumer Voices for Coverage.

turned to California after earning a master's degree at the Massachusetts Institute of Technology. Packard had built the first audio oscillator to test sound equipment, and the two men formed Hewlett-Packard (HP) on January 1, 1939, in order to sell this device. A coin toss decided the company name. Hewlett focused on engineering, while Packard concentrated on management. With only $538 in capital, Hewlett and Packard set up shop in a one-car garage that later became a California historical landmark as the birthplace of Silicon Valley. The partners developed an electronic device to spot bowlers who stepped over the foul line, a weight-loss machine, and an electronic toilet flusher. When Walt Disney bought eight of the audio oscillators to help produce the film *Fantasia*, HP took off. The company had three employees and $34,000 in sales in 1940.

Mature Wealth

HP manufactured measurement and testing equipment. However, the company was best known for the HP Way, a corporate philosophy that fostered individual motivation and creativity by providing employees with considerable freedom to work toward established goals. Packard would later claim that the HP Way was his greatest achievement. He believed in "management by walking around" and "management by objective," both of which are now routinely taught in business schools. Packard frequently asked employees on the shop floor how their work was going and whether management could do anything to make their jobs more productive. His firm adopted an informal style of management and held numerous gatherings at which employees and their bosses discussed their work. Both "Bill and Dave," who along with other HP senior executives had an open-door policy, despised executive pomposity.

Packard also shared his wealth with his employees and demonstrated considerable concern for his workers' well-being. HP provided catastrophic health insurance for employees in the 1940's, a time when hardly any other company was offering this benefit, because Packard believed that family medical crises had cost two of his workers their jobs. The company embraced a broad-based profit-sharing plan and flexible scheduling.

Despite fluctuations in its finances, HP under Packard's leadership never laid off its employees and enjoyed a reputation as one of the best employers in Silicon Valley. Packard believed that respect and concern for individual employees assured a solid return on shareholders' investments, unlike many of HP's competitors, who simply focused on shareholders.

By 1960, HP had become the largest producer of electronic measuring devices. The company had particular success with heart-monitoring equipment and atomic clocks for the Apollo spacecraft. However, Packard encouraged innovation. Once asked about his formula for success, the always pragmatic and direct Packard replied that he believed in doing something useful and then moving on without gloating about it. HP frequently moved on. The company successfully transformed itself into a manufacturer of computer equipment in time to lead the computer revolution. HP built the first desktop scientific calculator in 1968 and introduced the pocket calculator in 1972, which made the ubiquitous slide rule obsolete. HP's LaserJet printer, launched in 1984, provided high-quality printing for personal computers. By the time Packard retired in 1991, HP ranked second only to International Business Machines (IBM) as the world's largest manufacturer of computer equipment.

Packard's commitment to the welfare of others did not stop at the doors of HP. He had a long-standing interest in conservation, serving as vice chair of the California Nature Conservancy. In 1964, he gave $45 million to establish the Monterey Bay Aquarium and its research institution. He donated an additional $120 million to the aquarium through the David and Lucile Packard Foundation. He also gave $70 million to construct the Lucile Salter Packard Children's Hospital at Stanford University. Stanford University received more than $300 million from Packard and Hewlett, including a $77.4 million donation in 1994, the largest gift in campus history, for a new science and engineering complex.

Packard also made large contributions to Republican Party campaigns. He served as deputy secretary of defense in President Richard Nixon's administration from 1969 to 1971, and he remained close to subsequent Republican leaders. He served on the Trilateral Commission from 1973 to 1981 and chaired the Blue Ribbon Commission on Defense Management created by President Ronald Reagan in 1985. The latter commission recommended sweeping changes in the procurement of military equipment. Not much of a hawk, Packard promoted increased trade with the Soviet bloc nations as the best way of ending the Cold War. Packard also served as a trustee of the Herbert Hoover Foundation, the American Enterprise Institute, and the Hoover Institution. He sat on the boards of several corporations, including Boeing, Caterpillar, Chevron, and Genentech.

Hewlett retired in 1986. Packard had been semiretired throughout the 1980's but returned in 1991 when HP fell into financial difficulties. Packard permanently stepped down as HP's chair in 1993, but he cheerfully promised to offer free friendly advice to his successor. At his retirement, Packard was worth an estimated $1.4 billion. He died of pneumonia in 1996 at Stanford University Medical Center in the company of his only son and his three daughters. By the time of his death, he had given away most of the $3.7 billion fortune that he had amassed through the years.

Legacy

Widely regarded as one of the greatest business leaders in the twentieth century, Packard was one of the founders of California's Silicon Valley. He and his company, Hewlett-Packard (HP), laid the foundations of one of the most profound technological revolutions in history. HP played a major role in making computers a part of everyday life. The firm built the first audio oscillator, the first desktop scientific calculator, and the first pocket calculator. Under Packard's guidance, HP became the leading producer of minicomputers and laser printers, as well as a company known for its technical innovations and its fair and generous treatment of employees. Some of the largest Silicon Valley companies, including Apple Computer, Inc., were founded by former HP employees and modeled after HP. Through his charitable endeavors, Packard ensured that significant private support for scientific and engineering innovation would continue long after his death.

Kerry Packer

Australian media mogul and investor

Packer inherited a sizable estate from his father, including newspapers, magazines, and television stations. Before Packer died in 2005, he had become the richest person in Australia, with his wealth estimated at more than $6 billion in Australian ($5 billion in U.S. dollars).

Born: December 17, 1937; Sydney, Australia
Died: December 26, 2005; Sydney, Australia
Also known as: Kerry Francis Bullmore Packer
Sources of wealth: Inheritance; media; real estate
Bequeathal of wealth: Spouse; children

Early Life

Kerry Francis Bullmore Packer was born in Sydney, Australia, on December 17, 1937. His father, Sir Frank Packer, was a businessman whose investments were primarily in newspapers and magazines. Ambitious and ruthless, Frank was not an ideal father to his two sons, Clyde and Kerry. He verbally and publicly abused and criticized them, as he did his employees. With their parents often absent, the brothers were raised by nannies. In 1945, Kerry was struck down by infantile paralysis and was confined in an iron lung. Enrolled in several schools, he was an indifferent student, and it was eventually discovered that he suffered from dyslexia. A loner with few friends, he excelled in sports. However, in his father's eyes, Kerry was "the idiot son."

First Ventures

After leaving school, Packer worked in his father's newspaper business, starting at the bottom in menial jobs that he attempted to avoid. His older brother, seemingly brighter and more suitable, was groomed to take over Frank's many businesses. Kerry was the black sheep. In 1956, Frank acquired Channel Nine, one of Australia's first television stations, which would later prove to be the key to Kerry's financial success. By the early 1970's, Clyde had become estranged from his father, and Kerry was the heir to the family fortune.

Mature Wealth

When Frank died in 1974, his financial interests were estimated at about $100 million (Australian dollars), although probate proceedings indicated that the estate was worth only $1.3 million. Kerry inherited two television stations, five radio stations, nine newspapers, magazines, considerable property, shares in a gold mine, racehorses, and other investments. Initially, he saw his duty as merely to husband his father's fortune, but over the next thirty years his moneymaking abilities enabled him to vastly increase his wealth and become Australia's richest person.

Ironically, his father's verbal abuse taught him lessons about being tough and caring little about what others thought of him. Packer's temper was legendary, and although he had a quick wit, he seems to have suffered from a siege mentality, convinced that the world was out to get him and his money. Given the opportunity, he showed that he had his father's talent for business.

By 1976, he had bought out his brother's share of Consolidated Press, the newspaper corporation founded by his father. He had already proved himself at the *Sydney Bulletin* and with the new magazine *Cleo* (loosely modeled on *Cosmopolitan*), which was more titillating than Frank's more conservative women's magazines. Circulation of *Women's Weekly*, long the flagship of

Consolidated Press, also increased significantly. Employees at Channel Nine were initially concerned that Packer had neither much knowledge nor much interest in the television business, but they were proved wrong. Packer made a fortune from his television station, in large part because his tastes were those of most Australians, who liked films and sports and cared little for intellectual or artistic programs. Channel Nine focused on sports, news, and game shows that were cheap to produce but were extremely rewarding financially.

The Packers, father and son, were very well known in Australia but had a lower profile outside the country. Kerry Packer became famous, or infamous, in the wider world because of the quintessential English game of cricket, which was a legacy to Great Britain's former colonies, including Australia. For much of its history, cricket was largely a "gentleman's" game, where amateur gentlemen players took precedence over professional or working-class athletes who played the sport for money, although not much money. Packer challenged cricket's status quo by staging World Series Cricket for his television network, which aired these games from 1977 through 1979. Cricketers were seriously underpaid in comparison to athletes in many other sports, and when Packer in 1977 secretly offered cricketers $25,000 (Australian dollars) for twelve weeks of work, many players eagerly seized it, including a majority of Australia's Test team and several of England's premier players. England's cricket establishment and the British press ridiculed "Packer's circus." Packer was ready to compromise in exchange for gaining a monopoly on televising Australian cricket. When his offer was rejected and he was refused access to Australia's major cricket grounds, he found other venues in which to stage cricket matches. When various cricket organizations, including the International Cricket Conference, banned anyone who played in Packer's supertests, he took the conference to court and won. Political pressure forced the opening of the traditional cricket grounds in Sydney and other sporting venues for Packer's matches, and when he instituted night cricket by adding electric lights to the field, the fans came in great numbers. In 1979, the traditionalists conceded. In exchange for Packer abandoning his World Series Cricket, he received a ten-year monopoly on televising, merchandizing, and marketing cricket in Australia, including the exclusive right to televise Australian matches played overseas. The agreement proved to be a financial bonanza for Packer.

Politically, Packer and his father were backers of Australia's Liberal Party, which despite its name was politi-

cally conservative. Packer, however, was willing to support any party and any politician, including those from the Labor Party, who would do business with him, and his media power found most politicians irrespective of party eager to work with him. In return for his support, Packer wanted to have few government regulations on his media activities, a policy that was popular with other media barons, such as Rupert Murdoch, a fellow Australian.

Packer also had an appreciation of when to buy and when to sell. When Frank died, the Packer family owned only 25 percent of Consolidated Press. In the early 1980's, in a brilliant financial coup, Kerry bought the non-Packer shares at less than the price established by the auditors, giving him full control of Consolidated Press. He always desired to be in complete control and not troubled by any outsiders, be they politicians or shareholders.

In 1983, the Costigan Royal Commission accused Packer of numerous crimes, including tax evasion, money laundering, corporate fraud, the importation of drugs, pornography, and even murder. Tax fraud was the central allegation, while the other accusations were secondary. Initially, Packer was not publicly named in the investigation, but his name soon surfaced in the newspapers. Packer, like many other successful businesspeople, had sought loopholes that limited his taxes, and some of his investments were intended to lose money in order to reduce his tax burden, a practice that could be ethically problematic but not necessarily criminal. Eventually the findings of the Costigan Commission were sent to Australia's director of prosecutions for further action, but it was not until 1987 that the government announced that the commission's charges against Packer were groundless. The public exoneration was possibly due in part to the intervention of Australia's prime minister, Robert Hawke, whom Packer had supported politically. However, the accusations seriously damaged Packer's reputation not only in Australia but also in England, where his victory over the cricket establishment was of recent memory. By some accounts, Packer was nearly suicidal during the investigation. He never had much respect for journalists, and after the affair was over, he held the press in total contempt.

In 1987, Packer sold Channel Nine to another ambitious Australian entrepreneur, Alan Bond, for $1.06 billion (Australian dollars), about twice what it was worth. Although television was Packer's mainstay, it was impossible to pass up $1 billion. After the sale, Packer, who had been consumed with the business of making money for twenty years, decided to step back from the marketplace. He was overweight and out of condition, suffering a severe heart attack in 1990, after which he made a sizable donation toward equipping all New South Wales's ambulances with defibrillators.

The sport of polo became his new compulsion. At his estate seventy miles north of Sydney, where he owned more than sixty thousand acres of land, he built a polo field and barns for his 160 polo ponies. He also established a polo center in England, and he sponsored an international polo team, of which he was a member; it competed before Queen Elizabeth II at Windsor Castle. In addition to polo, Packer gambled heavily in London, Las Vegas, and elsewhere, sometimes winning or losing millions of dollars in one night. While retreating from day-today business activities, he invested in gold mines, engineering companies, magazines, ski resorts, casinos, and other endeavors. His landholdings in Australia were larger than the entire nation of Belgium.

After Bond suffered business reversals, Packer repurchased Channel Nine and made $800 million in profit. To escape changes in Australian tax laws, he relocated his corporate headquarters to the Bahamas. He was not always successful, but over time his wealth continued to grow substantially.

Packer's health was never good. In addi-

KERRY PACKER CIVIC GALLERY

Kerry Packer had little interest in establishing art galleries or museums or in endowing universities or other institutions. He attained his wealth and success because he shared the tastes of the masses rather than the cultured elite. However, in 2007, his son, James Packer, donated $2 million (Australian dollars) to the University of South Australia in memory of his father. The funds were used to create the Kerry Packer Civic Gallery within the university's Bob Hawke Prime Ministerial Centre, named for Australia's prime minister from 1983 until 1991. Although a member of the liberal Labor Party, Hawke was often allied with business interests, and Kerry Packer gave him considerable political support, so it seemed logical that the Kerry Packer Civic Gallery should become part of the Hawke center. Mitsubishi Motors of Australia provided additional financial support for the gallery, which was designed by the architect John Wardle and the architectural firm of Hassell.

The gallery is committed to the themes of democracy and diversity, particularly in Australia, focusing on the topics of media and human rights, the environment, governance, and freedom. At the entrance to the gallery there is a message stick of the aboriginal Kaurna people. Aboriginal people in Australia used message sticks to share information or as a welcoming gift, and the message stick's placement in the gallery is intended to give recognition to Australia's first people.

Since its founding, the gallery has presented numerous exhibitions, including displays of the artifacts and narratives of South Australia's numerous peoples, a visual arts presentation of young adults with intellectual disabilities, a photographic presentation of Australia's powerful women, a cross-generational exhibit of Aboriginal art, a photo competition by the Australian Human Rights Commission, a "Conversation Between Muslims, Christians, and Jews," and the Greenpeace Design Awards. The gallery presents lectures, organizes seminars, and is open for conferences, with space for approximately 250 persons.

tion to the polio he suffered as a child and his near-fatal heart attack in 1990, he received a kidney transplant in 2000. He died at his home in Sydney of kidney disease on December 26, 2005, refusing to prolong his life with dialysis treatment. His wife Roslyn and his two children, James and Gretel, were at his side. A state memorial service was held at the Sydney Opera House, with many politicians, cricket players, and show business personalities in attendance.

Legacy

Kerry Packer's aim was to make a great deal of money. When he died he was worth more than $6.5 billion (Australian dollars), and he was the richest person in Australia and among the top one hundred richest individuals in the world. He was brutal and overbearing to those who stood in his way, but he was loyal to his friends. While he made billions of dollars, he also spent vast amounts on gambling and his other interests, including his passion for polo. After his death, his son James became head of the many Packer enterprises.

Sir Horatio Palavicino

English banker, merchant, and government official

An Italian expatriate who became an English citizen and renounced Catholicism in favor of Protestantism, Palavicino used his fortune to gain entrée to the English court. He served as financier and greatly influenced foreign policy during the reign of Queen Elizabeth I.

Born: c. 1540; Genoa (now in Italy)
Died: 1600; Babraham, England
Also known as: Horatio Palavicino
Sources of wealth: Banking; trade; government; investments
Bequeathal of wealth: Spouse; children

Early Life

Sir Horatio Palavicino (hoh-RAY-shoh pal-ah-vee-CHEE-noh) was the second son of Tobias Palavicino, a wealthy merchant and banker from a twelfth century family that wielded influence from Genoa to Sicily. His mother was Battina Spinola, who was from an equally powerful family. As a youth, Palavicino was sent to the Netherlands, where for several years he oversaw his family's northern European commercial and financial interests. A shrewd businessman, he became fluent in a number of languages, and by the mid-1550's he was dealing with Queen Mary I of England as the official collector of papal taxes.

First Ventures

In 1566, the Palavicino family paid a large fee to be exclusive agents for the papally monopolized Tolfa mines, a source of alum, a mineral used in the manufacture of paper and textiles. Trading primarily with the Netherlands and England, Palavicino annually imported thousands of tons of alum. When Palavicino ignored papal demands that he not deal with Protestant nations, the pope had his older brother tortured. Palavicino retaliated by selling a warehouse full of alum to Dutch Protestants and pocketing the proceeds instead of giving them to the pope.

Palavicino took up permanent residence in England, became a naturalized citizen, and converted from Catholicism to Protestantism. He parlayed his ill-gotten funds into a fortune by investing in the Royal Exchange stock market. He began a lucrative shipping company, imported pepper, and lent money at high interest rates.

Palavicino was a charming fellow with a reputation as a lothario. He became a favorite of Queen Elizabeth I, and he was a protégé of William Cecil, the queen's treasurer and adviser. When Sir Thomas Gresham, the queen's financial agent and ambassador, died in 1579, Palavicino was named to succeed him.

Mature Wealth

Palavicino became indispensable to Queen Elizabeth and was widely considered to be a savior of the English nation. He lent the financially strapped English government vast amounts of cash, was considered an expert on currency exchange and credit transfer, and served as ambassador to France, Germany, and the Low Countries. As the queen's representative, he was heavily involved in political intrigues, and he stole letters and documents, spread rumors, recruited spies, and negotiated secret agreements.

For his many services, Palavicino was knighted in 1587. Because of his intimacy with foreign affairs, he was one of the first to raise the alarm about the Spanish Armada. He subsequently built and provisioned a ship for this conflict, and he participated in the 1588 battle in which England defeated Spain. The following year, he acquired Babraham Place, a luxurious Cambridgeshire manor surrounded by thirty-five hundred acres.

In 1591, Palavicino married Anna Hooftman of Antwerp, daughter of a prosperous banker. The couple subsequently had three children, Henry, Toby, and Baptina. Palavicino continued to serve Elizabeth until late in the 1590's, when he ran afoul of the queen by trying to corner the grain market, and he was banished from court. He spent his last years at his estate, living comfortably from the proceeds of his many enterprises before he died at his home in 1600. At the height of his prosperity, Palavicino was estimated to be worth the equivalent of nearly £5 billion in 2010 currency.

Legacy

Horatio Palavicino's efforts on behalf of his adopted country, particularly his role in defeating the Spanish Armada, helped change the course of British history. The riches he had accumulated, however, were dissipated not long after his death. His widow, Anna, wed Sir Oliver Cromwell, the wastrel son of wealthy Henry Cromwell and the uncle of Oliver Cromwell, the dominant figure in the Puritan Revolution of the seventeenth century. Anna married off her young children to Sir Oliver's children by a previous marriage. Sir Oliver, a congenital spendthrift in control of his wife's vast fortune, eventually lost Babraham Place and died deeply in debt at age ninety-three; rebuilt in the mid-nineteenth century as Babraham Hall, the estate eventually became home to the Babraham Institute, a biomedical research facility. Of Palavicino's three children, only Baptina, a minor poet who died young, is remembered. However, many of Palavicino's distant relatives, who have included several composers, writers, and cardinals, remained prominent in Italy into the twenty-first century.

John Palmer

British merchant and banker

Palmer's wealth was derived from trade with India. He lived the life of a merchant prince in Calcutta, relying on his reputation for liberality and his social contacts to attract capital and business. However, poor business methods and corruption within his firm resulted in his bankruptcy.

Born: 1766 or 1767; Saint Kitts, British West Indies (now Saint Kitts and Nevis)
Died: January 21, 1836; Calcutta, India
Sources of wealth: Trade; banking
Bequeathal of wealth: Dissipated

Early Life

John Palmer's father, William Palmer, was a high-ranking employee of the British East India Company and later a lieutenant-general in the Indian army. John was the youngest of William's three sons, and the boys were brought up in England while their father served in India. The disgrace of William's patron, Warren Hastings, the first governor-general of Bengal, meant that William was not able to help John attain a lucrative position. Instead, Palmer joined the Royal Navy, seeing action in America's Revolutionary War.

First Ventures

In 1784, Palmer quit the navy and followed his father to India, entering one of the "agency houses," the trading companies set up to take over the duties of the British East India Company after scandals and charges of corruption changed the firm's operations. After the British East India Company effectively became an arm of the British colonial power, trading and banking services were taken over by private enterprises, such as the agency houses.

Palmer joined the firm of Burgh and Barber in Calcutta and was made a partner in the firm in 1793. Two years earlier, he had married Mary Hampton (the couple eventually had five sons and seven daughters). Palmer moved to the firm of Cockerell, Trail & Co. in 1803. In 1810, Cockerell, Trail's business was divided into two companies. The home department in London retained the firm's title, while the Indian division, based in Calcutta and headed by Palmer, became known as Palmer & Co. The two companies retained strong links, although Baring Brothers of London also handled Palmer's financial transactions.

Mature Wealth

Palmer's business philosophy was based on magnanimity. He sought cordial relationships with Indian merchants and British government officials because he was seeking their money as capital for his trading ventures. He became the banker for both the Indians and the British, administering his clients' wills and trusts and remitting money back to London. Although he lived in a grand style, he lent money, helped unfortunate people, and made donations to charity. One of the British governors called him "the prince of merchants."

Palmer expanded his Indian trade from indigo, India's best-selling crop at the time, to cotton, sugar, salt, and, more controversially, opium. He expanded his remittance to all of Southeast Asia, including the Dutch East Indies (now Indonesia), Malaya, and Canton in southern China. He also traded with Australia and the United States, although communication with these nations was slow. To help his trading business, he set up a fleet of ten ships in 1815, expanding to twenty-one ships in 1821, and he established a profit-sharing plan for the ships' captains and crews.

However, his business accounting methods were poor. Palmer was lenient with subcontractors' debts, and he found it difficult to supervise distant enterprises. He lost large amounts of money in the Dutch East Indies, and some of his trusted Indian managers systematically defrauded the company, as did some of the fleet captains. The Anglo-Burmese wars of 1824-1826 made it harder for Palmer to acquire capital.

Eventually, after several smaller agency houses failed, the London firm of Cockerell, Trail called in its debts from Palmer & Co. The company's debts were about £600,000, and Palmer's money was tied up in the indigo trade, which was then undergoing a slump. Despite efforts by some Indian financiers to rescue the company, Palmer & Co. declared bankruptcy in 1830. This bankruptcy soon brought down the rest of the agency houses and left many of Palmer's patrons destitute. In 1833, Palmer tried to continue agency work on a small scale, but he was poor when he died of a fever in 1836.

Legacy

At the time of his death, John Palmer had little money or property to bequeath to his wife and children. However, he did leave a reputation for being the last of the old-style merchant princes, conducting business in India with both the Indians and the British. After Palmer's death, these two communities grew apart and the Indian trade became more profit-oriented and exploitive.

PASION

Greek banker

Pasion, a foreign-born slave in ancient Athens with a reputation for trustworthiness and financial skill, earned great wealth as a banker. Gaining both freedom and citizenship, he contributed armaments to the Athenian military.

Born: c. 430 B.C.E.; possibly Phoenicia
Died: c. 370 B.C.E.; Athens, Greece
Sources of wealth: Banking; real estate
Bequeathal of wealth: Spouse; children

EARLY LIFE

Pasion (PAH-see-ohn) was born around the year 430 B.C.E. and most likely was of Phoenician origins. He was a slave belonging to two Athenian bankers, Antisthenes and Archestratos. Their banking and loan company was located in the busy commercial port of Piraeus, five miles from Athens. Pasion married Archippe in the 390's. The couple's son, Apollodorus, was born about 394, and a second son, Pasikles, was born in 380.

FIRST VENTURES

Pasion began working in the bank when he was about twenty years old. His masters were impressed with his honesty and reliability, essential qualities for the handling of large amounts of money. Pasion soon achieved the highest position in the bank: chief clerk managing the money table at the Piraeus harbor. Because of his valuable services, his owners emancipated him.

Pasion continued to work for the bank until he had accumulated sufficient wealth to first lease the bank and then buy it around the year 394. Pasion staffed his bank with slaves; his manager and chief cashier was Kittos and later Phormion. Interest rates in Athens were high, about 12 percent; bankers paid no interest on deposits and collected large commissions on money changing. Pasion's annual income was some 100 minae, equivalent to about $1 million in twenty-first century currency.

MATURE WEALTH

Pasion became the wealthiest banker in Athens. His success was recorded in speeches of the celebrated orators Demosthenes (speech numbers 36, 45, 46, 49, 50, 52, and 59) and Isocrates (speech number 17), to which historians owe many details of Pasion's life. The leading merchants, generals, and elders of Athens and Piraeus banked with him. With his profits, Pasion bought a shield factory (a leading industry in warring Athens), blocks of apartments to rent, and an assemblage of slave employees and servants. Pasion also made generous benefactions to Athens of one thousand shields and five triremes (warships), for which he also supplied crews. As a result, Pasion was granted the prize of Athenian citizenship and enrolled in the deme (village) of Archarnai.

By the 370's, Pasion's eyesight was failing and he was embroiled in heated lawsuits with several depositors. Whether this litigation resulted from the corruption and greed of Pasion, that of the depositors, the exorbitant nature of Athenian banking, or the general litigiousness of Athenian society is difficult to say. Pasion entrusted the operation of his bank and shield workshop to Phormion. Pasion died around 370 B.C.E., the wealthiest man in Athens. His widow married Phormion, per Pasion's instructions.

Pasion's fame was such that the terms of his will were preserved and remain available to scholars and historians. For his widow's remarriage dowry, Pasion left two talents (the largest unit of Greek currency), a block of apartments, jewelry, and maidservants. The remainder of his estate was divided equally between his sons Apollodoros and Pasikles. The estate included about 50 talents (some in the form of outstanding loans), the bank, the shield factory, real estate worth 20 talents, cups, and a gold crown. As it is estimated that the Athenian talent at that time was worth the equivalent of as much as $600,000 in 2010 dollars, Pasion's estate can be said to have been worth approximately $55 million.

Legacy

It would be hard to imagine a more spectacular rise than that of a foreign-born slave to the wealthiest citizen of Golden Age Athens. Pasion acquired a reputation for savvy and hard work but was not without critics and opposing litigants. His rise also reflects the sophisticated nature of Athenian society. Athenians reposed trust in their banking system, with its advanced arrangements of currency, loans, and credit. Pasion's accumulation of money could burst the bonds of slavery in a manner that would be impossible in the harsher, race-based slavery of later times. Pasion's remarkable legacy was paid tribute in orations by his son Apollodorus, Isocrates, and Demosthenes, who were awed by the prowess and wealth of this banker-slave.

Simón Iturri Patiño

Bolivian tin mining magnate and businessman

Patiño mined Bolivian tin, laying the foundation of one of the twentieth century's greatest fortunes and eventually becoming the dominant force in world tin production. He presided over the international tin cartel of the 1930's.

Born: June 1, 1860; Santiváñez, Cochabamba Department, Bolivia
Died: April 20, 1947; Buenos Aires, Argentina
Sources of wealth: Mining; metals refining; banking
Bequeathal of wealth: Spouse; children; charity

Early Life

Simón Iturri Patiño (see-MOHN ee-TUHR-ree pah-TEEN-yoh) was born on June 1, 1860, in the village of Santiváñez, in the department of Cochabamba, Bolivia. The details of his youth are cloudy, although most accounts say that his parents, Eugenio Iturri and María Patiño, were of indigenous and Basque descent. He attended elementary school in the village and then moved with his mother to Cochabamba, where he received his secondary education in a Catholic seminary.

Seeking employment, Patiño left Cochabamba and moved to Oruro in the late 1870's to work for a company that supplied imported goods for the nearby silver mines. In 1884, he obtained a clerical position in the Huanchaca Company of Bolivia, a large silver mining enterprise, which gave him important experience in the operations of the mining industry. He then took a position with the Fricke Company, a German business that supplied machinery and working capital to miners and bought ore from them. By the mid-1890's, Patiño had gained broad experience in most aspects of mining. On May 1, 1889, he married Albina Rodríguez Ocampo of Oruro, with whom he had five children: René, Antenor, Graziella, Luz Mila, and Elena.

First Ventures

In 1895, Patiño formed a partnership with Sergio Oporto, who had been working the small, four-hectare mining claim of La Salvadora, located southeast of Oruro and at an elevation of twelve thousand feet on Espíritu Santo mountain. Larger claims were already being worked profitably for silver and tin nearby at Uncía by John Minchin and at Llallagua by Pastor Sainz. Discouraged by La Salvadora's lack of success, Oporto sold his share of the mine to Patiño on August 26, 1897. At that point, Patiño left Fricke and went to the mine to direct its operations.

In early 1900, Patiño's workers struck an extremely rich vein of tin, the exploitation of which laid the foundation of Patiño's fortune. He immediately hired an engineer to manage La Salvadora and set about acquiring financing for machinery in order to modernize operations, meanwhile working furiously to fend off lawsuits and attempted invasions of the mine by Sainz and Minchin. With funds from international lenders, he built a refining mill to concentrate his ore and thus reduce the cost of shipping it out for smelting. By 1905, he had become Bolivia's largest tin producer. Five years later, he purchased Minchin's holdings at Uncía. Additional purchases of tin mines elsewhere in Bolivia expanded his holdings. Primitive transportation infrastructure had initially forced Patiño to ship out his ore by llama and mule. He built cart roads, and from 1911 to 1921 he financed and constructed a railroad that connected the mines with Oruro and the La Paz-Antofagasta line.

MATURE WEALTH

Not satisfied with being the largest producer of tin ore in Bolivia, Patiño moved toward further expansion by acquiring ore deposits in other countries and, more important, by increasing his holdings in the smelting business. One of Patiño's competitive challenges was that mining costs in Bolivia were higher than in the Southeast Asian and African tin fields. In the Andes mountains, tin was mined underground and at high altitude, compared to Malaysia, where the metal could be dredged or extracted from open pits. The transportation costs of hauling ore down from the mountains to the coast were also expensive. Patiño kept workers' wages low at his Bolivian mines, and he also bought shares in Malaysian and African ore fields.

The smelting or refining of his ore also presented challenges for Patiño. Heating the ore required great amounts of energy, but fuel was scarce in Bolivia. Patiño consequently had to ship his ore out of the country for smelting. He established processes to concentrate the ore in order to remove as much of the dross as possible so that only profitable tin ore was exported. Patiño also began investing in European tin smelters. His early relationship with the Fricke company of Germany led him initially to associate with the German smelting company of Zinnwerke-Wilhelmsburg. However, Patiño astutely broke with the German smelters at the outbreak of World War I, shifting his ore to Williams, Harvey & Company, Ltd., of Liverpool, England, which was the largest European tin smelter. He later joined forces with Edward J. Cornish of the American-based National Lead Company, a large consumer of tin, to press Williams, Harvey to allow Patiño and Cornish to buy a share of the British company. Patiño and Cornish threatened to build their own smelter unless Williams, Harvey agreed to the sale. Patiño and Cornish initially bought a half interest in Williams, Harvey, and by the end of the war they had purchased the remainder, giving them control of the British smelter. Between 1916 and 1918, the two men also established the Williams, Harvey Corporation, an American firm that built a smelter in Long Island, New York.

Meanwhile, Patiño continued to build his holdings. Through the firm of Penny and Duncan, he secretly bought stock in the Llallagua Tin Company, his old rival from the Espíritu Santo mountain. In 1924, he and Cornish announced that they owned two-thirds of the Llallagua stock. A few weeks later, he founded Patiño Mines and Enterprises Consolidated, which he incorporated in Delaware, near sources of American capital. He also bought interests in African and Asian tin mines. All of these transactions internationally diversified his holdings. In 1914, he and his family moved to Europe, where he could more closely supervise his companies and investments, and he left his Bolivian holdings under the management of a trusted and brilliant lawyer, Arturo Loaiza.

Patiño never returned to Bolivia after 1920, although he continued to exert tremendous economic and political influence in his homeland. Besides his tin mining interests in Bolivia, he owned banks and commercial enterprises and produced other metals, such as tungsten, lead, and silver. He founded the nation's Mercantile Bank, invested heavily in the electrical utilities of Oruro and Cochabamba, and supplied funds to build a railroad from Sucre to Potosí when other sources of capital were unavailable. As the country was dependent on earnings from tin exports, Patiño had tremendous political power in Bolivia and could rely on the government to send in troops to quell labor unrest in his mines. It was said that his Catavi and Siglo XX mines produced and consumed more electricity than the rest of Bolivia. Patiño also served as his country's ambassador to Spain and to France. His wealth was staggering, with some ranking him among the world's five wealthiest individuals.

When tin prices declined in the late 1920's because of an oversupply of tin on the world market, Patiño led the move to create the Tin Producers Association in July, 1929, in an attempt to increase prices by limiting production. With Patiño as its president, the association set national output quotas (with Bolivia receiving a large share), and by 1933 the International Tin Control Scheme had managed to eliminate the tin glut and raise prices. The outbreak of World War II, with the war's tremendous demand for metals, ended the need for the cartel. To avoid the hostilities, Patiño moved to the United States in 1939. He wanted to return to Bolivia, but his doctors advised against it because of a serious heart attack he had suffered in 1924. Patiño did return to South America, however, dying in Buenos Aires, Argentina, on April 20, 1947. He was buried on the grounds of his Paurumani estate outside Cochabamba.

LEGACY

Simón Iturri Patiño left a contradictory legacy. A self-made entrepreneur and industrialist of mestizo ancestry, he accumulated one of the great fortunes of the early twentieth century and gained entry into the circles of European aristocracy and international finance. Bolivia depended on revenues from his tin, yet many Bolivians believed Patiño had abandoned the nation and had siphoned profits away from a country that desperately needed the capital for its own development. The largest private employer in Bolivia, Patiño provided housing, schools, hospitals, and subsidized food for his workers and their families, but he kept their wages low and their working hours long. Until the 1940's, his managers brutally resisted any workers' attempts to organize, as evidenced by the massacre at the Catavi mine in 1942.

Patiño's mining empire in Bolivia did not survive. During the Bolivian Revolution of 1952, the nation seized his mines. Nonetheless, after Patiño's European smelters refused to refine Bolivian tin ore, Bolivia compensated his family for the confiscated properties. Patiño's heirs suffered surprisingly little from the expropriation because his diversification had made his Bolivian holdings a relatively small part of his estate. By the early 1970's, after declining tin prices and mismanagement had caused the collapse of Bolivia's government-operated mining industry, some workers found themselves wishing for the return of Don Simón.

FONDATION SIMÓN I. PATIÑO

Eleven years after the death of Bolivian mining magnate Simón Iturri Patiño, Patiño's heirs founded the Fondation Simón I. Patiño in 1958. The foundation, headquartered in Geneva, Switzerland, promotes and funds programs related to South America, especially Bolivia, giving preference to projects in the fields of education, culture, research, health, hygiene, nutrition, agriculture, and ecology. Many of its programs are carried out from the Bolivian properties of the Fondation Universitaire Simón I. Patiño (Simón I. Patiño university foundation), which Patiño created in 1931. Other activities, particularly those related to culture, ecology, and literary publication, are centered in Europe.

The two foundations' programs build upon the work initiated by Patiño himself, who established his university foundation to rectify the lack of technological and managerial expertise in Bolivia. Patiño never had the opportunity to obtain university training, but he recognized his country's tremendous need for such education. He worked to set up the foundation with Belgian educator Georges Rouma, who had been training teachers in the normal school at Sucre, Bolivia. Patiño chose the university foundation's motto: "Love for the work and respect for the law." The organization provided scholarships for students to attend foreign institutions, funds for Bolivian universities, and cultural and scientific prizes in Bolivia.

In the twenty-first century, the Fondation Simón I. Patiño pursues its activities in several locations. The Simón I. Patiño Pedagogical and Cultural Center in Cochabamba, Bolivia, hosts meetings for the discussion of teaching and of general Bolivian problems and also promotes reading through a network of libraries. The Simón I. Patiño Space in La Paz, Bolivia, is a meeting place for artists and intellectuals and a center for expositions of photography, design, and painting. The Albina R. de Patiño Pediatric Center in Cochabamba provides medical training and treats Bolivian orphans. The Pairumani Center of Fito-Ecogenetic Research is a genetic seed bank for highland food crops located in the department of Cochabamba, which is also the site of both the Pairumani Model Farm, which works to improve Bolivian livestock and develop seeds for the Fito-Ecogenetic Center, and of the Pairumani Seed Center, which sells the center's seeds. The Simón I. Patiño Center of Applied Ecology in Santa Cruz, Bolivia, tests environmental models. The University Center in Geneva, Switzerland, provides executive training for Bolivian university students, and the Editorial Patiño, also in Geneva, publishes works in indigenous languages and translations from Spanish into French of literary and artistic works.

Jacopo de' Pazzi

Italian merchant and banker

Pazzi inherited a great deal of his fortune from the commercial and banking wealth accumulated by his Florentine father, brothers, and nephews. As his family's leader from 1464 to 1478, he challenged the fortune of the powerful Medici family, initially as a competitor for papal business and then in the infamous, failed Pazzi Conspiracy to overthrow Medici rule.

Born: 1433; Florence (now in Italy)
Died: April 30, 1478; Florence
Also known as: Jacopo di Andrea de' Pazzi; Iacopo de' Pazzi
Sources of wealth: Inheritance; banking; real estate
Bequeathal of wealth: Relatives; dissipated

Early Life

Although the lives and fortunes of many Renaissance-era Florentines are well documented, Florentine officials and mobs destroyed many of the records of the Pazzi family after the Pazzi Conspiracy of 1478. However, it is known that Jacopo di Andrea de' Pazzi, better known as Jacopo de' Pazzi (YAHK-oh-poh day PATS-zee), was the son of Andrea de' Pazzi (1371-1445), whose commercial and banking ventures established the old noble family's business foundation. Jacopo would have been apprenticed to his father's firms, following the leads of his two older brothers. With unlimited credit from the Medici family, Andrea, from his headquarters in Florence, had established branches of the cloth trade in Barcelona and banking relations with both the Papacy and the king of Naples. Andrea also had a contract to deliver silver to Barcelona's mint. The family's first papal deposit was 4,000 florins in 1443, the same year that King René I of Naples knighted Andrea.

First Ventures

Jacopo was twelve when Andrea died, and he would eventually have served his brothers, Antonio and Piero, as they expanded their father's commercial and financial empire. The Pazzi family established branch offices for trade and banking in French and Flemish cities, such as Lyon and Bruges, as well as strengthening their already existing branches in Italy and Aragon. Unmarried and free to travel, Jacopo represented the brothers' presence across the Pazzi commercial network until his nephews came of age. Jacopo eventually married Florentine aristocrat Maddalena Serristori, and the couple had a daughter, Catherine, born in 1463, but no sons.

Mature Wealth

In 1458, the city-state of Florence surveyed the wealth of its inhabitants for tax purposes. Cosimo de' Medici headed the list with a liability of 576 florins; Jacopo ranked only twelve notches below Cosimo, though his liability was one-sixth of Cosimo's. In the same year as the Florentine survey, Jacopo and his brother Piero challenged Cosimo and his putative heir, Piero di Cosimo de' Medici, by hiring architect and sculptor Giuliano da Maiano to build a family palazzo that rivaled that of the Medici. Piero de' Pazzi died in 1464, leaving Jacopo as paterfamilias for his five nephews. These nephews handled the major Pazzi companies in Rome, Naples, Barcelona, Bruges, and Lyon, while Jacopo ran the family bank and cloth warehouses in Florence and oversaw smaller offices in far-flung cities like Marseille, Valencia, and Ragusa. At this time, only the Salviati family had a similar system of companies, or cluster of companies, in Florence.

The overlapping of debits, credit, cash, and goods in transit makes estimations of Jacopo's personal wealth difficult to ascertain. Historian Francesco Guicciardini stated that by the 1470's, the Pazzi were Florence's richest family, and Jacopo was at the family's head. Jacopo served in several major offices, including prior; ambassador to the Holy Roman Emperor and to the king of Naples; gonfalonier of justice; and one of the twelve Buonuomini, an organization that dispensed charity. Between 1474 and 1476, the Pazzi family outmaneuvered the Medici at the Papacy, gaining both the papal depository and alum concession in return for a 30,000-ducat loan, which kept Lorenzo de' Medici from acquiring the small state of Imola. This was the high-water mark of Pazzi family power.

Legacy

Resentful of Medici arrogance and power in Florence, Jacopo's nephew Francesco de' Pazzi plotted to kill Lorenzo and his brother Giuliano de' Medici in what has become known as the Pazzi Conspiracy. On April 26, 1478, the Medici brothers were assaulted, and Giuliano was killed. Ever the gambler, Jacopo had discharged all of his debts in the days preceding the attack, and when the assault occurred he rode his charger through the streets crying "Libertá" (liberty). Like several of the Pazzi, he was hunted down and executed. Part of his estate was seized by the government, part by his nephew Guglielmo, and his personal effects were auctioned off on June 1 at the Florentine mint. Jacopo's generosity to churches, religious houses, and the poor paled beside his infamy as a conspirator.

George Peabody

American banker, merchant, and philanthropist

Peabody amassed his fortune as one of the first investment bankers, and he then used his wealth to aid people in the United States and London. Generally recognized as the first American philanthropist, he funded schools, museums, cultural institutes, and housing projects.

Born: February 18, 1795; South Danvers (now Peabody), Massachusetts
Died: November 4, 1869; London, England
Sources of wealth: Banking; trade
Bequeathal of wealth: Charity; educational institution

Early Life

George Peabody was the son of Thomas Peabody and Judith Dodge Peabody, both of whom were from Massachusetts families of English dissenters. Thomas Peabody, a leatherworker and small farmer, could not support his large family. At eleven, George, the third of eight children, was apprenticed to John Proctor, who ran a general store. Here Peabody learned to keep accounts, write clearly, serve customers, and appreciate those who helped him. Proctor valued Peabody as a conscientious worker and offered him a paid position when his apprenticeship was completed. However, Peabody chose to explore other possibilities, moving to his grandparents' farm in Vermont, where he worked with his grandfather and met his sea captain uncle who impressed upon him that there were other possibilities in life. At age fifteen, Peabody returned to work in his brother's drapery shop in Newburyport, Massachusetts. This business failed because of a widespread, local fire, and Peabody began looking for a new position.

First Ventures

Peabody's first successful business venture resulted from an opportunity presented by an uncle, Colonel John Peabody. Recognizing the charisma and good work habits of this young man, Colonel Peabody invited his nephew to join him in establishing a general store in the Georgetown area of the District of Columbia in 1812. This business thrived, despite the impact of the War of 1812 upon the area. While young Peabody prospered, Colonel Peabody became mired in debt and had to give up the store.

While working with his uncle, Peabody served as a volunteer soldier in the auxiliary in the War of 1812. There he met Elisha Riggs, a merchant and banker, who was so impressed with the young man that in 1814 he invited Peabody to join him in a partnership in which Riggs was the major investor. According to Peabody's records, after five years the firm earned a profit of $70,709.24, a figure reflecting the partners' success and Peabody's habit of keeping precise records. In 1816, the partners decided to move their business to Baltimore, Maryland, which at this time was second only to New York City as a commercial center. By 1827, the business had greatly expanded, and Peabody frequently traveled to Europe in order to develop markets and buy products. In so doing, he cultivated important business associations and learned about world trade. The partners renamed the company Riggs, Peabody and Company and developed branches in Philadelphia and New York City.

Mature Wealth

By 1829, Riggs withdrew from the company and moved to New York City, where he became an investment banker. Peabody became partners with Riggs's nephew, Samuel Riggs, and changed the name of the company to Peabody, Riggs and Company, a firm that bought and sold products in Europe, the United States, and China. By the end of the 1830's, the company's focus was shifting from simply buying and selling products to financing the production and distribution of goods manufactured by other companies. Having traveled to Europe frequently by 1837, Peabody established himself in London. He gave up the dry goods business altogether and became a merchant and investment banker. By 1842, Samuel Riggs had left the firm, which was renamed George Peabody and Co.

Peabody earned a reputation for being a shrewd and honest businessman. He dealt largely in foreign exchange and American securities. American states had looked to Europe, especially London, to borrow money. In 1837, America experienced an economic crisis that caused individual states to repudiate interest on their loans and sometimes fail to repay these loans. Peabody was distressed to see this financial embarrassment of his countrymen, and he worked to restore confidence in the American states. To this end, he invested heavily in the states' securities, simultaneously working to promote American enterprises in Europe and urging the states to preserve their commercial honor. At one point he labored to sell bonds for the state of Maryland in order to finance construction of the Chesapeake and Ohio Canal. He finally persuaded Baring Brothers, the wealthiest banking house in Europe, to accept the states' securities, a deal reflecting his persuasive powers and trustworthy reputation.

Peabody lived a modest lifestyle, but he believed in presenting a positive image. He wore fine clothes and entertained with style. He eagerly welcomed Americans to London and eased their way into business or society. During any given week he took as many as eighty American visitors to dinner and thirty-five people to the opera. In 1851, England planned the Great Exhibition of Works of Industry. When Peabody learned that the United States was sending representatives but did not plan to exhibit America's important new inventions, he undertook to pay for the effective presentation of such products as Samuel Colt's revolver, Cyrus Hall McCormick's reaper, and Richard March Hoe's printing press, all of which astounded exhibition visitors. In the same spirit of fostering goodwill, Peabody began hosting huge Independence Day dinners, with the first one attended by the duke of Windsor.

From his youth, Peabody felt a strong sense of responsibility for those close to him, an ever-expanding circle of people. He supported his family from his first apprenticeship, and he supported Colonel Peabody's family after the colonel's death. He contributed to fire victims in his hometown, and he aided his first employer, Proctor, in old age. He paid for his nephews and nieces to attend college and graduate school. Appalled at the desperate condition of the Irish people during the potato famine, he paid for grain to be delivered to the hungry. Having had little education himself, Peabody supported not only the education of his family but also the education of others, funding scientific studies, libraries, museums, lectures, and teacher training. In London, he created a fund to build housing for the poor.

As Peabody's company thrived, he began to look to the future and to retain a new partner. He found this person in Junius Spencer Morgan, who joined his firm in 1854. After Peabody's death, Morgan's son J. P. Morgan would become a partner in the firm that became J. P. Morgan and Company.

As Peabody grew older, he became increasingly interested in ways to divest his wealth for the optimum benefit of humankind. He made extended trips to the United States in the last years of his life, visiting his many friends and relatives and developing philanthropic plans. He was esteemed and honored in both the United States and Great Britain. Grateful citizens of London erected a statue to him in the city's financial district, and Queen Victoria presented him with a letter of gratitude and her portrait. He received the Freedom of the City of London award. When he died in London in November, 1869, he became the first American to be honored with interment in Westminster Abbey. At his request, his body was to be buried in his family plot in Salem, Massachusetts, and his body was moved to the United States. The British and American navies vied for the honor of transporting his remains. In a compromise, his coffin traveled across the Atlantic in a British warship, *The Monarch*, escorted by an American warship.

The Peabody Institute

George Peabody dedicated the Peabody Institute in 1857 to acknowledge his appreciation of the kindness and hospitality of the citizens of Baltimore. He had long desired to create a cultural center in order to support and develop the city where he first made his fortune. His goal was to establish a facility that would promote the public welfare. Peabody designed the institute with advice from John Pendleton Kennedy, a lawyer and former congressman and secretary of the U.S. Navy. The building included a public library, music conservatory, art gallery, and facilities for public lectures.

Although the Peabody Institute was dedicated in 1857, its opening was delayed by disagreements related to the Civil War, with some trustees expressing pro-Northern sentiments and others favoring the South. As city leaders continued to bicker, Peabody came to feel even more strongly that the institute could be source of national healing, a place where all citizens of Baltimore could gather, put aside their differences, and appreciate art and learning.

The building finally opened in 1878. It was designed by architect Edmund G. Lind in cooperation with first provost Nathaniel H. Morrison. The most prominent feature of the institute was its interior, which contained five tiers of cast ornamental iron fabricated by the Bartlett-Robbins Company of Baltimore.

In 1966, management of the institute's Peabody Library was transferred to the city of Baltimore to be administered by the Enoch Pratt Free Library. Johns Hopkins University assumed the Peabody Library's administration in1982. In the twenty-first century, the George Peabody Library, a noncirculating collection open to the public, was part of the special collections department of the university's Sheridan Libraries. The entire institute was a division of the university, which was fitting because Peabody persuaded his friend, businessman Johns Hopkins, to establish the college that would bear Hopkins's name.

Legacy

Peabody, considered the first American philanthropist, became a model for others. He established the first philanthropic foundations in England and America. In Baltimore, he advised and inspired Johns Hopkins and Enoch Pratt, who respectively financed a university and library for this city. Other philanthropists also followed Peabody's lead.

Peabody himself funded the Peabody Institute in Baltimore, the first cultural center in the United States, which provided a public library, lyceum, music conservatory, art gallery, and monetary awards for outstanding students. He established the Peabody Education Fund, designed to reinvigorate education in the South after the Civil War. The George Peabody College for Teachers, now merged with Vanderbilt University, remained a leading school for training teachers into the twenty-first century. He created the Peabody Institute in what is now Peabody, Massachusetts, and he endowed museums and chairs in natural science and anthropology at Yale and Harvard Universities, respectively. In London, he built Peabody Homes, a multibuilding complex that in the twenty-first century continued to provide thousands of homes for the working poor. His assistance to his nephew, Othniel C. Marsh, enabled Marsh to become a world-renowned paleontologist.

Jean Pellet

French trader and landowner

Pellet acquired his primary wealth in colonial trading, which was an important commercial activity in eighteenth century France. As his wealth increased, the upper echelons of society opened to him and his lifestyle changed, as was typical of successful members of the bourgeoisie.

Born: 1694; Bordeaux, France
Died: 1772; place unknown
Sources of wealth: Trade; real estate
Bequeathal of wealth: Children

Early Life

Jean Pellet (zhahn peh-LAY) was born in 1694 in Bordeaux, France. His family belonged to the bourgeoisie. Pellet's father went to Martinique, where he became involved in trading. His success as a trader enabled him to amass a small fortune and start a family firm that provided Jean and his brother with a sizable amount of capital to begin their careers.

In 1711, Pellet set sail for the West Indies for the first time. There, he bought a house for 78,000 livres. In 1717, he married a Creole woman who brought him a dowry of 20,000 livres, and the following year he returned to Bordeaux.

First Ventures

In 1719, Pellet founded a trading firm with his brother. Pellet established himself as a successful speculator and outfitter of trading ships in Bordeaux. At first, he was simply involved in trading as a merchant selling goods. However, in 1729 he became the agent for a Spanish company, La Compagnie de Caraque, which brought cocoa from Venezuela to sell in France. His work on behalf of the company led him to acquire three or four ships of his own and to expand his trading activities to include the ports of Hamburg, Amsterdam, Cork, and Bilbao. As a speculator, Pellet shipped manufactured goods and foodstuffs that arrived in the West Indies when agricultural products grown there were being harvested. At harvesttime, West Indians would have a surplus of local products, which Pellet would purchase at low prices and then sell at higher prices in France and other European countries. By 1733, he had amassed capital of 300,000 livres.

Mature Wealth

Pellet, like all members of Bordeaux's bourgeoisie, envisioned his trading operations not only as a way to become rich but also as a vehicle to attain upward social mobility. By acquiring wealth, he was able to buy land in order to raise his standing in society. The landed nobility were at the top of the social hierarchy. Thus, Pellet began buying land with the purchase of some vineyards in Graves, a city southwest of Bordeaux. In 1735, he purchased the office of secretary to the king for 120,000 livres. He also devised a scheme to present his family as a forgotten branch of the Narbonne lineage in order to become *grande noblesse* (major nobility). The failure of this scheme, however, caused him a certain amount of ridicule.

In 1738, he purchased land belonging to the Anglade family for 145,000 livres. During the War of the Austrian Succession (1740-1748), the English captured Pellet's best trading ship. Recognizing the dangers of seafaring and trading, Pellet decided to stop trading and to invest his money in land. In 1741 and 1746, he bought properties bearing noble titles, including the comte de Talmont. From 1747 to 1750, he built an elaborate thirty-room house on the Place Royal in Bordeaux. By 1768, his wealth had risen to the sum of 1,930,000 livres. He died four years later.

Legacy

Jean Pellet's life illustrates the role of acquired wealth in changing the social status of individuals in eighteenth century France. During his lifetime, Pellet became one of the major businessmen and traders of Bordeaux. Using the wealth he acquired in colonial trading and speculation, he ascended socially from the merchant class of bourgeoisie to that of landed gentry and *petite noblesse* (minor nobility).

Although Pellet did not succeed in becoming part of the *grande noblesse*, his four sons were fully accepted into the *noblesse de la robe* (judiciary nobility). The two eldest sons, Jean-Jacques and Jacques, became members of the Bordeaux parliament. One of Pellet's other sons held the office of treasurer of France, and the fourth son became governor of Langon. Ironically, because Jean-Jacques was a member of the aristocracy, he was guillotined in 1793 during the French Revolution.

William Penn

British landowner and founder of the Pennsylvania colony

Penn, an English Quaker and a proponent of religious tolerance, founded the Pennsylvania colony. The colony and his estates in England and Ireland made him for a time the largest private landholder in the world.

Born: October 14, 1644; London, England
Died: July 30, 1718; Ruscombe, Berkshire, England
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Spouse; children

Early Life

William Penn was born on October 14, 1644, in London, the son of Admiral Sir William Penn and Margaret Jasper. The senior Penn had fought in the English Civil Wars and was rewarded by Puritan leader Oliver Cromwell with estates in Ireland. The junior Penn developed an early interest in religion, having heard a speech by Thomas Loe, a missionary for the Society of Friends, known by the then-derisive name Quakers.

Penn studied Greek and Roman classics and became a religious rebel at Oxford University, where he defied Anglican Church officials by visiting John Owen, a professor who had been dismissed for advocating tolerant humanism. Penn also protested compulsory chapel attendance, which resulted in his being expelled from Oxford at age seventeen. Penn's parents then sent him to France, where he enrolled at the Protestant Academy.

First Ventures

Returning to England by 1664, Penn studied at Lincoln's Inn, a prestigious London law school. He attended Quaker meetings, a criminal act at this time, and was arrested several times. As an aristocrat, he was offered release, but he refused, insisting that all Quakers be treated equally. Penn was imprisoned six times in England for speaking his mind on religion. He used his diplomatic skills and family connections to release large numbers of Quakers from jail. He also saved many from the gallows.

As a result of these activities, Penn's father disowned him for a time. Penn later used his legal training to prepare a historic defense of religious toleration in court. The jury acquitted all defendants, but the lord mayor of London refused to accept the verdict. The lord mayor fined the jury members and ordered them to be held in the brutal Newgate Prison. The jurors sued the mayor for false arrest and won, establishing a major precedent protecting the right of trial by jury.

In 1670, Admiral Penn died, leaving William with a substantial income of £1,500 a year, estates in Ireland, a gold chain and medal, and silver bullion.

Mature Wealth

Convinced that religious toleration was not possible in England, Penn requested a charter for an American colony. On March 4, 1681, King Charles II granted Penn a charter for territory west of the Delaware River and north of Maryland, in exchange for canceling a debt of £16,000 that was owed to Admiral Penn. The Pennsylvania colony's original principles included scrupulous attention to nonviolence, as well as fairness in land dealings and trade with Native Americans.

Despite his radicalism, Penn retained great wealth, living in an English country mansion, Warminghurst, and an American country manor, Pennsbury. His other estates in England and Ireland produced revenue of £2,000 per year, equivalent to about $22 million in 2010 U.S. dollars. In addition, the royal grant of Pennsylvania made him, for a time, the largest private landowner in the world, with more than forty-five hundred square miles of private property, rich in natural resources.

Although he retained very little of this wealth, Penn used his influence to endow a colony that embodied his personal beliefs of religious tolerance and peaceful relations with the original inhabitants, going against prevailing public opinion. Penn's personal wealth enabled the realization of his vision. Penn's First Frame of Government, which the initial land purchasers adopted on April 25, 1682, anticipated the Declaration of Independence, providing for secure private property, nearly unlimited free enterprise, a free press, and trial by jury, as well as religious toleration.

Legacy

Penn was a shrewd businessman who competed with George Calvert, founder of Maryland, for territorial rights. Using his friendly relations with Native American peoples, Penn outmaneuvered Maryland agents, a fact that remains evident in the twenty-first century to anyone who compares the relative sizes of Pennsylvania and Maryland.

By 1701, Penn had returned to England for the rest of his life. He tried to administer his declining estate from a

distance until he experienced a debilitating stroke in 1712. Four months later, he suffered a second stroke. In the meantime, his financial adviser, Philip Ford, swindled Penn out of nearly all of his income from lands in Ireland. After that, Penn experienced difficulty speaking and writing until he died on July 30, 1718, at his home in Berkshire, England.

Penn's will directed that the income from his Pennsylvania lands be used to pay his debts. After the debts were settled, he bequeathed the Pennsylvania proprietorship and his considerable English, Irish, and American estates, as well as several thousand pounds a year, to his wife, children, grandchildren, and heirs. His will stated his desire that his children "may settle at least in good part in America where I leave them so good an Interest to be for their Inheritance from Generacon [generation] to Generacon, which the Lord's p'serve and prosper."

THOMAS H. PERKINS

American merchant, investor, and politician

Amassing a fortune by trading with China, Perkins was able to invest in domestic enterprises. A member of an elite group of Boston merchants, he became a patron of the arts and financially supported a number of institutions, including the Perkins School for the Blind.

Born: December 15, 1764; Boston, Massachusetts
Died: January 11, 1854; Boston, Massachusetts
Also known as: Thomas Handasyd Perkins; Colonel T. H. Perkins
Sources of wealth: Trade; slave trade
Bequeathal of wealth: Children; relatives

EARLY LIFE

Thomas Handasyd Perkins (TOM-ahs HAHND-ah-sid PUHR-kihns) was the second son of James Perkins, a wine merchant, and Elizabeth Peck Perkins. Perkins's father died in 1773, leaving Elizabeth to care for a large family. Elizabeth's father, Thomas Handasyd Peck, an importer and dealer in furs and hats, helped her set up a grocery shop. Although James left an estate of about £350, Elizabeth, a natural businesswoman, increased his estate one hundredfold before she died.

However, Boston was becoming an increasingly dangerous place to live after the Boston Massacre and the Revolutionary War battles at Lexington and Concord. Food was becoming scarce, and shortly before the battle of Bunker Hill on June 17, 1775, Elizabeth took her seven children to Barnstable on Cape Cod. Her father and mother stayed in Boston to protect their property and other interests. Elizabeth and the children stayed with Squire Edward Bacon, and the children went to school. After the British withdrew on March 17, 1776, the Perkins family returned to Boston.

That autumn, Thomas was sent to live with Reverend Daniel Shute in Hingham in order to be prepared to enter Harvard College. However, his mother's business had suffered during the revolution and Perkins needed money, so after three years of study with Shute he went to work at William Dall's counting house. A year later he gained employment at W. & J. Shattuck, a large mercantile enterprise, where his older brother James was foreman of the apprentices. At age twenty-one, Perkins received £65 from his grandfather's will. Following his older brother, Perkins went to sea, looking for adventure and fortune.

FIRST VENTURES

At Cape Francis on the island of Santo Domingo (later renamed Hispaniola) in the West Indies, Perkins found an opportunity. In 1786, Perkins, his brother James, and Walter Burling founded a commission merchant business, Perkins, Burling & Perkins. Acting as middlemen, the three men were involved in the slave trade. They also sold other commodities, including dried fish. On March 25, 1788, Perkins married Sarah Elliot from Boston. When her father Simon Elliot died, Sarah and her husband inherited $16,000. The couple would have eleven children. Wishing to stay in Boston, Perkins formed a company with an uncle, which they called T. H. Perkins & James Magee. The firm sold wine, spirits, and rice on commission but had aspirations beyond shopkeeping.

MATURE WEALTH

In 1785, Elias Hasket Derby of Salem, Massachusetts, had opened up trade with China. By the summer of 1788, Derby arranged with Magee, a ship captain, to sail Derby's ship *Astrea* to China. Magee engaged Perkins to be his "supercargo" for the trip; Perkins's duties were to supervise the cargo, handling all aspects of its care and sale, as well as the purchase of return goods. On February 15, 1789, the voyage to China began. Perkins and his shipmates reached Whampoa (Huangpu) on September 18, but they had to moor the ship and row up the Pearl River to Canton because the Chinese government had proclaimed that all trade with the outside world was to be conducted at Canton. In conversation with other merchants, Perkins found out about lucrative trade opportunities in sea otter skins found along the northwest coast of the United States. Loaded with goods, the *Astrea* returned to Boston on May 31, 1790.

With his share of the profits, Perkins became a ship owner. He, Magee, and Russell Sturgis purchased the *Hope*, and they fitted this ship to sail to the West Coast, purchase sea otter skins and other furs, and continue to China, where these furs were extremely popular. Because of the slave insurrections in the West Indies, James joined his brother Thomas in Boston, and the firm James and Thos. H. Perkins was established on Long Wharf, selling various sugars, cotton, wine, and other goods. By 1792, the company had investments in seven ships. Although the Perkins brothers suffered major losses to their business in Santo Domingo because of the slave riots, and the *Hope* did not achieve its anticipated profits, another of their ships, the *Margaret*, made the equivalent of $100,000 for each owner. The brothers put their earnings back into the ships that they owned solely or in partnership with other merchants. The Perkins brothers also became involved in short-term speculation in the West Indies, sizable investments in the European markets, and long-term ventures in the China trade.

Searching for new markets and goods to sell, Perkins traveled to Europe. In 1794 he decided to go to Paris to take advantage of the shortages and scarcities caused by the French Revolution and to recoup his loss of business in the West Indies. When the United States became concerned about a possible war with France, Perkins was appointed a colonel in the Massachusetts State militia in 1799. Thereafter, he used the name Colonel Perkins in order to differentiate himself from Thomas Perkins, who was born one year before Thomas Handasyd Perkins and was involved in many of the same pursuits, including shipping.

In 1807, in an attempt to prevent American involvement in the Napoleonic Wars, the Embargo Act closed U.S. ports to all exports and restricted imports from Great Britain. New England ship owners and merchants were irate, and a group of Federalists, including Perkins, proposed secession from the United States. Fortunately, the Perkins firm had five vessels at sea at this time, so the company was able to trade. The Embargo Act proved unpopular and unenforceable and was repealed in 1808. When the embargo ceased, Perkins's business boomed, and he made his fortune trading with China. As the owner of a fleet of ships, he traded in silk, spices, tea, and opium. When James died in 1822, it was estimated that each brother's share in the partnership was far in excess of $133,000. Perkins formed a new business in 1823, J. & T. H. Perkins and Sons. He never retired, staying involved with his investments to provide "continuance and support."

At home in Boston, his wealth enabled him to invest in a number of businesses, including a theater; a luxury hotel at Nahant, Massachusetts; an ironworks in Vermont; and textile mills in Lowell, Massachusetts. He invested in the new toll bridge from Boston to Cambridge, and he also financed and helped organize the Granite Railway, one of the first

Perkins School for the Blind

The Perkins School for the Blind was established in Boston in 1829—the first school for the blind in the United States. John Fisher of Beverly, Massachusetts, a medical student, traveled to Paris, where he visited the world's first school for the blind in the early 1820's. Realizing the need for such a school in America, he and some friends, including Thomas H. Perkins, who was himself visually impaired, applied for a charter from the commonwealth of Massachusetts to found a school devoted to the education of blind students.

The school opened in 1832 under the directorship of Samuel Gridley Howe, who used rooms in his father's Boston home on Pleasant Street for classes. A year later, the school moved to a larger home on Pearl Street, owned by Perkins, the institute's vice president and trustee. Within six years, enrollment had grown to sixty-five students. In 1839, Perkins sold his mansion and donated the proceeds to the school, enabling the institution to purchase a larger building in South Boston. Around this time, the school was named the Perkins Institute for the Blind to acknowledge Perkins's generosity to the school; it would later be renamed the Perkins School for the Blind. In 1885, property was purchased to build a kindergarten in the Jamaica Plain neighborhood of Boston. By 1912, the school had grown in size and enrollment, necessitating a final relocation to a thirty-eight-acre site on the Charles River in Watertown, Massachusetts.

In 1842, author Charles Dickens visited the school during his lecture tour of America. Dickens was so impressed with Howe's teaching of the deaf-blind student Laura Bridgman that he devoted a section of his book *American Notes* (1842) to the school. This book was read by Kate Adams Keller, mother of a deaf-blind daughter named Helen. Kate requested help from the Perkins School, and director Michael Anagnos arranged for one of the school's graduates, Anne Sullivan, to teach Helen at the Kellers' home in Tuscumbia, Alabama. In May, 1888, Sullivan brought Helen to the Perkins school, where Helen was warmly received by the students.

Over the years, the school has developed numerous resources for its students. The Samuel P. Hayes Research Library, opened in 1880, offers a vast collection of books and materials on blindness and deaf-blindness. In 1931, the school established the Braille and Talking Book Library for adults and children, who can order materials through the mail. After years of experimentation, in 1951, David Abraham, a woodworking teacher at the school, produced the Perkins Brailler, a Braille-writing machine. In 1982, the school changed its charter to accept students with disabilities other than blindness. Nine years later, the facility launched an outreach program for seniors who were losing or who had already lost their eyesight. Perkins provides services throughout the United States and in fifty other countries.

commercial railroads in the United States, which began operations in 1826, with Perkins as its president. The railway moved freight, particularly stone from granite quarries in Quincy, Massachusetts, to the Neponset River. Some of this granite was used to construct the Bunker Hill Monument, one of Perkins's favorite projects, and the Tremont House hotel in Boston.

Perkins's interests extended beyond business. He was part of a group of wealthy Bostonians who supported the development of Massachusetts General Hospital, contributing $5,000 and serving as chairman of the board of trustees. Like other members of the Boston elite, he supported the Boston Athenaeum, contributing $40,000 to this private library and serving as its president. Perkins, who had developed an interest in art and supported American artists, was also involved in establishing an art gallery in Boston. Like other wealthy men of the time, Perkins constructed a second home in the country. On a sixty-one-acre plot in nearby Brookline, he built a mansion and planted extensive gardens. This home and his Boston residence were filled with works of art and furnishings collected on his frequent trips to Europe. An ardent Federalist, Perkins was involved in Massachusetts politics, serving eleven terms in the Massachusetts State legislature and senate.

Perkins died at his Boston home on January 11, 1854. Out of respect, the state legislature adjourned, allowing members to attend his funeral, where a choir of blind children from the Perkins Institute for the Blind sang. Perkins was buried in Mount Auburn Cemetery. His estate was valued at $1.6 million.

Legacy

Thomas H. Perkins left a legacy of hard work and civic commitment. The fortune he made with various partners, his brother, and other relatives benefited many people. Perkins was instrumental in founding the first school for the blind in the United States. He aided in the development of Boston by investing in an art gallery and hospital for the city. He also patronized American artists. As a businessman, he founded new companies that spurred the Boston-area economy, and he helped open up America's lucrative China trade.

H. Ross Perot

American computer magnate and politician

Perot was among the first entrepreneurs to realize the potential of information technology, and he pioneered information systems outsourcing, staffing, and consulting. His presidential campaigns during the 1990's had a significant, though in many respects unforeseen, impact on American politics.

Born: June 27, 1930; Texarkana, Texas
Also known as: Henry Ross Perot; Henry Ray Perot (birth name)
Source of wealth: Computer industry
Bequeathal of wealth: Spouse; children

Early Life

Henry Ross Perot (peh-ROH) was born Henry Ray Perot in Texarkana, Texas, in 1930, the son of Gabriel Ross Perot and Lula Mae Ray Perot, and he grew up in a moderately prosperous middle-class environment. The Perots were of French extraction. Gabriel had moved to Texas from Louisiana and established himself in Texarkana as a dealer of horses and cotton. Perot had two siblings, a sister, Elizabeth, and a brother, Gabriel Ross, Jr. When his brother, to whom he had become very strongly attached, died at the age of three, Perot legally changed his middle name from Ray to Ross and preferred thereafter to be addressed as "Ross."

Perot was attending Texarkana Junior College when in 1949 he received a long-sought-after acceptance into the U.S. Naval Academy at Annapolis, Maryland. Graduating in 1953, he served his tour of duty in the Navy until 1957. In 1956, he married a schoolteacher, Margot Birmingham, and they had one son, Henry Ross, Jr., and four daughters, Nancy, Suzanne, Carolyn, and Katherine.

First Ventures

After his service discharge in 1957, Perot was employed by International Business Machines (IBM) as a salesman, entering on the ground floor, as it were, of the new technology systems industry. He proved to be an exceptionally effective sales representative, but he grew restive. On June 27, 1962, having assiduously set aside money and parlaying some capital from his wife's earnings, he incorporated his own company, Electronic Data Systems (EDS), headquartering his firm in Dallas, Texas. EDS began as a one-person consulting operation, with Perot basically competing to secure and deliver information systems and installation contracts to both private- and public-sector clients. Liberally employing the folksy manner and dogged persistence that would characterize him throughout his career, Perot was able to land some significant contracts, notably with governmental agencies, and to expand his operations rapidly. By 1968, when EDS was first listed on the stock exchange, the firm mushroomed into a multimillion-dollar concern, with assets of more than $1 billion.

Mature Wealth

Perot gained favorable national attention outside the business world in 1979, when he bankrolled and participated in a successful rescue mission to release two of his employees from incarceration by the revolutionary regime in Iran. His rescue operation was perceived more favorably than the bungled attempts by the U.S. government to free Americans held hostage at the American embassy in Tehran, and his employees' release was recounted in a Ken Follett novel and a television series, both entitled *On Wings of Eagles*.

Perot's sale of EDS to General Motors (GM) in 1984 for $2.5 billion shook the financial world. As part of the transaction, Perot retained a large number of shares of GM's stock and a place on the company's board of directors, making him well placed to differ quite visibly and aggressively with GM chairman Roger Smith over the direction of the company and the quality of its automotive products. After two years of acrimony and conflict between Perot and Smith, the Texan sold his remaining shares of GM stock and seemed to be retiring from involvement in the corporate world.

Perot's retirement, however, was short-lived. Even though his severance contract with GM precluded him from competing with this firm for three years, he formed a new information technology business, Perot Systems, on June 1, 1988. Although legal wrangling with GM hampered operations for a year, Perot Systems soon became a viable competitor for EDS.

In the late 1980's and early 1990's, Perot grew more outspoken on national issues, stridently criticizing the George H. W. Bush administration over the return of Vietnam prisoners of war and people who were missing in action, the trade and budget deficits, and the Gulf War (1990-1991). Perot eventually opted to run for president in 1992, dropping broad hints about his intentions and encouraging the formation of a grassroots political effort to place his name on each state ballot. These individual statewide movements soon came together as a citizen action organization, United We Stand America. During his campaign, Perot emphasized his belief that the two major parties had become bankrupt in terms of creating innovative policies and creative solutions to the nation's problems. He illustrated through liberal use of charts, graphs, and visuals in infomercials what he described as a practical, commonsense approach to herald a new change of direction, which would include a fuels and gasoline tax, drastic reduction of the budget deficit, and strict immigration control. Surprising all the pundits, Perot's appeal was so strong and his antiestablishment credentials so well accepted at the beginning of his campaign that by July, 1992, he was outpolling both Republican incumbent Bush and Democratic challenger Bill Clinton by 39 percent to a respective 31 percent and 25 percent.

However, on July 16, 1992, Perot abruptly quit the presidential race, citing his belief that political opponents would manufacture naked, suggestive photographs of his daughter Carolyn and possibly ruin her upcoming marriage unless he dropped out of the campaign, an explanation that was greeted by some in the media with skepticism and that left many of his followers angered, feeling that they had been abandoned. Although the Perot campaign organization continued to function and Perot himself reentered the race in September with former naval vice admiral James Stockdale as his running mate for vice president, Perot had lost a measure of credibility and never shook off a reputation as an unreliable eccentric. He did participate in televised presidential debates, but he finished the race in third place with slightly less than 19 percent of the popular vote. Forming the Reform Party of the United States in 1995, he attempted another run for the White House in 1996 under the party's aegis, but he finished the race with a disappointing 8.4 percent of the popular vote.

With the party apparatus slipping out of his control and taking on a life of its own, Perot left the political arena to focus on Perot Systems, returning in 2000 as the company's chair, the position he had vacated in 1992. In 2004, he turned over the firm's chairmanship to his son, Ross, Jr., but retained the title of chair emeritus. On November 3, 2009, Dell, Inc., acquired Perot Systems for

The Reform Party

The Reform Party was founded by H. Ross Perot in 1995 as a political vehicle to enable voters who had supported his independent presidential candidacy in 1992 to remain a force in American politics, beginning with the 1996 presidential race. The party originated in Perot's United We Stand America, the numerous grassroots organizations that backed him in 1992. The new political party was officially organized in every state as the Reform Party of the United States of America.

Perot himself initially indicated that he did not wish to accept the party's 1996 presidential nomination, and Richard Lamm, the Democrat governor of Colorado from 1975 to 1987, entered the race. Perot, however, reversed his earlier stand and returned to secure the party's presidential nomination for himself, running with vice presidential candidate Pat Choate, an author and economist. Perot's decision engendered the first intraparty split. Supporters of Lamm argued that Perot had "set up" their candidate to run, and lose, in order to maintain a facade of democracy, and then "strong-armed" himself into the nomination, demonstrating Perot's penchant for personal control over what he viewed as an organization of his creation. In 1997, the dissidents coalesced into the rival American Reform Party.

The Perot-Choate ticket, despite being excluded from televised presidential debates, garnered 8,085,294 popular votes (8.4 percent of the total), which was enough to qualify for federal electoral funding. The party's most notable success occurred on November 3, 1998, when Jesse Ventura, the colorful former professional wrestler and the mayor of Brooklyn Park, Minnesota, narrowly defeated Republican candidate Norm Coleman by 773,713 to 717,350 votes in the race for the governorship of Minnesota. As state governor from 1999 to 2003, Ventura remains the highest-ranking official elected as a Reform Party candidate. Perot, however, was never enthusiastic about Ventura.

Perot lowered his political profile before the 2000 presidential elections and would subsequently abandon politics. In 2000, the Reform Party split between moderate liberals, who backed the candidacy of physicist John Hagelin, and more conservative party members, who supported the right-wing insurgency led by Pat Buchanan. Buchanan's defection from the Republican Party in 1999 and his rapid rise within the Reform Party aroused Ventura's opposition, resulting in Ventura's 2000 decision to abandon the Reform Party in favor of the Independence Party of Minnesota. Hagelin and Buchanan partisans held separate nominating conventions, and the Federal Election Commission ultimately ruled in favor of Buchanan and his vice presidential running mate, Ezola Foster, as the official Reform Party candidates. The Buchanan ticket failed disastrously, obtaining only 449,895 votes.

Buchanan returned to the Republican fold in 2002, and the Reform Party endorsed the preexisting independent campaign of consumer activist Ralph Nader in the 2004 presidential race. Nader, running with Peter Miguel Camejo, polled only 465,650 votes. Thereafter, the Reform Party's history was riddled with internal dissension and declining support. In 2008, the party's presidential ticket of Ted Weill and Frank McEnulty appeared only on the Mississippi ballot and captured a scant 481 votes.

$3.9 billion, and Perot's firm became a fully owned subsidiary of Dell known as Dell Perot Systems. Perot's net worth, including real estate development holdings, is estimated to be between $5 and $6 billion.

Legacy

While there is general agreement on Perot's business acumen, his stature as an aggressive and competitive innovator in the technology field, and his role in showing the way into a rapidly expanding field, his political legacy is more hotly debated. Controversy and speculation remain over what "might have been" had he not dropped out of the presidential race in July, 1992, and about Perot's controlling and sometimes irascible personality, which was highly effective in the corporate boardroom but attained less fruitful results in the political arena. Both major parties, however, were forced to take note of the comparative success of Perot's independent candidacy, and former Speaker of the House Newt Gingrich and other Republicans particularly capitalized on some of Perot's ideas in the "Republican Revolution of 1994."

FILIPPO DI PERUZZI

Italian banker and trader

Peruzzi and his family founded one of the great banking and trading companies of the medieval era, which accumulated enormous assets and created previously unknown investment opportunities. His agile political maneuvering and sound acquisition policies enabled his company to expand beyond the borders of thirteenth century Florence into other parts of Europe.

Born: c. 1240; Florence (now in Italy)
Died: c. 1303; possibly Florence
Also known as: Filippo di Amideo Peruzzi
Sources of wealth: Banking; trade; real estate
Bequeathal of wealth: Relatives

EARLY LIFE

Filippo di Amideo Peruzzi, better known as Filippo di Peruzzi (fee-LEE-poh dee peh-REWT-see), was born in Florence around 1240. As a young man he fought in the Battle of Montaperti, which was a dispute between two Florentine political factions, the Guelphs and the Ghibellines. Peruzzi initially sided with the Ghibellines, who were crushed in two conflicts in the late 1260's. On the heel of these defeats, Peruzzi went into exile, perhaps earning a living as a mercenary. By 1274, he apparently was back in Florence, having registered a company under the Peruzzi name there.

FIRST VENTURES

The precise path to wealth that Peruzzi pursued is unclear from the historical record. It was not uncommon in thirteenth and fourteenth century Florence for merchant-class and noble families to intermarry in order to strengthen their alliances and combine their assets, and marriage was probably a factor in Peruzzi's acquisition of wealth. In addition, there are accounting records indicating that members of the Peruzzi family were involved with French banks in the 1240's, so the family apparently had established international connections around the time of Filippo di Peruzzi's birth. Peruzzi and his family were members of the Arte di Calimala, a guild or union of merchants and cloth finishers. The Peruzzis also belonged to the Arte del Cambio, the guild of bankers and moneylenders. With this background and his own business sense, Peruzzi was well placed to move his company forward.

MATURE WEALTH

By 1300, Peruzzi, along with his brother, sons, and nephews, had established a company structure that endured until its bankruptcy in 1343. Capital assets in 1300 amounted to 124,000 lire or 85,000 gold florins. Partners from outside the family owned about 40 percent of the firm's shares, but a Peruzzi family member was always in control of the company. The company attracted powerful investors by guaranteeing a fixed annual rate of return of 8 percent. Most of Peruzzi's wealth was funneled back into his company, which was controlled by his sons, nephews, and grandsons. Peruzzi also purchased real estate in the Florentine *contado*, or countryside. This land was passed on to his progeny and increased in value with each passing year.

The Peruzzi Company engaged in international trade, not only moving luxury goods, such as finished cloth, a Florentine specialty, but also dealing in large-scale quantities of grain. In addition, the firm lent money, with interest, to kings, popes, nobility, and businesses all over Europe. Peruzzi oversaw offices in Naples, Paris, and London, as well as smaller branches throughout Italy, Sicily, and Asia Minor.

One key to Peruzzi's success was his political involvement. In 1284, he was elected a prior (or councilman) in Florence. In 1294, he became a captain of Orsanmichele, an important religious confraternity that distributed alms to the poor. Sometime between 1292 and his death around 1303, he was consecrated as a knight.

Legacy

Peruzzi displayed an array of aptitudes in developing one of the largest multinational firms of the medieval era. His company's organization was sophisticated, engaging in trade and moneylending on an unprecedented scale. He succeeded in combining and expanding business endeavors that previously were confined to individual niches. Because he was politically savvy and socially astute, he elevated his family above the common traders and into the *popolo grasso*, the wealthy merchant class.

It appears that Peruzzi paid whatever was necessary to maintain his prominent status in Florentine society. He commissioned the artist Giotto to decorate the Peruzzi Chapel. He paid the substantial expenses required to participate in his own company of knights. Although there are only scant details about his life and business, Peruzzi obviously thrived in the ever-shifting sociopolitical climate of medieval Florence. He exemplifies the successful businessperson of any era—politically connected, socially acceptable, internationally renowned, and, of course, rich.

Joseph Pew

American engineer and industrialist

Pew was an innovative engineer who made significant contributions to the oil-drilling business. He used his wealth to charter the Pew Charitable Trusts, an organization of seven charitable foundations.

Born: November 12, 1886; Pittsburgh, Pennsylvania
Died: April 9, 1963; Philadelphia, Pennsylvania
Also known as: Joseph Newton Pew, Jr.; J. N. Pew, Jr.
Sources of wealth: Inheritance; oil
Bequeathal of wealth: Children; charity

Early Life

Joseph Newton Pew, Jr., was born to privilege, the youngest son of Joseph N. Pew, Sr., one of the founders of Sun Oil. The younger Pew attended a prestigious private academy in Pittsburgh, Pennsylvania, and then was graduated with distinction from Cornell University in 1908 with a degree in mechanical engineering. His older brother, J. Howard Pew, had the practical business savvy and astute financial sensibility that made him the logical choice to take over Sun Oil after Joseph, Sr., died in 1912. Joseph, Jr., was made vice president of the company.

Athletic and outgoing, Joseph, Jr., demonstrated a fiercely independent nature and a reckless love of adventure. Between his graduation and the outbreak of World War I, he learned the oil business firsthand, working in the dangerous wildcat oil fields of the Midwest and in

South America, where Sun Oil was pursuing new deposits.

First Ventures

As vice president (a position he would maintain until his brother's retirement in 1947, when he became president), Pew quickly became known as a visionary, a man with ideas, intrigued by engineering's no-nonsense approach to defining problems and devising innovative solutions.

Pew is credited with designing a kind of gyroscope with a timer and a camera that oil diggers used to locate prospective oil reserves. This device enabled the oil-drilling machines to pivot in response to the changing conditions of a deep dig, thus preventing the drills from cracking or from drilling a crooked hole in the well. Pew also devised the first formulas for custom-blending gasoline, creating a lead-free gasoline called Blue Sunoco. In addition, Pew proposed what would become a mainframe pipeline connecting the Sun Oil refineries at Marcus Hook, in the southeastern corner of Philadelphia near the New Jersey border, with the Great Lakes.

Perhaps his greatest achievement as vice president of Sun Oil was his development of the Sun Shipbuilding & Dry Dock Company in southeastern Philadelphia. Between the two world wars and under Pew's direction, this facility created a massive armada of cutting-edge oil tankers to serve Sun Oil's burgeoning global interests and to protect those interests during the war. Sun Oil's shipyard eventually became the largest and most successful such enterprise in the United States, and the company could boast that it never laid off a single employee during the Great Depression.

Mature Wealth

His wealth secure, Pew began to take an interest in national politics. With the emergence of President Franklin D. Roosevelt and the New Deal economic program in the early 1930's, Pew, who initially supported the economic

The Pew Charitable Trusts

The seven trusts that are collectively known as the Pew Charitable Trusts evolved from the Pew Memorial Foundation, which Sun Oil executive Joseph Pew and his siblings established in 1948. The seven individual trusts were established between 1948 and 1979, and they provide significant grant commitments in programs dealing with public policy, biomedical research, environmental advocacy, culture and the arts, religion and culture, education, and economics. Among its activities, the organization has established the Pew Research Center, a conservative think tank in Washington, D.C.; the Pew Environmental Group; and a generous program of scholarships for promising artists and writers. The organization has also worked to protect First Amendment rights for proponents of conservative Christianity, expand the accessibility of early education programs for children of all economic classes, and encourage entrepreneurship by financing start-up businesses and first-time business owners.

In 2004, the trusts registered as a nonprofit public charity, which provided directors with considerably more latitude in raising funds. Increased funding enabled the organization to expand its lobbying of state and federal governments in order to inform lawmakers about the trusts' programs and activities. The Pew Charitable Trusts have grown to become one of the largest private philanthropies in the nation, with assets estimated at close to $5 billion and an annual grant commitment of more than $250 million. The Pew family still maintains a major presence on the organization's board of directors.

The organization views its mission as tackling significant problems head on. To this end, it has funded programs that promote ocean conservation, investigate options for managing overcrowded state prisons, and evaluate access to preschool programs among impoverished inner-city children. The trusts use their considerable financial resources to partner with public and private organizations that share the trusts' commitment to exploring innovative solutions to social problems. In financing promising, cutting-edge research or sponsoring a collection of useful research data, the trusts believe their impact should be immediate and practical.

This philosophy is exemplified by the work of the Pew Research Center, a kind of "fact tank" that gathers data through polling. The center's questionnaires solicit responses on a variety of issues, including public attitudes about the press, politicians, and controversial issues. In an era when polling is routinely spin-doctored and can be notoriously unreliable, the Pew Research Center has a reputation for impartiality and rigorous scientific methodology. The center's statistics have been used by policy makers in both major American political parties, as well as by journalists and academics, thus maintaining the trusts' mission to maintain an informed public in order to address significant societal issues.

recovery initiatives, later raised significant and heated objections to the direction the country was taking. He was especially concerned about the federal government's attempts to fix oil prices and to regulate the oil industry by curtailing production. He perceived the Democratic Party's agenda as a massive attack on free enterprise, self-reliance, and, with his signature penchant for grand-scale thinking, the entire American way of life. After the defeat of Republican candidate Alf Landon in the 1936 presidential election and Roosevelt's ill-conceived attempt to pack the U.S. Supreme Court and passionate support of unions (Sun Oil never unionized), Pew began to direct his attention beyond the ward politics of Philadelphia. By the end of the decade, Pew was recognized as the undisputed boss of the powerful Pennsylvania Republican Party, and he was on the cover of *Time* magazine in May, 1940. He pumped more then $2 million into conservative publications and candidates and engineered the election of Arthur James as Pennsylvania's governor in 1939.

Despite Pew's considerable presence and formidable wealth, the pivotal moment in his campaign to bring down the Roosevelt administration—the 1940 Republican Convention in Philadelphia—did not go the way he had planned. Pew favored U.S. Senator Robert Taft as the party's presidential candidate, but the convention nominated a dark horse, the Wall Street lawyer Wendell Willkie, who would lose to Roosevelt. With the advent of war, Pew turned his attention to Sun Oil, but he never lost his vigor for conservative causes and never reconciled with the more liberal wing of the Republican Party.

In 1947, the year Pew became chairman of the board of Sun Oil, Republicans realized that with the death of Roosevelt and the unpopularity of President Harry S. Truman, it was time for the party to reorganize. Pew decided to organize a charitable foundation that would involve itself specifically in directing and articulating conservative causes in order to contribute to the public welfare. He saw this foundation's mission as encouraging individual growth and improving the quality of life, as well as protecting religious freedom, nurturing democratic institutions, and developing programs to help the needy without relying on government assistance. It was an ambitious undertaking. However, with the confidence of a career engineer Pew believed that there was no significant problem—social, economic, cultural, or religious—that could not be addressed and, in turn, resolved.

In 1948, with the support and backing of his brother, J. Howard, and his sisters Mary Ethel Pew and Mabel Pew Myrin, Pew established the Pew Memorial Foundation, headquartered in Philadelphia. The organization initially funded conservative causes, including the John Birch Society and other anticommunist organizations. However, it also financed entrepreneurial ventures; investments in higher education, including a groundbreaking program designed to benefit African American colleges; the Red Cross; and experimental cancer research. In addition, the foundation provided funding to evangelical religious projects, including the Billy Graham Evangelical Association, and to political organizations that advocated the benefits of free enterprise and less government intrusion.

In addition to running Sun Oil while the company was expanding its international drilling, Pew directed the foundation through its first decade, during which it evolved from its specifically conservative mission to embrace a wider range of public endeavors. This evolution mirrored the change in Pew's personal sensibility. His stinging, very public defeat to maneuver himself into the national political scene and the nearly two decades of liberal Democratic direction convinced him that the United States was imperiled. However, Pew realized that he could not control political events but could use his wealth to reclaim individuals' dignity, sense of self-reliance, and initiative—personality traits which were critical not only to the Republican agenda but also to the American character. Under his guidance, the foundation flourished. At his death in 1963, it was hailed as one of the most significant philanthropic organizations in the country.

LEGACY

Joseph Pew understood the value of his family's fortune as a formidable resource to address community problems, and this sense of civic duty became Pew's defining legacy. In funding a wide range of research endeavors in medicine and science, and in gathering and collating critical data on economics, law and order, and politics, the trusts that Pew established have become a vital, integral element of a dynamic philosophy that views human enterprise as best dedicated to problem solving and civic duty as the major responsibility of the wealthy. Unlike other philanthropic foundations dedicated to a relatively narrow range of concerns, the Pew Charitable Trusts engage in a wide variety of activities. More important, the trusts promote the resilient spirit of individuals, a passion for investigation, and individual intuition and imagination as the highest expressions of the American endeavor—principles that were the cornerstone of Pew's philosophy.

Early Life

Henry Phipps (fihps), Jr., was the son of a Scottish cobbler who moved to Philadelphia after immigrating to the United States. His father's business was not successful, so the family left Philadelphia to settle in Pittsburgh, where his father hoped to make a fresh start. Henry Phipps, Jr., was born in Pittsburgh, where the family was no better off financially than they had been in Philadelphia and continued to live in poverty. However, young Henry met another poor neighborhood boy, his older brother's friend Andrew Carnegie, which formed the foundation for Phipps's successful and lucrative career in the steel business.

First Ventures

Phipps began working professionally at the age of sixteen, taking a job as a store clerk in 1855. From 1856 to 1861 he worked as an office boy and bookkeeper, learning the fundamentals of business. In 1861, Phipps posted an advertisement in a local newspaper that cost him a quarter, which he borrowed from his brother. The advertisement simply said "a willing boy wishes work," and it helped land Phipps a position as an office boy at Dilworth & Bidwell, where he progressed through the ranks until he became a partner running one of the firm's smaller offices. Tom Miller, a friend of Carnegie and a pioneer in steelmaking processes, took notice of Phipps and sponsored him in a partnership with Andrew Kloman, a boyhood friend of Carnegie's brother and a genius inventor who helped develop the steel industry. With Kloman and Miller, Phipps opened a small iron mill.

Mature Wealth

Phipps, Kloman, and Miller continued together for several years, gradually growing their small mill into a productive enterprise. However, in 1864, Kloman and Phipps had a falling out with Miller and pushed him out of the business. Carnegie sided with Miller and attempted to bring everyone back together in a new and larger ironworks, Cyclops Mills, but Miller asked to be bought out. Carnegie, Phipps, Kloman, and Tom Carnegie (Andrew's brother) joined together to create Union Mills, which was later to become Carnegie Steel.

Phipps took an increasingly important role in Andrew Carnegie's enterprises. Working together with other relatives and friends, he and Carnegie built up the small Cyclops Mills, buying land and producing a larger volume of iron products at a greater profit than any other producer in the country. Phipps's background in office management and bookkeeping, as well as his financial acumen, made him the perfect partner for Carnegie, and Phipps eventually moved from running the commercial end of the business to running the mills themselves.

In 1870, Carnegie built his first blast furnace, the Lucy Furnace, which produced more tons per day than any other blast furnace at the time. As Carnegie became more important, he began traveling to England and other European countries to conduct business with foreign inventors and mill owners, feeling secure that he could leave his company in the hands of his brother Thomas and Phipps. Ultimately, the care and maintenance of the Lucy Furnace was handed over to Phipps, who hired a dedicated manager and a chemist to run the furnace as efficiently as possible, replacing the unskilled laborers who traditionally performed this work. In 1872, Phipps became Carnegie's full partner in Carnegie Steel, which used Sir Henry Bessemer's process for turning pig iron into usable steel.

Carnegie Steel continued to be successful, and Phipps, who owned more shares of the firm than anyone other than Carnegie himself, began to reap great financial rewards. Phipps's personal wealth grew so large that he was able to begin his philanthropic work by building the Phipps Conservatory and Botanical Gardens for the city of Philadelphia in 1893.

In 1901, Carnegie Steel was sold to J. P. Morgan and became U.S. Steel. Phipps's share of the sale, as the firm's second largest shareholder, was $50 million. The buyout money was enough to allow Phipps to move to

New York, retire permanently from business, and devote himself to developing real estate holdings and to philanthropy.

Phipps purchased large tracts of waterfront land in New Jersey, Florida, and Long Island, New York. He was one of the first investors to recognize the investment potential of Florida's coastline. By the mid-1920's, he owned one-third of Palm Beach, Florida; much of the coastline acreage between Palm Beach and Fort Lauderdale; and large parcels of land in Miami and in other places in Florida. He also purchased a large barrier island off the coast of New Jersey in 1926, keeping it free from development.

The recipients of his philanthropy included the Institute for the Study, Treatment, and Prevention of Tuberculosis in Philadelphia. This organization sought to discover cures for the disease and offered in-house treatment to victims of tuberculosis. Another medical facility that benefited from Phipps's charity was the Henry Phipps Psychiatric Service, which opened in 1913 as part of Johns Hopkins Medical School and Hospital in Baltimore, Maryland. The endowment for the psychiatric service was announced in 1908, after Phipps asked William Henry Welch, dean of the medical faculty, if there was a goal that Phipps could help the hospital achieve. As a result of their conversation, Phipps endowed the first permanent facility devoted to the care of the mentally ill that was housed as part of an acute-care hospital. Phipps made an additional financial contribution in 1923 that ensured the continued success of the facility.

Phipps was also instrumental in the creation of low-cost urban housing, a cause he supported partly as a result of his continued interest in eradicating tuberculosis. The Phipps Houses, a low-income housing complex for the working poor, opened in New York City in 1905. Phipps spent $1 million to construct the homes, but he insisted that they earn a profit of at least 4 percent. which he believed would show other investors that using their money for philanthropy could still enable them to generate profits. However, the dividends earned by the Phipps Houses were reinvested into the organization, and Phipps did not use these profits for any other purpose. In 1906, Phipps built four low-cost apartment buildings that were primarily marketed to African American tenants who could not obtain adequate, reasonably priced housing because of racial discrimination.

Phipps died at his Great Neck estate, Bonnie Brink, just five days before his ninety-first birthday, and he was buried in Westbury, Long Island.

The Bessemer Trust

In 1907, Henry Phipps established the Bessemer Trust, a conservative, private wealth management firm, to handle the proceeds of the sale of his shares of Carnegie Steel to J. P. Morgan. The company was named after Sir Henry Bessemer, whose steel-refining process was highly admired by Phipps; Bessemer's new methods for turning pig iron into steel enabled Carnegie Steel to outstrip its competitors. Phipps created the trust with the intentions of maintaining his family's wealth for succeeding generations and preserving and growing the wealth to ensure the family's financial well-being in perpetuity.

In 1911, Phipps sent each of his five children a letter explaining the structure and goals of the trust, the first entity of its kind. In the letter, he expressed his hopes that the family would never live beyond its means or borrow from the trust. He told them never to sell strangers any of the stocks or bonds that were held by family members; in the event that a sale was desired or necessary, they were to offer these items to other family members. The trust was to be governed by majority rule and it sought to increase the growth of the family's wealth and to continue to fund good works.

As part of the trust, Phipps established the Bessemer Securities Corporation in 1911 to reinvest the proceeds from his stock sale. From that year until 1975, Bessemer Venture Partners, which provides venture capital to organizations and individuals supported by the Phipps family, operated as a division of the securities company. In 1974, the trust opened its doors to clients who were not members of the Phipps family, requiring an initial investment of $10 million per person. That same year, the trust also created its own national bank in New York City to handle its assets. In 1975, Bessemer Venture Partners became an independent partnership, with the securities corporation as its primary limited partner.

By 2009, the trust had a membership of two thousand families, handled more than $50 billion, and maintained offices in the United States, the Cayman Islands, and Europe. The Phipps family, more than three hundred members strong, continued to control 100 percent of the voting shares. The Bessemer Trust remains one of the highest-ranked wealth management and investment advisory funds in the world, and it still operates based on Henry Phipps's principles of conservative growth and low-risk management.

Legacy

Henry Phipps combined managerial talent, financial acumen, and a strong work ethic to become part of Andrew Carnegie's empire and reaped lifelong benefits from that relationship. More than a passion for iron and steel linked the two men; they also shared a vision that the rich are responsible to their communities and to the common good. Phipps believed it was his duty to relieve suffering and promote social well-being. He even went so far as to incur the anger of local religious leaders, when in 1903 he insisted that the Phipps Conservatory be open on Sundays to allow working people an opportunity to visit. He gave large parcels of land to the states of Pennsylvania, New Jersey, and Florida, requiring that this property be maintained for public recreation. Island Beach, purchased by Phipps in 1926, was donated to New Jersey by his descendants in 1953; it is the last undeveloped and unspoiled barrier island off the coast of New Jersey and is now a nature reserve.

Pablo Picasso

Spanish artist

Picasso was a prolific artist whose paintings, drawings, sculptures, and other works commanded increasingly higher prices, enabling him to become the richest artist of all time.

Born: October 25, 1881; Málaga, Spain
Died: April 8, 1973; Mougins, France
Also known as: Pablo Ruiz y Picasso (birth name)
Source of wealth: Artwork
Bequeathal of wealth: Spouse; children

Early Life

Pablo Ruiz y Picasso, better known as Pablo Picasso (PAB-loh pee-KAH-soh), was born in 1881. His father was an art teacher who later became the curator of a museum. Picasso watched his father paint, and at an early age he started to draw. In 1892, he began formal art classes and made numerous drawings of animals, bullfights, people, and other subjects. He attended the School of Fine Arts in Barcelona in 1895, and the following year enrolled in a prestigious art school in Madrid. Picasso, however, became bored with the standard assignments, such as making drawings of plaster casts.

First Ventures

Picasso made little money on the works he painted from 1895 to 1905. He often had little to eat, and he spent most of his money on art supplies. Many of his paintings from 1901 to 1904 were made with shades of blue, and these years are known as his Blue Period. These paintings generally were somber, depicting mothers and children, beggars, and prostitutes. He began to use brighter shades of orange and pink during his Rose Period from 1904 to 1906, when he often painted circus performers. In 1907, he began experimenting with cubism. The objects and people in these works were often painted in neutral colors, and Picasso emphasized and altered their shapes in a fantastic and unrealistic manner.

At this point, the sales and prices of his paintings began to increase rapidly. For example, the cost of one of his paintings in 1907 was around 150 francs (about $600 in 2010 U.S. currency), while the price of his works rose to about 3,000 francs (around $10,000) in 1911. Many of his works were initially sold to writer Gertrude Stein and to many other persons through an art dealer, Daniel-Henry Kahnweiler, in Paris. Kahnweiler sold a small group of Picasso's paintings at an auction in 1914 for 31,000 francs (about $102,000). World War I interrupted sales, and the Germans removed many of his paintings from Paris.

Mature Wealth

After the war, Picasso created many paintings in a more surrealistic style. By the 1920's, Picasso had grown wealthy from the sale of his art. However, he lived simply and did not like to spend much money on extravagant items. His ideas about money caused conflict between Picasso and his first wife, Olga Khokhlova, whom he married in 1918. Olga enjoyed buying expensive jewelry and clothes and attending parties, and her expenditures angered Picasso. The two separated in 1927. That same year, Picasso met Marie-Thérèse Walter, who shared his ideas about simple living, and the two lived together for a number of years. One of the most famous of these works was *Guernica* (1937), a huge painting, about 26 feet by 12 feet, which represents the bombing of this city by the Germans during the Spanish Civil War.

Picasso stayed in Paris during World War II, but the Germans who occupied the city did not like his work and prohibited any public displays of his art. Picasso lived modestly with Françoise Gillot from 1944 to 1953 and had two children with her.

After World War II, Picasso became a well-known artist, and the price of his paintings rapidly increased. For example, the painting *Yo Picasso* sold for $500,000 in 1969. He often left piles of money and gold lying around his houses.

Picasso died in Mougins, France, in 1973. He had no will, so his family decided to split his estate among his four children and his second wife, Jacqueline Roque. This was a complicated process because his estate included many properties and bank accounts and vast numbers of unsold artworks. The total value of his estate in the 1970's was estimated to be about $840 million. France took a number of his paintings in order to pay for his estate tax.

Legacy

Picasso was one of the most significant and prolific artists of the twentieth century, whose work, painted in a wide range of styles, including cubism and surrealism, mirrored the development of modern art. Unlike many artists, who are obscure and unrewarded, Picasso was virtually a household name. He became the best-known artist of his era—and the wealthiest. His artwork continues to command astronomical prices; his painting *Garçon à la pipe* (1905; *Boy with a Pipe*) was sold for

$104 million in 2004, while *Dora Maar au chat* (1941; *Dora Maar with Cat*) was purchased at a cost of $95.2 million in 2006. On May 4, 2010, *Nude, Green Leaves, and Bust* was sold for $106.5 million, setting a record for art sold at auction. Picasso's career demonstrated that artwork could be both artistically brilliant and commercially successful, setting an example that subsequent artists would emulate.

T. BOONE PICKENS

American oil tycoon and financier

After making a fortune with his own oil company, Pickens sought to acquire rival firms, earning a reputation as a tough corporate raider. He has also donated more than $700 million to charity, giving generously to medical institutions, animal rights groups, and institutions of higher learning.

Born: May 22, 1928; Holdenville, Oklahoma
Also known as: Thomas Boone Pickens, Jr.
Sources of wealth: Oil; investments
Bequeathal of wealth: Charity; educational institution; medical institution

EARLY LIFE

Thomas Boone Pickens, Jr., was born in Holdenville, Oklahoma, on May 22, 1928, the only child of Grace Molonson Pickens and Thomas Boone Pickens, Sr. Pickens's father leased petroleum and mineral rights, and his mother was an administrator for the federal agency that rationed goods in the area around Holdenville during World War II. In 1944, the family moved to Amarillo in the Texas Panhandle, where Pickens graduated from high school. Upon graduation, he attended Texas A&M University on a basketball scholarship for a year before transferring to Oklahoma A&M College (now Oklahoma State University), from which he graduated in 1951 with a degree in geology. In 1949, he married his high school sweetheart, Lynn O'Brien. The couple's first child, Deborah, was born within a year of their marriage. Eventually the couple had three more children, Pam, Mike, and Thomas Boone III.

FIRST VENTURES

After graduating from college, Pickens worked for a time in an oil refinery and as a roughneck in the oil fields before landing a job as a geologist with Phillips Petroleum Company. He worked for Phillips for three years, gaining practical experience in most phases of the oil business.

In 1954, with high hopes and $2,500 of borrowed money, Pickens and two partners, Eugene McCartt and John O'Brien (his wife's uncle), formed an oil and gas firm named Petroleum Exploration, Inc. Pickens held half interest in the company, while his two partners each had a one-quarter interest. Initially the firm made money by selling oil leases that Pickens had discovered and retaining a percentage of the profits made by these leases during their first few years of oil production. Pickens's success attracted a group of investors from Amarillo whose money permitted Pickens to drill his own wells. In 1959, Pickens formed the Altair Oil and Gas Company to look for sources of energy in Canada. By 1962, his companies had drilled ninety-eight productive wells and made more than $760,000 in profits.

MATURE WEALTH

In 1963, Pickens bought out McCartt, and the following year he established Mesa Petroleum Co. by combining the assets of the original Petroleum Exploration, Inc., with those of Altair. In its first year of operation, Mesa produced revenues of $1.5 million, and by 1968 the company had revenues of $6.2 million and profits of $1.4 million.

Pickens then began the activities that later made him famous (or infamous)—the acquisition of other oil companies. In 1968, he tried to acquire the Hugoton gas field in southwestern Kansas. Hugoton resisted the efforts of the much smaller Mesa Petroleum to obtain its assets, but Pickens persisted and in 1969 acquired enough shares of Hugoton to complete his takeover. The acquisition of Hugoton's assets gave Pickens the capital he needed to complete other deals, and he shortly diversified through the purchase of cattle feeding operations and cattle in Texas. Mesa also began offshore exploration in the North Sea.

Pickens and his wife divorced in 1971, and a year later he married Beatrice "Bea" Carr Stuart, a divorcée who had four children of her own. According to his autobiography, Bea played an important role in Pickens's subsequent business career. Pickens acquired more oil companies, and in 1972 Mesa reported more than $90 million in total revenues and $15 million in profits. In 1976, Mesa discovered the largest oil field in its history in the North Sea, and this field earned the company more than $31 million in profits. By 1981, Mesa's assets had grown to more than $2 billion, making it one of the largest independent oil companies in the world.

After 1981, Pickens became more of a financier than an oilman, embarking on a career that some have called "corporate raiding." He launched several efforts to take over oil companies that were often much larger than his own. His acquisition targets included Cities Service, Superior Oil, and General American Oil of Texas. None of these acquisition efforts succeeded, but Pickens's attempted takeovers drove up the price of the target companies' stocks, which made him and other investors a great deal of money. Pickens saw himself as an advocate for stockholders rather than as a corporate raider, targeting companies he felt were mismanaged by their own executives.

Pickens then turned his attention to Gulf Oil, the sixth-largest oil company in the United States. Pickens was convinced that Gulf needed to be restructured, and to accomplish this he formed the Gulf Investment Group, which eventually acquired 11 percent of Gulf's stock. The subsequent battle between Pickens and Gulf Oil garnered great media attention. Although Pickens lost the ensuing proxy battle, his Gulf Investment Group netted more than $750 million in profits when Standard Oil of California bought Gulf Oil in 1983. Over the next few years, Pickens attempted to take over other oil companies, including Phillips Petroleum Company and Unocal. Although these attempts did not succeed, Pickens made millions of dollars in profits. In 1986, he formed the United Stockholders' Association, a nonprofit organization to defend shareholders' rights.

Pickens's popularity and notoriety began to diminish during the late 1980's. In 1996, he resigned as Mesa's chairman after presiding over the company's increasing debt buildup. He and his second wife divorced at about the same time. Seemingly defeated both financially and personally, the then-sixty-eight-year-old Pickens rebounded. In 1997, he founded BP Energy Fund, which ran two hedge funds, Capital Commodity and Capital Equity, both of which invested in energy companies. In the same year, he formed Pickens Fuel Corporation and began extolling the virtues of natural gas as the best substitute for gasoline as a fuel for vehicles. In 2005, he married his third wife, Madeleine Paulson, a widow who was an activist on behalf of wild mustangs. Pickens earned more than $1 billion from the two hedge funds in 2006 and more than $2.5 billion the following year. He began acquiring subsurface water rights in Texas in 2006.

In 2008, Pickens proposed the so-called Pickens Plan, which promotes alternatives to petroleum as a source of energy, advocating the use of natural gas and wind and solar power. One of the plan's major features was a proposal to replace the electricity generated in the United States by natural gas with wind energy, which would enable natural gas to replace gasoline as the primary fuel for vehicles. For various reasons, the plan has met with considerable opposition.

BOONE PICKENS STADIUM

After the success of the 2001 football season, Oklahoma State University embarked on a large-scale fund-raising program for the renovation of its aging football stadium, Lewis Field. The fund-raising campaign received a major boost when oilman and financier T. Boone Pickens donated $165 million to the project. Pickens's donation was the largest gift for athletics to an institution of higher learning in American history. His gift financed a new outdoor practice field, a new baseball stadium, an equestrian facility, a new track, and tennis and soccer facilities.

During the 2003 football season, Oklahoma State University began a $283 million upgrade to the renamed Boone Pickens Stadium, installing a new brick facade and a connection to the basketball arena. The upgrade also included a new artificial grass surface for the field and greatly expanded seating capacity. As of the 2009 season, the stadium seated 60,218.

As part of the renovation, the stadium provided many special amenities, such as armchairs with cup holders, more legroom, television monitors, and sound systems, for spectators who pay higher prices for premium seating. People who purchase these club seats also have private access to parking facilities near the stadium. These seats cost between $1,000 and $1,500 each, with the money helping to fund further improvements to the stadium, including expanding the seating capacity to as much as 73,000.

The economic recession of 2008-2009 depleted the funds earmarked for the stadium's renovation. In 2008, Pickens provided an additional $63 million to complete the project. In all, he has donated more than $250 million to Oklahoma State University's athletic programs. The stadium was officially rededicated for the opening game on September 5, 2009, when the Oklahoma University Cowboys squared off against the University of Georgia Bulldogs.

LEGACY

Pickens has been a generous donor, giving more than $700 million to charity. In May, 2006, for example, he contributed $50 million each to the University of Texas M. D. Anderson Cancer Center in Houston and the University of Texas Southwestern Medical Center in Dallas. In December, 2005, he donated $165 million to his alma mater, Oklahoma State University, which was subsequently invested in a hedge fund controlled by Pickens's BP Capital Management company. In 2008, he gave this university another $100 million to finance academic programs, which was to be matched by the state of Oklahoma. The Pickens Plan, if implemented, could help eliminate America's dependence on foreign oil and greatly reduce greenhouse gas emissions, helping to address some of the problems associated with global warming.

François Pinault

French retailer and investor

Without following the traditional French path to business success, Pinault became a major retailer of luxury goods and one of the richest men in France. He also challenged the French disdain for displaying privately owned artworks, exhibiting works from his art collection at two Venice museums.

Born: August 21, 1936; Champs-Géraux, Côtes-du-Nord, Brittany, France
Sources of wealth: Trade; retailing
Bequeathal of wealth: Charity

Early Life

François Pinault (fran-SWAH pee-NOH) was born in Champs-Géraux in Brittany, France, on August 21, 1936. He left school at the age of sixteen without completing any program that would qualify him to perform a specific trade or skill; this was most atypical for a young Frenchman who had any ambition of success in the financial and corporate world. Shortly thereafter, he began working in his father's small timber business.

First Ventures

In 1963, Pinault founded his own company, which dealt in timber and other construction materials. An astute businessman, Pinault was able to purchase a number of companies that had gone into bankruptcy and restore them to profit-making enterprises. In 1963, with the purchase of Château Latour in Bordeaux, the Pinault family became involved in the wine trade. By 1988, Pinault had expanded his activities in the timber and construction materials business by importing wood and by manufacturing, selling, and distributing various wood products. At this time, he reorganized his company as a corporation, Pinault S.A., and began publicly selling its stock in the French stock market.

In 1990, Pinault decided once again to modify the direction of his business activity. He refocused his company's activities toward specialized sales and distribution, and his company ended its dealings in wood and timber goods. Pinault had purchased CFAO, an enter-

François Pinault Foundation for Contemporary Art

For almost thirty years, François Pinault has collected works of contemporary art not only for his own enjoyment but also with the desire to share these works with the public. The creation of the François Pinault Foundation for Contemporary Art has enabled him to attain both goals.

After an unsuccessful attempt to build a museum in Paris, Pinault in May, 2005, acquired the Palazzo Grassi in Venice, Italy. Pinault created a company, the Palazzo Grassi S.p.A., to oversee the conversion of the palazzo to a museum. He is the majority shareholder of the company, with 8 percent ownership, and he has one partner, the Casino Municipale di Venezia. Pinault commissioned the Japanese architect Tadao Ando to renovate the building while maintaining its architectural style. Ando designed the museum to enable its historic architecture and interior design to blend with and complement the contemporary artwork on display. The Palazzo Grassi is primarily a venue for the exhibition of contemporary art, particularly works in Pinault's collection. The facility hosts temporary exhibitions and in 2006 presented three shows, with each displaying a portion of Pinault's collection.

In June, 2007, Pinault undertook another project to promote the exhibition of contemporary art. At the request of the city of Venice, he implemented the conversion of the Punta della Dogana, originally a sixteenth century customs house, into a venue for contemporary art, with Ando in charge of the renovation. On June 6, 2009, the new center opened with an exhibition, "Mapping the Studio," which was presented in partnership with the Palazzo Grassi and featured artworks displayed at both venues.

Pinault's collection is on permanent display at the Punta della Dogana. However, through the foundation he also exhibits some works from his collection in temporary exhibitions in other cities, including facilities in Lille and Dinard, France, and in Moscow, Russia. The foundation has given both established and new artists the opportunity to have their works exhibited and made known to a wider public. In addition, the foundation has enabled a large number of people to appreciate and enjoy contemporary art, thus fulfilling Pinault's desire to share his enthusiasm for these works with others.

prise involved in international trade, especially with Africa. In 1991, he acquired Conforma, a household goods and furniture group, and he entered the mass-distribution market. This decision to further diversify his business led to the founding of a holding company, Artemis S.A., in 1992. Artemis is owned entirely by Pinault's family.

Mature Wealth

Through Artemis, Pinault has continued to diversify his family's business activities. Artemis also owns *Le Point*, a news magazine, and *L'Agefi*, a daily newspaper. In 1992, Pinault purchased the French department store Au Printemps and created the business group Pinault-Printemps. Pinault also acquired 54 percent of La Redoute, a mail-order company, in 1994; this company became part of the Pinault-Printemps group, which was renamed Pinault-Printemps-Redoute (later renamed PPR). The record and book distributor Fnac also became a part of PPR.

Since its acquisition of Au Printemps, PPR has continuously renovated and reorganized this department store. After Pinault acquired it, the store was organized into five specialty sections: fashion, beauty, accessories, art of living, and men. In 1995, fashion was renamed printemps de la mode; in 1998, the men's section was renovated and became printemps de l'homme. In 2003, the store's beauty department was transformed into the largest such department in the world.

Through PPR, Pinault has continued to play a leading role in the business world. In 1996, he entered the pharmaceutical business with the acquisition of the major pharmaceutical distribution company for Western Africa. In 1998, the group became involved in the distribution of office furniture and equipment with the takeover of Guilbert, a supplier of office products to large European businesses. In 1999, PPR purchased 42 percent of the Gucci Group; with this venture, Pinault began to create a major, multibrand corporation involved in the sale of luxury goods. Pinault has continued to increase PPR's share of ownership in Gucci, and Gucci has acquired numerous companies that produce high-end fashions, cosmetics, perfumes, shoes, jewelry, and leather goods, including Yves Saint Laurent, YSL Beaute, Sergio Rossi, Boucheron, Bottega Veneta, and Balenciaga. In addition, Gucci has partnered with fashion designers Stella McCartney and the late Alexander McQueen.

While Pinault's vast fortune was made in retailing, he has also invested in entertainment and sports ventures. He owns Stade Rennais Football Club, a football team in France's premier league, and the Théâtre Marigny in Paris.

In 2003, Pinault's son, François-Henri Pinault, became the chief exeuctive officer of PPR, and Pinault began to devote more of his time to his art collection and its exhibition. In 2004, Pinault was the third-richest individual in France. In 2008, Pinault ranked thirty-ninth on *Forbes* magazine's list of world billionaires, with his net worth estimated at $16.9 billion; in 2010, his net worth dropped to $8.7 billion, and he was the seventy-seventh-richest billionaire on the magazine's list.

In addition to his involvement in the business world, Pinault is a renowned art collector. His success in business has enabled him to acquire an art collection, which is perhaps the most important private collection in France. In 1990, he bought his first major artwork, a 1925 painting by Piet Mondrian, *Lozenge Composition with Red, Black, Blue, and Yellow*; the cost of the painting was £5.7 million. In 1998, he purchased Christie's Auction House for £7 million. Pinault has not been satisfied to merely enjoy artworks as a private collection but has also concentrated on exhibiting them. His desire to show his artworks challenges French cultural customs, because France does not have a tradition of allowing the public to view privately owned art collections. In an initial effort to exhibit his art, Pinault bought a ruined Breton chapel and transported it to his château in Paris, where it was reassembled by American sculptor Richard Serra and presented for public display. The French government and populace were scandalized by Pinault's action.

Pinault was embroiled in another controversy when he purchased Seguin Island in the Seine, on which an abandoned Renault automobile factory remained. He planned to build the François Pinault Foundation for Contemporary Art museum there in order to exhibit his two thousand paintings, sculptures, and other pieces. However, the factory, known as Fortress Billancourt, is viewed by many French people, especially the socialists, as a monument to the nation's industrial past and the trade unions that fought for workers' rights. Consequently, after considerable opposition to Pinault's planned destruction of the factory, problems of decontamination, and other bureaucratic issues, Pinault abandoned the project, in which he had invested $26 million. In 2005, he acquired the Palazzo Grassi in Venice, Italy, where he has created a venue for exhibiting his art collection and established the François Pinault Foundation for Contemporary Art.

Legacy

François Pinault has received both praise and criticism throughout his career. He is certainly atypical as a French entrepreneur, as he did not follow the usual path of education to enter the business world. He has also been accused of putting his interests ahead of France's broader cultural considerations, as demonstrated by the controversies over his public exhibition of the reassembled Breton chapel and his plans to build a museum on Seguin Island.

However, Pinault has left the world two significant legacies. Through his commercial enterprises, he has made major contributions in the areas of mass distribution of goods and in the development of the luxury goods sector of the world economy. His most important legacy, however, is his contribution to contemporary art. Through his support of artists and his public presentations of his art collection, he has made modern artworks available to the public and has encouraged the development of this art. The François Pinault Foundation for Contemporary Art plays a significant role in the advancement and preservation of contemporary art through its museums, the Palazzo Grassi and the Punta della Dogana in Venice.

C. W. Post

American inventor and industrialist

Post founded the Postum Cereal Company to market Grape-Nuts, Post Toasties, and the coffee substitute Postum. By the early twentieth century, his company had made him one of the country's wealthiest men.

Born: October 26, 1854; Springfield, Illinois
Died: May 19, 1914; Santa Barbara, California
Also known as: Charles William Post
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Spouse; children

Early Life

Charles William Post was born in 1854 to Charles Rollins and Caroline Lathrop Post. He dropped out of Illinois Industrial University after two years and worked briefly in Independence, Kansas, before returning home to Springfield, Illinois. There, he invented, manufactured, and sold farm implements. In 1874, he married Ella Letitia Merriweather, with whom he had one child, Marjorie Merriweather Post.

Post moved to Texas in 1886 and with his brother Rollin became a land developer. Their projects included both industrial mills and housing. His marriage to Ella failed, and in 1904 Leila Young became his second wife.

First Ventures

Post led a troubled life. His zeal, coupled with a restlessness that required constant stimulation, propelled him into the invention of "scientific suspenders," a safety bicycle, and his version of a player piano, as well as the farm machinery he had earlier invented or improved. He experimented with using dynamite for making rain.

His frenzied pace resulted in mental and physical health problems, including two nervous breakdowns. He sought treatment from John H. Kellogg at the famed Battle Creek, Michigan, sanatorium. Kellogg, a physician with a penchant for treating sickness with health foods, helped Post realize that cereals and beverages similar to those served at the sanatorium could be marketed to the general public. Post's first product was Postum, a coffee substitute made of bran and molasses

that went on the market in 1895. Two years later, he introduced Grape-Nuts cereal, which was followed in 1907 by Elijah's Manna, a corn flakes cereal that was renamed Post Toasties the following year. Venturing into the consumer marketplace soon put Post in direct competition with another Battle Creek cereal maker, Kellogg's brother W. K. Kellogg.

Mature Wealth

By 1909, Post's firm, the Postum Cereal Company, had sales of more than $5 million. The company's Battle Creek manufacturing facility, called the "White City" because the buildings were all painted white, contained cereal and paper factories, grain storage silos, offices, and warehouses. The paper factory was used for product packaging. Post attributed his phenomenal success to large-scale advertising methods, including the then-unheard-of practices of giving away product samples and issuing coupons to entice shoppers. He appealed to consumers' health concerns by claiming that Post products would put them on the "road to Wellville."

His company's sales grew until Post's personal fortune made him one of the wealthiest men in the early twentieth century United States. Post cereals were internationally popular and his workforce expanded. A paternalistic employer, he vigorously campaigned against labor unions. He sought to increase employee satisfaction by building hundreds of houses that his workers could buy for down payments of $4 and monthly mortgages of around $20.

Post strongly believed that physical health required spiritual peace, and for this reason in 1907 he founded a utopian town named Post City in Texas. The community failed to thrive, but the town, renamed simply Post, still exists today. In 1914, Post died in Santa Barbara, California, at the age of fifty-nine. His death was deemed a suicide, brought on by his despondency over his poor health.

Legacy

Post had laid the groundwork for his company to expand by acquiring other brands. After the company had acquired Birds Eye Foods and Jell-O, its name was changed to General Foods Corporation in 1929. General Foods was taken over by the Phillip Morris Company in 1985, and it later became part of Kraft Foods.

Post's daughter, Marjorie Merriweather Post, and her second husband, financier E. F. Hutton, managed the wealth she inherited from her father, including his company and the majority of his personal estate. She was a socially conscious heiress, contributing, often anonymously and always without fanfare, to causes, including a World War I hospital on a military base in France, schools, colleges, children's camps, and the arts.

Post's greatest legacy may be the C. W. Post Campus of Long Island University. The school was founded in 1954 to teach what Post believed to be the basic qualities needed for success in any endeavor: ingenuity, determination, and courage.

Marjorie Merriweather Post

American businesswoman and philanthropist

An heiress, socialite, and pioneer businesswoman, Post helped transform her father's cereal company into General Foods Corporation, the leading frozen and prepared food company in the United States. She donated millions of dollars to various philanthropic causes, built luxurious estates that became landmarks, and bequeathed her unique art treasures to a public museum.

Born: March 15, 1887; Springfield, Illinois
Died: September 12, 1973; Washington, D.C.
Sources of wealth: Inheritance; manufacturing; sale of products
Bequeathal of wealth: Children; relatives; educational institution; charity

Early Life

Marjorie Merriweather Post was born on March 15, 1887, in Springfield, Illinois. She was the only child of C. W. Post, a salesman, and Ella Letitia Merriweather. In 1891, the family moved to Battle Creek, Michigan, where Charles was treated for a severe digestive ailment at the sanatorium managed by doctor John H. Kellogg, a facility that was famous for its dietary cures. Charles invented Postum, a coffee substitute made of bran, wheat berries, and molasses. In 1895, he launched the successful Postum Cereal Company, which manufactured Grape-Nuts, America's most popular cereal. By 1909, he had made a $5 million fortune.

After attending public schools in Battle Creek, Marjorie attended the Mount Vernon Seminary in Washington, D.C., from 1901 to 1904. Outside the classroom, her father prepared her to inherit his company. She toured factories, attended board meetings, traveled to Europe, and learned marketing techniques.

First Ventures

In 1905, Post married her first husband, wealthy lawyer Edward Bennett Close. They settled in Greenwich, Connecticut, and had two children, Adelaide, born in 1908, and Eleanor, born in 1909. Post attended classes in art and architecture at a local private school. When Post's mother Ella died in 1912, Post inherited her mother's Postum stock. When her sick father committed suicide in 1914, the twenty-seven-year-old Post became the sole heir of the cereal company, worth $20 million, which was a huge fortune at the time. During World War I, Post made her first major philanthropic contribution. In 1917, she funded a Red Cross army hospital in Savenay, France, at a cost of $75,000.

Close became the cereal company's director, and the couple eventually purchased the five-story Beaux-Arts Burden Mansion on New York City's Fifth Avenue. Post decorated her first showplace home with the advice of art dealer Joseph Duveen, who had helped develop the Old Masters collections of John D. Rockefeller, Henry Clay Frick, and Andrew Mellon. At Duveen's suggestion, Post enrolled in courses about porcelain, furniture, and tapestries at the Metropolitan Museum of Art. She developed her lifelong love of collecting unique objects and furnishings. Post acquired exquisite pieces, including Sèvres porcelains, paintings by Thomas Gainsborough, Louis XVI furniture, Peter Paul Rubens's *Adoration of the Magi*, Gobelin tapestries that Louis XVI and Marie Antoinette had given to Prince Henry of Prussia, and Beauvais tapestries designed by François Boucher.

Mar-a-Lago

Mar-a-Lago, which is Latin for "sea to lake," was the luxurious Palm Beach, Florida, estate of cereal heiress Marjorie Merriweather Post and her second husband, financier E. F. Hutton. In the early 1920's, Post searched for a beachfront location to build a majestic mansion where she could host lavish parties during the winter social season. After crawling through the underbrush of many undeveloped jungle areas, Post and her realtor finally found seventeen acres between the ocean and Lake Worth where she could build a hurricane-resistant building, anchored by concrete and steel to the ancient coral reef under the barrier island.

Mar-a-Lago was built between 1924 and 1927 at a cost of approximately $2.5 million. Post employed six hundred local craftsmen, European artisans, and other skilled workers. She brought in prominent architect Marion S. Wyeth for the basic floor plan and hired Austrian architect Joseph Urban for the more intricate designs. Urban had created designs for the khedive of Egypt, Emperor Franz Joseph, and the Ziegfeld Follies.

When finished, the crescent-shaped structure was topped by a seventy-five-foot tower with views in all directions. A blend of Spanish, Moorish, Venetian, and Portuguese styles, this architectural masterpiece had 115 rooms. Special features included carved stone sculptures, gold bathroom fixtures, frescoes, twenty thousand Cuban roofing tiles, and more than thirty-six thousand rare antique Spanish and Moorish tiles, some dating back to the fifteenth century. In 1969, Mar-a-Lago was designated a National Historic Site, and in 1972 it was added to the National Register of Historic Places.

Post regularly hosted her International Red Cross Ball at Mar-a-Lago. This annual charity event was a formal gala attended by wealthy socialites, foreign ambassadors, and celebrities. Mar-a-Lago remained Post's favorite winter haven until her death on September 12, 1973. In her will she donated Mar-a-Lago to be used as a presidential and diplomatic retreat by the federal government.

However, this estate was too expensive to maintain and its location near water and an airport posed security risks, so in 1980 the government returned the property to the Post Foundation. In 1985, realtor Donald Trump purchased the property to use as a private residence. He spent millions of dollars to restore and upgrade the property. In 1995, he established the estate as the Club Mar-a-Lago, one of the most expensive and beautiful private clubs in the world. The last of the grand estates built in Palm Beach in the 1920's, the Mar-a-Lago Club is considered the most valuable piece of property in Florida.

Mature Wealth

Close and Post divorced in 1919, and Post married Wall Street financier E. F. Hutton in 1920. Their daughter, Nedenia Marjorie Hutton, born in 1923, later became the actor Dina Merrill. As Postum's chairman of the board of directors, Hutton made the firm a publicly traded company on the New York Stock Exchange in 1922. Postum also acquired other food manufacturers, including Maxwell House Coffee, Hellmann's Mayonnaise, Jell-O, and Log Cabin Syrup. However, it was Post who realized the potential market for prepared foods and persuaded Postum to purchase Clarence Birdseye's frozen food brand. Subsequently, in 1929, Postum became the powerful General Foods Corporation, the largest food firm in the country.

During the 1920's, Post built famous homes, including the Hillwood mansion on 176 acres in Long Island; the 115-room Mar-a-Lago in Palm Beach, Florida; and a 207-acre Adirondacks camp called Hutridge (later renamed Topridge). Post also designed a fourteen-story apartment building, with a fifty-four-room penthouse, in New York City. She owned the world's largest private sailing yacht, *Hussar V*, later called the *Sea Cloud*.

To furnish her homes, she became an avid collector. Some of her treasures included a Louis XV jewelry coffer inset with Sèvres porcelain plaques, a Louis XVI commode by Jean-Henri Riesener, a unique rolltop desk by Abraham and David Roentgen, and eighteenth century French decorative furniture and gold boxes. While ostentatiously spending money, Post was also devoted to charity work. During the Depression, she funded Salvation Army and church soup kitchens in New York City. She also supported Franklin D. Roosevelt's New Deal policies.

After Post and Hutton divorced in 1935, Post joined the board of directors of the General Foods Corporation. In December, 1935, Post married attorney Joe Davies, who had chaired the Federal Trade Commission from 1915 to 1916. President Roosevelt appointed Davies ambassador to the Soviet Union in 1936. While in the Soviet Union, the couple was able to acquire Russian imperial art treasures at discount or nominal prices. Post's collection of Fabergé jewelry, Russian Orthodox icons, porcelain, gold chalices, jeweled ornaments, and other items would become the most comprehensive collection of its kind outside Russia.

In 1955, Davies and Post divorced. Davies kept their Washington, D.C., home, so Post bought a twenty-five-acre Washington estate, Hillwood, which she intended to become a museum. Hillwood would house her Russian imperial art collection, as well as her famous collection of eighteenth century French decorative art and furnishings.

In 1958, Post married Pittsburgh businessman Herbert Arthur May. That year she also retired from the General Foods board of directors. In the early 1960's, Post donated $100,000 to help build the John F. Kennedy Center for the Performing Arts. Post and May were divorced in 1964. Through the years, Post was a major benefactor of the National Symphony Orchestra. In 1967, at her eightieth birthday celebration at Constitution Hall, the symphony performed in her honor.

In 1971, Post's health began to deteriorate, and she started to suffer from a series of strokes. By August, 1972, she had severe memory loss and was soon confined to a wheelchair. She died of cardiac failure on September 12, 1973.

In her will, Post left $117 million to her family, with the remaining assets divided among her daughters. The will provided endowments of $100,000 each to the C. W. Post Campus of Long Island University, the National Symphony, the American Red Cross, and Mount Vernon College. Smaller amounts were bequeathed to various relatives, business associates, servants, and others. Post also left trust funds to maintain Hillwood and Mar-a-Lago. Hillwood eventually became a significant public art collector's museum called Hillwood Estate, Museum, and Gardens. She donated Mar-a-Lago to the United States federal government to use as a diplomatic and presidential retreat.

Legacy

With a net worth of $250 million (or $1 billion in 2008 dollars), Marjorie Merriweather Post was the wealthiest woman in America. An independent thinker with a sharp business sense, she helped create the powerful General Foods Corporation and was one of the first women to be a director of a major company.

Considered America's version of royalty, Post was like an empress living the American dream of wealth with luxurious homes, expensive jewelry, unique furniture, extravagant parties, and powerful friends. At the same time, Post was a dedicated philanthropist. She donated millions of dollars to charities, such as the Boy Scouts of America, the National Symphony, C. W. Post Campus at Long Island University, and soup kitchens in New York City. Many of her lavish homes have become landmarks, and she left estates to benefit the government and to serve as public museums.

JAY A. PRITZKER

American hotel magnate and conglomerate owner

Pritzker used his professional training in law and accounting to acquire a diverse group of small companies and build them into an enormous business empire. His most notable success was the creation of the Hyatt Hotels Corporation, which not only made him a personal fortune but also revolutionized the business travel industry.

Born: August 26, 1922; Chicago, Illinois
Died: January 23, 1999; Chicago, Illinois
Also known as: Jay Arthur Pritzker
Sources of wealth: Real estate; tourism
Bequeathal of wealth: Children; educational institution; Pritzker Architecture Prizes

EARLY LIFE

Jay Arthur Pritzker (PRIHTZ-kehr) was born in Chicago, Illinois, in 1922, the son of Fanny Doppelt and Abram Nicholas Pritzker. Jay was the oldest of three sons, and he and his brothers Robert Alan Pritzker and Donald Nicholas Pritzker would later create a family financial dynasty. His father Abram was the son of a Russian-Jewish immigrant who knew the importance of hard work, education, savings, and secure investments. Jay's grandfather Nicholas Pritzker laid the foundation for the future financial empire by establishing the law firm of Pritzker & Pritzker and by investing the firm's profits in real estate. After graduating from Harvard Law School, Abram joined the family law firm.

Clearly, family tradition and mutual support played an important role in the success of the Pritzker family, and these values had a positive effect on Jay's developing personality and character. Growing up in Chicago in the 1920's also played a pivotal role in his early development. In this "roaring twenties" era, Chicago was experiencing rapid economic growth, notorious gangland violence, corrupt politics, and an ever-increasing immigrant population from Eastern Europe. The city was ripe for individual fortunes to be made, and Jay did not waste any time in pursuing his dreams. He finished high school at age fourteen and then attended Northwestern University in Evanston, Illinois, receiving his undergraduate degree in 1941 and his law degree in 1947. During World War II, Pritzker was a naval aviator. As a young man entering into the business world, he relied upon what he called the "Pritzker work ethic" to achieve success—the belief that everyone should contribute to the family's wealth and not live off the money earned by others.

FIRST VENTURES

Pritzker, whose academic training was in law and accounting, spent the early years of his career gaining valuable experience through his involvement in his family's businesses. By age twenty-nine, he had taken the first steps toward making his personal mark on the business world. He initially bought up small, relatively inexpensive companies and turned them into highly profitable entities. Never content with success, Pritzker was always looking for ways to increase his holdings through additional acquisitions and new ventures.

Pritzker's early success was partly due to the business opportunities that arose at the end of World War II, a period that brought many changes in the American lifestyle. During the war, women in the workplace not only filled the void left by the men who were drafted into military service but also represented new business markets. In the postwar era, there was a great demand for manufactured goods, automobiles, housing, luxury items, and vacation travel. The travel industry flourished, creating a great demand for better means of transportation and affordable accommodations. Businessmen who were regularly away from home demanded a higher-quality accommodation that would make their stay more comfortable but still be suitable for conducting business.

This desire became apparent to Pritzker in 1957, while he was waiting for a flight at Los Angeles International Airport. Always looking for a good investment opportunity, Pritzker noticed that the airport coffee shop was doing an unusually good business. He also learned that the airport hotel was usually booked to capacity, and he was impressed by the fact that this was the only first-class hotel he had ever seen at an airport. As luck would have it, both the coffee shop and the Hyatt Von Dehn hotel were for sale. Acting upon his instincts, Pritzker immediately made an offer of $2.2 million to buy both, and the offer was accepted. Pritzker was betting that business executives like himself would be willing to pay a higher price for the convenience of staying at a quality hotel close to the airport.

His gamble paid off, and the purchase of the Hyatt hotel in Los Angeles quickly led to construction of another Hyatt hotel located near the San Francisco International Airport in Burlingame, California. With the success of a second Hyatt hotel, Pritzker and his brothers expanded their operations by acquiring additional hotel properties at several major airports across the United States. These acquisitions would eventually evolve into the multibillion-dollar international Hyatt Hotels Corporation that serves as the flagship of the Pritzker family's investments.

Mature Wealth

One of Pritzker's early acquisitions was the Colson Corporation, a financially troubled manufacturer of wheelchairs and bicycles. He and his brother Robert were able to turn the company into a financial success. Similar acquisitions over the years led to the formation of the Marmon Group, a Chicago-based manufacturing conglomerate of more than one hundred companies with a diversity of industrial and service products. In 1967, Pritzker bought a half-finished Atlanta, Georgia, hotel and turned it into the elegant Hyatt Regency with what would become a trademark giant atrium. The success of the Hyatt Regency Atlanta led to similarly designed hotels being built in many other major markets.

However, Pritzker's investment interests extended far beyond the hotel business. Throughout the years, his family's holdings have combined into a vast multibillion-dollar empire protected by more than one thousand trust funds. A diversity of businesses, land holdings, and interests in natural resources all increased the family's wealth. In addition to Global Hyatt and the Marmon Group, the group also owns the Royal Caribbean International cruise ship line; the TransUnion credit bureau; Triton Holdings, an operator of marine cargo container ships; and the Conwood Company, a manufacturer of snuff and chewing tobacco. The Pritzker family also purchased Braniff Airlines and was involved in a famous takeover battle for RJR Nabisco. The Pritzkers had an in-

The Pritzker Architecture Prize

Jay A. Pritzker and his wife Cindy established the Pritzker Architecture Prize in order to draw public attention to the importance of buildings and the architectural profession. The couple were lifelong residents of Chicago and were keenly aware of this city's historic importance in the field of architecture. Chicago was the birthplace of the skyscraper and home to many buildings designed by famous architects, such as Louis Sullivan and Frank Lloyd Wright. The Pritzkers were also aware of the impact of architecture upon human behavior and how buildings influence their environments.

In 1967, Jay Pritzker acquired a partially finished hotel in Atlanta, Georgia, featuring a soaring atrium that let in natural light and gave the building an open-air feel. This design had a very positive effect on both guests and hotel employees, and it became an architectural model for other hotels. His experience at this hotel gave Pritzker a new appreciation for architecture. In 1978, he and his wife were presented with the idea of creating an annual award, including a monetary prize, in order to honor living architects and to promote creativity in architectural design. The Pritzkers enthusiastically accepted this challenge and made preparations for the presentation of the first award in 1979. Criteria for selection of an honoree would follow guidelines similar to those established by the Nobel Prize committee.

Since 1979, the award has been made on an annual basis. In 2009, winners received a $100,000 grant, a formal citation certificate, and a bronze medallion. The award ceremony is held each year at an architecturally significant site. The award has become known as the "architectural Nobel" and is regarded as architecture's highest honor.

terest in Ticketmaster; Levitz Furniture; *McCall*'s magazine; casinos in Las Vegas, Lake Tahoe, Atlantic City, and Elgin, Illinois; and AmeriSuites, a chain of more than 140 mid-priced hotels. This structured diversification of business interests and investments has enabled the Pritzker family fortune to continue to grow and has made many of the family members billionaires.

Legacy

Often cited as the creator of the Pritzker family's great wealth, Jay Pritzker had a vision of how this money should be used and maintained. It was his wish that the immense family fortune would be protected in perpetuity for the benefit of all family members in a manner respective of their individual ages and status within the family. His vision began to change in 1995, when he designated his son Thomas as his direct successor and placed him in control of the family businesses. Pritzker assumed that under Tom's leadership, business would continue as usual, but he was wrong. Tom had a different idea of how the family wealth should be distributed. Tom believed that the greatest rewards should go to those family members who made the most significant contributions to the family's financial success.

Shortly after Jay Pritzker's death in 1999, his principal heirs decided to divide the Pritzker family fortune into eleven equal shares, each worth close to $1.4 billion. These arrangements would have remained outside of public scrutiny had it not been for a lawsuit filed by Robert Pritzker's children, Liesel and Matthew. They alleged that their trust funds had been compromised, and they wanted their fair share of the inheritance, as well as punitive damages totaling almost $6 billion. A settlement was eventually reached, but not before turning the Pritzkers' private family business into a public spectacle, which was not what Jay Pritzker had intended.

Jay A. Pritzker was innovative in business, loyal to his family, and generous to the community at large. He contributed to a variety of charities in support of the arts and sciences and to medical, religious, and civic organizations. There is no way of accurately measuring the effects of his generosity, but his gifts have supported many causes and have affected literally millions of lives.

Joseph Pulitzer

American newspaper editor and publisher

Pulitzer developed techniques of reporting and publishing that led to increased circulation and advertising revenue at two major urban newspapers, allowing him to generate great personal profits. He helped create the modern newspaper industry and established journalism as a respected profession in America.

Born: April 10, 1847; Makó, Hungary
Died: October 29, 1911; Charleston, South Carolina
Source of wealth: Media
Bequeathal of wealth: Spouse; children; educational institution; Pulitzer Prizes

Early Life

Joseph Pulitzer (PYEWL-ihts-ehr) was born in Makó, Hungary, the child of middle-class parents who provided him a good education. Nevertheless, constant arguments with his stepfather drove Pulitzer to emigrate to the United States, where he enlisted in the Union army in 1864. After the Civil War, he drifted about looking for work, and he was nearly destitute when he arrived in St. Louis, Missouri. Within a few years, however, he had managed to acquire an education in the law, develop a passion for the news business, and become an American citizen. He worked at various newspapers as a reporter and eventually was made editor of the German-language *Westliche Post*. Although he continued doing legal work for several years, Pulitzer realized that his passion was for journalism.

First Ventures

Pulitzer's work ethic at the *Westliche Post* so impressed the owners that in 1872 they made him managing partner and allowed him to become part owner by purchasing shares on credit. To their dismay, his overbearing nature as an editor and publisher made them quickly regret their decision. Within months they bought him out, paying him $30,000 for his interest. Although Pulitzer used some of his money to travel, in 1874 he spent several thousand dollars at auction to buy the bankrupt newspaper *Staats-Zeitung*, realizing that its Associated Press franchise was a valuable asset. He sold the newspaper almost immediately for $20,000, a considerable sum, given that the average annual income at the time was $450 to $500. Another stint of traveling took him to Washington, D.C., where he worked briefly for the *New York Sun* covering the 1876 presidential election. In 1878, he married southern socialite Kate Davis; during the next two decades the couple would have seven children. Later in 1878, Pulitzer was back in St. Louis, ready to invest his savings in another newspaper, the bankrupt *Evening Dispatch*. Once again, Pulitzer bid at auction, paying $2,500 for the assets and vowing to turn a profit on his investment.

Mature Wealth

Within months Pulitzer transformed the nearly defunct *Evening Dispatch* into the widely read and highly profitable newspaper he renamed the *Post-Dispatch* after com-

Joseph Pulitzer. (The Granger Collection, New York) bining it with competitor John A. Dillon's *Evening Post*. Pulitzer's first move as owner was to hire a highly competent staff of reporters, editors, and advertising sales personnel and pay them well, a practice he continued throughout his career. In 1879, he bought out the *Evening Star*, thereby gaining a monopoly on the evening news market in St. Louis.

Pulitzer was a hands-on publisher, writing copy himself and closely supervising employees. A liberal Democrat, he supported reformist causes but consistently touted the independence of his newspaper. The *Post-Dispatch* attacked corruption in government and the private sector, adopting principles of reporting that would eventually come to be known as sensationalist journalism. Circulation soared, and with increased sales came substantial profits, largely from advertising revenues. In his first year as publisher of the *Post-Dispatch*, Pulitzer netted a profit of $80,000 after paying nearly $100,000 in expenses. During the next five years, his income from the newspaper continued to increase, and by 1883 he had established his family in a fashionable neighborhood in St. Louis and was earning more than $100,000 annually.

This handsome income allowed him to fulfill a dream he had nurtured for a decade: to purchase a New York City newspaper. In 1875, he had made an unsuccessful bid for New York's *Belletristiche Journal*. Nine years later and possessing considerably more resources, Pulitzer bought the struggling *New York World* from railroad tycoon and financier Jay Gould for $346,000, paying $100,000 in cash and deferring the remainder, which he paid over the next several years out of the profits from the revitalized newspaper. Even in the highly competitive New York City market, where several morning newspapers vied for readership, Pulitzer was phenomenally successful. When Pulitzer took over the *World*, its circulation stood at less than fifteen thousand. By the fall of 1884, the *New York World*'s circulation exceeded 100,000; in 1890, the daily edition had a circulation of nearly 300,000. Pulitzer's competition with rival William Randolph Hearst's *New York Journal* only led to increased efforts at providing more sensational news accounts that in turn attracted even more readers. At the end of the century, circulation at the *World* exceeded one million.

As he had done at the *Post-Dispatch*, which he continued to own and run in absentia, Pulitzer used the *World* to expose corruption and champion causes important to the working classes. At both newspapers he was extremely innovative. Always a believer that sensational reporting helped sell newspapers, over the course of his career Pulitzer introduced multicolumn banner headlines, pioneered sports reporting and sections devoted to women's issues, and experimented with story placement. Curiously, although he was eager to become wealthy, his newspapers often exposed the greed of other millionaires whose wealth was ostensibly accumulated at the expense of the common people. Powerful politicians were also fre-

The Pulitzer Prizes

According to the terms of newspaper publisher Joseph Pulitzer's will, after his death the awards known as the Pulitzer Prizes were created to recognize significant work in fiction, biography, drama, education, and journalism. A special committee consisting of working journalists and members of Columbia University's faculty was established to choose recipients from among nominees each year. The first prizes were awarded in 1917. Over the years, categories have been added, so that by the end of the twentieth century Pulitzer Prizes were also awarded for poetry, music, and photography. Recipients are presented a certificate and a cash award, but the real value of receiving a Pulitzer has always been the recognition given to an individual or organization fortunate enough to be chosen as a winner.

Many well-known American writers and musicians have been honored with Pulitzer Prizes for literary and musical compositions, including Ernest Hemingway, William Faulkner, and Toni Morrison for fiction; Richard Wilbur for poetry; Eugene O'Neill and Arthur Miller for drama; Vernon Louis Parrington and Arthur M. Schlesinger, Jr., in history; and Wynton Marsalis in music. Because the award recognizes a particular work, however, the Pulitzer has often gone to less well-known individuals whose novels, histories, poems, dramas, or musical compositions stood out from among the nominees.

The idea of treating journalism as serious literature was a radical notion at the beginning of the twentieth century, but Pulitzer wanted to recognize the contributions journalists made to American society by equating the practice of news reporting and writing with other forms of literary art. Over time, however, the most coveted prize has been the award of a gold medal for public service journalism. Newspapers large and small have been honored for stellar reporting on events of significance to their readership. Perhaps no Pulitzer has been more widely recognized than the one awarded in 1973 to *The Washington Post* for its coverage of the Watergate break-in and its aftermath, a series that was instrumental in forcing Richard Nixon to resign the presidency of the United States.

quent targets of Pulitzer's wrath, and a feud between him and Republican politician Theodore Roosevelt ended up in the courts, where Pulitzer was eventually able to win a nasty libel suit. Ironically, Pulitzer made a brief foray into national politics in 1886, running successfully for Congress. He resigned the following spring, however, finding he could not serve in Washington, D.C., and run his newspapers successfully.

A shrewd businessman as well as a committed journalist, Pulitzer realized that growth in circulation provided the opportunity to generate additional advertising, and by the mid-1880's he had increased advertising by eighteenfold. Revenue from advertising produced the real profits for a publisher—in Pulitzer's case, more than $500,000 annually by 1886. The bulk of any dividends declared from these profits went to Pulitzer as principal shareholder in the corporation he had set up to run the *World*.

By 1885, he was able to provide his wife an annual allowance of $100,000, purchase a mansion on Fifth Avenue in New York City, and contribute to a number of political and social causes for which he had special sympathy. Over the next twenty years he and his family lived luxuriously, his wife enjoying frequent overseas trips, where she spent lavishly on the latest fashions. The Pulitzers also accumulated an enviable collection of artwork, which they displayed in a series of increasingly elegant mansions that they acquired in fashionable New York neighborhoods.

Of course, some of the *World*'s profits went back into the business to pay for state-of-the-art printing presses and reward employees who helped make the newspaper a success. In 1890, Pulitzer paid $2.5 million to construct the *New York World* building in downtown Manhattan. When it was completed it was the tallest building in the city. Unfortunately, by this time Pulitzer was unable to attend its opening. In 1888, he suffered a breakdown that robbed him of his eyesight and made him especially sensitive to noises. Although he continued to direct operations at the *World* and to a lesser extent at the *Post-Dispatch*, Pulitzer became a virtual recluse, sending memos and telegrams to his managers while spending most of his time at his retreat in Maine, at various resorts in Europe, or at sea. In 1907, he spent $1.5 million for a specially designed yacht, the *Liberty*, aboard which he could enjoy the quiet respite that urban life denied him. During the last decade of his life, he became a strong advocate for a new brand of journalism that stressed accuracy and fairness in reporting. Pulitzer died in Charleston, South Carolina, in 1911.

Legacy

Pulitzer left an estate of more than $18 million, as well as several homes. Beneficiaries included several charities and nonprofit organizations; the Metropolitan Museum of Art and the Philharmonic Society each received $1 million. He established an endowment of $2.5 million to provide for his widow, and he made smaller bequests to his daughters and some longtime employees. The bulk of his estate, his stock in the *World* and *Post-Dispatch*, was divided among his three sons; Herbert received 60 percent, Ralph, 20 percent, and Joseph, 10 percent, with the remaining 10 percent dispersed among key employees of the newspapers. Sadly, although the *World* was considered the flagship of the Pulitzer empire, Ralph and Herbert were able to maintain it as a family corporation only until 1931, when they sold out to the Scripps-Howard chain. Under Joseph Pulitzer II, however, the *Post-Dispatch* continued to flourish and remained one of America's most prestigious newspapers throughout the twentieth century.

By far the most notable bequest Pulitzer made was to Columbia University. In 1902, Pulitzer began negotiating with university president Nicholas Murray Butler to establish a journalism school at Columbia and create a series of prizes to recognize accomplishments in various literary fields, including journalism. In his will, Pulitzer left $2 million to Columbia to carry out this plan. The School of Journalism opened in 1912, the year after Pulitzer died, and at the 1917 commencement the university honored the first recipients of what would become America's most prestigious annual awards for literature: the Pulitzer Prizes.

GEORGE MORTIMER PULLMAN
American inventor and industrialist

Pullman, the inventor of the railroad sleeping car, changed the nature of railroad travel. He initially was admired for his employee policies, but his relationship with his workers quickly deteriorated after an economic downturn in 1893 resulted in an ugly strike at his company the following year.

EARLY LIFE

George Mortimer Pullman was born into the world of his blue-collar father. Young Pullman was reared in the shadow of the Universalist Church, in which two of his brothers would become pastors. However, Pullman always preferred to emphasize good decisions, self-control, and honesty over overt Christian orthodoxy. Therefore, although he attended church throughout his life, the lessons he learned were always applied in a manner that coincided with his innate convictions about decency and character. Pullman attended school until age fourteen, when he traded formal studies for a job at a general store in Westfield, New York. Three years later, in 1848, he became a cabinetmaker, and he later joined his father in the business of moving buildings.

FIRST VENTURES

He and his father were fortunate to be living near the Erie Canal when the decision was made to widen it, because this project required that many homes be moved away from the waterway, thus providing ample work for the Pullmans. Five years later, in 1853, Pullman's father became ill and died. This left Pullman to finish moving the homes without his father's guidance, a job he successfully completed in 1855.

Pullman then opened an office in Chicago and began elevating buildings, as well as moving them. In the mid-1850's, many of the buildings and streets in Chicago were only a few feet above Lake Michigan's water level, and flooding and poor drainage were common

The Pullman Strike

Under the auspices of his Palace Car Company, George Mortimer Pullman forever changed the means of railroad travel and relations between factory owners and their workers. Until he set about developing his railcars, passengers rode long distances on cars outfitted with uncomfortable seats. These seats were narrow, and they failed to soften the bumpy rides. Railroad owners were more concerned with expanding their lines than with the comfort of their passengers.

Pullman invented railcars with more comfortable seats that folded over to provide bunks for sleeping. These cars were outfitted with carpeting, drapes, upholstered chairs, libraries, card tables, and washrooms, and travelers were provided with exceptional customer service. Pullman offered his customers a more luxurious journey at a higher price than his competitors.

Pullman initially partnered with Benjamin and Norman Field to construct sleeping cars for two railroads, both of which were in Illinois. In 1867, he received a charter from the Illinois legislature to establish his Palace Car Company. Pullman later built a town, Pullman, Illinois, where the employees of the Palace Car Company could live, but he did not provide this amenity without making a profit. His workers paid rent for their housing, and Pullman also profited from the groceries, clothing, and other merchandise that was sold in his town's stores.

At first the trade-off between having a place to live in Pullman's town and knowing Pullman profited from the town posed no problem for workers. However, this changed in 1893, when a nationwide economic downturn significantly slowed the Palace Car Company's business. When Pullman seemed oblivious to the economic hard times, his relations with his employees soured, and in 1894, workers planned for a strike at the Pullman facilities. In early May, 1894, the workers' committee at the company's factory confronted Pullman about the problems arising because their low salaries could barely pay for their high rents. Pullman responded by firing committee members.

His action led Palace Car Company workers to go on strike beginning on May 11, 1894. Eugene V. Debs, a representative of the American Railway Union (ARU), led the strike. ARU members who did not work at the Pullman factory were instructed not to handle any of Pullman's cars and not to work for railroads that continued to handle them. This decision set off a wider strike against Pullman that began on June 26, 1894. At the strike's peak, about 250,000 workers in about twenty-seven states were involved in the work stoppage.

Railroad owners, who had long sided with Pullman on labor issues, were able to force the federal government to break the strike by attaching U.S. mail cars to the trains containing Pullman's cars. The owners argued that unless the federal government intervened, mail delivery would be at a standstill aboard the boycotted trains. Convinced of the veracity of the railroad owners' arguments concerning mail delivery, President Grover Cleveland sent federal troops to Chicago in July, 1894, to break up the strike, and this intervention ended the work stoppage.

problems facing Chicagoans. In 1858, Pullman secured a contract to raise the Tremont Hotel so it would safely rest above the threat of Lake Michigan's waters. Pullman successfully raised the hotel, and he went on to elevate other historically significant buildings.

With the arrival of winter and the subsequent freeze that halted work on construction projects, Pullman boarded a train to return to New York. His arduous trip led Pullman to design a more comfortable means of travel for passengers taking long journeys by train. Just as his move to Chicago had been well timed for a man in the business of moving buildings, his decision to design a luxurious railcar proved equally fortuitous.

Mature Wealth

In order to build his cars, Pullman found two normal railcars suitable for a makeover and available for purchase. He converted these cars into facilities with sleeping accommodations. Although this conversion cost $2,000, a hefty sum at this time, Pullman staunchly believed that people would pay more money for a higher-quality rail trip. To this end, he made sure that the inside of his cars looked exquisite, from their fine, interior wood paneling to their toilets and linen closets.

By the time the Civil War began, Pullman had sufficiently expanded his rail line to provide travel between a greater number of cities. By 1862, he had developed an even smoother-riding vehicle by building a car with sixteen instead of eight wheels. However, when the Union began using cars to transport troops during the Civil War, Pullman's ambitions were put on hold for a few years.

In August, 1865, just months after the end of the Civil War, Pullman was able to persuade Union commander Ulysses S. Grant to travel aboard one of his sleeping cars. The car provided for Grant was far more advanced than those constructed three years earlier, and Grant's use of it was an advertising boon for Pullman, who quickly discovered that the public readily approved of almost everything the Union leader endorsed.

As 1866 came to a close, Pullman had nearly fifty sleeping cars in operation, and in February, 1867, the Illinois legislature granted a charter to Pullman's Palace Car Company. With the charter in hand, Pullman resolutely began the work of making passengers' rides not only more comfortable but also less burdensome. Pullman recalled how the unpleasantness of his travels between Chicago and New York in the winter of 1858 was multiplied by the aggravation of having to drag baggage from one car to another as he changed lines at various train stations during the thirteen-hundred-mile journey. He worked on ways to ensure that his passengers would not have to change cars or move their luggage during a trip.

When Pullman was ready to demonstrate that he had envisioned every possibility for making rail travel easier, he sponsored a week-and-a-half-long cross-country trip aboard a group of his sleeping cars. Departing Boston on May 23, passengers were wined and dined in the sleeping cars until they arrived in San Francisco ten days later. Pullman, ever the publicist, brought reporters along in order to have the details of the transcontinental trip relayed to the public.

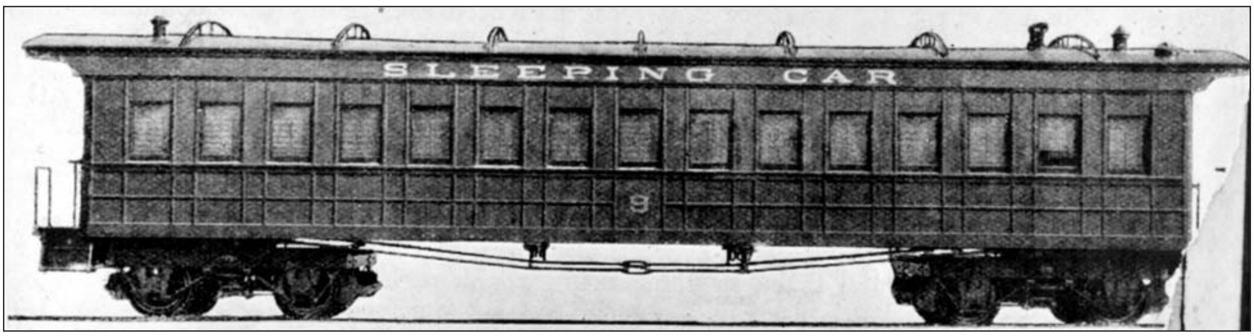
Pullman began planning a town for employees of the Palace Car Company with the intention of bettering his workforce. A progressive before progressivism became fashionable in the early twentieth century, Pullman sought to build a town where the environment would make his workers more suited to education and ethical behavior than to the alcohol and debauchery that marked many other factory communities. Located by Lake Calumet, just outside Chicago, the town of Pullman, Illinois, was purposely self-contained. It sat on approximately six square miles of land and eventually housed almost twelve thousand residents. In addition to the Palace Car factory and approximately eighteen hundred homes for workers, the town also had a library, a theater, and an arcade with various shops and outlets for goods and services. There were grocery and clothing stores, as well as a club where gentlemen could gather, read, and converse. One of the most prominent buildings was the Florence Hotel, which was the only place in town where alcohol could be purchased; by design, there were no saloons in Pullman, Illinois.

During the first years of the town's existence, Pullman enjoyed the world's adulation. Both the town and the man were praised for the moral benefits the workers appeared to be receiving. In time, however, the novelty of the town wore off, and Pullman began to be criticized as intensely as he had been lauded. When the Panic of 1893 sent the nation into an economic downtown, Pullman came to be despised by many of the very workers who had initially liked and admired him.

The economic woes of 1893 resulted in job cuts at the Pullman factory, as demand for his cars waned. Some employees were fired, and the salaries of the remaining workers were cut, but there was no corresponding reduction in workers' rents. Thus, the already struggling workers were forced to pay what they viewed as exorbitantly high rents during what would be the worst economic downturn in American history prior to the Great Depression. The following year, workers at the Pullman factory went on strike, which further eroded Pullman's reputation among his workers and the public.

LEGACY

Pullman died in 1897. He left his wife his Chicago estate on Prairie Avenue and $1.25 million. His two daughters received $1 million each, and his daughter Florence was bequeathed his summer home. His two sons were left lit-



George Mortimer Pullman's Pioneer sleeping car, introduced in 1865 at a cost of $20,000, set the standard for luxury rail travel. He left his two brothers and two sisters $50,000 each, and he bequeathed $1.2 million to build a manual trades school in Pullman, Illinois.

Pullman's luxurious sleeping car transformed the way the nation traveled, bringing refinement to what had been a bone-jarring experience. However, he was an inept manager of employee relations, seeming to turn a blind eye toward the plight of his workers during an economic crisis. His treatment of employees spurred the formation of workers' unions, convincing his employees and many members of the public that Pullman valued his money more than he valued the people whom he employed. Pullman's reputation for mistreating his workers was given greater credence after it became known that he not only refused to hear the workers' grievances before the 1894 strike but also left Chicago and went to his East Coast home during the strike. His conduct gave fodder to the newspapers, making it easy for them to represent him as a greedy capitalist who did not want to be bothered with the struggles of common people.

William Pulteney

British aristocrat and politician

Pulteney's wealth supported his controversial political career. Unlike many eighteenth century politicians dependent on the proceeds of public office, Pulteney was financially independent and able to chart a course of opposition to the British government.

Born: March 22, 1684; London, England
Died: July 7, 1764; London, England
Also known as: First Earl of Bath; Baron of Hedon; Viscount Pulteney of Wrington
Sources of wealth: Inheritance; real estate; government
Bequeathal of wealth: Relatives

Early Life

William Pulteney (PUHLT-nee), first earl of Bath, was born in 1684, the son of Colonel William Pulteney and his wife Mary Floyd. Pulteney came from a family of wealthy landed gentry who owned property in London. He was educated at Westminster School and Christ Church College of Oxford University, excelling both as a student and as an athlete. After leaving Oxford, Pulteney made the grand tour of Continental Europe that was a common practice among wealthy young male British aristocrats.

First Ventures

Much of Pulteney's political and financial career remains unknown because of his decision to have his papers burned after his death. In 1705, he entered the House of Commons as a member of the Whig Party under the patronage of Henry Guy, secretary to the Treasury. Guy had no close family and on his death in 1711, Pulteney inherited Guy's estate, including land in Middlesex and a large sum of cash. On December 27, 1714, Pulteney married Anna Maria Gumley, the daughter of John Gumley of

Isleworth, a rich cabinetmaker who gave Anna Maria a dowry of £6,000. The couple seem to have been happy, but like her husband Anna Maria was mocked for being both greedy and parsimonious.

In 1715, Pulteney's father died, and Pulteney inherited the family estates in London, primarily in Soho and Piccadilly. Pulteney launched an ambitious program of development around Great Pulteney Street in Soho and in the northern area of Piccadilly. He built a splendid mansion in Piccadilly, later known as Bath House, designed by architect Giacomo Leoni. The house was furnished expensively and in contemporary taste. It was demolished in 1821.

Mature Wealth

Pulteney initially was a close ally of the Whig politician Robert Walpole, fighting for Walpole's interests when a Tory administration sent Walpole to the Tower of London. When Walpole came to power in the 1720's, however, Pulteney did not receive the position of responsibility he wanted. Instead, he was given the profitable but powerless sinecure of cofferer of the royal household. By April, 1725, the conflict between Walpole and Pulteney was public, and Pulteney was dismissed from office.

As an opposition politician, Pulteney denounced Walpole in Parliament, wrote several pamphlets attacking the government, and collaborated with First Viscount Bolingbroke, who wrote letters attacking Walpole that were published in *Craftsman*, the leading opposition newspaper. Pulteney remained a Whig, but he worked with Tories like Bolingbroke as a united opposition. Although Pulteney came close to returning to power on two occasions, he never succeeded. However, he was raised to the peerage in 1742 as the earl of Bath.

In addition to developing his London real estate, Pulteney's immense wealth was spent on a variety of causes. He was a collector of plate and pictures, although not on the grand scale of the greatest English collectors. He sat for many portraits, including one painted by Sir Joshua Reynolds, the portrait painter of choice for the English elite. Pulteney was also a director of the Royal Academy of Music and a patron of the theater. He donated money for the construction of a hospital at Bath and a market cross at Hendon, and he chaired the committee that designed a new London Bridge.

Legacy

Pulteney's only son had died the year before Pulteney's own death, and the bulk of Pulteney's estate went to his brother and close intimate, General Harry Pulteney. In addition to land, it was estimated that Pulteney's personal estate was worth between £600,000 and £1.2 million. Many of Pulteney's friends and associates who hoped to be remembered in his will were disappointed. His greatest legacy is the development of a considerable portion of the West End of London.

Charles Rasp

German mining magnate

A German of Portuguese heritage, Rasp immigrated to Australia, where in the Outback he discovered a massive ore-bearing lode that enriched him personally and boosted the economy of his adopted country.

Born: October 7, 1846; Stuttgart, Württemberg (now in Germany)
Died: May 22, 1907; Adelaide, South Australia, Australia
Source of wealth: Mining
Bequeathal of wealth: Spouse

Early Life

Charles Rasp's grandfather was a Portuguese aristocrat and politician who was exiled in disgrace. Rasp's father, the private secretary to a German noble, accompanied his employer to Germany, married a German woman, and died in debt to the Rothschild banking firm. Charles was orphaned at age twelve and grew up with relatives in Paris. He was well educated in languages and science, and as a young man he worked in a Hamburg chemical plant. During the Franco-Prussian War, he served with the Royal Saxon Army but deserted, finding it expedient to adopt the surname of a friend killed in action.

First Ventures

Rasp arrived in Australia in the early 1870's. For a decade, he worked at a succession of jobs, including grape picking, mining, and sheep ranching. By 1883, he was employed as a boundary rider in the Outback. It was there that he noticed a strange formation called Broken Hill. Thinking it might be rich in minerals, he staked out a mining claim. Rasp and fellow employees formed the Syndicate of Seven to pool their money and purchase a sizable tract of land for exploration. In 1885, rich silver ore was discovered, leading Rasp and his partners to establish the Broken Hill Proprietary Company Limited (BHP), giving the company control of a major source of minerals.

Broken Hill proved to hold a mountain of valuable ores. Its vein was more than four miles long and more than 750 feet wide—the planet's greatest single source of silver, lead, and zinc. In its first year, BHP produced nearly £43,000 in ore, and the mine issued stock. In short order, BHP became Australia's largest company, stimulated tremendous economic growth throughout the country, and made Rasp a rich man.

Mature Wealth

In 1886, Rasp married German immigrant Agnes Klevesahl, who worked in an Adelaide restaurant. They bought a mansion in Adelaide called Willyama, the aboriginal name for his lucky strike, and the couple began enjoying the finer things of life. Within three years, Rasp had become a multimillionaire, and the dividends kept rolling in.

Besides part ownership in BHP, he held shares in and sat on the boards of several other companies. Charles added twelve rooms, including a French- and German-language library, to the luxurious residence where he and Agnes entertained often and opulently. They traveled far and wide. In 1897, the couple toured Japan, China, India, Africa, and Europe. Throughout 1900-1902, they saw the sights and hobnobbed with the cream of industry and aristocracy in England and on the European continent.

In Australia, Charles kept his hand in mining and commerce for the remainder of his life. He died of a heart attack before his sixtieth birthday, without ever telling anyone the truth about his mysterious past. Most of the money in his estate was left in his wife's name.

His widow Agnes returned to Europe with a large sum of money that she used to buy her way into high society. In 1913, an elderly German baron proposed to her, but he died before the wedding. The following year, Agnes married Count von Zedtwitz, but he was killed in World War I. Because Agnes stayed in Germany during the war, she was considered an enemy alien in Australia, and her Australian property was confiscated. When the war ended, Agnes moved to London before returning to Adelaide in 1921, eventually regaining her possessions. She died in 1936, leaving a sizable estate.

Legacy

Charles Rasp's discovery continued to produce minerals for more than a century, though mining operations eventually slowed. By 2009, Broken Hill had produced about two hundred million tons of ore, worth about $300 billion; an estimated one hundred million tons of ore remain to be exploited. In the twenty-first century, the boomtown of Broken Hill was a popular tourist destination. The former Rasp mansion, situated on acres of botanical gardens, was sold in 2006 for $6.4 million, the most expensive residential property ever sold in South Australia.

Sumner Redstone

American media and entertainment magnate

Redstone used his intelligence, drive, and unshakable resolve to become one of the richest men in the entertainment industry. He has allocated much of his wealth to philanthropic efforts for children, medical institutions, and other causes.

Born: May 27, 1923; Boston, Massachusetts
Also known as: Sumner Murray Redstone; Sumner Murray Rothstein (birth name)
Sources of wealth: Inheritance; media; entertainment industry; investments
Bequeathal of wealth: Children; relatives; charity

Early Life

Sumner Murray Redstone was born Sumner Murray Rothstein in Boston, Massachusetts, in 1923, the older of the two sons of Max and Belle Rothstein. The family lived in a tenement in the West End section of Boston, where Max had once sold newspapers and later linoleum to support his own family, his parents, and his wife's family.

Redstone attended James A. Garfield Intermediate School and became the top student in his class. He once was eliminated in a spelling bee, and he remembered the devastation of that failure for years. He was admitted to the prestigious Boston Latin School, and for six years he mingled with Boston's best students in an atmosphere of fierce, unrelenting competition. Redstone learned to always work at his highest level and graduated with the highest grade point average in the school's three-hundred-year history.

First Ventures

Redstone's outstanding accomplishments at Boston Latin School guaranteed his acceptance at Harvard University. He entered as Sumner Redstone, as his father officially changed the family name from Rothstein to Redstone. After his graduation from Harvard Law School, he married Phyllis Raphael, began a legal clerkship in San Francisco, and soon became a special assistant to U.S. Attorney General Tom C. Clark; in the latter position, Redstone argued cases involving hundreds of millions of dollars. Redstone's salary climbed to about $100,000 in 1954, but by this time his idealistic belief that he was a lawyer who was making a contribution to society had eroded, and he realized he was actually engaged in business.

He resigned and returned to Boston to work with his father. His father's company, Northeast Theater Corporation, built drive-in theaters for the exhibition of films. Redstone scouted prime locations and established a $50 million line of credit with the Bank of New England for the development of more theaters. Incensed by the fact that larger corporations were offered first choice of films, Redstone and his company, renamed National Amusements, filed a lawsuit in 1958 against eight major film studios, charging them with conspiracy to restrict trade. The case was settled in Redstone's favor before it went to the jury.

In the 1960's, Redstone began converting drive-ins to indoor theaters, and having originated the term "multiplex," he built a circuit of these venues. Redstone was elected chairman of the board of the National Association of Theater Owners, an organization that represented more than 80 percent of film exhibitors in the United States.

Mature Wealth

During the 1970's and 1980's, National Amusements was making money, but Redstone, seeking company growth, invested substantially in film studios, including the Walt Disney Studios and Twentieth Century-Fox. Believing cable television to be a threat to the exhibition of films, he set his sights on acquiring Viacom International, a company with holdings that included the Showtime cable television network; The Movie Channel; MTV (Music Video Television) Networks; five television stations, eight radio stations, eighteen cable television stations in seven states; Viacom Productions; Viacom Enterprises; and Viacom Worldwide. Owning 18.6 percent of Viacom, Redstone in 1987 initiated a six-month-long hostile takeover of this company. Three times he raised the amount of his initial bid, finally paying $3.4 billion to buy Viacom, an amount deemed excessive by almost all involved in the deal.

In 1989, despite lucrative returns from MTV and the syndication of *The Cosby Show*, Redstone alleged that HBO (Home Box Office), a cable pay-television network, was intimidating cable operators and Hollywood studios to obtain preferential treatment over his competing cable pay-television network, Showtime. At the time, Time Warner controlled 65 percent of the pay-television market. After warning Time Warner of his intentions, and against the advice of his colleagues, Redstone filed a $2.4 billion suit against Time Warner, alleging that the company had conspired to monopolize the pay-television business in the United States. After the litigation dragged on for years, Time Warner capitulated, and the lawsuit was settled in Redstone's favor.

By 1993, Redstone's empire was thriving, and Viacom was worth $5.5 billion. However, Redstone was determined to buy Paramount Pictures, which would complete his dream to create the number-one software-driven media company in the world. Paramount's parent company, Paramount Communications, owned Paramount's motion-picture and television production operations; a library of 890 films; five Paramount theme parks; more than one thousand film screens; Famous Music, a publisher that owned the copyrights to the music featured in many films; book publishers Simon & Schuster, Prentice-Hall, Macmillan, Scribner, and Pocket Books; Madison Square Garden; the New York Rangers and New York Knicks sports teams; cable's MSG (Madison Square Garden) Network; and seven television networks in the United States—in addition to being the co-owner of USA Networks.

Following endless negotiations with unreliable bidders, Redstone, who had been forced to raise his initial purchase price, announced Viacom's acquisition of Paramount. However, a few days later, in an attempt to break up the deal, Barry Diller, one of the owners of the QVC cable shopping network, countered with an offer of $2 billion more than Redstone's and said his offer had been accepted by Viacom before Redstone had announced his acquisition. Meanwhile, Tele-Communications, Inc. (TCI), a cable television provider, had refused to provide access to Redstone's Showtime networks, and Redstone filed a lawsuit accusing TCI of monopoly that was settled by the U.S. Justice Department. As Redstone was attempting to purchase Blockbuster Entertainment Corporation, a chain of video stores, in order to finance the acquisition of Paramount, Diller and QVC filed a lawsuit to challenge the methods by which Redstone sought to obtain Paramount. Diller eventually won the case. However, Redstone persevered, and while fending off both Diller and H. Wayne Huizenga, the owner of Blockbuster, he finally acquired both Paramount and Blockbuster.

Redstone spent a great deal of his time at Paramount making sure that all of the corporation's divisions functioned smoothly. He replaced the chief executive officer of Simon & Schuster and sold Madison Square Garden for more than $1 billion. He traveled to Europe to negotiate Paramount licensing agreements in Germany for $2 billion and later transacted a deal in France. In 1997, Blockbuster was experiencing a financial crisis that required Redstone's personal intervention. He installed a new chief executive officer, who devised a revenue-

Sumner M. Redstone Charitable Foundation

A burn victim and a survivor of the Boston Copley Plaza Hotel fire in 1979, Sumner Redstone has been a generous contributor to medical causes. About a year after the fire, he donated several million dollars to the Massachusetts General Hospital Burn Center, the facility at which he was treated after the hotel fire; Redstone had received this sum in the lawsuit he had filed against the Copley Plaza. Redstone had previously founded the Sumner M. Redstone Burn Center at the hospital in 1974. In 2007, he agreed to provide $35 million to enable the hospital to establish the Sumner M. Redstone Burn and Trauma Service and the Sumner M. Redstone Emergency Department, which is dedicated to streamlining emergency care.

In 2007, Redstone donated another $35 million to expand The Research Acceleration and Innovation Network (TRAIN), a program operated by FasterCures, a Washington, D.C.-based group that seeks to coordinate the efforts of more than twenty nonprofit disease research organizations. TRAIN works to cure such diseases as breast, prostate, and brain cancer; the human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS); Alzheimer's disease; diabetes; and Parkinson's disease. Redstone's grant enabled TRAIN to work with additional disease research organizations and to improve the implementation of research practices. In honor of its benefactor, the organization was renamed The Redstone Acceleration and Innovation Network (also abbreviated as TRAIN).

Also in 2007, the Sumner M. Redstone Charitable Foundation acknowledged the diagnostic and treatment abilities of Cedars-Sinai Prostate Center in Los Angeles with a $35 million cash contribution to support a six-year National Prostate Cancer Study aimed at developing new treatments for cancer patients. Specifically, Redstone's gift allowed the center to expand its laboratory research and clinical trials.

Redstone's charitable foundation in 2007 provided a $500,000 grant to the Cambodian Children's Fund, a nonprofit organization that seeks to provide health and educational services to children in Phnom Penh, Cambodia. Redstone's grant will be used to construct the Sumner M. Redstone Child Rescue Center, an independent facility that will house one hundred of Phnom Penh's most impoverished and abused children from the ages of five to sixteen. Redstone also announced plans to build a large child development center in Cambodia.

Additional recipients of contributions from Redstone and the Sumner M. Redstone Charitable Foundation include the American Cancer Society, Boston Museum of Fine Arts, Dana-Farber Cancer Institute, Combined Jewish Philanthropies of Greater Boston, Will Rogers Memorial Fund, and Children's Cancer Research Foundation.

sharing plan that Redstone implemented, and this plan eventually restored Blockbuster's economic stability.

In 1997, after the Federal Communications Commission adopted new regulations that allowed one company to own no more than two television stations, executives at CBS (Columbia Broadcasting System) Corporation made an overture to Redstone about a possible merger of CBS and Viacom. Redstone agreed, provided he could control the merged company and Mel Karmazin, CBS's president and chief executive officer, could assume the position of chief operating officer. In 2000, Viacom purchased CBS for $37.3 billion; in 2005, the two corporations were split into separate companies, with Redstone remaining chair of both firms.

By 2005, Viacom's holdings had been substantially reduced, with the company consisting of MTV Networks, BET Networks, and Paramount Pictures; in that same year, Paramount Pictures purchased DreamWorks SKG, a film studio, for $1.6 billion. In 2006, Redstone stepped down from chief executive officer positions at Viacom and CBS, naming Les Moonves the chief executive officer of CBS and Tom Freston as chief executive officer of Viacom; Freston was subsequently replaced by Redstone's longtime associate Philippe Dauman.

In 2007, *Forbes* magazine estimated Redstone's net worth at $8 billion, ranking him eighty-sixth on the magazine's list of the world's richest billionaires. In 2009, *Forbes* estimated that his wealth had shrunk to about $2 billion, but the following year the magazine listed his net worth as increasing to $2.4 billion. Although Redstone's two marriages ended in divorce, his daughter, Shari Redstone, one of two children from his first marriage, has assumed many leadership positions in her father's company and is in line to succeed him when he retires. Redstone has secured all of his stock in irrevocable trusts designated for his grandchildren.

Legacy

The accomplishments of Sumner Redstone in his rise from a child of poor, hardworking Jewish Americans to the head of one of the world's largest media empires are testaments to his strength of character. Certainly, his success can be attributed to his close relationships with his uneducated, but smart, ambitious father and with his mother, who always demanded his best efforts. Redstone also had an excellent education and an intelligence that enabled him to navigate the business world, while avoiding many of its pitfalls. However, Redstone's most outstanding attributes are his gritty determination and strength of will. From the fierce competition of his early schooling to the later tenacity with which he clung to the ledge of a third-story window at a burning hotel, when his own body was more than half burned, Redstone has exhibited an unshakeable resolve. His formidable business maneuvers, his notoriously litigious inclinations to protect his property, and his refusal to be intimidated by anyone, all signify an individual whose unwillingness to give up is his greatest legacy.

Cecil Rhodes

British mining magnate, landowner, and politician

Rhodes gained control of vast deposits of diamonds and gold and acquired huge tracts of land throughout southern Africa, from which he developed a sizable fortune. He used his wealth to establish the Rhodes Trust, through which the Rhodes Scholarship is administered.

Born: July 5, 1853; Bishop's Stortford, Hertfordshire, England
Died: March 26, 1902; Muizenberg, Cape Colony (now in South Africa)
Also known as: Cecil John Rhodes
Sources of wealth: Mining; real estate
Bequeathal of wealth: Relatives; friends; scholarship

Early Life

Cecil John Rhodes (rohdz) was born to a country cleric, Francis Rhodes, and his second wife, Louisa Peacock Rhodes, and was part of a family of nine children raised in Bishop's Stortford, Hertfordshire, England. He attended the local grammar school and seemed to have a normal middle-class Victorian upbringing. Rhodes was described as a "delicate" child. When he was seventeen, he was sent to his brother Herbert's two-hundred-acre cotton farm in Natal in southern Africa in the belief that the climate would be good for him. Up to this point in his life, Cecil had not demonstrated any hints of the relentless ambition and drive that would characterize his later career.

First Ventures

Herbert had mismanaged his farm, and Cecil was left to take care of the farm while Herbert went into the interior of Africa in search of diamonds. Cecil began expanding the area under cultivation and applied scientific methods to produce cotton. In October, 1871, Cecil left the cotton farm and traveled some four hundred miles into the interior to the sites of significant diamond finds. Tens of thousands of fortune hunters had already congregated there.

Herbert and Cecil's brother Frank worked the diamond claims, and Cecil formed lifelong associations with Charles Dunell Rudd and John X. Merriman. Cecil was already demonstrating a solid work ethic and entrepreneurial spirit as he became involved in making ice, supplying and pumping water, and purchasing shares in a railway. After suffering and recovering from what is usually described as a "heart attack" in 1872, Cecil traveled with Herbert for eight months farther north into remote parts of Africa. Cecil returned to England in 1873 because of his mother's ill health and to enroll in Oriel College, Oxford. He would later return to England to continue his education between 1876 and 1878.

Mature Wealth

By his early twenties, Cecil Rhodes had accumulated wealth by virtue of his hard work in the diamond fields. As he matured he would increase that wealth through business deals, partnerships, fortuitous circumstances, and ruthlessness. Shortly before Rhodes left for England in 1873, an economic depression hit the mines. A combination of local natural disasters, the crash of Austria's stock market, and the exhaustion of easily accessible diamonds in the "yellow soil" forced many miners to sell their claims cheaply. Rhodes and his brothers bought claims and worked deeper into the hard "blue soil," which actually contained more diamonds. Diamond mining became a large-scale enterprise as more miners sold out, regulations limiting the number of claims held by any one group were abrogated, and blacks were barred from holding claims.

While at Oxford in June, 1877, Rhodes drafted his "Confession of Faith" in which he speculated about the creation of a secret society through which the British Empire might expand and incorporate the "uncivilized world" under British rule. This confession, along with a last will and testament modified several times, became the basis for the famous Rhodes Scholarship program.

In April, 1880, one of the most significant developments in Rhodes's career occurred when he, Rudd, and several other claim holders created the De Beers Mining Company, Ltd. Additional partners joined the firm the following year, and the company's capital was increased. This company eventually supplied 90 percent of the world's diamonds, becoming one of the world's most successful monopolies. In 1881, Rhodes was elected to the Cape Colony Parliament, the beginning of a political career that he used to protect and advance his finances, especially through his support of the Diamond Trade Act, which was designed to curb diamond smuggling and control black laborers.

The next phase of Rhodes's life focused on gaining control of territory north of the Orange Free State and the Transvaal in order to secure a steady supply of black labor and additional sources of diamonds and gold. By 1885, Rhodes's efforts, backed by the British government fearful of expansion by Germany and the Transvaal state, added the Bechuanaland Protectorate (now Botswana) to the British Empire. Rhodes continued to conduct his diamond mining business, but he had stiff competition, notably from a Jewish man from London, Barney Barnato, who had large holdings in the Kimberley Diamond Mines and whose wealth eclipsed that of

Rhodes several times over. In 1887, the two men would battle for control of the diamond industry.

In 1886, news that the largest gold deposit in the world was discovered in Witwatersrand alerted Rhodes to another source of potential wealth. However, he attained only modest profit from this goldfield because he was cautious in pursuing claims, was distracted by his male secretary's ill health, and had difficulty managing both his diamond mines and his goldfields. He did establish the Gold Fields Company of South Africa.

In March, 1888, a new company, De Beers Consolidated Mines, Ltd., was created with Barnato as its governor and largest shareholder. Rhodes was given the tools with which to build an empire: control of transportation networks and the ability to raise troops and acquire additional territory. Other competitors in the diamond business were absorbed into the new company. In 1888, Rhodes's agent George Rudd negotiated a treaty, the Rudd Concession, with Lobengula, chief of the Matabele people, which gave Rhodes control over massive tracts of land that would later be known as Northern Rhodesia (now Zambia) and Southern Rhodesia (now Zimbabwe) in return for a payment of £100 a month, one thousand rifles with ammunition, and a steamboat on the Zambesi River. A small military force sent by Rhodes in 1890 took control of Fort Salisbury (now Harare, Zimbabwe), and in 1893, the Matabele people were brutally suppressed.

Rhodes served as prime minister of Cape Colony from 1890 to 1896, and he purchased Groote Schuur as his residence in 1891. Groote Schuur served as the official residence of leaders of the Cape Colony, Union of South Africa, and the Republic of South Africa until South African president Nelson Mandela refused to use the home. As prime minister, Rhodes saw no conflict of interest in using his position to propose and support legislation that would benefit his businesses and personal finances. He sponsored agricultural projects, banking reform, improvements to education, and the Glen Grey Act (1894), which regulated relations between blacks and whites, limited the size of black landholding and rights of inheritance, and instituted a "labor tax" to try to force blacks to work for whites. Rhodes's political career

Rhodes Scholarships

Although Cecil Rhodes did not engage in scholarly activity or athletics or make important connections while at Oriel College, Oxford, he included such requirements for the students selected as Rhodes Scholars. The Rhodes Scholarship program was deeply rooted in his belief that an elite group of English-speaking people should be educated in order to perpetuate and run the British Empire.

The provisions for the scholarship program were set forth and modified throughout the seven wills Rhodes executed. Scholarships were to be awarded to fourteen "constituencies" from within the British Empire, the United States, and the German empire. Of the original fifty-two scholarships, the United States was allocated thirty-two, and that number has remained unchanged. Germany was to have five scholars selected by the kaiser, and the remaining recipients were to be chosen from "colonies" within the British Empire. Since Rhodes's death, forty more scholarships have been added. Scholarships are normally granted for two or three years, depending upon the degree program pursued by the recipient.

The original criteria for selecting scholars were success in "literary and scholastic" achievements; participation in sports; qualities of honesty, courage, duty, concern for the underprivileged, and selflessness; and characteristics of morality and leadership. Over the years, more than seven thousand scholars have been selected. Women were included in the program in 1977. German scholars were excluded during the two world wars and immediate postwar periods, and Hong Kong was barred from 1997 through 2006.

The first trustees' meeting was held on May 5, 1902. George Parker of Canada, the group's organizing secretary, essentially established the program by determining selection criteria and arranging for colleges to enroll Rhodes Scholars. In the early years, trustees disagreed about candidates' race and religion, the problems created when candidates moved to another country in order to be selected, finding qualified candidates in some constituencies, the weight to be given athletics as a scholarship criterion, and candidates' lack of preparation in Greek and Latin. For the most part, these disagreements were resolved.

Perhaps the most thoroughgoing change in the program was the creation of the Mandela-Rhodes Foundation linking Nelson Mandela, the first black president of South Africa, with the Rhodes Foundation in order to allocate funds from the Rhodes Trust for the education of South African students. The new foundation, created in 2001, also sought to facilitate the process of racial reconciliation in postapartheid South Africa.

In February, 2003, a celebration was held in Cape Town, South Africa, to mark the one-hundredth anniversary of the program. The attendees included Mandela, former U.S. President and Rhodes Scholar Bill Clinton, and British prime minister Tony Blair.

ended with his sponsorship of the Jameson Raid (1895-1896), an attempt to overthrow the Transvaal government of Paul Kruger. The raid's failure forced his resignation. Rhodes died in 1902, during the last year of the Boer War (1899-1902). His estate was worth about £5 million.

Legacy

Rhodes's entrepreneurial activities and political machinations helped develop areas of southern Africa that would later become the the Republic of South Africa, Botswana, Zimbabwe, and Zambia. He was an ardent supporter of British imperialism. The diamond and gold deposits that he and others developed and exploited continued to form the backbone of South Africa's economy into the twenty-first century. His labor policies at the mines, reinforced by laws such as the Glen Grey Act, helped establish racial segregation and discrimination before apartheid became South Africa's official policy.

Aside from a few personal bequests to relatives and staff, the bulk of Rhodes's wealth was used to establish the Rhodes Scholarship program, which in the twenty-first century remained one of the most prestigious scholarships, attracting well-qualified students from numerous countries.

Sid W. Richardson

American oil magnate and businessman

Richardson was one of a handful of powerful and influential Texas businessmen of the first half of the twentieth century who served as prototypes for an icon of popular culture, the Texas oil or cattle baron, as represented by Bick Benedict in Edna Ferber's novel Giant *and J. R. Ewing in the television series* Dallas.

Born: May 25, 1891; Athens, Texas
Died: September 30, 1959; St. Joseph Island, off the coast of Rockport, Texas
Also known as: Sid Williams Richardson; Bachelor Billionaire
Sources of wealth: Oil; ranching
Bequeathal of wealth: Relatives; friends; charity

Early Life

Sid Williams Richardson was born in the small east Texas town of Athens in 1891, the son of Nancy and John Isidore Richardson. His skill in business was made manifest early in his life. While still a high school student in Athens, he managed to earn almost $4,000, a large sum for this time, by buying and trading cattle. He tried to obtain a higher education, first at Baylor University and then at Simmons College, but he spent little more than three semesters in college, and he never obtained a degree.

First Ventures

After dropping out of college, Richardson took a number of jobs involving the oil trade. He was a scout for oil properties, a buyer of leases for oil companies, and a salesman for a company that manufactured and sold equipment for oil wells. By 1919, he had established his own oil company in Fort Worth, Texas, in partnership with a lifelong business associate and friend, Clint Murchison, Sr. The Richardson-Murchison partnership prospered in the early 1920's, garnering the two more than $1 million, but this fortune was soon dissipated during subsequent downturns in the oil market in the later years of the decade.

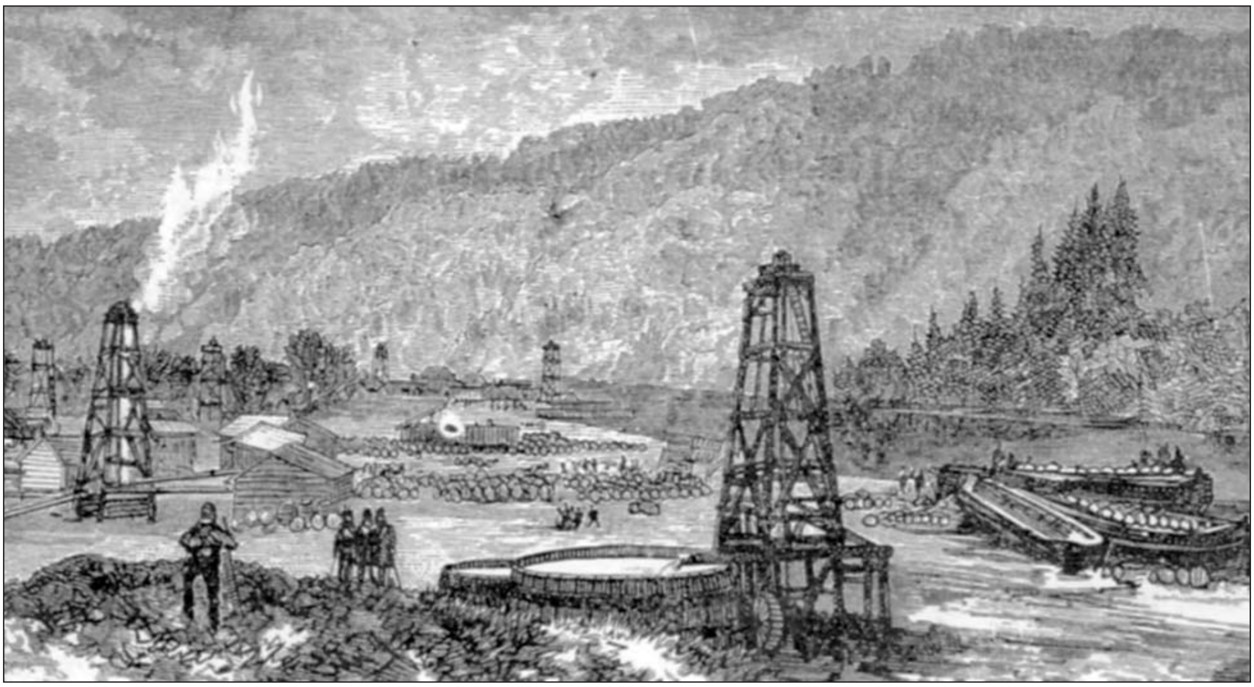
Richardson worked primarily as a wildcatter, a combination oil-field scout and land speculator, traveling around Texas buying up land that might contain petroleum reserves. His canniness as a wildcatter was proven and his fortune assured in the mid-1930's, when, with the assistance of Murchison and other financial supporters, he was able to lay claim to the Keystone oil field near Wink in West Texas, which turned out to be one of the most productive fields in the state, eventually yielding more than 100 million barrels of oil. By the early 1940's, Richardson was operating more than a hundred wells in various counties in West Texas.

Mature Wealth

After his success with the Keystone oil field venture, Richardson's fortunes never again ebbed, as he began to assemble a vast network of businesses. Fort Worth would remain his base of operations throughout his life, and two of his most important corporations had their headquarters there: Sid W. Richardson, Inc., and Richardson and Bass, Oil Producers, in which he had gone into partnership with his nephew, Perry Richardson Bass. Nevertheless, he maintained diverse enterprises in other parts of the state. For example, in southeast Texas he owned a refining company in Texas City, and in West Texas he set up the Sid Richardson Carbon Company in Odessa and the Sid Richardson Gasoline Company in Kermit.

In addition to his petroleum-related enterprises, he maintained several ranches in Texas and Oklahoma on which he raised quarter horses and, in a reflection of his first success as a teenaged entrepreneur, Santa Gertrudis cattle. However, Richardson's business and personal interests included much more than petroleum products and ranch animals. For example, with his partner Murchison and another Texas millionaire, Robert Ralph Young, he bought the New York Central Railroad in 1954. The three men spent approximately $20 million buying up almost 900,000 shares of the railway system. Another business venture that was unrelated to cattle and oil was the Texas State Network, one of the earliest television companies in the Lone Star State.

During World War II, Richardson began to take a serious interest in art, especially art depicting Texas and life in the American Southwest. Among the artists who he felt best provided iconic images of both the romance and



Early oil wells in Pennsylvania, where Edwin Drake drilled an oil well in 1859. Other American entrepreneurs would follow in his footsteps, creating a boom in commercial oil drilling. (C. A. Nichols & Company)

Great Wealth and Oil

The ancient Chinese and the medieval Persians mined oil, and oil was used in lamps as far back as the sixteenth century in parts of Persia and Eastern Europe. However, dealers in petroleum products began to achieve great riches only in the latter half of the nineteenth century. In fact, one of the founding fathers of the oil industry, the Canadian physician Abraham Pineo Gesner, who discovered how to refine kerosene from oil in 1849, at one time had to open his laboratory to the public as a museum in order to pay his bills.

The first petroleum entrepreneur in the United States, Edwin Drake of Pennsylvania, drilled the nation's first oil well. However, Drake neither patented his drilling innovations nor invested wisely, and he ended up living on a state pension. The first true oil magnate was the Pole, Ignacy Łukasiewicz, who drilled the first oil well in Europe in 1854 near the town of Bóbrka in Galicia (now in Ukraine). He was in many ways the prototype for the later oil barons of North America. His well and refineries earned him a vast fortune, much of which he spent on philanthropic projects, such as public spas, churches, and democratic political organizations. After Michael A. Dietz invented a kerosene-fueled lamp in 1857, the need for oil skyrocketed, and oil speculators profited across North America, especially in Pennsylvania and California. The demand for oil declined after Thomas Edison invented the lightbulb in 1878, and oil profits ebbed drastically.

However, after Carl Benz and Gottlieb Daimler independently conceived and manufactured the first automobiles in the last decades of the nineteenth century, oil and oil products soon became a source of great wealth. Beginning at this time, significant oil fields were discovered in various parts of the United States, especially in Texas. In this state the most successful and colorful wildcatters, such as Sid W. Richardson and H. L. Hunt, rose to prominence. Despite their excesses and foibles, these men were reminiscent of Łukasiewicz; their philanthropy and community involvement accompanied their vast petroleum wealth.

However, wealth derived from oil does not always yield benevolent outcomes for the societies in which oil magnates operate. When oil was discovered in Persian Gulf nations in the early twentieth century, most of the money went into the coffers of the kings and princes who owned the lands on which the oil was found, not into the hands of upstart entrepreneurs like Łukasiewicz and Richardson. The Persian Gulf autocrats tended to spend their money on themselves, often squirreling it away in bank accounts in other countries. As financial commentator Michael Moynihan stated about petroleum-fueled prosperity on a national level, "Oil wealth always tends to contain the seeds of its own destruction," citing, among other examples, Russia and Iran. In these nations, the millions of dollars obtained from oil seem to have done little to improve the lives of the citizens. Instead, petroleum-related wealth has furthered political corruption and detracted attention from other formerly prosperous economic ventures.

reality of the Old West were Frederic Remington, Charles Russell, and Frank Tenney Johnson. Throughout the 1940's, Bertram Newhouse, a prominent New York gallery owner, helped Richardson acquire a large collection of the works of these and similar painters. After Richardson's death, his collection was eventually housed in the Sid Richardson Museum in the Historic Sundance Square area in Fort Worth, where it draws some fifty thousand visitors a year.

In 1947, Richardson set up the Sid W. Richardson Foundation, which issues substantial grants annually to Texas applicants in the fields of education, medicine, the arts, and human services.

Although Richardson never formally entered political life, like many wealthy people he nevertheless had an effect on government. A Democrat, he was a friend of President Franklin D. Roosevelt and served as an unofficial adviser to him in matters pertaining to the petroleum industry throughout World War II. He was also a friend of President Dwight D. Eisenhower and may have been responsible for Eisenhower's appointing a friend of Richardson, another oilman, Robert B. Anderson, as secretary of the Navy, a position that later led to his becoming secretary of the Treasury. Richardson was also friendly with Sam Rayburn, the Speaker of the House of Representatives; President Lyndon B. Johnson; and J. Edgar Hoover, director of the Federal Bureau of Investigation (FBI). Hoover regularly visited Richardson and his business partner Murchison in Fort Worth.

Richardson's immense wealth allowed him to indulge in an iconic act of luxury. In 1936, he purchased his own island, St. Joseph Island (also called San Jose), off the coast of the Texas seaport town of Rockport. Although Fort Worth remained the base of much of his professional life, Richardson lived on St. Joseph for the rest of his life, dying in his home there of heart failure in 1959. At the time of his death, his wealth was estimated at around $800 million.

Legacy

Sid W. Richardson's legacy is manifold. As a businessman, he did much to further the development of the petroleum industry in the United States, in the process enriching his own coffers immensely and earning himself the nickname Bachelor Billionaire. As a philanthropist, his contributions to educational and cultural organizations were frequent and generous. Within his home state, buildings on at least five college campuses bear his name in remembrance of the donations and funding he provided—the University of Texas; Rice, Baylor, and Texas Christian Universities; and Austin College. On a folkloric level, Richardson provides an avatar of an archetypal Texan character—the wildcatter who through sheer pluck and determination rises from humble, small-town origins to become a millionaire many times over.

Abby Aldrich Rockefeller

American art collector, museum founder, and philanthropist

Rockefeller was a major collector of French and American art who cofounded and donated some of her collection to the Museum of Modern Art. She also initiated a unique collection of American folk art that would later be housed in the Abby Aldrich Rockefeller Folk Art Museum in Williamsburg, Virginia.

Born: October 26, 1874; Providence, Rhode Island
Died: April 5, 1948; New York, New York
Also known as: Abby Greene Aldrich (birth name)
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Relatives; museum; artistic patronage

Early Life

Abby Greene Aldrich Rockefeller (RAW-keh-fehl-luhr) was born in Providence, Rhode Island, the third of eight children of Nelson Wilmarth Aldrich, a businessman who later became a U.S. senator, and Abby Chapman Aldrich. She was educated by a private teacher at home and then attended Miss Abbott's School in Providence, graduating in 1893. As a debutante, she traveled frequently in the United States and Europe, often accompanying her father, who stimulated her interests in art collecting and public affairs.

Abby Greene Aldrich was married to John D. Rockefeller, Jr., son of John D. Rockefeller, the founder of

Standard Oil Company, on October 9, 1901, following a long courtship that began when the younger Rockefeller was an undergraduate at Brown University. This marriage of two vastly different personalities was a successful union of his reserved personality and her more engaging and impulsive temperament. They had six children, and all whom were involved in the family's philanthropic activities.

First Ventures

As the daughter-in-law of John D. Rockefeller, Sr., and wife of his only son and heir, Abby Rockefeller learned the significance of the family's charities, especially after her husband decided to focus his life on philanthropy instead of being an executive at Standard Oil, the company that was the major source of the Rockefellers' wealth. She was an active participant in the Young Women's Christian Association (YWCA), and she founded the Good Fellowship Council, a neighborhood association that included representatives from many of the immigrant and minority groups on New York City's East Side.

Mature Wealth

As her children grew older, much of the Rockefeller fortune was directed to philanthropies that were often the initiatives of others, such as Rockefeller aides Abraham Flexner, Simon Flexner, and Frederick T. Gates. This enormous wealth impacted Abby Rockefeller's life. Along with the management of several homes, including a nine-story house on Fifty-fourth Street in New York City (later the first permanent home of the Museum of Modern Art) and estates in Pocantico Hills, New York, and Seal Harbor, Maine, Rockefeller was involved in several social welfare causes, including the Girl Scouts and the American Red Cross. She planned and organized a model home and community center project for Standard Oil employees in Bayway, New Jersey, site of the company's headquarters; helped to build and furnish International House, a dormitory and social center for American and foreign students near Columbia University; and encouraged the housing and community service efforts of the YWCA during World War I. During World War II, with four

Museum of Modern Art

The Museum of Modern Art (MOMA) in New York City was very likely the result of John D. Rockefeller, Jr.'s, discomfort with modern art. Sensitive to this aspect of her husband's character, Abby Aldrich Rockefeller commissioned architect Donald Desk to create a private gallery on the seventh floor of her Fifty-fourth Street mansion, where she was able to arrange continually changing exhibitions that enabled family and friends to view modern art, many for the first time. From this small gallery, Rockefeller decided to make her collection available to the public.

In May,1929, she met with two progressive and influential patrons of the arts, Lillie P. Bliss and Mary Quinn Sullivan, to explore the possibility of establishing an institution devoted exclusively to modern art that would also challenge the conservative policies of traditional museums. MOMA opened in 1929. Conger Goodyear was the first president, and Albert H. Barr, Jr., was the first director, but Rockefeller remained the catalyst for the museum.

The museum initially displayed works from both American and European artists, with an emphasis on drawings, prints, and watercolors. By 1940, Rockefeller had given most of her private collection to MOMA, including works by American artists Peter Blume, Preston Dickinson, Walt Kuhn, and Charles Sheeler and by such European artists as Pablo Picasso, Aimed Modigliani, and Henri Matisse. The public's response was quite enthusiastic. Over the next ten years, MOMA moved three times into progressively larger temporary quarters, and in 1939 finally opened the doors of the building it continues to occupy in midtown Manhattan, the gift of John D. Rockefeller, Jr. Subsequent expansions by the architect Philip Johnson took place during the 1950's and 1960's. (Johnson also designed the Abby Aldrich Rockefeller Garden in Seal Harbor, Maine.) In 1984, a major renovation designed by architect Cesar Pelli doubled the museum's gallery space and enhanced visitor facilities.

The rich and varied collection of the museum provides one of the most comprehensive and panoramic views of modern art and includes more than 150,000 paintings, sculptures, drawings, prints, photographs, architectural models and drawings, design objects, approximately twenty-two thousand films, and four million film stills. In 2004, MOMA completed the largest and most ambitious building project in its history, nearly doubling its space for exhibitions and programs with 630,000 square feet of new and redesigned space. As the result of this project, the Peggy and David Rockefeller Building housed the main exhibition galleries. The Lewis B. and Dorothy Cullman Education and Research Building provided more than five times more space for classrooms, auditoriums, teacher training workshops, and an expanded library and archives. It is considered one of the premier research facilities of its kind in the world, with more than 300,000 books, periodicals, and extensive individual files on more than seventy thousand artists. These two buildings frame the enlarged Abby Aldrich Rockefeller Sculpture Garden.

sons either on active duty or in government work, Rockefeller entertained servicemen, helped the United Service Organizations (USO), and worked with planners of veterans' rehabilitation centers.

Her most important philanthropic contribution grew out of her fascination with art. Her personal art collection, composed primarily of drawings and watercolors and purchased almost entirely with her own funds, initially consisted of works of European and Chinese art. After 1920, she began collecting work by American artists. This interest eventually led to Rockefeller's most demanding project: the founding of the Museum of Modern Art (MOMA) with art collectors Lillie P. Bliss and Mary Quinn Sullivan. The idea to create a new museum was first proposed during a luncheon meeting of the three women in May, 1929, when they decided to appoint a committee to raise the necessary funds and recruit museum staff. As the moving spirit behind the creation of this now internationally recognized art museum, Rockefeller is considered one of a small number of founders in the field of museum patronage, and her activities helped stimulate investment in the works of living artists. In her efforts to develop MOMA, Rockefeller served as its treasurer, first vice president, and vice chairman of the board, and she donated more than 2,000 art objects from her personal collection to the museum, including some 190 paintings and 1,600 prints.

She also donated a good part of her art collection to colleges throughout the East in order to educate future patrons. With her son Nelson A. Rockefeller, she established an unrestricted purchase fund for MOMA, deliberately remaining neutral in acquisition decisions so she would not impose her personal tastes in art on the museum staff. During the Depression, she commissioned works by American artists, such as Charles Sheeler and Ben Shahn. With her husband, she was involved in the restoration of colonial Williamsburg, Virginia, where in 1935 she initiated an American folk art collection. Her collection, which included favorite paintings, carved animals, and dolls, later was exhibited at the Abby Aldrich Rockefeller Folk Art Museum in Williamsburg.

Mrs. Rockefeller died in New York City at the age of seventy-three. She was cremated and her ashes were buried in the family plot at Sleepy Hollow Cemetery, Tarrytown, New York. Her estate, including her art collection, was appraised at $1,156, 296. Although she had already given most of her art collection and the bulk of her assets to MOMA, she bequeathed four major works (two by Georges Seurat and two by Vincent van Gogh) to MOMA for fifty years, after which the Seurats would go to the Art Institute of Chicago and the van Goghs would remain at MOMA. Her Oriental miniatures were donated to the Fogg Art Museum at Harvard University. Rockefeller's entire residuary estate of $850,848, minus estate taxes of approximately $150,000, was given to MOMA.

In the 1950's, Rockefeller's son Nelson, who was involved in MOMA from the earliest meetings of the planning committee, was the museum's president. Her husband John D. Rockefeller, Jr., in 1952 gave forty thousand shares of stock in the International Basic Economy Corporation, then worth $4 million, to MOMA's endowment fund. John also financed construction of the Abby Aldrich Rockefeller Folk Art Museum.

Legacy

Abby Aldrich Rockefeller combined her love of art with philanthropy and a strong family life. In her philanthropic work, she engaged in actual contact with those she helped, providing a human element in her projects. The organizations and charities she sponsored or created, especially the Museum of Modern Art and the folk art collection in Williamsburg that bears her name, are her best-known legacies. They are a testament to her incredible generosity, which could not have been possible without the Rockefeller fortune that subsidized it.

Rockefeller's sense of mission was intensified by the fact that she was not born into the Rockefeller fortune, so she was more aware of its power, as well as the problems outsiders had in adjusting to it. Her marriage to John D. Rockefeller, Jr., helped perpetuate the Rockefeller social and political dynasty into the twenty-first century.

David Rockefeller

American banker, economist, and statesman

Rockefeller inherited much of his wealth from his father, John D. Rockefeller, Jr. His own work at the Chase Manhattan Bank and with world leaders has helped the world's economy.

Born: June 12, 1915; New York, New York
Sources of wealth: Inheritance; investments; real estate
Bequeathal of wealth: Relatives; charity

Early Life

David Rockefeller (RAW-keh-fehl-luhr) was the youngest of six children born to John D. Rockefeller, Jr., and his wife, Abby Aldrich Rockefeller. His grandfather, John D. Rockefeller, was the founder of the Standard Oil Company. David's parents had a large art collection displayed in the house, which stimulated his early interest in art. He and some of his brothers often roller-skated to the Lincoln School, which stressed working in the library to solve problems rather than memorizing facts. The children were given a small allowance, and their father required them to keep a journal of their expenditures and donate money to charities. The family often spent weekends or summer vacations at their estates at Pocantico Hills, New York, and Seal Harbor, Maine. David also enjoyed traveling with the family to the western United States, France, Virginia, and Egypt in the late 1920's.

David Rockefeller graduated from Harvard University with honors in 1936. He then attended the London School of Economics and worked for the Chase National Bank in London. He obtained a Ph.D. in economics from the University of Chicago in 1940.

First Ventures

In 1940, Rockefeller began working as a secretary to Fiorello Henry La Guardia, the mayor of New York City, in order to gain a better understanding of government operations. After a year and a half at this job, he became assistant director of the U.S. Office of Defense, Health, and Welfare Services, serving in this position from 1941 to 1942. When World War II began, he enlisted in the army

Council of the Americas

David Rockefeller founded the Council of the Americas in 1965 and served as its first chairman. The council is an organization of business executives, the majority of whom are from the United States, that promotes free trade and open markets between North America and Latin America. At the time the council was established, the corporations it represented included companies that had contributed about 90 percent of the total U.S. investment in Latin America. This financial clout enabled the council to have significant input on American policy in Latin American countries. The council also contained a cultural arm, the Center for Inter-American Relations (CIAR), which promoted Latin American writers, artists, and musicians.

North American businesses had a difficult time investing in Latin America from the 1960's through the 1980's because Latin American countries had became very hostile to the United States. Some Latin American nations had expropriated American businesses, such as oil companies. In addition, a number of Latin American governments were overthrown and replaced with military dictatorships, which stifled these nations' economies.

In an effort to improve relations between North American companies and Latin America, Rockefeller, on behalf of the Council of the Americas, in 1981 invited representatives from Latin American countries to participate in an advisory council in order to discuss how these nations could manage their large debts and stimulate their economic growth. The council recommended that Latin American countries lower trade barriers, seek foreign investments, and allow their governments to cede control of oil companies and some other businesses.

The Council of the Americas prospered in the 1970's because of the support of the large corporations that were its members. The CIAR, however, had a difficult time raising money because there were few individuals or corporations interested in contributing to the arts. In the 1980's, the CIAR was renamed the Americas Society.

The Council of the Americas has become a driving force in the support of free trade in the Americas. The organization played a key role in negotiations regarding the North American Free Trade Agreement, which was signed by the United States, Canada, and Mexico in the early 1990's. As a result of this agreement, Presidents Bill Clinton and George W. Bush promoted free trade agreements between Latin America and the United States.

as a private. He was sent to officers' candidate school in 1943 and then was stationed in North Africa and France, where he worked in military intelligence. Toward the end of the war, he was assigned to the American embassy in Paris, where he gained valuable experience in working with groups of people in the French government and military.

After World War II, Rockefeller went to work at the Chase National Bank in New York City, becoming the only Rockefeller to become a banker. He worked in the foreign department at Chase, primarily in the Latin American section, focusing on commodities, such as coffee and metals. He kept careful documentation and laid out specific goals just as his father trained him to do when he was a child. Rockefeller worked well with his colleagues, listening to their points of view and providing logical arguments for his opinions. He worked exceedingly hard and eventually became vice president of the section in 1950.

During this time, Rockefeller also worked with his brothers in the family business and on charitable activities. He became chairman of the International House in New York City, an organization that assisted foreign students. The International House was located in a decaying portion of the city, and Rockefeller helped to redevelop the area in the 1950's. He also became chairman of the Rockefeller Institute for Medical Research, devising a plan to expand the institute's research programs.

Mature Wealth

In the 1950's, Rockefeller used his background in economics to take a leading role in the development of Chase National Bank. As vice president of Chase in the 1950's, he helped to expand the bank's international loans to developing world markets, particularly in Latin America and Western Europe. Chase purchased many existing banks in these areas and implemented procedures that conformed with its banking practices; this process also required Chase to reorganize its own operations. In 1955, Chase merged with the Bank of Manhattan to become the Chase Manhattan Bank, which was then the second-largest bank in the world, with billions of dollars in assets. During his years at Chase, Rockefeller continued to evaluate the bank's operations, and he began to change the internal organization of its management. He changed pay scales, fringe benefits, and promotion policies for bank employees.

Rockefeller became vice president of the bank's management board in 1957. He proposed construction of a $100 million, sixty-story building for Chase, made of glass and aluminum, with two million square feet of working space. Many members of the bank's board of directors opposed his plan, especially since many businesses were then beginning to move out of New York City's financial district. The board would allow Rockefeller to build the structure only if he could convince other businesses to stay in the district. In response, Rockefeller organized the Committee on Lower Manhattan, which consisted of many business and banking leaders in the area who were charged with rebuilding a one-square-mile area. This area was the site of the major stock exchanges, many large banks, and the headquarters of large corporations. The building process was slow, but by 1980 more than fifty million square feet of office space was added to this area, including the new Chase Manhattan Bank building, completed in 1961. Rockefeller also convinced Chase's board to purchase $500,000 worth of art for the new building, which was a boon to many artists.

Rockefeller became president of the Chase Manhattan Bank in 1961. The banking industry changed rapidly in the 1960's, and under Rockefeller's leadership, Chase bank was in the forefront of these developments. Chase expanded its moneylending, amassing more than $21 billion worth of loans by the end of the 1960's. Many of these loans were made to growing businesses, such as automobile and textile companies.

In 1969, Rockefeller was made Chase's chief executive officer and chairman of the board. At this time, the bank had branches in ninety countries, and he continued to travel to keep in touch with Chase's worldwide operations. He remained chairman until 1981, and he held about 2 percent of the bank's stock.

Rockefeller's total wealth has been estimated at more than $2 billion. Much of his initial wealth came from trusts that his father had set up for him in 1934. Rockefeller's advisers also invested much of his money in stocks, bonds, and real estate. His salary at the bank in the later years was around $1 million per year, which was a negligible amount compared to his total investments.

Rockefeller volunteered his time to assist numerous organizations and donated a vast amount of money for causes he believed were important. In the 1940's, he began his longtime association with the Council on Foreign Relations, eventually becoming the organization's director. The council studied America's long-range foreign policy and made recommendations on America's relations with other countries. Rockefeller worked on the council's study groups concerning Europe, the North Atlantic Treaty Organization (NATO), and trade policy. He became well acquainted with American presidents, who appointed him to a number of commissions studying economic policy.

Rockefeller also made large donations to the Rockefeller Institute for Medical Research, the Museum of Modern Art, and the University of Chicago, among other institutions. He took over the leadership of the Rockefeller Institute for Medical Research in 1950, focusing on fund-raising and directing the institute's biomedical research. He also obtained a large collection of art, a great deal of which was given to the Museum of Modern Art.

Legacy

David Rockefeller became a world economic leader through his work at the Chase Manhattan Bank, his role in many economic committees, and his personal relationships with many world leaders. In the twenty-first century, he continued to provide money and leadership to organizations he considered important. For example, in 2005 Rockefeller donated $100 million to the Museum of Modern Art, another $100 million to the Rockefeller Institute for Medical Research, and $10 million to Harvard University. He has also willed $225 million to the David Rockefeller Global Dynamic Fund in order to provide financial assistance for a variety of issues, such as world health care, poverty, increasing the dialogue between Muslims and the West, and supporting research on international economics.

John D. Rockefeller

American oil magnate

Rockefeller, the founder of Standard Oil Company, became the world's first billionaire and arguably the richest man who ever lived. He used some of his great wealth to endow many institutions of higher learning and to establish a number of public health institutions.

Born: July 8, 1839; Richford, New York
Died: May 23, 1937; Ormond Beach, Florida
Also known as: John Davison Rockefeller
Source of wealth: Oil
Bequeathal of wealth: Children; charity; educational institution

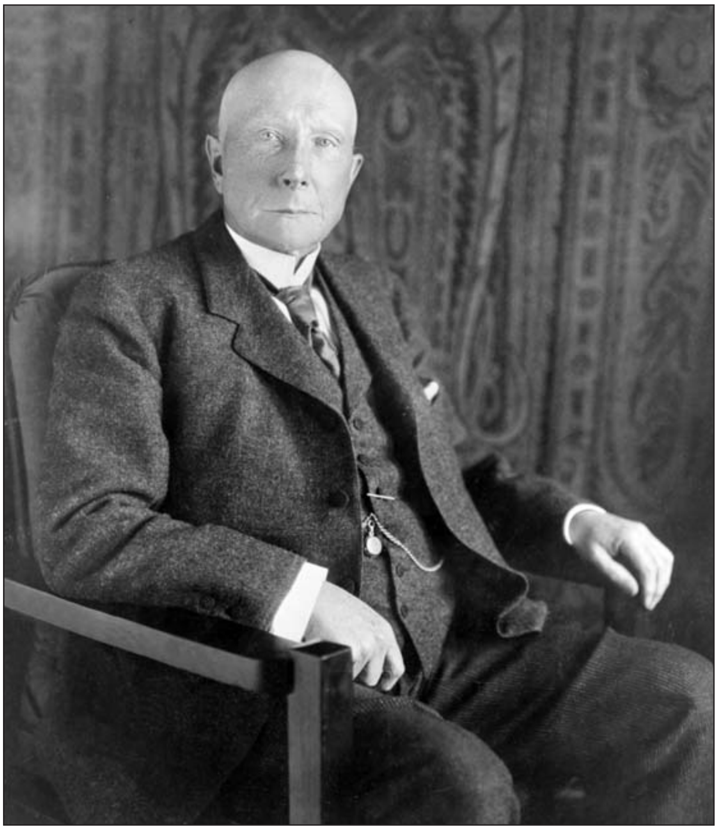
Early Life

John Davison Rockefeller (RAW-keh-fehl-luhr) was the second of six children born to William Avery Rockefeller, Sr., and Eliza Davison Rockefeller. His father was a traveling salesman, who spent much time away from home, leaving the responsibility of raising his family to his wife, who was a devoutly religious Baptist. Eliza instilled strong Baptist principles in John, who was a teetotaler all of his life, using neither tobacco nor alcohol. When he was twelve, John's family moved to Oswego, New York, where the boy attended Oswego Academy. In 1853, the Rockefellers moved to Strongsville, Ohio, near Cleveland.

First Ventures

When he was sixteen, John took a job as an assistant bookkeeper with a small produce commission firm for a salary of less than $20 per month. In 1858, he went into the produce commission business with a partner, M. B. Clark, calling their firm Clark & Rockefeller. The two young men invested their profits in an oil refinery in 1863 in Cleveland's growing industrial area. He married Laura Spelman in 1864. The couple eventually had five children, four daughters and a son. In 1865, Rockefeller bought out Clark and established the firm of Rockefeller & Andrews with Samuel Andrews.

John's brother William built another refinery in Cleveland in 1866 and joined in partnership with John and Andrews. The next year, Henry M. Flagler became a partner in the firm, and the firm's name was changed to Rockefeller, Andrews & Flagler. The partners borrowed



John D. Rockefeller remains the wealthiest person in U.S. history, with a net worth of about $200 billion in 2010 currency. (Library of Congress) heavily and reinvested most of the profits from their firm. By the end of 1867, they owned two refineries and a marketing subsidiary in New York and had become the largest oil refiner in the world. The firm became the predecessor of Standard Oil Company.

Mature Wealth

Rockefeller founded Standard Oil of Ohio in January, 1870. By using questionable business practices, Standard Oil quickly became one of the largest producers of oil and kerosene in the United States. Standard Oil absorbed most of its Cleveland competitors in 1872. During the subsequent decade, Rockefeller and Standard Oil gradually gained almost total control, or nearly 90 percent, of oil refining and marketing in the United States.

Since state legislatures made it nearly impossible to incorporate in one state and operate in another, Rockefeller by this time owned separate corporations in many different states. In 1882, Rockefeller created the Standard Oil Trust, a corporation composed of his oil companies that established a monopoly on oil refining and kerosene products, controlling more than 75 percent of the American market. His business practices in subsequent years attracted the attention of "muckraking" journalists (early investigative reporters), who referred to Standard Oil as "the octopus," denounced the firm's monopolistic practices, and called upon the federal government to disestablish the company. Despite these denunciations, Rockefeller's practices had beneficial effects on the price and availability of oil and kerosene products for the public. Nevertheless, the uproar caused by the muckrakers led to the growth of the antitrust movement in the United States.

Rockefeller demonstrably indulged in unscrupulous business practices, including price-fixing with the railroads, cutthroat pricing practices, industrial espionage on a large scale, and bribing state and federal political officials. Rockefeller and his company spent decades avoiding prosecutors until President Theodore Roosevelt and his trustbusters at last cornered him. One of the most effective of the muckrakers was journalist Ida Tarbell. The publication of her book *The History of the Standard Oil Company* in 1904 was instrumental in the pursuit of Rockefeller's company by the trustbusters.

The Rockefeller Foundation

John D. Rockefeller in 1909 donated seventy-three thousand shares of stock in Standard Oil of New Jersey to the first three trustees of what later became the Rockefeller Foundation. These shares were worth about $50 million at the time (nearly $2.5 billion in 2010 dollars), and they were to be the first payment of a projected $100 million endowment. Governor William Sulzer of New York approved the state charter for the foundation in May, 1913, with John D. Rockefeller, Jr., serving as the first president.

In December, 1913, the foundation made its first grant of $100,000 to the American Red Cross, enabling the Red Cross to purchase property for a headquarters in Washington, D.C. For the first decade of its existence, the foundation focused entirely on public health, medical education, and the sciences. During its first year of operation, the foundation established the International Health Commission, which funded field research on malaria, yellow fever, and hookworm. The commission also supported the Bureau of Social Hygiene's research and education on birth control, sex education, and maternal health.

The foundation initially focused its activities on five areas: medical, health, and population sciences; agricultural and natural sciences; arts and humanities; social sciences; and international relations. Approximately thirteen thousand scientists and scholars from around the world have been granted scholarships and fellowships from the foundation, which has also provided funding to scholarly publications and conferences.

By 2009, the foundation had redirected its philanthropy toward five main program areas: The Creativity and Culture program includes support for dance, film, digital media, music, and theater in order to promote cultural diversity and cross-cultural understanding. Food Security programs provide assistance to the rural poor, especially people in Asia and sub-Saharan Africa, by improving agricultural technology. Health Equity programs seek to eliminate unfair differences in the health status of populations within the United States based on race or ethnicity. The goal of the Working Communities program is to transform poor, urban neighborhoods into safe and healthy environments by improving employment opportunities and schools. Efforts at Global Inclusion seek to ensure that the benefits of worldwide globalization are equally shared by all strata of society. The foundation in 2009 had assets of more than $3.8 billion and made contributions of approximately $150 million annually.

In 1911, after years of litigation, the U.S. Supreme Court ruled that Standard Oil of New Jersey had violated the Sherman Antitrust Act and ordered the corporation to be broken up into thirty-four new companies. These included Standard of New Jersey (now Exxon), Standard of New York (which became Mobil), Continental Oil (later Conoco), Standard Oil of California (later Chevron), and many others. Rockefeller retained large shares in all of these companies. He subsequently became the world's first billionaire and arguably the richest man who ever lived.

In 1889, the publication of an essay "The Gospel of Wealth" by another wealthy industrialist, Andrew Carnegie, called on all wealthy men to give generously to benefit humankind. This publication prompted Rockefeller to begin donating to charities on a large scale. In that year he gave his first large gift to establish the University of Chicago, and the new university opened in 1890. After 1896, Rockefeller largely retired from business and turned his attention to philanthropy. Rockefeller had tithed 10 percent of his earnings to his church since the beginning of his career. As he grew wealthier, he increased his charitable donations, focusing on public health causes, scientific research, and educational institutions. He even retained a personal adviser on philanthropic activities, his business partner Frederick T. Gates.

In 1884, Rockefeller had provided much of the funding for an African American women's college in Atlanta that became Spelman College, named for his wife's family, who had been abolitionists in antebellum New York. Rockefeller also provided much of the funding for the establishment in 1902 of the General Education Board, which supported African American schools in the South.

He eventually gave approximately $80 million to the University of Chicago, making it a world-renowned institution of higher learning. He provided funds for many other colleges and universities in the United States, including Harvard, Yale, and Brown Universities.

Rockefeller also financed public health institutions. In 1901, he provided funding for the Rockefeller Institute for Medical Research in New York, renamed Rockefeller University in 1965. His funding was also used to found the Rockefeller Sanitary Commission in 1909, which worked to wipe out hookworm. He established the Rockefeller Foundation, which continues to operate today. Among many other philanthropic activities, the Rockefeller Foundation endowed the Johns Hopkins School of Hygiene and Public Health. In 1918, Rockefeller endowed the Laura Spelman Rockefeller Memorial in order to support research in social studies. Named for his wife, this organization was eventually absorbed into the Rockefeller Foundation. During Rockefeller's lifetime, he gave approximately $550 million to various charitable institutions.

Rockefeller died of arteriosclerosis at his home in Ormond Beach, Florida, on May 23, 1937, two months before his ninety-eighth birthday. He is buried in Lake View Cemetery in Cleveland, Ohio.

Legacy

The enormous wealth accumulated by John D. Rockefeller has benefited the people of the United States and the world in innumerable ways.

Although Rockefeller was undoubtedly an unscrupulous and ruthless businessman, he was also a generous humanitarian who did perhaps more than any other historical figure to uplift humankind. His gifts to higher education helped establish one of the most prestigious institutions in the world, the University of Chicago, as well as providing major funding for many more universities and colleges. His contributions to public health eradicated hookworm, one of the greatest scourges in the American South, and created health education institutions around the world. The Rockefeller Foundation has elevated scholarship, the arts, and science by awarding fellowships and grants to scholars, artists, and scientists. The foundation's programs have also been instrumental in helping alleviate world poverty and hunger.

John D. Rockefeller, Jr.

American landowner and philanthropist

Rockefeller was heir to the huge fortune amassed by his father, founder of the Standard Oil Company. A hard worker but one for whom business held little appeal, Rockefeller found fulfillment in large-scale philanthropic pursuits. His lifetime charitable donations totaled more than half a billion dollars.

Born: January 29, 1874; Cleveland, Ohio
Died: May 11, 1960; Tucson, Arizona

Bequeathal of wealth: Spouse; children; charity

Early Life

John Davison Rockefeller (RAW-keh-fehl-luhr), Jr., was born in Cleveland, Ohio in 1874. He was the youngest of five children and the only son of Laura Spelman Rockefeller and Standard Oil Company founder John D. Rockefeller. Standard Oil's success allowed the family to enjoy a more than comfortable lifestyle. The Rockefellers lived in a fashionable Cleveland neighborhood, employed servants, kept a country home, wintered in New York City, and traveled through Europe. Yet they avoided excess, idleness, and vice; staunch Baptists, they raised their children to be industrious, thrifty, and prayerful. During his adolescence, John, Jr., attended the small Browning School in New York City. In 1893, he began undergraduate studies at Brown University, where he developed a reputation as an earnest, religious, penny-pinching nondrinker. He graduated from Brown in 1897 as a member of Phi Beta Kappa.

First Ventures

After graduation, Rockefeller went to work in the New York City offices of Standard Oil. The anxious, insecure, and self-deprecating young man received no guidance and was left to find his own way. He handled some of his father's correspondence, including requests from charitable organizations, and he took on detail-oriented tasks for various projects.

In the late 1800's, his father loaned him money to invest in the stock market. After minor gains and losses, Rockefeller fell victim to David Lamar, a Wall Street operator who would become known as "the Wolf of Wall Street." Lamar's manipulations resulted in a loss for Rockefeller of about $1 million, which he was unable to repay to his father. While the senior Rockefeller received the news calmly and without accusation, the press reported the humiliating loss with glee. John, Jr., was so shamed by the experience that he avoided speculation in the stock market for the rest of his life.

In 1901, after several years of shy courting, Rockefeller married Abby Greene Aldrich, the wealthy and socially prominent daughter of Nelson Wilmarth Aldrich, a politically powerful senator from Rhode Island. The couple took up residence in New York City; ultimately, they would also keep homes in Pocantico Hills, New York; Seal Harbor, Maine; and Williamsburg, Virginia. Over the next fifteen years, the couple had six children: Abby ("Babs") Rockefeller, John D. Rockefeller III, Nelson A. Rockefeller, Laurance Spelman Rockefeller, Winthrop Rockefeller, and David Rockefeller.

Mature Wealth

Gradually, Rockefeller's focus became the philanthropic use of his father's fortune. He helped found the Rockefeller Institute for Medical Research (later the Rockefeller University) in 1901 in order to advance scientific research into the cause and cure of diseases. He was also instrumental in organizing the General Education Board in 1903, which was created to promote educational opportunities for all, regardless of race, gender, or religion.

Another major philanthropy he helped establish was the far-reaching Rockefeller Foundation, launched in 1913 in order to support worldwide efforts in education, medicine, public health, the natural sciences, the social sciences, and the arts and humanities.

In 1916, Rockefeller gave the U.S. government thousands of acres of land to create Maine's Acadia National Park. Rockefeller would later contribute millions of dollars toward New York City's Fort Tryon Park, along with The Cloisters, which he erected in the park to house the Gothic art collection that he had donated to the Metropolitan Museum of Art; the New York-New Jersey Palisades Interstate Park Commission; California's Save-the-Redwoods League; Shenandoah National Park; Yosemite National Park; and the Jackson Hole Preserve.

During World War I, Rockefeller chaired New York's United War Work Campaign, which raised $35 million for private organizations working with American troops. After the war he contributed to the rebuilding of war-damaged structures in Europe, including France's Rheims Cathedral, and to the restoration and conservation of the French historical sites at Versailles and Fontainebleau.

In 1926, Rockefeller initiated restoration work in the historic district of Colonial Williamsburg, Virginia. His support transformed Colonial Williamsburg from a dilapidated town to a popular tourist attraction and a model of restoration and historic preservation.

In 1928, Rockefeller made plans with others to purchase a midtown Manhattan site for a new Metropolitan Opera House. After he leased much of the desired land from Columbia University and bought the remainder from other owners, the onset of the Great Depression forced the opera to abandon its plans. Committed to a long lease of the university property, Rockefeller decided to build an international business and entertain-

The Rockefeller University

The Rockefeller University had its start as the Rockefeller Institute for Medical Research (RIMR). John D. Rockefeller, Sr., founded RIMR in 1901, after his daughter Edith Rockefeller McCormick lost her eldest child to scarlet fever. The death of three-year-old John Rockefeller McCormick spurred the boy's grandfather to act on a plan that he had been discussing with his son John D. Rockefeller, Jr., and his adviser Frederick T. Gates for three years: the establishment of an institution in the United States entirely dedicated to exploring the causes of disease through modern laboratory science.

John, Jr., was fascinated with the medical field and was particularly devoted to RIMR from its inception. He was instrumental in exploring organizational logistics, and he secured funding from and presented ideas to his father, who was distrustful of nonhomeopathic approaches to medicine. John, Jr., also worked with prominent physicians to assemble a board of directors. He served on the institute's board of trustees from 1910 to 1950, taking over the chairmanship in 1928 after Gates's death left the position vacant.

RIMR operated out of temporary quarters until 1906, when its laboratories opened in New York City at Sixty-sixth Street and Avenue A (now York Avenue). The Rockefeller Institute Hospital, the first clinical research center in the United States, opened in 1910, enabling RIMR scientists to augment laboratory studies with patient-based research.

RIMR's early successes included institute director Simon Flexner's development of a new delivery system for an antimeningitis serum, Hideyo Noguchi's studies linking the *Treponema pallidum* spirochete with syphilis, Louise Pearce's work with the compound tryparsamide as a drug against African sleeping sickness, and Peyton Rous's discovery that viruses play a role in the transmission of certain cancers. John, Jr., made medical breakthroughs of his own: In 1923, he gave a $150,000 grant to RIMR, with additional follow-up funding, to help supply the new drug insulin to financially disadvantaged diabetics in the United States and Canada and to train doctors in the drug's proper use.

In 1944, RIMR researchers Oswald T. Avery, Colin Munro MacLeod, and Maclyn McCarty began the era of modern genetics with the discovery that deoxyribonucleic acid, or DNA, is the chemical basis of heredity. RIMR scientists in the 1940's and 1950's were also the first to study cell structure by using the recently developed technique of electron microscopy.

In 1954, RIMR became part of the State University of New York; it admitted its first class of graduate students the following year and awarded its first doctoral degrees in 1959. RIMR became The Rockefeller University in 1965. In 1972, the university began a collaboration with Cornell University to offer graduate students an M.D.-Ph.D. program. The Sloan-Kettering Institute later joined the partnership in what became the Tri-Institutional Program.

More than a century after its founding, The Rockefeller University remains a major biomedical research center. Prizes earned by its scientists include the Albert Lasker Medical Research Award, the Gairdner Foundation International Award, the U.S. National Medal of Science, and the Nobel Prize.

ment center. The construction of the fourteen-building Rockefeller Center complex employed more than seventy-five thousand people between 1931 and 1940. The center's six million square feet of leasable space made Rockefeller one of the city's largest real estate holders.

In 1941, Rockefeller helped establish the United Service Organizations (USO), of which he would remain an active leader. In 1943, he worked with the USO to form the National War Fund, which raised more than $321 million for U.S. military personnel and others.

In late 1946, thanks to a phone call from his son Nelson, Rockefeller learned that the nascent United Nations was hours away from its deadline to select a site for its permanent headquarters. (Nelson was serving on a committee to persuade the international organization to settle in New York City.) After a late-night scramble to resolve legal details, Rockefeller resolved the matter by offering the United Nations an $8.5 million gift of six Manhattan blocks on New York City's East River.

Abby Aldrich Rockefeller died in 1948. Three years later, Rockefeller married pianist Martha Baird Allen, the widow of an old friend and classmate from Brown University. Rockefeller provided his new wife with a trust fund as a wedding gift so she could experience the philanthropic giving that he so enjoyed.

One of Rockefeller's last major projects was Sleepy Hollow Restorations. This organization, which he founded in 1951, initially handled the management and operation of two historic Hudson Valley properties he had acquired in the 1940's: Philipsburg Manor and author Washington Irving's residence, Sunnyside. He donated a third property, Van Cortlandt Manor, in 1959. He invested more than $12 million to purchase and restore the three sites.

In 1960, Rockefeller was diagnosed with prostate cancer. He died in 1960 in Tucson, Arizona, and he was buried in the Rockefeller Family Cemetery in Sleepy Hollow, New York. His estate was probated at $157 million. His will divided these assets almost evenly between his wife and the Rockefeller Brothers Fund, a charitable organization that his sons had established in 1940. Rockefeller had made a substantial gift to the fund in 1951; the further endowment upon his death made it one of the ten largest charitable foundations in the United States.

Legacy

John D. Rockefeller, Jr., was compelled not to follow in his father's entrepreneurial footsteps but to apply the family's great wealth toward the public good. Over his lifetime he gave more than $537 million to charitable projects. He worked with his father to create several important institutions in the areas of education, medicine, and general philanthropy. He also collaborated with his first wife, Abby Aldrich Rockefeller, to provide philanthropic support to historic preservation causes and the art world. He passed a legacy of philanthropy to his children, not only by setting an example of large-scale charitable giving but also by establishing trusts to enable them to continue such giving. His daughter and five sons, in turn, passed the family tradition of philanthropy to their own children, the fourth generation of Rockefellers, to carry on the legacy of giving established by Rockefeller and his father.

JOHN D. ROCKEFELLER III

American philanthropist

Rockefeller inherited his wealth from his father, and he used it for philanthropy. He founded the Asia Society and the Population Council and provided funds to the Council of Economic and Cultural Affairs and the Lincoln Center for the Performing Arts.

Born: March 21, 1906; New York, New York

Bequeathal of wealth: Children; charity

EARLY LIFE

John Davison Rockefeller (RAW-keh-fehl-luhr) III was the first of six children born to John D. Rockefeller, Jr., and his wife, Abby Aldrich Rockefeller. His parents required that he go to the Baptist church and read the Bible. Even when was young, he was taught about the importance of earning and managing money. For example, he was given an allowance of ten cents a week beginning at the age of eight, and he was required to keep a journal and discuss the use of his money with his father. He had to keep track of how much he spent on himself, how much he gave away, and how much he saved. To earn additional money, he would do chores, such as catching mice, helping with cooking and sewing, or, during World War I, growing a victory garden and packaging bandages. Rockefeller went to the Browning School in New York City and then to the Loomis Institute, a preparatory school in Windsor, Connecticut. He graduated from Princeton University in 1929, receiving high honors in economics.

FIRST VENTURES

Rockefeller worked as a clerk for the League of Nations in Geneva, Switzerland, in the summer of 1928. This was a great position for him, since he was able to observe and talk with many of the world leaders and see how they interacted. After graduating from Princeton, he attended a conference in Japan, at which many of the problems of Asia were discussed. This trip also included stops in a number of other Asian countries and parts of the Soviet Union.

On returning from this trip, he worked for his father in the Standard Oil Building in New York City, helping with the many charitable donations his father made. Rockefeller became a trustee in many organizations, such as the Rockefeller Foundation, the Rockefeller Institute for Medical Research, and the China Medical Board. These activities enabled him to understand how such organizations worked.

In the 1930's, Rockefeller became interested in the overpopulation problems of Asia. He was especially concerned about birth control, which then was an unpopular topic of discussion. He donated money to several birth control organizations that trained more than thirty thousand nurses and doctors in birth control techniques and issues regarding sexuality and fertility. He also worked through the Rockefeller Foundation to give money to a medical school in Beijing, China.

During World War II, Rockefeller became a lieutenant commander in the U.S. Navy. He worked for four years in the Office of the Chief of Naval Operations in Washington, D.C., and he then helped to plan the United States' policies for its postwar relations with Japan.

MATURE WEALTH

After World War II, Rockefeller and his brothers, Nelson A., Laurance, Winthrop, and David, took on a greater role in managing the family business. The brothers got along reasonably well, although there were often major disagreements among them. John, Jr., in 1934 had given his five sons and daughter Abby trust funds with an estimated total value of $640 million, so each sibling had a fair amount of money. In 1954, John, Jr,. set up another trust for his children estimated at around $100 million.

John III had little interest in managing his money, and he hired others to invest it for him. Most of his money was invested in stocks, bonds, and real estate. His major interest was contributing money to charities that worked for the causes in which he was interested. Rockefeller also served as a trustee on many boards of philanthropic organizations, and he established many organizations for which he was the director.

For example, after World War II, Rockefeller thought that Germany needed help to better understand the principles of democracy, and he started programs that aimed to address this concern. He especially wanted to help Japan and other Asian countries solve the problems associated with decreasing food production and increasing population, and to this end he directed major efforts to provide medicine and birth control and to improve the health of people in these nations. In 1951, Rockefeller went to Japan to meet with many of the nation's leaders. He helped form working groups to organize cultural exchange programs between the United States and Japan. Through his efforts, Americans began to appreciate Japanese culture, art, and industry, including automobile manufacturing.

Rockefeller fought hard in the 1950's to start birth control programs in Asia. In that decade, he was influential in the National Academy of Sciences' announcement that birth control measures deserved further study. In 1952, Rockefeller used his own funds to establish the Population Council, which provided fellowships to those studying population control and family planning. In 1959, the council also provided funds for the use of the intrauterine device (IUD), a plastic coil placed in the uterus to avoid pregnancy. The council obtained money from the Ford Foundation and the U.S. government to supply the large demand for IUDs. By the late 1960's, the council advocated that information about sex education, birth control, and abortion be provided to American teenagers.

Rockefeller organized the Council of Economic and Cultural Affairs in 1953 in order to help Asian nations with farming, marketing their products, and banking. Money was available to enable Asian scholars to come to the United States to learn more about these economic activities. Rockefeller also helped to plan and finance the Center for Performing Arts in New York City in 1955.

In 1952, he became the chairman of the board for the Rockefeller Foundation, a charitable organization founded by his grandfather, John D. Rockefeller, Sr. The foundation gave tens of millions of dollars to implement the best proposals regarding health, medicine, agriculture, the arts, social sciences, and international relations. In his position of chairman, as in his other charitable activities, Rockefeller worked in a low-key manner, allowing all board members to express their opinions but ultimately convincing the trustees to support his ideas.

In the late 1960's, many young people began to rebel against the Vietnam War and the American government. Rockefeller gave a number of speeches about fighting injustice in the United States, and he started a Task Force on Youth to seek solutions to the issues young people were raising. In 1970, he began to involve himself in environmental issues, and he financed a study aimed at cleaning up the Connecticut River.

The Asia Society

The Asia Society initially was created to promote a cultural exchange between the United States and Asia and to be a source of information about Asia for the United States. When it was founded in 1956 by John D. Rockefeller III, the society did not address Asian politics or economics, primarily because many Americans in the post-World War II period continued to dislike Japan and were not particularly interested in Asia. Rockefeller gave almost $2 million to establish the society and support it during its first five years of operation, and this money was primarily used to find a building in New York City in which to house the organization.

In its early years, the Asia Society sponsored seminars, talks, art exhibits, and publications about Asia. It also presented programs about some of the Asian nations, such as Sri Lanka. The society soon ran out of space and needed more money to develop its programs.

In the 1960's, the Asia Society took on a more political agenda under the direction of its president, Kenneth Young, a career diplomat in Asia. In these years, the society also became more dependent on government funding. The society started a program that enabled Southeast Asian nations to receive advice aimed at improving technology for agriculture, water supply, and population control.

Phillips Talbot took over the Asia Society in 1969, and under his direction the organization became a resource for Asian economic development and public affairs. He encouraged Asian and American scholars to meet and discuss problems. During his presidency the society staged art exhibits and plays, organized programs on literature, and created individual country councils. He also obtained funds from the Ford Foundation, corporations, and individuals. In 1971, he organized the Williamsburg Conferences, in which the United States, Japan, and other Asian countries discussed mutual problems in a constructive way.

Early in the 1970's, Rockefeller donated his Asian art collection to the Asia Society, and he gave money to build a gallery to house the collection. This collection had 260 pieces that were valued at $21 million in 1974.

The Asia Society remains an active organization in the twenty-first century, with several offices in the United States, as well as offices in Hong Kong, Manila, Melbourne, Mumbai, Seoul, and Shanghai. The organization sponsors numerous activities, including art exhibitions, film screenings, and lectures and conferences about foreign policy, politics, business, and other topics regarding the more than thirty countries in the Asia-Pacific region, which it describes as "the area from Japan to Iran, and from Central Asia to New Zealand, Australia, and the Pacific Islands."

Legacy

John D. Rockefeller III is known for his philanthropic contributions to causes in the United States and Asia. He provided financial assistance to artistic, scientific, and cultural activities in the United States, promoted improved relations between Asian communities and the United States after World War II, guided the Rockefeller Foundation, and advocated the use of birth control and family planning. He became a leader in advising Asian leaders about American-Asian relations. Rockefeller was a moderate person, who stressed that cooperation was important in solving the many problems with which he was concerned. He was also a leader in helping to enact tax laws that would encourage philanthropy in the United States, and he encouraged others to donate money to causes they believed were significant.

Great Lives from History

The Incredibly Wealthy

Laura Spelman Rockefeller
American philanthropist

Rockefeller was the wife of John D. Rockefeller, the founder of Standard Oil. The child of abolitionists, she shared her husband's interest in philanthropy, and the couple provided financial assistance to the first historically black female institution of higher learning, named Spelman College in her honor.

Born: September 9, 1839; Wadsworth, Ohio
Died: March 12, 1915; Pocantico Hills, New York
Also known as: Laura Celestia Spelman Rockefeller; Laura Celestia Spelman (birth name); Cettie Spelman Rockefeller
Source of wealth: Marriage
Bequeathal of wealth: Children; educational institution; charity

Early Life

Laura Celestia Spelman Rockefeller (RAW-keh-fehl-luhr) was born in Wadsworth, Ohio, on September 9, 1839, the daughter of Harvey Buel Spelman, a dry goods merchant, and Lucy Henry Spelman. She was the second of two daughters. The family had relocated to Ohio from Massachusetts and moved from Wadsworth to Akron and then finally to Cleveland, where Laura's parents were actively involved in the church and in politics. Her father helped establish a Congregational Church in Cleveland, served as a state legislator, and was active in the abolition movement, helping fugitive slaves on their perilous treks to Canada.

Educated in Cleveland schools, Laura graduated as valedictorian from Central High School, where John D. Rockefeller was a member of her senior class and her good friend. A deeply religious young woman, she and her sister Lucy wanted to become teachers. In 1857, they both went off to the Oread Institute, a women's college in Worcester, Massachusetts. Upon completion of their studies, Lucy took a teaching position in the Cleveland public schools. However, Laura's attempts to establish and teach music classes failed until she began teaching at the Hudson Street School in 1860. Her success there led to her being appointed to the position of assistant principal.

About this time, Laura was being actively courted by her former classmate, John Rockefeller. He gave her bouquets and took her to lectures, and in 1864 he finally proposed marriage and gave her a diamond ring. They were married on September 8, 1864, and honeymooned in Niagara Falls, Canada, and in New England. Once back in Cleveland, they bought a modest house next to the home of John's parents and began raising a family. Between 1866 and 1874, the couple had four daughters, one of whom died in infancy, and a son, John D. Rockefeller, Jr.

Laura's life revolved around her marriage and family. She did, however, maintain her interest in the church, joining her husband's Baptist congregation. As the family outgrew their first home, she and her husband purchased a larger but still unpretentious house on a Cleveland street that became known as "Millionaires' Row." They later acquired a property with a view of Lake Erie that became a summer home they named Forest Hill.

First Ventures

Inasmuch as Laura Rockefeller was first and foremost a wife and mother, the wealth she possessed was actually her husband's, which he acquired through highly successful business ventures in oil refining and company mergers. He had started his first company at age nineteen, in 1859, grossing $450,000 in the first year. By the time he and Laura married in 1864, the Civil War had begun and it helped his company prosper. By 1870, he had entered the oil refining business, and his Standard Oil Company was refining 10 percent of America's oil. By 1879, this amount had skyrocketed to 90 percent, and Standard Oil had its own warehouse, depots, tank car fleets, and even its own barrel-making plants.

While John accumulated his fortune, Laura raised their four children. She did not allow them to be indulged as spoiled "rich kids." She made them work in their own vegetable garden plots, pull weeds from the lawn (and earn a penny for every ten weeds), and turn off unnecessary lights to help save energy costs. She set a routine of family prayers each morning at half past seven, music lessons, and regular church attendance. Laura herself always taught a Sunday school class, and she maintained her devotion to her church.

Because John's business often took him to New York City, he ultimately bought a home there on West Fifty-fourth Street, and the family began spending late fall, winter, and early spring in New York. John's company had become "the first great American trust" by 1882, holding the stock of forty businesses and having a value of nearly $70 million.

SPELMAN COLLEGE

Spelman College, located in Atlanta, Georgia, is the oldest historically black college for women in the United States. It is a predominantly residential, private college providing a liberal arts education. In 2009, more than twenty-three hundred women were enrolled, and these students came from more than forty states and fifteen foreign countries. The faculty, numbering about 150 full-time teachers, 85 percent of whom hold doctorate degrees, provides instruction leading to B.A. and B.S. degrees in the fine arts, humanities, social sciences, natural sciences, and education.

Originally established in 1881 as the Atlanta Baptist Female Seminary, the institution came to the attention of John D. and Laura Spelman Rockefeller when its founders, Sophia B. Packard and Harriet E. Giles, were raising funds for the school at an Ohio church conference. Packard and Giles had taught at the Oread Institute in Worcester, Massachusetts, where Laura was educated. The Rockefellers donated $250 in 1884, which was sufficient to settle the school's debts, and that year the school's name was changed to Spelman Seminary to honor Laura Spelman Rockefeller and her parents, Harvey and Lucy Henry Spelman, staunch antislavery activists.

The college's original location was the basement of the Friendship Baptist Church in Atlanta, Georgia, but in 1883 it was relocated to a nine-acre site on which there were five buildings. The school became Spelman College in the 1920's, and a building honoring Laura and her sister Lucy, the Sisters Chapel, was erected on campus in 1927.

The earliest academic program provided what was basically an elementary through high school education to a group of women, most of whom were former slaves. The program grew to a college-level curriculum, and in 1901 the first college degrees were conferred. By the twenty-first century, Spelman was offering academic programs in the humanities, child development, comparative women's studies, drama, economics, human services, anthropology, biochemistry, computer and information sciences, environmental science, and languages, as well as opportunities to study abroad and exchange programs with other American colleges.

In 1992, the school received the largest donation ever given to a historically black institution of higher learning, when the DeWitt Wallace/Reader's Digest Fund gave Spelman a gift of $37 million. That same year, *U.S. News and World Report* ranked the college as number one on its list of regional liberal arts college in the South. Spelman's endowment had grown to $141 million by 1996, the largest of any historically black institution of higher learning, and by 2009 its endowment had climbed to almost $292 million.

Although Spelman is a relatively small college, as a member of the Atlanta University Center consortium its students have access to the resources and faculty of five other African Amercan schools of higher learning, all within walking distance of the Spelman campus. Over the years, Spelman has graduated more than six generations of women, many of whom have reached the highest levels of academic, community, and professional achievement.

MATURE WEALTH

Laura's philanthropic bent had almost always centered on her church and the abolitionist leanings of her parents. When she married John, she had in him a soul mate who also believed in charitable giving. The Rockefellers donated money to numerous charities, with the size of their contributions growing with the steadily increasing amount of their wealth. In 1892, John and the American Baptist Education Society founded the University of Chicago, with John providing funds for the new school.

In 1881, the Atlanta Baptist Female Seminary was established to provide an elementary through high school education to black women, most of whom were former slaves. Two teachers from the Oread Institute, the college that Laura had attended, founded the seminary and taught its initial classes. John was made aware of the school and its financial needs in 1882, when he attended a Baptist conference in Ohio. He visited the school in 1884 and, impressed with its mission, paid off the school's debts. To acknowledge his support, the school's name was changed to Spelman Seminary in honor of his wife and her parents, who had been active in the antislavery movement. One of the seminary's buildings, Rockefeller Hall, was built with funds from the Rockefellers and dedicated in 1886; in the twenty-first century, this hall was the oldest building on the campus of what was now Spelman College. The Laura Spelman Rockefeller Memorial Building was completed in 1918.

In 1927, Sisters Chapel, considered one of the most important buildings on campus, was dedicated; the building was named for Laura and her sister Lucy Spelman, who had donated the majority of its funding. The chapel has an auditorium that seats more than one thousand people, as well as an elaborate pipe organ and chimes.

Laura remained very close to her parents and sister over the years, and when Lucy stopped teaching, she moved in with Laura, John, and their family. When

Laura's father died in 1881, her mother also moved in with the Rockefellers and lived with them until her death in 1897. When John and Laura's children grew up and married, some of the children lived nearby and the couple could enjoy regular visits with their grandchildren.

At the beginning of the 1900's, Laura's health began to fail, until by 1910 she was a semi-invalid, spending most of her days in bed. She and John were able to enjoy their golden wedding anniversary together on September 8, 1914, but she died the following spring of a heart attack. John established the Laura Spelman Rockefeller Memorial in 1918 in memory of his wife. The memorial's endowment reached almost $74 million during its eleven years of operation, and it made grants related to Laura's interests in missionary work and the welfare of women and children.

Legacy

While Laura Spelman Rockefeller herself did not make money, there is little doubt that she was a strong influence on her husband's resolve to give generously to various charities throughout the couple's lives. Her background as a child of antislavery activists had filled her with the desire to improve the lives of others, and to this end she encouraged her willing husband to endow schools and social service organizations that continue to provide service and support into the twenty-first century.

WILLIAM ROCKEFELLER

American industrialist and financier

Rockefeller was a shrewd but well-liked manager of the Standard Oil Company. He helped his more famous brother, John D. Rockefeller, gain a monopoly on kerosene and other petroleum products in the late nineteenth and early twentieth centuries, and he later became a major investor in other companies.

Born: May 31, 1841; Richford, New York
Died: June 24, 1922; Tarrytown, New York
Also known as: William Avery Rockefeller, Jr.
Sources of wealth: Oil; investments
Bequeathal of wealth: Children; relatives

EARLY LIFE

William Avery Rockefeller (RAW-keh-fehl-luhr), Jr., grew up in the small town of Richford, New York, where he attended local schools. The family moved to Strongsville, Ohio, in 1853, where he and his brother John D. Rockefeller attended Cleveland High School. The brothers became reasonably close friends and maintained this friendship throughout their lives. William's father, William Avery Rockefeller, Sr., sold patent medicine, and he had to make many trips away from home to promote sales. William's father taught both brothers about the positive and negative aspects of business. His mother, Eliza Davidson Rockefeller, had a hard time raising her sons because of her husband's long absences and heavy drinking.

FIRST VENTURES

In 1857, young William worked as a bookkeeper in Cleveland, Ohio. After a year, he went to work for a produce commission business, becoming a partner there in 1862. His brother John also went into the produce commission business in 1858, working for the firm of Clark & Rockefeller. John and his partner, M. B. Clark, built an

John bought the firm from Clark in 1865 and started a new business, Rockefeller & Andrews, with Samuel Andrews. John convinced William to invest in Rockefeller & Andrews when the firm built a second oil refinery called the Standard Works. William accepted the offer, and he was put in charge of selling the refinery's products in New York City. William was a shrewd man who had a likable personality. In contrast to John, William did not believe in donating money to charities. William turned out to be a great export manager who was able to keep an eye on kerosene prices and ensure that the Ohio refineries produced the needed amount of oil. He also was able to borrow money for the refineries more cheaply in New York than in Ohio.

Mature Wealth

In 1870, the name of the firm was changed to Standard Oil of Ohio, with John as president and William as vice president. William supported John's efforts to acquire other oil companies. The Rockefellers purchased most of the oil companies in Cleveland, Ohio, in 1872, and they soon controlled nearly 90 percent of the refineries in the United States.

The control of these companies became complicated, since many state laws made it difficult for a company in one state to run a company in another state. Thus, the Rockefellers had to turn their companies into separate corporations in different states. These corporations were finally united into a single company called the Standard Oil Trust. William was one of the original trustees of this trust until the Ohio courts declared it illegal. The Rockefellers then reorganized the trust into Standard Oil of New Jersey, with William as director. He also became the president of Standard Oil of New York.

By the 1890's, William was making a fortune in Standard Oil, and he began to invest in gas, electric utilities, mining ventures, and railroads. In 1911, the U.S. Supreme Court ruled that Standard Oil of New Jersey had violated the Sherman Antitrust Act and ordered the company to be broken up into thirty-four smaller firms. By that time, William had given up the management of all of his companies, and he focused on his railroad investments.

Legacy

With his brother John D. Rockefeller, William Rockefeller built a major empire that controlled the production of all oil products from the late nineteenth to the early twentieth centuries. Many criticized the way that the brothers monopolized the industry and attacked Standard Oil for its size and wealth. Nevertheless, kerosene prices dropped by about 80 percent in these years, and the quality of the kerosene improved.

William's involvement in Standard Oil and his many investments made him a very wealthy man. When he died in 1922, he left his children an estate valued at about $100 million.

ANITA RODDICK

British businesswoman and activist

Roddick, one of the richest women in Great Britain, attained her wealth from The Body Shop, an international chain of cosmetic products made with natural ingredients. An environmentalist and activist for social change, she used her wealth to promote human and animal rights, rain forest preservation, and many other issues.

Born: October 23, 1942; Littlehampton, West Sussex, England
Died: September 10, 2007; Chichester, West Sussex, England
Also known as: Anita Lucia Perella Roddick; Anita Lucia Perella (birth name); Dame Anita Roddick
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

Anita Lucia Perella Roddick, better known as Anita Roddick (ah-NEE-tuh RAW-dihk), was the third of four children born to Italian immigrants and café owners. After her mother's divorce and marriage to Henry, her former husband's cousin, Roddick learned that Henry was her biological father. Henry helped transform the café. He gave Roddick comics and collectable cards that she could trade, providing her with her first marketing lessons.

Roddick trained to be a teacher at Newtown Park College in Bath, England. In 1962, she received a scholarship that enabled her to live on a kibbutz in Israel. Roddick later worked for the *International Herald Tribune* in Paris and then took a job in the women's rights department of the International Labor Organization in Geneva, Switzerland. She traveled widely, visiting Panama, Tahiti, Australia, South Africa, and other places, where she took note of the body care products available in these countries.

When her mother introduced her to Gordon Roddick, their rapport was immediate. The two married and had two daughters, Justine, born in 1969, and Samantha, born in 1971. The couple ran a bed-and-breakfast inn and an Italian health food restaurant in Brighton, England.

FIRST VENTURES

Gordon had always dreamed of riding horseback from Buenos Aires, Argentina, to New York, and the couple sold their restaurant to finance his eighteen-month, 5,300-mile trip. Anita continued to manage the inn, and in 1975 she began experimenting with techniques for creating cosmetics and body care products using natural ingredients. As a result, she developed fifteen products, secured a loan for $8,254 with the inn as collateral, and in 1976 opened her first store, The Body Shop, in Brighton. She later sold a 50 percent interest in the shop to Ian McGlinn, which gave her another $8,254. The first Body Shop was located between two mortuaries. Roddick used natural and herbal ingredients, such as honey, cucumber, avocado, cocoa butter, and oatmeal, to make her products, and she set up perfume bars in the store where customers could create their own fragrances. Her store received so much media coverage that she did not have to advertise.

After Gordon returned from his trip in 1977, he helped his wife with the business, providing Anita with more time for public speaking. The couple began selling franchises for The Body Shop in 1978 and opened a store in Brussels, Belgium, their first shop outside the United Kingdom. The Body Shop began selling its stock publicly in 1984, at which time the chain was worth 8 million, and Roddick's personal fortune was 1.5 million. The Body Shop established an environmental projects department in 1986, and that year the Confederation of British Industries named the chain the company of the year.

Roddick opened her first American store in 1988, and by then the chain consisted of two hundred stores in thirty-three countries. She continued her political and environmental activism. In 1990, she founded Children on the Edge, a charitable organization that provides aid to disadvantaged children in Eastern Europe and Asia.

MATURE WEALTH

Roddick was made a member of the Order of the British Empire in 1988, and by1990, she was one of the richest women in Great Britain. She used her wealth to promote social change. Roddick provided funding for *Big Issue*, a magazine produced and sold by homeless people. In 1992, Roddick joined with executives of Ben & Jerry's ice cream and other companies to organize Business for Social Responsibility. She supported environmental groups, such as Greenpeace and Save the Whales.

Roddick's concern for the environment and animal rights was evident in her management of The Body Shop. In addition to making her products from natural ingredients, she refused to test her products on animals. In 1996,

Anita Roddick. (AP/Wide World Photos)

she made a donation to the Fund for the Replacement of Animals in Medical Experiments. An advocate of the importance of skin care, Roddick also made financial contributions to the Skin Treatment and Research Trust. By 2000, seventeen hundred Body Shops were operating in forty-nine countries. Three years later, Roddick was made a Dame Commander of the Order of the British Empire.

Roddick suffered from hepatitis C and cirrhosis of the liver. In 1998, she stepped down from her position as chief executive officer of The Body Shop, and four years later Gordon resigned as cochair of the company. The L'Oréal Group bought The Body Shop in 2006, and Roddick earned profits of $231 million from the sale. Roddick died the following year at the age of sixty-four.

Legacy

Roddick's legacy was her concern for people, animals, and the environment, and she practiced the ethical behavior she preached. She donated the majority of her profits from the sale of The Body Shop to charity. Her donation of $1.8 million to Amnesty International continues to provide training to activists.

NIKITA ROMANOV

Russian aristocrat and landowner

The owner of multiple estates and more than seven thousand serf households, with about thirty thousand peasants, Romanov was the largest landholder and serf owner among the Russian nobility in the mid-seventeenth century.

Born: c. 1607; Moscow, Russia
Died: December 21, 1654; Vyazma, Russia
Also known as: Nikita Ivanovich Romanov
Sources of wealth: Inheritance; real estate; slaveholding
Bequeathal of wealth: Relatives; government

EARLY LIFE

Born around 1607, Nikita Ivanovich Romanov (nee-KEE-tah ee-VAHN-oh-vihch roh-MAHN-of) came from an aristocratic family that first achieved prominence when one of its members, Anastasia, married Czar Ivan IV ("the Terrible"). Subsequently, after the tumultuous Time of Troubles at the beginning of the seventeenth century, the Romanovs became the dynasty that ruled Russia from 1613 to 1917. Nikita's cousins, Michael Romanov and Alexis, became the first Romanov czars, while his uncle Filaret was patriarch of the Russian Orthodox Church.

FIRST VENTURES

Although a scion of a nonroyal branch of Russia's ruling dynasty, Romanov grew up in and inherited great wealth. His father, Ivan, was the wealthiest magnate in the service of Czar Michael Romanov, owning estates in ten districts and more than seven thousand serf households. His family's wealth enabled Romanov in 1629 to present Michael's newly born son, the future Czar Alexis, with "costly gifts," an event earning Romanov his first mention in surviving Russian sources and placing him in the monarch's good graces. Ten years later, on July 12, 1639, Czar Michael appointed Romanov to the ceremonial office of court table attendant on the occasion of the czar's name day. In 1644, Romanov personally attended the czar at a banquet honoring Count Waldemar Christian of Schleswig-Holstein, the son of Denmark's King Christian IV. Waldemar had been invited to Russia as part of Michael's efforts to find an appropriate husband for his daughter Irene.

MATURE WEALTH

According to a governmental survey conducted in 1647-1648, Romanov, who had been promoted to boyar, the highest rank within the Russian aristocracy, on September 28, 1645, owned multiple estates that contained some 7,012 serf households. Such extensive possessions made Romanov the wealthiest Russian aristocrat and the second-richest man in the country. Two other aristocrats owned estates with 6,000 and 5,000 serf households, respectively; one individual possessed lands with 3,000 serf households; and eight aristocrats held lands with between 2,500 and 1,000 serf households. Only Czar Alexis exceeded Romanov as an owner of land and serfs, with the monarch possessing estates that contained 27,200 serf households, according to the records of the Bureau of the Grand Court.

Although a member of Russia's aristocratic elite, Romanov enjoyed great popularity with the lower strata of society in the city of Moscow, a fact exemplified in the spring of 1648, when Alexis assigned him to calm the misnamed Moscow Salt Tax Rebellion. This revolt was a popular uprising directed against Boris Ivanovich Morozov, the czar's brother-in-law and closest adviser, and Morozov's associates, whose political, military, and financial reforms angered and alienated Moscow's population. In the rebellion's aftermath, which saw Morozov exiled to a monastery, Romanov achieved his greatest political power, being appointed head of the Boyar Duma, the council of aristocrats that advised the czar.

Romanov's tenure as leader of the council proved short-lived. Following Morozov's return from exile in October, 1648, Romanov proclaimed himself ill and unable to continue to participate in government. During the last years of his life, Romanov lost favor with Czar Alexis. He died, unmarried and without heirs, on December 2l, 1654, in the city of Vyazma, his land and serfs reverting to the czar in accordance with Muscovite custom.

LEGACY

Nikita Romanov's significance is not to be found in his status as the wealthiest magnate in mid-seventeenth century Russia. Instead, it lies in his admiration for Western (European) culture, specifically German dress and music, in a country dominated by tradition and xenophobia. As a proponent of the West, Romanov was one of a small group of individuals who set the stage for the accelerated and extensive Westernization carried out by Czar Peter the Great during the first quarter of the eighteenth century.

Rong Yiren

Chinese industrialist and politician

Rong, China's famed "Red Capitalist," showed great entrepreneurial ability when he was entrusted by Communist Party leader Deng Xiaoping to move China toward a new age of foreign investment and market-oriented commerce.

Born: May 1, 1916; Wuxi, Jiangsu Province, China
Died: October 26, 2005; Beijing, China
Also known as: Jung I-jen; Jung Yi-jen; the Red Capitalist
Sources of wealth: Inheritance; trade; manufacturing
Bequeathal of wealth: Children

Early Life

Rong Yiren (rahng ee-rehn) was born in Wuxi, a town in Jiangshu Province near Shanghai. At the time of his birth, the Rong family was the most established family of industrialists in China. They were also the richest, and their wealth surpassed that of the more famous capitalists of the Chinese republican era, such as T. V. Soong and H. H. Kung, whose prominence arose as much from their political connections to the Kuomintang Party as from their fortunes.

Rong's father, Rong Desheng, and his uncle, Rong Zongjing, opened their first bank in 1896 and their first flour mill in 1902. The Rongs eventually operated flour mills in Wuxi and expanded operations throughout China and internationally, with business ventures in cotton, milling, banking, and other commercial enterprises. In the 1930's, the Rongs operated thirty of Shanghai's roughly one hundred textile mills. Their companies helped to make Shanghai the industrial powerhouse of twentieth century China. Rong Desheng and Rong Zongjing became so wealthy that they were called the "Rockefellers of China." The Rongs lived in mansions containing ballrooms with parquet floors and mirrored banquet rooms. After Rong Yiren graduated from St. John's University in Shanghai, he took over management of twenty-four of the family's flour and cotton mills.

Great Wealth and Marxism

Marxism constitutes the most aggressive attack on the accumulation of great wealth in human history. Prior to the philosophy of Karl Marx, there had been other critiques of private wealth. For example, Pierre-Joseph Proudhon, the French anarchist, declared that "property is theft," and he called for the abolition of money. However, it was Marx who claimed to have developed a scientific understanding of economics in which the accumulation of capital was viewed as nothing more than the exploitation of workers.

Marx's theory of scientific materialism laid the basis for twentieth century expropriations of private property—and often for the liquidation of its holders. In *Manifest der Kommunistischen Partei* (1848; *The Communist Manifesto*, 1850), Marx wrote, "The theory of the communists may be summed up in the single sentence: Abolition of private property." Although communist theory stated that wealth belonged to the laborers who created it, in twentieth century communist states the practice was for wealth to end up in the hands of the government, which, it could be argued, used this capital to inflict unprecedented misery.

Nevertheless, the relationship between Marxist states and the wealthy was not as predetermined as Marxist theory would predict. In proclaiming his New Economic Policy in 1921, Soviet leader Vladimir Ilich Lenin realized that the survival of the Soviet economy depended on allowing some private wealth and market development. The American industrialist Armand Hammer was sympathetic to the Soviet Union and was glorified in Soviet propaganda. Hammer spent his ninetieth birthday in China, where he was feted at the Great Wall Hotel in Beijing. Hammer had invested millions of dollars in China, and China's new entrepreneurial class was in attendance at his celebration. The wealthy Chinese industrialist Tan Kah Kee, who for many years had lived outside the country, returned to China in 1950 after the Communist Revolution and was an honored citizen of the People's Republic of China until his death in 1961.

While the Soviet and Chinese Communist regimes brutally executed the remnants of what they declared to be a feudal class—aristocrats, landlords, and wealthy peasants—they often spared the lives of capitalists. According to Communist ideology, Russia and China would need to pass through a stage of capitalism on their way to a socialist paradise, and in this initial phase these nations would need capitalists like Chinese businessman Rong Yiren. However, the Russian and Chinese Communists also believed that once the phase of capitalism was completed, whatever this might mean in practice, the capitalist class could look forward to its own extermination.

Chinese leader Chiang Kai-shek on the island of Taiwan or in the British colony of Hong Kong, as well in Western havens such as San Francisco and London. Although probably the wealthiest person in China, Rong Yiren did not flee. The Communist government was desperate for capital and eager to showcase Rong's decision to remain in China as both patriotic and prudent. However, it probably was uncomfortable for Rong to be a famous capitalist in the world's most rabidly Marxist state, and his position in the People's Republic of China was precarious. In later interviews, Rong stated that he remained in China because he believed that he could help alleviate the nation's poverty. The leader of the People's Republic of China, Mao Zedong, labeled wealthy industrialists and bankers who remained "national capitalists" and promised them a place in the "new" China, even while remnants of the aristocratic and landholding elite were being liquidated. Rong was allowed to continue operating his businesses, but he submitted a large portion of his profits to the state.

In 1950, Rong became a member of the Shanghai Finance and Economic Committee and a general adviser to the Communist Party on economic matters. Vice Premier Chen Yi labeled Rong the "Red Capitalist." Even when Rong's industries were nationalized in 1956, along with other privately held companies, he was treated with courtesy. Rong was paid more than $6 million in compensation, given charge of the Maoxin flour mill, and appointed vice mayor of Shanghai, China's most industrial city. When he moved to Beijing in 1959, he became vice minister of the textile industry.

However, these privileges were not enough to enable Rong to escape the ravages of China's Cultural Revolution, which threw the nation into tumult from 1966 to 1969 and resulted in the deaths of millions of people. Rong and his wife were abused by the Red Guards, Mao's ideological fanatics. His wealth was confiscated, his home looted, his artworks smashed. He was compelled to work as a janitor.

Mature Wealth

With the death of Mao and the arrest of his widow, Jiang Qing, and the "Gang of Four" in 1976, China entered a new stage. Deng Xiaoping took the reins of government, determined to make China an economic power. In 1978, Deng launched his reform campaign, looking to replace China's moribund state economy with a modern, global economy fueled by private capital and entrepreneurial initiative. Deng's motto, "To be rich is glorious," was printed on posters hung throughout China. It was a moment in Chinese history tailor-made for Rong, who had abided thirty years of Mao's ideological upheavals.

Deng asked Rong to create the China International Trust and Investment Corporation in 1978, with Deng pouring billions of dollars into this enterprise. The company's mission was to reform China's state economy by attracting foreign investment and technology. Under Rong's leadership, the corporation grew rapidly and became a transnational conglomerate. It bought land in Hong Kong and invested in companies in North America. Rong was allowed to retain a share of the company's profits. In 1987, he held a Rong family reunion in Beijing, with Deng in attendance, to celebrate the turn of events. Rong was also made a director of the Bank of China and a member of the Standing Committee of the People's National Congress. He dressed handsomely in the garb of a Chinese professional, accented with fine Western accessories. Rong's only son, Rong Zhijian, known in the West as Larry Yung, assisted his father in the activities of the China International Trust and Investment Corporation. As proof of their success, the heads of China's Communist Party vied to have their sons and daughters placed in key posts in this corporation.

The brutal massacre of students in Tiananmen Square in 1989 was a setback to Deng's economic reforms, as China faced boycotts and economic sanctions from other nations. Rong is alleged to have written a letter to the Communist Party, in which he urged peaceful negotiations with student demonstrators. Nevertheless, after Deng's crackdown on protest, Rong was allowed to continue as president of the China International Trust and Investment Corporation and worked to attract investment, particularly from South Korea and Taiwan. In 1993, he was appointed vice president of China. He retired in 1998. At his death in 2005, Rong's fortune was estimated at almost $2 billion. His son Larry Yung inherited his father's fortune and his role in assisting China in the world of international finance and enterprise.

Legacy

Few people have straddled two worlds as dramatically or successfully as Rong Yiren. Heir to the greatest fortune of pre-Communist China, he made the shocking decision to remain on the mainland after the Communists seized power. Alternately praised and abused in China's ideological windstorms, his time came in what can be called the second revolution of Communist China—the market reforms of Communist Party leader Deng Xiaoping. Deng successfully called upon Rong's expertise, and Rong took the lead in attracting foreign investment to China and aggressively investing China's reserves in overseas industries. Although considered China's richest citizen at his death, his true legacy is having helped usher in a new world of international finance and market reform in what had once been the world's most ideologically driven and relentless Marxist state.

Roscius

Roman actor

Roscius, an actor, amassed a huge fortune and gained great respect. These accomplishments were remarkable in ancient Rome, where actors were typically seen as little better than criminals and often barely managed to earn enough money to survive.

Born: c. 126 B.C.E.; Solonium (now in Italy)
Died: 62 B.C.E.; Rome (now in Italy)
Also known as: Quintus Roscius Gallus
Source of wealth: Acting
Bequeathal of wealth: Unknown

Early Life

Quintus Roscius Gallus, better known as Roscius (ROH-shee-uhs or ROH-shuhs), was born in a small village called Solonium near Lanuvium (now Lanuvio, Italy). The often-repeated story that he was born into slavery is now thought by some authorities to be specious, based on a misunderstanding of Pliny the Younger's remarks about Roscius or else on Pliny's own misunderstanding of Roscius's background. Next to nothing is known of Roscius's parents or his personal life, including whether he married and had children.

First Ventures

It is not certain what prompted Roscius's interest in acting or at what age he began his theatrical career, but he most likely started acting when he was a boy or very young man. He seems to have quickly made a name for himself, primarily as a comic actor, although he did appear occasionally in tragedies. He soon became one of only a handful of Roman thespians to become what later generations would label a superstar, and a number of ancient writers note his remarkable popularity with all sorts of theatergoers. He was a handsome man, another trait much commented upon by contemporary Roman writers. As he grew older, he developed a problem with his eyes, usually described in English translations of Latin texts as a "squint." This affliction may be the reason that he later wore a mask on stage, in the manner of Greek actors. His use of a mask was an innovation in Roman comic theater, and other actors soon began to follow the popular actor's lead and to also wear masks.

Mature Wealth

Roscius studied the oratorical skills of his friend Cicero, who once defended him in a notorious court case, and other famous speakers. Roscius excelled in playing the *leno*, the comic stock character of the avaricious pimp or slave trader, his most famous depiction of which was that of Ballio in Plautus's *Pseudolus* (191 B.C.E.; English translation, 1774). He taught acting and wrote a treatise on the craft.

The widespread popularity of Roscius inspired the dictator Lucius Cornelius Sulla to elevate him to equestrian rank. To be eligible for this ennobling, ceremonially conducted by the bestowing of a gold ring, the actor would have to have possessed a net worth of at least 400,000 sesterces. Converting ancient monetary units to modern equivalents is difficult, but some sense of how significant this amount is can be suggested by comparison. For example, a Roman legionnaire at the beginning of the common era earned only about 1,200 sesterces a year, and Pliny the Younger indicates that a farm cost about 100,000 sesterces. Pliny also mentions that the comic poet Juvenal insisted that a Roman of his day could live free of economic worries on 20,000 sesterces a year. If one compares these numbers to some authorities' estimations of the annual income of Roscius—approximately 600,000 sesterces—the extent of his wealth appears staggering. The references of his contemporaries to changes in his appearance over time, such as the lessening of his good looks and the development of the "squint," imply that his career was lengthy. However, even if his heyday consisted of only ten years, he may have earned about 6 million sesterces in that decade.

Legacy

While it is uncertain what happened to Roscius's wealth upon his death, his legacy remains clear in other ways. His rise to fame and the respect he earned in a much-disparaged profession truly is a classic rags-to-riches story of personal triumph. His expertise in his craft kept his name alive for millennia in the English language. Eminent British actors, such as Richard Burbage and David Garrick, were often referred to by the admiring epithet of "Roscius." As late as the 1860's in the United States, the term "the African Roscius" was used to describe Ira Frederick Aldridge, one of the first African American actors to play serious dramatic roles.

JULIUS ROSENWALD

American merchant

Rosenwald was an executive of Sears, Roebuck and Company and made the retail chain a national giant. He was also an important philanthropist, helping to build schools for African Americans across the South and to found Chicago's Museum of Science and Industry.

Born: August 12, 1862; Springfield, Illinois
Died: January 6, 1932; Chicago, Illinois
Source of wealth: Retailing
Bequeathal of wealth: Educational institution; museum

EARLY LIFE

Julius Rosenwald (ROHZ-ehn-wahld) was born and raised in Springfield, Illinois. At the age of sixteen, he was apprenticed to a relative in New York City to learn how to make clothes. Rosenwald made a number of connections while he was in New York that would help him in later years, including establishing friendships with Henry Goldman, later a partner in the Goldman Sachs investment bank, and Henry Morgenthau, Jr., who served as secretary of the Treasury during the administration of Franklin D. Roosevelt.

When his apprenticeship was completed, Rosenwald and his younger brother Morris went to work for a clothing firm. However, the firm closed as a result of an economic downturn in 1885, and Rosenwald decided to move to Chicago.

FIRST VENTURES

In Chicago, Rosenwald and Morris started another clothing company that manufactured standardized clothing, which was becoming more fashionable. The Rosenwald brothers joined with a cousin, Marcus Weil, to organize their company. The firm did relatively well, and one of their prime customers was Sears, Roebuck and Company, which originally made watches and had started to diversify by the early 1890's. Alvah C. Roebuck retired from the business in 1895, and his partner, R. W. Sears, was looking for investors. Sears turned to Aaron Nusbaum, Rosenwald's brother-in-law, who in turn recruited Rosenwald as an investor. Rosenwald was made vice president of Sears, Roebuck in 1895.

MATURE WEALTH

Rosenwald served as vice president from 1895 to 1908, and he then replaced Sears as the company's president from 1980 to 1924; he was chairman of the board from

1924 until his death in 1932. During these years with the company, Rosenwald helped Sears, Roebuck greatly expand its retail business. In the 1890's, the firm moved into the general merchandising market, offering a wide array of goods, which expanded its catalog and mail-order sales. The company also began selling its merchandise at a chain of stores.

Rosenwald carefully and methodically selected the items to be sold in the company's stores. In the 1910's, he was one of the first businessmen to create a profit-sharing plan for his employees, and he supported efforts to increase the wages of salesclerks. Rosenwald also transformed Sears, Roebuck into a publicly traded firm, with his friend Goldman helping to prepare the initial public offering.

After World War I, Sears, Roebuck's sales plummeted. The company, unable to predict this decline, had not scaled back its inventory of merchandise and was close to declaring bankruptcy. Rosenwald loaned the company $21 million of his own money in 1921, enabling the firm to prosper and return to financial stability the following year.

During his years at Sears, Roebuck, Rosenwald participated in philanthropic and public service work. He established the Rosenwald Fund in 1917 to provide financial assistance to those in need, particularly targeting African Americans and Eastern European Jews. To help African Americans, he provided funding to establish five thousand schools throughout the South, with the stipulations that the communities in which the schools were located would raise matching funds and that white people in these communities would assist in the fund-raising efforts. This last stipulation was Rosenwald's attempt to combat the prevalent racism of the South.

Rosenwald also assisted universities. He was a trustee of Tuskegee University for two decades, and he helped to fund buildings at several African American colleges. His foundation endowed thousands of scholarships for deserving students. He also financed dental clinics and helped to build Young Men's Christian Association (YMCA) facilities in African American areas. Rosenwald believed there was a need for moderate-income housing, and to this end he built the Michigan Boulevard Garden Apartments in Chicago. The complex contained four hundred housing units, gardens, and a playground. Rosenwald was active in a variety of other ventures, including assisting the National Urban League.

During World War I, Rosenwald was a member of the Council on National Defense, visiting American troops who were stationed overseas. He also served on President Woodrow Wilson's Industrial Conference. Rosenwald believed the U.S. government should provide assistance to rural areas, and he was influential in getting the Department of Agriculture to send out county extension agents.

Rosenwald was the first person to endow Chicago's Museum of Science and Industry, eventually providing more than $5 million to create the institution. He served as the museum's president from 1927 to 1932.

The Museum of Science and Industry, Chicago

The Museum of Science and Industry in Chicago is the largest museum of its kind in the world. It is housed in a building that is more than one hundred years old and was originally built for the World's Columbian Exhibition in 1893.

Julius Rosenwald was one of the driving forces behind the museum. He was said to have gained his inspiration for the institution from a museum in Munich, Germany. In 1926, he pledged $3 million to construct a similar museum in Chicago, and he later provided an additional $2 million. Rosenwald also served as the museum's president from 1927 to 1932. He died a year before the building opened to the public in 1933.

Since then, the museum has continued to grow and develop. Some of the original exhibits are still on display, including a huge model train and a coal mine. Over the years, however, more modern technology has been featured, with areas devoted to space flight and the only captured German submarine from World War II. A full-scale Boeing 727 jet, a replica of the Wright brothers' aircraft, an Apollo spacecraft, and one of the fastest trains from the 1930's are all permanently displayed. The museum also presents rotating exhibits, including some that focus on the latest technologies, such as an eco-friendly house.

The museum's overall goal—to educate the public about science—has not changed. It was one of the first museums to have hands-on exhibits, which continue to be one of its hallmarks. The museum has used new technology to make some of its exhibits even more interactive. Rosenwald greatly believed in education for the underprivileged, and he would have been proud to learn that the Museum of Science and Industry has created partnerships to provide instruction to inner-city children. The museum also offers workshops for teachers. It uses its Web site to bring educational resources to many different groups, including providing online activities that students and teachers can conduct in the classroom.

Legacy

Rosenwald's legacy is found in two areas: education and the creation of the Museum of Science and Industry in Chicago. At a time when most southern states had few high schools and colleges, most of which were underfunded, Rosenwald provided money to existing elementary and secondary schools and established a network of African American schools. Without his schools, thousands of African American students in the South would not have received an education. It is estimated that more than 600,000 students a year received an education at the schools he built or helped fund.

Rosenwald's other significant contribution is the Museum of Science and Industry. One of the first museums to focus on the sciences and technology, by the twenty-first century it was the largest museum of its kind in the world. To many, it is a model of what a museum of science and industry should be.

First Baron Rothschild

British banker and politician

Rothschild used his family's immense wealth and financial reputation to play a political role in influencing British policy both at home and abroad. His lack of initiative in pursuing new financial avenues left an opening for other banks and reduced the ubiquity of the Rothschild name.

Born: November 8, 1840; London, England
Died: March 31, 1915; London, England
Also known as: Nathan Mayer Rothschild (birth name); Sir Nathan Mayer Rothschild; Natty Rothschild
Sources of wealth: Inheritance; banking
Bequeathal of wealth: Spouse; children; charity

Early Life

The first baron Rothschild (ROTH-child) was born Nathan Mayer Rothschild. His family was one of the wealthiest in England. He grew up in London and was educated by private tutors. His academic accomplishments in areas like the humanities outstripped his mathematical skills. He went to Cambridge University in 1859, but he left Trinity College three years later without completing his degree. One benefit of his college years was getting into the circle of Queen Victoria's eldest son, the prince of Wales, although there is no evidence that Rothschild was attracted by the moral laxity that prevailed there.

First Ventures

On leaving Cambridge, Rothschild entered the family firm of N. M. Rothschild and Sons, which was under the direction of his father, Lionel Nathan Rothschild. In 1867, he married Emma Louisa, a cousin from Frankfurt, in accordance with the endogamous practice of the Rothschild family. Rothschild lived in London, and after his father's death he moved into the house in which he grew up. Of his three children, his elder son became a zoologist, but his younger son Charles was to succeed him at the bank. Rothschild himself succeeded to the directorship of the Rothschild family firm on the death of his father in 1879.

First Baron Rothschild. (The Granger Collection, New York)

Mature Wealth

Rothschild was more concerned with preserving the sources of the family's wealth than with following the tradition of his grandfather's pursuit of new avenues for investment and trade. The family had long been a mainstay of international lending at the governmental level, and Rothschild was content with continuing these financial dealings. By temperament he was averse to risk and sought to avoid anything savoring of danger. For example, he refused to insure the RMS *Titanic* on its maiden voyage, a decision for which he was ridiculed at the time. His financial conservatism also enabled him to save Barings Bank, the best known of his competitors, when the institution needed help to avoid bankruptcy. On the other hand, his financial assistance for Cecil Rhodes's adventures in Africa proved to be a boon, although the initiative may have been a political gesture in support of the British Empire rather than a financial transaction.

He was perhaps happier outside the offices of his company. Rothschild was elected a member of Parliament in 1865, when he was a candidate from a riding that included one of his family's estates. He remained in the House of Commons for two decades, although he was not politically active in this role. He preferred to exercise his influence with the government in private. In particular, he was worried throughout his life about the Russian government's tolerance for the persecution of Russian Jews, and his support of the British government depended on its readiness to stand up to Russia. His company even refused to make loans to Russia in the hope that this action would alter the political climate there. He was elevated to the peerage by Prime Minister William Ewart Gladstone in 1885, the first British Jew to be so honored. In addition to his political efforts on behalf of Russian Jews, he was a generous supporter of efforts to assist immigrants from Russia who moved to England.

As Rothschild grew older, his deafness increasingly kept him out of society, although he remained on close terms with leading politicians, such as Arthur Balfour. At the time of his death in 1915, he left an estate of more than £2.5 million, and his funeral attracted a crowd of five thousand.

Legacy

Rothschild's career in the world of finance depended on his coming into the firm founded by his grandfather and cultivated by his father. He was able to pass along a healthy company to his son, but the events of World War I that were sweeping over Europe interfered with the international organization of the Rothschild family. Dealing with the changed world after the war was left to the next generation, but Rothschild himself lived in a way that showed that Jews were accepted as part of the British political and social structure as never before.

James Mayer Rothschild

French banker and winery owner

Rothschild headed the Paris branch of the Rothschild family bank. Supplying credit to cash-starved governments and investing in railways, he assisted in the industrialization of Europe.

Born: May 15, 1792; Frankfurt am Main (now in Germany)
Died: November 15, 1868; Paris, France
Also known as: Jakob Mayer Rothschild (birth name); Baron James Mayer de Rothschild
Sources of wealth: Inheritance; banking
Bequeathal of wealth: Spouse; children

Early Life

James Mayer Rothschild (MI-uhr ROTH-child) was born Jakob Mayer Rothschild in Frankfurt am Main, the youngest of the five sons of Mayer Amschel Rothschild and Guttle Schnapper Rothschild. Mayer had risen from the Jewish ghetto to become a leading banker in what is now Germany. He established a banking partnership among his five sons, sending them to the financial capitals of Europe: Amschel to Frankfurt, Nathan to London, Salomon to Vienna, Calmann to Naples, and James to Paris. James arrived in Paris in 1815, and armed with Rothschild capital he quickly became the leading banker in the country. In this tumultuous period of French history, French kings, aristocrats, and governments relied on him for loans.

First Ventures

Rothschild was eager to ascend in French society. In 1817, he moved to Paris's chief financial district in the ninth arrondissement (administrative district). He purchased a summer house with a three-acre garden at Boulogne-sur-Seine. A year later, he moved into a commodious *hôtel* (private mansion) on the fashionable rue Laffitte. In 1822, he was made a baron of the Austrian Empire. In 1824, he married his niece Betty Rothschild. They would have five children: Charlotte, born in 1825; Alphonse, in 1827; Gustave, in 1829; Salomon, in 1835; and Edmond, in 1845. In 1829, Rothschild purchased a twelve-hundred-acre hunting estate in Ferrières, a suburb of Paris, replete with a historic château (castle). James and Betty made forays into French high society, hosting several full-scale balls and state dinners featuring sumptuous and elaborate cuisine.

After the 1830 revolution in France, Rothschild played a major role in stabilizing the nation's finances. In the1840's, he invested heavily in French railways, helping make France a modern industrial power. During the 1848 revolutions in Paris and other parts of Europe, Rothschild labored to preserve unity among the five branches of his family's bank. In 1850, he wrote a significant letter to his nephew Lionel, who had assumed control of the powerful London branch of N. M. Rothschild and Sons from his father Nathan. James warned that if the dissension in the family's banking business was not healed, the Rothschild wealth was in danger of falling into the hands of outsiders. "It is easier to break up a thing than to put it back together again," he wrote.

In 1852, under James's leadership, a new partnership agreement among the Rothschild sons was arranged. James was allotted 20 percent of the Rothschild capital, worth £1,847,083. In 1855, his share was increased to 25 percent, worth £2,727,987. Under his astute management, the Paris branch outstripped the other Rothschild banks in the accumulation of capital. In 1818, when the five banking branches were established, the London branch was capitalized at £742,000, Frankfurt at £680,000, and Paris at £350,000; in 1852, Paris had the most capital, with £3,542,000, compared with Frankfurt at £6,694,000 and London at £2,500,000. In 1874, Paris had far outstripped the other branches, with capital of £20,088,000, while London had £5,922,000 and Frankfurt had £4,735,000.

Mature Wealth

A secret of the Rothschilds' success was their ability to operate as a cohesive unit, a strategy initially developed by Mayer Amschel Rothschild and continued in the second generation by James. With branches throughout Europe, the family held a remarkable advantage over competing bankers. The Rothschilds were fanatically insular. Determined to maintain their money within the confines of their family, they tended to marry their own nieces and cousins. They did intermarry with the Sassoons, a like-minded Jewish family of merchants who had accumulated their fortune in Persia and India; two of James's grandchildren would marry Sassoons.

James's primary business activity was lending money to the governments of Europe at a time when countries had not established stable bond markets. Although he was cautious in dealing with the succession of Bonapartist and royalist governments of France, he became the leading financier of his adopted nation. In the 1850's, he made several large loans to Prussia. In 1849, he loaned about 150 million lire to the Kingdom of Piedmont-Sardinia. From 1850 to 1857, he loaned the Vatican about 150 million francs, a large portion of the papal debt.

In 1855, Rothschild and his brothers formed the Creditanstalt group of banks in order to dominate the finances of the Austro-Hungarian Empire. With the Creditanstalt and other firms, Rothschild financed railroad construction throughout Europe. In association with the German Jewish banker Gerson von Bleichröder, he helped fund Otto von Bismarck's consolidation of the German territories. Because of their substantial loans to all of Europe's nations, the Rothschilds were a natural force for stability and peace in Europe. James advocated for the Anglo-French rapprochement that would prove one of the dominant new alliances of modern Europe.

Rothschild commissioned the leading English architect Joseph Paxton and builder George Myers to construct an 18-million-franc mansion in Ferrières. Completed in 1860, this residence featured more than eighty rooms filled with paintings by masters such as Sir Anthony van Dyck, Peter Paul Rubens, and Diego Velázquez. An underground railway connected the dining room to the kitchen. Paxton designed a fantastic assemblage of ponds, bridges, hothouses, greenhouses, conservatories, gardens, and miniature farms filled with exotic animals. Rothschild also purchased Château Lafite, one of France's great wineries, for 4.1 million francs in 1868.

Rothschild's philanthropy seemed motivated as much by public relations as by good intentions. For example, in 1852 he built a new Jewish hospital in Paris and funded a new synagogue, two new orphanages, and a soup kitchen in the rue de Rivoli. He subsidized several authors, including Honoré de Balzac. Nevertheless, he was the inspiration for the unflattering character of Gundermann in Émile Zola's novel *L'Argent* (1891; *Money*, 1891), and for the character Nucingen in Balzac's novel *Le Père Goriot* (1934-1835; *Père Goriot*, 1860), reappearing in much of Balzac's *La Comédie humaine* (1829-1848; *The Comedy of Life*, 1885-1893, 1896). As wealthy Jewish capitalists, the Rothschilds were targets of all manner of anti-Semitic attacks.

James Rothschild died in 1868 at the age of seventy-six. Niall Ferguson, who has written a biography of the Rothschild family, maintains that James was one of the richest men in history. When James died, newspaper accounts estimated his cash holdings alone at between 1,100 and 2,000 million francs, which would have amounted to about 8 percent of the French gross national product and would be worth about $100 billion in 2010 dollars. Ferguson, however, calculates a less staggering figure for Rothschild's estate. He estimates Rothschild's cash holdings at 20 million francs; his extensive real estate holdings in the rue Laffitte, Ferrières, Boulogne, and Château Lafite at 30 million francs; and his stake in the Rothschild business at 143 million francs, for a total of 193 million francs. However, even this amount does not include the value of Rothschild's private portfolio of securities or his immense art collection. In the end it might be enough to say that in terms of financial holdings, partnerships, and influence, the Rothschilds held the greatest private fortune in history, and James was the wealthiest member of the family.

As specified in James's will, the bulk of his estate was left to his widow Betty. A large proportion of the residual properties were bequeathed to his oldest son, Alphonse, with the remainder equally divided among his other sons and daughters. Rothschild also left money to his grandchildren, daughters-in-law, other relatives, and servants.

Legacy

A member of a family whose wealth rivaled only that of the Rockefellers, James Mayer Rothschild played a pivotal role in his family's fortunes. In the century from 1815 to 1914, the Rothschilds were the wealthiest family in the world, their capital and influence without rival until the creation of other banking and industrial conglomerates in the 1880's. James inherited his father's business abilities and was perhaps the most capable of the five Rothschild sons. He built the family's Paris branch into a financial titan.

James was allied most closely with his older brother Nathan. Together, they forged an English-French banking alliance that not only dominated European finance but also prefigured the French-British rapprochement of the late nineteenth century. The governments of Europe relied on the Rothschilds in an age when there was no reliable system of sovereign bonds to raise capital. In his elaborate social functions, his Ferrières mansion and grand art collection, and his acquisition of the Château Lafite winery, James Mayer Rothschild symbolized the transition of the Rothschild family from a group of Jewish financiers outside the social mainstream to members of the highest echelons of European society.

Food, Wine, and Wealth

In a sense, wealth began as food. In primitive times, when starvation was omnipresent because of droughts, floods, fire, rain, ice, locusts, spoilage, mold, and other difficulties, the ability to accumulate food represented wealth. Storehouses of grain, fields of wheat and rice, vineyards, domesticated livestock, fishing barges, and slaves to work farms, paddies, and rivers were the first source of excess riches. For most of humankind, existence consisted of heavy labor to eke out daily sustenance, enough calories to sustain another day of work. For the wealthy, however, food could be a luxury, with gourmet delicacies transported from across the globe or cultivated and stored with intensive human labor and prepared with great expertise to equip the finest tables.

Ancient Western texts refer to the fatted cows and delicious wines served to the wealthy on festive occasions. The Chinese have been producing fine cuisine for several millennia. However, the global culture of fine dining did not exist until the explosion of worldwide trade in the Middle Ages. At this time, spices and teas were obtained from the East at great cost. Pasta became a dish for the wealthy people of Italy. European aristocrats developed a taste for caviar, the prized delicacy of Russian royalty. In fact, much of the increase in trade during the late Middle Ages was prompted by the desire to obtain ingredients from faraway cultures for the markets of Europe. The rich dined on herring, lobsters, oysters, grouse, pigeon, caviar, truffles, chocolates, cakes, mustards, all kinds of spices, and other delicacies.

Beginning in the late Middle Ages, fine restaurants were established that catered to the tastes of wealthy diners. The Wierzynek in Kraków has served the Polish nobility roast game, including quail, deer, duck, and boar, since 1364. The Owariya in Kyōto, Japan, has served varieties of Japanese soba and udon noodles since 1465. La Procope opened in Paris in 1686, catering to the leading members of French society for several centuries. Nearby, Tour d'Argent has been showcasing haute cuisine for four centuries, individually pressing and numbering each of its famous duck dishes. Botin, a restaurant in Madrid, has featured Spanish specialties of suckling pig and roast lamb since 1725. In the nineteenth century, aristocrats dined at Delmonico's in New York City, the Union Oyster House in Boston, Yar in Moscow, Rules in London, and Maxim's in Paris.

The most expensive food product is wine. A 1784 bottle of the famous Château d'Yquem Sauterne sold for $56,588 in 1986; a 1945 bottle of Château Mouton Rothschild sold in 1997 for $114, 614. James Mayer Rothschild's Château Lafite winery, famous for producing "the king's wine," dates from the seventeenth century, and Rothschild's purchase of this winery represented the symbolic entry of the Rothschilds into the world of high society. Château Lafite also produced the most expensive bottle of wine ever sold: a bottle from 1787 bottle that cost $160,000 in 1985.

MAYER AMSCHEL ROTHSCHILD

German merchant and banker

Although Rothschild began and ended his life in a German Jewish ghetto, he managed to grow wealthy and forge strong business relationships with royalty. Thanks to the accumulated wealth, influential connections, business skills, and philosophy of family unity that he passed down to his five sons, Rothschild's descendants quickly rose to prominence as powerful international financiers.

Born: February 23, 1744; Frankfurt am Main (now in Germany)
Died: September 19, 1812; Frankfurt am Main
Also known as: Meyer Amschel Rothschild
Sources of wealth: Banking
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

Mayer Amschel Rothschild (MI-uhr AM-shehl ROTH-child) was born in 1744 in the Judengasse, or Jews' alley, the Jewish ghetto of Frankfurt am Main (now in Germany). He was the fourth of eight children (five of whom survived childhood) born to Schöenche Lechnich and Amschel Moses Rothschild. Mayer and his siblings learned business at an early age from their father Amschel, who was a lower-middle-class merchant and money changer. Money changing was a critical part of conducting business in mid-eighteenth century Germany, which was a patchwork of small independent states with their own currency systems. Through his father's business, Mayer learned about exchange rates and developed an interest in rare and historically valuable coins. The boy received a traditional Jewish religious education, first in the Judengasse and later at the Jewish seminary in Fürth near Nuremberg. In 1755, a smallpox epidemic claimed his father's life; his mother died nine months later.

FIRST VENTURES

In 1757, at the age of thirteen, the orphaned boy moved to Hanover, where family connections had secured him an apprenticeship at the Oppenheimer Bank. There Rothschild learned the rudiments of banking. He also became acquainted with a general named von Estorff, an ardent coin collector, who employed the savvy Rothschild to locate and buy valuable coins on his behalf.

Around 1763, Rothschild returned to Frankfurt. He joined his brothers Moses and Calmann Rothschild in running the family pawnshop, secondhand-goods business, and money changing bureau. He also began to develop a business of his own: a trade in old coins, medals, jewels, curios, and antiques. His acquaintance with von

Estorff proved invaluable, as the general knew Prince Wilhelm of Hanau. Through von Estorff, Rothschild forged a business relationship with the prince, who was interested in investing in rare coins and medals. In 1769, after years of selling to the prince, Rothschild requested and received from Wilhelm the designation of "court factor," essentially an official acknowledgment that Rothschild had done business with royalty. The prestige of the factorship no doubt helped him advance as a merchant; it may also have played a part in his winning the hand of Guttle Schnapper, the daughter of well-to-do Judengasse tradesman Wolf Schnapper. Rothschild married Guttle in 1770 and received a considerable dowry of 2,400 gulden. Beginning around 1771 and for the next twenty years, Rothschild had a catalog of his old coins, medallions, and antiques printed for distribution to royalty and other wealthy potential customers.

Mature Wealth

Between 1771 and 1779, Rothschild's income averaged 3,835 gulden annually, making him wealthier than many of Frankfurt's more prosperous Christian citizens. He expanded his business to include trade in goods such as coffee, sugar, rabbit pelts, and English cloth. He also began to act as a banker, providing small loans, letters of credit, and capital transfers. Prince Wilhelm had sufficient need of Rothschild's services, and in 1783 Wilhelm's representatives intervened with Frankfurt authorities in order to obtain a special pass that allowed Rothschild to leave the Judengasse after dark and on Sundays and holidays.

By the mid-1780's, with assets estimated at 150,000 gulden, Rothschild was wealthy enough to afford a larger home for his wife and six children. (By 1792, Guttle had given birth to four more.) In 1786, the family moved into a residence called the House at the Green Shield. While one of the better Judengasse homes, the four-story Green Shield—only fourteen feet wide and thirty-eight feet long—provided cramped quarters for the growing family, who shared the space with merchandise and business offices.

Rothschild and his wife lived simply, and they generally channeled profits back into their business. Rothschild trained his children in the business, especially his five sons, Amschel Mayer, Salomon Mayer, Nathan Mayer, Calmann Mayer, and James Mayer Rothschild. He placed particular emphasis on the power of family unity. As his sons matured, Rothschild made them junior partners in his business, and all of them shared profits and losses. When they married, Rothschild brought his daughters-in-law into the business. Rothschild relied on his family because they were more accountable, better able to maintain confidentiality, and cheaper than outside help.

Beginning in 1789, Rothschild received a gradually increasing share in the financial affairs of his royal client, Wilhelm. Four years earlier the prince had become William IX, the landgrave of Hesse-Cassel, inheriting a sizable fortune to manage. Carl Friedrich von Buderus Carlshausen, one of Wilhelm's court officials, whom Rothschild had befriended years earlier, had been made Wilhelm's chief revenue officer, and he strove to send business to Rothschild.

The years of war that followed the French Revolution in 1789 were a time of dramatic growth and prosperity for Rothschild's business. He traded in cloth, foodstuffs, and tobacco, with wartime shortages enabling him to command high prices. The Austrian army became a major client for his war matériel business. When almost half of the Judengasse was destroyed in the 1796 French bombardment of Frankfurt (the House at the Green Shield was unharmed), Rothschild took full advantage of the subsequent loosening of the city's restrictions upon Jews. He moved all of his stores to warehouses outside the ghetto and opened business offices beyond the Judengasse walls. As of 1797, Rothschild's assets were more than 470,000 gulden.

In 1806, when Wilhelm, by then elector of Hesse-Cassel, fled the country to escape Napoleon I's troops, Rothschild kept four trunks of Wilhelm's private papers and possessions safely concealed at the House at the Green Shield and covertly acted as a debt collector and investor on Wilhelm's behalf during the elector's exile. Buderus, who had become the profit-obsessed Wilhelm's chief financial adviser, authorized Rothschild to borrow the money he collected for Wilhelm, which Rothschild invested in British securities through his third son, Nathan Mayer Rothschild, who had moved to England in 1798. When shrewd investments enabled Nathan to acquire gold with which to fund the the duke of Wellington's campaign against Napoleon I, Rothschild and his sons on the Continent helped smuggle this gold to the duke in Spain.

In his later years, Rothschild lobbied for equal rights for Frankfurt's Jews, which his people obtained in late 1811, in exchange for a sizable cash payment to the city, a quarter of which Rothschild paid himself. In 1812, the sixty-eight-year-old Rothschild died in his Judengasse home. He left the family business exclusively to his sons, in five equal shares. He sold his own shares in the busi-

The House of Rothschild

Mayer Amschel Rothschild and his wife Guttle died wealthy, but they died in the restrictive Jewish ghetto in Frankfurt where their families had lived for centuries. Their five sons, by contrast, began their days in the crowded, unsanitary ghetto of their forefathers, but they ended them in sumptuous residences as titled nobility.

Mayer's sons founded branches of the family business in commercial centers throughout Europe. His eldest son, Amschel Mayer Rothschild (1773-1855), remained in Frankfurt with his father and assumed control of the Frankfurt branch upon Mayer's death in 1812. Salomon Mayer Rothschild (1774-1855) went to Austria in 1820 and established the firm S. M. von Rothschild in Vienna. Nathan Mayer Rothschild (1777-1836) ventured to England in 1798 and founded N. M. Rothschild and Sons in London in 1811. Calmann Mayer Rothschild (1788-1855) established C. M. de Rothschild e Figli in 1821 in Naples, Italy. The youngest son, James Mayer Rothschild (1792-1868), moved to France in 1811 and founded de Rothschild Frères in Paris in 1817. The brothers, trained by their father to value family unity above all, formed a powerful banking network against which few could compete in the emerging field of international high finance.

In 1817, in recognition of the role that the house of Rothschild played in developing Austria's economy, Austrian emperor Francis I made Mayer and his descendants nobility. All but the English branch of the family added the prestigious "von" or "de" to the Rothschild name. In 1822, Austria granted the title of baron to the five brothers. Amschel, Calmann, and Jakob gentrified their first names to Anselm, Carl (or Charles), and James, although none forsook his Jewish heritage. Indeed, the family used its money and influence to advance the cause of Jewish equality throughout Europe.

The family's wealth, prestige, and international clout only increased as the house of Rothschild became the bank of nineteenth century royalty, statesmen, and governments. After financing the British war effort against Napoleon I, the Rothschilds remained at the hub of influential change in Europe and abroad. The house of Rothschild financed military actions, railway systems, mining, oil exploration, and high-profile projects, such as construction of the Suez Canal in the 1950's.

Unlike their conservative parents, the Rothschild brothers and their children did not shy away from conspicuous consumption. Palatial estates, extravagant entertainments, world-class vineyards, and impressive collections of art and antiquities became associated with the name Rothschild. In time, the family also became known for patronizing the arts and sciences, making major donations of artworks to public institutions, and other large-scale philanthropy. In the twentieth century, entire Rothschild properties, such as England's Waddesdon Manor and Ascott House and France's Villa Ephrussi de Rothschild, were donated for use as public museums.

ness and all his other possessions to his sons for a nominal 190,000 gulden, which was to be disbursed for the benefit of his wife and daughters. His will stated that any of his heirs who worked against the unity of the family was to receive only the legal minimum specified in the Napoleonic Code, minus what he or she had received up to that point. He also left 100 gulden to three Christian charitable foundations.

Legacy

Mayer Amschel Rothschild was a canny businessman who understood the value of diversification. During chaotic times when wars and occupations rocked his city and country, he identified needs that he could fulfill as an entrepreneur. He was willing to forgo immediate profits in the interest of winning future business. While humble and self-effacing, he did not hesitate to pursue and cement advantageous connections, even with persons whose assets, social standing, and religion were far different from his own. He amassed considerable wealth during his lifetime but prioritized the well-being of his business over ostentatious living. For Rothschild, business and family life were inextricably linked, and the health of the business relied upon familial harmony and cooperation. His distinctive approach to making and retaining wealth made him the founder of an international dynasty of bankers.

Nathan Mayer Rothschild

British banker and merchant

Rothschild created a new level of internationalism in commodities trading and banking. His readiness to provide loans to governments and royalty gave his business a connection with politics that transcended national boundaries.

Born: September 16, 1777; Frankfurt am Main (now in Germany)
Died: July 28, 1836; Frankfurt am Main
Source of wealth: Banking
Bequeathal of wealth: Spouse; children; charity

Early Life

Nathan Mayer Rothschild (NAY-thun MI-uhr ROTH-child) was born in the Jewish ghetto of Frankfurt, the son of Mayer Amschel Rothschild, a coin dealer and moneylender, and his wife Guttle. His father brought Rothschild into the family business at the age of twelve, and his brothers followed him. Rothschild left Frankfurt for England in 1798 out of concern that the fighting between England and France would interfere with the family's ability to trade in British merchandise. He learned English and became a naturalized British citizen, although he never lost his German accent.

First Ventures

In England, Rothschild initially traded in textiles and other commodities in Manchester as an agent for his father's business. This venture enabled him to offer ready money to those with wares to sell and to receive this merchandise at prices lower than his competitors' prices. He also started trading on the stock exchange. In 1806, he married Hannah Barent Cohen, which gave him a connection to both the business world and the Jewish community.

Rothschild came to London in 1808 and started dealing in bullion the next year. He was able to sell bullion to the British government at a time when the duke of Wellington's soldiers in Spain were threatening to revolt because they had not been paid. This opportunity placed Rothschild in a unique position as a financier for the government.

Mature Wealth

Rothschild became a legend in 1815, when his news that the British had won the Battle of Waterloo reached the British government in London a day before official sources. He began to deal directly with the Bank of England, and he helped to avoid a run on this bank at a time when other banks were failing. He was also involved in making loans to a number of European countries, especially the Austrian Empire, from which he received a patent of nobility. His handling of foreign loans benefited from the international character of his family's business, as his brothers had gone to the financial capitals of Paris, Vienna, and Naples, in addition to the business hub of

Frankfurt. When Napoleon I took possession of parts of what became Germany, at least one elector put his wealth in the hands of Rothschild for safekeeping. Rothschild helped finance the government of King Louis XVIII of France after Napoleon I's defeat. Brazil's status as an independent country also depended on Rothschild's financing.

At the height of his career, Rothschild was able to enter into areas like life insurance in order to break the stranglehold of others' monopolies. He was not interested in the life of a country gentleman, although he moved his family out of his place of business in 1816, a luxury his father had never been able to afford. He put his wealth and reputation at the disposal of those who wished to see the Jews of England take advantage of the liberalization in laws governing the right to vote.

Rothschild died in 1836 while at a family conclave in Frankfurt, and his body was brought back to London for burial. At his death he left an estate of slightly more than £1 million. Even though his son Lionel Nathan Rothschild was brought in as head of the firm, now called N. M. Rothschild and Sons, the leadership of the international Rothschild network passed to Rothschild's brother James Mayer Rothschild in Paris.

Legacy

Nathan Mayer Rothschild brought the image of financier to a new level of awareness in the public mind of Great Britain. He appears in Lord Byron's poem *Don Juan* (1819-1824) in a somewhat ambivalent role, and there was enough anti-Jewish feeling in England at the time for a lukewarm reception of Rothschild's wealth. The importance of his contributions to the government made him something of a necessity in the tradition of the Court Jew of earlier centuries. As the nineteenth century went on, the wealth of the Rothschilds would be used to support the emancipation of Jews in England, enabling them to obtain better educations and to become involved in the political process.

J. K. ROWLING

British author

Rowling achieved the extremely rare feat of becoming a multimillionaire by means of authorship—an accomplishment all the more remarkable for being achieved in the previously unproductive field of children's fiction and in an era when the reading habit seemed to be dying out among the young.

Born: July 31, 1965; Chipping Sodbury, Gloucestershire, England
Also known as: Joanne Kathleen Rowling; Kennilworthy Whisp; Newt Scamander
Source of wealth: Writing
Bequeathal of wealth: Unknown

EARLY LIFE

Joanne Kathleen Rowling (ROH-lihng) was born in a Gloucestershire village, the daughter of Peter James Rowling, an engineer working for Rolls-Royce, and Anne Rowling (née Volant). When she was nine the family moved to the small village of Tuthill, near the Welsh border in the Forest of Dean. She was educated thereafter at Wyedean Comprehensive and went on to study French and classics at Exeter University. She then went to Moray House Teacher Training College in Manchester, but she did not immediately seek work as a teacher. Instead, she went to London to work as a secretary and as a research assistant for Amnesty International. It was while traveling between Manchester and London by train in 1990 that she came up with the idea of writing a series of novels describing the unorthodox schooldays of a teenage wizard named Harry Potter.

In 1991, Rowling went to Portugal in order to teach English as a foreign language in Oporto. Because she worked in the afternoons and evenings, she was able to spend her mornings writing, but her progress was slow and her production mostly consisted of voluminous notes and disconnected chapters. She married a televi-

Following her divorce in 1993, Rowling returned to Britain with her infant daughter Jessica, born on July 27, 1993, and eventually took up residence in Edinburgh, initially living with her younger sister Dianne, who had formerly worked as a nurse but was now studying law.

First Ventures

The cost of child care made it uneconomical for Rowling to work, but she also found it difficult to continue writing while suffering from the emotional fallout of her failed marriage. She formed the habit of taking long walks, which put her daughter to sleep, and then working on the first volume of her projected series of novels, *Harry Potter and the Philosopher's Stone*, in coffee shops. It took her until 1995 to finish the book, and it was not accepted for publication until 1997. Rowling was then able to obtain a grant of £8,000 from the Scottish Arts Council in order to continue work on the second volume in the series, *Harry Potter and the Chamber of Secrets*, which was published in 1998.

The initial advance for *Harry Potter and the Philosopher's Stone* was only £1,500, but the novel was very carefully marketed by its initial publisher, Bloomsbury Publishing, which gave away most of the first edition to schools, hoping to obtain word-of-mouth publicity for the subsequent paperback. This ploy worked and ensured that most of the hardcover copies sustained sufficient wear and tear to make the remainder very valuable, retailing for tens of thousands of pounds. The novel won the Smarties Book Prize Gold Medal and was shortlisted for the *Guardian* Fiction Award and the Carnegie Medal. When rights to the book were auctioned in the United States, they went to Scholastic for $105,000, then a record sum for a children's book, and Warner Bros. subsequently bought film rights to the first two volumes for "a seven figure sum." The U.S. edition of the first volume was retitled *Harry Potter and the Sorcerer's Stone* on the assumption that American children were more likely to be sympathetic to the idea of sorcery than to the concept of philosophy.

Mature Wealth

When the third novel in the series, *Harry Potter and the Prisoner of Azkaban*, was published in 1999, the magnitude of the burgeoning phenomenon was fully revealed. The three novels shot to the top of the American best seller lists and the sale of further film rights ensured that Rowling rapidly became the highest-earning woman in Great Britain and the second-wealthiest, after Queen Elizabeth II. In 2000, the year in which *Harry Potter and the Goblet of Fire* was published, Rowling set up the Volant Charitable Trust, which took its name from her mother's maiden name, in order to channel some of her wealth back into society.

In 2001, Rowling bought Kilchassie House, a nineteenth century mansion in Perthshire, to serve as a home for the new family created by her marriage to Neil Murray, an anesthetist whom she wed in a private ceremony at the house on December 28, 2001. In the same year, she produced two brief volumes that were spun off from the series, *Fantastic Beasts and Where to Find Them*, written under the pseudonym of Newt Scamander, and *Quidditch Through the Ages*, written by the pseudonymous Kennilworthy Whisp. The two books benefited the charity Comic Relief, with their sales raising £15.7 million for the organization. Her second child, David Gordon Murray, was born on March 23, 2003. These developments slowed down the production of the fifth volume in the series, *Harry Potter and the Order of the Phoenix*, which did not appear until 2003.

Bloomsbury had made the launch of *Harry Potter and the Goblet of Fire* into a large-scale public event that was so successful that the publishing house was forced to narrow the focus of subsequent book launches in the series, especially in view of the expectation built up by the anticipation of its belated successor. The publishing company did everything possible to control not merely the day of release but the moment the books were issued; the remaining books were all released on the stroke of midnight, with potential purchasers often queuing for hours or days beforehand. *Harry Potter and the Order of the Phoenix* set a new world record for the rapidity of book sales, which was then broken by *Harry Potter and the Half-Blood Prince*, published in 2005.

Although the bans on premature release proved unenforceable, this public relations strategy succeeded in maintaining a high level of anticipatory excitement, especially in regard to the seventh and climactic volume, in which it was widely rumored beforehand that the hero might die. Harry Potter's death was a possibility that would have previously been unthinkable in a children's book, but it did not seem unlikely in the new context of expectation that Rowling had created. Although *The New York Times* broke ranks by publishing a review of the final book, *Harry Potter and the Deathly Hallows*, on the day before its publication, the reviewer was careful not to reveal the ending.

Harry Potter and the Deathly Hallows sold 2.7 million English-language copies in its first twenty-four hours of publication on July 21, 2007, beating its predecessor's record comfortably, and this book soon racked up total worldwide sales of eleven million copies. By that time, the first six volumes had sold 325 million copies, and it seemed inevitable that the series total would eventually exceed four hundred million. Rowling's net worth was then in the tens of millions. The 2010 Sunday *Times* "Rich List" estimated her potential worth at £499 million, but such lists are notorious for the generosity of their estimates of "potential." *Forbes* magazine described Rowling as the first person to become a billionaire in terms of American dollars by means of authorship. The Harry Potter series also made money for Rowling's agent, Christopher Little, who initially placed the unread manuscript of the first book in the reject pile, maintaining that children's books never made any money. He later became a multimillionaire, thanks to the office assistant who took the manuscript out of the pile to read because it had an attractive binding.

Volant Charitable Trust

J. K. Rowling established the Volant Charitable Trust in Edinburgh, Scotland, in 2000 for the purpose of conducting two main areas of activity. The first was the promotion of research into the causes and treatment of multiple sclerosis, a disease from which Rowling's mother had suffered throughout her later life; the second was the alleviation of "social deprivation," especially with respect to the problems of single-parent families and child poverty. Grants awarded for the second goal were jointly administered with the Scottish Community Foundation. The charity's initial funding allowed it to deploy an annual budget slightly in excess of £5 million.

In association with the Volant Trust's work, Rowling became the president of the Multiple Sclerosis Society, although she gave up that position in April, 2009, because of serious infighting within the organization, in which the Scottish and English branches were at odds. Rowling also became involved with numerous other related charities. The most important of these was the Children's High Level Group (CHLG), jointly founded in 2005 with Emma Nicholson, a member of the European Parliament. Rowling donated one of seven handwritten copies of *The Tales of Beedle the Bard*, a book of short stories featured in *Harry Potter and the Deathly Hallows*, to the CHLG. The book was bought at auction by Amazon.com for £1.95 million, and the proceeds of the subsequent printed version were also donated to the charity. Among other major events, Rowling participated in a reading session at Radio City Music Hall in New York City with authors Stephen King and John Irving, with the proceeds going to the Haven Foundation and Médécins Sans Frontières (Doctors Without Borders).

Legacy

The immediate legacy of Rowling's success was a huge flood of money into the children's book market, resulting in numerous other authors being given huge advances for projected series, only a handful of which repaid the investment. The more enduring legacy of her spectacular success seemed likely to be the Volant Trust and her other charitable endeavors, which generated revenues that were enormous in the context of British philanthropy. A less tangible impact of the Harry Potter books was an increased interest in reading among children and young adults in an age when a variety of media distracted them from the printed page. After the Harry Potter series was published, the world waited to see whether anything Rowling wrote in the future could possibly match the success of her first great endeavor.

HELENA RUBINSTEIN

American cosmetics magnate

Rubinstein established a multimillion-dollar cosmetics empire spanning five continents. She used her personal fortune of approximately $100 million to maintain homes around the world, collect priceless jewelry and art, and support philanthropic causes. In 1953, she established the Helena Rubinstein Foundation to develop her philanthropies, especially organizations helping women and children.

Born: December 25, 1870; Kraków, Austro-Hungarian Empire (now in Poland)
Died: April 1, 1965; New York, New York
Also known as: Chaja Rubinstein (birth name)
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Children; relatives; charity

EARLY LIFE

The woman who would become Helena Rubinstein (REW-bihn-stin) was born Chaja Rubinstein on December 25, 1870, into an upper-middle-class Jewish family in Kraków. She was the oldest of eight daughters born to Hertzel Naftaly Rubinstein, a shopkeeper, and Gitel Silberfeld, the daughter of a rabbi.

Revealing remarkable business acumen at an early age, Rubinstein often helped her father with bookkeeping and planning. Rubinstein credited her mother for teaching her and her seven sisters the importance of a daily beauty routine, which included a special herbal beauty cream at bedtime. As a child, Rubinstein also developed a lifelong love of jewelry, painted dolls, and miniature furniture. In her teens, her parents tried to arrange a marriage for her, but she refused. After attending public schools, Rubinstein enrolled in medical studies and enjoyed laboratory research, but she left the program because she had a fear of blood.

FIRST VENTURES

In 1896, Rubinstein left Kraków to live on her uncle's sheep ranch in Coleraine, Australia, where the idea for her future business was conceived. She discovered that Australian women needed a skin care product to improve their red and rough complexions, which were damaged by the sun and wind. According to her autobiography, Rubinstein had brought containers of her mother's special facial cream, developed by their relative, the Hungarian chemist Jacob Lykusky. She gave the cream to neighbors, who found that it greatly improved their skin, and she had to order more jars from Kraków.

In 1901, while working as a waitress in Melbourne, she met John Thompson, owner of the Robur Tea Company, who became her business mentor. She borrowed $1,500 from a friend to start her business. In 1902, Rubinstein opened Helena Rubinstein & Company, Australia's first beauty salon, in Melbourne. Sales and demand kept increasing for the special face cream, which would later bear the trademark Valaze cream. She manufactured a growing variety of other skin care products that she either imported or invented. She realized the power of publicity when just one favorable article by Eugenia Stone, an editor in Sydney, resulted in fifteen thousand orders.

MATURE WEALTH

In 1905, Rubinstein returned to Europe to study with skin specialists in Berlin, Munich, Dresden, Paris, and Vienna. She returned to Australia and opened a larger salon in Melbourne and then a salon in Sydney in 1907. She also established successful mail-order and wholesale businesses. During these years, she laid the foundation of her cosmetics empire and made a fortune.

Before Rubinstein started her business, men owned the major cosmetic companies, and makeup was used primarily by performers and prostitutes. Rubinstein perfected the marketing technique of making women feel fearful about their skin conditions, such as freckles, wrinkles, blackheads, and sunburn. Women would then purchase skin care products to treat these skin problems. Other innovations essential to Rubinstein's success were teaching women how to use her products and meeting each client's specific needs. She also published a self-help pamphlet called *Guide to Beauty*, in which she was the first to identify skin as "dry," "normal," and "oily." She also used these categories in her advertising.

Immensely successful in Australia, Rubinstein decided to move to London and to begin expanding internationally. In 1908, with $100,000 in cash, she rented the beautiful twenty-six-room mansion that had once belonged to the marquis of Salisbury in London. Her elegant salon appealed to a wealthy clientele. That same year, she married American journalist Edward William Titus, who developed creative new product packaging and advertisements featuring an elegant Rubinstein. Their son Roy Valentine was born in London in 1909. Attracted to the cosmopolitan lifestyle of Paris, Rubinstein opened a salon there in 1911. Her second son, Horace, was born in London in April, 1912, and that autumn the family moved to Paris.

As World War I escalated, Rubinstein moved to the United States in October, 1914. She traveled around the country to promote her products. Meanwhile, Titus and the children arrived in New York, and Rubinstein's luxurious Maison de Beauté Valaze in New York City opened in May, 1915. For fifty years, she would compete with Elizabeth Arden, her main rival in the cosmetics business. Her ingenious publicity described how Red Cross nurses in Europe received Rubinstein beauty kits and instructions for using her products before going to the front. She realized it would be impossible to open salons in every major city, so she opened schools to train department store salesgirls, who would be demonstrating her products. By 1918, Rubinstein cosmetics were sold in major American department stores.

After the war, the family returned to Europe but left again when World War II began. In 1937, her famous salon on New York's Fifth Avenue opened, and the instantly popular Day of Beauty was introduced. That year, she and Titus divorced, and in 1938 she married a Russian nobleman, Prince Artchil Gourielli-Tchkonia, and started a House of Gourielli line of men's cosmetics. In 1950, she introduced her revolutionary, automatic mascara, Mascara-Matic, and she sold more than two million of these products in the first year they appeared on the market. Gourielli-Tchkonia died in 1956.

In 1959, Rubinstein was the United States cosmetics industry's official representative at the American National Exhibition in Moscow. That year also saw the opening of the grand Helena Rubinstein Pavilion for Contemporary Art exhibition venue at the Tel Aviv Museum.

Rubinstein continued her busy work schedule until her death. She suffered a stroke at work and was admitted to New York Hospital, where she had a more serious stoke and died on April 1, 1965. She left a personal estate worth more than $100 million. With thirty thousand employees, operations in more than one hundred countries, and salons and facilities in fourteen countries, her business had assets valued at more than $17.5 million and was making more than $60 million annually. After her death, the chief beneficiaries of her estate were her immediate family and relatives. A major part of the estate was also left to the Helena Rubinstein Foundation, which she had established in 1953 to benefit women and children. Her autobiography, *My Life for Beauty*, was published posthumously in 1966.

In 1970, Colgate Palmolive bought the Rubinstein company from the family for $143 million and then sold the business to Albi Enterprises, Inc. in 1980. By 1988, L'Oréal Group owned all of the Rubinstein operations. In 2009, the Public Broadcasting System (PBS) aired *The Powder and the Glory*, a documentary film about the rivalry between Rubinstein and Arden.

Legacy

Helena Rubinstein was an innovative cosmetics pioneer who helped define and create the modern global health and beauty industry. One of the world's wealthiest women, she promoted glamour, introduced many modern marketing techniques, and was one of the first to mass-produce cosmetics. She developed the first sunblock and tinted facial foundation and powder. Rubinstein also introduced dieting and massage as beauty treatments and established beauty health farms. She believed in beauty education, and her salons taught basic skin care. She also distributed instruction booklets, and she wrote *The Art of Feminine Beauty* (1930) and *This Way to Beauty* (1936).

A dedicated philanthropist and women's rights advocate, she ensured permanent support for women and their children with her foundation. From 1953 to 2009, the Helena Rubinstein Foundation awarded more than $108 million in grants to programs in education, health, the arts, the arts in education, and community services.

The Helena Rubinstein Foundation

In the first half of the twentieth century, pioneer cosmetician and industrialist Helena Rubinstein was one of the wealthiest and most successful women in the world. She was a generous patron of the arts and a dedicated philanthropist. She believed that her wealth came from women, so she wanted to fund programs and educational opportunities for women and their children.

In 1953, she established the Helena Rubinstein Foundation to support programs in health, education, the arts, the arts in education, and community services. When Rubinstein died in 1965, her business was generating more than $60 million annually, and her personal estate was valued at more than $100 million. The foundation was a major beneficiary of her wealth and was designated to administer part of her estate.

From 1953 to 2009, the foundation awarded a total of $108,301,440 worth of grants. More than $2.5 million worth of grants were awarded in fiscal 2008, the majority of which, totaling more than $1.3 million, were allocated for educational purposes. Other appropriations in 2008 included $500,825 for community services, $452,540 for arts/arts in education, and $236,000 for health programs. For the fiscal year ending in 2009, the foundation awarded grants totaling more than $1.6 million, with $870,240 for education, $412,025 for community services, $245,340 for arts/arts in education, and $101,000 for health programs.

The foundation has provided support to numerous health organizations, such as the Memorial Sloan-Kettering Cancer Center in New York City; Doctors Without Borders USA; the Fund for Public Health in New York, Inc.; the American Italian Cancer Foundation; and the Children's Health Fund. Major education grant recipients have included public television station Thirteen/WNET in New York City in order to sponsor children's educational television programming; YouthBASE in Brooklyn, New York, for the general support of human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS) education programs in public high schools; the Museum of Modern Art in New York City in order to provide stipends for the Helena Rubinstein Foundation Summer Internship Program for college and graduate students; and Teach for America for the recruitment, training, and placement of college graduates in teaching positions in underserved public schools.

Through the years, the foundation has also provided major arts/arts education support grants to numerous organizations, including the Bronx Museum of the Arts; American Friends of the Tel Aviv Museum of Art; the Studio in a School Association in New York; the New World Symphony of Miami Beach, Florida; and the Alvin Ailey American Dance Theater. Recipients of major grants for community services have included the United Jewish Appeal, Federation of Jewish Philanthropies of New York, Planned Parenthood Federation of America, the Partnership for the Homeless, Big Brothers Big Sisters of New York City, and the Women's Housing and Economic Development Corporation.

Alanus Rufus

Norman aristocrat, landowner, and military leader

Rufus was a companion of William the Conqueror and played a key role in the Norman Conquest. William rewarded Rufus with large estates, including the Honour of Richmond. These lands formed the basis of the great wealth Rufus bequeathed to his descendants, later styled the earls of Richmond.

Born: c. 1040; Brittany (now in France)
Died: 1089; England
Also known as: Alain le Roux; Alan the Red; Alan Rufus
Sources of wealth: Real estate; government
Bequeathal of wealth: Relatives

Early Life

Alanus Rufus (ah-LAHN-uhs ROO-fuhs) was the son of Eudes, count of Penthièvre, and Agnes of Cornwall. His birth date is unknown but was sometime around 1040, and he was born in Brittany, in what is now northern France. "Rufus" means "the red," likely in reference to his hair color or complexion, and this name distinguished him from his younger brother Alan Niger, or le Noir, meaning "the black." Rufus was a great-grandson of Richard II, duke of Normandy, which made him a cousin of King William I, better known as William the Conqueror; in Norman terms, Rufus was William's "nephew." Rufus had several brothers and half brothers. Little is known of his early life, but he came to England as a companion of William in 1066, and he fought with William at the Battle of Hastings.

First Ventures

In addition to fighting at Senlac during the Battle of Hastings, Rufus played an important role in the Harrying of the North, a series of campaigns waged by William the Conqueror in the winter of 1069-1070 to pacify northern England. These campaigns were brutal and resulted in partial depopulation of the north and subjugation of local Anglo-Danish lords under newly installed Norman lords. For his service, particularly in the Harrying of the North, William granted Rufus extensive lands, including the Honour of Richmond in Yorkshire, one of the most important fiefs in England. Most of these estates in Yorkshire had previously belonged to Edwin, earl of Mercia, who had rebelled against William in 1071.

Mature Wealth

The Honour of Richmond extended thirty-seven miles east to west and twenty-seven miles north to south and contained most of northwestern Yorkshire. The honour was primarily divided into the "hundreds," an obsolete geographic subdivision, of Gilling, Hang, and Hallikedd. The Gilling hundred contained the land between the River Tees and the River Swale and was divided into eastern and western portions. The village of Gilling was the manorial center, but Rufus replaced it with a new castle and village of Richmond, located in the Gilling hundred just two miles south of the village of Gilling. The Hang hundred lay directly south of the Gilling hundred, with the River Swale forming its northern boundary. Hallikeld comprised the parishes between the River Ure and the River Swale until their confluence at Ellenthorpe; parts of Hallikeld were held by other nobles. Rufus also owned the townships of Howe, Baldersby, Assenby, and Rainton, which may have been in the adjacent Birdforth hundred, although the *Domesday Book* (1086), a comprehensive inventory of English property, lists them in Hallikeld.

In 1071, Rufus began building Richmond Castle, originally called Richemund or Richemont, meaning "strong hill," on a hill above the River Swale. The castle was intended primarily as a military fortification. The town of Richmond grew around the castle, which was completed in 1086, although later residents continued to add improvements.

In addition to providing the source of Rufus's personal wealth and a base for his power, the Honour of Richmond served as a military buffer with northern Northumbria. Each year, Rufus's tenants were required to provide a specified number of knights who would defend the Richmond Castle; Yorkshire alone contributed sixty knights. This military force, along with the castle's architectural defenses, made direct attack upon the structure a daunting proposition. The strategic and financial importance of the honour ensured that it remained intact for three centuries.

In addition to the Honour of Richmond, Rufus owned significant holdings in Lincolnshire and eastern En-

Niglutsch) gland, primarily in Cambridgeshire. In total, his holdings were assessed for 180 knights. Rufus's lands included 166 manors in Yorkshire, and almost 200 in total, and may have contained as much as 250,000 acres. Although not formally titled as such, Rufus was effectively the earl of Richmond. It is difficult to assess exactly how many manors Rufus owned, as sources for this period are often unclear as to whether lands were granted to Rufus, to his brother Alan Niger, or to another aristocrat named Alan Fergeant, but Rufus was undoubtedly one of the wealthiest men in England.

Under the fief system administered by the Normans, Rufus's wealth, as well as his military power, came from his landholdings and tenants. The king granted Rufus fiefs, which Rufus in turn allowed to be used by his tenants, lesser lords, and knights. Rufus ruled his lands largely autonomously, and he gained both military service and revenue in exchange for allowing his vassals to use his property. In some cases, he would receive fees in order to relieve knights of service. In the Norman system, land was vital to obtaining significant wealth. This system also helped the Normans keep the Anglo-Danish subjugated and maintain power in Norman hands.

Although he became an extraordinarily wealthy landowner, Rufus continued to serve as one of William the Conqueror's chief military leaders. In 1085, he appears to have commanded the Norman army in Maine, a province of Normandy.

Despite his brutal actions during the Harrying of the North, Rufus seems to have been well regarded as an overlord and known for his respect of religion and support of the poor. Rufus never married. He died in 1089 and was buried in the Abbey of Bury St. Edmunds in Suffolk, which later fell into disuse. The ruins are now a heritage site.

Richmond Castle

Alanus Rufus began building Richmond Castle in 1071, shortly after William the Conqueror granted him the Honour of Richmond, a vast English land grant. Rufus's wealth and landholdings made it possible for him and his successors to both build and maintain the castle for several centuries.

Richmond Castle is a fortified stone structure located on a hill above the River Swale. Rufus likely began building the castle to solidify his military position on the border with Scotland and to create a strong base from which to administer one of the largest Norman estates of his time. The castle was unusual for its time because it was built of stone instead of the cheaper materials of earth and wood that were used to construct motte-and-bailey castles—structures that were built atop a raised earthwork and surrounded by a protective fence. Like most castles of its period, Richmond Castle maintained an open bailey, or enclosed courtyard, beyond its defensive walls to ensure that attackers could be seen; this bailey was used as a market. However, unlike most Norman castles, there is no clear evidence that Richmond Castle had a motte, or earthen mound upon which it was elevated. This castle may have once contained a motte that could have been converted to the barbican, a fortified gateway.

Richmond Castle also had projecting mural towers to aid in its defense, which was another uncommon feature of eleventh century Norman architecture. The original structure also appears to have lacked a keep—a separate building to which defenders could retreat in a final attempt to protect the castle. Rufus's grandnephew Conan built a keep toward the end of the twelfth century that was one hundred feet tall, with walls that were eleven feet thick. This keep was intended only for military purposes, and it has no kitchens, fireplaces, living quarters, or chapel. During periods when Richmond Castle was held by the Crown, Kings Henry II, Henry III, and Edward I made additional, primarily defensive, improvements.

Richmond Castle was one of the best-situated, best-fortified castles of its time in England, and it served an important strategic role from the twelfth through the early fourteenth centuries. During a period in the early fourteenth century when the Scots were raiding England, the castle's owners received permission to build a defensive wall around the bailey in order to protect civilians. However, by the end of the fourteenth century, Richmond Castle had fallen out of use.

By the twenty-first century, Richmond Castle had been partially restored and was administered by English Heritage. The structure remains one of the best examples of Norman architecture in Great Britain.

Legacy

Rufus bequeathed his land and fortune, worth approximately £11,000, or more than 7 percent of England's net national income at this time, to his brother Alan Niger. Niger had also fought at the Battle of Hastings and been rewarded with considerable lands in his own right. He died in 1093, leaving the combined estate to another brother, Stephen (or Étienne), count of Tréguier, who was noted for his financial support of a number of religious houses. Stephen's son Alan Niger II was the first to be formally styled the earl of Richmond.

Rufus's wealth helped his successors gain power and status. His grandnephew Conan married the sister of

Malcolm IV of Scotland, and Conan's daughter Constance married Geoffrey Plantagenet, son of Henry II of England. The family continued to enjoy influence until one of Constance's sons-in-law, Peter de Braine, renounced allegiance to England in 1235 and forfeited the family's estates to the Crown.

Richmond Castle remained in use through the early fourteenth century, and in the twenty-first century it was an important heritage site.

Philip Rundell

British jeweler, silversmith, and goldsmith

Rundell's firm of Rundell and Bridge dominated the luxury jewelry and silversmith trade in Great Britain in the early nineteenth century.

Born: 1746; Norton St. Philip, Somerset, England
Died: 1827; London, England
Source of wealth: Trade
Bequeathal of wealth: Relatives

Early Life

Philip Rundell (RUHN-duhl) was born in Norton St. Philip, near Bath, the son of Richard Rundell, a food and malt merchant. After he turned fourteen, Rundell was apprenticed to the jeweler William Rogers in Bath on May 10, 1760. After serving out his apprenticeship, Rundell found employment in London in about 1767 as a shop man with the retail goldsmith William Pickett. He displayed his skill for business so quickly that within four years Pickett took him as a partner. Rundell was made a freeman of the Draper's Company in 1771. Rundell and Pickett continued as partners until 1786, when Rundell bought out his partner and took full charge of the business.

First Ventures

The following year, Rundell took John Bridge as a partner, and the firm changed its name to Rundell and Bridge. This firm became the dominant jewelry and silver- and goldsmith firm in Great Britain.

For forty years, Rundell and Bridge had the perfect partnership, with each man concentrating on the aspect of business in which he excelled by virtue of temperament and character. The hardworking Rundell, the best judge of diamonds in the trade, oversaw the firm's jewelry and manufacturing departments. He was an unpleasant man, who was despotic, sharp-tongued, and demanding of his workmen; avaricious with suppliers; and curt and rude with customers. Bridge's polished, courteous, and diplomatic manners were used to great advantage in the firm's dealings with aristocratic customers and members of the royal family. The pair were known as Oil (Bridge) and Vinegar (Rundell).

Rundell purchased the well-established jewelry firm of John Duval, Sons & Co. in 1797, when Rundell and Bridge became jewelers to the Crown. Rundell's nephew Edmund joined the firm in 1803, and the firm became known as Rundell, Bridge and Rundell.

Mature Wealth

The firm was now the dominant jeweler in Great Britain. It controlled the best workshops and commissioned works or designs from some of the best craftsmen and artists, including John Flaxman, Thomas Stothard, and Augustus Welby Northmore Pugin. Customers from all over Europe flocked to the shop to spend their wealth. Between 1821 and 1829, the prince regent (the future King George IV) spent more than £105,000 on jewelry and luxury goods at the firm.

The firm thrived during the period of the Napoleonic Wars. Military victories required the Crown to spend lavishly on decorations, trophies, diamond-studded hilts for presentation swords, and silver plate for elaborate dinners. Diplomats required silver plate, gold snuffboxes, silver service, and diamond jewelry for gifts, presentations, and ostentatious display. For the dazzling celebrations of the year 1814, the British crown spent almost £48,000 with the firm.

Rundell, Bridge and Rundell designed and manufactured elaborate jewelry and silver in its network of suppliers and workshops. The firm bought jewelry and other treasures from fleeing French aristocrats, and these items were resold or broken up and turned into new pieces, earning double or triple profits. The company also created new consumer demand by marketing its "brand name." To attract global clients in a new age of conspicuous consumption, the firm stressed glamorous showrooms, publicity, and generous credit terms and cash discounts. Its trade and wealth grew from sales of new and antique silver and its purchases and sales of precious stones, pearls, and gold boxes, especially elaborate snuffboxes.

In the last two decades of his life, Rundell suffered from deafness and other ills, and he retired on September 29, 1823. He died in London in 1827.

Legacy

Rundell amassed his wealth by supplying luxurious and magnificent jewelry and decorative silverware to European aristocrats and royalty during the regency and reign of King George IV in the nineteenth century. His firm continued to operate for a short period after his death, but it was dissolved in 1842.

Bequeathal of wealth: Relatives

Early Life

Pavel Pavlovich Ryabushinsky (PAH-vyehl PAHV-loh-vihch ryah-byew-SHEEN-skee), was the oldest of eight sons of Pavel Mikhailovich Ryabushinsky. His grandfather Mikhail established a business selling linen and sackcloth in Moscow at the beginning of the nineteenth century. In 1846, Mikhail purchased a weaving mill in Moscow. By 1858, the year of his death, Mikhail had built two more mills that held eight hundred looms and had contracts for cloth production with small weaving shops that together had another three thousand looms. His sons Pavel Mikhailovich and Vasily continued operating the business under the name P. & V. Ryabushinsky.

After Vasily's death, Pavel Mikhailovich renamed the business P. M. Ryabushinsky and Sons, hoping that his sons would carry on the business after his death. When Pavel Mikhailovich died in 1899, his son Pavel, who had been well educated and groomed for his position, took over the reins of the business. Ryabushinsky was thirty-eight years old at the time, but he had already worked for his father for more than twenty-five years.

First Ventures

In 1900, Ryabushinsky had to deal with two calamities. First, some of the Ryabushinsky textile mills were totally destroyed in a fire. Ryabushinsky was able to rebuild the factories, and by the beginning of World War I, P. M. Ryabushinsky and Sons employed more than forty-five hundred workers and earned about 8 million rubles annually. However, the business lost about 4 million rubles in a failed investment it made through banker A. K. Alchevsky, who committed suicide. The Ryabushinsky brothers were able to gain control of Alchevsky's bank, and in 1902 they opened their own bank. By 1912, their bank, now named the Moscow Commercial Bank, was a leading financial institution in Russia with capital of more than 25 million rubles.

Mature Wealth

During World War I and the beginnings of the Russian Revolution, Ryabushinsky became a member of the Progressive Party, supporting ideas of free enterprise and capitalism. He began publishing a popular newspaper entitled *Morning of Russia*. In 1915, Pavel was elected chairman of the Moscow Stock Exchange Committee and was made the head of the War Industry Committee. In 1916, he opened the first automotive factory in Moscow.

Ryabushinsky opposed the Soviets and their participation in the provisional government that took control after the revolution of February, 1917. H supported General Lavr Georgiyevich Kornilov, who believed that Russia was heading toward anarchy and that Vladimir Ilich Lenin and the Soviets had to be done away with. After Kornilov's defeat, Ryabushinsky moved to the Crimea, where he sought a cure for tuberculosis at a local hospital. However, after the October Revolution firmly placed the Soviets in control, all the Ryabushinsky brothers emigrated to Paris, France.

With the introduction of the New Economic Policy in 1921, which allowed Russian farmers to keep their crop surpluses, Ryabushinsky was hopeful that capitalism would return to his home country. The Ryabushinsky brothers believed the new policy indicated that the Communist economic system was on the brink of bankruptcy. However, when Joseph Stalin came to power in 1928, all hopes for the restoration of capitalism in the Soviet Union were quashed.

Ryabushinsky died of tuberculosis in France on July 19, 1924. None of the Ryabushinsky brothers ever returned to Russia.

Legacy

Pavel Ryabushinsky's grandfather, a peasant, opened a fabric store, and in three generations the family, with Ryabushinsky at the head, had amassed great wealth and rose to become noted industrialists, financiers, and part of the Russian bourgeoisie. All of this ended with the Communist takeover of Russia. One of the few remnants of Ryabushinsky's life still extant in twenty-first century Russia is the Gorky House in Moscow, so named because author Maxim Gorky lived there from 1931 to 1936. The magnificent Art Nouveau mansion had been the home of Pavel Ryabushinsky. It would please Ryabushinsky to know that his dream of having a capitalist economy return to Russia was achieved after the fall of the Soviet Union in 1991.

THOMAS FORTUNE RYAN
American investor and financier

Ryan combined charisma, opportunism, intuitive business savvy, a keen instinct for profit potential, and ruthless competitiveness to become one of the dominant financiers in the Gilded Age. He created a financial empire with unprecedented reach into numerous enterprises, domestic and international, most prominently public transportation and tobacco.

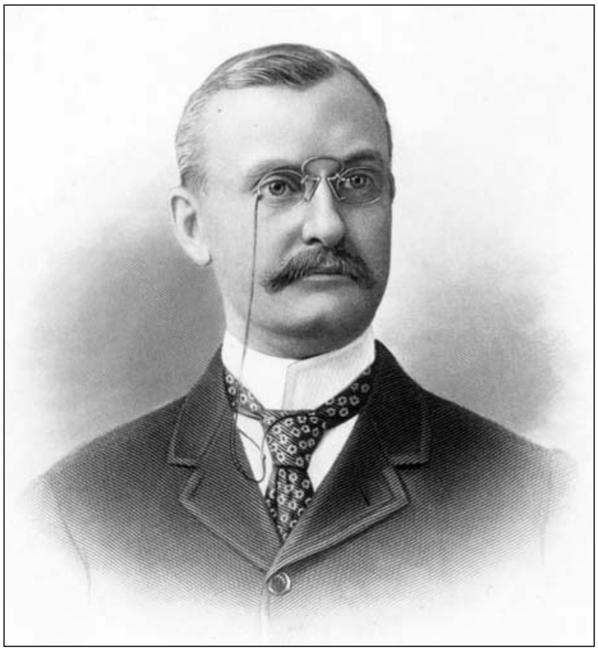
Born: October 17, 1851; Lovingston, Virginia
Died: November 23, 1928; New York, New York
Sources of wealth: Transportation systems; investments; trade
Bequeathal of wealth: Church

EARLY LIFE
Thomas Fortune Ryan (RI-uhn) was born in modest circumstances in the rugged foothills of the Piedmont, where there were few public records. When he became one of the titans of the Gilded Age, Ryan would zealously protect his private life from public scrutiny. For these reasons, very little is known about his childhood. His father, a tailor who also ran a small wayside inn catering to the Charlottesville-Richmond merchant traffic, remarried after Ryan's mother died when the boy was five years old. The family moved to the new wife's family plantation in Tennessee. Although still an adolescent, Ryan involved himself in plantation management, forsaking formal college study and impatient with the impracticality of book learning. After the Civil War dramatically altered economic conditions in the South, Ryan, with his family's blessing, headed north in 1868 to the nearest large city, Baltimore, with a little more than $100 and a letter of introduction for a position as a clerk in a highly successful dry goods business.

FIRST VENTURES
Historians are uncertain about what happened to Ryan at this point in his life. What is indisputable is that during the long train ride to Baltimore, Ryan, a Protestant educated by Baptists, accepted Catholicism. According to some accounts, he converted after engaging in emotional theological discussions with the train's conductor. Other historians suggest a far more practical motive: Ryan, already an opportunist with savvy instincts, understood that any success in Baltimore, at the time America's largest Catholic city, would necessitate his conversion.

Ambitious and restless, Ryan within four years relocated to New York City, where he accepted a position as a brokerage assistant on Wall Street. Amid the wheeling and dealing, he demonstrated a keen financial sense. He wed the Catholic daughter of the dry goods merchant, and with her family's financial backing he purchased a seat on the prestigious New York Stock Exchange when he was twenty-three, making him the youngest member in the history of the exchange. However, it was Ryan's calculated move into the corrupt Tammany Hall political machine that put him in the position to make his first major move. In 1886, after bidding to construct a significant portion of the city's new cable railroad service and being out-bribed by competitors, Ryan established the Metropolitan Traction Company and controlled the prime tracks that served Broadway. Within eight years, through bribery and cutthroat competitive practices, he controlled the majority of the city's electric streetcar service.

His wealth growing exponentially, Ryan turned to aggressive investment opportunities, notably an ambitious challenge to James Buchanan Duke's tobacco empire through Ryan's financial support of the rival Union Tobacco Company. When Duke himself recognized Ryan's business savvy and realized the catastrophe of a price war, he proposed a merger of his company and Ryan's, forming the American Tobacco Company in 1899,



Thomas Fortune Ryan. (Archive Photos/Getty Images) which quickly became the dominant force in international tobacco sales.

Mature Wealth

Across the next two decades, Ryan continued to define himself as one of the most formidable business minds of his era. He made fortunes by investing in more than twenty-five corporations, displaying a business acumen in fields as diverse as coal and diamond mining, banking, public utilities, and railroads. Along with Jay Gould, David Guggenheim, and Harry Payne Whitney, Ryan embodied the spirit of venture capitalism at the turn of the century. While other investors found the sturdy flatbed typewriter designed for the fledgling Royal Typewriter Company to be plain and uninspiring, Ryan recognized the advantages of this design. He invested in a controlling interest of the firm's initial stock and briefly served as president of the company. A career Democrat, Ryan wielded massive influence in New York politics, and he supported the resurgence of Grover Cleveland and his return to the presidency in 1885.

Not all of his business transactions were successful. Against the growing popularity of the Manhattan subway system, he attempted a disastrous merger with a rival streetcar company and in the process lost nearly $35 million and was investigated for misappropriation of public bond money. In 1905, he made an ill-advised purchase of the Equitable Life Assurance Society. His move into the insurance business, about which Ryan knew little, was criticized as being indefensibly self-aggrandizing and motivated solely by greed, and it did not help that Equitable had a reputation for neglect of the poor and for ruthless settlement practices. This negative public opinion compelled Ryan to back out of the insurance business within four years.

Ryan earned a reputation for competitive, mercenary capitalism and ostentatious living at his Fifth Avenue town house, as well as at Oak Ridge, his five-thousand-acre estate in Virginia. However, his wife, Ida Barry Ryan, emerged as a champion of Catholic charities in New York City, donating large sums of money to both churches and church-run hospitals. In 1909 the Ryans contributed more than $600,000, making them the major donors for the elegant Italian Renaissance-style St. Jean Baptiste Catholic Church on fashionable Lexington Avenue.

Although this generosity was lauded, the Catholic community in New York City was large, and its own financial resources were considerable. When the Ryan family relocated to Oak Ridge at the turn of the century, Ida faced a much different circumstance. The Catholic community in the Protestant South, while steadily growing, lacked the congregational support to undertake the ambitious building program that the church needed. Ida donated considerable sums to assist the Richmond, Virginia, Catholic diocese in constructing new churches to attract the nouveau riche of the Gilded Age and to renovate churches that still bore structural damage from the Civil War. Ryan's money financed the construction of seminary facilities, as well as Catholic elementary and secondary schools. However, it is the unprecedented commitment, made in 1901, to finance the construction of the Cathedral of the Sacred Heart in Richmond with which the Ryan fortune is most associated. The pope recognized Ida's philanthropic efforts by making her a countess of the Holy Roman Empire.

Despite the publicity about his works of charity for the church, Ryan in his sixties became the subject of public scandal. He grew estranged from his wife over her increasing devotion to the church, as well as her immense weight gain (she weighed more than three hundred pounds), and her preference for living at the family's estate in upstate New York. Ryan sought the very public company of Mary Townsend Lord Cuyler, a wealthy widow. When Ida died on Ryan's sixty-sixth birthday, she was not interred in the crypt she had designed in the Cathedral of the Sacred Heart but was buried far away in Hyde Park, New York. Less than two weeks later, Ryan married Cuyler. His eldest son publicly decried the marriage. When Ryan died in 1928, leaving an estate valued at close to $1.5 billion (adjusted for inflation), he left his son only a set of pearl shirt studs. Ryan himself was buried, along with his second wife, on the grounds of Oak Ridge.

Legacy

Thomas Fortune Ryan came from modest beginnings, but with his appetite for acquisition and his passion for the competitiveness of venture capitalism he created an international financial empire that made him, at his death, the wealthiest man the South had ever produced. His legacy, however, is problematic. He invented nothing, no twenty-first century company bears his name, and he did not use his wealth to establish a charity foundation or to endow a university or hospital system. Nor did his family continue his legacy; his fortune was quietly distributed among his descendants, who held a variety of occupations.

Ryan simply made money. He had a lifelong penchant for building ostentatious homes and acquiring contem-

The Cathedral of the Sacred Heart

The Catholic population in largely Protestant Richmond, Virginia, began to increase significantly in the Reconstruction era, when a generation of Northerners relocated with their families to help manage and direct the rebuilding of the South. At this time, the city's Catholic population rose from three thousand to slightly more than thirty thousand in forty years. Leaders of the Richmond diocese recognized that the city's cathedral, built in the 1830's, no longer provided the facilities necessary to accommodate the growing number of churchgoers.

As early as 1886, funds were allocated to try to secure the land needed for a new cathedral. The diocese favored a prime lot in the city's newest neighborhoods, its far west section overlooking Monroe Park. However, the diocese could not raise enough capital. At the request of Richmond's new bishop, Augustine Van De Vyver, Thomas Fortune Ryan and his wife Ida donated $500,000 to ensure the purchase of land and the construction of the facility.

The Ryans chose to direct the project. Joseph Hubert McGuire, a New York City architect schooled in European design, with a strong background in the Italian Renaissance Revival architecture and church construction, was hired to design the cathedral. McGuire had previously worked on numerous church projects in Manhattan. The centerpiece of his design was a magnificent 118-foot copper dome and twin 90-foot bell towers, making the church far taller than any building in Richmond at the time. At the arrangement of the Vatican, a block of white marble from the Garden of Gethsemane was used as a cornerstone at the 1903 ceremony marking the beginning of construction.

The sheer scale of the construction project drew national attention during its three-year duration. No expense was spared in the interior decorations. The cathedral was equipped with the latest safety precautions, notably an elaborate fireproofing system, a legacy of the considerable damage done by fires during the Civil War. Specially designed fireproof tiles lined the church's foundation, an innovation Ryan had first encountered in the construction of New York City's subway system. The church's massive interior, with seating for fifteen hundred people, was decorated with stunning mosaics and imported statuary. The organ, designed by McGuire, was for more than a half a century the largest organ south of the Mason-Dixon line.

With much fanfare and pageantry, including a citywide parade of parishioners carrying lanterns, more than two hundred servers and one hundred bishops from across the country, and a representative of the Holy See, the cathedral was consecrated on Thanksgiving Day, 1906. Cardinal James Gibbons of Baltimore preached the consecration sermon. The Ryan family, seated in the first pew, was lauded for its single-minded determination to ensure the project's completion. In the twenty-first century, the building remained the only cathedral in the United States to be built entirely from the donation of a single family.

porary European art, particularly sculpture, and he commissioned Auguste Rodin to sculpt no fewer than three busts of himself. Despite his indulgences, Ryan resolutely maintained his fortune, except for the almost $20 million (adjusted for inflation) that he donated to the Catholic Church. Although fabulously wealthy in his time, in the twenty-first century Ryan is largely forgotten among the more prominent financiers of the American Gilded Age.

John Rylands

British industrialist, merchant, and philanthropist

Rylands was an archetypal self-made man, who provided a crucial role model by deciding to use his textile company, and the enormous wealth it brought him, as an instrument of religious charity, thus becoming the first—and, some might argue, the only—great Christian capitalist.

Born: February 7, 1801; Parr, near St. Helens, Lancashire, England
Died: December 11, 1888; Stretford, near Manchester, England
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Spouse; charity

Early Life

John Rylands (RI-lahndz) was the third and youngest son among the five children of Joseph Rylands (1767-1847) and his wife Elizabeth (née Pilkington; 1761-1829). He attended St. Helens Grammar School for a while, but in 1817 he followed his brothers into the family business, which was then based in the family home and consisted mainly of using hand looms to produce linen goods. Demand for such goods was booming, and in 1819 Joseph was able to elevate their activity to the status of a formal business as Rylands & Sons, operating a draper's shop, as well as manufacturing cloth. Young Rylands became heavily involved in the retail side of the business, working in the shop and operating as a commercial traveler.

The business thrived on the relentless endeavor of the family members, and Rylands was later to claim that he routinely worked a nineteen-hour day. The firm was able to open an outlet in Manchester in 1822. The company then diversified into bleaching and dyeing, as well as manufacture, initially basing its operations in the towns of Wigan and Ainsworth, near Bolton. The profits of the mills acquired in this period were plowed back into the business to enable further expansion.

First Ventures

On March 17, 1825, Rylands married Dinah Raby (1801-1843), with whom he had seven children, all of whom died, and these misfortunes inevitably affected his attitude toward life and work. The death that affected him most of all, however, was that of his mother in 1829. It was that moment, he later claimed, which marked the crucial turning point in his life, after which he was baptized and made a serious commitment to Christian faith and action. Until then he had made money for the sake of making money, but he now had a mission: to build Rylands & Sons into a mighty enterprise for the benefit of its employees and its clients and for the relief of poverty.

The company, largely driven by Rylands's fervent enterprise, expanded into cotton spinning in 1830. Expansion continued in the following decade, when the firm began weaving cloth on power looms. The company's profits were further boosted when rich coal seams were discovered beneath its Wigan mills, enabling the sale of mineral rights. In 1839, Rylands's brothers withdrew from active involvement in the company, and three years later, following the retirement of his father, Rylands became the sole director of the firm, a position he held until his death.

Mature Wealth

On January 4, 1848, Rylands married Martha Cardew (1806-1875), a deeply religious woman who supported him wholeheartedly in his charitable endeavors. The couple had no children, but that merely allowed them to concentrate their efforts on their mission. The firm opened a London branch in 1849, and the company withdrew from linen manufacture in 1854 in order to concentrate on the booming cotton market. Rylands had already become Manchester's first self-made millionaire, and in 1857, when James Morrison died, he became England's leading textile merchant.

The abundance of demand and attempts by cotton growers to sell their goods at higher prices led to a mid-nineteenth century "cotton famine" that brought many of Rylands's rivals to the brink of disaster. Rylands was in a sufficiently strong position to exploit the situation, buying up additional mills and machinery at low prices. He was, however, determined not to exploit his workers in the same fashion as some of his competitors, and he built a number of new mills in Wigan that became models of their kind, as well as greatly improving the mills he owned in Ainsworth and elsewhere. He became the largest manufacturer of cotton in England, as well as the largest trader.

Although his family had been Congregationalist nonconformists, Rylands and his wife were determined that their own cause should not be sectarian in nature. Long before the birth of any formal ecumenical movement, Rylands began promoting the idea of a "Church universal" possessed of a fundamental harmony that he found in church music. He became an avid collector of hymns, amassing thirty thousand in the 1860's, as well as an ardent student of the Scriptures.

In 1873, Rylands & Sons became a limited company, with a capital of £2 million. Although he maintained total control of its operations, Rylands permitted his employees and clients to buy shares in the enterprise and profit from it directly.

By this time, he claimed, he had relaxed his own working day to a mere twelve hours, but he probably did not include his charitable enterprises in this estimate. He had already expanded into the manufacture of ready-made clothing and launched an export drive in Europe and the United States. The two thousand employees he had in 1860 had expanded to twelve thousand by 1875. Cotton was then at the very height of its economic importance, and Rylands exploited that importance to the full. He had built up a reputation for high-quality goods, which he maintained by the use of trademarks, and his manner of doing business commanded enormous respect.

On October 6, 1875, Rylands married for the third time; his new wife, Enriqueta Augustin Tennant (1843-1908), was forty-two years his junior. They adopted a son and a daughter, but it was Enriqueta who was entrusted with securing and continuing his legacy following his anticipated death. In 1878, he was offered the post of sheriff of London, which would have made him eligible for election as the city's lord mayor, but he declined, apparently out of loyalty to Manchester. He was by far

The *Rylands Paragraph Bible* and the John Rylands Library

The first edition of the *Rylands Paragraph Bible*, so named because it numbered all the paragraphs in the text to facilitate indexing, was issued in 1863, with the second edition in 1878 and the third in 1886. The scholars who compiled the new version at John Rylands's request included the Reverend F. Bugby and John Gaskin. The new version, which featured a revised translation of the text, was particularly useful because it contained an index of more than two hundred pages that facilitated searching in a more accessible fashion than Alexander Cruden's *Concordance* of 1737.

The site for the John Rylands Library at 150 Deansgate in central Manchester was purchased by Rylands's wife Enriqueta in 1889, and she commissioned architect Basil Champneys to design the building. Champneys's basic construction material was a distinctive buff and pink stone of a kind known as shawk, which came from the vicinity of Penrith in Cumbria. The library's reading room was built thirty feet above street level in order to minimize traffic noise because at the time of construction, Deansgate was a cobbled street and was exceedingly busy. The library is considered to be one of the finest examples of Gothic architecture in Great Britain.

Enriqueta's original intention was for the library to specialize in theological literature. However, when she began purchasing books, she acquired a considerably larger range of material, mainly because she had bought a collection of forty thousand items assembled by George John Spencer, which had previously absorbed the important Lewis Court Bible collection. Over the years, the library's field of interest expanded considerably to embrace almost all of social science, history, and philosophy, as well as theology.

The library opened its doors on January 1, 1900. It was one of the first buildings in Manchester to be equipped with electric lighting. Two librarians were appointed in 1889, but one of them, Edward Duff, left the library after two years. The other librarian, Henry Guppy, continued to serve in that function until 1948. In 1903, Guppy began issuing a scholarly journal, *The John Rylands Library Bulletin*, which was still published in the twenty-first century.

The largest subsequent addition to the library's collection came in the 1930's, when the widow of Ernest Hartland donated her husband's book collection, which had previously absorbed the collection of Walter Copinger of Owens College. This donation added another two thousand Bibles and ten thousand other volumes to the library's holdings. By the end of the twentieth century, the facility's collection contained ten thousand Bibles in four hundred languages, including twenty complete or partial versions of the English Bible, ranging from the West Saxon Gospels of 990 to the New English Bible of 1970. The library held some four thousand incunabula (or books printed before 1501), including the largest collection of books printed by English pioneer printer William Caxton outside of the British Library.

The John Rylands Library was absorbed into the University of Manchester Library in 1972, when the building became the university's special collections department. The university renamed its library facilities the John Rylands University Library and supplemented the earlier institution's endeavors in several important ways, including publishing important facsimile editions of, and establishing online access to, some of its precious manuscripts, such as the earliest extant example of a New Testament text, a papyrus known as the St. John Fragment.

the most generous philanthropist of his era, making substantial gifts to several towns in which he bought mills. In Stretford, where he lived at Longford Hall, he paid for the town hall, the public baths, the library, and a coffee shop. He disposed his charity far and wide, and his donation to the poor of Rome won him a knighthood of the Order of the Crown of Italy. When the company building the Manchester Ship Canal was threatened with bankruptcy in 1886, Rylands rescued the firm, thus securing the project that made Manchester a port.

When he died in 1888, Rylands's wealth was assessed at £2,574,922. He left numerous specific bequests to charities, lavishing £1 million on the John Rylands Library alone. Enriqueta inherited the remainder of Rylands's estate and earned money from the profits of his business, providing her an estate of £3,607,059 upon her death. No one replaced Rylands as the permanent head of his company. Instead, his three chief lieutenants agreed that they would each serve limited terms as chairman of its board and that the post would continue to rotate thereafter. The company lasted long into the twentieth century in spite of the declining economic importance of cotton, and it was finally dissolved in 1989.

Legacy

The principal legacy Rylands left behind him was his unparalleled example as a Christian capitalist, employing his enterprise for the benefit of entire communities rather than for his own personal enrichment. He dressed plainly and lived frugally, redistributing his wealth on a massive scale. More tangibly, he left behind several collections of hymns culled from his collection that had reached sixty thousand items by the time he died. He also left three editions of the *Rylands Paragraph Bible*, which was intended to free the Scriptures from sectarian interpretations and return them to their individual users, as well as new French and Italian translations of the New Testament. His strong belief in education as a means of cultural progress was translated by his widow into the John Rylands Library, which became one of Manchester's most famous institutions.

Habib Sabet

Iranian industrialist and businessman

Sabet was the greatest industrialist of twentieth century Iran. He helped modernize the nation's economy by importing Western goods and economic methods. A follower and benefactor of the Baha'i faith, he left Iran in the 1970's, and much of his wealth was confiscated in Iran's Islamic Revolution.

Born: 1903; Tehran, Iran
Died: February 13, 1990; Los Angeles, California
Also known as: Sabet Pasal
Sources of wealth: Manufacturing; trade; sale of products; transportation systems
Bequeathal of wealth: Children; confiscated

Early Life

Habib Sabet (hah-BEEB SAH-bay) was born in Tehran, Iran, to a family who practiced the Baha'i faith but who also had Jewish roots. His father owned a small fabric shop. Although Sabet's father was illiterate, he made sure that Sabet and his sister had a good education, sending Sabet to the progressive Baha'i Tarbiyat elementary school. Sabet later attended St. Louis High School, run by the Jesuits, and he graduated in 1921.

At this time, the newly invented modern bicycle was a novelty in Tehran. Sabet received a used bicycle from his uncle, Rahim Arjomand, and he began working in a shop, repairing and renting bicycles. For 500 toomans, he purchased a used Willys-Overland Jeep. (A tooman was a large Iranian currency bill; in the 1920's, 500 toomans were worth about $150.) Sabet transported passengers and merchandise throughout Tehran and other parts of Iran (also known as Persia), operating what apparently was the country's first taxi service. Sabet's introduction of the taxi service illustrates his ingenuity and drive, as well as his ability to adapt foreign services and goods to the Iranian economy, qualities that he would exhibit in abundance throughout the building of his economic empire. In 1929, Sabet married Bahareh Bagheroff.

First Ventures

With money earned from his taxi service, Sabet expanded to other ventures. He purchased a furniture factory in 1932, which soon landed lucrative contracts with the government. In 1936, he added trucks to his line of taxis and formed the Sabet Transportation Company. Eventually, this company received a contract to deliver a portion of Iran's mail. In his travels in Europe, Sabet would observe features of the European economy, which he would later use in his Iranian businesses. He paid special attention to the fields of media and entertainment, and among his endeavors he operated the first circus in Iran. He spoke six languages, including Arabic, French, and English, in addition to this native Persian.

With the onset of World War II, Sabet decided to immigrate to the United States with his wife Bahareh and their two sons, Iradj and Hormoz. Settling in New York, he rented an office in Rockefeller Center and launched the Sabet-Pasal Company in order to import and export goods between Iran and the United States. Before returning to Iran in 1949, he arranged to become the Iranian representative of some of America's leading exporters.

In August, 1955, Sabet began importing Pepsi-Cola into Iran, opening a state-of-the-art bottling facility in Tehran. Soft drinks may be thought to contain an excess of sugar, but in his memoirs Sabet claimed that Pepsi was a healthy drink in Iran, as Iranians were contracting dysentery from unclean drinking water. Sabet also became the distributor for Volkswagen and General Tire and Rubber Company in Iran. In 1956, his son Iradj returned to Iran, having finished his education in the United States; two year later, his son Hormoz also returned after completing his education. The two would assume important roles in their father's companies.

In 1959, Sabet opened the first television network in Iran, despite several fatwas (condemnations by Islamic scholars) against this Western invention. Most of the shows that Sabet broadcast were imports from the United States, such as *The Untouchables* and *The Lone Ranger*. In 1960, he began broadcasting on a second station. In 1966, he was compelled to sell his television stations to the government, which was establishing a state-owned network. Sabet negotiated a price of about 17 million toomans for his stations, which at that time was equivalent to about $2.5 million.

Mature Wealth

Sabet founded more than forty business entities in the course of his career. In an October, 1974, article, "Entrepreneurial Elite," *Fortune* magazine described Sabet as owning 10 percent of Iranian industry. His Sabet Group consisted of twenty-eight companies with gross revenues of more than $300 million a year, employing more than 8,000 Iranians and 175 foreigners. His companies

Great Wealth and Religion

Jesus Christ warned that it is easier for a camel to pass through the eye of a needle than for a rich person to enter the Kingdom of God (Matthew 19:23-34, Mark 10:24-25, and Luke 18:24-25). Nevertheless, the major religions of the world do not condemn the accumulation of wealth outright, although they do denounce the selfish or perverse ends to which wealth can be used. Great riches can become an idol in place of true worship, but in the hands of a reverent believer, wealth can be used for pious ends. The world's religions have encouraged the wealthy to use their riches not only for the greater productivity and prosperity of humankind but also for humankind's spiritual advancement, since spiritual enterprises require financial support.

As an example of this spiritual philanthropy, the wealthy merchants of medieval Europe helped pay for the continent's magnificent Gothic cathedrals, among the most beautiful and ethereal of human achievements. Almsgiving is one of the traditional good works of the Christian religion, along with prayer and fasting; members of many Christian churches are expected to tithe 10 percent of their annual income. In Islam, the wealthy have for centuries established *waqfs*—endowments used for religious and charitable purposes. One of the pillars of Islam is the *zakāt*, the requirement to donate 2.5 percent of one's wealth to the poor. In Judaism, *tzedakah* (charity) consists of annual support of the needy. Hinduism, Buddhism, and other faiths have similar strictures. In India, Jain merchants have a long tradition of providing for monks, manuscripts, and monasteries. Habib Sabet's prominence in the Baha'i religion can be partly attributed to his business success and his ability to contribute to the support of Baha'i temples worldwide.

As great wealth is accumulated, however, it becomes a tempting target. Money can be put aside for godly purposes, but that does not mean that God will protect it from human greed. In the fourteenth century, the wealth accumulated by the Knights Templar proved to be too much of a temptation. King Philip the Fair of France condemned the order and confiscated its property. In the sixteenth century, King Henry VIII appropriated the wealth and property of the English monasteries. Protestant reformer Martin Luther attacked religious donations that were connected to indulgences, alms, and good works as Catholic "trafficking" in souls.

Throughout history, there have been perennial attempts to justify the accumulation of great wealth as the will of God. Sociologist Max Weber wrote *The Protestant Spirit and the Rise of Capitalism* (1905) to investigate the link between the growth of capitalism and the evolution of Protestantism. Andrew Carnegie, perhaps the second-richest industrialist of all time, after the equally religious John D. Rockefeller, wrote his essay "The Gospel of Wealth" (1889) to urge the captains of industry—known to some as "robber barons"—to fulfill a religious imperative by employing their wealth for the good of society. Carnegie certainly became one of the greatest of all philanthropists. In the twentieth and early twenty-first centuries, the so-called Prosperity Gospel gained adherents in evangelical and Pentecostal churches, illustrating that the generation of wealth continues to be capable of generating religious fervor.

spanned the business spectrum. He was engaged in oil and gas refining and distribution and later moved into the field of nuclear power. He also was involved in various types of manufacturing. His retail and wholesale business chains sold pharmaceuticals, household appliances, and other consumer items. He owned a real estate company that held almost one hundred properties. His Pepsi-Cola license remained a mainstay of his business. In addition, he was a major banker, serving as the vice chairman of the Industrial and Mining Development Bank of Iran and serving on the board of directors of the Iran-British Bank and the Iran-Middle East Bank.

Sabet successfully licensed other Western products for sale in Iran, as he had already done with Pepsi-Cola. He had licenses with Autolite, the Bank of London, Johnson & Johnson, Magic Chef, Nabisco, Phelps-Dodge, RCA, Revlon, Squibb, Union Carbide, and Whirlpool. His Iranian companies were vertically integrated, allowing him to control the production and sale of items from their manufacture to their eventual distribution.

In the 1960's, Sabet began spending more time in his luxurious Parisian apartment in order to escape the Iranian persecution of Baha'is and because of his interest in art collecting. He filled his apartment with valuable antiques, including a writing desk that formerly belonged to the Russian czarina Alexandra, for which he paid $440,000. In June, 1975, he purchased a three-foot-tall bronze horse made in sixteenth century Florence from Guy de Rothschild for $375,000. "The nicest thing about it," Sabet quipped, "is that you don't have to feed it." On property located outside Tehran, he built a replica of the Petit Trianon, Marie-Antoinette's hideaway in Versailles, but with the modern additions of a swimming pool and an underground garage.

Sabet faced several obstacles to his success. He was born poor, had no government contacts, and was a member of the Baha'i religion. He was able to overcome the first two obstacles, but his religion continued to expose him to discrimination. Sabet made donations to Baha'i temples throughout Iran. He visited Baha'i members and delegates on his worldwide trips. When he was proposed for a seat on the board of the National University of Iran, Islamic clerics threatened a fatwa against the university, and his nomination was quashed. His economic ties to the West were often labeled unpatriotic, and he was even accused of spying. In 1976, he became a permanent resident of France, leaving the management of the company to his sons, who divided their time between Iran and the United States. However, they also fled Iran in 1979, when the Islamic Revolution overthrew the existing government.

Sabet's property and wealth were confiscated by the newly created Islamic Republic of Iran. In 1981, Iran and the United States created a claims tribunal in order to handle the complaints of American citizens whose property had been seized by the Iranian government. Neither Sabet nor his wife and sons could register a claim under the statute as they were not American nationals as defined by the terms of the tribunal. However, Sabet's six grandchildren had been born in the United States, and they sued for the return of $75 million worth of shares in Sabet's companies that had been expropriated. Habib Sabet died of congestive heart failure in Los Angeles in 1990.

Legacy

Habib Sabet helped modernize Iran's economy and industrial capacity, and he is best known for introducing two innovations: Western soft drinks and television. His industrial conglomerate had a wide impact on Iran's economy. Perhaps endowed with a more internationalist perspective because of his Baha'i faith, Sabet licensed numerous Western products for distribution in Iran. His grandchildren's lawsuit against the Islamic government of Iran created a new precedent in international law when the Iran-United States Claims Tribunal in 1999 determined that the grandchildren were nationals of the United States, despite their Iranian ancestry, and were therefore able to recover family assets seized by the Islamic government.

RUSSELL SAGE

American banker, investor, and politician

Sage was one of the leading financiers of the nineteenth century, amassing a large fortune from the railroads and banking. His wealth was used for worthy social purposes, and after his death his widow established a prominent foundation and a women's college.

Born: August 4, 1816; Oneida County, New York
Died: July 22, 1906; Lawrence Beach, Long Island, New York
Sources of wealth: Banking; investments
Bequeathal of wealth: Spouse

EARLY LIFE

Like most boys of his era and family economic status, Russell Sage received a brief and indifferent education and left school early. He had been born while his father Elisha Sage and mother Prudence (née Risley) Sage were trekking from Connecticut by oxcart destined for Michigan. The exact location of Sage's birthplace is open to question and is variously given as Verona Township or Shenandoah, New York, both in Oneida County. His New England-born father supposedly could trace his ancestry in America back to the 1650's.

After Sage's birth, the family progressed no farther than upstate New York, where his father purchased land and began farming. The young Sage labored as a farmhand, and in his early teens he went to work at his older brother's store. Despite his lack of formal education, he was bright and ambitious and began attending night school to learn arithmetic and accounting practices. He began trading in securities and by the age of twenty-one had amassed enough capital to buy his brother's store. Within a relatively short time he had sold the business at a profit.

FIRST VENTURES

Sage's business acumen resulted in the establishment, with a partner, of a wholesale grocery company in Troy, New York, in 1839. Besides the sale of meats and grains, the company expanded to include horse trading. The partners also maintained a fleet of ships on the Hudson River to transport their goods. Quickly becoming a significant citizen in his small town, Sage made his first foray into politics as a Troy alderman in 1841 and served in this capacity until 1848. In 1841 he also married his first wife, Maria Winne, a local girl.

From his initial political office he advanced to the position of Rensselaer County treasurer. By his early thirties, Sage was a force in the local Whig Party and was elected to be a delegate to the party's national convention. He next turned his ambitions toward Congress, to which he was elected, after an initial defeat, in 1852. He won reelection two years later but did not seek another term. During the time he held office he deserved at least partial credit for urging the restoration of Mount Vernon, George Washington's Virginia home.

MATURE WEALTH

By the mid-1850's, Sage had departed political life to devote full time to building his fortune, which he accomplished through banking and by investing in railroads. His interest in railroads apparently had been sparked by a chance meeting, supposedly in a railway station, with the notorious "robber baron" and railroad manipulator Jay Gould. Sage had loaned money to a small Midwestern railroad in which he became a major stockholder. When that line expanded into a much larger regional line, the Chicago, Milwaukee and St. Paul Railroad, his investment paid off handsomely. He was also made a director and then a vice president of this rail line. Much of Sage's fortune was made when smaller railroads in which he had invested were merged into larger companies.

During the height of the Civil War, Sage moved to New York City. He had become increasingly involved in the stock market, buying a seat on the exchange, and he is credited with being the originator of the financial instruments called "puts" and "calls" in the early 1870's. He still retained interests in several railroads and served as a director for many of them, including the mighty Union Pacific. He also served on the boards of many large banks.

Two years after his wife Maria's death in 1867, he married for a second time to Margaret Slocum. This same year he ran afoul of the law in a usury case and was fined, although he avoided a jail term. Sage increasingly had linked his business activities with those of Gould, and together they attempted to seize control of the elevated lines in New York City. Their method of stock manipulation was widely decried, and their partner, the well-regarded industrialist Cyrus West Field, was permanently tarred by this venture. Sage and Gould, however, not only gained control of the lines but also emerged from the bruising battle relatively untouched. Although moguls like Gould tended to be bold and audacious, Sage was more conservative in his financial dealings, preferring possibly smaller but more certain profits. Speculation was generally something he avoided, and this philosophy stood him in good stead as his vast fortune grew. His greatest reversal came during one of Wall Street's many "panics," during which he lost an estimated $7 million in the mid-1880's.

Among Sage's business dealings was his involvement with Gould in the founding of the Atlantic and Pacific Telegraph Company, which eventually merged with Western Union Telegraph Company. As he grew older he became even more conservative, preferring to be involved in loaning money to others rather than risking it himself. He was said to have made loans of several million dollars in the course of a single day. In spite of his great wealth, Sage lived a relatively spare life, except for his indulgence in raising racehorses, and he could even be called somewhat miserly in his everyday domestic dealings. His wife was credited with being the instigator of much of the couple's charitable activities, and she obviously did not share her husband's penuriousness. As did many of their rich contemporaries, the

The Russell Sage Foundation

The Russell Sage Foundation was originally established in 1907 with funding from Margaret Sage, the widow of financier Russell Sage. The foundation's stated purpose was the "improvement of social and living conditions in the United States." During its initial years, the organization played a major role in investigating how life for the poor and elderly could be improved and how conditions in prisons and hospitals could be ameliorated. Early efforts also were directed toward establishing social work as a respected profession. The organization subsequently involved itself in health care, labor legislation, training for nurses, and social security programs. In more recent years it has sought to foster rational social policies by strengthening the social sciences as a discipline.

One of the foundation's major ongoing initiatives began with the use of data from the 1950 census. Except for the 1970 census, the organization has published multivolume reports about economic and social conditions within the United States based upon the statistics gathered by each census count.

The foundation began a visiting scholars program in 1967 that enables participants to pursue their writing and research and collaborate on projects. Scholars each year are invited to investigate topics in the social and behavioral sciences. Many of the studies focus on the evolution of the United States' social and economic policies, and much of the research is conducted at the foundation's research center in New York City.

In 1993, the Russell Sage Foundation established the prestigious Behavioral Economics Roundtable; subsequently, three of its members went on to win Nobel Prizes. In addition, the foundation finances research at other institutions that advance its own research programs, sponsors seminars and working groups aimed at developing new topics in the social sciences, maintains its own extensive book publishing program, and collaborates with other grant agencies and academic institutions to study issues in the social sciences.

Some of the research programs undertaken by the Russell Sage Foundation in the twenty-first century include studies relating to the absorption of immigrant families into the mainstream of American life and immigrant experiences in small towns and cities. Other studies relate to the social effect of economic inequality; the ways in which American institutions were affected by the terrorist attacks on September 11, 2001; and how these institutions respond to the growing diversity of the nation's population. A major cofunded study launched in 2008, and a subsequent report, surveyed the prevalence of workplace violations endured by workers earning low wages in three major American cities.

DAVID SAINSBURY

British corporate executive, politician, and philanthropist

Sainsbury, one of the richest men in Great Britain with a personal fortune of between £1 and £2 billion, uses his wealth to support liberal political parties and to fund philanthropic projects through the Gatsby Charitable Foundation, which focuses on projects relating to science.

Born: October 24, 1940; London, England
Also known as: David Sainsbury, Baron Sainsbury of Turville; Lord Sainsbury; Baron Sainsbury of Turville
Sources of wealth: Inheritance; retailing
Bequeathal of wealth: Political organization; charity

EARLY LIFE

David Sainsbury (SAYNZ-buh-ree), Baron Sainsbury of Turville, was born on October 24, 1940, the son of Sir Robert Sainsbury. David was a member of the Sainsbury family, which in 1869 founded what would later become Sainsbury's Supermarkets Ltd., one of the most successful grocery store chains in Great Britain.

David was educated at Eton and Cambridge University. He began studying history at Cambridge but became interested in science. He earned a degree in psychology in 1963 because he was fascinated by the discoveries being made in the study of deoxyribonucleic acid (DNA). This prompted his lifelong interest in cognitive neuroscience, and he also developed an interest in plant genetics.

FIRST VENTURES

Because his college grades were not good enough for him to become a scientist, Sainsbury joined his family's firm, J. Sainsbury plc, as a trainee in the personnel department in 1963. Three years later, he rose to be a director of the firm. He went to Columbia University in New York City to earn a master's degree in business administration in 1971. Based on his experience in the United States, he introduced discounted cash flow techniques to J. Sainsbury. He returned to the firm as financial controller, serving in this position from 1971 to 1973, and he also was the firm's financial director from 1973 to 1990 and its deputy chairman from 1988 to 1992.

MATURE WEALTH

In 1992, Sainsbury took over the firm's leadership as chairman and chief executive officer. During that time, J. Sainsbury's sales tripled, climbing to £10.6 billion in 1994. However, his chairmanship of the company was more difficult for him than for any of his predecessors, and he was often asked to resign.

J. Sainsbury was gradually losing market share to competitors Asda, Safeway, and Tesco. The chain's customers no longer perceived that the Sainsbury supermarkets offered low prices, good service, or innovation. In 1995, Tesco surpassed Sainsbury Supermarkets as the number one grocery chain in Britain, and in 1996, J. Sainsbury reported its first profit decline in twenty-two years. David Sainsbury was accused of letting his attention to the grocery business drift while the firm diversified in the United States.

However, Sainsbury led the fight to revive the business. He recruited new senior management and reorganized the firm's structure to make it run as a group of diverse and significant businesses, not a supermarket chain with some additional businesses. He also restored the firm's culture of innovation. To regain sales, J. Sainsbury undertook a number of initiatives. It improved its cus-

The Gatsby Charitable Foundation

Following his family's tradition of public service and philanthropy, David Sainsbury founded the Gatsby Charitable Foundation in 1967, using his own inheritance. The Gatsby Foundation is the largest and most prominent of the nineteen trusts established by the Sainsbury family. In 1993, Sainsbury gave the foundation more than £300 million, the majority of which was in shares of stock from his company, the J. Sainsbury grocery chain; at the time, this was the largest charitable donation ever given in Great Britain. Each year since 1993, Sainsbury has added £10 million to the grant. In 2005, Sainsbury directed that the foundation spend all its capital and income before his death.

The foundation funds programs that are close to Sainsbury's own interests, focusing on neuroscience research, science education, mental health, aid to Africa, and plant science, especially the genetic resistance of plants to disease. Among its plant science initiatives, the foundation planned to construct a new research laboratory for the botanic garden at Cambridge University. In addition, the Sainsbury Laboratory in Norwich conducts research on the molecular interactions between pathogens and plants. The foundation is also financing research on neural circuits and behavior at University College, London, and is using technology to better understand how the brain works.

In its efforts to assist Africa, the foundation believes in the value of working through small-scale trusts that it has established since the mid-1990's. The organization seeks to assist small-scale farmers in order to improve their agricultural productivity; for other small business enterprises, the foundation's goal is to help them toward industrialization. The skills that Africa needs for management and governance are being developed within the trusts. The foundation also seeks to create investment funds that will allow African enterprises to develop and grow.

To stimulate Great Britain's innovation and growth, the foundation places great emphasis on science and engineering education. It is concentrating on four areas: fostering innovative approaches to recruiting secondary school science teachers; providing resources for professional development and curriculum; supporting vocational courses and a new engineering diploma for continuing education instructors; and partnering with key organizations to coordinate initiatives in science education.

The Sainsbury Centre for Mental Health focuses on mental health in the criminal justice system and in employment. In these areas, the center is combining its research and advocacy skills with its contacts among policy makers.

The Gatsby Foundation also supports several arts projects that have been initiated by other members of the Sainsbury family. It has contributed to the Sainsbury Centre for Visual Arts in Norwich at the University of East Anglia, the Sainsbury Institute for the Study of Japanese Arts and Culture, and the theater for the Royal Shakespeare Company at Stratford-upon-Avon. By 2009, the Gatsby Foundation had donated £660 million for its various activities.

tomer service with the addition of five thousand employees and added the Texas Homecare chain for the do-it-yourself market in 1995, transforming it into the Homebase brand. In 1997, J. Sainsbury opened a fully chartered retail bank, Sainsbury Bank, offering credit cards, savings accounts, personal loans, mortgages, and other financial services. The firm also opened Orderline, a home shopping venture, and expanded into Scotland and Northern Ireland. Despite these steps, the firm's market value dropped from its peak of £10.3 billion to £5.7 billion in 1998.

David Sainsbury continued his family's commitment to public service, charitable works, and progressive politics. His political career began when he joined the Labour Party in the 1960's. He later supported the Social Democratic Party, whose leader, David Owen, he admired. Sainsbury was a trustee of the Social Democratic Party from 1982 to 1990, and in 1987 he pledged to be the troubled party's benefactor and fund-raiser, which ensured the party's survival. When the Social Democrats and Liberal Party alliance collapsed, Sainsbury returned to the Labour Party, to which he donated £16 million after Tony Blair became its leader. Sainsbury once gave the party £1 million to clear a postelection debt. Sainsbury also funded Progress, Blair's policy institute and political magazine.

In a surprising move in 1998, Sainsbury resigned from J. Sainsbury after thirty-five years with the firm in order to pursue his two passions, politics and science. As a reward for his services to the Labour Party, Blair in 1997 elevated him to the House of Lords as Baron Sainsbury of Turville and the following year appointed Sainsbury the Labour Party's minister for science and technology, which allowed him to pursue his passion for science. Sainsbury gave up direct control of his company, and to remove the appearance of a conflict of interest he put his 23 percent of J. Sainsbury shares into a blind trust.

As a junior minister, Sainsbury guided legislation through Parliament, and he oversaw a large increase in government spending on the sciences. As science minister, he aroused some controversy. He acted to protect Huntingdon Life Sciences from the protests of animal rights activists. His own financial interest in companies that held patents for the development of genetically modified food crops aroused objections when the government was being attacked for refusing to ban these crops.

Sainsbury resigned from the government in 2006 in order to focus on business and charity. Upon his resignation, the nation's scientists expressed gratitude for his achievements during his eight years as a champion of British science. He had persuaded the government to increase its science budget from £1.3 billion to £3.4 billion. Under his influence, the government also provided incentives for universities to transfer technology. At the request of Prime Minister Gordon Brown, Sainsbury agreed to oversee a review of science and innovation across government. His report, *The Race to the Top*, was published in 2007.

In 2005, Sainsbury pledged to be the first Briton to donate more than £1 billion to charity during his lifetime. He instructed the trustees of his foundation, the Gatsby Charitable Foundation, to spend all his money before his death. In this way, he could ensure that his money was distributed according to his wishes. In 2009, Sainsbury, through his Gatsby Charitable Foundation, spent £15 million to create the Institute for Government. The institute conducts research and sponsors educational programs for all political parties and senior civil servants in order to improve government effectiveness.

Sainsbury has received numerous awards, many recognizing his philanthropic activities and contributions to science. He received an honorary doctorate in science from Cambridge University in 1997; that same year, Columbia University awarded him the Botwinick Prize, given to business leaders who display outstanding ethical practices in management and leadership. He was the first Briton to receive the Andrew Carnegie Medal in 2003 for his services to philanthropy. He was made an honorary fellow of the Royal Society in 2008.

Legacy

David Sainsbury is determined to use his huge personal wealth, derived from the Sainsbury's supermarket chain, to continue his family's commitment to public service, liberal politics, and philanthropy. His special interest, science, led him to work as a government minister to promote science and innovation in Great Britain.

José de Salamanca y Mayol

Spanish banker, railroad builder, real estate developer, and politician

Salamanca was one of the wealthiest persons in nineteenth century Spain. He was a pioneer in building railroads and took on projects that combined profits with public service and national development. He maintained an extravagant lifestyle, but much of his spending supported the arts in Spain.

Born: May 23, 1811; Málaga, Spain
Died: January 21, 1883; Carabanchel Bajo (now in Madrid), Spain
Also known as: Pepe Salamanca; Marqués de Salamanca; Conde de los Llanos
Sources of wealth: Banking; railroads; real estate; investments
Bequeathal of wealth: Dissipated

Early Life

José de Salamanca y Mayol (ho-ZAY day sahl-ah-MAHN-kah ee mah-YOL) was born on May 23, 1811, in Málaga, Spain. His father, José María Salamanca, was from the town of Utrera, southeast of Seville, and was an important doctor. His mother, María Polonia Mayol, was a native of Málaga. In 1825, the young Salamanca received a scholarship to study philosophy at the Colegio de Santiago in Granada and then law at the University of Granada. At this time he got involved in liberal politics against the regime of King Ferdinand VII, but he was able to finish his law studies in 1829.

Through his father's political connections, Salamanca became magistrate of Monóvar. His notable achievements there earned him an appointment in 1835 as magistrate of Vera. That year, Salamanca married Petronila Livermore Salas, daughter of an English businessman in Málaga, and he was chosen to represent Almería Province in the revolutionary junta (assembly) of Seville. In 1836, he was elected a *diputado* (deputy) to the Cortes en las Constituyentes (Constituent Parliament), although when he arrived in Madrid he had to wait another year to assume the seat because of his young age.

First Ventures

Salamanca showed an early proclivity for mixing politics and business. In 1841, he persuaded the minister of finance to lease the salt monopoly to him for twice the amount it was earning for Spain. During the five-year lease, Salamanca's profits exceeded 300 million reales, allowing him to move into a large house, which he always kept open to artists and writers whom he feted with fine food, French wines, and Cuban cigars. In the same year he was sent to London to try to reduce Spain's debt; he succeeded in getting the interest rate lowered from 5 to 3 percent. This deal cemented his reputation as a premier financier. In the 1840's, he started speculating in the Madrid stock market, but its small size and undercapitalization meant that huge returns were often followed by large losses.

Mature Wealth

Temporarily renouncing the stock market, Salamanca returned to business. In 1844, he was the leading cofounder of the Banco de Castilla (Bank of Castile), which later became the Banco de Isabel II and then merged with the Banco de San Fernando (now the Banco de España). After traveling abroad to study railroads, Salamanca started the construction of a rail line between Madrid and Aranjuez in 1845. In the same year he formed the Caminos de Hierro del Norte de España, a company that built railroads in northern Spain, with funds from Spanish and British investors. These ventures required government support at a high level, which led him in 1847 to accept the post of minister of finance with backing from the left wing of the Partido Moderado, one of the country's political parties. The party's conservatives put him on trial in the Congreso de los Diputados (Congress of Deputies) in January, 1848, for using his post for personal gain. Fearing prison, Salamanca fled to Bayonne, France, in March. In May, 1849, a Madrid court declared Salamanca bankrupt.

Returning to Spain in May thanks to a general amnesty for political exiles, Salamanca sought to restore his fortune. He obtained an extension of his concession for the Madrid-Aranjuez rail line and managed to get the declaration of bankruptcy removed. When the Madrid-Aranjuez line was inaugurated in 1851, his reputation was restored. He quickly sold the concession to the city of Aranjuez for 60 million reales, leased the line back from the city, and used the remaining funds to win new concessions all the way to Alicante by 1858. The Aranjuez-Alicante line was sold to French parties, including the Rothschilds, for 135 million reales. With that capital and his earnings from continued speculation on the Madrid stock exchange, Salamanca built other railroads in Spain, Italy, Portugal, France, the Danubian principalities (now Romania), and the United States, where he was an investor in the Atlantic and Great Western Railway and Salamanca, New York, the railway's eastern terminus, which is named in his honor. By 1854 his fortune exceeded the one he had lost while in exile.

In the early 1850's Salamanca assumed an even more extravagant lifestyle. He moved into a palace that occupied nearly an entire block and filled this mansion with an extraordinary collection of fine art and antiques. He also rebuilt the Circo de Paul, a theater that had burned down, and made it a favorite destination for Madrilenians wishing to watch opera or ballet. Once again, however, Salamanca had to flee to France, this time to escape the fury of the revolution of 1854, during which rioters destroyed his home.

Returning in 1856 to a calmer Spain, Salamanca resumed his ventures. The late 1850's and early 1860's marked the apogee of his wealth. Around 1856 he assembled the lands in Albacete that were to comprise the great estate called los Llanos. In 1858 he completed construction of the Palace of Recoletos and founded the Banco Hipotecario, a mortgage bank. In 1859 he bought for 2.5 million reales the Palace of Vista Alegre, which had been built by Queen Maria Cristina and King Ferdinand VII. In addition, he owned houses in Paris, Rome, Lisbon, and London. By 1863 his wealth totaled 400 million reales. That year, Queen Isabel II gave him the title marqués de (marquis of) Salamanca and made him a senator for life. The following year she added the title of conde (count) de los Llanos to his laurels; this honor made him a grandee of Spain.

The undertaking that most people associate with his name—development of the Salamanca district of Madrid—was the beginning of his ruin. In 1860, the Plan Castro for the extension of Madrid was approved by royal decree. Salamanca was the first to dare to profit by implementing the plan. Rents in Madrid were soaring because there was insufficient housing, and Salamanca was aware that in England and the United States real estate development had yielded great fortunes. Salamanca decided to buy agricultural land in the northeast sector of

The Salamanca District of Madrid

The Salamanca district is one of twenty-one Madrid districts. Situated near the center of the city, it includes the neighborhoods of Recoletos, Goya, Lista, Castellana, Fuente de Berro, and Guindalera. The first four neighborhoods include the part of Madrid's extension that José de Salamanca y Mayol began to urbanize in the 1860's because he thought the land, east of the paseos (avenues) of Recoletos and la Castellana, was well located and salutary.

Salamanca built 130 apartment buildings and eighteen single-family dwellings (*hoteles*) in the area he called New Madrid. He originally intended to follow the guidelines in Plan Castro (1860), which called for blocks open in the center and buildings of no more than four stories. Although pressure for profits led to more intensive construction, the district was developed attractively.

The first apartment buildings had four floors and interior patios with gardens and coach houses. The ground floor was designed as a semibasement for service activities; in later years, this floor became a location for luxury retailers. The two floors above the ground floor had two apartments, one facing the street and the other the patio. The attic was for servants and employees. Facades were plastered with decorative moldings and ironwork balconies, presenting a uniform exterior.

Salamanca intended the *hoteles* for the high bourgeoisie who could not afford palaces. There were two orders of *hoteles* with different price levels. The first order had more and larger rooms and was slightly taller. However, all the homes had a semibasement, a ground floor, two living floors, and an attic. The semibasement was designed for service workers; the ground floor featured the dining room, drawing room, and study or library; the two living floors contained bedrooms and a dressing room; the attic was the site of the servants' bedrooms. The additional rooms of the first-order homes included a billiards room and an office on the ground floor and a bathroom on the second living floor; these homes also had a service stairway and a cupola. The exteriors of the two orders of homes were similar except for the doorways, windows, and decorative moldings.

After the initial construction, laws were passed that permitted less space in the interior patios and allowed buildings of five stories and higher. Nevertheless, in the twenty-first century the older neighborhoods of the Salamanca district continued to be divided into the original grid of right-angled streets and still contained some of the most expensive residences in Madrid. The mansions or palaces there have typically been converted into embassies, museums, swank hotels, or offices. The existing architecture is more diverse than it was in the nineteenth century and includes some twentieth century styles. However, municipal laws protect many of the old buildings and the most popular style in the early twenty-first century was neoclassical.

the approved extension, urbanize it, and watch its value soar. Failing to win financial backing in London and Paris, he undertook the urbanization at his own expense. Because real estate prices began to fall and interest rates, at 18 percent, were high, he had to sell the buildings at a loss.

The declining real estate values, stock market losses, and the death of his wife Petronila in 1866 damaged Salamanca's self-confidence. He sold off his best artworks in Paris in 1868 and more pieces of art and his library in another auction there in 1875. To reduce exposure to his real estate holdings, in 1873 he formed a limited liability company for the Salamanca district, Compañía de Inmuebles del Barrio de Salamanca, which reduced his debt to 35 million pesetas; however, this company soon failed. He then he sold the Palace of Recoletos to the Banco Hipotecario in 1876 and planned to move in with his adopted daughter, María Josefa, who resided in a single-family dwelling in the Salamanca district.

Salamanca undertook two final projects to turn his fortunes around. In 1879 he started constructing the Duero Canal to provide the city of Valladolid with water, but creditors took over the project. Then, envisioning the resort potential of San Sebastián, a city on Spain's north coast, he hired more than one thousand men to reclaim swampy land along the mouth of the Urumea River. Some 52,000 square meters of land were reclaimed, but Salamanca worked so hard he contracted pneumonia. He rushed home to his Palace of Vista Alegre and died on January 21, 1883, leaving almost no estate to his two grown children María and Fernando.

Legacy

Spain in the twenty-first century is a richer country because of Salamanca's energy and foresight. He envisioned and constructed some of the most well-traveled rail lines in Spain. His real estate investment in the Salamanca district was the catalyst for the creation of the finest residential area in central Madrid. The first to make mortgages available in Spain, he expanded home ownership. As the premier representative of a new money aristocracy in nineteenth century Spain, he assumed spendthrift habits, but he was also very generous in his support of the arts.

David Sassoon

Iraqi merchant

Although he built a fortune bringing the misery of opium addiction to millions of people in China and Japan, Sassoon used his wealth to do good, especially for the Jews of Iraq and India. In the process, he founded a dynasty of international renown.

Born: October, 1792; Baghdad, Ottoman Empire (now in Iraq)
Died: November 7, 1864; Pune, India
Sources of wealth: Inheritance; trade; narcotics trafficking
Bequeathal of wealth: Children; charity

Early Life

David Sassoon (sah-SOON) was the son of Saleh Sassoon, a descendant of Abraham Ibn Shoshan, a Sephardic Jew who flourished in fourteenth century Spain. Saleh was a prosperous financier and respected leader of Baghdad's Sephardic community who served as state treasurer between 1781 and 1817 under a succession of Ottoman pashas.

David was traditionally raised and educated. He became fluent in Hebrew, Arabic, Persian, and Turkish. As an adult, Sassoon went to work in a banking house. He married and fathered four children by his first wife. After she died he married Farha Hayim, and the couple had six sons and three daughters.

First Ventures

Conditions changed for the Baghdadi Jews after Daud Pasha came to power in 1817 and began a campaign of persecution. As the son of a prominent community leader, Sassoon was imprisoned. After his release following the payment of ransom, the Sassoon family, like most of the Jews in Baghdad, fled the city. The Sassoons moved first to Basra and by the early 1830's had made their way to Bombay (now Mumbai), India.

In India, David Sassoon & Company was established, and the firm soon became the exclusive agency for the British textile and Indian silk trades. Sassoon was also given monopoly rights for Indian opium, and with the assistance of his sons he developed a network that imported the drug in vast quantities into China and Japan. By the mid-1830's, the Sassoon family annually imported tons of opium into Chinese ports, earning millions of dollars. When the Manchu emperor tried to halt opium imports, the British launched the First Opium War (1839-1842) at Sassoon's instigation. The Chinese were defeated, and Sassoon gained important concessions for his drug trade in the Treaty of Nanjing.

Mature Wealth

Sassoon and his sons continued to expand their export trade, dealing in silver and gold, spices, and wool, although the mainstay of the business remained opium until late in the nineteenth century. By the end of the Second Opium War (1856-1860), the Sassoons were bringing millions of pounds of drugs into China, and the family had become the richest Jewish merchants in the world.

David Sassoon earned a reputation for giving back to the community. He employed entire families of Jews from Baghdad and Bombay. He built several synagogues and a Talmudic school. He constructed a reformatory, an asylum, a hospital, and a library. He donated generously to sailors' homes, famine funds, and other charities. He became a British citizen in 1853, and he was accorded many honors during his lifetime and after his death in 1864.

After his death, Sassoon's children carried on various aspects of the business. His son Albert Abdallah David Sassoon succeeded his father as head of the family's company before moving to England, where he was visible in British society and was knighted. Another son, Edward Albert Sassoon, married into the Rothschild family, served in Parliament, and also was knighted. A third son, Elias David Sassoon, opened his own company in China and Hong Kong; Jacob Elias Sassoon became a prosperous mill owner in India; and Solomon David Sassoon became a prominent banker in Bombay.

Legacy

While the Sassoon empire had been largely dispersed by the twenty-first century, many landmarks erected by the family, including docks, hotels, synagogues, hospitals, schools, libraries, and parks, still stand in India, China, Hong Kong, and Great Britain as reminders of the widespread influence and financial power of David Sassoon and his far-flung progeny. Numerous descendants of Sassoon, including his late grandson, poet Siegfried Sassoon, and several rabbis, lived in the United States, Israel, and Great Britain, though not all bore the Sassoon name. Diminished in numbers since Sassoon's time, many of the close-knit, formerly Baghdad-based Sephardic communities that his business enterprises fostered continue to live in the Far East.

Jacob Schiff

American investment banker

Schiff used his financial genius to become one of the richest investment bankers in the world. He was instrumental in the development of the railroads and used his wealth to found and support various medical, educational, political, and philanthropic organizations.

Born: January 10, 1847; Frankfurt-am-Main (now in Germany)
Died: September 22, 1920; New York, New York
Also known as: Jacob Henry Schiff; Jacob Hirsch Schiff (birth name)
Sources of wealth: Banking; railroads; investments
Bequeathal of wealth: Children; medical institution; charity

Early Life

Jacob Henry Schiff (shihf) was born in Frankfurt-am-Main in 1847, the son of Moses and Clara Schiff. The Schiffs, a well-to-do family, were descendants of the oldest recorded Jewish family, tracing their roots back to the fourteenth century. Moses Schiff started his career as a clothing trader and became a successful stockbroker. The Schiffs, who shared a two-family house with the Rothschilds, were part of the upper-class Orthodox Jewish society of Frankfurt.

Jacob was sent to a model school, Israelitische Religionsgesellschaft, which balanced traditional education with religious instruction. His experience at school was the foundation of Schiff's lifelong love of education, art, and religion. At fourteen, Schiff was apprenticed to a large mercantile business, and in 1864 he apprenticed at his brother-in-law's bank. By 1864, Schiff was determined to leave German banking, which he felt was stifling, for the greater opportunities that existed in American business. After a struggle with his father, Schiff finally left for the United States with the family's blessing.

First Ventures

In 1865, Schiff began working at a New York City brokerage firm, Frank & Gans, where he excelled at making money and acquiring clients. He attained his brokerage license in 1866 and by 1867 had joined Bridge, Schiff & Co. as a partner. In September, 1870, Schiff became a naturalized American citizen, an honor he took seriously for his entire life. He loved being an American and developed his political and philanthropic ideals from a balance of Judaic and American beliefs.

However, he returned to Germany in 1872 to head the Hamburg branch of the London & Hanseatic Bank, and he moved back to Frankfurt the following year because of his father's failing health. He remained in Germany until his father's death and returned to America in 1874, at the behest of Solomon Loeb, to continue his financial career. In 1875, Schiff joined Kuhn, Loeb and Company, and he married Theresa, Loeb's daughter, on May 6, 1875. Schiff's extraordinary knowledge of and friendship with banking families throughout Europe, both Jewish and Gentile, allowed him access to untold wealth from investors and made Kuhn, Loeb, and Co. a very successful brokerage firm, second only to that of J. P. Morgan. Schiff's access to wealth and his financial acumen were the springboards from which Kuhn, Loeb, and Co. moved into the railroad business.

Mature Wealth

In 1870, Schiff invested between $6 and $8 billion of German money and bought bonds in the Northern Pacific Railway in order to stabilize the rail line, which began his firm's involvement in the railroad industry. In 1885, after Solomon Loeb's retirement, Schiff became head of Kuhn, Loeb and Co. His aggressive style and excellent intuition led the company to have fewer failed business ventures than any American investment firm.

Schiff's greatest interest was the railroads, and he used his influence with domestic and foreign financiers to build and purchase American rail lines. A lifelong friendship and partnership with Ernest Cassel, who shared Schiff's belief in the future of railroads being tied to the country's prosperity, led to Schiff's period of greatest financial successes. In 1896, the Union Pacific Railroad sought Schiff's help to avoid receivership. The Northern Pacific Railway, which first turned to Morgan and was rebuffed, approached Kuhn, Loeb, and Co. in order to avoid bankruptcy. These two actions catapulted Schiff into competition with Morgan, making Schiff the second most important man in the American railroad industry. During the next few years, Schiff and Morgan kept vying for control of the railroads. Each bought various lines, determined to reorganize them and make them part of their railroad empires. Schiff partnered with previous rival James J. Hill, head of the Great Northern Railway, and the two struggled with Morgan for control of the Great Northern Railway and Northern Pacific Railway. Morgan won when he combined the railroads into a mutually beneficial alliance.

Meanwhile, Schiff turned his focus away from Hill, who he felt had allied with Morgan against him, and began focusing on the Union Pacific Railroad. Schiff's plans for reorganization, however, were blocked by Edward H. Harriman. A compromise was reached when Schiff placed Harriman on the board of directors. From this confrontation grew a long friendship and business relationship. In 1897, Schiff purchased the Union Pacific for $81 million. Ultimately, Harriman controlled the Union Pacific and the Southern Pacific, earning millions of dollars for both Harriman and Schiff.

In 1901, the groups of rivals, all determined to control the railroads, caused the Panic of 1901. Hill, backed by Morgan, and Harriman, supported by Schiff, were both trying to buy the Chicago, Burlington & Quincy Railroad in order to gain control of the rail lines west of the Mississippi. Schiff planned to buy the Northern Pacific Railway secretly, beginning a stock purchase war between the two rival factions. This caused a disaster on Wall Street. Schiff, hoping to protect the average investor from ruin, negotiated a truce that ended the panic and restored a normal value to Northern Pacific's stock of $150 per share, down from the panic price of $1,000. He refused to allow his company to make any money on the stock's speculation and implored Morgan to compromise on ownership and directorship of the Chicago, Burlington, & Quincy. This plan was successful, and although Morgan and Hill retained ownership of this rail line, a board made up of Morgan and Schiff's representatives ran the company. However, the panic raised fears in President Theodore Roosevelt that businesses could control too much money, and he began a long court case to divest control of the railroads. Schiff, who believed in the free market, tried to persuade Roosevelt to leave the railroads alone and to trust in the directors to make the best decisions. Roosevelt disagreed and began drawing up antitrust legislation.

Montefiore Medical Center

Although involved with many charities, Jacob Schiff felt closest to the Montefiore Medical Center. For thirty-five years he spent every Sunday visiting patients there, and he went to the hospital a few days before he died. He attended almost every board meeting and called the facility his "labor of love."

Adolphus S. Solomons, cofounder of the American Red Cross, suggested that Schiff become involved in the facility as a way to serve the medical needs of poor New Yorkers and to honor Moses Montefiore, a great nineteenth century Jewish philanthropist, on the occasion of his hundredth birthday. Schiff and other members of New York's Jewish community undertook to endow the Montefiore Home for Chronic Invalids, which opened on October 26, 1884. Schiff initially was the home's treasurer, and he became president in 1885, serving in this position until his death in 1920. The original facility, housing about thirty patients, was dedicated to providing care to poor patients who could not stay indefinitely in hospitals or be easily cared for at home. In 1888, the facility moved to a larger 140-bed hospital in Harlem, and in 1912 it relocated to a 600-bed hospital in the Bronx, where it continued to operate into the twenty-first century. A sister facility in Westchester, New York, treats tuberculosis patients.

Under Schiff's direction and with a quarter of the funding donated by him, the hospital built a second wing, called the pavilion, aimed at providing care for middle-class patients. Schiff felt that working, middle-class people often had as difficult a time as poor people in caring for invalids and that Montefiore should provide assistance to a wider range of patients. He also maintained that although the hospital was established by Jews for the poor members of their community, patients of all religions should be admitted as soon as a bed was available. He vigorously and successfully fought a proposal that would have based patients' admittance on their social contacts or financial status.

Throughout its history, Montefiore Medical Center has been an innovator in providing medical care and maintaining social justice. In 1903, it was the first hospital to have a full-time laboratory staffed with a chemist and a pathologist. It was the first clinic to conduct tuberculin testing, use insulin therapy, and employ radioisotopes in cancer treatment. It created the first social medicine department and has always retained a philosopher and a lawyer specializing in ethics on its staff. The hospital began hiring women in 1914, began paying salaries to full-time medical staff in the 1920's, and employed its first African American doctors in the 1930's.

In the 1900's Schiff turned away from the railroad industry, except for funding a Mexican railroad, and he began investing in many other endeavors, including Westinghouse Electric, Wells Fargo Bank, American Beet Sugar, Western Union, National City Bank of New York, and Equitable Life Assurance.

During 1904 and 1905, Schiff supplied Japan with $200 million for its war against Russia. A longtime anticzarist, Schiff had never allowed his business or personal funds to finance Russian endeavors. When the Russo-Japanese War began, Schiff realized that Japan could not compete with Russia, whose anti-Semitic policies he abhorred. For his contribution, Japan awarded Schiff the Order of the Sacred Treasure in 1905 and the Order of the Rising Sun in 1907. Schiff was so respected by the Japanese that he was given these awards personally by the emperor.

Schiff also was involved in American policies that affected Jews. He worked hard to counter anti-Semitism and other human rights violations. He often wrote to politicians and spoke at hearings on issues concerning immigration, international passport law, and discrimination.

Schiff died on September 25, 1920, after a short, but not debilitating, illness. He remained head of Kuhn, Loeb, and Co. until his death and was succeeded by his son, Mortimer Schiff.

Legacy

Schiff, a great philanthropist, supported institutions that mirrored his democratic and religious values, donating at least 10 percent of his personal fortune during his lifetime and leaving more money as bequests after his death. He donated generously to Jewish organizations. He was a founder and benefactor of the Henry Street Settlement, Jewish Theological Seminary, Hebrew Union College, United Hebrew Charities, and 92nd Street Young Men's Hebrew Association (YMHA). To help counter rising anti-Semitism, he founded Harvard University's Semitic Museum and the department of Semitic literature at the New York Public Library. A major supporter of Columbia University until it refused to appoint Jews to its board of directors, he shifted that support to Cornell University and Barnard College. Although not a Zionist, he funded farming and education initiatives in Palestine. He also gave support to sectarian and Christian organizations, such as the Knights of Columbus. His friendship with Booker T. Washington resulted in large donations to Tuskegee University. New York City received a great deal of his generosity, and he funded the Bronx Zoo, built parks, supported museums, and created funds for the underprivileged.

Charles M. Schwab

American steel magnate

Schwab's rise to wealth and power in the steel industry was a testimony to the unlimited opportunities available during the Gilded Age to anyone with the right combination of luck, drive, and circumstance. Under his leadership, Bethlehem Steel became one of the largest steelmakers in the United States.

Born: February 18, 1862; Williamsburg, Pennsylvania
Died: September 18, 1939; New York, New York
Also known as: Charles Michael Schwab
Sources of wealth: Steel; investments
Bequeathal of wealth: Dissipated

Early Life

Charles Michael Schwab (shwahb) was born on February 18, 1862, in Williamsburg, Pennsylvania, the first of five children born to John Schwab and Pauline Farabaugh Schwab. The family moved to Loretto, Pennsylvania, when John bought the town's livery stable. Charles completed high school there, and that was the end of his formal education. Following his graduation, he went to the larger town of Braddock, where he worked as a grocery clerk. Braddock was also the location of Andrew Carnegie's Edgar Thomson Steel Works. In 1883, Schwab married Emma Eurana Dinkey. The couple had no children.

First Ventures

One of Schwab's grocery customers was Captain William R. Jones, a superintendent of one of Carnegie's steel mills. Jones was impressed with Schwab's unfailing good nature and his ability to get along with all types of people. Mentored by Jones, Schwab went to work at the steel mill. He worked as an engineer's helper while learning the steel business.

Schwab was a quick study, and his rise in the company can be attributed in large part to a management style that enabled him to earn the support and respect of both labor and management. Before he was named manager, the mill's workers had unionized and gone on strike; the manager who preceded Schwab broke the union. Schwab had a less contentious relationship with his employees, who remained loyal to him even though their wages were below the industry average.

Mature Wealth

Schwab's increasing power in the steel industry was a result of the continued trust that Carnegie placed in him. As

Carnegie became more critical of his top management team, Schwab emerged as the only person in the inner circle whom Carnegie continued to hold in high esteem. As a result, Schwab acquired more influence in the business, which in turn led to an increased salary. Schwab and his wife lived a life most could only imagine. At the height of his success he built a four-story mansion on the corner of Riverside Drive and Seventy-second Street in New York City that contained ninety bedrooms, a sixty-foot swimming pool, and a bowling alley.

When the time came for Carnegie's retirement, Schwab was able to broker the deal between Carnegie and financier J. P. Morgan to liquidate Bethlehem Steel. Schwab agreed to head the new company, United States Steel Corporation. During his tenure at this company, Schwab oversaw the development of steel girders, a product in great demand for constructing skyscrapers. These beams, along with government contracts to produce needed products during World War I, ensured the success of U.S. Steel.

Schwab's wealth was once thought to be more than $200 million, but some of his investments were unsuccessful, and the Great Depression further eroded his fortune. On September 18, 1939, he died of coronary thrombosis in New York City, less than a year after the death of his beloved wife Emma.

Legacy

Charles M. Schwab was one of the leaders of America's emerging steel industry. Under his direction, Bethlehem Steel became a major world steel manufacturer. Before his money was dissipated in the Depression, he gave generously to charity. Among those benefiting from his largesse were the Catholic church in Braddock, Pennsylvania State College, St. Francis College, and various other schools, convents, and monasteries.

Charles R. Schwab

American financial services executive

Schwab was a leader in the discount brokerage business, making it easier and less costly for investors to purchase and sell securities. He has used his wealth to establish the Charles and Helen Schwab Foundation.

Born: July 29, 1937; Sacramento, California
Also known as: Charles Robert Schwab, Jr.
Sources of wealth: Financial services; investments
Bequeathal of wealth: Spouse; children; educational institution; charity

Early Life

Charles Robert Schwab (shwahb), Jr., was born in Sacramento, California, the son of a district attorney. He grew up in an upper-middle-class environment and showed signs of entrepreneurship early on. When he was a child he raised chickens and sold them to the neighbors. He soon discovered he had a natural talent for selling everything from magazine subscriptions to the walnuts he plucked from the backyard trees. It was a talent that would serve him well.

Schwab attended Stanford University, earning a bachelor's degree in economics in 1959 and an M.B.A. in 1961. He married twice and had five children, three with his first wife, whom he later divorced, and two with his second wife, Helen.

In May, 1975, his firm became a discount brokerage, buying and selling securities for its clients at lower rates than those charged by a traditional, full-service broker. In this work, Schwab found his true calling, and his luck changed dramatically when he realized that not all investors required in-depth help in selecting their stocks. Many clients were already choosing their investments and their brokers earned large fees for simply executing their clients' decisions. He was among the first to see the potential of this untapped business and his firm has consistently held the majority of the discount brokerage market.

Although Schwab kept his firm's San Francisco headquarters, everything else about his company changed. Schwab transformed himself from just another staid stockbroker among many to "Chuck," a familiar presence who wanted his clients to make the most of their investments by using their own initiative, thereby avoiding the large fees charged by full-service companies. However, his company's earnings were erratic during its early years, in part because traditional companies attempted to discredit discount investing. Schwab published a book, *How to Be Your Own Stockbroker*, in 1984 that was designed to take some of the mystique away from stock trading. His book elevated both his credibility and his public persona.

First Ventures

Schwab was by no means an overnight success. In the early years of his career he endured a string of failures, including his ventures in a music festival and a theme park, Congoland, USA. In 1971, he established First Commander Corp., at that time a traditional stockbrokerage; two years later, the firm changed its name to Charles Schwab & Co., Inc. Schwab found the business more competitive than he had expected it to be, and he was able to achieve only moderate success. However, the deregulation of the financial industry ultimately enabled him to alter the operations of his business and made it possible for Schwab to become an industry legend.

Charles R. Schwab. (©Bettmann/CORBIS)

Mature Wealth

Schwab weathered criticism of his company and became a trusted businessman. His account base grew exponentially as he made it less difficult and less expensive for the average person to invest in the stock market. Advanced technology allowed clients to place orders twenty-four hours a day. The firm opened as many as half a million accounts a year and soon expanded into the European and Japanese markets. Schwab's instinct was right—not everyone required or wanted a full-service stockbroker.

Schwab sold his firm to the Bank of America in 1981, but this turned out to be a bad decision. The firm's stock plummeted. Worse, he disagreed with the new owner's vision of the company's future direction. He was able to buy back his company six years later in a leveraged buyout. Although it cost him $230 million to regain his firm, he could once again control the company.

Schwab & Co.'s foray into the burgeoning mutual fund market contributed substantially to both the firm's growth and the accumulation of Schwab's personal fortune. His firm created Schwab & Co.'s Mutual Fund Marketplace in order to market these funds to investors. Schwab's company soon ranked third in mutual fund sales, with only Fidelity Investments and Vanguard companies outperforming it. By the late 1990's, Schwab's personal wealth was estimated at more than $1.5 billion. His company was the largest discount brokerage firm, and his client asset accounts were valued at $1 trillion. His personal involvement in the company kept it on track in an industry that in the preceding years had often been tainted by scandal and greed.

When he was forty years old, Schwab learned that he was dyslexic. He sometimes credits his dyslexia with his business success, claiming that this disability forced him to learn things in a different from the way others learned and to come up with creative solutions when traditional study methods did not work for him.

Schwab enjoyed the privileges of wealth, engaging in philanthropy, as well as indulging his personal interests. He has amassed an art collection of museum-quality pieces for his home and donated money to art museums. He derived pleasure from the artistic and cultural opportunities in the San Francisco area, where he has long made his home and where his contributions are valued.

Another of his passions, golf, began when he played on his high school team with future professional golfer Al Geiberger. Later, Schwab's nine-handicap made him a competitive player at various tournaments, including the AT&T Pebble Beach National Pro-Am tournament near Carmel, California. Schwab's company also hosts golf tournaments and in 2009 signed a contract to establish the Schwab Cup on the Professional Golfers' Association of America's PGA Senior Tour, a move that will enhance the firm's role as the "official investment firm" of both the PGA Tour and the PGA Senior Tour.

In recognition of Schwab's contributions to the financial industry, President George W. Bush in 2008 appointed him to the President's Council on Financial Literacy.

The Charles and Helen Schwab Foundation

The Charles and Helen Schwab Foundation came into existence in 2001 as a result of the merger of the Schwab Foundation for Learning and the Schwab Family Foundation. With assets worth nearly $650 million, the foundation is a separate entity and is not affiliated with the Charles Schwab Corporate Foundation or Charles Schwab & Co.

The primary focus of this nonprofit organization is on children with learning disabilities, a subject of deep concern for foundation cofounder Charles R. Schwab because both he and his son Michael are dyslexic. Schwab wants to make it easier for others with learning disabilities to function and succeed in society. He was not diagnosed with dyslexia until he was forty years old, and he believes that early diagnosis and remediation are essential elements in helping people with dyslexia cope with their learning disability.

The foundation's board of directors provides grants to recipients, focusing its efforts on kindergarten through twelfth-grade education, human services, and the fine arts. Children and parents of learning-disabled children are nearly always the beneficiaries of these grants.

In addition to his work with the foundation, Schwab is involved with All Kinds of Minds, a nonprofit organization that promotes alternative learning methods and recognizes that some students do not respond to traditional forms of education.

Legacy

As a pioneer in the discount brokerage business, Charles R. Schwab forever changed the way many people invest. "Chuck" became a guest in America's living rooms via television and full-page newspaper advertisements, assuring the average investor that wise financial management is a skill that can be learned and that each individual must be responsible for his or her own investments. He proved by example that financial consultants can be hugely successful and still operate with personal and corporate integrity.

Schwab's legacy also includes his philanthropic activities, such as the Charles and Helen Schwab Foundation and the Charles Schwab Corporate Foundation. The latter is a private, nonprofit organization created by Schwab & Co. that supports charities selected by company employees, and, in the words of the company's Web Site, fosters "financial literacy through funding, involvement and expertise." Schwab's daughter, Carrie Schwab-Pomerantz, is the president of the corporate foundation, continuing her parents' tradition of philanthropy.

Seng Sae Khu

Thai merchant and investor

Seng gained affluence by collecting taxes and selling silk in Thailand. His wealth financed his family's educations, investments, and aspirations, enabling them to expand his fortune to several billion dollars by the twenty-first century and attain economic and political power.

Born: c. 1840; China
Died: c. 1920; Siam (now Thailand)
Also known as: Khu Chun Seng
Sources of wealth: Trade; government
Bequeathal of wealth: Spouse; children

Early Life

Seng Sae Khu (sihng say kew) was born in China in the mid-nineteenth century. Information regarding his parents, the precise date and place of his birth, and his childhood is vague. Most sources indicate that Seng's family lived in Guangdong Province along the southern China coast and were Hakka Chinese. Sometime during the latter 1860's, Seng traveled to Siam (now Thailand), perhaps with his father or male relatives, probably for employment because Siamese officials sought Chinese laborers for various projects. Some versions of Seng's immigration suggest he was a boy as young as ten when he moved to Siam.

First Ventures

Many Chinese immigrants left Bangkok, Siam, for less populated areas where they pursued trade or other occupations. As an adult, Seng settled in Chanthaburi, approximately 250 kilometers (155 miles) southeast of Bangkok. Histories state that Seng earned income as a tax farmer for the government in the late nineteenth century. Tax farmers accrued wealth by collecting and retaining taxes from Siamese people that exceeded the taxes levied by the government. Most Chinese tax farmers like Seng assisted the Siamese government in collecting local taxes associated with such vices as drinking alcohol, smoking opium, and gambling.

Seng met a woman named Thongdi from Chanthaburi, who became his wife. She gave birth to the couple's six children: Muisian, Chiang, Bieo, Lek, Jansom, and Sengkim. By the beginning of the twentieth century, Seng's tax-collecting endeavors in Chanthaburi had ceased. He relocated his family to a Bangkok neighborhood, Talat Noi, where there were many Chinese merchants. By working as a merchant, Seng accumulated sufficient funds to send his sons to prestigious schools in Bangkok.

Mature Wealth

During 1908, Seng decided to settle in Chiang Mai in northern Siam and resume his work collecting gambling taxes. According to relatives who provided information for Prani Sirithorn Na Phatthalung's book *Phubukboek haeng Chiang Mai* (1980; pioneers of Chiang Mai), a Bangkok official related to Thongdi arranged for Seng to collect all taxes associated with Chiang Mai's gambling operations. Family members told the couple that Chiang Mai was the place where several Chinese entrepreneurs and their children had accrued significant wealth.

Thieves ambushed and killed Thongdi in 1910 while she was helping Seng collect money from gambling businesses. Grieving at his wife's death, Seng purchased a 3-rai (0.4-acre) piece of land in Sankamphaeng, located about 12 kilometers (7.5 miles) east of Chiang Mai and adjacent to a trading area. He invested in a caravan to transport Siamese goods to China and Burma. Seng married a woman named Noja, with whom he had three children: Nang, Bualoi, and Sumet.

With his oldest son, Chiang, Seng expanded his caravan-trading endeavors and purchased silk in Burma. Seng benefited financially by focusing on trading silk, enriching his already ample tax-farming profits. When railroad routes were built, Seng and his descendants increased silk sales to Bangkok markets.

Records do not report Seng's estimated wealth. His family's lifestyle and prestige in Chiang Mai suggest that his financial worth exceeded that of most people in his community.

English-language accounts state that Seng died during the 1920's, probably in northern Siam, but do not provide details.

Legacy

Seng established the foundation for his family's prosperity and influence. After his death, his descendants began using the Thai surname Shinawatra instead of Seng's Chinese name in order to assimilate into Thai society. Seng's family also appropriated the surname Shinawatra as the brand name for the silk business that Seng had established. The family benefited from sales to elite Thai entrepreneurs, leaders, and royalty. Their wealth enabled them to purchase shares in banks in northern provinces and other financial endeavors. Many Thais considered Seng's descendants among Chiang Mai's most outstanding residents. Seng's great-grandson Thaksin Shinawatra was prime minister of Thailand from 2001 through 2006. Other descendants include a mayor of Chiang Mai and members of Thailand's parliament.

William Sevenock
English merchant

As one of the few London merchants who prospered in the prolonged economic downturn of 1404-1430, Sevenock played an important part in civic life and business and helped underwrite Henry V's military campaigns. At his death, he endowed England's first public secular educational institution.

Born: c. 1373; Sevenoaks, Kent, England
Died: 1433; London, England
Also known as: William of Sevenoaks, William Sennock; William Sennoke
Source of wealth: Trade
Bequeathal of wealth: Charity; educational institution

Early Life
William Sevenock (SEH-vehn-ahk) was born around 1373 in or near Sevenoaks, a market town about twenty-one miles southwest of London in the county of Kent. Nothing is known of his parentage. According to tradition he was abandoned as an infant. His decision to take the name of his birthplace as a surname, rather than that of his parents or his guardian, William Rumschedde, could indicate uncertainty about his parentage, but surnames in the fourteenth century were not fixed and London apprentices often adopted the name of their birthplace.

Sevenock was born into a world still reeling from the ravages of the Black Death, which wiped out one-third of the population of southeastern England from 1349 until 1352. On one hand, a man born to humble circumstances in the 1370's faced a bleak future of civil strife and disrupted commerce, as well as bitterly cold winters and agricultural failures as the Little Ice Age strengthened its grip on Europe. On the other hand, a man's prospects for success, should he survive, were better than they had been a century earlier because the population crash created a demand for skilled labor and a lack of heirs at all levels, from skilled craftsmen to nobility, opening up opportunities for people without any hereditary connection.

Sevenock's guardian, a small landowner, probably provided him with a basic education and paid a premium to apprentice him to a London ironmonger. Apprentices to London trades were expected to be able to read and write in English and perform simple arithmetic. Although tradesmen might loan a prospective apprentice the premium money, paying it back would prove a barrier to apprentices wishing to establish a business, but Sevenock's early success is an indication that he had no such impediment.

In London in the 1390's, the ironmongers were a loose association of retail merchants, some of whom also engaged in manufacturing. By contrast, the mercers (cloth merchants) were tightly organized into a company with a royal charter and an effective monopoly on the import and export of cloth. The grocers occupied an intermediate position, lacking a company charter but having a formal organization and political clout. Significantly, when Sevenock was admitted as a freeman of the city of London in 1394, it was as a grocer rather than an ironmonger.

First Ventures
In the Middle Ages, the term "grocer" referred to a wholesaler who traded in items that were sold by weight, rather than by the piece or by volume. The grocers of London paid for exclusive access to the beam balance that served as a standard for calibrating weights throughout the kingdom, and they held an effective monopoly on the import of high-value items for which accurate weighing was critical. The grocers' biggest stock in trade were spices, a particularly lucrative business in the Middle Ages. They also dealt in drugs, dyes, and dried fruit. They were not heavily involved in the export trade or in the movement of produce and grain from outlying areas into the city of London.

Sevenock paid a premium of £10 to enroll in the Grocers' Company in 1497, an act that would have required him to have enough capital to rent warehouse space and purchase a sufficient stock of "groceries" to supply city retailers and merchants traveling to country fairs. His affairs evidently prospered rapidly, for in 1401 he was able to advance £100 to a fellow grocer on credit, and in 1404 he was listed as the owner of a ship that attacked Prussian ships between England and Zeeland.

Mature Wealth
The rapid growth of imports to England between 1390 and 1404, which formed the basis of Sevenock's early commercial success, rested on an uncertain foundation. In order to expand, merchants needed to borrow money, shipping gold and silver coin to the Continent. The value of goods exported did not compensate them for their loans, and an unfavorable trade balance resulted. Laws against loaning money at interest failed to prevent speculative investment in mercantile ventures. People with

MEDIEVAL PHILANTHROPY

Large donations to charitable causes, both during the lifetime of the donor and as part of a bequest after death, were common in medieval times. However, the motivation behind this charity was strongly influenced by the doctrines and practices of the Roman Catholic Church and only indirectly stemmed from either *philanthropos*—the love of humanity—or a desire to enhance the social status of heirs. Philanthropy directed toward social reform was singularly absent from the late medieval world, both in theory and in practice.

Thomas Aquinas outlined seven good works of charity: to clothe, give water, feed and shelter the needy, release people from prison, nurse the sick, and bury the dead. He considered these acts of charity to be acts of friendship to God. At the same time, Catholic theology held that prayers for the dead eased the deceased's passage through Purgatory, irrespective of the person's virtue when living. Consequently, most bequests endowing hospitals, almshouses, and educational institutions contained a provision requiring that the individuals supported by the endowment pray for the soul of the departed. Most charitable institutions were attached to monasteries. In the case of an educational institution, the teachers were monks or priests, and poor boys admitted without payment of fees were required to join the monastic order. A common type of endowed institution was the chantry, which provided support exclusively for saying masses for the dead. Larger bequests supported multiple clerics and erected chapels.

Agricultural land was the main source of personal wealth in medieval England. Possession of such land, derived from a royal grant, was inalienable, except by royal decree, and a man could not sell land or give it to charity but could only transfer it to his lawful heirs. Between 1307 and 1485, the Crown granted 446 licenses to landowners to transfer property to the Church.

capital contrived to disguise interest as fees or phantom leases. In 1404, the entire edifice of overextended credit came tumbling down, leading to multiple bankruptcies and a general contraction of the grocers' and other workers' trades. The fundamental problem, an absolute shortage of gold and silver coin, could not be remedied except by increasing exports. This economic slump persisted until about 1430.

That Sevenock was one of the few London grocers who continued to prosper suggests that he never became heavily involved in either borrowing or lending, and that as a lender he demanded security rather than contriving to collect fees for the use of money or becoming a partner in a speculative enterprise. His estate at his death included a wharf and numerous commercial buildings, some purchased directly with the proceeds of trade and some most probably acquired as a security interest when a borrower was unable to repay a business loan.

Sevenock's continued commercial success provided him an avenue into London civic life. He became a warden of the Grocers' Company in 1404, an alderman in 1411, sheriff in 1412, a member of the London Commons in 1417, and lord mayor in 1418. All of these positions required that the incumbent expend substantial sums underwriting civic ceremonies. They also entitled a man to a degree of personal opulence in dress and entertainment but required that this luxury be shared in a very public manner with the citizens of London. Because of the expense, the city had difficulty filling these positions during the economic slump, and a law was passed in 1416 against conspiring to avoid service as sheriff or lord mayor. In the second, more impoverished decade of the fifteenth century, only four men from the Grocers' Company rose to the rank of alderman, with three of them, including Sevenock, not originally grocers.

The years 1390-1420 were marked by the rise of Lollardism, an anticlerical, theological reform movement espoused by the followers of John Wyclif. Lollardism, in some ways a forerunner of Protestantism, had sympathizers among the London mercantile community. The only connection to Sevenock seems to be a confrontation in 1415 with Thomas Maynald, a grocer of possible Lollard sympathies, who insolently suggested that Sevenock, as alderman of his ward, ought to be hanged if he did not conduct himself well and honestly. When Maynald was imprisoned for his outburst, Sevenock paid his bail and stood surety for him.

Sevenock contributed £100 to King Henry V's second expedition to Flanders in 1417; this was a secured loan, not a gift. In contrast to his wealthier contemporary, the mercer Richard "Dick" Whittington, Sevenock was not heavily involved in government finance. When the Grocers' Company received a royal charter and began building a hall in 1427, he contributed £40 to the effort.

LEGACY

Sevenock's only enduring legacy is the Sevenoaks Grammar School in his native village in Kent. Still operating in the twenty-first century as a prestigious public school, it is the oldest secular secondary school in Great

Britain and one of the oldest in the world. Sevenoaks, England, also is home to a row of almshouses, a form of public housing for the poor. Originally built in 1418, these houses had a perpetual endowment providing 10 shillings a year to twenty poor men and women. The present almshouses, built from proceeds of the sale of Sevenock's London property, date from the 1700's.

The terms of Sevenock's 1432 will bequeathed all of his lands, buildings, and appurtenances to the village of Sevenoaks. The will also directed the vicar and churchwardens of the town to use the income generated by those properties to maintain "One Master, an honest man, sufficiently advanced and expert in the science of grammar, by no means in holy orders, to keep a Grammar school in some convenient house . . . to teach and instruct all poor boys whatsoever coming there for the sake of learning, taking nothing from them or their parents for the teaching of them."

What little evidence there is of Sevenock's personal life suggests he was austere and pious, even in comparison with contemporaries. There is no evidence of his having been married or of having had children. His bequest of the majority of his estate to the poor people of his native community, rather than to the Church, indicates an understanding of Christian charity similar to the Franciscans and represents a radical outlook for his time. Obtaining a basic education was a prerequisite to entry into the mercantile community, and Sevenock was perhaps the first person to realize that providing children of the poor with this essential tool for bettering themselves, without obligating them to a career in the Church, was a truly charitable act.

Shah Jahan
Mughal emperor

Shah Jahan's rule was the golden age of the Mughal Empire. His passion for grandeur, as evident in the construction of massive architectural marvels, including the Taj Mahal, and his Peacock Throne, made of precious stones, metals, and jewels, elicited the admiration of numerous travelers and traders.

Born: January 5, 1592; Lahore, India (now in Pakistan)
Died: January 22, 1666; Āgra, India
Also known as: Khurram (birth name); Shahjahan
Source of wealth: Government
Bequeathal of wealth: Children

Early Life
Shah Jahan (shah jah-HAHN) was born in Lahore on January 5, 1592. He was the third son of Emperor Jahāngīr, who ruled the Mughal Empire from 1605 to 1627, and the Hindu Prajput queen Jagat Gosain (or Princess Manmati). Jahan's birth name was Khurram. In his youth, he appears to have received an education that enabled him to grow up as a man of culture and artistic taste. He was betrothed by his father on April 5, 1607, to Arjumand Banu Begam, daughter of Asaf Khan. The couple married in Āgra on May 10, 1612, and Shah Jahan named his wife Mumtaz Mahal, which means "exquisite one of the palace." During his father's reign, Shah Jahan distinguished himself in numerous battles, including those in Mewar in 1615, the Deccan in 1617 and 1622, and in Kangra in 1618.

First Ventures
Even as a young man, Shah Jahan demonstrated his passion for architecture. At sixteen, he had built impressive quarters inside Emperor Bābur's Kabul fort and redesigned the quarters inside the Āgra fort. Shah Jahan also built the Shahibaug locality in the city of Ahmedabad and constructed buildings on a hill in Udaipur in 1613. He began construction of the Shalimar Garden in Kashmir at the behest of his father in 1620 and completed it in 1634. Early in his career, Jahan also built a fine hunting resort on an artificial lake near Burhanpur.

Shah Jahan ascended the throne on February 14, 1628, at Āgra. By this time, he had constructed his father's tomb in Lahore and a mosque at the shrine in Ajmir, and he planned to build public audience halls. He would subsequently embark on a phenomenal building spree, constructing palaces, fortresses, canals, and gardens throughout his realm, as well as the arcades of his favorite city, Shahjahanabad, and his dream mausoleum, the Taj Mahal (crown of the palace), described as a "teardrop upon the cheek of time." Remarkably, all of these structures were financed without straining his treasuries.

Mature Wealth
Shah Jahan's court historian, Abdul Hamid Lahori, provides a detailed account of the emperor's opulence. The Mughal Empire, stretching from Sind in the northwest to Syllet in the northeast and from Balkh (now Afghanistan) in the north to the Deccan in the south, was divided into twenty-two provinces containing nearly 4,350 administrative units, or *parganas*. Of these, the larger *parganas* of Āgra and Lahore alone generated revenues amounting to more than 1 million rupees annually. Even though Emperor Jahāngīr had liquidated the vast re-

serves he inherited, by 1647, Shah Jahan succeeded in earning revenues amounting to 220 million rupees, as compared with his grandfather's assessed revenue of 100 million rupees in 1595-1596.

Shah Jahan's wealth was also derived from military victories and conquests accompanied by plunder from the treasuries of the defeated kings. After his conquests in central India and the Deccan in 1635-1637, Shah Jahan is reported to have boasted of his financial gains in a letter to the Persian king. With expansion came larger tax and tribute revenues levied on additional populations. However, the growth of the Mughal Empire's revenue was primarily the result of increased agricultural cultivation and production in the imperial provinces. The Mughal peasantry augmented agricultural production by developing improved methods of farming, including clearing new lands; adopting new crops, such as the New World plants of tobacco and maize; and growing cash crops, such as cotton, poppy, and sugarcane.

The Mughal government earned additional revenue from the empire's burgeoning export economy. Indian spices and dyestuff commanded a world market. Throughout the seventeenth and eighteenth centuries, the Golconda diamonds were highly valued for their clarity and purity. Hand-spun and handwoven cotton and silk cloth fetched enormous earnings from the markets of the Persian Gulf, East Africa, and Southeast Asia. By 1500, the Portuguese operated a monopoly trade in pepper and

The Taj Mahal

The most notable architectural achievement of Shah Jahan's reign is the Taj Mahal, the mausoleum enshrining the tomb of his beloved wife, Mumtaz Mahal, who died on May 26, 1631, at Burhanpur in central India. The site of the Taj Mahal is a luxuriant parcel of high ground in the southern part of the city of Āgra, known as Akbarabad at the time the structure was built. The site was originally the property of Raja Man Singh of Ambar and had been inherited by his grandson Raja Jai Singh. Raja Jai Singh offered the property to Shah Jahan and also contributed stonemasons, marble from the quarry of Makrana, and carts for transporting the stones to Āgra in exchange for a splendid palace in Āgra.

Construction of the mausoleum began in 1632. According to contemporary sources, numerous artists worked on the Taj Mahal, including Makramat Khan and ʿAbd al-Karim Maʿmur Khan, who supervised the project, and, most important, Ustad Ahmad Lahori, the principal designer of Mumtaz's tomb. The Taj Mahal was completed on February 6, 1643, the twelfth anniversary of Mumtaz's death. The mausoleum was erected in the course of twelve years at a cost of 50 million rupees. Its gardens were surrounded by squares, inns, and markets. To maintain the main edifice and the surrounding structures and gardens, an endowment of 100,000 rupees was established, representing the annual revenues of thirty hamlets in the *pargana* of Akbarabad.

The Taj Mahal was conceived as the earthly replica of the paradisiacal house of Islam. The exterior of the mausoleum is white marble inlaid with colored stones. Rectangular panels with black calligraphy, created by the Persian calligrapher Amanat Khan, render verses from the Qurʾān that are inlaid into the tomb's white surface. The octagonal central chamber is an inlaid marble cenotaph marking the placement of Mumtaz's interred body in the crypt below. Shah Jahan's cenotaph, similarly decorated, is built to the west of the queen's. A latticed marble screen surrounds both royal cenotaphs. Qurʾānic passages promising rewards to believers and eternal doom to the *kafirs* (nonbelievers) on the Day of Judgment are inscribed on the tomb complex.

The designers of this magnificent tomb were highly educated in mathematics, engineering, astrology, literature, and theology, and thus were well qualified to create a structure symbolizing the ultimate vision of paradise on earth. The celebrated verse by the thirteenth century Sufi poet Amir Khusrau (1253-1325), which adorns the walls of Diwani-i-Khass at the Red Fort in Delhi, is eminently appropriate for the magnificent Taj Mahal: "If there be paradise on earth anywhere, it's here, it's here, it's here." In 1983, the Taj Mahal was designated a United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage Site.

precious stones between India and Europe. A century later, the British, Dutch, and French East India Companies further expanded this connection. By the end of the seventeenth century, these companies sold millions of yards of Indian cloth. European traders had to pay for this imported merchandise in gold or silver coin. By the 1600's, more than thirty tons of silver and one-half ton of gold were brought by the Western traders to India. Foreign coins were melted and converted into Mughal silver rupees and gold *mohurs* for a fee charged by the imperial mints. Thus, in addition to land revenue, customs duties and mint fees added to the imperial profits.

Shah Jahan's revenue system was based on his grandfather's. Taxes were assessed according to the recorded crop yields and their prices and were collected in fixed annual installments of imperial copper (*dam*) and silver coins (rupees) by salaried revenue officials who came from the ranks of *amirs* or *mansabdars*. This requirement of monetary payment generated a spiraling agrarian market that fed the growing towns and cities of the empire. Taxes from imperial crown lands, containing some of the most productive tracts in the empire, were collected directly by imperial officials or *jagirdars* (assignment holders) and deposited into the provincial treasuries at the disposal of the emperor.

Throughout his reign, Shah Jahan constructed and renovated forts. He remodeled forts in Gwalior, Āgra, Lahore, Kabul, and Kandahar, often adding new structures, such as courts, mosques, towers, and gardens. Almost everywhere in his empire, new structures were built of marble rather than sandstone, as was the practice of his predecessors, Emperors Akbar and Jahāngīr. Shah Jahan's many splendid structures include the Moti Masjid (Pearl Mosque). He also constructed a new capital city of Shahjahanabad, where he built the Jama Masjid (public mosque), the imperial palace, and the magnificent sandstone Lal Qila (Red Fort) that housed the Diwani-i-Amm (public audience hall), Diwani-i-Khass (private audience hall), and the Takht-e-Taous (Peacock Throne), consisting entirely of precious stones, metals, and jewels. However, he is best known as the emperor who commissioned the building of the Taj Mahal, a mausoleum at Āgra dedicated to the memory of his beloved queen.

Shah Jahan was a connoisseur of jewelry, and under his patronage jewelry making reached a high degree of perfection. Jewelers from Asia and Europe visited the Mughal court to sell their crafts and gems. Shah Jahan's famous Koh-i-Noor diamond weighed 787.5 carats. The diamond, discovered in the Kollur Mine in Golconda in 1650, was originally cut, albeit unsatisfactorily, by a Venetian lapidary named Ortensio Borgio. Later, the diamond, as well as the Peacock Throne, became the property of the Persian king Nādir Shāh, who carried them off to Isfahan in 1739. After Nādir Shā's assassination in 1747, the Koh-i-Noor diamond disappeared and the Peacock Throne, reportedly, was broken up into ten thousand pieces of precious stones and jewels and scattered all over the world.

Shah Jahan's reign, celebrated in history as the golden age of Mughal India, ended in personal tragedy for the emperor, as well as in the political and economic decline of his empire. He fell ill in 1657, and his four surviving sons took advantage of his infirmity, making a bid for the throne in the absence of any system of inheritance by primogeniture. The ablest son, Aurangzeb, emerged victorious. He deposed his father in 1658 and sent him to confinement at the Āgra fort, where Shah Jahan died in 1666 and was interred, along with his favorite wife, inside the Taj Mahal.

Legacy

Shah Jahan, arguably the most admired and remembered Mughal emperor, left behind him a vibrant and cosmopolitan artistic tradition and a rich country with magnificent structures, of which the Taj Mahal stands as the best-known legacy of his reign. The emperor also acquired posthumous fame for his fabulous romantic love, as demonstrated by the Taj Mahal's commemoration of beloved wife, Mumtaz Mahal. A crater on the planet 433 Eros has been named Shah Jahan in accordance with astronomers' convention of naming craters on this asteroid after romantic lovers, real or fictional.

THAKSIN SHINAWATRA

Thai merchant, investor, and politician

Shinawatra used his family connections and wealth to secure government licenses and invest in telecommunications technologies, resulting in the formation of one of the largest conglomerates in Thailand. He later became the nation's prime minister, but he was ousted in a coup and accused of using corrupt and manipulative methods to attain his fortune.

Born: July 26, 1949; San Kamphaeng, Chiang Mai Province, Thailand
Also known as: Thaksin Chinnawat
Sources of wealth: Computer industry; telecommunications; investments
Bequeathal of wealth: Spouse; children; educational institution

EARLY LIFE

Thaksin Shinawatra (TAHK-sihn shihn-ah-WAHT) was born on July 26, 1949, in San Kamphaeng in northern Thailand's Chiang Mai Province. His father Bunloet Sae Khu, later known as Loet Shinawatra, and his mother Yindi Ramingwong were descended from Chinese immigrants. The Shinawatra family attained notable financial resources from their silk business, which was established by Shinawatra's great-grandfather Seng Sae Khu. Shinawatra's father served as a member of the Thai parliament.

After graduating from Thailand's police cadet academy, Shinawatra pursued a law enforcement career. In the 1970's, he lived in the United States while attending graduate school at Eastern Kentucky University. Shinawatra received a master's of science degree in criminal justice in 1974, writing a thesis examining police training. He later resided in Huntsville, Texas, where he completed a Ph.D. in criminal justice at Sam Houston State University in 1979.

FIRST VENTURES

Shinawatra returned to Thailand, earning a living as a policeman with the Royal Thai Police Department. Shinawatra married Pojaman Damaphong, and the couple later had three children: a son, Panthongthae, and daughters Phinthongtha and Phaethongthan. After his marriage, Shinawatra benefited financially from the business contracts he secured through his father-in-law, Samoe Damaphong, a police general whose department purchased computer equipment from Shinawatra.

Shinawatra's entrepreneurial endeavors needed government approval from officials who would grant him licenses. He appealed to these political leaders, mostly military men, by offering such incentives as expensive cars or promising them impressive positions at his businesses. He founded the Shinawatra Computer Corporation in 1983; this firm would later be renamed the Shin Corporation and would become one of the largest conglomerates in Thailand.

In 1985, Shinawatra established a cable television network, and the next year he launched a pager business. Shinawatra resigned from his police position in 1987 and secured additional licenses. He excelled at generating wealth from advances in telecommunications technology, such as mobile phones, as they became available in Thailand during the late 1980's. The 1991 military coup in Thailand enabled Shinawatra to attain the rights associated with Thailand's first satellite from junta leader General Sunthon Kongsompong.

Mature Wealth

After Sunthon's junta lost power in 1992, military leaders no longer controlled licensing for telecommunications, threatening Shinawatra's investments. Shinawatra decided to become a politician so he could influence government policies. By 1994, Shinawatra represented the Palang Dharma Party in the Thai cabinet because that party had power regarding the decisions of the Ministry of Transport and Communications. The next year, he was elected a member of Thailand's parliament. By that time, Shinawatra had accrued a personal fortune ranging from 60 to 80 billion baht (with an exchange rate of 40 baht per dollar).

From 1995 through 1997, Shinawatra was deputy prime minister in the administrations of Prime Ministers Banharn Silpa-archa and Chavalit Yongchaiyudh. After one of Shinawatra's competitors, the Charoen Pokphand Group, received a profitable mobile telephone contract, Shinawatra decided to seek greater political power. After surviving the 1997 economic crisis, he created the Thai Rak Thai political party the next year.

Shinawatra invested his wealth in more digital technologies, ensuring Shin Corporation's telecommunications dominance. Shinawatra's critics suggested that he had acted illegally by using his political influence to increase the corporation's profits. In December, 2000, the National Counter Corruption Commission accused Shinawatra of concealing wealth he had earned in order to avoid taxation. Popular with rural populations, Shinawatra won Thailand's election for prime minister in January, 2001. At that time, he was the wealthiest person in Thailand.

Critics continued to publicize allegations that Shinawatra had hidden profits. Many middle-class and wealthy Thais disliked Shinawatra's authoritarian behavior, and they pressured for his removal from office. In June, 2001, *Forbes* magazine included Shinawatra on its list of the world's wealthiest people, valuing his assets at $1.2 billion. By 2004, the wealth of Shinawatra's family expanded by an estimated 76 percent, and that same year he told the Export-Import Bank of Thailand to loan Burma 4 billion baht (24 baht per dollar) to purchase satellite technology from his company.

Shinawatra won reelection in 2005. He sold the 49.6 percent share he and his family owned in the Shin Corporation to Singapore's Temsaek Holdings for $2 billion in January, 2006. Because Shinawatra's income from this foreign transaction was not taxed, many Thais protested, demanding he resign as prime minister. Shinawatra met with Thailand's King Bhumibol Adulyadej to discuss his leadership. In July, 2006, *Forbes Global* ranked Shinawatra and his family as the fourth-wealthiest family in Thailand, stating they were worth $2.2 billion.

On September 19, 2006, General Sonthi Boonyaratglin led a military coup and established martial law. He stressed that Shinawatra was corrupt and should be prosecuted for hiding money, often unlawfully acquired, and arranging for his wife to purchase government land along Ratchadapisek Road in northern Bangkok without paying its legal value or taxes.

Shinawatra was in New York City when the coup occurred. He flew from there to London, where he requested that Great Britain provide him political asylum and not extradite him to Thailand. Shinawatra worried that his enemies might confiscate his financial resources. The next summer, *The Nation*, a Bangkok-based newspaper, reported that Thai officials had frozen 65 billion baht (33 baht per dollar) of Shinawatra's wealth; the newspaper also speculated that Shinawatra had hidden more than 200 billion baht in foreign banks.

In 2008, *Forbes* included Shinawatra on its list of wealthy people. At this time, he was enduring legal problems, particularly regarding additional allegations that he had used his office for financial gain. The Asset Examination Committee in Thailand outlined charges against him, including allegations that Shinawatra had obtained monetary benefits associated with the construction of Suvarnabhumi Airport in Bangkok. Aspiring to regain political power, Shinawatra traveled to Thailand in February, 2008. A court sentenced Shinawatra's wife to three years in prison for evading taxes. Permitted to pay bail in order to attend the Beijing Olympics, Shinawatra and his wife resumed exile in London.

In October, 2008, the Thai Supreme Court sentenced the absent Shinawatra to a two-year prison sentence for his illegal actions regarding the Ratchadapisek Road land sale. England stripped Shinawatra of his visa, and he took up residence in Dubai, and he had not returned to Thailand since his conviction. The Shinawatras divorced the next month. In November, 2009, Shinawatra began serving briefly as the economic adviser to Cambodian prime minister Hun Sen. Sri Lankan officials asked Shinawatra to perform similar services.

In late 2009, a criminal division for political officeholders of the Thai Supreme Court scrutinized the wealth Shinawatra accumulated during his tenure as prime minister. Shinawatra was tried by the court, with witnesses stating that he had manipulated policies in order for the Shin Corporation to receive government funds and tele-

Shinawatra University

In September, 2002, Shinawatra University began offering classes on its campus, located on 300 rais (118 acres) in Thailand's Sam Khok district of Pathum Thani Province, approximately 50 kilometers (31 miles) from Bangkok. Telecommunications entrepreneur and politician Thaksin Shinawatra and his friend, Thai minister of the interior Purachai Piemsomboon, began discussions in 1996 regarding the creation of a university that would educate students to perform innovative jobs in business and technology. Shinawatra viewed education as a commodity that enabled Thailand to compete in the global economy. In 1999, Shinawatra and his family provided 1 billion baht (with the exchange rate averaging 27 baht per dollar) to establish this school.

Shinawatra and administrators, including university chairman Olarn Chaipravat, an economic adviser to the Thai minister of finance, consulted businesses to learn the qualities they sought in employees. The leaders of Shinawatra University envisioned preparing graduates to fulfill employers' needs. In 2001, the university's council, composed of people selected by the Thai minister of education, endorsed the university's master of business administration (M.B.A.) program, as well as bachelor degrees in business administration, computer science, and the "built environment," an innovative architecture and technology program. Architect Soontorn Boonyatikarn designed buildings compatible with Thailand's tropical climate for Shinawatra University.

The university operates academic programs in either its school of technology or its school of management. The school also funds scholarships for students, including employees of Shinawatra's company, the Shin Corporation, and government officials and workers. University officials intend for graduates to acquire the essential knowledge that will enable them to become employable in their fields, with many students developing skills that will allow them to establish companies. Students study and debate actual business situations. Shinawatra's companies, particularly the Shin Corporation, and other Thai businesses provide students opportunities to gain realistic work experiences.

During 2004, Shinawatra University graduated its first M.B.A. recipients, expanded to a second campus for graduate courses taught on two floors in the Shinawatra Tower III building in Bangkok, and established additional master's programs in management technology, information technology, and systems engineering. The next year, the school began awarding doctorates in management and technology. In 2006, Shinawatra University's first undergraduate students received their degrees.

In July, 2007, the *Bangkok Post* reported that the 2006 coup in Thailand and Shinawatra's exile to avoid being prosecuted for corruption had detrimentally affected Shinawatra University, causing the school to lose both financial resources and students. Many students became disillusioned with Shinawatra and quit their studies or transferred to another school, fearing the university would close or Shinawatra's name might be a stigma impeding their employment possibilities. Enrollment in 2006 dropped to 320 students from 383 the previous year. Some foreign students and faculty worried about safety issues. Administrators assured the university community that despite Shinawatra's assets being frozen, the university's endowment of 300 million baht (averaging 32 baht per dollar) had not been seized.

In 2008, the university council endorsed a bachelor's program in liberal arts and a master's degree for teaching English as an international language. Shinawatra University hosted its ninth anniversary celebration on December 26, 2008. In September, 2009, the *Nation*, a Thai newspaper, reported that the Thaicom Foundation would provide 1 million baht (33 baht per dollar) in order to award scholarships to fifty aspiring Thai entrepreneurs.

communications contracts with better terms than competing firms were granted. Thai officials prevented Shinawatra's access to approximately 76 billion baht (33 baht per dollar), a portion of the money he had placed in banks. *Forbes* named him the sixteenth-wealthiest person in Thailand that year, estimating his net worth at $390 million. However, he was not included on the magazine's 2010 list of world billionaires. In February, 2010, Thailand's Supreme Court ruled that $1.4 billion worth of Shinawatra's assets that the government had frozen would be confiscated.

Legacy

Shinawatra's wealth primarily benefited his immediate family and allies, enabling them to purchase luxury items and financing elaborate lifestyles in Bangkok's Bang Plad and Dusit districts and abroad. Interested in improving education in Thailand, Shinawatra invested some of his fortune to establish Shinawatra University in order to prepare Thais for employment in the nation's businesses. He viewed the university's creation as a means of sharing the Shin Corporation's revenues with others and of helping Thais improve their economic status. Shinawatra envisioned his namesake school as a community of aspiring entrepreneurs.

Although his popularity and riches secured him political power, Shinawatra was a divisive figure whose leadership strategies, based on his identity as an executive, often provoked strife among Thais, who either supported or loathed him. His questionable actions associated with procuring his vast assets provoked controversy and litigation. Thai officials devoted considerable resources to seeking prosecution or amnesty for Shinawatra, diverting time from their efforts to govern the nation.

Georg von Siemens

German banker, landowner, and politician

Siemens founded the Deutsche Bank, the first international investment bank in Germany. Through his work in financing German international business ventures, Siemens built a substantial fortune of his own and enhanced the wealth of his industrialist relatives.

Born: October 21, 1839; Torgau, Prussia (now in Germany)
Died: October 23, 1901; Berlin, Germany
Sources of wealth: Banking; real estate
Bequeathal of wealth: Children

Early Life

Georg von Siemens (GAY-org fuhn SEE-mehnz) was born into a prominent German family. His father, Johann von Siemens, was a civil servant, and his cousins Verner and Johann Georg von Siemens were electrical engineers and inventors who together would found one of the first telegraph companies. Young Siemens appeared destined to follow in the footsteps of his father, studying law at the University of Heidelberg and, after a brief stint in the German military, serving legal internships with several district courts. Following his admission to the bar in 1866, Siemens went to work as a legal adviser to his cousins at the Siemens and Halske Company, where he was instrumental in the establishment of several large and lucrative business ventures, including the Indo-European Telegraph Company. His success as a negotiator and manager prompted his cousins to place their trust in him in managing their international business affairs.

First Ventures

Siemens's work with the Siemens and Halske Company allowed him to amass a measure of wealth uncommon to a man who had not yet reached the age of thirty. His role as manager of overseas operations for the company also exposed him to the financial difficulties and risk inherent in international business ventures. During the nineteenth century, German businesses seeking financing for such ventures were often forced to turn to British banks. As a growing number of German businesses engaged in international commerce, demand grew for a German bank with sufficient resources to finance global trade ventures. In 1870, a group of German industrialists and bankers joined together to found the Deutsche Bank, recruiting Siemens to serve as its first manager.

Mature Wealth

Despite having no prior experience in banking, Siemens immediately sought to challenge British banks in international trade through an aggressive policy of expansion, opening offices in London, New York, and Paris, as well as in China, Japan, and South America. Siemens also defied precedent by allowing the bank to accept short-term deposits from private patrons for fixed periods, a practice that set a precedent for such subsequent banking services as certificates of deposit. His ideas produced mixed results: Political and economic conditions resulted in the closing of the bank's Asian operations, yet the acceptance of private deposits allowed the bank to maintain sufficient capital to maintain growth and to finance a number of lucrative international projects, including the Baghdad Railway in the Ottoman Empire and the Northern Pacific Railway in the United States.

As the Deutsche Bank prospered from the German industrial expansion of the late nineteenth century, Siemens joined the ranks of successful businessmen from the German middle class. Like many of his peers, he avoided extravagant behavior and stressed practicality and frugality in his daily life. While traveling, he often dressed so modestly that he was mistaken for a person of limited means. His estate grew to include extensive landholdings, including a vacation home in Italy, yet Siemens rarely took a vacation, although his extensive business travels continued. As his success in business grew, he entered politics in the 1870's and was elected to the Riechstag in 1874. As a legislator, Siemens advanced a probusiness agenda that increased his power, influence, and wealth. Siemens continued to maintain a relatively simple lifestyle, largely eschewing the lavish social life of a wealthy businessman.

Legacy

A pioneer of the modern banking industry, Georg von Siemens built substantial personal wealth as well as a financial institution that survived global economic turmoil and world war to remain one of the largest investment banks in the world at the end of the twentieth century. In keeping with his ancestors' family-centered philosophy, Siemens left most of his wealth to his children. The Siemens family retained financial interests in Deutsche Bank long after his death.

Harry F. Sinclair

American oil magnate

Sinclair created one of the largest oil companies in the United States. By the time he retired from active management, Sinclair Consolidated Oil Corporation had become the seventh-largest oil company in America, with assets of more than $700 million and more than 100,000 stockholders.

Born: July 6, 1876; Wheeling, West Virginia
Died: November 10, 1956; Pasadena, California
Also known as: Harry Ford Sinclair
Source of wealth: Oil
Bequeathal of wealth: Relatives

Early Life

Harry Ford Sinclair (sihn-KLAYR) was the son of a pharmacist who operated a successful business in Independence, Kansas. He intended to carry on his father's business and studied pharmacy at the University of Kansas. However, he lost the pharmacy in some speculative ventures. When a hunting accident forced the amputation of one of his toes, Sinclair used his $5,000 insurance settlement to invest in "mud silles," the large logs that were used as skids upon which drilling rigs were erected. He also began working as a lease broker, signing up leases for oil exploration and drilling on land in southeast Kansas and in the northern part of the Indian Territory (now Oklahoma).

First Ventures

With the income generated by his early involvement in the oil business, Sinclair began drilling his own wells, and in July, 1905, he made his oil discovery just south of Caney, Kansas, in the Indian Territory. By 1907, Sinclair was one of the wealthiest men in Kansas, and he was a millionaire by 1911. However, the following year the Cushing Field was discovered in Oklahoma, a vast petroleum reserve that for a time produced so much oil that the supply outstripped demand, driving prices to low levels. Eventually, however, the demands created by World War I and the growth of the automobile industry in the United States caused consumption to rise again. In 1916, Sinclair offered stock in Sinclair Oil and Refining Corporation, with $50 million of stated assets. Eventually, Sinclair Oil became a prime example of vertical integration, involved in every step of the oil business, including exploration, drilling, transportation, refining, and retail sales.

Mature Wealth

Although Sinclair claimed to disdain the public spotlight, he lived lavishly. He traveled widely by private aircraft and also had a private railroad car named Sinco. At one time, he owned an elaborate French Renaissance-style mansion on Fifth Avenue in New York City. He had a great interest in sports and was a financial backer of the short-lived Federal Baseball League, which in 1914 and 1915 tried to break the monopoly on professional baseball held by the National and American Leagues. He was an avid fan of horse racing and for a time owned the Rancocas Stables near Jobstown, New Jersey.

In 1924, Sinclair was accused of offering bribes to Secretary of the Interior Albert B. Fall in order to obtain drilling rights in the Teapot Dome area of Wyoming, an area that was part of a naval oil reserve, where oil was supposed to be left untouched in case the U.S. Navy needed it in a national emergency. The Teapot Dome Scandal resulted in Fall's eventually being sentenced to prison. Sinclair was acquitted of the bribery charges, but he was convicted of contempt of court and of contempt of Congress for failing to answer questions about his alleged involvement. He spent six and a half months in prison because of these convictions. In January, 1949, Sinclair retired from active leadership of his company.

Legacy

Estimates of the extent of Sinclair's personal fortune vary widely, and for much of his career it is difficult to separate his personal wealth from the value of his corporate empire. However, his greatest financial legacy was the corporation he had created. In 1950, Sinclair Consolidated Oil had assets of more than $1 billion. In 1957, it was listed as the seventh-largest oil company in the United States and the fourteenth-largest industrial firm of any kind, doing business throughout the United States and in many foreign countries.

Sinclair's career after the Teapot Dome scandal somewhat rehabilitated his name and image, but it is likely that in American historical memory, he will always be linked to that infamous oil deal. In 1969, Sinclair Oil was acquired by the Atlantic Richfield Company, but in the mid-1970's much of the Sinclair assets were spun off into a privately held corporation that continues to do business as Sinclair Oil Corporation.

ISAAC MERRIT SINGER

American inventor, industrialist, and actor

Singer earned his wealth by patenting and producing a popular sewing machine. A former actor with a flamboyant and unorthodox lifestyle, he understood how to advertise and market his products, devising an innovative plan for selling sewing machines on credit.

Born: October 27, 1811; Pittstown, New York
Died: July 23, 1875; Torquay, Devon, England
Also known as: Isaac Merrit
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Spouse; children

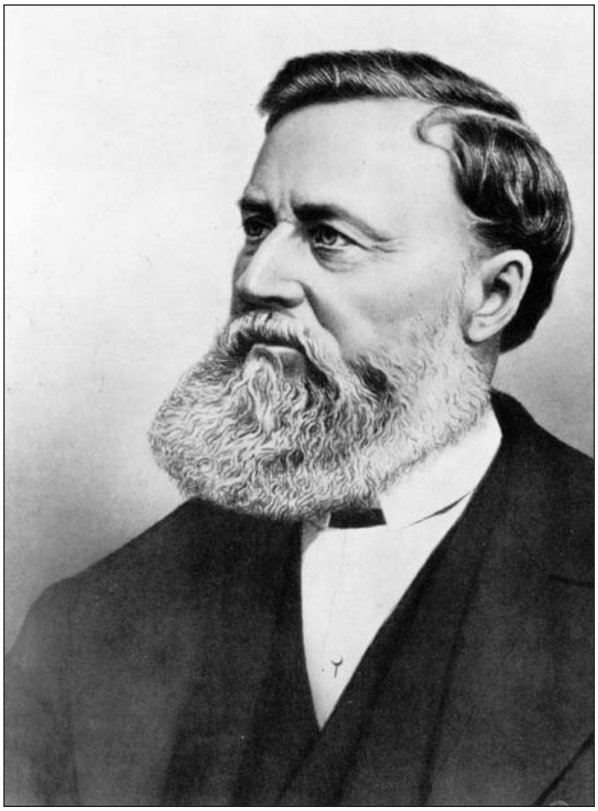
EARLY LIFE

Isaac Merrit Singer was born in Pittstown, New York, on October 27, 1811, the seventh son of Adam Singer and his wife Ruth Benson Singer. His father had immigrated from Germany and is believed to have been Jewish. Singer's parents divorced when he was ten years old. His father remarried, and difficulties developed between Singer and his stepmother. At the age of twelve, Singer went to live with his elder brother in Otsego County, New York. His brother had a machine shop, where Singer began working and learned the machinist trade.

In 1830, Singer married Catharine Maria Haley. They moved to New York City in 1831 but returned to Otsego County two years later. Singer found work at the machine shop of George Pomeroy. In 1836, having decided that he would rather be an actor than a machinist, he joined a touring company of actors. He and his wife were again living in New York City in 1837. During this time, they had two children, William and Lillian. Singer had also fathered a child with Mary Ann Sponsler, whom he had met while on tour.

FIRST VENTURES

While Singer preferred acting to the machinist trade, the acting profession did not provide him and his family with an adequate and dependable living. Thus, he returned to the machinist trade. He invented a rock-drilling machine for which he obtained a patent in 1839. He sold the patent for $2,000 and returned to acting. He formed a company called the Merrit Players, using the name Isaac Merrit as his stage name. Sponsler, the woman he had met on his earlier tour and with whom he was living at the time, performed with the Merrit Players. The company toured for five years until 1849. By then, his patent money was ex-



Isaac Merrit Singer. (Hulton Archive/Getty Images) hausted, and Singer once again stopped acting. He took a job in a print shop in Fredericksburg, Ohio.

Two years later, he went to Pittsburgh, Pennsylvania, where he set up a shop of his own. He began working on the invention of a machine for carving both wood and metal. In 1849, he received a patent for such a machine. He went back to New York City and found employment with A. B. Taylor and Company, and while there he developed a woodblock-cutting machine. This machine, as well as the shop, was destroyed when a steam boiler blew up. Fortunately for Singer, Orson Phelps was familiar with Singer's machine, and Phelps offered Singer a job in his Boston shop. In 1850, Singer moved to Boston and built another woodblock-cutting machine. The new machine was not a success.

At this time, Phelps's shop manufactured sewing machines for the Leroy and Blodgett Company. These machines were neither easy to build nor easy to use. Hoping for some improvement, Phelps, who admired Singer's skill as a machinist, had him examine the machine's design. Singer improved the machine, replacing its curved needles with straight ones and changing the mechanism of the shuttle from a straight-line to a circular movement.

Mature Wealth

Singer received a patent on his improved design for a sewing machine on August 12, 1851. Singer and Phelps then went into partnership with George B. Zieber, who provided the financial backing, and formed the Jenny Lind Sewing Machine Company. Singer soon had another partner, Edward C. Clark, a New York lawyer whose business skill would enable the company to be a success. The partners also renamed the firm I. M. Singer & Co.

Shortly after forming his company, Singer became involved in patent lawsuits. There were several other companies with various patents producing rival sewing machines. In 1856, the sewing machine manufacturers, with the exception of Elias Howe, met in Albany, New York. The manufacturers were well aware that they were spending a considerable portion of their profits on litigation. Orlando B. Potter, the president of the Grover and Baker Company, suggested a solution to the problem: the pooling of patents, which would permit all of the companies to produce sewing machines without patent infringement conflicts. There was unanimous agreement to the proposal, and shortly thereafter, Howe also accepted the plan and the Sewing Machine Combination was formed. This agreement initiated the mass production of sewing machines.

While Singer could not be credited with inventing the sewing machine, he was recognized as producing the most practical machine. He produced two versions of his machine. He manufactured a large machine, which was suitable for use by tailors, as well as shoe cobblers, since it was able to sew through leather. He also manufactured a smaller sewing machine, called the Turtle Back Machine, for use in the home. From 1851 to 1865, Singer continuously improved his sewing machine, and by 1865 he had patented twenty improvements to his product. Two of the most important of these were the continuous wheel feed and the yielding pressure foot.

I. M. Singer & Co. grew rapidly, and on the suggestion of Clark the firm moved from Boston to New York City. In 1860, the company, located at Mott Street in New York City, produced 13,000 sewing machines, compared with only 2,564 four years earlier. With his flair for drama and his vivid imagination, Singer developed innovative ways of bringing his product to the attention of all classes of society. He appeared at fairs and outdoor gatherings and personally demonstrated his sewing machine. He also sang a special tune, "The Shirt Song," to advertise his product. To reach the upper echelons of society, he hosted gala balls in New York. At these balls, attractive women were seated at sewing machines strategically placed throughout the venue, and they demonstrated the ease of sewing with a Singer machine.

Just as Singer was creative in promoting his product, he was also innovative in his sales methods. For those who could not afford to pay cash for a sewing machine, he offered the "hire purchase plan," enabling customers to make a $5 down payment, take the machine home, and then pay the rest of the price in monthly installments of $3. Singer was one of the first to offer this credit installment plan. By 1860, Singer was a millionaire as the result of his firm's success.

In 1863, I. M. Singer & Co. was reorganized both financially and structurally and was renamed the Singer Manufacturing Company. Singer himself no longer played an active role in the company but retained 40 percent of the stock and served on the board of trustees. In 1867, the company entered the European market with the establishment of a factory in Clydebank, Scotland. Subsequent factories were established in Rio de Janeiro, Brazil, and near Paris, France, making the Singer Manufacturing Company one of the first American firms to operate internationally.

Singer's immense wealth enabled him to own several mansions, with the most elaborate one being Oldway Mansion in Paignton near Torquay, England. When he purchased this English property in 1871, it was the site of the Fernham estate. Singer tore down all of the estate's buildings and hired the architect George Soudon Bridgman to build a magnificent mansion with 115 rooms. Singer lived there until his death from heart failure on July 23, 1875. He was buried in the Torquay cemetery. At the time of his death, Singer had twenty-two acknowledged children from two wives, a common-law wife, and two mistresses, and he left an estate worth approximately $14 million.

The Singer Will Lawsuits

Upon his death in 1875, Isaac Merrit Singer left an estate of approximately $14 million. He also left two wives to whom he had been legally married, a common-law wife, and two mistresses, and with these women he had twenty-two children whom he recognized as his own. Singer did not divide his wealth evenly among his children. To some he left a large inheritance, to others he left very little, while others were entirely excluded. He left the largest shares of his fortune, as well as his Oldway Mansion, to his six children by his last wife, Isabella. His sons from this marriage received more money than his daughters. His children from his first marriage, William and Lillian, received very small amounts of money, with William inheriting $10,000 and Lillian receiving only $500. Among his wives and mistresses, he left money only to Isabella, his wife at the time of his death.

With so much money involved, several of his children, wives, and mistresses filed lawsuits against the estate. These suits resulted in years of litigation and were often without a valid claim to Singer's fortune. One of the most curious of the lawsuits was that of his common-law wife, Mary Ann Sponsler. In 1875, she sued the estate, alleging that she was Singer's lawful widow because she had lived with him for seven months after his divorce from his first wife, Catharine Haley, and was therefore his wife according to common law. Sponsler based her claim on the grounds that she had not been granted a divorce from Singer when she sued him for divorce after discovering his infidelity with his employee and mistress, Mary McGonigal. Therefore, she claimed, she was Singer's wife at the time he married Isabella. Sponsler made her allegations despite the fact that she had married John E. Foster in 1862, and at that time declared herself an unmarried woman. The lawsuits against Singer's will reflect his chaotic and unorthodox lifestyle, which caused him to be barred from polite society, notwithstanding his immense wealth.

Legacy

Isaac Merrit Singer acquired his wealth through his exceptional talent as a machinist who quickly realized how to improve a design and who tenaciously sought further refinements. He was also an astute businessman with a good sense of a product's marketability and a knowledge of sales techniques. By developing the Singer sewing machine and a company that would eventually market his product worldwide, Singer provided customers with a product that was useful in both the home and in some businesses. As one of the innovators of a credit plan with monthly installment payments, he helped increase the purchasing power of the wage earner and changed the structure of buying and selling merchandise. His Oldway Mansion in England, now opened to the public, provides cultural and artistic insights to visitors.

Samuel Slater

American industrialist and inventor

Slater built cotton spinning mills in New England that not only provided a product at a cheaper price than goods imported from England but also employed hundreds of workers. His mills developed commerce and generated income that helped build the economy of the United States.

Born: June 9, 1768; Belper, Derbyshire, England
Died: April 21, 1835; Webster, Massachusetts
Also known as: The Father of American Manufactures
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Spouse; children; relatives

Early Life

Samuel Slater (SLAY-tuhr) was the second son of William Slater, a prosperous farmer and landowner, and Elizabeth Fox Slater. At school he excelled in arithmetic, and at home he exhibited his mechanical skill by making a polished steel spindle to facilitate winding worsted yarn. A neighbor, mill owner Jedediah Strutt, needed an apprentice; William Slater recommended Samuel, since his older son wished to become a farmer. Strutt had been a partner of Sir Richard Arkwright, who had invented the spinning frame, later renamed the water frame as factories converted to water power. This machine revolutionized the developing textile industry.

Slater signed his apprentice agreement on January 8, 1783. It committed him to work for Strutt for six and a half years. Strutt, in turn, was to provide Slater with food and housing, and more important, with instruction in the art of cotton spinning. Slater was fascinated by the complex machinery, and when his apprenticeship ended, he supervised the construction of new machinery in one of Strutt's other mills.

By chance Slater read an advertisement offering £100 to anyone who could come to America and teach the latest methods of textile manufacture. Unfortunately, acts of Parliament made it illegal for information on developing technologies to leave England, prohibiting mechanics from emigrating. Slater decided to go to the United States, and he told officials at the port of London that he was a farmer and, therefore, exempt from the law restricting emigration. He sailed from London in September, 1789, with his apprenticeship certificate, which would prove his skills, carefully hidden, and he arrived in New York sixty-six days later.

First Ventures

His first job at the New York Manufacturing Company was disappointing. The mill was poorly equipped and had insufficient water power. Slater learned that Almy & Brown, a Rhode Island company, needed a manager for its cotton spinning mill. His letter to Moses Brown, an owner, touting his background in working with Arkwright frames and in Strutt's mills, was enthusiastically received. In his reply letter of December 10, 1789, Brown wrote of the company's need for someone who could fix the faulty machinery. He offered Slater a share in the profits and a partnership if he could make the machines work. For the wages of $1 a day, Slater's primary job was to build a working Arkwright machine. He accepted the challenge and the position.

When Slater left England, he could not legally bring machine models or even drawings of machines out of the country. Consequently, his knowledge of the spindles and gears that made up an Arkwright frame was all in his head. Slater relocated to Pawtucket, Rhode Island, and began work in what had once been a clothier's shop, located above the falls of the Blackstone River. Handicapped by lack of skilled mechanics and tools, Slater labored for almost a year to build the first machine. On December 20, 1790, the first cotton spinning mill in America began production with the Arkwright system, and orders started pouring in. Now Americans could buy cotton cloth from Almy, Brown & Slater for nine cents a yard. Previously, cotton cloth imported from England cost forty to fifty cents a yard. Slater had supplied the technical know-how to build the machines, and he also managed the mill.

Two years later, the profits were sufficient to warrant an expansion of the mill, and Slater's share in this venture was about $5,000. With his wages and his inheritance from his father of real estate and a nail store, Slater was in a financial position to marry. He had been living with the Wilkinson family, and he married the younger daughter, Hannah Wilkinson, on October 2, 1791. They would have ten children; six sons survived to adulthood, and three followed him into the business.

Mature Wealth

In 1793 the Almy, Brown & Slater partnership constructed a new, larger mill on the Blackstone River in Pawtucket, near the original mill. This mill, now called the Old Slater Mill, became a National Historic Landmark in 1966. It had three carders and two spinning frames, containing seventy-two spindles. With this mill, as in other Slater mills, Slater demonstrated not only his mechanical expertise but also his skill managing workers. Slater copied the English system of family labor where entire families—men, women, and children—worked in the mills. He set up New England's first Sunday school for the children, not for religious purposes but to teach reading and writing to children who worked in his mills six days a week. Slater provided company-owned housing for the workers, as well as a company store, developing the "Rhode Island system" of labor management.

Slater, who owned a one-half interest in the mill, disagreed with his partners over the mill's management, and in 1798 he organized a new firm with his in-laws, Samuel Slater and Company. He continued to build textile mills, all operating with the Arkwright machinery and fueled by water power. In 1801, in Rehoboth, he built the first mill in Massachusetts to use the Arkwright system, known as the White Mill because of its color.

Still connected with Almy, Brown, Slater added his brother John Slater, who had emigrated from England in 1803, to the partnership. John was a skilled mechanic and had knowledge of the latest textile manufacturing techniques in England. It was John who selected the site for a new mill, erected in 1806, in northern Rhode Island on the Branch River. As was customary around the new mills, a town developed. This town was named Slatersville. By 1812, Slater was a wealthy man, owning interests in four highly profitable mills. That year his wife died.

The Slater Education Fund for Emancipated Slaves

The Slater Education Fund for Emancipated Slaves was created by John Fox Slater (1815-1884), a nephew of Samuel Slater. John Fox Slater's father John Slater had emigrated from England and went to work in his brother Samuel's textile mills. John later owned mills on his own. When John Fox Slater was seventeen, he began work in his father's woolen mill, and he later managed his father's cotton mill in Jewett City, Connecticut. When his father died, he was left a modest fortune, and his own efforts in manufacturing made him a wealthy man.

Slater had always been interested in education. In 1868, he helped to found and endow the Norwich Free Academy. Influenced by the work of the Peabody Education Fund, established in 1867 to promote education in the South, he donated \$1 million to set up a fund to educate former slaves. The fund was incorporated on April 28, 1882, and the first meeting of its trustees was held on May 18, chaired by former U.S. president Rutherford B. Hayes, who served on the board until his death. The board selected Methodist clergyman and Emory College president Atticus G. Haygood to be its general agent. It was Haygood's responsibility to distribute money to various African American schools and colleges throughout the South.

Between 1883 and 1886, the Slater fund distributed more than \$100,000 to black schools and colleges, primarily to equip and operate manual training programs. The fund also supported black colleges by providing salary supplements for teachers employed in the fields of teacher training and industrial education. Notably, it provided financial support to the Hampton Institute in Virginia, which also enrolled Native Americans, and the Tuskegee Institute in Alabama, established by Booker T. Washington. By 1900, these schools received one-half of the annual Slater appropriations.

Other foundations, such as the Carnegie Corporation and the General Education Board, provided funds that were administered by the Slater fund. In 1911, in cooperation with the General Education Board, founded by John D. Rockefeller, and the Anna T. Jeanes Fund, the Slater fund established county training schools to provide a high school education, teacher training, and courses on "basic" industries, such as domestic training for girls and manual training for boys. Between 1914 and 1930, 384 county training schools for the rural African American population were established in thirteen southern states. Later, many of these institutions became secondary schools. In 1914, the Peabody Education Fund was dissolved and donated \$300,000 to the Slater fund. By 1935 the Slater fund had distributed \$4 million.

Although John Fox Slater had included the provision that the fund might be dissolved after thirty-three years, it continued its work until 1937, when it merged with the Negro Rural School Fund, also known as the Anna T. Jeanes Fund, and the Virginia Randolph Fund. The new organization, named the Southern Education Foundation, Inc., is headquartered in Atlanta, Georgia, and continues to support minority education.

When the War of 1812 began, Slater saw an opportunity to extend his financial interests since British imports were closed to American markets. He constructed a mill, known as the Green Mill, at Oxford (now Webster), Massachusetts. In 1815, he was involved in building a woolen mill, also at Oxford. Following the conclusion of the war, Slater suffered financial difficulties, but he was able to recover. On November 21, 1817, he married Esther Parkinson, a wealthy widow from Philadelphia. He became a partner in the Amoskeag Mill, in Manchester, New Hampshire, in 1822, and, a year later, with his brother John, he bought a mill in Jewett City, Connecticut.

To this point, all of his mills had been water powered. In 1827, Slater and his partners erected a steam-driven mill in Providence, Rhode Island. Because his business was extensive, three of his sons helped operate the mills, and he formed a corporation, Samuel Slater and Sons. He made Providence his headquarters and relinquished partial control of the business to his sons. Slater, who had retired from his business about six years before his death, died from complications of a cold in 1835. At the time of his death, he owned six mills, and his fortune was estimated at more than \$1 million.

Legacy

Samuel Slater was visited in 1833 by President Andrew Jackson, who named him the Father of American Manufactures. In all, Slater was connected to thirteen textile mills that he owned or in which he held shares. He introduced machinery that revolutionized the production of textiles in the United States and was the first to install the factory system in America. He also provided a model for factory management that was replicated in other industries. At one point, Slater employed more workers than any other person in America. Slater not only acquired wealth in the United States but also contributed to the financial prosperity of many others.

CARLOS SLIM

Mexican industrialist and businessman

Slim topped Forbes *magazine's 2010 list of world billionaires, with an estimated net worth of $53.5 billion. Critics accuse him of exercising near monopolistic control over the Mexican economy; Slim responds by pointing to his flourishing companies and the thousands of jobs they provide.*

Born: January 28, 1940; Mexico City, Mexico
Also known as: Carlos Slim Helú
Sources of wealth: Inheritance; real estate; media; investments; telecommunications
Bequeathal of wealth: Charity

EARLY LIFE

Carlos Slim (KAHR-lohs sleem; American pronunciation, slihm) Helú was born in Mexico City in 1940. His father, Julián Slim Haddad, was born Kahild Yusef Salim Haddad in Jezzine, Lebanon, in 1888. His mother, Doña Linda Helú, was the daughter of Lebanese immigrants. At the turn of the century, Lebanon was part of the Ottoman Empire. In 1902, Slim's father, a Maronite Catholic, immigrated to Mexico, seeking greater religious autonomy, as did many other Lebanese of that era. Julián Slim Haddad was a successful businessman, operating the Oriental Star line of stores and acquiring real estate. By the time he died in 1953, he had a net worth of 1,021,258 pesos, which is equal to more than $35 million in 2010 U.S. currency.

Carlos Slim was the fifth of six children. Julián gave Carlos lessons in business from an early age, requiring him to record his allowance and expenditures in a savings book. With his boyhood friends, Carlos traded baseball cards, meticulously recording his profits. Carlos opened his first checking account and purchased his first stock market shares when he was twelve. He was an excellent student, and he received his college degree in civil engineering from the National Autonomous University of Mexico in 1961. He worked for several years as an engineer before realizing that his passion was finance. In April, 1966, he married Soumaya Domit Gemayel, also of Lebanese heritage; they would have six children: Carlos, Marco, Patrick, Soumaya, Vanessa, and Johanna.

FIRST VENTURES

In a sense, Slim had been preparing for success in business his entire life, learning from his father, reading books on investing by J. Paul Getty and other businesspeople, and dabbling in the stock market. In 1966, he was already worth $400,000. In January, 1966, Slim incorporated his first business, Immobiliaria Carso, with the name derived from the first syllables of the first names of Carlos and his wife Soumaya. In 1967, he entered the real estate market, establishing a residential real estate company, Promotora del Hogar, S.A., and a construction equipment company, GM Maquinaria. As he earned profits from each business, he used this money to finance new ventures, including a printing shop, a paper company, a copper mine, food sales, and the cigarette manufacturer Cigatam. In 1980, he created a holding company, Grupo Carso, for his various ventures.

Mature Wealth

Like many shrewd businessmen, Slim made his fortune in times of adversity, and two events were particularly significant in the accumulation of his vast fortune. The first event was the near collapse of the Mexican economy in 1982, when the nation defaulted on its debts and devalued its currency. Devaluation resulted in an economic panic, in which the prices of Mexican companies fell sharply. At this time, Slim went on a buying spree. He accumulated shares in the Mexican subsidiaries of Reynolds Aluminum Company, General Tire and Rubber Company, Anderson Clayton, and Firestone Tires. His largest purchases were the Seguros de Mexico insurance company and Sanborns, which would become the largest retail and restaurant chain in Mexico. When the Mexican economy rebounded, Slim was in possession of a conglomerate, in which the companies had greatly increased in value. He duplicated this success in other countries, acquiring shares of Argentinean, Brazilian, and Colombian companies at times of national economic crises. He also obtained shares of American companies, such as Saks Incorporated, CompUSA, and *The New York Times*.

The second event occurred in 1990, when the Mexican government divested itself of its telephone monopoly, Telefonos de Mexico, better known as Telmex. Because Telmex was poorly run, the government seemed to have little idea of the potential profitability of the company's operations, especially the licensing of cell phones, which at this time was an innovation in the telephone industry. Slim obtained control of the company for less than $2 billion. He immediately overhauled management, instituted employee training, and invested billions of dollars in infrastructure. He devised innovative marketing techniques, such as pairing calling cards with mobile phones. To protect against devaluation, he pegged Telmex's rates to the U.S. dollar, not the Mexican peso. By 2001, the company was capitalized at $27 billion. In addition, Slim spun off the wireless portion of Telmex into its own company, America Movil S.A.B. de C.V., which by 2007 was Latin America's largest mobile telephone operator, with 143.4 million subscribers and a market capitalization of about $105.24 billion. Slim also controlled Tracfone, an American prepaid cell phone company.

In October, 2008, Slim lent *The New York Times Company*, in which he already held a substantial number of shares, $250 million in exchange for warrants on another sixteen million shares of *Times* stock. This loan generated speculation about the reasons for the transaction. Some observers maintained that Slim simply saw an opportunity to acquire stock that had become devalued. Others, however, argued that Slim was trying to influence one of the world's most respected newspapers by obtaining the second-largest block of stock in the *Times* company, exceeded only by the shares of the newspaper's longtime owners, the Ochs and Sulzberger families.

In 2005, *Forbes* magazine ranked Slim as the fourth-richest man in the world. He continued to increase his fortune during the recession of 2008-2009. On March 10, 2010, Slim ranked as the richest person in the world in *Forbes*' list of billionaires, with a fortune estimated at $53.5 billion, roughly equivalent to 5 percent of Mexico's gross national product. Slim owned about two hundred of Mexico's leading companies; the value of these firms' stock amounted to about 40 percent of the entire Mexican stock exchange. Slim's holdings include the bank Inbursa; the Condumex electric company; the CILSA construction company; the Swecomex drilling company; the Star Medica chain of hospitals; financial and insurance companies; real estate holdings, including five hotels; cigarette and bottling manufacturers; airline companies; and a mining company.

Slim has been criticized for having an octopus-like control of the Mexican economy. Some of his critics allege that he obtained control of Telmex through political

Philanthropic Foundations

There is no more important institution connected to the incredibly wealthy than the philanthropic foundation. Rich people establish these charitable organizations for several reasons. One motive is their genuine desire to perform "good works" with their accumulated billions of dollars. Charitable donations and the distribution of philanthropic funds can also result in tax advantages. In addition, a philanthropic foundation can advance an individual's good name and commercial enterprises. Whatever the motive, there is no denying that many of the philanthropic causes, initiatives, and benefices of the twentieth century were pioneered by foundations established by the immensely wealthy. Institutions such as the Ford, Carnegie, Rockefeller, Hearst, and Mellon Foundations read like a roll call of the great American industrialists of the late nineteenth century. These foundations have extended the impact of these men far beyond the grave and have greatly influenced society in the United States and other countries during the twentieth century.

Foundations have precedents in the charitable endowments, trust, and *waqfs* (Islamic endowments) established for religious purposes. Many early foundations were established as a means of benefiting specific causes. George Peabody, a nineteenth century American financier and merchant, played a significant role in setting the precedent for modern foundations. He established an education fund that enabled him to make a large number of donations, demonstrating how money deposited in a nonaffiliated, legally organized corporation could accomplish charitable goals.

By the end of 2009, the largest charitable foundation in the world was the Bill and Melinda Gates Foundation, established by the cofounder of Microsoft and his wife, which had an endowment of $38.9 billion. The Wellcome Trust, founded by pharmaceutical executive Henry Wellcome, was the second-largest, with an endowment of $27.2 billion. Rounding out the top ten wealthiest foundations in the world were the Ford Foundation, with an endowment of $13.7 billion; the J. Paul Getty Trust, with $10.5 billion; the Church Commissioners of England, with $10.5 billion; the Li Ka Shing Foundation, with $10.1 billion; the Robert Wood Johnson Foundation, with $10 billion; the Muḥammad bin Rāshid Āl Maktūm Foundation, with $10 billion; the W. K. Kellogg Foundation, with $8.5 billion; and the William and Flora Hewlett Foundation, with $8.4 billion. Some of the other American foundations with assets of more than $5 billion included the Lily Endowment, the David and Lucile Packard Foundation, the Andrew W. Mellon Foundation, the John D. and Catherine T. MacArthur Foundation, and the Gordon and Betty Moore Foundation.

In a November 30, 2009, article, *Barron's Financial* identified the philanthropic foundations it considered to be the most effective. The top-ranked organization was Omidyar Network, established by eBay founder Pierre Omidyar and wife Pam, which invests in nonprofit enterprises that seek to bring about about social change. The magazine also praised the Broad Foundations, established by businessman Eli Broad and his wife Edythe, which provide funding in the areas of education, science, art, and civic activities; the Robin Hood Foundation, founded by billionaire hedge fund manager Paul Tudor Jones III, which attempts to alleviate poverty in New York City; the Bharti Foundation, created by Indian telecommunications mogul Sunil Bharti Mital, which works to improve literacy in India; and the Magic Johnson Foundation, established by the former basketball star, which assists people with the human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS). Mexican billionaire Carlos Slim has provided a $10 billion endowment to finance his four charitable organizations: the Carso Foundation, the Telmex Foundation, the Condumex Foundation for History Studies, and the Carlos Slim Foundation.

connections, engaging in "crony capitalism" that enabled him to obtain a vast fortune from the telephone monopoly. Slim responds to these charges by pointing to the productivity of his companies and the 218,000 workers they employ. What cannot be denied is that Slim pursued his business empire with single-minded tenacity and vision.

Despite his unprecedented wealth, Slim maintains a simple lifestyle, living in a modest house in Mexico City, surrounded by the houses of his children. His wife Soumaya died in 1999. Except for some of the priceless art in his house by Bartolomé Esteban Murillo and El Greco, his home is not opulent. His chief passion outside of business is American baseball; the statistical nature of the game apparently appeals to his mathematical mind. He is also an art collector. In 1994, he opened the Museao Soumaya, which contains sixty-four thousand pieces of artwork, including a collection of sculptures by Auguste Rodin. Slim has run several charitable foundations that distributed hundreds of millions of dollars. In 2000, he paid for the renovation of Mexico City's downtown area, and he has donated 100,000 computers to fourteen hundred Mexico schools. Nevertheless, he has expressed skepticism about direct charitable giving, maintaining that this philanthropy is unlikely to solve the structural problems that create poverty.

Legacy

Carlos Slim is one of the most successful capitalists of the late twentieth and early twenty-first centuries. He has excelled at purchasing undervalued and often mismanaged companies at low prices, applying his financial savvy to improve these firm's operations, to make them profitable, and to fit his acquisitions securely within his financial empire. He once told a newspaper reporter, "Buying well is a discipline." Following this advice, he has been able to assemble a large conglomerate of companies. With his relentless business methods, he has dominated the Mexican economy and become one of the richest persons in history.

Alfred P. Sloan

American automobile company executive

Under Sloan's management, General Motors became a leader in the automobile industry and the world's largest corporation. His principles of corporate management, as described in his book My Years at General Motors, *were essential to his company's success and have been used by many other organizations.*

Born: May 23, 1875; New Haven, Connecticut
Died: February 17, 1966; New York, New York
Also known as: Alfred Pritchard Sloan, Jr.
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Educational institution; medical institution

Early Life

Alfred Pritchard Sloan (slohn), Jr., was the oldest of five children born to Alfred P. Sloan, Sr., and Katherine Mead in New Haven, Connecticut. Both maternal and paternal families were respectable and middle class. Sloan's father was a machinist and a merchant, who ran a successful business selling wholesale roasted and ground imported coffee, tea, and cigars. Sloan attended Brooklyn Polytechnic at the age of eleven and graduated from Massachusetts Institute of Technology (MIT) at age twenty after studying electrical engineering.

First Ventures

Sloan went to work as a draftsman in the Hyatt Roller Bearing Company, a manufacturer of small, flexible rollers (ball bearings), after he completed his studies at MIT. His focus in school had been mechanics and engineering, and he brought his education and knowledge of science to the Hyatt Company. He soon discovered that his company faced financial crisis each payday. Sloan resigned and was hired by Hygienic Refrigerator Company, but this company folded when the owner died. About the same time, Sloan's father and Mr. Donner, who was in the sugar refining business, partnered and purchased Hyatt Roller Bearing Company. At age twenty-four, Sloan became the company's president. He enjoyed the challenge of running this business. Under his leadership, this almost bankrupt company garnered a profit of $12,000 in six months. Sloan's challenge was to market the antifriction ball bearings to businesses with turning wheels. In the years to come, the automobile industry would provide excellent profits for Hyatt, and at one time, Sloan supplied Hyatt ball bearings to both Ford Motor Company and General Motors (GM).

Mature Wealth

Sloan developed the Hyatt Roller Bearing Company into a competitive and prosperous business. However, when he received a call from William Crapo Durant, an automotive guru, to discuss the purchase of Hyatt, he replied that the company was available for $15 million. After some negotiation, the company his father and business partner purchased in 1889 for $5,000 was sold in 1916 to "Billy" Durant for $13.5 million.

Sloan was invited to become part of Durant's leadership team. Durant, known for his lucrative carriage and wagon business in the early 1900's,

The Sloan-Kettering Institute

In 1945, the Sloan-Kettering Institute, destined to become a premier biomedical research facility, was funded through the efforts of Alfred P. Sloan, Jr., chairman of General Motors (GM), and Charles F. Kettering, a GM executive. Sloan and Kettering donated $4 million to establish this fourteen-story private research center located next to Memorial Hospital in Manhattan and to cover its basic operating expenses. The institute was intended to enhance the research capability for the treatment options offered at the hospital. In the 1940's, research was needed to explore the impact of various forms of chemotherapy that could be used as cancer treatment, either alone or in combination with surgery and radiation, the main cancer treatment modalities at this time. In 1960, the hospital and the research institute merged to become the Memorial Sloan-Kettering Cancer Center.

The research institute's mission is to advance the understanding of the biology and management of cancer by conducting the research that is needed to cure the disease. The institute supports eight research programs with ninety laboratories, including research in cancer biology and genetics, cell biology, immunology, molecular biology, molecular pharmacology and chemistry, developmental biology, computational biology, and structural biology. Diverse research programs that link the research center to the clinical setting include the Brain Tumor Center, Center for Cell Engineering, Experimental Therapeutics Center, Geoffrey Benne Cancer Research Center, and Metastasis Research Center.

The institute hosts a postdoctoral training program for physicians and biomedical scientists. Each year, the facility provides its Major Trends in Modern Cancer Research symposium to present its most recent research and educate the public about cancer research and treatment. The target audience is high school teachers and students. In 2008, about 460 students from sixty schools in the New York City area attended. The program is designed to promote student interest in scientific research in the hope that some students will become medical researchers.

Memorial Sloan-Kettering Cancer Center is the world's oldest, private, nonprofit organization for cancer treatment. The goal of this organization is to provide cancer patient care and education, as well as perform cancer research. *U.S. News and World Report* has given the center a first-place rating among medical facilities treating cancer in the United States.

The main campus of Memorial Sloan-Kettering Cancer Center is in the Upper East Side of Manhattan. In addition, there are five suburban branches, including three in Long Island, one in Westchester County, and one in Bernards Township, New Jersey. The center employs more than 9,000 people, with 128 of them dedicated to research at the Sloan-Kettering Institute. In 2008, Memorial Sloan-Kettering Cancer Center offered free cervical and breast cancer screening in Harlem through the Breast Examination Center of Harlem. The center's 2008 annual report documents that it received more than $1.82 billion in donations and pledges during the previous seven years, with philanthropic donations for 2008 totaling $315.4 million.

reorganized the Buick Motor Company and employed Sloan as the president at United Motors from 1916 to 1918. Sloan accepted half his salary in United Motors stock. He managed to attain net sales of $33,638,956 during his first year there. In 1918, United Motors merged with GM. Sloan became a vice president and a stockholder. Although he and Durant differed in management styles, many of Sloan's suggestions were accepted and implemented by Durant.

In 1918, GM launched an executive bonus plan. GM believed this plan would motivate its managers by rewarding them for running the company as if it were their own firm, enabling the company to decentralize operations. The plan rewarded a manager up to 12 percent of his net earnings. In 1962, some fourteen thousand employees received awards in cash and stock worth $94,102,089. In 1919, GM offered employees a savings and guaranteed investment plan in company stock, with payouts in five years. GM employees had more than $75 million credited to their accounts to draw on during the Great Depression. Sloan enjoyed healthy financial benefits as part of the executive management team.

When Durant left GM in 1923, Sloan became the president, chairman, and chief executive officer of the company until he retired in 1946. Business grew until the stock market crash, when GM stock dropped from $262 a share in 1929 to $8 a share in July, 1932. Sloan reorganized and redesigned GM. He attributed the company's success to its use of group management with decentralized operational units, centralized financial controls, product upgrades, and the introduction of new car models every year to meet the needs of consumers. Sloan's philosophy of corporate management contrasted with the philosophy of the Ford Motor Company, where management was centralized and the firm continued to release one basic car design, the Model-T. Within six years under Sloan's corporate management, GM became a leader in the automobile industry, with profits of more than $260 million and a rapid increase in the price of its stock.

With Sloan at the helm, GM became the largest corporation in the world, replacing Ford as the automobile market leader. GM marketed the Pontiac, Chevrolet, Buick, Oldsmobile, and Cadillac automobile brands, as well as GMC trucks. In 1962, GM had 600,000 employees and one million shareholders, with assets of $9.2 billion; at the end of the year, the firm had sales of $14.6 billion in sales and profits of $1.46 billion.

During his tenure as president of GM, Sloan demonstrated that business growth and progress could result in a healthy, competitive environment of free enterprise. He stated that he personally believed that competition was a way of life for his company. Sloan described himself as a substantial shareholder and one of the largest individual GM company shareholders. At one point, he held as much as 1 percent of the company's stock, a sizable share of his successful firm. *Fortune* magazine in 1957 included Sloan in its list of wealthy Americans, estimating his personal fortune to be between $200 and and $400 million. He owned a 235-foot yacht, the *Renée*, which he purchased for $1.25 million. In the early 1960's, when he wrote his book *My Years with General Motors*, he stated that most of his wealth had been donated to his charitable foundations for scientific research and education. Despite Sloan's generous philanthropy, at the age of ninety he had a personal bank account of a $250 million.

Legacy

Alfred P. Sloan believed in philanthropy. In 1934, he established the Alfred P. Sloan Foundation; three years later, he donated $10 million to the foundation in order to improve the quality of life in America through original research and education in technology, science, and economic performance. In the twenty-first century, the foundation provided grants for both scholars and practitioners who work to maintain the health and economic prosperity of the United States. Grant recipients have included thirty-eight Nobel Prize winners. In 1966, the foundation had assets of $305 million; in 2005, foundation assets had a market value of $1.5 billion.

Sloan joined GM executive Charles F. Kettering to establish the Sloan-Kettering Institute for cancer research with a donation of $4 million. Sloan also contributed freely to his alma mater, MIT, and the institute named its business school the Sloan School of Management in his honor. Sloan's book *My Years with General Motors* is required reading in many graduate-level business schools.

Donald Smith

Canadian fur trader, investor, and politician/statesman

Smith made his fortune from the Hudson's Bay Company and by investing in railroads. Elevated to the British peerage as the first Baron Strathcona and Mount Royal, he was one of the leading philanthropists of the early twentieth century.

Born: August 6, 1820; Forres, Scotland
Died: January 21, 1914; London, England
Also known as: Donald Alexander Smith; First Baron Strathcona and Mount Royal
Sources of wealth: Trade; railroads; investments
Bequeathal of wealth: Children; charity

Early Life

Donald Alexander Smith was born in Forres, Scotland, a town of about 3,500 inhabitants in the Morayshire district of the Scottish Highlands. Forres was the historic home of the Scottish kings; it may well have been the site of the murder of King Duncan in the story that was the basis for William Shakespeare's play *Macbeth* (pr. 1606, pb. 1623). Smith's father, Alexander Smith, worked as a merchant, and his mother, Barbara Stuart Smith, was from the Grant clan of highlanders.

Donald Smith was his parents' third child. He was educated at the Anderson Institution and the Forres Academy. At sixteen, he left school to apprentice with Robert Watson, the Forres town clerk. He also studied Scottish law from books.

First Ventures

Many of Canada's early pioneers were Scottish. Donald Smith's uncle, John Grant, became a trader and explorer in Canada, earning mention in author Washington Irving's *Astoria* (1836). With the support of Grant, Donald Smith sailed to Quebec in 1838 to take a position at £20 a year with the Hudson's Bay Company, one of the oldest joint-stock companies in the world, which was chartered in 1670. The company owned much of central Canada and dominated fur trading. For the next fifteen years, Smith worked at various Hudson's Bay stations along the St. Lawrence River, examining furs and accounting for them in the company's books. It was a difficult life, filled with mosquitoes, black flies, desolation, rivalry, danger, and the drudgery of handling furs and pelts.

On March 9, 1853, Smith married Isabella Hardisty. Her previous marriage was annulled, and her marriage to Smith took place under irregular circumstances, a lifelong source embarrassment for the couple. The following year, their only child, Margaret Charlotte, was born. In 1853, Smith was promoted to chief trader of Hudson's Bay Labrador district. Traders were paid in shares of company stock, as well as salary, and Smith began to accumulate Hudson Bay's stock. As chief trader, Smith managed the expansion of the company's commerce into salmon fishing and the sale of salmon, sealskins, and seal oil to England. In 1862, Smith was appointed chief factor, which made him responsible for the financial side of the company's business. As factor, Smith was entitled to about three-fifths of the share of the firm's trade, or about £500 a year. As Smith rose in the company ranks, he helped negotiate the transfer of much of the firm's land to the Canadian Confederation, created in 1867.

Mature Wealth

With the creation of the Canadian Dominion, Smith prominently entered upon the national stage as both a statesman and a businessman. From 1871 to 1880, he served in the Canadian parliament. His investments in railways began in 1873 with his purchase of depreciated bonds in the St. Paul, Minneapolis & Manitoba Railway. Eventually, he acquired one-fifth of the railway's stock. With the dividends he received, he steadily acquired shares in dozens of other railroad companies, and this stock would constitute the largest part of his immense fortune. Smith became one of the leading investors in the Canadian Pacific Railway, and for this reason he participated in a ceremony on November 7, 1885, in which he drove in the last spike needed to complete Canada's first transcontinental railroad. The ceremony was a moment of personal prestige for Smith and a triumph for the Canadian Dominion. The Canadian Pacific Railway was also a new source of wealth for Canada, as goods could now be shipped across the nation's vast expanses. Canada would benefit economically, and Smith would expand his personal fortune.

Smith was reelected to the Canadian parliament in 1887, and he served until 1896. In that year, he was appointed a Canadian high commissioner, representing the dominion in London. From 1889 to 1914, he was the governor of the Hudson's Bay Company, serving in effect as its chief operating officer. Having worked for the company for seventy years, accumulating shares of stock for most of that time, he had become the firm's largest shareholder. With the steady increase in the stock's value,

Railroads and Wealth

Every technological advance of the Industrial Revolution brought opportunities for the creation of great wealth, but perhaps no form of technology was as profitable as the railroad. The completion of railways across continents was the key component in advancing the growth of industry in the nineteenth century. Railroads united the wide expanses of the Americas, the markets of Europe, and the wilds of Asia. For the first time in history, perishable foodstuffs could be transported swiftly and securely overland; merchandise of all kinds could be moved inexpensively from one end of a nation to another. The railroads not only created markets for goods but also were the chief spur for other heavy industries. The iron and steel industries grew to meet the need for high-quality rails and railroad cars, and the coal mining industry expanded in order to power the locomotive.

Great fortunes were made in the railroads, both honestly and dishonestly, by entrepreneurs and by schemers, by men with vision and by men without heart. Writer Malcolm Gladwell describes the era of railway building in the 1860's and 1870's as the greatest opportunity to amass vast wealth in the history of humankind. Likewise, J. Bradford DeLong, a professor of economics at the University of California at Berkeley, calculates that among the twenty-one industrialists known as "robber barons" in nineteenth century America—the nation's first class of billionaires—thirteen made their fortunes from railroads. The railroad tycoons included the Big Four—Leland Stanford, Collis P. Huntington, Mark Hopkins, and Charles Crocker—as well as Jay Gould, Daniel Drew, James J. Hill, Edward H. Harriman, John Insley Blair, Anthony N. Brady, and Cornelius Vanderbilt. As a class, these men were admired and envied, but they were also hated by many for the sometimes scandalous manner in which they accumulated and spent their wealth. Canada also had its share of railroad barons in the nineteenth century, including Sir William Mackenzie, Sir Donald Mann, Sir Robert Gillespie Reid, Sir William Cornelius Van Horne, Sir Hugh Allan, and Donald Smith, first Baron Strathcona and Mount Royal.

On May 10, 1869, Leland Stanford hammered in the golden spike connecting the Central Pacific Railroad and the Union Pacific Railroad at Promontory Summit, Utah Territory. The installation of that spike completed a railroad that stretched from the East Coast to the West Coast of the United States. This transcontinental railroad would be the chief catalyst for the post-Civil War expansion of the Western United States. In Canada, Donald Smith, first baron Strathcona and Mount Royal, drove in the historic spike in Craigellachie, British Columbia, on November 7, 1885, uniting the two halves of the longest railroad in the world, stretching from one end of Canada to the other. The photograph of Smith driving in the Canadian Pacific Railway spike, surrounded by awe-struck railroad men, has been called the most famous photograph in Canadian history.

Smith had amassed a fortune in his shares alone, and his wealth was multiplied many times over by his investments in railways and other ventures.

In 1897, he received one of his greatest honors when he was elevated to the British peerage as the first baron Strathcona and Mount Royal. (Strathcona is a Gaelic version of Glencoe, a town in the Scottish Highlands.) He was now a respected person in Scotland, Canada, and England. Smith owned houses at 53 Cadogan Square and 28 Grosvenor Square in London. He was a member of the prestigious Athenaeum Club in the city's Pall Mall neighborhood. He also maintained homes in the English countryside, where he leased Knebworth Hall and owned Debden Hall in Essex. He owned the Silver Heights Estate in Manitoba, as well as a mansion on Dorchester Street in Montreal, which consisted of two adjoining residences and was filled with fine European paintings and Japanese antiques. In Scotland, he owned the Black Corries Estate in Glencoe, formerly belonging to the MacDonald Clan, and a mansion in the Scottish Hebrides.

Smith held shares in hundreds of Canadian and American railroads, insurance companies, hotels, manufacturing businesses, mining companies, and textile firms. He also owned shares in many newspapers, including the *Manitoba Free Press*, which he controlled for several years. He was the principal shareholder of the Bank of Montreal. He was the third-largest shareholder of the immensely wealthy but short-lived Northern Pacific Securities Company holding trust. He also owned thirty thousand of the one million common shares of the Anglo-Persian Oil Company, a firm he helped establish and for which he served as chairman in 1909. In addition to owning numerous Canadian and provincial bonds, Smith also held mortgages on hundreds of properties, for which he received interest of 5-7 percent annually. Smith also sat on numerous company boards of directors.

Smith's wife Isabella died on November 12, 1913, and he died two months later on January 21, 1914. Upon his death, his estate was valued at $28,867,635 Canadian. Smith had established trusts for his daughter and other descendants. During his life and in his will he bequeathed large gifts to the Trafalgar Institute, the Young Men's Christian Association (YMCA), King Edward's Hospital, the Sheffield Scientific School, St. John's College at Oxford University, the Royal Victoria College at McGill University, the Royal Victoria Hospital, Yale University, the University of Birmingham, and scholarships too numerous to mention. Smith also bequeathed funding for Lord Strathcona's Horse, a cavalry regiment that he personally recruited and financed in order to assist the British military during the Boer War. Smith's donations and bequests totaled £1,026,381, or $7,520,601 Canadian. This amount would exceed $1 billion in 2010 U.S. dollars, making Smith one of the leading philanthropists of the early twentieth century.

Legacy

Donald Smith initially made his fortune as a shareholder of Hudson's Bay Company and then increased his wealth several times over with his investments in railroads and a host of other companies. His seventy years at he Hudson's Bay Company are the longest tenure of any employee in the company's history. Several parks, cities, streets, buildings, and schools are named for him in both Canada and the United Kingdom, and the winner of a curling tournament, in which Canada and Scotland participate, is awarded the Strathcona Cup. His charitable donations are another significant part of his legacy, and as a philanthropist, Smith had few peers.

JAMES SMITHSON
British chemist

Smithson, a British chemist who never visited the United States, nevertheless bequeathed a portion of his estate to establish a museum in Washington, D.C., which would eventually become the Smithsonian Institution.

Born: 1765; Paris, France
Died: June 27, 1829; Genoa, Kingdom of Sardinia (now in Italy)
Also known as: James Louis Macie (birth name)
Sources of wealth: Inheritance; investments
Bequeathal of wealth: Relatives; educational institution

EARLY LIFE

James Smithson (SMIHTH-suhn) was born in Paris, most likely in 1765, as James Lewis Macie, the illegitimate son of Hugh Smithson, who later became the first duke of Northumberland, and the widowed Elizabeth Keate Hungerford Macie, an ambitious woman whose first husband, John Macie, was dead when her son was born. The personal estate that John Macie left his wife formed part of the wealth she eventually left her son, although her constant litigation over her property decreased its value over the years. Her estate at probate was valued at less than £10,000. Smithson, who deeply felt the circumstances of his birth, successfully petitioned the Crown to take his father's name after his mother's death in 1800, a move he had contemplated for some time.

In 1782, Smithson entered Pembroke College, Oxford University. In 1784, he undertook his first scientific expedition, a geological tour that included visits to Oban, Staffa, and the Western Isles of Scotland, accompanied by two aeronautics experts, Barthélemy Faujas de Saint Fond and Count Paolo Andreani, where he recorded journal observations on mining and manufacturing processes. He received an honorary master of arts degree from Pembroke in May, 1786.

FIRST VENTURES

Smithson, who never married, was trained as a chemist, and much of his professional work was undertaken on the European continent against the turmoil of the French Revolution and the Napoleonic Wars. His life was essentially that of the bachelor scientist who spent considerable time in scientific research and exploration, notably in chemistry, mineralogy, and geology. During his life, he lived in cities as diverse as Berlin, Florence, Geneva, and Rome, where he spent much of his later years as his health worsened. His schooling and interests afforded him the opportunity to mix with many noted scientists who valued him for his chemical analyses of minerals, which he published in the Royal Society of London's *Philosophical Transactions* and later in the *Annals of Philosophy: Or, Magazine of Chemistry, Mineralogy, Mechanics, Natural History, Agriculture, and the Arts*, published by Thomas Thomson. Smithson's research included the chemical content of a lady's teardrop, the crystalline form of ice, and an improved method of making coffee, while his work and travels brought him into contact with all of the premier scientists of the period, including Sir Joseph Banks, Sir Humphry Davy, and Antoine-Laurent Lavoisier.

Smithson, along with many of his friends, was an active member of several organizations dedicated to advancing scientific research and using science to benefit society. He and his friend Henry Cavendish, a noted chemist and physicist, were fellows of the Royal Society of London, England's oldest and most prestigious scientific society, and charter members of the Royal Institution of Great Britain.

In 1802, Smithson overturned popular scientific opinion by proving that zinc carbonates were true carbonate minerals, not zinc oxides. One calamine, the mineral $ZnCO_3$, a type of zinc carbonate, was named smithsonite after him in 1832. Smithsonite was a principal source of zinc until the 1880's.

Mature Wealth

Smithson and his brother Henry Louis Dickinson, also fathered by the duke of Northumberland, inherited a considerable estate from their mother's family, but Smithson's real fortune came upon his mother's death in May, 1800. In July, he sold £13,350 of the Bank of England's 5 percent annuities and reinvested his proceeds in exchequer bills. This supplemented his own shrewd investments in relatively safe, blue-chip Bank of England investments, including the Bank of England's 3 and 5 percent annuities, India bonds, and others.

He now used his increased fortune to bankroll technological innovations that promoted the economic strength of England. One of his first and most successful investments was the Grand Junction Canal, which was constructed to ship goods from Birmingham to London and opened in 1801. The canal immediately showed a return on his investment, and Smithson continued to receive dividends from it for all of his life. He also received profits from the New Croydon Canal and from one of its biggest competitors, the Surrey Iron Railway, which carried goods from the Thames at Wandsworth south through Colliers Wood to Croydon. An 1801 act of Parliament made the Surrey Iron Railway the first railroad independent of a canal, and Smithson purchased several hundred pounds' worth of stock in order to fund the project.

It is not possible to gain a complete picture of Smithson's finances from the official bank records that remain, since in the late eighteenth and early nineteenth centuries, when Great Britain was engaged in many wars, investors did not confine their holdings to one place. Smithson's records at Hoare's Bank, and his subsequent account at Drummond's Bank, probably reflect only a small portion of his financial dealings, but they demonstrate his active interest in his portfolio. He took a small inheritance from his mother and, through a lifetime of shrewd investment and management, turned it into the fortune that he eventually bequeathed to the United States.

Smithson died in Genoa on June 27, 1829, after a long

The Smithsonian Institution

In 1826, James Smithson, a British scientist, drew up his last will and testament, naming his nephew as beneficiary. A contingency clause in the will stated that upon his nephew's death without children, the "whole of my property" should be allocated to establish an educational institution in Washington, D.C.

The motives behind Smithson's bequest remain mysterious. He never traveled to the United States and seems to have had no correspondence with anyone there. One reason for this benevolent act may have been a lifelong grudge against the condescension of the British nobility, especially against his father, who never recognized him. Smithson once commented that his name would "live in the memory of man when the titles of the Northumberlands and the Percys are extinct and forgotten." Others have suggested that the bequest reflected Smithson's interest in the Enlightenment ideals of democracy and universal education.

In 1835, six years after Smithson's death, President Andrew Jackson announced the bequest to Congress. On July 1, 1836, Congress accepted the legacy, and in September, 1838, Smithson's legacy, which amounted to more than 100,000 gold sovereigns, was delivered to the mint at Philadelphia. When the bequest was recoined in U.S. currency, the gift amounted to more than $500,000. However, Smithson's bequest was nearly lost as a result of fierce battles among many Americans, who argued over the acceptance of a gift from an Englishman. A surprising supporter was former president John Quincy Adams, whose travels with his diplomat father, former president John Adams, exposed him to the scientific establishments in Europe. Adams's knowledge, along with his tireless efforts, undoubtedly helped him sway Congress to accept the bequest.

After eight years of sometimes heated debate, an act of Congress was signed by President James K. Polk on August 10, 1846. This legislation, drafted by Congressman Robert Dale Owen, a Democrat from Indiana, a socialist, and the son of Robert Owen, the father of the cooperative movement, established the Smithsonian Institution as a trust to be administered by a board of regents and a secretary of the Smithsonian. The institution is functionally and legally an agency of the federal government.

The institution's first building, located on the National Mall and known as "the Castle," was built by architect James Renwick, Jr., and completed in 1855, but the Smithsonian soon outgrew its space. Although the Smithsonian's first secretary, Joseph Henry, wanted the institution to be a center for scientific research, it soon became the depository for various Washington and U.S. government collections, which, in turn, required their own display spaces. The second secretary, Spencer Baird, gave much attention to zoological and ethnological explorations.

In 2009, there were seventeen Smithsonian museums located in Washington, D.C., including the National Museum of African American History and Culture (scheduled to be built between 2012 and 2015) and the National Zoological Park. The National Gallery of Art is affiliated with the Smithsonian and is run by a separate charter. In New York City, there are two museums, including the Cooper-Hewitt National Design Museum, and in Virginia, there is the Steven F. Udvar-Hazy Center in Chantilly and the Smithsonian Naturalist Center in Leesburg. The institution's research function is supported by thirteen research centers, several affiliated with museums, including the Archives of American Art; the Smithsonian Astrophysical Observatory and the associated Harvard-Smithsonian Center for Astrophysics; the Marine Station at Fort Pierce, which is associated with the Natural History Museum; and the Migratory Bird Center, associated with the National Zoo and the Smithsonian Tropical Research Institute in Panama.

illness. He was buried in the English church there until the demolition of its cemetery in 1903. The next year, Smithsonian regent Alexander Graham Bell brought Smithson's remains to Washington, D.C., where they were interred in a tomb in the Smithsonian Institution's original building.

Legacy

Smithson's will contained one of the nineteenth century's greatest endowments. In this testament, written in his own hand and dated October, 23, 1826, Smithson left the bulk of his estate to his nephew, Henry James Hungerford. Upon his nephew's death without children, legitimate or illegitimate, a contingency clause stated that "the whole of my property," estimated at more than $500,000, would go to "the United States of America, to found at Washington, under the name of the Smithsonian Institution, an Establishment for the increase & diffusion of knowledge among men." Smithson's library, consisting of 115 titles, totaling about 250 individual volumes, survived a fire in the Smithsonian Institution in 1865. By the twenty-first century, the collection was part of the Smithsonian Institution Libraries.

Historians have long debated the reason behind

Smithson's bequest to a country he never visited. One repeated theory is that the donation was a chance to gain revenge against his father's family, and consequently the British nobility, for the circumstances of his birth. Smithson once swore that his name would live on in the memory of men when the titles of the Northumberlands and the Percys were extinct or forgotten, but at the time of his death, the Northumberlands were thriving. However, by taking the Smithson name, his father's name when he was a mere baronet from Yorkshire, Smithson highlighted his own illegitimacy in a period when name meant everything in British society. This pursuit of both name and property, the impetus for Smithson's lifelong search for a successful financial legacy, as well as his pursuit of knowledge as a chemist, the most exacting of all eighteenth century sciences, ensured that his own name added some luster to the family pantheon. This seems to be the most feasible reason for the establishment of a scientific institution, with the name Smithson, in the United States.

Israeli monarch

According to the Old Testament, or Hebrew Bible, Yahweh, the Hebrew god, granted Solomon an understanding heart, wisdom, and riches. However, Solomon strayed from Jewish laws, and his reign is an example of great riches lost through poor decisions and extravagance. He wrote the book of Ecclesiastes, which describes his realization that happiness and a meaningful life do not come through riches.

Born: c. 991 B.C.E.; Jerusalem, Israel
Died: c. 930 B.C.E.; Jerusalem, Israel
Sources of wealth: Inheritance; trade; slaveholding
Bequeathal of wealth: Children

Early Life

Solomon (SAHL-uh-muhn) was the son of King David of Israel. His father granted him the throne at the request of his mother Bathsheba, and at the age of twelve, Solomon superseded his firstborn brother Adonijah to become king. Solomon sought guidance to be the king. With a sacrifice on Gideon, a high place, Solomon dreamed that Yahweh (the Hebrew name for God) asked him what he wanted. Solomon responded that he desired an understanding heart to judge the people of his kingdom fairly. Yahweh was pleased with this mature and selfless answer, so he granted Solomon not only an understanding heart but also wisdom, riches, and honor like no other king of his time. The story of King Solomon is found in 1 Kings:1-11 in the Old Testament.

First Ventures

Solomon inherited the wealth of his father, King David. Because Solomon was the younger son of David, some thought it unfair that his older brother Adonijah was not chosen king. Unsuccessful schemes were devised to trick King Solomon into abdicating his throne, but he eliminated those who plotted against him. Solomon was wise in his knowledge of the Jewish Torah, as well as in the science of his time. He became known throughout the surrounding lands for his wisdom. People from other countries, including royalty, came to speak with him and received his advice. Many bought gifts of silver, gold, spices, horses, and weapons. His reputation spread as he became wealthier, securing even greater riches than his father King David had acquired. Solomon would write several books containing three thousand sayings, more than one thousand poems, and one thousand songs. His reign was the golden age of Israel, an era of peace and prosperity.

MATURE WEALTH

Solomon secured lucrative commercial relationships with strong countries near his kingdom, such as Tyre. His goal was peace and prosperity. His competitors, Egypt and Assyria, were weak. The geographic location of his nation supported trade paths from Egypt to Asia Minor, and ships transported the gold, ivory, and silver that Solomon desired. He secured a trading agreement with the queen of Sheba for chariots and horses. Solomon married the daughters of key nations' rulers in order to forge peaceful political alliances; he added Siamun, the daughter of Egypt's Pharaoh, to his harem.

Solomon's wealth could be measured by his possessions. His court required as many as 335 bushels of flour and 670 bushels of meal to be used in one day. The daily consumption of meat within his court included thirty oxen, one hundred sheep, and various fowl. Solomon also had seven hundred wives and three hundred concubines, representative of his wealth. He decorated his buildings, furniture, and tables with gold, and his bodyguards carried shields covered with gold. Solomon's throne was made of ivory and cloaked in gold. The six steps leading to his ornate throne were adorned with fourteen statues of lions. He boasted fourteen hundred chariots, four thousand stalls for his horses, and about twelve thousand horsemen for his army. His court included musicians, artists, and scholars.

Solomon demonstrated his wealth with his plan for buildings leading to the Temple of Jerusalem. The lowest building was used for government purposes; a slightly higher building was his home. He also built a royal palace for his queen. His chief lifetime achievement was to construct and furnish the sacred Temple of Jerusalem for Yahweh. King David planned the temple, but he could not build it because he had blood on his hands from waging war. The temple was constructed on the site where Abraham was called to sacrifice his only son, Isaac, but was stopped by Yahweh before the deed was done. This building, commonly called Solomon's Temple, took seven years to construct.

Over time, the income of Solomon's kingdom could not match his lavish lifestyle, so he resorted to heavy taxes and mandatory labor by the Israelites to support his wealth. History reports that he commanded ten thousand people to work for several weeks to a year in order to help with his building projects. His subjects became resentful.

Solomon made another critical error when by taking seven hundred wives and three hundred concubines. Moses warned the Hebrews in Deuteronomy

Solomon's Temple

Solomon's Temple was planned by King David years before his son Solomon became the king of Israel. King David was not permitted to build this temple because he had blood on his hands through his involvement in wars. David knew that Solomon would be a young and inexperienced king, so he prepared the temple plan and acquired the material resources needed to build this great religious institution. The building materials included stones, cedar timber, and iron for the nails of the gates. According to 1 Chronicles 22:44, David gave Solomon "a hundred thousand talents of gold, a million talents of silver, and bronze and iron beyond weighing and wood and stone."

Solomon initiated construction of the temple in his fourth year as king and finished it seven years later. The location was in Jerusalem on top of Mount Moriah, the place where many years earlier Abraham had submitted his will to that of Yahweh, the Hebrew god, to sacrifice his only son, Isaac. Prior to the slaughter, Yahweh stayed the hand of Abraham and spared Isaac's life. Although Solomon received building materials from his father, more were needed. The wood was cut from the cedars of Lebanon. Craftsmen came from neighboring Tyre to help. The labor force for this work included a total of seventy thousand men to quarry the stones, to carry the burdens, and to oversee the project.

The temple was rectangular, with the entrance on the east side. Its dimensions were about 180 feet long and 90 feet wide, with a ceiling about 50 feet high. The entire interior was covered with gold. Chains of gold divided two separate areas, the larger room that contained the Showbread Table, the Altar of Incense, and the menorah; and the inner sanctum, the Holy of Holies, where the Ark of the Covenant and the Ten Commandments were kept. The Holy of Holies was only accessed yearly by the high priest on the Day of Atonement. Two cherubim made from olive wood and overlaid with gold watched over this inner room. A porch was located at the front of the temple, with an area around the outside where people could gather. A description of Solomon's Temple is recorded in 1 Kings 6 of the Old Testament.

The purpose of the temple was to provide a place for the Ark of the Covenant and for communion between God and the Hebrew people. The temple would remind the Hebrews to worship Yahweh and to turn away from the idols found in surrounding cultures. This temple welcomed foreigners of all nations who wished to worship Yahweh, and the Israelites could make their burnt offerings and sacrifices to Yahweh. Four hundred years after its completion, Solomon's Temple was destroyed by the Babylonians. A second temple, rebuilt some seventy years later, was eventually destroyed by the Romans.

that a king should avoid too many wives or horses. Rashi, a medieval French rabbi who was an expert on the Torah, suggested that the number should be no more than eighteen wives in order to avoid distraction from the responsibilities of the kingdom. Solomon's father King David had only six wives. Some believe that Solomon may have thought he was too wise to succumb to the corruptive power of materialism and to the influence of his harem. He wed many of his wives in political marriages designed to align Israel with the leaders of foreign countries. Instead of turning to Yahweh, these wives brought their own idols and customs to Solomon's court. In 1 Kings 11, Yahweh expressed his disappointment by telling Solomon that He would honor his father, King David, by allowing Solomon to keep his kingdom until his death. However, Solomon's son, Rehoboam, would receive only a portion of the kingdom.

Solomon wrote the book of Ecclesiastes. In this book he expressed his discontent with his life, including his many wives and concubines and all of his material accomplishments. He sought a meaning to his life that could not be purchased with riches. He explained that a human life is subject to various seasons before it ends. Solomon concludes this book and life search with this scripture in Ecclesiastes 12:13-14:

> The conclusion, when all has been heard, is: fear God and keep His commandments, because this applies to every person. For God will bring every act to judgment, everything which is hidden, whether it is good or evil.

Solomon, in all his glory and wealth, recognized that life was vain and empty without a relationship with Yahweh. He learned that riches and material wealth cannot bring happiness.

Solomon died around 930 B.C.E., although there is no description of how or where he died. At the time of his death, people were plotting to kill him, his country was in debt, his land was mortgaged to Tyre's leader Hiram, and his kingdom faced division without peace or prosperity under his son's rule.

Legacy

King Solomon left a painful legacy to his son Rehoboam and the nation of Israel. Solomon's poor choices, a lavish lifestyle, and debt in his later life led to his misery and Israel's discontent. The people's commitment to Yahweh was replaced with loyalty to the kingdom. Living standards for some increased in the prosperous times, while living standards for others decreased, leaving a gaping division between the poor and the rich. At Solomon's death, the northern tribes rejected Rehoboam as king and broke apart from the nation. The peaceful, consolidated nation of Israel was no more.

George Soros

American investor and philanthropist

Soros is not only an accomplished investor of great wealth but also a philosopher, the author of several books, and a major philanthropist, who has directed more than $6 billion toward charitable causes.

Born: August 12, 1930; Budapest, Hungary
Also known as: György Schwartz (birth name)
Sources of wealth: Investments; financial services
Bequeathal of wealth: Children; charity; political organization

Early Life

George Soros (SOH-rohs) was born György Schwartz in Budapest, Hungary, on August 12, 1930, the son of Tivadar Schwartz, a Hungarian Jew who wrote in Esperanto, an experimental world language. Tivadar (also known as Teodoro) had been a prisoner of war in Russia during World War I. Tivadar changed the family name to Soros in 1936 because of the anti-Semitism of the rising Nazi movement. In Hungarian, *soros* means "next in line," and in Esperanto it translates as "soaring."

Adolf Hitler's troops conquered Hungary in March, 1944, when George was thirteen. His father bribed a government official in the Ministry of Agriculture to take George in and pass him off as a son during the summer of 1944. In 1945, George survived house-to-house combat as the Soviet army moved eastward through Budapest.

After the war, Hungary was beset by rapid inflation, which became Soros's first opportunity to speculate in currencies. In 1947, Soros immigrated to Great Britain, defecting from Communist Hungary while attending a conference. He graduated from the London School of Economics in 1952, studying with philosopher Karl Raimund Popper, whose ideas on the nature of open societies shaped Soros for life. Soros was attracted to open societies by his experiences with both Nazism and Communism. To put himself through college, Soros supported himself with work as a railway porter and waiter.

First Ventures

Soros moved to New York City in 1956, where he joined F. M. Mayer, an arbitrage trading firm. After three years there he moved to Wertheim and Company, where he worked as a financial analyst until 1963. During the following decade he worked at the investment advisement firm of Arnhold and S. Bleichroeder, eventually becoming a vice president. In 1967, Soros started a hedge fund, Double Eagle, at this company. Chafing at the corporate restrictions placed upon his work, Soros resigned from Arnhold and S. Bleichroeder in 1973 and started his own investment fund, which eventually became the Quantum Fund.

Initially, Soros's goal was to make enough money to support an independent career as an author and philosopher, which he believed would be about $500,000. Soon, however, Soros was earning much more than that. Returns on the capital he managed increased rapidly because he sold stocks short as markets fell when inflation and oil prices rose during several periods in the 1970's. Between 1969 and 1974, his fund tripled in value, while the stock market generally was stagnant. Between 1969 and the end of 1980, the Quantum Fund increased by 3,365 percent as the Standard & Poor's composite stock index rose only 47 percent. In 2007, the Quantum Fund earned Soros $2.9 billion, with an annual return of 32 percent.

MATURE WEALTH

Soros's acumen at currency speculation made headlines worldwide on September 16, 1992, or "Black Wednesday," when the British government withdrew the pound sterling from the European exchange rate mechanism as it crashed on world markets. Soros sold the pound short that day, making more than $1 billion.

The key to Soros's success as a speculator has been his ability to go against the majority of investors, staking his bets on unpopular assets and then selling out later when others buy en masse, thus driving up prices. Popper's philosophical outlook has heavily influenced Soros's worldview and investment strategy; the name of Soros's foundation, the Open Society Institute, is drawn from a two-volume work of Popper titled *The Open Society and Its Enemies*, first published in 1945. Soros has applied Popper's theory of "reflexivity" to economic bubbles, including the housing bubble that burst in 2007. Soros has contributed much of his enormous wealth to advocating the need for open societies around the world, encouraging democratic institutions in economic activities and tolerance of different political views.

Soros has earned some credit for being prescient regarding world economic conditions. He anticipated the global financial crash that began in 2007, criticizing the "bubble economy" created by overuse of exotic financial instruments, such as derivatives. Two of his books, *The Alchemy of Finance* (1987) and *The Crisis of Global Capitalism* (1998), sounded warnings that later books, including *The New Paradigm for Financial Markets* (2008), would analyze. He also freely acknowledges his mistakes, and he says he is rich because he knows when he is wrong.

LEGACY

Soros has not been shy about using his wealth for political purposes. During a South Asian monetary crisis in 1997, Malaysian prime minister Datuk Seri Mahathir bin Mohamad accused Soros of using the wealth under his control to punish the Association of Southeast Asian Nations for accepting Myanmar (Burma), with its brutal military junta, as a member. Soros contributed heavily to attain democracy in the former Soviet republic of Georgia, and in 2004 he supported the Democratic Party in its attempt to defeat the reelection of President George W. Bush. At that time, Soros said that removing Bush from office was the central purpose in his life; he added that he would spend his entire fortune if doing so would oust

Bush from the presidency. The Center for Responsive Politics reported that Soros spent $24.6 million in 2003 and 2004 to assist groups dedicated to defeating Bush. Soros has contributed significant amounts to left-wing political groups that generally support the Democratic Party in the United States, including $5 million to MoveOn; $3 million to the Center for American Progress; and $10 million to America Coming Together, a joint grant with friend Peter Lewis. Soros's Open Society Institute has supported decriminalizing possession of less than an ounce of marijuana and assisted suicide.

Soros is a board member of the Council on Foreign Relations and was a cofounder of the Center for American Progress. He has been granted honorary degrees from Oxford University, Corvinus University in Budapest, and Yale University, among others. He is twice divorced, from Annaliese Witschak and Susan Weber Soros, and has five children: Robert, Andrea, Jonathan, Alexander, and Gregory.

French courts in 2002 convicted Soros of insider trading after he purchased stakes in four state-owned companies. The conviction was upheld in 2006 by France's highest court. *Forbes* magazine in 2010 listed Soros as the thirty-fifth-wealthiest person in the world, with a net worth of about $14 billion.

The Open Society Institute

During the 1970's, with South Africa in the grip of apartheid. investor George Soros provided money to black students so they could enter the University of Cape Town. This probably was Soros's first act of philanthropy, and it bore the characteristics that distinguish his Open Society Institute: a worldwide reach, liberal principles, a dedication to educational purposes, and an emphasis on politics.

Soros created the Open Society Institute in 1993 to support his various foundations that seek to bring democratization to the former Soviet Union and to central and eastern Europe. By 2008, the institute had formed networks which promoted open societies in more than sixty countries. The institute grants about $400 million in an average year. By 2008, Soros had given away more than $6 billion through his institute and related foundations.

Soros's financial aid played a role in the collapse of Communist regimes in Eastern Europe during the late 1980's. He was a major contributor, at $3 million a year, to Poland's Solidarity labor union movement, which became a popular front for dissident activities. Soros also donated large amounts to Chapter 77, a resistance group in Czechoslovakia.

A sizable portion of Soros's charitable donations, more than $700 million, has gone toward combating poverty in Africa. The institute has given several million dollars to enable African villages to purchase nets that prevent the spread of malaria from mosquitoes. In addition, the institute has furnished fertilizer to restore depleted soils, medical treatment for people with human immunodeficiency virus/acquired immunodeficiency syndrome (HIV/AIDS), and school lunches in Africa.

Soros has also given $100 million for Internet infrastructure in Russian universities, and he provided an endowment of 420 million euros for Central European University. Included in its diverse interests, the institute has also contributed $5 million to support the creation of documentary films by Robert Redford's Sundance Institute.

Soros's activities have met with resistance from some governments. After the Soviet Union collapsed in 1991, his work was banned in Kazakhstan and Turkmenistan. His office in Belarus closed after that government fined him $3 million for "tax and currency violations." During June, 2009, Soros's foundations donated $100 million to address the effects of the economic collapse on the poor in central and eastern Europe.

Sir John Spencer

English aristocrat, merchant, and politician

Spencer was one of the wealthiest men in Elizabethan England. Although he is best remembered for being the lord mayor of London from 1594 to 1595, his greatest impact on history was probably his investment in the East India Trading Company, which remained a powerful organization until 1874.

Born: c. 1530; Suffolk, England
Died: March, 1610; London, England
Sources of wealth: Trade; investments
Bequeathal of wealth: Children

Early Life

Sir John Spencer (SPEHN-suhr), the son of Richard Spencer of Waldingfield in Suffolk, was born around 1530. Few records remain of Spencer's early life and family, although he had at least one sister, Alice Spencer. Sometime before 1544, Richard Spencer remarried to Alice Wincoll (or Wyncoll), who probably raised John. Young Spencer was apprenticed in London, presumably to a clothworker. Probably sometime in the 1570's, he married Alice, daughter of Thomas Bromfield of London. They had one surviving daughter, Elizabeth Spencer.

First Ventures

By the time Spencer joined the Clothworkers' Company in 1570, he was already a successful merchant in his thirties or forties. His trade in Spain included the importation of wine, raisins, oil, and iron, and he also traded in Turkey and Venice.

Spencer helped found the Spanish Company in 1577. The charter of the company granted broad rights, covering English trading activities along the Iberian coastline, as well as business in England. By the 1580's, the Spanish Company was effectively inactive because of the war between England and Spain and conflicts with other merchant companies.

Mature Wealth

With Sir Edward Osborne and Richard Staper, also clothworkers, Spencer pioneered trade in the Levant in the 1580's. Levantine spices, dyestuffs, and textiles were valuable commodities in England, and Spencer built much of his wealth in this trade through the 1590's. Spencer also invested in the 1591 voyage to India and China that led to the founding of the British East India Company. In 1599, Spencer was one of the leading investors in what became the British East India Company on December 31, 1600.

Although Spencer was not enthused about civic duties, he served as common councilor of London's Bishopsgate ward from 1576 through 1583 and as alderman for the wards of Bridge Without, Langbourn, and Bassishaw from 1583 through 1610. He was the sheriff of London from 1583 to 1584, and he is best remembered for his tenure as the city's lord mayor from 1594 through 1595.

Spencer was an unpopular lord mayor. The 1590's was a time of wartime taxation and rising prices, and Spencer's personality was abrasive. He was frequently at odds with other aldermen, known for favoritism, and his character was one of the grievances that spurred the apprentice riots of 1595. Despite Spencer's reputation for corruption and his loss of control of London during the riots, he was knighted between May 27 and June 13, 1595.

In addition to his interest in the British East India Company during the late 1590's, Spencer was occupied in preventing the marriage of his daughter Elizabeth to William Compton, first earl of Northampton. Spencer hid Elizabeth and claimed she had a premarriage contract with Sir Arthur Heveningham. Compton, however, had Spencer briefly committed to Fleet Prison, after which Elizabeth was removed from Spencer's care. She married Compton on March 15, 1599. Spencer saw Compton as a spendthrift fortune hunter, and even the birth of a grandson in 1601 did not lead to a reconciliation.

During his later years, Spencer expanded his ventures into moneylending. At his death in March, 1610, Spencer possessed between £300,000 and £800,000, a vast fortune at the time. He died intestate, so his fortune passed to his despised son-in-law Northampton via Elizabeth. Spencer's nephews alleged that Compton had suppressed the will, but nothing came of the allegations. Although there were no charitable bequests in Spencer's will, large sums were given to the poor at his funeral and it was rumored that the "suppressed will" contained £40,000 of bequests to poor relatives and charities.

Legacy

Spencer left a reputation for usury and avarice, perhaps only partially deserved. While his term as lord mayor was unsuccessful, he participated in several significant merchant ventures, most notably the founding of the British East India Company, an extremely powerful organization until 1874. His daughter Elizabeth was the forebear of the earls of Northampton, and Spencer's wealth went to that line.

Steven Spielberg

American film director, film producer, and screenwriter

Spielberg is one of the wealthiest and most famous film directors, producers, and screenwriters in American film history. Throughout a career of more than forty years, his films have become interwoven within the world's artistic culture, breaking multiple box-office records in the process. In 2010, Spielberg's net worth was estimated at $3 billion.

Born: December 18, 1946; Cincinnati, Ohio
Also known as: Steven Allan Spielberg
Sources of wealth: Entertainment industry
Bequeathal of wealth: Spouse; children; charity; medical institution

Early Life

Steven Allan Spielberg (SPEEL-buhrg) was born in Cincinnati, Ohio, and grew up in Arizona, the son of computer engineer Arnold Spielberg and restaurateur and pianist Leah Adler. Growing up in the Jewish household, the lifelong film fan was given an amateur eight-millimeter camera, and Spielberg began filming a variety of scenes plucked straight out of his imagination, unknowingly laying the groundwork for future financial prosperity. In 1958, he made a short film entitled *The Last Gunfight*, which earned him a Boy Scout merit badge, and by age sixteen his first official film, *Firelight*, was written and completed. Upon high school graduation, he attended California State University, Long Beach, becoming an intern at Universal Studios and completing the short film *Amblin'* in 1968.

First Ventures

Spielberg's first major break came in 1969, when he was working on the pilot for the television show *Night Gallery*. As a result of this job, he directed an episode of the already established television program *The Name of the Game*. Spielberg continued to direct episodes of several television series, including *Colombo*, before directing made-for-television films, including the critically acclaimed *Duel* and *Something Evil*. His first film to be shown in theaters, *The Sugarland Express*, was released in 1974, and while it received rave reviews, it was considered a disappointment at the box office.

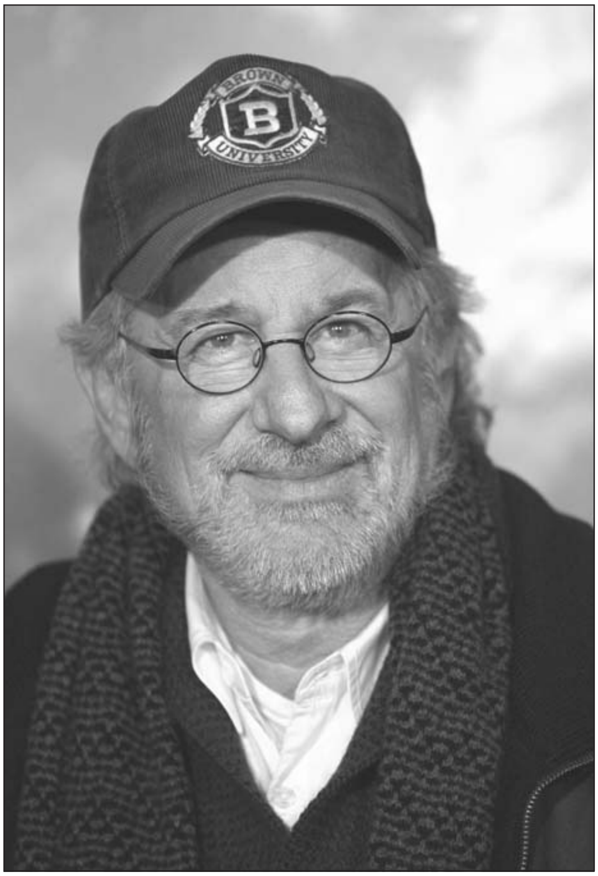
Undeterred, Spielberg scored a major motion-picture success with *Jaws*, based on the book by Peter Benchley. This horror film about a killer shark almost did not materialize, as the young director outspent his original budget and encountered numerous production delays. However, upon its release in 1975, the box office receipts more than made up for his overspending. *Jaws* grossed a surprising $470 million worldwide, which turned out to be the highest gross in film history at that time. The film also received three Academy Awards. As a result, Spielberg was instantly one of Hollywood's hottest commodities and became well known to film audiences worldwide. Most important, *Jaws*' sizable gross enabled Spielberg to have the financial freedom to explore more ambitious creative concepts, while simultaneously purchasing the most cutting-edge production equipment available at this time.

Mature Wealth

With the momentum behind the *Jaws* phenomenon, Spielberg found the confidence both to write and to direct his next major motion picture. *Close Encounters of the Third Kind*, released in 1977, was a science-fiction work that also found a widespread audience and critical acclaim, garnering $303 million at the box office and receiving two Academy Awards. Given that success, Spielberg continued to reach for deeper artistic affinities, but not everything he touched would turn to gold, such as the 1979 comedy film *1941*, which parodied the World War II era. Although a film grossing a little more than $92 million at the box office does not sound like a failure, *1941* was significantly less popular than his previous films and was met with critical indifference.

As a result of this financial letdown, the director returned his focus to mainstream audiences, rebounding to even greater heights when collaborating with *Star Wars* director George Lucas on *Raiders of the Lost Ark* in 1981. The action-packed production became the first in the iconic series of Indiana Jones films and grossed $384 million, far surpassing its $20 million budget.

Lightning was about to strike twice for Spielberg in 1982 with the release of *E.T.: The Extra-Terrestrial* about a lovable space alien that lands on Earth. Once again, Spielberg surpassed previous box-office records for his own films and even those for Lucas's *Star Wars*,



Steven Spielberg. (AP/Wide World Photos)

with *E.T.* grossing more than $792 million. Spielberg followed up with a combination of other science-fiction films and comedies, including *Poltergeist* and *The Goonies* (which, respectively, he produced and executive produced), throughout the mid-1980's. His next major breakthrough as a director came with another Lucas collaboration on *Indiana Jones and the Temple of Doom*, released in 1984 and earning $333 million.

Spielberg's films continued to do well at the box office, and as a result he was able to make some films that lacked a mainstream, commercial appeal. *Gremlins* (1984), which he executive produced, is often described as a dark comedy. This film earned a little more than $148 million from its theatrical release in the United States. Although by no means a failure, it was certainly a departure from and less popular than his more mainstream films of previous years. He took another risk in 1985, when he directed *The Color Purple*, based on Alice Walker's book of the same name. Oprah Winfrey was virtually unknown at the time, and this film introduced her to the public alongside the already established actor Whoopi Goldberg. This dramatic tale was vastly different from Spielberg's previous science-fiction, comedy, and adventure titles, and it became a critical favorite. The film cost about $15 million to make, and it earned $98 million.

In 1989, *Indiana Jones and the Last Crusade* was released and grossed $474 million. In 1991, Spielberg turned toward the Peter Pan story in *Hook*, which was plagued with costly production delays and lukewarm critical reaction but still reeled in $300 million. However, Spielberg returned to the top of his form with his direction of *Jurassic Park* (1993), based on Michael Crichton's novel. Spielberg used some of his past profits to purchase state-of-the art special effects programs that enabled dinosaurs to be reimagined for the audience. The film earned more than $914 million, becoming the highest-grossing motion picture to date. *Jurassic Park* also sparked tremendous interest and occasional controversy from the scientific community during a period when rapid advances in genetic engineering were prompting ongoing bioethical debates.

Spielberg's next film was the Academy Award-winning *Schindler's List* (1993), which recounted the true story of Oskar Schindler, a German businessman who became an unlikely savior of a group of Jews during the Holocaust. After the film grossed $321 million, Spielberg established a charity, the Survivors of the Shoah Visual History Foundation, which works to preserve the legacy of those who survived the Holocaust.

With a slower production schedule than he had in the 1980's, Spielberg became involved in other aspects of filmmaking in the 1990's. He established the film studio DreamWorks SKG in 1994 with colleagues Jeffrey Katzenberg and David Geffen, with each man contributing $33 million to the project, along with $500 million from Microsoft cofounder Paul Allen. In 1997, the sequel to *Jurassic Park*, *The Lost World: Jurassic Park*, had grossed $618 million, while *Saving Private Ryan*, a World War II drama released in 1998, earned more than $481 million.

After that successful streak of films, Spielberg began producing television series, including the ten-episode miniseries *Band of Brothers*, which aired on Home Box Office (HBO) in 2001. He also made the theatrical film *War of the Worlds* (2005), which grossed more than $591 million. In 2008, Spielberg returned to the action/adventure genre with the long-awaited fourth title in the Indiana Jones series, *Indiana Jones and the Kingdom of the Crystal Skull*. This film was released to overwhelming fanfare and generated more than $785 million, proving that Spielberg was still able to create commercial blockbusters.

Legacy

As a result of his drive, determination, and creativity, Steven Spielberg has become one of the film industry's most lauded luminaries, known for di-

The Starlight Starbright Children's Foundation

Steven Spielberg has used his star power not only to make major motion pictures but also to contribute to a variety of charitable organizations. In 1991, he and Randy Aduana established the Starbright Foundation, which sought to inspire sick children through entertainment and education. Although the foundation operated on its own for more than a decade, in 2002 Starbright merged with the Starlight Foundation, which was founded in 1983 by actor Emma Samms and film producer Peter Samuelson.

Now known as the Starlight Starbright Children's Foundation, the nonprofit organization is dedicated to improving the quality of life for children with chronic, terminal, and life-altering diseases and injuries. The organization not only seeks to provide entertainment to ailing children but also offers educational activities and advice to help their families cope with the childrens' conditions. The list of the foundation's initiatives is as varied as Spielberg's films. The organization provides family outings away from the hospital in order to combat the childrens' feelings of isolation and to reengage the children with the joys of popular culture. For the times when children must remain in the hospital, the Starlight Starbright offers access to various films and musical programs, along with educational materials and ways to stay connected with their peers.

The foundation offers online communities and interactive Web sites geared toward teenage patients who are coping with a severe medical condition. For younger patients, the organization provides toys and special events in hospital playrooms that serve as alternatives to often painful medical procedures.

In addition to Spielberg, numerous other celebrities contribute to the foundation, and the organization also receives support from the Walt Disney Company, Nintendo, Hollywood Video, and Game Crazy. Several corporate donors and fundraising efforts help fuel the foundation's efforts, while the organization has received several grants that help it bring its programs and resources to children.

recting and producing profitable blockbusters as well as less commercial projects. He continued to shatter his own records at the box office, while evolving with the times and setting new artistic trends.

Along the way, he has amassed a rarely rivaled amount of wealth that continues to provide sizable budgets for his feature films and to be a source of charitable contributions. Outside the film industry, Spielberg remains committed to recognizing his ethnic heritage as a Jew and to reaching out to the less fortunate, particularly ailing children. All the while, he continues to come up with concepts for new products, releasing new films and television programs that are met with tremendous anticipation and financial success.

Claus Spreckels

American industrialist and landowner

Virtually every enterprise Spreckels touched made a profit, thanks to his hard work, imagination, and ruthless business tactics. An early pioneer of vertical integration, Spreckels built an industrial empire by controlling every aspect of sugar manufacture, from growing and transporting the raw material to refining the finished product.

Born: July 9, 1828; Lamstedt, Hanover (now in Germany)
Died: December 26, 1908; San Francisco, California
Also known as: Adolph Claus J. Spreckels; The Sugar King
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Relatives; charity

Early Life

Adolph Claus J. Spreckels, less formally known as Claus Spreckels (klows SPREHK-ehlz), was the eldest of six children born to German peasants Diedrich and Garinna Spreckels. At the age of eighteen, he arrived almost penniless in Charleston, South Carolina, where he went to work as a grocery store clerk; within three years he owned the store. In 1852, Spreckels married his childhood sweetheart, Anna Christina Mangels, who had come to the United States three years earlier. The couple had thirteen children, five of whom survived, and three sons, John, Adolph, and Rudolph, would later join their father's businesses.

First Ventures

In 1855, Spreckels sold his store and moved with his family to New York City, where he opened successful wholesale and retail grocery operations. Following a brother west, he moved the next year to San Francisco and set up a new grocery outlet that made tremendous profits selling foodstuffs to gold rush prospectors. In 1857, he expanded his business, founding the Albany Brewery, another success.

worlds to conquer. He sold the grocery and brewery and used the proceeds to open the Bay Sugar Refining Company in 1863. The company refined Hawaiian sugarcane. However, shipping the raw product cut deeply into his profits, so for two years he studied modern manufacturing techniques in Europe to improve the company's efficiency. Back on the West Coast in 1867, he built the California Sugar Refinery. By the early 1870's, he had invented a new method of making sugar and secured a virtual monopoly on the commodity in the West, producing fifty million pounds of refined sugar annually.

Mature Wealth

Beginning in the 1870's, Spreckels refined tons of sugar and improved his business tactics. He went to Hawaii, the source of the material for his product. Here he ingratiated himself with King David Kalakaua, giving him gifts and granting him loans that put the king in debt and made him ripe for political manipulation. Spreckels set up the islands' largest sugarcane plantation, more than forty thousand acres, and he built an elaborate irrigation system to water his crops. To control transportation costs, he established the Oceanic Steamship Company between Hawaii and San Francisco. To ship cane to his refineries, he built narrow-gauge railroads, which would later carry passengers and serve local cattle feedlots.

Spreckels constantly added to his empire, building the West Coast's largest refinery, buying newspapers in Hawaii and San Francisco, and, when Hawaiian politics turned against him, purchasing large tracts of land in California to grow sugar beets for his refineries. In the late 1880's, he built a refinery in Philadelphia in order to compete on the East Coast. In 1899, his new plant near Salinas, California, the world's largest, began producing three thousand tons of refined sugar per day.

At the height of his career, Spreckels operated fifty companies worth more than $60 million. In his heyday, Spreckels was an important and respected member of San Francisco society. He owned two magnificent mansions in the community, built the city's tallest skyscraper, and gave generously to numerous charities.

Legacy

Following Spreckels's death, his eldest son John D. took over the *San Francisco Call* newspaper and the family steamship line and later became a major developer of San Diego. His second son, Adolph, managed the sugar businesses before dying of syphilis. Another son, Rudolph, became a banker who was worth millions of dollars before he lost his money in the 1929 stock market crash.

Although Spreckels's heirs ultimately sold off the family businesses, many traces of Claus Spreckels's empire remain. The Spreckels Building stands in San Francisco. The former company town of Spreckels, California, still exists, as does the Spreckels Sugar Company, which in 2010 was owned by a Minnesota cooperative.

John D. Spreckels

American businessman and real estate investor

The son of a sugar magnate, Spreckels acquired a fleet of ships that opened up American trade with Hawaii, New Zealand, and Australia. More important, he used his wealth to develop the city of San Diego, California.

Born: August 16, 1853; Charleston, South Carolina
Died: June 7, 1926; San Diego, California
Also known as: John Diedrich Spreckels
Sources of wealth: Inheritance; manufacturing; shipping; real estate
Bequeathal of wealth: Unknown

Early Life

John Diedrich Spreckels (SPREHK-ehlz) was the first of five children born to Claus and Anna Christina Mangels Spreckels. He was born in Charleston, South Carolina, and the family later moved to New York and then to San Francisco. A decade after John's birth, Claus Spreckels opened a sugar-refining company, and his subsequent involvement in the sugar business would make him a very wealthy man.

Young Spreckels attended public school in San Francisco and Oakland College, a preparatory school, before studying chemistry and engineering at Polytechnic University in Hanover, Germany. When he returned to the United States, he began working in his father's sugar refinery as a common laborer. Within three years, Spreckels had worked in every department and was the superintendent of the plant. Soon he was training other superintendents for the firm's Hawaii plant. He married Lillie Siebein in October, 1877, and the couple had four children. They initially lived in Hawaii, where they started a new sugar plantation for Claus.

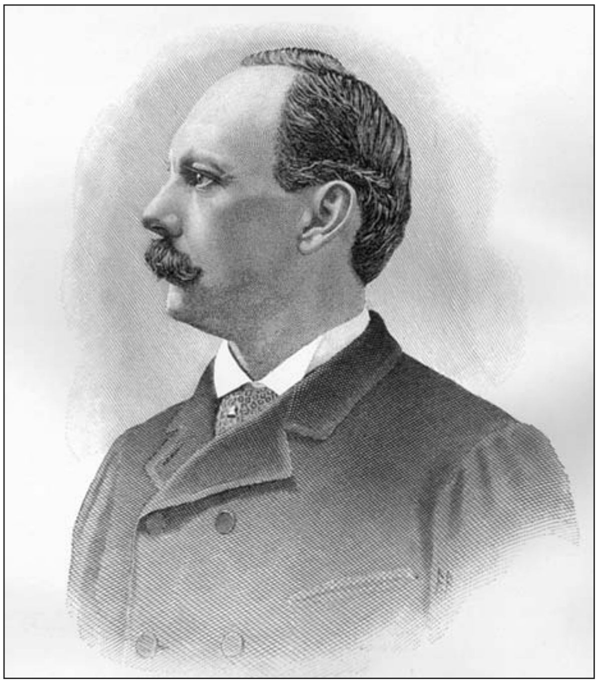
First Ventures

During his time in Hawaii, Spreckels began a shipping line with one leased ship. Later, he and his wife moved to San Francisco, where he continued to work with his father but also ventured into his own business. With his brother Adolph, he formed a company in order to open a trade route between the United States and Hawaii. This company eventually grew into two large fleets of ships connecting the United States with Hawaii, Australia, and New Zealand. Adolph and John became partners in several other ventures. They jointly owned the Beaver Hill Coal Company, which supplied coal to San Francisco from Oregon; the San Francisco and San Joaquin Valley Railway Company; the *San Francisco Call* newspaper; and extensive real estate holdings in San Francisco. Spreckels also was president of a railroad and several sugar companies in San Francisco and Hawaii. After the earthquake and fire in San Francisco in 1906, he moved his family to San Diego, California.

Mature Wealth

In 1887, Spreckels docked his yacht in the bay at San Diego for supplies. Whether he liked the beauty of the area or he saw the possibilities of a port city is unknown, but he spent the rest of his life building San Diego. He constructed a wharf where coal would be shipped in order to supply coal to the railroad. While Adolph stayed in San Francisco and kept the sugar, shipping, and other businesses operating and profitable, John obtained ownership of the Coronado Beach Company, the Hotel del Coronado, the San Diego and Coronado Ferry, and the streetcar lines. He later bought two San Diego newspapers, the *Union* and the *Evening Tribune*.

Investing in real estate was a continuing venture. Spreckels purchased property in downtown San Diego, where he built several buildings and hotels, and he also



John D. Spreckels. (Getty Images)

bought land outside the city. He built the San Diego and Arizona Railway to connect San Diego with the rest of the nation. Constructing this railroad was a difficult engineering project, and it was interrupted by World War I and other complications; completion of the line required thirteen years and $18 million of Spreckels's money.

Legacy

In his development of San Diego, Spreckels created a city where he had originally found only a village. He provided San Diego with a system for obtaining water, land developments where people could live, streetcars to transport people around town, companies to provide jobs, buildings to house businesses, and wharves for shipping. He also supplied the city with entertainment and culture, building a theater, library, park, and organ pavilion. The twenty-first century city of San Diego is the primary legacy of Spreckels's wealth.

Jane Stanford

American philanthropist

As the wife of a successful businessman and politician, Jane Stanford used her influence and energy for philanthropy. Stanford University, founded by Stanford and her husband Leland, is now one of the most highly regarded research institutions in the world.

Born: August 25, 1828; Albany, New York
Died: February 28, 1905; Oahu, Hawaii
Also known as: Jane Eliza Lathrop Stanford; Jane Eliza Lathrop (birth name)
Source of wealth: Marriage
Bequeathal of wealth: Relatives; educational institution

Early Life

Jane Eliza Lathrop Stanford was born Jane Eliza Lathrop on August 25, 1828, in Albany, New York. Her parents were Dyer Lathrop, a successful merchant, and Jane Anne Shields Lathrop, the mother of seven children. The Lathrops were part of an influential family whose relatives would later include Presidents Franklin Roosevelt, George H. W. Bush, and George W. Bush. Jane attended the Female Academy in Albany in 1840 and 1841. In 1850, she married an attorney, Leland Stanford, and moved with him to Port Washington, Wisconsin, where he had set up his legal practice. After a fire destroyed Leland's legal library and home, he went into business with his brothers, who were merchants in California. He started small, with a mining store and an interest in a mine.

First Ventures

Stanford lived in her parents' home in Albany until her husband made a small fortune in mining and rejoined his wife in New York. In 1885, the couple settled in Sacramento, California, where Leland planned to expand his business interests and enter politics. In 1861, he was elected to one two-year term as governor, and he used his influence to support the proposed transcontinental railroad, in which he had a large financial stake. He made millions of dollars in the next decade as the cofounder and president of the Central Pacific Railroad, and he later was elected a U.S. senator. As California's First Lady, Jane Stanford became a popular hostess and a hardworking philanthropist. She founded kindergartens in the area of Palo Alto, California, and established an orphanage in Albany to commemorate her parents.

Mature Wealth

In 1868, the couple's only child, a son named Leland, Jr., was born. In 1884, while the family was on a tour of Europe, the child died of typhoid at the age of fifteen. To address their grief and to celebrate their child's love of learning, Leland and Jane Stanford established the Leland Stanford Junior University on their eight-thousand-acre estate in Palo Alto. The first classes were held in 1891, and Leland, Sr., died two years later, leaving Jane in charge of the family businesses and the university.

Jane undertook an aggressive expansion program, straining the university's budget, and her autocratic decision making, guided by advice from a spiritualist, led to the creation of national policies on academic freedom for faculty members. She also took over the management of the family's sixty-three-thousand-acre cattle and sheep ranch, making it profitable for the first time. She commissioned a large stained-glass window, designed by Louis Comfort Tiffany, for a Sacramento church in memory of her son. In 1897, she deeded her mansion and the artwork it contained to the university, reserving the right to live in the residence until she died. Under pressure, she gave up control of the university to the board of trustees in 1903. Her death in 1905 was dramatic and controversial. Although some biographies say she died of a heart attack, others agree with the coroner who examined her body that she was murdered, poisoned with strychnine in Hawaii.

Legacy

Stanford donated the bulk of her personal fortune, valued at some $15 million, to what is now the world-renowned Stanford University, and she later gave the school all of her husband's cattle ranches and horse breeding facilities. The university's early attention to the arts was a result of her influence and her generosity. However, her politically motivated firing of a sociology professor in 1901 ultimately led to the formation in 1915 of the American Association of University Professors, established to delineate and protect the rights of academics.

Leland Stanford

American railroad magnate, politician, and landowner

Stanford was one of the foremost railroad magnates of the nineteenth century. He and his wife Jane established Stanford University in memory of their son and only child, Leland Stanford, Jr., who died at the age of fifteen.

Born: March 9, 1824; Watervliet, New York
Died: June 20, 1893; Palo Alto, California
Also known as: Amasa Leland Stanford
Sources of wealth: Railroads; real estate
Bequeathal of wealth: Spouse; relatives; educational institution

Early Life

Amasa Leland Stanford was born into a farming family in Watervliet, New York, a village on the Hudson River some twenty miles south of Troy. When he was twelve, the family moved to the Elm Grove Farm on the turnpike between Albany and Schenectady. In 1841, Stanford entered the Clinton Liberal Institute, opened ten years earlier by the Universalists as a protest against the narrow, conservative education then available to young students. In 1844, Stanford transferred to Cazenovia Seminary, a school near Syracuse, run by the Methodist church. Stanford spent a year there before leaving to read for the law in Albany.

First Ventures

By 1845, having passed the New York bar examination, Stanford had moved to Port Washington, Wisconsin, to practice law. In 1850, he was admitted to the Wisconsin bar. In the same year, he married Jane Eliza Lathrop of Albany, and they settled in Port Washington. Stanford entered politics in Wisconsin in 1850, when he was nominated as a Whig Party candidate for district attorney of Washington County. Although he was not elected, he ran successfully in 1851 for Port Washington's village trustee.

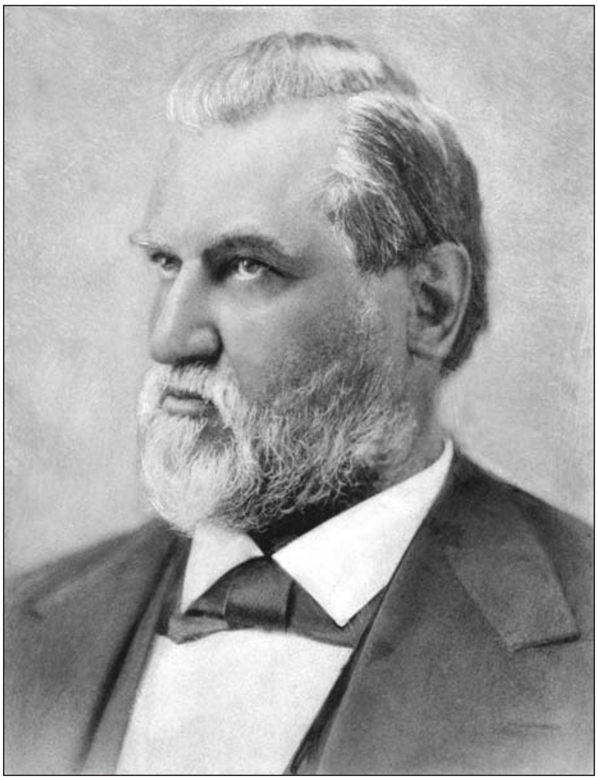
When fire destroyed much of Port Washington, Stanford, leaving Jane in Albany, sailed to California, where his brothers Josiah, Philip, and Thomas had begun to establish themselves.

He opened a store in Eldorado County to serve the growing population drawn to California by the gold rush of 1849. Stanford opened another store in 1853 in Michigan City, a gold rush town that had grown in one year from a population of thirty people into a community of two thousand, mostly prospectors. With this population boom, Stanford, who worked long hours and took no time off, was rapidly becoming rich.

Mature Wealth

The people who became rich as a result of the California gold rush were not the hopefuls who went into the field to pan for gold but the provisioners and the owners of boardinghouses that were quickly erected to feed and accommodate the prospectors pouring into the gold country. As soon as Stanford arrived in California in 1852, he became a provisioner and quickly gained the reputation of being exceptionally accommodating to the people he was serving, venturing into the field to take orders from them and to deliver supplies.

By 1856, Stanford owned four stores in the area of Sacramento, California. Money poured in as Stanford developed a reputation for being trustworthy. After his father-in-law died in 1855, Stanford returned to Albany to bring Jane, who had been caring for her father, to California. By 1856, having helped to organize the Republican Party in Sacramento, Stanford, working out of his new and expanded store on Front Street, was instrumental in persuading the Republicans to hold their state convention in Sacramento on April 30, 1856.



Leland Stanford. (The Granger Collection, New York)

In 1857, Stanford was nominated to be state treasurer but was defeated in the election. In 1859, he was nominated to be California's governor but was defeated. In 1860, undaunted by these two political setbacks, Stanford presided over the Republican convention in Sacramento that ratified the nomination of Abraham Lincoln as president of the United States.

Following Lincoln's election, Stanford sailed to the East Coast to stake his claim to the federal patronage that resulted from his support of Lincoln. In June, 1861, the Sacramento Republican Committee nominated Stanford to be governor of California, a post to which he was elected in September. That same year, Stanford, along with Charles Crocker, Collis P. Huntington, and Mark Hopkins, who came to be known as the Big Four, invested $24,000 to establish the Central Pacific Railroad. Stanford was elected president of the railroad on June 28, 1861. The following year, Congress passed the Pacific Railroad Act, which chartered the Union Pacific Railroad to build the eastern end of a new transcontinental railroad. The Central Pacific was given the contract to build the western end of this line.

In the 1860's, Stanford bought a lavish house in San Francisco, marking the beginning of what became his vast property acquisitions on the San Francisco peninsula. He also purchased large tracts of farmland some thirty miles south of San Francisco that added considerably to his wealth and provided the acreage for the eventual construction of Stanford University.

Upon his inauguration as governor in January, 1862, Stanford, not yet forty, had been in California for less than a decade. After serving his two-year term as governor, Stanford did not seek reelection. As his governorship neared its end in 1863, he was much engaged with the Central Pacific Railroad, which was now laying track for the transcontinental railroad. In 1869, the Central Pacific and Union Pacific rail lines merged.

Stanford's range of interests was enormous. In 1870, he bought his first racehorse and the following year began to experiment with winemaking, using his farmland near Palo Alto, California, as the venue in which to explore these interests. Stanford's involvement with transportation was a central part of his life, and in 1874 he helped to organize the Occidental and Oriental Steamship Company, of which he became president.

STANFORD UNIVERSITY

With the birth of Leland Stanford, Jr., in 1868, his middle-aged parents, Jane and Leland Stanford, were able to face life with renewed enthusiasm and hope. Their son, bright and inquisitive, grew up to become interested in antiquities and archaeology. The Stanfords, applauding their son's intellectual enthusiasms, took him abroad where he could pursue his interests. When Leland, Jr., died in Florence, Italy, just short of his sixteenth birthday, his distraught parents were disconsolate.

Several years before his son's death, Leland Stanford had contemplated establishing a school, although he had no detailed plans for doing so. As president of the Central Pacific Railroad, he had observed the damage that ill-trained railway engineers could cause. He considered establishing a school to train engineers who would be valuable to the nation's rapidly expanding railroad network.

Following the death of his son, Stanford discussed his thoughts about establishing a university with Harvard University's president, Charles William Eliot. Before the Stanfords left Europe in late April, 1884, Leland executed a new will. It provided money to create a university in his son's memory that would provide a first-rate education for promising students. This action stemmed from a troubled dream Stanford had about his son on the night of the boy's death, in which Leland, Jr., appeared to his father seeking to comfort him and showing Stanford that he still had a purpose in life. In the dream, young Stanford urged his father to build a university for poor young men and to live for humanity.

Stanford had acquired large parcels of farmland in and around Palo Alto, California. The Stanfords engaged Frederick Law Olmsted and some other notable architects to develop detailed plans for their proposed university. On May 14, 1887, their son's nineteenth birthday, they laid the cornerstone for this school on their Palo Alto farm. Stanford was elected to the U.S. Senate in 1885, and his frequent absences from California to serve in the senate delayed the founding of his university. By early 1891, however, the school, then named Leland Stanford Junior University, enrolled its first class of students.

The Stanfords set about finding a president for the university. They met with Andrew Dickson White, president of Cornell University, and offered him the position. White declined but suggested that his former student, David Starr Jordan, president of Indiana University, possessed the qualities of intellect and business acumen that the Stanfords sought in a president. Jordan was offered the position, and he accepted immediately. However, Jordan had one caveat: In the founding grant for the university, it was clearly stated that the school would be conducted according to the wishes of its sole trustee, who initially was Leland Stanford. Upon Leland's death in 1893, Jane Stanford became sole trustee, and her ten-year term was often a source of Jordan's displeasure.

The greatest trial in Stanford's life came in 1884, when his beloved son, Leland, Jr., died. The heartbroken Stanford, who two years earlier had been appointed to the board of regents of the University of California, had long harbored the idea of establishing a university. Upon his son's death, he conferred with Harvard University's president, Charles William Eliot, about this desire.

Stanford soon settled on building his university south of San Francisco. The cost of doing so was estimated to be between $2 and $3 million. When he mentioned these sums to his wife, she said, "We can afford it." In 1885 Stanford was elected to the U.S. Senate, and he held his senate seat until his death in 1893. The pressures of serving as senator delayed the founding of Stanford University, but the cornerstone was laid in 1887 and the school enrolled its first students in 1891.

LEGACY

Leland Stanford's wealth had been variously estimated at between $50 and $100 million dollars. When his estate was evaluated, however, its value was placed at around $18 million, the total reduced by the generous contributions that he and his wife Jane made to educational endeavors throughout their lives. Most of Stanford's estate was left to Jane, although bequests were made to several relatives and to some of the Stanford's servants, including Leland's assistant Herbert C. Nash.

Stanford is remembered as an early governor of California, as a major force in establishing a transcontinental railroad, as a skillful entrepreneur, and as a wealthy landholder in the San Francisco area. His most notable legacy, however, was the establishment of Stanford University.

Stanford and his wife not only furnished the funds to create the university but also provided the hundreds of acres of land on which the campus was built. Stanford University quickly evolved into one of a handful of truly outstanding world universities.

Cornelius Vander Starr

American insurance executive

With broad vision and an international sensibility, Starr pioneered the expansion of the insurance industry to untapped markets in China, enabling him and others to introduce Western business practices to the massive East Asian markets. Under his leadership, the American International Group (AIG) became the largest insurance company in the world.

Born: October 15, 1892; Fort Bragg, California
Died: December 20, 1968; New York, New York
Source of wealth: Insurance
Bequeathal of wealth: Relatives; charity

Early Life

Cornelius Vander Starr (kor-NEE-lee-uhs VAHN-duhr stahr) was born in 1892 in Fort Bragg, a tiny, picturesque town along the Pacific coast in northern California. His father was a first-generation Dutch emigrant who worked as a railroad engineer. After his father died when Starr was two, Starr was raised by his mother on the income from a modest boardinghouse she ran. Early on, Starr was taught the impact of unexpected death and the importance of managing income in unforeseen circumstances—the foundations for success in the insurance field.

As a child, Starr was restless with small-town life. In 1910, with aspirations in excess of his resources, he enrolled at the University of California. He dropped out within the year and began his first business: running an ice cream parlor in Fort Bragg. It did well, but Starr was ambitious. He decided to venture into the real estate business, where he perceived that money could be made quickly.

However, he was subsequently introduced to the more lucrative and more financially secure insurance business. He moved to San Francisco, where he pursued a law degree at night and sold automobile insurance door-to-door during the day. In 1918, he passed the California bar exam and set up a small insurance business, but his heart was not in settling down. Eager for adventure, he enlisted in the U.S. Army in the waning months of World War I. However, the war drew to a close before he would see any action overseas.

First Ventures

Starr's brief stint in the army only piqued his frustrated sense of adventure. After his discharge, he joined the Pacific Mail Steamship Company, and in 1919 he arrived in Shanghai, China, to work as an office stenographer. Once there, he gravitated to several small-scale insurance outfits. He was convinced there was a viable market for insurance in China, which was rapidly introducing greatly improved hygiene practices and Western medical techniques provided by trained physicians. Starr believed these improvements in health care delivery would increase life expectancy, making the vast country a prime market for insurance.

In the same year he arrived in China, Starr founded the American Asiatic Underwriters, the first Western insurance agency in China. It represented five insurance brokers from the United States and specialized in marine disaster and fire insurance. Because he never learned the Chinese language, Starr surrounded himself with business-savvy locals who worked the neighborhoods of Shanghai with confidence and tact, thus creating a sense of trust among the Chinese, which other Western entrepreneurs struggled, most often unsuccessfully, to achieve. Starr's insurance business quickly thrived, and it expanded to become the Asia Life Insurance Company. His insurance agencies underwrote the development of both commercial and industrial facilities, becoming a dominant force in China's rapid industrialization between the two world wars. Instead of hiring employees from other countries, Starr staffed his offices with Chinese workers, teaching them Western business techniques and management skills.

Mature Wealth

In 1926, Starr expanded his operations to the United States, opening an office of the American International Underwriters in New York City. Although his American operations thrived, Starr was principally interested in his enterprises in China. By World War II, Starr's company was the dominant insurance broker in China.

The onset of World War II, however, radically changed the course of Starr's career. During the war, he was enjoined by the Office of Strategic Services (OSS), a precursor of the Central Intelligence Agency (CIA) that gathered covert intelligence about military operations through a clandestine web of informants, including businesspeople, such as Starr. Although the extent of Starr's actual intelligence work during the war has never been made public, he helped monitor the early days of the Chinese Communist movement and Mao Zedong's

Red Army, which was originally supplied arms and money from the United States as a valuable ally in the war against Japan. Ironically, after the war it was this same Communist army's takeover of mainland China that compelled Starr in 1949 to relocate the headquarters of his multibillion-dollar insurance conglomerate, now known as the American International Group (AIG), to New York City.

However, Starr never abandoned his zealous advocacy of providing Western-style insurance to the Far East. He began selling insurance in the Philippines shortly after the war, and within five years his Philippine American Life and General Insurance Company became the dominant insurer in that nation. The corporate growth of AIG made company reorganization a necessity. In the early 1950's, Starr directed the company to separate its domestic and international agencies, headquartering the domestic groups in New York and the international groups in Bermuda, which Starr's advisers regarded as politically stable and friendly to the West. During the next two decades, AIG continued to be a major force in the global insurance business.

Starr remained director of AIG, focusing his considerable energies on its expansion and its international reputation. He never married, never had a family, and, except for a love of skiing, was seldom not directing the business. At the height of his tenure, AIG expanded into Latin America, the Middle East, and Western Europe. By the early 1960's, it was the largest insurance company in the world.

Now among the wealthiest financiers in the world, Starr became increasingly interested in using that wealth to promote the gospel message he held most dearly: the unlimited potential of the individual given the right opportunities and right resources. He had published a popular series of motivational books designed to encourage self-development. In 1955, Starr chartered the Starr Foundation, headquartered in New York City. The mission of the foundation, which shared many of its directors with AIG management staff, was to provide grant money for projects and research protocols aimed at offering solutions to a wide variety of pressing urban problems.

Nearing seventy, Starr accepted a diminished role in the direction of AIG's operations in 1962 and retired entirely in 1968, just months before his

THE STARR FOUNDATION

The mission statement of the charter for the foundation that Cornelius Vander Starr began in 1955 was appropriate for an insurance magnate who had spent the previous forty years redefining the dynamics of risk venture and risk management. The foundation recognized the value of initiative and taking risks, as well as the importance of managing risk to a positive result. The Starr Foundation defines an umbrella of concerns that are united by Starr's conception of the importance of risk and how an ingenious individual (or a commission or a research team) can conceive of solutions to pressing problems only by taking a chance on investigating solutions that were previously ignored or dismissed.

The majority of the foundation's grants are awarded to projects in the Manhattan area of New York City. The organization encourages projects in six areas. In education, the foundation provides need-based scholarships and student exchange programs. In the area of medicine and health research, the organization offers grants designed to help New York City hospitals serve the underprivileged. Human needs projects include literacy programs, job training, computer skills introduction, care of the elderly, housing for the disabled, and refugee relief. In the area of public policy, the foundation supports the work of commissions that investigate the adoption of democratic principles in countries in which individual freedoms have been contested or denied. The organization's culture and arts projects include financing for museums and community-based arts programs geared to particular groups of people, such as the disabled, minorities, or children. Environmental initiatives include funding for research projects and committees that are actively involved in conservation, ecosystem management, and the preservation of irreplaceable wetlands in areas being developed.

Unlike many foundations with grandiose mission statements, the Starr Foundation thinks locally rather than globally, in specifics rather than generalities, and aims at solutions rather than recommendations. Cornelius Vander Starr combined the characteristics of pragmatism, business acumen, and risk taking. He encouraged his foundation to recognize the value of ideas and of tackling thorny and persistent problems, using the foundation's resources to achieve results.

In 2008, American Insurance Group (AIG), the insurance corporation that Starr founded, was embroiled in financial scandals that prompted concern about the solvency of the Starr Foundation. The stock and assets of AIG are inextricably bound with the foundation, which owned more than fifteen million shares of AIG stock. On May 8, 2009, the Starr Foundation sued AIG, claiming the insurer had misrepresented the foundation's exposure to billions of dollars of losses in AIG's portfolio of credit default swaps. The lawsuit, filed in the New York State Supreme Court, sought damages of $300 million for the alleged fraud. However, on November 17, 2009, the case was dismissed by a judge, who called the lawsuit a "waste of time."

death. At the time of his retirement, AIG, despite aggressive competition from dozens of firms that used Starr's model for corporate development, retained its dominant position in the insurance industry and was among the top ten largest corporations in the United States. When Starr died, his entire estate was given to his foundation, which in the twenty-first century was among the most successful endowments, with resources of almost $5 billion and annual distributions of slightly more than $200 million. Long after his death, Starr continued to hold near-legendary status in the insurance field for his bold initiatives overseas. He was posthumously inducted into the prestigious Insurance Hall of Fame in 1975.

Twenty years after Starr's death, AIG insured more than thirty million people in the United States alone, serviced more than 130 countries, and employed more than 120,000 people internationally. In 2008, AIG became entangled in the housing, banking, and credit collapse that led to the most severe economic downturn since the Great Depression. In September, 2008, the company obtained $85 billion in government assistance in order to maintain its operations—the largest government bailout of a private company in U.S. history. This bailout, combined with allegations of corporate wrongdoing and financial malfeasance, generated a firestorm of public protest over AIG's business practices. However, AIG's business operations remained largely intact, and the firm was still ranked among the top twenty companies in America—a monument to the solid business foundation Starr had set more than half a century earlier.

Legacy

Any assessment of Starr's fortunes must take into account his global vision. Born of his childhood restlessness and his love of the peripatetic life, Starr's international sensibility defined the importance of his threshold position in American economic history. Born at the close of the century that marked America's economic maturity and confidence, Starr was among the visionaries of the early twentieth century who brought American ingenuity and business savvy to the international arena. Starr's considerable financial stake in China and his years of covert operations during World War II have made both Starr and AIG the subject of conspiratorial theorists, who allege that there was government intrigue in Starr's operations and in subsequent ties between the government and AIG. What is indisputable, however, is that Starr's fortunes expressed America's move to become a global economic force in the twentieth century.

GEORGE STEINBRENNER

American shipbuilding magnate and baseball team owner

Steinbrenner's vast wealth enabled him to buy the New York Yankee baseball club and to become famous, not only for the team's success but also for his autocratic management style.

Born: July 4, 1930; Rocky River, Ohio
Died: July 13, 2010; Tampa, Florida
Also known as: George Michael Steinbrenner III; The Boss
Sources of wealth: Inheritance; shipping; sports franchise
Bequeathal of wealth: Charity

EARLY LIFE

George Michael Steinbrenner (STIHN-brehn-ehr) III was born on July 4, 1930, in Rocky River, Ohio, the first of three children born to Henry and Rita Steinbrenner. Henry Steinbrenner became a Great Lakes shipbuilding magnate by marrying the daughter of a shipping company owner. He was also a domineering father, who forced young George to wear a white shirt and tie to grade school, apparel that often elicited teasing from George's fellow students.

Most children of wealthy parents received lavish allowances. Henry gave his son chickens. George was expected to sell eggs to earn his spending money. The young entrepreneur called his egg business the George Company, and when he went away to school he sold the company to his younger sisters, Susan and Judy, who changed the name to the S and J Company. Steinbrenner would later say he got his toughness from his father and his empathy from his mother, a devout Christian Scientist. At age fourteen he was sent to the Culver Military Academy in Indiana, and from there to Williams College in Massachusetts.

FIRST VENTURES

Following college, Steinbrenner went into the U.S. Air Force as a second lieutenant in fulfillment of his Reserve Officers' Training Corps (ROTC) commitment. He was assigned to Lockbourne Air Force near Columbus, Ohio, and given the job of athletic director, overseeing baseball, basketball, and intermural events. His peers considered him aloof, in part because he did not drink and lacked social skills. His habit of flaunting his wealth also made him unpopular. However, he excelled at his job, perhaps a foreshadow of his later destiny. Even in the Air Force, Steinbrenner was driven to win, and for one tournament he switched professional ballplayers for a few of the airmen on his team. He later managed, and eventually bought, the Cleveland Pipers, a short-lived professional basketball team.

In 1956 he married Joan Zeig. The couple had four children; sons Hank and Hal, and daughters Jennifer and Jessica. Although on the brink of divorce in the early 1960's, the couple reconciled and celebrated their golden anniversary in 2006.

By 1957, Steinbrenner had joined his father at Kinsman Marine Transit, the family shipbuilding business. Not surprisingly, the two men clashed on a regular basis, and Henry sometimes fired his son and then reinstated him. The firings were a management ploy George himself would use throughout his volatile career. He was

Great Wealth and Sports

In the past, men and women of wealth who wanted to invest in a sporting endeavor bred and raced horses. In the late twentieth and twenty-first centuries, however, rich people are more likely to buy an athletic team. George Steinbrenner, the controversial owner of the New York Yankees from 1973 through 2007, was one of the first among the incredibly rich to purchase a professional sports franchise. Other purchasers have included Joan Kroc, who owned the San Diego Padres baseball team and whose husband, Ray Kroc, built the McDonald's Corporation; media mogul Ted Turner, owner of both the Atlanta Braves baseball franchise and the Atlanta Hawks basketball club; former president George W. Bush, who was a co-owner of the Texas Rangers baseball team; entrepreneur Mark Cuban, owner of the Dallas Mavericks basketball franchise; and Paul Allen, cofounder of Microsoft Corporation, who owns the Portland Trail Blazers basketball team and the National Football League's Seattle Seahawks.

While investing in a Major League Baseball (MLB), National Basketball Association (NBA), or another association franchise can be risky, some owners emerge victorious. Steinbrenner, for example, hit a home run with his investment in the Yankees. He bought the team for $10 million in 1973, and by 2010 the MLB franchise was worth $1 billion. In 2010, his family owned 80 percent of the team.

The same competitive spirit that brings investors success in other fields may lead them to enjoy the rivalry inherent in athletics. Most people who buy teams are sports fans, and they may have grown up wishing they could be Mickey Mantle, or Michael Jordan, or another great athlete. However, some owners are exceptions to this rule. Hiroshi Yamauchi, a Japanese businessman and one of the principal owners of the Seattle Mariners, had never attended a baseball game before he became involved with the team.

Professional sports teams can be a profitable venture for their wealthy owners. Gate receipts, postseason playoff games, broadcasting rights, stadium concessions, and licensed merchandise can generate millions of dollars. Investors like Turner, who own both the team and the television network on which its games are aired, are in a position to profit exponentially through advertising sales, as well as through tax savings, in which the cost of one business venture can be written off as the expenses of another enterprise.

In addition to the money, there is also a certain cachet in owning a sports franchise, not to mention a chance to see the games from the best seats in the house. During Dallas Mavericks games, Cuban sits courtside, frequently yells at officials or players on the opposing team, and in the opinion of many fans and commentators is the most vocal and prominent supporter of his team.

wildly successful by anyone else's standards, but he always felt that he failed to live up to his father's often unrealistic expectations. Steinbrenner bought the business from his father in 1963.

Mature Wealth

Steinbrenner, like other sports team owners, had considerable wealth before buying the New York Yankees from William S. Paley in 1973. He paid $10 million, raising the money through a limited partnership that included Texas oilman Nelson Bunker Hunt and Chicago businessman Lester Crown. Steinbrenner insisted upon being the managing partner. By buying the team, Steinbrenner appeared to have finally gotten out from under his father's shadow, and Major League Baseball would never be the same.

The news media soon discovered, and exploited, Steinbrenner's explosive temperament and delighted in reporting his many battles with players, including Dave Winfield, Reggie Jackson, and Darryl Strawberry. Steinbrenner once made Yogi Berra so angry that the baseball great vowed never to set foot in Yankee Stadium again. However, the person who most often endured the wrath of Steinbrenner was the legendary coach, Billy Martin, whose firings and subsequent reinstatements became the fodder for sports journalists, not to mention late night television show hosts and comedians.

Steinbrenner's management style emulated that of his father. He ran the team the way Henry managed both the family shipbuilding business and the family itself. George was fiercely loyal to those around him who measured up to his exacting standards, but he felt personally hurt and exacted revenge when he believed he was betrayed. More often than not, his decisions were about money. Steinbrenner's overwhelming success allowed him to manage by intimidation or by any other style he chose. As long as the Yankees won, the fans were happy, and the money rolled in. If the team lost, someone would be held accountable. That someone was often Billy Martin.

One reason for Steinbrenner's success was his understanding that money attracts money. He was in the vanguard of hiring highly paid—or, in some critics' opinions, exorbitantly paid—professional athletes. By paying his players more than any other baseball team owner, Steinbrenner was assured of building a team with the kind of talent that would win repeated championships.

Steinbrenner's wealth assured him a perennial spot on the lists of the richest Americans. He used his fortune to improve the lives of others, at times acting on impulse to fulfill a perceived need. For example, while driving in Florida, he came upon a broken school bus, and he not only paid for its repair but also bought lunch at McDonald's for the stranded children. He sent $50,000 worth of toys to an orphanage in need. When Hurricane Andrew ravaged Florida, Steinbrenner was a major donor, making public appearances to urge others to join the relief effort. After he learned that Florida's Salvation Army employees were driving trucks without air conditioning, he immediately arranged to have air conditioning units installed in every vehicle. Steinbrenner's generosity, combined with his often autocratic nature, illustrate the contradictions and complexities of his character. The man that his staff and team encountered was the Steinbrenner who preferred being feared over being liked; the beneficiaries of his kindness saw an empathetic man who recognized life's inequities and worked to alleviate them.

Unlike his father, who never indulged in any form of conspicuous consumerism, Steinbrenner and his family always lived in a manner befitting his balance sheet. He enjoyed lavish homes in both New York and Florida, and he made sure his own children never had to suffer the indignities he experienced in childhood. Joan Steinbrenner had everything a wife could want but at the price of being dominated by her husband.

In 2007, Steinbrenner turned the team over to his sons. Steinbrenner had a long run with the New York Yankees, and this tenure was both successful and controversial. He was twice suspended from Major League Baseball, and he was twice reinstated. One of the dismissals came after he was convicted of a felony for making an illegal contribution to President Richard Nixon's reelection campaign.

In his later years, Steinbrenner's health declined. On July 13, 2010, he had a heart attack and was taken to St. Joseph's Hospital in Tampa, Florida, where he died at the age of eighty.

Legacy

George Steinbrenner will be best remembered as the man who brought the New York Yankees to even greater glory, making it the most successful franchise in baseball history. Although often harsh and dogmatic, he achieved his goals and made Yankee fans happy. Although he did not always show his more compassionate nature, his generosity is also a large part of who he was. He assisted charities in New York and in the Hillsborough County area of Florida, where the Yankees have their spring training camp. Among his philanthropic causes, he founded the Silver Shield Foundation to pay the college tuition of children whose fathers were police officers who died in the line of duty in New York City or in Hillsborough County. He also was a longstanding donor to the Special Olympics. Steinbrenner Field, the Yankees' winter home in Tampa, Florida, is named for him, as is a high school in Hillsborough County, which recognizes his charitable contributions to the area's schools.

Alexander Turney Stewart

American retailer

At the time of his death, Stewart was the third-wealthiest man in New York, with an estate valued at $50 million. He obtained his wealth by creating a chain of retail stores that helped make shopping and consumption essential elements of American life.

Born: October 12, 1803; Lisburn, County Antrim, Ireland (now in Northern Ireland)
Died: April 10, 1876; New York, New York
Also known as: Alexander Turney Stewart
Sources of wealth: Inheritance; retailing; real estate
Bequeathal of wealth: Spouse

Early Life

Alexander Turney Stewart was born in Lisburn in what is now Northern Ireland. Growing up in a close-knit Scotch-Irish Protestant community, in the heart of the thriving linen trade, reinforced a strong culture of hard work, scrupulous honesty, and responsibility. His father died when Stewart was three months old. After remarrying, his mother immigrated to the United States, leaving Stewart in the care of his grandfather, a man of some substance financially, who provided the boy with a good education and sent him to Trinity College in Dublin to study for the Anglican ministry.

Upon his grandfather's death in 1820, Stewart quit his studies and paid passage to New York, where he secured a teaching position. In 1823, he returned to Ireland to collect an inheritance of £1000 (about $10,000, or between $80,000 and $100,000 in 2010 currency) from his grandfather's estate. He used most of his inheritance to buy Irish linens and lace, which formed the nucleus of a small dry goods store. In 1823, he married Cornelia Clinch, daughter of a New York ship chandler.

First Ventures

Stewart's store prospered, quickly outgrowing its narrow quarters. Early on, Stewart established the business practices that enabled him to amass a fortune as New York City's leading retailer. By buying from the source, eliminating the middleman, and doing a larger volume of business than his competitors, he was able to cut prices and still make a profit. His reliance on cash transactions in both purchasing and selling was one factor that helped him weather the volatile economic climate of America in the first half of the nineteenth century. He personally supervised all aspects of his business and insisted on rigorous honesty in all transactions.

The opening of the Erie Canal in 1825 established New York City as the preeminent port through which American raw materials were shipped overseas and manufactured goods from Europe entered the United States. The canal resulted in a rise in the city's wealth, creating a burgeoning demand for luxury consumer goods, which Stewart readily supplied. An Englishwoman writing about New York in 1854 remarked on gold brocade selling for £9 (about $900 in 2010) a yard and a fine lace flounce priced at 120 guineas. Such wares were displayed in colonnaded marble halls, proffered by a small army of handsome young clerks well versed in polite, low-key sales tactics. Although Stewart's store did sell some lower-end and discounted merchandise, it was preeminently the emporium of the fashionable and well-to-do.

In the mid-nineteenth century, dry goods occupied the central place in retailing that women's ready-to-wear clothing would later assume. The Industrial Revolution made available inexpensive machine-made fabrics, enabling middle-class women to follow fashion and have more extensive wardrobes than they had before, but the usual practice was to buy yardage and findings from the dry goods store and give them to a dressmaker to be made into clothing.

Making his stores places where women enjoyed shopping was a key feature in Stewart's success. In 1848, having outgrown a series of successively larger rented quarters, he built the Marble Palace at 280 Broadway. By building a facility with high ceilings, classical architectural details, and a glass-domed rotunda, Stewart carefully created an atmosphere that reinforced shopping as a pleasant pastime. Among his store's innovations were periodic fashion shows, floor-length mirrors, and stools upon which ladies could sit and gossip while they examined fabric. Sometimes considered America's first department store, the Marble Palace was predominantly a dry goods store.

Mature Wealth

After 1848, Stewart's empire expanded rapidly. By 1869, he owned more real estate in Manhattan than anyone except the heirs of John Jacob Astor; his holdings included two major stores, the Metropolitan and Park Hotels, the Globe Theater, and Niblo's Garden. He also purchased and expanded the Grand Union Hotel in the resort town of Saratoga Springs, New York, making it the largest hotel in the world. Stewart operated satellite stores in Boston and Philadelphia and branches in Great Britain, France, and Germany.

The Marble Palace was a huge financial success, and it stood at the center of fashion and opulence in female dress. One of its notable customers was Mary Todd Lincoln, to whom Stewart personally presented a valuable lace shawl, with the gift serving multiple functions as thanks to a loyal customer, publicity for the shop, and an expression of support for the administration of her husband, President Abraham Lincoln.

In 1862, Stewart opened the Iron Palace, a six-story building occupying an entire city block between Ninth and Tenth Avenues on Broadway. This massive building, with its cast-iron facade, glass dome, skylight, and grand emporium, employed two thousand people in nineteen separate departments, including various categories of fabrics, furs, housewares, carpets, and toys. It was a true department store, catering to the diverse shopping needs of the well-to-do New York woman.

In 1870, the workforce of the Iron Palace consisted of one superintendent, 9 department heads, 25 bookkeepers, 30 ushers, 200 cash boys, 470 clerks, 50 porters, and 900 seamstresses. Stewart was an exacting employer, demanding diligence and honesty and by no means generous with wages. His fairness, consistency, and personal example, however, allowed him to maintain a loyal workforce. His Garden City and women's residence hotel projects, initiated shortly before his death, represented an innovative solution to ensuring adequate living standards for employees in a high-cost urban area, with the employer taking advantage of economies of scale to provide inexpensive housing.

During the Civil War, Stewart manufactured and sold cloth for Union army uniforms at less than the going rate. He later sent a shipload of provisions to Ireland during the famine and a shipload of flour to sufferers of the Franco-Prussian War, and he provided $50,000 for relief after the Chicago fire of 1871. Although significant, these explicit charitable acts are minor compared to Stewart's resources.

Around 1870, the New York City store began receiving mail-order requests from women in rural areas. Stewart created a department to handle these requests, which by 1876 generated profits of $500,000 annually. To supply his stores, Stewart established a carpet factory and woolen mills.

In 1869, Stewart hired the architect John Kellum to design a suitable mansion. Located on Fifth Avenue and Thirty-fourth Street, the five-story marble-faced structure designed in French Second Empire style was the grandest private residence of its day in New York. The house, a private art collection valued at $1 million, and excellent horses were the only outward displays of wealth in which Stewart indulged.

Publicly, Stewart took relatively little part in political life. Despite his close association with Judge Henry Hilton, his wife's second cousin and a member of the Tweed Ring, Stewart distanced himself from the extreme corruption of New York City's government in the 1860's and assisted in the prosecution

GARDEN CITY

In 1869, Alexander Turney Stewart used some of the profits from his retailing empire to purchase the Hempstead Plains, a tract of more than seven thousand acres of treeless land on Long Island, New York. He announced an ambitious plan to develop the area as a residential community for families of men working in his New York City enterprises, a proposal most contemporaries regarded with skepticism. Commuting to work by rail was a novelty, as was the idea of constructing an entire community from the ground up.

Collaborating with John Kellum, the architect of Stewart's Iron Palace, America's first real department store, and Stewart's New York City mansion, Stewart laid out plans for a model town to be named Garden City, with broad, tree-lined avenues, extensive parks, schools, churches, a modern water system, centralized steam heating, and a commercial district, all of which would be leased, leaving Stewart with ultimate authority over who lived there and what businesses could operate there. To ensure ease of commuting the nineteen miles to New York City, he built his own spur railroad. Although aimed at people lower down the social scale than earlier planned communities, such as Lewellyn Park in New Jersey, Garden City was never a purely philanthropic venture. Stewart expected to profit from it, both from rents and from innovative methods of cutting his employees' housing costs, thereby enabling him to pay his workers lower wages.

At the time of Stewart's death in 1876, only a central hotel, some of the infrastructure, and twelve large executive homes ("the Apostles") had been built. His widow concentrated construction efforts on building the Anglican cathedral and developing playgrounds for wealthy New Yorkers who built or leased summer homes in the vicinity. As a residential community, Garden City did not really begin to grow until after 1907, when Stewart's corporation sold lots to individuals. The resulting city was, and still is, a desirable place to live, although far removed from Stewart's original vision.

of "Boss" William Marcy Tweed in 1872. In March, 1869, President Ulysses S. Grant offered Stewart the post of secretary of the Treasury, but an old law barring anyone actively involved in imports from this position prevented his confirmation.

Stewart died unexpectedly of peritonitis on April 10, 1876. The terms of his will left his entire fortune to his wife, with the exception of some small bequests to individuals and $1 million to Henry Hilton, a relative and business partner. The Stewarts had three children, but they died when they were young and did not have their own children. Shortly after his death, thieves stole his body from its temporary resting place in St. Mark's Church in New York's Bowery neighborhood and held the body for ransom. Upon payment of the ransom, Stewart's remains were returned and interred in the new Cathedral of the Incarnation in Garden City, New York.

Legacy

Stewart's most enduring legacy is probably not what his wealth bought but the business model that made accumulation of his fortune possible. In 1823, few Americans thought of themselves as consumers, and retailing, even in large cities, focused on meeting the practical needs of plain folk. The elite looked to the Old World, especially to France, for luxury items, and conspicuous consumption of these goods was viewed as vaguely un-American.

By 1876, New York City had become established as a center for fashion and luxury, and other large cities followed suit. Shopping and consumption had become legitimate and primary aims of life, worthy of the trappings formerly reserved for theater, civic life, and worship. The store had become a palace, and the shopkeeper, a prince.

Of the edifices Stewart built, only the Marble Palace survive in the twenty-first century, as a civic building and historic landmark. The Iron Palace was acquired by Wanamaker's, a Philadelphia-based department store chain modeled on Stewart's stores. Wanamaker's operated the Iron Palace as one of New York's grand department stores until 1955. The Grand Union Hotel in Saratoga Springs fell into disrepair and was razed in 1953 to make way for a supermarket, and Stewart's Fifth Avenue mansion was demolished in 1902.

James Stillman
American banker and investor

Stillman was president of National City Bank of New York and led the bank to spectacular growth, opening international branches and becoming the largest bank in that state.

Born: June 9, 1850; Brownsville, Texas
Died: March 15, 1918; New York, New York
Also known as: James Jewett Stillman
Sources of wealth: Inheritance; banking
Bequeathal of wealth: Children

Early Life
James Jewett Stillman was the oldest of five children born to Charles Stillman and Elizabeth Pamela Goodrich Stillman. Charles Stillman was the founder of Brownsville, Texas, and James was born there on June 9, 1850. By 1856, the family had moved to New York. James received his formal education at Churchhill School, a military academy in Ossining, New York. Since his father was away for long periods, often in Mexico or Texas, James was forced to be the man of the house.

First Ventures
At age sixteen, Stillman began working, and two years later he was promoted to cashier at Smith, Dunning, and Woodward, a company dealing in cotton and hides. The firm later reorganized and was renamed Woodward and Stillman.

Stillman married Sarah Elizabeth Rumrill in 1871, and the couple had three sons and two daughters. Sarah desired more companionship than the aloof James supplied. In 1894, she left her husband and moved to Paris.

When Stillman was twenty-one, his father suffered a paralyzing stroke, and Stillman took over all of his father's investments. After his father died in 1875, Stillman inherited about $1 million. He invested much of this money into the stock of a dozen strong railroads. He also used his father's business interests to gain control of sixteen banks and a large amount of land in south Texas, and he began to buy stock in National City Bank of New York. In 1883, Stillman took his father's place on the board of directors of National City Bank, and the following year he began serving as a director of both Hanover Bank and the Chicago, Milwaukee, and St. Paul Railroad. By 1884, Stillman was earning $50,000 a year.

Mature Wealth
In 1891, Stillman became president of National City Bank, which at that time was losing money. Under his leadership, the bank became profitable. Stillman increased National City's capital, cash reserves, and the amount of gold that the bank owned when other banks were selling gold. His management techniques also enabled the bank's deposits to skyrocket from $12 million to $638 million.

In 1897, National City Bank was the only bank stable enough to finance the reorganization of Union Pacific Railroad. This strength also enabled the bank to be the agent for the United States in the transaction in which America paid Spain $20 million to purchase the Philippines. National City Bank continued its remarkable growth, and in 1919 became the first U.S. bank with $1 billion in assets. During economic downturns, when many other banks failed, National City actually increased its capital and deposits.

Stillman became good friends with William Rockefeller, the manager of Standard Oil; Stillman's two daughters married Rockefeller's two sons. Another of Stillman's associates was railroad magnate Edward H. Harriman. With Harriman, Rockefeller, and other Wall Street associates, Stillman controlled the most important railroads in Texas, as well as the Union Pacific and the Chicago and Alton rail lines. In 1897, National City Bank took over Third National Bank to become the largest bank in New York.

Stillman earned an estimated $3.5 million annually and was worth $200 million. Near the end of his life, he gave money to family and friends and was therefore worth only $50 million at his death. He died of heart problems on March 15, 1918.

Legacy
With his personal fortune, Stillman provided a fund for French war widows and children and financed construction of a hospital for Harvard University. However, his legacy was not in his philanthropy but in his role as a banker and financier. As president of National City Bank, Stillman played a significant role in American business in the late nineteenth and early twentieth centuries. His management enabled the bank to become one of the largest and most solid financial institutions in the country. Among its accomplishments under Stillman's leadership, National City financed the restructuring of

Union Pacific Railroad and played an important role in the United States' acquisition of the Philippines. By the twenty-first century, National City Bank had become Citibank, one of the largest full-service banks in the world.

Nathan Straus

American department store owner

Straus was the co-owner of two of the largest department stores in New York City—Macy's and Abraham & Straus. He also was an active philanthropist, advocating milk pasteurization, opening a tuberculosis sanatorium for children, and providing coal, food, housing, and other relief during economic and natural disasters.

Born: January 31, 1848; Otterberg, Bavaria (now in Germany)
Died: January 11, 1931; New York, New York
Source of wealth: Retailing
Bequeathal of wealth: Charity

Early Life

Nathan Straus (strows) was born in Otterberg, Bavaria, the son of Lazarus and Sara Straus. He was the third of four children. At the age of six, he traveled with his mother, sister Hermine, and brothers Isidor and Oscar to join their father in the southern United States. After the Civil War, the family moved from the state of Georgia to New York City.

His father founded L. Straus & Sons, a business that sold crockery and glassware. The three boys learned this trade from their father and eventually took over the business. On April 28, 1875, at age twenty-seven, Straus married twenty-one-year-old Lina Gutherz. The couple had six children.

First Ventures

L. Straus & Sons began selling crockery to R. H. Macy & Company department store. In 1888, the Straus business and Macy's became partners, and less than a decade later the Straus family co-owned the store. In 1893, Nathan and Isidor bought a Brooklyn dry goods store, Abraham and Wechsler, from its owner Joseph Wechsler. The brothers renamed the store Abraham & Straus.

During this time, Straus noticed the struggles of the city's poor. Especially cold winters in 1892 and 1893 caused economic distress, so Straus set up shelters and created a chain of centers to distribute food and coal to the needy. The Straus family's dry goods business also offered coal, bread, sugar, flour, and other staples at a minimum cost. The personal cost for helping those in need was estimated at $100,000, nearly ten times what local charities were contributing, yet Straus's philanthropic efforts were criticized for encouraging pauperism.

Shortly before the hardship of these terrible winters, Straus took an interest in public service. From 1889 to 1893 he served as the park commissioner for New York City. He declined the Democratic Party's nomination for mayor of the city in 1894. However, the plight of the city's poor and homeless continued to concern him. The high death rate of infants and children led him to explore health issues among the poor.

Mature Wealth

Straus was intrigued with the discoveries of scientist Louis Pasteur, and after the death of two of his three small children Straus became convinced that raw milk was "white poison." The sudden death of a family cow revealed that it had died of tuberculosis, and Straus suspected the cow had passed on the disease to his children. Straus and his wife created and financed the Nathan Straus Pasteurized Milk Laboratory. Here milk was pas-

teurized, or heated, to kill bacteria and was then bottled to help combat infant mortality from tuberculosis, typhoid, scarlet fever, diphtheria, and other diseases. Eighteen milk depots were established throughout the city to sell sterilized milk for a few cents or to provide it for free to those unable to afford it for their children. Straus and his wife also opened and financed the Tuberculosis Preventorium for Children in Lakewood, New Jersey. In 1898, Straus served as president of the New York City Board of Health.

After their efforts to pasteurize milk, Straus and his wife Lina planned a trip to Israel. The couple and Straus's brother, Isidor, and Isidor's wife traveled to Palestine in 1912. Straus was taken by the area but grew concerned about the health and housing problems he saw in Palestine. Although he and Lina remained abroad, Isidor and his wife returned to New York aboard the RMS *Titanic*. They perished, and Straus took the deaths very hard. He believed divine intervention had spared him and his wife and committed himself to helping those in Palestine.

Legacy

The last decade of Straus's life was devoted to assisting the Jewish community in America and helping underwrite Zionist activities in the Holy Land. Straus and Lina devoted two-thirds of their fortune to these efforts. They funded pasteurization plants, nursing missions, and hospitals in Tel Aviv and Jerusalem and worked to improve living conditions for both Arabs and Jews in Palestine. In 1920, Straus turned the New York City milk depots over to public agencies and donated his pasteurized milk laboratory to the state of New York, since by that time milk pasteurization was required by most cities and states.

Grigory Stroganov

Russian landowner, merchant, and statesman

Stroganov consolidated his family's vast landholdings and developed numerous enterprises that made the Stroganovs one of the wealthiest and most influential families in Russia. He also helped finance the Russian government in times of need, earning nobility for his descendants.

Born: 1656; Solvychegodsk, Russia
Died: November 21, 1715; Moscow, Russia
Also known as: Grigory Dmitriyevich Stroganov; Gregory Stroganoff
Sources of wealth: Inheritance; trade; real estate; government
Bequeathal of wealth: Children

Early Life

Grigory Dmitriyevich Stroganov (grih-GOH-ree dih-MYEE-tryee-vihch STRAH-gehn-ahf) was born into a family of ambitious peasants from the White Sea. A century before his birth his family had been granted large tracts of land as a reward for their service to and financial support of Czar Ivan the Terrible. Grigory was the only son of Dmitri Andreyevich Stroganov. In keeping with the family tradition of paying homage to the Russian monarch, in 1672 Grigory was sent to the court of Czar Alexis in Moscow with lavish gifts for the future czar, Peter the Great, who was born that year.

First Ventures

Stroganov's rise to power and wealth began in 1673, when his father died and he inherited one-third of the Stroganov landholdings. He obtained another third of the family's property in 1681 and the remainder in 1686, after the other heirs had died. In 1692, Czar Peter the Great granted the Stroganovs their land in perpetuity, making Stroganov the largest landowner in Russia, after the czar, with some seventy thousand square miles of land. Stroganov's property included between fifteen and twenty thousand serfs whose labor could be exploited with impunity, thanks to the presence of a small private army to carry out Stroganov's wishes with the tacit approval of the czar. Stroganov's minions explored Siberia and the Ural Mountains, annexing huge tracts of mineral-rich land that would become part of the Russian Empire. Stroganov also greatly added to his family's fortune by expanding the family's longtime salt-making business, and he developed or improved the efficiency of lucrative fur, hunting, fishing, and mining operations on his property.

Beginning in the early 1680's, Stroganov exerted powerful influence on the Russian court because of his willingness to lend the government of Peter the Great hundreds of thousands of rubles. After the outbreak of the Great Northern War against Sweden (1700-1721), Stroganov paid for the construction of two warships for the fledgling Russian navy.

Mature Wealth

For his service to his country, Stroganov was recognized as a distinguished person, granted various honors, and given additional lands. One of these properties was Kuzminki, a fabulous estate in Moscow, replete with ponds, bridges, gardens, and original sculptures. Here Stroganov carried on the family tradition of collecting art and artifacts, including Roman statuary, fine furniture, tapestries, historical relics, coins, books, and paintings. Like his father, he sponsored artists and craftspeople. Under his tutelage, a Stroganov style of art turned out Westernized icons painted on canvas, gold-threaded embroidery, and fine enamels. He also developed a Baroque-influenced Stroganov architecture that was incorporated into the churches he had built, including the Cathedral of the Presentation of Mary, the Church of Our Lady of Kazan, and the Church of Our Lady of Smolensk.

Stroganov was married twice, first to Princess Vassa Meshcherskaya and then to Princess Maria Novosiltseva. He and Maria had three surviving sons, Alexander, Nikolai, and Sergei. At the time of his death in 1715, Stroganov was one of the richest men in Russia.

Legacy

After Stroganov's death, his sons were elevated to the nobility in recognition of their father's role in Russia's growth. They and their descendants enjoyed all the benefits of wealth and prestige for the next two centuries. Many Stroganovs would play significant roles in Russian history. Count Sergei Stroganov, who built the ornate Stroganov Palace in Moscow, served Czarina Elizabeth Petrovna. Sergei's son Alexander helped reform laws during the rule of Czarina Catherine the Great and became president of the Russian Academy of Sciences. Other Stroganov descendants served as government ministers.

The Stroganov family fortune came to a sudden end during the Russian Revolution of 1917. Several family members, including Princess Maria Stroganov Shcherbatova and her children, were among thousands of nobles who were executed. Survivors fled, and Stroganov lands, businesses, and possessions were nationalized. By the twenty-first century, Stroganov Palace had been converted into a museum and the Stroganov family no longer existed.

Filippo Strozzi

Italian merchant and banker

Strozzi amassed one of the greatest fortunes of the Renaissance, dedicating much of his wealth to the construction of a grand palace in Florence.

Born: 1428; Florence (now in Italy)
Died: 1491; Florence
Also known as: Filippo di Matteo Strozzi; Filippo Strozzi the Elder
Sources of wealth: Banking; trade; real estate
Bequeathal of wealth: Children

Early Life

Filippo di Matteo Strozzi, better known as Filippo Strozzi (fee-LEEP-poh STROHT-tsee), was born in 1428 into one of the most prestigious patrician families of Florence. Of older lineage than the Medici, the Strozzi family was also as wealthy, and for these reasons they posed a challenge to Medici power. Filippo's father Matteo was exiled from Florence in 1434. Matteo died a year later, and Filippo's mother then returned to Florence with her children. Although Matteo was known as a humanist scholar, his son Filippo received a more commercial and vernacular education, learning reading, writing (especially letter writing), and arithmetic.

First Ventures

For both financial and political reasons, Strozzi was apprenticed abroad at age thirteen. After working in Sicily, he joined the firm of his father's cousins, working at their various foreign branches and rising from apprentice to junior partner. By 1447, Strozzi had been working for Niccolò Strozzi in Naples, trading cloth and grain and providing credit to the Neapolitan court. He was frustrated by his limited status, for despite his mother's support, he did not have sufficient capital to found an independent business. Furthermore, he also was sentenced to exile in 1458 and could not return to the city he loved.

Mature Wealth

Strozzi's fortunes improved in the early 1460's. His support for King Ferdinand I of Naples against his barons made him one of the king's close advisers. Strozzi served as managing partner of the Naples bank when Niccolò Strozzi moved to Rome. After much effort, Strozzi's exile was lifted in 1466. Finally, in 1468, Niccolò died without heirs and left Filippo half of his estate. By 1470, Filippo Strozzi had status, political clout, and a large amount of capital. He returned permanently to Florence.

In the next two decades, Strozzi amassed astounding wealth from his endeavors in banking, trade, real estate, and probably usurious personal loans. Detailed records chart how his personal worth climbed from 32,649 florins in 1471 to 112,281 florins in 1483. Although he loaned money to kings and popes, he managed to avoid the devastating entanglements that led others into bankruptcy. Perhaps because he kept unusually large cash reserves, he could weather economic downturns. At his death in 1491, he was worth 116,255 florins.

Strozzi dedicated the last decade of his life to architectural projects. In the largest of these, he renewed and beautified the Strozzi quarter of Florence through the construction of an immense palace. He began to acquire the necessary land by 1470; foundations were laid and construction began in 1489. The building was unfinished at his death, but his will provided for its completion by his heirs.

Legacy

After his father's disgrace and exile, Filippo Strozzi reestablished his family's fortune and prestige. After making a number of religious bequests, he left the bulk of his wealth to his children. His dynastic concerns are clear from his will, most of which deals with the completion of his palace and his attempts to ensure that it remained in the hands of the Strozzi family. His efforts were successful, for the Strozzi family remained powerful into the eighteenth century.

His palace is his lasting monument. Its construction was an urban renewal project that beautified the neighborhood long associated with his family. Strozzi's personal and family emblems decorate the structure and announce his importance. In late fifteenth century Florence, not even the Medici could match the palace's grandeur.

Süleyman the Magnificent

Ottoman sultan and military leader

Süleyman the Magnificent earned his sobriquet during a long reign as sultan of the Ottoman Empire. Although he was a feared military leader, a capable administrator, a dynamic builder and reformer, and a noted poet, he most impressed visitors with the splendor and opulence of his fabulous palace compound.

Born: 1494 or 1495; probably Constantinople, Ottoman Empire (now Istanbul, Turkey)
Died: September 5 or 6, 1566; near Szigetvár, Hungary
Also known as: Süleyman I; Süleyman Kanuni; Suleiman I; Suleiman the Magnificent; Suleiman the Lawgiver; Suleiman the Great
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Children

Early Life

Süleyman (sew-lay-MAHN) the Magnificent was the only son of Selim, who as Sultan Selim I ruled the Ottoman Empire from 1512 through 1520; Süleyman's mother was Aisah Sultan. By the time of Süleyman's birth, the Ottoman Empire was the dominant power in southeastern Europe and the eastern Mediterranean and included what is now Turkey and the Balkan countries. Süleyman's father, Selim I, extended the empire, establishing Ottoman rule in Egypt, and Süleyman would continue this expansion.

As a boy, Süleyman grew up in the Topkapi Palace at the empire's capital at Constantinople (now Istanbul), where he received a fully rounded education in religion, history, science, literature, art, and military strategy. After his father became sultan, the teenaged Süleyman was appointed governor at outposts on the Black Sea, in Armenia, and in western Turkey in order to learn how to administer the powerful and far-flung empire.

Upon his father's death in 1520, Süleyman ascended to the Ottoman throne as the tenth sultan. He immediately embarked upon military campaigns, waging constant warfare throughout his reign. In 1521, he captured Belgrade, an important stronghold of the Kingdom of Hungary. The following year, he captured the Christian-held island of Rhodes. In subsequent battles, Süleyman. leading seasoned, professional troops and commanding vast fleets of ships, would defeat Hungary, besiege Vienna, encroach deep into Persia (now Iran), dominate North Africa, and sweep across the Mediterranean, greatly expanding the Ottoman Empire.

First Ventures

These conquests added vast territories to the Ottoman sway and brought in enormous wealth in booty, tribute, and gifts that made Süleyman incalculably rich. This money was used to finance imperial troops, and untold treasure was spent to add to the glory of the sultan's residence at Topkapi. Süleyman expanded and renovated the palace compound until it covered about 700,000 square yards, adding kitchens, gardens, fountains, libraries, mosques, schools, aviaries, and stables. Sporting a huge turban, Süleyman received emissaries while sitting on a jewel-encrusted throne in a gilded hall, ate from solid gold plates, and never wore the same clothing twice. He enjoyed the favors of a three-hundred-woman harem, and one of the women, Roxelana, became his second wife.

Mature Wealth

Despite his opulent lifestyle, Süleyman was generous toward his subjects. He welcomed Christians and Jews into his domain and passed decrees protecting them. He freed slaves. He reformed outmoded laws governing criminal conduct, taxation, and inheritance. In Constantinople, he paid for the construction of many mosques, including the massive Süleymaniye Mosque, as well as schools, hospitals, public baths, aqueducts, bridges, and facilities for the poor. He rebuilt religious shrines in Mecca, Medina, and Jerusalem. He promoted a strong agricultural base to make his empire as self-sufficient as possible.

Even at the end of his long reign as sultan, the ambitious Süleyman continued to expand the sphere of Ottoman influence. In 1566, he died of natural causes while commanding his troops during another expedition to conquer the Hungarians.

Legacy

Middle Eastern culture flourished during Süleyman's reign. He was a devoted patron of art, literature, and music, and he became a renowned poet himself, using the pseudonym Muhibbi (lover). Süleyman's sponsorship resulted in the creation of artistic societies that attracted many of the empire's painters, jewelers, goldsmiths, and other craftspeople, and the members of these societies produced artworks and jewelry for the sultan and his court.

After Süleyman's death, the Ottoman Empire began a long, slow decline under the rule of weak, often incompetent sultans before dissolving in 1921 after more than six centuries. In the twenty-first century, many of Süleyman's architectural works continued to stand in Istanbul and elsewhere in Turkey, including the Süleymaniye Mosque, where he is buried. Remnants of his fabulous wealth can be seen in the imperial treasury at Topkapi Palace, now a museum that houses collections of porcelain, arms and armor, miniatures, portraits, and many priceless golden, bejeweled objects.

First Earl of Surrey

Norman military leader and landowner

The first earl of Surrey's service to William the Conqueror and his son, William II, enabled Surrey to achieve a position of prominence and great wealth in post-Norman Conquest England. For his years of faithful service, he received vast tracts of land, important posts within the government, and the earldom of Surrey.

Born: c. 1030; Bellencombre, Seine Inferieure, Normandy (now in France)
Died: June 24, 1088; Lewes, Sussex, England
Also known as: William de Warenne (birth name)
Sources of wealth: Conquest; government; real estate
Bequeathal of wealth: Children

Early Life

The first earl of Surrey was born William de Warenne around 1030. He was the son of Ralph, an insignificant member of the Norman aristocracy, and Emma, a woman about whom nothing is known. Even so, some studies assert that his lineage can be traced back to the family of Duke Richard I of Normandy. The surname "de Warrene" is almost certainly derived from the village or fortress of Varenne situated on the river of that name between Dieppe and Rouen.

First Ventures

If Surrey's story is not one of rags to riches, it is at least the story of a self-made man. His family inheritance was meager, consisting of a small amount of land in the vicinity of Rouen that remained in his father's hands until his death around 1074. Thereafter, Surrey shared the land with an elder brother named Ralph. Almost nothing is known of Surrey's youth, though there is every reason to believe that he had to don the trappings of warfare and master the art of horsemanship at an early age to survive in a strife-torn land. By the mid-1050's, Surrey had sufficiently proven his mettle, enabling him to earn a position of leadership in a Norman army dispatched to repel the French king and his allies, including his kinsman, the rebellious Roger of Mortemer. The invasion was thwarted and Mortemer stripped of his lands and castles. Some of these lands, including important castles at Mortemer and Bellencombre, were given to Surrey by the future king of England, William the Conqueror. Surrey was now a victorious general and a propertied lord. More important, he had gained the trust and patronage of the most important man of his day.

Mature Wealth

Little is known of Surrey's activities between the Battle of Mortemer in 1054 and the Norman Conquest in 1066, though it seems likely that his stature as a warrior continued to grow. Ordericus Vitalis, a monk chronicler, reported that Surrey was among the "illustrious nobles" summoned to advise William on the possibility of an invasion of England in order to claim the crown which William felt had been promised to him years earlier by his cousin, the recently deceased Edward the Confessor. Vitalis also lists Surrey as one of the men who fought by William the Conqueror's side in his 1066 victory against the English usurper King Harold II in the Battle of Hastings.

When William the Conqueror returned to Normandy in the spring of 1067, Surrey was one of four magnates entrusted with the governance of the realm in the king's absence. In this capacity, Surrey worked hard during the next twenty years, first for William the Conqueror and later for his son and successor, William II, in order to tame a land that was always ready to revolt. In 1068, Surrey marched against the English rebels in Yorkshire, and in 1071 he was among those dispatched to the fens of East Anglia to put down an uprising led by the outlaw Hereward the Wake. Although Hereward escaped the battlefield, the resistance was crushed. Other tasks soon followed. In 1075, Surrey and Richard de Clare, another trusted Norman lord, marched into Cambridgeshire to suppress an uprising led by Roger, earl of Hereford, and Ralph, earl of Norwich.

For his faithful service in these campaigns, William the Conqueror bestowed honors and responsibilities on his faithful servant, which made Surrey one of the greatest landholders, and, in turn, one of the wealthiest men in England. Surrey's first truly significant acquisition, probably for his heroic actions at the Battle of Hastings, was the so-called Rape of Lewes, one of five strips of land in Sussex created by the Conqueror for his tenants-in-chief. At some point in time, an impressive castle was constructed near the town of Lewes, which became the foundation of Surrey power in England. For his efforts against the English rebels in Yorkshire in 1068, Surrey was given Conisbrough, an important royal manor formerly held by Harold II Godwinson. Most of his concessions, dutifully recorded by the king's agents in the Domesday Book in 1086, were concentrated in Norfolk, where Surrey built a great manor house at Castle Acre. In the course of time,

The Earl of Surrey's Dynastic Line

Owing to some ambiguities in the works of Ordericus Vitalis, the most important contemporaneous source, there is some uncertainty about the point at which William de Warenne received the earldom of Surrey and became the first earl of Surrey. Vitalis suggests at one point in his narrative that some sort of grant within Surrey was conferred by William the Conqueror a few years after the Battle of Hastings in 1066. This point is echoed by Edward Augustus Freeman in his seminal work on the Norman Conquest. However, other historians, including William Hunt in his article in the *Dictionary of National Biography*, have argued that there is nothing in the records of the Conqueror's reign to suggest that Surrey bore the title of earl at this early date.

Most historians are of the opinion that Vitalis was correct, when, some pages later in his study, he gave William II the credit for conferring the title upon Warenne in 1088 as a reward for a lifetime of faithful service, or perhaps more particularly for Warenne's role in helping to suppress the great rebellion of that year staged by the followers of Robert Curthose. Although Warenne held the title for only a few months before his death on June 24, 1088, it did validate thirty-five years of faithful service to William the Conqueror and William II and placed him and his heirs among the elite lords of the realm for many years to come.

Most members of the Surrey dynasty, including Warenne's son and grandson, the second and third earls of Surrey, respectively, worked closely with the Crown; a few labored in the other direction. All, however, were conspicuous for their actions, whether on the battlefield or within the government. It was not until John de Warenne, the eighth earl of Surrey, died in 1347 without issue and was succeeded by a nephew, Richard FitzAlan, the earl of Arundel, that the Warenne line died out. Not long thereafter, the earldom of Surrey fell into abeyance. In the sixteenth century, the title was revived and given to the current holders, the dukes of Norfolk, who, in memory of the Warenne family, have incorporated the Warenne coat of arms into their own.

Surrey acquired lands in twelve counties, including Suffolk, Essex, and Cambridgeshire.

There can be no doubt that Surrey was a dutiful servant, one of the very few Norman lords whose loyalty to the Conqueror never wavered. Yet there was a less admirable side to his character. In an effort to increase his wealth, Surrey did not hesitate to take lands from the laity or from the Church, sometimes through coercion, sometimes through outright theft. He seized lands from the bishop of Durham, the nuns of Wilton, and the monks of Ely, who never forgave him and resisted his wife's efforts years later to give them a sum of money in recompense. Between 1181 and 1183, possibly as a form of penance, Surrey and his first wife, Gundrada, a Flemish princess, undertook a pilgrimage to Rome. Although the political conditions in Italy prevented them from completing the journey, they were befriended by the monks of Cluny along the way. So favorably impressed was Surrey with their hospitality that a few years before his death, he founded a small Cluniac priory, St. Pancras, at Lewes, the first of its order in England.

Whether through legal or extralegal means, Surrey had become one of the richest men in England. He might have been content to spend his last years overseeing the management of his vast estates, manors, mills, tenants, and flocks, but it was not meant to be. In 1183, Surrey was among those dispatched to the Continent by William II to suppress an uprising led by Hubert de Beaumont, who had taken refuge in a fortress at Sainte-Susanne. Beaumont could not be dislodged and Surrey was wounded in the conflict, but the affair ended happily not long thereafter when the rebellious Beaumont was reconciled with the king. In 1088, Surrey was summoned to duty again, this time to deal with the Norman lords who had raised a rebellion on behalf of Robert Curthose, the king's brother and the duke of Normandy. This particular engagement would cost Surrey his life. Wounded in the Siege of Pevensey, Surrey was carried to Lewes, where he died on June 24.

Legacy

According to Ordericus Vitalis, the first earl of Surrey was one of the few Norman knights who "maintained their fealty to their sovereign and gave him useful aid, both with their arms and their counsels, against the common enemy." Indeed, as David C. Douglas points out in his biography of William the Conqueror, Surrey's life illustrates the heights to which a Norman knight of modest means might rise through hard work and faithful service to his feudal lord in an age of warfare and shifting loyalties. For his many years of service, Surrey received large tracts of land throughout England, and, at the end of his life, the earldom of Surrey. His great wealth allowed Surrey to become a patron of several monasteries. While the Cluniacs of St. Pancras Priory might be excused for their obvious religious bias, it was their opinion that the monastery Surrey founded in Lewes was his "noblest monument."

SURYAVARMAN II

Cambodian king and military leader

The greatest Khmer king, Suryavarman II strengthened the internal structure of his kingdom, increased territorial claims through frequent military campaigns that added wealth to the kingdom's treasury, and made extensive additions to the Khmer capital of Angkor, including the construction of the magnificent temple of Angkor Wat.

Born: Date unknown; Kingdom of Khmer (now in Cambodia)
Died: c. 1150; Kingdom of Khmer
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Relatives

EARLY LIFE

Suryavarman (soor-yuh-VAWR-muhn) II was the son of a Khmer provincial leader named Ksitindraditya and his wife Narendralashmi. In Sanskrit, Suryavarman's name means that he was protected by Surya, the Hindu sun god. Suryavarman grew up on the frontier of the Kingdom of Khmer, north of present-day Bangkok, Thailand, and more than two hundred miles away from Angkor, the religious, cultural, governmental, and economic center of the powerful Khmer kingdom. The Khmer empire existed from 802 to 1431 and at its height included significant portions of Cambodia, Laos, Thailand, Vietnam, Myanmar (Burma), and Malaysia.

An ambitious young prince, Suryavarman, while receiving the education to which the privileged classes were entitled, grew to believe that his family was a legitimate member of the royal lineage. He thus felt he had a rightful claim to the throne of the Khmer, and he soon began planning his ascent to the seat of power.

FIRST VENTURES

While still a young man, Suryavarman started his campaign for the crown by removing a southern rival from the competing line of Harsavarman III, a former ruler. This blatant power play forced the elderly Khmer leader, King Dharanīndravarman I, into a war against Suryavarman, his great-nephew. In the midst of a bloody conflict between the armies of the two men, Suryavarman made a bold move. He leapt upon the king's battle elephant and slew Dharanīndravarman.

Suryavarman was proclaimed king of the Khmer in 1113 and served in this position until his death in about 1150. He dipped liberally into the kingdom's treasury to shower faithful supporters and priests with gifts, such as golden palanquins, exquisite fans, jewel-studded diadems, and rings encrusted with precious stones. He vis-

Angkor Wat

The world's largest religious structure, Angkor Wat (*wat* is a Khmer term for "temple"), was begun early in the reign of Suryavarman II. Based on an inscription that uses his posthumous name, the temple was not completed until after he died in about 1150. It is estimated that some seventy thousand workers were employed during a forty-year period to build the temple, its connecting open-air galleries and gates, and its surrounding 4,000-foot-by-5,000-foot moat.

Considered a masterpiece of Khmer architecture, Angkor Wat features five towers: a stepped central tower rising 200 feet into the air and four smaller towers linked by covered galleries. These towers represent the quintuple peaks of mythical Mount Meru, the sacred center of the physical and spiritual universe for both Hindus and Buddhists. The five towers are elaborately and densely carved with depictions of more than eighteen hundred heavenly beings, and intricate bas-relief panels contained within and without show scenes from both Hindu legend and everyday life. Originally, the temple's towers were gilded, accented with silver, and decorated with thousands of inset pearls and precious stones. These treasures were probably stripped when the city of Angkor was conquered by the Thais in 1431.

One unusual aspect of Angkor Wat is that it was not dedicated to Shiva, the Hindu god of destruction, as were most of the other temples in Angor, but it was dedicated to Vishnu, the protector god. A second unique characteristic of the temple is that it contains depictions of Suryavarman II, both in carved relief and in cast bronzes that have survived into the twenty-first century, making Suryavarman the first Khmer king to appear in a work of art. This depiction of a living king was a departure from traditional practice, in which only deceased monarchs were portrayed, and it indicated to the Khmer people that Suryavarman should be considered not only a king but also a living god. As in the art of ancient Egyptian, Mayan, Aztec, and other lost civilizations, Suryavarman is portrayed on his temple and is considerably larger than his subjects. He is seen with a dead snake, a symbol that relates his seizure of the throne to an event from Hindu mythology. He is also shown riding an elephant, being saluted by an orchestra, enjoying the company of women, and with his conquering army. Everywhere, the bronze or stone images of Suryavarman are laden with objects symbolizing wealth and kingship. He wears a crown and pectoral badge of office, sports ornaments in his ears, and is decorated with bracelets, rings, and other jewelry. He is sheltered beneath parasols and is pampered by servants waving fans and fly whisks, the very picture of a divine ruler.

Once an endangered historical site, the city of Angkor and Angkor Wat have undergone restoration since 1907, although the battle to preserve the former Khmer capital continues into the twenty-first century. Cambodia paid homage to Suryavarman II by placing the king's temple on its national flag since the 1850's.

ited temples throughout the realm and presented them with golden figurines of Hindu gods. Suryavarman used a major part of the kingdom's vast resources to finance numerous military incursions that greatly expanded the kingdom on several fronts, although he suffered several expensive and humiliating defeats in attempting to invade what is now Vietnam. He increased the tribute acquired from subjects of the Khmer. He also spent enormous sums to improve the ceremonial and political capital at Angkor, founded in the late ninth century, spending an incalculable amount to construct his own monumental temple-mausoleum.

Mature Wealth

Despite Suryavarman's spendthrift ways, the unified Khmer kingdom thrived as never before during the first half of his reign. The kingdom, a monarchy-theocracy, was located in an incredibly fertile agricultural region united by common religious beliefs under the leadership of a semidivine king. When the monsoon rains flooded the Mekong River that ran through the heart of Khmer territory, rich silt was deposited, allowing a bounty of vegetables to be grown throughout the region. The Khmer network of irrigation canals and capacious reservoirs provided water to far-flung fields, permitting three or four annual harvests of rice; the surplus of the yearly yield of eleven thousand tons was sold for profit. The kingdom also exported lucrative spices, such as sesame, cardamom, nutmeg, cumin, coriander, mustard, fennel, ginger, and cinnamon, as well as honey, sugar, camphor, and fruits. All such products were taxed, and the resulting revenues flowed into Suryavarman's coffers.

Early in his reign, Suryavarman eliminated a potential threat to his throne and gained an enthusiastic trading partner by initiating a diplomatic relationship with China. Khmer ambassadors visited the Chinese emperor in 1116, 1120, and 1128 to negotiate agreements regulating commerce between the two empires.

Suryavarman spent freely, and in its heyday Angkor must have amazed visitors to the capital city. Everywhere, the towers of magnificent temples glittered with gold or gleamed of copper. Golden lions guarded a bridge made of gold. The king resided in a palace beneath a golden minaret, where half-ton vessels of gold and silver served as decorations and everyday dishes were made of gold inset with precious stones or pearls. Expensive Chinese silks, handcrafted parasols, and fans were commonplace. The air was fragrant with costly sandalwood incense. Rest stations were strategically located to assist travelers, and hospitals offered health care to the ill or infirm.

The second half of Suryavarman's reign was less successful. He stubbornly continued to expend considerable time, energy, and assets in fruitlessly assailing two rival kingdoms in what is now Vietnam—Dai Viet, where he fought from 1126 through 1134, and Champa, where he waged war from 1145 through 1150. The expense of his expansionist policy was ruinous. Since little new territory was gained, Khmer farmers were hard-pressed to produce the surplus necessary to finance the wars. Khmer soldiers were exhausted from the constant battles and dispirited from their failed invasions. The kingdom's treasury was depleted from the glut of building in Angkor and from the cost of mounting elaborate military campaigns, including the ill-fated outfitting of a fleet of seven hundred ships for an attack upon Vietnam by sea in 1129. By the middle of the twelfth century, the Khmer kingdom was close to bankruptcy.

At this crucial juncture, Suryavarman II died, perhaps while engaging in yet another military invasion of Champa. A cousin, the son of his mother Narendralashmi's brother, succeeded Suryavarman as king of the Khmer; the new king was ironically named Dharanīndravarman II, after the king Suruyavarman had deposed. Compared to his dynamic predecessor, Dharanīndravarman II was a dull, weak ruler who could only inspire plots to replace him. From its apex during the harmonious, prosperous first fifteen years of rule under Suryavarman II, the Kingdom of Khmer went into decline. Internal dissension led to feuding among claimants to the throne, and the empire began to fragment.

By the early thirteenth century, construction in Angkor, a continuous activity in the city since its founding, had ceased. Because the reservoirs and irrigation ditches were no longer maintained, the canals became clogged with silt and thus unusable, causing farmers to seek greener, more productive land in other locations. Once the structure of their civilization collapsed, the Khmer faded into the jungle, abandoning Angkor and other population centers. By the mid-fifteenth century, not long after the Thais captured Angkor in 1431, essentially ending the Khmer empire, the magnificent former capital of the mighty Khmer was a vine-covered ghost town, and it would remain so until its rediscovery in the late nineteenth century.

Legacy

Suryavarman II came to power during a tumultuous time in Khmer history. He seized control of the kingdom and instituted a brief golden age, uniting the various factions of the kingdom under a strong, visionary ruler and developing the area's agriculture into a smoothly running, income-producing industry. A portion of the kingdom's riches was reserved for military conquest in order to gain lands vital to sustaining the agricultural economy. While Suryavarman was victorious in military campaigns in the west, south, and north, his eastern campaigns proved to be his undoing.

During his reign, much of the national wealth was returned to the populace in the form of improved irrigation, and the capital of Angkor was transformed into a resplendent ceremonial showpiece, boasting fabulously rich trappings and comfortable amenities. Suryavarman also built many shrines and temples in outlying areas of the empire, including Banteay, Samre, Thommanon, Beng Mealea, and Chau Say Tevoda, for subjects who could not visit the capital. For those who could visit Angkor, the centerpiece was Suryavarman's awe-inspiring, indisputably unique contribution to the kingdom's history—the temple of Angkor Wat.

First Duke of Sutherland

British aristocrat, landowner, and diplomat

Sutherland was one of the richest men in nineteenth century Europe. He used his wealth to promote railway development in the heart of industrial England, and he and his family attempted to alter the traditional agricultural society of the Scottish Highlands.

Born: January 9, 1758; London, England
Died: July 19, 1833; Dunrobin Castle, Sutherland, Scotland
Also known as: George Granville Leveson-Gower (birth name); Earl Gower; second marquess of Stafford; George Levenson-Gower; Viscount Trentham
Sources of wealth: Inheritance; real estate; railroads; investments
Bequeathal of wealth: Spouse; children

Early Life

The first duke of Sutherland was born George Granville Leveson-Gower in London on January 9, 1758. He came from an aristocratic family; his father, Granville Leveson-Gower, was the first marquess of Stafford, and his mother, Lady Louisa, was the daughter of Scroop Egerton, the first duke of Bridgewater. Young Sutherland, who was titled Viscount Trentham until 1786, was educated by a private tutor at Westminster and subsequently at Christ Church College, Oxford University, where he studied botany and Latin, French, English, and Italian literature and language. He made his first visit to Scotland in 1780 and also visited Ireland, acquiring opinions of the social improvements and political policies of both countries. In the early 1780's he traveled on the Continent, visiting France, Germany, Austria, Italy, and the Low Countries.

The wealth of the Levenson-Gower family originated in the English Midlands, where they owned land and were involved in industry and investments in Staffordshire and Shropshire. Through the years, the family increased its wealth by marrying rich heiresses. Sutherland continued this tradition by marrying Elizabeth Gordon, countess of Sutherland, in 1785. This marriage represented the convergence of two old families—one English, the other Scottish—with a vast combined ownership of land, magnificent country houses and castles, and political influence.

First Ventures

Sutherland held his first seat in Parliament in 1778 as the member for Stafford. He was appointed the British ambassador to Louis XVI of France from 1790, but he was recalled two years later because of the French Revolution. Sutherland was active in politics as member of Parliament for his family home counties until he was called to the House of Lords in 1798.

Mature Wealth

In 1803, Sutherland's maternal uncle, the duke of Bridgewater, died, and Sutherland inherited ownership of the Bridgewater Canal, as well as Bridgewater House, with its extensive galleries and art collection, to which he added his own art collection. He enlarged and improved Bridgewater House at considerable expense, and Sutherland opened his private art collection to the public. Sutherland's father also died in 1803, and he became the second marquess of Stafford, inheriting the family land and estates in Staffordshire and Shropshire. He continued to improve and manage his estates, land, and businesses in the Midlands with the help of estate manager James Loch, spending substantial sums remodeling the family's country houses. With his fertile land occupied by rent-paying tenants, the lucrative Bridgewater Canal, and coal and pottery businesses, Sutherland greatly increased his fortune.

Sutherland had retired from politics by 1812, devoting himself to the renovation of his estates and to patronage of the arts. At this time, he turned his attention to the improvement of his property in Sutherland, a peninsula in the far north of Scotland. His policies for economic reform of these estates, known as the Highland Clearances, were and remain highly controversial. His family's vast highland properties existed in virtual isolation from the rest of the world. The area's population lived a traditional, preindustrial lifestyle, raising cattle, oats, and potatoes in the interior at subsistence level. Sutherland spent considerable funds to develop the highlands by building roads and bridges. At the same time he conceived the plan of moving the population to the coast, developing fisheries and coastal industries, encouraging emigration, and converting the vacated interior glens to sheep pasturage. His attempts to execute this policy resulted in coercion and violence, and he was accused of destroying the traditional language and culture of the Scottish Highlands. Sutherland took money from his more fertile English estates in order to renovate his Scottish estates, which never became profitable.

The British Midlands, where Sutherland's family estates were located, was an area of rapid industrialization in the late eighteenth and early nineteenth centuries. This area encompassed the industrial cities of Manchester, Birmingham, and Liverpool. Stafford owned the Bridgewater Canal, which linked Liverpool and Manchester at a time when canals were a significant industrial transportation system. Sutherland realized that canals would eventually be replaced by railways, and in 1826 he began investing in the newly developing railroad industry. He was a major investor in the pioneering Liverpool and Manchester Railway, and he later financed an expansion of this railroad in order to connect it with the city of Birmingham. At the time of his death, a significant portion of his capital was invested in railways, along with other industrial and transportation stocks.

In 1827, Sutherland acquired York House, thereafter known as Stafford House, which he lavishly furnished and decorated at great expense. Stafford House was the largest and most extravagant of London's great town houses and would become a center of London society.

Before he died in 1833, he was elevated as the first duke of Sutherland. He died at Dunrobin Castle, the fam-

Stafford House

Stafford House, now renamed Lancaster House, is a mansion situated at the bottom of Green Park facing St. James's Park in the West End of London. The structure has been called London's greatest town house. The visual impact of this freestanding Palladian-style mansion, flanked by terraces and clad in Bath stone, is palatial. The interior, decorated in the style of Louis XIV, is dominated by a grand staircase, leading from the ground floor to the state apartments, and a long gallery on the first floor.

Originally called York House, construction of the town house began in 1825 as a residence for Frederick, duke of York and Albany, the second son of King George III. However, the duke became mired in debt, and when he died in 1827, the structure had not been completed. Upon his death, the land on which the residence was located was leased from the Crown, and the mansion was purchased by the first duke of Sutherland, then the marquis of Stafford, who renamed it Stafford House and modified the design to include gallery space for his private art collection. Construction proceeded gradually, initially commissioned by the first duke of Sutherland and then by his son, the second duke. The mansion, with its opulent interior decoration, was not completed until 1842, and it subsequently became a center of social life in London during the Victorian era. The house was used for grand receptions and lavish entertaining. Queen Victoria and Albert were frequent guests, as were many heads of state, politicians, and celebrities.

Both the first and second dukes of Sutherland were active art collectors. Until 1913, the galleries of Stafford House held one of the most important private collections of paintings, books, furniture, and objets d'art. The house and its collection were open to the public. However, the Sutherland family's fortune declined, and the mansion, designed for a formal lifestyle and to be maintained by a large household staff, became outmoded. The third and fourth dukes of Sutherland began to sell the art collection. In 1912, the fourth duke sold the house and the art that remained there; the rest of the collection had already been moved to the family's other residences or dispersed to museums, galleries, and private collections.

The Stafford House was purchased by William Lever, an aristocrat and industrialist, with the intention of converting it to a museum. He donated the house to the nation of Great Britain and changed the name to Lancaster House, and the London Museum was housed there until shortly after World War II. After the war, Lancaster House was used to entertain foreign dignitaries and was the site of international conferences. In the twenty-first century, the building is managed by the Foreign and Commonwealth Office and is a venue for conferences, meetings, and entertaining.

ily seat in Sutherland, on July 19, 1833. At the time of his death, he was the wealthiest man in Great Britain and Europe, with his holdings in land and stocks valued at more than £1 million.

Legacy

The first duke of Sutherland's life and work illustrate the uses of aristocratic wealth during the early nineteenth century. He not only was involved in the economic and social changes of his era but also was known for his extensive patronage of the fine arts. He continued the family tradition of buying and exhibiting an impressive collection of Old Masters, while also supporting contemporary British artists. He financed awards, encouraged exhibitions, and was a benefactor of the National Gallery of Painting. His own extensive collection, both inherited and purchased, was displayed to the public at Bridgewater House and at Stafford House. The inherited wealth of the Sutherland family allowed a succession of dukes to live an opulent lifestyle, dominating London society in the Victorian era.

LOUIS F. SWIFT

American meatpacking magnate

As head of Swift & Company, the firm his father founded, Swift made the company the world's largest meatpacker, with annual sales climbing from $200 million in 1903 to $700 million in the late 1920's.

Born: September 27, 1861; Sagamore, Cape Cod, Massachusetts
Died: May 12, 1937; Chicago, Illinois
Also known as: Louis Franklin Swift
Sources of wealth: Inheritance; sale of products
Bequeathal of wealth: Children

EARLY LIFE

Louis Franklin Swift was the son of Gustavus Franklin Swift and Anna Maria Higgins Swift. He grew up in several towns in Massachusetts, where his father moved to establish meat markets. Swift's introduction to the meat-processing business occurred before his teen years, when he held a lantern so his father could butcher a steer. In 1880, he married Ida May Butler, and the couple had six children. At his death in 1937, only a son, Louis F. Swift, Jr., and a daughter, Ida May Minotto, survived.

FIRST VENTURES

At an early age, Swift became a cattle buyer for Swift & Company, the firm founded by his father. When the family moved to Chicago, Swift became head of the firm's pork division; two of his brothers managed the cattle and sheep divisions. In 1885, Swift became treasurer of the company when it was incorporated. The firm's capital

Louis F. Swift, right. (©Bettmann/CORBIS) value was $200,000, but in three years this amount climbed to $2 million because of the company's rapid growth.

Among other management concerns, Swift focused on the use and production of meat by-products. No part of an animal was to be thrown away. The lesser cuts of meat, such as liver or kidney, were sold in poorer areas of town. The fat was made into soap and the bone into knife handles. Swift & Company's margin of profit was so small that the sale of by-products often made the difference between earning a profit or operating at a loss.

Mature Wealth

At his father's death in 1903, Swift became president of the company and continued to expand the firm. Swift & Company had already started using iced railcars to keep meat fresh when it was shipped from the firm's slaughterhouses to various locations, especially the East Coast. The number of slaughterhouses had multiplied from one in Chicago to several others in prime locations. As refrigeration techniques developed and railroads expanded, Swift & Company was able to ship a larger volume of clean, dressed meat to markets all over the United States. The company also sold a significant amount of its products overseas.

Swift revered his father and tried to maintain the principles that his father had used to start and build the business. Among these principles were honesty, cleanliness, and wasting none of the animal. Swift followed his father's example by rewarding his employees for good work, not by praise but by salary increases, promotions, and chances to advance. He advised his workers to buy shares in the company because employees with financial stakes in the firm were more likely to work hard and would also increase their incomes. The company also established an employee benefit association.

Swift retired in 1932, becoming chairman of the board of his company that same year. Before his death on May 12, 1937, he had been in the hospital for several weeks but had not been considered seriously ill.

Legacy

Under Louis F. Swift's leadership, Swift & Company provided millions of people with clean, fresh, and high-quality meat. Before his company started shipping processed meat, people obtained beef and pork at the local butcher shop, where these products were often unclean and unregulated. Swift also helped his company develop canned meat, which could be shipped to customers worldwide and was an essential part of soldiers' diets during World War I.

In July, 2007, Swift & Company, based in Greeley, Colorado, was acquired by JBS S.A., the largest beef processor in South America and one of the largest worldwide beef exporters. Two months before the sale, Swift & Company reported that it had $9 billion in annual sales, was the world's third-largest processor of beef and pork products, and was the largest beef processor in Australia.

Henry Sy, Sr.

Filipino retail magnate and investor

Sy employed keen business insight, determination, and available resources to rise from poverty and become the richest man in the Philippines. In the process of building his wealth, Sy developed a new approach to shopping in the Philippines, earning the moniker "Father of Philippine Retailing," and created a foundation to help local residents.

Born: December 25, 1923; Ang-khue, Dieng-oh, Jinjiang, China
Also known as: Sy Chi Sieng; Shi Zhi Cheng (birth name); Father of Philippine Retailing
Sources of wealth: Retailing; real estate; investments
Bequeathal of wealth: Spouse; children; charity

Early Life

Henry Sy (see), Sr., the son of Henry H. Sy, was born in 1923 in a small village in China. When he was twelve years old, Sy traveled to Binondo, a district of commerce and trade for Chinese merchants in Manila, Philippines, where he joined his father, a shopkeeper with a *sari-sari* store, a privately owned convenience shop. Times were tough in 1936, and young Sy spoke no English, nor did he speak Tagalog, the principally spoken Philippine language. Despite these obstacles, Sy enrolled in the local school system and sold merchandise in his spare time. He completed elementary school. During World War II, his father's store was looted and his father returned to China, but Sy remained in the Philippines.

First Ventures

Sy's first business venture was selling American shoes brought to the Philippines by U.S. military personnel during World War II. In 1948, Sy opened a shoe store in the Quiapo district of Manila. Despite his previously minimal formal education, Sy successfully completed entrance requirements to enroll in an associate of arts degree program in commercial studies at Far Eastern University. The shoe entrepreneur traveled to the United States in 1955 to familiarize himself with new marketing techniques. Three years later, he applied his newfound knowledge by opening an American-style shoe store in Manila. The success of ShoeMart, later abbreviated to SM, led to the addition of two branch stores.

Mature Wealth

Since shoes were a limited commodity, in 1975 Sy chose to broaden his business enterprise by opening an integrated department store. Ten years later, despite the political and economic instability in the Philippines, Sy opened the SM City North EDSA supermall, which at-

Henry Sy, Sr., sits in a wheelchair as he is being escorted by his grandson Hans Sy, Jr. (AP/Wide World Photos) tracted more than 200,000 daily visitors. This mall was only the first of many to come. Among the most notable of his thirty malls are the SM Megamall, opened in Manila in 1991; a mall in Fujian Province, China; a mall in Guam; and the SM Mall of Asia in Manila. Each of these malls included a source of entertainment, such as a skating rink or IMAX film theater. Although Sy went into business in the 1940's, his first major financial success did not occur until he opened his malls in the 1980's.

In the process of building his retail empire, Sy diversified his interests to include retail merchandising, real estate (including residential towers), and financial services. Initially, Sy kept his business ventures privately owned, at least within the family, but in 1994, SM Prime Holdings, the shopping mall portion of the family subsidiary, went public. The firm was to become the highest revenue-producing company on the Philippine Stock Exchange.

By 2010, Sy's business interests included the SM Department Store, Inc., SM Investments, SM Development Corporation, SM Funding, and SM Keppel Land, Inc., as well as other corporations. Banking mergers gained Sy an additional $1.4 billion in 2007. In 2008, he obtained a 60 percent interest in the National University in Manila. That same year, his net worth was estimated at $3.1 billion. Sy continued to be an adviser and chairman for several company boards and to insist that his business operations be family-oriented. His wife, Felicidad Tan-Sy, and six children, Teresita, Elizabeth, Henry, Jr., Hans, Herbert, and Harley, became integral to company operations.

Legacy

Henry Sy, Sr., came from an underprivileged childhood in a small village in China and rose to become the founder and chair of SM Prime Holdings, the largest retailer and shopping mall owner in the Philippines. He is the wealthiest man in the Philippines, with several residences, including a $2 million log cabin, yet he has not forgotten his past. His conglomerate, the SM Group of Companies, operates the SM Foundation, which supports education, outreach programs, health projects, and religious organizations in communities surrounding his malls. In 2009, Sy was selected by *Forbes* magazine as that year's Hero of Philanthropy.

TAN KAH KEE

Chinese industrialist

Tan was a successful Chinese-born businessman who built numerous industries in Singapore and Malaysia. He established and funded the prestigious Xiamen University, the only mainland Chinese university founded by a Chinese native living outside the country.

Born: October 21, 1874; Jimei, Xiamen, Fujian Province, China
Died: August 12, 1961; Beijing, China
Also known as: Chen Jiageng; the Rubber King
Sources of wealth: Agricultural products; trade; shipping
Bequeathal of wealth: Educational institution

EARLY LIFE

Tan Kah Kee was born in Jimei, a fishing village on the outskirts of Xiamen in Fujian Province in southeast China. His father was Tan Kee Pek, and his mother was known as Madame Sun. Tan had a brother, Tan Keng Hian, and six adopted brothers, who were the sons of his father's concubines. When Tan Kah Kee was eight, he entered the village Confucian school. When he was sixteen, he left school to travel to Singapore in order to apprentice in Chop Soon An, his father's rice company. At this time, Singapore was part of British Malaya. The Chop Soon An company imported rice from Thailand and sold it to retailers in Singapore. It was a flourishing business but made little profit, largely because Tan Kee Pek spent his time managing his other business ventures, a sago factory and real estate, as well as smoking opium and consorting with concubines.

When Tan Kah Kee was nineteen, he returned to Jimei to marry Teo Po Ke, who lived in the neighboring village. In 1895, he returned to Singapore to assist his father in opening a pineapple plantation. His father's operations were worth about 400,000 Singapore dollars, equal to about $4 million in 2010 U.S. currency. In 1900, Tan returned to China to begin a construction project, in which a large section of Xiamen that had been destroyed by fire was rebuilt. When he returned to Singapore in 1903, he found his father deep in debt and Chop Soon An in crisis. Tan realized that there had been massive embezzlement by one of his father's adopted sons. He took over his father's business, reorganizing its operations and its debts.

FIRST VENTURES

Tan founded his first firm in 1904, the Sin Lee Chuan pineapple company outside Singapore. He was soon making a profit of 40,000 Singapore dollars from this venture. He then established the Kiam Aik rice company, and in 1905 he began to create a pineapple plantation. The plantation was well run and Tan had enough money to establish the Hock Shan rubber plantation in 1906. He sold enough rubber from his plantation to pay off his father's debts.

He soon moved into rubber manufacturing. His rubber operations were hugely successful and constituted the basis of his lifelong fortune. Tan automated his rubber factory and became known as "the Henry Ford of Malaya," as well as the "the Rubber King." By 1911, he was a millionaire. Tan used his profits to acquire his own shipping operation. In 1916, he bought his first steamer ship, the *Khiam Hong*, for $300,000; the next year, he paid $420,000 for the steamer *Warrimoo*. With his success in business, he began thinking of charitable endeavors, and his devotion to Confucianism led him to the field of education. He built several primary and secondary schools in his hometown of Jimei. On 1917, he founded a high school in Jimei that would become well known.

Tan's wife, Teo Po Ke, died in 1917. Tan and Teo had seven children. He eventually married three other women, Goh Shik Neo, Yap Kheok Neo, and Zhou, and with these wives he had eleven additional children. He also took several concubines.

MATURE WEALTH

Tan's proudest moment came in 1919, when he conceived of a new university in Xiamen, the first that would be funded by a Chinese native living outside the country. Ever since the attempted reforms of the Qing Dynasty, universities had played a critical social and political role in China. Peking University was founded by the Qing reformers in 1898, and this school played an instrumental role in the May Fourth Movement of 1919, in which student protesters denounced imperialism and the weakness of the Chinese government.

Xiamen University opened in 1921. Tan financed the school with profits from his businesses, which were considerable. In 1919, his assets were 4 million Singapore dollars; six years later, he was earning 8 million Singapore dollars a year and his total assets were worth 12 million Singapore dollars. His primary business was rubber, but he was also successful in other ventures, such as pineapple growing and canning, the manufacture of various products, shipping, sawmills, an import-export business, rice cultivation and trading, and real estate. The hub of his business empire, his rubber plantations and industry, was worth 6 million Singapore dollars. His enterprises employed more than thirty thousand workers, with 140 offices on five continents, and he conducted business with forty-eight countries.

Tan owned three mansions, including Carinhill, which boasted an extensive garden. He also owned a German-made luxury car, the Daimler 1314. He was president of the millionaires' Ee Ho Hean Club. Tan was the acknowledged leader of the Singapore Chinese community, and he founded several schools in Singapore, including the Chinese High School. During the 1920's, his income provided the only financial support for the Jimei schools and Xiamen University.

However, his businesses suffered during the Great Depression. Commodity prices throughout the world were deflated, and Tan saw the price of his rubber steadily decline. Nevertheless, he continued to support Xiamen University and various other schools. In 1934, he sold his businesses, retaining a fortune for himself of about 6 million Singapore dollars. During the next few years, he concentrated on guiding and funding Xiamen University. He also raised money to assist Chinese people who were suffering under the occupation of invading Japanese troops. In 1942, Tan fled to Java to escape the Japanese.

After World War II, he became disgusted with the corruption of the Kuomintang Party and looked favorably upon the Chinese Communists. After the Communist Revolution, he returned to China permanently on May 21, 1950. Chinese leader Mao Zedong apparently considered Tan one of China's national capitalists, and Tan was not mistreated by the Communists. Tan assumed minor administrative posts in the government but devoted most of his time to Xiamen University. He died in 1961, leaving an estate valued at $3 million. He bequeathed $2 million to the Jimei schools, and the remaining $1 million to other charities. Tan was accorded a state funeral with high honors. The major Chinese leaders—Mao Zedong, Zhou Enlai, Zhu De, Liu Shaoqi, and Madame Sun Yat-sen—attended his funeral to pay their respects.

WEALTH AND LEISURE

Great wealth implies leisure. For most of history, the majority of humankind's time has been dominated by the necessity of working for sustenance. Work hours were long, while free time was scarce. However, the wealthy did not share this burden. With riches came the ability to employ time as one chose, beyond the need to earn one's daily bread.

The philosopher Joseph Pieper, in *Leisure, the Basis of Culture* (1952), wrote that leisure is necessary for a life of cultural and intellectual accomplishment. For example, Chinese businessman Tan Kah Kee used his leisure time to write five books about Confucian thought and ethics. The economist Thorstein Veblen expressed a different opinion of leisure than Pieper. In *The Theory of the Leisure Class* (1899), Veblen coined the terms "conspicuous consumption" and "conspicuous leisure" to describe how wealthy people wasted their time and money in the pursuit of status.

During the twentieth century, the amount of leisure time expanded for all segments of society in many areas of the world. With an eight-hour workday, weekends, summer vacations, and long-lived retirements, as well as the growth of public parks, resorts, and cruises, leisure is no longer the exclusive province of the wealthy. However, some wealthy people continue to indulge in conspicuous consumption, leading extravagant lifestyles and pursuing expensive recreational activities.

Golf, sailing, and tennis have long been the forms of recreation that are most associated with the elite. However, the only sports that truly represent great wealth involve horses, because only the very wealthy can afford to purchase and maintain a stable of thoroughbreds. Wealthy people race horses, play polo on horses, and hunt on horses. The traditional sport of the English nobility was the fox hunt, in which hunters pursued the fox on horseback.

No single item, however, represents wealth and leisure more than the yacht. Greek shipping magnate Aristotle Onassis's chief residence was his yacht, *Christina*, which featured a bathroom that replicated King Minos's lost palace of Knossos. Arms dealer Adnan Khashoggi's yacht, *Nabila*, was sold to Sultan Hassanal Bolkiah of Brunei, who sold it to American real estate developer Donald Trump, who sold it in 1991 for $40 million to Saudi investor Al-Waleed bin Talal, who renamed it the *5KR*. Even the *5KR*, however, is dwarfed by the new breed of superyachts, equipped with every possible luxury, such as computer magnate Larry Ellison's *Rising Sun*; Microsoft cofounder Paul Allen's *Octopus*; the ruler of Dubai, Muḥammad bin Rāshid Āl Maktūm's, appropriately named *Dubai*; and Russian businessman Roman Abramovich's *Eclipse*, the largest of them all at 560 feet.

LEGACY

Tan Kah Kee was an outstanding businessman, who during his career founded thirty factories, one hundred stores, and several pineapple and rubber plantations. He was one of the leading rubber manufacturers in the world, and he also operated shipping, import-export, and real estate businesses. He contributed about 10 million Singapore dollars to various educational projects, which has been estimated as the equivalent of $100 million in 2010 U.S. currency.

Besides other educational ventures, he founded Xiamen University, which has continued to grow in importance as one of China's premier institutes of higher education. Since Tan founded the university in 1921, 150,000 students have graduated from the school. In 2009, Xiamen University comprised twenty-two schools, sixty academic departments, and ten research institutes and had 2,383 full-time faculty members. Its campus, sandwiched between the mountains and the ocean, is breathtakingly beautiful.

Jamsetji Tata

Indian industrialist

Tata is considered the father of Indian industry. He founded the Tata Group of industrial companies, which remained dominant in India into the twenty-first century.

Born: March 3, 1839; Navsari, India
Died: May 19, 1904; Bad Nauheim, Hesse, Germany
Also known as: Jamsetji Nasarwanji Tata; Jamsetji Nusserwanji Tata
Sources of wealth: Manufacturing; real estate
Bequeathal of wealth: Children; charity

Early Life

The lineage of the Tata family can be traced back to Sherirar, who was a Zoroastrian Parsi living in Gujarat around the tenth century. The Tata family meticulously kept its family tree from that point forward and records about twenty generations of Tatas before the birth of Jamsetji Nasarwanji Tata (jahm-SEHT-jee nah-sahr-WAHN-jee TAH-tah) in 1839. The men in each generation were priests in the town of Navsari in Gujarat.

Jamseti's mother and father were Nusserwanji Tata and Jeevanai Tata. Like his ancestors, Jamsetji received an education as a Zoroastrian priest, learning the prayers and scriptures of his religion. In 1852, his father moved the family to India's largest commercial city, Bombay (now Mumbai), to begin a trading business. Jamsetji attended Elphinstone Institution and College from 1853 to 1858. In 1857, he married Heerabai Daboo. The couple's first son, Dorabji, was born in 1859, and their second son, Rata, was born twelve years later.

In 1858, Tata began working in his father's trading business, Nusserwanji and Kaliandis. He traveled to Hong Kong to work in a branch of his father's company, selling cotton and opium to Chinese merchants in exchange for silk, tea, gold, and spices. From there, he trav-

The Tata Group

The Tata Group was the leading industrial entity of twentieth century India and a legacy of Jamsetji Tata. Since Tata's death in 1904, the majority of this conglomerate's chairmen have been members of Tata's family. His eldest son, Sir Dorabji Tata (1859-1932), became chairman upon his father's death. Dorabji opened three hydroelectric power plants and turned the Tata Iron and Steel Company (now Tata Steel) into the largest steelmaker in India. With great ambition, he moved the Tata Group into the manufacturing and provision of textiles, chemicals, electrical works, cement, tea, management services, and motor vehicles, and he opened the company's first overseas branch in London. Continuing Jamsetji's concern for worker conditions, Dorabji introduced the eight-hour workday for employees of Tata industries. He also created the Sir Dorabji Tata Trust, which performs educational and charitable work.

Sir Nowroji Saklatvala (1875-1938) was chairman of the Tata Group from 1932 until 1938, when Jehangir Ratanji Dadabhoy Tata (1904-1993) assumed the position. Better known as J. E. H. Tata or J. R. D. Tata, he expanded the Tata Group to include more than one hundred industries. He developed civil aviation in India and founded the nation's first commercial airline, Tata Airlines, which later became Air India. Tata Exports was established in 1962. Ratan Naval Tata (b. 1937) took over as chairman in 1991. He made Tata Motors a worldwide force in automobile production, and under his leadership Tata Telecommunications began doing business in 1996.

As of 2010, the Tata Group remained one of the world's largest industrial conglomerates. It was India's largest private sector employer, with a workforce of about 350,000. Tata Steel produced five million tons of steel annually, earning $4 four billion in revenue and employing forty-four thousand workers. Tata Motors was one of the largest automakers in the world, ranking second in the production of commercial vehicles, fourth in truck manufacture, and second in bus manufacture. Tata Tea supplied tea to 1.2 million retail stores. Titan Industries, a subsidiary of the Tata Group, was India's largest producer of personal accessories. Tata Chemicals was the second-largest producer of soda ash in the world. Voltas, another Tata Group subsidiary, was among India's leading air conditioning, refrigeration, and engineering services companies. Tata Consulting Services employed more than 130,000 trained information technology consultants in forty-two countries, generating revenues of $5.7 billion annually.

Reflecting Jamsetji Tata's philanthropic outlook, about 65 percent of the Tata Group is owned by charitable trusts created by Jamsetji and his descendants. Because an unusually large amount of the Tata Group's income is directed to philanthropic activities, such as support for the prestigious Indian Institute of Science in Bangalore, no member of the Tata family has enough "liquid capital" to be listed in the 2010 *Forbes* magazine list of the world's billionaires. However, in their creation and control of a nation's industry and their support of philanthropic activities, the Tatas have few equals.

eled to Singapore to set up a similar trading branch. Tata did well until cotton prices crashed in 1864.

First Ventures

India is a venerable and diverse civilization, recognizing many ethnic groups and religions. It is a sign of Indian tolerance that traditional minorities in India, such as Parsis, Jains, Ismāʿīlī Muslims, and Armenians, have been successful merchants. During the centuries when India was part of the Mughal and British Empires, the country benefited from the participation of various religious and ethnic groups in trading ventures. For example, Sir Jamsetjee Jeejebhoy, first baronet, was a well-known Parsi merchant of the early nineteenth century who amassed a huge fortune of 30 million rupees by trading with English businessmen. Jeejebhoy established more than one hundred charities in India and was the first Indian to be knighted and appointed a baronet.

However, while trade and agriculture were the backbone of the nineteenth century Indian economy, the nation had failed to establish a modern industrial sector. India's highly regarded merchandise, such as textiles and cotton, were primarily produced by human labor, without the aid of machines. It was Jamsetji Tata who would develop mechanized industries in India. He witnessed the progress of the Industrial Revolution in England and wanted to bring similar technology and manufacturing techniques to India. From 1864 to 1868, he studied industrial works in Manchester and other English cities.

Tata and his father earned a profit by providing supplies to armed forces of the British Empire during the 1868 Expedition to Abyssinia. With 21,000 rupees that he accumulated from this transaction, Tata purchased an oil mill in Chinchpokli that had gone bankrupt. He renovated the facility so it could produce cotton cloth, renaming it the Alexandra mill. In 1874, he opened a new cotton mill in Nagpur, which he named the Central India Spinning, Weaving and Manufacturing Company.

When Queen Victoria was declared empress of India in 1877, Tata renamed the facility the Empress mill, which signified both his loyalty to the British Empire and the beginning of the Tata industrialization of the Indian economy.

Mature Wealth

In 1886, Tata established the Svadeshi mill with the explicit goal of outperforming the British in cotton production. In 1887, he founded Tata and Sons, which would be the core of his industrial empire. Tata brought the Industrial Revolution to his mills, making them highly mechanized and continually seeking the latest technological improvements. He was a paternalistic boss, improving labor conditions and installing ventilation at his mills, which resulted in decreased employee absenteeism. In 1886, he instituted a policy for providing employee bonuses. The same year, he started an insurance fund for his workers and introduced a pension fund in 1887. Eight years later, he formed an accident compensation fund. Recognizing India's industrial needs, he set in motion plans for steelworks and hydroelectric plants.

Tata spent 600,000 rupees to build his splendid Esplanade mansion. He also used his wealth to improve educational opportunities for Indians. In 1892, he founded the J. N. Tata Endowment to pay for numerous scholarships, the recipients of which were known as Tata Scholars. In 1896, he donated fourteen buildings and 3 million rupees to establish a university. In 1903, he opened the magnificent Taj Mahal Palace Hotel in Bombay, which was operated as part of his India Hotel Company, indicating that he envisioned creating a chain of hotels. The Taj Mahal Palace cost £250,000 to build, the rough equivalent of about $200 million in 2010 U.S. dollars, and was the first luxury hotel in India. It also was the first building in Bombay with electricity, as well as American fans, German steam elevators, Turkish baths, and English butlers. Not long after the hotel opened, Tata became ill, and he died on May 19, 1904.

Legacy

Jamsetji Tata is the founder of modern industrial India. He introduced technological innovations to his cotton mills. With amazing rapidity he earned a great fortune, and he planned to use his wealth to industrialize the Indian economy by building a modern hotel, a university, steelworks, ironworks, and hydroelectric power. He lived to see only his hotel built. However, the university he endowed, the Indian Institute of Science in Bangalore, opened in 1909 and is one of the world's premier educational institutions. His plans for hydroelectric power came to fruition in 1910 with the opening of a Tata hydroelectric plant, and his planned steel mill, the Tata Steel plant in Sakchi, opened two years later. For the remainder of the twentieth century, the Tata Group of industries, with such major companies as Tata Motors, continued to lead the way in the industrialization of India.

On November 26, 2008, the Taj Mahal Palace Hotel, which Tata constructed in Bombay, was attacked by terrorists, and more than one hundred guests were killed. The hotel was badly damaged in the attack. However, in a demonstration of resiliency worthy of Jamsetji Tata himself, the hotel was swiftly rebuilt and reopened within a month.

Moses Taylor

American investor, banker, merchant, and industrialist

Taylor was one of the earliest American investors to amass great wealth through diversification of holdings, and his promotion of the utilities, railroad, and coal industries was instrumental in their growth. His management of City Bank was responsible for its development into one of the country's most prosperous financial institutions.

Born: January 11, 1806; New York, New York
Died: May 23, 1882; New York, New York
Sources of wealth: Banking; investments
Bequeathal of wealth: Spouse; children; medical institution

Early Life

Moses Taylor was born in New York City in 1806. His father was a successful businessman who served as an agent for John Jacob Astor, the wealthy fur merchant and New York power broker. Taylor completed his formal education at age fifteen and went to work as an apprentice, first for the firm of J. D. Brown and then for G. G. and S. S. Holland, merchants involved in the import and export business. For seventeen years he moved up steadily in the company, learning all aspects of the commodities trading business, so that in 1832, with $15,000 in savings and a $35,000 loan from his father, he was able to start his own mercantile firm. Shortly before he struck out on his own, he married Catherine Wilson; the couple would eventually have six children.

First Ventures

Taylor quickly proved to be a shrewd businessman and an even more competent investor. His import business, largely concentrated on bringing in sugar from Cuba, produced notable profits, and by 1838 he was worth $200,000. Never one to spend carelessly, he invested his earnings in various other businesses, particularly City Bank of New York. In 1837, Taylor was elected a director of the bank, putting him in a position to guide that organization's moneylending to merchants and allowing him to find appropriate investments for his own growing income. While he continued to work actively in his business, Taylor devoted considerable time to his duties at City Bank, even serving as interim president in 1842. He formally separated his commercial business from his investment activities in that year. Gradually, he became more active in the firms in which he was placing his money. In 1849, he admitted Percy Pyne as a full partner in his business and turned over many of the daily management tasks to him.

Mature Wealth

Free to pursue his interests in companies in which he had significant investments, Taylor gradually moved away from activities involving commodities trading into banking and investments in various industries. City Bank became the hub of his financial empire. His own money was deposited there, as were funds from the companies in which he had controlling interest. In 1856, he became the bank's president, a position he held until he died. Because Taylor insisted the bank maintain significant cash reserves, there was always "ready money" for loans to various commercial and industrial enterprises. The interest payments made by these enterprises allowed the bank to pay its shareholders (including Taylor, who held a majority of the bank stock) annual dividends of 10-20 percent. His position as a director of Farmers Loan & Trust gave him further opportunities to generate profits from mortgages and loans made to companies in which he was involved. Taylor's conservative banking policies helped City Bank (renamed National City Bank of New York in 1863) to weather three periods of financial crisis in the

United States, each time emerging as a stronger institution.

From his earliest days as a merchant, Taylor invested in local businesses other than his own, usually ones owned by fellow directors at National City Bank. He was heavily involved in the shipping industry until the advent of the Civil War, largely as a means of assuring deliveries between Cuba and his warehouses in New York City. In 1841, he became a principal shareholder in the Manhattan Gas Company, one of the city's suppliers of a commodity critical to providing light and heat before the rise of electrical power. As a director of this utility, Taylor took an active role in managing its operations and negotiating mergers or working agreements with competitors. He also put money into a number of other utilities in New York and New Jersey, eventually becoming a director of the New York Gas Light Company in 1865.

As early as the 1840's, Taylor began investing in railroads. By 1856 he was a major shareholder in the Delaware, Lackawanna & Western Railroad, one of the principal lines transporting coal from western Pennsylvania to the East Coast. He also invested in other rail lines in Pennsylvania, New Jersey, the Midwest, and the South. As was the case with most of his forays into enterprises other than his own firm, Taylor's general practice was to make a modest investment initially, and, if the venture showed promise, he would purchase sufficient shares to exert direct control over the railroad's operations. As an adjunct to his railroad ventures, he established the Jersey Shore Improvement Company, which improved land along the Hudson River that eventually was sold to the Delaware, Lackawanna & Western line, netting Taylor a profit of $400,000. Sometimes Taylor made money simply through extended loans to railroads in which he did not have controlling interest. For example, his decision to underwrite operations of the Pennsylvania & Reading Railroad brought him a profit of $750,000 in 1871.

Closely aligned with Taylor's investments in railways were his ventures in the coal and iron industries. In 1843, his involvement with the gas company led Taylor to invest in coal. Realizing that great profit could be made in businesses that served the needs of a growing industrial society, Taylor gained controlling interest in the Lackawanna Iron & Coal Company. In addition to mining, this company was involved in manufacturing rails for the growing railway industry. This enterprise alone brought Taylor significant revenues during the Civil War years, when the federal government took an active role in improving railway transportation in order to move troops and equipment. Taylor purchased stock in other coal companies and iron manufacturers and invested in other industries, such as zinc mining and manufacturing, further diversifying his holdings in businesses that were fueling the country's growth as an industrial power.

Throughout his career, Taylor invested in insurance companies, many of which provided underwriting for the companies in which he was a shareholder. In 1854, Taylor put money into Cyrus West Field's venture to lay a cable across the Atlantic, and in 1866 he saw his decision to back that enterprise come to fruition with the success-

Moses Taylor Hospital

In March, 1882, Moses Taylor made the most significant charitable contribution of his life—a donation of approximately $270,000 to establish a hospital in Scranton, Pennsylvania, for the treatment of employees of the Delaware, Lackawanna & Western Railroad and the Lackawanna Iron & Coal Company. Workers at these companies would receive free hospitalization and medical treatment for any reason, not just job-related injuries. Taylor's motives may have been philanthropic, but it is almost certain that practical business considerations entered into his decision. Workers in these companies were often injured, and providing them with adequate health care was a way to maintain good employee relations.

In 1884, Taylor's daughter and son-in-law made a $100,000 gift to the hospital fund, assuring that sufficient funds would be available to construct the medical center without resorting to borrowing.

Construction of the hospital took several years. When completed, the building occupied a city block in downtown Scranton. It opened its doors to patients on October 1, 1892. Four years later, a nursing school was established at the hospital, and a branch was opened in Buffalo, New York, another location where Taylor's companies were operating. The Buffalo facility closed in 1952. In Scranton, however, Moses Taylor Hospital remained an important fixture on the health care landscape. Gradually the hospital changed its policies to allow for treatment of patients who were not employees of the companies originally designated as beneficiaries of Taylor's bequest. Over the years the hospital was able to respond aggressively to changes in the health care industry. In the twenty-first century, Moses Taylor Hospital operated as a full-service community health care facility, employing more than 1,200 people, and it was part of the Moses Taylor Health Care System, which included another hospital and a multispecialty physicians' group.

ful installment of a transatlantic cable. When Fields's Anglo-American Telegraph Company merged with Western Union Telegraph Company in 1866, Taylor became a director of this company.

This diversified portfolio of investments generated increasingly large profits for Taylor. By the mid-1850's his annual income exceeded $250,000; a decade later it had risen to $1.4 million. These figures do not take into account the value of his investments, which ran well into the millions of dollars. He always had significant funds available for investment because he and his family lived comfortably but modestly. He did move several times to increasingly fashionable houses, eventually building a mansion on Fifth Avenue near Eighteenth Street in New York City and a vacation home in Long Branch, New Jersey. Nevertheless, his annual living expenses never exceeded $100,000, leaving him as much as $1 million in new income each year to loan out at interest or purchase stocks and bonds in companies he thought showed promise.

Although he was never a prominent figure on either the social or the political scene, Taylor occasionally became involved in both arenas. From time to time he donated modest sums and sometimes lent his name to committees raising funds to support civic causes. During the Civil War he was instrumental in getting the New York banking community to loan money to the federal government in order to support the war effort. Sadly, his involvement as a member of an audit committee in 1870 tarnished his reputation. One of three prominent financiers asked to examine the books of the city of New York just prior to an important mayoral election, Taylor provided an endorsement for the current administration, which had been portrayed by the media as exceedingly corrupt. He and his fellow committee members were immediately pilloried in the press as stooges of the Tweed Ring and Tammany Hall, which was believed to be controlling politics in the city for its personal profit. Even Taylor's reputation as an honest tradesman, financier, and industrialist could not save him from opprobrium.

Legacy

Estimates of the value of Taylor's estate made at the time of his death in 1882 varied widely, from a low of $30 million to a high of $50 million. Later valuations suggest the number was closer to $40 million (the equivalent of approximately $40 billion in 2000). Just before he died, Taylor donated approximately $270,000 to establish a hospital in Scranton, Pennsylvania, to care for workers at the Delaware, Lackawanna, & Western Railroad and the Lackawanna Iron & Coal Company. The remainder of his fortune passed to his wife and children.

His greatest legacy as a businessman, however, was his development of City Bank into one of the largest and most important financial institutions in New York City. From the foundations put in place by Taylor, this organization continued to grow in size and influence throughout the twentieth century. By the twenty-first century, the bank had become Citibank, one of the world's leading financial institutions.

Tenkamenin

Soninke caliph

Tenkamenin expanded the Ghana Empire to the height of its power and wealth. Although he enriched himself through taxes and tributes, Tenkamenin was also known to be a just and sympathetic king who went out among the people to hear their concerns.

Born: c. 1010; probably Ghana Empire (now in Mali, Mauritania, and Senegal)
Died: c. 1078; probably Ghana Empire
Also known as: Tunka Manin
Sources of wealth: Inheritance; government
Bequeathal of wealth: Unknown

Early Life

Tenkamenin (tehn-kah-MEHN-ihn) was probably born in the Ghana Empire around 1010. Nothing is known about the first half century of his life. The Ghana people, or the Wagadou, did not keep written records; what is known about them comes primarily from the accounts of an Arab historian who recorded his interpretations in 1067.

First Ventures

Tenkamenin became caliph, or ruler ("tunka" means "ruler" in the Soninke language), of the vast kingdom of Ghana in 1062 or 1063. According to custom, he inherited the throne from Bassi, his mother's brother. The common practice in sub-Saharan Africa at this time was for a single word to be used both for the name of a capital and for its ruler; thus, the word "Ghana" means "king" in Malinke. The empire, also called the Wagadou Empire ("Wagadou" means "land of the herds" in Soninke), covered the territory that is now western Mali, southeastern Mauritania, and eastern Senegal, northwest of the present country of Ghana. The empire was blessed with important natural resources: gold to the south, and salt, equally valuable, to the north. Ghana exploited both resources, and the empire served as a central point for trade between the ivory and gold producers to the south and the Berber traders to the north.

Mature Wealth

Collecting taxes from traders and tributes paid by conquered tribes brought Tenkamenin great wealth, and he lived and ruled in a splendid palace filled with sculpture and other art. According to the law, only the king could own gold nuggets. Other people were allowed to own gold dust, but in practice, all of the gold found in the kingdom belonged to the king. Tenkamenin's complex at Kumbi Saleh included temples to local gods, the burial chambers for his predecessors, and a prison for political prisoners. Under his rule, Ghana's trade in gold, salt, copper, and other commodities expanded significantly.

Tenkamenin was known for his spectacular appearance. He wore clothing trimmed in ivory, gold, and jewels, and he presented himself as a semidivine being and a democratic ruler whom his subjects were eager to serve and protect. His throne room, where he was known to listen attentively to the needs of the common people, was guarded by armed pages, vassals, and thoroughbred dogs wearing gold and silver collars.

Tenkamenin's palace was fortified and well defended, in part because the kingdom was periodically attacked by the Almoravids, led by Abū Bakr ibn ʿUmar. For several years, Tenkamenin fought off the Almoravids, drawing on his military forces that Arab historian al-Bakri (1014-1094) described as comprising 200,000 warriors, including some forty thousand armed with bows and arrows. In 1076, the Almoravids seized power and established Islam as the official religion of the region. These were not the first Muslims to inhabit the Ghana Empire; for many years, Muslims had worked as scribes and officials, and the capital city had a mosque.

Tenkamenin died about two years after the decisive invasion, possibly murdered by the Muslim prince Kema-Magha, and he was buried, with several of his retainers, under a mud and timber dome.

Legacy

Tenkamenin was the last king of the Ghana Empire and the last of the animist rulers before Islam became the dominant religion in the area. The Ghana Empire reached its peak under his rule. His insistence upon listening to the concerns of his subjects and seeking a more democratic form of government made his reign one of the great models of African rule. However, his kingdom disintegrated abruptly after the Almoravid invasion in 1076.

William Thaw

American railroad and canal executive

Through his ownership and management of Pennsylvania's canal system and of railroad lines in the East, Thaw improved the transportation system and thus the commerce of the United States.

Born: October 12, 1818; Pittsburgh, Pennsylvania
Died: August 17, 1889; Paris, France
Sources of wealth: Transportation systems; railroads; investments; real estate
Bequeathal of wealth: Spouse; children; charity; educational institution

Early Life

William Thaw was born in Pittsburgh, Pennsylvania, in 1818 to John and Elizabeth (née Thomas) Thaw, who were of Scots-Irish ancestry. John Thaw was the scion of a Quaker family who had lived for many generations in Philadelphia. He relocated from that city in 1804 to become chief clerk of a Pittsburgh bank. William attended the Western University of Pennsylvania (now the University of Pittsburgh). At the age of sixteen he had already been employed by the Bank of the United States to travel through the Ohio Valley on horseback in order to make collections. It may well have been on these journeys that his interest in the improvement of transportation was fostered. By the age of seventeen he was a clerk with a firm of merchants.

First Ventures

In 1840, Thaw and his brother-in-law Thomas Clarke became partners in Clarke & Thaw, a company that owned a number of canal boats and steamboats. In this era canals were a major factor in Pennsylvania commerce, especially because they had recently been linked by major land routes. With the completion of this linkage, an unbroken route from Philadelphia to western Pennsylvania was a reality. Clarke & Thaw's ownership of the Pennsylvania and Ohio Canal Line put the partners in a good position to profit from Pittsburgh's newly enhanced role in trade. In 1841, Thaw married Eliza Burd Blair, and the couple had two daughters and three sons. Eliza died in 1862.

Mature Wealth

During the fifteen years following the founding of Clarke & Thaw, the partners grew prosperous by transporting goods along canals and rivers. The partners were said to have a financial stake in at least 150 steamboats owned by various companies, including the Pittsburgh and Cincinnati Packet Line. In 1855, the partnership dissolved when Clarke and Thaw sold off their interests in canal transportation in order to concentrate on railroads, which by then were becoming increasingly important in the commerce of the United States. Thaw first entered the railroad business by working for the freight agents of the Pennsylvania Railroad.

A year or two later, he and Clarke reunited to form Clarke & Company, a freight company for goods being transported west from Pittsburgh. With the abundance of railroad lines, the shipment of freight was not only poorly coordinated but also quite expensive. Toward the end of the Civil War, a group of men working for the Pennsylvania Railroad introduced a system for economically transporting freight via different railroads through an entity called the Star Union Line. Thaw was one of these men, and he was in charge of the line from its establishment in 1864 until 1873.

During these years, Thaw was also second vice president of the Pennsylvania Company, which managed the several lines that the Pennsylvania Railroad operated north and west of Pittsburgh. In the 1880's, Thaw was a director of the Pennsylvania Railroad itself, providing oversight of the company's internal and financial affairs. At the same time he was a vice president of the Chicago, St. Louis and Pittsburgh Railroad. Thaw's other major positions included directorships of the Atlantic and Pacific Ship-Railway and the International Navigation Company. He also founded the East St. Louis and Interurban Water Company.

In his position at the International Navigation Company, Thaw was instrumental in the establishment of the first international shipping company, the Red Star Line. He had now become enormously wealthy, with a fortune estimated at between $8 and $12 million, an amount equivalent to hundreds of millions of dollars in the early twenty-first century. Thaw also had sizable investments in railroad and transportation companies, as well as in coal-bearing lands. When he died in 1889, he was considered to be one of the one hundred wealthiest Americans. Although Thaw was as rich as many of the "robber barons" of his era, he was generally considered an upright citizen who had made his money in an honorable fashion. Upon his death he seemed genuinely mourned by all who knew him.

Thaw had remarried in 1867 to Mary Sibbet Copley, with whom he had five more children, once again three sons and two daughters. Harry Kendall Thaw, a son from his second marriage, was to become one of the most notorious men in the United States at the beginning of the twentieth century. Harry, born on February 12, 1871, apparently was mentally unstable from childhood. His mother later claimed in court that his problems had started in the womb. As the son of the rich and revered William Thaw, however, Harry was given much latitude. Even though one private school after another proved unable to cope with him, he attended the University of Pittsburgh, as well as Harvard University, from which he was expelled for chasing a cab driver with a shotgun.

Because of Harry's instability, William Thaw had left his son's share of the vast inheritance in trust, and Harry was granted only $200 a month. However, his formidable but indulgent mother increased his allowance to $80,000 a year, a fortune at this time. This allowance enabled Harry to pursue his vices, which included gambling, drinking, using drugs, and pursuing usually unsuitable female companionship. It was during one of his carousals that he met the famed society architect Stanford White, also a connoisseur of young womanhood. The two men were almost immediately antagonistic toward one another, but their fatal encounter, often dubbed the Crime of the Century, resulted from a rivalry over Evelyn Nesbit. Nesbit, born in 1884, was a beautiful showgirl who had come to New York as a teenager, became an artist's model, and then was a stage performer in the renowned musical *Florodora*. She became White's lover when she was only sixteen. After their relationship ended, Harry began wooing her, and they were married in 1905. By this time, Harry was exhibiting signs

The Allegheny Observatory and the Thaw Memorial Refractor

The upgrading of the Allegheny Observatory in Pittsburgh was underwritten by William Thaw's largesse. In 1866, he gave the observatory a gift that paid off the facility's debt and provided an endowment for its ongoing operations. The progenitor of the observatory had been established in 1859 by a group of prominent citizens, known as the Allegheny Telescope Association, soon to be renamed the Allegheny Observatory Society. The structure itself was opened in 1861 and featured a 13-inch telescope, at that time one of the largest in the world.

The observatory was located on the campus of Thaw's alma mater, the Western University of Pennsylvania, and its first director was Professor Lucien Bradley. In 1869, the observatory was the first to broadcast time signals over telegraph lines to local businesses and the Pennsylvania Railroad. This service permitted the railroad to operate more safely and efficiently and partially paid the cost of the observatory's operations.

However, it was not considered a major observatory until its affiliation with the Western University of Pennsylvania (now the University of Pittsburgh) in the late 1860's. Its director at this time, Samuel Pierpont Langley, befriended Thaw, who had an abiding interest in science and whose grants to astronomical instrument maker John Brashear helped to make Pittsburgh a leader in that industry. Brashear later served as interim director of the observatory. Among the research conducted by the facility in this period were studies of lunar heat, the solar spectrum, and heavier-than-air flight.

Construction on a new observatory began in 1900. The new facility was dedicated in 1912 and continued to operate into the twenty-first century. It contains three separate telescopes, including the largest refractor in the United States—the Thaw Memorial Refractor. The 47-foot-long refractor was a gift to the observatory in Thaw's name by his son and namesake; this gift, donated in 1914, is reported to have been $125,000. Built by Brashear's optical company, the 30-inch lens of the telescope was designed to take photographs and was originally corrected for the focusing of blue light. In 1985, the original lens was replaced with one that is corrected to focus red light. By 2009, the telescope had taken approximately 110,000 exposures, and the observatory had one of the oldest and largest collections of photographic plates in the world. Most of these photographs aid in the study of stellar parallax (star distances), and the telescope is engaged in searching for planets around distant stars.

of insanity, including sexual sadism. He had never relinquished his hatred of White, and he increasingly brooded on the notion that the architect had "ruined" his wife when she was but an innocent girl. On June 25, 1906, Harry shot and killed White in front of hundreds of people at Madison Square Garden's rooftop theater. He was tried in 1907, and the case resulted in a hung jury. As part of Harry's defense, White was portrayed as a libertine and seducer of young women, while Harry was depicted in a sympathetic light. Some even lionized Harry for having protected his wife's virtue. Harry also claimed that he had been possessed by the spirits of dead people when he murdered White.

At his second, lengthy trial, Harry was adjudged to be insane and committed to a New York hospital for the criminally insane. He remained institutionalized until 1915, when he was considered to have regained his mental faculties. The vast wealth that William Thaw had bequeathed to his family had been liberally used by his widow Mary, who brought all her resources to bear on obtaining lenient treatment for Harry.

Nesbit had a son during the time Harry was hospitalized, but she claimed it was Harry's son, fathered when he bribed a guard for a conjugal visit. Harry denied it, divorced her upon his release, and continued his profligate ways. He lived another twenty-five years until 1947, continuing to be seen with much younger girls. Nesbit's notoriety resulted in her being cast in a few silent films and writing two books. She died in reduced circumstances at age eighty-two in 1967.

A heavily fictionalized film about Nesbit, *The Girl in the Red Velvet Swing*, starring Joan Collins, was released in 1955. The title referred to the red velvet swing that the married White maintained in one of his many love nests, on which he would push his young girlfriends while peering up their skirts for a sexual charge. It was rumored that Nesbit had posed nude on the swing for his delectation. The popular novel *Ragtime* (1975) by E. L. Doctorow also prominently featured the shooting scandal.

Legacy

William Thaw's organizational genius helped to bring order to the chaos caused by a multitude of railroads in competition with each other, thus benefiting the commerce of the United States. His charitable works were numerous, including the donation of considerable sums to his alma mater, the Western University of Pennsylvania. He also gave money to several other colleges and universities, including Harvard and Princeton Universities, churches (he was a Presbyterian), hospitals, scientific endeavors, and various charities. The problems of his scapegrace son Harry did not tarnish the elder Thaw's sterling reputation.

Israel Thorndike

American investor, merchant, privateer, and politician

Thorndike became a wealthy man through his investments in the maritime trade, the evolving textile industry, and transportation. He owned and commanded ships during the Revolutionary War and made his fortune trading with the West Indies and later the East Indies and China.

Born: 1755; Beverly, Massachusetts
Died: May 10, 1832; Boston, Massachusetts
Also known as: Colonel Thorndike
Sources of wealth: Trade; privateering; investments; real estate
Bequeathal of wealth: Children; educational institution; medical institution

Early Life

Israel Thorndike (IHS-ree-ehl THOHRN-dik) was the youngest of four children born to Andrew Thorndike, a farmer, and Anna Morgan Thorndike, a homemaker. When Israel was six, his father was lost at sea. Four years later, Andrew Thorndike was declared legally dead, and the bulk of his estate went to his eldest son, Joseph; Israel received £1 and 4 shillings. Israel was educated in the local public schools and apprenticed to a cooper, but he had greater ambition and was interested in both farming and the sea.

First Ventures

By the time he was seventeen, Thorndike was the proprietor of a shipping business, owning six fishing vessels and a three-eighths interest in a seventh; these fishing vessels were valued at £900. He also owned two small craft, valued at £600. In addition to being a ship owner, in 1772 he became a partner with Moses Brown of Waltham, Massachusetts, in a mercantile business, selling broadcloths, velvets, dress goods, and fishermen's supplies. On October 9, 1777, Thorndike married Elizabeth Trask, Brown's sister-in-law; they would have two children.

The outbreak of the Revolutionary War created another opportunity for Thorndike. The colonies lacked a navy, and in the fall of 1775, state governments began licensing privateers. These ships were to seize British merchant vessels that would then be sold at auction, with the proceeds to be distributed among the rebel ship owners and crews.

The Massachusetts legislature created a state navy, and Thorndike was commissioned as an officer, serving actively on various privateers. His first command in October, 1776, was the schooner *Warren*, a fifty-ton ship carrying sixteen guns. He also served on the *Tyrannicide* and the *Scorpion*. Throughout the Revolutionary War, he was the owner or part owner of several privateering ships. In 1779, he and Brown were among the owners of the *Black Prince*, carrying eighteen guns and 130 men, and the smaller *Defense*. Both ships were lost in a failed expedition against the newly established British base at Penobscot, Maine. In 1780, Thorndike went to sea again as master of the *Resource*, a ship with sixteen guns and a crew of thirty of which he was also a part owner. Thorndike was also involved in outfitting the *Scourge*, a ship with twenty guns and a crew of 120. His final venture in privateering during the Revolutionary War was on the *Shaker*. Unlike many ship owners, Thorndike and his partners did not lose a fortune, nor did they make one.

On October 20, 1783, Thorndike's wife died. He remarried a year later, and he and his second wife, Anna Dodge, had twelve children. Anna inherited more than $45,000 when her father, merchant George Dodge, died. A third wife, Sarah Dana, outlived Thorndike.

Mature Wealth

Thorndike realized that America's independence from Great Britain would affect the shipping business, and he embarked on new investments. In 1787, he and a group of Essex County businessmen invested in a toll bridge between Beverly and Salem, Massachusetts. As a prominent businessman, Thorndike was selected as a delegate to the Massachusetts constitutional convention. Thorndike was a Federalist, favoring a strong central government as beneficial to order and economic stability. The citizens of Beverly elected him to the lower house of the Massachusetts state legislature in 1788. A conservative politician, Thorndike was interested in legislation affecting business, and he was elected to the state legislature thirteen times.

Thorndike was part of a group of businessmen who incorporated the Beverly Cotton Manufacturing Company in February, 1789. This company was the earliest attempt to establish the textile industry in the United States; however, the enterprise was not successful. Thorndike was also involved in foreign trade, fishing, and coastal shipping. By 1789, he and Brown owned a fleet of sixty-seventy-ton schooners and a 243-ton ship, the *Fabens*. Thorndike's ships sailed regularly between

THORNDIKE NATURAL HISTORY PROFESSORSHIP

The Thorndike Natural History Professorship, also known as the Massachusetts Professorship of Natural History, was established on March 27, 1805. A group of prominent Boston-area citizens, including John Adams and John Quincy Adams, raised more than $30,000 to endow this professorship at Harvard College (now Harvard University), and the Agricultural Society of Massachusetts also supported the project and donated funds. Other subscribers made contributions ranging from $100 to $500, with businessman Israel Thorndike providing $500.

The first professor of natural history was to be chosen by the "great part" of the subscribers, with successors elected by Harvard College's president and fellows. Each professor who held the position was required to be a master of arts, a Protestant, and of "good moral character." Other stipulations stated that the professor of natural history would create a botanic garden on the grounds of Harvard College and would present lectures on botany and entomology to college students; Harvard students who were sons of the subscribers could attend these lectures free of charge. Funds for the position were to be administered by Harvard College, and all real estate purchased for the foundation was to be vested in the president and fellows of the college. The college was also required to build a house for the professor.

William Dandridge Peck (1763-1822) was elected to be Harvard's first professor of natural history. Peck was known for his contributions to zoology and was America's first native entomologist. His first assignment in his new position was to travel to Europe to collect plants and seeds, and he was also to hire a gardener. When he returned to Harvard, Peck and the gardener, William Carter, established a botanical garden on seven acres acquired for that purpose in Cambridge, Massachusetts. The original subscribers did not provide additional funds for the upkeep of the garden, and the initial endowment eventually dwindled.

When Peck died, the professorship was vacant for several years because of a lack of funds. However, in 1833, Joshua Fisher of Beverly, Massachusetts, who had donated $500 to the Massachusetts Professorship of Natural History in 1805, bequeathed $20,000 to endow a new professorship in natural history under his name. The funds to hire the Fisher Professor of Natural History were administered separately from those for the Massachusetts Professorship, and the college chose to let Fisher's endowment accumulate interest for several years until it would be sufficient to pay the school's standard salary for a professor. In 1842, when the endowment was worth almost $30,000, renowned American botanist Asa Gray (1810-1888) was hired to be Harvard's first Fisher Professor of Natural History. Harvard continued to administer this professorship into the twenty-first century.

Beverly and the West Indies, carrying provisions and consumer goods to the planters and their slave laborers; his fleet returned with sugar, molasses, rum, and coffee. Thorndike made a significant part of his fortune from the West Indies trade. In 1792, he had become wealthy enough to purchase a fine home and several parcels of land in Beverly. By 1795, Thorndike's fleet and other ships in which he had an interest were sailing to ports around the world. At the end of the century, Thorndike become increasingly involved in the East Indies and China trade.

His business was so successful that Thorndike needed more space in his warehouses and office in Beverly. In 1804, he purchased property on India Wharf in Boston for his business interests. Thorndike relocated his family from Beverly to Boston in 1810, but he maintained a summer home in Beverly. His home in Boston became a center of political activity. Thorndike and fellow Federalists became involved in the Essex Junta, a group advocating secession for New England during the War of 1812. Although Thorndike was against the war, he went back to sea, and as captain of the *Hyder Ally*, he captured a valuable British ship after rounding the Cape of Good Hope.

Thorndike continued to invest in various industries. He was part of a group that in 1813 invested in the Boston Manufacturing Company, a textile manufacturing firm in Waltham. The company's first mill, equipped with an innovative power loom, was built on the Charles River. Thorndike's share of the company was $40,000. He invested additional funds in this successful firm in 1816 and 1820. His interest in the manufacturing of textiles led to investments in other textile firms, including the Taunton Manufacturing Company, the Hamilton Company, and the Appleton and Lowell Companies.

According to one contemporary account, Thorndike invested a "greater amount of capital" than any other New Englander, including investments in insurance and in real estate. He was involved in land purchases in Ohio and Maine. He was an original proprietor of the Massachusetts Bay Canal, a forerunner of the present Cape Cod Canal; he was a stockholder of the Massachusetts Railroad Corporation and the Boston and Taunton Railroad; and he owned property around the Boston wharf and other parcels of land in Boston. However diversified his interests, Thorndike continued his involvement in shipping until his death.

Although Thorndike did not attend Harvard College, he donated $500 to the fund creating the Massachusetts Professorship of Natural History and contributed another $500 toward construction of the library at the Harvard Theological School. His most important gift was procuring the library of Professor Christoph Daniel Ebeling of Hamburg, Germany. After a series of negotiations, Thorndike purchased the library in 1818 for $6,500 and donated it to Harvard. This library of more than four thousand volumes contains numerous works of American history, as well as maps and charts of the United States.

Thorndike died in Boston on May 10, 1832, and was buried in Mount Auburn Cemetery in nearby Cambridge. His estate exceeded $1.5 million.

Legacy

Although he began his life in poverty, Israel Thorndike's hard work and business acumen made him a millionaire. His involvement with trade and manufacturing and his associations with like-minded individuals, both in business and in politics, resulted in his economic and social prominence within the Boston community. He was one of the first New England merchants to make a fortune in the China trade. He also participated in state politics as an elected member of the Massachusetts legislature. Thorndike had little formal education, but he supported Harvard College with generous gifts. He also contributed $2,000 to the newly established Massachusetts General Hospital and was instrumental in raising funds for the Boston Athenaeum.

RICHARD THORNTON

English merchant

Thornton was a highly successful English merchant who made his fortune by trading with Russia during the Napoleonic Wars. At his death, he left a personal estate of more than £3 million, the largest British fortune of the nineteenth century.

Born: September 20, 1776; Burton-in-Lonsdale, North Yorkshire, England
Died: June 20, 1865; Merton, Surrey, England
Also known as: The Duke of Danzig
Source of wealth: Trade
Bequeathal of wealth: Children; relatives

EARLY LIFE

Richard Thornton was born on September 20, 1776, at Burton-in-Lonsdale, the second son in an established yeoman family. He attended Christ's Hospital in London, where he demonstrated his future ability to amass wealth by accumulating a store of marbles, coins, and other valuable items. Following his education he worked as a hop merchant in the Southwark area and was also involved in the leather trade. His brother Laurence was also active in commercial enterprise, and the two brothers often worked together, eventually incorporating under the firm name of Thornton.

FIRST VENTURES

The beginnings of Thornton's wealth came with the opportunities brought by the Napoleonic Wars, particularly the invasion of Russia. Since the late sixteenth century, the British had realized that Russia provided a store of raw materials and products, such as tar, tallow, and hemp, that were vital to maritime ventures. After Napoleon I's invasion of Russia, the French army was headquartered at Danzig, where it guarded the Baltic seaport, making it difficult for the British to gain access to Russia or Denmark. The Baltic trade was vital to the maintenance of the Royal Navy, and the lack of access to the area made it difficult and dangerous for English merchant ships to do business there.

In 1810, Thornton was commissioned to buy as much Russian hemp as possible so the British navy could use this material to rig its ships. Thornton armed one of his own merchant vessels and sailed to the Baltic. During his journey, he was forced to fight off a Danish attacker before reaching land. He eventually arrived in Russia, where he bought thousands of tons of hemp that he sold to the Royal Navy for a large profit.

MATURE WEALTH

While Laurence Thornton was in the Baltic area, he learned that Napoleon was retreating from Moscow. He immediately sent a message to his brother Richard, who received the news before anyone else in London. Thornton used this advance knowledge to continue his successful Baltic area trade. Russian produce and products were bringing high prices because of their scarcity. Thornton knew this, and he sagely traveled around London, making agreements for the forward delivery of hemp, tallow, hides, and Baltic produce. His speculation made him more than £100,000, securing his estimable wealth. This action also earned him the nickname the "Duke of Danzig."

As the Napoleonic Wars ended, new opportunities for commerce arose, and Thornton used his wealth to expand into a host of ventures around the globe. He focused a great deal of energy on colonial trade, particularly in India. Like other rich businessmen, he used his wealth to produce great returns by lending money to people in foreign countries. After his brother died, Thornton brought his two nephews into his business, changing the name of the firm to Thornton and West. He spent the majority of his later years conducting speculative trade from the Baltic Coffee House, a gathering place for all who were connected with trade in Russia. Thornton amassed a substantial fleet of ships over the years, and his final commercial venture was marine insurance. He used his money to provide insurance to hundreds of ships, becoming the largest marine insurance underwriter.

LEGACY

The news of Thornton's death of bronchitis on June 20, 1865, spread rapidly throughout England because of the size of his fortune and questions about its fate. Thornton never married, although he and his housekeeper had a son, Richard Napoleon Lee. Thornton's business passed on to his two nephews, Thomas Thornton and Richard Thornton West. Thomas Thornton inherited roughly half of his uncle's fortune. The rest was parceled out among West, Lee, and various other family members. At the time of Thornton's death, a charity school he had built in his hometown and some almshouses he had donated remained in operation.

Thornton is remembered for amassing the largest personal fortune of his century, yet little remains in the form of a legacy. His contribution to the commercial enterprises of Great Britain was vital to the Baltic trade at a key moment in history, and his later endeavors demonstrate the power of the enterprising British merchant in the nineteenth century.

Charles Lewis Tiffany

American merchant and jeweler

Tiffany started a fancy goods and jewelry business that became the premier source of luxury items in the United States. Avoiding the faddish and concentrating on selling items of lasting quality, his name became synonymous with wealth and good taste, and his customers included royalty, presidents, and celebrities.

Born: February 15, 1812; Killingly, Connecticut
Died: February 18, 1902; New York, New York
Also known as: The King of Diamonds
Source of wealth: Sale of products
Bequeathal of wealth: Children

Early Life

Charles Lewis Tiffany (TIHF-fah-nee) was the son of Comfort Tiffany, a cotton manufacturer, and Chloe Draper Tiffany, a homemaker. Comfort Tiffany was one of the first manufacturers of cotton goods in Connecticut. Charles attended the local school in Danielsonville and later spent two years at the Plainfield Academy. When he was fifteen, his father put him in charge of a general store he had started near the cotton mill. Charles worked there for ten years until joining his father in the business that had prospered and now became C. Tiffany & Son. By managing the store, young Tiffany learned retailing, managed the books, and made frequent trips to New York City for supplies.

First Ventures

By 1837, Tiffany had realized that he did not want to work in the cotton industry in Connecticut. A friend, John B. Young, had relocated to New York City and was working in a stationery and fancy goods store; six months later, in September, 1837, Tiffany joined Young. It was not a good time for businesses because the Panic of 1837 had resulted in many bank failures and a lack of consumer confidence, yet Tiffany and Young decided to combine Young's experience and Tiffany's money and open a fancy goods and stationery store. Tiffany's father loaned him $1,000 to start the business. A new partnership, Tiffany & Young, was established, and on September 18, 1837, the partners opened for business at 259 Broadway.

There was some concern that this location was too far uptown and distant from the fashionable stores where the wealthy shopped. However, Tiffany had a knack for selecting unusual merchandise to sell and stocked the store with unique bric-a-brac, Chinese objects, Japanese papier mâché, umbrellas, walking sticks, dressing cases, fans, fine stationery, pottery, and other goods. Each article was marked with a nonnegotiable selling price, which was an innovation at this time; Tiffany did not believe in bartering with customers. Total sales for the first three days were $4.98, with an added $2.77 on the fourth day. However, the store gradually became known for the high quality of its merchandise, and sales steadily increased. In addition the company adopted a distinctive shade of blue to be used on Tiffany boxes and shopping bags. This color became a symbol of the company's reputation for quality and craftsmanship.

Tiffany consistently searched importing houses to find exceptional goods. By 1841, business was good enough to rent the adjoining corner store. Increased space resulted in more and different inventory, including Bohemian glassware, French and Dresden porcelain, cutlery, clocks, and Parisian jewelry. This year saw the addition of a new partner, J. Lewis Ellis, resulting in a new name for the company: Tiffany, Young & Ellis.

Mature Wealth

At this point, Tiffany realized the necessity of having one of the partners search for merchandise abroad in order to ensure the novelty and exclusiveness that their customers were demanding. This idea was unique in retailing. Many European businesses sent salesmen to the United States, but American businesses did not send buyers abroad. Tiffany's plan was considered bold, hazardous, and typical of his style of management. Young made the trip; Tiffany was occupied with the business and getting married. On November 30, 1841, he married Harriet Olivia Avery Young, the sister of his partner. The couple would have six children.

Young's trip to Europe resulted in the company becoming involved in the jewelry trade, initially selling French costume jewelry. These items sold so well that in 1844 the store introduced precious jewelry to its merchandise. In 1845, Tiffany created the country's first mail-order catalog, called a *Catalogue of Useful and Fancy Articles*. An increase in business necessitated a move in 1847 to a larger store at 271 Broadway. Taking advantage of the glut of diamonds on the market due to the European revolutions of 1848, Tiffany invested heavily to buy these stones, the value of which had declined 50 percent. Every spare dollar was invested in diamonds, and the result was huge profits. One such purchase was the zone, or girdle, of diamonds worn by Marie-Antoinette.

The company began manufacturing gold jewelry and in 1850 established its first branch store in Paris. In 1851, Tiffany contracted with silversmith John C. Moore to produce silverware for the company, and the next year the firm introduced sterling silver to the United States. It was Tiffany's ambition to rival the silversmiths of Europe, both in purity of metal and in fine workmanship. As a result, Tiffany established a benchmark that became the United States sterling standard.

On May 1, 1853, Young and Ellis retired. Tiffany remained with the company, and with the addition of new partners the name of the firm was changed for a final time to Tiffany & Co. Business continued to grow, necessitating yet another move. This time Tiffany had a building constructed at 550 Broadway. Many criticized the location as being too far above the business district, but soon critics praised Tiffany for his foresight. By 1861, Tiffany acquired the adjoining building as the company prepared for the Civil War.

Tiffany had previously bought the cable that was not used when the first transatlantic cable was completed in 1858. Tiffany had this twenty miles of unused cable cut up into souvenirs of the event, ranging from paperweights to canes, bracelets, seals, and watch charms. Tiffany knew how to promote his products, as his earlier sale of the hide of P. T. Barnum's elephant, which he purchased to promote the sale of leather goods, attests. Crowds were so eager to buy the cable mementos that policemen were hired to maintain order at the store.

During the Civil War, Tiffany, an ardent Union supporter, devoted capital and facilities to support the government. Showrooms were turned into a supply depot. Tiffany's also sold quantities of gold braid, badges, and officers' swords in addition to its usual wares. One of its customers, President Abraham Lincoln, purchased a pearl necklace and bracelets for his wife to wear for his 1861 inauguration.

By 1867, Tiffany became the first American silversmith to earn a first prize at the Paris Exposition Universelle, spreading his fame throughout Europe. In 1868, the business was incorporated, with Tiffany as president and treasurer. That same year, branch stores were opened in London and Geneva. In 1870, once again Tiffany moved his headquarters, this time to Union Square, where a five-story, completely fireproof building was constructed. This new store was filled with distinctive merchandise made in Tiffany's own workshops, as well as goods imported from all over the world. One of

Tiffany's greatest achievements was acquiring, for $18,000, a 128.54-carat yellow diamond discovered in the newly opened Kimberly mines in South Africa. Tiffany sold so many diamonds that he became known as the King of Diamonds, and to show off the beauty of the stones, in 1886 he designed a six-prong diamond solitaire setting that became known as the Tiffany setting. In 1887 he acquired one third of the French crown jewels for a cost of $480,000. These gems were resold at a handsome profit to wealthy American families, including the Astors, Stanfords, and Pulitizers.

Fifty years after Tiffany founded his company, its vaults held more than $40 million worth of gems. By 1894, Tiffany was focused on manufacturing and built a factory in Newark, New Jersey. Here eight hundred employees produced twenty-five thousand different items, ranging from sterling flatware and silver plate to leather goods and stationery.

Tiffany belonged to a number of clubs and was a founding member of the Union League Club and the New York Society of Fine Arts. He never retired from his business. He died in 1902 at his home on Madison Avenue in New York City. At the time, his personal estate was worth $35 million and his firm was capitalized at $2.4 million.

Legacy

Charles Tiffany left a legacy of quality and restraint. He became a wealthy man, but he lived a simple life. "Understated elegance" is a phrase descriptive of what he sought and achieved in both his business and his personal life. Never a believer in following the beaten path, he took chances and seized opportunities. His products, including jewels, loving cups, silver services, and diamonds, became "must-haves" for generations of wealthy customers.

Louis Comfort Tiffany Foundation

Louis Comfort Tiffany (1848-1933) was the son of Charles Lewis Tiffany and Harriet Young Tiffany. Although Charles wanted Louis to join his business, Charles supported his son's interests and allowed Louis to study painting instead of attending college. Louis achieved fame as an artist, first as a painter and later for his work with stained-glass lamps and windows. He was a leading exponent of the Art Nouveau style. When he gave up painting to work solely with glass, he formed the Tiffany Studios, which was independent of his father's firm, Tiffany & Co., although his father's store sold many of his products. Louis Tiffany became vice president of Tiffany & Co. when his father died in 1902.

Louis's own success and the inheritance he received from his father enabled Louis to help other artists. To this end, he established the Louis Comfort Tiffany Foundation in 1918. He gave the foundation his entire collection of paintings, glass, and other artworks, as well as $1 million. Louis's donation also included Laurelton Hall, his eighty-acre estate at Cold Spring Harbor, on Long Island, New York. The foundation was to operate Laurelton Hall as a summer retreat for young artists and craftspeople.

When his estate was sold in 1946, the proceeds were used to finance a new purpose for the foundation: the provision of grants for artists. These grants were determined by an annual competition in painting, sculpture, graphics, and textile design. Grants were awarded to nurture creative talent, and they were used for numerous purposes, including purchasing artworks and donating them to institutions, an apprenticeship program that enabled young craftspeople to work with master craftspeople, and direct grants to young painters and sculptors. In 1980, the grant process was changed, with awards presented in a biennial competition. In addition, the foundation broadened the award base to include painting, sculpture, printmaking, photography, video, and craft media, with direct monetary grants to artists. Artists cannot apply for a grant; they must be proposed for consideration by art professionals throughout the country. Those who are nominated submit their work to be reviewed by a jury, which includes artists, critics, museum professionals, and the foundation's trustees. Continuing the mandate of Louis Comfort Tiffany, the foundation awards grants to those artists whose work shows promise but has not received widespread critical or commercial recognition

DONALD TRUMP

American real estate developer

Trump initially earned his fortune by developing hotels, casinos, condominiums, and other real estate projects. This internationally known billionaire later diversified into other business ventures and hosted a popular reality television series, The Apprentice.

Born: June 14, 1946; New York, New York
Also known as: Donald John Trump
Sources of wealth: Inheritance; real estate; media
Bequeathal of wealth: Charity

EARLY LIFE

Donald John Trump was born and raised in New York City, the son of Fred Christ Trump and Mary MacLeod Trump. His father was a real estate developer and investor, which eventually inspired Trump to enter the real estate field. Trump's rambunctious behavior at the Kew-Forest School resulted in his being sent to the New York Military Academy by the age of thirteen. At the latter school he succeeded in both academics and athletics, playing football, soccer, and basketball.

From there, Trump went to Fordham University through his sophomore year, followed by a transfer to the Wharton School of Finance at the University of Pennsylvania, from which he graduated with a bachelor of science and economics degree in 1968. Upon graduation, he returned home to New York City and promptly started working at his father's real estate company, the Trump Organization.

FIRST VENTURES

The road from student to real estate tycoon was slow but steady as Trump received his first experiences in the business under his father. Trump's early projects included the overseeing of rental properties throughout Brooklyn, Queens, and Staten Island, and he eventually branched out into other parts of the country. One of his notable early triumphs came in Cincinnati, Ohio, where he repaired a foreclosed apartment building and rented it to full capacity, earning the company a $6 million profit upon the building's sale.

By 1971, Trump had turned his attention to a burgeoning Manhattan, spending the majority of the decade focusing on business ventures in this New York City borough. Three years later, he took the Commodore Hotel, which was failing, and formed a partnership with the Hyatt Hotels Corporation to restore the structure. By 1980, renovation of the newly named Grand Hyatt was completed, providing Trump with the profits to enter into more ambitious real estate ventures.

MATURE WEALTH

By 1982, Trump had completed his next major project—construction of the $200 million apartment complex and shopping center known as the Trump Tower in New York City. The fifty-eight-story high-rise became known for its luxurious fixtures and elegant style, immediately establishing the public's perception of Trump as a man of great wealth and lavish taste. He soon expanded into other areas of the leisure and entertainment business, turning his attention toward Atlantic City, New Jersey, where he obtained a gambling license and a partnership with Holiday Inn to open Harrah's Casino at Trump Plaza in 1982. Trump bought out Holiday Inn's interest in the project in 1986, and he renamed the $250 million property the Trump Plaza Hotel and Casino.

Not everything Trump touched throughout the 1980's turned to gold, including his purchase of an apartment complex near New York City's Barbizon-Plaza Hotel. He had hoped to convert both the hotel and a nearby apartment building into condominiums, but this plan was met with resistance by residents of the apartment house, who wanted to remain in their rent-controlled apartments. Although it took him longer than he anticipated, by 1997 Trump had converted both buildings to condominiums, renaming the Barbizon Hotel Trump Parc and the adjoining building Trump Parc East. During the conversion, he remained in constant communication with the New York City government, offering his company's development services at a fraction of the cost of other bidders. This initiative led his company to be hired to complete the city's failed restoration of the Wollman Skating Rink in Central Park. What was once scheduled as a two-and-a-half-year project had not been finished after six years, at which point Trump stepped in to complete the remainder of the renovation in three months, saving the city $750,000 from the project's remaining $3 million budget.

Two years later, in 1988, he purchased the Plaza Hotel in New York City, spending an initial $407 million to buy the property and an additional $50 million in remodeling costs. As the 1980's rolled into the next decade, he also returned to Atlantic City to acquire the Hilton Hotel's $320 million resort, renaming it Trump's Castle, while also purchasing the world's largest hotel and casino, the Trump Taj Mahal Casino Resort.

Trump's excessive spending and huge profits in the 1980's were brought to a halt when the United States entered an economic recession at the beginning of the 1990's. This economic downturn sent Trump's net worth plummeting from an estimated $1.7 billion to $500 million. In 1991, Trump sold half of his share in the Taj Mahal, and the following year he filed a Chapter 11 bankruptcy protection plan for the Trump Plaza Hotel and Casino and obtained several needed loans. Nonetheless, Trump pressed on throughout the lean years, and his net worth climbed to $2 billion in 1997, thanks to a series of restructuring plans and wise investments, along with several successful real estate licensing ventures in Manhattan, the New York City suburbs, and Florida.

After riding out the economic roller coaster in the 1990's, Trump found the first decade of the twenty-first century to be one of his most successful periods. In this decade, he sold his late father's company to a group of investors for $600 million, earning $200 million for Trump after he split the proceeds with his siblings. This decade also saw his involvement in several new building projects, including the Trump International Hotel and Tower chain in Honolulu, Chicago, Toronto, and Atlanta.

During 2004, Trump, who by then was a household name, unexpectedly evolved into a television personality. His reality show, *The Apprentice*, was aired that year by the National Broadcasting Company (NBC) and became a popular program. He diversified into other ventures, founding a mortgage firm, Trump Financial; an education company, Trump University; a chain of Trump restaurants; and the Trump Signature Collection menswear line. He also became co-owner of the Miss Uni-

GREAT WEALTH ON TELEVISION: DONALD TRUMP'S *THE APPRENTICE*

Often called "the ultimate job interview," *The Apprentice* is a televised opportunity to see Donald Trump in action. In this reality show, Trump, the boss, interviews several potential employees, putting them through a series of corporate challenges in the form of team tasks that pit them against each other. He then gradually eliminates the candidates as the program progresses through the season. Since its debut in 2004, Trump's catchphrase has become "You're fired!," which he exclaims after a contestant who has failed to complete an assigned task is subsequently relieved of his or her duties. The catchphrase not only was used in a series of commercials promoting the program but also has entered popular culture in a variety of other places, including Trump's personal appearance during World Wrestling Entertainment's Wrestlemania 23 in 2007.

Viewers not only tune into *The Apprentice* to see whom Trump will fire but also are curious about the winner of each season's show. The victor joins Trump's real-life business team and receives a salary for the following year of $250,000. In the seventh season, the show was retooled as *The Celebrity Apprentice*. The new program featured famous television, film, music, and media personalities who compete for the same prize as contestants on the original show, but the celebrity winners' money is distributed to a charity of their choice. This decision is in line with Trump's commitment to a variety of charities, including his considerable contributions to Children with AIDS, Make a Child Smile Appeal, Pediatric Epilepsy Project, Mississippi Animal Rescue League, and the Muhammad Ali Parkinson Center. Trump continues to shout his signature catchphrase, "Your fired!," which, when barked in the face of a celebrity, provides additional audience appeal.

In addition to their entertainment value, *The Apprentice* and *The Celebrity Apprentice* enlighten their audiences on some of Trump's actual business practices. Many of his employees have appeared on the program, including George H. Ross, his executive business and legal adviser, and Carolyn Kepcher, the former executive vice president, chief operating officer, and general manager of the Trump National Golf Club. Despite their insightful additions to the show and ability to help influence who scores the $250,000 prize, the real attraction of the program remains Trump's personality, his tough-but-fair approach to judging the contestants, and the clear-cut finality of his assessments, summed up in the tag line, "You're fired!"

verse Organization. He wrote several books, including *Trump: The Art of the Deal* (1987), coauthored with Tony Schwartz; *Trump: Surviving at the Top* (1990), written with Charles Leerhsen; and *Trump: The Art of the Comeback* (1997), coauthored by Kate Bohner. In 2010, Trump was included on *Forbes* magazine list of the world's billionaires, with his net worth calculated at $2 billion.

LEGACY

By constantly making innovative business decisions and bouncing back from blunders, Donald Trump became one of the world's wealthiest men and one of its best-known billionaires. Although he originally worked in the real estate field, he later diversified, which led to his continued success. Now known as a television personality as well as a real estate mogul, his wealthy lifestyle set an example for others, and he continued to acquire new fans of his television program and to serve as a mentor to other businesspeople. Along the way, Trump's personality and ego have grown as large as his fortune, earning him throngs of admirers, as well as many detractors. There is, however, no denying that Trump's generally sound property purchases, wise investment decisions, and all-around business savvy have made him one of the most memorable billionaires of his era.

Yasujirō Tsutsumi

Japanese real estate developer and statesman

Tsutsumi earned his wealth through aggressive, heavily leveraged land development for recreational purposes. He acquired railroad lines and developed hotels by converting the palaces he bought from impoverished princes after World War II. His wealth made him a postwar power broker in Japan and enabled him to become the nation's goodwill ambassador, hosting diplomatic events and traveling abroad.

Born: March 7, 1889; Yagiso, Omi Province (now Shiga Prefecture), Japan
Died: April 26, 1964; Tokyo, Japan
Also known as: Tsutsumi Yasujirō; Pistol
Sources of wealth: Real estate; railroads
Bequeathal of wealth: Children; spouse

Early Life

Yasujirō Tsutsumi (yah-soo-jee-roh tsoo-tsoo-mih) was born in 1889 in the village of Yagiso northeast of Kyōto. He was the oldest son of Yujiro, a land-owning farmer and linen trader, and his wife Miwo (née Kamibayashi). In 1891, Tsutsumi's sister, Fusako, was born. When Tsutsumi was four, his father died of typhoid fever and was cremated on September 30, 1893. His mother left the village, leaving her two children with their grandparents, Kiyozaemon Tsutsumi and Kiri Tsutsumi. In 1987, Tsutsumi's cousin Kunio Kamibayashi claimed Miwo left because of sexual harassment by Tsutsumi's grandfather. Only rarely and as an adult did Tsutsumi see his mother, who eventually remarried.

At age thirteen in 1902, Tsutsumi finished primary school. He worked on the family farm until attending Kyoto Naval College from 1906 to 1907. His grandfather died on April 7, 1907. When Tsutsumi reached maturity at age twenty in 1909, he married Koto Nishizawa shortly after their daughter Shukoku was born. He mortgaged his family land for 5,000 yen and went with his family to Tokyo to study economics and political science at Waseda University.

First Ventures

As a student, Tsutsumi invested his 5,000 yen (very roughly the equivalent of $60,000 in 2010 currency) into a textile company, Goto Woolens. Half a year later he cashed out his investment, now worth 60,000 yen. With this money he bought the rights to a third-class post office in Tokyo's Nihonbashi district and invested in an iron foundry with one hundred employees, taking over its management.

Tsutsumi graduated from Waseda University in 1913, and the following year his mistress gave birth to his first son, Kiyoshi. Tsutsumi divorced his first wife, and in April, 1915, he married Fumi Kawasaki. Tsutsumi's iron foundry went bankrupt, a linen venture failed, and insider trading in a Manchurian railroad resulted in a loss of money.

In June, 1915, Tsutsumi turned to land development. For the next two years he struggled to acquire village property outside the resort town of Karuizawa on the railroad line running from Tokyo to Nagano. On December 23, 1917, a majority of the villagers sold Tsutsumi what they thought were 490 acres of land for 30,000 yen (worth roughly $300,000 in 2010 currency). When the land was surveyed, it turned out to be 650 acres instead. The deal was highly leveraged, with only a small cash deposit changing hands. To build cottages on his land and develop its infrastructure, Tsutsumi founded Sengataki Resorts Limited. He found a respected businessman to front as the firm's president, and he offered half of the company's shares to the public, raising the firm's capital value to 250,000 yen.

The Palace of Prince Asaka and Other Prince's Palaces

Japan's Imperial House Law of January 16, 1947, made commoners of all former imperial princes and princesses who were not directly descended from an emperor. While the former imperial family were allowed to keep their palaces and vast landholdings, they had to pay punishing taxes on them by October 14, 1947, and annually thereafter. Prince Yasuhiko Asaka approached real estate developer Yasujirō Tsutsumi through a middleman. As a result, Tsutsumi agreed to have one of his corporations, Kokudo Keikaku, buy Asaka's palatial Edwardian-style summer cottage neighboring Tsutsumi's land at Karuizawa on August 12, 1947. Typically for this and subsequent deals, Tsutsumi paid a low deposit and then made annual payments of the interest on the outstanding principal. This enabled the prince to avoid paying tax on a lump sum and allowed Tsutsumi to avoid paying a large amount of money. The summer cottage was turned into the Karuizawa Prince Hotel but was effectively put at the disposal of the imperial family, with Akihito, the future emperor of Japan, spending many summers there.

Asaka continued to experience money problems, and he agreed to sell his Tokyo palace, built in 1933. Initially, the government rented the palace and used it as the prime minister's official residence from 1947 to 1950. When Asaka put the palace up for sale, Tsutsumi bought it through his company, Seibu, on October 7, 1950. From 1950 to 1974, the palace was officially called a state guesthouse, though Tsutsumi and his successors let Asaka use it until the prince's death in 1981. In 1983, the palace was donated to the Tokyo Metropolitan Foundation for History and Culture, which opened it to the public as the Tokyo Metropolitan Teien Art Museum on October 1, 1983.

By 1953, Tsutsumi had bought other prince's palaces. Unlike the government, which demolished the Kitashirakawa palace in Tokyo's Tanakawa district to build a nondescript dormitory for Diet members, Tsutsumi retained the original structures. He turned them into hotels of his Prince brand, and these establishments survived even when high-rise hotels were subsequently built adjacent to them. Thus, Prince Takeda's former palace continues to be used as a banquet facility next to the new Grand Prince Tanakawa Hotel. Another Kitashirakawa palace, designed in 1884 by British architect Josiah Conder, survives as the Old Building on the grounds of the Grand Prince Hotel Akasaka, built in 1982.

Mature Wealth

Living by his philosophy of borrowing money, buying land, and borrowing more money for more land, Tsutsumi bought eighty acres in Hakone, a fashionable mountain area east of Mount Fuji, in 1920. He renamed his company Hakone Resorts Limited and raised its capitalization to 20 million yen in 1923. Tsutsumi succeeded because he targeted the middle class and its desire for recreation. The great Kanto earthquake of September 1, 1923, destroyed much of Tokyo and injured Tsutsumi. Yet his housing development in Tokyo's Koishikawa district survived and people desired his buildings.

Looking toward Izu peninsula south of Mount Fuji for new development, Tsutsumi started to buy shares in the local Sunzu railroad line. Sunzu's president sent thugs to confront Tsutsumi, one of whom threatened to shoot him. Tsutsumi stood still, daring the gangster to shoot, and the bullet missed him, earning him the nickname "Pistol." This incident typified his dictatorial business style, which brooked no opposition.

With Tsutsumi's highly leveraged land development business advancing, yet always tottering on the brink of bankruptcy because of the breakneck speed he demanded, in May, 1924, he turned to politics. He was elected to the Diet, the Japanese parliament. While his business flourished in the late 1920's and survived the Great Depression, with different mistresses Tsutsumi fathered his second son Seiji in 1927 and his third son Yoshiaki in 1933, both of whom he adopted. His wealth enabled him to provide for his wife, two mistresses, and his children.

To gain access to his properties in western Tokyo and the Hakone mountains, Tsutsumi acquired the Musashino railroad line in 1938. In 1940, he bought a department store. He also finished his Tokyo mansion, where he brought together his many children and his lover Misao Aoyama, whom he entrusted to help with his business. Tsutsumi opened his home to government leaders as a meeting facility, resulting in extremely valuable business contacts.

In 1942, Tsutsumi married his oldest son, Kiyoshi, to a daughter from a samurai family. His wife, his lovers Misao Aoyama and Tsuneko Ishizuka, and all of his children attended the wedding, as did Prime Minister Hideki Tojo. In 1943, Tsutsumi bought the Seibu railroad line, eventually choosing Seibu as the name for his holding company. His railroads provided Tsutsumi with much needed wartime revenue. On November 21, 1944, his Seibu line started transporting effluent out of Tokyo and bringing in food from the countryside, a logistics feat for which Tsutsumi was awarded 30 million yen, with which he bought more land. On March 24, 1945, his home was destroyed in that night's firebombing of Tokyo. He and his family survived in a bunker on the property. When Japan surrendered on August 15, 1945, Tsutsumi was purged from his political offices but retained his wealth.

In 1946, Tsutsumi disinherited his oldest son, Kiyoshi, after a family argument. Beginning in 1947, Tsutsumi began buying the palaces and land of impoverished former members of the imperial family. Tsutsumi turned most of these palaces into hotels and developed their land in prime Tokyo locations. In 1951, he was able to reenter politics and was elected to the Diet; on May 18, 1953, he was elected speaker of the Diet. The *Nippon Times* listed his wealth as consisting of one department store, three railroad lines, two golf courses, two recreational parks, vast landholdings, and twelve hotels. He also built three new suburbs in western Tokyo.

Tsutsumi divorced Fumi and married Misao in July 1954. He resigned as speaker of the Diet on December 6, 1954. Because his properties were highly leveraged and he successfully hid most of his assets, he had to pay only modest taxes on his small official salary starting in 1958. However, Tsutsumi treated his companies as personal property and financed his lavish lifestyle with company funds.

At the age of seventy in 1959, Tsutsumi was considered one of the five wealthiest men in Japan. Along with his wife Misao, he increasingly put the husbands of his daughters and his sons Seiji and Yoshiaki in charge of the companies he controlled. In 1961, Tsutsumi embarked on a world tour as Japan's goodwill ambassador, meeting outgoing president Dwight D. Eisenhower in Washington, D.C., before meeting prime ministers in the capitals of London, Paris, Bonn, Vienna, and Delhi. A scandal surrounding his reelection in 1963 damaged his reputation. However, his funeral on April 30, 1964, after he suffered a stroke and died on April 26, had all the trappings of a state affair. Tsutsumi's body was entombed in his Kamakura Mausoleum on April 26, 1965.

Legacy

Yasujirō Tsutsumi provided middle-class Japanese families with affordable housing and recreational facilities in the lean years after World War II, and in the process he became one of the richest men in Japan. He hid his wealth so successfully that after his death his family did not have to pay any inheritance taxes. A family council entrusted the bulk of Tsutsumi's assets to his favorite and third son, Yoshiaki. His second son, Seiji, received only a small share of the estate, resulting in a long enmity between the brothers that ended in the mid-1990's.

Yoshiaki Tsutsumi remained true to his father's business practices and continued aggressive land development. *Forbes* magazine listed Yoshiaki Tsutsumi as the richest individual in the world in 1984, with assets worth $21 billion. As land value declined in Japan, his wealth declined to $2.8 billion in 2001. However, Japan no longer tolerated the rough business style of his father, and on October 27, 2005, Yoshiaki Tsutsumi pleaded guilty to violating securities trading law and received a suspended thirty-month prison sentence. With his wealth significantly reduced, by 2009 he still pursued real estate development projects.

Ted Turner

American media mogul

Turner is one of the pioneers of the cable television industry, founding the cable stations TBS, TNT, Cable News Network (CNN), Headlines News, the Cartoon Network, and Turner Classic Movies. He has used his wealth to fund many charities, including his own Turner Foundation.

Born: November 19, 1938; Cincinnati, Ohio
Also known as: Robert Edward Turner III
Sources of wealth: Inheritance; media; real estate; sports franchise
Bequeathal of wealth: Children; educational institution; charity

Early Life

Robert Edward "Ted" Turner III was born in Cincinnati, Ohio, the son of Florence (née Rooney) Turner and Robert Edward "Ed" Turner II, a car salesman. When he was nine, his family moved to Savannah, Georgia, where his father had purchased a small billboard advertising company. Young Turner attended the McCallie School, a private, Christian military preparatory school in Chattanooga, Tennessee, and Brown University in Providence, Rhode Island, where he was vice president of the debating union and captain of the varsity sailing team. Turner initially majored in Latin and Greek, but his father objected that this major was impractical. Turner eventually changed his major to economics, but he was expelled before graduating because he was caught with a woman in his dormitory room. After serving in the U.S. Coast Guard, Turner returned home to work for his father.

First Ventures

Turner already knew his father's advertising business because he had worked there during summer vacations. He quickly became the general manager of the Macon, Georgia, branch of the business. Following his father's suicide in March, 1963, Turner became the sole owner of the Turner Advertising Company, by then the largest outdoor advertising company in the Southeast. Turner expanded the business by buying small billboard companies in Chattanooga and Knoxville, Tennessee. However, he encountered pressure from environmental groups that wanted to reduce and even eliminate billboard advertising along highways, so Turner diversified by buying five radio stations in the late 1960's.

In 1970, he bought two television stations, including WJRJ (later renamed WTCG) in Atlanta, Georgia, which broadcast on Channel 17. These stations aired old films; reruns of television series, such as *The Andy Griffith Show*; and any network shows that the local affiliates chose not to broadcast, including the made-for-television film *Brian's Song*. Turner also bought the rights to broadcast Atlanta Braves baseball games, Atlanta Hawks basketball games, and Atlanta Thrashers hockey games. He bought the Braves in 1975 and the Hawks in 1977.

Mature Wealth

In 1976, the Federal Communications Commission (FCC) gave Turner permission to use satellite transmission technology to carry WTCG (later renamed WTBS and then TBS) on cable television systems all over the United States. He did not charge cable systems any fees to carry his station, relying solely on advertising sales to generate revenues. At first, the station was broadcast to two million homes, but that number increased as cable television expanded into more markets.

Despite widespread skepticism in the broadcasting industry, Turner started the Cable News Network (CNN), the first twenty-four-hour live news channel, in 1980. In addition to selling advertising, CNN charged providers fifteen cents per subscriber per month. Like WTBS, it initially aired in two million homes but its audience grew as cable television expanded. In 1981, he added CNN2 (later renamed Headline News), which used film footage already obtained for CNN in order to broadcast thirty-minute news summaries, repeated throughout the day. Cable systems in Asia began carrying CNN in 1982, and the network began airing on European cable stations in 1985.

After failing to acquire the Columbia Broadcasting System (CBS) in 1985, Turner purchased the MGM/UA Entertainment Co. for $1.5 billion. Following this acquisition, Turner had an enormous debt and had to sell portions of the company. After all of the deals were finally completed, Turner owned Metro-Goldwyn-Mayer's (MGM) entire film library up to 1985, including the films *Gone with the Wind* (1939,) *Meet Me in St. Louis* (1944), *Singin' in the Rain* (1952), *Doctor Zhivago* (1965), and *The Wizard of Oz* (1939); a small portion of United Artists' (UA) film and television library, including the television series *Gilligan's Island;* the entire RKO (Radio-Keith-Orpheum) Pictures' film library, including *Citizen Kane* (1941) and *King Kong* (1933); and the pre-1950 Warner Bros. film library, including the motion pictures *Casablanca* (1942) and *The Maltese Falcon* (1941).

Turner used these films and television series to provide programming for new cable channels. In 1988, he introduced Turner Network Television (TNT) by airing the film *Gone with the Wind*. TNT initially showed older films and television shows, but the station later added original programs, including *Captain Planet;* original films, such as *Gettysburg;* sports; and reruns of newer films and television shows. TNT charged cable providers fifteen cents per subscriber per month, starting with 17 million subscribers and passing the 30 million mark after its first eight months on the air. Turner Classic Movies (TCM) came on the air in 1994, and in the twenty-first century continued to broadcast the older Warner Bros., RKO, and MGM films.

In 1992, Turner leveraged the MGM cartoon library—which included Tom and Jerry cartoons; pre-1948 Warner Bros. properties, such as cartoons featuring Bugs Bunny, Daffy Duck, and the Road Runner; and television specials, such as *How the Grinch Stole Christmas*—to create the Cartoon Network. That same year, Turner purchased Hanna-Barbera Productions, which owned about one-third of all of the cartoons ever produced in the United States. The Hanna-Barbera properties included the cartoon series *Yogi Bear, The Flintstones, Scooby-Doo*, and *The Jetsons*. Hanna-Barbera's production studios also developed new shows, such as *Dexter's Laboratory, Johnny Bravo*, and *The Powerpuff Girls*, for the Cartoon Network. After Turner Broadcasting merged with the Time Warner entertainment company in 1996, the channel gained access to the post-1948 Warner Bros. cartoon library.

Turner generated controversy when he began to colorize old black-and-white films in order to show them on TBS and TNT. Despite opposition by film aficionados, stars, and directors, the colorization process became popular with the public, and Turner colorized many of the films that he owned. However, the cost turned out to prohibitive for all but a few films. In contrast with TNT and TBS, Turner Classic Movies shows unaltered and restored versions of films.

In 1986, Turner established the Turner Entertainment Company to produce original programming. He eventually purchased the production companies Castle Rock Entertainment and New Line Cinema, which made the films *The Mask* (1994) and *Dumb and Dumber* (1994). With Turner's encouragement and approval, New Line financed the film adaptations of the *Lord of the Rings* trilogy, released from 2001 through 2003. When Turner merged his companies with Time Warner on October 10, 1996, Turner owned about 10 percent of the combined

company. He was made vice chairman and head of Time Warner's cable networks division, and he added management of the cable networks HBO (Home Box Office) and Cinemax to his responsibilities.

On January 11, 2001, Time Warner merged with America On Line, becoming AOL Time Warner. Although Turner owned about 4 percent of the new company, he found himself without any operational responsibilities, so he stepped down as vice chairman in 2003 and resigned from the board of directors in 2004. He began selling his AOL Time Warner stock in 2002, and he finally sold all of it by the end of 2004.

In 2002, Turner cofounded Ted Montana's Grill, a restaurant chain specializing in bison meat. The first location was in Columbus, Ohio, and by 2009 the chain had grown to fifty-five locations in nineteen states.

THE UNITED NATIONS FOUNDATION

In 1997, Ted Turner was honored as Man of the Year by the United Nations Association. As a sign of gratitude, he originally considered giving $1 billion outright to the United Nations, but he learned that the organization could not legally accept donations from individuals. Instead, he created the United Nations Foundation, pledging to fund it with $100 million a year for ten years beginning in 1998. (After the price of his AOL Time Warner stock declined, he had to stretch his contribution out over fifteen years.) Other donors have contributed more than $400 million to the organization.

Turner selected Timothy Wirth, a former U.S. representative and senator from Colorado, as the foundation's first administrator. The foundation's purpose is to support the United Nations' causes and activities; be an advocate for the United Nations; and provide a platform for connecting people, ideas, and resources to help the United Nations solve global problems. The organization's programs have included eliminating land mines; working with the World Health Organization (WHO) and UNICEF (United Nations International Children's Emergency Fund) to provide medicine for children, especially those suffering from polio, measles, and malaria; distributing insecticide-treated bed nets to prevent mosquitoes from infecting people with malaria; reducing population growth through the provision of sex education and condoms; promoting sustainable tourism; reducing the number of nuclear warheads worldwide; reducing poverty; minimizing climate change by improving energy efficiency and switching to clean energy technologies; and easing the plight of disaster evacuees by means of wireless technologies.

The foundation also works to strengthen the relationship between the United Nations and the United States government, with a focus on urging Congress to help pay America's debt to the United Nations. This effort is led by the foundation's sister organization, the Better World Fund, which Turner established in order to broaden public support for the importance of international cooperation and a strong relationship between the United States and the United Nations.

The United Nations Foundation has been a very efficient charity, spending more than 90 percent of its funds on actual programs and less than 10 percent on administration and fund-raising. The foundation's success led the United Nations to establish an Office for Partnerships that works directly with nongovernmental organizations, corporations, and private individuals.

LEGACY

By 2009, CNN, TBS, TNT, the Cartoon Network, Headline News, and Turner Classic Movies were still major cable networks, and the first four were consistently in the top ten of the most watched cable channels in the United States. CNN has inspired several imitators, including Fox News, MSNBC (Microsoft and the National Broadcasting Company), Worldwide BBC (British Broadcasting Corporation), and Al Jazeera.

Turner purchased the 119,000-acre Flying D Ranch in Montana in 1989 with the goal of restoring the land to its condition prior to 1860, and he owns the world's largest private bison herd, with fifty thousand head. He has reintroduced endangered species, such as gray wolves, red-cockaded woodpeckers, and black-footed ferrets, to his ranch. In 1997, he created the Turner Endangered Species Fund.

Turner followed his father's example in supporting civic organizations and schools. In addition to founding the United Nations Foundation, Turner started his own family foundation in 1990 in order to fund charities; the Better World Society in 1985 in order to fund documentaries on environmental pollution, nuclear proliferation, and the population explosion; and the Nuclear Threat Initiative in 2001 in order to limit and reduce the number of nuclear warheads around the world. He has also made large donations to the McCallie School, Brown University, and The Citadel. His example inspired other billionaires, such as Bill Gates and Warren Buffett, to donate large portions of their fortunes to charities.

José Tomás Urmeneta

Chilean mining magnate, businessman, and politician

Urmeneta transformed Chile's copper mining industry in the mid-nineteenth century by discovering rich cooper veins and using the latest machinery and technology to extract the metal.

Born: October 8, 1808; Santiago, Chile
Died: October 20, 1878; Limache, Chile
Also known as: José Tomás de Urmeneta García
Sources of wealth: Mining; investments
Bequeathal of wealth: Spouse; children; medical institution

Early Life

José Tomás de Urmeneta García, better known as José Tomás Urmeneta (hoh-SAY toh-MAHS uhr-meh-NEH-tuh), was born in 1808 in Santiago, Chile, the first of seven children of Tomás Urmeneta and Manuela García-Abello. Urmeneta was sent to Brown University in the United States in 1823, where he obtained a law degree. Soon after his return to Chile in 1827, he moved to London, where he remained until 1831 as an attaché for the Chilean government. In Europe he was exposed to the effects of the Industrial Revolution, a fact that would be essential to his future entrepreneurial endeavors in mining. In 1832 he married Carmen Quiroga, with whom he had three daughters.

First Ventures

Urmeneta entered the mining business immediately after his return to Chile from London in 1831. He initially was the manager of the Sotaqui and Guaillillinga States, two copper mines in the Tamaya region owned by Mario Ariztia, his wealthy brother-in-law. However, in 1833 Urmeneta became an entrepreneur himself when he discovered another rich copper vein near the mines. His decision to use European extraction technology enabled him to exploit the vein. However, by 1842 his mine shafts had flooded because of poor weather in the area, and he lost almost everything. By the end of the 1840's, Urmeneta was nearly bankrupt. Nevertheless, Urmeneta was persistent, and upon receiving a loan from Ariztia he resumed his mining activities. In October, 1852, he found an even richer layer of copper. By 1857, his quarry employed 360 workers, and his output of copper had tripled because of the international demand for the metal created by the Crimean War.

Mature Wealth

Urmeneta experienced tremendous economic success in the 1860's because of his diversification strategy. He mined coal, gold, and silver in addition to copper. Among other undertakings, he went into real estate, banking and loans, insurance, railways, and stocks. He also established two companies: the Gas Corporation of Santiago and the Chilean Foundry Corporation. These businesses opened other doors for him. When he moved his residency to Santiago in 1855, he became acquainted with important Chilean businesspeople and politicians. These connections would assist him in becoming a member of the Chilean senate from 1855 to 1864 and in serving on the government's treasury advisory and mortgage loan reserves committees. In 1871, his economic and political influence permitted him to become a presidential candidate, running unsuccessfully against Federico Errázuriz Zañartu.

Urmeneta had a setback when his Chilean Foundry Corporation went bankrupt. The company had unpaid loans with the Gibbs Company of England. Nevertheless, since he had diversified his capital gains, he was able to absorb this loss, as well as the losses created by the international decline in copper prices. By the late 1860's he owned the main mines in the Tamaya region in the north of Chile, as well as the principal foundries in the area. He added new technologies, including a railroad system that connected his mines in Tamaya to his foundries in the coastal town of Tongoy. This resulted in increased metal yields and exports that allowed Urmeneta to respond to the high demand for copper created by the European wars of the 1870's. This period of major copper sales abroad increased Urmeneta's wealth and enabled him to invest in nonrelated ventures, such as cattle ranching and wine production.

Legacy

Urmeneta's sense of business led him to become one of the most important Latin American magnates of the 1800's. He was also known for being a generous donor to medical facilities. He bequeathed large sums of money to a hospital in Ovalle, Chile. In 1860, he became president of the Casa de Orates, a major psychiatric center.

Nevertheless, his most significant contribution was to his country's mining industry. Largely through his efforts, Chile became the largest copper producer in the world between 1861 and 1870. Urmeneta is considered to be one of the founders of the copper industry in his country.

Urmeneta employed ten thousand workers in thirty-nine highly productive mines. He was able to supply a large volume of copper because he had spent time in Europe, learning how machinery and other technology could be used to increase production. He applied this knowledge to invigorate his own companies and, in the process, set a precedent for other Chilean entrepreneurs.

Jay Van Andel

American household products company executive

With partner Richard DeVos, Van Andel established the Amway Corporation, an international household products company with distributors in more than ninety countries. He used his considerable wealth to finance political, philanthropic, and civic causes, including the Van Andel Research Institute, Van Andel Arena, and the Grand Rapids Public Museum.

Born: June 3, 1924; Grand Rapids, Michigan
Died: December 7, 2004; Ada, Michigan
Sources of wealth: Sale of products; investments
Bequeathal of wealth: Relatives; charity

Early Life

Jay Van Andel (van AHN-dehl) was born in Grand Rapids, Michigan, in 1924, the only child of Dutch immigrants James and Petronella (née Van der Woude) Van Andel. James owned an automobile dealership in Holland, Michigan, and then opened Van Andel and Flikkema Chrysler Dodge with John Flikkema. The family practiced their strict Christian Reformed faith, which Van Andel credited with his later successes, stating his belief that "the task of every person on Earth is to use everything he's given to the ultimate glory of God." Following the Dutch tradition, Van Andel attended Christian schools. It was at Grand Rapids Christian High School that he met his best friend and lifelong partner, Richard DeVos. Van Andel attended Calvin College but left to serve in the Army Air Corps during World War II, where he earned the rank of second lieutenant.

First Ventures

Like many Dutch immigrants, including his father, Van Andel had an independent streak and preferred self-employment to working for someone else. His first entrepreneurial venture occurred when he offered classmates a ride to school for the price of twenty-five cents a week. Most students did not own cars, and Van Andel had the use of one only because his family was in the automobile business. When DeVos became one of his riders, their destiny was sealed.

After the war, the two men realized that they wanted the same things from life and their strengths complemented each other. Before forming Amway (short for American Way), the duo tried a few other businesses. Among them were the Wolverine Air Service flight school, an importing company, the Riverside Drive-In Restaurant, and a Nutrilite vitamins distributorship. These business endeavors met with varying degrees of success. Through them, Van Andel learned the importance of trusting God, of taking risks, of selling only products he believed in, and of maintaining personal integrity. It was while making a Nutrilite sales call on the Hoekstra family that Van Andel met Betty Jean Hoekstra, the woman he married and with whom he shared his life for fifty-two years.

Van Andel and DeVos named their Nutrilite business the Ja-Ri (Jay and Rich) Corporation and recruited distributors throughout Michigan. Ja-Ri became a profitable venture for all concerned, but Nutrilite began having internal problems. Because they believed in the product, the partners were unwilling to stop marketing the vitamins and decided to expand their product line.

In 1959, they formed a new company, the Amway Corporation, and they decided that the firm should sell recession-proof necessities, like laundry and cleaning detergents. They set up offices in their basements, and with their wives and a few employees went to work. Amway acquired Nutrilite in 1972.

Mature Wealth

Van Andel achieved his enormous wealth through the Amway Corporation. The company grossed $500,000 in its first year; four years later, Amway grossed $10 million. Sales continued rising, even in bad economic times. Van Andel noticed that people who lost their jobs or felt insecure about employment were more likely to become entrepreneurs, selling products for the company. He was confident that the multilevel marketing practiced by the company could also enrich those who became distributors, who then recruited and mentored other distributors. Many of the company's employees were wildly successful, though most hung on to their regular jobs and considered their Amway earnings supplemental income. The company espoused traditional family values and encouraged husband-and-wife teams. Some of the early successful marketers brought their children and grandchildren into their businesses.

Multilevel marketing is a controversial practice, and it can often be a pyramid scheme. While not all multilevel sales organizations are pyramid schemes, all pyramid scams practice multilevel marketing. Some Amway distributors did indeed become multimillionaires. However, every investigation of the company concluded that it was not engaged in any wrongdoing. Van Andel and DeVos voluntarily changed some of the company's recruiting materials to indicate that while it was possible to attain great wealth as a distributor, the position requires hard work, entrepreneurial zeal, and a long-term commitment beyond the reach of many recruits. Those signing on with get-rich-quick expectations soon dropped out.

One thing that set Amway apart was the quality of its product line, most of it manufactured by the company. The firm gradually added cosmetics and other products to its line, along with a catalog shopping service that allowed distributors to sell carefully selected items produced by other companies. The company also sold earth-friendly, biodegradable supplies long before the terms became buzzwords. These ecologically sound products and the personal integrity of Van Andel and DeVos made it impossible for detractors to tarnish the business, although some tried.

Mike Wallace of the Columbia Broadcasting System (CBS), reputedly one of the most hard-hitting interviewers on television, took on Van Andel in a segment of the weekly newsmagazine *Sixty Minutes*. Soon after the taping, Wallace talked about the interview with newsman Larry King. Wallace admitted that he began his Amway investigations with preconceived negative ideas, but that "my attitude is now so positive, this is going to sound like an Amway commercial." He went on to say, "Their [Amway's] products are good" and "the people in Ada [Michigan] are first-rate."

Van Andel was a fixture on the *Forbes* magazine billionaire lists, once placing as high as number ten. He neither confirmed nor denied the magazine's reports, and because Amway was a privately held company, he was not required to do so.

Amway sales climbed to $7 billion annually in the late 1990's. This revenue, along with prudent investments, allowed Van Andel to become rich and live a lifestyle far beyond the wildest dreams of most people. He owned boats, planes, and lavish residences in Ada and on Peter Island in the British Virgin Islands. However, he never strayed from his roots and Calvinistic upbringing. He believed that the amount of money accumulated during one's lifetime did not matter; what mattered was how that wealth was used and how much good one did with it. Van Andel was successful on both fronts. He amassed an impressive fortune, and he practiced good stewardship with the riches he deemed a gift from God.

Van Andel undertook other business ventures, including refurbishing the Pantlind, a beautiful old hotel in Grand Rapids. The hotel reopened as the Amway Grand Plaza in 1981 and with the adjoining Grand Plaza Tower is recognized as a world-class hotel. Amway itself underwent changes under the next generation of Van Andel and DeVos leadership. Alticor, formed in 1999, is the parent company for Amway, Amway Global, and the Access Business Group. Quixtar, an Internet business, is part of Amway Global.

As a firm believer in a free enterprise system in which small businesses can flourish, Van Andel worked hard for the United States Chamber of Commerce, where he was elected to the board of directors. He served fourteen

years, including a term as chairman, and he used that time to further the message that "industry, not government, is the best source of economic growth."

Van Andel died of natural causes on December 7, 2004, at the age of eighty, almost a year after his wife Betty died on January 19, 2004.

LEGACY

It takes only a drive through Grand Rapids to see firsthand the legacy of Jay Van Andel. In addition to supporting his church (La Grave Avenue Christian Reformed), Christian Schools International, and conservative political causes, he gave lavishly to the community in which he attained his great wealth. Beneficiaries of his largesse include the Van Andel Museum Center at the Grand Rapids Public Museum; Van Andel Arena, a concert and professional sports venue; the Van Andel Education Institute; and the Van Andel Plaza at Hope College in Holland, Michigan.

The Van Andel Research Institute, founded by Jay and Betty Van Andel in 1996, is a medical research facility where advances continue to be made in cancer diagnosis, treatment, and prevention. In 2009, Van Andel's son, David, was chairman and chief executive officer of the institute. Some might argue that Van Andel's greatest legacy is a family actively involved in maintaining both the family business and following his example in giving back to the community with a generosity matched by few others.

GRAND RAPIDS PUBLIC MUSEUM

When the Grand Rapids Public Museum outgrew its facility, Jay and Betty Van Andel contributed $3 million toward a new building, the Van Andel Museum Center, that opened in 1994. The museum, established in 1854, describes itself as "a collections-based educational organization that explores and celebrates the world and our [Grand Rapids] place in it." In 1971, it became the first museum to be accredited by the American Association of Museums.

The Van Andel Museum Center is the museum's main building, housing permanent exhibits, such as Furniture City, Streets of Old Grand Rapids, and Anishinabek, among others. In the mid-1800's, Grand Rapids earned the name "Furniture City," a title it held for more than one hundred years. The museum celebrates this phase of local history with examples of fine, locally made pieces, re-creations of pieces made at the Phoenix Furniture Factory and at designer Frank Davidhazy's studio, and interactive displays detailing the manufacturing process and the men and women who created the furniture.

The Streets of Old Grand Rapids is a three-quarter-scale replica of historically accurate 1890's shops and businesses, an opera house, gaslights, a streetcar, and a Queen automobile made in 1904. Anishinabek, or the People of This Place, honors the three tribes—Ottawa, Potawatomi, and Chippewa—that populated West Michigan before the English, Dutch, Poles, Germans, Lithuanians, Africans, and Asians discovered the region.

Another museum highlight, the Roger B. Chaffee Planetarium, is named for the Grand Rapids astronaut who died at the John F. Kennedy Space Center in 1967, when a fire struck the launchpad during a pretest flight of his plane. Astronauts Virgil I "Gus" Grissom and Edward H. White were also killed in the fire. The planetarium offers state-of-the-art seasonal and special shows, complete with special effects, digital sound, and laser images providing entertainment along with education.

Young and old visitors enjoy choosing their mounts on the 1928 Spillman Carousel. A giraffe, camel, goat, tiger, lion, and more than forty exquisitely carved horses prance to music provided by a Wurlitzer organ. The carousel is located in the Cook Pavilion of the main building, on the Grand River.

The Van Andel family maintains its ties to the museum. Jay and Betty's daughter-in-law, Carol, the wife of their son, Dave, served on the board of directors in 2009.

Consuelo Vanderbilt

American socialite and philanthropist

Among America's best-known heiresses, Vanderbilt was forced into marriage with an English nobleman. Bitterly unhappy and hearing impaired, she began major philanthropic work, which continued during her separation, divorce, and successful remarriage. Returning to America in 1940, she recorded these events in a best-selling memoir.

Born: March 2, 1877; New York, New York
Died: December 6, 1964; Southhampton, Long Island, New York
Also known as: Duchess of Marlborough; Consuelo Balsan
Source of wealth: Inheritance
Bequeathal of wealth: Children; relatives; friends; employees

Early Life

Consuelo Vanderbilt (kon-SWAY-loh VAN-duhr-bihlt) was the only daughter of William Kissam Vanderbilt, heir to a fortune estimated at between $40 and $65 million of the $200 million amassed by his grandfather, Cornelius Vanderbilt, and his father, William Henry Vanderbilt. Consuelo's mother was the impoverished, ruthlessly ambitious Alva Ertskin Smith Vanderbilt Belmont, who would divorce Vanderbilt, later marry millionaire Oliver Belmont, and become a woman's suffrage movement leader. Alva determined to control Consuelo, isolating her from outside influences and training her for an international marriage. Consuelo spoke and read fluent English, German, and French by age eight and hoped to study languages at Oxford University. Instead, Alva arranged a marriage with Charles Richard John Spencer-Churchill, ninth duke of Marlborough. The much-publicized wedding took place on November 6, 1895.

First Ventures

Openly contemptuous of Americans, the duke of Marlborough needed wealth to maintain Blenheim Palace, his beloved family home. As Consuelo's marriage settlement, he received $2.5 million worth of Vanderbilt money, and both he and Consuelo received $100,000 annually. As Consuelo recorded in her 1952 memoir, *The Glitter*

Consuelo Vanderbilt. (Hulton Archive/Getty Images) *and the Gold*, she was miserable, lonely, and idle as mistress of Blenheim, especially after her hearing failed. British elitism offended her, but when she paid workmen during a period of economic hardship, her husband was enraged; he used the money to adorn himself and his estate. Consuelo and the duke had two children, John, the future tenth duke of Marlborough, and Ivor. She found some relief from boredom in caring for tenants on the estate. When her husband left for the Boer War in 1899, she joined with other American-born women to raise $200,000 to provide a hospital ship for British troops, although she did not approve of the imperialistic war. This was her first major step toward finding her own voice and direction.

Mature Wealth

Separating from Marlborough in 1906, Consuelo settled at Sunderland House, London, part of her divorce settlement, along with joint custody of her sons. Her divorce was final in 1920, shortly after her father gave her an additional $15 million. Her father died in 1920, and she was among his heirs. On July 4, 1921, Consuelo married wealthy French industrialist and famed pilot Louis Jacques Balsan. They lived in France until 1940, when they fled from Nazi invaders, having heard that Consuelo was to be captured and held for ransom.

Consuelo used her wealth for causes primarily benefiting women and children, although she was never committed to radical political activities. She served on the London County Council, and her publications include a three-part essay, "The Position of Women," in the *North American Review* (1909). In England, she helped finance and raise funds for a women's college, a shelter where convicts' wives could earn money, lodging houses, and insurance plans for working and poor women. She chaired the American Women's War Relief Fund during World War I, financing a four-hundred-bed military hospital. In France, she established a hospital and a sanatorium for sick children. She received the French Legion of Honor in 1931.

Returning to America, she retired from public life. Her husband and younger son died in 1956. At her death in 1964, she left an estate estimated at between $1 and $2 million.

Legacy

During Consuelo Vanderbilt's lifetime, higher education and some professions were opening to women, but these opportunities were of most benefit to middle-class women. The very poor and very rich alike were viewed as commodities, with poor women destined to a life of drudgery and rich women expected to enhance their families' social prestige. When the pain of her marriage forced her into self-awareness, Consuelo was one of the few wealthy women who broke out of their gilded prisons to use their wealth for the good of the larger community.

Cornelius Vanderbilt

American steamship and railroad magnate

Vanderbilt established the personal fortune that would be passed down to generations of his family and would make his name synonymous with American wealth. He amassed his fortune through his ownership of steamboat and railroad lines, often resorting to manipulative business practices to drive out his competitors.

Born: May 27, 1794; Port Richmond, Staten Island, New York
Died: January 4, 1877; New York, New York
Also known as: Cornelius Vanderbilt; The Commodore
Sources of wealth: Transportation systems; railroads; investments
Bequeathal of wealth: Spouse; children; educational institution

Early Life

Cornelius Vanderbilt (kor-NEEL-yihs VAN-duhr-bihlt) was born in 1794 in a farming village on Staten Island, New York. He was the fourth of nine children born to Cornelius and Phebe Hand Vanderbilt. His family were middle-class workers who raised livestock, farmed their land, paid their taxes, and attended Moravian church services. Vanderbilt was the first of his family to demonstrate an ambition for achievement and wealth. He was known for his willfulness, fierce independence, stubbornness, and elevated physical energy. He disliked weakness and admired strong and independent individuals.

At age thirteen, Vanderbilt chose to work on the family farm and a local ferry instead of completing his education. By this time, his older brother had died, and his parents needed his help on the farm. He discovered he did not like farming but loved the water. Vanderbilt chose to learn and work in the ferry business, physically difficult work which he enjoyed.

First Ventures

Vanderbilt approached his frugal mother Phebe when he was sixteen years old, asking for a loan of $100 to buy a boat that could carry twenty passengers. She agreed to make the loan, but he had to work for it by plowing eight acres of farmland. He found some friends who would help him plow in exchange for the excitement of future fishing trips and rides on his boat. With his mother's loan, he bought his first periauger, a two-masted sailboat, and established a ferry that carried passengers between Manhattan and Staten Island. A year later, he returned the $100 to his mother along with a $1,000 bonus, and in subsequent years he gave her $1,000 annually to cover family expenses. Vanderbilt soon acquired interests in several other boats, beginning his career in the transportation industry.

At nineteen, Vanderbilt married Sophia Johnson, his first cousin, and he worked constantly to build his wealth. In 1814, following the War of 1812, he signed a lucrative service contract with the U.S. military, securing twice as much business. With his profits from this venture, he built a schooner, and he and his brother-in-law later built an even larger sailboat. He banked the sum of $9,000 when he was twenty-three, having saved $3,000 a year for the past three years.

Mature Wealth

Vanderbilt realized that the steamboat would revolutionize transportation, and in 1818 he went to work for a steamboat company that operated in New York City and New Jersey. He initially earned $1,000 a year as a steam-

Vanderbilt University

Despite his great wealth, transportation mogul Cornelius Vanderbilt made few charitable donations. However, during his lifetime he performed one major act of philanthropy—providing the funds to establish Vanderbilt University in Nashville, Tennessee.

A self-made man with little formal education, Vanderbilt did not value intellectualism. However, after a discussion with his friend, the Reverend Dr. Deems of the Church of Strangers, Vanderbilt expressed some interest in funding a Moravian university. Deems, who had been a clergyman in the South, believed that the proposed university should be located in the South to enable this area of the United States to reconcile with the North after the Civil War.

Deems knew Holland N. McTyeire, a bishop in the Southern Methodist Church and a cousin of Vanderbilt's second wife. McTyeire went to New York for medical treatment in 1873, and while there he recuperated in Vanderbilt's mansion. Vanderbilt was impressed with McTyeire, and he agreed to support a university in the South that would "contribute to strengthening the ties which should exist between all sections of our common country." In 1873, Vanderbilt donated an initial $500,000 to build Central University of Nashville, eventually renamed Vanderbilt University. He would later provide another $500,000, although his $1 million contribution was less than 1 percent of the net worth of his estate.

During the university's first forty years, the Methodist Episcopal Church, South, provided oversight for the school. However, in 1914, the school's self-governing board of trust discontinued the university's relationship with the church. By 1963, Vanderbilt had gained recognition as one of the top twenty private universities in the United States and maintained that ranking into the twenty-first century.

In 2009, Vanderbilt's annual enrollment was more six thousand undergraduates and more than five thousand graduate and professional students. The campus had ten schools, a public policy center, a medical center, and The Freedom Forum First Amendment Center. The nation's largest collection of network newscasts is housed at the Vanderbilt Television News Archive. The Vanderbilt-Ingram Cancer Center is designated as a comprehensive care center by the National Cancer Institute, one of forty-one such centers in the United States and the only one in Tennessee. In 2007, the Vanderbilt School of Medicine ranked tenth in National Institutes of Health funding with $282.3 million, an increase of $36.7 million from the previous year. Vanderbilt Hospital provided $183 million in charity care in 2008. Hospital services include a trauma center; an adult and pediatric burn center; a comprehensive children's hospital, with nineteen specialties and a neonatal intensive care unit; and the state of Tennessee Poison Control Center and Organ Transplant program.

boat captain, and he learned everything he could about the steamboat business. After more than a decade in this job, he resigned and in 1829 started his own steamboat line. His company operated between New York City and Philadelphia, earning Vanderbilt profits of $30,000 in the first five years and $60,000 in the following years.

He subsequently established steamboat lines that operated between New York City and Peekskill, New York, and between New York City and Albany. These and his other steamboat lines faced stiff competition from rival companies. However, Vanderbilt developed a successful strategy of slashing his rates, which would increase his business, eventually driving out his competitors or forcing him to sell out.

By age forty, Vanderbilt had accumulated $500,000. He continued to watch for trends in the transportation business and to capitalize on them for his personal gain. He was reported as saying that he had been successful because he kept to his own business and kept his business dealings secret until after he had completed them. This strategy proved strategic in the competitive world of transportation.

By 1846, Vanderbilt was worth several million dollars. He had also acquired a nickname, The Commodore, because of the profits he generated from his steamboats. He increased his earnings by more than $1 million annually after the 1849 California gold rush, when he recognized that would-be prospectors from the East Coast would need to travel to the goldfields. Vanderbilt founded the Accessory Transit Company, which transported passengers to Nicaragua and then to San Francisco at half the price of a rival firm. His company provided this service for about nine years, earning Vanderbilt about $10 million.

Although The Commodore seldom revealed the value of his wealth, by some estimates he had about $7 million in assets, while continuing to earn around $100,000 per month in income from his steamboat business. This business would eventually generate around $20 million for Vanderbilt.

As early as the 1840's, Vanderbilt realized that the railroads would result in decreased steamboat travel. In 1849, he became a director of the New York and New Haven Railroad after buying stock in the line. He subsequently became a director of the New York and Harlem Railroad, which operated in New York City.

Among his railroad ventures, he purchased the stock of the New York and Hudson Railroad for $25 a share, and the price climbed to $150 in less than one year. In the end, Vanderbilt made about $3 million in this stock deal and gained control of the line's management. He entered into a bidding war with competitors over stock in the New York and Harlem Railroad, finally selling his stock for $285 per share, which generated proceeds of slightly less than $25 million. As a result of this bidding war, he gained control of the Harlem line in 1863 and became its president. He sought to merge rail lines, improve them, manage them with fewer overhead expenses, and increase his profits.

In 1867, Vanderbilt acquired control of the New York Central Railroad, and two years later he merged this line with his Hudson River Railroad, creating the New York Central and Hudson River Railroad. His other rail lines, including the New York and Harlem Railroad and railways operating in the Midwest and Canada, were operated as a part of the New York Central.

Vanderbilt was not known as a philanthropic businessman, but before he died he funded Vanderbilt University in Nashville, Tennessee, with a donation of $1 million. At his death in 1877, this father of thirteen children left an estate worth $105 million. In 2007, *The New York Times* reported Vanderbilt's wealth to be $143 billion in 2007 dollars.

Legacy

Cornelius Vanderbilt's affluence was the result of long hours of work, manipulative business practices, and personal sacrifice. He followed his instincts as a young man and built his business on the water, which he loved. Ever vigilant of the trends in transportation, he moved his interests from sailboats to steamboats to railroads. He was diligent in his pursuit of money and provided reduced prices and desired services for his customers. Vanderbilt was severely competitive, tireless, and reliable, but he was also frugal; all of these characteristics built the Vanderbilt fortune.

Gloria Vanderbilt

American businesswoman, socialite, and author

An heir to the Vanderbilt family fortune when she was only fifteen months old, Gloria Vanderbilt became a textile and fashion designer, actor, artist, perfume manufacturer, and author.

Born: February 20, 1924; New York, New York
Also known as: Gloria Laura Morgan Vanderbilt; Gloria Vanderbilt DiCicco; Gloria Vanderbilt Stokowski; Gloria Vanderbilt Lumet; Gloria Vanderbilt Cooper
Sources of wealth: Inheritance; sale of products; writing; investments
Bequeathal of wealth: Unknown

Early Life

Gloria Laura Morgan Vanderbilt (VAN-duhr-bihlt) was the daughter of Gloria and Reginald Claypoole Vanderbilt. Her father was the grandson of transportation magnate Cornelius Vanderbilt. When she was only fifteen months old, her father died, leaving her a $4 million trust fund. After she gained access to these funds, Vanderbilt and her mother moved to Paris, where her mother enjoyed a socialite's lifestyle.

In a highly publicized legal battle, Reginald's aunt, sculptress Gertrude Vanderbilt Whitney, sought custody of Gloria, and Gloria began living with her aunt in 1931. Gloria enrolled in the Mary C. Wheeler School in Providence, Rhode Island, and in Miss Porter's School in Connecticut. She discovered her love for the arts and began keeping a journal, which helped with her later writing.

Vanderbilt left school at age seventeen, and in 1941 she married Pasquale DiCicco, an actors' agent. This marriage lasted until 1945, and that same year Vanderbilt wed conductor Leopold Stokowski, with whom she had two sons, Stanislaus, born in 1950, and Christopher, born in 1955. She divorced Stokowski in 1955, and the next year married her third husband, director Sidney Lumet.

First Ventures

Vanderbilt wrote her first book, *Love Poems*, published in 1955. She based this book on her diaries. Other books would follow. In the mid-1950's, Vanderbilt trained to be an actor at the Neighborhood Playhouse School of the Theater in New York City, and she made her debut in the play *The Swan*. She had several roles on television programs, including appearances in two episodes of *Studio One* in 1957; in a play directed by Lumet, *Dog in a Bush Tunnel*, which aired on *Kraft Televison Theatre* in 1958; and in an episode of the television series *Adventures in Paradise* in 1960. She also performed in a Broadway play and summer stock. Her acting brought her publicity, acclaim, and income.

Gloria had studied art at New York's Art Students League before she married her fourth husband, Wyatt Emory Cooper, in 1963. She and Cooper had two sons, Carter (1965-1988) and Anderson, born in 1967. Cooper encouraged her to pursue her artwork, and she began to give one-woman shows of oils, pastels, and watercolors.

Mature Wealth

In 1968, Vanderbilt began to design linens, china, glassware, and flatware for Hallmark Paper Products and textile manufacturer Bloomcraft, which adapted her designs and licensed her work. By 1970, the name "Gloria Vanderbilt" appeared on eyeglasses and clothing, notably on her collection of high-end jeans, which she introduced in the mid-1970's. The following decade, she began marketing her perfume, Glorious. These products carried her logo of a swan, a reference to her favorite acting role in the play *The Swan*.

In the 1980's, Vanderbilt's attorney, Thomas A. Andrews, and her psychiatrist, Christ L. Zois, founded a design company. Vanderbilt sued the two men, alleging that by establishing their business they had colluded to defraud her of her $2 million line of home furnishings. An extensive court case was settled in her favor, and the two partners lost their licenses to practice law and psychiatry. The court awarded Vanderbilt damages in the amount of $1.6 million, but she never obtained the vast majority of this sum. When she had to sell her town house to pay her back taxes, Vanderbilt, a widow after Cooper's death in 1978, realized she needed additional income.

She received royalties from her nonfiction books. Three of of her earliest books were *The Gloria Vanderbilt Book of Collage* (1970), *Paintings and Crayon Drawings* (1977), and *Woman to Woman* (1979), in which she provides practical advice to other women. She used her diaries to prepare the autobiographical *Once upon a Time: A True Story* (1985); *Black Night, White Night* (1987); *A Mother's Story* (1996), which described her son Carter's suicide; and *It Seemed Important at the Time: A Romance Memoir* (2004). These successful books were able to increase her income. Vanderbilt also wrote works of fiction, including *Never Say Good-Bye* (1989), the semifactual *The Memory Book of Starr Faithfull* (1994), *Stories and Dream Boxes* (2002) with Richard Burgin, and *Obsession: An Erotic Tale* (2009).

Legacy

The public's interest in Gloria Vanderbilt's family and her inherited wealth enabled her to successfully market her fashions, perfumes, art, and books, which in turn increased her fortune. At the age of eighty-six, she continued to write books. Other writers have found Vanderbilt to be a subject of interest. Truman Capote claims to have based the character Holly Golightly in his novella *Breakfast at Tiffany's* on Vanderbilt. *Little Gloria . . . Happy at Last*, a television miniseries about her great-aunt's battle to retain custody of the young Vanderbilt, aired in 1982. Anderson's children, including her son Anderson Cooper, a television newsman, are also a legacy of this artist, writer, socialite, and businesswoman.

William Henry Vanderbilt
American railroad magnate

Vanderbilt inherited $100 million when his father, Cornelius Vanderbilt, died. Vanderbilt expanded the family's railroad empire, amassing a fortune of almost $200 million by the time of his death.

Born: May 8, 1821; New Brunswick, New Jersey
Died: December 8, 1885; New York, New York
Sources of wealth: Inheritance; railroads
Bequeathal of wealth: Spouse; children; charity

Early Life

William Henry Vanderbilt (VAN-duhr-bihlt) was born on May 8, 1821, to Cornelius and Sophia Vanderbilt. As a child, William was frail and often sickly. Because of his ill health, his father never thought much of William and regularly insulted him. Even into adulthood, Cornelius believed that William was not smart enough to run the family business and called him names like "beetlehead," "blockhead," and "good for nothing." When William was a teenager, Cornelius got him a job in a New York banking house. The two men had a falling-out when William was nineteen and decided to marry Maria Louisa Kissam. Cornelius felt that his son's decision to marry the daughter of a poor minister from Brooklyn exhibited bad judgment.

First Ventures

Cornelius bought a seventy-acre farm on Staten Island and sent William to run it. All eight of William and Louisa's children were born while living on the farm. Under his management, the farm grew to 350 acres and became increasingly profitable.

It was at William's urging that the Vanderbilts entered the railroad business. In 1857, he convinced his father to put him in charge of the small Staten Island railroad that was bankrupt. William expanded the railroad, and soon it was turning a profit. By this point, his father had started to take notice of his "blockhead" son's business sense.

Cornelius moved William and his family back to Manhattan in 1864. By then, Cornelius had left the steamboat business and had bought the New York and Harlem Railroad. He made William a vice president of this line. After his father took over the New York and Hudson River Railroad, William also became vice president of this railway.

The two men worked together for several years, during which William learned a great deal about his father's business. He also made suggestions for expanding the family's growing railroad empire. It was William who encouraged his father to buy the Michigan Central Railroad and the Lake Shore and Michigan Southern Railway. The Vanderbilts' New York railroad was now connected with Detroit and Chicago.

Mature Wealth

As Cornelius reached old age, he decided he would not fragment the family fortune by dividing it equally among his many children. Upon his death in 1877, Cornelius left $200,000 to each of his eight daughters. His son, Cornelius Jeremiah, who was a drunken gambler and could not be trusted with the business, received $300,000. The bulk of Cornelius's estate, $100 million, was bequeathed to William. The other Vanderbilt children sued William for a larger share of the inheritance. He agreed to pay each of his sisters an additional $500,000, and he made a similar deal

Vanderbilt Mansions

William Henry Vanderbilt's elaborate Fifth Avenue mansion covered the entire block from Fifty-first to Fifty-second Street. Construction of the New York City residence began in 1879. The original plans called for the home's facade to be made of white marble. However, Vanderbilt was in declining health, and he did not want to wait for the marble to be quarried and sent to New York. Instead, he constructed the mansion with brownstone, which could be quarried in New Jersey or Connecticut. More than six hundred men labored day and night for a year and a half to build the mansion.

The Vanderbilt family moved into the residence in January, 1881. William, his wife, Maria, and their teenage son, George, lived in the southern half of the mansion, while the northern half was divided into two parts and shared by William's daughters Emily and Margaret and their husbands. New York residents commonly referred to the home as the "twin Vanderbilt mansions."

The mansion was five stories high but from the outside appeared to have only three stories. The cost of the residence was more than $3 million, exclusive of its furnishing. The ornamentation and furnishing of the mansions took an additional two years to complete. Visitors entered a large foyer, shared by the three sections of the house, that contained a skylight made out of stained glass. The public was allowed to view Vanderbilt's extensive art collection by invitation on Thursdays.

Four of Vanderbilt's children also built mansions in New York City. His daughter Lila and her husband, William Seward Webb, built their residence on Fifth Avenue near Fifty-third Street, adjacent to Saint Thomas Church. Daughter Florence and her husband, Hamilton Twombly, lived in a mansion next door. William Kissam Vanderbilt and his wife, Alva Ertskin Smith Vanderbilt Belmont, had their mansion built in the style of a French château at the northwest corner of Fifty-second Street and Fifth Avenue. Six blocks away, Cornelius Vanderbilt II lived with his wife, Alice, at Fifth Avenue and Fifty-seventh Street. The family also bought a number of lots along Fifth Avenue, and the area was soon known as Vanderbilt Row. However, by 1947 all of the Vanderbilts' New York City mansions had been torn down.

The Vanderbilts constructed mansions in many other locations, including the country home built by William Henry's son Frederick William Vanderbilt in Hyde Park, New York. Frederick remodeled the mansion that was on the site when he purchased it. The northern and southern wings of the residence were removed and then expanded. A pavilion was built to temporarily accommodate the family until the mansion was completed. Frederick summered at the mansion until his death in 1938. After his death, the estate was given to his wife's niece. She gave the mansion to the federal government in December, 1940, and the government declared it a National Historic Site and opened it to the public.

William Henry's youngest child, G. W. Vanderbilt II, constructed Biltmore, a country home located in Asheville, North Carolina, which in the early twenty-first century was still owned by members of the family. The Biltmore mansion contains four acres of floor space, with 250 rooms, making it the largest privately owned home in the United States. It is open to the public and includes an inn and winery on the seventy-five-acre property. G. W.'s widow sold eighty-five thousand acres of the property to the government, which preserved it as a national forest.

with his brother. Having satisfied his siblings, William established himself as the new head of both the Vanderbilt family and the railroad empire.

Vanderbilt continued to expand his railroad company in the Midwest, including the cities of St. Louis and Indianapolis. He acquired the Chicago and Northwestern; Nickel Plate; and Cleveland, Columbus, and Cincinnati Railroads, as well as other rail lines. In 1879, Vanderbilt sold more than half of his shares of stock in the New York Central Railroad in an attempt to quiet antimonopoly activists and negative coverage from news reporters. He hired a young financier, J. P. Morgan, to handle the sale without causing the price of the stock to plummet. Morgan sold the shares, brought in a number of European investors, and received $30 million for the stock. Vanderbilt paid Morgan's investment group $3 million in commissions and gave Morgan a position on the New York Central's board of directors.

Vanderbilt is probably best remembered for a statement he made to a reporter in October, 1882. When asked whether he felt that railroads should be run for the benefit of the public, Vanderbilt answered that he was working for his stockholders and, "the public be damned!" The railroad industry at this time was highly competitive. Smaller companies would often build rail lines nearby the operations of larger railroads and then charge lower rates than their larger competitors. The small lines hoped that the larger companies would then buy them out. Shortly after Vanderbilt bought the Nickel Plate Railroad, the West Shore Railroad began advertising competing fares and faster routes. The Pennsylvania Railroad was rumored to be buying large amounts of stock in West Shore, expecting to profit when Vanderbilt's New York Central bought out the company. Vanderbilt, however, opted to start a rate war to force the Pennsylvania Railroad out of business. In 1883, Vanderbilt retaliated against the Pennsylvania line by purchasing controlling stock in the Southern Pennsylvania Railroad. Vanderbilt had also made a deal with the major steel producers in Pittsburgh, who were unhappy with the Pennsylvania Railroad. He then conducted a two-year survey of the state of Pennsylvania and began building tracks rivaling the Pennsylvania Railroad's routes. In 1885, Morgan negotiated a deal that gave the Pennsylvania Railroad control of the Southern Pennsylvania and Beech Creek Railroads. In exchange, Vanderbilt was able to buy out the bankrupt West Shore. In the late 1930's, Vanderbilt's planned Pennsylvania rail routes were turned into the country's first turnpike, a testament to his extensive surveying and planning.

As the head of a corporate empire, Vanderbilt felt he needed a home that reflected his status. He purchased the block of Fifth Avenue in New York City between Fifty-first and Fifty-second Streets, the site of a run-down mansion that had been damaged during the 1863 draft riots. Vanderbilt had two massive homes built on the block beginning in 1879, and he and his family moved in two years later. The mansion on the southern section of the property, at the corner of Fifth Avenue and Fifty-first Street, was the home of William, Louisa, and their teenaged son George. The residence on the northern section was divided in two parts and was occupied by Vanderbilt's daughters Emily and Margaret and their husbands.

Vanderbilt was generous with his fortune. In 1869, an ancient Egyptian obelisk, known as Cleopatra's Needle, was given to the United States. Vanderbilt paid all the expenses to transport the gift from Egypt to America, where it was erected in Central Park in 1881. The obelisk is located across the street from the Metropolitan Museum of Art. In 1884, Vanderbilt gave $100,000 to Vanderbilt University in order to finance a theological school. That same year he also donated $500,000 to create Columbia University's College of Physicians and Surgeons.

William Henry Vanderbilt died in his home, unexpectedly, around two o'clock in the afternoon on December 8, 1885. Unlike his father, William divided his nearly $200 million fortune more equally among his widow, sons, and a number of charities. He left $200,000 to Vanderbilt University, $100,000 to St. Luke's Hospital, $100,000 to the New York YMCA (Young Men's Christian Association), $100,000 to the Metropolitan Museum of Art, $50,000 to the American Museum of Natural History, and $450,000 to other charities and religious organizations.

Legacy

William Henry Vanderbilt first interested his family in the railroad business, convincing his father Cornelius to let him run a small rail line in 1857. Vanderbilt surprised his father with his financial and business abilities, and he later extensively increased the railroad empire he inherited from his father. In the less than nine years that Vanderbilt lived after Cornelius's death, he almost doubled the family fortune to nearly $200 million. Vanderbilt also secured his family's place in society and built two elaborate mansions on Fifth Avenue in New York City. He filled his home with one of the largest private collections of artwork and sculpture in the world. Several of his descendants followed his example by building extravagant mansions of their own. William was also a great philanthropist, donating hundreds of thousands of dollars to various hospitals, museums, churches, universities, and other organizations.

Stephen Van Rensselaer III

American landowner, military leader, and politician

Van Rensselaer was in effect the last patroon of Rensselaerswyck, a huge quasi-feudal estate in east-central New York that he had inherited from his Dutch forebears. His public service and charitable ventures earned him the nickname "The Good Patroon."

Born: November 1, 1764; New York, New York
Died: January 26, 1839; Albany, New York
Also known as: The Good Patroon
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Spouse; children; educational institution

Early Life

Stephen Van Rensselaer (van REHN-suh-lihr) III was born into a rich and famous family. His father, Stephen Van Rensselaer II, was a descendant of Kiliaen Van Rensselaer, a jewel merchant in Amsterdam, who, through an agent, had bought a vast tract of land in New Netherland from the Mohawks and Mohicans in 1630. Eventually the estate, Rensselaerswyck, in what is now the state of New York, stretched twenty-four miles along the Hudson River and twenty-four miles on each side and included thousands of tenants. In 1763, Stephen Van Rensselaer II married Catherine Livingston, whose father, Philip Livingston, would sign the Declaration of Independence in 1776. The family's big house at Albany was not yet completed, so the couple initially lived with Catherine's parents in New York City, where Stephen Van Rensselaer III, their first child, was born on November 1, 1764. The next year the young parents moved with their son to Albany.

First Ventures

When Stephen Van Rensselaer II died in 1769, Stephen Van Rensselaer III became the new patroon, although his mother and an uncle were in charge of the family's lands. In the New Netherland colony, a patroon was a landholder with manorial rights to large tracts of property.

After receiving a general education at home and elsewhere and learning Latin and Greek, Van Rensselaer entered the College of New Jersey, now Princeton University, but eventually transferred to Harvard University, from which he earned a bachelor's degree in 1782. Within a year, on June 6, 1783, Van Rensselaer married his cousin Margarita Schuyler, whose father had served as an American general in the Revolutionary War and would later represent New York in the U.S. Senate. This marriage made Van Rensselaer the brother-in-law of Alexander Hamilton, who had married Margarita's sister Elizabeth in 1780 in a ceremony at which Van Rensselaer's stepfather, the Reverend Eilardus Westerlo, had presided.

On November 1, 1785, upon reaching his majority, Van Rensselaer, along with his wife and their baby daughter, moved from Westerlo's parsonage, where they had been living, to the Rensselaerswyck manor house, and Van Rensselaer's mother and stepfather moved to the parsonage. Van Rensselaer himself now controlled his lands and the immense rent they brought in money and agricultural commodities.

Mature Wealth

With great riches and a distinguished family, Van Rensselaer had an inclination toward public life, despite his lack of showmanship. A Federalist during the years when Hamilton's Federalist Party existed, Van Rensselaer served in the New York Assembly from 1789 to 1790 and in the New York Senate from 1790 to 1795. As a state senator, he voted in 1792 for the gradual elimination of slavery in New York. That same year, some of his tenants challenged his legal title to his land; that incident, combined with his generosity, led to his leniency in collecting rents. From 1795 to 1801, Van Rensselaer served as New York's lieutenant governor, while the Federalist leader John Jay served as governor.

The year 1801 was a time of loss. Van Rensselaer's gubernatorial campaign failed, and in March his wife died, survived by one son but preceded in death in 1787 by her daughter and another son. In 1802, Van Rensselaer married Cornelia Paterson, the daughter of William Paterson, an associate justice of the U.S. Supreme Court. The couple eventually had three daughters and six sons, thus creating a large number of heirs to the Van Rensselaer fortune.

The biggest challenge in Van Rensselaer's public life came in 1812, when Congress declared war against Great Britain. Daniel D. Tompkins, the governor of New York and a member of the Democratic-Republican Party, asked Van Rensselaer to command the state militia. By appointing a political foe to the position, Tompkins hoped to win Federalist support for the war. Recognizing his own initial opposition to the war and his military inexperience, Van Rensselaer nevertheless accepted the appointment, with the understanding that he would rely on a militarily experienced cousin for advice. Motivated by a sense of obligation as a wealthy public man and by a dread of being called cowardly if he remained a civilian, Van Rensselaer faced a nearly impossible task in trying to transform underfed, ill-equipped, untrained, inexperienced, long unpaid, and often insubordinate militiamen into an army that could not only defend New York along its western boundary but also take control of Upper Canada before winter. Suspecting that his American political enemies might accuse him of treason if he did not invade Canada, Van Rensselaer launched an attack on October 13, 1812, from Lewiston, New York, across the Niagara River against the British and their allies near Queenston. The Americans captured Queenston Heights, but they could not move enough fighting men across the river fast enough to stave off the British counterattack. The day ended with Van Rensselaer's cousin severely wounded and with the Americans in Canada surrendering. On the New York side of the river, Van Rensselaer arranged a truce, and he soon relinquished his command and returned to civilian life.

The Rensselaer Polytechnic Institute

Writing on November 5, 1824, to the Reverend Samuel Blatchford, Stephen Van Rensselaer III established what is now Rensselaer Polytechnic Institute (RPI), the oldest degree-granting, continuously operating technological school in an English-speaking country. Blatchford became the school's first president, while Amos Eaton, as senior professor, and Lewis Beck, as junior professor, were its first faculty members. Located in Troy, New York, and initially called the Rensselaer School, the institute's purpose, according to Van Rensselaer, was to prepare its students to apply science to life's ordinary experiences, focusing on the training of individuals who would teach students in the New York public schools to apply scientific principles to farming, housekeeping, and manufacturing.

Instruction began on January 3, 1825, with ten students. Supported in large part by Van Rensselaer's money and energized by Eaton, the Rensselaer School held its first graduation ceremony on April 25, 1826, and it officially became the Rensselaer Institute in 1832. In 1835, the institute broadened its purpose beyond Van Rensselaer's goal of training science teachers. In this year, it began offering two degrees—bachelor of natural science and civil engineer.

The relationship between the Van Rensselaers and the institute inevitably changed over time. Even before Stephen Van Rensselaer died, his son Cortlandt had told Eaton that the institute should not depend on the family's patronage. Shortly after Van Rensselaer's death in 1839, Eaton told Philip Van Rensselaer, a trustee and Stephen's son, that his father had promised the Rensselaer Institute $10,000 if the citizens of Troy gave an equal sum. Philip's brother Alexander replied, saying that even if his father had said so, the promise was no longer binding. However, in 1844, two years after Eaton's own death, the city of Troy donated real estate worth $6,500 to the institute, and William Van Rensselaer, another of Stephen's sons, provided a matching endowment. The direct connection between Stephen Van Rensselaer's children and the institute continued for more than two decades until William and Alexander finished their terms as trustees.

The institute prospered academically from 1847 to 1859, with Benjamin Franklin Greene as senior professor. Greene began using the name "Rensselaer Polytechnic Institute" and referring to himself as "director," although those names did not become official until 1861. A period of academic contraction began in 1871, when for fourteen years the only degree offered was in civil engineering. Under Palmer C. Ricketts, however, the institute expanded enormously. Ricketts became director in 1892, and in 1901 he also became president. Through his leadership until his death in 1934, the institute built extensively on its main campus, expanded its offerings, and began a program leading to master's degrees and doctorates. Despite what Stephen Van Rensselaer said in his letter to Samuel Blatchford, the institute does not have a school of education or agriculture, nor has it a department of home economics. Nevertheless, since Ricketts's death, through good times and bad, the school has continued to be a leader in technological education.

Despite the defeat, almost inevitable under the circumstances, Van Rensselaer remained respected, as well as rich, and he ran again for governor in 1813, when he failed to unseat Tompkins. Later in the decade, Van Rensselaer returned to the New York Assembly, and in 1821 he participated in a New York constitutional convention, as he had done twenty years earlier. From 1823 to 1829, he served in the U.S. House of Representatives, where he worked to attain better discipline in the state militias and chaired the Committee on Agriculture.

While in the House of Representatives, Van Rensselaer in effect picked John Quincy Adams to be the sixth president of the United States. None of the presidential candidates in the general election of November, 1824, had won a majority of electoral votes. Under the terms of the Twelfth Amendment to the U.S. Constitution, the House of Representatives had the authority to vote on the top three candidates. A supporter of Adams, Van Rensselaer cast the decisive vote that resulted in Adams's election by the House of Representatives on February 9, 1825.

Even when he was not serving in politics or the military, Van Rensselaer kept active beyond Rensselaerswyck. Besides assuming high office in Freemasonry, he worked as an Erie Canal commissioner, paid for geological surveys conducted by the scientist Amos Eaton, founded and supported what is now Rensselaer Polytechnic Institute, and supported other colleges, as well as serving as a college trustee. For many years, Van Rensselaer was a regent and then the chancellor of the University of the State of New York. He also was a benefactor of an Albany orphanage and the Dutch Reformed Church, and as a businessman he became the first president of a bank and of New York's first railroad. After two years of poor health, Van Rensselaer died at his home on January 26, 1839, at the age of seventy-four. At the time of his death, his estate was valued at $10 million.

Legacy

Not long after the plain funeral that Stephen Van Rensselaer III had requested, Rensselaerswyck began to disintegrate. The heirs' efforts to collect overdue rents led tenants to refuse to pay, eventually resulting in an antirent movement that spread from the Van Rensselaer estate to other estates that remained from New Netherland. After violence and so much political manipulation that the colonial Dutch system of nearly feudal landholding seemed no longer viable, the Van Rensselaer heirs sold their rights to their ancestral land piecemeal. Nevertheless, Stephen Van Rensselaer III's reputation for public service and generosity remained, as did the institutions he had founded or supported. As a gentleman widely respected and often called upon, he was not only effectively the last patroon but also "The Good Patroon."

Juan Antonio Corzo Vicentelo

Corsican merchant and aristocrat

Trading worldwide goods and African slaves for South American gold and silver, Vicentelo became the richest merchant of his age.

Born: c. 1517; Calvi, Corsica (now in France)
Died: April 17, 1587; Seville, Spain
Also known as: Juan Antonio Corzo Vicentelo de Leca; Gian Antonio Vincentelli de Leca (birth name); First Count of Cantillana
Sources of wealth: Trade; slave trade
Bequeathal of wealth: Spouse; children

Early Life

Juan Antonio Corzo Vicentelo (wahn ahn-TOH-nee-yoh KOOR-zoh bee-THIHN-tay-loh) de Leca was born around the year 1517 to a Genoese family on the island of Corsica. His father was Vicentelo Nicoroso de Leca; his mother was Bernardina de Frate. Corsica was then a part of the Genoa Republic. Vicentelo's uncle, Antonio Corzo el Viejo, was a leading trader with Spain's new American colonies. Vicentelo began his life at sea at the age of thirteen, sailing in various Mediterranean fleets.

First Ventures

El Viejo was the family patriarch of a tight-knit group of Corsicans making their fortune in the Atlantic trade. He resided in Seville, Spain's chief trading city, and married into one of Seville's most distinguished families. Vicentelo became his chief protégé. Sometime in the late 1530's, el Viejo sent Vicentelo to Lima (now in Peru), the major South American port for trade with Spain and Asia. By 1544, Vicentelo was well established in Lima and in the mercantile city of Nombre de Dios (now in Panama), trading oils, saffron, linens, and African slaves for silver from the Potosí mine and for gold.

Mature Wealth

Through the 1540's, Vicentelo crisscrossed the Atlantic, adeptly building his fortune amid the brutal civil wars of the Spanish colonies. In 1551, he returned to Seville with fabulous wealth. He used his capital to merge his enterprises with those of el Viejo. Gaining a papal dispensation, he married his first cousin, Brigida, daughter of el Viejo. On his marriage he declared his wealth to be about 30,000 golden ducats. (The 2010 equivalent of a ducat is estimated at around $125.) El Viejo granted the couple an additional dowry of 4,000 ducats.

In 1558, Vicentelo returned from South America for good. Concentrating on making his way in Seville society, he entrusted his trading business to family members and servants. Under the management of Juan Lucas Corzo, Vicentelo's business ventures continued to flourish. In 1565, his enterprise in Lima was estimated to be worth 80,000 ducats. His joint company with el Viejo had earned about 5 million maravedies (375 maravedies were worth 1 ducat). His total enterprises were worth 300,000 ducats. When el Viejo died in 1563, he left his vast fortune of 30 million maravedies to the administration of Vicentelo, who became the new patriarch of Corsican traders in Seville.

A contemporary chronicler, Antonio Filippini, called Vicentelo the "wealthiest man in Christendom." On April 26, 1567, King Philip II named him the first señor (lord) of the town of Cantillana, which Vicentelo had purchased. His oldest son, Juan Antonio Frate Vicentelo, would become Cantillana's first count. Vicentelo's Spanish-language biographer, Enriqueta Vila Vilar, reports that Vicentelo gave a 240,000-ducat dowry to his daughter Bernardina when she married the count of Gelves in 1581. Vicentelo's possessions included several palatial houses, exquisite furniture, land, hoards of gold and silver, ships, and merchandise. His will is extant and runs more than forty pages. He declared an immense estate of 1.6 million ducats, passed on to his wife and children. The creation of this vast family fortune by Vicentelo had a surprising legacy. A family descendant, Don Miguel Manara Vicentelo de Leca (1627-1679), was one of the prototypes for the legend of Don Juan, the famous aristocratic lover from Seville.

Legacy

The great Spanish empire of the sixteenth century depended on foreign expertise from wealthy bankers from Genoa and fearless traders from Corsica for much of its administration. Juan Antonio Corzo Vicentelo was the richest of these merchants, building a vast trading empire, including traffic in slaves. His family wealth and notoriety passed on to his descendants, such as Don Miguel Manara, who had a role in creating one of the great legends of Europe, that of Don Juan. This story of the fabulously wealthy seducer of women was made famous in a play by Molière, in a poem by Lord Byron, and in the incomparably great opera *Don Giovanni* by Wolfgang Amadeus Mozart.

Virji Vora

Mughal merchant and banker

Accumulating a business empire and an enormity of wealth that dazzled even European traders, Virji Vora, "the Merchant Prince of Surat," was the leading merchant and banker of seventeenth century Mughal India.

Born: c. 1594; Surat, India
Died: c. 1670; Surat, India
Also known as: Virji Vora Kendrua; Baharji Bohra; the Merchant Prince of Surat
Sources of wealth: Trade; banking
Bequeathal of wealth: Children

Early Life

Virji Vora (VIHR-jee VOH-rah) Kendrua was born into a Jain family in Surat, India, a chief trading port of the wealthy Mughal Empire. He was apparently a member of the Sthanakvasi sect of Jainism and became a leader of that sect as an adult.

First Ventures

History first records the activities of Virji Vora on August 25, 1619, when he engaged in commercial transactions with English merchants in Surat. He already owned a fleet of trading ships. The Dutch, French, and British East India Companies established bases in Surat as a gateway to the rich East Indies trade. Their traders described Virji Vora as a skilled and aggressive businessman. They also considered him to be the richest merchant in the world. In 1663, his wealth was estimated at 8 million silver rupees, the equivalent of hundreds of millions of dollars in 2010.

Mature Wealth

Surat was perfectly situated to profit from the Indian Ocean maritime trade. The city's Swally harbor was visited by ships from all over the world; its Tapti River provided inland access. Surat was also the headquarters for English traders from 1608 to 1687. From his base in Surat, Virji Vora dealt in all manner of commodities, for both import and export. He bought and sold vast quantities of opium, cotton, spices, coral, pepper, quicksilver, tea, turmeric, cloves, ivory, lead, silver, gold, pearls, and gems. He had branches and representatives in trading routes throughout the Mughal Empire in cities such as Āgra, Ahmedabad, Baroda, Broach, Burhanpur, and Golconda; in the trading bazaars of Arabia; and in the ports of Decca, Malabar, and Malay. Virji Vora also employed a cadre of traders, brokers, shippers, clerks, accountants, money changers, and minters.

Virji Vora's business activities are well recorded in the voluminous records of the Dutch East India Company. He often used European ships for trading. He bought commodities wholesale in Asia for supply to Europe and purchased great quantities of finished goods from Europe. Virji Vora's business strategy was simple: He would establish a monopoly on a commodity, so that all traders had to buy it from him, at his price. In 1625, the English were compelled to buy 10,000 rupees worth of pepper from him because he alone in Surat had sufficient quantities. When additional pepper arrived in Surat, he outbid all traders and ensured his monopoly. When the English in frustration sent traders to Decca to buy the pepper directly, Virji Vora's agents were already there with instructions to outbid all buyers. The English finally conceded the pepper monopoly to him.

Virji Vora also dominated moneylending. The Europeans lacked ready access to capital in the Indian Ocean trade and were compelled to borrow from Virji Vora at rates they complained of being usurious, from 7 to 18 percent per year, with an additional 3 percent charged for money changing. He lent as much as 1 million rupees to the Dutch in 1642 and 4 million rupees to the English in 1669.

As a merchant prince, Virji Vora took responsibility for the Jain community. Like his legendary predecessor, Jagdu, a Jain merchant in the thirteenth century who assisted the needy, Virji Vora distributed grain in the famine of 1630-1632. He also donated to Jain monasteries and temples. Virji Vora was shrewd enough in dealing with Europeans traders and Mughal overlords, but he was prey to foreign raiders. In 1664, the Maratha general Śivājī plundered Surat, looting Virji Vora of six barrels of gold, coins, and precious gems. In 1670, Śivājī sacked Surat again. Perhaps related to this catastrophe, Virji Vora either died or retired to a Jain monastery around 1670.

Legacy

Virji Vora, "the Merchant Prince of Surat," dominated commodities trading and moneylending in the Mughal Empire in the first half of the seventeenth century. Even European traders were compelled to meet his terms because of his monopoly on goods and capital. His vast wealth from trade symbolizes the splendor, prestige, and stability of the Mughal commercial empire; his despoiling in 1664 and 1670 demonstrates the decline of Mughal military strength.

Madam C. J. Walker

American cosmetics magnate

Walker rose from washerwoman to wealthy entrepreneur by manufacturing and marketing hair care products for African American women. She was widely recognized as the first black woman millionaire, although her wealth never reached that level.

Born: December 23, 1867; Delta, Louisiana
Died: May 25, 1919; Irvington-on-Hudson, New York
Also known as: Sarah Breedlove (birth name); Madam Charles Joseph Walker
Sources of wealth: Manufacturing; sale of products; real estate
Bequeathal of wealth: Children; charity

Early Life

Sarah Breedlove, who would later be known as Madam C. J. Walker, was born near the banks of the Mississippi River in Louisiana, the fifth child of recently emancipated sharecroppers. Her impoverished childhood working in the cotton fields and playing in the bayous gave virtually no clue that she would become a wealthy entrepreneur. Left an orphan when she was seven, she moved with her sister to Vicksburg, Mississippi, and began onerous work as a washerwoman at age ten. Partly to escape abuse by her brother-in-law, she entered a common-law marriage with Moses McWilliams at age fourteen, becoming a mother at age seventeen and a widow two years later. She then moved to St. Louis, Missouri, continued laundry work, and married John Davis, a decision she soon regretted because of his drinking, womanizing, and lack of financial support.

Despite these bleak prospects and only three months of formal education, Breedlove began to nurture higher aspirations, encouraged partly by the friendships she cultivated at the St. Paul African Methodist Episcopal Church. In 1903 she became one of the earliest sales agents of Annie Pope-Turnbo, later Annie Malone, whose new company sold treatments designed to reverse hair loss and other scalp problems.

First Ventures

In 1905, Breedlove moved to Denver, Colorado, where she worked as a cook in a boardinghouse for $30 a month and made extra money as a sales agent for Malone. In her spare time she mixed tubfuls of hair restorer, experimenting with new formulas. Although not officially divorced, she married for a third time, wedding Charles Joseph Walker, an advertising agent and business promoter.

At about this time she decided to go into business selling Madam C. J. Walker's Wonderful Hair Grower, initially marketing it door-to-door in Denver's African American neighborhood. The hair restorer was made of a petroleum jelly base, beeswax, copper sulfate, precipitated sulfur, and perfumes, all of which were readily available on the market. Walker advertised that the product had cured her own hair loss problem and told the story that the formula came to her in a dream. Hair loss was a common problem at the time, the result of a range of causes, including poor nutrition; infrequent shampooing, which led to clogged pores; inhibited circulation in the scalp; and dead hair follicles. Walker's formula was similar to many other products on the market, including Malone's, and her product's name was copied from Malone, who subsequently rebranded her product as Poro. Malone and Walker became bitter rivals but both prospered.

Walker developed a very successful business plan as she went on the road, first in Colorado and then throughout the segregated South, to sell her products. After contacting the local Baptist and African Methodist Episcopal churches, she arrived in a new town or city, took lodging in the area's best black boardinghouse, introduced herself to local African American fraternal lodges, and arranged for free demonstrations of her hair care lessons and products at the local church or lodge. She held classes on her methods, which included the use of a light oil and a heated wide-tooth steel comb for pressing hair. She also enrolled and trained agents and took orders for her products before moving on to the next town. Initially, she enrolled family members, including her daughter and sister-in-law, to take mail orders and prepare the hair restorer. Earnings in 1906 were a little more than $1,000, but they rose to $3,700 in 1907 and $6,700 in 1908.

Walker began extensive advertising, which included her uplifting philosophy and pictures of her before and after she used her products. She developed a loyal corps of agents, many of whom were recruited when she began to make appearances at national gatherings of African American organizations, such as the National Negro Business League and the National Association of Colored Women. Soon she became a celebrity, and women clamored to take her courses and buy her scalp treatment, which sold for 50 cents per tin at a time when many black women earned little more than this amount each day. She had developed an effective method of tapping a huge latent demand and identifying herself and her products with the aspirations of a consumer base that exceeded three million black women of all ages.

As demand began to overwhelm her unsophisticated production methods, she decided to relocate production to Indianapolis, Indiana, in 1910. She also incorporated and hired a talented young black attorney, Freeman Briley Ransom, to oversee day-to-day business and systematize operations. In Indianapolis she built an office and factory and began to emerge as a community leader, philanthropist, and socialite. Among her community activities, she hosted Booker T. Washington during his 1913 visit to Indianapolis. She cultivated an image of grace and success, hiring a chauffer and a diction tutor. Testimonials for Walker's products continued to pour in and sales grew exponentially, as did her sales staff, with ten thousand agents generating annual sales of more than $100,000 ($2.2 million in 2010 dollars) by the end of 1915. Surging black migration to the urban North helped boost demand, but rivals began selling knock-offs, often adulterated versions of her products.

Villa Lewaro

Although Madam C. J. Walker lived in the Villa Lewaro mansion for less than a year, its construction and elegance did much to cement her reputation as the wealthiest black woman in the world. The estate, located at 67 North Broadway in Irvington-on-Hudson, New York, is about twenty miles north of midtown Manhattan, in upscale Westchester County, not far from homes of the Rockefellers, Morgans, Vanderbilts, and Astors. Renowned opera tenor Enrico Caruso, a family friend, coined its name as an acronym for Lelia Walker Robinson, the name of Madam Walker's married daughter.

Upon its completion, *The New York Times* declared that Villa Lewaro exhibited a "degree of elegance and extravagance that a princess might envy." The *New York Herald* praised it as "one of the showplaces of the entire Hudson east shore." Its cost has been estimated at $250,000 (almost $4 million in 2010 currency). The thirty-four-room Italianate villa, designed by African American architect Vertner Woodson Tandy, featured a vermilion Spanish tile roof and white stucco facade with a view across the Hudson River to the New Jersey Palisades. The master bedroom was decorated with a twelve-piece Louis XVI chamber suite of ivory-enameled mahogany and a handwoven Aubusson carpet. Handcrafted tapestries lined the walls of the main hall, an impressive organ accentuated the music room, and the library was well stocked. Artwork included a mural of sea sprites, mermaids, and demons on the dining room ceiling and sculptor Auguste Rodin's *La Vieille Courtisane*.

To many people the villa represented an object lesson on the capacities of accomplishment for a race mired in poverty, although others, including African Americans, begrudged Walker's excessive extravagance and self-aggrandizement. Under the terms of Walker's will, upon Lelia's death the villa was to be turned over to the National Association for the Advancement of Colored People (NAACP) or a similar organization judged by the trustees to be "doing the most for Racial uplift." However, with the onset of the Great Depression, the trustees were forced to auction off the mansion's contents late in 1930. Faced with high taxes and maintenance costs, the NAACP sold the building to the Companions of the Forest, a women's benevolent organization, in 1932. By the twenty-first century the estate was a private residence.

Mature Wealth

In 1914, the National Negro Business League approved a resolution recognizing Walker as "the foremost business woman of our race." Her marriage to C. J. Walker ended in divorce after she apparently caught him with another woman. Drawn by her daughter, Lelia (also known as A'Lelia), who was becoming the most celebrated hostess in Harlem, Madame Walker moved to New York City in 1916.

Business continued to grow, and she maintained an often grueling schedule of travel to market her growing line, which expanded to include facial products. Some sales agents reported earnings that doubled or tripled their previous pay, and her representatives were spurred on by prizes and bonus incentives. However, the Madam C. J. Walker Company had become much more than a moneymaking enterprise, with a mission of uplift through beauty and social outreach. In 1916, Walker organized the first Madam C. J. Walker Benevolent Association as a charitable, social, and self-help organization for the company's sales representatives, who held their first national convention in Philadelphia in 1917. Although there was almost a missionary zeal among Walker agents, labor relations were not entirely smooth. At one point, agents petitioned to protest the company's decision to sell some of its products at retail outlets.

In 1917, Walker hosted the inaugural meeting and was elected president of the National Negro Cosmetics Manufacturers Association, an industry trade group organized to protect members from the competition of white-owned businesses that were expanding into the African American market. In addition, she became increasingly involved in politics, becoming vice-president-at-large of the National Equal Rights League, as well as a leader of antilynching protests. She also engaged in numerous charity efforts through organizations like the Circle for Negro War Relief. However, near the end of World War I she was placed on the Military Intelligence Division's "Negro subversives" list because of her associations with and support of known radicals, including William Monroe Trotter, an African American political activist.

Walker's "dream of dreams" was fulfilled in June, 1918, when she moved into a sumptuous estate, Villa Lewaro, in Irvington-on-Hudson, a wealthy suburb of New York City. In early 1919, the villa hosted the International League of Darker Peoples. This group hoped to influence postwar American foreign policy, but the U.S. government denied Walker permission to travel to France.

Legacy

Although her business continued to thrive, by late 1916 Walker began to suffer from exhaustion and poor health because of nephritis, prompting stays at the Battle Creek Sanitarium. When she died in 1919, the news was reported around the world. Although her estate's value had climbed to about $600,000 (more than $7 million in 2010 dollars), she was erroneously hailed as the first black woman to become a millionaire.

Sales of the Walker Company's products peaked to almost $600,000 (almost $7 million in 2010 dollars) the year after her death. Despite having trained about forty thousand agents, the company's fortunes waned, probably due to relentless competition and the loss of the connection of agents and customers to her charismatic presence and inspiring example. The Great Depression hit Walker's interests very hard, and the Walker Company's sales collapsed. Lelia, whose fortune dwindled, died of a brain hemorrhage in 1931, and Villa Lewaro was sold by the estate's trustees in 1932. The company stayed in business until 1986, but as its importance diminished, Walker's chief legacy was her personal example of the entrepreneurial abilities of African Americans, particularly the ability of a black woman to achieve celebrity and financial success by serving the needs of other black women.

Walter de Merton

English clergyman and royal administrator

Walter de Merton was a gifted cleric in high-medieval England. His talents commended him to Church leaders and King Henry III, all of whom rewarded his service with gifts in the form of income from land (benefices) and Church parishes throughout England. His use of his wealth to found a college at Oxford University was unique in his time.

Born: c. 1200-1205; probably Surrey, England
Died: October 27, 1277; Rochester, England
Also known as: Bishop of Rochester
Sources of wealth: Inheritance; real estate; church
Bequeathal of wealth: Relatives; friends; educational institution

Early Life

Walter de Merton was born to a woman named Christina Fitz-Oliver (or Fitzace) and her husband, a man unknown except for his first name, William. Walter became heir to his mother's lands in Basingstoke, and since his parents were buried in the parish church there before 1237, it is likely that he and his seven sisters grew up nearby. Walter's chosen surname, de Merton, may indicate that he underwent primary education at the Augustinian priory of St. Mary of Merton. He attended Oxford University, where tradition suggests he was a resident of Mauger College (later the Cross Inn).

First Ventures

Armed with what he had learned at Merton Priory and at Oxford, Walter appears first as an agent and attorney for the Merton Priory around 1230. In 1233, he was awarded the income of the priory's benefice of Cuddington. Some years before, the priory had been given rights to the landlord's share of income produced in the village or villages of Cuddington, either in a will or as a gift inter vivos (while the giver was alive). In return, the Augustinian friars would pray for the souls of the gift givers and perhaps provide other services for their patrons. Such funds might be used to support priory employees, such as Walter, or students in the form of scholarships.

Adam de Marisco (or Adam Marsh), a Franciscan cleric and probably one of Walter's teachers, recommended Walter to Bishop Robert Grosseteste for ordination as subdeacon sometime after June, 1235. Walter's income as subdeacon would have depended upon his position and employer. In 1237, he is identified merely as "clerk" (cleric) in a document. At some point before

Merton College, Oxford

Merton College is considered one of the oldest of Oxford University's colleges. Founded by Walter de Merton in 1264, Merton College was the first college in England to place its operation in the hands of the members of the college itself.

The earliest students to attend Oxford University found lodgings where they could in inns and with private families. Between the 1220's and 1260's, various religious orders, especially the Franciscans and Dominicans, established convents at Oxford and Cambridge Universities in which young members of their orders could live and study together. University College, the oldest college at Oxford University, was founded around 1250 by Archdeacon William of Durham, whom Walter probably knew. William left an endowment in the hands of university authorities for the purchase of houses and the provision of student loans.

Merton College provided a new and very important model for subsequent colleges, at both Oxford and Cambridge Universities. Walter provided both real estate in Oxford, on which to erect college buildings, and rural properties scattered throughout central England, the income from which would support Merton College and its scholars. In his will, he added 1,000 marks for the purchase of property. Walter stipulated that his own family members should be given priority as college residents, but by 1300 there were thirty young men in residence as fellows.

As universities developed in Europe during the thirteenth century, they adopted many of the features of the long-established monasteries, including their general physical layouts and communal prayer and meals. At Merton's heart has been the Chapel of St. Mary and St. John, originally the dilapidated parish church of St. John, where the choir dates from the late 1280's. The Hall, which served as Merton College's lecture room, meeting place, and dining hall (refectory), was erected in the late thirteenth century, as was the Treasury, in which the college's funds and gifts were stored. Residential quarters were probably quite modest initially, and the houses that wrap around the four main quadrangles, each mimicking a monastery's cloister, date from the seventeenth century and later. The original library, built in the 1370's, continues to stand in the twenty-first century. Here books were chained to tables to prevent them from disappearing, and the practice of storing volumes on their edges along shelves, instead of laying them flat, was introduced.

Over the centuries, Merton College has boasted many famous fellows, including John Wyclif (c. 1328-1384), who produced an unauthorized version of the Bible in English and established the pre-Reformation sect known as the Lollards; Sir Thomas Bodley (1545-1613), who founded the Bodleian Library as Oxford University's central book collection; William Harvey (1578-1657), who discovered the circulation of the human bloodstream; T. S. Eliot (1888-1965), one of the greatest English poets of the twentieth century; Anglo-Saxon scholar and fantasy author J. R. R. Tolkein (1892-1973); literary critic Northrup Frye (1912-1991); and musician and actor Kris Kristofferson (b. 1936). In the early twenty-first century, Merton's scholars have academically outperformed students of every other college, and in 2006 the college had an endowment of £172 million.

1238, therefore,Walter entered royal service as a cleric, a combination of secretary, administrator, and legal counselor. In 1242, Walter entered the service of the bishop-palatine of Durham.

Although his wealth was hardly great, between 1240 and 1245 Walter established a hospital (almshouse) in Basingstoke in honor of his dead parents. Such institutions were quite common, serving the physical and spiritual needs of the poor, handicapped, aged, or injured. Residents would live in relative comfort and have daily opportunities to pray for the souls of the founders, supporters, and their families. In 1253 and again in 1262, when Walter was serving as King Henry III's chancellor, the king provided royal grants of landed income for support of the hospital. In 1262, Walter transferred formal patronage of the hospital to Henry as a way of protecting it from Walter's political enemies.

Mature Wealth

Despite his having founded a university college, there is relatively little known about the details of Walter's career and his accumulation of income, although he appears in a number of Church and royal documents. By 1249, he held lands in or near Malden, Surrey, and had received the benefice of Sedgefield, Durham, from the bishop, Nicholas Farnham. Records show that Walter also received incomes from properties scattered across England. He received Staindrop, Durham, and Haltwistle, Northumberland, from Farnham or his successor; Walter also came to hold Benningbrough, Yorkshire; Branston, Lincoln; Bratton, Wiltshire; Codington, Surrey; and Potton, Bedfordshire. Other benefices fell to him in the mid-1260's.

Walter appears sporadically in Church records during the 1250's. In 1256, he was part of a legal team defending the proprietary rights of Walter of Kirkham, the bishop of Durham. Like other clerics of the day, Walter benefited most from appointments to official Church positions that did not require his presence or attention, but which provided an income. For a period before 1262, he was a canon of Wells Cathedral and held the prebendary—a lower form of canon—of Yatesbury at Salisbury Cathedral. In June, 1259, he was presented with the prebend of Kentish Town at St. Paul's Cathedral in London, and a month later he became prebendary of Exeter.

In addition to earning his ecclesiastical incomes, Walter served the king at his chancery, an office that handled record keeping and both foreign and domestic royal diplomacy. He rose to the position of protonotary, just below that of chancellor. From July, 1262, to July, 1263, Walter held the chancellor's position, in which he served as King Henry III's right-hand man. In October, 1262, Henry provided Walter with 400 marks for chancery expenses and his own income; Henry's take was not recorded. When Henry's enemies among the English aristocracy gained the upper hand, Walter was replaced as chancellor and his prebendal properties of Chessington, Cuddington, and Malden near London were sacked in 1263.

Little is known of Walter's life in the 1260's, though he appears in one document as a justiciar, or a political and judicial officer of the king. Henry died in late 1272 and Walter was named chancellor again by both the royal council and Parliament. He held this position during the underage King Edward I's time in France, resigning in August, 1274. In preparation for the new regime, Walter had been elected the bishop of Rochester in late July, replacing Lawrence of St. Martin, who had died in June; Walter was installed as bishop in October, 1274. Like his other church posts, his position as the bishop of Rochester was a gift for services well rendered. He served his diocese and the college he founded for the three years that preceded his accidental death in 1277. The few notices that remain from his service as bishop indicate that Walter was intelligent, hardworking, and open-handed with religious houses, but that he paid more attention to his college than to the concerns of his cathedral and its personnel.

Legacy

By all accounts, Walter de Merton is most significant for his foundation of Merton College at Oxford University. Its origins date to 1262, when Walter arranged to have his income from Chessington and Farleigh and part of the income from Malden transferred to Merton Priory. The Augustinans would hold the funds in trust and use them to educate a group of young men at Oxford University.

Two years later, Walter named eight of his nephews as the first students and completely revamped the arrangements. He established a collegial convent at Malden named the "house of the scholars of Merton," which was to be administered by two priests and to provide a formal education for twenty students. Income from Malden and Farleigh manors provided the students' stipends, which were disbursed by a warden, the first of whom had been master of Basingstoke Hospital. Walter's relatives were given priority to attend the college, with secondary priority given to young clerics from the Winchester diocese. The bishop of Winchester was to serve as protector of the college.

The statutes of 1264 regulate the disbursal of aid, collection of incomes, auditing of the warden's activities by senior students, and operation of the Malden house. In 1270, after adding more income to the endowment and purchasing nearly an acre of Oxford property around the church of St. John, Walter issued new statutes, expanding the duties of the house in Malden and the number of scholars. The Oxford properties became the core of the physical college, and its administration was moved from Malden to Oxford in 1274. At this point, the college was constituted as a self-governing corporation, the earliest of its kind at Oxford or Cambridge University.

Alice Walton

American stockbroker and heiress

The only daughter of retail magnate Sam Walton, Alice Walton founded her own investment firm, as well as other businesses. Her earnings and her share of the Walton family wealth have made her one of the richest women in the world.

Born: October 7, 1949; Newport, Arkansas
Also known as: Alice Louise Walton
Sources of wealth: Inheritance; financial services
Bequeathal of wealth: Charity; museum

Early Life

Alice Louise Walton was born in 1949 in Newport, Arkansas, to Sam Walton and Helen Walton, the founders of the Wal-Mart chain of retail stores. The youngest of the Waltons' four children and their only daughter, she was given her mother's middle name. Walton was an extremely active child, and accidents of various kinds plagued her throughout her life, the first being a broken ankle at the age of four incurred as she was learning to ride horses. As a teenager, she worked as a popcorn vender in one of her parents' first stores, but like her brothers she rejected the family business for a time in early adulthood. As Sam Walton's definitive biographer, Vance Trimble, bluntly writes, "Sam was told, in effect, to take Wal-Mart and shove it." However, after attending Trinity University in San Antonio, Texas, and receiving a B.S. degree in economics and finance, Walton had a change of heart and agreed to take a job with Wal-Mart.

First Ventures

Walton's first position at her family's business headquarters in Bentonville, Arkansas, was that of buyer, but she quickly came to realize that this work was not fulfilling. A family friend and director of Wal-Mart, James Jones, was also president of the National Bank of Commerce in New Orleans, Louisiana, and he offered Walton a job there in 1972. She worked first in the loan department at Jones's bank and then in investment research while pursuing studies for a M.B.A. at Tulane University. While living and working in New Orleans, she met and married another banker in the investment field, Laurence Eustis III, in August, 1974. The marriage lasted only three years, after which Walton married New Orleans contractor Hall Morehead, but that union was also short-lived. By the end of the 1970's, Walton was working for her father again, overseeing investments at his bank in Rogers, Arkansas.

Mature Wealth

While living in New Orleans, Walton became an account executive for E. F. Hutton, one of the first women to serve in this position at the prestigious brokerage firm. She worked tirelessly to promote women in business, conducting seminars for female investors. She perhaps would have begun a business of her own at this time had she not had one of her recurrent accidents in 1983. During a combination Thanksgiving celebration and business meeting of the Walton family in Acapulco, Mexico, Walton was driving a Jeep in the mountains when the vehicle plunged off a cliff, and she suffered a broken leg. Complications set in when a bone in the leg developed a persistent infection. Walton spent much of the mid-1980's recuperating from the accident, which ultimately involved almost two dozen operations on the affected leg. Another accident befell Walton in 1989, when she was driving and accidentally struck and killed a woman who was crossing a road in Springdale, Arkansas.

However, in 1988, Walton was finally able to establish her own firm, which handles portfolios of securities for wealthy individuals, as well as for banks in Arkansas and neighboring states. The business, Llama Co., took its name from Walton's pet llama, LeRoy. In an interview in *Forbes* magazine, Walton explained that she chose the name because llamas are "intelligent, unique animals with almost 360-degree vision. I like those qualities as they relate to what I'm trying to do in the investment business." Like Wal-Mart, Llama Co. is a family affair. Although Walton is president and chief executive officer, her surviving brothers and other relations maintain an almost two-thirds interest in the firm.

Although Walton's company has been successful from its origin, much of her wealth is inherited. Although the public and many within the business world did not realize it until well into the 1980's, the Walton offspring had been shareholders since they were children. Walton was barely five years old in 1954 when her parents set up a trust providing her with one-fifth of all their landholdings and their stock in the Wal-Mart corporation. In 1989, Alice ranked twenty-fourth in *Forbes* magazine's list of the four hundred wealthiest people, with her assets listed as close to $2 billion. In 2010, the magazine estimated that her net worth had climbed to $20.6 billion and ranked her the sixteenth-richest individual in the world.

Like her parents, Walton has used her immense wealth to fund and support numerous causes and endeavors. She was a primary contributor of funds to build the Northwest Arkansas Regional Airport in the 1990's, and she donated almost $3 million to support various conservative political programs and candidates in the first decade of the twenty-first century. She has served on the boards of the graduate business school at the University of Arkansas in Fayetteville, the University of Arkansas for Medical Sciences in Little Rock, and her mother's Walton Family Foundation. In regard to the latter, Walton was the guiding force behind the establishment of the Crystal Bridges Museum of American Art in Bentonville, Arkansas. She has also served on the boards of other museums, including the Trustees' Council of the National Gallery of Art in Washington, D.C., and the Amon Carter Museum in Fort Worth, Texas. In addition, she has worked to bring children of contrasting social and economic levels together through Camp War Eagle, a Christian summer camp for young people located in Arkansas.

Legacy

As a member of the Walton clan, Alice Walton shares in her family's legacy of reshaping the type of places in which Americans shop and revising the very nature of retail merchandising in the United States, as well as many other countries. The family's legacy is apparent in the twenty-first century retail business, the size and shape of stores, and their business hours and prices. Although much of Walton's fortune came to her via inheritance, she has nevertheless been financially involved in her family's wealth since she was in elementary school,

The Crystal Bridges Museum of American Art

The Crystal Bridges Museum of American Art is the brainchild of Alice Walton, the youngest child and only daughter of Sam and Helen Walton, the founders of the massive Wal-Mart chain of retail stores. The museum's name reflects its setting—a bucolic collection of woods, gardens, and pools near the town center of Bentonville, Arkansas. The design of the museum by architect Moshe Safdie is somewhat reminiscent of the architecture of Frank Lloyd Wright, whose design for the Fallingwater residence in the Pennsylvania countryside was in part the inspiration for the architecture of the Walton family home in Bentonville. The cost of the museum's construction was predicted to be in excess of $50 million, and the site will eventually provide more than twenty thousand square feet of exhibition space.

In 2005, Alice Walton hired John Wilmerding, a noted expert on art history, to serve as an adviser for acquisitions, and in the summer of 2009, she appointed Don Bacigalupi, a graduate of the University of Texas school of art and former director of the Toledo Museum of Art, to be the museum's director. Walton envisions Crystal Bridges as a collection house for works by American artists in various media from colonial times to the present. By the end of 2009, she had spent more than $200 million on paintings in order to establish a core of artworks that will form the museum's permanent exhibits. Among the famous American painters whose works she has acquired are Thomas Eakins, Winslow Homer, John Singer Sargent, and Norman Rockwell.

Some of the paintings are famous in their own right, and they attracted publicity when they were acquired for Crystal Bridges. Two of these works were Charles Willson Peale's painting depicting George Washington in battle uniform and the even more iconic portrait of Washington by Gilbert Stuart. A similar painting that attracted public attention was Asher B. Durand's *Kindred Spirits*. A hallmark of American landscape painting in the Romantic tradition, this painting depicts the Transcendentalist poet William Cullen Bryant meeting his friend, the painter Thomas Cole, on the edge of an escarpment overlooking a valley in the Catskill Mountains. This classic American work of art had come into the possession of Julia Bryant, the poet's daughter, who donated it to the New York Public Library. When the library put it up for auction at Sotheby's in the spring of 2005, Walton obtained it by secret bid that was rumored to be more than $350 million.

Diverse modern works have also been commissioned for Crystal Bridges, including a bronze sculpture of a bicycle suspended in a tree by Arkansas artist George Dombek, a work based on a well-received watercolor by Dombek. Perhaps the most striking and innovative work commissioned thus far is Pat Musick's *A Place Where They Cried*, a line of stone monoliths stretching sixty-five feet, which commemorates the sufferings of Native Americans on their forced march from the southeastern states to Oklahoma, the notorious "Trail of Tears" of the late 1830's. Both Dombek and Musick's massive works will be featured in the parks and pathways on the museum grounds.

In October, 2010, Crystal Bridges had not opened to the public. Museum officials said they were continuing to "evaluate the project's design and construction plans as well as the time line needed to complete those plans" in order to get a "clearer picture of a projected opening in the coming months."

when her parents divided their assets in order to share them with their four children. She regularly appeared in listings of the world's richest people as either the first- or second-wealthiest woman in the world and somewhere in the top twenty-five of the richest individuals of either gender.

Like her mother Helen Walton, Alice has built her own legacy through contributions to charitable and civic causes. Her efforts on behalf of the Northwest Arkansas Regional Airport, for example, inspired its board of directors to name the terminal after her and ultimately resulted in her being included in the Arkansas Aviation Hall of Fame. Her contributions to business education inspired the University of Arkansas to set up the Alice L. Walton Chair in Finance in her honor in 1996. Her most significant accomplishment, however, is likely to remain the establishment of the Crystal Bridges Museum of American Art.

Helen Walton

American retail magnate and philanthropist

Walton worked closely with her husband, Sam Walton, and with her brother-in-law, James "Bud" Walton, to establish and promote Wal-Mart, the most successful chain of retail stores in business history, in the process becoming one of the wealthiest women in the world.

Born: December 3, 1919; Claremore, Oklahoma
Died: April 19, 2007; Bentonville, Arkansas
Also known as: Helen Alice Robson (birth name)
Sources of wealth: Retailing; marriage
Bequeathal of wealth: Children; charity; educational institution

Early Life

Helen Alice Robson Walton was born in 1919 in Claremore, Oklahoma, to Leland Stanford Robson and Hazel Corrine Carr Robson. Her father, usually called L. S., originally came from Georgia. Successful as a lawyer in Claremore, he also owned large tracts of ranch land and became involved in banking, eventually becoming president of the Rogers County Bank in Claremore. L. S. Robson insisted that his children learn to handle money, opening up bank accounts for them in their early teens so they could gain a sense of fiscal responsibility.

Helen Robson was a student at what is now Columbia College in Columbia, Oklahoma, and in her junior and senior years she attended the University of Oklahoma at Norman, receiving a bachelor's degree in economics in the spring of 1941. Returning home, she worked as an accountant for her father, overseeing the finances of his ranch. Sam Walton, waiting to be called up for duty in World War II, moved to Pryor, a town near Claremore, to work in a du Pont company plant manufacturing gunpowder for the military. In April, 1942, Walton and Robson met in a bowling alley in Claremore in an encounter that could have come from the "screwball comedies" popular in films of the time. Walton asked Robson, "Don't I know you?" to which she replied, "You do now." They were married on Valentine's Day the following year. They eventually had four children: Robson (born 1944), John (1946-2005), James (1948), and Alice (1949).

First Ventures

Sam Walton developed many of his business techniques while training in a J. C. Penney store in Des Moines, Iowa, in the early 1940's. His first real success was as a manager at a Ben Franklin store in Newport, Arkansas, but he soon lost his lease there. This setback inspired Walton to envision his own chain. He first experimented by managing two more Ben Franklin stores, where he employed business practices that would later be typical of his Wal-Mart chain. These stores, called Walton's Five and Tens, were successes. By all accounts, Walton always consulted his wife and respected her opinions during these transactions. However, as he moved to open his first official Wal-Mart in the early 1960's, Helen Walton played an integral role. It was her sizable trust fund and the equity she had in her family's vast landholdings that persuaded a bank officer to give them a $350,000 loan. Both Sam and Helen signed the loan papers.

Mature Wealth

This loan allowed the Waltons to open the first Wal-Mart, called the Wal-Mart Discount Store, in Rogers, Arkansas, in July, 1962. The store's success spurred Sam to begin assembling a chain as quickly as possible, and by 1967, there were twenty Wal-Mart stores. On October 31, 1969, the chain was incorporated, and the following year it began to sell its stock over the counter, listing itself on the New York Stock Exchange for the first time in 1971. By this time, the chain had grown to include more than forty sites. Throughout the 1980's, more than three hundred Wal-Marts were racking up sales of approximately $1 billion annually.

Toward the end of the 1980's, the Waltons began to experiment with the concept of the "hypermarket," a huge store that brought together under one roof the goods and services once offered by the many and varied types of shops that lined the streets in the downtown areas of American towns and cities. The first such "mega-store," called a Wal-Mart Supercenter, was opened in Missouri in 1988. This "super Wal-Mart" proved so popular that it soon came to replace the original, prototypal Wal-Mart stores across the United States. By 2010, the Wal-Mart chain consisted of some eight thousand outlets not only in the Unites States, Canada, and Mexico, but also in countries such as China and the United Kingdom. This enormous chain earned almost $400 billion annually.

Although Helen Walton was a source of much support and counsel for her husband during the growth of the Wal-Mart franchise, and although the integral early bank loan might not have gone through had it not been for her own financial assets, she was not always in favor of the seemingly unending expansion that Sam Walton undertook. Although she shared his customer-conscious, common-sense approach to business, at times she seemed reluctant to join wholeheartedly in her husband's enthusiasm for adding more stores to the already fast-growing chain. She was also purported to have had doubts about her husband's decision to take Wal-Mart's stock public. Some of her qualms about the growth of the franchise no doubt lay in its inevitable impact on her family's life; her husband spent an increasing amount of time away from home scouting out new sites and coordinating activities between numerous stores. Many of Helen's activities in the early years of the family business were typical of American women of her generation; she reared the children for an often-preoccupied husband and father and socialized with the wives of Wal-Mart executives, who in the early days were almost always male. An important feature of the Wal-Mart empire that has been attributed to Helen is the location of its headquarters in Bentonville, Arkansas. Allegedly, she insisted on settling the family in a small town instead of a larger city, such as Oklahoma City or Little Rock.

While Helen's familial and educational background in economics and business enabled her to participate in the Wal-Mart Corporation, her most important role was using the chain's vast wealth for charitable causes. Her philanthropy was admirable and all but inexhaustible. Education was a primary concern of hers, and schools throughout Arkansas benefited from her largesse. For example, in the 1980's, she and her husband were instrumental in establishing scholarship programs for Central American students at several Arkansas colleges and universities. Under these programs, Helen oversaw the distribution of almost $4 million to needy students. Acting as president of the Walton Family Foundation, in 2002 she donated $300 million to the University of Arkansas and an additional $50 million to the School of Business there, which was later renamed the Sam M. Walton College of Business. She also supervised the funding of a number of projects at the University of the Ozarks; she donated $40 million via the Walton Family Foundation and helped finance the building of the Robson Library and the Walton Fine Arts Center. In addition, she donated $20 million of her private funds to the teacher training program at the University of the Ozarks. In her hometown of Bentonville, she organized and helped fund a program to provide computers for local schools, and she set up and oversaw the Walton Scholarship Program, which each year gives 150 children of Wal-Mart employees college scholarships of $10,000 each. She also worked to promote the arts on a state and national level and became the first woman to serve as a vice chairperson of the board of trustees of the Presbyterian Church Foundation.

The Walton Family Foundation

Founded in 1988 and drawing on assets of almost $1 billion, the Walton Family Foundation, Inc., is one of the most active nonprofit charitable organizations in the United States. When they introduced the new foundation, Sam and Helen Walton spoke of bringing to charitable activities the same sort of common-sense style and straightforward approach that had served them well in their business endeavors. Within five years of the foundation's inception, however, Sam Walton died, leaving Helen Walton to primarily oversee much of the organization's activities.

From the beginning, education was a principal beneficiary of foundation funding, with private schools being a particular concern. The foundation supports two similar organizations—the California Charter Schools Association and the Charter School Growth Fund—to promote and maintain charter schools in, respectively, the state of California and Washington, D.C. However, another education endeavor funded in part by the foundation, Teach for America, supports public schools in inner-city neighborhoods and rural regions by recruiting top-ranking university graduates to teach in such areas for two-year stints, similar to volunteers in the Peace Corps.

The foundation also concerns itself with economic and community improvement, the arts, and the environment. For example, in 2003 it became partners with the Delta Bridge Project to ameliorate living conditions in Phillips County, Arkansas, one of the poorest counties in the region. Funds from the foundation helped the Delta Bridge Project to energize the county's economy and improve health services for citizens. The foundation also supports the arts in Arkansas by funding the Crystal Bridges Museum of American Art in Bentonville and supporting the Walton Arts Center in northwest Arkansas. Crystal Bridges is a teaching museum, with artwork displayed both inside and on the grounds, staffed by guides trained to educate visiting students about the works on display. The Walton Arts Center presents not only exhibitions of painting and sculpture but also plays, concerts, and dance performances.

The primary environmental work supported by the foundation is Conservation International's Seascape Program. This program works to improve seaside communities both environmentally and financially by ensuring that fish populations are sustained, that people living in such regions are made safe from marine disasters, such as storms, and that tourism is a vital part of these areas' economies. The Seascape Program has done much work in Central America, Malaysia, Indonesia, and the Philippines and has had a positive impact on almost two million miles of coastline.

LEGACY

The retail chain empire that Sam and Helen Walton created changed shopping in the United States irrevocably. As a result of their success, the prototypal American store would never again be a small shop specializing in specific goods and services but would instead be a warehouse-like "hyper-mart," where shoppers in one visit could purchase groceries, appliances, medications, clothes, gardening supplies, books, jewelry, and much more. At least two of the hallmarks of the Wal-Mart tradition and legend have been attributed directly to Helen Walton: the maintenance of its headquarters in the small town of Bentonville and the positioning of employees as partners within the corporation. However, Helen Walton's greatest legacy lies in her distribution of large amounts of the immense Walton wealth to further education, the arts, the environment, and the overall quality of life in the United States and elsewhere.

SAM WALTON

American retail magnate

Walton employed traditional American virtues of hard work and common sense to create Wal-Mart, the most successful chain of retail stores in the world, in the process becoming the wealthiest person in the United States for much of the 1980's.

Born: March 29, 1918; Kingfisher, Oklahoma
Died: April 5, 1992; Little Rock, Arkansas
Also known as: Samuel Moore Walton; Samuel M. Walton; King of the Discounters
Source of wealth: Retailing
Bequeathal of wealth: Spouse; children; relatives; charity

EARLY LIFE

Samuel Moore Walton was born in 1918 in Kingfisher, Oklahoma, to Thomas Gibson Walton and Nancy Lee Lawrence Walton. He grew up working on family farms in Oklahoma and Missouri. His younger brother, James, always called Bud, was born in 1921. Despite later public perceptions of Walton as a backwoodsman who made good by sheer luck and pluck, Walton actually came from a middle-class background, was an "A" student in high school, became an Eagle Scout at a very young age, graduated from the University of Missouri with a degree in economics, and served in U.S. Army Intelligence during World War II. On Valentine's Day of 1943, Walton married Helen Alice Robson of Claremont, Oklahoma. They remained married throughout Walton's lifetime and had three sons and a daughter: Robson (born 1944), John (1946), James (1948), and Alice (1949).

FIRST VENTURES

Walton trained in a store in the J. C. Penney chain in Des Moines, Iowa, in the early 1940's, and the operational principles of this chain later influenced Walton's own stores. In 1945, Walton took a job in Newport, Arkansas, as manager of a store in the Ben Franklin chain. However, he lost his lease when the store's owner demanded it back so it could be operated by his children. Frustrated, Walton determined to go into business for himself, experimenting with two stores in the Ben Franklin franchise tailored to his own tastes called Walton's Five and Tens, the first in Bentonville, Arkansas, which would become Walton's home and base of operations for the rest of his life, and the second in Fayetteville, Arkansas.

MATURE WEALTH

Walton opened the first Wal-Mart Discount Store in Rogers, Arkansas, on July 2, 1962. It was an overwhelming success, and Walton at once began to assemble a chain of stores, which grew to twenty outlets in five years. These were incorporated as Wal-Mart Stores, Inc., on Halloween, 1969. By 1970, when Wal-Mart first began trading its stock over the counter, the number of stores had almost doubled. In 1971, the company was listed for the first time on the New York Stock Exchange. The chain had increased to three hundred stores by the beginning of the 1980's, bringing in more than $1 billion in annual sales, with a net profit of more than $40 million. At the beginning of the 1990's, more than fifteen hundred Wal-Marts operated throughout the United States, garnering more than $25 billion in annual sales. By the end of the first decade of the twenty-first century, almost eight thousand Wal-Mart outlets operated both in the United States and in other countries, such as Mexico, Canada, China, and the United Kingdom, generating around $400 billion annually.

In the early 1980's, Walton initiated Sam's Club, a series of huge discount warehouses for merchants and others who bought in bulk. Customers paid annual membership fees in order to buy a great deal of merchandise for a small amount of money. The first Sam's store opened in Oklahoma City in the spring of 1983 and was a tremendous success, inspiring Walton to expand this new chain. In 1988, Walton oversaw the opening of a "hypermarket"—one large store that subsumed all the shops that had traditionally been found in downtown areas. This first Wal-Mart Supercenter, which featured groceries and a pharmacy, opened in Washington, Missouri, in the spring of 1988. This format proved so popular that within a decade it had replaced the original prototype as the dominant Wal-Mart model.

The astronomical wealth that Walton accrued was derived from a combination of old-fashioned traditional American values, an adherence to common-sense business practices, and a reliance on technology. Drawing on the near-biblical injunctions of training manuals from such chains as J. C. Penney, Walton insisted on the humane treatment of both employees and customers, making a point of being on a first-name basis with everyone from executives to stockroom workers, while calling employees "associates" and arranging for profit-sharing schemes to define them as quasi colleagues. He instituted a group of workers known as "greeters" whose sole duty was to stand near entryways and welcome shoppers enthusiastically. In addition to following the traditional discount practice of buying in bulk and selling cheap, Walton also had his stores stay open long hours for the customers' convenience and made certain that stores were always located near Wal-Mart warehouses in order for stocks to easily be replenished. In fact, he often chose the location of a warehouse first and then planned a constellation of stores around this epicenter. However, along with these old-fashioned, pragmatic approaches, Walton consistently used modern technology. In the 1960's, he taught himself to fly small planes in order to travel quickly from one store to another. Likewise, he began employing computer

(©Bettmann/CORBIS) connections in the 1960's to establish links with employees throughout his chain, and in the 1970's he began to pioneer teleconferencing via closed-circuit television for meetings with his executives across the nation.

Walton expended very little of his wealth on himself, living comfortably but modestly. Even at formal events, he often wore inexpensive clothes from his own stores. His one semiluxury was quail hunting with dogs. He once appalled a group of aristocratic Georgia business tycoons by bringing his beloved but scruffy hunting hounds to a British-style bird shoot. Purportedly, the Wal-Mart on Highway 281, south of the little towns of Premont and Falfurrias in south Texas, was situated there so that Walton could be near one of his workplaces when he hunted at his south Texas camp, Campo Chipote—a rare example, perhaps, of his letting personal pleasure dictate a business decision.

Throughout the 1980's, Walton used his wealth to support the Buy America program, credited with promoting American businesses over foreign companies and providing thousands of jobs; to establish the Arkansas Business Council in order to improve the state's economy and education; and to promote capitalism and democracy in Central America. He also bravely served as one of the first human test patients for the anticancer drug Interferon when he contracted hairy-cell leukemia in the 1970's. His recovery helped establish Interferon as a major weapon against cancer and acquired immunodeficiency syndrome (AIDS). Walton died of another form of cancer, myeloma, in 1992, the same year in which he received the Presidential Medal of Freedom.

The Sam M. Walton College of Business

The business school at the University of Arkansas had been a successful program for seven decades before the Walton name was attached to it. Initiated in 1926 with only a handful of professors and a few students, the school nevertheless offered a wide array of courses, including general business, marketing, economics, and banking. Four undergraduate degrees were awarded in 1927, and by 1930, a master's program had begun, followed by a doctoral degree program in 1950. The school offered programs involving the development of small businesses, a center to further the effective teaching of business-related subjects, a Center for Retailing Excellence, a center to award grants for economic research, and a number of other similar agencies.

It is no wonder, then, that the Walton Family Charitable Support Foundation, in 1998 made a donation to the University of Arkansas School of Business. The amount of the gift was nothing short of staggering: $50 million, the single largest sum ever donated to a business college in American history. In gratitude, the university administration changed the name of the school from the University of Arkansas School of Business to the Sam M. Walton College of Business Administration. However, perhaps because the name was too limited for the various programs the college housed and perhaps because the lengthy moniker proved unwieldy, the name was changed again in 2000 to the simpler Sam M. Walton College of Business. The patronage of the Walton foundation allowed the school to pursue innovative programs, including the application of information technology to the retail business, a subject which Sam Walton would have heartily approved.

By the early twenty-first century, the number of faculty in the college had increased to almost one hundred, and the number of students pursuing degrees totaled almost three thousand. Undergraduates could choose from among nine possible majors, including international business, accounting, and transportation and logistics. The Sam M. Walton College of Business regularly rated highly in *U.S. News and World Report*'s annual list of institutions of higher learning for business and finance, usually ranking in the top twenty-five for its undergraduate program and in the top fifty for graduate business schools.

Legacy

It would be difficult to overstate or exaggerate the effect that Sam Walton had on many facets of American life. His business practices forever changed the way that retail business was conducted in the United States. On a very elemental level, he and his chain stores assured that millions of working-class and middle-class Americans would have convenient access to inexpensive goods and commodities of practically every sort—groceries, clothes, appliances, drugs, and much more. He also changed the topography of small towns: No longer were shops of many sorts primarily clustered together along downtown streets or housed in suburban shopping centers or even in the malls that became popular in the 1970's. With his original stores, and especially with his "superstore" format, Walton basically changed the prototype of the American shopping venue to a vast, warehouse-like megastore, where anyone can quickly and cheaply buy just about anything under one large roof at any time of the day or night.

JOHN WANAMAKER

American retail magnate

Wanamaker created the first modern department store. He was also a respected religious leader and philanthropist, donating thousands of dollars and several buildings to Young Men's Christian Association (YMCA) chapters worldwide and funding the campaign for a national Mother's Day.

Born: July 11, 1838; Philadelphia, Pennsylvania
Died: December 12, 1922; Philadelphia, Pennsylvania
Also known as: John Nelson Wanamaker
Source of wealth: Retailing
Bequeathal of wealth: Children; charity

EARLY LIFE

John Nelson Wanamaker (WAHN-ah-may-kehr), the oldest of seven children, was born on July 11, 1838, in Philadelphia. His father, Nelson, owned a small brickyard. Young Wanamaker helped turn bricks out of molds so they could dry in the family's backyard. He attended school for three years, starting at age nine. As a teenager, he worked in men's clothing stores, becoming a manager by age nineteen. He quit this job for health reasons and spent his savings traveling the country. In 1858, Wanamaker became the secretary of the Philadelphia Young Men's Christian Association (YMCA), earning $1,000 a year. Wanamaker married Mary Brown on September 27, 1860.

FIRST VENTURES

Wanamaker and his brother-in-law Nathan Brown each invested $2,000 to start Oak Hall, a men and boys' clothing store. Their store opened on April 8, 1861, just days before the start of the Civil War. The store was small, located on the first floor of a building at Sixth and Market Streets in Philadelphia. The first day the partners sold $24.67 worth of merchandise. However, business improved after the two men acquired a contract to manufacture military and customs uniforms. Wanamaker and Brown also advertised special sales, a rare practice at the time. Customers were curious to test the honesty and accuracy of these advertisements. In its first year, Oak Hall's total sales amounted to $24,125.62; by the end of the 1860's, annual sales had climbed to more than $2 million.

MATURE WEALTH

A year after Brown died, Wanamaker opened a second store in Philadelphia under the name John Wanamaker and Company. In 1875, he purchased an abandoned train depot for $505,000 and began renovating it in January, 1876, so it could open as a store in time for the nation's centennial celebration. Wanamaker focused his advertising for his Grand Depot store on out-of-town tourists. The two-acre store opened on May 6, 1876, four days before the centennial celebrations began.

In order to keep sales from falling, Wanamaker decided to create a new kind of store. In addition to men and boys' clothing, the store began selling women's merchandise. He made a more controversial addition to the store in early 1877, when he started to sell dry goods. Wanamaker eventually expanded his retail space to eight acres and installed an air-cooling system. By 1884, the Grand Depot was the largest retail store in America. The following year, the Grand Depot was generating more than $10 million in sales. Wanamaker sold his two smaller stores to his brothers, who had been managing them.

Wanamaker served in President Benjamin Harrison's cabinet as postmaster general beginning in 1889. In this position, he extended free mail delivery to all Americans, not just those living in cities. He also created the U.S. Postal Savings System.

Wanamaker opened a store in New York City in 1896. This venture paid off, allowing him to take a long European vacation within three years. In 1906, construction began on a sixteen-story addition across the street from the New York store, with an overhead walkway connecting the two sites. Wanamaker also opened stores in London and Paris. He died in 1922, leaving his estate, estimated at $100 million, to his three surviving children.

Legacy

One of the keys to John Wanamaker's success was his commitment to his customers. He used the innovative practice of attaching price tags to all of his merchandise, believing that all customers should pay the same price. Wanamaker guaranteed his merchandise in writing, upheld the promises in his stores' advertisements, gave cash refunds, and allowed customers to return items.

Wanamaker loved music and purchased a large pipe organ that was used at the 1904 World's Fair. He later had the organ installed in the Grand Depot, and immediately began enlarging it. Customers were treated to organ music every day for eighty years. The Grand Depot also was the site of public concerts featuring symphonies and organists from around the world. In the twenty-first century, the organ remained in the Wanamaker Building in Philadelphia.

Wanamaker was also a philanthropist. When Anna Jarvis petitioned to make Mother's Day a national holiday. Wanamaker financed her campaign from 1908 to 1914. He also gave money to YMCA branches worldwide.

GEORGE WASHINGTON

American politician, military leader, and landowner

Best known as America's first president and the leader of the American forces in the Revolutionary War, Washington was also a wealthy man, who accumulated large landholdings through careful management. His fortune has become associated with civic virtue and fine character.

Born: February 22, 1732; Bridges Creek (now Wakefield), Westmoreland County, Virginia
Died: December 14, 1799; Mount Vernon, Virginia
Sources of wealth: Inheritance; marriage; real estate; government
Bequeathal of wealth: Spouse; relatives; charity

EARLY LIFE

George Washington was the first son born to Augustine "Gus" Washington (1694-1743) and his second wife, Mary Ball (1708-1789). He had two older half brothers, Lawrence and Augustine, and five younger siblings. His father was a tobacco planter and part owner of an iron foundry near Fredericksburg, Virginia. In 1743, Washington assumed family leadership at age eleven following his father's death. Washington learned skills as a plantation manager and from an early age wisely handled his family's finances.

At the age of twenty-one, he inherited the 260-acre Ferry Farm, plus four smaller land parcels and ten slaves, and his mother continued to live on this farm until her death. His half brother Lawrence inherited the family plantation on Little Hunting Creek and renamed it Mount Vernon in honor of his commanding officer, Admiral Edward Vernon, with whom he had campaigned while in military service to Great Britain.

FIRST VENTURES

Excelling in science and mathematics, Washington was an expert draftsman and mapmaker, who designed roads and bridges and became a proficient land surveyor by 1746, earning a considerable income. At seventeen, Washington plotted out the town of Belhaven (now Alexandria), Virginia, and with support from the Fairfax family he became the surveyor of Culpepper County in 1749, making £125 per year. He conducted 190 land surveys to validate colonial land claims and deeds. Washington was often paid in land for his services, and he had purchased 1,459 acres in the Shenandoah Valley before he inherited Ferry Farm. Like his father, he speculated in land.

MATURE WEALTH

In 1747, Washington surveyed lands for the Ohio Company and developed a useful knowledge of the wilderness. Before Lawrence died of tuberculosis in 1752, he had willed Mount Vernon to his half brother, George, who would later become the legal owner of the estate. Robert Dinwiddie, lieutenant governor of Virginia, in 1752 commissioned Washington to command Virginia's southern district militia at an annual salary of £100, launching Washington's military career. Dinwiddie assigned Washington to carry a letter requesting that the French evacuate the Ohio Valley, as the area was claimed by the British. Washington delivered the letter of ultimatum to the French at Fort LeBoeuf, but the French refused to abandon the area. Washington received £50 after the Virginia assembly published *The Journal of Major George Washington* recounting his Ohio adventure.

Washington was promoted to lieutenant colonel in the Virginia militia, ordered by Dinwiddie to drive out the French from the Ohio Valley, and provisioned to build Fort Necessity in order for the British to occupy the region. However, this fort was captured and partially destroyed, and the French built Fort Duquesne on the site. The French refusal to leave the Ohio Valley precipitated the French and Indian War (1754-1763). During this conflict, Washington served as military aide to British major general Edward Braddock, who was sent by the Crown to drive out the French. Washington distinguished himself in 1755 and was heralded as the "Hero of the Monongahela" following Braddock's death that year. Washington served without official rank or pay because he would not accept a rank from the British that was below his standing in the Virginia militia, in which he was commissioned as a colonel early in the war. However, he wore the uniform of a British colonel and received a stipend of £300 for his expenses. Washington also led the Virginia militia and British soldiers to capture Fort Duquesne. The British did not match the pay scale of the colonial militias, thus fanning additional resentments that would later lead to the Revolutionary War. These economic slights plus unjust taxation led Washington to enter colonial politics, and he was elected to the Virginia House of Burgesses from Frederick County in 1758.

Washington married Martha Dandridge Custis, the wealthy widow of Daniel Parke Custis, in 1759. At the time of their marriage, Martha presented Washington with her dowry of two hundred slaves; her residence, called the White House, on the Pamunkey River, where they were married; another home, Six Chimneys, in Williamsburg; £23,000 in British sterling; and 17,500 acres of land. Washington also managed the inherited properties of Martha's two minor children from her earlier marriage, John Parke Custis and Martha Parke Custis. In addition, Washington was awarded vast amounts of land in western Virginia as compensation for his military service in the French and Indian War.

Between 1761 and 1775, Washington doubled the size of his Mount Vernon estate to sixty-five hundred acres, and he held more than one hundred slaves. He and Martha made Mount Vernon their home, and the couple's joint assets made them one of Virginia's wealthiest families. Their family later increased when the Washingtons provided for two grandchildren, John Parke Custis's younger children, Eleanor Parke Custis and George Washington Parke Custis.

Washington diversified his crops at Mount Vernon because of the unpredictability of the overseas tobacco market, cultivating wheat and other grains that he could sell in the American colonies. He sought to make Mount Vernon self-sufficient with flour milling, fishing ponds, two boats on the Potomac River, a blacksmithing forge, distilleries, horse breeding, a sawmill, masonry works, and weaving centers. Washington lived the lifestyle of a wealthy Virginia planter, enjoyed high society, with fox-hunting his favorite sport, and was generous in his hospitality. He imported fine furniture and household goods, including a harpsichord for his music room. In 1773, his stepdaughter Martha Parke Custis died, and he and his wife used the £8,000 in her trust to pay their British debts.

After the outbreak of the Revolutionary War, Washington on June 19, 1775, was commissioned by the Continental Congress to be commander in chief of the Continental Army. He would not accept any payment for his services and requested that he be reimbursed only for his

MOUNT VERNON

George Washington's most visible legacy of wealth was his estate, Mount Vernon, located on the banks of the Potomac River in Virginia. Mount Vernon was designated a National Historical Landmark in 1960 and is listed on the National Register of Historic Places.

The original Mount Vernon estate was part of a 1674 land grant to John Washington, George Washington's great-grandfather, and Nicolas Spencer from Thomas Colepeper, a British baron who later was the colonial governor of Virginia. The Washington interest in the land passed to Lawrence Washington, George Washington's grandfather, who divided the property with the Spencers in 1690. Lawrence's daughter Mildred sold the property to her brother Augustine, George Washington's father, who developed the property, then known as Little Hunting Creek, building a farm house in 1741-1742 for his son Lawrence, who willed it to his half brother George Washington. George Washington became legal owner of Mount Vernon after the death of Lawrence's only child, Sarah, in 1754, and his widow Anne Fairfax Washington Lee in 1761.

In 1774, George Washington paid taxes on 135 slaves who worked the property, and by July, 1799, the estate's lands were assessed at $488,000. Washington had started remodeling Mount Vernon in 1757, when he leased the property from Lawrence's widow, who had remarried, and he constructed wooden buildings in the neoclassic Georgian style. A second series of improvements was undertaken before the American Revolution.

Washington often accepted land and slaves as payments for debts. He was a prominent agriculturalist who studied the latest farming techniques and diversified his crops, growing flax, hemp, cotton, and silk when tobacco prices fell. He endeavored to abandon slavery, viewing it as economically unprofitable, and he attempted to recruit tenant farmers. In his will, Washington bequeathed Mount Vernon to his nephew Bushrod Washington, and ownership of the property eventually passed to John Augustine Washington, Jr., George Washington's great-grandnephew, who sold Mount Vernon in 1858 to the Mount Vernon Ladies' Association. The association continued to administer the Mount Vernon Estate and Gardens into the twenty-first century, when the properties had become an educational facility open to the public.

military expenses at the end of the war. On July 1, 1783, Washington provided the Continental Board of Treasury with his Revolutionary War expense account. Throughout the war, Washington campaigned for adequate provisions and pay for his soldiers. Following the American victory, he resigned his military commission on December 23, 1783. He then returned to managing Mount Vernon and became the first American chancellor of the College of William and Mary in Williamsburg, serving from 1788 until 1799.

Washington participated in the Constitutional Convention and supported ratification of the new federal Constitution, and in 1788 the convention delegates unanimously elected him the first president of the United States; four years later, he was once again the unanimous choice of presidential electors. The first U.S. Congress voted Washington a salary of $25,000 per year, which at first he declined, not wishing to appear self-serving, but he was finally persuaded to accept it. As president, Washington was as adept at managing the public's money as he was at supervising his private estate. He firmly established the nation's economic foundations by funding the public debt, establishing a national bank, managing the Western lands, encouraging capitalism, and formulating national tax policy in order to support the federal government's goals. To ensure U.S. prosperity, he encouraged ratification of the Jay Treaty with Great Britain, opposed "entangling alliances" with foreign nations, expedited the terms of the Treaty of Paris of 1783, opened trade with the British West Indies, and worked through the Residence Act of 1790 to establish the national capital in Washington, D.C. Washington received the first Congressional Gold Medal.

Washington died on December 14, 1799. His will was carefully drawn, with Martha receiving a life interest in Mount Vernon. Washington released his relatives from any debts they owed him. More than forty relatives were bequeathed large plots of land or cash, with his grandchildren Eleanor receiving two thousands acres from the Mount Vernon estate and his grandson George obtaining twelve hundred acres near Alexandria, as well as property in Washington, D.C. Washington's favorite swords were to be selected by his nephews. Mount Vernon's mansion and the bulk of its acreage and his personal papers and books were willed to his nephew Bushrod Washington. Washington also freed his own slaves, effective upon Martha's death, and provided that they be fed and clothed and the younger ones educated.

Washington bequeathed $4,000 to support a free school in Alexandria that would educate orphaned children so they would not have to drop out of school, as he had done after his father died. He pledged his shares in a Potomac navigation company to establish a national university, which later become George Washington University. He also gave one hundred shares in the James River Company to the Liberty Hall Academy. A gold-headed cane from Benjamin Franklin was willed to his brother Charles Washington, and Lawrence and Robert Washington received canes and spyglasses. To the marquis de Lafayette, with whom Washington fought in the Revolutionary War, he willed two steel pistols, but the key to the Bastille that Lafayette had given him remained at Mount Vernon. Washington provided $100 to each of his sisters-in-law for mourning rings. Unbequeathed lands were to be sold and the proceeds distributed to twenty-three heirs, and a large family crypt was to be built at Mount Vernon.

Legacy

For George Washington, morality was in league with riches. He became known as the Father of His Country because he led the American citizen-army to victory during the American Revolution, and he became a moral exemplar hailed for the civic virtue he demonstrated by resigning his military commission and deferring to civilian authority. As president, Washington was celebrated for his purity of character and his virtue in safeguarding the public welfare. He used much of his wealth for public benefit, and his image has become a symbol of the United States, depicted on the $1 bill and the quarter and memorialized at the Washington Monument in the nation's capital.

Josiah Wedgwood

English pottery designer, merchant, and inventor

Wedgwood combined talents in art, science, and marketing to build a worldwide, multimillion-dollar business that lasted into the twenty-first century. He was also an enlightened employer and social reformer who created a modern model of workers' benefits and compensation.

Born: Baptized July 12, 1730; Burslem (now in Stoke-on-Trent), Staffordshire, England
Died: January 3, 1795; Etruria, Staffordshire, England
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Spouse; children; relatives

Early Life

Josiah Wedgwood (joh-SI-ah WEHDJ-wood) was baptized on July 12, 1730, in Burslem, Staffordshire, England. He was the twelfth child of Thomas Wedgwood III, a potter, and Mary Stringer Wedgwood, the daughter of a Unitarian minister. His family had entered the pottery business in the seventeenth century, when Wedgwood's great-great-grandfather Gilbert Wedgwood became a master potter.

Wedgwood received a basic school education in nearby Newcastle-under-Lyme. In 1739, his father died, leaving the family in heavy debt. The nine-year-old Wedgwood went to work in the family's Churchyard Works, now owned by his brother Thomas. When he was twelve, a serious smallpox attack weakened his right leg, which was eventually amputated in 1768. He worked less at the potter's wheel and focused on learning the art of the craft and experimenting with new ways of preparing and modeling clay. In November, 1744, he began an apprenticeship with his brother.

First Ventures

After his apprenticeship ended in 1749, Wedgwood worked for three years in the family business. He proposed a partnership, but his brother refused. From 1752 to 1753 he had a partnership with John Harrison in Stoke-on-Trent, Staffordshire, and in 1754 he entered a new partnership with the foremost English potter, Thomas Whieldon at Fenton, near Stoke. This alliance proved mutually beneficial. Wedgwood admired Whieldon's treatment of his workers, and Whieldon encouraged Wedgwood's creativity. In February, 1759, Wedgwood began the first of his famous detailed experiment notebooks, recording his daily chemical experiments to develop new, complex glazes. In March, he developed his first unique glaze, a translucent green glaze to be put on white or cream-colored earthenware. This elegant glaze surpassed all other green glazes and later became his trademark "grass green" glaze. In May, Wedgwood founded his own company, and his first factory was the Ivy House works in Burslem.

Mature Wealth

At Ivy House, Wedgwood produced his innovative, popular "greengrocery" wares: pots in the shape of cauliflowers, artichokes, melons, and pineapples, decorated with his unique green and yellow glazes. Most important, Wedgwood developed his revolutionary creamware, a pearly, glazed pottery that resembled fine porcelain. In contrast to the expensive porcelain or the standard earthenware that was dull, porous, and easily broken, creamware was easily decorated, durable, light, and relatively inexpensive to produce. This fine but affordable tableware was especially popular among the rising middle class.

Wedgwood constantly looked to the latest inventions and technology for ideas. He discovered that in 1756, John Sadler and Guy Green of Liverpool had invented the technique of transfer printing on earthenware, which was an inexpensive way of decorating and putting designs on pottery. In 1761, Sadler and Green began decorating Wedgwood creamware with emblems, landscapes, ships, and other scenes. These products sold well, and in 1763 Wedgwood purchased the right to use the process. The income of the Liverpool business grew from £30 a month in 1763 to £650 a month in 1771. Wedgwood's affiliation with Sadler and Green lasted until 1795.

On a trip to Liverpool in the spring of 1762, Wedgwood met Thomas Bentley, a cultured, educated, and influential merchant. Bentley became Wedgwood's closest friend and sold Wedgwood wares in Liverpool beginning in the mid-1760's. On August 10, 1769, Wedgwood and Bentley signed official partnership documents. Their friendship and successful partnership lasted until Bentley's death in November, 1780.

Wedgwood's unique glazes and distinctive wares surpassed other pottery products, and his business flourished. In early 1763, the company moved to the larger Brick House (or Bell) factory. That year, Wedgwood was the first to adapt the engine-turning lathe, a metalworking tool, for use in pottery. His business was also aided by the Act of 1763, which extended the Liverpool turnpike road to Burslem, thus enabling easier transporting of his products and raw materials.

On January 25, 1764, Wedgwood married a distant cousin, Sarah Wedgwood. Her huge dowry of £4,000 (more than $600,000) and moral support helped expand his business. The couple had eight children; their first child, Susannah, would become the mother of Charles Darwin, author of *On the Origin of Species by Means of Natural Selection: Or, The Preservation of Favoured Races in the Struggle for Life* (1859).

In 1765, Wedgwood opened his first London showrooms. Beautifully designed large meeting rooms and constantly changing displays made visiting the showrooms a fashionable pastime. Wedgwood also began using royal patronage and product names as marketing techniques. He completed an elaborate tea set in green and gold creamware for Queen Charlotte. She was so pleased that she allowed him to name his creamware "queensware" and appointed him the "potter to her majesty." Subsequently, creamware became the standard domestic pottery, attaining a worldwide market by the end of the 1760's. Later, in 1773, he created the 1,282-piece Frog Service dinnerware for the Russian empress Catherine the Great.

Wedgwood led the campaign to build a canal joining the Trent and Mersey Rivers. Completed in 1777, this canal opened up continental trade through Liverpool. In 1766, Wedgwood purchased a 350-acre estate between Burslem, Hanley, and Newcastle-under-Lyme, where he built a factory strategically located along the route of the planned canal. In partnership with Bentley, this new manufacturing complex, named Etruria, opened in June, 1769. At Etruria, Wedgwood introduced revolutionary concepts, such as health insurance, sick leave, and housing for workers and their families. Politically he was radical, supportive of the French Revolution, the abolition of slavery, and American independence. He was the first potter to market his products and the first to use his own name as the trademark. Wedgwood was also the first to use cost accounting, unsolicited samples, illustrated catalogs, traveling salesmen, money-back guarantees, self-service, and free delivery.

In 1768, he developed his unique black basalt pottery. In 1775, after thousands of experiments, Wedgwood introduced his world-famous jasperware, a white, unglazed stoneware capable of being stained many colors and ornamented in bas-relief. Renowned sculptor John Flaxman created many of the neoclassical-style decorations for Wedgwood jasperware, regarded as the greatest ceramic invention since the invention of Chinese porcelain. In 1790, after three years of development, Wedgwood introduced his Portland Vase, a perfect jasperware repro-

THE WEDGWOOD MUSEUM

The Wedgwood Museum reflects the true legacy of Josiah Wedgwood, revolutionary pottery designer, entrepreneur, and social activist. In a letter written on September 3, 1774, to his business partner Thomas Bentley, Wedgwood proposed establishing a historical collection representing each new ceramic piece created by the Wedgwood company. Although numerous wares were kept in storage and some Wedgwood family members saved certain pieces, the official museum collection was not established until 1906 by Josiah Wedgwood & Sons.

One of the earliest permanent ceramics museums, the Wedgwood collection was displayed at Etruria, the historic Wedgwood factory and village located near Stoke-on-Trent, England, and named after the Etruscan pottery being excavated in Italy. During World War II, the collection was kept in safe storage. In 1940, Wedgwood production was relocated from the Etruria site to Barlaston, Staffordshire, England. The new Wedgwood Works was the most advanced pottery factory in Great Britain. In 1952, the collection was reopened to the public in its new "long gallery," which was a wide corridor more than one hundred yards long, with display windows through which to view the objects. In the 1960's, the Wedgwood Museum Trust assumed management of the museum from Josiah Wedgwood & Sons, and the museum has remained independent from the company.

In 1975, the museum added a large visitor center complex, which included an art gallery, a theater, a demonstration hall for traditional ceramics methods, and 5,500 square feet of museum galleries with cases arranged in chronological order. In 1984, the museum galleries were rebuilt to double the floor space and to add content about the technical advancements and changes in artistic style and design within the chronological development of the company. A new picture gallery displayed the famous Wedgwood family paintings. The new galleries won the Industrial and Social History Museum of the Year Award in the 1984 National Heritage and *London Illustrated News* competition.

In September, 1999, the galleries were closed, and planning and development began for a new Wedgwood Museum, with expanded display and research facilities. The new state-of-the-art museum was designed and built with sensitivity to the environment. The increasing air pollution in Etruria had been one of the reasons for moving to Barlaston, which Wedgwood factory workers considered a garden. The Staffordshire Environmental Trust supported the new museum project, which used recycling, materials from sustainable sources, and an air-exchange system instead of traditional air conditioning. The multimillion-pound building project was completed in nine years, and the new contemporary Wedgwood Museum building opened in October, 2008.This new museum has the world's most extensive collection of Wedgwood manuscripts and pottery. In 2009, the museum won the £100,000 Art Fund Prize, the United Kingdom's largest single arts prize that honors the most imaginative and original museum or gallery of the year.

duction of the ancient, dark blue glass and enamel Greek vase excavated from a tomb near Rome in the seventeenth century.

In 1790, Wedgwood entered into a partnership with and his sons Joss, John, and Tom and his nephew Tom Byerley. On January 3, 1795, Wedgwood died from cancer of the jaw. He left the bulk of his estate, worth £600,000 (the equivalent of $100 million in 2010) to his wife and children, and Byerley inherited one-eighth of the thriving business.

Legacy

Regarded as the most innovative English potter, Josiah Wedgwood transformed a cottage industry into an international manufacturing empire. An enlightened employer, he introduced unique benefits for workers. He creatively combined science and art to develop a brand that would be popular for centuries. Often regarded as the inventor of modern marketing, he developed new ways of selling that were successful with both royalty and the rising middle class.

Wedgwood's company continued to operate as a family business through another five generations and was incorporated in 1895. Family members stopped chairing the board in 1967, but direct descendants of Josiah Wedgwood continued to serve as board members. By 1975, the Wedgwood company had almost nine thousand employees in twenty factories, but the recession in the 1980's forced the company to lay off almost half of its workforce. In 1986, Waterford Crystal acquired Wedgwood for £252.6 million and formed the Waterford Wedgwood Group. In January, 2009, Wedgwood's 250th anniversary, the economic downturn and mounting debt forced Waterford Wedgwood into bankruptcy. In March, 2009, the private equity firm KPS Capital Partners acquired Waterford Wedgwood and formed WWRD Holdings Limited, the leading provider of luxury home and lifestyle products worldwide.

William Weightman

American pharmaceutical manufacturer and landowner

Weightman was the richest man in Pennsylvania in his lifetime but continues to rank as one of the wealthiest Americans in history, with a personal net worth of $44 billion in 2010. He initially amassed his wealth by manufacturing an antimalarial drug, and he then invested in real estate, acquiring an even greater fortune.

Born: September 30, 1813; Waltham, Lincolnshire, England
Died: August 25, 1904; Philadelphia, Pennsylvania
Also known as: The Quinine King; The Richest Man in Pennsylvania
Sources of wealth: Manufacturing; sale of products; investments; real estate
Bequeathal of wealth: Children

Early Life

William Weightman (WAYT-mahn) was born on September 30, 1813, in Waltham, Lincolnshire, England, to William and Anne Farr Weightman. His maternal uncle was John Farr, a chemist, who in 1818 cofounded Farr & Kunzi, a chemical and pharmaceutical manufacturing firm in Pennsylvania. In 1829, when Farr encouraged the sixteen-year-old Weightman to move to America to work with the firm, Weightman immigrated and began his career as chemist at Farr & Kunzi.

First Ventures

As a chemist employed by Farr & Kunzi, Weightman teamed up with Thomas Powers, and upon the death of Abraham Kunzi in 1836, Weightman was made a partner in the firm. The newly established company of Farr, Powers & Weightman was well on the way to engaging in what would become one of the first, most reputable, and most lucrative chemical manufacturing endeavors in America. When Farr died in 1847, the business was renamed Powers & Weightman, and the company almost immediately attained international distinction for producing fine, medicinal chemicals at a time when the American pharmaceutical industry was just beginning to evolve.

Mature Wealth

Weightman began to amass his great wealth during the Civil War, when he was the first person to manufacture quinine sulfate in the United States. This drug was used to treat typhoid, malaria, and other diseases. Weightman attained great profits through the sale of quinine sulfate at a time when he had what one reporter later suggested was a virtual monopoly on the market. For nearly two decades, Powers & Weightman enjoyed a business with little competition and much profit. Powers died in 1878, leaving Weightman the sole chemist, manufacturer, and, financier of the firm.

By that time, however, Weightman was prepared to maintain a thriving business. He had wed Louise Stelwagon in 1841, and the couple had two sons and a daughter. In 1883, Weightman made his two sons partners in his firm. His sons, Farr Weightman and William Weightman, Jr., were both doctors of medicine and they worked alongside their father until their deaths, building the company that was pioneering the production of new chemicals and leading the development of the manufacturing process.

When the demand for quinine sulfate became greater than the supply, and as the price of the drug proved to be almost prohibitive, Weightman developed a method for manufacturing preferable and equally effective substi-

The Court Battle over William Weightman's Fortune

William Weightman had partnered with his sons, Farr Weightman and William Weightman, Jr., and his son-in-law, Robert C. Walker, to manage his pharmaceutical company. However, by January, 1904, these three partners had died, so that month Weightman made his daughter Anne M. Weightman Walker his new business partner. When Weightman died in August, 1904, Anne was the only heir to his fortune and she continued to run the company until that December, when it merged with another firm.

Weightman's will bequeathed all of his $60 million estate to his daughter. However, in March, 1905, Mrs. Jones Wister, the widow of her first husband, William Weightman, Jr., brought suit to contest the will. Wister argued that there was a codicil in the will that provided for Weightman's surviving grandchildren, including Wister's five children. She maintained that Weightman had a "lack of testamentary capacity" and was under "undue influence" when he wrote his will. Wister's son-in-law, Richard Waln Meirs, disputed Wister's claim about a codicil, and he said he was with Weightman at the time the will was written. Meirs also stated that his wife was happy with her current life and was in no way siding with her mother's lawsuit.

In June, 1905, one of Weightman's grandchildren, A. M. W. Weightman, also protested the will. A judge of the Orphans' Court ordered her to show cause why the probating of the will should not be set aside and why the contest should not be tried before a jury in the Common Pleas court. A. M. W. Weightman claimed that her grandfather had been "insane," that he had proposed to and been refused by Wister, and that he was profoundly jealous of Wister's current spouse. She also alleged that in preparing his will, Weightman had been "poisoned by false representations" and had disinherited his grandchildren as a result.

A judge in the orphan's court gave A. M. W. Weightman ten days to file a petition contesting the will. During that time, however, new evidence was revealed in the form of a "mysterious . . . bit of aged yellow notepaper," and this evidence caused the case to come to an abrupt halt. The contents of this note were never made public. Only a few individuals know what it said and why it was able to change the decision of the plaintiffs, who were sworn to secrecy about the note. In fact, as Meirs claimed, he would have preferred his tongue be cut out rather than disclose the secret.

In court proceedings before the note surfaced, Anne Weightman Walker testified to having given some $100,000 to one of the persons who witnessed the will, A. W. Hoopes, the account manager at her father's company. Her testimony also suggested that there may have been questionable activity regarding the actual writing of the will, during which time Walker was believed to have written the original draft to be copied by Weightman. Walker's testimony pointed to her knowledge of the contents of Weightman's original will and of her father changing the will to enable her to be its sole beneficiary. However, when the note was produced, the case was quickly concluded—apparently in favor of Walker. Walker appeared to be pleased; Wister and her lawyer refused to comment. Walker's lawyer, John G. Johnson, announced to reporters that it was "beyond human possibility" for the mysterious note to be disclosed to the public.

tutes, including less costly alkaloids of cinchonine. These synthetic substances also proved to be profitable, as was the company's later manufacture of citric acid. The senior Weightman continued to serve as head chemist in addition to the company's business manager. He would continue to hold these positions until shortly before his death in 1904, seeing his business yield remarkable profits.

In these productive years of his pharmaceutical business, Weightman engaged in other ventures to expand his wealth. He and his son-in-law, Robert C. Walker, made extensive investments in real estate. In one instance, the two took ownership of more than $1 million worth of property that lumber baron Peter Herdic had been forced to sell in the Panic of 1873. Weightman also owned extensive commercial holdings in Philadelphia, such as the Market House block, the Park Hotel, the Trinity Place block, and the Weightman block. Eventually, Weightman became the largest holder of real estate in Philadelphia and Pennsylvania, as well as one of the largest in the nation, and he was commonly considered to be the richest man in Pennsylvania.

Weightman became a director of the Commercial National Bank, the Northern Trust Company, and the Philadelphia Trust Company, and he was an active member of the Philadelphia College of Pharmacy from 1856 until his death. He also belonged to the Franklin Institute, the Pennsylvania Historical Society, and the Pennsylvania Horticultural Society, and he was noted for his philanthropic contributions. In 1893, for example, he donated $100,000 to the Pennsylvania Museum and School of Industrial Art for the purchase of the Haviland-Strickland Building, which was converted to an industrial art school.

Weightman died on August 25, 1904. His daughter Anne, who at the time of his death was a partner in his business, was the sole beneficiary of his entire estate, which at that time was worth $60 million.

Legacy

A few months after his death, Weightman's company merged with Rosengarten & Sons, and this firm eventually was absorbed by the pharmaceutical firm of Merck & Co. During his firm's operation, Weightman made significant contributions to the nascent American pharmaceutical business. He was business savvy, enterprising, and competitive, and these qualities enabled him to introduce new drugs to the United States and to develop synthetic compounds for these drugs, as well as to become one of the nation's largest landowners. Just as he had the knack for cultivating the rare flowering plants on the grounds of his summer home, Ravenhill, so did Weightman have a gift for generating and cultivating great wealth.

Henry Wellcome

British pharmaceutical company executive

Overcoming humble origins, Wellcome used his entrepreneurial abilities to revolutionize the drug industry. He and his partner Silas Burroughs established one of the leading pharmaceutical companies of the nineteenth and twentieth centuries.

Born: August 21, 1853; Almond, Wisconsin
Died: July 25, 1936; London, England
Also known as: Sir Henry Solomon Wellcome
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Charity; medical research

Early Life

Sir Henry Solomon Wellcome (WEHL-kuhm) was born in rural Wisconsin in 1853, the son of a Quaker mother, Mary Curtis, and Solomon Wellcome, a farmer. When his father's potato crop failed in 1861, the family moved to Garden City, Minnesota, a trip of several weeks by covered wagon. Like most poor boys of that era, Wellcome left school in his early teens and went to work in his uncle's drugstore. His tasks included compounding the primitive medicines, and he also formulated his own compounds, including a lemon juice-based mixture that he attempted to peddle as "invisible ink." This job engendered an interest in medicine that Wellcome retained all of his life. He also was ingrained with deep religious feelings and a strong work ethic. Several of Wellcome's family members were evangelicals who believed in temperance, a belief to which he strictly adhered.

The small town in which the Wellcomes lived was very much a frontier settlement, and clashes with local Native American tribes were not uncommon. In 1862, Garden City was attacked by the Sioux, and as a result, several of the tribe's chiefs were hanged. Although most of the citizens were rabidly anti-Indian, the young Wellcome apparently harbored sympathy for the Native

Americans' plight. This feeling was to manifest itself later, when he devoted a portion of his fortune to Indian causes. When he was seventeen, Wellcome moved to Rochester, Minnesota, where William W. Mayo, a physician and family friend who would found the Mayo Clinic with his two sons, helped Wellcome obtain a position in a drugstore.

First Ventures

Mayo encouraged Wellcome to attend college in Chicago. When the college was destroyed in the great Chicago Fire of 1871, Wellcome relocated to Philadelphia, was apprenticed to a pharmacist, and attended a college of pharmacy. He specialized in the marketing and production of drugs, and while there he met Silas Burroughs, who was to become important in his later business ventures. By the age of twenty-one, Wellcome was working out of New York City as a traveling salesman for a major pharmaceutical company. Within two years he had obtained a position with the prestigious pharmaceutical firm of McKesson & Robbins.

As a rising star within the company, Wellcome was sent to South America to find herbs and medicinal plants that could be used to manufacture new drugs. In particular, his company desired a steady source of the tree bark used to make quinine, the antimalaria drug. Wellcome's exposure to the Indian culture in South America apparently reawakened his empathy for native peoples. He began recording his experiences in a popular series of papers that were published in pharmaceutical journals. He was still in his twenties when he became reacquainted with Burroughs, who was then working for the Wyeth drug company. Their meeting ultimately led to the establishment of the hugely successful pharmaceutical firm, Burroughs Wellcome & Company.

Mature Wealth

By the time Burroughs Wellcome was founded, the American pharmaceutical industry had progressed beyond the mortar-and-pestle stage to the manufacture of pills by machine. American drug companies envisioned great business opportunities in Europe and other areas of the world, where medicine was still primarily dispensed in powdered or liquid form. McKesson & Robbins awarded Wellcome the exclusive right to sell its products overseas, including in Africa, Asia, and Australia, and

The Wellcome Trust

The Wellcome Trust was established by the will of Henry Wellcome upon his death in 1936 at the age of eighty-two. The trust received the bulk of Wellcome's assets. Its initial stated purpose was to promote and support research aimed at improving the health of human beings and animals, and the trust eventually grew to become one of the world's largest private biomedical charities. In 1986, the trust began divesting itself of stock in the Wellcome pharmaceutical company in order to separate itself from the industry. This divestiture was completed in 1995 with the sale of all remaining stock to the Wellcome company's former competitor Glaxo, when the two firms merged to become GlaxoWellcome. The name Wellcome was later dropped in the formation of GlaxoSmithKline.

The Wellcome Trust is the largest nongovernmental source of funds for biomedical research in the United Kingdom. In 2009, its endowment was about £13.1 billion, and it spends about £600 million each year on its programs. Part of its mission is the funding of research programs in the medical humanities and biomedical fields, as well as activities that promote public engagement with science. Some of its programs are involved with technology transfer, the treatment of malaria, the sequencing of the human genome, the establishment of the United Kingdom Biobank, medical techniques for saving premature babies, cognitive therapy for bulimia, brain imaging and psychological disorders, and skin cancer research.

One of the Wellcome Trust's major initiatives, funded by a grant of £90 million, is a partnership with Merck & Co., a pharmaceutical firm, to create a nonprofit research center in India. The center seeks to facilitate the development of new vaccines for use in developing countries. This is the first time that a pharmaceutical company and a medical charity have formed such a partnership for this purpose. The trust is also engaged in a partnership with the U.S. National Institutes of Health; this partnership supports a four-year training program for Ph.D. candidates in international collaborative biomedical research at campuses in the United Kingdom, Ireland, and Maryland.

The Wellcome Trust also supports research at universities and other academic facilities in both the United Kingdom and abroad. It financed the construction of the Wellcome wing of the Science Museum in London and the establishment of a national network of Science Learning Centres. The trust sponsors a publications program and funds the Wellcome Trust Book Prize, an annual award of £25,000, one of the richest literary awards in the world, to a book about some aspect of health, illness. or medicine. In addition, the trust makes its published research available online without cost. The Wellcome Trust Case Control Consortium, composed of fifty research groups, was created in 2005 to help in the understanding of human genome sequencing and to identify genes associated with diseases and serious medical conditions, including glaucoma, multiple sclerosis, ulcerative colitis, and Parkinson's disease.

Wellcome and Burroughs set up a London office in 1880. A few years later, the two partners decided to stop importing medications from America because of heavy tariffs and to manufacture their own drugs in England. They set up a factory, and by the time he had reached the age of thirty, Wellcome was already a rich man.

The partners purchased a larger factory in England and had new machinery designed that produced pills at a rate of six hundred per minute. Wellcome used the brand name "Tabloid," a combination of "tablet" and "alkaloid," registered for the company's product line, and this product proved wildly successful. Burroughs Wellcome fought and won several court cases that enabled the firm to retain the name Tabloid as its own proprietary trademark. Upon the death of Burroughs in 1895, Wellcome assumed full control of the company and oversaw the opening of branches in Australia, New York, Canada, China, and South Africa. In order to retain its employees' loyalty, Burroughs Wellcome established an eight-hour workday and offered workers paid tuition for attending night classes. In the 1890's, Wellcome bought an English estate where his workers could enjoy company-sponsored outings, and the company also provided facilities for employees to participate in various sporting events and hobbies. Whether his beneficence sprang from altruism or from profit motives, the company did gain a more contented workforce.

Wellcome did not marry until 1901, when he was forty-eight years of age. His wife was a prominent doctor's daughter, Gwendoline Barnardo, known as Syrie, who was twenty-six years his junior. They had one son, born in 1903 and also named Henry, who appeared to be a disappointment to both of them. When their son was still very young, he was temporarily raised by foster parents. The Wellcomes' marriage proved to be an unhappy one, and in 1909 they began to live separately, eventually divorcing in 1915. Among Syrie's lovers (and later her husband) was the author W. Somerset Maugham, whom Wellcome named as corespondent in his divorce suit. Wellcome won custody of their son and apparently established an amicable relationship with him.

In 1910, Wellcome became a British subject, having lived in the country for some thirty years. In 1924, he combined all of his business interests into a holding company called the Wellcome Foundation. He was honored with a knighthood in the early 1930's, thus becoming Sir Henry Wellcome, and was also made an honorary fellow of the Royal College of Surgeons of England.

As an adjunct to his business activities Wellcome was a passionate, possibly obsessive, collector of items related to medicine. In order to house his collection, he established the Wellcome Historical Medical Museum in London in 1913, with his artifacts forming the core of its collection. At the time of his death in 1936, the Wellcome collection contained more than one million items, and by the twenty-first century the collection was housed in a building that was once a part of Wellcome's corporate empire. A majority of the nonmedical items were removed from the collection over the years, and some of the remaining items are on display in museums. Wellcome also had a great interest in archaeology and participated in many digs in Africa. The company he cofounded, Burroughs Wellcome & Company, was one of the firms that eventually merged to form the pharmaceutical giant GlaxoSmithKline.

Legacy

Henry Wellcome's business acumen helped to bring the pharmaceutical industry into the modern era, particularly in areas outside the United States, with technological advances in the production of medicines. His large fortune was used to establish a prominent biomedical charity that has significantly aided medical research in numerous fields throughout the world.

Bartholomeus Welser

German banker, investor, and merchant

Under Welser's leadership, his family wielded great economic and political influence in Europe, rising to great heights as bankers and merchants during the early sixteenth century. Welser financed a German colonization effort in Venezuela, which was instrumental in the European settlement of South America.

Born: c. 1488; Augsburg, Swabia (now in Germany)
Died: c. 1561; Amberg, Swabia (now in Germany)
Also known as: Bartholomew Welser
Sources of wealth: Inheritance; banking; trade; slave trade; government
Bequeathal of wealth: Children

Early Life

Bartholomeus Welser (bahr-THOL-oh-may-uhs VEHL-sehr) was the son of Anton Welser, a prominent and wealthy Augsburg merchant. Family members had been public officials and businessmen in Germany since the thirteenth century. Welser grew up amid luxury provided by the family's lucrative import-export trade in the eastern Mediterranean and supplemented by European silver mining interests, which helped the Welsers amass a fortune. From an early age, Welser worked alongside his father, and he soon demonstrated his aptitude for entrepreneurial enterprises.

First Ventures

A family dispute in 1517 led several of Welser's brothers to relocate to Nuremberg and Ulm. After his father died in 1518, Welser and a brother, Anton the Younger, founded Welser and Company, and they added banking to their family business ventures. When the Habsburg king of Spain, Charles I, made a bid to become the Holy Roman emperor, the Welsers, along with the rival German bankers the Fuggers, financed his election, and he became Holy Roman Emperor Charles V in 1519. Contemporary accounts indicate that Welser lent Charles nearly 150,000 florins to secure the election. The Welsers subsequently backed many of the emperor's various European wars at the cost of twelve tons of gold.

As a reward for Welser's financial support, Charles appointed Welser his privy councilor and later elevated Welser to a position of nobility in 1532. Welser gained other privileges, such as safe-conduct passes and tax exemptions. Charles V was supposed to repay Welser's loans by 1527, but he could not. As compensation, Charles granted Welser the right to establish trade in sugar, precious metals, textiles, pearls, and slaves between Europe and Hispaniola (now Haiti and the Dominican Republic). Charles also gave Welser an exclusive concession to explore and exploit the newly discovered Spanish province of Venezuela ("little Venice") in the New World.

Mature Wealth

In 1528, Welser outfitted several ships, staffed with Flemish and Spanish mercenaries and German miners, that sailed to Venezuela under the control of his agents. These passengers were to erect forts and establish settlements for colonization, meanwhile developing mineral deposits and importing slaves from West Africa to work the land in the new colony. The Venezuelan enterprise, which continued for more than twenty-five years, proved to be disastrous.

From the start, there was hostility between the Spanish and the Germans. The colonizers, made greedy by the lucrative 1521 conquest of Mexico, were more interested in finding treasure than in building communities. Wave after wave of German-led expeditions, revitalized in the 1530's by the rich conquest of Peru, journeyed into the harsh, swampy interior of Venezuela in search of El Dorado, the fabled lost city of gold. Instead of gold or precious stones, they found only hardship, disease, and death by starvation or in conflicts with belligerent natives, who fiercely resisted attempts at subjugation. In 1546, the year Charles V revoked Welser's Venezuelan concession, Welser's son, Barthlomeus the Younger, coleader of another excursion into the interior, was murdered at the hands of the Spanish. Although Welser fought for a decade to reverse the revocation, his concession was formally terminated in 1556. It is estimated that the Venezuela venture cost the Welser family more than 3 million gold florins, and the family never did recoup its original loans to Charles V.

Legacy

Welser retired from business in the mid-1550's and died in 1561, leaving the much-depleted family business in the control of his three sons and two nephews. Although the house of Welser declined and went bankrupt by 1614, and the Augsburg branch of the family became extinct in 1797, the contribution of Barthlomeus Welser to the history of the Old and New Worlds is significant. Welser's funds supported Emperor Charles V's numerous military enterprises in Europe between 1519 and 1556, and Welser-backed expeditions resulted in the founding of Bogotá, Colombia, and Buenos Aires, Argentina, helping make possible the conquest of South America.

Joséphine de Wendel

French industrialist

The widow of an iron entrepreneur, Wendel expanded the ironworks and established a tightly controlled family enterprise that became the leading iron and steel conglomerate of nineteenth century France.

Born: February 17, 1784; Metz, France
Died: March 13, 1872; Metz, France
Also known as: Marie Françoise Joséphine de Fischer de Dicourt (birth name); Madame Joséphine; Madame François de Wendel
Sources of wealth: Inheritance; steel; manufacturing
Bequeathal of wealth: Children

Early Life

Joséphine de Wendel (joh-say-feen duh WEHN-dehl) was born to Pierre Alexandre Chrétien de Fischer de Dicourt and Anne Eléonore Reine de la Cheze. In 1804, she married a distant cousin, François de Wendel, who was heir to an iron forge and castle in Hayange founded by his great-grandfather, Jean-Martin Wendel (1665-1737) but ruined in the French Revolution. François repaired the castle and rebuilt the ironworks. By the time of his sudden death at age forty-seven, he had built the third-largest iron enterprise in France, producing almost 1 percent of the nation's iron.

First Ventures

After her husband's death in 1825, Wendel was left with five children. In 1826, she married her daughter Marguérite to a widower, Théodore de Gargan, who was a foundry operator in the French royal mines. Gargan expertly managed the Wendel mines, obtaining a royal land concession and ensuring the prosperity of the ironworks. Wendel's son Charles studied mining and metallurgy in England and returned in 1834 to share management of the company with Gargan. As the business expanded its iron and real estate ventures throughout Alsace-Lorraine, Wendel organized the Wendel holdings to keep them intact, a task made difficult by the inheritance laws of the Code Napoleon. She drew up contracts for each of her descendants in which they ceded their rights of inheritance in exchange for 400,000 francs to be paid out as annual income over ten years.

Mature Wealth

With Joséphine de Wendel organizing the family industries and Charles de Wendel and Gargan managing them, the Wendels became the leading iron and steel industrialists in nineteenth century France. The expansion of railroads created an insatiable demand for iron for rails and coal for energy. The ironworks increased the number of blast furnaces it used from three in 1834 to eight in 1857, and the number of workers grew from 325 in 1828 to 2,000 in 1850 and 7,000 in 1869. Production of coal from the Wendel mines climbed from 32,000 tons in 1847 to 223,000 in 1870. The output of cast iron increased from 6,000 tons in 1828 to 23,000 in 1847, 88,000 in 1862, and 134,500 in 1869, with the Wendel ironworks ultimately producing 11.2 percent of the iron made in France.

On April 24, 1857 Wendel established a new company, Les Fils de François de Wendel (the sons of François de Wendel). She injected capital of 30,306,330 francs for the company (at this time equivalent to \$5.8 million), with a pledge of an additional 8,177,873 francs (equivalent to \$1.6 million). In exchange, she received 80 percent of the company's profits, bringing her great wealth. In 1857, she paid 1.5 million francs for a new coking furnace. In 1862, she gave her son Charles 1,481,252 francs from her company shares, and she gave 100,000 francs to each of her other descendants. Les Fils de François de Wendel pioneered new ways to organize family wealth in France and to provide benefits for its employees. In 1857, it created a model town for its workers, Stiring-Wendel. The firm also introduced the use of pensions, seniority, workers' compensation, company shops, and sick pay.

When Charles died in 1870, Wendel, although eighty-six years of age and blind, took complete control of the company. She deftly maintained ownership of her properties, even though Germany had annexed Alsace-Lorraine after the Franco-Prussian War. She renamed the company Les Petits-Fils François de Wendel (the grandsons of François de Wendel), with shares held by her fourteen grandchildren. When she died in 1872, the Wendel industries were an intact family dynasty that would operate into the twenty-first century.

Legacy

Inheriting a growing ironworks from her intrepid husband François, Joséphine de Wendel turned it into a leading industrial power in France, with vast iron and steel factories and real estate holdings throughout Alsace-Lorraine. She helped establish a new form of family capitalism, refashioning inheritances to preserve an intact Wendel company closely held by her descendants. Wendel industries would continue to flourish in the twentieth century, with her great-grandson François de Wendel (1874-1949) the leading industrialist in interwar France. In the twenty-first century, the Wendel Group proclaimed itself a historic pioneer in recognizing the entrepreneurial abilities of women, citing the remarkable organizing genius of its matriarch, Joséphine de Wendel.

George Westinghouse

American inventor, engineer, and industrialist

By the end of the nineteenth century, Westinghouse was America's greatest engineer. His inventions of the air brake and alternating current system revolutionized the railroad and power industries. He was also a benevolent employer, who built an international commercial empire based on his unique management of ideas and people.

Born: October 6, 1846; Central Bridge, New York
Died: March 12, 1914; New York, New York
Also known as: George Westinghouse, Jr.
Sources of wealth: Patents; manufacturing; utilities
Bequeathal of wealth: Children

Early Life

George Westinghouse, Jr., was born on October 6, 1846, in Central Bridge, New York, the eighth child of George and Emmeline Vedder Westinghouse. His father's ancestors, originally from Westphalia, Germany, settled in England in the fourteenth century. In the seventeenth century, they immigrated to the United States, where they settled in Vermont. Westinghouse's father, a farmer, moved from Vermont to Ohio and finally to Central Bridge. Westinghouse's mother was related to the American symbolist artist Elihu Vedder.

When Westinghouse was ten years old, his family started a manufacturing firm to produce agricultural machinery and steam engines. His father was a talented inventor and acquired numerous patents. In 1860, Westinghouse began working at his father's shop, where he learned about tools and machinery. During the Civil War, Westinghouse served in the infantry and then became a naval engineering officer.

First Ventures

After the war, Westinghouse attended Union College for three months and then returned to work in his father's shop. In October 1865, when he was only nineteen years old, Westinghouse received his first patent, for a rotary steam engine, which was impractical but inspired future high-speed rotating turbines and generators. Westinghouse frequently traveled by train to meet with customers and suppliers. Observing that train derailments were a common problem, he invented a railroad car replacer, a switch that quickly brought derailed freight cars back on their tracks. He also developed an improved railroad frog, a permanent piece of track or track switch that allowed trains to go across rails at a junction. Westinghouse also realized that steel would be a more durable material for his inventions than the commonly used cast iron and wrought iron.

In 1866, he formed a partnership with two businessmen from Schenectady, New York, who each contributed $5,000 to form the company of Rawls, Walls, & Westinghouse. Problems arose when Westinghouse's two partners wanted control of his patents. Westinghouse traveled regularly to Pittsburgh, Pennsylvania, where he founded a steel company to manufacture his inventions more economically. He also met potential financial backers. In 1867, he filed a patent for a reversible steel railroad frog. His design of two frogs in one product introduced the engineering concept of redundancy. On August 8, 1867, he married Marguerite Erskine Walker, and they settled in Pittsburgh in 1868. They had one child, George Westinghouse III, born in 1883.

MATURE WEALTH

Westinghouse realized the significance of railroads to American industrialization, but trains had frequent accidents because of a system that required brakemen on each car to manually apply the brakes. In April, 1869, he obtained a patent for his first major invention, an effective air brake system operated by compressed air. In July, 1869, Westinghouse founded the Westinghouse Air Brake Company on thirty acres of land in Pittsburgh. This firm was the first of sixty companies he would establish during his life. The Railroad Safety Appliance Act of 1893 made air brakes a requirement on all U.S. trains. With continual improvements, the automatic air brake increased safety and enabled railroads to travel at higher speeds and with a greater number of cars. By 1905, Westinghouse's company was producing one thousand brakes per day and had about three thousand workers. Westinghouse's "Quick-Action Automatic Brake" was used in eighty-nine thousand locomotives and more than two million railroad cars.

Westinghouse subsequently worked on an improved method of railroad signaling. With a combination of his own inventions and the purchase of other patents, he perfected an electrical and compressed air signaling device. In 1881, he established the Union Switch and Signal Company in Pittsburgh.

Westinghouse saw the potential of clean-burning natural gas as an alternative to coal, so he acquired thirty-eight patents for gas piping equipment. In 1884, he purchased the charter of the Philadelphia Company in order to start a utility company for the distribution of natural gas through pipelines to thousands of Pittsburgh homes. By 1887, 90 percent of factories and 75 percent of homes in Pittsburgh used natural gas.

Westinghouse realized the disadvantages of Thomas Edison's direct current (DC) system, in which an electric charge moves in only one direction. He saw the potential of alternating current (AC), in which the flow of an electric charge periodically reverses direction. In 1886, he founded Westinghouse Electric Company to make AC equipment. On March 20, 1886, his engineer, William Stanley, successfully demonstrated the first commercial use of AC power and transformers to provide electric illumination. A steam-engine-driven AC power generator electrified buildings on Main Street in Great Barrington, Massachusetts. In 1888, Westinghouse purchased the exclusive rights to Nikola Tesla's patent for a polyphase electrical system and hired Tesla to work for him. Thus began the famous and bitter conflict with Edison, whose DC service in 1882 was the first electrical utility service. The battle between Edison's DC and Westinghouse and Tesla's AC was the first major standards war in the United States. When AC was used for the first electric chair execution on August 6, 1890, AC was stigmatized as an electrocution current.

In 1893, Westinghouse set up 250,000 lights to illuminate the World's Columbian Exposition at the Chicago World's Fair. That same year, he built three five-thousand-horsepower, two-phase generators to harness the energy of Niagara Falls; in 1895, this installation was able to light up Buffalo, New York. AC eventually became the standard current in the United States. In 1895, Westinghouse also began developing high-speed steam and gas engines. The following year, he bought the

American rights to the Parsons steam turbines, and the first U.S. public utility steam turbine generator became operational in 1900.

Westinghouse's management practices were unique for his time. He believed in treating his workers with respect and providing for them and their families. He pioneered pension plans for workers, and his factories had on-site hospitals. Paycheck deductions helped workers purchase homes in planned communities at Wilmerding in East Pittsburgh and Trafford in Pennsylvania.

He hired other gifted engineers and gave them credit for any new products they developed. Patents were issued with an inventor's name, rather than in Westinghouse's name. For instance, the patents for all 162 products developed by employee Benjamin G. Lamme were issued in Lamme's name.

By 1900, Westinghouse's companies were valued at \$120 million. In 1905, he introduced the first mainline, AC locomotive for the Manhattan Elevated Railroad in New York City. In 1910, he invented a compressed air spring or shock absorber for automobiles. In 1911, after a power struggle involving bankers and creditors, Westinghouse lost the presidency of the board of the Westinghouse Electric Company. Westinghouse died on March 12, 1914. His wife died that June, and their son, George Westinghouse III, and his wife were the sole heirs.

Legacy

At the time of his death, Westinghouse owned 314 patents, controlled more than fifteen thousand patents, and employed more than fifty thousand workers. He had founded sixty companies worldwide and transformed the railroad industry with his air brake and railroad signaling inventions. His development of the AC standard revolutionized the field of electrical power. Westinghouse Electric and many of his companies continued into the twenty-first century.

A millionaire entrepreneur, Westinghouse believed that his wealth should benefit mankind, and he treated his employees with kindness. In 1930, thousands of employ-

George Westinghouse Medals

The American Society of Mechanical Engineers (ASME), founded in 1880, is a nonprofit professional organization that promotes the science, art, and practice of engineering and allied sciences worldwide. Inventor, entrepreneur, and industrialist George Westinghouse was an honorary member of ASME, and he served as its twenty-ninth president from 1910 to 1911. A gifted, self-taught mechanical engineer, Westinghouse valued this recognition by his peers.

Westinghouse shaped modern technology and transformed the manufacture of power by developing the use of alternating current (AC), which became the standard for electric power transmission. In honor of his contributions, ASME awards two George Westinghouse Medals to recognize outstanding achievement or service in the power field of mechanical engineering, including power design, research, development, and utilization, or the administration and organization of these activities. The George Westinghouse Gold Medal was established in 1952 and includes a vermeil medal, a certificate, an honorarium of \$1,500, and hotel and travel expenses to attend the awards ceremony. The George Westinghouse Silver Medal was established in 1971. It is limited to applicants who are forty-five years old or younger on June 30 of the year of the presentation ceremony. This award includes a silver medal, a certificate, an honorarium of \$1,000, and hotel and travel expenses to attend the awards presentation.

The first Gold Medal was awarded in 1953 to Alexander G. Christie for his civic power development. A pioneering mechanical engineer, Christie taught at Johns Hopkins University for fifty years. The first Silver Medal was awarded in 1972 to aeronautical engineer William E. Rice for his work with the National Aeronautics and Space Administration's (NASA's) propulsion and power systems.

The 2009 Gold Medal was awarded to Essam E. Khalil, a fellow at Cairo University, Egypt, for his work on power plant design and the use of mathematical modeling of flames and turbulent combustion in order to reduce pollution from power plants and to increase efficiency. The 2009 Silver Medal was awarded to Somrat Kersuwan, a professor in the department of mechanical engineering at the King Mongkut University of Technology in North Bangkok, Thailand. This award recognized Kersuwan's work as a researcher, educator, and engineer in the development, design, and application of wastes and low-grade fuels for clean energy conversion and power production, with emphasis on pollution and alternative energy sources.

Other medalists have included Janos M. Beer (2001 Gold), a chemicals and fuels engineer; Fred J. Moody (1980 Gold), a thermal-hydraulics engineer; Joseph A. Barsin (1986 Silver), an expert in combustion systems and fuel energy conversion; and Ting Wang (1998 Silver), a specialist in gas turbine technology.

ees and retirees of his companies donated the funds to create a memorial to Westinghouse in Pittsburgh's Schenley Park. The American Society of Mechanical Engineers established the George Westinghouse Gold Medal in 1952 and the George Westinghouse Silver Medal in 1971 to honor achievements in the power field of mechanical engineering.

Frederick Weyerhaeuser

American lumber baron, landowner, and investor

Weyerhaeuser became the first modern timber products magnate in the United States, assembling an empire consisting of millions of acres of land, sawmills, paper mills, and other assets. His company pioneered methods of sustainable forestry that treated timber as an agricultural crop.

Born: November 21, 1834; Nieder Saulheim, Hesse (now in Germany)
Died: April 4, 1914; Pasadena, California
Also known as: Friedrich Weyerhaeuser (birth name); the Timber King
Sources of wealth: Lumber; real estate; investments
Bequeathal of wealth: Charity

Early Life

Frederick Weyerhaeuser, the son of John Weyerhaeuser, was born in the village of Nieder Saulheim in the Rhine Valley, an old Roman walled town in an agricultural region. Weyerhaeuser was one of eleven children. He attended a Protestant school and began farm work at the age of eight. His workload increased at the age of twelve, when his father died. At fourteen, Weyerhaeuser was confirmed in the German Reformed Church. (Later, when he settled in the United States, he attended Presbyterian and Lutheran churches.) Land was scarce in the overpopulated Rhine Valley, so many area residents immigrated to the United States in the mid-nineteenth century. One of Weyerhaeuser's older sisters and an aunt moved to western Pennsylvania in 1849, and Weyerhaeuser and the rest of his immediate family followed in 1852.

First Ventures

Weyerhaeuser's first job in the United States was as a day laborer near Erie, Pennsylvania. He also learned the brewer's trade before moving to Rock Island, Illinois, in March, 1856, where he worked on construction of the Rock Island and Peoria Railway. Everywhere he was employed, Weyerhaeuser advanced quickly because of his willingness to work long hours.

In Rock Island, he got his first taste of the forest products business when was hired as night watchman at the Mead, Smith & Marsh sawmill. He later sold lumber and then was promoted to supervisor of the sawmill and an adjoining lumberyard. The sawmill fell into bankruptcy during the Panic of 1857, and Weyerhaeuser used his savings to buy both the mill and the lumberyard. On October 11, 1857, he married Sarah Elizabeth Bloedel, who also had emigrated from Nieder Saulheim.

Weyerhaeuser refined his skills in the lumber business, and within a few years he mastered the rudiments of growing evergreen trees, harvesting them, readying lumber for manufacture and sale, using railroad networks to transport his products, and investing his profits to expand his landholdings and ability to grow more trees. His business grew with a building boom that followed the westward expansion of the United States.

Weyerhaeuser joined in partnership with his brother-in-law, F. C. A. Denkmann, in 1860 under the corporate name of Weyerhaeuser & Denkmann, and he swiftly expanded the company's business operations. The company's lumber output tripled within a few years. The firm also acquired a lumber shipping business along the Mississippi River and added several other sawmills to its growing list of properties. By 1864, the company was buying tracts of lumber-producing forest land. Weyerhaeuser and Denkmann built a vertically integrated business that controlled the production process of timber from tree to sawmill.

Mature Wealth

From the 1860's through the 1880's, Weyerhaeuser acquired more timber-bearing land in Minnesota, Idaho, Wisconsin, Washington, and Oregon as he became a friend of James J. Hill, the primary figure in the new Northern Pacific Railway, who had also become a major landowner of timber resources through federal laws that allowed railroads to acquire inexpensive land along their rights-of-way. Northern Pacific had obtained almost sixty-nine thousand square miles of forests on its route from Lake Superior to Puget Sound. Weyerhaeuser first met Hill as a next-door neighbor in St. Paul, Minnesota. Hill did not realize the value of the forests on his lands, and he thus sold large tracts to Weyerhaeuser for very low prices, adding to the profitability of Weyerhaeuser's growing business empire. Weyerhaeuser snapped up Hill's Western lands at a time when many old-growth forests in the East were being logged. While Hill was short of cash, Weyerhaeuser was in need of trees.

On one day alone, January 3, 1900, Hill sold Weyerhaeuser 900,000 acres (1,406 square miles) of timber-bearing land in Washington State for \$5.4 million, about \$6 per acre. Within days of this purchase, Weyerhaeuser on January 18 incorporated the Weyerhaeuser Timber Company, the largest lumber firm in the state of Washington.

By the beginning of the twentieth century, Weyerhaeuser's company owned more timber-bearing land than any other business in the United States, with a total of 1.5 million acres in 1903. While the company acquired a sawmill in Everett, Washington, among other industrial properties, its primary business continued to be the growing and selling of timber to other firms for processing. Eventually, Weyerhaeuser acquired more than two million acres of timberland in the Pacific Northwest at an average cost of only \$8.80 per acre, and he regarded this property as a long-lived productive asset.

Weyerhaeuser chose George S. Long as the company's first general manager, and Long held the job for three decades. During that time, Long developed some of the earliest ideas of sustainable forestry, and in 1904 he began to view timber as an agricultural crop. Sustainable forestry was not always beautiful or environmentally friendly; it involved clear-cutting, wetland drainage, and intense use of chemicals, such as fungicides, herbicides, and fertilizers, to accelerate the trees' growth. Weyerhaeuser and Long campaigned against tax laws that encouraged onetime harvests of timber on land that would subsequently be used for farming. Reforestation, land conservation, and fire prevention became company priorities early in the twentieth century. At the same time, Weyerhaeuser was acquiring more land on which to pursue his model of sustainable tree farming.

Weyerhaeuser's philosophy was simple: Wherever his company bought timber, he believed he could make a profit; a purchase avoided was an opportunity lost. He also believed in cooperation, rather than competition, and he bought other lumber firms in order to reduce the cost of production by increasing the economies of scale. In 1872, Weyerhaeuser played a key role in founding the Mississippi River Boom and Logging Co., which controlled every log milled along the Mississippi River.

Weyerhaeuser spread his influence through interlocking directorates with other firms. Eventually, he was president of sixteen lumber companies other than the one that bore his own name; the other companies retained their original names, including Boise Cascade and Potlatch. He also was a major stockholder in many other firms.

Work was an ingrained habit and was its own reward for Weyerhaeuser. Long after his wealth made it unnecessary for him to work long hours, he continued working, and he regarded public glorification of his labor as a waste of time and energy. He spoke instead of the joy he derived from accomplishment. Work engaged Weyerhaeuser more than the mere accumulation of wealth, although he also saw money as a just reward for his labor. Despite his wealth, he remained a person of simple tastes who avoided publicity, giving few interviews to the press. Weyerhaeuser even avoided being mentioned in *Who's Who in America*, and the publication did not manage to catch up with him until 1911, three years before he died. By that time, Weyerhaeuser already was a multimillionaire. Weyerhaeuser was described as the "Timber King" in a profile published by *The New York Times* in 1913. The next year, on April 4, 1914, he died while on vacation in Pasadena, California.

WEYERHAEUSER FAMILY FOUNDATION

The Weyerhaeuser Family Foundation, which was incorporated in 1950, provides funds for programs that it defines as having an impact in the United States and internationally, "to promote the welfare of human and natural resources." The foundation's guidelines direct its board and staff to "enhance the creativity, strengths and skills already possessed by those in need and reinforce the sustaining processes inherent in nature."

The foundation has several specific initiatives. One project is aimed at children who have been exposed to domestic violence. Another promotes programs that assist the conservation of forests and sustainable economic development of natural resources, as well as local community building.

In 2008, the foundation reported a market value of $14.5 million and awarded $898,000 worth of grants, including almost $300,000 related to the Children's Initiative and $205,000 for its Sustainable Forests and Communities Initiative. In addition, $394,000 was granted as part of the organization's "general docket." Grants usually range from about $10,000 to about $30,000 and often are given to American-based groups that work in other countries. Examples of grants include an award to Empowerment International of Lyons, Colorado, in order to encourage primary school education in Santa Ana de Malacos, Nicaragua ($20,890); India Partners of Eugene, Oregon, for developing instructional programs in Andhra Pradesh, India ($8,000); and Environment Agros International of Seattle, Washington, in order to aid reforestation and economic development in fourteen villages in southwestern Nicaragua ($20,000).

While the Weyerhaeuser Family Foundation is endowed with money earned through the activities of the Weyerhaeuser family since its patriarch, Frederick Weyerhaeuser, began working in the 1850's, it is not controlled by the Weyerhaeuser Company, and it is unrelated to a larger foundation that is operated by the company itself. The larger organization, the Weyerhaeuser Company Foundation, was founded in 1948 and had contributed more than $190 million in charitable grants as of 2008.

LEGACY

The Weyerhaeuser Company, as it was renamed in 1959, remained a major timber firm long after its founder died. Shortly after Weyerhaeuser's death, World War I created a substantial new demand for timber to build wooden ships, as well as rudimentary airplanes and barracks. Demand was so intense that for a time the U.S. Army sent troops onto Weyerhaeuser land to assist in the harvest of timber.

Frederick and Sarah Weyerhaeuser remained married for more than fifty years and had seven children. The eldest, John P. Weyerhaeuser, followed his father into the forestry business, managing the Nebagamon Lumber Company, in Wisconsin. Upon his father's death, John became president of the Weyerhaeuser Company. Another son, Charles A. Weyerhaeuser, managed the Pine Tree Lumber Company in Minnesota and later became president of the Potlatch Lumber Company in Washington State.

In the twenty-first century, the Weyerhaeuser Company was based in Tacoma, Washington, and the firm remained a leading world producer of lumber, paper, pulp, packaging materials, and other products, with 270 sawmills, paper and pulp and mills, and factories in the United States and seventeen other countries. The company is one of the world's largest nongovernmental landowners, with seven million acres in the United States and thirty-one million in Canada.

Edith Wharton

American author and socialite

Wharton was born into a wealthy family, and she lived among America's richest men and women. She chronicled and satirized this elite society in her novels, short stories, travel writings, and memoirs.

Born: January 24, 1862; New York, New York
Died: August 11, 1937; St.-Brice-sous-Forêt, France
Also known as: Edith Newbold Jones (birth name)
Sources of wealth: Inheritance; writing; real estate
Bequeathal of wealth: Relatives; friends; employees; charity

Early Life

Edith Wharton (EE-dihth WAHR-tuhn) never had to worry about "keeping up with the Joneses" in order to show off her wealth. She was born into the Jones family that reportedly inspired the adage. Her parents, George Frederick Jones and Lucretia Rhinelander Jones, belonged to one of the largest, richest, and most socially prominent families in nineteenth century America. Edith Newbold Jones was born with the proverbial silver spoon in her mouth.

In 1879, Edith was presented to society in New York City, and in August, 1882, she became engaged to Henry Leyden Stevens, the son of a family with as much money as the Joneses. The planned October wedding did not take place, however, because Stevens's mother disapproved of the match. Officially, it was Edith who broke off the engagement, and she never forgot the experience. The constricting web created by snobbery and social conventions would become one of the most important themes in her fiction.

In 1883, during what has been called a husband-hunting expedition at Bar Harbor, Maine, she met and became infatuated with Walter Van Rensselaer Berry. However, Berry left when the season was over, and he and

Edith did not meet again until thirteen years later. They then became lifelong, intimate friends, but by that time Edith had already been married for more than ten years to Edward "Teddy" Wharton, a mentally unstable but socially appropriate suitor.

First Ventures

Wharton began writing almost as soon as she could organize the letters of the alphabet into words. When she was fifteen in 1877, she secretly completed a short novel titled *Fast and Loose;* it would be published a century later. In 1878, her family privately printed a volume of her poetry titled *Verses*. Five of her poems were published in *The Atlantic Monthly* magazine in 1880. Her first published short story, "Mrs. Manstey's View," appeared in *Scribner's Magazine* in 1891.

In 1897, Wharton and architect Ogden Codman wrote *The Decoration of Houses*. Their book influenced interior design among the wealthy across the nation. However, it was her novel *The House of Mirth* (1905) that became an international best seller and put her into the literary society of author Henry James. This book is a scathing depiction of high society's disdain for Lily Bart after she falls from wealth to poverty. Wharton's 1911 novel *Ethan Frome* turned her focus to the moral choices in life on an impoverished farm in New England.

Edith Wharton. (Library of Congress)

In her early years as a professional writer, Wharton lived lavishly at her mansion, The Mount, in Lenox, Massachusetts, and traveled extensively abroad. During these years she forged intimate connections with the men who would influence the rest of her life: novelist James, American journalist Morton Fullerton, art historians Bernard Berenson and Kenneth Clark, and lawyer and diplomat Berry.

Mature Wealth

Wharton divorced her philandering husband Teddy in 1913 and moved permanently to France, where she lived in all the comfort her money could buy. She also traveled luxuriously throughout Europe and North Africa. Among her friends abroad were writers André Gide, Joseph Conrad, Louis Auchincloss, Paul Bouget, Jean Cocteau, and Marcel Proust. Her closest female friend was Sara "Sally" Norton, daughter of Charles Eliot Norton, an art professor at Harvard University.

After the sinking of the *Lusitania*, Wharton was ashamed of and angered by America's neutrality in World War I. She was active in war relief fund-raising efforts throughout the United States. She wrote short stories, articles, and poems to increase American awareness of the war, and she visited the front lines eight times in her chauffeur-driven Mercedes so that she could report on combat conditions to the Red Cross and deliver much needed food and medical supplies. In 1915, she published *Fighting France*, a work describing the devastation she witnessed.

Away from the front lines, Wharton used her wealth to establish orphanages, hospitals, nursing care facilities, and workshops for displaced workers. To raise additional funding for relief efforts, she collected and edited *The Book of the Homeless*, published in 1916. In that year, France named her Chevalier de l'Ordre National de la Légion d'Honneur, its highest honor.

After the end of World War I, Wharton renovated two houses in France: the Pavillon Colombe in St.-Brice-sous-Forêt and Ste-Claire-de-Château on the site of a seventeenth century convent near the Côte d'Azur. She also designed and planted the gardens in both locations.

Despite her interests in art, travel, gardens, and houses, Wharton's primary indulgence in her life was books. At her death, her personal library contained more than three

The Mount: Edith Wharton's Lenox Estate

The Mount was both the home and the creative work of writer Edith Wharton. After writing *The Decoration of Houses* (1897) with architect Ogden Codman, the young socialite went on to design the house and gardens in Lenox, Massachusetts. She sited the mansion on the high ground of 113 acres of farmland. The residence was completed in 1902, and for many contemporaries it became the American standard for early twentieth century good taste and design excellence.

Considered a "summer cottage" by Wharton's social set, the three-story house has forty-two rooms in sixteen thousand square feet of living space. Its architectural design is modeled on the seventeenth century Belton House in England but with some classical Italian and French touches. After a restoration investment of approximately $15 million, the white main house, augmented by a Georgian Revival gatehouse and stable and a greenhouse, has become a period museum. It is surrounded by 49.5 acres of formally landscaped grounds and gardens.

The Mount is listed on the National Register of Historic Places and has been designated a National Historic Landmark. In 2007, it won a National Preservation Honor Award. The public is allowed to tour the property from May through October, and more than thirty thousand people visit each year to take a metaphorical trip back to the Gilded Age.

Wharton considered The Mount her "first real home" and her character is reflected in the rooms that she designed and decorated and through the landscaping and formal gardens. As in her work as a writer, her design for the house focused on beauty, balance, symmetry, and attention to proportional relationships. Like her characters, the rooms seem to interact with one another as a visitor moves about the house.

In 1911, after Wharton left The Mount to live permanently in France, the property was sold. Over the years it went through various owners, including a boarding school, and the buildings and grounds eventually slumped into disrepair. In 1980, the estate was purchased and rescued by an organization called Edith Wharton Restoration, Inc. By 2009, most of the rooms had been restored with period furniture and accessories that replicate Wharton's original designs. In 2005, the restoration company purchased twenty-six hundred volumes in Wharton's personal library from a British bookseller for $2.6 million. Now shelved at The Mount, this collection of books contains many autographed first editions including, Theodore Roosevelt's *America and the World War* (1915) and Henry James's *The Golden Bowl* (1904).

thousand "well-used" volumes, most of them with markings and personal comments. These books' subjects included art, history, literature, philosophy, and science. She read and wrote equally well in English and French. Among her favorite authors were William Shakespeare, John Keats, Walt Whitman, Johann Wolfgang von Goethe, Charles Baudelaire, Elizabeth Barrett Browning, and Proust. Her readings in philosophy ranged from *The Rubáiyát of Omar Khayyám* (1859) to Friedrich Nietzsche, George Santayana, John Locke, and Charles Darwin

A life of luxury, art, and intellect did not deter Wharton from managing her business affairs with careful scrutiny and organization. She was particularly attentive to the sales figures of her books. In fact, some say she wrote *The Age of Innocence* (1920) to restore her popularity with her American readership. If that was the motivation, it worked. The novel won her the Pulitzer Prize in fiction in 1921.

Wharton was the first woman to win a Pulitzer Prize and the first, in 1923, to receive an honorary doctorate from Yale University. The latter honor prompted her last visit to the United States, even though she was elected to the American Academy of Arts and Letters in 1930.

Wharton's books have sold more copies than those of Henry James and more of her works remain in print. When films began to become popular in the United States, Wharton was particularly attentive to selling the film rights to her work. *The House of Mirth, The Age of Innocence*, and *Ethan Frome* have all been produced several times and recognized as outstanding American films. In 2008, a musical dramatization of her novel *The Glimpses of the Moon* (1922) was produced in New York City.

At the end of her life, Wharton employed more than twenty people just to run her houses. At the age of seventy-five, after a severe cerebral hemorrhage, she died on August 11, 1937. She is buried in Versailles, France.

Legacy

Edith Wharton is the author of more than forty published volumes: novels, short stories, poetry, memoirs, travel writing, and other nonfiction. Through her work, she chronicled American life in her time, particularly among the wealthiest individuals and their elite society. Her observations are precise and insightful, and her writing is spiced with irony, satire, and humor.

Wharton was a woman of great wealth who loved luxury; dressed in elegant clothes, jewels, and furs; entertained some of the finest minds of the age; and traveled extensively. However, she did not let social status and its conventions dictate her life. She was annoyed by pretense and superficiality but fascinated by the limitations and pressures that societal dictates can put upon human behavior. Her fiction deals with moral choices in settings where selfishness and social status often color the view.

Wharton had something to say to the world and she worked to say it until the last days of her life, writing while in bed and dropping the pages on the floor for her secretary to type. Her last novel, *The Buccaneers* (1938), was unfinished at her death. She stands among the greatest of American writers.

William Collins Whitney

American attorney, investor, and government official

Born into a wealthy and prosperous family, Whitney substantially increased his fortune through ambition and hard work. He used his affluence to finance substantial contributions to philanthropy and public service.

Born: July 5, 1841; Conway, Massachusetts
Died: February 2, 1904; New York, New York
Sources of wealth: Inheritance; law practice; investments; horse breeding
Bequeathal of wealth: Children

Early Life

Born in Conway, Massachusetts, to a prestigious family of Puritan heritage, William Collins Whitney (WIHT-nee) was reared in affluence. His father, James Scollay Whitney, was a former army officer and was active in the Democratic Party, which included holding an important patronage position in the administration of President James Buchanan. His mother, Laurinda Collins, could trace her lineage back to the founding of the Plymouth colony. Influenced by the success of his industrialist older brother, Henry Melville Whitney, William excelled in his studies as he prepared for adult life. In 1859, he graduated from Williston Seminary and then moved on to Yale University as he prepared for a career in law. After graduating with honors in 1863, Whitney enrolled in Harvard University's law school and began practicing law in 1865.

First Ventures

Whitney decided to move to New York City as he began his legal career, primarily because he saw greater economic opportunities there. He joined the law firm of Abraham Lawrence, a much respected judge, and the young attorney soon built a reputation for honesty, diligence, and complete dedication to his clients. In 1869, he wed Flora Payne, who also came from a politically connected family, as her father was a member of the U.S. Senate from Ohio. Flora was a loving wife and the couple enjoyed a happy marriage and had five children.

Whitney's earnings escalated with the number and affluence of his clients, and he became active in the politics of the New York Democratic Party. He led a group of ambitious reformers and helped create the Young Men's Democratic Club. This group's primary goal was to confront and defeat the entrenched corruption of the Tweed Ring and Tammany Hall.

In 1872, Whitney served as school inspector before becoming New York City's corporation counsel in 1875. As corporation counsel, he saved New York a large amount of money by skillfully contesting false claims against the city. Whitney developed very powerful mentors, such as politicians Samuel Jones Tilden and Grover Cleveland, because of his friendly personality, his incorruptibility, and his wealth and family connections.

Mature Wealth

Whitney was part of a syndicate that purchased the South Pennsylvania Railroad, and the syndicate then created a committee to oversee the railroad's financial interests, to which Whitney was appointed. He also invested in the New York and Northern Railroad Company and earned a large salary defending other railroads in legal actions. His investments were diverse, ranging from railroads to banks, utility companies, race tracks, and real estate.

His friend Cleveland was elected president of the United States in 1884 and subsequently appointed Whitney to the cabinet-level position of secretary of the navy, a post he held for the duration of Cleveland's first term. Whitney began the process of modernizing the U.S. Navy by building new armored ships, opposing political partisanship in the development of naval budgets and fighting against patronage and the spoils system. He never again held an elective or appointive political position, despite his popularity in the Democratic Party and across the nation. He survived Flora and a second wife before dying of natural causes on February 2, 1904.

Legacy

Whitney amassed great wealth, but he also served the public by improving transportation, promoting the electrification of the United States, and eliminating wasteful spending in governmental activities. The horse racing facilities he built or in which he invested, such as Westbury Stable and the Belmont Park race track, brought pleasure and enjoyment to the public. Although he lived during the Gilded Age, his goals and actions also made him part of the reform-minded Progressive Era.

Eleanor Elkins Widener

American socialite and philanthropist

Widener was born to wealth and married into a rich family. When her son Harry died in the RMS Titanic *disaster, she used her funds to finance Harvard University's Harry Elkins Widener Memorial Library, a gift in memory of her son.*

Born: September 21, 1861; Philadelphia, Pennsylvania
Died: July 13, 1937; Paris, France
Also known as: Eleanore Elkins (birth name)
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Children; charity; educational institution

Early Life

Eleanor Elkins Widener (WI-dehn-uhr) was born into a life of privilege. Named Eleanore, she later dropped the final "e," using it only in formal documents. She was the daughter of William Lukens Elkins and Maria Louise Broomall Elkins, who had two sons and two daughters. William amassed a fortune from his interests in oil refineries, gas works, and street railroads. With his business partner Peter A. B. Widener, he purchased large tracts of land in Philadelphia.

Eleanor, the younger sister, enjoyed the social life afforded by her class and adopted the family habit of collecting art; her father had a valuable art collection. She attended Vassar College for a year before marrying George Dunton Widener (1861-1912), the son of her father's business partner, on November 1, 1883. They had three children: George Widener, Jr., Harry Elkins Widener, and Eleanor Widener. The couple and their children lived with their Widener in-laws in the 110-room Lynnewood Hall mansion in Elkins Park, Pennsylvania. Like the Wideners, who also collected art and rare objects, Eleanor and her son Harry were collectors. Eleanor had an impressive collection of jewelry. One particular set of pearls, a Christmas gift from her husband in 1909, was valued at $750,000. She also collected silver and porcelain; Harry collected rare books. To encourage her son's collecting, she purchased several important volumes, including William Shakespeare's second, third, and fourth folios for $8,700. She also spent more than $18,000 on color-plate books for his nineteenth birthday present. While Harry was a student at Harvard University, his mother continued to purchase major books for his collection. When her father died in 1903, she inherited a one-quarter share of his estate, conservatively estimated at more than $25 million.

First Ventures

In 1912, Eleanor and George were planning to build a mansion in Newport, Rhode Island. They had hired the architect Horace Trumbauer, who had designed mansions for both the Elkins and Widener families, and sailed to Europe on March 13 aboard the RMS *Mauretania* to purchase furniture for the new home. In London, the Wideners presented King George V and Queen Mary with thirty silver plates that had once belonged to Nell Gwyn, the mistress of Charles II. Eleanor also shopped for her daughter's trousseau. Their son Harry, who accompanied them, went shopping for books, purchasing several valuable volumes, including a 1598 edition of Francis Bacon's *Essays*, a treasure he said would accompany him if he were ever shipwrecked.

The family left Southampton on April 10, 1912, for New York aboard the RMS *Titanic*. Eleanor's husband and her son Harry went down with the ship on April 15. Wearing the multistrand of pearls that insurer Lloyds of London required she keep with her at all times, Eleanor and her maid Amalie "Emily" Henriette Gieger were put into a lifeboat and eventually taken aboard the RMS *Carpathia*, which docked in New York on April 18, 1912. When she returned to Philadelphia, Eleanor focused on creating memorials to her husband and son. She rebuilt St. Paul's Episcopal Church in Ogontz, Pennsylvania, near Philadelphia, as a memorial to her husband, and in 1929 she gave $300,000 to the Hill School in Pottstown, Pennsylvania, for a science building. Harry had graduated from the school in 1903.

Mature Wealth

George Widener left one-third of his multimillion-dollar estate to Eleanor. Harry willed his small estate of $150,000 to his mother, as well as his collection of thirty-five hundred rare books, with the request that the collection be given to Harvard University once a suitable accommodation for it could be found. Harry had graduated from Harvard in 1907. His mother continued to purchase books for his collection. Initially, it was thought that the Wideners would donate a wing for a future Harvard library. Although Peter A. B. Widener expressed interest in making a donation for a building at Harvard, it was Eleanor who decided that Harvard was to have a new library as a memorial for her son. The library was to be named the Harry Elkins Widener Library, and, as she continually stressed, the money for the library, close to

$3 million, was not Widener money but Elkins money; it was her gift.

Eleanor involved herself with the project from the start, hiring Trumbauer as the architect. In addition to building mansions, Trumbauer had designed a number of public buildings, including the Free Library of Philadelphia. Eleanor was involved with all of the details of the project and signed the agreement to build the library with A. Lawrence Lowell, president of Harvard, on December 31, 1912, quickly moving ahead with the project. The agreement included specific instructions concerning the Memorial Room, set aside for Harry's collection of rare books. There was to be a curator for the collection, whose salary was to be paid from a special trust fund of $150,000 in securities donated by Eleanor for the maintenance of the library's rooms and books. She named herself trustee of the trust and hired the curator. Although illness kept her from attending the groundbreaking ceremony, she laid the cornerstone on June 18, 1913, and she was present at the dedication of the building that followed Harvard's 274th commencement ceremony on June 24, 1915. At that time she handed the key to the library to Lowell. Eleanor continued her involvement in the library until her death. In 1916, she wrote Lowell, requesting that fresh flowers be placed daily by the photograph of her son; the flowers were to be purchased with money from the fund for the Memorial Room. She once told a friend that she felt closer to her son when she visited the Harry Elkins Widener Library.

During the Harvard commencement in 1915, one of the recipients of an honorary degree was Alexander Hamilton Rice, a medical doctor and an explorer, famous

The Harry Elkins Widener Library, Harvard University

In the early twentieth century, Harvard College needed a new library. The existing library, Gore Hall, could no longer house the university's growing book collection. A committee was formed to discuss a new library, and by January, 1912, the search for donors began.

Tragedy became good fortune for Harvard when Harry Elkins Widener, a Harvard graduate, died aboard the RMS *Titanic* on April 15, 1912. He had willed his valuable collection of rare books to Harvard. To house the collection and to memorialize her son, Eleanor Elkins Widener decided to build a new university library. She hired the architect Horace Trumbauer, involved herself in all of the details of the project, and paid for its construction and maintenance. Ground was broken on February 11, 1913, and on June 24, 1915, following Harvard's 274th commencement, the new library was dedicated. Archibald Cary Coolidge, the library's first director, carried the first book into the building, which was John Downame's *The Christian Warfare* (1609-1618), the only volume remaining from the library of John Harvard, the college's first benefactor. U.S. Senator Henry Cabot Lodge delivered the presentation address. Shortly thereafter, trucks began arriving with the books that had been stored off-site; by August 9, the library was established in its new home.

Widener Library is located on the former site of Gore Hall, which was demolished to provide a location for the new library. The agreement between Eleanor Widener and Harvard stipulated that the library would contain a memorial room in honor of her son and that no other memorials would be permitted in the building. However, after many Harvard alumni died in World War I, Widener changed her mind, allowing the library to contain other memorials, including John Singer Sargent's murals commemorating Harvard's war dead. There was also a provision that no structures be erected in the courts around which the library was built. Changes, additions, or alterations to the building were also prohibited.

Such restrictions became a problem over the years, as Harvard's book collections began to outgrow the building. In 1915, the library had 600,000 volumes. When Widener died in 1937, the collection had more than 1.8 million books. Some books were removed to a new home in Houghton Library. Others were stored off-site in the New England Depository, and, in 1949, some were relocated to the new Lamont Library. Books continued to be added to the Widener Library. One of these volumes was a gift from Harry Widener's brother and sister: a Gutenberg Bible.

As computers became essential to libraries, Widener Library needed renovation. Improvements, such as the addition of cabling, computer workstations, smoke detectors, and air ducts, had to be made. The best place to install new systems was in the library's light courts, but they were protected by Widener's provision against changing the building's exterior. However, the Widener family agreed that the changes could be made. In 1999, an extensive, five-year renovation began. Nine miles of electronic cable and three miles of fire alarm wires were installed, and many other upgrades were made. More than 3.5 million books were moved, cleaned, and reshelved. The Memorial Room was updated, but it continued to display fresh flowers beside the portrait of Harry Elkins Widener, book lover.

for his expeditions to South America. Rice and Eleanor formed a friendship. He was a frequent guest at her Newport estate, Miramar, which had been completed in 1915. They planned to marry in Trinity Episcopal Church in Boston, but to avoid publicity they married in the vestry of Emmanuel Church in Boston on October 6, 1915. Eleanor traveled with Rice on his trips to explore South America. In 1920, she went further up the Amazon River than any white woman had before. Over the years she supported a number of charities, notably the Newport chapter of the American Red Cross. Eleanor died of a heart attack in Paris on July 13, 1937. At her death, her estate was valued at $14,284,276.

Legacy

Eleanor Elkins Widener's principal legacy was the Harry Elkins Widener Library, which, when built, had the capacity to house more than two million books. The facility also included an area devoted to her son and his collection. The library was the largest gift that Harvard University had ever received. Widener continued to purchase volumes for her son's collection, which has been a treasure for scholars over the years. It is estimated that her gifts to Harvard totaled more than $4 million. Her devotion to her lost son became a continuing gift to generations of Harvard students and scholars.

Peter A. B. Widener

American public transit magnate and investor

Widener parlayed his profits from a Civil War contract into investments that allowed him to unify the Philadelphia mass transit system and to organize several large corporations.

Born: November 13, 1834; Philadelphia, Pennsylvania
Died: November 6, 1915; Elkins Park, Pennsylvania
Also known as: Peter Arrell Brown Widener
Sources of wealth: Trade; transportation systems; investments
Bequeathal of wealth: Relatives; charity

Early Life

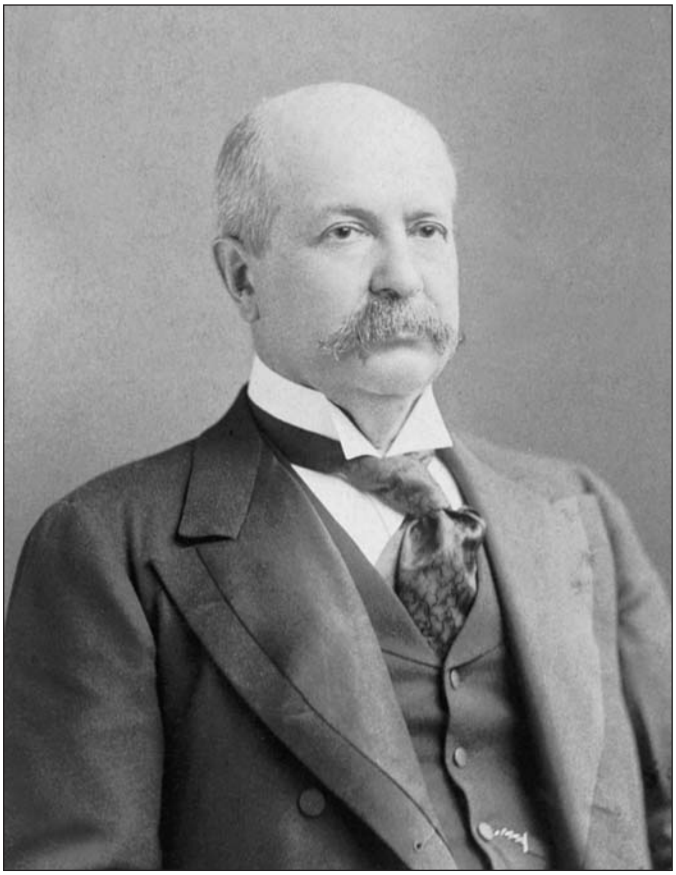
Peter Arrell Brown Widener (WI-dehn-uhr) was born in Philadelphia, Pennsylvania, on November 13, 1834, to John Widener and Sarah Fuller Widener. He was educated at the Coates Street Grammar School and then attended Central High School for two years. He dropped out of school and went to work as a butcher's assistant in his brother's meat market. A few years later, he opened his own butcher shop.

Widener became interested in politics and joined the local Republican Party. This association proved to be useful during the Civil War, when Widener received a contract to supply mutton to Union troops stationed in the Philadelphia area from Secretary of War Simon Cameron, who was also the head of the Pennsylvania Republican Party. Widener netted a profit of $50,000 from this contract.

After the war, Widener was elected to the Philadelphia Board of Education, serving from 1867 until 1870, and he was the city treasurer in 1873. He then ran for mayor but lost the election, so he decided to leave politics.

First Ventures

Widener used his profits from his Civil War contract to invest in street railways. In 1875, he became partners with William Kemble and William Lukens Elkins in the Continental Street Railway Company. Together, they set out to gain control of the Union Passenger Company, Kemble's former employer. The partners constructed railway lines parallel to those of the Union Passenger Company and provided more upscale cars. By 1880, they controlled the Union company and were carrying thirty-three million passengers per year. In 1883, they established the Philadelphia Traction Company, a holding company that they used to lease competing street railway companies. They converted the old, horse-drawn cars to cable cars, an undertaking that took more than five years to complete and cost $4 million.



Peter A. B. Widener. (The Granger Collection, New York)

Mature Wealth

By 1895, Widener's companies carried more than 100 million passengers per year. The partners upgraded to an electric trolley car system, which was cheaper to build and maintain. The partners also merged their newer companies to form the Union Traction Company, which in turn leased their older companies. By forming another holding firm, the Philadelphia Rapid Transit Company, the partners gained a monopoly over mass transit systems in Philadelphia.

However, because of the fixed fare rates imposed by the city, the firm could not keep up with needed repairs and the system's infrastructure began to deteriorate. In 1907, the city of Philadelphia took over the operations of the mass transit system. By that time, Widener and his partners had expanded their investments to other major cities, such as New York, Chicago, Pittsburgh, and Baltimore, so that by the turn of the century the men were worth about $1.5 billion.

Widener used much of his wealth to help found other companies. He became a good friend of James Buchanan Duke and joined Duke in forming the American Tobacco Company. He also invested in U.S. Steel and Standard Oil. His fortune was estimated to be between $30 and $50 million, making him one of the one hundred wealthiest Americans in history.

Widener married Hannah Josephine Dunton in 1858 and they had three sons, two of whom died in childhood. His third son, George Dunton Widener, and his grandson Harry Elkins Widener, were lost when the RMS *Titanic* went down. Saddened by their deaths and in poor health, Widener died in his home, Lynnewood Hall, on November 6, 1915.

Legacy

Widener was a principal developer of suburban street railways in many major cities in the United States. He also was a founding organizer of many key businesses. One of his finest legacies was his charitable contributions; he donated more than $11 million to various charities. He was an avid art collector and bequeathed his artworks, which included paintings by Rembrandt, Édouard Manet, and Pierre-Auguste Renoir, to the city of Philadelphia. He gave his house on Broad Street to the Free Library of Philadelphia. He endowed the Widener Memorial Industrial Training School for Crippled Children in 1906. In honor of Widener and his family, the Pennsylvania Military College changed its name to Widener College in 1972.

WILHELMINA

Dutch monarch

Wilhelmina became the queen of the Netherlands at the age of ten, skillfully leading the country through two world wars. She invested her income and her inherited wealth in a number of Dutch companies, reputedly making the Dutch royal family one of the richest in the world.

Born: August 31, 1880; The Hague, the Netherlands
Died: November 28, 1962; Het Loo, the Netherlands
Also known as: Wilhelmina Helena Pauline Marie (birth name); Wilhelmina of the Netherlands; Duchess of Mecklenburg
Sources of wealth: Inheritance; investments
Bequeathal of wealth: Children

EARLY LIFE

Wilhelmina (WIHL-hehlm-mee-nah) was born on August 31, 1880, in The Hague, the Netherlands, to the aging King William III and his young second wife, Emma of Waldeck and Prymont, a reigning princely state in imperial Germany. By the time Wilhelmina was four years old, her father's three sons had died childless, and she became the sole heir to the Dutch throne. At the age of ten, Wilhelmina succeeded her father as monarch under the eight-year regency of her mother, Queen Emma. Wilhelmina was later enthroned on September 6, 1898.

Wilhelmina's education was under the supervision of her mother, who brought the best teachers to the royal court, where the young queen studied economics, Dutch public law, Dutch history, military tactics, modern languages, and her constitutional role as monarch. Wilhelmina's clear mind, excellent memory, sense of duty, and dedication emerged as qualities that served her well in her dual roles as monarch and businesswoman.

FIRST VENTURES

Wilhelmina was the sole heir to her father's estate. She invested her inheritance in forestlands, commercial property, royal residences, jewelry, art, and banking transactions. The extent of the queen's wealth has never been publicly documented. However, it is known that she inherited a considerable jewelry collection that began with the marriage of her grandfather, William II, to Grand Duchess Anna Pavlova of Russia. Anna amassed a fortune in diamonds, rubies, emeralds, sapphires, and pearls that formed an extensive collection of tiaras, parures, necklaces, bracelets, and brooches, and subsequent Dutch queens acquired additional pieces of jewelry that remain the personal property of the royal family. William I, Wilhelmina's great-grandfather and the first king of the Netherlands, invested the royal family's money in the spice, rubber, tea, and coffee trading companies based in the Dutch East Indies (now Indonesia).

Wilhelmina's inheritance was skillfully managed by her mother, Queen Emma. Wilhelmina was always frugal and never ostentatious, and the demarcation between her private wealth and her public income was never questioned. Dutch companies may have been required to pay a commission to the royal family when they were granted a charter, and the amount of money that the queen invested in Dutch companies has not been publicly disclosed.

MATURE WEALTH

In 1898, a royal charter was granted to Royal Dutch, an oil company which merged with the Shell Company of Great Britain to form Royal Dutch Shell. About 60 percent of the new corporation was controlled by Dutch businessmen, with Wilhelmina a principal investor.

Wilhelmina. (Hulton Archive/Getty Images)

Royal Dutch Shell would become the third largest company in the world. According to some reports, Wilhelmina may have owned at least 5 percent of Royal Dutch Shell, providing her with a major interest in the company's decision making. In 1910, Wilhelmina reputedly invested $750,000 of the $2 million that the Cullman Alabama Coal and Coke Company needed to transport coal from the United States to the Netherlands, affording a substantial profit for the queen.

During her lifetime, Wilhelmina retained control over the royal archives, which included an extensive collection of books, photographs, and artworks, and the royal forests. When the Dutch East Indies became the independent nation of Indonesia in 1948, Wilhelmina was forced to divest and reinvest her fortune. A principal beneficiary of this reinvestment was the Dutch bank ABN Amro, which in the early twenty-first century was the twentieth largest bank in the world. The Dutch royal residences of Noordeinde, Huis ten Bosch, Dam, Het Loo, and Soestdijk reverted to state control after Wilhelmina's death and are maintained by the Dutch government.

Legacy

Time magazine declared in 1962, the year Queen Wilhelmina died, that she was the richest woman in the world, with a personal fortune of $1 billion. *Forbes* magazine estimated the wealth of the Dutch royal family at $2.5 billion in 2003. Prince Bernhard, the husband of Queen Juliana, Wilhelmina's successor, demanded a retraction from the magazine, which downgraded the royal family's assets to just $250 million. In 2009, it was estimated that the investments of the royal family, begun by Queen Wilhelmina, exceeded $5.5 billion.

Early Life

William II was born around 1056 and was the third of four sons of William the Conqueror and Matilda of Flanders, the daughter of Baldwin V, count of Flanders. All of the chroniclers agree that his nickname, William Rufus, was derived from either the color of his hair or a ruddy complexion. Little is known about his youth, though it seems likely that his education was entrusted at an early age to the monk scholar Lanfranc of Bec, who became the archibishop of Canterbury in 1070. William II, however, was not destined for a career within the church. Like his brothers and father, he was a soldier, adventurer, and plunderer.

First Ventures

As a younger son who was not expected to ascend the throne, William II did not garner much attention from chroniclers in his youth. However, there is every reason to believe that he received the requisite training in arms and horsemanship expected of a Norman knight. Between 1078 and William the Conqueror's death in 1087, William II, now in the prime of life, participated in a number of campaigns on the Continent and in England against the Welsh and the Scots with his father and eldest brother Robert Curthose, the heir to the duchy of Normandy. While the family was at times able to present a united front, there were simmering differences which sometimes erupted into youthful pugilism and other times into open conflict. The differences between the William the Conqueror and his son Robert, who was seeking greater independence, were serious enough to work to William II's advantage in years to come.

Mature Wealth

In September, 1087, William the Conqueror suffered a fatal injury while campaigning on the Continent. On his deathbed, he made arrangements for succession to the monarchy. Grudgingly, he conceded Normandy, where the rule of primogeniture was firmly established, to Robert, while his youngest son, Henry, received a large sum of money. England, with its great wealth, was reserved for William II, the faithful son who most closely resembled his father in appearance and temperament.

William wasted no time in taking possession of his inheritance. He crossed the English Channel and was crowned king of England on September 26, 1087, in Westminster Abbey. He also moved quickly to secure the royal treasury at Winchester, where, according to the *The Anglo-Saxon Chronicle*, he beheld a vast fortune in gold, silver, and other precious objects. Here, William was also able to inspect the Domesday Book (1086), a comprehensive inventory of England's wealth, including its fiefs, manors, mills, farms, ploughs, and other appurtenances, that was compiled only a year earlier by his father's government. The exact purpose of this unique survey is not known, though it is reasonable to suppose that it was conducted to satisfy William the Conqueror's curiosity about his new possessions and to serve as a basis for future taxation. Although William II had much to learn about his new country, his resources at the beginning of his reign were vast.

The transition from a junior member of William the Conqueror's family with a dubious future to the English king was carried off without incident, owing in large part to the unflagging support of his former mentor, Lanfranc, and the goodwill William II achieved through the use of his father's fortune to curry favor with the Anglo-Norman baronage and the Church. However, William's euphoria over his newly acquired wealth and possessions was short-lived. He knew all too well that his ascension would soon be challenged by his brother Robert, duke of Normandy, and Robert's supporters. Between 1088 and 1096, William fought a confused series of wars against Robert and his vassals, while attempting to maintain his boundaries to the west and north against the Welsh and the Scots. The great rebellion of 1088, led by Odo of Bayeux, William the Conqueror's half brother and one of the heroes of the Battle of Hastings in 1066, resulted in a dramatic victory for William II. Enemy castles were seized, while some of the rebels, including Odo, were disinherited and banished. Even Henry, William II's younger brother, who had tacitly supported Robert, was denied the opportunity to take up family lands in England allegedly promised to him by his mother.

With England secure, William II was now free to return to his homeland, where he used his great wealth to gain widespread support among the Norman nobility. What he could not achieve through the use of money, intrigue, and negotiations was accomplished on the battlefield. On occasion, William and Robert collaborated, as they did in 1091,when Henry was besieged at Mont St. Michel, and again when faced with uprisings in Wales and Scotland. These periods of peace and cooperation, however, were infrequent. William's problems with his older brother were not resolved until Robert, influenced by Pope Urban II's sermon at Clermont in 1095, took the cross and embarked on the First Crusade. To fund the venture, Robert was forced to pawn his duchy to William for the astronomical sum of 10,000 marks of silver. This transaction worked to the advantage of both parties. Robert would eventually return from the Crusade a hero with a wealthy wife. William, for his part, acquired the right to the revenues of the duchy of Normandy for the next three years. In his brother's absence, William now reigned over a wealthy Anglo-Norman empire.

William's life, however, was not to have a happy ending. When Lanfranc, always the voice of reason, died in 1089, William was freed of all restraints. A chronicler, in his consideration of this important event, referred to William as a "crop of evil increased to ripeness." Thereafter, his lust for power and his unbridled cupidity alienated both the nobility and the Church. Never especially reli-

Pillaging and Great Wealth

William II assumed the English throne in 1087 with great promise. From his father, William the Conqueror, he inherited a unified kingdom; the unstinting support of Lanfranc of Bec, the archbishop of Canterbury; a bloated treasury; and, according to the inventory in the *Domesday Book*, the promise of a substantial annual revenue from royal estates scattered throughout the land. Unfortunately, within a few years the unity of the kingdom had been compromised by rebellion, Lanfranc was dead, and much of his father's money had been dissipated.

The monastic chroniclers who wrote a few years after William's death in 1100 did not spare him the verbal lash. According to these accounts, William was guilty of many crimes, including blasphemy, immoral conduct, and avarice, among others. William of Malmesbury, the most objective of the chroniclers, says that the king, desperate for money, now "turned his thoughts to rapine." Ordericus Vitalis, an Anglo-Norman monk, accused William of unleashing his knights on the peasantry, snatching food from their very mouths, while the writer of *The Anglo-Saxon Chronicle* repeatedly bemoaned the condition into which the country had been plunged under William's odious practices, citing bad weather, famine, and "excessive taxation."

While allowances have to be made for the chroniclers' hyperbole, even modern historians liken the king's presence in England between 1088 and 1096 to an army of occupation. Thereafter, when Robert, the duke of Normandy and William's older brother, embarked on the First Crusade, William was free to pillage Normandy as he had plundered other areas of his realm. Through ruthless taxation, Church vacancies, and exploitation of the feudal obligations, William amassed a fortune in excess of £60,000 per year. However, his great wealth and power came at the expense of his reputation, and if the Church chroniclers are to be believed, his salvation.

gious, William kept the archiepiscopal see of Canterbury vacant for four years, pocketing the considerable revenue associated with the office. Indeed, at one time or another eleven bishoprics and at least thirteen abbeys were made to suffer lengthy vacancies. Although such things are difficult to calculate, it has been estimated that William derived at least £31,000 from these vacancies. It was not until 1093, when William fell gravely ill and feared death, that he recanted and appointed Anselm, the abbot of Bec, to be the new archbishop of Canterbury. This spiritual awakening was brief. William and Anselm, a strong advocate of papal supremacy who later attained sainthood, quarreled incessantly until Anselm fled the country in 1097.

Although William was careful to ensure the loyalty of the great lords through gifts and grants of one kind or another, the nobility also groaned under the weight of an exploitative king. When William purchased his brother's duchy in 1096, he did so through the imposition of burdensome taxes. Moreover, in addition to the profits derived from his landed estates, William looked for every opportunity to bend the feudal obligations to his monetary advantage. The heirs of great lords were sometimes required to repurchase their fiefs instead of paying a reasonable relief, while heiresses and widows were sold to the highest bidders. In addition to William's estimated annual income of £29,000, he gleaned incalculable profits and booty from successful military campaigns carried out on the Continent in his brother's absence between 1097 and 1099. The money bilked from the Church and the nobility merged with the normal sources of income to make William one of the wealthiest, and, at the same time, one of the most despised men of his day. When he died in a hunting accident on August 2, 1100, few mourned his passing.

Legacy

According to the monk chroniclers, William II was a bad king—an evil man who, when his life ended tragically, had received God's judgment. These chroniclers could never forgive William for his treatment of the archbishop, the usurpation of Church prerogatives, and the systematic spoliation of Church property and revenues. This dark picture has endured, largely unaltered, into the modern era. However, in the late twentieth and early twenty-first centuries historians sought a more balanced approach to his reign. While it is not possible to totally rehabilitate William's image, these historians describe him as a competent captain and an able administrator. They maintain that it was William's duty to protect the Crown against the schemes of a reform-minded Church. As for the outrageous exactions which brought him such great wealth, revisionists argue that this money was needed to appease and to subsidize the great lords of the realm, to support a growing government and an active court, and to fund his far-flung military campaigns.

Mason, Emma. "William Rufus: Myth and Reality." *Journal of Medieval History* 3 (1977): 1-20. Mason endeavors to refute the charges of monk chroniclers. She argues that William was not, in fact, a villain and a plunderer but a staunch defender of the Crown and its prerogatives.

Vitalis, Ordericus. *The Ecclesiastical History of England and Normandy.* Translated by Thomas Forester. London: Henry G. Bohn, 1853. Reprint. New York: AMS Press, 1968. Vitalis was an Anglo-Norman monk who wrote one of the most important histories of the age. Especially valuable for the period following the Norman Conquest. Provides excellent character sketches, though Vitalis is somewhat melodramatic in his condemnation of William.

William of Malmesbury. *William of Malmesbury's Chronicle of the Kings of England: From the Earliest Period to the Reign of King Stephen*. London: H. G. Bohn, 1847. Reprint. New York: AMS Press, 1968. William of Malmesbury was arguably the most competent monk chronicler of his age, and his book is especially valuable for the period of the Norman Conquest and beyond. Malmesbury was more objective than most writers of his day, though he, too, suggests that William II was a plunderer.

Oprah Winfrey

American media magnate

Winfrey has created a powerful media empire, using it to aid others and mold society. She has reshaped daytime talk programs, making their content somewhat more serious, and she has influenced society with a variety of initiatives, from her book club to her endorsement of Barack Obama in the 2008 presidential election.

Born: January 29, 1954; Kosciusko, Mississippi
Also known as: Oprah Gail Winfrey
Sources of wealth: Media; entertainment industry
Bequeathal of wealth: Charity

Early Life

Oprah Winfrey (OH-prah WIHN-free) was born in Mississippi. Her parents had intended to name her after Orpah, a Biblical figure, but her name was changed to Oprah. She grew up in extreme poverty on a farm with her grandmother. Winfrey excelled intellectually at an early age and was reading by the time she was three. She also displayed some of the talents that would later be evident on her television program, when, at the age of five, she began interviewing her dogs and other pets and speaking at churches and other gatherings. After she moved to Milwaukee, Wisconsin, to live with her mother, Winfrey was sometimes the victim of sexual abuse. She went to Nashville to stay with her father in her early teen years, and she excelled in school and in public speaking. After winning several beauty contests and appearing on local television programs, she became well known to local television viewers. She graduated from college in 1976 and moved to Baltimore to be a co-anchor for a television news program.

First Ventures

In Baltimore, she first appeared on the evening news and then presented local news updates during nationally televised morning programs. After she cohosted a morning talk show, she realized this work would be her lifetime occupation. In almost seven years as cohost, her show covered many different topics and ranked at the top of the ratings, even beating the nationally syndicated talk show hosted by Phil Donahue, who had revolutionized the talk show format. In 1984, the success of Winfrey's Baltimore program landed her a job in Chicago, where a local television station was searching for a replacement for its low-rated local morning program. Winfrey's producer had been sending Winfrey's audition tapes to television stations, and the Chicago station manager saw one, noted that this show was beating Donahue, and hired Winfrey and her producer. The job in Chicago moved Winfrey onto a larger stage and would lead to her national fame.

Mature Wealth

Winfrey quickly reversed the fortune of her new television show. Within a year, her ratings pulled ahead of Donahue's, and within two years the program was renamed *The Oprah Winfrey Show,* increased to an hour-long format, and expanded from local to national broadcast. At the same time, Donahue relocated his Chicago-based program to New York, explaining that he wanted to be closer to his wife. However, many observers suggested that Winfrey had hastened Donahue's departure

Oprah's Angel Network

Oprah Winfrey founded Oprah's Angel Network in 1997. She wanted the organization to provide scholarships for the Boys & Girls Clubs of America and to assist the work of Habitat for Humanity. After it was founded, however, the organization took on a life of its own, and by 2009 and it had raised nearly $100 million.

Oprah's Angel Network has been involved in a wide variety of projects, with its efforts focused on four areas: education, leadership, basic rights, and communities. Among its education programs, the network has helped build sixty schools in thirteen countries, providing education for thousands of children in rural areas. One of these schools is the Seven Fountains Primary School in KwaZulu-Natal, South Africa, which is a model for other African education programs.

The network worked with another organization, Free the Children, to create O Ambassadors, a school-based program that aims to inspire young people to become compassionate and knowledgeable citizens. In addition, the organization since its founding has awarded more than $8 million in grants to groups that promote basic human rights.

Oprah's Angel Network has provided relief to areas devastated by catastrophic events. It worked to rebuild homes and businesses and constructed a vocational training center in Sri Lanka after the country was struck by a tsunami in 2004. Similar assistance was provided to victims of Hurricane Katrina, with the network enabling more than one thousand people to return to their homes and helping to build or restore more than four hundred houses. After a major earthquake struck Haiti in 2010, the network contributed $1 million to the American Red Cross to assist the relief effort.

Oprah's Angel Network has been involved in some of the world's most troubled regions. For example, it helped to construct schools and teach computer skills to people in Afghanistan. In addition, the network helps provide education for Afghani women, teaching them basic reading and math skills, as well as providing information about health care and democracy. The organization has built schools in Pakistan and has been involved in educational efforts in the Caribbean and the United States. In the latter country, the organization supports a program aimed at reducing violence among young people through counseling and rallies and by encouraging former gang members to speak to young people in their communities.

from Chicago, which would have been a significant coup. Regardless of how much of a role she played in forcing Donahue's move, Winfrey was doing well.

Winfrey began to gain more control of her show. The producers allowed her to ask her guests the questions that occurred to her while she was on the air, rather than read prepared questions from cue cards. This new spontaneity helped her bond with her viewers, particularly with women, and she became less packaged and more human. She appealed to viewers because she appeared to be one of them. Winfrey also had a variety of personal issues that connected her to the public. Her battles with her weight have been highly publicized in the tabloids, but this struggle gained her sympathy from people who had also fought to lose weight.

Winfrey's show has always featured a wide variety of guests, ranging from well-known celebrities to people who are outside the mainstream of society. Occasionally, her guests display unusual behaviors. For example, in 2005, actor Tom Cruise gained notoriety for jumping on Winfrey's couch during a guest appearance. She featured nudists who, not surprisingly, appeared naked on the program, although the camera did not show their nudity. Despite these and other incidents, Winfrey's program has generally avoided the sort of "trash TV" confrontation that was a fixture on other talk shows, notably the program hosted by Jerry Springer.

The appeal of her show was its ability to capture Winfrey being herself, managing to sympathize with her audience without patronizing it. This is a difficult line to walk, but Winfrey excelled. During a program about incest, she confessed to being molested, and many other incest survivors were able to come forward after that. Her show was also critically acclaimed, winning several Daytime Emmy Awards and an Emmy Lifetime Achievement Award. In 2009, Winfrey announced that she would quit the program in September, 2011, twenty-five years after it premiered on national television.

Besides being a television host, Winfrey is also a television producer, magazine publisher, and actor. She owns her own television production company, Harpo, Inc., which produced her program. Harpo has also produced a variety of movies, including *The Great Debaters* (2007), and it has produced other television talk programs, including *The Rachel Ray Show* and *The Dr. Phil Show.* In addition, Winfrey publishes *O, the Oprah Magazine*, and she was one of the founders of the Oxygen cable television network. In 2008, Winfrey and Discovery Communications formed OWN: The Oprah Winfrey Network, a cable television channel that was scheduled to debut on January 1, 2011. She was nominated for an Academy Award for Best Supporting Actress for her role in *The Color Purple* (1985), and she has appeared in other films and has voiced the characters in several animated films.

Winfrey actively works to help others and has been an active philanthropist. Some of her efforts have been well publicized, such as her gift of a new Pontiac automobile to each member of the studio audience at one of her television programs. In the 1990's, she launched Oprah's Book Club to encourage students and others to read. She founded Oprah's Angel Network, a philanthropic organization, and the Oprah Winfrey Leadership Academy for Girls in South Africa.

Legacy

Winfrey can boast of significant accomplishments in two areas. The first is her philanthropy. Oprah's Angel Network, promoted on her show and funded in part by public donations, has performed charitable activities worldwide, from building schools in developing countries to sponsoring summer camps for children who have lost their limbs. She supported efforts to rebuild the areas devastated by Hurricane Katrina. Winfrey has also helped teachers and assists in the Use Your Life Award, which recognizes distinguished educators.

Winfrey's second legacy is her restructuring of American media. As a result of her television program, talk show hosts are expected to present more serious subjects and to be more engaged with their viewers and guests. She has proven that a black woman can be a media mogul, and she has reshaped public images of women and African Americans as much as she has altered the image of talk show hosts. Her media legacy will probably be as long lasting as her philanthropy.

Tiger Woods

American professional golfer

After becoming a professional golfer at age twenty, Woods became a multimillionaire overnight, breaking previous earnings records in that sport, primarily from product endorsements. Throughout the 1990's and 2000's, his popularity and wealth continued to grow, exceeding the earnings of superstar athletes in more popular sports, such as football and basketball.

Born: December 30, 1975; Cypress, California
Also known as: Eldrick Tont Woods
Sources of wealth: Golfing; product endorsements
Bequeathal of wealth: Charity

Early Life

Eldrick Tont Woods was born on December 30, 1975, to Earl and Kutilda Woods, and was immediately nicknamed "Tiger" by his father. Earl Woods had recently taken up golf, and from infancy Tiger was fascinated by the sport. In 1991, he became the youngest winner of the U.S. Junior Amateur tournament at age fifteen. While enrolled at Stanford University, he again made history in 1996 by becoming the first golfer to win the U.S. Amateur tournament for three consecutive years. Already famous at the age of twenty, Woods made his professional debut at the 1996 Greater Milwaukee Open tournament.

First Ventures

When Woods announced in 1996 that he was turning professional, he had already chosen the International Management Group (IMG) to represent him. IMG had prenegotiated an endorsement deal with Nike, a shoe and clothing manufacturer, for $40 million over five years, including a $7.5 million signing bonus. Woods was also paid $3 million over three years to use Titleist golf balls, gloves, and bags, and shortly thereafter he concluded another deal to use that company's golf clubs. To maximize his earnings, Woods formed a corporation called ETW and moved from California to Florida to avoid paying state income taxes. Although his income came primarily from product endorsements, his winnings from the Professional Golfers' Association of America (PGA) tournaments were also significant. In 1997, only his second year as a professional, Woods led all PGA money earners by winning more than $2 million in tournaments. By the mid-2000's, Woods's prize money often exceeded $10 million per year.

Mature Wealth

As Woods's popularity continued to increase, bringing many new fans to the sport of golf, his endorsement deals also grew. In the late 1990's, his name was attached to a golf video game from Electronic Arts that eventually was adapted for platforms including PlayStation, Xbox, Nintendo, Wii, and the iPhone. Nike paid increasing amounts of money to continue their lucrative association with Woods, in recognition of his role in helping the company's fledgling golf division secure a significant share of the global golf apparel and equipment markets. Woods has also teamed with American Express, General Mills, Gillette, and Buick, among other companies.

In addition to straightforward endorsements, in the 2000's Woods began to become more personally involved in product development, giving him more control over quality and potential earnings. In 2005, the Swiss company Tag Heuer introduced a luxury wristwatch that Woods had helped develop specifically for golfers. In

2006, Woods formed a company, Tiger Woods Design, and he began working on design projects for golf courses in Dubai, Mexico, and the United States. In 2008, Woods and PepsiCo introduced Gatorade Tiger, a new variant of the company's popular sports drink. Over the years, Woods has also purchased several valuable waterfront properties in Florida, including a new multimillion-dollar residence upon his marriage to Elin Nordegren in 2003.

LEGACY

Tiger Woods's initial endorsement deals with Nike and Titleist, agreed to before he had played a single round of professional golf, were groundbreaking, particularly for a sport that historically had been popular only among wealthy Caucasian men. Woods's multiracial background and easygoing personality have contributed to his immense popularity, which is widely considered to be the driving force behind the increased public interest in professional golf and the significant rise in PGA prize money offered during the 2000's. In addition to being an athlete, Woods has become a global industry, carefully choosing which products and companies to support and becoming increasingly involved in product development. In 2008, *Forbes* magazine projected that Woods would become the world's first billionaire athlete by the early 2010's, which is particularly remarkable considering that golf is not as popular worldwide as many other sports.

However, there was a downside to Woods's immense wealth and celebrity. The golfer had enjoyed a spotless reputation until late 2009, when several women claimed to have had affairs with Woods. On February 19, 2010, Woods publicly apologized to his wife, family, business associates, and fans, and he pleaded with the media to leave his wife and children alone. Woods had not played golf during the highly publicized controversy, but in April, 2010, he returned to the game when he competed in the 2010 Masters Golf Tournament. On August 23, 2010, Woods finalized his divorce from his wife.

F. W. WOOLWORTH

American retail magnate

Woolworth built his multimillion-dollar fortune from his chain of five-and-dime stores, at which he offered common items to customers at low, fixed costs. His stores attracted low-income buyers and anyone else who wanted a bargain and helped create a new type of merchandising.

Born: April 13, 1852; Rodman, New York
Died: April 8, 1919; Glen Cove, New York
Also known as: Franklin Winfred Woolworth
Sources of wealth: Retailing; investments
Bequeathal of wealth: Church; charity; educational institution

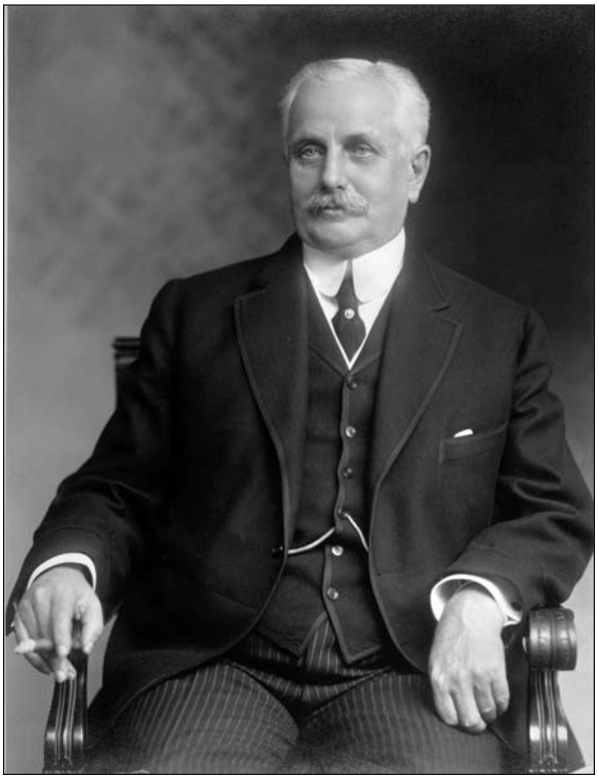
EARLY LIFE

Franklin Winfred Woolworth was the oldest of two boys born to John Hubbell Woolworth, a potato farmer, and Fanny McBrier Woolworth. At the age of seven, his family moved to Great Bend, New York. In his childhood, Woolworth and his younger brother would play "store" in their dining room, placing items on a table inside their home. Woolworth admired the clerks behind the counter at town stores. At sixteen, he left public school to attend a commercial school with aspirations of becoming a merchant or a railroad engineer. An inexperienced twenty-one-year-old, Woolworth went to work for a trial period of three months without pay for Augsbury & Moore's dry goods store. He discovered his skill was in store display and window dressing, not in sales. He worked for two years for $6 per week, later raised to $10.

FIRST VENTURES

While Woolworth worked for Augsbury & Moore, he responded to a request by his boss, William Moore, to sell some small fabric remnants and other poor-selling items for whatever price he could get for them. Woolworth set up a table and posted a sign that any article on his table cost 5 cents. To Moore's surprise, customers rushed to buy all the products on the table. Moore noted that Woolworth's sales approach worked, and Moore became more interested in it when a visitor told him that five-cent stores were successful in the West. Moore backed Woolworth in opening a five-cent store when Woolworth had no funds.

This first store in Utica, New York, did not perform well, but another in Lancaster, Pennsylvania, was successful. After a store in Harrisburg, Pennsylvania, failed, Woolworth opened a five-and-ten-cent store in Scranton, Pennsylvania, with his brother as manager, that was a great success, and his brother eventually became a millionaire. By 1879, Woolworth had three failed and two successful five-and-ten-cent stores; between 1879 and 1889, he opened twelve additional stores. He knew he needed to purchase merchandise in volume at low prices so he could afford to sell these items for only 5 and 10 cents. From 1895 to 1900, Woolworth continued to open stores across the United States. In 1889, his shops sold a total of $246,782 worth of merchandise; by 1899, sales volume had risen to $4.5 million. In 1905, Woolworth had amassed $10 million in capital.



F. W. Woolworth. (The Granger Collection, New York)

Mature Wealth

Woolworth went international with his five-and-ten-cent stores, opening one in London in 1909. His business expanded to more than three hundred stores. However, Woolworth was not the only entrepreneur in the five-and-ten-cent store business. Other American businessmen provided friendly competition using the same strategy. Some of these competitors were familiar to him, such as his brother C. S. Woolworth, his cousin Seymour H. Knox I, Knox's partner Earle P. Charlton, and Fred Kirby, and F. W. Woolworth remained friendly with these merchants. Woolworth recognized that to be successful in the five-and-ten-cent market, merchandise had to be purchased in large quantities in order to keep costs low and to provide an increased margin of profit. He knew that his chain's financial gain would increase if he and his rivals pooled their purchasing orders for inventory and agreed not to cross into one another's sales territories.

However, some of other merchants were less amicable, including his cousin Herbert G. Woolworth, who apprenticed under F. W. Woolworth but branched out on his own. Other competitors included the Titus Supply Company, Rothschild & Company, McCrory Stores, S. S. Kresge Co., and S. H. Kress & Co. Woolworth realized that none of these smaller operations posed a formidable threat while operating independently, but that they could do damage to his chain if they worked together.

In 1911, F. W. Woolworth, Knox, Kirby, Charlton, and C. S. Woolworth met to discuss how they could expand their individual businesses without invading one another's sales territories. F. W. Woolworth's suggested a merger. The other men expressed interest, but some time passed before they could reach a compromise. F. W. Woolworth insisted that the merged company have his name on its stores, as he had the most popular trademark. In November 2, 1911, these businessmen formed the F. W. Woolworth Company with $65 million in capital stock, divided into $50 million in common stock and $15 million in preferred stock, to be sold on the New York Stock Exchange, as well as overseas. F. W. Woolworth was the firm's president and held more than 50 percent of its stock. The merged company operated 596 five-and-ten-cent stores in thirty-seven states.

The F. W. Woolworth Company was managed by a board of directors with twenty-one members. This company was one of the first to decentralize the management

The Woolworth Building

With his business expanding both geographically and financially, F. W. Woolworth decided to construct his dream building for his office headquarters and for other business tenants in New York City. He considered numerous locations in lower Manhattan, eventually selecting a site on Broadway near Park Place.

Woolworth desired an elegant building with a unique neo-Gothic design, so he employed architect Cass Gilbert, well know for his classic stone work. The construction of this terra-cotta-covered, 792-foot skyscraper, almost one-sixth of a mile in height, began in November, 1911. The completed structure, dubbed the "Cathedral of Commerce," opened in April, 1913, and was the tallest building in the world until construction of the Chrysler Building in 1930. The Woolworth Building was sixty stories high and featured fifty-seven floors, a three-story tall entrance, walls of marble from the Isle of Skyros off the coast of Greece, and an extravagant lobby with a stained-glass dome, mosaics, wall murals, and a marble staircase. To maximize natural lighting, Gilbert designed the building as a U-shaped structure, which would allow the projected fifteen thousand employees to work in offices facing outward.

Woolworth's primary concern for his "Skyline Queen" was safety. The structure was made of steel and brick, without any flammable materials. The building was designed to withstand a two-hundred-mile-per-hour hurricane without damage and to protect against lighting strikes, with grounded copper cables connected to the copper roof. Stairways were enclosed spaces in order to minimize the effect of a fire. A fire pump in the subbasement allowed additional defense against fire with its ability to push five hundred gallons of water to the fifty-eighth story. Workers could access their offices by any of the thirty elevators designed to carry them with modern speed and maximum safety. Each elevator car contained a telephone connected to the Bell Telephone Company. The skyscraper also employed departments of police and detectives, fire, and cleaning and repair maintenance, as well as a power plant.

After a disagreement with banker Henry Goldman, Woolworth paid $13.5 million in cash for the lavish building project. Woolworth later earned revenues of $200,000 each year from visitors who paid to view the city from the building' s fifty-fourth floor public observation area.

The Woolworth Building was declared a National Historic Landmark in 1966. A $20 million renovation began in 1977 and was completed in 1981. The building has been featured in several films, including *Enchanted* (2007) and *Kramer vs. Kramer* (1979), and has been referenced in books and poems. The structure also served as the headquarters for *Mode* magazine in the television series *Ugly Betty*, and Columbia Records once leased space for a recording studio there.

The "Cathedral of Commerce" was the site of the Woolworth company's headquarters until the firm declared bankruptcy in 1997. After eighty-five years of ownership by the Woolworth company, the firm's successor, the Venator Group, sold the building to the Witkoff Group, a real estate developer, for $155 million in 1998. In 2005, the building was purchased by the Greater Haverhill Foundation for $1.5 million; this nonprofit organization planned to preserve the historic structure and sell it to a downtown developer. The building closed to the public in 2001 but reopened for limited tours in 2007.

of its stores. The stores were organized into eight districts, each with its separate staff and district office. The board adopted the red mastheads on the front of F. W. Woolworth's stores for all of the company's shops. After the corporation was organized, Woolworth turned to his next major project, constructing the Woolworth Building in New York City to house the headquarters of his firm. He personally financed the project with $13.5 million in cash, building a Gothic skyscraper in Manhattan that for years stood proudly as the tallest building in the world.

When Woolworth died on April 8, 1919, his company operated 1,050 stores. The year before his death, the chain garnered $107 million in revenue. His personal fortune was valued at around $65 million.

Legacy

F. W. Woolworth made his fortune in a business that appealed to the common person: the sale of general merchandise at low, fixed prices, with no haggling or bargaining. His life demonstrated how an American without social advantages could become wealthy through hard work and imagination. Before his death, Woolworth honored his parents by building and endowing the Woolworth Memorial Episcopal Church of Great Bend. He left his fortune to his wife, who had dementia.

Keith Elliot, director of public affairs for Woolworth's company, noted in his paper "Why Corporations Give: A Case Study of F. W. Woolworth Company, Limited" that both the firm and its namesake supported corporate contributions to charity. F. W. Woolworth believed these donations should be based on the needs of the communities in which his customers lived and worked, which would enable his corporate contributions to benefit the people who shopped at his stores. This policy would be adopted by many other businesses that make charitable contributions to the communities in which their firms operate.

William Wrigley, Jr.

American chewing gum magnate

Wrigley made his fortune in the chewing gum industry, using his wealth to become the owner of the Chicago Cubs baseball team and to purchase Catalina Island, off the coast of Los Angeles.

Born: September 30, 1861; Philadelphia, Pennsylvania
Died: January 26, 1932; Phoenix, Arizona
Also known as: William Mills Wrigley, Jr.
Sources of wealth: Manufacturing; sale of products; investments; real estate; sports franchise
Bequeathal of wealth: Spouse; children

Early Life

William Mills Wrigley (RIHG-lee), Jr., was born on September 30, 1861, in Philadelphia, Pennsylvania. His parents, William Wrigley, Sr., and Mary Ann Ladley Wrigley, had married on December 3, 1860. William, Sr., was a soap maker, and in 1870 he founded the Wrigley Manufacturing Company, which made Wrigley's Scouring Soap. William, Jr., and a friend ran away to Manhattan at age eleven, where William worked selling newspapers. He soon returned to Philadelphia and quit school at age thirteen to work for his father. He made $1.50 a week stirring a vat of liquid soap in the factory and later became a soap salesman. As a teenager, Wrigley traveled from city to city, convincing merchants to carry Wrigley's Scouring Soap in their stores. He married Ada Foote in 1885, and their daughter Dorothy was born in July, 1886; eight years later, the couple had a son, Philip.

First Ventures

In 1891, Wrigley and his family moved to Chicago. He had $32 in his pocket when they arrived, and he borrowed $5,000 from his uncle, William Scotchard. The only condition of the loan was that Wrigley would make his cousin a partner in the William Wrigley Jr. Company. This firm soon began selling Wrigley's Scouring Soap, and Wrigley began offering free gifts with the purchase of his product. Initially, he offered cans of baking powder, but he soon found that baking powder was more popular than scouring soap. He then began to sell baking powder instead. He continued offering premiums, including two packs of chewing gum with each purchase. Wrigley again found that his premium was more marketable than his product. In 1892, he contracted the Zero Manufacturing Company to produce his chewing gum. Wrigley's first two gum products were Lotta Gum for children and men and Vassar gum for women.

Mature Wealth

Wrigley traveled by train around the country, trying to sell his gum to store owners. During the first year, he spent 187 nights on the road. The company sold many different types of gum, including Juicy Fruit, which was introduced in 1893. The following year, Wrigley started selling his own brand of Spearmint gum, a product that no other company had been able to make profitable. Wrigley was involved in all aspects of his company, even designing the now-famous Spearmint gum arrow wrapper.

The chewing gum industry at the end of the nineteenth century was a highly competitive business. In 1899, the six largest gum makers in the country joined together to create a chewing gum trust. Wrigley was invited to join, but he declined, determined to make it on his own. The heavy competition, however, took a toll on Wrigley's business, which in the early years was often close to bankruptcy.

Wrigley spent large amounts of money on premiums and advertising. He placed advertisements in magazines and newspapers and produced posters. His sales motto became "Tell 'em quick and tell 'em often." During an economic downturn in 1907, Wrigley spent $284,000 on advertising, which in more prosperous years would have cost $1.5 million. Most of these advertisements promoted Wrigley's Spearmint gum. He added a variety of free gifts, including fishing tackle, lamps, coffee makers, cash registers, store displays, cutlery, guns, razors, and cookbooks. In 1909, the William Wrigley Jr. Company earned more than $1.34 million in sales revenue. By the following year, Wrigley's Spearmint was the best-selling gum in the United States.

In 1910, Wrigley expanded his business into Canada. The following year, he bought out the Zero Manufacturing Company and began creating his own products. Doublemint gum was introduced in 1914. Wrigley further expanded his company to Australia in 1915 and Great Britain in 1927. Businessman L. P. Larson sued Wrigley in 1911 for alleged trademark infringement regarding the trademark of Wrigley's Spearmint gum. After seventeen years of litigation, the courts ordered Wrigley to pay damages of $1.9 million.

Wrigley was a baseball fan, and he invested in the Chicago Cubs in 1917. He purchased Catalina Island for $2 million in 1919. This rocky island off the coast of Los Angeles is twenty-two miles long and eight miles wide. To promote tourism on the island, he held the Wrigley Ocean Marathon in 1927, awarding $25,000 to the first man who would swim to the island from the mainland; the first woman to complete the twenty-two-mile swim would receive $15,000. Canadian George Young was the only person to finish the race out of a field of 102, completing the swim in fifteen hours and forty-four minutes; the two women who came the closest each received $2,500. The Chicago Cubs used the island for spring training from 1921 until 1951, with the exception of the years during World War II. Wrigley became the majority owner of the Cubs in 1924, and three years later, the team's stadium in Chicago was renamed Wrigley Field.

In 1920, construction began on the Wrigley Building in Chicago. The location that Wrigley chose for his headquarters was a triangular-shaped lot in what is now the business district above Michigan Avenue. The building was designed after the Giralda Tower of the Seville Cathedral in Seville, Spain, combined with French Renais-

Wrigley Field

The home of the Chicago Cubs was originally named after the team's co-owner Charles Weeghman. In 1913, Weeghman owned the Chicago Federals baseball team. He hired Zachary Taylor Davis, the architect who designed the Comiskey Park baseball stadium a few years before, to build a park for the Federals. Groundbreaking on the new stadium took place on March 4, 1914, and the steel and concrete park was ready for the opening home game on April 23, 1914. Weeghman Field could accommodate up to fourteen thousand visitors. Before the 1915 season, additional bleachers were built to increase seating capacity to approximately eighteen thousand, and the scoreboard was moved to center field.

The park became home to the Chicago Cubs in 1916 after Weeghman bought the team for $500,000. A number of investors owned percentages of the team's stock, including William Wrigley, Jr., who bought into the franchise in 1917. Wrigley was a great fan of baseball and rarely missed a home game. However, the Cubs were a poorly run team and lost money every year. The players were so unruly that Wrigley became a reformer in addition to a co-owner. He bought additional shares of the franchise as Weeghman experienced mounting financial difficulties. In 1918, Weeghman retired as team president and sold his remaining shares to Wrigley. The stadium was renamed Cubs Park in 1919.

Three years later, Wrigley hired the original architect to design a major expansion of the ballpark. As part of this project, the grandstand was cut into three pieces. The home plate section was moved sixty feet west, and the left field section was moved one hundred feet to the northwest. The gaps were filled in with more bleachers, and box seats were added. Cubs Park now had a capacity of thirty-one thousand. The playing field was rotated three degrees counterclockwise to accommodate the box seating.

In 1924, Wrigley bought out another investor and became the majority owner, with 71 percent of the stock. Toward the end of 1926, construction began on a second deck of seats that was completed prior to the 1928 season. The stadium was renamed Wrigley Field early in 1927. In the five years before Wrigley's death in 1932, the Cubs began making a profit. They won the National League pennant in 1929 but lost the World Series to the Philadelphia Athletics.

The ivy that covers the outfield walls was planted in 1937. Lights were to be added in 1942, but after the Japanese attack on Pearl Harbor in 1941, William's son, Philip K. Wrigley, donated the lights and other materials to the war effort. Lights were not installed at the park until decades later, and the first night game was played at Wrigley Field in 1988.

The Tribune Company has owned the park since 1981. The company considered renaming the stadium but ultimately rejected this idea. However, in 2007, the owner of the Tribune Company announced that he would consider selling the field's naming rights following the trend of corporate sponsorship in baseball. Even if the naming rights were sold, the Tribune Company has said that the stadium's marquee would remain unchanged. The Chicago city council declared the famous Wrigley Field marquee, scoreboard, ivy, and exterior brick walls a local landmark in 2003.

sance architecture. The structure features two towers of differing heights and is covered in glazed terra cotta, giving the facade a gleaming, white exterior. The Wrigley Building is occasionally hand-washed in order to preserve the terra cotta. The south tower is thirty stories high and was completed in 1921; the north tower is twenty-one stories high and was not completed until 1924. The Wrigley Building has become one of the most famous landmarks in Chicago.

By the time of his death in 1932, Wrigley had factories in Chicago, Manhattan, Brooklyn, Toronto, London, Berlin, Frankfurt, and Sydney. His company was earning $75 million in annual sales revenue, of which Wrigley received profits of around $12 million. He had invested in a variety of other businesses, including railroads, banks, mines, and hotels. Wrigley owned the Biltmore Hotel in Phoenix, Arizona, where he was staying when he died. He left his fortune to his wife and two children. His estate was estimated to be worth at least $22.5 million, which did not include his homes and property in California and Arizona.

Legacy

William Wrigley, Jr., is known for his love of baseball generally, and of the Chicago Cubs specifically, and he rarely missed a Cubs home game. He also played an important role in the history of Catalina Island. Wrigley improved the island by building hotels, public utilities, the Casino dance hall, and steamships to transport visitors. He also had trees, shrubs, and flowers planted on the island. Wrigley loved Catalina, refused to sell it on several occasions, and wanted to make it available to the public. In 1972, his son Philip K. Wrigley created the Catalina Island Conservancy and transferred ownership of the island to this organization. In addition to developing Catalina, Wrigley constructed the Wrigley Building, an architectural landmark; expanded Wrigley Field, which was designated a local landmark in 2003; and created several of the most popular, best-selling chewing gums in the world.

Wu Bingjian

Chinese banker and merchant

Wu, one of a handful of merchants authorized by the Chinese government to trade with the West, exported native products to America and European nations and imported opium from British traders. In the course of his transactions, he became one of the richest men in the world.

Born: 1769; Fujian, China
Died: 1843; Guangzhou, China
Also known as: Howqua II; Bingjian Wu; Wu Ping-chien
Sources of wealth: Inheritance; trade; narcotics trafficking
Bequeathal of wealth: Children; government

Early Life

Wu Bingjian (woo bihng-zhyan) was the third son of Fujian businessman Wu Guorong (also known as Wu Kuo-ying), who founded the family trading enterprise known as Haoguan. Because Western merchants had trouble pronouncing the name of the company, the firm became known to Westerners as Howqua, and Wu Guorong was known as Howqua I in Canton (Guangzhou), China, the only location where business dealings with foreigners were allowed. Trade between foreign countries and China had begun in the late seventeenth century under the Qing Dynasty. By the late eighteenth century, the pattern for conducting business was well established: Silk, porcelain, tea, and other locally produced goods left China, and silver for Chinese purchase was brought into the country. The Haoguan company flourished.

Wu Bingjian took over the family business in 1789 and was known as Howqua II. A shrewd trader, Wu, unlike his colleagues, was capable of communicating with foreigners through pidgin English. He also was well liked by the Westerners and was willing to lend them money, at a healthy interest rate, to help less financially secure foreigners establish their businesses. Because of his abilities, Wu began to grow wealthy and influential, and he gained a reputation among foreign traders as a fair and honest businessman.

First Ventures

Late in the eighteenth century, the trade imbalance between China and foreign businessmen had significantly increased. While exotic Chinese products, such as tea, silk, porcelain, lacquerware, and other goods, were highly desirable luxuries to the Westerners, the foreign traders offered little of interest to the Chinese beyond the precious metals that were used to buy Chinese products. To offset this imbalance and to recoup the money spent in China, the English traders and their authorized agents, the British East India Company, began processing and shipping opium from their colonies in India for sale in China. While opium had been imported to China on a casual basis since the 1720's, the drug traffic increased substantially with the advent of the nineteenth century.

The ever-amiable Wu Bingjian, realizing there was a ready market for opium among the Chinese, quickly added the drug to his list of import commodities, and his profits continued to grow as he earned a percentage of every import or export transaction in which he participated. Within a decade, millions of Chinese were addicted to smoking opium, and the government, alarmed by this development, issued several edicts banning the importation of the drug as contraband and providing severe penalties for opium dealers, including death by strangulation. Despite the prohibition and threatened punishment, drug traffic continued to flourish for another forty years, and Wu became wealthier. Between 1808 and 1820, an average of four thousand to five thousand chests of opium, worth an average of more than $1,000 apiece, were brought to China from India, primarily by English traders, under the auspices of the British East India Company and by Americans shipping inferior, but more affordable, opium from Turkey. From 1825 until 1835, between twenty thousand and thirty thousand chests of opium were reaching China every year, and addiction to the drug had grown to epidemic proportions.

Mature Wealth

In the early 1820's, Wu Bingjian, concerned about the Chinese government's increased hostility toward drug trafficking, tactfully withdrew from the opium trade. His caution earned him a new nickname among his peers, the "Timid Old Lady." Wu did not care, because his legitimate business continued to produce a steady flow of income, and he amassed a fortune in silver, especially in silver dollars, which was his favorite medium of exchange. In 1822, a fire in Canton destroyed many of the Chinese merchants' businesses, melting the hoards of metals in these structures and creating a silver river two miles long. Wu contributed the lion's share of cash needed to rebuild the merchants' enclave.

By 1834, Wu's personal fortune, consisting of millions of silver coins, was estimated to exceed £6 million sterling (equal to $56 million in American currency then and worth more than £300 million or $600 million in 2010). A significant portion of his wealth was invested through the American opium-trading firm of Russell & Co., which invested in domestic railroads and industries. Wu was instrumental in endowing a number of institutions of higher learning in the United States. Although Wu continued to oversee his various trading enterprises, day-to-day operations were turned over in the late 1820's to his fourth son, Wu Yuan-hua, or Howqua III, who managed the business until his death in 1833, when Wu Bingjian's fifth son, Wu Ch'ung-yueh, took over as Howqua IV.

Wu Bingjian, however, was thrust back into the limelight in 1839, when the Qing emperor, determined to stamp out opium trading, appointed Lin Zexu as the high commissioner of Canton. On behalf of the emperor, Lin demanded that the Chinese merchants, of whom Wu Bingjian was the longest tenured, wealthiest, and most

powerful and respected, approach their Western trading partners to persuade them to turn over their supplies of opium for confiscation. For several tense months, recalcitrant Westerners, unwilling to lose the profits from their drug caches, were essentially confined to their places of business and under siege, hundreds of addicts were executed, and opium smugglers' boats were destroyed. Eventually, the Western traders surrendered more than 2.5 million pounds of opium. This mountain of contraband was shoveled into trenches, burned, and dumped into the ocean. The foreign traders were driven from Canton and subsequently retrenched in Macao, a nearby Portuguese colony.

Because the destroyed opium was considered British property, the British government demanded compensation. The Chinese refused, and the British launched the First Opium War (1839-1842) to force reparations. The British, with their superior warships, soon prevailed over the Chinese and their sixteenth century weapons. The 1842 Treaty of Nanjing reopened Canton to foreign trade, established four other ports as approved centers of trade, ceded Hong Kong Island to the British, and required the Chinese to pay $6 million as compensation for the foreign traders' lost opium. In one of his last acts of generosity, Wu Bingjian, on his deathbed, paid one-third of the entire compensation in silver dollars. He died soon afterward.

After the First Opium War, the Chinese *hong* merchants, who had been authorized by the Chinese government to trade in Canton, lost much of their influence, since additional trade centers were opened and they no longer had a monopoly on the import-export business. The merchant centers, called factories, were burned in 1856 during the Second Opium War. When this war ended in 1860, many prominent Chinese businessmen relocated to Hong Kong, where, in association with European trading partners, they would become leaders of industry in the twentieth century.

Legacy

Although the power of the *hong* merchants of Canton dropped sharply after the death of Wu Bingjian and the First Opium War, his son, Wu Ch'ung-yueh, continued to trade in tea and silk at least until the mid-1850's, after which the house of Wu fades from history. Wu Bingjian, well respected for his business practices, was commemorated in the United States with the naming of a clipper ship for him, the *Houqua*, built in the early 1840's.

Wu Bingjian's portrait, in which he is seen as an extremely thin, balding, innocuous-looking middle-aged Asian man dressed in flowing silk dress, also graced the homes of many wealthy Americans. The Howqua River in Australia and a tea called Hu-Kwa were named in his honor.

The effect of the Chinese opium trade has been long lasting, as the use of heroin and other poppy by-products spread worldwide during two centuries. Many prominent American families were involved in Asian drug trafficking. Some of the country's major institutions of higher learning, including Yale, Princeton, and Harvard Universities, in a form of money laundering, were endowed with money earned from dealing drugs to China.

THE CANTON COHONG MERCHANTS

The Cohong (known in Chinese as *kitng-hang*), a business guild established by merchants in Kwangtung and Fukien in 1720, drew up a code governing trade with foreigners in Canton. By the early 1780's, the Cohong members were granted exclusive rights to trade with Western businesses, and they essentially monopolized transactions between China and the United States, Great Britain, France, Denmark, Spain, and other European nations, earning a share of each deal and growing rich in the process. During the 125 years in which the Cohong held sway over foreign trade in Canton, many Chinese businessmen rose to prominence and later fell out of favor as their fortunes waxed and waned. Some of the better known of the Cohong members, recognized primarily by their business or trading names rather than their personal names, included Suqua, Cudgin, Munqua, Phuankhequa, Mawqua, Hunsunquin, Deanqua, Chun Yea, Chun Sam Mia, Linqua, Anqua, Empshaw, Pinqua, Cowlo, and Old Quiqua. One of the most important and enduring of these merchants was Wu Bingjian, known to Westerners as Howqua II, who conducted numerous transactions with Western traders for a half century between 1789 and his death in 1843.

Members of the Cohong were recognized by the symbols of their office: special buttons worn on their hats designating their rank in the hierarchy of businessmen. The Cohong was charged with maintaining factories (named for Western agents, called factors), the buildings along the waterfront in which foreigners and their staff were housed. Thirteen factories, including Chow-Chow, Old English, American, Imperial, and Tranquilit, were provided at Cohong expense, and the Cohong was also responsible for coastal defenses to protect shipments from pirates.

Following the Opium Wars, the power of the Cohong dissipated. Many of the surviving businesses that had been powerful in Canton relocated to Hong Kong, the former British crown colony that since 1997 has been a special administrative region of the People's Republic of China. Beginning in 1842, many former Canton traders, both Chinese and Western, set up their businesses in Hong Kong. Over the years, these businesses merged, becoming international conglomerates that represented the interests of East and West alike. Jardine Matheson & Company, one of the firms that traded opium and other goods with the Cohong in Canton, remained headquartered in Hong Kong into the twenty-first century.

Stephen Alan Wynn (wihn) was born in Connecticut and reared in Utica, New York. His father, Michael Weinberg, changed the family name to Wynn in 1946 to help promote business for a string of bingo parlors that he operated in Maryland. After the younger Wynn graduated from a private school for boys near Syracuse, New York, he earned a B.A. degree in English literature and anthropology from the University of Pennsylvania.

After his father's death in 1963, young Wynn took over his father's bingo business. He invested his profits into a share of the Frontier Hotel and Casino in Las Vegas, Nevada. In 1967, Wynn and his wife Elaine moved to Las Vegas.

First Ventures

During the early 1970's, Wynn began buying shares in other Las Vegas casinos. After securing a major land deal involving Howard Hughes and Caesar's Palace in 1971, Wynn bought a controlling interest in the Golden Nugget in downtown Las Vegas. He renovated and expanded the

Golden Nugget into a very successful resort hotel and casino that attracted wealthy clientele. In 1980, he built the Golden Nugget Hotel and Casino on the boardwalk in Atlantic City, New Jersey. By 1985, Wynn's fortune was estimated at $100 million.

After selling the Atlantic City Golden Nugget in 1987 for $440 million, Wynn built the Mirage Resort and Casino, a major casino along the Las Vegas Strip. At a cost of $630 million, this venture was considered a major risk. However, with its vast size, lavishness, indoor forest, and outdoor human-made volcano, the Mirage proved to be a major success. This hotel firmly anchored Wynn's wealth and established him as a major figure in the historical development of Las Vegas.

Mature Wealth

With the Mirage generating an average of $1 million a day, Wynn built the Treasure Island Hotel and Casino, which featured a sinking pirate ship and was located next door to the Mirage. Treasure Island opened in 1993 and cost $450 million to construct. This hotel was another financial success for Wynn.

After purchasing and demolishing the old Dunes Hotel, Wynn replaced it with the ultraposh Bellagio Resort and Casino in 1998. Built at a cost of more than $1.5 billion, the Bellagio contains 3,421 rooms, an artificial lake, a magnificent art gallery, and a dancing water fountain show. The Bellagio spurred the development of numerous luxury hotels and casinos in Las Vegas.

In May, 2000, Wynn sold his company, Mirage Resorts, Inc., which included the Mirage, Treasure Island, and Bellagio, to Metro-Goldwyn-Mayer (MGM) Studios for $6.6 billion. Wynn used some of the proceeds to build the Wynn Las Vegas hotel on the Strip. Standing fifty stories high, Wynn Las Vegas contains 2,716 rooms and the Wynn Art Collection, including paintings by Vincent van Gogh, Édouard Manet, and Pablo Picasso. This hotel opened in April, 2005.

In 2004, Wynn became a billionaire, who was worth an estimated $1.3 billion. His net worth grew to $3.9 billion in 2008. That year, he opened the elaborate Encore Hotel and Casino in Las Vegas on December 22.

Legacy

With his legacy still evolving, Steve Wynn is recognized as a major contributor to the development of the Las Vegas gambling empire. He has been a key player in the revitalization and expansion of Las Vegas, and he helped transform the city into a world-renowned resort and convention destination. With each new investment, his hotel and casino enterprises in Las Vegas have continued to grow in size, lavishness, reputation, and success.

In May, 2006, Wynn was included in *Time* magazine as one of the one hundred most influential people in the world. Later that year, he was inducted into the Hall of Fame of the American Gaming Association.

José Xifré

Spanish industrialist and merchant

Xifré was the wealthiest of the indianos, *Spaniards who sought fortunes in the Spanish colonies in the West Indies. Acquiring a business fortune in Cuba and New York City, Xifré returned to Catalonia as a builder and philanthropist.*

Born: October 15, 1777; Arenys de Mar, Spain
Died: August 7, 1856; Barcelona, Spain
Sources of wealth: Trade; manufacturing; real estate
Bequeathal of wealth: Spouse; children

Early Life

José Xifré (hoh-SAY see-FRAY) was born in Arenys de Mar in Catalonia, Spain, in 1777, the son of Juan Bautista Xifré Horta and Margarita Casas Castelló. He was one of six children. His father owned four maritime ships that traded with Spain's American colonies. However, this fleet was damaged in the war between England and Spain from 1779 to 1783. On October 3, 1786, Xifré's father agreed to surrender his commercial property to his creditors. After Xifré acquired his first fortune, he extinguished his father's debts.

Xifré hoped to recover his family's finances in Cuba, a flourishing Spanish colony. The Spanish who traded in the American colonies were known as *Americanos* or *indianos*. Xifré's uncle, José Xifré Horta, was a successful *indiano*, owning a leather tanning factory in Cuba.

First Ventures

In October, 1798, Xifré moved to Cuba to make his fortune. Cuba was a center of the Atlantic trade in the early nineteenth century, producing great quantities of sugar, liquor, coffee, and tobacco. It was a vital link in the triangular trade, by which slaves were traded from Africa, raw products from the Americas, and manufactured goods from Europe. Xifré began working for a friend of his father, Mariano Baralt, and then for his uncle. Showing great ambition and intelligence, he acquired a small fortune within five years. His uncle had no sons and gave Xifré increasing stakes in the leather factory.

Xifré began building a trading fleet, purchasing the ships *San Jose* in 1804 and *Margarita* in 1809. He also acquired plantations and expanded his businesses into wool making, coffee, sugar, tobacco, brandy, and rum. Although Xifré's name has been linked to the Atlantic slave trade, there is no evidence that he was involved; Arenys de Mar historian Zenon de Pol i Alguer claims that the historical record demonstrates that Xifré was not a slave trader, although he certainly worked thousands of slaves on his plantations and businesses. Xifré's resources allowed him to dominate the leather trade in Cuba and export large quantities of leather goods to the United States and England. He imported the best machinery from England for his factories. In 1808, he was awarded an exclusive monopoly to obtain all hides for tanning from cattle slaughtered in Havana and Santiago, Cuba. Although his competitors finally succeeded in ending his monopoly in 1840, Xifré had already solidified his businesses.

Xifré was an innovator in the leather industy. He imported plants containing tannin from Catalonia to be used in the tanning process. When this shipment was cut off during the Peninsular War (1808-1814), Xifré substituted tannins found in the bark of Cuban mangrove trees. When the inception of a leather industry in the United States threatened his export business, he became a founding member of the first U.S. leather joint-stock company, the New York Tannery, contributing $10,000 to the firm in 1817. With his great wealth, Xifré loaned more money in Cuba than many banks. In 1818, he married Judith Downing, the daughter of one of his New York partners; they would have one son.

Mature Wealth

With the expansion of his trade with the United States, Xifré moved to New York City in 1823. Although he would never return to Cuba, he kept close oversight over his Cuban managers and continued to reap profits. In New York, he opened an office on 343 Greenwich Street and moved into banking. He purchased other properties in Manhattan and constructed buildings. In 1831, he returned to Catalonia after visiting industrial sites in England and France. Xifré was granted a hero's welcome in Spain because of his vast wealth and all of the assistance he had provided to *indianos* from Arenys de Mar. With a fortune estimated at 120 million reales (the equivalent in 2010 of more than $1 billion), he was the richest man in Catalonia and probably in all of Spain. He was nicknamed the "Builder of Wealth." Spaniards would exclaim the idiom, "He is richer than Xifré!"

As he did in New York, Xifré financed new industries in Catalonia. He served as president of the Caja de Ahorros y Monte de Piedad savings bank and was mayor of Barcelona in 1850. He and his wife supported the research of the foremost Spanish phrenologist, Mariano Cubí. He acquired vast properties in and around Barcelona, many in an auction of lands seized from the Catholic Church. In response to a cholera outbreak in his birthplace of Arenys de Mar, he built a grand hospital in 1849, endowing the town with 2,000 duros (equivalent to about $400,000 in 2010 currency) to maintain the facility. The hospital had twenty-five beds, a nursing home, and classrooms.

Xifré built a palatial home on his estate called Manso Xifré. All of the structures he built were in the same architectural style, dominated by arches and porticoes reminiscent of the structures in Cuba. His most architecturally significant building was Porxos d'en Xifré (Xifré's porches). Construction began in 1836 and was completed in 1840 on a two-block area facing the Barcelona stock exchange on one side and the harbor on the other. Porxos d'en Xifré was designed by architects Josep Buixareau and Francesc Vila as a neoclassical palace, replete with lavish gardens. The ground floor consists of cascading arches—hence the name Xifré's porches—that unite five adjacent buildings. The structure has three upper floors and an attic, all made of fine materials. The arcades are ornamented with sculptures, plaques, and bas-reliefs celebrating both the conquest of the Spanish New World and its wealth, depicting explorers and conquistadores, as well as fruits, fish, maritime trade, sugarcane, coffee, and toiling slaves.

When Xifré died in 1856, he was buried in the chapel of the Xifré Hospital in a magnificent vault designed by the famous Parisian sculptor Charles Guméry. Xifré left his fortune to his widow and to his son José Xifré Downing. His son built a grand palace in Madrid, modeled after the Alhambra. His grandson Don José Xifré Hamel married a countess and in the 1880's became a leading member and benefactor of the Theosophical Society of Helena Petrovna Blavatsky. Hamel financed numerous Theosophist enterprises, including a printing

THE ATLANTIC SLAVE TRADE AND WEALTH

Traffic in slaves has been one of the great sources of wealth in human history. Slavery is an ancient institution. In early economies, wealth was accumulated in precious metals and stones, in livestock and land, and in ownership of humans—slaves. In the classical world, slaves often occupied a fluid and familial part of the economy; Pasion, a Phoenician slave in ancient Athens, became the wealthiest banker in ancient Greece. However, slavery always had its brutal side; Athenian slaves worked the silver mines of Laurium in shackles and were treated with contempt and brutality.

The Atlantic slave trade was the most profitable and most inhumane traffic in slavery the world has known. With the discovery of the New World, the continent of Africa was pillaged to provide millions of slave laborers. Slave trading in Africa and Arab societies had existed for centuries. With the demand for workers for the American colonies, however, African slaves were not directed overland to the Arab world but were sent across the Atlantic. It is estimated that in the sixteenth century about 300,000 Africans were transported to the Americas. The transatlantic slave trade expanded in the seventeenth century, but the most active period of trading was in the eighteenth and nineteenth centuries. According to some historians, approximately ten million African slaves made the transatlantic journey to supply Portuguese Brazil, the Spanish colonies, and the newer outposts of North America and the Caribbean. As many Africans died during the transportation as survived.

Some chieftains in the Kongo and other parts of Africa gorged themselves on profits from selling rival tribesmen to Portuguese slavers. Greater fortunes were made by English, French, Dutch, and Brazilian slavers, and often by bankers and merchants, as Africans were purchased from tribal chiefs and Arab traders, crammed into ships, and auctioned at rich prices. Numerous early American fortunes, such as those of John Brown (Brown University is named for his family), were made through the slave trade.

Denmark banned the slave trade in 1803, Great Britain in 1807, and the United States in 1808. The British navy worked throughout the Atlantic to suppress slave transporting, boarding ships of any nation to ferret out slaves and traders. In the United States, the wealthy southern cotton trader Charles Lamar was indicted for slave trading in 1857. The last major American slave trader, Nathaniel Gordon, was executed in 1862. Nevertheless, an illegal slave trade to Cuba existed until slavery was abolished in 1886. Vast fortunes were made in Cuba both in trading slaves and in working them on Cuba's vast plantations. Much of the wealth of the rich *Indianos*, including men such as Antonio López y López, Miguel de Aldama, Joan Güell y Ferrer, and Manuel Calvo, was generated from slavery. The rich shipping merchant Pedro de Zulueta was tried in a London court in 1843 for slave trading. His nephew Julián de Zulueta was reputed to be the chief importer of slaves into Cuba, gaining great sums of money.

press that disseminated a great quantity of free literature promoting Theosophy.

Legacy

José Xifré was perhaps the wealthiest of the Spanish *indianos*—the Catalans and other Spaniards who made their fortune in the American colonies. They returned to their homeland to join the Spanish aristocracy and rebuild Spain. Xifré's fortune was made in leather making and exporting and was multiplied in plantations in Cuba and in his activities as a financier and capitalist in New York City. A street in Havana is named for him.

His grand building, Porxos d'en Xifré, is one of the historic sites of Spain and remains a tourist attraction in the twenty-first century. The first photograph ever taken in Spain was of Porxos d'en Xifré; it was the first building in Barcelona to have running water, and it is a national monument. It was built to have restaurants and shops on the first floor and apartments above. When artist Pablo Picasso arrived in Barcelona in 1895, he and his family resided in the building's apartments, and Picasso painted city landscapes atop the roof. One of Spain's most famous seafood restaurants, Set Portes (seven doors), operating since 1836, is located in Porxos d'en Xifré. Hundreds of celebrities have dined there, including actors Ava Gardner, Catherine Deneuve, and John Wayne; film director Orson Welles; performers Josephine Baker, Maria Callas, and Xavier Cugat; artists Joan Miró, Salvador Dalí, and Yoko Ono; writer Ernest Hemingway; scientist Albert Einstein; soccer champion Pelé; radical activist Che Guevara; and King Juan Carlos I and Queen Sophia of Spain.

Yasuda Zenjirō

Japanese businessman and banker

Yasuda rose from humble origins to become the founder of a huge banking empire. His prosperity enabled him to become a generous philanthropist who financed cultural facilities and other projects in Tokyo.

Born: November 25, 1838; Toyama, Etchu Province (now Toyama Prefecture), Japan
Died: September 28, 1921; Ōiso, Kanagawa Prefecture, Japan
Sources of wealth: Banking; government; insurance
Bequeathal of wealth: Relatives; charity

Early Life

Yasuda Zenjirō (yah-soo-dah zen-gee-roh) was born in Toyama, in Etchu Province (now Toyama Prefecture), Japan. Born into a family of very modest circumstances, he was the son of a poor samurai. When he was seventeen, he ran away from home and made his way to Edo (later Tokyo), where he became a shop assistant in a money-changing company. He opened his own money-changing business in 1863, when he was twenty-four.

First Ventures

One of Yasuda's clients was the government of the Tokugawa shogunate. He performed "tax farming" services, collecting taxes for citizens and sending these levies to the government. When the Tokugawa era collapsed and the shogun was forced to resign, the country returned to imperial rule in 1868 with the Meiji Restoration. Yasuda was able to provide similar financial services to the Meiji government. During the early years of the new era, when many aspects of Japanese business were in disarray, Yasuda enjoyed impressive profits gained from the gap between the time taxes were collected and the time they were sent to the government. He earned additional profits from purchasing Meiji paper money, which was greatly depreciated, and trading it for gold.

Mature Wealth

When the Meiji government made the announcement that it would exchange depreciated paper money at face value in gold coin, Yasuda made a fortune as the official handler of funds for the Ministry of Justice, placing him in the position to help establish a bank. In 1876, the Third National Bank was founded; it would later become Japan's sixth largest bank, the Fuji Bank. In January, 1880, Yasuda was granted a charter to establish his private bank, the Yasuda Bank. By this time, his reputation for leadership in the financial world had been established, as demonstrated by his appointment to become an adviser to the businessmen who founded the Bank of Japan, the nation's first central bank.

The establishment of the Yasuda Bank marked the beginning of the Yasuda *zaibatsu*, or family-owned business conglomerate, which, along with several other *zaibatsus*, exercised control over much of the Japanese economy during the Edo and Meiji periods. This financial control contributed substantially to Japan's successful industrialization. The Yasuda *zaibatsu* was the fourth of the so-called "Big Four." It differed from the others in that it remained primarily a financial enterprise rather than a company that developed and controlled commercial and industrial firms. By 1880, Yasuda had acquired the Yasuda Mutual Life Insurance Company. This firm prospered, and in 1893, his *zaibatsu* purchased the Tokyo Fire Insurance Company (later called the Yasuda Fire and Marine Insurance Company), Japan's first fire insurance company. Extensive public relations work sought to introduce Japanese consumers to fire insurance, and awareness of this product was spurred by the Great Yokosuka Fire of 1890, which destroyed 830 homes. The fire also plunged Yasuda's company into debt, even though the firm's commitment to pay claims associated with the blaze gained the company credibility and attracted more clients. Financial restructuring was necessary, and Yasuda stepped in to help, enabling the firm to grow steadily between 1893 and the beginning of World War I in 1914. Yasuda was also one of the major financiers of the Russo-Japanese War (1904-1905).

Among the better known of Yasuda's philanthropic deeds was his donation of the Yasuda Auditorium, a landmark located on the Hongo campus of the University of Tokyo. This auditorium, seating more than one thousand people, was completed in time to be used on the occasion of a visit of the Taisho emperor. Yasuda's wealth also made possible the Hibiya Public Hall, completed in 1929, which came under the control of the city of Tokyo, and the Honjo Public Hall, which Yasuda donated to the city of Tokyo. Yet another philanthropic gift was the Kyu-Yasuda Garden, originally the site of a feudal lord's residence in the Sumida-ku area of Tokyo. One of the garden's best-known features is a pond fed by the

Sumida River. After Yasuda's death in 1921, the garden was opened to the public. Kyu-Yasuda Garden was renovated after it was destroyed in the Great Kanto Earthquake in 1923 and despoiled by the pollution of the Sumida River.

Yasuda gave his wholehearted support to the mayor of Tokyo, Gotō Shinpei, who worked to establish the Institute for Municipal Research, an independent agency that provides guidance for governing Tokyo. Yasuda had expressed his plan to make a 3.5 million-yen donation to the enterprise. His family honored his wishes to do so, and the institute was established in 1922, the year after his death.

On September 28, 1921, Yasuda was assassinated by Asahi Heigo, an ultraright-wing activist who was upset because Yasuda declined to make a donation for the construction of a workers' hotel. During his lifetime, Yasuda had amassed a fortune that exceeded $1 billion. His remains were buried in the Gokoku-ji Temple Cemetery in the Bunkyo ward of Tokyo. A monument honoring Yasuda's memory was erected in the financial district of Toyama in the prefecture of his birth.

Great Wealth and Banking

By its very nature, the business of banking is the business of accumulating money, and many of the world's leading bankers have amassed their own private fortunes to become some of the richest people of their times. Banks of a sort existed in ancient Greece and Rome. The "new banking" in the Middle Ages saw a shift from an agricultural to a commercial orientation, and there was less antagonism regarding the activities of borrowing and lending money than there was in the past.

The industry grew more sophisticated in Italy in the centuries just before and during the Renaissance, when many of the practices of modern banking were initially developed. The bankers of Genoa, Venice, Florence, and other city-states were often merchants, many of whom had connections in high places. A number of banking companies, notably the one established by the Medici family, established branches throughout Italy and in other countries. Italian bankers who expanded into England brought sophisticated financial and commercial practices that boosted both the state and the economy, becoming lenders to the government, or "crown bankers." By the late fifteenth century, German businessmen had moved into Europe's financial services business. Typical of these bankers was Jakob Fugger, called Jakob the Rich. Having inherited his father's trading business, Fugger grew immensely wealthy and became famous throughout Europe for lending money to its rulers. His influence among royal circles influenced European history long after his death.

The seventeenth and eighteenth centuries saw the rise of such prominent European bankers as Francis Baring and his son Alexander; Henry Hope, who established ties to King George I and ran the leading banking house in Europe; and the house of Rothschild, a European dynasty of German-Jewish origin that established their banking business in the late eighteenth century. By the mid-twentieth century, the total wealth of the Rothschild family, when calculated in 2010 currency, amounted to hundreds of billions of dollars.

Two of the most important American-born bankers were Junius Spencer Morgan and his even more prominent son, J. P. Morgan. The younger Morgan transacted some of the most significant corporate deals of the late nineteenth and early twentieth centuries. Another major nineteenth century financier was Gerson von Bleichröder, a Jewish-German banker and a Prussian noble, who took care of the private banking business of Otto von Bismarck, the Prussian state, and the German empire. Having close ties with the Rothschild family, Bleichröder's banking house served as a branch office of the Rothschilds' bank in Berlin.

While fortunes were being made in Europe, Yasuda Zenjirō founded two banks in Japan in the late nineteenth century. These banks were part of the Yasuda *zaibatsu*, a word that literally means "financial clique" and refers to a family-controlled banking and industrial conglomerate. Among the dozen or so *zaibatsu,* the "Big Four" were Mitsubishi, Mitsui, Sumitomo, and Yasuda. Typically, these vertical monopolies consisted of a holding company at the top, with a wholly family-owned banking subsidiary to mobilize capital. At the Yasuda *zaibatsu*, Yasuda Zenjirō was chairman, four of the seven directorships were held by Yasuda family members, three members of the board of directors were salaried managers, and two others were former bureaucrats. Most of the founders of the Japanese *zaibatsu* were samurai bureaucrats with a privileged position within the government, making it possible to obtain lucrative monopolies, subsidies, and state assets at greatly reduced prices when the government sold its industrial holdings during the 1870's. The *zaibatsu* helped to finance numerous enterprises in Japan and abroad. Eventually, the Big Four would control more than one-third of Japan's mining and chemical industries, nearly one-half of the machinery market, 60 percent of the commercial stock exchange, and a substantial portion of the merchant fleet.

LEGACY

Having come from a humble background, Yasuda Zenjirō became wealthy through his astute insight into money management coupled with his involvement in the movement to overthrow the Tokugawa shogunate, which put him in a position to enjoy recognition and work from the Japanese government. As his business successes multiplied and the Yasuda *zaibatsu* was formed, Yasuda sometimes was forced to reorganize financially troubled ventures, such as the Tokyo Fire Insurance Company, Ltd. After Yasuda restructured this firm, it eventually amassed assets of 2.80 trillion yen ($19.48 billion) and employed more than ten thousand workers.

Yasuda's wealth and his appreciation of and interest in cultural and community affairs enabled him to finance public halls, gardens, buildings, and educational projects that brought him recognition as a major philanthropist in Japan. His business legacy was carried on by his descendants, who continued to operate his banking enterprise, with the Yasuda Bank reorganizing as the Fuji Bank and later merging with two other banks to form the Mizuho Financial Group in 2003.

Yodoya Tatsugorō

Japanese merchant

Yodoya's family built the greatest fortune in Tokugawa Japan through innovative business practices. However, the family's wealth was confiscated in 1705 when Yodoya was embroiled in a scandal.

Born: c. 1686; possibly Ōsaka, Japan
Died: date unknown; Japan
Also known as: Saburōemon
Sources of wealth: Inheritance; trade
Bequeathal of wealth: Confiscated

Early Life

Yodoya Tatsugorō (yoh-doy-ah taht-zuh-gaw-roh) was born to the fifth generation of successful Yodoya merchants in the city of Ōsaka, the commercial hub of Japan. Although sources differ somewhat in their history of the family, it seems that the Ōsaka house of Yodoya began in the late sixteenth century, when Tsuneyasu Yosaburo moved from Okamoto to Ōsaka to begin a lumber business under the trade name Yodoya. He prospered, building bridges throughout the city and supplying lumber to the great general Toyotomi Hideyoshi. Tsuneyasu's son Gento received a royal license to engage in the lucrative silk trade with China, which at this time, like most silk industries, was under a government monopoly.

The most important head of the house, Yodoya Ryoan, also known as Saburaemon, began selling foodstuffs, and around 1654 he offered his residence in the Kitahama district as a trading center for rice merchants. He built a bridge over the Tosabori River for easier access to the large rice fields that surround Ōsaka. The merchants not only exchanged rice but also traded bills of sale for future rice deliveries, over which they haggled and speculated. This sophisticated rice market developed into the famous Kitahama and Dojima Rice Exchanges, the first such markets in Japan. In 1688, the exchange was moved to more spacious quarters in Dojima. Supplying 100,000 *koku* of rice every year, Yodoya Ryoan became the leading rice merchant in Ōsaka.

Although Yodoya Tatsugorō was born to the family of greatest mercantile wealth in Tokugawa Japan, he remained a commoner in a rigidly stratified society, dominated by the daimyo—the hereditary, aristocratic feudal lords of Japan. Yet to the amazement of all, the opulence of the house of Yadoya exceeded not only the wealth of the aristocracy but also the fortune of the shogun ruler himself.

First Ventures

When he was young, Yodoya Tatsugorō's father died, and he was given an allowance by his mother. The accounts of the Yodoya possessions that are still extant describe the family as owning numerous estates, with their chief mansion covering 14,200 square yards, surrounded by a nine-acre garden. The mansion's interior was gilded with gold, and its screens were painted by famous artists. The summer chamber was made of glass and decorated with gold fish; the tea room was adorned with gold and silver; the reception chamber was filled with exquisite engravings; and the hallways were lacquered red. The mansion's garden was graced with a picturesque pond, elegant bridge, and trees imported from the far reaches of Japan and China.

The Yodoya family also owned forty-eight warehouses crammed with treasures of crystal, carpets, birds made of gold, antique scrolls, and Chinese brocades and silk. A cadre of clerks and superintendents watched over each warehouse. According to some accounts, the Yodoya family owned 250 fields and massive amounts of gold and silver coins. (The claim in the historical record that they owned 146,000 pounds of gold and 583,000 pounds of silver is almost certainly exaggerated.) The family was also a generous supporter of Buddhist monasteries. In addition to their own wealth, they were owed huge debts by many daimyo and the shogun.

Mature Wealth

There are various accounts of the fall of the house of Yodoya, including one in the *Setsuyo Ōsaka* (records of Ōsaka) and the original sources used by Isaac Titsingh in his eighteenth century memoir of Japan. The two most important facts, however, seem certain. First, at the age of nineteen, Yodoya Tatsugorō became embroiled in a great scandal arising from his opulent lifestyle and pleasures with courtesans. Second, the enormous wealth of the Yodoya family was confiscated by the shogun, and all debts owed to the house were canceled, resulting in ruin.

According to the accounts, Yodoya Tatsugorō lived a debauched lifestyle, amusing himself with women from the Shinmachi courtesan district of Ōsaka. He dressed in white robes and smoked a silver pipe, privileges usually permitted only to daimyo. He wanted to marry a courtesan of the highest station named Azuma, of the courtesan house of Ibaragiya. To do so, he needed to buy Azuma's contract for 200 gold pieces. This sum exceeded his al-

GREAT WEALTH AND SCANDAL

"There is no great fortune without a great crime," is a saying often attributed to the French novelist Honoré de Balzac. This proverb is well illustrated in *Les Misérables* (1862; English translation, 1862), written by Balzac's fellow novelist, Victor Hugo, which portrays the Thenardiers, a gang of thieves who accumulate wealth by robbing dead bodies in the sewers of Paris and trading slaves in the United States. Certainly many rich people have earned their fortunes honorably, but there are also people who have employed unseemly tactics to accumulate their wealth. For example, Maḥmūd of Ghazna, the founder of the Ghaznavid Dynasty in India in the late tenth century, gained his fortune through conquest and plunder.

Wealth has always been scandalous when ostentatiously displayed or contrasted with nearby poverty. Queen Marie-Antoinette's wealth and supposed indifference to the plight of the peasants created a scandal in eighteenth century France, as did the actions of Imelda Marcos in the twentieth century Philippines. The wife of Philippine president Ferdinand Marcos, Imelda became the object of opprobrium when it was revealed that she owned approximately three thousand pairs of shoes. The Nazi leader Hermann Göring, second-in-command to Adolf Hitler, built a great fortune on the ravages of World War II. His agents roamed the conquered states of Europe for priceless art and artifacts, which were sent to Göring's Carinhall mansion. The twentieth century has seen the sorry spectacle of heads of state, known as kleptocrats, looting their often impoverished nations of billions of dollars to be secreted in Swiss bank accounts.

How does one assess America's Gilded Age, sometimes called the Great Barbecue, in the latter half of the nineteenth century? It was a period filled with the scandalous grab for wealth by financiers like James Fisk and Jay Gould. However, this period also saw the industrialization and rapid growth of the nation's economy, with concomitant prosperity for many middle-class Americans. Were the magnates of that era "robber barons" or "captains of industry"?

The twentieth century has seen its share of financial scandals, no doubt connected to the increasing repository of human wealth in bearer instruments—documents, such as stock shares or bonds, which indicate that the bearer has a title in property. Charles Ponzi, who imparted his name to the greatest vehicle of financial fraud ever invented, the Ponzi or pyramid scheme, earned millions of dollars through his ruse. Bernard Madoff used the same ruse to bring $50 billion into his investment firm from 1990 to 2007; unfortunately, his prosecutors were unable to determine how many of these billions were kept by Madoff and his family, to the detriment of the cheated investors. The greatest financial swindle of the twentieth century, however, was probably that employed by Ivar Kreuger, the Swedish "Match King," who built a conglomerate of fraudulent companies in the 1920's and 1930's, bringing ruin to millions of people.

The very wealthy have also been involved in their share of personal scandal. For example, Harry Kendall Thaw was the heir to one of America's great fortunes, which his father, William Thaw, had amassed in the nineteenth century. On June 25, 1906, Harry Thaw shot and killed architect Stanford White in front of hundreds of people at Madison Square Garden's rooftop theater. Scandal can expose great wealth to danger. The Manchu official Heshen saw his immense wealth confiscated by the Chinese emperor and was executed when he was accused of scandal. Similarly, the immense fortune of the Yodoya family may have been seized by the shogun as punishment for Yodoya Tatsugorō's fraud, or the family's wealth may have been confiscated because Yodoya's scandalous behavior allowed the Japanese aristocracy to teach the mercantile class a lesson, while relieving itself of some very uncomfortable debts.

lowance, but his mother refused to extend him more money. Although he secretly pawned several of his family's heirlooms, he could not raise enough money to buy the contract or pay for his other accumulated debts.

A member of his coterie of servants and friends who accompanied him on his revels advised him to forge a bill of payment under his family name. One of his servants impersonated a banker to deliver the forged bill. When the forgery was discovered, the shogun ordered Yodoya's accomplices executed. Because of his family name, Yodoya's life was spared, but he faced an even harsher penalty. All of his family's wealth was confiscated, and the debt of 20,000 silver pieces owed to it by various daimyo, as well as the debt of 80,000 gold pieces owed by the shogun, were canceled. Yodoya was exiled to the town of Yamata, where he joined an order of priests.

This scandalous story of love, money, and downfall was reenacted in several Kabuki plays of the period, including *Keisei kogane no yodogoi* (courtesans and golden yodo carp), *Keisei hachisu no itu* (a courtesan and strings of lotus), and *Monju no kaichō* (the monju unveiling). Two novels of the affair appeared at the same time: *Karanshi daimon yashiki* (residence with the great quince gate) and *Chō kigen bukuro* (the millionaire's bag of treats). Yodoya's fall is said to have affected the rising mercantile class of Kyōto and Ōsaka. These merchants realized that enforcement of the debts owed to them relied entirely on the goodwill of the political authorities. As a result, they reduced their extravagant way of living and adopted a more modest lifestyle.

Legacy

The house of Yodoya is significant for both its rise and its fall. During its rise, it was clearly one of the most innovative groups of merchants in the history of Japan. The Yodoya family developed the first market exchange for rice, which would play a central role in the Japanese economy for centuries. In fact, legal scholar Mark West has described the Dojima Rice Exchange as the world's first organized futures market, in which money was exchanged for promissory notes for the future delivery of rice. Because rice was so important to the Japanese economy, these promissory notes represented a form of currency, the value of which derived from changing rice prices. As a form of financial "derivatives," these notes became the source of frantic bidding, with traders speculating on their value.

Numerous lessons can be derived from the Yodoya family's fall. Tokugawa Japan was rigidly divided into hierarchical groups, with merchants occupying the lowest rung. However, in the unified, stable economy that the Tokugawa shogunate made possible, Ōsaka merchants achieved great wealth, far in excess of the other social classes. Contemporary accounts are in awe of the wealth and luxuries displayed by the house of Yodoya. The shogun and daimyo depended on the Yodoya family and other merchants for loans but also expressed shame at being in debt to members of such a lowly caste. The destruction of the house of Yodoya may have been the Japanese officials' fierce reaction to the unseemly rise of the merchant class, a confiscation with an air of legality due to Yodoya Tatsugorō's indiscretions. Certainly the feudal lords relieved themselves of a great debt when they vanquished the house of Yodoya.

Perhaps the most intriguing explanation for the family's fall has been offered by legal scholars. They claim that the attack on the house of Yodoya may have been a financial regulatory reform, with the shogun expressing disapproval of the disordered futures speculations of the Dojima Rice Exchange.

SIR DAVID YULE

British merchant and industrialist

Yule became the owner and manager of Andrew Yule & Co., one of the largest trading and industrial companies in India, expanding the business to become one of the richest and most powerful men in the country.

Born: August 4, 1858; Edinburgh, Scotland
Died: July 3, 1928; Hertfordshire, England
Sources of wealth: Trade; real estate
Bequeathal of wealth: Spouse; children

EARLY LIFE

Sir David Yule (yewl) was born in Edinburgh, Scotland, on August 4, 1858, the son of David Yule, the assistant keeper of the general register of the sasines (legal documents that record the transfer of ownership of a parcel of land or a building). Young David received his education at the Royal High School in Edinburgh and then spent three years learning the cotton trade in Oldham.

Yule's uncles, Andrew and George, had been merchants and traders in Great Britain in the nineteenth century and increasingly had business activities in India. In 1863, Andrew Yule went to Calcutta, India, to establish himself as a merchant and agent, founding a firm known as Andrew Yule & Co. that traded in jute, cotton, tea, and other goods. The company expanded to manage jute, cotton, and flour mills; tea plantations; coal mines; and rail and inland navigation companies. By 1866, Andrew Yule & Co. was well established enough to join the Bengal Chamber of Commerce.

In 1875, David Yule and his uncle George went to India to manage the Bengal Cotton Mills for Andrew Yule & Co. David was a hard worker and soon took the lead in the business.

FIRST VENTURES

David became a partner in Andrew Yule & Co. and in 1887 bought his Uncle Andrew's share. Andrew was taking increasingly long visits back to England, where he finally moved permanently in 1888, and David replaced him as the company's resident partner in India. George left for England in 1891, and David assumed complete control of the firm's business in India the following year. In 1899, the firm controlled assets in excess of £1.2 million. When Andrew died in 1902, David became sole owner of the firm.

Yule greatly expanded the range of the company's business ventures in India. His faith in the tea industry led to his acquiring numerous tea estates. The growth of the jute and tea industries required the transportation of goods to the mills and for export. In 1883, the firm formed its own Inland Flotilla Company, and in 1895 the company founded the Bengal Assam Steamship Company in order to engage in inland navigation. The steam-

HANSTEAD HOUSE

In 1920, Sir David Yule retired from his business in India and returned to live in Great Britain. In 1925, he decided to build a mansion on a twelve-hundred-acre estate near Bricket Wood, Hertfordshire, five miles northwest of London. While a Georgian-style mansion was being constructed on the property, Yule built a temporary home, consisting of two stories and fourteen rooms, which later became the guest house. Yule died in 1928, and his elaborately carved tomb, showing various aspects of his life, is located on the grounds of Hanstead House.

The house and property were inherited by Yule's widow, Lady Annie Yule, and her daughter Gladys. The two women were world travelers who enjoyed big-game hunting and loved animals. The house is said to have housed a large stuffed bear killed on a trip to the Rockies, and the grounds were home to various animals. To house Arabian horses, the women added a set of famous stables. Gladys Yule died in 1957, and Hanstead House was put up for sale, remaining unsold for several years.

In 1959, the house, grounds, and stables were purchased for $22,800, by Herbert W. Armstrong, who used them as the site for the second campus of his Ambassador College. He renamed the house Memorial Hall as a memorial to his deceased son, Richard David Armstrong. From this college campus, Armstrong and his son, Garner Ted Armstrong, made worldwide broadcasts of their radio program *The World Tomorrow*. The college made improvements to the grounds in the form of tennis courts, an Olympic-standard indoor swimming pool, a track, and a gymnasium. Ambassador College closed in 1974, and the sports facilities were sold separately. The swimming pool, the most modern pool in the area, became the Bricket Wood Sports Centre, and in 1979 it became home to the Verulam Amateur Swimming Club. The college itself was used as a training school for electric power companies and in 1993 was sold to the HSBC Bank as a training center.

ship firm was so successful that in 1906 Yule established Port Shipping Ltd, which became the largest lighter (barge) service for Calcutta.

Mature Wealth

Yule founded Midnapore Zemindary Co. Ltd in 1902 in order to purchase and develop land in Bengal. On its twenty-four hundred square miles, Midnapore Zemindary promoted agriculture, forestry, fishing, and other industries and founded schools and hospitals. Realizing the importance of coal to India's new industrial economy, Yule expanded and consolidated the firm's substantial activities in Indian coal mining, and in 1908 the company became managing agents of Bengal Coal Ltd.

This broad range of commercial activities made Yule the most important businessman in India. His firm's business ventures were certainly aided by his friendship with Vivian Hugh Smith, a partner in the banking firm of Morgan Grenfell & Co. Yule's preeminence as a British businessman in India was signaled in 1911-1912, when King George V was on a trip to India and asked to meet the most important businessman in Calcutta, who he was told was Yule. During the king's visit, Yule was given a knighthood in 1912; he was made a baronet in 1922. When asked why Yule deserved the knighthood, a friend replied, "He has provided food and employment for about 200,000 people. Is not that sufficient reason?"

Yule was a shy and private person. Although he married and had a daughter, he led a solitary life, completely absorbed in his business. In India, he initially lived at one of his company's mills before moving to Calcutta in 1900. After 1907, he lived above the offices of Andrew Yule & Co. He seems not to have socialized with the European community in Calcutta. He took no role in public affairs or commercial politics. It is said he never took a holiday, and only after eighteen years did he return to Great Britain for a visit. His sole interest was in the Calcutta business, and he ignored its London offices.

Yule had no heir to inherit his business; his brothers, who had been partners or worked for the firm, were deceased, and many junior men in the firm were lost in World War I. In 1916, he decided to sell the firm, which now managed more than sixty companies. Worried that the company would fall into the hands of men who would not run it according to his principles, in 1917 he sold the firm to J. P. Morgan & Co. and Morgan Grenfell & Co., who became the major shareholders for £600,000. The newly created company was known as Andrew Yule & Co. Ltd. Yule stayed on as chairman of the new company. Thomas Catto, a Scottish businessman, was sent to India as vice chairman and partner and to manage the firm; he later became governor of the Bank of England.

Yule retired from active involvement in the firm in 1920 and returned to England, where he built and lived at Hanstead House, Bricket Wood, Hertfordshire. In England, he continued his involvement in the world of business by serving as a director of numerous companies. In 1926, he began purchasing newspapers in England and India. He first bought United Newspapers from the prime minister, David Lloyd George, with the understanding that the *Daily Chronicle* would continue to support progressive liberalism. He later bought two newspapers in Calcutta.

Yule died on July 3, 1928. His obituary in *The Times* of London described him as "one of the wealthiest men, if not, indeed, the wealthiest man, in the country."

Legacy

David Yule created a vast mercantile and industrial empire that contributed to the industrialization of India. By 2010, the government of India owned almost 97.5 percent of the stock of the former Andrew Yule & Co. Ltd., now called the Andrew Yule Group. Based in Kolkata (the new name of Calcutta), the group's Web site describes it as a $124 million (in American currency) "multiproduct, multiunit conglomerate" with "diverse business interests" in power, telecommunications, engineering and the environment, industrial electronics, tea, printing, financial services, and other ventures.

FELIX YUSUPOV

Russian aristocrat, socialite, and landowner

As the heir to what was arguably the largest fortune in Russia, Yusupov used his wealth to support causes benefiting the poor, as well as his scandalous social life. His immense financial and property assets positioned him to play a pivotal, controversial role in Russian history.

Born: March 23, 1886; St. Petersburg, Russia
Died: September 27, 1967; Paris, France
Also known as: Prince Felix Felixovich Yusupov II; Feliks Yusupov; Feliks Feliksovich Yusupov; Felix Yussopov; Felix Felixovich Yussopov
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Children

EARLY LIFE

The Yusupov family descended from Mongol warlords who settled in Russia in the 1300's. One family member converted from Islam to Christianity and was named Prince Dmitri Yusupov by Czar Fyodor III. Firmly establishing themselves as trusted retainers to the Romanov czars, the family by the late 1880's had amassed tremendous wealth.

The Yusupov male line died out in 1891. The heiress, Princess Zenaida Yusupova, married Felix, count of Sumarokov-Elston, on whom Czar Alexander III conferred the title of Prince Felix Yusupov I. Their second son, born prior to the imperial conferral, became Prince Felix Felixovich Yusupov II, also known as Felix Yusupov (FAY-lihks yoh-SOH-pohv). In 1908, when his older brother Nicholas lost his life in a duel, Prince Felix II stood to inherit all the Yusupov holdings.

FIRST VENTURES

Yusupov was an undergraduate student at Oxford University from 1909 to 1912. Shortly before journeying to England, he began the characteristically paradoxical disposition of his wealth, spending a portion of it on charitable donations and another on decadent social outings. Even before his brother's death, Yusupov's controversial personal life was well known. The young man enjoyed dressing as a woman, smoked opium, patronized brothels, and engaged in both heterosexual and homosexual liaisons. His behavior brought great embarrassment to his parents, who expended considerable effort and money to discipline and change their wayward son, to no avail. However, while accompanying Grand Duchess Elizabeth, who had become a nun, and engaging in charity work in St. Petersburg's impoverished districts, Yusupov was so shocked with conditions there that he began to disburse sums of money to ameliorate them. His marriage on February 22, 1914, to Irina Alexandrovna Romanov, the niece of Czar Nicholas II, brought him renewed respectability and somewhat moderated his behavior. Their daughter and only child, Irina Yusupova, was born on March 21, 1915.

MATURE WEALTH

By late 1916, Yusupov had joined a growing throng of dismayed aristocrats and middle-class politicians who believed that anger at Russian battlefield losses in World War I, food shortages, and perceptions of corruption in government, including the widespread belief that the czar and czarina had come under the thumb of the unsavory peasant priest, Grigori Yefimovich Rasputin, was leading the monarchy to disaster. During the early morning hours of December 16, 1916, Yusupov lured Raspu-

Felix Yusupov. (Hulton Archive/Getty Images) tin to his St. Petersburg residence at Moika Palace, and, with the aid of other conspirators, assassinated the priest. Yusupov was never arrested for this offense. After the March, 1917, revolution that overthrew the czar, the Yusupovs escaped to the Crimea and boarded a British ship, sailing into exile. Most of the Yusupov fortune had to be left behind and was lost forever. Estimates vary, but prior to the revolution and his exile, the prince's inheritance was worth some $500 million. Assets included a total of seven palaces in St. Petersburg and Moscow; some forty landed estates; scattered factories and mines; and sumptuous art, porcelain, and jewelry collections.

Legacy

For all his wealth and philanthropy, Felix Yusupov was never able to break away from his notoriety as Rasputin's killer. Financially compelled to capitalize upon this lurid murder, he collected the royalties from three published versions of the event. He had to sell some Rembrandts and other treasures that he managed to smuggle out of Russia, and he won a lawsuit against MGM (Metro-Goldwyn-Mayer) Studios for allegedly defaming his wife. In exile in Paris, the Yusupovs were praised for their generosity in assisting fellow émigrés, but their charity further whittled down their financial assets. Business ventures, notably a fashion boutique called Irfe, failed, though the Yusupovs were still able to exist comfortably, if not ultraluxuriously as before. By the twenty-first century, the family fortune had virtually disappeared, absorbed into the Soviet and later the Russian states, although much has been preserved at Moika Palace, which serves as a tourist attraction.

BASIL ZAHAROFF

Greek arms dealer

Zaharoff made a fortune by selling munitions to opposing sides in numerous wars. His wealth and scheming business practices established him as a man of great power in many countries. During World War I, statesmen and leaders of the Allied forces typically consulted with Zaharoff before planning significant attacks.

Born: October 6, 1849; Muğla, Ottoman Empire (now in Turkey)
Died: November 27, 1936; Monte Carlo, Monaco
Also known as: Basileios Zacharias (birth name); Sir Basil Zaharoff
Source of wealth: Trade
Bequeathal of wealth: Children; educational institution

EARLY LIFE

Basil Zaharoff (BAZ-ihl ZAH-uhr-of) was born to Greek parents while they were living in Turkey. When Zaharoff was about six years old, his family moved to Tatavla, a poor area near Constantinople (now Istanbul). Young Zaharoff enjoyed learning foreign languages and had a great ability to do so. He sought business experience by trying his hand at a variety of jobs, including tourist guide, fireman, and money changer.

FIRST VENTURES

On October 14, 1877, Zaharoff was hired as the sales representative for the Swedish arms manufacturer Nordenfelt. Shortly thereafter, Zaharoff sold a steam-driven submarine built by Nordenfelt to Greece. He then convinced Turkey to buy two of the submarines and Russia to do likewise in order to maintain a military balance in the Balkans. Zaharoff was paid well for his efforts and was off to a spectacular career as an arms dealer.

Through some clever maneuvering instigated by Zaharoff, Hiram Stevens Maxim, inventor of the automatic machine gun, was forced to merge his company with Nordenfelt in 1886. Zaharoff was appointed as the principal salesman of the Nordenfelt-Maxim company and worked for a substantial commission rate. After Nordenfelt and Maxim parted ways in 1890, Zaharoff stayed with Maxim and purchased enough shares to gain control of the company.

Basil Zaharoff. (Hulton Archive/Getty Images)

MATURE WEALTH

In 1895, Vickers, Sons & Company, the second-largest manufacturer of arms in Great Britain, purchased the Maxim company. Zaharoff was appointed to Vickers's board of directors and oversaw munitions companies associated with Vickers in many countries. To enhance munitions dealings with numerous countries during World War I, Zaharoff purchased a bank in Paris in 1918 in order to control the financing arrangements of any consummated deals. By supplying munitions to the Allied forces, Zaharoff grew his fortune.

Zaharoff seemed to know when and how to invest for his financial gain. Recognizing the importance of petroleum in the world, Zaharoff made several investments in the oil industry. In 1922, he organized a British-owned integrated oil industry in France. His assets rose to more than $45 million. Under his direction, Vickers merged with munitions manufacturer Armstrong Whitworth in 1927 to form Vickers-Armstrong Ltd.

After retiring from the weapons business, Zaharoff gained control of the Casino de Monte Carlo in Monaco. Implementing his crafty business skills in the gambling arena, he greatly increased his financial assets. After he had made enough money, he sold the casino for a significant profit. Although he kept most of his financial affairs quite secret, his estimated worth when he died in Monaco in 1936 was more than $500 million.

Legacy

More than any other individual, Basil Zaharoff developed the international market for military weapons. He was a genius at using the munitions industry for his financial gain. A crafty, shrewd businessman, Zaharoff established credentials of respectability and power with many important officials and leaders of different countries that he used to his advantage. His numerous financial gifts, which he considered investments in goodwill, rewarded him both financially and politically.

In 1908, Zaharoff was made a Knight of the Legion of Honor of France. Five years later, he was promoted to be an Officer of the Legion of Honor, and in 1914 he was elevated to the rank of commander in the organization. In 1918, he was awarded the Grand Cross of the Order of the British Empire and named a Knight of Bath, Sir Basil Zaharoff. Shortly thereafter, he was decorated as a Grand Officer of the French Legion. In 1919, he received the highest decoration that France could offer, the Grand Cross of the Legion.

Shantidas Zaveri

Mughal merchant and banker

The most prominent jewelry merchant of the bejeweled Mughal court, Zaveri traded diamonds with exchanges in South Asia, Arabia, and Europe.

Born: c. 1587; Ahmedabad, Gujarat (now in India)
Died: 1659; Ahmedabad, Gujarat
Source of wealth: Trade
Bequeathal of wealth: Children

Early Life

Shantidas Zaveri (shahn-TIHD-ahs zah-VEHR-ih) was born around 1587 in the Mughal *subah* (province) of Gujarat. His father Sheskarana and his grandfather Vachhasha were prominent jewelers of the Jain community. The Mughal Empire was the powerful Muslim dynasty that ruled much of India from the sixteenth to the nineteenth century. Operating under a confluence of Persian, Muslim, Hindu, Turkish, and Asian influences, the empire was a center of trade and a repository of vast wealth. Located on the west coast of India, Gujarat was a center for the flourishing maritime trade between India and Arabia, the China Sea, and Europe. Gujarati merchants, such as Virji Vora, Abdul Ghafur, Mulla Muhammad Ali, Ahmed Chameli, Haji Muhammad Zahid Beg, Haji Kasim, Shaik Hamid, Saleh Chalebi, Hari Vaishya, and Haji Abdul Nabi, were among the wealthiest in the world. As a measure of the wealth that passed through western India, it has been calculated that in 1571 the sultanate of Gujarat received customs revenues from its ports of 4 million rupees on a sea trade of approximately

80 million rupees, equivalent to about $9 billion in 2010 currency. Gujarat was conquered and annexed to the Mughal Empire in 1576. Ahmedabad was the capital of the *subah* of Gujarat, and its trade in jewelry was so extensive that jewelers had their own settlement, the Zaverivad, located near the mint. (Zaveri, a surname often appended to Shantidas, refers to the jewelry business.)

First Ventures

Members of the Jain religion were prominent in Indian trade and business, in part because of religious strictures that discouraged occupations such as farming and husbandry. Already in thirteenth century Gujarat, the Jain trader Jagdu was famous for his enormous wealth. Shantidas was heir to this tradition. He dominated not only the jewelry industry but also the commerce in Ahmedabad. His ships were among the most profitable of the Indian Ocean maritime trade. Diamonds, pearls, rubies, emeralds, and other precious stones were in great demand by India's Mughal rulers and by the courts and nobility of Europe. In fact, precious jewels and diamonds have a long history in India, in production, in trade, and in adorning the royal and aristocratic families of the subcontinent.

Shantidas regularly visited Bijapur, the center of Indian diamond mining, to purchase the finest diamonds, which he would sell to the Mughal rulers. He kept close business relations with jewelers in London, Paris, Florence, and Antwerp. The British East India Company first sailed to Gujarat in 1608, establishing a factory there four years later. With his accumulation of capital, Shantidas played the role of chief money changer (*shroff*) of Ahmedabad. He advanced loans to the British East India Company; for example, in 1627, he lent the English factory in Gujarat 10,000 rupees at 12 percent interest per year.

Shantidas was jeweler to the rich Mughal emperors and officials, as wealthy a court as existed anywhere in the world. (The riches of the Mughals were so fabled that the contemporary word "mogul" derives from the word "Mughal.") Much of Shantidas's success was built on his ability to accurately assess the quality of diamonds and other precious stones and to anticipate the desires of his Mughal patrons. He was able to speak with the Mughals in their native Persian. He sold precious jewels to Emperor Shah Jahan, builder of the Taj Mahal, and to the princes Asaf Khan and Dara Shikoh. Emperor Jahāngīr purchased a diamond worth a reputed 1 million rupees from Shantidas.

Mature Wealth

The Mughals conferred the title of *Nagarsheth* (head merchant) on Shantidas and presented him with gifts, such as elephants, pearl earrings, and inlaid robes. Shantidas was entrusted with responsibility for Jain pilgrimage sites and temples. In 1625, he built the opulent Jain temple of Chintamani in Saraspur, one mile to the east of Ahmedabad. At this time it was one of the grandest temples in India, with imposing stone courtyards and two immense black marble elephants guarding the entrance. When Aurangzeb was *subahdar* (governor) of Gujarat, he had the temple desecrated in 1645 by killing a cow in the courtyard and then converting the building to a Muslim mosque. Shantidas appealed to Emperor Shah Jahan, who had the temple restored and Shantidas compensated. Nevertheless, when Aurangzeb became emperor he had the temple destroyed.

Shantidas made donations to Jain monasteries and helped the monks preserve Jain religious manuscripts. He even intervened in the appointment of monks to positions of authority. In 1656, Shantidas was given custody of the Palitana Hills, site of numerous Jain temples, for which he paid rent to the Mughals.

The Mughal rulers were foreign Muslims ruling an empire of Ismāʿīlīs, Hindus, Parsis, Turks, and Jains. Learning to enrich themselves through trade, customs, and taxes, the Mughals depended on merchant princes, such as Shantidas, Virji Vora, and Abdul Ghafur. Shantidas was able to employ the power of the *mahajans*—guilds of Indian merchants—to great advantage. As *Nagarsheth*, Shantidas commanded the citywide *mahajan* representing all of the individual *mahajans* of Ahmedabad. As such, he served as the intermediary between the Indian merchant class and the Mughal governors. When English pirates robbed Shantidas's ships in 1636, he pressured the Mughal *subahdar* to imprison two English businessmen in order to obtain restitution.

In their dynastic wars of succession the Mughal rulers often turned to Gujarati merchants, such as Shantidas, to lend them the money needed to equip their armies. Mughal rulers also eyed merchants whose wealth exceeded their own, and in times of chaos Shantidas was subject to extortion. When Emperor Shah Jahan was ill, his son Prince Murad Baksh forced Shantidas to pay a sum of 5.5 lakhs of rupees (1 lakh equals 100,000 rupees). When the Emperor Aurangzeb ascended to the throne, he ordered repayment to Shantidas and issued a declaration of goodwill to the *mahajans* he represented.

The title of *Nagarsheth* was hereditary and passed down to Shantidas's descendants, including his son

Jewelry and Great Wealth

Throughout history, jewelry has been both the progenitor and repository of great wealth. Almost every known human society has used jewelry for adornment, as currency, as wealth, and as a symbol of status. Jewelry is made of precious metals and gemstones, including gold, silver, diamonds, pearls, jade, rubies, emeralds, opals, and sapphires.

For almost one thousand years, the wealth and pomp of England have been symbolized by the crown jewels of its monarchs. The Anglo-Saxon kings began accumulating the jewels and regalia that adorned the English sovereigns; the Stuarts and Hanovers greatly enriched the collection. The crowns of the British monarchs are encrusted with the finest jewels from India and other colonial possessions of Great Britain. In France, the Affair of the Diamond Necklace in 1785 propagated rumors of Queen Marie-Antoinette's extravagance with jewelry and contributed to the fall of the Bourbon monarchy.

Jade adorned the wealthy people of China and Mesoamerica, and silver and gold decorated the ancient Pharaohs, but diamonds are perhaps the most valued of all jewels. The most famous diamond is possibly the 45.52-carat Hope Diamond. Other famous diamonds from history include the 3,106.75-carat Cullinan, the 105-carat Koh-i-Noor (meaning "Mountain of Light"), the 24.04-carat Moon of Baroda, the 190-carat Orloff, the 140.50-carat Regent, the 9-carat Conde, the 340-carat Nizam, the 90-carat Briolette of India, and the 69.42-carat Taylor-Burton. Many of these diamonds originated from the fabled mines of Golconda in India and were owned by the world's wealthiest monarchs, aristocrats, and industrialists. In modern times, jewelers such as Garrard and Company of London; Tiffany & Co., founded by Charles Lewis Tiffany; Cartier, founded by Pierre Cartier; Frederic Boucheron of Paris; Peter Carl Fabergé; Van Cleef and Arpels; Harry Winston; and Bulgari of Rome have achieved worldwide fame trading and setting magnificent diamonds. Since the late nineteenth century, South Africa has been the leading source of gold and diamonds; the De Beers conglomerate, based in Johannesburg, South Africa, has dominated the production and trade in diamonds.

Diamonds were mined first in India, and India remained the exclusive producer of diamonds for two millennia until these gems were discovered in Brazil and South Africa. The maharaja rulers of eighteenth and nineteenth century India possessed almost unimaginable wealth. Much of it was held in exquisite diamonds and gold mined and fashioned in India. Fabulous collections of diamonds and jewels were owned by maharaja dynasties, such as the Asaf Jah of Hyderabad, whose collection is now held in the Nizam Jewellery Trust; the Wodeyars of Mysore; the Scindias of Gwalior; the Jamwal Rajputs of Jammu and Kashmir; and the Holkars of Indore. Perhaps the most spectacular manifestation of the immense wealth of the maharajas was the Baroda treasury of the Gaekwad Dynasty of western India. Collected from the nineteenth to the twentieth century, the Baroda treasury included exquisite diamonds, such as the 128.48-carat Star of the South, the 51-carat Princess Eugénie, and the 88.7-carat Shah. The Baroda treasury also contained priceless gold and silver jewelry, carpets sewn with precious stones of every kind, and gorgeous pearl necklaces.

Lakhmichand and his grandson Khushalchand. Born in 1674, Khushalchand would himself become a prominent Gujarati merchant and play a major role in the affairs of the later Mughal Empire.

Legacy

As the leading jeweler of the Mughal rulers and *Nagarsheth* of the *mahajans*, Shantidas Zaveri was a power at the Mughal court, an authority in Jain religious matters, head of the business community, and both a rival to and partner with Europeans. Some modern Indian historians point to Shantidas as a prototypical "economic nationalist," who was able to use his vast wealth to assert Indian and Jain identity against Middle Eastern and European powers. Shantidas established a business dynasty that lasted into the twenty-first century. His descendants, the Lalbhai family of Gujarati merchants, expanded into textile factories, chemical production, and other industries. One of India's leading industrialists and philanthropists of the twentieth century, Shri Kasturbhai Lalbhai (1894-1980), proudly traced his family lineage to Shantidas.

A

Abramov, Alexander (b. 1959): Russian. Abramov is one of the Russian oligarchs, a group of entrepreneurs who made billions of dollars from Russia's abundant natural resources after the fall of the Soviet Union. A former scientist, Abramov heads EvrazHolding, Russia's largest steel production company. He was ranked number 121 on *Forbes* magazine's 2010 list of billionaires, with an estimated net worth of $6.1 billion.

Abramovich, Roman (b. October 24, 1966): Russian. After investing in the Russian oil giant Gazprom and other businesses, Abramovich had a net worth of $23.5 billion in 2008. He owned England's Chelsea football club; mansions in London and Aspen, Colorado; and a spectacular collection of yachts, including the 557-foot *Eclipse*. In 2010, Abramovich was ranked the fiftieth-wealthiest person in the world, according to *Forbes* magazine, with an estimated net worth of $11.2 billion.

Akmetov, Rinat (b. September 21, 1966): Ukranian. In 2008, Akhmetov's net worth was $31 billion, the bulk of which was derived from his steel and coal businesses. By 2010, his personal fortune had dropped to $5.2 billion, according to *Forbes* magazine, which ranked him number 148 on its list of world billionaires.

Albrecht, Karl (b. February 20, 1920): German. Albrecht owned the Albrecht Discount (Aldi) supermarket chain with his brother Theo Albrecht (1922-2010). In 2010, Aldi operated more than eight thousand stores worldwide; Karl's fortune was estimated at $23.5 billion and Theo's at $16.7 billion.

Aldrich, Lucy Truman (1869-January 12, 1955): American. Aldrich was the daughter of U. S. senator Nelson Wilmarth Aldrich (1841-1915), a leader of the Senate's "Millionaires Club" who was instrumental in creating the Federal Reserve. Lucy made news when she was kidnapped by bandits in China in 1923. An international art collector, she donated her artworks to Rhode Island museums.

Allan, Sir Hugh (September 29, 1810-December 9, 1882): Canadian. Allan immigrated to Canada in 1826 in order to advance his family's shipping business, later launching into railroads and banks. By the 1870's, he was Canada's leading capitalist, with far-flung interests in steelmaking, insurance, real estate, fishing, mining, coal, and cotton. Allan and his wife Caroline raised thirteen children in their 609,260-square-foot Italianate mansion, Ravenscrag, built in 1863 in Montreal. He bequeathed a fortune of $8 million, the largest bequest in Canadian history.

Amin al-Zarb, Haj Muhammad Hassan (c. 1834-December 22, 1898): Iranian. The first major entrepreneur of modern Iran, Amin al-Zarb imported luxury items for the shah; established factories and mining operations; acquired land; traded silk, opium, and tobacco; and built railroads. As a banker and money changer, he was appointed master of the Persian mint by Nasir al-Din Shah. In his book *For God, Mammon, and Country: A Nineteenth Century Persian Merchant, Haj Muhammad Hassan Amin al-Zarb* (1999), author Shireen Mahvdavi estimates that Amin al-Zarb's fortune ranged from 1 to 25 million Persian tumans, with the latter figure equivalent at the time to more than $1 million. His son Haj Husayn Aqa Amin al-Zarb II expanded the family industries.

Arnault, Bernard (b. March 5, 1949): French. Arnault founded the company that manufactures the LVMH (Louis Vuitton Moet Hennessy) brand of luxury goods. His net wealth in 2010 was $27.5 billion.

Astor, Nancy (May 19, 1879-May 2, 1964; Viscountess Astor; Lady Astor; Nancy Witcher Langhorne Astor): English. Astor was born to the wealthy Langhorne family, and in 1906, she married the wealthier Waldorf Astor.

Entertaining lavishly in Cliveden, the couple's Italianate estate in Buckinghamshire, England, Astor was famous for her wit, although she was once famously bested by Winston Churchill. Astor remarked, "Winston, if I were your wife I'd put poison in your coffee," to which Churchill replied, "Nancy, if I were your husband I'd drink it." In 1919, Astor became the first female member of Parliament.

Azcárraga, Emilio, Jr. (September 6, 1930-April 16, 1997; Emilio Azcárraga Milmo; El Tigre): Mexican. The son of Mexican newspaper magnate EMILIO AZCÁRRAGA VIDAURRETA (1895-1973), Emilio Azcárraga, Jr., expanded into media markets in Latin America and the United States and into real estate and sports holdings.

B

Baghayogho, Muhammad (1523/1524-1594; Muhammad ibn Mahmud ibn Abi Bakr al-Wangari al-Tinbuktui): Malian. In medieval times, Timbuktu was the most prosperous city in the Mali and Songhai Empires, in which merchants traded salt, ivory, gold, and slaves. The merchants of Timbuktu spent lavishly to acquire and copy Islamic manuscripts. Books represented wealth and prestige in Timbuktu's golden age, and Baghayogho built an impressive library that continued to be treasured in the twenty-first century.

Bakrie, Aburizal (b. November 15, 1946): Indonesian. Bakrie inherited control of the Bakrie conglomerate from his father, Ahmad Bakrie. Since then, Bakrie & Brothers has seen its fortunes wax and wane. In 2007, *Forbes* magazine estimated Bakrie's wealth at $5.4 billion, making him the world's richest Indonesian.

Balbus, Lucius Cornelius (c. 100 B.C.E.-after 30 B.C.E.; Balbus the Elder; Lucius Cornelius Balbus Major): Roman. Balbus was born in Cadiz, Spain, which in the first century B.C.E. was a Roman province. As Julius Caesar's chief assistant, Balbus acquired spoils from Caesar's Gallic Wars. Skillfully wending his way through Rome's civil wars, Balbus accumulated estates and gold. His will left 100 sesterces (about $500) to each Roman citizen, amazing the populace with his wealth.

Batista, Eike (b. November 3, 1957): Brazilian. With holdings in Brazilian oil, mining, real estate, and energy, Batista had a fortune of $27 billion in 2010.

Bemberg, Otto (May 1, 1827-March 2, 1896): Argentinian. A German immigrant to Argentina, Bemberg exported Argentine grains. In 1886, he established the Quilmes brewery, the largest in Argentina. His son, OTTO SEBASTIÁN BEMBERG (1857-1932), created a worldwide conglomerate with operations in brewing, banking, real estate, public utilities, cotton, wool, tea, and dairy. Several family members were charged with tax evasion in 1951. In 2010, the Bembergs were the richest family in Argentina.

Benetton, Luciano (b. May 13, 1935): Italian. Benetton has been the chairman of the Benetton fashion corporation since he founded it in 1965 with his three siblings—GIULIANA (b. 1937), GILBERTO (b. 1941), and CARLO (b. 1943). The Benneton Group has been innovative in its creation of colorful designs and its procedures for subcontracting, franchising, and advertising for the United Colors of Benetton. In 2010, the four Benetton siblings were each worth $2.1 billion.

Bettencourt, Liliane (b. October 21, 1922): French. An only child, Bettencourt inherited her fortune from her father, EUGÈNE SCHUELLER (1881-1957), founder of the L'Oréal Group cosmetics company. In 2010, she was the richest woman in the world, with a net worth of $20 billion. She was also engaged in a lawsuit with her estranged daughter, Françoise Bettencourt-Meyers, over her mental capacity to dispose of her fortune.

Bingham, William (March 8, 1752-February 6, 1804): American. An Atlantic shipper, Bingham was the wealthiest merchant in the Pennsylvania colony. He also acquired two million acres in Maine, then part of Massachusetts. Like Bingham, the wealthy banker THOMAS WILLING (1731-1821) was a Pennsylvanian delegate to the Continental Congress.

Bleichröder, Gerson von (December 22, 1822-February 18, 1893; Baron von Bleichröder): German. Bleichröder's bank helped finance Otto von Bismarck's transformation of the Prussian state and wars in Europe. Bleichröder's fortune of 40 million marks was rivaled in Germany only by that of Alfred Krupp. The first German Jew to be ennobled, Bleichröder bequeathed his bank and his fortune to his sons; both bequests were obliterated in lawsuits and in the Aryanization campaign of the Nazis.

Bolívar, Simón (July 24, 1783-December 17, 1830): Venezuelan. Born to a Venezuelan family who became wealthy from sugar estates and copper mines, Bolívar is celebrated as the liberator of South America.

Brooks, Peter Chardon (January 6, 1767-January 1, 1849): American. Insuring ships in the lucrative maritime trade, Brooks became the wealthiest New Englander in the early nineteenth century. He bequeathed $1.3 million to his seven children.

Bunzaemon, Kinokuniya (1669-1734): Japanese. A lumber and food merchant in Edo (now Tokyo), Bunzaemon rivaled the mercantile house of Yodoya in wealth and extravagance. In 1704, he paid 1,000 gold pieces to rent the Yoshiwara pleasure district for a night. In 1709, his trading house collapsed, although he was able to bequeath a substantial fortune to his son.

Buring, Henning (c. 1430-1499): German. Based in Hamburg, Germany, Buring was a wealthy merchant of the powerful Hanseatic League of Baltic and North Sea traders. He traded with English merchants, and he left an estate of 46,000 marks.

C

Cheong Fatt Tze (1840-September 11, 1916; Zhang Bishi; Teoh Tiauw Siat; J. P. Morgan of China): Malaysian. A member of the Hakka minority in China, Cheong immigrated to Penang, Malaysia, in 1856 and built a business empire consisting of banks, wineries, textile works, glassworks, and cattle, rubber, and tea farms. He had eight wives and many concubines. Cheong established the Chung Hwa Confucian School in Penang. Among his many residences, the most notable is the fifty-six-thousand-square-foot Blue Mansion in Penang, built in classical Chinese style with five courtyards.

Chew, Thomas Foon (1889-1931; Asparagus King): American. 1n 1890, Sai Yin Chew opened what would become the Bay Side Cannery in Alviso, California. His son Thomas Foon Chew built it into the third-largest cannery in the world, after Libby's and Del Monte, with additional canneries in Mayfield (now Palo Alto) and Isleton, California. As the first person to can asparagus, Chew earned the title "Asparagus King," but he also canned spinach, apricots, catsup, cherries, fish sauce, fruit cocktail, peaches, pears, plums, and tomatoes. At his death in 1931, he was the third-richest man in California.

Cook, William W. (April 16, 1858-June 4, 1930): American. Cook multiplied his inheritance by investing in street railways, Cuban sugar, and railroads. He donated $400,000 to build the resplendent Martha Cook dormitory and $20 million for the Gothic law quadrangle at the University of Michigan.

Crichton-Stuart, John Patrick (September 12, 1847-October 9, 1900; Third Marquess of Bute): Welsh. An only child, Crichton-Stuart inherited his fortune from his father, John Crichton-Stuart (1793-1848), the second marquess of Bute, who built Cardiff, Wales, into the coal exporting capital of the world. The third marquess was reputed by some to be the richest man in the world. A convert to Catholicism and a respected historian, Crichton-Stuart commissioned architect William Burges to transform historic Cardiff Castle into a medieval fantasy.

D

D'Arcy, William Knox (October 11, 1849-May 1, 1917): English. D'Arcy was an original partner in Australia's Mount Morgan gold mine. With his share in the mine at one point worth about $800 million, D'Arcy moved to England in 1886. In England, he bought mansions in Middlesex and London, a shooting estate in Norfolk, and a box at Epsom racecourse. He was the driving force in the 1909 founding of the Anglo-Persian Oil Company, the forerunner of British Petroleum (BP). D'Arcy bequeathed £984,000 to his family.

De Geer, Louis (November 17, 1587-June 29, 1652): Swedish. The Belgian Walloon family of Louis de Geer fled to the Netherlands in 1595 after adopting Protestantism. In 1619, de Geer began operating iron mines in Sweden, which under King Gustavus II Adolphus was the strongest Protestant nation in Europe. De Geer became the chief financier and arms supplier to Calvinist Europe. In 1641, he was ennobled by Sweden. Three years later, he equipped a Swedish navy at a cost of about 2 million florins. He left 1,000 florins annually to support Protestant pastors and 1.7 million guilders to his family. He is considered the father of modern Swedish industry.

Depont, Paul-François (1700-1774): French. Receiving an inheritance from his father, PAUL DEPONT (1661-1744), a wealthy shipper, Paul-François Depont was the wealthiest merchant in eighteenth century France. In 1746, his estate, containing extensive landholdings, rents, mortgages, debtor notes, gold, and silver, amounted to about 1 million livres, producing an annual income of 32,000 livres. He spent one-tenth of his income endowing various Catholic charities. His son PAUL-CHARLES DEPONT (1723-1800) lost most of the family's estate in the French Revolution.

Deripaska, Oleg (b. January 2, 1968): Russian. Deripaska is one of the Russian oligarchs, a group of entrepreneurs who made their fortunes after the fall of the Soviet Union. Derispaska owns United Company RUSAL, one of the world's largest aluminum companies. His net worth was $28 billion in 2008, but two years later it had dropped to $10.7 billion, according to *Forbes* magazine.

De Silva, Sir Ernest (November 26, 1887-May 9, 1957): Sri Lankan. De Silva was the wealthiest Sri Lankan of the twentieth century, owning large tea, rubber, and coconut plantations and founding the Bank of Ceylon. His Sirimathipaya Mansion later became the office of the Sri Lankan prime minister. De Silva was knighted by Great Britain for his extensive philanthropy, which included the establishment of schools, orphanages, hospitals, and Buddhist temples. Another Sri Lankan businessman, UPALI WIJEWARDENE (1938-1983), founded the Upali Group of companies and may well have surpassed De Silva in wealth but for his untimely death when his private plane disappeared midair.

Diocles, Gaius Appuleius (second century C.E.-second century C.E.): Roman. Chariot races were the favorite sport of ancient Romans, and charioteers were celebrities. The satirist Juvenal complained that a charioteer could earn an income one hundred times that of a senator. The wealthiest charioteer was the Spaniard Diocles, who won 1,563 victories in his twenty-seven-year career, earning him prize money of 36 million sesterces (about $180 million in 2010 currency). In addition, Diocles received large gifts from his aristocratic and imperial supporters. In 146 C.E., he retired to Praeneste (now Palestrina, Italy). He left his fortune to his son Nymphidanus and daughter Nimphydia, who built him a statue, memorializing his achievements.

Dorrance, John Thompson (November 11, 1873-September 21, 1930): American. A brilliant chemist, Dorrance built the Campbell Soup Company into the largest soup manufacturer in the world. He left one-fourth of his $115 million fortune to his wife, one-fourth to his son, and one-eighth each to his four daughters. His grandchildren BENNETT DORRANCE (b. 1947) and MARY ALICE MALONE (b. 1950) were each worth about $2 billion in 2010.

F

Fenzi, Emanuele (April 8, 1784-January 10, 1875): Italian. In 1821, Fenzi established the Fenzi bank, which financed the industrialization of Italy. In 1829, he bought the imposing Palazzo Fenzi for his bank and as a residence.

Fish, Mamie (June 8, 1853-May 25, 1915; Marion Graves Anthon Fish): American. Possessed of the Hamilton Fish family fortune, Mamie Fish was a grande dame of New York and Newport, Rhode Island, society at the end of the nineteenth century. A rival of prominent hostesses CAROLINE SCHERMERHORN ASTOR (1830-1908) and ALVA ERTSKIN SMITH VANDERBILT BELMONT (1853-1933), Fish was known for her lavish parties, costume balls, and caustic comments directed at unfortunate guests.

Fitzharding, Robert (1095-1170): English. A wealthy merchant and landowner from Bristol, England, Fitzharding financed King Henry II, and he was rewarded with the Berkeley Castle and Berkeley baronetcy; the baronetcy has continued in unbroken succession into the twenty-first century. Fitzharding also endowed Bristol Cathedral.

Flick, Friedrich (July 10, 1883-July 20, 1972): German. Flick founded a coal and steel conglomerate that supplied armaments to the Nazis and employed slave labor. He was convicted of war crimes at the Nuremberg trials in 1947, but he rebuilt his fortune after release from prison. His son FRIEDRICH KARL FLICK (1927-2006) was the richest resident of Austria, with a fortune estimated at $6 billion.

Forbes, Malcolm S. (August 19, 1919-February 24, 1990): American. Forbes's father, B. C. FORBES (1880-1954), founded *Forbes* magazine. Malcolm expanded into other ventures, building a personal estate estimated at $1 billion. He was known for his fleet of personal airplanes, motorcycles, and hot-air balloons; his million-dollar birthday parties; and his multimillion-dollar art and Fabergé egg collections. His son STEVE FORBES (b. 1947) inherited $400 million and control of *Forbes* magazine, which publishes an annual listing of the world's billionaires.

Fridman, Mikhail (b. April 21, 1964): Russian. Fridman cofounded the Alfa Group Consortium, a holding company which consists of several subsidiaries, including Tyumen Oil, Alfa Bank, food processing firms, and a chain of supermarkets. In 2003, fifty percent of Tyumen Oil was sold to British Petroleum (BP) at a cost of more than $6 billion. Fridman placed forty-second on the *Forbes* magazine 2010 list of world billionaires, with a net worth estimated at $12.7 billion.

G

Garza-Sada, Eugenio (January 11, 1892-September 17, 1973): Mexican. Garza-Sada established a brewery and other businesses in Monterrey, Mexico. In 1943, he took the lead in founding the Instituto Tecnológico y de Estudios Superiores de Monterrey, one of Mexico's leading educational institutions. Garza-Sada was killed in an attempted kidnapping for ransom.

Gaston, Arthur George (July 4, 1892-January 19, 1996; A. G. Gaston): American. Gaston was the leading African American entrepreneur before the Civil Rights movement, earning a fortune of $130 million on the success of his Booker T. Washington Insurance Company. In his book *The African American Entrepreneur: Then and Now* (2010), Sherman Rogers includes portraits of early African American entrepreneurs, such as Paul Cuffe and Madame C. J. Walker (see main entries). EMMANUEL "MANNA" BERNOON (c. 1710-1769) and his wife Mary operated the first oyster and ale house in Rhode Island; in 1769, Bernoon left an estate of £539. STEPHEN SMITH (1795-1873) operated coal, lumber, and real estate businesses in antebellum Philadelphia, amassing a net worth of $500,000. MAGGIE LENA WALKER (1867-1934) founded the St. Luke Penny Savings Bank in 1903.

Gershwin, George (September 26, 1898-July 11, 1937): American. In 2005, a *Guardian* newspaper study listed Gershwin as the richest composer in history. Gershwin was rewarded handsomely for his hit musicals and compositions, and he lived in a fourteen-room Manhattan duplex with a gymnasium, art studio, and gallery. At his death, his estate was underestimated at $400,000 for tax purposes. (Musical genius is no guarantee of wealth; Wolfgang Amadeus Mozart died in debt.)

Godrej, Ardeshir Burjorji (March 26, 1868-January, 1936): Indian. Godrej, a member of a Parsi merchant family, founded several factories manufacturing locks, which were the origins of the Godrej business conglomerate.

Grimaldi, Ansaldo (1471-1539; Great Benefactor): Italian. Grimaldi was a merchant, a member of the St. George Bank, and the richest Genoese of his time. He was admired for his benefactions, such as his 1536 gift to the University of Genoa in order to endow chairs of canon law, civil law, moral philosophy, and mathematics. With only daughters, he left his estate to his nephew Jerome Grimaldi.

Grimaldi, Erminio (c. thirteenth century-c. thirteenth century): Italian. Giovanni Boccaccio in *The Decameron* (1349-1351; English translation, 1620) describes Erminio Grimaldi of Genoa as by far the richest citizen of thirteenth century Italy. Boccaccio was almost certainly referring to the rising Grimaldi family of merchants, destined to be a great house of Genoa and Monaco for the following seven centuries. It is not clear, however, whether Erminio was an actual person or a composite figure in the book.

Péreire, Émile (1800-January 5, 1875; Jacob Émile Péreire): French. Péreire and his brother ISAAC (1806-1880) were bankers in the nineteenth century, second in French finance only to their rivals, the Rothschilds. They created the Crédit Mobilier Bank. Isaac's son EUGÈNE PÉREIRE (1831-1908) took over the administration of the family's business empire and founded the Banque Transatlantique.

Perelman, Ronald (b. January 1, 1943): American. Investing in a number of troubled businesses and then selling them at great profit, Perelman amassed a fortune of $4.3 billion in 1996 and $11 billion in 2010, although his wealth was impeded by his four divorces and court battles with in-laws. One of his biggest deals was the purchase of the Revlon Corporation, a cosmetics manufacturer, in 1985, which was financed with more than $700 million in junk bonds.

Perrson, Stephan (b. October 4, 1947): Swedish. Persson founded the H&M fashion stores. His net worth in 2010 was $22.4 billion.

Picaud, Pierre (fl. nineteenth century-fl. nineteenth century): French. French archivist Jacques Peuchet recounted the alleged story of Picaud, who in 1814 was given a fortune by a dying fellow prisoner, an Italian priest named Torri. The story of how Picaud employed his riches to obtain revenge on his accusers was the basis of Alexandre Dumas, *père*'s, novel *Le Comte de Monte-Cristo* (1845-1846; *The Count of Monte Cristo*, 1846).

Ponzi, Charles (March 3, 1882-January 18, 1949): American. Ponzi contributed his name to the most infamous and lucrative financial swindle—the pyramid scheme—in which early investors are paid with money received from later investors, rather than from the proceeds of legitimate investments. Ponzi used the money he received from his postal coupon swindle to buy a five-acre estate with a twenty-two-room mansion and heated swimming pool in Lexington, Massachusetts. His scheme had garnered $15 million, but when he was arrested about $8 million of this amount was unaccounted for and presumed to have been spent or secreted by Ponzi. He was imprisoned in 1920 and died in poverty.

Poppen, Jacob (1576-1624): Dutch. Jacob's father, JAN POPPEN (c. 1545-1616), was a wealthy grain merchant who helped found the Dutch East India Company, paying 30,000 guilders for shares of stock in the new firm. Other wealthy Amsterdam merchants, such as GERRIT BICKER (1554-1604), REINIER PAUW (1564-1636), and GERRIT REYNST (1599-1658), also purchased shares in order to establish the company. Jacob Poppen expanded his father's maritime trading business. At the time of his death, Jacob left a fortune of 920,000 guilders, the largest in Amsterdam. His son JOAN POPPEN (1617-1654) commissioned the Palladian-style Poppenhuis mansion from the architect Philips Vingboons in 1642.

Potanin, Vladimir (b. January 3, 1961): Russian. In 2008, Potanin's net worth was estimated at $19 billion, the majority of which was derived from his shares in a major Russian nickel company.

Prokhorov, Mikhail (b. May 3, 1965): Russian. According to *Forbes* magazine's 2010 list of world billionaires, Prokhorov is the richest man in Russia and the thirty-ninth-wealthiest individual in the world, with an estimated net worth of $13.4 billion derived from his investments. In May, 2010, Prokhorov became owner of the New Jersey Nets, the first non-North American to own a National Basketball Association (NBA) franchise.

Q

Quandt, Günther (July 28, 1881-December 30, 1954): German. Quandt built one of the largest industrial empires of pre-World War II Germany. In 1921, he married Magda Ritschel; after their divorce, Magda married Nazi propaganda chief Joseph Goebbels. Quandt's connections to Goebbels helped Quandt became a leading supplier of armaments to the German military, and he employed slave labor at his factories. Quandt was imprisoned after the war and released in 1948. His son with Magda, HARALD QUANDT (1921-1967), was one of the wealthiest men in Germany. (Magda and Joseph Goebbels killed their six children and committed suicide on May 1, 1945.) Günther's other son, HERBERT QUANDT (1910-1982), turned the nearly bankrupt BMW company into one of the most successful postwar automakers, and he became the richest person in Germany. In 2010, Herbert's survivors remained among the richest people in Germany. His widow JOHANNA QUANDT (b. 1926) possessed a personal fortune of $5 billion; his children SUSANNE KLATTEN (b. 1962) and STEFAN QUANDT (b. 1966) were worth $11.1 billion and $5.7 billion, respectively. In October, 2007, the Quandt family hired historian Joachim Scholtyseck to investigate Günther Quandt's ties to the Nazi regime.

She spent 1.336 million rupees to construct the majestic Dakshineswar Kali compound, comprising thirteen temples near the sacred Ganges River.

Rausing, Ruben (June 17, 1895-August 10, 1983): Swedish. Rausing founded Tetra Pak, which pioneered the manufacture and sale of plastic-coated paper cartons used for multiple products. His businesses were inherited by his sons GAD RAUSING (1922-2000) and HANS RAUSING (b. 1926). In 2010, Gad's widow, BIRGIT RAUSING (b. 1924), had a net worth of $13 billion; Hans's net worth was $10 billion.

Reynst, Jan (1601-June 29, 1646): Dutch. Jan and his brother GERRIT REYNST (1559-1658) were wealthy Dutch merchants and acquirers of the Reynst Collection of art. The history of the collection is complex but significant. GABRIELE VENDRAMIN (1484-1552), a scion of the wealthy Venetian Vendramin family, assembled the bulk of the collection. Reflecting the rising dominance of Dutch mercantile wealth, the Reynst brothers purchased the collection from the widow of Gabriele's nephew, ANDREA VENDRAMIN (c. 1565-1629). With choice additions by Jan, the Reynst Collection grew to include three hundred Roman sculptures, two hundred Italian Renaissance masterpieces, and various antiquities. A portion of the collection, the so-called Dutch Gift, was given to King Charles II of England in 1660. The rest of the artworks are on display in museums throughout Europe.

Rich, Marc (b. December 18, 1934): American. In the 1970's, Rich began trading commodities. In 1983, he was indicted for illegally trading with Iran. At the time of the indictment, Rich was in Switzerland, and as of 2010 he continued to live in that country and had not returned to the United States. In 2001, President Bill Clinton issued a controversial pardon for Rich. According to Daniel Ammann in *The King of Oil: The Secret Life of Marc Rich* (2009), Rich's company, which traded in 128 countries and earned profits as high as $400 million annually, was worth $1.5 billion in 1993.

Rogers, Henry Huttleston (January 29, 1840-May 19, 1909): American. Rogers was a partner in the Standard Oil Company, later expanding into railroads, manufacturing, and copper. He amassed a fortune of $100 million. A hard-driving capitalist, he is perhaps most notable for his "secret" philanthropy, providing support to Mark Twain, Helen Keller, George Washington Carver, and others.

Ruiz, Simón (1525-1597; Simón Ruiz Embito): Spanish. A merchant from Castile, Ruiz traded fabrics, spices, indigo, wheat, salt, and olive oil. He posted trading agents throughout Europe and in the West Indies. He became a money changer and a banker to King Philip II of Spain. Ruiz lived in a mansion filled with treasures that his agents sent from France, Germany, and India. He founded a hospital and church complex in Medina del Campo, Spain. In his will, Ruiz left funds to maintain this church; he also bequeathed property to his widow Maria Montalvo and his businesses to his nephew Cosme Ruiz Embito, who later became bankrupt.

Rybolovlev, Dmitry (b. 1966/1967): Russian. Rybolovlev began to make his fortune in the 1990's, when he took over a Russian potash fertilizer company that had previously been owned by the Soviet Union. According to *Forbes* magazine, he was the seventy-ninth-wealthiest individual in the world in 2010, with an estimated net worth of $8.6 billion.

S

Sanguszko-Lubartowicz, Paweł Karol (1682-1752): Polish. Sanguszko-Lubartowicz was a Polish aristocrat who became phenomenally wealthy when he married MARIANNA LUBOMIRSKA (1693-1729), heiress of the Ostrog estates. The couple was famous for their exquisite collection of Persian carpets.

Schneider, Eugène (March 29, 1805-November 27, 1875; Joseph Eugène Schneider): French. Eugène and his brother ADOLPHE SCHNEIDER (1802-1845) established an iron foundry in 1836, and two years later they manufactured the first steam locomotive and river steamboat in France. Schneider and Co. eventually became the leading munitions manufacturer in France. After Eugène's death, the leadership of the company was assumed by his two sons and later by his grandson, CHARLES PROSPER EUGÈNE SCHNEIDER (1868-1942). In the twentieth century, the company was criticized for supplying arms on an international scale. After World War II, the firm began to abandon the armaments business and to focus on other activities. In 1999, the company was renamed Schneider Electric, and as of 2010 it continued to manufacture electrical equipment.

Sears, R. W. (December 7, 1863-September 28, 1914; Richard Warren Sears): American. Sears founded Sears, Roebuck and Company, which revolutionized the mail-order business. He left $25 million to his widow and four children.

Sheba, Queen of (fl. tenth century B.C.E.-fl. tenth century B.C.E.): Ethiopian. In the Bible, the Queen of Sheba visits King Solomon of Israel with a magnificent retinue (1 Kings 10:1-13, 2 Chronicles 9:1-12). Her great wealth is demonstrated by her gifts to Solomon of precious stones, rare spices, and 120 talents of gold (about four and one-half tons).

Smirnov, Pyotor Arsenievich (1831-1898): Russian. Born a serf, Smirnov established the leading vodka manufacturer in Russia, grossing 600,000 rubles annually. His fortune of $130 million was the largest in czarist Russia. Linda Himelstein recounts Smirnov's innovative marketing techniques in *The King of Vodka: The Story of Pyotr Smirnov and the Upheaval of an Empire* (2009).

Solomon, Haym (1740-January 6, 1785; Haym Salomon): American. Solomon was a Polish Jew who immigrated to the American colonies in 1775 and became a wealthy banker. He helped finance the American Revolution by contributing perhaps as much as $800,000 to the Continental Congress.

Soong, T. V. (December 4, 1894-April 25, 1971; Soong; Tse-ven; Song Ziwen): Chinese. The son of a Chinese industrialist, Soong graduated from Harvard University and became the leading financier of the Republic of China and the Kuomintang Party. In 1924, he established the Central Bank of China. His wealth in 1943 was estimated at $70 million. During World War II, Soong financed the Flying Tigers, a group of American volunteers who served in the Republic of China Air Force. His three famous sisters played historic roles in China. The eldest, Soong Ai-ling, was married to H. H. KUNG (1881-1967), a banker, the finance minister of the Republic of

China, and one of the richest men in the country. The second sister, Soong Ching-ling, was married to Sun Yat-sen, the father of modern China. The youngest sister, Soong Mei-ling, was married to Chiang Kai-shek, president of the Republic of China.

Spencer, Sir Robert (1570-October 25, 1627; First Baron Spencer of Wormleighton): English. Spencer was reputed to be the richest man in Elizabethan England, acquiring £500,000 from the wool trade, moneylending, and investments in the Virginia colony. He expanded the fourteen-thousand-acre Althorp Estate, ancestral home of Diana, Princess of Wales (1961-1997).

Strauss, Levi (February 26, 1829-September 26, 1902): American. Strauss fashioned sturdy denim pants for California gold rush miners. In 1871, he added copper rivets to fashion the blue jean, the most successful article of brand-name clothing in history. Strauss endowed twenty-nine scholarships at the University of California, among other charitable gifts, and he left $6 million to his four nephews. The Levi Strauss Company remained privately owned by his descendants into the twenty-first century.

Sumitomo, Tomomochi (1607-1662): Japanese. The second head of the mercantile house of Sumitomo, Sumitomo Tomomochi built it into an industrial giant. He moved the base of its operations from Kyōto to Ōsaka, then Japan's commercial hub. He expanded the clan into a major trading house by mining and exporting copper, importing silk, and providing money changing and other financial services.

T

Tan Tock Seng (1798-February 24, 1850; Chen Dusheng): Singaporean. Of Chinese ancestry, Tan was a wealthy businessman and landowner in colonial Singapore. He built the Tan Tock Seng Hospital for $5,000. He bequeathed his fortune to his widow, Lee Seo Neo, and his six children. His grandson Tan Chay Yan (1870-1916) was also a merchant, rubber planter, and philanthropist, who constructed the Tan Tock Guan medical building in 1870 for $15,000.

Tavernier, Jean-Baptiste (1605-July, 1689): French. A French traveler and merchant in Asia, Tavernier amassed a fortune, which allowed him to purchase the barony of Aubonne for 60,000 livres. Dealing in jewels, he traded with the fabulously rich court of the Mughal emperors and with such merchant princes of India as Virji Vora, Abdul Ghafur, and Shantidas Zaveri. He sold a treasure trove of Indian diamonds to French royalty, including the Tavernier Blue Diamond, from which the famous Hope Diamond was cut. His efforts to establish a French company to rival the Dutch East India Company failed.

Temple-Grenville, Richard (February 11, 1797-July 29, 1861; Richard Plantagenet Temple-Grenville-Nugent-Brydges-Chandos; Second Duke of Buckingham and Chandos; Sixth Viscount Cobham): English. Temple-Grenville, the second duke of Buckingham, was heir to one of the great fortunes of the English aristocracy, that of the Temple and Grenville families. He owned sixty-seven thousand acres in England, Ireland, and Jamaica, including the magnificent Stowe House. According to Niall Ferguson in *The Ascent of Money* (2008), Buckingham's extravagance and ruin symbolized a new age of aristocratic decline.

Terrazas, Luis (July 20, 1829-June 18, 1923; José Gonzaga Jesús Daniel Terrazas Fuentes (birth name): Mexican. The leading cattle rancher of nineteenth century Mexico, Terrazas owned seven million acres of ranch land.

Terry, Tomás (c. 1820-1886; Tomás Terry y Adán): Spanish. Terry earned the nickname the "Cuban Croesus" from his slave trading and sugar mills in that country. At his death, his estate, which primarily consisted of foreign investments, was worth $25 million.

TUNG (1912-1982), who built Asia's largest shipping empire, resided in both Taiwan and Hong Kong.

Tuason, Don Antonio (Unknown-1794; Son Tua): Philippine. Son Tua was born in China, and he Hispanicized his name when he immigrated to the Philippines. He became the wealthiest Filipino of the eighteenth century, amassing his wealth in the galleon trade, in which Spanish trading ships would annually sail from Manila with Asian goods and spices that were sold in Acapulco, Mexico, in exchange for New World silver. After he equipped the Philippine colonial army, the Spanish crown rewarded Tuason with a title of nobility, Caballero Hijo-Dalgo, and with landed estates. Tuason bequeathed his estate to his son Don Vicente Tuason, who expanded the family holdings by purchasing the extensive lands of the Jesuit order, which was expelled from the Philippines in 1768. Antonio's daughter Gregoria married Don Luis Rocha, who built the Malacañang presidential palace. Antonio's descendant Don Gonzalo Tuason y Patino was a leading Philippine industrialist in the nineteenth century, partnering with the wealthy Filipino industrialists DON ENRIQUE ZOBEL DE AYALA (1877-1943) and DON PEDRO PABLO ROXAS (1847-1912). The extensive Tuason lands were the subject of litigation for much of the twentieth century.

Tucher, Lazarus (Nov. 1, 1491-1564): German. Having made a fortune speculating in pepper, Tucher joined the other great German banking houses of the sixteenth century—the Fuggers, Welsers, and Hochstetters. Tucher made large loans to the English crown.

Web Sites

The following sites were visited by the editors of Salem Press in 2010. Several of the Forbes *and* Fortune *magazines lists, and* The Sunday Times Rich List*, may have been updated since then, and users can access the most current listings via Google or another search engine. Because URLs frequently change, the accuracy of these addresses cannot be guaranteed; however, long-standing sites, such as those of magazines, major newspapers, and national organizations, generally maintain links when sites are moved or updated.*

The Richest People in America: 2009
http://www.forbes.com/2009/09/30/forbes-400-gates-buffett-wealth-rich-list-09_land.html

Forbes magazine annually ranks the four hundred wealthiest Americans. This Web site contains the 2009 list and provides a separate page about each of the persons listed, with brief profiles and photographs. This site also enables users to access Web pages about wealthy individuals who made their money in the fields of finance and investments, technology and medicine, service and retail, the media, real estate, food and manufacturing, and energy. Users can sort the list by the individuals' names, net worth, ages, residences, sources of wealth, states, and industries.

The World's Billionaires: *Forbes* Magazine 2010 Rich List
http://www.forbes.com/2010/03/10/worlds-richest-people-slim-gates-buffett-billionaires-2010_land.html

Forbes magazine has essentially cornered the market for listings of wealthy individuals from all over the world and from a variety of ethnic backgrounds. Foremost among these rankings is the magazine's annual list of the world's billionaires. In 2010, Mexican business tycoon Carlos Slim headed the list with a net worth of $53.5 billion, beating out Americans Bill Gates and Warren Buffett. The complete list is on the Web, with information about the billionaires' net worth, ages, and countries of nationality and residence. Users can also obtain a separate page of information about each billionaire, with a photograph and a brief profile describing the person's age, country of citizenship, source of wealth, education, and marital status. Other sections of the site provide articles on billionaires' homes and playgrounds, technology's youngest and richest billionaires, the world's richest women, and billionaires from the United States, Latin America, Asia, and Europe. There is also information about people who dropped off and returned to the list in 2010, as well as "billionaires you've never heard of."

World's Richest Women: 2009
http://www.forbes.com/2009/06/09/worlds-richest-women-walton-bettencourt-business-billionaires-wealth.html

Forbes magazine compiled this list of the world's wealthiest women, many of whom were included in its annual list of billionaires. In 2009, the top-ranked woman was Christy Walton, the widow of Wal-Mart scion John Walton; her net worth was estimated at $20 billion. This site contains a separate page about each of the women on the list, with a brief profile and photograph (if available).

OTHER LISTS OF WEALTHY INDIVIDUALS

***The Sunday Times* Rich List 2010**
http://business.timesonline.co.uk/tol/business/specials/rich_list/rich_list_search/

The Sunday Times newspaper compiles an annual list of the wealthiest individuals or families in the United Kingdom and Ireland. The 2010 list contains the names of one thousand millionaires and billionaires whose cumulative wealth was £335.5 billion, an increase of £77.265 billion, or 29.9 percent, since 2009, the largest annual rise in the twenty-two-year history of the list. Steel tycoon Lakshmi Mittal topped the list, with a personal fortune of £22.45 billion.

World's Richest Latinos of 2009
http://www.dtmmag.com/news.php?nid=915

DTM magazine lists eight wealthy people from the United States, Mexico, and several South American countries, including Alex "A-Rod" Rodriguez of the New York Yankees, actor and singer Jennifer Lopez, and Brazilian entrepreneur Eike Batista.

RICHEST PEOPLE IN AMERICAN HISTORY

The Wealthiest American Ever
http://www.nytimes.com/ref/business/20070715_GILDED_GRAPHIC.html

The New York Times compiled this interactive graph of the thirty wealthiest people in the history of the United States. The graph enables users to access a brief profile and a link to the *Times'* obituary or to related *Times* articles for each individual. John D. Rockefeller leads the list, with a net worth of $192 billion (adjusted in 2007 dollars), followed by Cornelius Vanderbilt, with $143 billion.

Other Useful Web Sites

Economic Mobility Project: An Initiative of the Pew Charitable Trusts
http://www.economicmobility.org

Some of the wealthiest people in the United States were self-made millionaires, who came from lower- or middle-class backgrounds but were able to move up the social and economic ladders to amass large fortunes. The Economic Mobility Project (EMP), in the words of its Web site, "focuses public attention on economic mobility—the ability to move up or down the income ladder within a lifetime, or from one generation to the next." EMP seeks to forge "a broad and nonpartisan agreement on the facts, figures and trends in mobility" in order to generate policy debate "about how best to improve economic opportunity in the United States and to ensure that the American Dream is kept alive for generations that follow." The site allows users to download articles exploring various aspects of economic mobility, including examinations of advanced economic mobility through savings, post-secondary education, and attendance at community colleges; the mobility gap between black and white Americans; an economic mobility poll; and "Chasing the Same Dream, Climbing Different Ladders: Economic Mobility in the United States and Canada." In addition, the Findings at a Glance section of the site provides numerous summaries of the project's findings.

EH.Net Encyclopedia of Economic and Business History
http://eh.net/encyclopedia

This site provides easy access to reference articles written, edited, and screened by experts in the fields of economic and business history. The online encyclopedia contains a wide range of topics, not only about the economic history of the United States but also about the economy of many other nations, including premodern China, ancient Greece, the Dutch golden age in the sixteenth and seventeenth centuries, Australia, Japan, Korea, and Malaysia. One of the articles examines Gresham's law, while others look at specific industries, such as aerospace, agriculture, banking, coal, telegraphy, and savings and loans.

***Fortune* 500**
http://money.cnn.com/magazines/fortune/fortune500/2009/full_list/

Some of the wealthiest Americans in history have been executives or investors in major corporations. *Fortune* magazine annually compiles a list of the five hundred major American corporations. This Web site provides access to the magazine's lists from 1955 to the most recent year in which the corporations were ranked. Users can also find specific information for the latest list, such as the state in which each corporation is located, an alphabetical roster of companies' chief executive officers, the "*Fortune* One Thousand Best Companies to Work For," and America's fastest-growing industries.

Subscription Web Sites

The following Web-based databases are available only to paying subscribers. Many public, college, and university libraries subscribe to these sources. Readers can consult library Web sites or ask reference librarians about availability.

AP Images from AccuWeather
http://apimages.accuweather.com

The Associated Press (AP) is one of the longest-operating news gathering organizations, and this site provides access to the AP's captioned photographs from 1828 to the present, as well as audio sound bites, graphics, and texts. AP Images contains a search engine for both keyword and advanced searches, with the capability to locate photographs by the name of the person in the photo, the date the photo was taken, major historical events, photo location, and the full text of the caption. More than 3.5 million primary-source photographs and more than 100,000 graphics, including maps, time lines, logos, and graphs, are included in this database. The audio section contains more than forty-five hundred hours of brief clips from news broadcasts, interviews, and other sources.

Cambridge Histories Online
http://histories.cambridge.org/public_home

Cambridge University has published more than 250 history books, including economic histories of premodern and modern Europe, India, Latin America, the Greco-Roman world, the United States, and modern Great Britain. These books and the other history volumes are available online. The university's online resource contains a search engine that enables users to access content-specific information.

Dun and Bradstreet (D & B) Million Dollar Databases

http://www.dnbmdd.com/mddi

Dun and Bradstreet, which provides numerous services to businesses, maintains two Internet databases. The North American Million Dollar Database offers information on about 1.6 million American and Canadian public and private businesses. Company information pages list the number of employees, annual sales, type of ownership, principal executives, and biographies.

The International Million Dollar Database provides similar information about more than 1.6 million international companies.

Encyclopedia Britannica Online

http://www.britannica.com

The thirty-two-volume encyclopedia, a long-established and authoritative reference book, is available online to subscribers. In addition to the encyclopedia's articles, the online version contains numerous features that are not found in the printed volumes. These features include the Merriam-Webster *Collegiate Dictionary* and *Thesaurus*; a Research Tools section, with a Video Collection; *Britannica Daily*, containing *Britannica* Blog, This Day in History, and Biography of the Day; a daily news blog with links to article update alerts, *The New York Times*, and British Broadcasting Corporation (BBC) sites; and full-text links to scholarly journals and magazine articles from EBSCO Publishing.

Encyclopedia of American Wealth

http://www.raken.com/american_wealth/encyclopedia/index.asp

This site, in its own words, enables "users to search and analyze the history and genealogy of the wealthy families of America in a structured way, according to your needs and interests." It includes biographical profiles of both wealthy individuals and families; examinations of the industries or ventures in which these individuals and families made their fortunes, ranging from plantation owners and slaveholders in 1860 through corporate chief executive officers in 2008; lists of wealthy families from 1850-1925; and lists of wealthy individuals from 1675 through 1950, with the individuals' names, residences, sources of wealth, and estimated fortunes. The encyclopedia also provides brief historical overviews that describe wealth in colonial and mercantile America, America in the Gilded Age, and America in the twentieth century and beyond; some of this information can be accessed without a subscription to the site, but the majority of the data is available only by subscription. The site also features bibliographies and Web links.

Oxford Dictionary of National Biography Online

http://www.oxforddnb.com

The online version of the Oxford Dictionary of National Biography is an authoritative reference source. The site states that the dictionary has more than 576,250 biographies of "people who shaped the history of the British Isles and beyond, from the earliest times" to the current year. The biographies have been continually updated and new ones have been added each year since the online version was introduced in 2004. Many of the biographies are illustrated with drawings or photographs.

The Rich Register

http://www.richregister.com/products.cfm

Hoover's, Inc., a long-established publisher of business information resources, annually produces both a print and online database version of The Rich Register. The online register contains profiles of more than six thousand individuals whose net worth is greater than $25 million, ranging from well-known billionaires to more obscure entrepreneurs and heirs to large fortunes. For each individual, the register lists an office address, telephone number, estimate of wealth, source of wealth, college from which he or she graduated, and brief business history and biography. In addition, there are lists of the wealthiest African Americans, Hispanics, and women and of America's billionaires; a nationwide ranking, in order of wealth, of the richest men and women; rankings of the wealthiest individuals in each state; a list of owners of professional sports teams; and a list of America's youngest and wealthiest entrepreneurs.

ELECTRONIC DATABASES

Electronic databases usually do not have their own URLs. Instead, public, college, and university libraries subscribe to these databases, provide links to them on their Web sites, and make them available only to library cardholders or specified patrons. Readers can check library Web sites or ask reference librarians to check on availability of these databases.

GENERAL REFERENCE

World Book Encyclopedia

Several versions of this popular and authoritative reference source are available for school and public libraries, including versions for young children, elementary and middle-school students, and older users. Each site features articles from the encyclopedia, as well as illustrations.

BIOGRAPHY RESOURCES

Biography Reference Center

Created by EBSCO Publishing, Biography Reference Center is an online collection of more than 450,000 full-text biographies, including the complete full-text run of Biography Today and Biography, as well as thousands of other narrative biographies. This site enables users to conduct keyword searching and to access biographies in more than twenty-five categories, including figures relevant to American history and to world history.

Biography Resource Center

Produced by Gale Cenpage Learning, this database includes more than 450,000 biographies on more than 380,000 people. This information is acquired from more than one thousand volumes of Gale's reference sources and is supplemented by full-text articles from 135 magazines. Users can search for biographies in specific categories, including business leaders; African, Hispanic, and Asian Americans; notable Canadians; and British and world royalty. The database also enables users to search by occupation, nationality, ethnicity, year of birth and death, and gender.

Biography Resource Center: African Americans

This electronic collection, produced by Gale Cenpage Learning, features almost thirty thousand biographies of more than twenty-four thousand African Americans who have attained prominence in a number of areas, including the arts, business, current events, entertainment, government, history, literature, politics, and sports.

Wilson Biographies Plus Illustrated

Produced by H. W. Wilson, this database contains more than 147,000 narrative profiles, more than thirty-six thousand images, bibliographies, and links to related material. Content is derived from Wilson reference books, including Current Biography, as well as from information licensed from other reference publishers.

BUSINESS RESOURCES

The following are among the electronic databases that provide information about the companies (and in some cases, successor companies) that were the source of wealth for many rich people:

Business and Company Resource Center

This database, created by Gale Cenpage Learning, provides information about companies and industries, with separate search engines for both of these categories. Another search engine enables users to access articles about business that have been published in magazines and journals. The company information pages offer brief narratives; the name or names of the parent company or companies; and statistics regarding annual sales, number of employees, year founded, and corporate officers.

Business Source Complete

EBSCO Publishing, the creator of Business Source Complete, describes this resource as "the world's definitive scholarly business database," with a collection of bibliographic and full-text material. The database features articles from more than thirteen hundred business-related journals. Additional content includes financial data, major reference works, conference proceedings, case studies, investment research reports, industry reports, market research reports, country reports, and company profiles, among other information.

Hoover's Company Records

ProQuest, a database provider, maintains an electronic database of company records compiled by Hoover's, Inc., a producer of business reference materials. Database users can obtain profiles of more than 40,000 companies, 600 industries, and 225,000 key executives. The available information includes company overviews and histories, as well as data about officers and board members, competitors, products, operations, and related industry information.

Reference USA

Some public and academic libraries subscribe to Reference USA, which includes a U.S. business database. Information in this database can be accessed via a business's name; the first or last name of an executive; and the city, state, or telephone number of a business. There is specific information about each business's location; profiles of the business itself and the industry in which it operates; and demographic data about sales volume, number of employees, and credit rating. Additional information includes a management directory, company news reports, stock data for publicly traded firms, and lists of competing companies.
