Rest in Peace to Aaron Swartz beloved friend of the internet, defender for freedom of speech and information, May your struggle not be in vain, the earth is 4.5 billion years, mankind has been around 160,000 yrs and the average span of an individual is just 70, but the idea of free universal knowledge can never die.

(Some will say this is not the time. I disagree. This is the time when every mixed emotion needs to find voice.)

Since his arrest in January, 2011, I have known more about the events that began this spiral than I have wanted to know. Aaron consulted me as a friend and lawyer. He shared with me what went down and why, and I worked with him to get help. When my obligations to Harvard created a conflict that made it impossible for me to continue as a lawyer, I continued as a friend. Not a good enough friend, no doubt, but nothing was going to draw that friendship into doubt.

The billions of snippets of sadness and bewilderment spinning across the Net confirm who this amazing boy was to all of us. But as I've read these aches, there's one strain I wish we could resist:

Publisher's Note

Great Lives from History: The Incredibly Wealthy (3 vols.) joins the *Great Lives* series, which provides in-depth critical essays on important men and women in all areas of achievement, from around the world and throughout history. The series was initiated in 2004 with *The Ancient World, Prehistory-476 C.E.* (2 vols.) and was followed in 2005 by *The Middle Ages, 477-1453* (2 vols.) and *The Renaissance, 1454-1600* (2 vols.); in 2006 by *The 17th Century, 1601-1700* (2 vols.) and *The 18th Century, 1701-1800* (2 vols.); in 2007 by *The 19th Century, 1801-1900* (4 vols.) and *Notorious Lives* (3 vols.); in 2008 by *The 20th Century* (10 vols.); and in 2010 by *Inventors & Inventions* (4 vols.). With this new installment, the entire series extends to 34 volumes, covering more than 5,300 lives.

Online Access

Salem provides access to its award-winning content both in traditional, printed form and online. Any school or library that purchases this three-volume set is entitled to free, complimentary access to Salem's online version of the content through our Salem History Database. Access is available through a code printed on the inside cover of this first volume, and that access is unlimited and immediate. Our online customer service representatives, at (800) 221-1592, are happy to help with any questions.

The advantages are clear:

- Complimentary with print purchase
- Fully supported
- Unlimited users at your library
- Full access from home or dorm rooms
- Immediate access via online registration
- A simple, intuitive interface
- User profile areas for students and patrons
- Sophisticated search functionality
- Complete content, including appendixes
- Integrated searches with any other Salem Press product you already have on the Salem History platform.

E-books are also available.

Scope of Coverage

Great Lives from History: The Incredibly Wealthy features 445 essays covering 446 people (including 43 women) from all time, worldwide. The vast majority of the individuals included in this set have never been covered in this series before, and all of them have never been covered from the perspective of how they generated and used their wealth, impacting society as a whole. Many of these individuals—major "players" but often persons behind the scenes—are not covered in other biographical reference works of this magnitude.

Each one of these essays has been specially written for this set. The subjects of these essays are wealthy people who earned their fortunes in a wide range of endeavors from ancient times into the twenty-first century—coverage that is essential in any liberal arts curriculum. The editor's criteria for including these individuals in this publication took into account the amount of their wealth; their historical significance; their representation from a wide range of countries and historical periods; the sources of their wealth from a vast range of endeavors; their relevance to class curricula; and their interest to high school, undergraduate, and general readers.

For purposes of this publication, the term "incredibly wealthy" is defined to include men and women who were or are among the wealthiest people at the time in which they lived. Many of these individuals were members of the wealthiest families of their times; profiles of numerous members of the Vanderbilt, Rothschild, and Rockefeller families, for example, are included here.

By category, the contents include persons whose sources of wealth fall into one or more of the following areas: acting (2), agricultural products (13), artwork (1), banking (65), church (4), computer industry (12), conquest (21), construction business (5), embezzlement (2), entertainment industry (9), financial services (9), gambling (1), golfing (1), government (37), horse breeding (5), inheritance (142), insurance (3), investments (97), law practice (3), liquor importation (1), lumber (2), manufacturing (68), marriage (17), media (27), metals refining (5), mining (22), moneylending (4), narcotics trafficking (4), oil (21), patents (21), privateering (4), product endorsements (1), railroads (26), ranching (2), real estate (135), retailing (14), sale of products (70), shipbuilding (1), shipping (14), slave trade (7), slaveholding (6), sports franchise (6), steel (10), telecommunications (4), telegraph (4), tourism (9), trade (85), transportation systems (8), tutoring (1), utilities (4), and writing (4).

The wealthy individuals covered in these volumes are also identified with one or more of the following countries or regions: Afghanistan (1), Argentina (1), Australia (3), Austria (4), Azerbaijan (1), Belgium (2), Bolivia (2), Brazil (4), Brunei (1), Cambodia (1), Canada (7), Chile (2), China (12), Colombia (1), Cuba (6), Cyprus (1), Czech Republic (1), Ecuador (1), Egypt (5), England (75), Ethiopia (1), France (22), Germany (19), Ghana (1), Greece (7), Hungary (3), India (14), Iran (5), Iraq (4), Ireland (6), Israel (1), Italy (23), Japan (9), Lithuania (1), Malaysia (1), Mali (2), Mauritania (1), Mexico (4), Mozambique (1), Netherlands (2), Nigeria (1), Northern Ireland (2), Peru (1), Philippines (1), Poland (2), Portugal (2), Russia (8), Saudi Arabia (3), Scotland (7), Senegal (1), South Africa (3), South Korea (1), Spain (10), Sri Lanka (1), Sweden (2), Switzerland (1), Thailand (3), Turkey (7), United Kingdom (81), United States (227), Wales (1), Yemen (1), and Zimbabwe (1).

ESSAY LENGTH AND FORMAT

Each essay is from 750 to 2,000 words in length (approximately 2 to 4 pages) and displays standard ready-reference top matter offering easy access to the following biographical information:

- The **name** of the individual, as best known.
- The individual's **nationality** and **occupation** (e.g., Japanese physicist).
- A **synopsis** highlighting the individual's historical importance in relation to his or her wealth and indicating why the person is studied today.
- ***Born*** and ***Died*** lines that list the most complete dates of birth and death available, followed by the most precise locations available, as well as an indication of when these data are unknown, only probable, or only approximate. Both contemporary and modern place names (where different) are listed; a question mark (?) is appended to a date or place if the information is considered likely to be the precise date or place but remains in question; a "c." denotes circa and indicates that historians have only enough information to place the date of birth or death near the year listed; and when a range of dates is provided for birth or death, historians are relatively certain that the birth or death year could not have occurred outside the date range.
- ***Also known as***, a listing of other versions of the individual's name, including full names, birth names, alternative spellings, pseudonyms, and nicknames.
- ***Sources of wealth***, a listing of the industries, occupations, business ventures, and other ways in which the subjects earned their fortunes, from acting through writing.
- ***Bequeathal of wealth***, a listing of how the subjects disseminated their wealth, including charitable endeavors, artistic patronage, or bequests to family members or other individuals.

The body of each essay, which also includes a byline for the contributing writer-scholar, is divided into the following four parts:

- ***Early Life*** provides facts about the individual's upbringing and the environment in which he or she was reared, as well as the pronunciation of his or her name (if unfamiliar to English speakers). This section describes the individual's early life, particularly as it laid the groundwork for his or her later wealth. Where little is known about the person's early life, historical context is provided.
- ***First Ventures*** describes the individual's early career, endeavors, enterprises, and other efforts and risks that led to success (and failures), or other circumstances of the subject's life that laid the groundwork for mature wealth.
- ***Mature Wealth***, the heart of the essay, consists of a straightforward, generally chronological, account of how the individuals earned their fortunes, emphasizing the most significant achievements in their lives and careers. This section emphasizes not only the creation of their wealth but also how the individuals managed (or mismanaged) their fortunes during their lifetimes.
- ***Legacy*** provides an overview of the long-range significance of the individual's wealth, emphasizing its impact on history, business, charity, architecture, culture, and other areas of endeavor. This section explains why it is important to study this individual.

The end matter of each essay includes the following resources:

- ***Further Reading***, a bibliography, is a starting point for further research.

- ***See also*** lists cross-references to essays in the set covering other individuals of interest.

SPECIAL FEATURES

Several features distinguish this set:

- ***Complete List of Contents***: This alphabetical list of contents appears in all three volumes.
- ***Key to Pronunciation***: A key to in-text pronunciation of unfamiliar names appears in all volumes. Pronunciation guidelines for difficult-to-pronounce names are provided in the first paragraph of the essay's "Early Life" section.
- **Sidebars**: A key feature of many of the essays in this publication is a sidebar on an aspect of the individual's wealth, the lives of wealthy people, or the specific businesses and endeavors in which some individuals generated and spent their fortunes. With topics such as charitable foundations, patronage of the arts, and "Great Wealth and Oil," these sidebars also present a thematic look at economic history.
- **Photographs**: 253 photographs illustrate the essays.

The back matter to Volume 3 includes several appendixes:

- ***More Wealthy Persons from History***, a directory of other wealthy people throughout history, with brief descriptions of their significance and the sources of their wealth
- ***Chronological List of Entries***, a listing of the 446 wealthy persons covered, arranged by birth year, useful as a "time line" of coverage
- ***Electronic Resources***, a guide to Web sites and electronic databases providing additional information about wealthy persons
- ***Bibliography***, a comprehensive listing of books about wealth in history, arranged by geographic locale, as well as some of the key industries and businesses (e.g., oil) that generate great wealth

Finally, Volume 3 ends with three useful indexes:

- **Category Index**: entries by area of achievement, from acting to writing.
- **Geographical Index**: entries by country or region.
- **Subject Index**: comprehensive index including personages, corporations, business ventures, philanthropic endeavors, fields of endeavor, concepts, technologies, terms, and other topics of discussion, with full cross-references for alternative spellings and to the category and geographical indexes.

USAGE NOTES

The worldwide scope of *Great Lives from History* resulted in the inclusion of names and words transliterated from languages that do not use the Roman alphabet. In some cases, there is more than one transliterated form in use. In many cases, transliterated words in this set follow the American Library Association and Library of Congress (ALA-LC) transliteration format for that language. However, if another form of a name or word has been judged to be more familiar to general readers, it is used instead. The variants for names of essay subjects are listed in ready-reference top matter and are cross-referenced in the subject and personages indexes. The Pinyin transliteration was used for Chinese topics, with Wade-Giles variants provided for major names. In a few cases, a common name that is not Pinyin has been used. Sanskrit and other South Asian names generally follow the ALA-LC transliteration rules, although again, the more familiar form of a word is used when deemed appropriate for general readers.

Titles of books and other literature appear, upon first mention in the essay, with their full publication and translation data as known: an indication of the first date of publication or appearance, followed by the English title in translation and its first date of appearance in English.

Throughout the set, readers will find a limited number of abbreviations used in both top matter and text, including "r." (reigned), "b." (born), "d." (died), and "fl." (flourished).

CONTRIBUTORS

Salem Press would like to extend its appreciation to all involved in the development and production of this work. The essays have been written and signed by scholars of history, humanities, the sciences, and other disciplines related to the essays' topics. Without these expert contributions, a project of this nature would not be possible. A full list of the contributors' names and affiliations appears in the front matter of this volume.

Special thanks go to Howard Bromberg, the set's editor, without whose guidance and creative vision this publication would not have been possible. Clinical Assistant

Professor of Law at the University of Michigan Law School, Dr. Bromberg developed the contents list and sidebar topics, as well as contributing significantly to this work. He has practiced law as Legislative Counsel to Congressman Thomas Petri of Wisconsin and as a prosecutor in the Appeals Bureau of the New York County District Attorney's Office; has taught at Chicago and Stanford Law Schools and at the Peking University School of Transnational Law; was Associate Professor and Assistant Dean of Clinical and Professional Skills Programs at Ave Maria Law School; and, as Associate Director at Harvard Law School, helped establish Harvard's First-Year Lawyering Program. Professor Bromberg serves on the Advisory Committee of the State of Michigan Moot Court Competition. In 2005-2006, he chaired that committee and was also Director of the annual competition. He has published more than 100 articles and essays in legal history and biography. His B.A and J.D. degrees are from Harvard Law School and his J.S.M. degree is from Stanford Law School.

Editor's Introduction

If history is made by great men and women, it is gilded by the incredibly wealthy. Riches give individuals the ability to influence human affairs, shape economies, provoke war, purchase peace, build monuments, dominate others, or relieve distress. Wealth can be used for either good or bad ends, but it is rare that great wealth passes through history without leaving a trace.

Great Lives from History: The Incredibly Wealthy chronicles the lives of men and women of great wealth. Every attempt has been made to include figures from various nations and historical periods. The essays represent a range of ways in which wealth was derived, used, and disseminated. The subjects of the essays were culled, and their lives were written, based on the widest range of sources—biographies, economic histories, general histories, and records of businesses and foundations. (Sources can be found in the bibliographies at the end of each essay and in the appendix.) The chief criterion for inclusion was not sheer wealth but the impact of that wealth upon history.

Varieties of Wealth

The varieties of wealth are manifold. In ancient times, wealth was possessed in chattel—livestock, produce, vineyards, and ornaments. With the growth of commerce, more liquid means of wealth were required in the form of gold coins, silver plate, jewels, jade, tapestries, ointments, and porcelains. Until modern times, holdings in land were the badge of riches. Sadly, wealth has also been marked by ownership of persons—slaves, indentured servants, and serfs. With the Industrial Revolution and the rise of market economies and capitalism, wealth has taken one dominant form: the accumulation of money, denominated in the various currencies of the world.

History—the written record of human activity—in a sense began with wealth, as the ancient Sumerians invented writing by chiseling their business accounts on clay tablets. The earliest business family represented in *Great Lives from History: The Incredibly Wealthy* are the Egibis, who built a trading empire in ancient Babylon. Other persons chronicled from the ancient world include Biblical figures, Greek legends, Roman actors and charioteers, Mesoamerican emperors, Chinese imperial bureaucrats, Muslim caliphs, and a slave who became the wealthiest banker of golden age Athens. Plunder was an accepted means of acquiring wealth in early societies. Conquerors who seized wealth are included in these volumes, as well as those who, often under the impulses of the nascent world religions, gave wealth away.

The medieval period saw the emergence of feudalism in Europe and elsewhere. Feudal lords—British peers (dukes, marquesses, earls, viscounts, and barons), Russian boyars, Mexican ranchers, Argentine hacienda *patróns*, Prussian Junkers, and the like—acquired vast holdings in land. With their property, these landed lords obtained equally valuable feudal incidents, rents, tithes, crops, and services, as well as peasants to work the land. The Middle Ages and the Renaissance were also a time of world wide exploration and commerce. Great wealth took new forms. Banking families in the Italian city-states funded English kings, Renaissance artists, and Spanish explorers. The Hanseatic League of merchants controlled the Baltic and North Sea trade. Merchant princes in the Mughal Empire traded diamonds, indigo, and textiles. The world craved sugar from plantations in Cyprus, Brazil, and Jamaica. Timbuktu merchants measured their wealth in the acquisition of Islamic manuscripts; the Mali Empire traded gold, salt, and slaves. In the Age of Exploration, European ships expanded the slave trade across the Atlantic and brought home vast quantities of silver from the mines of Potosi in Peru and Zacatecas and La Valenciana in Mexico. Much of this silver found its way to Asia in the Spanish galleon trade and the commercial armadas of the Dutch and English East India Companies. The European ships returned laden with exquisite fabrics, teak furniture, and costly spices. Cotton and opium from India were traded for silk from China. The Chinese Cohong merchants of Canton reaped fortunes from tea; the Chinese merchants of Yangzhou confined themselves to the domestic trade, but benefiting from a government monopoly in salt, they gained fortunes rivaling the Cohongs.

With the Industrial Revolution, the ranks of the wealthy became dominated by a new phenomenon: the modern businessman, whether industrialist, entrepreneur, merchandiser, or investor. The nineteenth century saw the greatest private fortunes in human history as new business organizations—corporations, trusts, and conglomerates—enabled capitalists to amass hitherto uncontemplated riches. The rising economic strength of the United States created great fortunes for Southern tobacco planters, Northwest fur traders, New York financiers, New England whalers, Midwest industrialists, Michigan cereal sellers, Pennsylvania steel and coal tycoons, Nevada silver mine owners, Chicago salesmen and retailers, Newport society matrons, Detroit automakers, St. Louis brewers, California canners, Florida real estate agents, Washington lumbermen, Texas oil barons and ranchers, operators of steamships in trans-Appalachian canals and the Atlantic and Pacific Oceans, and railroad entrepreneurs knitting the nation together with steel tracks.

By the turn of the twentieth century, industrial production had replaced land as the chief source of wealth in the world. Just as with cuisine, clothing, music, and other artifacts of civilization, wealth takes on the trappings of the culture which engendered it. Personal fortunes are alike in their economic capabilities and privileges; they are distinctive in their national character, correlating with the resources and mores of the community. The ranks of the incredibly wealthy were made up of Austrian bankers; German and Swedish industrialists; British generals; Cuban sugar magnates; South African Randlords; French vintners, cosmeticians, and designers; Greek shippers; Latin American tin, cocoa, and banana kings; Russian commodities "oligarchs"; Canadian distillers and media barons; Japanese *zaibatsu*; Iranian peddlers; Arabian sheiks; Swiss chocolatiers; Hong Kong property developers; Hollywood film producers; and Silicon Valley semiconductor, microprocessor, and computer manufacturers and software developers. Although restricted in ownership of property, women were the backbone of numerous familial fortunes. Minority populations faced huge obstacles to economic success, but *Great Lives from History: The Incredibly Wealthy* recounts successful African American, Hispanic, and Native American entrepreneurs from the United States; Lebanese businessmen in Latin America; Armenian traders in Asia; Jewish bankers in Europe; Coptic merchants in Egypt; Parsi industrialists in India; and other wealthy members of minority groups.

PRIVATE WEALTH

Great Lives from History: The Incredibly Wealthy is about private wealth. The people who are profiled claimed incredible riches as their own, riches that were privately possessed and freely alienable, secure, and unencumbered, without the prior claim of states or governments. The largest number of subjects are drawn from late nineteenth and early twentieth century Great Britain and the United States. This is not merely because this is an English-language book; rather, these two countries saw the greatest accumulation of wealth in private hands during this period. Earlier wealth was rarely produced without the backing of the sovereign. Even in England, wealth was produced at the behest of the monarch or as the fruit of aristocratic titles and privileges. At the disfavor of the king or queen, a British duke could be attainted, his fortune confiscated. In the United States, wealth was separated from direct state control. Titles of aristocracy were forbidden; bills of attainder were expressly prohibited. The U.S. Constitution enshrined freedom of contract, limited taxation, liberty of work, and the right to property. For the first time in history, an elite class arose with no connection to royalty or aristocracy but only to the raw mechanics of enterprise and industry. If subsidies and illicit favors were squeezed from the legislature by American monopolists of the Gilded Age, that fact was disguised, not brandished.

Obviously royalty possessed enormous wealth. The Pharaohs could command the workforce of Egypt to build their monuments and pyramids. When William the Conqueror claimed the English throne in 1066, he also claimed ownership to the land of all England and promulgated the *Domesday Book* to enforce his claim. However in the truest sense, the wealth of the sovereign belonged to the state, not the ruler. The monarch was endowed with power; his or her wealth was a mere by-product of that power. If deposed, the monarch's wealth was transferred to the succeeding ruler. In Rome, the emperor passed his personal treasury, the *fiscus*, to the next emperor, not to his heirs. The resplendent crown jewels of England and Persia were passed from dynasty to dynasty, the individual property of no person. Indeed, the sovereign was usually expected to provide for state expenses out of his or her own pocket, and the seemingly richest monarchs, such as Philip II of Spain, Henry VIII of England, and Charles V of the Holy Roman Empire, were perennially in debt, due to the expenses of the state that they bore. The few royals included in *Great Lives from History: The Incredibly Wealthy* used their wealth to build great monuments, such as Angkor Wat temple, the Süleymaniye mosque, the Taj Mahal, and the Palace of Versailles. This book also includes modern constitutional monarchs, who, with the disappearance of their power, have acquired full possession over their estates.

Until the era of the modern nation-state, members of the nobility were minor royalty, ruling over cities, fiefdoms, and principalities. Again, their wealth pertained more to their offices and ranks than to themselves. The aristocrats included in *Great Lives from History: The Incredibly Wealthy* tend to more recent vintage, as the princely classes have likewise lost their jurisdiction of power but gained personal riches.

The requirement that wealth be private, unencumbered, and secure has led to the exclusion of the most infamous outlaws, regardless of the extent of their transient wealth. Criminals such as Pablo Escobar and Charles Ponzi are included because of their unique places in social history.

Finally, the emphasis on private wealth excludes the so-called kleptocrats—heads of state who helped themselves to great riches from their nations' treasuries. Nicolae Ceauşescu of Romania, Mobutu Sese Seko of Zaire (Democratic Republic of the Congo), the Duvaliers of Haiti, Ferdinand Marcos of the Philippines, Suharto of Indonesia, Sani Abacha of Nigeria, Bakili Muluzi of Malawi, Jean-Bédel Bokassa of the Central African Republic, Kim Jong Il of North Korea, and Slobodan Milošević of Serbia are alleged to have secreted billions of dollars for their own pleasures. If so, the extent of their gains will have to be explored in other venues.

Sidebars: Foundations of Wealth

The lives of the incredibly wealthy are a microcosm of the world's economic activity. The lengthier essays in *Great Lives from History: The Incredibly Wealthy* include a sidebar that is meant to illustrate an aspect of the subject's fortune that transcends his or her lifespan and makes a permanent impact on world history. These sidebars treat businesses, castles, palaces, cathedrals, skyscrapers, schools, colleges and universities, hospitals, museums, libraries, gardens, and mansions.

Two special uses of the word "foundation" are worth noting in the sidebars. First are the treatments of the foundations, or the derivations, of great wealth in the world economy. These sidebars treat such topics as the intersection of wealth with religion, gold, oil, salt, railroads, conglomerates, art, literature, publishing, sport, slavery, cuisine, and automobiles, among other subjects.

The second use of the word "foundation" in the sidebars is literal—the philanthropic foundations that are the mainstay of modern fortunes. In the twentieth century there was hardly a multimillionaire who did not endow a nonprofit foundation for philanthropic purposes. These foundations were created for a variety of reasons, some of which were certainly noble, but they were also established to generate good will, arrange familial affairs, and achieve favorable legal and tax statuses. The Ford, Rockefeller, and Carnegie Foundations were probably the most influential over the course of the century. Among the largest and most significant of the thousands of other foundations are the Stichting INGKA Foundation, Li Ka Shing Foundation, Bill and Melinda Gates Foundation, Robert Wood Johnson Foundation, W. K. Kellogg Foundation, the Kamehameha Schools supported by the Bernice Pauahi Bishop Estate, Muḥammad bin Rāshid Āl Maktūm Foundation, David and Lucile Packard Foundation, William and Flora Hewlett Foundation, and Annenberg Foundation.

More Wealthy People from History

In the back matter of Volume 3, *Great Lives from History: The Incredibly Wealthy* includes a directory of about two hundred additional wealthy people from history, with brief descriptions of their significance. These persons, also of historical importance, are included in abbreviated fashion for various reasons. For some, the record of their lives is sparse. Unlike talent or achievement, wealth is easily passed on to the next generation, even if dispersed; this section includes family members whose combined wealth propels them into the ranks of the incredibly wealthy. Finally, this section completes the list of contemporary persons whose fortune exceeds $10 billion; their long-term significance, however, remains to be determined.

Comparing Wealth

Calculating and comparing the extent of wealth are important features of *Great Lives from History: The Incredibly Wealthy*, both as a tool of selection and as a mainstay of the essays. However, it must be remembered that comparative wealth is incapable of exact measurement. In ancient times, wealth consisted largely of land and livestock and could not be quantified. Even when wealth took the form of money, obstacles to calculation remain. For one, the changing value of money over the centuries makes comparison difficult. Likewise, historical epochs differ in their rates of taxation, costs of labor and goods, and interest rates, all of which complicate comparisons. In addition, any transnational comparison will be complicated by the varying exchange rates of the world's currencies.

Nevertheless, a rough estimate of wealth, even from the most primitive times, is possible and employed in most of the essays. The most valuable tools for gleaning wealth are probate records, but information can also be found in memoirs, travelogues, tax records, court assessments, wills, and other records. To correlate historic wealth in modern terms, economic historians use various methods, such as the change in the consumer price index, comparative percentages of gross national product, gross domestic product per capita, and comparative daily wages of workers. Although these methods yield different results, all allow for an approximation of historic wealth in modern dollars. Due to the perennial effects of inflation, nominal wealth (the actual dollar value of a person's fortune at the time) must be converted to real wealth (a person's comparative fortune in modern dollars). Using the U.S. dollar as an example, nominal wealth of $500,000 in 1800 may be roughly akin to $3 million in 1850, $18 million in 1900, $125 million in 1950, and $6.5 billion in 2000. In other words, John D. Rockefeller, whose nominal wealth was estimated as high as $1.4 billion in an age of low taxation and inexpensive labor, must be counted as richer than Bill Gates, whose fortune was estimated at $53 billion in 2010.

Differences in the rates of exchange between countries must also be accounted. To give a useful example from Europe, the economic historian Niall Ferguson has estimated the exchange rate of the British pound in the middle of the nineteenth century to be at about 25 francs (whether French, Belgian, or Swiss), 500 Spanish reals, 6 Russian rubles, 6 Neapolitan ducats, and 7 Prussian thalers. (In 1850, 1 British pound was worth about 5 U.S. dollars.) Ferguson estimates the exchange rate in 1913 of 1 British pound to be about 20 German marks, 25 French francs, 25 Italian lire, 24 Austrian crowns, 9.5 Russian rubles, and 5 U.S. dollars. In 1950, the exchange rate for 1 U.S. dollar was about one-third of a British pound, 4 German Deutsche marks, 360 Japanese yen, and about 5 Indian rupees.

With these tools in hand, several historians have ranked Marcus Licinius Crassus as the richest person of the classical world. Alanus Rufus has been ranked as the richest person of medieval England, with his real wealth approximated at £82 billion or $122 billion in modern money. By most accounts John D. Rockefeller possessed the greatest real fortune in history, with his nominal wealth of $1.4 billion in the early twentieth century estimated to be worth as much as $200 billion in modern dollars.

In 2000, *The Wall Street Journal* published a time line of the fifty richest people of the second millennium (http://interactive.wsj.com/public/resources/documents/mill-1-timeline.htm). Cynthia Crossen, the newspaper's senior editor, selected the ten most distinctive and representative people from this list in *The Rich and How They Got That Way: How the Wealthiest People of All Times from Genghis Khan to Bill Gates Made Their Fortunes* (2000). In addition to Gates, Crossen included Mansa Mūsā, Maḥmūd of Ghazna, Genghis Khan, Pope Alexander VI, Jakob Fugger, John Law, Sir Richard Arkwright, Wu Bingjian, and Hetty Green.

Comparisons of modern wealth have been made more accessible by the American business magazines *Fortune* and *Forbes*, which consistently calculate and publish lists of the wealthiest people in the United States and the world. (Since 1989, *The Sunday Times* has published an annual list of the one thousand richest people in the United Kingdom.) These lists are compiled carefully by expert staffs and are reliable. In addition, the annual *Forbes* list of the world's richest people is measured in terms of U.S. dollars. *Forbes* first published a list of the thirty wealthiest Americans on March 2, 1918. John D. Rockefeller topped this list, with a fortune of $1.2 billion, followed by Henry Clay Frick ($225 million), Andrew Carnegie ($200 million), George F. Baker ($150 million), William Rockefeller ($150 million), and Edward Harkness ($125 million). *Fortune* published a list of the seventy-six wealthiest Americans in November, 1957. J. Paul Getty topped this list, with a fortune in the range of $700 million to $1 billion. In the second highest range of $400 million to $700 million were John D. Rockefeller, Jr., H. L. Hunt, Arthur Vining Davis, and four members of the Mellon family.

Forbes began publishing its annual list of the world's wealthiest people in 1996. That year, Bill Gates topped the list with $18.5 billion, followed by Warren Buffet with $15 billion. In the *Forbes* list published on March 9, 2010, Gates's wealth had grown to $53 billion and Buffet's to $47 billion, well illustrating the time value of money. Nevertheless, Gates and Buffet had been displaced as the world's wealthiest persons by Mexican businessman Carlos Slim, with a fortune of $53.5 billion. Occupying positions four through six in 2010 were Mukesh Ambani ($29 billion), Lakshmi Mittal ($28.7 billion), and Larry Ellison ($28 billion).

The Incredibly Wealthy

The incredibly wealthy have been viewed with admiration and disdain. The largest private fortunes were probably those compiled by American industrialists of the last half of the nineteenth century, such men as John D. Rockefeller, Andrew Carnegie, Cornelius Vanderbilt, Frederick Weyerhaeuser, and J. P. Morgan. The muckraking journalists called these men "robber barons," while their apologists called them "captains of industry." Their dominance and innovations in the oil, steel, coal, lumber, railroad, and banking businesses accelerated the American standard of living. However, they were also accused of brutal exploitation of workers and consumers.

Carnegie pleaded with his peers to be generous with their fortunes, and he founded the Carnegie Foundation, the Carnegie Endowment for World Peace, Carnegie Hall in New York City, the Carnegie Institution in Washington, D.C., and Carnegie museums and libraries throughout the nation. Carnegie, however, also received blame for the violent suppression of the Homestead Strike of 1892. Were these industrialists primarily plutocrats, absorbing an unfair portion of the nation's wealth, or were they philanthropists, both in the goods they produced and the foundations they endowed?

In the end, it seems that the wealthy, like others, faced individual choices about the accumulation of their wealth and its uses for ignoble ends or for the betterment of humankind. Thus, there may be no better way to assess the role of the incredibly wealthy in human affairs than by reading a collective biography of their lives, one gilded life at a time.

Key to Pronunciation

Many of the names of personages covered in *Great Lives from History: The Incredibly Wealthy* may be unfamiliar to students and general readers. For these unfamiliar names, guides to pronunciation have been provided upon first mention of the names in the text. These guidelines do not purport to achieve the subtleties of the languages in question but will offer readers a rough equivalent of how English speakers may approximate the proper pronunciation.

Vowel Sounds

Symbol	Spelled (Pronounced)
a	answer (AN-suhr), laugh (laf), sample (SAM-puhl), that (that)
ah	father (FAH-thur), hospital (HAHS-pih-tuhl)
aw	awful (AW-fuhl), caught (kawt)
ay	blaze (blayz), fade (fayd), waiter (WAYT-ur), weigh (way)
eh	bed (behd), head (hehd), said (sehd)
ee	believe (bee-LEEV), cedar (SEE-dur), leader (LEED-ur), liter (LEE-tur)
ew	boot (bewt), lose (lewz)
i	buy (bi), height (hit), lie (li), surprise (sur-PRIZ)
ih	bitter (BIH-tur), pill (pihl)
o	cotton (KO-tuhn), hot (hot)
oh	below (bee-LOH), coat (koht), note (noht), wholesome (HOHL-suhm)
oo	good (good), look (look)
ow	couch (kowch), how (how)
oy	boy (boy), coin (koyn)
uh	about (uh-BOWT), butter (BUH-tuhr), enough (ee-NUHF), other (UH-thur)

Consonant Sounds

Symbol	Spelled (Pronounced)
ch	beach (beech), chimp (chihmp)
g	beg (behg), disguise (dihs-GIZ), get (geht)
j	digit (DIH-juht), edge (ehj), jet (jeht)
k	cat (kat), kitten (KIH-tuhn), hex (hehks)
s	cellar (SEHL-ur), save (sayv), scent (sehnt)
sh	champagne (sham-PAYN), issue (IH-shew), shop (shop)
ur	birth (burth), disturb (dihs-TURB), earth (urth), letter (LEH-tur)
y	useful (YEWS-fuhl), young (yuhng)
z	business (BIHZ-nehs), zest (zehst)
zh	vision (VIH-zhuhn)

Great Lives from History

The Incredibly Wealthy

Aaron of Lincoln

English banker and financier

Aaron of Lincoln founded an international network of finance that allowed him to lend money and collect returns efficiently. His financial dealings contributed to the building and maintaining of major Cistercian monasteries and other Christian foundations, including the Cathedral and Abbey Church of St. Alban's and Lincoln Minster.

Born: c. 1125; probably Lincoln, England
Died: 1186; probably Lincoln, England
Sources of wealth: Banking; moneylending
Bequeathal of wealth: Government

Early Life

Virtually nothing is known of the early years of Aaron of Lincoln. Since there was little documentation of births in the twelfth century, his age can be surmised only by estimate and his place of birth or dwelling from the designation at the end of his name.

First Ventures

Aaron of Lincoln first appears in approximately 1166 C.E., when documentary evidence mentions his name in regard to money being paid to him by King Henry II through a transaction with the sheriff of Lincoln, almost certainly as the result of a loan. Most scholars believe that Aaron was well under way with his business ventures by this time, loaning money at interest to various individuals and entities. The source of his wealth at this point in his career is uncertain. Materials providing information for his biography are mostly business records, and few, if any, personal records remain.

Mature Wealth

The twelfth century saw the organization of the Jewish community throughout England in a vast structure mobilized to offer credit and collect on indebtedness with great efficiency. Although it is unknown whether this was the invention of Aaron of Lincoln or another great financier, Isaac, fil Joce, Aaron certainly developed this network to its fullest and most efficient extent. Laws forbidding Christians to loan money at interest were at the heart of this opportunity, and due to legal and religious restrictions on professions among the Jews, providing capital for Christian ventures of various types offered an opportunity for Aaron to create great wealth.

Aaron's investments included not only money for capital projects, such as abbeys and cathedrals, but also investments in farming operations and loans to small lenders. The interest rates that he and other lenders of the period charged were often very high, as much as 60 percent, but he is also known to have loaned a small amount to a female debtor named Truue at no interest at all. His business interests were comprehensive and successful.

Although he used a network of assistants, he was not in partnership with other Jewish lenders of the period, as the king generally forbade such partnerships. According to law, the estates of Jewish moneylenders reverted to the Crown upon their deaths. Partnership would have delayed the acquisition of their wealth by the Crown, although often, in practice, the monarch took only a percentage of the estate, allowing heirs to continue the business of lending, which profited the state greatly, given the various fees and taxes on the business's activities.

At Aaron's death in 1186, his total wealth was so great that the king chose to take the whole of his property, including Aaron's own treasury and material wealth at his house, as well as administration of his loans to others. Because of the extent of this wealth, a special government branch, the exchequer of Aaron, was set up to administer the loans. Concluding this business would take at least twenty years. The actual treasure of Aaron was shipped to France by King Henry and was lost when the ship sank in the English Channel. Aaron's wealth has been approximated at 2.5 percent of the national income of the period, the equivalent of almost £28 billion in 2010.

Legacy

Aaron's acquisition of wealth demonstrates that a financier could employ a network of agents spread over a large area to conduct almost limitless financial activities effectively and efficiently, without having to attend to every transaction personally. The immense structure that Aaron created to carry on his financial activities, the most successful early example of this type, makes him worthy of study and remembrance.

ʿAbbās the Great

Persian monarch and military leader

Under Shah ʿAbbās the Great, Ṣafavid Persia reached its height of political unity, economic prosperity, and cultural advancement. A homogenous state was created, with the Shīʿite faction of Islam as the official religion and Farsi as the national language. ʿAbbās's new capital, Isfahan, became one of the world's most beautiful cities.

Born: January 27, 1571; Persia (now Iran)
Died: January 19, 1629; Ashraf, Mazandaran, Persia (now in Iran)
Also known as: Shah ʿAbbās I; Shah ʿAbbās the Great; ʿAbbās I of Persia
Sources of wealth: Conquest; trade
Bequeathal of wealth: Children; artistic patronage

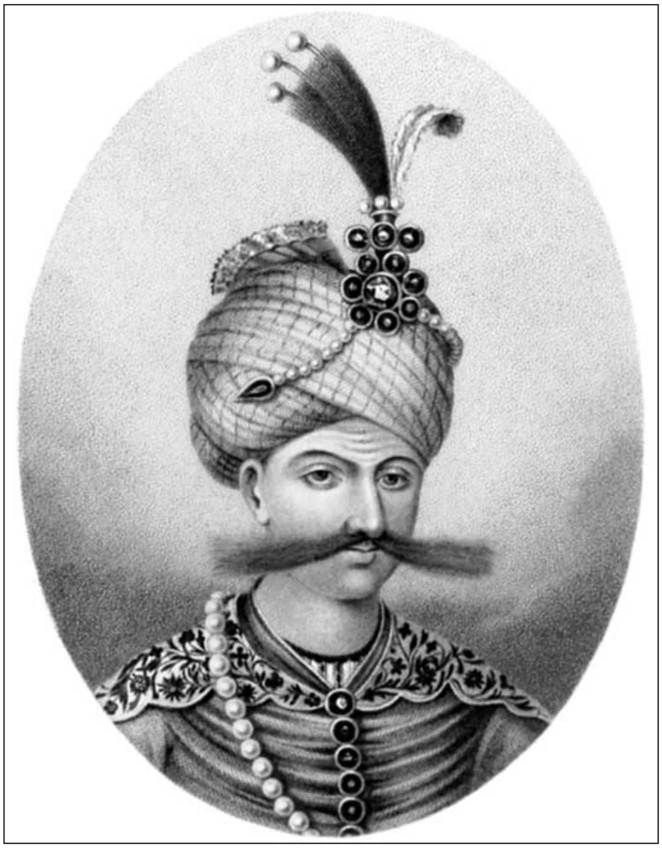
Early Life

ʿAbbās (AH-bas) the Great was born into a royal Persian family surrounded by palace intrigues. At age five, his life nearly ended when his uncle, Shah Ismāʿīl II (r. 1576-1577), ordered the execution of ʿAbbās and all of his brothers. Ismāʿīl's own untimely death prevented the murders. At the age of sixteen, ʿAbbās gained support from several leading nobles to seize the throne from his inept and nearly blind father, Shah Muḥammad Khudabanda (r. 1578-1587).

First Ventures

To unify a disintegrating Ṣafavid empire, ʿAbbās moved to quash the rebellious Turkmen and Uzbek people. By 1598, after ten years of costly military campaigns, Persia's eastern borders were secured. It was now time to confront the Ṣafavids' major adversary, the Ottoman Turks.

To prepare to fight the Turks, ʿAbbās created the *ghulam* system. *Ghulams* were personal slaves of the shah who would be trained either to be administrators, if they were bright, or to be professional soldiers of a new, standing army. Most of the *ghulams* were non-Persians and came from the Armenian, Circassian, and Georgian populations that had come under Ṣafavid rule. They were converted to Shīʿite Islam and were totally immune from Persian tribal politics. Other foreigners helped Persia forge an army capable of battling the Turks and helped construct the administrative apparatus needed to govern a re-created Persia more efficiently.



ʿAbbās the Great. (Hulton Archive/Getty Images)

Mature Wealth

In preparation for war, in 1598 ʿAbbās moved the capital from Qazwin to the more defensible central Persian city of Isfahan. From Isfahan, ʿAbbās had more central communication links with the entire country and with trading outlets on the Persian Gulf. ʿAbbās invested heavily in Isfahan, making it one of the most beautiful cities in the world. The magnificence of his capital and court and the lavish patronage given to philosophers, scientists, and artists were intended to symbolize the dawning of a new, glorious age for the Ṣafavids. A new central government administration, which ran relatively smoothly, was also constructed in Isfahan. New provinces were created and put under the administration of royal governors, many of whom were *ghulams*. All was designed to concentrate power into ʿAbbās's hands. National unity was further attempted by completing forced conversion to Shīʿism and by establishing Farsi as the national language.

The war against Turkey began in 1603, and an initial success was the retaking of Tabriz, given to the Ottomans by ʿAbbās at the start of his reign. In 1605, a major victory was achieved at Bossora, and ʿAbbās gained control of Shivran and Kurdistan. Finally in 1623, after a yearlong siege, Baghdad was seized from Ottoman rule. The holy Shīʿite cities of Karbala and Najaf also came under Ṣafavid control. Not resting on his accomplishments, ʿAbbās was able to obtain naval aid from the British East India Company, and he used this assistance in 1622 to end Portuguese control of the strategically located island of Hormuz. Thus, ʿAbbās became master of the Persian Gulf.

Legacy

Control of Hormuz produced close economic ties with Great Britain and the Netherlands, and a lucrative trade was created of Persian silks for English cloth. The sale of silk was made a royal monopoly. Under ʿAbbās, carpet weaving also became a major industry. It soon became fashionable for wealthy European homes to have fine Persian rugs. Porcelain, detailed metalwork, and miniatures also became manufactures in demand. To stimulate economic activity, ʿAbbās invested in building highways, bridges. and even merchant lodges along trading routes. He granted immunities and special privileges to attract European merchants. He also ordered many Armenian merchants to settle in Isfahan in order to help build up the silk trade with India. ʿAbbās's economic policies integrated Persia into world trade and led to a general period of prosperity.

Sheldon Adelson

American investor, property developer, and hotel and casino owner

Adelson managed to accumulate one of the largest American fortunes of the early twenty-first century through shrewd investing and vision. He gave much of his wealth to further Jewish education in the Las Vegas area and to advance medical research. He also supported Republican political causes and worked to extend the influence of Israel in the United States and the Middle East.

Born: August 1 or 4, 1933; Boston, Massachusetts
Also known as: Sheldon Gary Adelson
Sources of wealth: Real estate; tourism; investments
Bequeathal of wealth: Educational institution; political organization

Early Life

Sheldon Gary Adelson (A-dehl-suhn) is the son of Jewish parents whose families came from Lithuania and the Ukraine. He was born in a lower-class area of Dorchester, a neighborhood in Boston, where his mother owned a knitting shop and his father drove a taxicab and sold advertisements. Adelson sold newspapers as a boy. He moved to New York in the early 1950's to attend City College, where he majored in real estate and finance, but he left college without obtaining the required credits to graduate. He served a tour of duty in the army and then went to work as a stenographer on Wall Street. He became a millionaire by the early 1960's by consulting with companies on how to sell their shares in the stock market.

He thereafter returned to Boston and began speculating in businesses and increasing his wealth.

First Ventures

In Boston, Adelson began investing, eventually acquiring more than seventy different companies, the most profitable being a tour and travel business, American International Travel Service, which he bought with two friends in the 1960's. The tour service subsequently generated millions of dollars. However, he lost his fortune when the stock market declined in the late 1960's. He soon recouped his losses in the real estate brokerage business, but he lost another fortune when the condominium market crashed in the early 1970's.

In 1971, he bought a majority share of a company that published computer magazines. He then began producing shows about computers, the first one held in Dallas, Texas, in 1973. By 1984, his Interface Group had produced more than forty shows, and his Computer Dealers Exposition (COMDEX) company, designed to bring computer manufacturers and retailers together, became the largest trade show in Las Vegas. By the 1980's, Interface Company's net income exceeded $250 million, and Adelson was producing trade shows in many cities in the United States, Europe, and Japan.

Mature Wealth

Looking for more opportunities, in 1988 Adelson and his partners from Interface bought the Sands Hotel and Casino in Las Vegas, which in the public mind was forever associated with Frank Sinatra and the Rat Pack. The new owners renovated the Sands, adding a $60 million convention center. Because of a declining economy, however, the convention center did not open until 1995. In that year, Adelson and his partners sold their interest in the trade show industry to Japanese investors for $862 million. Adelson's profits in the transaction amounted to more than $500 million.

In 1996, Adelson razed the aging Sands in a nationally televised implosion to make way for his new project, a Venetian-themed hotel, for which he had gotten the idea while honeymooning with his second wife in Venice in 1991. The Venetian, a casino and hotel, in which all of the rooms were suites, opened in 1999. Constructed at a cost of $1.5 billion, the new hotel was a huge financial success. In 2003, Adelson added the Venezia Tower to the hotel, enlarging the facility to more than four thousand suites, eighteen first-class restaurants, and a shopping mall complete with canals, gondolas to transport the patrons, and singing gondoliers to pole them throughout the mall.

Adelson then turned his attention to the Far East, where he was among the first American investors to recognize a huge gambling and resort potential. He built the first Las Vegas-style casino in the People's Republic of China, the Sands Macau, in a former Portuguese colony off the Chinese coast at a cost of $265 million. He planned to build seven more casinos in the same area, including the

Sheldon Adelson visits the Marina Bay Sands construction site in Singapore. (AP/Wide World Photos)

The Dr. Miriam and Sheldon G. Adelson Educational Campus

The Las Vegas campus that bears the names of property developer Sheldon Adelson and his wife, Dr. Miriam Ochsorn Adelson, was initially founded in 1980. Back then, it was known as the Hebrew Academy, with fifty-seven Jewish students in kindergarten through second grade. Ten years later, the school moved to another location and became the Milton I. Schwartz Hebrew Academy, with enrollment expanded to include a preschool and kindergarten through eighth-grade students. A $25 million gift from the Adelsons in 2005 enabled the school to break ground for a new campus, to expand to include high school students, and to separate into three institutions: the Milton I. Schwartz Hebrew Academy for students in kindergarten through fourth grade, the Adelson Middle School for grades five through eight, and the Adelson Upper School for ninth- through twelfth-graders.

By 2009, the school was located in a $65 million ultramodern campus in the planned community of Summerlin, home to a dozen private schools, most of which are affiliated with religious institutions. The campus featured a research library and technology center; eighteen high school classrooms with three science laboratories; sixteen middle school classrooms with three science labs; twenty-four elementary school classrooms; a 350-seat performing arts theater; art studios; and a sports and fitness center with two indoor swimming pools, two basketball courts, an indoor running track, a volleyball court, tennis courts, a fencing area, and a soccer field. Enrollment in 2008 had increased to more than four hundred students enrolled in preschool through eleventh grade, and in 2009 the first twelve-grade class was in attendance. The curriculum includes instruction in the Hebrew language, Jewish religious texts, and other aspects of Judaic studies in addition to the students' other course work.

The campus is coeducational, and about 2 percent of its enrollees are students of color. It employs sixty-eight classroom teachers, 75 percent of whom have advanced degrees. Average class size is eighteen, and the teacher-student ratio is one teacher for five students. The dress code is formal. Yearly tuition for grades one through eight was $14,345 in 2009, with preschool, kindergarten, and high school students paying a slightly higher amount.

On the Adelson Educational Campus Web page, the School Notes state that "our comprehensive approach emphasizes educating each student to be academically stimulated, emotionally secure and physically healthy in a drug-free environment. It is our vision that our students will become the moral and ethical leaders of tomorrow. We are committed to providing students with an education that prepares them for life."

$2.4 billion Venetian Macau, which opened in August, 2007. Adelson also invested $12 billion to construct approximately twenty thousand hotel rooms in Macau's Cotai Strip, with the intention of modeling this area after the Las Vegas Strip. He became the first American to acquire a casino license in Singapore, where he planned to build the $5.4 billion Marina Bay Sands resort.

To raise the capital for these ambitious enterprises, Adelson took his company, Las Vegas Sands Corporation, public in December, 2004. The success of the company's initial stock offering resulted in *Forbes* magazine ranking Adelson as the world's third-richest man, with a net worth of more than $20 billion. Because of the economic downturn, however, Adelson's rank among the world's richest declined to 178th by 2008.

Adelson has devoted a considerable portion of his wealth to Jewish philanthropic enterprises, such as the Birthright Israel organization. Birthright Israel provides financial assistance to enable young Jews between the ages of eighteen and twenty-six to travel to Israel. He contributed $25 million to the Yad Vashem Holocaust Martyrs' and Heroes' Remembrance Authority in Israel. He and his wife, Dr. Miriam Ochsorn Adelson, have donated more than $25 million to the Milton I. Schwartz Hebrew Academy in Las Vegas in order to build a high school.

The Adelsons have also given considerable financial support to medical research, founding the Dr. Miriam and Sheldon G. Adelson Medical Research Foundation in 2007. The foundation is especially concerned with neural repair and rehabilitation. Adelson has suffered with peripheral neuropathy and has walked with the aid of a cane since 2001. Miriam Adelson, a native of Israel, operates drug rehabilitation clinics in Las Vegas and Tel Aviv. Adelson's adopted son Mitchell died of a drug overdose in 2005; his other adopted son, Gary, also suffers from drug dependency. The couple has plans to open more drug clinics in Israel and the United States. In early 2007, Adelson established the Adelson Family Charitable Foundation, which will eventually donate $200 million or more each year to Jewish and Israeli causes. The foundation's first gift was a pledge of $25 million to

Birthright Israel, which allowed the organization to double its capacity and bring twenty thousand participants to Israel during the summer of 2007.

Adelson has also been heavily involved in politics since accumulating his wealth. Although both he and his wife came from traditionally liberal families, he has contributed primarily to conservative political causes. In 2006, for example, he gave $1 million to former congressman Newt Gingrich's conservative political organization, Solutions for Winning the Future. In 2007, Adelson founded Freedom's Watch, a lobbying group that supports the involvement of the United States in Iraq, a militant stance toward Iran, and Republican candidates for Congress. Freedom's Watch began an advertising campaign in 2007 urging members of Congress, whose support for the Iraq War was wavering, to continue to back the conflict. In 2007, Adelson also began publishing a newspaper, *Israel HaYom* (Israel today), which strongly opposes a two-state solution for the Israel-Palestine dispute and supports Israeli Prime Minister Benjamin Netanyahu.

Since 2000, Adelson's detractors have accused him of corrupt business practices and attempting to influence public policy by buying political influence, although Adelson has been acquitted of several infractions in lawsuits brought against him.

Legacy

Sheldon Adelson accumulated an enormous fortune because of his business acumen, his ruthlessness (some would say unscrupulousness), his vision, and his willingness to take chances. He realized the potential for trade shows on a massive scale and the advantages of Las Vegas as a venue for these shows. He recognized the future of the gaming industry was in the upscale, family-oriented luxury hotels, and he built one of the first and most profitable of these hotels in Las Vegas. He was among the first to see the potential of the Far Eastern gaming industry and invested heavily in that area of the world.

However, perhaps his most far-reaching legacy is his influence on American policy in the Middle East. His lobbying efforts on behalf of Israel and the policies of Prime Minister Netanyahu will continue to affect the United States' position in that volatile area of the world for generations to come. His generosity has also had a beneficial effect on Jewish education in the United States and on medical research and drug rehabilitation efforts in Israel and America.

—Paul Madden

Claudius Aesopus

Roman actor

As the leading tragic actor of his time, Aesopus was able to acquire a vast fortune. He was, however, considered a spendthrift and was seen by later writers as an example of the decadent lifestyle of the rich during the Late Republic.

Born: fl. first century B.C.E.; place unknown
Died: After 55 B.C.E.; place unknown
Also known as: Clodius Aesopus
Sources of wealth: Acting; tutoring
Bequeathal of wealth: Children

Early Life

Nothing is known of the childhood or early life of Claudius Aesopus (KLOH-dee-uhs ay-SOH-puhs). Ancient writers were concerned with his skill as an actor and his great wealth. His cognomen, Aesopus, has led some scholars to suggest that he had once been a slave. However, it is just as likely that he was born a free Greek and later attained Roman citizenship. The latter is supported in that Cicero, the Roman statesman, would hardly have spoken of Aesopus in such endearing terms had he been of servile origin.

First Ventures

Much of the information about Aesopus comes from brief accounts in the surviving writings of ancient authors, particularly those of Cicero. According to Cicero, Aesopus was an established tragic actor by 91 B.C.E. and had performed at many state-sponsored theatrical shows. Valerius Maximus states that Aesopus would observe the manners of orators in the forum in order to hone his craft. He was known not only for his strong voice but also for his use of gestures, an important element of any form of public speaking in ancient Rome. Plutarch writes that Aesopus was so passionate an actor that on one occasion he struck and killed an attendant who crossed the stage.

Mature Wealth

Aesopus attained his great wealth by performing in plays and as a hired tutor to the up-and-coming statesmen of his day. His acting career reached a high point in 57 B.C.E., when he performed in two separate plays; he modified the lines to garner praise and support for the exiled Cicero. Indeed, Cicero was one of the statesmen who hired Aesopus as a tutor in order to improve his public speaking. The latest mention of Aesopus is contained in a letter to Cicero from his friend Atticus. Atticus states that Aesopus was among the retired actors who performed at the games celebrating the opening of the Theater of Pompey in 55 B.C.E. According to the fifth century C.E. writer Macrobius, Aesopus's estate was worth 20 million sesterces at his death. While such factors as inflation and differences in standards of living make modern dollar equivalents of ancient money untenable, it can be said that Aesopus was certainly among the wealthiest individuals of his time. To put Aesopus's wealth in its proper context, it should be considered that in his time the property qualification for a Roman senator was 800,000 sesterces, and that a day laborer earned approximately 1,000 sesterces a year.

While admired by many for his skill as an actor and tutor, Aesopus was criticized for mismanaging his wealth. Pliny states that he showed no respect for his lavish fortune, serving up dinners worth 100,000 sesterces that featured cooked songbirds costing 6,000 sesterces each. His son, Marcus Clodius Aesopus, continued to squander the family fortune. He was said to have concocted a favorite drink by dissolving an expensive pearl in vinegar.

Legacy

While actors were generally looked down upon in Roman society, the case of Aesopus demonstrates that the very best not only were in high demand but also were able to attain great wealth, reflecting the popularity of the theater in the Late Republic. They were also sought out as tutors by those, like Cicero, who wished to become important statesmen, thus demonstrating the important reciprocal nature of acting and public speaking in Roman society. The mismanagement of his wealth, however, caused Aesopus to be criticized by his contemporaries as an example of the excesses and decadent lifestyle of the rich.

Aga Khan I

Ismāʿīlī political and spiritual leader

Aga Khan I, spiritual and political leader of the Ismāʿīlī Shīʿite community of Islam, acquired his wealth from the tithing of his followers, as well as from horseracing and other investments. He used his wealth in a variety of civic and philanthropic ventures to improve the quality of life for his followers in South Asia, the Middle East, and Africa.

Born: 1800; Kahak, Persia (now in Iran)
Died: April, 1881; Bombay (now Mumbai), India
Also known as: Ḥasanʿalī Shāh (birth name); Muḥammad Ḥasan
Sources of wealth: Inheritance; church; investments
Bequeathal of wealth: Children

Early Life

Aga Khan (AH-gah kahn) I was born Ḥasan ʿalī Shāh in Kahak, Persia (now Iran), the son of the forty-fifth Ismāʿīlī imam, Shah Khalil Allah, and Bibi Sarkara, the daughter of a Persian poet. The untimely murder of Khalil Allah in 1817 elevated Aga Khan to the position of forty-sixth imam of the Nizārī Ismāʿīlī Muslims but left the new imam destitute. Aga Khan's mother moved the family to the Persian holy city of Qom and later to Tehran, seeking redress for Shah Khalil's murder by businessmen in Yazd.

Fatḥ ʿAlī Shāh , the shah of Persia, punished the murderers of Khalil Allah, gave Aga Khan's family land in the Mahallat and Kerman regions of Persia, and married Aga Khan to his daughter, Sarv-i Jahān Khānum. Fatḥ ʿAlī Shāh's generosity was based on his fears that the Ismāʿīlīs might seek revenge against him for their imam's murder.

First Ventures

Ismāʿīlīs are Shīʿite Muslims who believe that the rightful successor to the Prophet Muḥammad must be a blood descendant of the Prophet's daughter, Fāṭimah, whose husband Ali was both the Prophet's cousin and his son-in-law. In 1094, the Ismāʿīlīs split into two branches, the Mustalis and the more numerousNizārīs, as the result of a disagreement over which son of the eleventh imam of the Shīʿite sect should be recognized as the twelfth imam. The Nizārīs accepted blind obedience to their spiritual leader, sanctioning the imams' ruthless murders of political opponents. The Nizārīs came to be called Hashishi (hashish eaters), who consumed the plant before committing political assassinations throughout the Muslim world; the word "assassin" is derived from the word "Hashishi." Their history of violence relegated them to the mountain regions of Syria, Persia, and Afghanistan. In 1256, the Mongols destroyed most of the Nizārīs' Persian followers. The Nizārīs sought converts in Egypt, Africa, and China. Ismāʿīlī converts, called Khojas, settled in western India around Bombay and would eventually become the base of Aga Khan I's followers.

The title Aga Khan I was conferred on Ḥʿalī Shāh by his father-in-law, Fatḥ ʿAlī Shāh. Aga Khan means "lord chief." Aga Khan I governed Mahallat province and was known for his lust for both battles and beautiful women. He was reputed to have fathered more than three thousand children, but only three of his sons were considered legitimate. Light-skinned with a striking appearance, Aga Khan I displayed a gallant manner that masked his ambition.

Aga Khan's refusal to permit the marriage of his daughter to the prime minister of Persia in 1837 caused a rift with the Persian government under the new shah, Aga Khan's brother-in-law. Aga Khan considered the marriage proposal an insult because the prime minister's family was from a lower class. His refusal led to a battle between the Ismāʿīlī and Persian forces in 1838-1840, resulting in a defeat for Aga Khan's troops and his flight to the Sind region (now in Pakistan). While in the Sind, Aga Khan aided the British in the Punjab region of India in their war against the Afghans, fought in 1841-1842. By helping Charles James Napier conquer the Sind in 1843-

1844, Aga Khan was awarded a British pension of 1,000 rupees, or about $500.

Between 1845 and 1848, Aga Khan immigrated to Bombay (now Mumbai), where many Ismāʿīlīs resided, and in 1846 he was declared a political prisoner and removed to Calcutta by the British under pressure from the shah of Persia, who feared Aga Khan. Aga Khan returned to Bombay in 1848 after the death of his Persian brother-in-law, Muḥammad Shah Qajar. In Bombay, the Aga Khan established his religious headquarters, or *durkhana*, a place of pilgrimage where his associates and supporters could visit. Aga Khan paid the expenses of more than one thousand dependents, family members, retainers, and a troop of two hundred cavalry.

The Aga Khan Development Network and the Ismāʿīlī Imamat

The Aga Khan Development Network is a nonprofit organization funded by Aga Khan IV and by donations. The network seeks to improve living conditions and opportunities for poor people in Asia and Africa, regardless of faith, origin, or gender. The organization works in more than twenty-six countries and employs sixty thousand people. Among its projects, the network has brought water to dry regions; funded business enterprises; built medical facilities and nursing schools; and promoted education for Ismāʿīlī Muslims. In the twenty-first century, the network's projects have included financing centers for the study of Islam in Western nations.

The network consists of several agencies, including organizations focusing on microfinance, education services, economic development, health services, planning and building, and culture, as well as Aga Khan University and the University of Central Asia. Each agency is chartered with a specific mandate but is designed to work with the other organizations in order to achieve common goals. The network's budget for 2008 was $450 million; these funds were provided by the Aga Khan Fund for Economic Development, which generates annual revenues of $1.5 billion and reinvests surplus revenue in development projects.

The network was founded by Aga Khan IV, the forty-ninth imam and spiritual leader of the Ismāʿīlīs. Aga Khan IV has led the network for more than fifty years, and he has been instrumental in obtaining funding from national governments, multinational institutions, and private sector organizations. The Ismāʿīlī community contributes volunteer time, professional services, and financial contributions. Although the network initially was established to benefit the Ismāʿīlī Islam community in South Asia and East Africa, the organization has expanded its reach to Egypt, India, Kyrgyzstan, and Mali.

Ismāʿīlī Muslims believe that revelation ceased with the death of the Prophet Muḥammad, but the need for spiritual and moral guidance continues under the leadership of a direct descendant of the Prophet. The Ismāʿīlīs are the second-largest Shīʿite Muslim community, with the largest residing in Iran. Aga Khan IV has emphasized the role of intellect in the realm of faith, maintaining that intellect is revealed through the Prophet Muḥammad and through man's own virtue in remembering that the mind is God's creation. The projects of the Aga Khan Development Network emphasize that God's creation is not static but continues through scientific projects and other endeavors. Aga Khan IV has stated that confronting the challenges of science and ethics is a requirement of the Islamic faith. His guidance provides a liberating framework with which to enable an individual's quest for meaning and to find solutions to problems experienced by Ismāʿīlī Shīʿites in a global age.

Mature Wealth

The Bombay High Court on November 12, 1866, confirmed the title and rights of Aga Khan I. Under the British raj, Aga Khan was granted princely status with the right to use the initials H. H. (for His Highness) before his name. He resided in the Bombay palaces of Poona and Aga Hall. Aga Khan agreed to take no active part in Indian politics, but he did accept a seat on the Bombay legislative council.

Aga Khan I was widely recognized for his participation in the sports of hawking and breeding hounds, and he maintained a lavish stable of Persian, Arabian, English, and Turkomen racehorses. He successfully took legal action against a rival, more liberal branch of the Ismāʿīlīs, who criticized his morals. Aga Khan reorganized his sect's finances around the practice of tithing (donating 10 percent of income), providing gifts for special occasions, and the ritual of Kahada-Khuaraki, at which large meals for families were auctioned off and the revenue donated to Aga Khan. All of the funds he collected were invested in horses and real estate. Aga Khan died in 1881 and was buried at a shrine in Bombay.

Legacy

Aga Khan I redefined the image and purpose of Ismāʿīlī Muslims. The expulsion of Aga Khan from Persia, his elevation to princely status by the British, and his shrewd investments led to a complete image makeover for this branch of Shīʿite Muslims. Investments and tithing formed the basis of Aga Khan I's wealth, and his fortune was supplemented by silver, gold, and diamond celebrations in which Ismāʿīlīs brought these commodities to match his weight. The funds raised from these celebrations were invested and contributed to Aga Khan's charitable contributions, which were designed to benefit Ismāʿīlīs. In the process, the Ismāʿīlīs under Aga Khan I became an international organization with followers residing in twenty-five countries. With a strengthened religious and political organization, Aga Khan I engaged in humanitarian, educational, and philanthropic endeavors benefiting Ismāʿīlīs on a global stage.

Agamemnon

Greek king and military leader

Agamemnon, the king of Mycenae, is a well-known figure in Greek mythology and literature. His fortune, though considerable in its own right for a Homeric king in the Greek epic tradition, has come to symbolize the wealth and power of Mycenaean civilization of the late Bronze Age (c. 1580-1150 B.C.E.*).*

Born: fl. thirteenth-twelfth century B.C.E.; Greece
Died: fl. thirteenth-twelfth century B.C.E.; Greece
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Spouse

Early Life

According to Homeric and Greek mythological traditions, Agamemnon (ag-uh-MEHM-non) belonged to the royal line of Atreus. Hittite records from the fourteenth century B.C.E. attest to a certain Attarssiyas of Ahhiyawa, which may refer to Atreus, Agamemnon's father. Any connection, however, between Agamemnon, or his family, and specific historical figures in the Greek Bronze Age must remain speculative.

First Ventures

Agamemnon's early wealth would have come from inheritance, as he was the eldest son and heir of Atreus, the king of Mycenae. The historian Thucydides mentioned that Agamemnon's grandfather Pelops had acquired a great fortune in Asia Minor and had settled in Mycenae in the Peloponnese. Unfortunately, the house of Atreus was sullied by a troubled past filled with political intrigue, murder, rape, incest, and religious sacrilege. As a result, Agamemnon and his brother Menelaus found themselves deposed from their home city of Mycenae after the death of their father. Both Agamemnon and Menelaus took refuge in the city of Sparta, where they married the daughters of King Tyndareus. Menelaus married the beautiful Helen, while Agamemnon took the hand of the notorious Clytemnestra. Later, Agamemnon, with his brother's aid, returned to Mycenae, where he restored his immediate family to power and became king. As ruler of Mycenae, Agamemnon had access to the wealth and resources of one of the richest cities mentioned in Homer's *Iliad* (c. 750 B.C.E.; English translation, 1611).

Mature Wealth

Agamemnon was at the height of his wealth and power during the Trojan War, when he was the leader of the Greek expedition sent to retrieve Helen. Throughout Homer's *Iliad*, Agamemnon's epithet is the "Son of Atreus, wide-ruling," from "Mycenae, rich in gold." The epic tradition states that he was able to muster an armada of 1,186 ships from twenty-eight different areas in Greece. Agamemnon himself commanded one hundred of these ships, the largest of any single contingent of Greek heroes. Homer's famous catalog of ships provides evidence that Agamemnon had expanded his control over large areas of the Peloponnese and enjoyed the riches that his increased power provided.

The campaign against the Trojans was long and difficult, lasting for a good part of a decade. During the war's tenth year, a disagreement over the distribution of war booty between Agamemnon and the Greeks' best warrior, Achilles, jeopardized the entire conflict. In an attempt to mollify Achilles' hurt feelings, Agamemnon made the great warrior a substantial gift offering that included seven bronze tripods, twenty shining cauldrons, twelve horses, seven skilled women from the island of Lesbos, and an amount of gold equivalent to the value of five pairs of oxen. These gifts were of enormous value in a premonetary, gift-exchange economy. Eventually, the city of Troy fell, and the Greek heroes left for home. Upon his return to Mycenae, Agamemnon was struck down by his wife, Clytemnestra, and her lover Aegisthus.

Legacy

For centuries, Agamemnon and Mycenae were relegated to the realm of legend and mythology until the excavations of archaeologist Heinrich Schliemann brought to light the existence of a Bronze Age Greek civilization, which closely resembled in some aspects the civilization described in Homer's epic poems. In 1876, Schliemann, while excavating the city of Mycenae, discovered a group of grave circles containing magnificent objects, including a golden mask of such quality that it prompted Schliemann to exclaim that he had found the tomb of Agamemnon himself. Although modern analysis of Schliemann's finds date the mask and the circle graves to a time earlier than when Agamemnon supposedly lived, the golden artifacts and wealth found at Mycenae have become synonymous with its legendary king.

GIOVANNI AGNELLI

Italian automobile manufacturer

Agnelli ruled the automaker Fiat, one of Italy's largest companies. As head of the family-run firm for more than forty years, he became a great Italian industrialist, as well as a power broker. He oversaw Fiat's purchase of the Lancia, Maserati, Alfa Romeo, and Ferrari car companies.

Born: March 12, 1921; Turin, Italy
Died: January 24, 2003; Turin, Italy
Also known as: Gianni Agnelli
Sources of wealth: Inheritance; manufacturing; sale of products
Bequeathal of wealth: Spouse; relatives; charity

Giovanni Agnelli with the cars produced by his Fiat factory. (Time & Life Pictures/Getty Images)

EARLY LIFE

Giovanni "Gianni" Agnelli (joh-VAHN-nee jee-AH-nee ag-NEL-lee) was the grandson and namesake of Giovanni Agnelli, the founder of the Italian car company Fiat S.p.A., and the son of industrialist Edoardo Agnelli and Virginia Bourbon del Monte, daughter of an Italian aristocrat. Agnelli attended the Pinerolo Cavalry Academy and studied law at the University of Turin, though he never practiced as an attorney. When Italy entered World War II, Agnelli joined a tank regiment and saw service at the Russian front. Wounded twice in Russia, Agnelli recovered to serve in North Africa. A German officer in North Africa shot Agnelli in the arm during a bar fight over a woman. After Italy surrendered in 1943, Agnelli became a liaison officer with the occupying American forces because of his fluency with English.

FIRST VENTURES

Upon the death of his grandfather in 1945, Agnelli became the head of the family. He began learning the family business under the guidance of Vittorio Valleta, who headed Fiat until an Agnelli could take over the company. Like many Italian industrialists, who combine money with status by marrying into the nobility, Agnelli married Princess Marella Caracciolo of Castagneto, a socialite, in 1953. With a reputation as one of Italy's greatest playboys, Agnelli continued to be involved with other women throughout his marriage, including film star Anita Ekberg and fashion designer Jackie Rogers. He undoubtedly spent a good deal of money in his pursuit of women, while also developing a reputation as a man of exquisite fashion taste.

MATURE WEALTH

In 1963, Agnelli became managing director of Fiat; three years later, he became chairman. One of the major events of his professional life took place in 1966, when he orchestrated a joint venture between Fiat and Soviet automaker AutoVAZ, in which Russia built an automobile plant capable of producing 660,000 cars per year. Much of Agnelli's professional life, however, involved dealing with Italy's powerful trade unions. By appealing directly to Italians, Agnelli broke the power of the unions in the 1980's.

Agnelli spent his money on art, especially paintings, and on fashionable clothes. He could often be found in a custom-made suit designed by the Caraceni fashion house with an expensive wristwatch worn over the cuff. Typical of an automobile magnate, he also loved fast cars, as well as sailing, skiing, and horses. A famous soccer fan, he briefly owned the Italian club Juventus. Agnelli also spent money and time to promote Italy. The city of Turin won the honor of hosting the 2006 Winter Olympics largely because of Agnelli's promotional efforts. In 1991, Agnelli became a senator for life, with the honor serving as tribute to his long service to Italy.

Agnelli succumbed to prostate cancer and died in 2003. As he lay in state in an art gallery that he had recently donated to Turin, more than 100,000 people paid their respects. Agnelli's funeral, broadcast on television, brought thousands of mourners to Turin's cathedral. Agnelli bequeathed his famed collection of paintings to the city of Turin. Fiat remained in Agnelli family hands, though General Motors purchased 20 percent of the company in 2000.

Legacy

Agnelli provided jobs for Italians in the years after World War II, protecting them from poverty and earning the undying love of many people. To Italians, Agnelli was far more than an industrialist. With his love of fashion, appreciation for beauty, and financial influence, he became symbolic of Italy itself. Italians watched his every move and reacted to his death with tears. His demise was like the death of an Italian king.

For most of Agnelli's lifetime, Fiat held a major share of the Italian car business. In 1990, 75 percent of Italians bought a Fiat. By the time of Agnelli's death, however, only about 33 percent of Italians purchased a Fiat. The company reported a $1.3 billion loss for 2002, and many Italians doubted that Fiat would survive for much longer.

Mohammed Hussein Ali Al Amoudi

Saudi Arabian investor

Born in a small provincial town in Ethiopia, Al Amoudi was ranked by Forbes *magazine in 2010 as the world's sixty-fourth-richest person, with a net worth of $1 billion. Although he is involved in diverse ventures all over the world, his investments constitute a sizable portion of the Ethiopian economy.*

Born: 1946; Dessie, Ethiopia
Also known as: Mohammed Hussein Ali Al Amoudi
Sources of wealth: Construction business; investments; real estate; oil; mining; tourism
Bequeathal of wealth: Relatives; charity

Early Life

Mohammed Hussein Ali Al Amoudi (moh-HAH-mehd hoo-SAYN ah-LEE ahl ah-MOO-dee) was born in Dessie, Ethiopia, in 1946, the son of a Yemeni father and an Ethiopian mother. He grew up in Weldeya, a small rural town in Ethiopia, before he moved in 1965 to Saudi Arabia, where he became a citizen.

First Ventures

In Saudi Arabia, Al Amoudi embarked upon his first business venture. Although the details of his early business remain scanty, it is known that his initial wealth was acquired after he left his job as a cement dealer to become a construction material supplier to a Swedish-operated project for the Saudi defense ministry. Al Amoudi was said to have been a front man for Sultan bin Abdul Aziz al-Saud, the Saudi minister of defense and aviation.

Mature Wealth

After his first investments in construction-related businesses in Saudi Arabia, Al Amoudi rapidly branched out into real estate development, the oil and gas industries, mining, agriculture, hotels, and finance. His investments were organized under four conglomerate companies—Corral Group, MIDROC Europe, MIDROC Ethiopia, and ABV Rock Group—and were scattered across the globe, with significant concentration in Sweden, North Africa, the Middle East, and Ethiopia. Preem Petroleum, part of the Corral Group, is the largest integrated petroleum company in Sweden. Svenska Petroleum, Al Amoudi's other Swedish holding, has been engaged in explorations off the West African coast. Corral Morocco Gas and Oil and Corral Oil Company are major players in the gas and oil industries in Morocco and Lebanon, respectively.

However, nowhere do Al Amoudi's investments have as much impact as in Ethiopia, where his MIDROC Ethiopia conglomerate consists of thirty enterprises and business interests and is the largest privately held business in the country. In addition to his extensive control over gold mines and construction-related businesses, Al Amoudi has moved to expand his investments in Ethiopian farms. The Al Amoudi-owned Saudi Star Agricultural Development Company has been negotiating with the Ethiopian government to acquire about 500,000 hectares of agricultural land that would be used to grow food in Ethiopia for Saudi Arabia.

Legacy

Al Amoudi is a truly self-made billionaire who rose from an impoverished boyhood in a remote district in Ethiopia to become one of the richest men in the world. His far-flung business empire employs more than forty thousand people. He has made generous donations to several charity organizations, including the William J. Clinton Foundation. Al Amoudi sponsors the St. George Football Club, one of the best-known soccer teams in Ethiopia. He has paid the medical expenses of a number of individuals in Ethiopia who needed treatment abroad. The Ethiopian government has awarded him the First Special Millennium Golden Medal for his "exemplary deeds for the development of Ethiopia and its people." He has also been honored by King Carl XVI Gustaf of Sweden with the Swedish Royal Order of the Polar Star, and he has been recognized by the World Bank and the U.S. State Department for his support of African development through his investments.

There are persistent reports that Al Amoudi's holdings are partially a front for the Saudi royal family. Al Amoudi has also been accused of using his enormous wealth and close association with the Ethiopian government to force out business competitors and create a virtual monopoly on several lucrative sectors in the Ethiopian economy. In addition, there are allegations that Al Amoudi has been using his considerable wealth and influence to evade regulations and proper scrutiny of his business performance in Ethiopia. His open support for the government in power during the fiercely contested 2005 Ethiopian election has earned him widespread condemnation from opponents of the regime. The few private newspapers in Ethiopia including *The Reporter*, have run a series of articles alleging corruption and inefficient practices in Al Amoudi's business enterprises in that country.

Al-Waleed bin Talal

Saudi Arabian investor

Al-Waleed bin Talal may have been the leading global investor of the last decade of the twentieth and the first decade of the twenty-first century, with substantial holdings in 120 countries. He also was the largest single foreign investor in the United States.

Born: March 7, 1955; Riyadh, Saudi Arabia
Also known as: Al-Waleed bin Talal bin Abdul Aziz Al Saud; Al-Walid bin Talal; Walīd ibn Talāl; Alwaleed
Sources of wealth: Inheritance; investments
Bequeathal of wealth: Relatives; charity; educational institution

Early Life

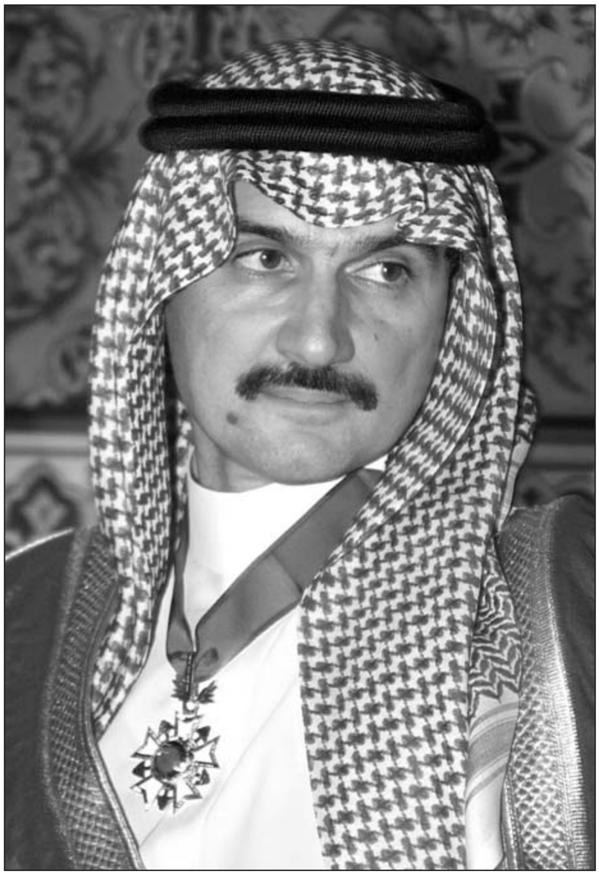
Al-Waleed bin Talal (ahl-WAH-leed bihn tah-LAHL) bin Abdul Aziz Al Saud is the son of Prince Talal bin Abdulaziz Al Saud and Princess Mona El-Sohl. Al-Waleed's father was the twenty-first son of King Abdulaziz bin Saud, the founder of modern Saudi Arabia, and Al-Waleed is a royal prince of the Saudi kingdom. (According to Arabic custom, the son takes the name of his father as part of his surname with the prefix "bin" or "ibn.") Princess El-Sohl is the daughter of Riad El-Sohl, the first prime minister of modern Lebanon. Al-Waleed was the oldest of three children born to his parents before they divorced in 1968.

As a result of the divorce, Al-Waleed was raised in both Lebanon and Saudi Arabia, and he has remained attached to both nations, as well as to the United States, where he attended college. He went to the Pinewood and Choueifat Schools in Lebanon, but he was a lackluster student. During this time, however, he did grow more attached to his Islamic faith. At nineteen, he enrolled in Menlo College in Atherton, California, near Stanford University. He also married his cousin, Princess Dalal Al Saud. They had two children, a son Khaled, born on April 12, 1978, and a daughter Reem, born on June 20, 1982.

First Ventures

In 1979, Al-Waleed returned to Saudi Arabia. For most of human history, the Arabian Peninsula has known little material prosperity. However, in the 1930's American geologists discovered the world's largest oil reserve beneath the area's desert sands. By the 1970's, the oil wealth of the Saudi royal family and its five thousand princes had become legendary. The Saudi economy was booming, and with $30,000 from his father, Al-Waleed set up his first company, the Kingdom Establishment for Trading and Contracting. Al-Waleed also accumulated a steady stream of income from the 5 percent commission that every foreign venture had to pay an Arabian representative in order to do business in the kingdom, a reliable source of revenue for Saudi princes and other well-connected Saudi businessmen. Al-Waleed received commissions from real estate and construction projects.

After earning a master's degree from Syracuse University, Al-Waleed borrowed 1 million riyals (equivalent at this time to about $300,000 in U.S. currency), and he expanded his business ventures by entering the banking sector. In 1986, he acquired control of the unprofitable United Saudi Commercial Bank. He revamped its operations by dismissing some employees and providing incentives to others, and the bank turned a profit within two



Al-Waleed bin Talal. (AP/Wide World Photos)

Stock Markets

In the modern world, there is no greater generator of wealth than the stock market. According to *Forbes* magazine's 2010 list of the world's billionaires, the three richest men accumulated their fortunes through spectacular increases in the value of their core stock holdings: Carlos Slim, with his shares of the Telmex telephone company; Bill Gates, with shares in Microsoft Corporation; and Warren Buffett, with shares in Berkshire Hathaway, Inc. The importance of the stock market reflects the dominance of the corporate model in the modern economy. It also demonstrates the movement of wealth from tangible assets, such as land, cattle, and gold, into financial instruments that can be denominated in stock shares and financial derivatives.

A stock market exchange is a medium that enables investors to buy and sell shares of companies. The rise of the joint-stock company—the first corporation—and the first modern stock exchange occurred simultaneously. The Dutch East India Company was chartered in 1602 in order to sell shares in the company's trade. Stock markets emerged to enable shares or stocks in this company to be exchanged for an agreed upon price. By 1607, one-third of the stock of the Dutch East India Company had been sold to secondary purchasers. In 1609, the Amsterdam Stock Exchange was founded in order to create an orderly secondary market for these shares. With the formation of similar joint-stock companies throughout the world, stock exchanges were created in the world's major financial markets.

Stock markets have been a critical means of raising money for corporations and of capitalizing major industries. Countless fortunes have been made—and lost—in the stock market. Stock markets have seen bubbles, panics, crashes, fraud, and every other spectacle of the modern fluctuating economy. By 2008, the size of the world's stock markets was estimated at more than $37 trillion, with the derivatives market—financial instruments that derive their prices from the price of underlying securities—at more than twenty times that amount, or a staggering $791 trillion. In separating ownership of the company from its management and liability, stock markets have allowed millions of average investors to participate in corporate ownership.

However, dispersing ownership among millions of uncoordinated, "part-time" shareholders can create difficulties. Accountability for the conditions and wages of workers can become attenuated. In addition, in the late twentieth and early twenty-first centuries corporate scandals arose when chief executive officers received hundreds of millions of dollars in compensation from corporate boards of directors and when lawyers collected billions of dollars from companies in which share prices declined or mergers were completed, to the detriment of shareholders.

Al-Waleed bin Talal is one of the most important stock market investors of modern times. As of 2009, he had significant holdings in 120 countries and was the single largest foreign investor in the United States. He has formulated some cardinal rules of investing. He maintains that one should always be patient and should not chase the stock market but should wait until stock prices decline before making investments. He also advises individuals to invest in "liquid" companies—or companies in which stock can be bought and sold easily and rapidly—so an investment can be sold quickly. Each investment should be equal to at least 1 percent of an individual's net worth, even if that net worth is in the billions of dollars, in order to make a significant impact on one's overall investment portfolio.

years. He then acquired the Saudi Cairo and Saudi American Banks, as well as the Savola and Al-Azizia Panda food operations. Al-Waleed then turned his attention to the United States, buying $250 million worth of shares in Citibank and Chase Manhattan, Manufacturers Hanover, and Chemical Banks.

Mature Wealth

By 1990, Al-Waleed had become a billionaire and the largest investor in the Middle East. That year, he made the most important investment of his career by obtaining 207 million shares of the undercapitalized Citibank at $2.50 a share. In 1991, he invested another $590 million in Citibank, making him its single largest shareholder. He then bought shares of other large American companies, including technology pioneer Apple Computer, Inc. Al-Waleed made a $345 million investment in Euro Disney, giving him a 24 percent stake in this amusement park. He has purchased world-famous hotels, such as the Plaza in New York City, the George V in Paris, and the Fairmont, Four Seasons, and Movenpick hotel chains. He has also invested in the Canary Wharf commercial real estate project in London, the Saks Incorporated retail chain, and Planet Hollywood restaurant and resort chain.

In Saudi Arabia, Al-Waleed's Kingdom Establishment holding company has played a dominant role in the economy. In 1985, he built the Kingdom Tower in Riyadh, a 994-foot-tall building that was the largest skyscraper in the Middle East. This real estate development, valued at 1.7 billion riyals ($453 million), includes the Kingdom Centre, with a shopping mall, a hotel, and an expansive apartment complex. Al-Waleed also constructed the modern Kingdom Hospital at a cost of 400 million riyals ($107 million), the Kingdom School for 330 million riyals ($88 million), and the Kingdom City residential complex for 400 million riyals ($107 million).

In 2005, *Forbes* magazine ranked Al-Waleed the fifth-richest person in the world, with assets of $21.5 billion. His Kingdom Holdings investment portfolio included $11.4 billion in the banking sector, primarily in Citibank. His stake in real estate, hotels, and Saudi Arabian construction projects totaled $4.6 billion. He also had invested $3.1 billion in Euro Disney and other entertainment ventures, including the Arabic recording label Rotana. His stake in the technology and Internet companies Apple Computer, Inc., Hewlett-Packard, Kodak, Motorola, Amazon.com, eBay, and Priceline was more than $1 billion. Al-Waleed was the largest single foreign investor in the United States. His Savola group of food-related investments in Saudi Arabia was worth almost $500 million. In addition, his personal trove of cash, palaces, planes, and boats was worth more than $5 billion. Al-Waleed had slipped to number nineteen in *Forbes* 2010 list of world billionaires, and his estimated net worth had declined to $19.4 billion.

Al-Waleed's wealth raises questions about the source of his fortune. His critics charge that he has made his money through his royal connections. Dan Briody, author of *The Iron Triangle: Inside the Secret World of the Carlyle Group* (2003), improbably suggests that Al-Waleed was a front man for secret government money supplied to him by Saudi defense minister Sultan bin Abdul Aziz. Al-Waleed, however, has insisted that he is essentially a self-made man, providing documentation to support his argument. Although he has conceded the benefits of the start-up money provided by his father and the prestige of his royal name, he has claimed that he earned his billions of dollars through his own investments.

He is certainly a disciplined investor, who has devoted his time and resources to economic research. One of his heroes is the world chess champion Garry Kasparov, whom Al-Waleed admires for his strategic and long-term thinking, qualities which Al-Waleed aimed to duplicate in his investment strategy.

Al-Waleed's status as the world's largest Middle Eastern investor has also generated controversy. After the terrorist attack on of the World Trade Center in New York City on September 11, 2001, he offered a $10 million donation to the Twin Tower Fund, which was rejected by Mayor Rudy Giuliani because of political statements that Al-Waleed had made regarding Middle Eastern politics.

In December, 1994, Al-Waleed divorced Princess Dalal. Two years later, he married Princess Iman Sudairi, but they divorced within a year. Since then, he has been married to two other women. With an annual income of more than $500 million a year, Al-Waleed has been able to live a princely lifestyle. His palace in Riyadh cost hundreds of millions of dollars to build and maintain, with a staff of more than two hundred servants and groundskeepers. The palace measures 460,000 square feet, with 420 rooms, 1,500 tons of Italian marble, exquisite silk carpets, 520 televisions, a forty-five-seat film theater, eight elevators, three swimming pools, a bowling alley, and tennis courts. His 120-acre desert compound outside Riyadh boasts a zoo, a farm, horse stables, and five artificial lakes. He has vacationed in a 283-foot yacht, the *5KR*, off the coast of Cannes, France, tended to by hundreds of employees in power boats. His fleet of personal planes includes a luxurious Boeing 747 jumbo jet; his fleet of cars numbers more than one hundred. In his palace, he stores fifty boxes of jewelry, worth $700 million.

Legacy

Al-Waleed spends about $100 million a year on charity, which includes building Islamic mosques throughout the world; donating to the needy in Saudi Arabia, Lebanon, and Palestine; and providing disaster relief. He has funded centers in universities in Cairo, Egypt; Beirut, Lebanon; Syracuse, New York; and Exeter, England. In 2005, he donated $20 million each to Georgetown University and Harvard University to establish Islamic study centers.

Eighteenth Duchess of Alba

Spanish aristocrat and socialite

The eighteenth duchess of Alba holds more titles than anyone in the world, with more than fifty titles of nobility. The sole heir to her family's fortune, landholdings, palaces, and private collections of art and artifacts, her net wealth is conservatively estimated at $500 million.

Born: March 28, 1926; Madrid, Spain
Also known as: María del Rosario Cayetana Alfonsa Victoria Eugenia Francisca Fitz-James Stuart y Silva (birth name); Cayetana Fitz-James Stuart; Duchess of Alba de Tormes
Sources of wealth: Inheritance; real estate; agricultural products
Bequeathal of wealth: Children

Eighteenth Duchess of Alba. (AFP/Getty Images)

Early Life

The eighteenth duchess of Alba (AHL-bah) is related by birth to Mary, Queen of Scots; Christopher Columbus; Empress Eugénie of France; and British prime minister Winston Churchill. Her ancestor, María del Pilar de Silva, thirteenth duchess of Alba, was the subject of *The White Duchess* (1795), a noted painting by Spanish artist Francisco de Goya.

Her name at birth was María del Rosario Cayetana Alfonsa Victoria Eugenia Francisca Fitz-James Stuart y Silva. An only child, the duchess's father was the seventeenth duke of Alba, Don Jacobo Fitz-James Stuart y Falcó, who served as Spain's ambassador to Great Britain during World War II; her mother was María del Rosario de Silva y Gurtubay, the fifteenth duchess of Aliaga and the ninth marchioness of San Vicente del Barco. Known by her nickname Tana, she grew up in an atmosphere of wealth and luxury. She was born in 1926 and lived in the eighteenth century Liria Palace in Madrid, which was destroyed during the Spanish Civil War (1936-1939) but subsequently rebuilt.

First Ventures

In one of the most expensive weddings ever, the duchess was married in 1947 to the duke of Sotomayor's son, Pedro Luis Martínez de Iroju y Artácoz. The couple had six children, all of whom were titled and made grandees after she became the eighteenth duchess of Alba upon the death of her father in 1953. The duchess's children are all surnamed Fitz-James Stuart y Martínez de Irujo and include

Carlos, eighteenth duke of Huéscar, born in 1948; Alfonso, duke of Aliaga, born in 1950; Jacobo, count of Siruela, born in 1954; Fernando, marquis of San Vicente del Barco, born in 1959; Cayetano, count of Salvatierra, born in 1963; and María Eugenia, eleventh duchess of Montoro, born in 1968.

Despite marriage and motherhood, the attractive and vivacious duchess was rumored to have engaged in numerous affairs with toreadors and flamenco dancers at her more secluded palaces in Cordoba and Seville. Her husband died of cancer in 1972, and six years later she married a former Jesuit priest and scholar, Jesús Aguirre y Ortiz de Zárate, who was temporarily given the title "duke of Alba." Her second husband and eldest son coadministered the extensive family properties until Zárate's death in 2001.

Mature Wealth

A well-known socialite and celebrity, the duchess of Alba has been an intimate of Spain's royalty and nobility. Although troubled late in life with physical problems, she continued to perform extensive charity work and has been a member, officer, and benefactor of many cultural organizations. She owns two agribusinesses, Euro Explotaciones Agrarias and Eurotéchnica Agraria, which have received millions of dollars in government subsidies. She also owns eighty-five thousand acres of land.

The duchess's residence, Liria Palace, features regular public tours of selected family treasures, from which she derives income. The items on display include paintings by Goya, Titian, Rembrandt, Peter Paul Rubens, Fra Angelico, Bartolomé Esteban Murillo, and El Greco. Display cases feature such unique items as the first Bible translated into Spanish, known as the Alba Bible (1430); King Ferdinand II and Queen Isabella I's marriage certificate; a document freeing Columbus from jail; and crown jewels. Tourists can also view masterpieces of tapestry that drape the walls, priceless porcelain figurines, suits of armor, and the duchess's own collection of perfume bottles.

Legacy

The duchess planned to marry for a third time when she was eighty years old. Her intended was antiques dealer Alfonso Díez Carabantes, twenty-four years her junior. Her desire became a point of contention among her six children. Three believed she should be allowed to marry; the others, including her eldest son Carlos, the future duke of Alba, opposed the wedding. Although the dukes and duchesses of Alba are exempt from kneeling before the pope and allowed other singular privileges, they are also subject to the Spanish monarchy. Therefore, the duchess must gain permission to marry from King Juan Carlos I. As of June, 2010, the king was against the wedding, but Queen Sofia was in favor of the proposed union, and the issue remained unresolved.

Miguel de Aldama

Cuban sugar magnate and investor

The wealthiest Cuban of the nineteenth century, Aldama supported Cuban independence, and for this reason his plantations and mansions were confiscated by the Spanish government.

Born: May 9, 1820; Havana, Cuba
Died: March 15, 1888; Havana, Cuba
Also known as: Miguel de Aldama Alfonso
Sources of wealth: Inheritance; agricultural products; slave trade; investments
Bequeathal of wealth: Children; confiscated

Early Life

Miguel de Aldama (mee-GEHL day ahl-DAH-muh) Alfonso was the oldest son of Domingo de Aldama, the wealthiest planter in Cuba, and Maria Rosa Alfonso, who came from a wealthy planter family. Cuban sugar was a much desired commodity, and Cuban sugar magnates were among the wealthiest in the Spanish empire. The Aldama family traveled in elaborate stage coaches with uniformed servants and outriders.

As was typical of wealthy Spaniards, the young Aldama received a cosmopolitan education. After instruction at the San Cristobel de Carruguao preparatory school, at age fifteen he was sent to Europe, where he studied in Hamburg, Berlin, Paris, and England. He returned to Cuba at the age of twenty-three. Aldama inherited his parents' estates and was considered to be the wealthiest man in Cuba.

First Ventures

Aldama owned five large sugar plantations in the Matanzas sugar zone. His Santa Rosa and La Concepcion sugar mills were the most productive in Cuba, encompassing three thousand acres worked by more than two thousand slaves. His Santa Rosa mansion contained more than twenty-five bedrooms and a dining table that seated fifty people. Aldama's revenue from his sugar plantations was estimated at $3 million a year. Aldama used his wealth to initiate enterprising banking ventures. He invested $4.5 million in banks that loaned money against the value of plantations and other properties. He similarly established banks to promote mercantile trade and agricultural production. His loan in 1857 of $3 million financed construction of a 150-mile railroad from Havana to Matanzas to Cardenas, and he became the chief shareholder in the Cuban rail industry.

Mature Wealth

Aldama and his father built a splendid mansion, Palacio Aldama, in Havana. Construction started in 1840, and the residence was designed by the Dominican architect Manuel José Carrera. Palacio Aldama featured two adjacent grand stone houses, marble floors, balconies and balustrades made of cast-iron and bronze, and hand-painted tiles. The banquet hall sat one hundred. The great hall featured two magnificent paintings, one of the Pilgrims landing on Plymouth Rock, the other of conquistador Hernán Cortés landing in Mexico. Aldama was an ardent Cuban patriot, who favored Cuba's independence from Spain and supported the ill-fated rebellion of Narciso López in 1851. The magnificence and symbolism of Palacio Aldama might indicate Aldama's hope that the residence would become the executive mansion of a Cuban republic. Aldama was also a patron of Cuban artists and writers.

Aldama's plantations produced about forty-eight thousand 425-pound boxes of white sugar annually. At the peak of his fortune, Aldama was worth about $12 million when the price of Cuban sugar doubled during the Civil War in the United States. Another Cuban rebellion broke out in 1867, prompting brutal repression by Spanish troops, including the pillaging of the Aldama residences. In 1869, Aldama was compelled to go into exile in Europe and New York. He spent the next two decades rallying for Cuban independence, spending about $2 million for this cause. On December 9, 1872, he wrote a letter from Paris in which he declared that all of his slaves in Cuba should be set free.

Settling in New York in 1877, Aldama became the president of the Cuban Revolutionary Committee. In the 1870's, the Spanish government confiscated his property in Cuba, valued at $5 million. Aldama returned to Cuba in 1885 but was unable to regain his property. He died of a liver ailment three years later. The estate he left to his daughters, Rosa and Lola del Monte, was worth only a fraction of his former fortune.

Legacy

Like George Washington and Simón Bolívar, Aldama was a wealthy man who risked his fortune for independence. It was said that Aldama built Palacio Aldama in the hope that it would become the executive mansion of an independent Cuban republic. However, he was forced to flee Cuba, his wealth was confiscated, and he died in relative poverty. On January 17, 1956, Cuba issued a postage stamp in his honor. The Palacio Aldama, which since 1987 has housed the Instituto de Historia de Cuba (institute of Cuban history), is considered the most important neoclassical building in Cuba and remains one of Havana's cultural treasures.

Vagit Alekperov

Azerbaijani oil magnate

Alekperov began his involvement in the Russian oil business in his teens. He used imagination, aggressiveness, and savvy to move steadily upward in the industry hierarchy before founding one of the world's largest oil companies, becoming enormously rich in the process.

Born: September 1, 1950; Baku, Azerbaijan, Soviet Union
Source of wealth: Oil
Bequeathal of wealth: Unknown

Early Life

Vagit Alekperov (vah-JEET ah-lehk-PEH-rawf) was the youngest of five children born to an oil worker who died when Alekperov was a child. Alekperov began working at age eighteen at Kaspmorneft, a Caspian Sea oil production facility. While employed as an oil-drilling operator on a platform rig, he attended the Azerbaijan Oil and Chemistry Institute, earning a doctoral degree in 1974.

First Ventures

Alekperov worked for Kaspmorneft until 1979, moving up from engineer to production director. He then went to work at Surgutneftegaz, a large oil and gas concern in western Siberia, where he rose to a high executive position while earning a reputation as a hydrocarbon energy expert. In 1985, he accepted a job at Bashneft, a Russian oil refining company, where he directed a production facility in Siberia.

Two years later, Alekperov became chief executive at Kogalymneftegaz, an oil and gas facility with enormous reserves but poor production figures. Employing the best business tactics of both capitalism and communism—a capitalistic focus on the bottom line, combined with socialistic concerns for workers' comfort and safety—he quickly increased production of crude oil from 2 million barrels to 240 million barrels. Alekperov's efforts caught the notice of Soviet president Mikhail Gorbachev, who in 1990 appointed Alekperov the nation's deputy minister of oil and gas. In his new position, Alekperov became an outspoken advocate of vertical integration of state-owned industries.

Mature Wealth

In 1991, following the Soviet Union's dissolution and the ascent of Boris Yeltsin to the presidency of the new Russian Federation, state industries began to be privatized. Alekperov became president of a huge new oil concern formed from three of Russia's largest energy production associations: Langepasneftegaz, Uraineftegaz, and Kogalymneftegaz. By 1993, when Alekperov resigned his post as deputy minister of oil and gas, the unwieldy company name had been condensed to Lukoil, and the operation had become a private concern.

By 2009, thanks to Alekperov's administration, Lukoil was Russia's largest oil company—and the world's second largest behind Exxon—with more than twenty billion barrels of proven reserves. The fully integrated company, Russia's largest taxpayer, employed more than 100,000 workers who explored, drilled, refined, distributed, and retailed diesel fuel, gasoline, and kerosene. With Alekperov at its helm, Lukoil was the

Vagit Alekperov. (AP/Wide World Photos)

first Russian company to be listed on the London Stock Exchange, and it was later listed on the New York Stock Exchange. Lukoil was also the first Russian firm to acquire an American company, obtaining Getty Petroleum Marketing, Inc., and its thirteen hundred U.S. gas stations in 2000.

Alkeperov, who continued to serve as president of Lukoil and was named chairman of the board of directors in 2001, grew extremely wealthy, earning an annual salary of $1.5 million, supplemented by generous bonuses and ownership of a 10 percent block of Lukoil stock. He also owns a $20 million private jet, and according to *Forbes* magazine was the world's fifty-eighth-richest individual, with a net worth $10.6 billion in 2010.

Legacy

Alekperov and Lukoil became major political and economic forces in Russia, but their success has not always been smooth or without controversy. Alekperov has been accused of using his relationships with local political officials to create difficulties for foreign investors in order to gain shares in oil exploration projects for his company. Both he and his company have suffered setbacks. For example, as a result of the Iraq War, Lukoil lost a $2 billion investment in exploration rights in the West Qurna oil fields.

However, Alekperov has managed to survive these allegations and setbacks and continues to build his empire. In the early twenty-first century he diversified his business ventures, moving into banking and media, and Lukoil explored new markets in China and South America.

ALEXANDER VI
Italian pope

Living in the style of a secular Renaissance prince, Alexander VI disgraced his church by using the Papacy to amass great wealth.

Born: January 1, 1432; Jàtiva, Valencia, Aragon (now in Spain)
Died: August 18, 1503; Rome, Papal States (now in Italy)
Also known as: Rodrigo de Borja y Doms (birth name); Rodrigo Borgia
Sources of wealth: Inheritance; church
Bequeathal of wealth: Relatives; church

EARLY LIFE
Alexander VI was born Rodrigo Borja y Doms (rod-REE-goh BOR-jah ee doms), the favorite nephew of Pope Calixtus III. Borja's uncle adopted him, appointed him to numerous church positions, and sent him to the University of Bologna to study law.

FIRST VENTURES
When Borgia was twenty-five, Calixtus named his nephew a cardinal-deacon, and the next year Borgia was appointed vice chancellor of the church. Borgia held this lucrative position until his own elevation to the position of pope in 1492. In 1476, he was appointed bishop of Porto, and he was made dean of the Sacred College of Rome.

Despite his ordination to the priesthood, Borgia remained preoccupied with the accumulation of wealth, as well as the welfare of his family. A handsome man, known for his charm and love of frivolity, he fathered several children with several mistresses. He lived in a magnificent style, indulging his love of cardplaying and revelry.

MATURE WEALTH
Borgia was elected pope by a two-thirds majority on August 11, 1492, amid allegations, never substantiated, that he had bribed several cardinals to vote in his favor. He took the name Alexander to honor the pagan conqueror Alexander the Great, as well as the five previous popes with the same name. Intelligent and eloquent, he restored order to the city of Rome, which had been the scene of considerable violence and more than two hundred assassinations before he assumed the papacy. He ruled skillfully, constructing a plan to reform church administration. Deeply superstitious, in the manner of his time, he consulted astrologers and feared evil omens. However, his theology was orthodox Catholicism, and it was rumored that he prayed all day and caroused all night. His interests remained family, wealth, women, and the Church—in that order.

Alexander used the Papacy to advance the interests of his children, not only to help them but also to strengthen his own political power. His son Cesare Borgia, though only eighteen at the time, was consecrated bishop of several wealthy sees, and at nineteen was appointed a cardinal. Cesare's political intrigues would inspire Niccolò Machiavelli's political treatise, *Il principe* (wr. 1513, pb. 1532; *The Prince*, 1640).

Alexander also arranged three lucrative and politically influential marriages for his daughter Lucrezia Borgia, a celebrated beauty. He betrothed Lucrezia to

Alexander VI.

Giovanni Sforza, a member of the powerful family who ruled Milan, hoping that this union would connect the Sforzas and the Borgias. When Alexander no longer had political use for this marriage, he annulled it and arranged for Lucrezia to marry the son of the king of Naples, who was killed in 1501. Alexander then married his daughter to Duke Alfonso I of Ferrera, hoping that this union would further his political power in the Romagna region of Italy. To this end, Alexander encouraged his son Cesare to establish a powerful principality in the Romagna, the most politically contentious area of the Papal States.

Alexander declared a jubilee year in 1500, sending pilgrims and their gold flocking to Rome. The Church's sale of indulgences financed building projects, in addition to Cesare Borgia's military exploits. After crushing powerful Roman families, the Borgias seized their estates. Fortunes were further augmented by strategic assassinations and simony, the selling of church offices. Although the Borgias were rumored to be Marranos—Sephardic Jews who had converted to Christianity—Alexander freely confiscated possessions from Jews who had settled in Rome after their expulsion from Spain.

The pope found ways to increase his wealth at every turn, even stockpiling wheat and selling contracts to work alum mines. For a price, he issued dispensations to princes wishing to annul inconvenient marriages. He created new positions for cardinals, sometimes charging the recipients as much as 25,000 gold ducats. Although his lavish banquets, tournaments, and spectacles—not to mention the exploits of his children—were costly, the pope indulged himself fully. Because it was impossible to separate Borgia personal wealth from that of the Church, nobody has ever fully calculated his total fortune.

Alexander's abuses did not escape notice. Johann Burckard, a papal official, kept a detailed diary of the activities that transpired during Alexander's term as pope, and the document was useful for later biographers and historians. A more contemporary threat was the Florentine friar Girolamo Savonarola, who denounced the licentiousness and criminality of the pope, calling for a council to depose him. Although Savonarola was executed in 1498, the decadence of the papal court under the Borgias would prove a powerful weapon for the leaders of the Reformation that would soon divide Western Christendom.

Alongside his moral laxness and financial abuses, Alexander was one of his era's most significant art patrons, using some of the Papacy's money to hire artists who beautified the Vatican. He employed painters and architects to rehabilitate the Borgo Nuovo, the region around the Vatican. Alexander commissioned Michelangelo to design the rebuilding of St. Peter's Cathedral and employed architect Donato Bramante to build the Tempietto, a commemorative martyrium in the courtyard of the church of San Pietro in Montorio. The painter Pinturichchio decorated many of the Vatican's new and rebuilt apartments, creating a famous portrait of Alexander kneeling in adoration of the miracle of the Resurrection. Alexander's patronage also enabled Michelangelo to complete the *Pietà*, his sculptural depiction of Mary holding Jesus after the Crucifixion.

Alexander became seriously ill during a banquet he attended in 1503 and died shortly thereafter on August 18. Although it was rumored that he had been poisoned, modern scholars generally believe that he succumbed to a plague.

Legacy

Most Catholic historians designate the reign of Alexander VI as the lowest point in papal history, pointing to his financial corruption, immoral behavior, and political machinations. Still, Alexander's career was not without achievements. He reformed monasteries and encouraged Christian missions to the New World.

Of even greater significance was his patronage of painting and architecture. He restored Castel Sant'Angelo, which remains one of the architectural treasures of Rome. He hired prominent architects to design buildings in the Vatican and financed the work of Michelangelo and the painter Pinturicchio, among other artists. There have been more saintly popes than Alexander, but few popes have left so large an imprint upon the world's great art.

—Allene Phy-Olsen

Paul Allen

American computer engineer, investor, and philanthropist

Allen left college to pursue his dream of technology and computers with his school friend Bill Gates. Together they changed how individuals communicate by founding Microsoft Corporation, a company that developed software for personal computers. Allen later became a multibillionaire well known for his business ventures and philanthropic support of diverse groups.

Born: January 21, 1953; Seattle, Washington
Also known as: Paul Gardner Allen
Sources of wealth: Computer industry; sale of products; investments; sports franchise
Bequeathal of wealth: Charity; educational institution; medical research

Early Life

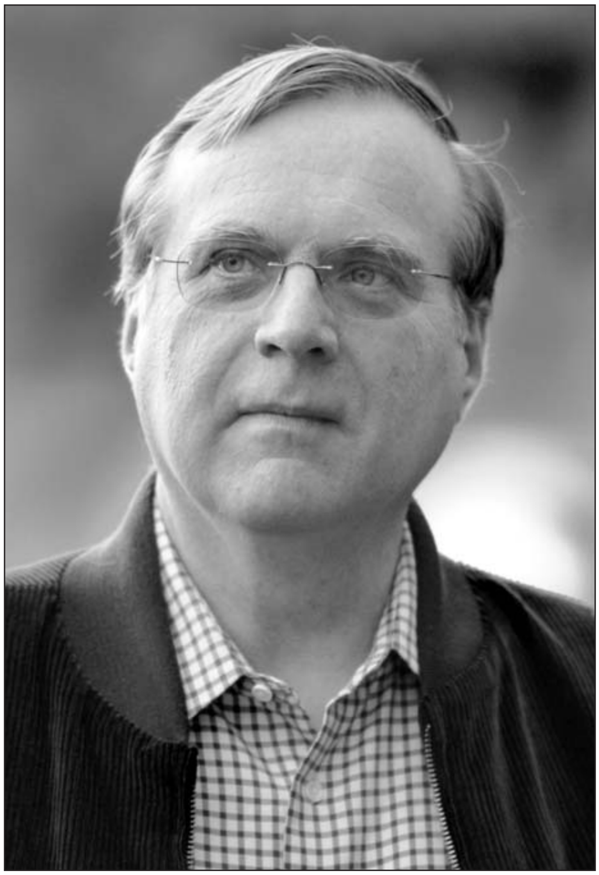
Paul Gardner Allen was born in 1953 to Kenneth S. and Faye Gardner Allen, hardworking people from humble backgrounds. Kenneth worked as an assistant director in the University of Washington library, while Faye taught elementary school. By the time Allen was born, they had achieved a comfortable middle-class status. Allen and his father enjoyed watching sports. Allen also loved to build model airplanes and perform science experiments; he wanted to know how things worked. His appreciation of music, especially of rocker Jimi Hendrix, would grow stronger over time. Allen attended Lakeside, a prestigious private preparatory school, where he shared an interest in computer programming with another student, Bill Gates. Allen was two years older and tall, while Gates was younger, shorter, and came from a privileged family background. With several other young men, they established the Lakeside Programmers Group.

First Ventures

Allen had a vision of linking people in what he termed a "wired world." After graduating from high school in 1971, he attended Washington State University for two years before dropping out to pursue his dream with Gates. Allen and Gates wanted to develop computer software for the new personal computers. They pooled their funds of about $360 to purchase an Intel 8008 chip in order to build a computer that provided traffic volume count analysis, a method of tracking the number of vehicles crossing a given location. Soon the young entrepreneurs started a computer company called Traf-O-Data to sell computers to users employed in traffic departments. They decided to close this company but would later use their technology in another way.

Allen worked for Honeywell International, Inc., as a computer programmer when Gates became a student at Harvard University. Allen read a cover story in *Popular Electronics* about theAltair 8800, one of the earliest successful personal computers that was developed by Micro Instrumentation and Telemetry Systems (MITS). Allen saw the potential in this microcomputer. He and Gates cowrote a Beginner's All-Purpose Symbolic Instruction Code (BASIC) software program for personal computers and started a new company, Micro Soft, in 1975, later changed to Microsoft. MITS started selling their software program.

Microsoft was incorporated in 1981. Allen led the technology side, while Gates negotiated contracts with business prospects. Microsoft was soon serving well-



Paul Allen. (AP/Wide World Photos)

known clients, such as Radio Shack, Texas Instruments, and Apple Computer, Inc., and the firm had sales of more than $1 million.

Mature Wealth

In 1980, Allen and Gates were contacted by International Business Machines (IBM) about programming for IBM's personal computers. About the same time, Microsoft purchased a computer operating system called Q-DOS for $59,000. Gates and Allen would further develop this system as MS-DOS, a universal personal computer operating system that became the primary product of choice at IBM. Around this time, Allen headed Microsoft's research and development efforts, helping to create the company's Microsoft Word software and Microsoft Windows operating system.

In 1982, Allen was diagnosed with Hodgkin's disease, a form of cancer that develops in the lymphatic system. Although he still worked in a limited way, he decided to retire from Microsoft in 1983. He spent time with his family and did the activities he loved, such as traveling and yachting. Allen continued to serve on Microsoft's board of directors and held a 13 percent interest in the company's stock. In 1985, his wealth was reported at $150 million, and before long his interest in Microsoft made him a billionaire. He resigned from Microsoft's board in 2000.

A knowledgeable investor, Allen bought stock in high-tech companies and other corporations, including America Online, CNET, USA Networks, Priceline.com, and Ticketmaster, and continued to hold stock in Microsoft. Some of his investments and business ventures paid off, while others did not. For example, Allen invested about $170 million in the Ticketmaster company and later sold it in 2002 for $586 million. In 1994, Allen spent $500 million to obtain a 24 percent interest in DreamWorks SKG, an American film and television studio cofounded by director Steven Spielberg. Allen's investment in the company soared to about $675 million within ten years, and some estimate that his share in DreamWorks may be worth as much as $900 million.

In 1993, Allen founded Starwave, a software and Web site company. Five years later, he sold this company to the Walt Disney Company for around $200 million. Allen owns Vulcan, Inc., which he founded with Jo Allen Patton in 1986. This multifaceted company seeks to change the world by improving people's quality of life through creativity. Vulcan has produced independent films, advocated the need for a sustainable environment, created interactive museums, and helped the community through the Paul G. Allen Family Foundation. In addition, Allen built the Experience Music Project and Science Fiction Museum and Hall of Fame in Seattle at a cost of around $240 million. Among other features, the museum contains exhibits about Jimi Hendrix and Michael Jackson.

The Allen Institute for Brain Science

The Allen Institute for Brain Science is a nonprofit medical research organization located in Seattle, Washington. Paul Allen, the cofounder of Microsoft Corporation, established the institute in 2003. The organization seeks to discover the workings of the brain and the brain's relationship to genes and to disease. Some of the institute's research focuses on understanding the brain's function in respect to cognition, language, emotion, and memory. In 2009, the institute was conducting research on genetic diversity in mice, transgenic mice, the human cortex, and sleep.

Allen's donation of $100 million to this research organization demonstrates his tendency to invest in what he terms "venture philanthropy," or major nonprofit efforts that reflect his passions and interests. Allen recognized that the government probably would not finance research connecting computer science with neuroscience and genomics, so he provided the seed money for the effort. The institute has since obtained additional contributions and solicits private and public donations and collaborations in order to fulfill its mission.

The Allen Institute for Brain Science provides free information for scientists, research hospitals, universities, and pharmaceutical and biotechnology companies. The organization's initial project was the development of the Allen Brain Atlas, an electronic database of gene expression in the mouse brain. In 2006, *Time* magazine listed the atlas as one of the top ten medical breakthroughs for the year. The atlas's Web site at http://www.brain-map.org enables users to assess the Allen Mouse Brain Atlas; Allen Developing Brain Atlas; and Allen Spinal Cord Atlas, a map of gene expression in the spinal cords of juvenile and adult mice. To create the atlas, researchers and scientists studied scans of ultrathin slices of brain tissue from mice and mapped every gene in a mouse's brain. These scans track the cellular level of more than twenty thousand genes in order to help scientists discover how the genes are turned on in various areas of the brain. Teachers can use the resources on the atlas's Web site to teach students about brain anatomy. Resources include a three-dimensional model to investigate the mouse brain and to view genome expression data in a virtual laboratory.

Allen enjoys his passions and pays for them. In 2003, he spent about $2 million for *Octopus*, a 416-foot yacht complete with its own permanent crew. *Octopus* is the fourth largest yacht in the world and contains two helicopters, a submarine, a music recording studio, and an ocean floor crawling vehicle. Allen also collects aircraft, such as his two Boeing 757's, and he spent $20 million to construct SpaceShipOne, the first privately owned rocket. His love of sports can be seen in his purchase of two franchises—the National Basketball Association's Portland Trail Blazers and the National Football League's Seattle Seahawks. His financial return on the Trail Blazers has been less than desired. After the team lost about $100 million in a single season, Allen revamped its management and sold players to create a better team.

In 2005, Allen's fortune was recorded at $20 billion, although by some estimates he has been worth as much as $30 billion. He suffered losses in the 2008 recession, and, according to *Forbes* magazine, his net worth was $13.5 billion in 2010, making him the thirty-seventh-richest person in the world and the tenth-wealthiest person in the United States.

In 2009, Allen was single and lived with his mother and sister in a forty-thousand-square-foot home on an almost eight-acre private retreat on Mercer Island, his hometown; his home is valued at $121 million. He is a guitarist and plays in a local band. Allen is known as a private man who rarely interacts with the media. In November, 2009, Vulcan, Inc., announced that Allen had been diagnosed with non-Hodgkin's lymphoma and had begun chemotherapy. Like Hodgkin's lymphoma, for which Allen was treated in the 1980's, non-Hodgkin's lymphoma is a cancer of the lymphatic system.

Legacy

Paul Allen was one of the pioneers of the personal computer industry, creating software and operating systems that would eventually be used by millions of people worldwide. He is also a generous philanthropist. For example, in 2003, he gave $100 million to the Allen Institute for Brain Science. The following year, Allen consolidated six charitable organizations into the Paul G. Allen Family Foundation, which has made donations of around $1 billion. According to some estimates, the foundation makes annual contributions of around $30 million. Allen also provided $5 million to the New Mexico Museum of Natural History and Science in Albuquerque in order to establish a microcomputer exhibit.

Nuno Álvares Pereira

Portuguese military leader, aristocrat, and saint

A member of Galician nobility and a national hero of Portugal, Álvares Pereira was richly rewarded for outstanding military exploits that helped secure his country's independence from Spain. He was also the progenitor of the house of Bragança, which later ruled Portugal and Brazil.

Born: July 24, 1360; Bomjardim, Portugal
Died: April 1, 1431; Lisbon, Portugal
Also known as: Holy Constable; Brother Nuno of St. Mary; Saint Friar Nuno de Santa Maria Álvares Pereira
Source of wealth: Government
Bequeathal of wealth: Charity; dissipated

Early Life

Nuno Álvares Pereira (NOO-noh AL-var-ehz peh-RAY-ee-ruh) was the grandson of Gonçalo Pereira, the archbishop of Braga. Nuno was illegitimate, one of the many children of Álvaro Gonçalves Pereira, the grand prior of Crato. As an infant, Nuno was legitimized by royal fiat to enable him to receive an education appropriate for nobility.

At the age of thirteen, Álvares Pereira joined the army and quickly proved to be a brilliant, fearless tactician during running battles with invading Castilian forces. He was shortly thereafter made a knight of the realm, and he became a model of knightly virtue. At age sixteen, Álvares Pereira married a widow, Leonor de Alvim, daughter of João Pires de Alvim. The couple had two sons, who died when they were young, and a daughter, Beatriz, who survived to adulthood.

First Ventures

Upon the death of King Ferdinand I in 1383, Portugal was plunged into civil war. The population was divided between two possible successors: Fernando's daughter Beatrice, wife of King John I of Castile, and Fernando's brother John of Aviz, grand master of the Knights of Aviz. Álvares Pereira, who supported John of Aviz, was appointed a constable (commander) of Portuguese forces, and in this position he succeeded in fending off incursions by Castilians who disputed John of Aviz's succession. Greatly outnumbered, Álvares Pereira decisively defeated Castilian troops in several confrontations that culminated in an overwhelming victory in 1385 at the Battle of Aljubarrota, which secured Portuguese independence.

After ascending to the throne, John of Aviz (now King John I) named Álvares Pereira the third count of Ourém, second count of Arraiolos, and seventh count of Barcelos. Each hereditary title came with lands, castles and palaces, and their contents—prizes of great value.

Mature Wealth

Álvares Pereira continued to serve John I as military commander until 1411, when the Treaty of Ayton-Segovia ended the war between Portugal and Castile and Castile recognized John as Portugal's undisputed monarch. A devout Catholic often witnessed praying on the battlefield, Álvares Pereira was known for his religious devotion and exemplary lifestyle. He used much of his wealth to construct churches in Souzel, Monsaraz, Carmante, and other places. He erected a massive monastery in Lisbon, and he began construction of the magnificent Gothic-style Batalha Monastery.

After his wife died in 1387, Álvares Pereira did not remarry. In 1401, he gave the hand of his daughter, Beatriz, in marriage to Afonso, the son of John I and the duke of Bragança. After peace was restored to Portugal in 1411, Álvares Pereira began to give away his possessions to the needy, military veterans, and friends. In 1423, he renounced his titles and divested his remaining wealth to take vows as a monk, Brother Nuno of St. Mary, at the Carmelite monastery he founded in Lisbon. He died and was buried there eight years later, at the age of seventy.

Legacy

Nuno Álvares Pereira's immense treasure was willingly scattered by his own hand. The monastery he built in Lisbon was destroyed in the great earthquake of 1755, though other churches he constructed remained standing into the twenty-first century. His influence was of incalculable value to Portuguese history. Through his daughter Beatriz and her husband Duke Afonso, the house of Bragança was established. Bragança descendants would reign in Portugal from 1640 to 1910 and in Brazil from 1815 to 1889, and the house would be well represented in other European royal dynasties.

From his time to the early twenty-first century, Álvares Pereira has been honored as a hero in Portugal. The faithful attested to miracles associated with him, and a movement to have him declared a saint arose after his death. In 1918, Pope Benedict XV beatified Álvares

Pereira, and in 2008, Pope Benedict XVI proclaimed him Saint Friar Nuno de Santa Maria Álvares Pereira. His feast day is November 6.

Mukesh Ambani

Indian entrepreneur and industrialist

As the chairman and largest shareholder of Reliance Industries, Limited, Ambani greatly expanded this company founded by his father. He became the wealthiest man in the world in 2007, the first Indian to claim that title.

Born: April 19, 1957; Aden, Yemen
Also known as: Mukesh Dhirubhai Ambani
Sources of wealth: Inheritance; oil; manufacturing
Bequeathal of wealth: Unknown

Early Life

Mukesh Dhirubhai Ambani (mew-KESH dihr-OB-hi ahm-BAH-nee) was born in Aden, Yemen, in 1957, to Gujarati-speaking Hindu parents who soon moved to Mumbai, India. The next year, his father, Dhirubhai Ambani, established a small spice-trading company that eventually became a yarn manufacturer and then Reliance Industries. The family lived in a modest tenement apartment, and Ambani learned frugal habits that would stay with him into adulthood.

By the late 1960's, the business was thriving and the family moved to a wealthy neighborhood, but Ambani and his siblings were never pampered. Their father, who had not completed high school, insisted that they be educated and that they use public transportation and learn the everyday skills that working-class people need for survival. Ambani attended the Abaay Morischa School in Mumbai, and he then completed a bachelor's degree in chemical engineering at Mumbia's University Institute of Chemical Technology. The family spoke Gujarati at home—a habit Ambani never abandoned.

First Ventures

As the oldest son in a traditional patriarchal culture, Ambani was always heir apparent and was groomed to succeed his father. He was named a member of the board of directors of the ever-diversifying and expanding Reliance Industries while still in his late teens. In 1979, Ambani began a master of business administration program at Stanford University in California. When he was only halfway through the program, his father, who believed that business education was best obtained through working in business, called him home to set up a yarn factory in a small village. This was no small venture: Ambani, Sr., gave his son the equivalent of $100 million to start the project, sure that he could make a success of it. Ambani showed a talent for management and a willingness to involve himself in the gritty details that helped build loyalty among his workers. Under his guidance, the yarn business led to the manufacture of polyester fibers, which led to the development of a petrochemical business.

Mature Wealth

Dhirubhai Ambani was a legend, widely admired and beloved because he was seen to have succeeded through hard work and honorable dealings. When he died in 2002, Reliance Industries was a huge, publicly owned multinational corporation, dealing in industrial manufacturing, petrochemicals, electrical power, banking, biotechnology, and communications technology. After the founder's death, Ambani and his brother Anil fought for control of the company until their mother, a major stockholder, stepped in and divided the company into two independent entities. Ambani became chairman, managing director, and the largest shareholder of Reliance Industries, the largest business in India.

More reform-minded than his father or his brother, Ambani undertook enormous projects to help meet the energy demands of India's growing middle class and to

Mukesh Ambani. (AP/Wide World Photos)

help combat the enduring poverty of the lower classes. He engaged in deep-water offshore exploration for oil and natural gas to reduce the amount of energy India needs to import, and he built the world's largest oil refinery, part of a $6 billion complex at Jamnagar, in the state of Gujarat. He established a network of grocery stores and other retail stores to help poor farmers find markets for their goods and create jobs for middle-class merchants. These projects had significant social effects on the developing nation, while making handsome profits for Reliance. Ambani also owned the Mumbai Indians cricket team.

LEGACY

Ambani is often said to be the face of an emerging Indian capitalism. His derives his wealth from such modern industries as petrochemicals, telecommunications industries, and online gambling—and from success in the stock market. By reaching the top of the list of the world's wealthiest people, and by being ranked among the most respected business leaders in the world, he has inspired other Indians to believe that they—and their country—can succeed in the twenty-first century.

Amenhotep III

Egyptian royalty

Amenhotep III's wealth reflects ancient Egypt at the apex of its power and prestige throughout the ancient Near East.

Born: c. 1403 B.C.E.; Thebes, Egypt
Died: c. 1349 B.C.E.; Thebes, Egypt
Also known as: Amenhophis III; Amenhotep the Magnificient; Nubmaatre
Sources of wealth: Inheritance; trade
Bequeathal of wealth: Children

Early Life

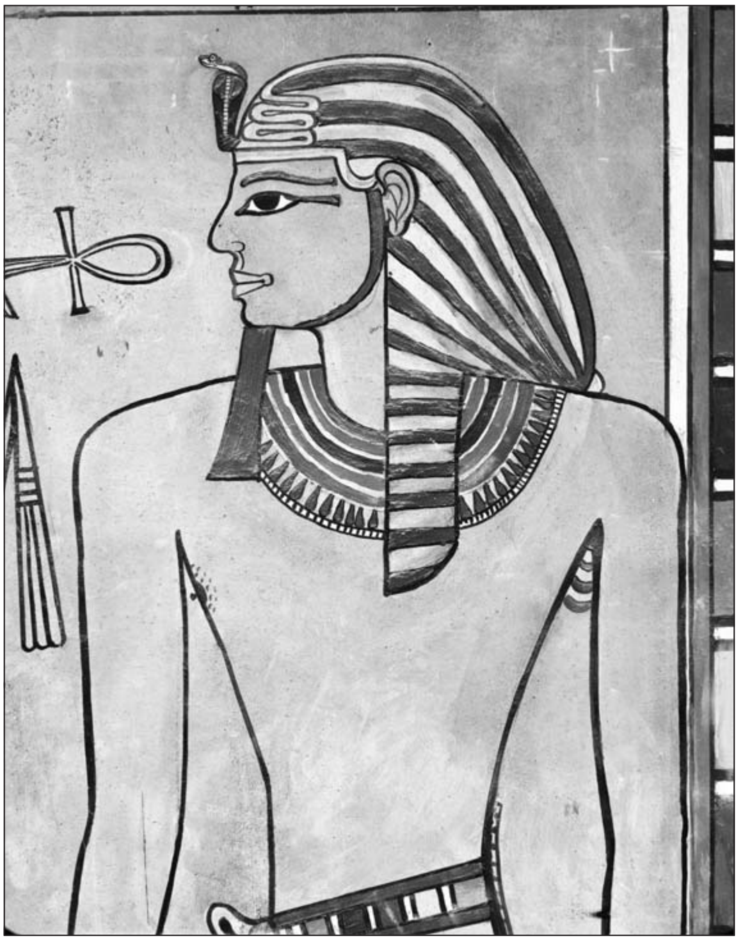
Amenhotep (ah-mehn-HOH-tehp) III inherited the throne of ancient Egypt from his father, Thutmose IV, whose reign had continued the successful policies of conquest and diplomacy that typified the vibrant Eighteenth Dynasty. At the time of Amenhotep's accession, Egypt stood at the head of an empire that included Egyptian outposts, tributary states, and closely aligned kingdoms directly bordering Egypt in Africa and extending into a significant portion of southwestern Asia. The extent of Egypt's domination can be attributed mostly to Amenhotep's great-grandfather, Thutmose III, whose conquests progressed up the Levantine coastline and concluded on the upper reaches of the Euphrates River in northern Mesopotamia. Following Thutmose III's successes, Amenhotep II and Thutmose IV(Amenhotep's grandfather and father, respectively) maintained Egypt's hold on these territories militarily and opened successful diplomacy with outlying regions that included the powerful Mesopotamian kingdom of Mitanni.

First Ventures

It is generally understood that Amenhotep was young when he began his reign, possibly as young as two and as old as twelve years of age. The stability of Egypt's empire at the time allowed him to enjoy a rule that lasted more than three decades and to live a luxurious life with little regard to military activity, concentrating his attentions on pleasurable activities. His marriage to a commoner, Queen Tiy, most certainly provided him the support of her family, which included several powerful figures in the Egyptian military. His wealth was based primarily on the religious understanding that the Pharaoh was the physical embodiment of the god Horus and therefore the master of all of Egypt and its resources. However, his wealth was augmented by the flood of goods that entered Egypt as a result of its extraterritorial holdings and network of allied states whose kings were referred to as "brothers."

Mature Wealth

While it is impossible to calculate precisely how wealthy Amenhotep III was, there are numerous indications of his estimable wealth from various sources. The breadth of his building program throughout Egypt attests to the extensive available resources of both materials and man-



A mural depicting Amenhotep III. (De Agostini/Getty Images) power that enabled him to leave his mark on the land—only hints of which still survive. However, those that survive include the monumental twin statues (commonly known as the Colossi of Memnon), which served as guardian figures to his memorial temple (now completely dismantled), which was said to have had "floors adorned with silver and all its doors with fine gold." He made extensive additions to the Temple of Amun at Karnak, which still stands as a testament to the grandeur of the age. In addition, the numerous discarded artifacts at Malkata, his palace complex near Thebes, indicate that the property covered no less than eighty acres. Commemorative scarabs found throughout the ancient Near East detail the killing of 102 "fierce lions" in just one of the several hunting expeditions that he enjoyed as a young man. Diplomatic marriages filled his harem with the sisters and daughters of the kings of Mitanni, Babylon (both in Mesopotamia), and Arzawa (in Anatolia). More explicit testimony regarding his wealth was provided by Tushratta, king of Mitanni, who noted that "in my brother's land gold is as plentiful as dust." The truth of such a statement is suggested by the staggering wealth of grave goods retrieved in 1922 from the tomb of Tutankhamen, the boy-king who ascended to the throne less than twenty years following Amenhotep's death.

Legacy

Amenhotep III's reign marked the high point of ancient Egypt's power. The wealth he enjoyed provided the economic basis for the reign of his son, Amenhotep IV, better known as Akhenaton, who famously attempted to impose the singular worship of the Aten (the disc of the Sun). As reflected in the diplomatic correspondence recovered from his capital at Amarna, Akhenaton's preoccupation with establishing his religious reforms kept him from responding to various challenges to Egypt's domination in the Levant. Nevertheless, Akhenaton's activities were well supported by his father's accumulated wealth, despite the troubles Egypt experienced in its larger empire. The richness of Amenhotep III's reign, though diminished by Akhenaton's inattention and Tutankhamen's minority, bridged the gap until Ramesses II of the Nineteenth Dynasty restored the basis for Egypt's international prominence.

Walter Annenberg

American publisher and diplomat

Annenberg, son of disgraced publisher Moses Annenberg, redeemed the family name and transformed his father's failure into a $6 billion fortune. Before his death, Annenberg, through the Annenberg Foundation, gave $2 billion to learning institutions, and his philanthropy continues into the twenty-first century.

Born: March 13, 1908; Milwaukee, Wisconsin
Died: October 1, 2002; Wynnewood, Pennsylvania
Also known as: Walter Hubert Annenberg; Walter H. Annenberg
Sources of wealth: Inheritance; media
Bequeathal of wealth: Spouse; children; educational institution; museum; charity

Early Life

Walter Hubert Annenberg was the eighth child and only son of Moses and Sadie Annenberg, Jewish refugees from East Prussia, Germany, who immigrated to the United States in 1882, settling in Chicago. In 1906, Moses, Sadie, and their children moved to Milwaukee, where Moses (better known as Moe) distributed newspapers for publisher William Randolph Hearst. Walter was born with a withered right ear, causing partial deafness; he also stuttered and was extremely shy and sensitive. Moe attempted to help Walter become tougher by bringing home a boxing bag and encouraging athletic activities. Walter attended the German-English Academy in Milwaukee, a tough school for minds and bodies, from age six to twelve. In 1920, amid the World War I paranoia about anything German in Milwaukee, Moe accepted a huge promotion from Hearst and moved his family to New York.

FIRST VENTURES

The life that greeted Walter at the Great Neck, Long Island, estate that his father purchased from noted musician George S. Cohan was a clear indication of the Annenbergs' rising status. Walter enrolled at the Peddie School, a preparatory school in New Jersey. A mediocre student, between classes he placed orders with his father's stock brokerage firm. His teachers, believing he was a financial wizard, felt compelled to seek his advice. At the end of his senior year, Walter had made enough money to donate $17,000 to Peddie for an athletic running track.

Walter entered the Wharton School of Finance and Commerce at the University of Pennsylvania, which he found even more boring than Peddie. He avoided classes, spending time near a brokerage office and playing the stock market with relish. He obtained his father's permission to drop out of school and spend more time trading stocks. In eighteen months, Walter amassed a $3 million portfolio ($28.3 million at 2010 value). In the crash of 1929, Walter's $3 million vanished, and he was $350,000 in debt. Moe absorbed Walter's losses and forced him to swear he would never again trade recklessly.

MATURE WEALTH

Upon the death of his father in 1942, Walter Annenberg assumed total control of the Annenberg estate, which at that point was practically bankrupt. In 1940, Moe had been sentenced to three years in federal prison for tax evasion, but he did not serve out his entire sentence and

Walter Annenberg. (AP/Wide World Photos)

The Annenberg Foundation

Walter Annenberg established the M. L. Annenberg Foundation in memory of his father, Moses Annenberg, in July,1989, with a grant of $1 billion, one-third of the revenue from the sale of Triangle Publications. The foundation was the successor to the Annenberg School at Radnor, Pennsylvania, which Annenberg founded in 1958. The Annenberg Foundation aims to advance public well-being through improved communication. Toward that end, the organization has encouraged the development of effective ways to share ideas and knowledge.

The primary program areas of the foundation are education and youth development; civic, community, and environmental issues; and health and human services. The organization contributes funds to institutions, not individuals, and has made grants to public elementary and secondary school systems. Annenberg Media, a part of the Annenberg Foundation, promotes excellence in teaching by supplying free multimedia resources, video collections, and related interactive activities to schools, colleges, and communities. Annenberg Media programs are frequently viewed on Public Broadcasting System (PBS) stations and are designed for high school and university students.

Annenberg's gifts to educational institutions have become legendary. Between 1960 and 1998, he gave $177 million to the University of Southern California to establish and support the school's Annenberg Center for Communication. His generous gifts to the University of Pennsylvania from 1960 through 1998 amounted to $239 million and were used to finance the Annenberg School of Communication. His grants to his alma mater, Peddie School, between 1927 and 1998 totaled an astounding $131.6 million. He also gave $55.2 million to Northwestern University, $50 million to the United Negro College Fund, $25 million to Harvard University, and $10 million to the University of Notre Dame. Other universities received smaller amounts, ranging from several hundred thousand dollars to $5 million.

In 1993, Annenberg issued a $500 million challenge to initiate reform in some of the nation's largest and most troubled schools, both urban and rural. He proffered the $500 million for matching grants of two-to-one in some instances, and five years after his announcement of the gift, $500 million was donated by businesses, foundations, universities, and individuals.

Annenberg's interest in art inspired gifts to the Metropolitan Museum of Art for $165 million and an art collection valued at $1 billion in 1991, as well as grants to other art institutions in the United States and abroad. In addition to the arts grants, Annenberg gave $11.3 million to the Eisenhower Medical Center in California, $15 million to the United Jewish Appeal, and enormous amounts for presidential libraries.

Following Annenberg's death, the Annenberg Foundation was under the sole directorship of his widow, Leonore Annenberg, until her death in 2009. At that time, the foundation announced its move to California, leaving only a small presence at Radnor, Pennsylvania. A new director, Annenberg's daughter Wallis Annenberg Weingarten, assumed control of the organization.

was released in 1942. He died several weeks later. Having been groomed to take over the business since his birth, Annenberg had spent years enjoying the family's wealth and observing his father's methods, but suddenly he inherited very little money and also a debt of $5 million of the $9.5 million fine that the U.S. government had levied against his father. Annenberg was left his father's shares of stock in Triangle Publications, Inc., and control of the *Philadelphia Inquirer*, *Daily Racing Form*, the Massillon (Ohio) *Independent* newspaper, *Screen Guide*, *Radio and Movie Guide*, *Click* (a photo publication), and a small group of pulp detective magazines.

In 1944, Annenberg replaced *Click* with *Seventeen*, a "wholesome" magazine for teens. Pursuing a conservative policy, he ruled out advertisements for liquor, beer, cigarettes, bridal gowns, honeymoon suites, or hair coloring. Annenberg wanted *Seventeen* to encourage respect between teens and their parents. This popular magazine offered advice on fashion, beauty, etiquette and behavior, and it flourished under the editorship of Enid Annenberg, Walter Annenberg's sister, whose skills helped promote circulation to nearly two million. Within six years, advertising revenues climbed to $18 million.

Annenberg had two children with his first wife, Canadian Veronica Dunkelman, before their marriage ended in 1950. His second wife was Leonore (Lee) Rosenstiel, whom he married in 1951. At this time, he also began expanding his business. Since his father's death, Annenberg had managed to get his business affairs on solid financial footing, and he paid off the government fine. He and Lee began to build an art collection and turn their home, Inwood, in Wynnewood, Pennsylvania, into a place filled with fine art and furnishings.

By 1953, Annenberg had begun making plans for a television publication that would provide complete program listings and feature stories about people in the television industry. He bought *TV Digest* in Philadelphia, *TV Forecast* in Chicago, and *TV Guide* in New York, and to prevent anyone else from copying his idea, he persuaded other television magazine publishers to become franchisees of his publication, *TV Guide*. All his advisers had vetoed the idea of starting the television publication, but Annenberg, who operated largely by instinct, pursued the project, which turned out to be the best business move he ever made. The first issue, released for the week April 3-9, 1953, appeared in ten cities and sold 1,560,000 copies. Despite the fact that the number of circulation copies declined the following week and on through the summer, circulation expanded in the fall, and by late 1955, *TV Guide* was producing thirty-nine editions and boasting a circulation of three million copies weekly.

Passionately interested in converting the "vast wasteland" of television into high-quality programming, Annenberg began his experimental program, *University of the Air*, on his own television station, WFIL. At very little cost, he began broadcasting college courses throughout eastern Pennsylvania, Delaware, and southern New Jersey, with the cooperation of twenty-two colleges in the area that were pleased to put their best professors on the air. Annenberg's educational program eventually aired on five other television stations owned by Triangle Publications and garnered prestigious awards, including the George Foster Peabody Award, broadcast journalism's highest honor.

The following year, WFIL, an American Broadcasting Company (ABC) affiliate, transferred a popular local radio program, *Bandstand*, which consisted of a disc jockey playing popular music, to television, with instant success. Six years later, Annenberg moved Dick Clark, radio emcee of *Bandstand*, to a ninety-minute network television production of *American Bandstand*. The show began airing in 1957 and by its fourth week had become television's number one daytime program.

President Richard Nixon nominated Annenberg for the post of ambassador to the Court of St. James, and following a contentious hearing, Annenberg was confirmed in 1969. During his five-and-a-half-year stay in London, Annenberg was made an honorary member of the British Empire by Queen Elizabeth II. When he and Lee returned home, he began to consolidate his wealth. Having sold the Philadelphia *Inquirer* and the Philadelphia *Daily News* in 1969 to Knight Ridder for $55 million, Annenberg next divested himself of Triangle Publications, selling *Seventeen*, *TV Guide*, and other publications to Australian media magnate Rupert Murdoch for $3 billion. Devoting his efforts to his famed art collection and to running the Annenberg Foundation, Annenberg divided his time between Pennsylvania and his four-hundred-acre estate, Sunnylands, at Rancho Mirage, California. Annenberg died of complications from pneumonia October 1, 2002, at Wynnewood, Pennsylvania, at the age of ninety-four. His net worth was estimated at $6 billion.

Legacy

Annenberg's impulse for giving—a trait inherited from his mother—was apparent in his early career, when he helped some of his employees during lean times. As his wealth increased, he turned toward his two favorite interests, young people and education. Insisting that young people shape the character of the United States, he saw education as the key to the quality of their leadership as adults.

Although some of Annenberg's gifts were noteworthy for their "leverage"—meaning recipients were required to double or triple his contribution and, with the help of partners, raise more money—a great many others were outright gifts. Annenberg's generosity assisted schools for white and black students, sent much of his art collections to museums around the world, and provided donations for medical research and new hospitals, as well as bestowing money for community charities and presidential libraries.

Barbara Cox Anthony

American investor and philanthropist

As a director of the media empire Cox Enterprises, Anthony oversaw and inspired its expansion from a newspaper chain into the new arena of cable television and related communications ventures, without abandoning its original interests. The heir to a $12.4 billion fortune, she gave away up to half her annual income, sometimes anonymously, and often to causes for which she herself worked, such as education and animal health.

Born: December 8, 1922; Dayton, Ohio
Died: May 28, 2007; Honolulu, Hawaii
Also known as: Barbara Cox (birth name); Barbara Anthony Cox
Sources of wealth: Inheritance; media
Bequeathal of wealth: Children; relatives; educational institution

Early Life

Barbara Cox Anthony was born in Dayton, Ohio, in 1922, the second daughter of James M. Cox and his second wife, Margaretta Parker Blair. In addition to owning the *Dayton Daily News*, Cox had a notable political career, serving four years in the House of Representatives and three terms as governor of Ohio before running for president on the Democratic Party ticket in the election of 1920. After losing this race, however, Cox withdrew from electoral politics at the age of fifty and devoted himself to building a business empire.

Anthony grew up in a hilltop manor called Trailsend, located just outside Dayton. Her early years were privileged and apparently happy. Trails for walking and riding surrounded her home, and she loved competitive sports, such as tennis and the rodeo. The family accompanied her father when he traveled to Europe on appointive missions. President Franklin D. Roosevelt, who had been her father's running mate in 1920, visited Trailsend in 1940, and she remembered sitting in on their political discussions. There is no record of Anthony having attended college after high school graduation, but her experiences traveling and meeting important people of her time were unique for a midwestern teenager.

First Ventures

Anthony was the daughter of a self-made and determinedly pragmatic man who wanted to run everything he touched. It is not surprising that, already in possession of enough wealth to make her way in the world, she set out for Miami, Florida, in the early 1940's. There she met and married a young naval aviator, Bradford Ripley. Like many brides of this time, she lost her new husband in World War II. Still living in Miami, she then met and married Stanley C. Kennedy II, a member of the United States Navy demolition team (now the United States Navy SEALs) and the son of the founder of Inter-Island Airways (later Hawaiian Airlines). The couple moved to Hawaii in the late 1940's. Anthony, intrigued by the islands' natural beauty, never moved away. Her marriage to Kennedy produced two children, James and Blair. Although she traveled back and forth to Dayton in the late 1940's and 1950's to visit her parents, and presumably sat in on family business councils, her main focus during this time was on family members' needs and Hawaiian institutions.

In both arenas she continued to widen her activities as time passed. After she and Kennedy divorced, she married contractor Jimmy Glover; upon his death, she stayed actively involved in raising two stepchildren, Glover's son and daughter, as well as her own children. She maintained an interest in the Dayton Arboretum and served on various boards in Hawaii, but she kept a low profile in order to maintain her privacy.

Mature Wealth

Meanwhile, the Cox newspaper chain had expanded by buying two Atlanta, Georgia, newspapers, the *Atlanta Journal* and the *Constitution*, and several radio stations. The elder Cox died in 1957, leaving his son by his first marriage, James M. Cox, Jr., as head of Cox Enterprises. Under his leadership the company diversified into such ventures as business publishing, motion-picture production (it purchased Bing Crosby Productions in 1967), and automobile auction management, although the first two ventures were dissolved within a decade. The company's first tentative steps into cable television systems began in 1962 in Lewistown, Pennsylvania. Both Anthony and her sister Anne Cox Chambers of Atlanta served as active directors, as Cox Enterprises was determined to remain a family business. Virtually all its new enterprises were hugely profitable. When James M. Cox, Jr., died in 1974, he left 95 percent of his holdings to his two sisters.

By this time, Anthony had remarried again. Her husband, Garner Anthony II, a real estate and financial investor in Hawaii, became chairman of the Cox Enterprises, while she became chairwoman of Dayton Newspapers. As dual directors of the larger company, the Anthonys led it through a spectacular growth period, building it into one of the largest cable television providers in the United States and combining the separate newspaper and broadcasting companies under the Cox Enterprises' umbrella.

Other than chairing Dayton Newspapers, which of necessity was exercised largely on a long-distance basis, Anthony never served in an executive capacity of any profit-making company. However, because of her ownership position and dynamic personality, she was an effective and active director, keeping in touch with all major issues and generally having the right instincts about the companies' directions and futures. She preferred to hire good people to manage her companies and to trust them with the day-to-day operations. This being said, both Anthony and her enterprises were fortunate in having family members who were able to carry out the executive functions effectively. For example, in 1988, James Cox Kennedy, her son, became chairman and chief executive officer of the much expanded Cox Enterprises. One of his major ventures was the purchase of Trader Publications, a publisher of magazines and Web listings of cars, boats, and other items for sale nationwide.

Cox Enterprises doubled in value between 1992 and 1997, operating some three hundred separate businesses. Anthony herself regularly appeared on the *Forbes* magazine lists of the four hundred wealthiest individuals, with an estimated worth of approximately $12.6 billion in

La Pietra

Of all the states, Hawaii has the largest percentage of its elementary and secondary students in private schools. One of the most creative is La Pietra, with which Barbara Cox Anthony was associated almost since its inception. La Pietra is the only nondenominational all-girls' school in the state. The school is located in Honolulu, at the base of Diamond Head and on the grounds of the old Dillingham estate.

La Pietra opened in 1964 as Hawaii School for Girls, with Anthony and Lorraine Cooke as its original founders. Classes were held in Honolulu's Central Union Church for the first five years. The Dillingham villa, named "La Pietra" (meaning stone or gem in Italian), was left to the older, prestigious Punahou School by its owners, the Walter F. Dillinghams. However, Punahou did not want the estate and put it on the market, where it languished for a while. Eventually Cooke and Anthony raised the money needed to buy the house and grounds, and they engaged an architectural firm to draw up plans for converting the mansion into a workable school. A freestanding six-classroom building was added to the campus in 1976. The site itself was on or near an ancient temple site, where events crucial to Hawaiian history took place in the early 1800's.

Anthony served as chairwoman of the school's board of trustees for more than two decades. She was also the school's "angel," providing financial aid for approximately half of its enrollees, as well as funding for more general school needs. Her own daughter Blair attended La Pietra.

The school is small, and in 2009 it had a total enrollment of fewer than four hundred students attending grades six through twelve. It is primarily a college preparatory school, and in the early twenty-first century its curriculum placed increasing emphasis on technology. A laptop computer was issued to every sixth-grade student. Like many private schools, it keeps the teacher-student ratio low and takes pride in innovative courses. For example, classes are offered in computer animation, marine biology, and modern Asian history, subjects not even available at many colleges.

In early 2008, several La Pietra students attended the presidential inauguration along with their teacher, Maya Soetoro-Ng, the sister of incoming President Barack Obama. La Pietra's benefactor might be gratified at this latter-day connection of her favorite school with the White House.

her later years. She was the only resident of Hawaii who was a billionaire.

In addition to her strictly business interests, Anthony invested in several ventures which, while profitable, also tied into her particular enthusiasms. In girlhood she had competed in rodeos, and her continued love of animals and nature led to ownership of a 7,500-acre ranch on the slopes of Mount Hualalai, Hawaii, devoted to the breeding of Gertrudis cattle and the production of kona coffee and cut flowers. Another large ranch operation, the Winderadeen Corporation, with cattle, quarter horse, and sheep production, was established in Australia after her daughter Blair Parry-Okeden moved there.

Anthony loved sports and was physically active through her later years, snow skiing and playing tennis even after joint replacement surgery. She died in 2007, a month after suffering a stroke.

Legacy

Anthony was more known in Hawaii for her philanthropy and work on charitable boards than for her business success. Although she preferred to make many gifts of her money anonymously, her work with such institutions as the La Pietra school, a children's hospital in Honolulu, and many other educational and health care institutions was substantial and public. She did not confine her philanthropies to Hawaii. She endowed two faculty chairs, in oncology and equine orthopedics, at Colorado State University, and another chair at the University of Sydney. Her ties with Dayton, Ohio, led to support of numerous college scholarships for Miami Valley high school graduates and to a children's medical center in Dayton, which later bore her name.

Unlike her sister Anne Cox Chambers, Anthony stayed largely out of her family's traditional involvement in electoral politics. However, she did serve as a member of the Democratic Senatorial Campaign Committee and of Senator Bill Bradley's presidential campaign in the 1999-2000 preprimary season.

Anthony's life exemplified many of the qualities prized by those who extol the American ideal of free enterprise: responsible stewardship of inherited wealth; growth of a family fortune through careful management and investments in related industries; and diverse philanthropic efforts with personal involvement, as well as the giving of money. Her fortune, which passed to her heirs, seemed poised to remain intact, if not grow further, under the management of the family's younger generations. Perhaps the most noticeable impact of her work was the importance of Cox Communications and Cox Broadband in the lives of many Americans, who relied on these companies as their links to the communications media.

Elizabeth Arden

American cosmetics magnate

Arden used her early wealth to grow her line of cosmetics and open an ever-increasing number of salons and spas, thus making her brand one of the first highly successful, woman-owned businesses. This foresight ultimately made her one of the world's richest entrepreneurs.

Born: December 31, 1884; Woodbridge, Ontario, Canada
Died: October 19, 1966; New York, New York
Also known as: Florence Nightingale Graham (birth name); Elizabeth N. Graham
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Relatives; employees

Early Life

Elizabeth Arden was born Florence Nightingale Graham in Woodbridge, Ontario, Canada, on December 31, 1884, the fourth of five children born to tenant farmers who had emigrated from Great Britain. Lacking the financial resources for college, she dropped out of high school but later enrolled in nursing school in Toronto. Despite the name "Florence Nightingale" (a famous nurse during the Crimean War), she soon realized that nursing was not the career for her.

Arden left Canada for good in 1908, living first with her brother, William, and getting her first taste of the cosmetics business. She married Thomas J. Lewis in 1915 and became an American citizen. Lewis acted as her business manager. After nearly twenty years of marriage, the couple divorced. She followed that with a two-year marriage to a Michael Evlonoff, a Russian prince.

First Ventures

Arden became convinced that women would be willing to spend large sums of money to enhance their looks, and she began developing creams in her spare time. She opened a salon with Elizabeth Hubbard but soon became the sole proprietor. Believing the name "Florence Nightingale" evoked the wrong image for a salon, she changed it to Elizabeth Arden. Some say she used her former partner's first name; others believe she borrowed the name from Elizabeth I, queen of England. The surname "Arden" came from the poem *Enoch Arden* by Alfred, Lord Tennyson.

Arden traveled to France to study beauty and massage techniques used in the upscale Paris salons so she could offer her clientele the best services. She introduced eye makeup to the United States, and hers were the first salons to offer cosmetic makeovers, a marketing ploy still practiced in the beauty industry. From the start she understood the importance of spending money to make money and had the fortitude to make moves others would have deemed too risky.

Mature Wealth

By the 1930's, Arden's meteoric growth included salons in Europe and South America, as well as the United States and Canada. She concluded, correctly, that even in the most difficult of times, women who were able would continue buying beauty enhancement products. Her European ventures put her under suspicion of the Federal Bureau of Investigation (FBI) and the agency's director, J. Edgar Hoover, during World War II amid false rumors that the salons were used as fronts for Nazi Party operations.

Elizabeth Arden. (Hulton Archive/Getty Images)

Elizabeth Arden, Inc.

Elizabeth Arden, Inc., could have died with its founder. Elizabeth Arden remained sole owner until her death in 1966 at age eighty-one, and because she considered herself to be the company, she never made concrete plans for it to outlive her.

To a large extent she *was* the company. Her attention to the tiniest of details, such as calling her establishments "salons" instead of "parlors," conjured an image of upper-class wealth guaranteed to reach her target market. She changed her name, intuitively knowing the name she attached to her business should reflect the type of clientele she expected to attract. In her mind her birth name, Florence Nightingale, sounded like the name of a health clinic. Her instincts were proven correct when her early patrons included a veritable who's who of money and influence.

She made sure all of her employees were trained in cosmetic application techniques that enhanced a woman's natural beauty, so her clients never appeared to have "clown faces" or wore makeup that in any way looked artificial. She might be accused of micromanaging, but her hands-on approach made the company so well known that a late 1930's reporter wrote, "only three company names are known everywhere in the world: Coca-Cola, Elizabeth Arden and Singer [sewing machines]."

Following Arden's death the company went through a succession of owners, the first being pharmaceutical giant Eli Lilly and Company. The business changed hands twice more before its acquisition by Unilever PLC in 1990, where it became part of the conglomerate's Prestige Personal Products Group, which also included Calvin Klein's fashion and beauty products. The company was sold again in 2001, this time to FFI (formerly known as French Fragrances, Incorporated) for about $190 million in cash, plus company stock that allowed Unilever 18 percent ownership. By then annual sales were approximately $890 million. In 2010, Elizabeth Arden, Inc., was a publicly owned, independent company.

Over the years the company has capitalized on the public's obsession with celebrities, adding brands, such as actor Elizabeth Taylor's fragrances, and using movie stars to advertise its products. Hollywood beauty Catherine Zeta-Jones, who in 2009 was the "face" of Elizabeth Arden, epitomized the company's concept of the modern woman: beautiful, talented, and successful in her own right. While these actors can by no means be considered average, it is to the company's credit that it chose to be represented by mature women, not girls still in the fresh bloom of youth. The company has become more community-minded over the years and contributes heavily to causes, including AIDS (acquired immunodeficiency syndrome) research and child welfare. Elizabeth Arden, Inc., is, and has always been, opposed to testing its products on animals.

Ever alert to new marketing possibilities, Arden developed a lipstick she named Montezuma Red to match the red trim on the uniforms of women in the armed forces, thus subtly planting the seed that wearing makeup to work was both acceptable and desirable.

The phenomenal success of Arden paved the way for other women to succeed in the beauty business, notably her first competitor, Helena Rubinstein. Their legendary rivalry lasted for decades, fueled in part when Arden's former husband, Thomas J. Lewis, went to work for Rubinstein following their divorce. Rubinstein had acted in retaliation after Arden recruited her sales manager. That both women courted the same customers, and both succeeded, shows the scope of the industry Arden began. In the years that followed, Estée Lauder and others joined the industry that seemingly had no bounds.

From the earliest days of her career, Arden knew the socially privileged were her target market. By consistently developing exceptional products for that segment, she created a client list that included First Ladies Mamie Eisenhower and Jacqueline Kennedy, Queen Elizabeth II, the Queen Mother, and the almost royal Wallis Simpson, along with the elite of mid-1900's Hollywood and Broadway. In the 1940's, her annual sales reached $60 million.

Diversification became the key to her company's growth, and, by association, the growth of her own substantial wealth. She began adding millinery and fashion to her mix of products and services. Oscar de la Renta was one of her first designers. Not content with salons alone, Arden turned her limitless energy to developing resort spas where women could be pampered for several weeks or longer. Her first spas were in New York and Arizona. She was ahead of the curve in other ways as well: She was the first, for example, to produce fragrances for men and to open a men's boutique.

Arden indulged in another love, horses, and bred thoroughbreds, leading some to say she built her wealth on fast horses and rich women. Her horses included Jet Pilot, the 1947 Kentucky Derby winner. She used the name

Elizabeth N. Graham in racing circles and owned close to 150 horses. In 1945, her Maine Chance Farm took in more prize money than any other American stable. After her death, Arden was inducted into the Canadian Horse Racing Hall of Fame. She approached racing as she approached everything else—with total commitment—a living testament to one of her advertising slogans: "Hold fast to youth and beauty." She named her first (and America's first) fragrance "Blue Grass" after the Kentucky horse country surrounding her farm near Lexington.

Arden was above all a hard-driven businesswoman, with her hand in virtually every slice of her empire's pie. Even so, she strove for an illusion of softness, probably to appear less intimidating. Whether it was due to the nature of her company, or just something she deemed a good business strategy, she retained a public persona of femininity. One way she accomplished this was by making pink her signature color, even to the extent of using it as one of her stable's racing colors.

Arden died on October 19, 1966, in New York City, still the grande dame of the cosmetics industry. She is buried in Sleepy Hollow, New York, under the name Elizabeth N. Graham, a combination of her birth and professional names and the name she used in horse racing.

Legacy

One of Elizabeth Arden's legacies is bringing the use of cosmetics into the mainstream. Formerly, such products were used primarily by actresses, prostitutes, and other women commonly looked down upon. Arden and others following in her footsteps, including rivals Helena Rubinstein and Estée Lauder, made it acceptable for a woman to enhance her appearance, and in so doing enhance her self-esteem. Her Red Door Salons, each with a uniformed doorman, serve a worldwide, upscale clientele, but less privileged women can buy lower-cost alternatives at their neighborhood drugstores. Once cosmetics gained acceptability, they paved the way for companies like Revlon, Max Factor, and the door-to-door marketer Avon Products, Inc.

As one of the first women entrepreneurs to achieve great wealth in a business climate dominated by men, Arden opened the door, if only a crack, for women who entered business, irrespective of their chosen industry. She proved conclusively that with a marketable idea, good business instincts, and dogged determination, there are no limits to what one can achieve.

Sir Richard Arkwright

British industrialist and inventor

Arkwright was an archetypal self-made man who acquired great wealth by exploiting an invention of his own making in his own factories, thus becoming a key contributor to the Industrial Revolution of the eighteenth century. He also won considerable fame by virtue of the ostentatious deployment of his wealth in buying land and building a castle fit for one of the new kings of industry.

Born: December 23, 1732; Preston, Lancashire, England
Died: August 3, 1792; Cromford, Derbyshire, England
Sources of wealth: Manufacturing; patents; real estate
Bequeathal of wealth: Children

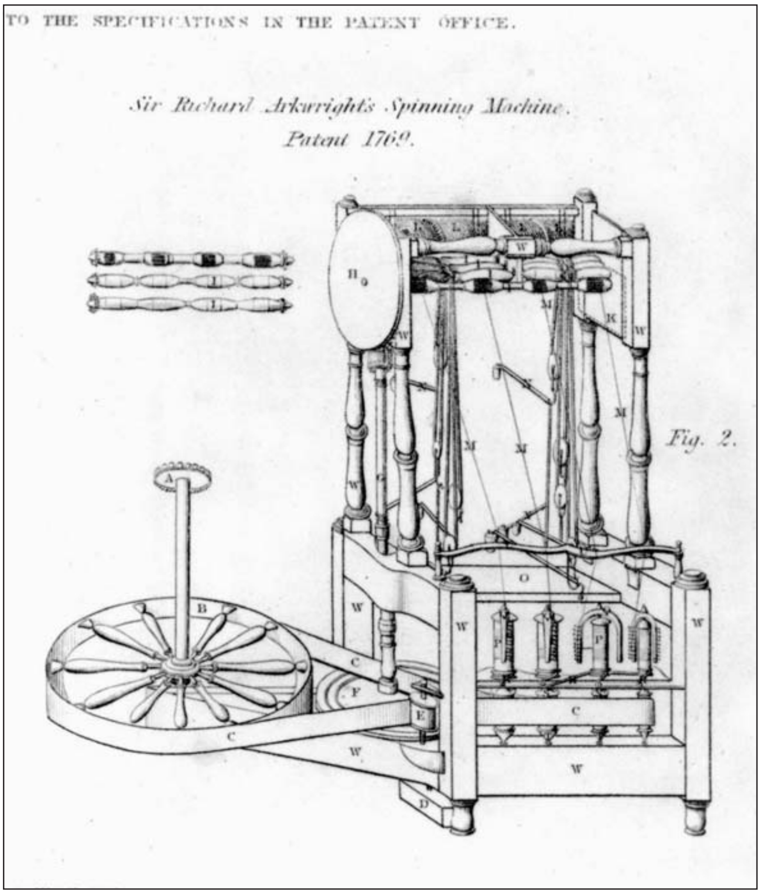
Early Life

Sir Richard Arkwright was the sixth of seven surviving children of Thomas Arkwright and Ellen Arkwright (née Hodgkinson). The family was poor and Arkwright received little formal education, although two of his elder sisters attended a blue coat (charity) school and passed on what they learned to their siblings. In his early teens he was apprenticed to a barber in the town of Kirkham, but he moved to Bolton-le-Moors in 1750 to work for the wig maker Edward Pollit. He continued to work for Pollit's widow for a short time, but by 1755 he had set up a barber's stall in a passage leading to an inn, shaving chins for a penny. On March 31 of that year he married Patience Holt, the daughter of a schoolmaster, and borrowed £60 from her father in order to expand his business. The couple's only child, also named Richard, was born on December 19, 1755. The marriage does not appear to have been happy; when Patience died on October 6 in the following year, she was buried with her mother under her maiden name.

On March 21, 1761, Arkwright married Margaret Biggins of Pennington, and he repaid the debt he owed his first wife's father with the bulk of an inheritance that she had received; he invested the rest in an inn, the Black Boy, whose publican he became. The business failed, and he returned to wig making, also dabbling, as most eighteenth century barbers did, in bleeding (a surgical practice) and tooth extraction. He began buying hair on a large scale, ostensibly making use of a secret dyeing technique in making his wigs. Margaret bore three children, one of whom—Susanna, born on December 20, 1761—survived into adulthood.

First Ventures

The device that made Arkwright's fortune mechanized one of the oldest traditional crafts, spinning yarn. Arkwright's spinning machine, subsequently known as a water-frame once it was adapted for use in association with a water mill, was not the only such device invented at the time; James Hargreaves's spinning jenny was virtually contemporary. Arkwright, however, was a deter-



Sir Richard Arkwright's yarn spinning machine helped mechanize textile production. (Library of Congress) mined opportunist who carried his machine all the way through the developmental process to full-scale industrial production. Arkwright's invention was understandably shrouded in secrecy and was embroiled in controversy from the start.

The search for such a process had been urgent for some time, but an earlier machine patented by Lewis Paul and John Wyatt in 1738 had proved impracticable. Thomas Highs of Leigh subsequently claimed to have devised the innovations that he carelessly confided to Arkwright in conversation. However, what is certain is that in 1767, Arkwright formed an association with a clockmaker named John Kay (sometimes mistakenly confused with another John Kay, who invented the fly-shuttle), who made him a model of a spinning machine, for which they began to seek financing.

After failing to find backers in Manchester and Preston, Arkwright and Kay took two of their relatives, the former publican John Smalley and the merchant David Thornley, into partnership in order to build and exploit a full-scale machine in Nottingham. They petitioned for a patent on June 8, 1878, but it was not granted until July 3, 1769, perhaps because they had trouble scraping together the money to pay the fee. Thornley had to sell part of his share to Smalley when his own capital ran out, and a new fifth share in the association was taken by Samuel Need and Jedediah Strutt, who provided the financing necessary to construct a horse-drawn mill, to be managed by Arkwright and Thornley.

The Nottingham mill did not start production until Christmas, 1772, by which time the partners had already commissioned the construction of a new mill on the River Derwent at Cromford in Derbyshire, driven by water power. The original intention had been to spin yarn for stockings (Strutt was already involved in that trade), but the yarn produced by Arkwright's machine was thin enough and strong enough to serve as the warp on a loom, so the Cromford mill began to produce calico, with an efficiency that astonished its owners and their rivals. Arkwright set up his headquarters there and began to expand his operation relentlessly. Strutt joined forces with other entrepreneurs to lobby Parliament to reduce excise duties on British cotton goods. When they were successful, the profits made by Arkwright's Cromford mills increased rapidly, and the company set out to dominate the trade, applying for further patents that would have established a virtual monopoly. The result of these moves was an intense competition, which was also reflected within the partnership as Arkwright attempted to squeeze out his associates.

Mature Wealth

Arkwright's legal wrangles came to a head in July, 1781, when he sued nine other manufacturers for breaching his patents. It was during this period that Highs came forward to lay charges of theft against Arkwright—charges that were never substantiated, but probably contributed to the eventual result of the conflict, which was the cancellation of Arkwright's patents in 1785. By that time, however, most of Arkwright's original partners were dead and he had become exceedingly rich, thanks to the huge profits he had made during the previous decade from his Cromford mills. The cancellation of the patents initiated a free-for-all that brought about a boom in the cotton industry throughout the north of England, but Arkwright never lost the crucial commercial advantage he had gained before his patents were canceled, and he remained the largest manufacturer in the country.

Arkwright was just as desperate to make social progress as economic progress, although he labored under the handicap of a personality that did not allow him to make friends easily and often alienated those he had. He was deeply resented by the landed gentry of Derbyshire, who mocked him relentlessly as an upstart when he bought Willersley Manor, near Cromford, in 1782, but if he cared he did not show it. When his daughter Susanna married the lead merchant and iron manufacturer Francis Hurt, he was able to give her a dowry of £15,000. His increasing political influence within the country reached a climax when he was knighted in 1786 and subsequently became high sheriff of Derbyshire.

In 1788, Arkwright involved himself in a project to construct a Cromford canal, but it soon ran into difficulties, allegedly because of his attempts to monopolize the project and its anticipated profits. His reputation for avarice and ostentation reached its zenith soon thereafter. Arkwright bought the manor of Cromford itself in 1789, and he promptly commissioned the construction of a grandiose stately home, which he named Willersley Castle. The traditional gentry were horrified by the prospect, and abusive comments were made about the priorities of its design; its library was said to be exceedingly small and ill-lit, and the whole enterprise was sometimes called a folly. However, it actually turned out to be a fine house, by no means tasteless in its architecture or furnishing. Arkwright bought a town house in London in the same year, although he actually lived for the greater part of his later life in Rock House, situated on a hill overlooking his Cromford mills.

In 1790, Arkwright introduced the first steam engine into his works at Nottingham, thus completing the foundations of the revolution in textile production that changed the face of England in the early nineteenth century. The *Gentleman's Magazine* estimated his fortune at the time of his death to be "not far short" of £500,000, but that was a guess; his family kept the details of his inheritance to themselves, and the sum did not include his various properties.

Legacy

Although he suffered all through his life from asthma, Arkwright insisted on working from 5:00 A.M. to 9:00 P.M. every day, and his industry became legendary. He became a heroic role model to the industrialists who followed him, but he also became a villain in the eyes of subscribers to the "rage against the machine" carried forward by active Luddites and the Romantic writers, who tended to equate industrialization with spoliation. One of his mills was said to have been demolished by rioters while police and military forces looked on sympathetically, although the reports might have been exaggerated. He was in any case unmoved by opposition of any sort. He was in essence a man who successfully reinvented the wheel—spinning being for most of its history at least as significant an application of the wheel as wheeled transport, whose utility was limited until roads improved sufficiently to accommodate such vehicles.

—*Brian Stableford*

Willersley Castle

As he approached the age of sixty, Sir Richard Arkwright commissioned the architect William Thomas to design for him a stately home on a sixty-acre site overlooking the valley of the River Derwent at Cromford, where his chief mills were situated. Construction began in 1790. The residence is a two-and-a-half-story edifice constructed in sandstone, with seven principal bays and two wings jutting out toward the edge of the cliff, equipped with fake battlements and a series of mock-turrets. The principal internal feature of note is the glass-domed Well Gallery in the center of the building, approached via an archway designed and supplied by the prestigious firm of Robert and James Adam. The fireplaces in the principal ground floor rooms were also supplied by the Adam brothers, who also sold Arkwright his London town house. The furniture for Willersley Castle was ordered from Edward Wilson of The Strand in London, and the luxury plate glass was imported from France.

Work on the "castle" was almost completed when a fire on August 8, 1791, destroyed the interior, and the shell of the building had to be completely restored—work undertaken by Thomas Gardner and Edward Blore. They had not finished when Arkwright died in 1792, and it was his eldest son, also named Richard, who eventually took up residence in the house in 1796. It was subsequently handed on to Arkwright's third son, Peter, whose descendants lived there until 1925. In 1927, the house was refashioned by the Wesley Guild, a group of wealthy Methodist businessmen, for use as a holiday center. It was used as a maternity hospital during World War II and then reverted to its use as a hotel, operated by an organization subsequently known as the Christian Guild.

GIORGIO ARMANI

Italian entrepreneur and fashion designer

Armani founded a fashion empire and is the most successful Italian designer in history. A very private person, he devotes his time to running his business and charity.

Born: July 11, 1934; Piacenza, Italy
Source of wealth: Sale of products
Bequeathal of wealth: Charity

EARLY LIFE

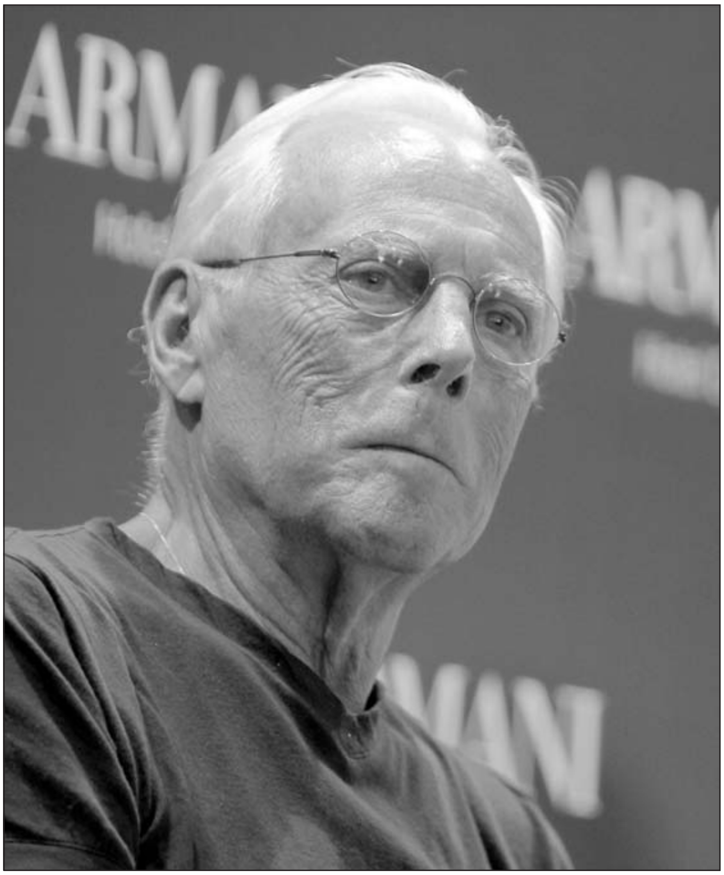
Giorgio Armani (JOR-jee-oh ahr-MAHN-ee) was born in rural Piacenza, Italy, to a hardworking family. His way to escape World War II, which claimed the lives of several friends and caused him and his sister to be strafed, was going to the cinema, where he developed his love of fashion, particularly from the 1930's. After the war the family moved to Milan and Armani began studying medicine, which he hated. In 1957, he returned to Milan after completing military service. An interest in photography led to a job at La Rinascente, Milan's largest department store. On the basis of his photographs of his sister, Armani was hired as a window dresser, his first job in fashion.

FIRST VENTURES

In 1961, Armani began working for Nino Cerruti, designing menswear for the Hitman line. In 1970, Armani left Cerruti to open a new business with Sergio Galeotti, his business partner until Galeotti's untimely death in 1985, freelancing and marketing his own designs. His first major collection, shown in Florence in 1973, included leather as an everyday fabric. This success led to the 1974 creation of his own label, Giorgio Armani S.p.A. menswear, followed in 1975 by his women's wear line. Armani's designs are characterized by his love of sophistication and comfort. Basing women's wear on menswear, he revolutionized the structure of suits and was instrumental in introducing menswear fabrics into women's wear lines. He is credited with the creation of the unstructured suit and the power suit. In 1980, Armani became world famous after designing the clothes for the film *American Gigolo*, starring Richard Gere.

MATURE WEALTH

Capitalizing on *American Gigolo*, Armani opened his first store in 1982, Emporio Armani Milan. He encouraged film stars to wear Armani clothes at the Academy Awards, ushering in the trend of designer-dressed actors on the red carpet. In 1982, Armani graced the cover of *Time*, the second fashion designer ever so honored. The 1980's began a decades-long period of continuing growth for Giorgio Armani S.p.A. and his personal fortune. Although Galeotti's death devastated Armani, he threw himself into work, diversifying and designing eyewear, blue jeans, prêt-à-porter, haute couture, accessories, perfume, underwear, and foodstuffs, while maintaining his original men's and women's wear lines. Armani took over many Italian fashion businesses, such as the knitwear firm Deanna S.p.A, Simint manufacturing company, and Guardi shoemakers. Armani loves cinema, and



Giorgio Armani. (AFP/Getty Images)

he has designed wardrobes for more than two hundred films.

The 2000's saw a move from purely clothing- and accessory-based designs to a greater interest in large-scale fashion. Having helped to design worldwide Armani retail sites, he developed the Armani Home collection of household furnishings. In 2005, he contracted to build and design a group of resort hotels, beginning in Dubai. Throughout his career Armani has retained total financial and creative control of his empire, making it one of the only fashion houses to be owned by a single person. Armani is a self-professed workaholic whose personal wealth was reported in 2010 at $5.3 billion, making him number 144 on *Forbes* magazine's list of the world's billionaires. His company grosses $1.69 billion annually.

LEGACY

Armani contributes to many charities, focusing on the arts, children, refugees, science, and the environment. He cofounded the Martin Scorsese Cinema Foundation to save old films. His work supporting international refugees led to an ambassadorship with the United Nations High Commissioner for Refugees (UNHCR). He has donated money to build and restore theaters, museums, research facilities, and medical centers. Since the 1990's he has worked for many environmental charities, including musician Bono's Project Red and Don't Bungle the Jungle. He has raised millions of dollars through the sales of T-shirts and other products specifically designed for charities, such as the UNICEF (United Nations International Children's Emergency Fund) Armani doll. He built a breeding facility in Seoul in order to help save the Korean tiger. One of the most honored fashion designers, Armani spends his time continuing to design and to help the less fortunate around the globe.

PHILIP DANFORTH ARMOUR

American industrialist and philanthropist

Armour, cofounder and chairman of Armour & Co., introduced modern and innovative technology and production methods to large meatpacking operations. Armour & Co. was among the largest employers in Chicago's historic stockyards and meatpacking industry. He used his wealth for philanthropic and educational ventures, founding the Armour Institute of Technology, later renamed the Illinois Institute of Technology.

Born: May 16, 1832; Stockbridge, New York
Died: January 6, 1901; Chicago, Illinois
Source of wealth: Sale of products
Bequeathal of wealth: Children; charity; educational institution

EARLY LIFE

Philip Danforth Armour was born in 1832 in Stockbridge, New York, the fourth of eight children of Danforth Armour and Juliana Brooks Armour. Danforth left Connecticut to run a rural New York family farm, where his children learned to slaughter cattle and produce soap from the fats. Armour attended the local Methodist church with his family and went to school in the nearby towns of Valley Mills and Cazenovia. He worked as a farm laborer for his family and neighbors, clerked in a store, and was employed as a driver on the Chenango Canal in New York, which connected the Susquehanna River to the Erie Canal. In 1852, he borrowed a wagon from the family and headed to California, lured there by the gold rush.

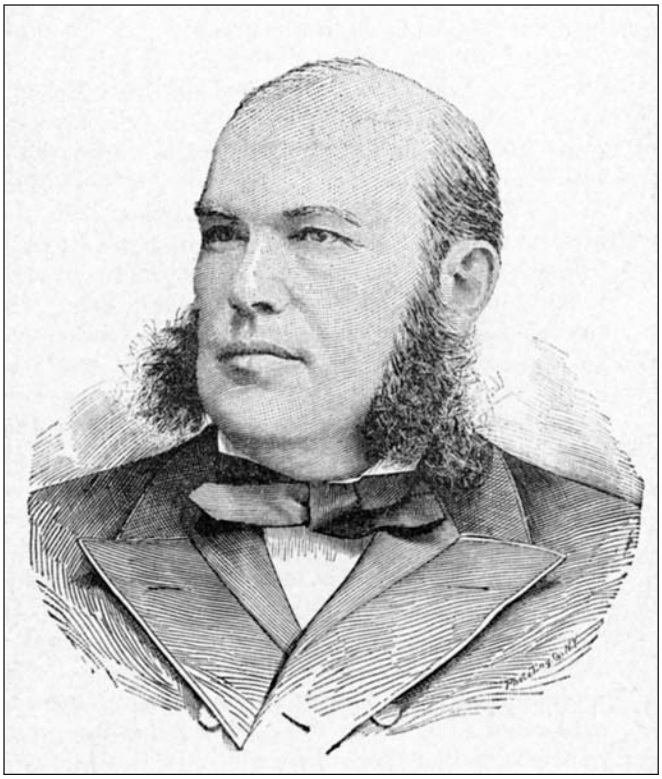
FIRST VENTURES

Armour was a determined entrepreneur. In the Sacramento Valley of California, Armour developed and leased aqueduct systems (sluiceways), bringing water to gold diggers and washers, which proved more profitable than mining. Returning east, he worked briefly in Milwaukee, Wisconsin, operating a soap business, then in St. Paul, Minnesota, where he partnered with James J.

Hill, selling hides, then returned to Milwaukee and founded a grocer provisions firm with Frederick B. Miles. In 1862, he visited Cincinnati, Ohio, and observed the booming Civil War demand for salt pork.

It was in Cincinnati that Armour met and married Malvina Belle Ogden (1842-1927). They would have two sons, J. Ogden Armour (1863-1927) and Philip Danforth Armour, Jr. (1869-1900).

In 1862, Armour took a half interest in the Milwaukee slaughterhouse founded by John Plankinton (1820-1891). By then, Armour's brother Herman Ossian Armour (1837-1901) was already the operator of a successful Milwaukee grocer provision firm, and another brother, Joseph Francis Armour (1842-1881), was a Chicago grain dealer. Before war's end Philip Armour sold short on pork, making Plankinton and Armour wealthy, while the fall in pork prices drove many of their Cincinnati competitors out of business. Armour would henceforth become an influential speculator in agricultural commodities. Railways, cattle, and pigs would make Chicago a center for agricultural industries in post-Civil War America, and Armour and his brothers set their sights there.



Philip Danforth Armour. (Archive Photos/Getty Images)

Mature Wealth

Armour and his brothers acted aggressively to build their businesses. Plankinton and Armour expanded to Kansas City, Missouri; Henry Armour opened Armour, Plankinton, and Co. in New York (later H. O Armour and Co.); brother Simeon Armour (1828-1899) established Armour Packing Co. in Kansas City (the two merged into a single firm in the 1890's); and Andrew Watson Armour (1829-1893) founded the Armour Brothers bank in Kansas City. The Armour yards and packinghouses in Chicago became the biggest in the city. Philip Armour led these enterprises with aggressive and astute business acumen, epitomizing the hard-nosed business culture of his era.

Armour was a great believer in trade and thrift (rather than in religion), as well as in the sciences that enabled their application in production. Thus he sought to employ the enormous amounts of waste, including heads, feet, tankage, and other matter, that packinghouses produced. Armour was among the first to fully incorporate and profit from the side businesses of manufacturing glue, oil, tallow, fertilizer, oleomargarine, sausage casings, pharmaceuticals, and other products from the nonmeat portions of farm animals. Eventually lower-quality meat was canned and sold as inexpensive new food products, such as pork and beans. Armour hired chemists and built a laboratory at his Chicago facilities to make possible the most efficient and profitable reuse of all parts of farm animals. He purchased competitors' businesses or founded his own, including fertilizer and soap firms, and had designs on tanneries and related businesses until the antitrust legislation of the early 1900's and the Packers and Stockyards Act of 1921 slowed the company's growth. It was these businesses related to meatpacking that made Armour & Co. the largest of its kind in Chicago and a global innovator in industrial agriculture processing.

Armour, who built and directed the collection of companies that he and his brothers commanded, shared a large, nonpartitioned office with three hundred employees at the Home Insurance Building on Chicago's LaSalle Street. Tall, weighing 250 pounds, he was known as a plain speaker whom few dared to cross. He became one of the wealthiest men of Chicago's Gilded Age, along with Marshall Field, George Mortimer Pullman, and Armour's chief rival, Gustavus Franklin Swift, who pio-

Illinois Institute of Technology

The origins of the Illinois Institute of Technology go back to 1886, when Philip Danforth Armour established the Armour Mission in Chicago to offer classes to young people of all races and ethnicities. It was operated by the Plymouth Congregational Church, led by the influential Reverend Frank Wakely Gunsaulus (1856-1921), who would help direct Armour's charitable efforts.

Armour sought to enlarge the missions founded in 1874 in Chicago by his late brother Joseph Francis Armour. The mission facility had been designed by the noted architects John Wellborn Root and Daniel Hudson Burnham. A row of apartments were built adjacent to the mission, and Armour encouraged company mangers and officials to live there so their rent might help enrich the mission's programs, which included an administrative and teaching staff, more than two thousand pupils, and a library. Librarian Julia A. Beveridge began offering technical classes in woodworking, mechanical drawing, and designing, and she is credited with providing the inspiration for the school's curriculum.

Opened in 1893, the Armour Institute of Technology was led by Gunsaulus. A technical school open to all young men who could pass the stiff entrance exams, regardless of race or ethnicity, the institute charged a maximum $60 annual tuition and was free for poorer students. A high-school-level academy was also built to serve young women. The institute's opening coincided with the 1893 World's Columbian Exposition held in Chicago, and some of the exposition's mechanical and electrical equipment was purchased for school use. Armour donated $3 million to the institute before his death. His wife Malvina and his son J. Ogden Armour donated another $1 million.

First courses included mechanical, electrical, and mining engineering, taught by a select faculty. The institute soon expanded its curriculum in civil engineering, chemistry, and library science, and became a premier institution in engineering education. In 1901, it graduated the first African American to receive a degree in chemical engineering, Charles Warner Pierce (1867-1947). In 1938, noted architect Ludwig Mies van der Rohe (1886-1969) assumed leadership of the institute's architecture program, which was operated jointly with the Art Institute of Chicago and named the Chicago School of Architecture.

In 1940, the Armour Institute of Technology merged with the Lewis Institute, a small Chicago liberal arts college, and changed its name to the Illinois Institute of Technology (IIT). By 2009, IIT was a distinguished university, providing degrees in engineering, science, psychology, architecture, business, design, and law.

neered the refrigerated railway car for beef transportation. Armour relentlessly applied practical business methods to lower costs and inefficiencies, and he employed professional mangers to oversee a diverse empire. He kept a vigorous schedule, arriving at his offices by six o'clock in the morning and holding first meetings soon thereafter.

Confronting the problem of transportation and distribution, Armour partnered with railroad magnates; became an owner in the Chicago, Milwaukee, and St. Paul Railroad Company and in the Baltimore and Ohio Railroad; and established distribution centers for beef, pork, and grain throughout the country and in Europe. Armour overcame considerable public opposition to fresh beef, as it challenged commonly held notions of food safety and competed (many claimed unfairly) with local butchers. The Armour brand became widely known, and Armour had the motto "We Feed the World" painted on his company's railway cars.

Chicago's South Side, where the Back of the Yards neighborhood and the stockyards and slaughterhouses were located, was known for its unsafe and poor living and working conditions. Upton Sinclair's best-selling book *The Jungle* (1906) depicted the stark life of packinghouse workers, and Jane Addams's Hull House settlement programs were established nearby to provide educational and other services to these residents. Staunchly antiunion, Armour defeated major strike waves in 1879, 1886, and 1894, and the company required workers to sign agreements not to join a union. The industry remained nonunion during Armour's lifetime.

Armour's supporters pointed to his undeniable generosity, his scorn for wealthy "society," his genuine love of children, and his ease with working men. He established the Armour Mission in Chicago in 1886, and in 1893 he founded the Armour Institute. These institutions became the passions of his life.

Armour died pf pneumonia in January, 1901, after a series of illnesses.

Legacy

Armour was one of the most innovative industrialists of late nineteenth century America. He represented the ideal of the self-made man of his era, and his Armour &

Co. businesses embodied the great maturation of the United States into a sophisticated industrial agricultural provider to the world.

His personal fortune was estimated at more than $30 million. He was survived by his wife and older son, J. Ogden Armour, who took on the Armour business with great composure, having served as a partner since 1884. His son took the company to new heights, at one point grossing $1 billion in a single year, but the company barely survived the post-World War I economic slump.

William Henry Aspinwall

American merchant and steamship and railroad owner

Aspinwall established himself as one of New York's most successful merchants in the 1830's and 1840's. His Pacific Mail Steamship Line was launched just before the beginning of California's gold rush and became immensely profitable, as did the railroad his firm constructed across Panama in the 1850's.

Born: December 16, 1807; New York, New York
Died: January 18, 1875; New York, New York
Sources of wealth: Trade; railroads; shipping
Bequeathal of wealth: Spouse; children

Early Life

William Henry Aspinwall (AS-pihn-wawl) was born into a respected New York merchant family. His father, John, and uncle were importers and wholesalers of dry goods. G. G. & S. Howland, a merchant partnership run by the brothers of Aspinwall's mother, was one of the city's most successful businesses. Aspinwall attended Bancel's Boarding College in New York City and became so adept at French and Spanish that he tutored in these languages after graduation.

First Ventures

In 1832, Aspinwall and his cousin William Howland were brought into G. G. & S. Howland to learn the business, and the firm was renamed Howland & Aspinwall in 1834. Three years later, Aspinwall's two uncles ceased active management of the firm, and Aspinwall began receiving a one-quarter share of its profits as a partner. Aspinwall was increasingly recognized as the dominant partner, known for his quiet, pious character, careful attention to detail, and conservative business decisions. The firm's ships carried goods to and from Europe, the West Indies, China, and South America. They secured a monopoly on trade with Venezuela, due to ties with President José Antonio Páez. By the mid-1840's. Aspinwall also became director or trustee of several banks and insurance companies and served as vice consul for Tuscany.

Mature Wealth

Aspinwall began to take greater risks in the mid-1840's, when he ordered shipbuilders Smith and Dimon to construct the world's first clipper ship, following naval architect John Willis Griffiths's radical new design. Aspinwall had second thoughts in the face of great public skepticism, which delayed construction, making the *Rainbow* the second clipper ship to be launched. Aspinwall's next clipper, the *Sea Witch*, astounded the shipping world by sailing from Canton, China, to New York in only seventy-four days. The speed and profitability of Aspinwall's vessels led to a flood of orders for the new clipper ships.

In late 1847, Aspinwall made another daring move, establishing the Pacific Mail Steamship Company after purchasing a contract to run a government-subsidized shipping line from Panama to Oregon. At the conclusion of the Mexican War in 1848, there were only about twenty thousand inhabitants scattered along the two thousand miles of the United States' newly acquired West Coast, and most observers believed the $199,000 annual government subsidy would not cover the costs of running three steamers along routes that had no coal stations or repair yards, inadequate port facilities, and very little freight or passenger potential. The construction of three wooden-hulled, paddle-wheel steamers began at once, and the first, the *California*, left New York on October 6, 1848. It carried only seven passengers from New York, its captain became ill, and it ran into a string of difficulties on its voyage around South America, but its voyage became the stuff of legend. When the beleaguered ship reached the Pacific coast of Panama, it found a mob of fifteen hundred men clamoring to reach California's gold fields. Because of the gold rush, Aspinwall's line expanded rapidly and became immensely profitable.

With even greater foresight, Aspinwall had already sent a surveying team to Panama and quickly negotiated for the rights to build a railroad across the isthmus. Panama's geography, climate, and disease-carrying mosquitoes made construction difficult, expensive, and slow. In late 1851, the partially built railroad was on the verge of running out of capital, as construction costs far outstripped estimates, and stock in Aspinwall's Panama Railroad Company fell to pennies per share. At this point, Aspinwall pledged his personal fortune to continue the project, saving the railroad, which was completed in 1855 at a cost of $8 million (about $200 million at 2010 prices) and about six thousand lives.

In 1856, Aspinwall began to withdraw from active management of his businesses and to turn the reins of the merchant house over to his younger brother and son. During the Civil War, Howland & Aspinwall acted as a government purchasing agent in Europe, but Aspinwall surprised Secretary of War Edwin M. Stanton by remitting his commissions from these purchases back to the government. Aspinwall also served on a secret mission to England to impede Confederate efforts to buy and outfit ships that would raid Union commerce.

Legacy

In his retirement, Aspinwall became a philanthropist and amassed a sizable art collection, with paintings by Thomas Gainsborough, Rembrandt, Peter Paul Rubens, Titian, Diego Velázquez, and others. He was a founder of the Metropolitan Museum of Art and a founding trustee of the Society for the Prevention of Cruelty to Animals.

Although he was one of the world's wealthiest men at his death in 1875, with net assets valued around $4 million ($80 million in 2010), time quickly obscured Aspinwall's fame and contributions. Howland & Aspinwall evolved into an investment, commission, and banking firm before ceasing operations in the mid-1890's. The Pacific Mail underwent numerous changes of leadership and ownership, while the Panama Railroad eventually became the property of the Panama Canal in the early twentieth century, and the port town of Aspinwall, Panama, was renamed Colón.

Brooke Astor

American philanthropist and socialite

Astor inherited one of America's great fortunes and became one of America's best known philanthropists, developing a personal involvement and style rare in American philanthropy. She continued her work until age ninety-five, when she closed the Vincent Astor Foundation.

Born: March 30, 1902; Portsmouth, New Hampshire
Died: August 13, 2007; Briarcliff Manor, New York
Also known as: Roberta Brooke Russell Kuser Marshall Astor; Roberta Brooke Russell (birth name)
Source of wealth: Inheritance
Bequeathal of wealth: Children; charity

Early Life

Brooke Astor was the only child of Marine officer John Henry Russell, Jr., and Mabel Howard Astor. Mother and child joined Russell at stations in Hawaii, Panama, and China. In Brooke's memoirs (*Patchwork Child*, 1962, rev. 1993; *Footprints*, 1980), she recalled learning from Chinese Buddhist priests to respect all living beings, an attitude that governed her philanthropic work. The family returned to the United States in 1914. In 1919, she married wealthy John Dryden Kuser. Her only child, Anthony Kuser, was born in 1924. The abusive marriage ended in 1930. In 1932, she married stockbroker Charles "Buddie" Marshall; her son changed his name to Anthony Marshall. After Marshall's 1952 death, she became an editor of *House and Garden* magazine. In 1953, she married Vincent Astor (1891-1959).

First Ventures

At Vincent Astor's death, his estate was worth $127 million. Brooke Astor received $2 million in cash, valuable real estate, and a $60 million trust fund. Much of this fortune had been amassed by John Jacob Astor (1763-1848), a fur trader who invested profits in increasingly valuable New York real estate. He leased land rather than sold it, allowing developers to build for maximum profit and disclaiming responsibility for the squalid tenements that resulted. Trusts kept money in the family. When John Jacob Astor IV died in the 1912 sinking of the RMS *Titanic*, his son Vincent inherited $87 million. He received his wealth outright, not in trust, and was free to rid the estate of slum properties, selling some to the city of New York for less than appraised value. In 1948, he established the Vincent Astor Foundation, to which he bequeathed $60.5 million. His widow was to head the foundation.

Mature Wealth

Under Vincent Astor, the foundation routinely donated about $175,000 each year to established charities, such as the American Red Cross and the Astor Home for Children, which he helped found. Brooke Astor redefined the foundation's mission, insisting that New York, the source of the family's wealth, should receive most of the money. She began personal on-site tours to potential recipients to ensure that money would be well used. In her first year, grants totaled more than $3 million.

Her interests included educational and cultural institutions, such as the New York Public Library and the

Brooke Astor. (AP/Wide World Photos)

Metropolitan Museum of Art; her support was crucial during New York's fiscal crisis in the 1970's. Animal welfare grantees ranged from the Bronx Zoo to the Seniors' Animal Veterinary Endowment to provide treatment for the aging pets of the elderly. The foundation also donated heavily to redevelopment of the Bedford-Stuyvesant neighborhood in Brooklyn, one of the most impoverished in the city. She closed the foundation in 1997. Final grant recipients included Partnership for the Homeless, the Animal Medical Center, and the Women's Housing and Economic Development Center.

Her mind gradually failed. Her son, Anthony Marshall, took charge of her until 2006, when a guardianship petition by his son Philip Marshall resulted in Astor's friend Annette de la Renta becoming guardian and Chase Bank taking charge of Astor's financial affairs. Investigation of Anthony Marshall's handling of Astor's funds began in 2006; the validity of 2004 codicils to Astor's will was questioned. In 2007, Marshall was charged with sixteen counts, including grand larceny and fraud, for defrauding his mother and stealing tens of millions of dollars from her. He was tried in 2009, and on October 8 was convicted of fourteen of the sixteen counts against him. On December 21, 2009, he was sentenced to serve one to three years in prison, the minimum sentence allowed.

Legacy

Astor was a woman of enormous personal wealth, leaving an estate of $198 million. She also possessed great social intelligence and vitality, making an outstanding contribution to her adopted city. The discipline provided by her international childhood, magazine editorship, and continual writing (memoirs, novels, essays, and poetry) gave her exceptional administrative skills. She recalled her husband telling her she would have fun administering the foundation, and she did. Her efforts gained her many honors, including a Medal of Freedom awarded by President Bill Clinton in 1998, her ninety-sixth year.

Caroline Schermerhorn Astor

American heiress and socialite

Astor stood at the forefront of Gilded Age society. Born into a respected old New York colonial family, she married into America's richest dynasty and used its wealth and position to become the uncontested leader of high society in New York.

Born: September 22, 1830; New York, New York
Died: October 30, 1908; New York, New York
Also known as: Caroline Webster Schermerhorn (birth name)
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Children; charity

Early Life

Caroline Schermerhorn Astor (KEHR-uh-lin SKAYR-murn AS-tuhr) was born Caroline Webster Schermerhorn in New York City in 1830. The daughter of Helen White and Abraham Schermerhorn, she was the youngest of eight children. Her father, a wealthy banker, merchant, and landowner, was worth about $500,000 when she was born. Her father was descended from the city's original Dutch settlers, and her mother could trace her lineage back to King James I of Great Britain. Caroline attended a school run by a Frenchwoman and completed her studies in Europe.

First Ventures

In 1853, she married William Backhouse Astor, Jr., grandson of the first John Jacob Astor, whose work in the fur trade and subsequent investments in land had made his family the wealthiest in America. Over the next decade, bearing and raising children occupied Caroline's time. She had four daughters, Emily, Helen, Charlotte Augusta, and Caroline, before giving birth to a male heir, John Jacob IV.

In 1872, when her mother-in-law Margaret Astor died, Caroline claimed for herself the title of *the* Mrs. Astor. The wife of the eldest Astor son, John Jacob Astor III, should have assumed Margaret's role as the family's social matriarch, but she lacked her sister-in-law's social ambitions. Caroline's hunger for status may have sprung from concern for her children. She had four daughters for whom she needed to secure the best possible marriages. Caroline's husband William shunned society gatherings. However, he seemed willing enough to pay for his wife's elaborate entertainments, jewels, dresses, springs in London and Paris, and summers in Newport, Rhode Island.

Mature Wealth

With the help of distant cousin Ward McAllister, who became her majordomo and publicist, Caroline Astor assumed the role of high society's leader. McAllister popularized the concept of the Four Hundred—the notion that only about four hundred people, the approximate number that Astor's ballroom could accommodate, constituted the cream of New York society. He contributed to the formal and somewhat stout Astor's mystique, naming her the "Mystic Rose" after a paradisiacal vision in the literary works of Dante. Society's inner circle, and those hoping to enter it, vied for Astor's invitations.

Astor's grand parties were initially held in the four-story family home at 350 Fifth Avenue, where an unprepossessing brownstone exterior belied a sumptuous interior. In 1881, Astor's husband purchased her a sixty-two-room summer home in Newport, Rhode Island, that became another high-society hub. After William died in 1892, Caroline had a double home constructed for herself and her son's family at 840 Fifth Avenue. This imposing château, completed in 1896, included a massive shared ballroom.

William's death was followed in 1893 by that of their daughter Helen. By the time Astor emerged from two years of mourning, she had slipped from the pinnacle of society. She continued in a diminished fashion for the next decade, throwing her last ball in 1905 and her last dinner party in 1907. She spent her final year in declining health, dying of a heart ailment in 1908. She bequeathed most of her estate, valued at about $1.8 million, to her two surviving daughters, the family jewelry to her son, and $5,000 each to her butler and a charity for the blind.

Legacy

Astor embodied the intermingling of New York's old, traditional colonial families with its newer wealth. Unlike her conservative ancestors, she used her money to emulate the opulent lifestyle of the European aristocracy.

Caroline Schermerhorn Astor. (©Bettmann/CORBIS)

However, she erected societal barriers to exclude the nouveau riche, who had not had enough time in high society to learn its niceties. She and McAllister determined that it took three generations of wealth to produce a gentleman, a rule under which her third-generation husband was acceptable and the second-generation Vanderbilts were not. In a chaotic, post-Civil War New York where respected old families suddenly found themselves rubbing elbows with robber barons, Astor represented order and taste.

JOHN JACOB ASTOR

American merchant and entrepreneur

Astor became the first American multimillionaire. A German immigrant who came to the United States immediately after the Revolutionary War, he sold everything from musical instruments to tea but made most of his money in the fur trade. Astor's wealth set up his family as one of America's richest and most influential dynasties.

Born: July 17, 1763; Walldorf, Baden (now in Germany)
Died: March 29, 1848; New York, New York
Also known as: Johann Jakob Astor (birth name)
Sources of wealth: Trade; real estate
Bequeathal of wealth: Children; charity

EARLY LIFE

John Jacob Astor was the youngest of six children of Jacob Astor, a butcher, and Maria Magdalena Vorfelder. Astor's mother died three years after he was born; his father remarried and had six more children. Astor was born in Walldorf, Baden, which had an excellent school system, giving him a better education than most boys of his time and background. He followed the traditional pattern of leaving school at thirteen after being confirmed in the Lutheran Church. He then apprenticed as a butcher in his father's shop but did not like the trade.

Astor's older brother George made musical instruments in London, and Astor joined him in 1779. When the American Revolution ended in 1783, Astor set sail to join another brother, Henry, in New York. He sold musical instruments and sheet music in New York City for several months as a way to raise money to enter the fur trade. In 1784, he began to sell furs to the London market. A year later, in September, 1785, he married Sarah Todd. The couple would have eight children.

FIRST VENTURES

Astor continued to sell musical instruments but became increasingly involved in the fur trade. Meanwhile, he used his wife's connections to the old Dutch families of New York to increase his social prominence and business opportunities. He developed friendships with most of the leading politicians and businessmen in New York City. He later befriended politicians James Monroe, Henry Clay, and John C. Calhoun, among others, and would occasionally provide loans for friends.

While Astor's wife ran the musical instruments store, he made multiple buying trips to Albany, New York, a regional fur-trading outlet. In 1787, Astor rented a warehouse in Montreal, Canada, the fur-trading center in North America, and began making deals with traders. Many of the pelts that Astor purchased were beaver, which were used to make fashionable hats for Europeans. Since British law prohibited direct trade between Canada and the United States, Astor shipped his pelts to

John Jacob Astor. (Library of Congress)

London and then to New York or smuggled them overland.

Mature Wealth

By the early 1790's, Astor had become the leading American fur trader. He wasted no opportunity to make money. On the return voyage to the United States, he would ship teas and silk, which he would then sell for a handsome profit. In 1803, Astor purchased eight ships and created his own fleet. In addition to furs, his ships carried ginseng to China, which paid six times the American price for the herb.

By 1807, Astor had become the first American millionaire and the leading American fur trader. However, he had no particular allegiance to any country. Never a nationalist, Astor traded with anyone. In his dealings with Canada and Great Britain during President Thomas Jefferson's 1808 embargo on trade, Astor broke the law. He would engage in war profiteering during the War of 1812.

In 1808, Astor created the American Fur Company in order to establish a West Coast trading base. The American Fur Company also did business in the Great Lakes region and in the St. Louis-Missouri River area. Except for a break during the War of 1812, Astor's ships moved between China, Europe, Latin America, Hawaii, and the Pacific coast of North America. In 1827, Astor sold his ships and ended regular trade with China because of increased costs.

Astor used much of the profits from his fur trading to invest in real estate. From 1800 until his death in 1848, Astor is estimated to have spent more than $2 million in land deals for both urban and agricultural tracts in the vicinity of New York City. As Manhattan and the rest of the city grew, the value of Astor's real estate leaped. By the 1820's, he was collecting more than $100,000 in rental payments. The rental money would continue to benefit Astor's descendants long after his death.

One of Astor's major real estate projects was the Park Hotel, later named the Astor House. Begun in 1834 in New York City, it cost more than $400,000 to build. Upon its opening in 1836, it was the most famous hotel in the United States. However, Astor had less success with his developments west of New York City. A settlement he established in 1835 did not succeed. In 1838, the township of Astor joined with another town to form Green Bay, Wisconsin.

It would be far-fetched to categorize Astor as a humanitarian. He paid little attention to civic duties. He gave $5,000 of the $20,000 needed to build a home for poor old women and made donations to New York City's fire department. However, he made no other significant charitable bequests during his lifetime, except for financing the Astor Library.

Astor focused on his family. In the aftermath of the 1818 drowning death of a grandson, Astor left for Europe in 1819 with his two surviving sons and daughter Eliza (he and his wife would eventually survive all but two of their eight children). The group included Astor's oldest son, the mentally ill John Jacob Astor, Jr. The family traveled through Europe for the next fifteen years,

Astor Library

John Jacob Astor left very little of his fortune to charitable causes, with the exception of $460,000 that he contributed to the Astor Library. The millionaire may have been influenced by criticism from educator Horace Mann, who publicly condemned him for not giving back more to the society that enriched him. Mann, the founder of the American public school system, called Astor "insane." In the 1820's, as Astor contemplated retirement and put an eye toward his legacy, he began to consider making a substantial charitable contribution. Writer Joseph Green Cogswell suggested that Astor fund a library to enhance the Astor name and give New Yorkers access to the cultural heritage of the world. In 1837, Astor agreed to fund a library. As befits such a founder, the Astor Library would be the greatest in the United States.

Unsure where to place the building, Astor finally decided upon some less valuable lots in Lafayette Place. This decision shows that he still had some trouble giving away money. Astor also repeatedly changed his mind about the library's architecture, personnel, and book purchasing. Cogswell managed to persuade the old millionaire to give him permission to buy a private European library that came on the market.

When the Astor Library finally opened in 1849, Cogswell had stocked it with 100,000 volumes at a time when the Library of Congress housed only 50,000 books and Harvard University's library held 72,000 volumes. The books were not loaned out and the hours of operation were limited, but the library quickly became established as a major source of reference and research. Astor's son, William Backhouse Astor, subsequently supplemented his father's endowment to keep the library strong.

The Astor Library's holdings merged into the New York Public Library in 1895. The former site of the Astor Library now houses the New York Shakespeare Festival's Joseph Papp Public Theater.

with Astor purchasing a home on the shores of Lake Geneva, Switzerland, in 1824. Astor received regular reports from his business partners and remained actively involved in all of his business interests. In 1834, Astor returned permanently to the United States.

As Astor saw death approaching, he wound down his business affairs. Furs were no longer as profitable as they once had been because the mechanization of cloth manufacturing allowed manufacturers to make clothes for less money than producing them from furs. Additionally, western expansion had brought considerable competition in the fur business, with an accompanying increase in costs.

In 1834, Astor divided the first business monopoly in American history when he sold the northern and southern segments of the American Fur Company. His son, William Backhouse Astor, put the value of the empire at $1 million. Astor kept his real estate. At the time of his death, Astor's estate was valued by executors at $8 million, but this does not include property. Most biographers put the total value of the estate at between $20 and $30 million.

Legacy

Astor helped establish the young United States as a major trading nation. He did not transform business in any way but instead proved to be a master in the art of trading. He was a shrewd businessman rather than an innovator.

America's first millionaire and likely the richest man in the United States at the time of his death, Astor saw his only duty as making money for his family. He spent too much energy on amassing wealth to be able to easily give it away to strangers. He found it far easier to be generous with his family. The bulk of Astor's estate went to his son William, with the other half left in trust for grandson John Jacob Astor III. Astor left $50,000 to his hometown of Walldorf in order to care for the elderly and to provide education for poor children. He also left $30,000 to the German Society of New York to be used to help immigrants, as well as $30,000 to the Home for Aged Ladies. New York City's Blind Asylum, Half-Orphan Asylum, and German Reformed Church received minor gifts. As a result of the vast amount of wealth, the dynasty founded by Astor became one of America's most famous families and a foundation of the *Social Register.*

Vincent Astor

American heir, investor, and philanthropist

Astor was the first member of his immensely wealthy family to gain a reputation for philanthropy. He had no heirs and left much of his vast fortune to the Vincent Astor Foundation, which continued to support charitable causes for almost four decades after his death.

Born: November 15, 1891; New York, New York
Died: February 3, 1959; New York, New York
Also known as: William Vincent Astor
Sources of wealth: Inheritance; real estate; investments
Bequeathal of wealth: Spouse; charity

Early Life

William Vincent Astor was born in New York City in 1891. The son of Ava Willing and John Jacob Astor IV and the grandson of Caroline Schermerhorn Astor and William Backhouse Astor, Jr., Vincent was born into one of America's wealthiest families. During his teens he attended Westminster School in Simsbury, Connecticut, and St. George's School in Newport, Rhode Island. His strict and emotionally distant father gave the schoolboy an allowance of only fifty cents a month, which would be reduced by fifteen cents if Vincent's grades were poor or if he behaved badly. The young man fared better at Harvard University, where he received a $2,000 annual allowance, from which he had to pay for his tuition and board. In April, 1912, his life changed abruptly when his father died aboard the RMS *Titanic*, making twenty-year-old Vincent the youngest Astor to inherit. He left college and immersed himself in learning how to manage the family estate.

First Ventures

Astor's father, who was worth $87 million at his death, bequeathed $70 million to his son, about $63 million of which was in real estate. Vincent's inheritance included the Hudson Valley retreat Ferncliff, the yachts *Noma* and *Nourmahal*, and a garage of thirty automobiles. Vincent officially took control of the Astor estate upon his twenty-first birthday. Shortly thereafter, he broke from his forebears' tradition of merely owning land and ventured into developing it. He also strayed from expected Astor behavior by establishing a playground in Harlem and making other recreational provisions for slum children.

In 1914, he married longtime acquaintance Helen Dinsmore Huntington. During World War I, Astor served in the navy, ultimately rising to the rank of captain. He also contributed to war loans, gave the navy his yacht *Noma*, and offered Ferncliff for use as a hospital.

In 1919, Vincent and Helen moved into the palatial Astor residence at 840 Fifth Avenue, an imposing château that Vincent's father and grandmother Caroline had

Vincent Astor walks his dog while visiting Marblehead, Massachusetts. (©Bettmann/CORBIS)

The Vincent Astor Foundation

Vincent Astor established the charitable trust that bore his name in 1948 with the intention of using the trust for "the alleviation of human misery." The foundation initially provided grants to hospitals, children's homes, and other institutions. Astor's will left half of his estate, or $65 million, to the foundation.

Upon his death in 1959, Astor's widow Brooke became the foundation's president. During her tenure, which spanned four decades, foundation funds were allocated to a variety of charities, including the Metropolitan Opera Association, the New York Botanical Garden, the Natural History Museum, the Bronx Zoo, the Pierpont Morgan Library, the East Harlem Tutorial Program, the Navy Yard Boys' Club, and the Greater New York Ice Hockey League. Many of the gifts granted during Brooke Astor's tenure reflected her own background and interests: her childhood in China, her passion for learning and the written word, and her love for her dachshunds.

New York's Metropolitan Museum of Art received $10 million from the foundation in order to add a Chinese courtyard to its Asian galleries. Astor Court, which features a covered walkway, a small reception area, a half pavilion, a koi pond, a skylight, and Ming Dynasty furniture, was modeled on a scholar's courtyard in the Garden of the Master of the Fishing Nets in Suzhou, a city inland from Shanghai, China, known for its fine garden architecture. The courtyard's components were crafted in Suzhou and installed by a team of Chinese engineers and craftsmen. Astor Court opened to the public in 1981.

In the early 1980's, Brooke focused the foundation's philanthropy on the ailing New York Public Library. Her efforts and contributions helped popularize the library as a cause. The foundation's $10 million gift to the library in 1985 ignited a fund-raising campaign that generated $300 million. The foundation's gift designated $7 million for the library's unrestricted endowment and $3 million for annual operations of the research libraries. Brooke and Vincent Astor are memorialized through several library fellowships, awards, and facilities that bear their names, including the Vincent Astor Gallery, an exhibition space at the New York Public Library for the Performing Arts at Lincoln Center Plaza. Other notable foundation activities included the 1982 establishment of the Astor Chair of Comparative Medicine at New York's Animal Medical Center (AMC) and the 1995 funding of AMC's Senior Assistance Veterinary Effort, which supplies medical care for the pets of elderly indigent persons.

With no direct Astor heirs to whom she could pass the foundation, Brooke decided it should not continue after she retired from management. In 1997, at the age of ninety-five, she dissolved the foundation and gave away its remaining assets. At the time of her death, on August 13, 2007, she was renowned as one of New York's greatest philanthropists, having given $25 million to the New York Public Library alone.

shared. (John Jacob, who divorced Vincent's mother in 1910, left the Fifth Avenue house, a sixty-two-room summer house in Newport, Rhode Island, and a $5 million trust to his second wife Madeleine; when she remarried in 1919, she forfeited these benefits, which reverted to Vincent.) While the Astors held an annual January ball in remembrance of Vincent's grandmother Caroline, famed for her elaborate high-society entertainments, they also hosted charitable banquets.

Mature Wealth

In the years after World War I, Astor began selling off many family properties, including the Schermerhorn Building on Broadway for $1.5 million and the Longacre Building on Times Square for $2.5 million. Sale of the Waldorf-Astoria Hotel, jointly owned by Astor and the British branch of the family, brought each party $7.56 million; the hotel was demolished and the Empire State Building erected in its place. Other Astor-owned hotels, the St. Regis and the Knickerbocker, were also liquidated. Even Astor's Fifth Avenue home went on the market, fetching $3.5 million in 1925. Vincent and Helen moved to a smaller, $250,000 Georgian-style town home at 130 East 80th Street.

Over the course of roughly a decade, this real estate liquidation yielded more than $40 million, which Astor profitably reinvested in stocks. He also acquired shares in the first motion picture adaptation of Lew Wallace's novel *Ben Hur: A Tale of the Christ* (1880). He used his $371,000 from the 1925 blockbuster film to purchase a new and better yacht, christened *Nourmahal* in honor of the yacht his father and grandfather had owned. The $1.75 million *Nourmahal*, built in 1928, had a forty-two-man crew and an annual operating cost of $125,000. For years, Astor made annual South Pacific and Caribbean cruises aboard *Nourmahal*. On a 1930 trip to the Galápagos Islands, he brought along a team of naturalists from the New York Aquarium, the American Museum of

Natural History, and the Brooklyn Botanic Garden to collect biological specimens for their institutions.

Astor was an early supporter of Franklin D. Roosevelt, a distant relative and Hudson Valley neighbor. He placed *Nourmahal* at Roosevelt's disposal, and it was aboard Astor's yacht that the rattled president-elect collected himself after surviving a 1933 assassination attempt in Miami, Florida. Astor later conducted espionage for President Roosevelt under the entirely credible cover of a wealthy man enjoying a pleasure cruise.

Astor disliked his family's history as slumlords, and he strove to divest himself of his inherited tenement holdings. In the early 1930's, after some lower East Side tenements caught fire, Astor worked with the city housing authority to sell off his holdings for $189,000, much less than their actual value. Astor provided assistance to the tenants, helping them move out and find alternate housing. The tenements were razed and the city's first low-cost public housing constructed.

In 1933, Astor became owner of the weekly magazine *Today* with an initial investment of $250,000. Four years later, the magazine was merged into *Newsweek*, and Astor became the majority stockholder. It took roughly ten years and $5 million of Astor's money for *Newsweek* to break even. *Newsweek* was one of Astor's passions, along with the St. Regis Hotel. Built by and inherited from his father, the luxury hotel was among the properties he had sold off during the 1920's. However, he reacquired the St. Regis in 1934 and spent $500,000 to improve it. Under Astor's watch, the hotel once again became a popular Manhattan destination.

In 1940, Astor's wife divorced him, and shortly after he married Mary Benedict "Minnie" Cushing. During World War II he transferred his beloved *Nourmahal* to the Navy. After the war he went through another period of liquidating his real estate holdings, investing the profits in the stock market. The resulting returns would nearly double the inheritance he received from his father.

Astor and his second wife divorced in 1953. That same year he married the recently widowed Mary Brooke Russell Marshall, better known as Brooke, the editor of *House and Garden*. Infamous for his moodiness, Astor nonetheless warmed to Brooke's young grandsons, roughhousing with them and taking them for rides on the narrow-gauge railroad he had built at Ferncliff.

In 1955, he unveiled plans for Astor Plaza, a forty-six-floor luxury office building at Park Avenue and Fifty-third Street. After investing $75 million in this ambitious project, Astor found himself unable to raise financing for its development. Three years later he sold his interest to First National City Bank, losing $3 million in the process.

Astor fell ill during a trip abroad in 1958. The next year, after a period of poor health, he died of a heart attack at the age of sixty-seven. He left his widow Brooke $2 million outright and a trust fund of more than $60 million. Half of his estate, $65 million, went to the Vincent Astor Foundation. Astor's estranged half brother John Jacob Astor VI, the son of John Jacob Astor IV and his second wife Madeleine, contested the will. He challenged Vincent's mental competence at the time the will was drafted and claimed undue influence by the executors. After several months, when it became clear his efforts would be fruitless, he settled for $250,000 offered by Brooke.

Legacy

The Astor family traditionally had a reputation for keeping their wealth largely to themselves. Their charitable donations were generally viewed as meager in comparison to what they were capable of contributing. Vincent, by contrast, was "the Astor who gave it away." His philanthropy set him apart from his ancestors, as did the social conscience that prompted him to reject the role of slumlord. While he enjoyed private yachts, airplanes, multiple homes, and other amusements of the rich, he also worked hard at managing and expanding his estate. After his death in 1959, the foundation that he established—and the woman in whose hands it was left—continued to improve life for New Yorkers for the rest of the century.

—Karen N. Kähler

William Backhouse Astor, Jr.

American heir and landowner

Astor was the grandson of self-made millionaire John Jacob Astor. He inherited the family's wealth and spent much of his life letting others manage it, becoming better known for spending his fortune on diversions than increasing or sharing it.

Born: July 12, 1830; New York, New York
Died: April 25, 1892; Paris, France
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Spouse; children

Early Life

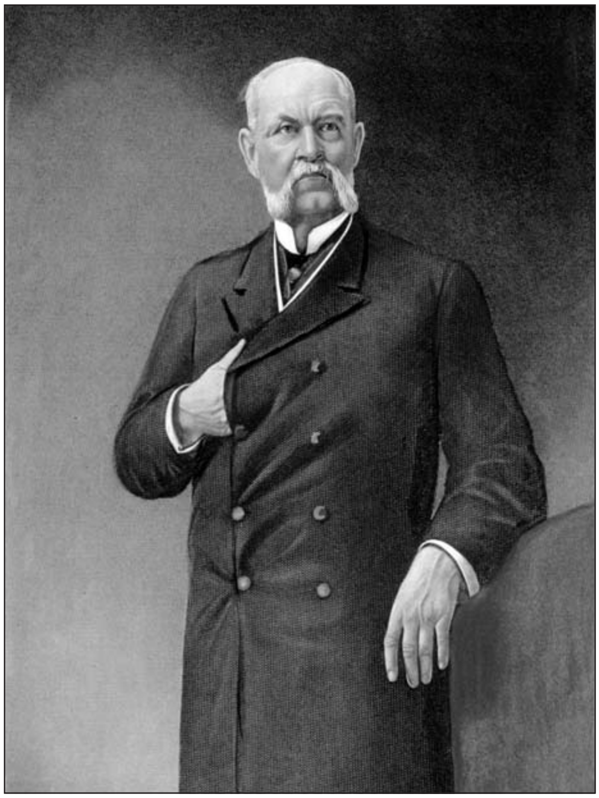
William Backhouse Astor, Jr., the second son of Margaret Armstrong and William Backhouse Astor, Sr., was born in New York City in 1830. He graduated from Columbia University in 1849 and then spent the next year abroad. In 1853, he married Caroline Webster Schermerhorn, a wealthy and pedigreed descendant of one of New York's earliest Dutch settlers. Over the next decade, the couple had five children: Emily, Helen, Charlotte Augusta, Caroline, and John Jacob IV.

First Ventures

Astor's grandfather, John Jacob Astor, had been a poor German immigrant who made a fortune in the fur trade and increased it through real estate investments, becoming the wealthiest American of his day. When he died in 1848, his estate was worth more than $20 million. During the life of William Backhouse Astor, Sr., this fortune grew to $45 million. Much of the Astor wealth was in New York City real estate, from fashionable Manhattan properties to overcrowded lower East Side tenements.

As a second son, William Backhouse Astor, Jr., found that elder brother John Jacob Astor III left him little or no role in managing the Astor estate. Lacking direction, the younger Astor pursued his passion for country life and travel.

After the birth of their son, Astor's wife Caroline focused on becoming the uncontested leader of New York



William Backhouse Astor, Jr. (The Granger Collection, New York) society. Their four-story brownstone at 350 Fifth Avenue was the site of countless high-society occasions. While content to fund his wife's social ambitions, Astor took no interest or pleasure in entertaining. He spent much of his time in Europe, at sea, or at Ferncliff, a country retreat he constructed in New York's Hudson River Valley.

Mature Wealth

While his father and brother managed the family estate, Astor led a life of leisure. At Ferncliff, he established stables for horse breeding, one of his favorite pastimes. An enthusiastic yachtsman, he had *Ambassadress* built in 1867, at the time the largest private sailing yacht ever constructed. Two decades later, he commissioned *Nourmahal*, a 250-foot-long steam yacht.

An extended yacht trip along Florida's coast during the 1870's interested Astor in the state's development potential. He constructed a railroad from Palatka to St. Augustine, a block of houses in Jacksonville, and a twelve-thousand-acre town on the St. Johns River. Originally called Manhattan, the town was later renamed Astor in his honor.

In 1875, the elder William died, leaving an estate of at least $100 million. After the payment of various bequests, equal shares of the fortune, an estimated $20 million each, went to sons John Jacob and William. (John Jacob is believed to have received more of the estate, presumably through gifts made during their father's life.)

In 1892, during a visit to Paris, William Astor, Jr., died from lung congestion. He left an estate valued at between $30 and $40 million, most of which he bequeathed to his son. He set up a trust for his wife, providing her $50,000 annually. No more than $5 million was divided among his daughters and their children. Of the $145,000 left to public institutions, $50,000 went to the Astor Library.

Legacy

By the third generation, the Astor dynasty had gained a reputation for making staggering amounts of money (much of it from rents paid by poor tenants living in Astor-owned slums) without contributing significantly to the general community. William Astor, Jr., did little to improve public opinion of his family. An ill-tempered, heavy drinker, womanizer, and absentee husband and father, he would become known as the first of the "decadent Astors." Friends asserted that he contributed extensively to charities; if so, he gave in too discreet and secretive a manner to have won recognition for his generosity. Overshadowed in business by his father and brother and in society by his wife, he chose to live the life of pleasure that his inherited fortune could furnish him.

Atahualpa

Incan royalty

To Atahualpa and his subjects, gold (called "sweat of the sun"), silver ("tears of the moon"), and other precious minerals were prized primarily for symbolic, religious, or decorative value. However, it was their intrinsic worth that was sought by the Spanish conquistadors, and in relentless pursuit of treasure, they trampled Atahualpa and the Inca Empire into the dust.

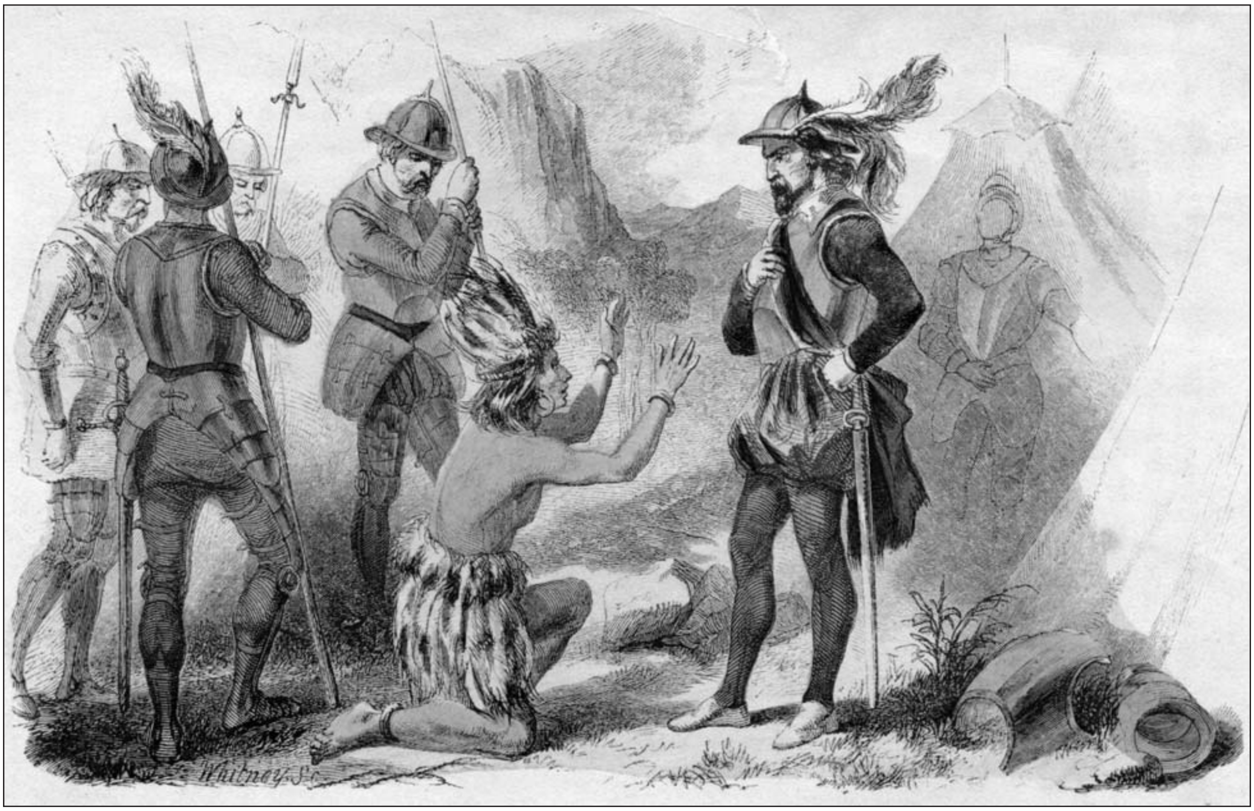
Born: c. 1502; Cuzco, Inca Empire (now in Peru)
Died: August 29, 1533; Cajamarca, Inca Empire (now in Peru)
Also known as: Atahuallpa; Atabalipa; Sapa Inca
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Confiscated

Early Life

Atahualpa (ah-tah-WAHL-pah) was born into a dynamic family in a turbulent era, when the Old and the New Worlds clashed. His mother was a royal concubine and Atahualpa was one of more than fifty children sired by Huayna Capac, eleventh Sapa Inca ("only Inca," or "supreme leader," called "the son of the Sun"). Although Ninan Cuyochi (born c. 1490) was eldest son and first in line to succeed his father as Sapa Inca, Atahualpa was his father's favorite. He enjoyed every privilege of the ultrawealthy, often accompanying Huayna Capac on military campaigns. Huayna Capac was so impressed with Atahualpa's courage that he vowed to divide the Inca Empire between Atahualpa and Ninan Cuyochi.

First Ventures

Atahualpa grew up surrounded by every imaginable luxury among numerous half brothers and half sisters in Cuzco, the richest city in the Western Hemisphere, where tribute poured in from every corner of the empire. In the mid-1520's, the empire was ravaged by a smallpox epidemic. Huayna Capac died of the disease; his heir Ninan



Atahualpa, after his capture by the Spanish conquistadors, kneels before Francisco Pizarro. (Hulton Archive/Getty Images)

Coyochi also perished. Into the vacuum swept Atahualpa's brother Huáscar, lord of Cuzco, who became Sapa Inca in 1527. Atahualpa, meanwhile, took control of Quito in the north. After several years of coexistence, the brothers collided in civil war. Initially, Huáscar prevailed, and his army defeated Atahualpa at Chillopampa and captured him. Atahualpa escaped, regrouped his army, and routed Huáscar's army at Chimborazo. Huáscar was later executed, and Atahualpa also put to death many members of the royal family to eliminate rivals.

Mature Wealth

Atahualpa became Sapa Inca in 1532—just months before the Spanish landed on the west coast of South America. Thus he did not long enjoy the perquisites of his position. As supreme leader, anything within his vast realm was his, and he had the power of life and death over his millions of subjects. Atahualpa had access to an unlimited number of concubines. By law, all gold and silver in the empire belonged to him, and he used gold in great abundance to decorate his palace, gild temples, adorn his person, and surround himself with gleaming objects of great beauty but of only aesthetic value to him. He was carried aloft on a golden throne, and he wore a necklace of emeralds and golden ornaments in his hair.

In late 1532, the Spanish under Francisco Pizarro encountered Atahualpa and his entourage in Cajamarca. In an act of treachery that would often be repeated, the Spanish ambushed Atahualpa's unarmed Indian courtiers and slaughtered thousands. Atahualpa was held hostage. To ransom himself, he offered to fill a large room with the treasures the Spanish wanted. The room was eventually stuffed with gold and silver artifacts. However, the Spanish accused Atahualpa of various acts of sacrilege and strangled him to death. As a result of the murder, additional tons of gold destined for Spanish coffers were allegedly diverted to unknown caches and remain hidden to this day.

Legacy

Material riches meant little to Atahualpa and the Incas, even though they were fabulously wealthy by contemporary standards, because they had no monetary system. Gold, silver, and jewels were merely attractive baubles. Power and control were all that really mattered to the supreme leader, who commanded the ultimate fate of all food, animals, humans, and objets d'art within the empire.

While wonderfully crafted golden objects of Incan handiwork still exist in museums, most treasures obtained from Atahualpa's ransom were melted down to form ingots. Even as the once-powerful Inca Empire quickly fell apart, the empire's gold helped fund the expansion of the Spanish Empire. Ironically, the gold—alloyed with iron, copper, or other metals to increase strength or malleability—was deemed inferior to the gold obtained during the conquest of the Aztecs in the 1520's.

Jorge Wolney Atalla

Brazilian sugarcane and biofuels magnate

Atalla, who owned sugar mills and plantations in Brazil, realized that sugarcane could be converted to alcohol and used as a source of power, supplementing the nation's lack of fossil fuels. He became an international representative of Brazil, exporting Brazilian goods around the world and sponsoring a Brazilian Formula One racing team.

Born: 1929; Jaú, Brazil
Died: July 31, 2009; São Paulo, Brazil
Sources of wealth: Manufacturing; agricultural products
Bequeathal of wealth: Relatives; charity; sporting event

Early Life

Jorge Wolney Atalla (ZHORE-jay VOHL-nay ah-TAHL-yah) was descended from Lebanese immigrants who came to Brazil and settled in the booming state of São Paulo, becoming prosperous landholders. His father was a physician and his mother inherited a considerable number of cattle and coffee landholdings. Atalla's family sent him to study in the United States, where he graduated with a degree in petroleum engineering from the University of Tulsa in Oklahoma. However, when his father decided to return to his medical practice, the young Atalla was ordered to return home to manage the family enterprises.

First Ventures

Atalla used his advanced technical education to modernize the family's business operations through technological and managerial improvements. He expanded the family holdings, selecting properties and businesses that were available at bargain prices. His purchases included sugar plantations and mills because a glut of sugar on world markets had reduced their price. Atalla examined alternative uses for sugar, particularly its use in producing alcohol as a combustible fuel.

Brazil's economy was becoming more industrialized, but this growth was hampered by a shortage of fossil fuels. Industrial managers, particularly motor vehicle manufacturers, quickly saw the benefit of using ethanol and other alcohol-based fuels as alternative sources of power. The development of alcohol and alternative biofuels became major national priorities and was subsidized by the government. Atalla led the proalcohol movement and sponsored sugar research institutes. His work helped create fuel for Brazilian motor vehicles, industry, and agriculture. As the need for sugar-derived fuel increased, sugar production, which had traditionally been centered in the northeastern part of Brazil, shifted to São Paulo and other places in the south. Extensive rural areas that were used to grow food were converted to biofuel production.

Mature Wealth

The sugar business was only one of the industries that were part of the Atalla Group. Atalla's conglomerate exported sugar, coffee, iron ore, wood products, and other raw materials. In the mid-1970's, as the price of coffee rose on world markets, Atalla bought Hills Brothers Coffee, an American company based in San Francisco. At this time, it was unprecedented for a Brazilian company to acquire a foreign industrial enterprise. The acquisition projected the image of Brazil as an expanding economic power and earned Atalla the acclaim of other Brazilian businesspeople.

More important, Atalla's international business operations allowed him to expand his export business. Like other twentieth century Brazilian conglomerates, such as the Votorantim Group and Camargo Corrêio, the Atalla Group's international business was dependent on minimized domestic competition. Such conglomerates enjoyed government promotion, sponsorship, subsidies, and regulatory advantages.

Atalla's increasing wealth enabled him to represent Brazil throughout the world. He promoted Brazilian Formula One racing, sponsored by his sugar cooperative, Copersucar (*açucar* is the Portuguese word for sugar). Copersucar race drivers won numerous championships in worldwide competitions.

By the end of the twentieth century, Atalla's accumulating wealth placed him on the *Forbes* magazine list of billionaires, with family holdings valued at approximately $1.3 billion. At the end of his career, however, his sugar enterprise had declined in production and profitability. Despite the attention given to his multinational feats, he was not someone who welcomed public interest in his business ventures. He led a subdued private life, on which there is scant public information. Hardly any obituaries appeared at the time of his death on July 31, 2009.

Legacy

Jorge Wolney Atalla demonstrated that the Brazilian economy had developed to such a point that it could compete in the world arena in the fields of business and sports. He was a leading figure in the Brazilian-Lebanese community and a longtime patron of the Brazilian Red Cross. Ironically, one of his sons, who bore his name, became a cinematographer whose most noted film was a documentary portraying the hardships and injustices suffered by sugarcane workers. The wealth accrued by Atalla and other Brazilian conglomerate leaders reflected the stark income chasm between rich and poor in the economically developing Brazil.

Aurangzeb

Mughal emperor

As emperor of Mughal India, Aurangzeb ruled over the richest and most fabled empire in the world. The wealth of India increasingly attracted the European powers to extend their trade, and ultimately their territory, in India.

Born: November 3, 1618; Dohad, Mālwa, India
Died: March 3, 1707; Ahmadnagar, Maharashtra, India
Also known as: Muhī-ud-Dīn Muḥammad Aurangzeb (birth name); ʿĀlamgīr I
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Children

Early Life

Aurangzeb (AW-rahng-zehb), the third eldest of four sons of the great Mughul emperor, Shah Jahan, was born in 1618. He was sent to live with his grandfather, Emperor Jahāngīr, where he was taught in Arabic and memorized the Qurʾān. In 1634, at the age of sixteen, he was given command of a force of ten thousand horses, and the following year he was sent to the south of India, the Deccan, to suppress a rebellion in Bundelkhand. He was then appointed the viceroy of the Deccan, a position he held for eight years.

First Ventures

In February, 1645, Aurangzeb was appointed governor of the rich province of Gujerat. He was an austere, puritanical leader who did not live ostentatiously or succumb to drink and drugs. He ran a strong and effective government, and he was rewarded by his father, who raised his salary to the vast sum of 6 million rupees a year. In 1646, Aurangzeb was sent to head the Central Asian campaign

Aurangzeb. (Library of Congress)

and was then appointed the governor of Multan before leading a campaign in Afghanistan. In July, 1652, he returned to the Deccan as the area's governor, and it was there that he kept the jewels from the sultan of Golconda, even though his father believed they were his property. By this time Aurangzeb was a powerful and wealthy regional leader with a strong and loyal following. Aurangzeb's father, Shah Jahan, fell ill in Āgra in 1657, and Aurangzeb moved north to seize the shah and his enormous treasury. Aurangzeb then waged a murderous civil war against his three brothers, imprisoned his father, and crowned himself emperor on July 31, 1658. Aurangzeb was now one of the richest men in the world.

MATURE WEALTH

Aurangzeb's reign can be divided into two twenty-five-year periods. The first was spent in the north of India, mostly at Delhi and Āgra, where he consolidated and expanded his power and wealth. In Bihar, he defeated the raja of Palamau in 1661 and annexed the raja's kingdom. Aurangzeb also acquired Assam in 1662, although he lost it five years later, and he incorporated Chittagong in 1666. His twenty-one separate provinces generated, on paper, a revenue of 334.5 million rupees. In addition, he collected taxes on the tithes paid by Muslims (*zakāt*), and in 1679 he reestablished the poll tax (*jizya*) on non-Muslims, which had been abolished in 1564. Comparatively small amounts of less than 3 million rupees, or 1 percent of total revenue per year, were also raised through import duties on foreign trade, which played only a small part in the Mughal economy.

The cost of India's imported silver, gold, copper, lead, high-quality woolen clothing, horses, spices, tobacco, glassware, wine, and slaves was offset by the export of cotton goods, pepper, indigo, and saltpeter. Aurangzeb ended the lavish building program conducted by his father, and he was renowned for his comparative miserliness. In 1679 he went to Ajmer to annex Marwar, which led to a military offensive in the Deccan, where he spent the last twenty-five years of his life in a futile attempt to expand his territory.

LEGACY

The Mughal Empire began its rapid decline after the death in 1707 of Aurangzeb because he bankrupted his realm in his attempt to expand it. He was the last of the "great Mughals," as well as a pious and strict Muslim. His reimposition of the poll tax, his prohibition against the building of Hindu temples, and his sanctioning of the destruction of old Hindu temples alienated Hindus and Sikhs and led to rebellion, most famously by the Maratha Hindu ruler, Śivājī. After Śivājī's death in 1680, Aurangzeb was only able to capture Bijapur in 1686 and Golconda in 1687. To control these territories, Aurangzeb moved his capital to Aurangabad in the Deccan. He doubled the size of his military corps to more than fourteen thousand officers as he faced an increasing number of revolts, but his huge, cumbersome army remained vulnerable to guerrilla attack. When he died in 1707 while on military campaign, he was buried in a modest tomb by the side of the road near Aurangabad.

Emilio Bacardi

Cuban liquor company executive

Bacardi used his influence with Cuban insurgents and the Spanish colonial government to maintain and expand the fortunes of his family's rum-distilling business during long periods of rebellion in Cuba. He established the Emilio Bacardi Moreau Museum to house his extensive collections of art and artifacts.

Born: June 5, 1844; Santiago de Cuba, Cuba
Died: August 28, 1922; Santiago de Cuba, Cuba
Also known as: Emilio Bacardi Moreau
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Spouse; children; charity; museum

Early Life

Emilio Bacardi Moreau (eh-MEE-lehoh bah-KARD-ee MOH-roh) was born in 1844 in Santiago de Cuba, Cuba, the eldest of four children of Facunda Bacardi Massó (1813-1866). When Emilio was a child, his father Facundo, a successful retailer, entered the fledgling rum business by purchasing a distillery for 3,000 gold pesos (almost $6,000). At twenty-one, Emilio entered the family business, but he was divided between his duties to the family and his desire to be a leader in the Cuban independence effort.

First Ventures

The period between 1868 and 1878 was marked by internal strife in Cuba that adversely affected the nation's sugar plantations. Bacardi was active in Cuba's effort to gain independence from Spain at the same time he worked in the family business. In 1874, Facundo Bacardi bought out his partners and with his sons formed a new corporation, Bacardi y Compania. Soon the company's products gained international recognition by winning major prizes at world's fairs. Key to the products' successes were the oak barrels in which the rum was cured, the quality of the Cuban sugar and molasses used in the blends, and the secret family recipe that made Bacardi's taste uniquely desirable.

At thirty-three, Bacardi became president of the firm, and he used his connections as a patriot and prominent businessman to promote a product that was distinctly Cuban. In September, 1879, Bacardi was arrested for his involvement in the Cuban independence movement. He was tried and deported to penal institutions in Spain and North Africa. The year 1880 proved deadly for Bacardi's business, and his company, which was nearly $40,000 in debt and lacked cash flow, declared bankruptcy. By 1883, however, Bacardi y Compania had returned to some of its former stability, posting a profit of nearly 23,000 pesos. During this period, Bacardi was torn between his Cuban independence efforts and his partnership within his family company, but he managed to balance both and earn a great deal of respect as a Cuban entrepreneur.

Mature Wealth

Despite the death of his wife in 1885 and his father in 1886, Bacardi began a corporate reorganization that would lead to his company's worldwide fame. Bacardi, as head of both the firm and family, hired Enrique Scheug as the company's financial manager and redistributed ownership of the remaining Cuban distillery to prevent the Spanish government from seizing its operations. In 1888, the Bacardi company's rums won international acclaim in spirits competitions. Profits trebled to nearly 65,000 pesos in 1891. As another period of political instability emerged in 1895, Bacardi kept positive working relations with Cuban sugar planters. However, in 1896, he was arrested and again sent to North Africa after he was found guilty of participating in political activities.

In 1898, Bacardi went to Jamaica, where his family had gone for safety, and in August, 1898, he returned to Santiago de Cuba to resume work. The Bacardi brothers and Scheug managed to survive the political uprisings, but the company earned only marginal profits between 1891 and 1893. However, Bacardi rums proved popular with the American soldiers who came to Cuba at the end of the nineteenth century to fight in the Spanish-American War. American efforts to annex Cuba were under way and General Leonard Wood set up operations there. Wood appointed Bacardi the mayor of Santiago de Cuba. Bacardi became active in rebuilding and restoring Cuba after many years of strife. He was elected mayor of Santiago de Cuba in 1901, and the following year Cuba gained independence from Spain. Bacardi was elected to the Cuban senate in 1905. Ten years later, exhausted from wrangling with the United States and disappointed by aspects of the new Cuban government, Bacardi resigned from politics and fully devoted himself to the family business.

Bacardi led the company into the twentieth century by

The Emilio Bacardi Moreau Museum

Emilio Bacardi Moreau, the Cuban rum executive, founded a museum to house his collection of artifacts in 1899. For many years his museum was a small-scale operation. By 1922, however, the museum's collection had grown large enough to be housed in a Palladian-style building in Bacardi's hometown, Santiago de Cuba. The museum opened in the fall of 1927 and continued to operate into the twenty-first century.

The museum displays a variety of artifacts in three dedicated exhibit areas: the Art Room, the History Room, and the Archaeology Room. Its collection includes an Egyptian mummy and two Peruvian mummies that Bacardi had collected, as well as artifacts highlighting the aesthetic development of Cuban arts, representative items from major world cultures, textiles, and items that once belonged to Cuban patriots, including Antonio Maceo and Carlos Manuel de Cespedes. Museum guides generally describe the holdings as "eclectic," since they appear to be items that Bacardi either liked or was able to obtain in world art markets. In 2006, eighty-four items were stolen from the collection, only to be recovered three days later.

The museum has played a significant role in promoting Cuban art. Before the country became independent, Cuban art either was religious in nature or consisted of decorative objects reflective of Spanish traditions. By collecting paintings by Cuban artists, Bacardi expanded the range of the nation's artwork. Although artistic patronage was a feature of Cuban society from the seventeenth century, the late nineteenth and early twentieth centuries marked a new era in private collecting, particularly of imported artworks from major dealers in Europe. By 1913, there were three public art museums in Cuba including the Emilio Bacardi Moreau Museum—the Museo Nacional in Havana and a museum in Cárdenas—and these institutions followed the Bacardi tradition of exhibiting Cuban regional art as well as international works.

introducing new rum drinks, ably marketed by Scheug, including a mixture of rum and Coca-Cola known as the Cuba Libré (free Cuba) and the daiquiri. The Cuba Libré was named after the slogan of the Cuban independence movement and was a particularly popular drink in the United States. The daiquiri initially was a drink popular with miners and was made from crushed ice, rum, and lime juice. At the 1904 World's Fair in St. Louis, Bacardi rums beat the competition and the company expanded into more global markets. During this time, Emilio Bacardi continued to lead the business from strength to strength with new rum blends and new methods of distilling.

With Bacardi as Santiago de Cuba's mayor and one of Cuba's leading businessmen, philanthropy and corporate growth occurred simultaneously. Bacardi used high-visibility public events, including sponsoring a baseball team, to position his rum brands with the public and to make drinking his company's beverages appear both fun and patriotic. Bacardi moved easily in government circles and his company enjoyed sufficient growth to enable it to add new operations in New York, Puerto Rico, and Barcelona, Spain.

As the business expanded, Emilio's brother, Facundo, Jr., created more new tastes, such as sipping rums that are not mixed with other liquids, promoted more rum-based cocktails, and updated distillation techniques. When certain doctors in Cuba indicated that rum drinking was medicinal, the Bacardi company promoted the health benefits of its products. In 1913, company profits were estimated at more than 175,000 pesos, and they would quadruple by the end of World War I.

In 1919, the company reorganized and incorporated under the name Compania Rum Bacardi, S.A. The company's partners, the Bacardi brothers and Scheug, were all millionaires, and they managed operations valued at roughly $4 million. In the 1920's, Emilio, who was remarried to Elvira Cape, enjoyed world travel, and on his trips he began to collect items for his museum, including an Egyptian mummy. In February, 1922, the company opened another distillery. The firm remained strong because its ownership continued to be held by the Bacardi family, with Emilio and his descendants, as well as those of his brothers, holding $10,000 worth of company stock per person.

Legacy

Emilio Bacardi died on August 28, 1922, and the city of Santiago de Cuba engaged in two days of public mourning for one of its patriots, philanthropists, and leading businessmen. Bacardi was also a journalist and an author of fiction, memoirs, and essays on Cuban politics. When his brother, Facundo Bacardi, Jr., died in 1926, *The New York Times* reported that the family's company was worth $50 million.

Raúl Baillères

Mexican banker and businessman

Baillères created a diverse business empire in Mexico during the twentieth century. Favoring free market capitalism over a state-run economy, he founded the Instituto Technológico Autónomo de México (ITAM) in order to train a new generation of Mexican political and economic leaders.

Born: 1895; Silao, Guanajuato, Mexico
Died: January 3, 1967; Mexico City, Mexico
Also known as: Raúl Baillères Chávez
Sources of wealth: Banking; investments
Bequeathal of wealth: Children; educational institution

Early Life

Raúl Baillères Chávez (rah-OOL bi-YAR-ehs CHAH-vehs) was born in 1895 in Silao, Guanajuato, Mexico, the son of Alberto Baillères. As a teenager, he worked with his father, a small businessman who sold seeds and groceries to the local population. With no money and virtually no formal education, Baillères left home in 1915 to seek his fortune in Mexico City. He obtained employment with a local investment firm, the Casa Lacaud. He was subsequently employed by the investment and trade department of the Chase Manhattan Bank in Mexico City. His talent as a silver trader laid the foundation of his future wealth.

First Ventures

During the early years of the Great Depression, Baillères left his job at Chase Manhattan. Taking advantage of the uncertain economic situation, he used his savings to purchase discounted stock in Mexican businesses and financial institutions from foreign investors eager to divest themselves of their Mexican holdings. In 1934, Baillères established Crédito Minero, S.A. (later the Banco Cremi), the first financial lending institution in Mexico primarily dedicated to mining activities. During the 1930's, Baillères, who supported free market capitalism, opposed the state-run corporatist economic strategies promulgated by Mexican president Lázaro Cárdenas. From 1941 to 1942, Baillères was the president of the Asociación de Banqueros de México, the nation's association of bankers. By this time, he had become a leading figure in Mexico's banking and business sectors.

Mature Wealth

During the 1940's, Baillères expanded his financial and business interests. In 1941, he led a group of Mexican investors that purchased the Cervecería Moctezuma, S.A., the largest brewery in Mexico. At the same time, he also acquired a controlling interest in El Palacio de Hierro, an upscale department store in Mexico City reminiscent of Harrods in London. In 1946, Baillères donated 2 million pesos to the presidential election campaign of Miguel Alemán. Alemán defeated opponent Ezequiel Padilla to become the first nonmilitary candidate to be elected president of Mexico since the Mexican Revolution.

On March 29, 1946, in an attempt to create an academically rigorous institution of higher education, Baillères, with the support of several like-minded industrialists and bankers, established the Instituto Tecnológico de México. In 1963, this university was granted autonomous status from the Mexican government and renamed the Instituto Tecnológico Autónomo de México (ITAM). Baillères argued that the national university, the Universidad Nacional Autónoma de México, was infested with leftist professors dedicated to the economic policies of Cárdenas. As such, it was Baillères's goal to create an institution of higher education, modeled on the Massachusetts Institute of Technology (MIT), dedicated to economic change in Mexico. Until his death, Baillères was the president of the Mexican Cultural Association, ITAM's founding entity, and he was an active financial supporter of the institution. In the early twenty-first century, ITAM was one of Mexico's preeminent institutions of higher education, and many people consider ITAM the best private university in the country.

Baillères's financial wealth dramatically increased during the 1950's and 1960's. Following his death in 1967, his vast financial empire was taken over by his son, Alberto. In 2009, Alberto Baillères was the second-wealthiest person in Mexico, with an estimated worth of $6 billion.

Legacy

Although he lacked a formal university education, Baillères created a successful business empire and laid the foundation for a Mexican university that has trained several generations of Mexican businesspeople. Graduates of ITAM, including the majority of the Mexican team that negotiated the North Atlantic Free Trade Agreement (NAFTA) and President Felipe Calderón, who assumed office in 2006, have played a crucial role in the economic liberalization process initiated in Mexico in the 1980's.

George F. Baker

American investment banker

Baker was one of the original directors of First National Bank of New York City, and he built a substantial fortune through his dominant role in banking and investment financing in the late nineteenth and early twentieth centuries. He made significant philanthropic gifts during his life, including donations to Harvard and Cornell Universities.

Born: March 27, 1840; Troy, New York
Died: May 2, 1931; New York, New York
Also known as: George Fisher Baker
Sources of wealth: Banking; investments
Bequeathal of wealth: Children; educational institution

Early Life

George Fisher Baker had little formal education, and no one in his family had any experience in business or finance. Baker worked briefly in a variety of retail businesses before becoming a clerk in New York State's Department of Banking in 1856. Here he became an expert in identifying the notes issued by banks throughout the country, and he grew familiar with the laws and standard practices of banking. Perhaps most important, he also became acquainted with some of the leading men in the state's banking industry, who came to appreciate Baker's expertise in banking matters.

First Ventures

Baker became an associate of John Thompson, one of the principal founders of First National Bank of New York City. This was the first federally chartered bank created under the National Banking Act of 1863. Thompson invited Baker to join this new bank, to invest in it, and to become one of its original directors. Thompson also offered to loan Baker money to buy stock in the bank, but Baker declined the loan because he did not want to assume its debt. Instead he used his own savings of $3,000 to buy his stock. His initial investment bought him thirty shares out of the original issue of two thousand. Later in life, he said he regretted not taking advantage of Thompson's offer and buying more stock.

Mature Wealth

Throughout his career in investment banking, Baker weathered three of the American economy's worst storms—the Panics of 1873 and 1907 and the early years of the Great Depression. The Panic of 1873, caused by the bankruptcy of the Northern Pacific Railway, which in turn led to the failure of Jay Cooke's investment firm, marked a turning point in Baker's career and fortunes. Amid the financial crisis, Sam Thompson, president of First National Bank and the son of John Thompson, wished to liquidate the bank's assets and get out of the banking business. Sam's brother, Fred Thompson, sided with Baker, and the two men worked together to keep the bank open. Baker arranged to gradually buy out the interests of the Thompson family, and he became the principal owner of First National Bank, assuming its presidency in 1877. His fortune at this time was estimated at about $100,000.

In the remaining years of the nineteenth century, Baker became an associate and often a business ally of industrialist and investment banker J. P. Morgan, especially concerning investments in the railroad and steel industries. Morgan also became a director of First National Bank. In 1901, Morgan and Baker were two of the principal investors who created U.S. Steel, the first corporation in the United States to be capitalized with a value of more than $1 billion. Baker also worked closely with Morgan to calm the financial crisis during the Panic of 1907.

Legacy

Having weathered previous financial crises, Baker was not overly concerned about the onset of the Great Depression in 1929. He later conceded he had been foolish to ignore the warnings of his son and other advisers. Baker's fortune may have been as high as $200 million at the beginning of the Depression. When he died in May, 1931, his estate was valued at $73 million. During his lifetime, Baker had made sizable gifts to numerous charities. His largest gifts were several donations to Cornell University, totaling $2 million, and $6 million to Harvard University in 1924 to enable the university to construct and furnish the buildings for the Harvard Business School. Baker also gave $1 million to endow the Baker Library at Dartmouth College, and he financed the Baker Athletic Field at Columbia University in New York City.

Steven Ballmer

American entrepreneur and business executive

Ballmer has guided one of the computing industry's most influential companies, Microsoft Corporation, to a place of market dominance. His brilliant marketing strategies and salesmanship, combined with his aggressiveness in promoting his company, brought Microsoft from a small company to a multinational giant that has generated billions of dollars of revenue and revolutionized personal computing.

Born: March 24, 1956; Detroit, Michigan
Also known as: Steven Anthony Ballmer
Source of wealth: Sale of products
Bequeathal of wealth: Spouse; children

Early Life

Steven Anthony Ballmer was born in Detroit, Michigan, in 1956. His father was a middle manager at the Ford Motor Company. Ballmer attended a private high school with his sister, where he was known for the energy and motivation that would become his hallmark at Microsoft Corporation. He attended Harvard University, where he met Bill Gates, who would later be one of the founders of Microsoft. Ballmer graduated magna cum laude with a degree in applied mathematics and economics.

First Ventures

Ballmer started working at Proctor & Gamble in 1977 as an assistant product manager but left within two years. He enrolled at Stanford University's business school in 1979. He dropped out after Gates called with an offer to work at Microsoft and a chance to own 10 percent of the company's stock. Ballmer started as the senior vice president of system software, where he was the head recruiter. Ballmer himself could not program computers, but had an eye for talent. He later moved on to vice president of sales and support. Microsoft worked a deal with International Business Machines (IBM) to create an op-

Steven Ballmer. (AP/Wide World Photos) erating system for their new line of personal computers, which would be known as MS-DOS. Gates and his Microsoft cofounder, Paul Allen, worked on technical issues, and Ballmer dealt with the business aspects of the company.

Mature Wealth

Gates received most of the media attention, especially after the departure of Allen in 1983. Ballmer was in charge of the core of the business—operating systems—in the 1980's. He recruited top students from first-rate universities to work at Microsoft. He pushed the marketing and sales efforts. Where Gates came up with ideas, Ballmer put those ideas into practical application.

Ballmer was the one who saw the importance of Apple Computer, Inc.'s graphical user interface and strove to make sure that Microsoft had a competing product, Windows. He forged deals with major players in the computer industry and helped drive software innovations. Between 1991 and 1995, Microsoft sales increased at the rate of a $1 billion per year; by 1995, company revenues were close to $6 billion.

Ballmer was key to the success of Windows 95 and designed everything from pricing to the distribution of Microsoft's products. His enthusiasm and salesmanship complemented the keen marketing strategies that he crafted for Microsoft's future. In 1995, Microsoft had more than twenty thousand people on its payroll. Because he brought Microsoft to a prominent position in the computer industry, Ballmer did very well financially and was ranked the twenty-ninth-richest man in America. As of 1999, he was worth an estimated $23 billion. In 2000, he became the chief executive officer and president of Microsoft.

Ballmer's aggressive marketing tactics caused some controversy. Two lawsuits in 2001 and 2003 cost Microsoft more than $2 billion. Regardless of these missteps, Microsoft had revenues of more than $26 billion for 2004, and Ballmer's net worth of $12.4 billion placed him nineteenth on the *Forbes* magazine list of the world's wealthiest people.

Legacy

Ballmer is generally hailed as the architect of Microsoft's success. His passion for Microsoft's success led it to the forefront of the computing industry. The mark that he has left on the face of computing is undeniable, as shown by the fact that a commanding majority of personal computers run some kind of Microsoft product. He helped to bring personal computing to a mass audience. The average person can use a computer with more ease because of the innovations that he helped develop and bring to the public. Ballmer uses some of his wealth to donate to political causes.

SIR JOHN BANKS

British merchant, landowner, and banker

Banks is an important figure in the growth of government finance as a source of individual wealth, and his life demonstrates how private bankers played an increasing role in shaping Great Britain's government policy.

Born: 1627; near Maidstone, Kent, England
Died: 1699; Aylesford, Kent, England
Also known as: Sir John Bankes
Sources of wealth: Trade; banking; real estate
Bequeathal of wealth: Children

EARLY LIFE

Sir John Banks was born in Kent, southeast of London, on August 19, 1627. His father, Caleb Banks, was a prosperous woolen draper and substantial landowner, with an income of £800 a year in 1640. Caleb served for a time as the mayor of Maidstone. This town was a particularly fortuitous location for an individual pursuing commerce in the seventeenth century, as Maidstone was one of the principal hubs through which agricultural products passed to supply the city of London, the British fleet, and Great Britain's expanding colonial empire. In an era when water transport was the only practical means of moving heavy goods, proximity to major rivers connecting metropolitan areas was crucial.

Little is known of John Banks's early life. He attended Emmanuel College, Cambridge University, and most probably worked in his father's business until 1652, when he became a partner in a syndicate supplying food to the British navy. At that time, the navy was the most comprehensive and in some respects the largest industry in Britain.

FIRST VENTURES

The years encompassing Banks's early rise in fortune were ones of political upheaval. The struggles between King Charles I and Parliament ultimately resulted in Charles's deposition and execution and precipitated a civil war that lasted from 1642 to 1646. Banks began his independent business career during the administration of Oliver Cromwell and continued it through the Stuart restoration and the reigns of Charles II, James II, and William III and Mary II. The effects of these dramatic political changes on business and commerce in southern England were not profound and could be manipulated to great advantage by a person skilled in keeping a low political profile and meeting the needs of whichever entity had ascendancy. Banks was such a person. As a merchant, he had political sympathies with the parliamentarians; as a conventional Anglican, he had no philosophical attachment to Puritanism. The king and Parliament both depended on the services of well-capitalized merchants and were prepared to overlook past affiliation with political rivals.

Throughout his career, Banks maintained just enough involvement in politics to nurture the connections he

An ambassador for Queen Elizabeth I stands before India's emperor, seeking permission to charter the East India Company. (Hulton Archive/Getty Images) needed to secure government contracts. He represented Kentish boroughs in the House of Commons under Cromwell, Charles II, and William III, but he was always a backbencher on the ministerial side of the Commons. Unlike his father, he avoided civil offices that entailed large financial and ceremonial obligations. In 1661, Charles II made him a baronet, a hereditary honor intermediate between knighthood and the peerage that was generally conferred on financially successful men who contributed to Great Britain's colonial expansion.

The naval supply business, lucrative in its own right, also led Banks to become a government creditor. Cromwell's government, embroiled in a series of wars with the Dutch, was slow to pay suppliers, and undercapitalized merchants were forced to sell promissory notes at a steep discount. Banks eventually realized a considerable profit from these notes and was also able to negotiate increasingly favorable terms on the loans he made directly to the British government. The law set a ceiling of 6 percent interest on loans, but premiums, bonuses, and actual dispensations, readily conferred by a cash-strapped government, could result in a much higher profit.

In 1655, Banks married Elizabeth Dethick, daughter of John Dethick, a wealthy London merchant and a former lord mayor of London. Dethick was a stockholder in the British East India Company and for a time was also a member of a rival syndicate engaged in the East India trade. Elizabeth brought substantial assets and connections to the marriage. The couple had three surviving children. Banks spared no expense preparing his son, Caleb, to take his place as a prominent member of society, at one time hiring the philosopher John Locke to be Caleb's private tutor. Caleb, however, proved a disappointment. He achieved no distinction in any field, never married, and left no heirs when he died at the age of twenty-six. Banks's daughter Mary married Heneage Finch, the second son of a prominent Nottingham businessman and jurist. Finch was later elevated to the peerage as the first earl of Aylesford, and he and Mary inherited most of Banks's estate.

The British East India Company

The British East India Company (also known as the English East India Company or the East India Company), established under royal charter from Queen Elizabeth I on December 31, 1600, was a joint-stock company given a monopoly on sea trade between England and all regions between the Cape of Good Hope and the Strait of Magellan. In its first two decades of operation, this trade consisted mainly of spices from the East Indies and led to direct competition with the already established Dutch trade routes. In 1608, the company founded a transshipment station at Surat, in southern India, which evolved into a fort and trading post. Trade with India expanded rapidly in the seventeenth century, mainly through the establishment of enclaves as stipulated in treaties with the Mughal emperors of Bengal. By 1647, the company had twenty-three factories (trading posts) in India, each with its own factor, or governor, and a defense force under its control. The firm's main items of trade in the seventeenth century were cotton, silk, indigo, saltpeter, and tea.

The political and military control that the company came to exercise over the entire Indian subcontinent developed gradually. King James I, Oliver Cromwell, and King Charles II all granted additional privileges and powers to the company when renewing its charter. Acts of Parliament under Charles II authorized the company to acquire territories, wage war and negotiate peace, mint money, and exercise civil jurisdiction. Robert Clive's territorial acquisitions in the mid-eighteenth century made British India a nation governed by a corporation, while the East India Company Acts of 1773 and 1784 brought the civil and military aspects of the region's administration firmly under the control of Parliament. The company lost its monopoly on the India trade in 1813, and following the Sepoy Mutiny of 1857 the firm was nationalized by the Government of India Act (1858). The tremendous wealth generated by the East India Company made its members a major lobbying force in Parliament and helped shape British foreign and colonial policy for more than two centuries.

Mature Wealth

In the late 1650's, Banks became a partner in the Levant Company, which exported cloth, lead, and tin to the eastern Mediterranean and imported oil, silk, and dyes. In 1661, he became a stockholder in the British East India Company, for which he later intermittently served as director between 1669 and 1685. Direct involvement in these merchant ventures provided substantial income, though for most of the period after 1660 this revenue was overshadowed by the money Banks earned through government finance and rents on landed property.

The saltpeter trade illustrates the complex connections between trade and government policy in seventeenth century England. The government's need for saltpeter for gunpowder manufacture greatly exceeded domestic supplies. Imports from India, channeled through the British East India Company, supplied the deficit. To no small extent, the government needed the gunpowder to fight the Dutch over control of the India trade. Banks and the British East India Company profited at all stages. They enjoyed a virtual monopoly on import, could set their prices, were able to negotiate exemptions from import duties, and, most important, loaned the government the money to buy their product.

Banks also invested in the Royal African Company and served as its director from 1674 until 1676. The company's sole business was the African slave trade, and its activities in attempting to enforce its monopoly precipitated the second Anglo-Dutch War of 1665-1667.

In 1672, Banks negotiated a loan of £36,500 of his own funds and an additional £47,512 of East India Company funds to the government, to be repaid from the rents of "fee farms," or the agricultural land seized from monasteries under Henry VIII. In 1685, Banks had a total income of £7,580 a year, including £2,462 from the British East India Company and £4,163 from rents, including fee farms. His household expenditures were around £3,000 a year and included the maintenance of two large establishments, an impressive town house in Lincoln's Inn Fields in London, and The Friars, a former Carmelite priory in Aylesford that Banks purchased in 1657 and transformed into a fine Caroline mansion.

Increasingly, Banks invested profits from his business ventures in landed property, which was typical in England at the time. Although the landed property produced a smaller return than moneylending or commerce, it was a more secure means of income and brought Banks a measure of prestige that investments in stock did not. The Friars was Banks's country estate, with extensive agricultural lands and the rights to manage the civil life of Aylesford; these rights were originally granted to the priory by the king and remained attached to it when the land was sold to successive owners.

Legacy

At the time of his death in 1699, Banks had an annual income of about £5,000 a year and total assets of £180,000, making him a multimillionaire by early twenty-first century standards and one of the richest men in England. Considering the magnitude of his wealth, he left remarkably little in the way of a direct legacy. He is possibly best remembered as the friend of the diarist Samuel Pepys, the secretary of the navy and a fellow member of the Royal Society, who enjoyed Banks's hospitality and mentions him frequently in his diary. Banks endowed no charities or institutions, and his heirs were distinguished neither by philanthropy nor by profligacy, content to be wealthy country gentlemen with no taste for politics or adventure. The Friars, eventually leased to tenants, burned in 1930. It has since been restored as a historic site but as the original medieval Carmelite priory rather than the seventeenth century mansion.

The effects of the commercial activities that Banks oversaw in India and West Africa were profound, far-reaching, and extremely negative from the point of view of the native populations, but it is difficult to assess how much he was personally responsible for the economic and social conditions in these areas. Were his management of, and profiting by, the slave trade considered pivotal, he would perhaps deserve a place among the villains of history instead of being an obscure figure who did not even qualify for an entry in the encyclopedic *Dictionary of National Biography* until 2004.

David and Frederick Barclay

British businessmen

The Barclay brothers were listed among the twenty wealthiest people in the United Kingdom in The Sunday Times *Rich List. In 2007, their wealth was estimated at £1.8 billion ($3.2 billion), compared with £750 million ($1.3 billion) in 2004. In 2000, they were knighted for their donations of £40 million ($71 million) to medical research.*

David Barclay

Born: October 27, 1934; London, England
Also known as: Sir David Barclay

Frederick Barclay

Born: October 27, 1934; London, England
Also known as: Sir Frederick Barclay
Sources of wealth: Media; retailing; real estate
Bequeathal of wealth: Relatives

Early Lives

David Barclay was born ten minutes before his twin brother, Frederick Barclay. The brothers were two of ten children born to Scottish-Catholic parents. They grew up in Shepherd's Bush, a working-class area of London. Their father, a salesman, died when they were twelve. The Barclay brothers attended public school until the age of sixteen, when they went to work in the accounts department of General Electric. They later worked as painters and decorators. The brothers have worked as partners for the majority of their lives, although David is often the spokesman for the two.

First Ventures

By the time they were twenty-eight, the Barclays were buying boardinghouses, which they then renovated into hotels. They purchased the Howard Hotel, overlooking the Thames, in 1975. In 1983, they purchased the

David and Frederick Barclay. (AP/Wide World Photos)

Ellerman Group, a brewing and shipping company, for £45 million ($80 million). They began acquiring their wealth when they sold the brewing operations of the Ellerman Group for £240 million ($425 million) within ten years after purchasing the company. Their proceeds from the sale were used to buy the Ritz Hotel in Picadilly in 1995.

The brothers entered the media field by buying two newspapers, *The European* in 1992 and *The Scotsman* in 1995. *The European* later went out of business, and *The Scotsman* was sold at a profit in 2005. In 1998, they relaunched another newspaper, *Sunday Business*, and in 2004 they bought the Telegraph Group, which includes two newspapers and a magazine. The brothers typically buy a business, work with it for a time, and then sell it at a profit. In the newspaper business, this strategy has required them to reduce the number of journalists and to repeatedly replace editors.

Mature Wealth

In 1999, the Barclays partnered with Boots, a leading British pharmacy chain, to create handbag.com, a fashion, beauty, and celebrity Web site. The site was sold in 2006 at a profit of £22 million ($39 million). In 2002, the brothers' financial company, LW Investments, bought Littlewoods, a retail company that owns a chain of department stores and a mail-order catalog. They sold off the department store chain, kept the mail-order catalog, and began selling the company's merchandise on Shop Direct, their online retail business. In 2009, the brothers expanded Shop Direct by purchasing Woolworth's, a venerable but ailing retailer. The Barclays planned to sell Woolworth's merchandise, including its Ladybird line of children's clothing, online at Shop Direct, which maintains a majority of the home shopping market in the United Kingdom. In 2009, the brothers also bought Standard Life Bank to add to their existing retail banking business, Barclays Bank. In addition to the Ritz, the Howard, and other hotels, the Barclays own the Hotel Mirabeau in Monte Carlo, Monaco.

The brothers are tax exiles and list their addresses as Monaco. They own Brecqhou, an island in the English Channel, where they have built a castle for their families; the brothers have three sons and a daughter. The castle required the labor of a thousand employees working in shifts for one year. The island has its own electricity, water, landscaped parks, swimming pools, employee village, and helipad. The Barclays have clashed with the authorities in the neighboring island of Sark over Sark's jurisdiction over Brecqhou.

Legacy

David and Frederick Barclay have had a major impact on the United Kingdom through their newspapers, hotels, online shopping business, and bank. By 2009, their multifaceted empire was controlled by David's oldest son, Aidan. In the twenty-first century, the billionaire brothers were two reclusive knights, living in their own castle on their own island.

Ridolfo de' Bardi

Italian banker and merchant

Bardi greatly expanded his family's banking business and other commercial ventures, making the Bardi firm the leading merchant house in fourteenth century Florence. However, his financial involvement in the Hundred Years' War led to a decline in the business he had worked hard to build.

Born: c. 1300; Florence (now in Italy)
Died: c. 1360; place unknown
Also known as: Ridolfo di Bartolo Bardi; Ridolfo di Bardi
Sources of wealth: Inheritance; banking; trade
Bequeathal of wealth: Children

Early Life

Ridolfo de' Bardi (Ree-DAHL-foh dee BAHR-dee) was one of fourteen children of Bartolo di Iacopo Bardi and his wife, Tedalda Acciaiuoli. Bardi's father was a prominent member of Florence's political class and an active member of the cloth merchants guild (Calimala); his great-grandfather Ricco di Bardo (also known as Riccus Bardi) was the patriarch of the clan, siring seven sons. By 1342 the Bardi family claimed 142 adult males, making it one of the largest of Florentine *famiglie* (families). Ridolfo's uncle Iacopo directed the Bardi businesses until at least 1300, leaving Ridolfo's father, who died in 1310, to dabble in politics and administration.

An artist's depiction of fourteenth century Italian bankers. Ridolfo di' Bardi's bank and other commercial ventures made his family's firm the leading merchant house in fourteenth century Florence. (Hulton Archive/Getty Images)

First Ventures

Iacopo's successor was his son Lapo, who was joined as partners by nephews Ridolfo and Giovanni in the year of their father's death. The young men worked under Lapo's direction until his death in 1322. Ridolfo probably represented the firm in Naples during this period, as he was known to be the favorite commercial agent of the kingdom's ruler, Robert.

Mature Wealth

Banking, which included holding cash deposits, loaning cash, arranging transfers at a distance, and exchanging currencies, had been a small part of the Bardi family portfolio. Under Ridolfo's new leadership in 1322, banking played a much larger role, although it presented tremendous risks. From the mid-1320's to 1340, Florence underwent several blows that damaged its reputation and strained its resources, leaving the city-state in deep debt that was parceled out to leading families, including the Bardis.

In the late 1330's, the royal administration in Naples caused a run on the Bardis' bank after the family failed to support a Florentine bid to possess the city of Lucca. The return and fall of Walter de Brienne, Duke of Athens, who ruled Florence from 1342 to 1343, cost Florence 400,000 florins and stirred the lower class to sack the town houses of the wealthy, who had initially supported Brienne. Bardi's immediate family suffered much, sharing part of the 60,000-florin Bardi clan loss. Worse, Robert, the king of Naples, had died in January, 1343, owing 100,000 florins to the Bardi firm, a debt repudiated by his successor.

In 1337, the firm's international dominance began its decline as the first stages of the Hundred Years' War erupted. The French king, Philip VI, pressured Florentine bankers for loans by jailing their compatriots and seizing assets within the kingdom. The English king, Edward III, already deeply in debt to the Italians, sought more cash while letting current debt payments lapse, and royal debt grew. Between 1311 and 1326 the Bardi banks had lent his father, Edward II, some £68,000. Royal revenues, such as customs duties, were assigned to the Bardi firm, which had to collect these funds. Meanwhile, the Bardi banking house continued to provide cash for royal expenses, while Edward III continued to pledge royal and church revenues. Edward granted the Bardi and the Peruzzi families, who, since 1337, had worked in partnership, a monopoly selling royal wool. By the early 1340's, royal claims and Bardi counterclaims led to legal action and a royal audit of the two families' business, during which Ridolfo was imprisoned as a hostage in London. Royal accounts in 1345 acknowledged that the king owed more than £50,000, but he made restitution of less than 1 percent. Panic and runs on the Bardi bank in Florence led to economic chaos. In 1357, Ridolfo lost control of the family business to his brother Filippo.

Legacy

Born into a mercantile clan in an era of great risk taking and great fortunes, Ridolfo de' Bardi rose past his kin to control one of the age's great commercial ventures. Skillfully and patiently he expanded his firm's capitalization and spread its risk among prominent clients, including four kings and a pope. However, his dealings with King Edward III led to the eventual bankruptcy of the Bardi merchant house, which temporarily ruined Florence's economy. Although Bardi was a brilliant businessman, the mere disapproval of a monarch would cause his life's work to crash.

Francis Baring

British banker, investor, and merchant

Baring was one of the first great British merchant bankers. He helped manage the British government's debt during the American Revolution and the Napoleonic Wars. His financial network extended throughout Western Europe and North America.

Born: April 18, 1740; Exeter, Devonshire, England
Died: September 11, 1810; Lee, Kent, England
Also known as: Sir Francis Baring, first baronet
Sources of wealth: Banking; trade
Bequeathal of wealth: Children

Early Life

Francis Baring was the third of four surviving sons of John and Elizabeth Baring. He was born partially deaf. One of his grandfathers had been a Lutheran pastor in Germany; his maternal grandfather was a prosperous grocer in Exeter in the county of Devon, England. His father was a leading textile merchant in Exeter, then the largest city west of London. His father died when Baring was only eight years old. He was largely brought up by his mother, who had a good business sense, under which his father's business continued to thrive. She extended the business to London. Baring moved to London for his education and then in 1755 was apprenticed to Samuel Touchet, a London merchant, for seven years.

First Ventures

On the completion of this apprenticeship in 1762, Baring joined his two older brothers in setting up two firms or "houses": John and Francis Baring & Co. of London and John and Charles Baring & Co. of Exeter. The Exeter branch needed a London base for many of its transactions. The two houses were interlinked in their finances. In 1767, he married Harriet Herring, the daughter of a merchant in Croydon. Around this time, he also injected some £20,000 into his business. He and his wife eventually had twelve children—six boys and six girls. Harriet Baring died in 1804.

Charles was not a good businessman and Francis frequently had to bail him out. John was also not much interested in the business, preferring to become a member of Parliament for Exeter in 1776. In the end, John became a sleeping partner only. Meanwhile, Francis was being recognized for his business acumen, and by 1771 he was a director of the Royal Exchange Assurance, a post he held until 1780.

The two firms did not do well at first, perhaps because of the brothers' inexperience. Francis's own capital had fallen from £10,000 after his marriage to only £2,500 in 1777. The two houses had to be restructured and separated. Thereafter, Baring prospered.

Gradually, the Barings' business was turning from trading to banking, particularly the financing of import-export trade in its many different facets. Baring acted as London agent for many Western European and North American firms, buying and selling consignments for them, collecting payments, arranging shipping and warehousing, making advances, and accepting bills of exchange.

Of the European houses, the Dutch bank of Hope & Co. was the most important. It had used the Barings for its British deals, and Baring tried to merge his business with Hope. One of the Dutch partners married one of Baring's daughters, and Baring later tried to get his son Alexander to work for Hope. During the Napoleonic Wars at the end of the eighteenth century, Hope was forced to relocate to London, and the firm worked closely with Baring's companies, eventually merging with them.

Before the American Revolution, Baring had seen the potential of trade with the United States. His first American client was a Philadelphia merchant in 1774. Through this contact he was introduced to one of America's richest men, William Bingham. Baring was consulted in the final negotiations over America's independence.

Mature Wealth

Beginning in 1777, the capital of Baring's business rose steadily, from £20,000 in 1777 to £400,000 in 1804. Baring's stake in this was a modest 12 percent in 1777, rising to 54 percent by 1804. Profits likewise rose steadily, from £40,000 during the 1790's to £200,000 by 1802. By then, Baring was taking the lion's share, so that his personal wealth grew from £5,000 when he started in 1763 to £64,000 in 1790 and to £500,000 by 1804. As a result of this expansion, in 1781 two additional partners were brought into the business, though only one, Charles Wall, stayed on, eventually marrying Baring's eldest daughter.

During the American Revolution, Baring had traded in supplies for the British army. He also marketed the British debt incurred by the war, probably making about

£19,000 in profit. After the war, he speculated in American property and bought large chunks of what is now the state of Maine. Several of his daughters married American merchants. He became the London banker for the Bank of the United States. In 1795, he sold some $800,000 worth of stocks for the United States government to help it negotiate with the Barbary States of North Africa, and he also negotiated the purchase of British armaments for the United States.

Baring had won the confidence of London and other European merchants through his good business methods, his sound judgment, and his pleasant manner. He now began to win the confidence of leading politicians in the British cabinet through contacts made by his brother John. His sister had married a member of Parliament. Politicians were impressed by Baring's forward-looking views on the economy and commerce. Prime Minister William Pitt, the Younger, appointed him a commissioner to investigate the payment of fees in 1784. That same year Baring became a member of Parliament for Devon. He served four sessions in Parliament, where he was noted for being a logical speaker, especially when discussing matters of commerce and expressing his belief in free trade. Although he opposed Pitt's war policy against France, seeing it as a waste of resources and a hindrance to trade, Pitt awarded him a baronetcy in 1793.

During the Napoleonic Wars, Baring again bought up government debt over a period of fifteen years, helping to finance a conflict he theoretically opposed. These transactions brought him some £190,000 in profit.

From 1779 he was a director of the British East India Company, a vastly profitable concern that ran all Indian trade. Baring made sure the company retained its monopoly, and he opposed government attempts to control it politically by making India a colony. Pitt commissioned Francis to renegotiate the company's charter.

In 1803, Baring began withdrawing from active management of his firm, and the next year he gave up his partnership. Charles Wall became the firm's manager, with three of Baring's sons assisting. In 1807, the name of the firm was changed from Sir Francis Baring & Co. to Baring Brothers. Baring had already begun to live like a gentleman, purchasing several country houses outside London; by 1803, these homes were worth £60,000. He then decided to settle at Stratton in Hampshire, some sixty miles southwest of London, which he furnished with old masters and luxury furniture and fittings.

BARINGS BANK

Until its collapse in 1995, Barings Bank (1762-1995) was the oldest merchant bank in the city of London. It was founded in 1762 by three brothers—Francis, John, and Charles Baring—who originally established two family firms, one in London and the other in Exeter, with interlinking finances.

The bank's first major venture was its 1803 negotiation of the Louisiana Purchase on behalf of Napoleon I, even though he was at war with England at the time. Technically, the United States bought Louisiana from Barings and its Dutch partners, Hope & Co. Napoleon discounted the purchase price to 87.5 percent, which meant he received only $8.8 million. One of the bank's principals, Alexander Baring, traveled to Paris to confer with the French director of the public treasury before bringing the purchase documents to the United States. The company also helped finance much of the railroad development in North America in the ensuing century.

Barings Bank continued to prosper in the nineteenth century until it overextended itself in transactions with Argentina and Uruguay. In 1890, Argentina reneged on its debt to the bank, and the Bank of England set up a consortium to provide financial relief. Barings received £17 million, the first bail-out package in British banking history. The bank was restructured, its control returned to the Baring family, and it became somewhat more cautious. For example, it refused to get involved in financing the German recovery after World War I, and so was spared the collapse of the German economy ten years later. However, Barings was soon dwarfed by larger banks, as British banking continued to develop.

By the 1920's, the bank had established ties with the British royal family under King George V, and these connections remained until its ultimate demise. During World War II, Barings liquidated British assets in the United States in order to finance Great Britain's war efforts.

Sadly, the demise of the bank came through the illegal speculating of just one man, Nick Leeson, in 1995. Leeson had been operating in Barings's Singapore office for three years, speculating in futures. Lax oversight from London and the breech of some banking regulations enabled Leeson to mount massive debts, far more than the bank was worth. Leeson was jailed but the bank had to be sold.

The Dutch bank ING bought Barings Bank for the nominal sum of £1 and payment of its debts. ING sold off Barings's American business and merged its European business into its own. The name "Baring" only survives as a minor Swiss bank, Banque Baring Brothers Sturdza, S.A., under the direction of Eric Sturdza.

Legacy

At his death in 1810, Baring was able to leave his children some £175,000. His capital at Baring Brothers was £70,000, his estates were worth £400,000, and his paintings were worth £30,000. His son Thomas succeeded to the baronetcy and estates. Another son, Francis, became a member of Parliament, eventually becoming Lord Northbrook.

Although fortunes like Baring's became more common during the Industrial Revolution of the nineteenth century, Baring's rise as a "prince of merchants" was unusual in his time. He can be said to be Great Britain's first merchant banker, instrumental in founding a long-lived firm. His sound financial judgment and honest dealings laid the foundation not only for Barings Bank but also for other merchant banks; this in turn laid the groundwork for London's centrality as the banking and financial capital of the world in the nineteenth century, taking away much of the importance of the Dutch and German financial centers. His ability to handle the national debt gave Great Britain a sound basis for its leadership in its fight against Napoleon I. Baring was truly an international figure, whose company represented Napoleon during negotiations for the Louisiana Purchase, conducted business with the newly created United States and with South American nations, and built railroads throughout North America.

Yaḥyā ibn Khālid al-Barmakī

Persian government official and landowner

Chief minister for the legendary Caliph Hārūn al-Rashīd, Yaḥyā ibn Khālid al-Barmakī accumulated vast wealth from government revenues, resulting in the downfall of his illustrious family.

Born: Date unknown; Balkh, Persia (now in Afghanistan)
Died: 805 c.e.; Baghdad (now in Iraq)
Sources of wealth: Inheritance; government
Bequeathal of wealth: Confiscated

Early Life

The Barmakīd family originated in the city of Balkh in the Oxus river valley. Located in what is now northern Afghanistan, Balkh was the capital of Greek Bactria and later incorporated into the Buddhist Kushan empire. The Barmakīds were a priestly Persian family, although different accounts state that their religion was either Zoroastrianism or Buddhism. After the Muslim conquest of the Near East, Khālid ibn Barmak converted to Islam and supported the ʿAbbasīd uprising against the Damascus Umayyad caliphate. When the ʿAbbasīds triumphed, establishing a new Islamic caliphate in Baghdad, Khālid became the chief financial administrator. Khālid's son, Yaḥyā ibn Khālid al-Barmakī (yah-YAH IH-bihn KAH-lihd al-bahr-MAK-ih), was raised in a family of exceeding influence and wealth.

First Ventures

The Arabic ʿAbbasīds increasingly relied on Persians and other non-Arabs to administer their kingdom, and the brilliant Barmakīds proved to be especially able administrators. Yaḥyā served as the governor of Rayy, governor of Azerbaijan, and secretary and adjutant to the royal prince, Hārūn al-Rashīd. In an ominous foreboding, the Caliph Al-Mansūr in 775 demanded that Khālid and his son Yaḥyā pay the caliph the sum of 3 million dirhams. (A silver dirham is roughly equal to \$4; about 10 dirhams equaled 1 golden dinar.) After Al-Mansūr's death, Yaḥyā carefully guided Hārūn to succeed to the caliphate in 786. Hārūn appointed Yaḥyā vizier, an office equivalent to prime minister, and also named him a royal emir and entrusted him with the royal seal.

MATURE WEALTH

In the golden age of the ʿAbbasīd Dynasty, the wealth and opulence of the Barmakīds rivaled that of the caliphate. Yaḥyā, along with his four sons, Jafar, Fadl, Mūsā, and Muḥammad, governed the great Islamic empire. As vizier, Yaḥyā distributed wheat throughout the kingdom, arranged for the swift delivery of mail, and built mosques, roads, and canals. He was granted a large share of government revenues, allowing him to acquire great treasures and vast tracts of land. The Barmakīd palaces lining the Tigris River were the most splendid in the kingdom. Yaḥyā's mansion was lined with gold tile; Jafar's cost 20 million dirhams.

To preserve his position, Yaḥyā distributed millions of dirhams to the leading ʿAbbasīd families and generals. He freely granted money to petitioners and supplicants. He was a patron of the arts and sciences, supporting poets and commissioning translations of Ptolemy's *Almagest* (c. 150 B.C.E.) and a scientific manual on the prism. He sent an expedition to India to gather information on medicinal plants and had two Sanskrit medical texts, including Ravigupta's *Siddhasāra* (ocean of attainments), translated into Arabic.

The great wealth of the Barmakīds, and their extravagance, proved their downfall. In 803, Hārūn ordered the sudden arrest of Yaḥyā and his sons. Jafar, who had been Hārūn's intimate friend, was cruelly executed; Yaḥyā, his three other sons, and his allies perished in prison. Although ʿAbbasīd historians record various motives for this catastrophic turn of events, one stands out: Hārūn had become envious of the power and wealth of the Barmakīds, reputed to exceed his own. Yaḥyā's estate, possessed of 30,672,000 in gold dinars alone, with rumors of vast treasures secreted away, was confiscated. The Barmakīd family was heard from no more.

LEGACY

Few court favorites in history have had as dramatic a fall as Yaḥyā ibn Khālid al-Barmakī. Possessed of his family's ingenuity and resources, he administered the Islamic empire under the greatest of ʿAbbasīd caliphs. His patronage assisted the literary and scientific renaissance of Islam's golden age. However, his success and riches inflamed his master, the caliph Hārūn, who purged the Barmakīd family, neither the first nor the last ministers of state to fall prey to jealous monarchs.

The Barmakīd name is preserved in history. The wonderful Arabic folktales, *The Arabian Nights' Entertainments* (fifteenth century; also known as *The Thousand and One Nights*), recount the cleverness of Yaḥyā, Jafar's adventures with Hārūn, and the family's fall from grace, a story echoed in modern American films, such as *The Thief of Baghdad* (1940) and *Aladdin* (1994). A "Barmecidal" or "Barmedice" feast refers to a lavish but imaginary banquet, and these words derive from the family name Barmakī.

Barney Barnato

British diamond mining magnate

From his humble East London beginnings, Barnato, once a stage magician, made a fortune in the South African diamond fields and helped to make the diamond industry an economic powerhouse.

Born: February 21, 1851; London, England
Died: c. June 14, 1897; Atlantic Ocean, near the coast of Madeira
Also known as: Barnett Isaacs (birth name)
Source of wealth: Mining
Bequeathal of wealth: Relatives

Early Life

Barney Barnato (BAR-nee bar-NAH-toh) was the stage name of Barnett Isaacs, who was born in Whitechapel, one of poorest sections of London, in 1851. The son of a Jewish shopkeeper, he left school by age fourteen and took a series of jobs, including bouncer at a public house (tavern). Some of his relatives, including a brother, had moved to South Africa after diamonds were discovered there. In 1873, Barnato also immigrated and joined his brother, who had become a stage magician. According to legend, his stage name came from a part of their act where he would call out, "And Barnett, too," which audiences popularized as "Barnato." Eventually he made it his legal name.

First Ventures

Barnato possessed an excellent business sense. He began buying diamonds from miners and then purchased the mining claims themselves in the Kimberley diamond fields. He eventually formed the Barnato Diamond Mining Company. It is said that his genial, extroverted personality was of considerable help in his quest to secure claims. By 1885, he owned so many claims that he expanded his company by merging it with another, establishing the Kimberley Central Mining Company. Cecil Rhodes (after whom the country of Rhodesia was named) was also purchasing mining claims, and Barnato and Rhodes became rivals who fought to control the majority of the diamond claims. However, their goal was impeded by Compagnie Française de Diamant du Cap, a French company that also controlled numerous claims at the Kimberley diamond fields.

Mature Wealth

Both Barnato and Rhodes made overtures to the French company, and Rhodes was able to raise enough financing to purchase it. He then offered the company to Barnato for no cash but for shares in Barnato's Kimberley Central Mining Company. As a result, Rhodes owned a considerable stake in Barnato's company, which apparently had been Rhodes's real objective all along. The two men continued to battle for control of the diamond business, causing the price of stock in Barnato's firm to triple to almost £50 per share. Rhodes and his associates eventually emerged as the victors, owning three-fifths of the company, and in 1888, Barnato ceded control of the firm. However, some of his unhappy shareholders went to court to try to reverse the transaction. The judge ruled that Rhodes's De Beers Consolidated Mines, Ltd., could buy the assets of Barnato's company if Barnato agreed to place his firm in voluntary liquidation, which he then proceeded to do.

As part of the settlement, Barnato was made a life governor in Rhodes's company, and the influential Rhodes even arranged to have Barnato elected to the Cape Colony assembly. As their part of the £5.339 million transaction, the Barnato brothers retained some £4 million, at this time a fabulous sum. Rhodes's company, renamed De Beers Consolidated Mines Ltd. (which in the twenty-first century remained one of the world's leading diamond merchants), now controlled the vast majority of South Africa's diamond-producing wealth.

Barnato continued to serve as a member of the assembly until 1897, the year of his death. It is speculated that political events in South Africa involving the British and the Boers had greatly affected him personally and financially. It is also possible that he was still unhappy about losing the company he had so diligently built. On a sea voyage with his wife, he apparently committed suicide at the age of forty-six by jumping into the sea from the ship. His body was recovered and buried in a Jewish cemetery in England.

Legacy

The entrepreneurial skills of Barney Barnato helped the African diamond industry to evolve from its somewhat chaotic "Wild West" beginnings, with its multitude of small, low-profit claim holdings, to an organized and extremely profitable business. The De Beers company, of which he was a director, became the world's leading diamond company.

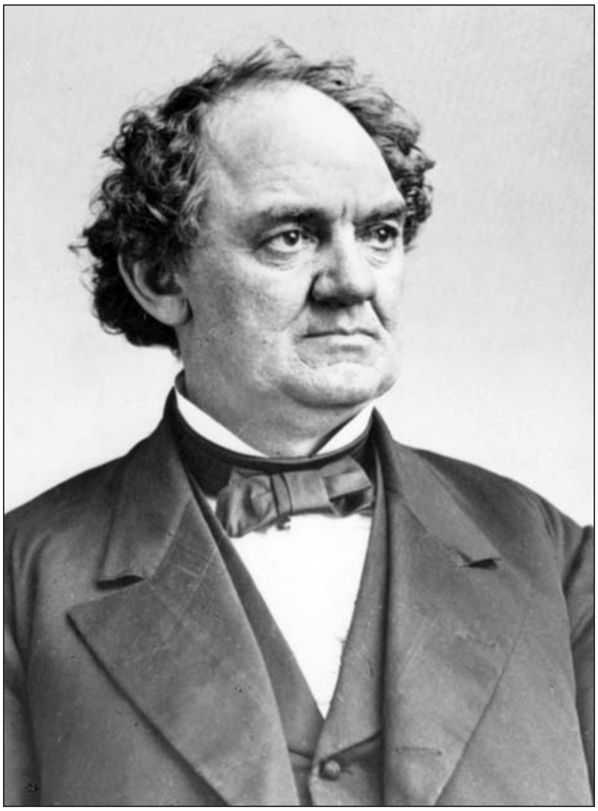
P. T. Barnum

American entertainer and entrepreneur

Barnum was one of the first people to "make it rich" in the entertainment business. He justified and made it somewhat more acceptable to profit from questionable entertainments, such as his exhibition of persons with physical oddities. Barnum also made money by operating a circus and making it a nationally known touring attraction.

Born: July 5, 1810; Bethel, Connecticut
Died: April 7, 1891; Bridgeport, Connecticut
Also known as: Phineas Taylor Barnum



P. T. Barnum. (Library of Congress)

Source of wealth: Entertainment industry
Bequeathal of wealth: Spouse; children; relatives; charity

Early Life

Phineas Taylor Barnum (FIHN-ee-uhs TAY-lor BAHR-nuhm) did not go to college but started working at a fairly young age. He ran a store, and he also learned the art of the lottery from his namesake, his grandfather Phineas Taylor. Barnum thought it was easier to earn money by running lotteries than by performing physical labor, and he operated a lottery out of his store, in addition to selling merchandise. From this experience in his store he gained skills of self-promotion, learning the dealing and scheming that would come in handy for his later careers as a showman and circus operator.

Barnum also was a frequent writer and became politically active. He spoke out against many reforms desired by church leaders, including the blue laws restricting work and amusements on Sundays. He wrote negative editorials about these reforms in a self-published newspaper. These editorials caused church leaders to sue him for libel, and Barnum spent time in jail. This experience and the ban on lotteries in Connecticut led Barnum to move to New York City. After gaining financial success, however, Barnum returned to Connecticut.

First Ventures

Barnum began his career as a showman soon after moving to New York City. He purchased Joyce Heth, a very aged African American slave, and presented her as George Washington's nurse. Barnum claimed that Heth was more than 160 years old and took her on a tour around the country. Barnum coached Heth about what to say and trained her to sing songs about Washington as an infant. Barnum greatly profited from this hoax. In response to questions about Heth's age and to appear that he had nothing to hide, Barnum offered to autopsy her body upon her death. Barnum conducted a public autopsy, with fifteen hundred people paying admission to get in. When the doctor concluded that Heth was really only eighty years old, Barnum then claimed that Heth was still alive and in Europe. The Heth autopsy was a template for the publicity stunts that Barnum would devise throughout his career.

With the profits from this venture, Barnum launched a touring troupe of what would later be called "circus freaks." He had mixed success, due in part to the economic recession from 1839 through 1843. Barnum survived the downturn and opened a museum in 1842.

Mature Wealth

The museum in many ways was a sort of carnival midway, minus the games, in a fixed building. Barnum continued to employ his trademark advertising with, among other things, balloon rides from the roof and posters in the windows advertising the exhibits. He also continued to plan his various hoaxes and attractions. His first major hoax after buying the building was to exhibit the Fiji Mermaid, which was a monkey's head sewed onto the tail of a fish. Even after most people had debunked the mermaid, Barnum continued to advertise it with the argument that no one knew for sure whether it was a hoax, so the public should come and see for itself.

Barnum never considered that he was cheating his customers if he gave them humbug along with entertainment. He also, it appears, considered his humbug different from the fortune tellers and other traditional carnival attractions. Barnum's exhibits included General Tom Thumb, the stage name of Charles Sherwood Stratton, who was only two-feet tall. Thumb was four years old when he started working for Barnum, even though Barnum presented him as being eleven. Thumb, with help from Barnum, imitated Napoleon I and other famous figures. Barnum and Thumb toured Europe, and Thumb continued to appear in Barnum's troupe for many years. Thumb took part in one of the most famous weddings of the 1860's, in which he married another short person, Mercy Lavinia Warren Bump. Barnum capitalized on every element of the wedding, even displaying Bump's wedding dress in his museum's windows for months after the ceremony.

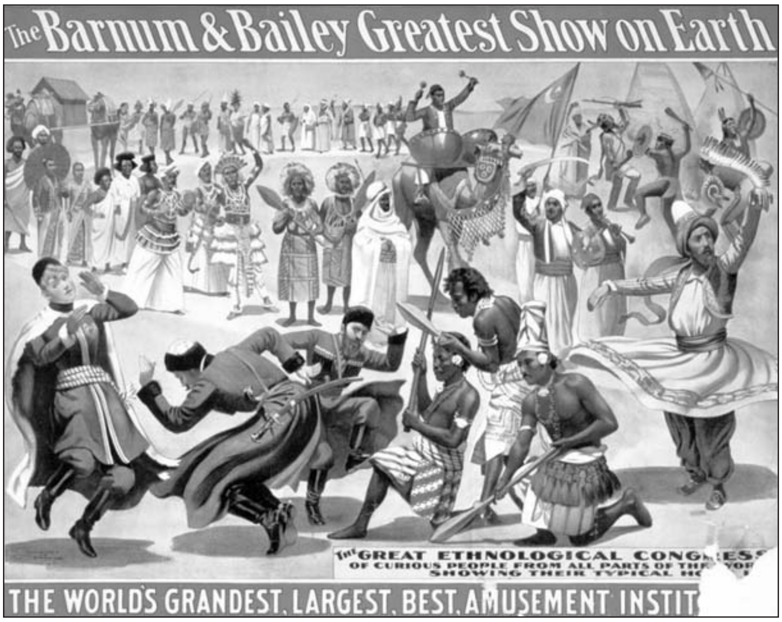
Barnum followed up the Tom Thumb tour of Europe with perhaps his greatest coup—organizing a series of American concerts for Jenny Lind. Lind was a great Swedish singer and was loved in Europe. Without ever hearing her sing, Barnum offered her the unheard-of sum of $1,000 a night to perform in the United States. Lind accepted and the tour was a huge popular success. Nearly everywhere Barnum and Lind went, Lind sang to full houses. The tour also was a financial success for Barnum, repaying him more than his investment. Barnum continued to operate his museum and to conduct hoaxes

Barnum and Bailey Circus

The Barnum and Bailey Circus, which later became the Ringling Brothers and Barnum & Bailey Circus, was the first of the nationally known circus troupes. P. T. Barnum started his circus in1871 as a traveling version of his curiosity show, and he labeled it as such. The word "circus" did not appear in his first advertisements. By 1872, Barnum was calling his attraction "the Greatest Show on Earth," the phrase that has become associated with his circus. Barnum advertised his collection of "freaks" and employed some of the same marketing ploys he had used for his museum. His was one of the first circuses to travel by train and to invent the circus train that eventually became a common feature of these shows. The train allowed his circus to travel more easily in order to perform in numerous venues, making the show a universal attraction.

Barnum relied on the expertise of managers whose circuses merged with his show, while he focused on the promotion of his attractions, including the creation of his "Greatest Show on Earth" slogan. One of these mergers was with the Cooper and Bailey Circus, founded by James Anthony Bailey. Among Barnum's most successful circus promotions was the publicity surrounding Jumbo, a huge elephant. He purchased this elephant from the London Zoo in 1882, buying him for the then-astronomical sum of $10,000 (many people at the time worked for a dollar a day or less). Barnum popularized the term "jumbo," helping to bring it into the American lexicon. In spite of his well-publicized connection with Barnum, Jumbo was with the circus for only three years, dying in a train accident in 1885. Jumbo and the other circus animals were moving across the tracks in a train yard when a locomotive hit the elephant. Most likely, the animal panicked and his handlers were unable to get him out of the way. Ever the promoter, Barnum told a story of how Jumbo charged into the fray, rescued a smaller elephant from the locomotive, and died as a hero. Not content with this promotion, Barnum also displayed the skeleton of Jumbo, along with his stuffed hide.

After Barnum's death, the circus was purchased by Bailey, who continued its operation. In 1907, the Barnum and Bailey Circus was purchased by the Ringling Brothers, creating the troupe that continues to perform into the twenty-first century.



A poster from the mid-1890's advertises the "great ethological Congress of curious people from all parts of the world," one of the exhibits at the Barnum and Bailey Circus. (Library of Congress)

for the rest of his career, but Lind was one of his few high-culture attractions.

Barnum generally had success in his amusements, but he failed in other areas. He went nearly bankrupt several times and had repeated tragedies with fire, including having his mansion burn down, but he always recovered. Barnum opened up theaters and tried to make theatergoing a family activity. He also generally closed his museum on Sunday, in keeping with the moral ideas of the time. In his theaters, he tried to adapt the plays of William Shakespeare and similar attractions for the nineteenth century audience, striving to make these presentations interesting for families. Barnum also continued his self-promotion. He wrote his autobiography, which went through many revisions, and he did not oppose other companies' efforts to publish it, viewing this as excellent publicity.

Some of Barnum's other ventures did not succeed. His investment in a variety of companies in the 1850's led to his personal bankruptcy. However, he hooked up again with Tom Thumb, toured Europe, regained his wealth, and built himself another mansion after a fire destroyed his home. He continued to add oddities and attractions to his shows, exhibiting the first widely publicized conjoined twins, Chang and Eng Bunker. After two fires in the late 1860's, however, Barnum turned to the circus business.

Barnum's circus initially was a touring show of many oddities similar to what might have been seen in his museum. He purchased a rival circus and allowed the former owners to continue running it while he handled its publicity. Tom Thumb and his wife toured with the circus in the early 1880's. Throughout that decade and until his death in 1891, Barnum continued to devote his efforts to his circus business.

Legacy

Barnum left several legacies, one of which he himself disputed. He was alleged to have said, "There's a sucker born every minute," but Barnum himself denied originating or using that phrase. He viewed himself as providing entertainment and argued that people were not suckers if they enjoyed his attractions, even if they never saw what they paid money to see. Thus, if someone paid to see the Fiji Mermaid but only saw a monkey sewed onto a fish, Barnum would argue that it was not a sham if one enjoyed the exhibit. Barnum also tried to revive the theater, and he created the modern traveling circus.

Barnum gave generously to colleges. Tufts University named a hall after him, and the school's mascot is Jumbo, named after the most famous elephant in Barnum's circus. Barnum is less well known for his one-year term as mayor of Bridgeport, Connecticut, and for his advocacy in support of moral censorship laws, including Connecticut's law banning the use of contraceptives.

Basil II

Byzantine monarch and military leader

Basil II labored almost obsessively and with great success to maximize the income and wealth of the Byzantine state, which he controlled and effectively owned as basileus *(emperor). He built up such a large treasury that he had to excavate additional storage rooms in the imperial palace.*

Born: 958; Constantinople, Byzantium (now Istanbul, Turkey)
Died: December 15, 1025; Constantinople
Also known as: Basil Porphyrogenitus (birth name); Bulgaroktonos (Bulgar Slayer)
Sources of wealth: Conquest; real estate; government
Bequeathal of wealth: Relatives

Early Life

Basil (BAZ-ihl) II, born Basil Porphyrogenitus, was the son of the Byzantine emperor Romanus II and his second wife, the tavern keeper Theophano. When their father died in 963, Basil and his brother Constantine jointly inherited the imperium as children but held no power. Instead, the monarchy ascended successively to two generals acting as coemperors: Nicephorus II Phocas, who married Basil's mother but was assassinated, with her assistance, several years later, and John I Tzimisces, who married Basil's aunt Theodora. Both generals dealt primarily with wars and diplomacy and were generally successful. Meanwhile, Basil and Constantine developed reputations as self-indulgent and frivolous, more interested in womanizing and other idle pursuits than in statecraft. Their father had the same reputation, and Constantine never changed.

First Ventures

With the death of John I Tzimisces in 976, Basil became sole emperor, and his brother never challenged him. His great-uncle, Basil Lecapenus, a eunuch, held power as chamberlain. Meanwhile, another general, Bardas Skleros, sought to rule as Nicephoras and John Tzimisces had. He was ultimately defeated by rival general Bardas Phocas, who supported Basil II and his chamberlain. At some point, young Basil began to pay more attention to state affairs, and in 985 he finally assumed power himself. Basil Lecapenus was exiled and his vast wealth, much of it a product of corruption, was seized.

By now, Basil II had completely lost his youthful frivolity. He had no interest in scholarship, art, rhetoric, or regal display, and he showed no personal feelings. He never married or had any known royal favorite. He was pious and commissioned a calendar of saints' days, the *Menologion*, and other religious works.

After Basil's brief and unsuccessful campaign against the Bulgars, which Anatolian magnates saw as proof that they should run the state, the emperor faced further civil war. Basil arranged a then-unprecedented royal marriage of his sister Anna to Vladimir I, the crown prince of Kiev, in return for Vladimir's conversion to Orthodox Christianity and his mercenary force, which became Basil's Varangian Guard. The guards' help, the sudden death of Bardas Phocas, and the incipient blindness of the aged Bardas Skleros enabled Basil to unify the empire in 989. Normal tax receipts at that time are estimated at approximately 54,000 pounds of gold.

Mature Wealth

Basil's sole concern was the wealth and power of his empire. For the next thirty years, his primary activity and expense was a long war against the Bulgars, occasionally interrupted in the early years by difficulties in Armenia and Syria. He was finally able to concentrate enough attention in the west to defeat the Bulgars near Serrai. In a notoriously cruel act, Basil blinded most of his prisoners. Samuel, the Bulgarian czar, collapsed and died when the prisoners returned. Basil soon completed the conquest.

Basil annexed Bulgaria entirely, but he treated it leniently, with low taxes paid in kind rather than in gold. He then took care of unfinished business in the east, annexing most of Armenia but never recovering Edessa in Syria. He planned to recover Sicily from the Arabs, but he died first.

Bardas Skleros, whom Basil asked for advice in 989, recommended that Basil assess high taxes and other exactions upon the great magnates. Basil accepted this advice, and in 996 he confiscated the land that the magnates had acquired during the past sixty years. Much of this property was returned to small landholders, and much of it went to the emperor. Basil subsequently required that the magnates pay all of the taxes that the local peasants were unable to pay. One source reports that Basil remitted taxes for two years near the end of his life.

Legacy

The Byzantine Empire reached its apogee under Basil II, and when he died in 1025, he left a treasury estimated at 200,000 pounds of gold. However, he failed to leave an heir, and his brother succeeded him as Emperor Constantine VIII. The decline of the Byzantine Empire began almost immediately after Basil's death, with much of the treasury spent on imperial frivolities. However, the imperial downfall was well cushioned for half a century thanks to the wealth that Basil left behind, and the empire temporarily expanded in the east and in Sicily.

Robert Bass

American investor

Bass was ranked as the 176th-richest person, with a net worth of $4.5 billion, in Forbes *magazine's 2010 list of the world's billionaires. He and the equity firm he founded have invested in a wide variety of businesses, including the media, publishing, oil, aircraft, and financial services.*

Born: 1948; Fort Worth, Texas
Also known as: Robert Muse Bass
Sources of wealth: Inheritance; oil; investments
Bequeathal of wealth: Relatives; charity; educational institution

Early Life

Robert Muse Bass was one of four sons born to Perry Richardson Bass and Nancy Lee Muse Bass. His uncle was Texas oil tycoon Sid W. Richardson, who was one of the wealthiest people in the United States when he died in 1959. Bass and each of his brothers inherited $2.8 million from their uncle. Part of Bass's education was received at two preparatory schools, Phillips Andover Academy and Governor Dummer Academy (now The Governor's Academy). He earned a B.A. from Yale in 1971 and an M.B.A. from Stanford University in 1974. Bass began his career at Wells Fargo Bank, and in 1974 he joined Bass Brothers Enterprises, the investment vehicle that Bass's father had organized for his sons.

First Ventures

Although Bass began to invest on his own in 1983, he continued to work with his brothers, controlling one of the largest private oil companies in the United States. Bass earned hundreds of millions of dollars in the late 1980's, buying up banking institutions that were in trouble, correcting the problems, and reselling the banks for a profit. One example of these ventures was the acquisition of American Savings Bank, which Bass eventually sold to Washington Mutual Bank in 1996.

Mature Wealth

Bass founded Oak Hill Capital Partners, a private equity firm, in 1999. He later established two associated companies, Oak Hill Capital Management Partners and Oak Hill Capital Partners II; the latter firm purchased companies, restructured them, and eventually resold them. Bass's firms have made several billion dollars worth of investments in numerous enterprises, including *The New York Times'* Broadcast Media Group, consisting of nine televison stations; the Duane Reade drugstore chain; GE Capital International Services, an Indian outsourcing company; The Container Store, Inc.; Alibris, an online book exchange; Jacobson Companies; Caribbean Restaurants, Burger King's exclusive franchisee in Puerto Rico; Southern Air Holdings, Inc.; Primus International, Inc.; and the Atlantic Broadband Group. One of Oak Hill's tactics is to invest in enough stock to force a company to restructure and to become more profitable—or risk being taken over by Oak Hill; either way, Bass's companies obtain a profit on their investments. Bass also founded Keystone, Inc., Oak Hill Venture Partners, and Oak Hill Securities Funds. As chairman of Aerion Corporation, he is a leader in the development of a supersonic business jet.

Although Bass's three brothers are all billionaires, he is the richest of the clan. Following his father's lead, he has donated a great deal of money to spur the growth of Fort Worth, Texas, especially in the city's downtown area, where many buildings have been remodeled.

Legacy

Although some people are made uncomfortable by the changes required when Bass acquires a business, his takeover generally results in a more profitable enterprise that benefits everyone involved in the venture. Bass's reorganizations and investments have changed many businesses and, in the process, have changed the lives of millions of Americans. Bass is also a generous philanthropist. He has given $13 million to renovate the Yale University library, $25 million to Stanford University, and $10 million to Duke University. In addition, he has devoted his time to causes that are important to him. For example, he fought construction of a highway in Fort Worth that would have demolished part of the city's historic district. Bass has been a chairman of Stanford Management Company, the National Trust for Historic Preservation, and Cook Children's Hospital, and in 2009 he was a trustee of Rockefeller University, Groton School, Middlesex School, and the Amon Carter Museum.

Jan Antonín Bat'a

Czech industrialist

Through his organizational genius, Bat'a presided over the growth of a moderately successful Czech shoe company that he turned into an international giant.

Born: March 7, 1898; Zlín, Moravia, Austro-Hungarian Empire (now in Czech Republic)
Died: August 23, 1965; São Paulo, Brazil
Also known as: Jan Bat'a; The King of Shoes
Sources of wealth: Trade; sale of products
Bequeathal of wealth: Relatives

Early Life

Jan Antonín Bat'a (yahn AHN-toh-neen BAH-tya) was born in 1898 in Zlín, Moravia, which was then part of the Austro-Hungarian Empire and is now in the Czech Republic. The Bat'a family had been cobblers for many generations when it established a small shoe-manufacturing company in 1894. The family first became rich when it supplied shoes to the military during World War I. Following the war, Czechoslovakia (what is now the Czech Republic and Slovakia) became an independent country, and the Bat'a firm was one of the first companies in the world to mass-produce shoes.

First Ventures

Upon the death of his half brother Tomas in an airplane crash in 1932, Bat'a assumed control of the family's company. By that time, the firm employed about 16,500 people and was internationally famous. Under his leadership the company began expanding from its base in Zlín throughout Europe, North America, India and other Asian countries, and North Africa.

Mature Wealth

Bat'a continued to grow his company, and by 1942 business had increased sixfold, with the firm employing almost 108,000 people worldwide, including at subsidiaries in the United States and Canada. He also diversified Bat'a products to include the manufacture of tires, chemicals, and textiles, established department stores, and even branched out into railroads, film studios, and airplane manufacturing. The company became the second largest in Czechoslovakia, after the Škoda Works, a munitions manufacturer. Many of the Bat'a factories were located next to small towns, dubbed Bat'a-villes, that were based on the "ideal city" concept and were built to house the firm's workers.

Following the German occupation of Czechoslovakia in 1939, Bat'a and his family left for the United States and remained there for more than a year. When he decided to leave he was placed on an international blacklist by the British government, who accused Bat'a of Nazi Party sympathies because his company had continued operating in Czechoslavakia during the German occupation. Bat'a sought refuge in Brazil, and while there he eventually founded several towns.

It is reported that Bat'a supplied aid to numerous Czechoslovakian Jewish families during World War II, helping them to escape the country, and that he also saved many other Czechs from being used as Nazi slave labor. He also reportedly sent financial assistance to the Czech government in exile in England. Following the war, the Czech government nationalized the Bat'a Shoe Company. Bat'a was accused, in absentia, of crimes against the state but was acquitted of some sixty-four charges.

When the Communists seized control of Czechoslovakia in 1948, Bat'a was again tried in absentia and sentenced to fifteen years. Once known as the King of Shoes, he was now portrayed as an exploitive capitalist, and his name was removed from the company, which was now to be called Svit. The company continued to be operated by the Bat'a family in other countries, however.

With Bat'a in exile in Brazil and his nephew Thomas J. Bata living in Canada, the company's operations were split in two. There began a struggle for control of the company, engendering many lawsuits, and young Thomas finally won complete control in 1949. In the early twenty-first century, the Bata Shoe Organization was headquartered in Lausanne, Switzerland, employed more than forty thousand people, operated thirty-three factories in twenty-two countries, and maintained a chain of five thousand retail stores in more than fifty countries. In late 2007, more than forty years after his death, Bat'a was finally cleared by the Czech judiciary.

Legacy

Jan Antonín Bat'a took over an already prosperous company, and through his organizational skills made it into an international powerhouse, with an estimated fourteen billion pairs of shoes sold by 2009. His visionary establishment of the Bat'a-villes, with their modern facilities for his employees, helped maintain a generally content workforce. If reports are true, his aid to the legitimate Czech government and people during wartime was of material assistance to the welfare of his native country.

Lord Beaverbrook

Canadian and British newspaper publisher, investor, and politician

Beaverbrook gained a fortune in Canada and later in England by selling bonds and investing in businesses with economic potential, notably in British newspapers. He created the Beaverbrook Foundation to continue his charitable interests after his death.

Born: May 25, 1879; Maple, Ontario, Canada
Died: June 9, 1964; Cherkley, Surrey, England
Also known as: Sir William Maxwell Aitken, first Baron Beaverbrook; William Maxwell Aitken (birth name)
Sources of wealth: Media; financial services; investments
Bequeathal of wealth: Children; charity

Early Life

Sir William Maxwell Aitken, first Baron Beaverbrook, was born in Maple, Ontario, on May 25, 1879. His family soon moved to Newcastle, New Brunswick, Canada, where his father, a Presbyterian minister, had accepted a new position. Aitken always identified Newcastle as his hometown. Described as a mischievous boy, his "puckish" character remained with him his entire life. Uninspired by school, he made pocket money by devising numerous stratagems, such as selling soap to obtain a bicycle. At the age of thirteen he founded a newspaper, a career he would pursue with greater success later in life. After failing the Latin examination for university he accepted a position as a law clerk, but he spent time selling life insurance and as a correspondent for a local newspaper. He bought a bowling alley, which he resold at a profit, and he lost money investing in frozen meat, which was ruined in a thaw.

First Ventures

In 1900, he abandoned selling insurance policies in favor of selling bonds. The Canadian economy was booming, but the stock exchange was limited in scope and most businessmen purchased bonds. Aitken was an excellent salesman, whose integrity was beyond dispute. With his commissions, he bought stagnant companies, made them profitable, and sold the now more valuable stock, and he then moved on to invest in other companies. His Royal Securities Corporation was the first company to sell bonds in eastern Canada.

Mature Wealth

By 1907, Aitken had become a millionaire in Canadian dollars. However, he was involved in disputes with his fellow investors in the Royal Securities Corporation; his partners wanted higher dividends, but Aitken preferred to retain profits for future investments. His success in part was due to his appreciation of the value of personal publicity, and in the early twentieth century publicity meant coverage in newspapers. The apex of Aitken's financial accomplishments occurred in 1909 and 1910, when he organized a number of successful mergers in such businesses as cast-iron manufacturing, railroad freight car construction, and the cement and steel industries. His appreciation of a unified Canadian market was in part a reaction to the growing economic power of the

Lord Beaverbrook. (Library of Congress)

United States. Aitken saw the British Empire as a potential economic unit, and for the rest of his life he championed the cause of "imperial preference" which would knit the empire into a single economic whole by encouraging free trade within the empire and establish tariffs against nonempire nations.

In 1908, Aitken made his first trip to London, where he acquired several new businesses, including London's Colonial Bank. He was introduced to Bonar Law, a Conservative Party politician and a fellow Canadian who shortly became Aitken's greatest hero. Aitken returned to England in 1910, and although he frequently said he would eventually make his permanent residence in Canada, he never did. Through his business connections in London—he briefly became a major shareholder in Rolls-Royce—he became involved in politics as a member of the Conservative Party. His tie with Law strengthened, and he developed connections with several of England's major publishers and journalists, notably Lord Northcliffe of the *Daily Mail*, an icon of "popular" journalism, and R. D. Blumenfeld, editor of the *Daily Express*. With Law's support, in 1910 Aitken was elected a member of Parliament from Ashton-under-Lyne, a textile center near Manchester. Aitken only rarely attended Parliament, preferring then and later to be a go-between among the major politicians of the day, working out compromises and obtaining solutions. When World War I came in 1914, he published a newspaper for Canadian troops in Great Britain and France, as well as creating the Canadian war records office.

In Britain, Aitken's most lasting economic endeavor was in the newspaper business. In 1911, he invested in the *Daily Express*, which had been failing financially. He acquired a controlling interest in the newspaper in 1916. At the same time he was deeply involved in the machinations that brought down Prime Minister H. H. Asquith, bringing to power David Lloyd George, who requested that King George V grant Aitken a peerage, in part because of the support the government was receiving from Aitken's newspapers. In February, 1917, Aitken took his seat in the House of Lords as Lord Beaverbrook, the name taken from a stream where he had fished as a boy. In the new government, Beaverbrook became the chancellor of the duchy of Lancaster and was placed in charge of war propaganda. He resigned his position at the end of the war in 1918, vowing never to hold office again unless there was another war. Beaverbrook enjoyed politics, and although he remained a Conservative, he was never a reliable party politician. After World War I he disposed of Royal Securities Corporation and the Colonial Bank; newspapers became his central interest.

Beaverbrook used his newspapers to publicize himself and to advocate his long-standing commitment to

BEAVERBROOK ART GALLERY

In 1947, Lord Beaverbrook became chancellor of New Brunswick University at Fredericton, New Brunswick, Canada. He already had a long connection to the university, and through the years he had provided many scholarships, as well as funding the Lady Beaverbrook Gymnasium and the Lady Beaverbrook Residence for men.

An old friend of Beaverbrook, Sir James Dunn, was an art patron at Canada's Dalhousie University, and the always competitive Beaverbrook decided to emulate Dunn. Beaverbrook had little interest in art and limited tastes, which included English landscapes, such as those of J. M. W. Turner and John Constable, portraits by Sir Joshua Reynolds and Thomas Gainsborough, and the French painters François Boucher and Jean-Honoré Fragonard, with their voluptuous females. He also acquired paintings by his friends, including Winston Churchill, Walter Sickert, and Graham Vivian Sutherland, who had painted a portrait of Beaverbrook. Beaverbrook's collection, along with several works by Salvador Dalí from Beaverbrook's last wife, Christofor Dunn (Sir James Dunn's widow) was donated to the Beaverbrook Art Gallery when it opened in 1959. William Constable, a descendant of the early nineteenth century landscape painter John Constable, officiated at the opening.

One biographer suggests that Beaverbrook believed his own collection was sufficient for the gallery; thus the gallery was complete in 1959. In any event, he made little provision for additional purchases or further expansion of the gallery's facilities. The gallery did continue to add to its collections, focusing on paintings by Canadian artists. In 1994, the gallery was officially designated as New Brunswick's Provincial Art Gallery.

In 2003, a dispute occurred between the Beaverbrook Art Gallery and the Beaverbrook Foundations of the United Kingdom and Canada. The foundations demanded that the gallery return the numerous paintings that Beaverbrook had donated, intending to sell them at auction to raise funds for the foundations. In a legal decision rendered in 2007, it was decided that 85 of the 133 contested works would remain with the gallery. The United Kingdom foundation was unwilling to accept that award and appealed the decision, but in 2009 the appellate court ruled in favor of the gallery.

imperial preference, but he was also sincerely interested in publishing the best possible newspapers. He invested heavily in the *Daily Express*, and he increased the newspaper's profits by expanding its advertising, an innovative practice that eventually was adopted by most other newspapers. However, he also was a strong believer in providing "news," and his publications had more foreign correspondents than any of the other British newspapers. In 1918, Beaverbrook started publishing a second newspaper, the *Sunday Express*, and in time this newspaper held an important position among elite newspapers, such as *The Sunday Times* and *The Observer*, and popular but at times salacious publications, such as *News of the World*. Although London was the center of English newspaper publishing, Beaverbrook also founded the *Scottish Daily Express*. In 1923, he acquired the *Evening Standard*. Beaverbrook allowed the editors of his newspapers to have considerable leeway in both content and policies, although he exerted his control in his advocacy of empire and in his opposition to socialism and any British involvement in European or continental affairs.

Beaverbrook remained a wealthy man during the Great Depression. In early 1929 he sold his stocks and put the money in bonds, thus insulating himself from the worldwide stock market crash. As a solution to the economic crisis, Beaverbrook, through his newspapers, launched an "Empire Crusade," which was a continuation of his long campaign for imperial preference. This campaign fared no better than his earlier attempts because there was widespread fear among voters that imperial preference would result in increased food prices. As the shadow of fascism spread across Europe, Beaverbrook favored a policy of "No More War" through British isolation from continental affairs. He opposed the League of Nations, believing the organization was more likely to lead to war than to peace. Through his newspapers, he continually predicted that there would be no war in Europe, or no war that would involve Great Britain. However, Britain declared war on September 3, 1939, after Nazi Germany invaded Poland. After the crushing German campaign in Western Europe, in May, 1940, Winston Churchill became prime minister. After the fall of France in June, the Nazis turned against Britain. One of Churchill's earliest acts was to appoint Beaverbrook the minister of aircraft production. In this position, Beaverbrook's energy and unorthodox methods enabled Britain to win the Battle of Britain, and this victory was perhaps "his finest hour."

After World War II, Beaverbrook withdrew from politics. He opposed the socialism of the Labour Party and deplored the developing Cold War between the former allies. In addition to his English residences, he acquired a home in southern France and two in the West Indies, and throughout the year he journeyed from one to another, always keeping in close contact with his newspapers by telephone. He wrote several well-regarded works on the events and people of the World War I years.

It is impossible to know the extent of Beaverbrook's fortune because he gave much of it away during his lifetime, but one biographer estimates it was in the range of $40 million. His benefactions were often in the form of investments that he made in the name of the recipient and were distributed to members of his family, friends from childhood, political friends and foes, educational institutions, and the Presbyterian Church. In 1906, he married Gladys Drury, who was from one of Canada's most distinguished families. It proved to be a satisfactory marriage, and the couple had three children. Beaverbrook had other female relationships, but he was devastated when Gladys died in 1927. For many years his closest female companion was Mrs. Jean Norton until her death in 1945. In 1963, the year before his death, he married Christofor Dunn, the widow of an old Canadian friend.

Legacy

Beaverbrook's major economic legacy was his profitable British newspapers, particularly the *Daily Express* and *Sunday Express*, which provided England's middle classes with publications that were readable and interesting and presented accurate coverage of the major news stories of the day. In 1954, he established the Beaverbrook Foundation, which supports numerous charitable causes in Canada and the United Kingdom.

Ninth Duke of Bedford

British aristocrat, agriculturalist, and politician

The dukes of Bedford are from an old, established, aristocratic family who own estates, London property, and stately homes. The family historically was involved in government and often served in the military, and the ninth duke of Bedford maintained both of these traditions.

Born: October 16, 1819; London, England
Died: January 14, 1891; London, England
Also known as: Francis Charles Hastings Russell (birth name)
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Children

Early Life

Francis Charles Hastings Russell, the ninth duke of Bedford, was the grandson of John Russell, sixth Duke of Bedford. His father, Major-General Lord George William Russell, was the duke's second son and a soldier, fighting in the Crimean War, and an aide-de-camp to King William IV and the young Queen Victoria. His mother was Elizabeth Anne Rawdon, also from an aristocratic family, a somewhat ambitious lady praised by Lord Byron. His parents married in 1817.

Bedford followed his father into the army, entering the Scots Fusilier Guards in 1838. He retired after his marriage to Lady Elizabeth Sackville West in 1844. The couple had four children, two boys, George and Herbrand, and two girls, Ella and Ermyntrude. Again following his father's footsteps and the family tradition, Bedford entered politics, becoming a Liberal Party member of Parliament for Bedfordshire from 1847 to 1872. In 1866, he broke with Prime Minister William Ewart Gladstone over the Irish Home Rule Bill, and thenceforth Bedford sat as member of Parliament from the Unionist Party.

First Ventures

It was Bedford's uncle, also named Francis Russell, who had inherited the family title on the death of the sixth duke. The Bedfords had a long history as aristocrats, dating back to the time of Henry VIII in the sixteenth century. Woburn Abbey, in Bedfordshire, had been given them by Henry's son, Edward VI, in 1547. The abbey, now one of England's grandest stately homes, had been a Cistercian abbey and became the main family residence in 1619.

Bedford's cousin, William, then became the eighth duke on the death of his father, but he died without an heir in 1872. As a result, Bedford became the ninth duke, and he was thus elevated to the House of Lords; his position as a member of Parliament ended, and he inherited Woburn Abbey, its estates in Bedfordshire, and many other estates throughout England, totaling some 90,000 acres. He also inherited large properties in fashionable areas of London near Woburn Square and Tavistock Square in Bloomsbury, later identified with the British Museum.

Mature Wealth

Woburn Abbey had been largely redeveloped by John Russell, the famous fourth duke of Bedford in the eighteenth century, and was then landscaped by noted landscape architect Humphry Repton in 1802. The ninth duke decided not to make additional improvements to the abbey but developed his estates around Tavistock in the West Country and in the fens of Cambridgeshire. He also turned his attention to the agricultural condition of his estates, becoming involved in experimental work, especially with fertilizers and stock breeding. In 1879, he succeeded the Prince of Wales as president of the Royal Agricultural Society, a public acknowledgment of his endeavors. He also improved his Bloomsbury estate, which increased its value by about £1 million.

Bedford channeled his political interests into being the lord lieutenant of the county of Huntingdon between 1884 and 1891, while his wife became the mistress of the robes for Queen Victoria from 1880 until 1883. In 1880, Bedford was made a Knight of the Garter, a select group of leading men of public affairs. However, at this time he also became increasingly hypochondriacal, and in 1891, after contracting pneumonia, he shot himself through the head while temporarily insane.

Legacy

Bedford bequeathed the family estates to his older son, George. These properties had increased in value and quality, largely because of their agricultural improvements. It is perhaps no coincidence that in the twenty-first century Woburn Abbey survived as a leading British stately home, and the house, furnishings, and art treasures are open to the public. In 1970, Safari Park, a menagerie of African animals, was opened to the public on the grounds of the estate.

—David Barratt

Alfred Beit

British mining magnate

Beit was one of the most important of the Randlords—the magnates who exploited the mineral wealth in Great Britain's Cape Colony (now in South Africa). He was also a generous philanthropist, creating the Beit Trust in order to benefit the people of southern Africa.

Born: February 15, 1853; Hamburg (now in Germany)
Died: July 16, 1906; Welwyn, England
Source of wealth: Mining
Bequeathal of wealth: Relatives; charity

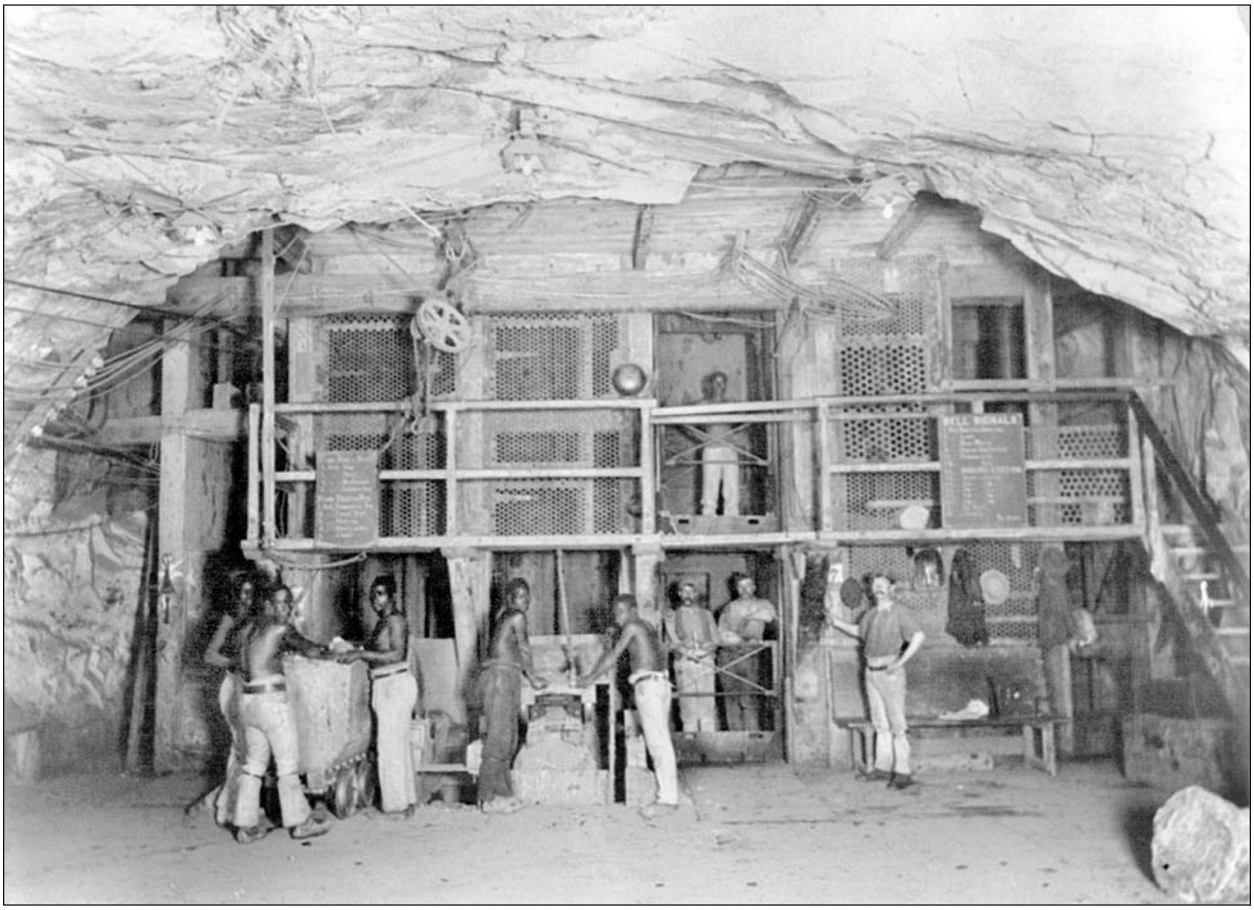
Early Life

The family of Alfred Beit (bit) descended from Sephardic Jews who had converted to Lutheranism and lived in Hamburg. Alfred's father, Siegfried Beit, was a prosperous silk merchant. Siegfried and his wife, Laura Hahn Beit, had six children, of which Alfred was the second oldest. An uninspired student, Alfred seemed destined for a career in business. When he was eighteen, he went to work for a diamond merchants' firm in Amsterdam. In 1875, D. Lippert and Company, a diamond trading firm, sent him to the British colony in southern Africa, where diamonds had been discovered several years earlier.

For most of human history, southern Africa was a sparsely populated, rugged area that was of interest to traders only as a stopping point for ships rounding the Cape of Good Hope on their voyages between Europe and Asia. However, the region acquired a new importance after gold and diamonds were discovered there in the late nineteenth century. Although there were enormous quantities of these commodities, they were buried deep in the ground, unlike the diamonds that had been found in India for millennia, which lie close to the surface, or the gold ore deposited in rivers and rock formations throughout the world. Obtaining these precious commodities would require innovative, enterprising, and efficient mining techniques. Of all the mining magnates in southern Africa, or Randlords, as they came to be called, Beit proved to be the most capable of devising new methods for extracting gold and diamonds.

First Ventures

Beit made his way to Kimberley, the center of diamond mining in Great Britain's Cape Colony. At this time, Kimberley was a wild town in which a large number of people had come to seek their fortunes. Beit was unprepossessing physically, with little social elegance. Nevertheless, he had two advantages over the other miners. Unlike many of the adventurers, he was studious and analytical. He had also been trained in the best diamond shops of Amsterdam. He realized that the diamonds from the Kimberley mines, which were held in low regard, were in fact high-quality gems, which were worth about



Miners at southern Africa's Kimberley diamond fields around the end of the nineteenth century. The discovery of diamonds and gold in the region resulted in massive profits for the Randlords. (The Granger Collection, New York)

ten times more money than diamond merchants had been receiving for them.

Beit borrowed £2,000 from his father and set up his own diamond firm, purchasing as much of the land around Kimberley as he could. As the diamond industry grew, he was able to rent his land at £1,800 a month, and he eventually sold his entire stake for £260,000. His firm set up several trading stations near the mines. He earned a reputation for trading diamonds fairly, quickly, and accurately. In the 1880's, he became associated with two other leading Randlords who were trading diamonds—Cecil Rhodes and Julius Charles Wernher. He and Wernher established the firm of Wernher, Beit. In addition, Beit helped Rhodes amalgamate the Kimberley mines into Rhodes's great diamond conglomerate, De Beers Consolidated Mines, Ltd., with Beit investing £250,000 in this new enterprise.

Gold was discovered in southern Africa in 1886, and Beit immediately turned his attention to this new commodity. Because this gold was buried deep in the ground, many people were skeptical about the long-term success of the area's gold mines. However, Beit saw opportunities where others saw obstacles. He realized that with new and improved engineering techniques, gold could be extracted at an increasingly reduced cost, leading to increasingly greater profits. He acquired several gold mines and brought in the best engineers from the British Empire to devise extraction methods. As a result, his firm pioneered new mining techniques and earned substantial profits. The engineering methods used in his mines were copied by other Randlords.

Mature Wealth

Beit showed excellent judgment in assessing the value of South Africa's diamonds and gold. However, his political instincts were often less astute. He became interested in the northern frontier that eventually became the colony of Rhodesia, and he was frustrated by the Boers, the perennial enemy of the British colonists in southern Africa. He supported the Jameson Raid (1895-1896), in which the British sought to overthrow the Boer Republics. For his part in the ill-conceived raid, Beit was censured by the House of Commons. Nevertheless, he heavily financed the British military force stationed in southern Africa. In 1902, a strengthened British military overcame fierce Boer resistance in the Second Boer War (1899-1902). Beit also supported the projected development of railway lines in South Africa and Rhodesia.

Beit never married. He moved into the seven-thousand-acre Tewin Water estate in Welwyn, England. His home there was a Regency-style mansion with Victorian additions. In 1895, he had a mansion built for him in Park Lane, London, by the architect Eustace Balfour. Beit filled his London mansion with his impressive collection of paintings by English, Dutch, and Spanish masters and with bronze statues from the Italian Renaissance. He endowed several professorships at Oxford University, and he made donations to the school's Bodleian Library. He also used his fortune to support artistic and civic causes.

Beit had always suffered from poor health, and in 1903 he had a stroke. He died on July 16, 1906. His estate was probated twelve days later and assessed at close to £8 million, which would be about $6 billion in 2010 U.S. currency. The bulk of his estate went to his brother, Otto Beit, but he also bequeathed about £2 million to charity. Additional benefactions included £130,000 to the Lon-

Randlords

For most of recorded history, southern Africa was little populated and little regarded. However, this part of the world began to attract attention in the nineteenth century with two discoveries: diamonds in 1866 and gold in 1886. Soon the mad rush was on for these commodities, resulting in a new class of incredibly wealthy magnates—the Randlords. Named for the Rand gold fields, this group of about fifty mining magnates is without parallel in history. During their heyday in the late nineteenth century, the Randlords became known for their rapid accumulation of wealth, their colorful exploits, and their domination of the fortunes of Great Britain's Cape Colony in what is now South Africa. The Randlords kept mansions in London and estates in the English countryside. They were the wealthiest subjects of the British Empire, both admired and hated, with their wealth and philanthropy earning them baronetcies from Great Britain. They competed with one another fiercely but also conspired in facing the formidable threats posed by the oppressed miners of African and mixed ancestry and the cantankerous Boer colonists.

Sir Joseph Robinson (1840-1929) is perhaps the first of the magnates properly called a Randlord. He owned shares in several of the earliest mines to be discovered, earning a great fortune from the West Rand mine. Alfred Beit (1853-1906) was perhaps the most farsighted of the Randlords in his development of South Africa's diamond and gold industries. Cecil Rhodes (1853-1902), Beit's friend and partner, also drew a great fortune from mining gold and diamonds. He established the De Beers Consolidated Mines, Ltd., in 1888, the most dominant diamond monopoly and conglomerate in history. Rhodes left much of his fortune to endow professorships and scholarships at Oxford University. Julius Charles Wernher (1850-1912), another partner of Beit, built his fortune largely on gold mining.

The colorful Barney Barnato (1851-1897) and his brother Harry (1850-1908) established Barnato Brothers, a company that made enormous profits by extracting diamonds from the Kimberley mines. Although Barney lost a good deal of his fortune in stock speculation, he still managed to leave more than £1 million upon his death; Harry left £5.8 million. Thomas Cullinan (1862-1936) controlled the Premier mine, which he bought in 1902 for £52,000. In 1905, the 3,106.75-carat Cullinan Diamond, the largest diamond ever found, was extracted from the Premier mine. This diamond was presented to King Edward VII as a gift, and it subsequently was incorporated into the British crown jewels. On February 26, 2010, a 507-carat diamond from the Cullinan mine was sold to the Chow Tai Fook Jewelry Company for $35.3 million, the largest amount ever paid for a rough diamond.

John Hays Hammond (1855-1936), an American, became the leading engineer of the Rand mines. When he returned to the United States, he was hired by Daniel Guggenheim, of the Guggenheim mining magnates, who through their Guggenex and ASARCO trusts controlled much of the world's mining and smelting operations. Hammond's total income was more than $1 million a year, propelling him into the ranks of the very wealthy.

Sir Ernest Oppenheimer (1880-1957) was the greatest mining magnate of the twentieth century. In 1917, he and American financier J. P. Morgan founded the Anglo American Corporation, a gold mining company which eventually became the majority stakeholder in De Beers.

don Imperial College of Technology, £200,000 for the general betterment of Rhodesia, £250,000 to construct a university and medical college in Johannesburg, and £20,000 each to King Edward VII Hospital and Guy's Hospital. He bequeathed his art collection to museums in London, Berlin, and Hamburg. His most important benefaction was £1.2 million to create the Beit Railway Trust in order to develop railway and telegraph operations in southern Africa. This trust would be administered by his brother Otto and other trustees. Beit's instructions for the Beit Railway Trust allowed for the future use of its funds for public charities and education.

Legacy

Beit was one of the leading Randlords, and the one with perhaps the most impressive history. His diamond-trading firm and engineering techniques enabled diamonds and gold to be efficiently extracted from South African mines. In a period when the miners were heartlessly exploited, Beit's operations were known for their humane treatment of these workers.

Beit also was one of the world's leading philanthropists. The Beit Railway Trust constructed most of the bridges that were built in central and southern Africa in the first half of the twentieth century. In 1932, the trust made a large grant in order to initiate civil aviation in South Africa. In 1954, the trust was reconstituted by an act of Parliament into an incorporated charity and renamed the Beit Trust. In the twenty-first century, the Beit Trust provided scholarships and grants in support of health, education, welfare, and environmental projects in Malawi, Zambia, and Zimbabwe.

Samuel Bellamy

British privateer

Bellamy was the captain of a band of pirates who plundered more than fifty ships in the early eighteenth century, amassing some of the great wealth then flowing through the Caribbean and along the Atlantic coast of British North America. He then lost all of his loot—and his life—in one terrible storm.

Born: baptized March 18, 1689; Hittisleigh, Devonshire, England
Died: April 26, 1717; off the coast of Wellfleet, Massachusetts
Also known as: Black Sam; Black Bellamy
Source of wealth: Privateering
Bequeathal of wealth: Dissipated

Early Life

After spending his childhood in the Devonshire countryside, Samuel Bellamy (BEHL-ah-mee) left the area to seek his fortune at sea. Not much is known for certain about where his early years as a sailor took him, though it is likely he spent some time in the Caribbean. In 1715, according to tradition, while working in the area of Cape Cod he fell in love with a local girl named Mary Hallett. To make a better life for her he determined to use his maritime skills to get a ship and seek out some of the recently wrecked Spanish galleons along the coast of Florida. He convinced Rhode Island native Paulsgrave Williams to join him and provide the capital needed for this project.

First Ventures

Although Bellamy and Williams did not secure any of the particular treasure that first drew them toward the Caribbean, they quickly discovered that they had the talent and strategy well suited to piracy. Beginning with two periaguas, or large canoes, they soon successfully stole the merchantman ship *St. Marie* from Captain Henry Jennings, and they then joined forces with a leading pirate in the area, Benjamin Hornisgold. Hornisgold, however, refused to rob British vessels, while Bellamy made no such distinction, making him popular with his men. On a democratic vote, Bellamy, at the age of twenty-seven, was elected leader of the gang of 170 pirates, and in one year he had already amassed booty worth thousands of British pounds.

Mature Wealth

A crowning achievement was Bellamy's capture and appropriation of the slave ship *Whydah*, which was well equipped with guns and with a three-hundred-ton hull then laden with ivory, indigo, spices, and other valuables, not to mention a separate stash of silver, gold, and gems valued between £20,000 and £30,000. Each member of the pirate crew who served with Bellamy, including the cabin boy and the pirates of African and Indian descent, was entitled to at least £100 of that loot, but the share for Bellamy was still considerable, and he proceeded to gather even more.

In the spring of 1717, Bellamy and Williams devised a plan to lead separate groups out of the Bahamas, pirating up the coast of North America, with Williams connecting in Rhode Island with friends and relatives to help market some of the plunder and Bellamy stopping by Cape Cod for provisions and most likely a visit to Hallett. Just off the coast of Cape Cod, very close to Bellamy's goal, the *Whydah,* holding accumulated wealth taken from fifty-three other vessels, got caught in a terrible and deadly night storm. Only two people aboard ship survived, and Bellamy went down with his vessel. It was the costliest pirate shipwreck ever recorded. One of the two survivors testified in court that among the many treasures lost that night were 180 bags of gold and silver, which the pirates had stored in chests kept between decks.

Legacy

New England diver Barry Clifford devoted his life to undersea probing for the *Whydah*, and in 1984 he found the first verifiable evidence and remains of the ship, thanks to modern techniques of underwater sand bed monitoring. In 1988, a Massachusetts court awarded him finder's rights. Subsequent excavation attempts into the twenty-first century have led to the establishment of the Whydah Museum in Provincetown, Massachusetts, where visitors can see what treasures have been recovered so far—some gold, silver, jewelry, and pieces of eight—and learn more about Bellamy and the life of eighteenth century pirates.

AUGUST BELMONT

American banker, horse breeder, and diplomat

Belmont was a leading figure in New York banking circles, wielding the considerable influence that his wealth conferred. Among the recipients of his beneficence were the Democratic Party, when it was long out of power, and the Union during the Civil War, when Belmont used his influence with powerful foreign banking interests to deny European funding to the Confederacy. He also became a noted sportsman who helped to modernize horse racing.

Born: December 8, 1816; Alzei, Rhenish Prussia (now in Germany)
Died: November 24, 1890; New York, New York
Also known as: August Schoenberg (birth name)
Sources of wealth: Banking; horse breeding
Bequeathal of wealth: Relatives

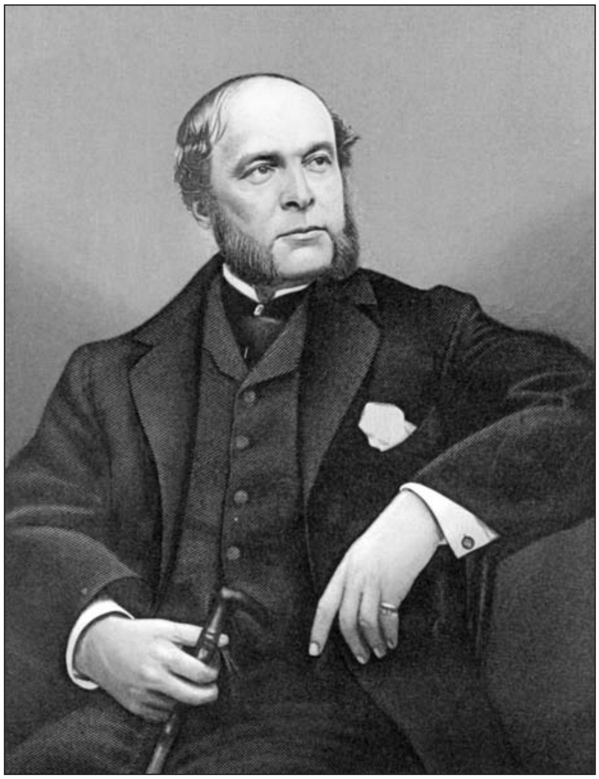
EARLY LIFE

August Belmont was born in 1816 in Alzei, a small city in the Rhenish Palatinate, to Simon and Frederika Elsaas Schoenberg. There is some difference of opinion as to when the original family name of Schoenberg received its literal translation into the French-sounding Belmont, but it is most probable that young August adopted the name when he began his American career. His father was a fairly successful Jewish landowner, so young August could reasonably expect to choose his own career and look forward to a life of relative comfort.

Ending his schooling at about the age of fourteen, he became a low-level employee at the Frankfurt offices of the great house of Rothschild, Europe's leading banking concern. According to some reports, his mother had secured the position for him through a family connection. Starting out, according to legend, as an unpaid floor sweeper, Belmont's intelligence and ambition soon became apparent, and while still a teenager he was rapidly promoted within the company. He was transferred to the Rothschild branch in Naples, Italy, where one of his tasks was negotiating contracts with representatives of the pope. During this time, he may have begun to develop the appreciation of art that in later life would bring him much renown as a collector.

FIRST VENTURES

It was a business trip to Havana, Cuba, for the Rothschilds in 1837 that gave Belmont the opportunity to branch out on his own. While still at sea he learned that the company that dealt with the Rothschild business interests in the United States had failed in the financial Panic of 1837. After completing his assignment in Havana, Belmont arrived in New York and established August Belmont and Company with little capital other than



August Belmont. (Archive Photos/Getty Images) his connection to the legendary house of Rothschild. He was barely twenty-one years old.

At its inception, Belmont's Wall Street firm dealt primarily in foreign currency exchange, a lucrative enterprise but not one that engendered huge profits. It was the company's later move into the more expansive banking business that enabled Belmont to earn a vast fortune. In his private life, Belmont seemed to exhibit the swashbuckling qualities that he perhaps lacked in his early business dealings. In 1841, for example, he engaged in a duel in Indiana over a female acquaintance, and he carried the scars of that incident for the rest of his life. He was also a gambler who would lose large sums in an evening, and it was not long before his reputation for high living became well known in New York society.

The Belmont Stakes

Following the Civil War, August Belmont became passionate about thoroughbred horse breeding and racing. He served as president of the American Jockey Club for about twenty years, even though Jews were barred from membership until many decades later. Belmont had a lavish Long Island estate, on which he housed several prize thoroughbreds. In the late 1880's, he moved his stables to Lexington, Kentucky, to take advantage of the more conducive climate and superior training facilities. His horses led the nation in earnings for the two years preceding his death, and one of his thoroughbreds may have been the first horse to be sold for $100,000 at auction.

Belmont went on to hold important positions in several racing clubs in New York and New Jersey, and the annual Belmont Stakes race was named for him. The inaugural Belmont Stakes took place in 1867 at Jerome Park, and the winner was a filly named Ruthless. With the Kentucky Derby and the Preakness Stakes, the Belmont Stakes eventually became part of the famed Triple Crown of horse racing. In the years since its inception, the race has been held at various racetracks in and around New York City, including Morris Park in the Bronx and Aqueduct in Queens.

In the early twentieth century, Belmont's son, August Belmont, Jr., and attorney William Collins Whitney built the Belmont Park racetrack in Nassau County, Long Island, New York. The track opened in 1905, and since then the Belmont Stakes has been held there each year in June, with the exception of a few years when it was staged at other race courses. Winners of the Belmont Stakes include champion thoroughbreds Man o' War (1920), Secretariat (1973), Whirlaway (1941), Seattle Slew (1977), and Citation (1948).

Since 1925, the course has been one-and-a-half miles in length, the longest of the three racetracks that are the sites of the Triple Crown. Until 1920, horse races at Belmont Park were run clockwise, as they are on English courses. The park can accommodate up to ninety thousand people, with seats available for thirty-three thousand; on occasion, more than eighty thousand people have attended races.

In 1955, the New York Racing Association purchased the track and renovated the course to make it more structurally sound. The rebuilt racetrack opened in 1968, after the facility had been closed for several years. In latter years, crowds generally thinned because of the popularity of off-track betting, which is legal in New York.

Belmont Park is open for racing from early May to the middle of July and in early September to late October. The course operates throughout the year as a training center for thoroughbreds.

Mature Wealth

Belmont became an American citizen and soon was a leading figure in the Democratic Party. In 1844, he was named the American consul general to the Austrian empire, a position he held until 1850, when he resigned to protest Austria's harsh treatment of those who sought Hungary's independence during the Hungarian Revolution of 1848. Belmont was a fun-loving man who possessed considerable personal charisma, and in 1849 he further solidified his place in society by marrying the well-connected Caroline Slidell Perry. She was the daughter of Matthew C. Perry, commodore of the U.S. Navy who within a few years was to help open Japan to foreign trade, and the niece of war hero Oliver Hazard Perry. Belmont and his wife built a large mansion on Manhattan's newly fashionable Fifth Avenue, and he further burnished his reputation as a bon vivant.

In 1853, President Franklin Pierce appointed Belmont to be the minister to the Netherlands, and Belmont lived in The Hague for four years. Although continuing to run his company, he seemed to be equally interested in his growing collection of paintings and his position within the Democratic Party leadership. Belmont became the party's national chairman and urged reconciliation with slaveholders before the onset of the Civil War. Although he did not support slavery, Belmont did not fight for its abolition. During the Civil War, despite his opposition to President Abraham Lincoln's policies, Belmont was convinced the Union would prevail and used his international connections to prevent European banking interests from financially supporting the Confederate government. He also provided funding to organize a German-American regiment from New York. In 1872, after twelve years, he stepped down from active leadership of the Democratic Party but continued his financial support of the organization.

Like many of his extremely wealthy Gilded Age contemporaries, Belmont enjoyed his place within society, but he was not considered to be among the notorious "robber barons," who appeared to value the accumulation of wealth above all else. Although apparently remaining nominally Jewish, Belmont was admitted to social and sporting venues ordinarily not open to those of his faith. He was, as a result, not well regarded by his fellow wealthy German Jews, perhaps because they believed he had somehow betrayed his religious heritage.

Belmont was proud of his American citizenship and was quoted as stating, "I prefer to leave to my children, instead of the gilded prospects of New York merchant princes, the more enviable title of American citizens." That said, he continued to spend prodigiously. His wine bills alone were said to exceed $20,000 in some months, an amount worth several hundred thousand dollars in twenty-first century money. He also continued to add to his fabled art collections, which were sold at auction after his death.

As Belmont aged his health began to deteriorate, and he suffered from what was then called dyspepsia, no doubt brought on by his high living. His private life had its share of tragedy. One of his daughters died young and a son committed suicide. It is ironic that his love of horses may have contributed to his own death. He caught cold, which turned into fatal pneumonia, while presiding at a New York horse show in late 1890. Upon his death, his son and namesake, August Belmont, Jr., assumed control of the banking empire and the family continued to exert a powerful presence through succeeding generations.

Legacy

August Belmont not only accrued great wealth but also was a respected diplomat and sportsman. He was highly regarded for his relative honesty in conducting business and for his principled political views. However, his profligate ways were a subject of criticism, and he is said to have been the prototype of the somewhat shady entrepreneur Julius Beaufort in Edith Wharton's Pulitzer Prize-winning classic novel *The Age of Innocence* (1920).

Belmont's loyalties lay with the Democrats, unlike many his fabulously wealthy contemporaries who were aligned with the Republican Party. His leadership and financial support undoubtedly strengthened the party during the long years of Republican ascendancy. Belmont did much to make horse racing a respectable activity in the United States, creating the Belmont Stakes, which is one of the most important events in the sport. His name was kept alive by the generations of distinguished August Belmonts who followed.

James Gordon Bennett, Jr.

American newspaper publisher

Bennett inherited his wealth and proprietorship of the New York Herald *from his father, James Gordon Bennett, Sr., but he became a leader in the journalism industry in his own right. His wealth benefited charity, and he also sponsored novel sporting events and world exploration.*

Born: May 10, 1841; New York, New York
Died: May 14, 1918; Beaulieu-sur-Mer, France
Sources of wealth: Inheritance; media; telegraph
Bequeathal of wealth: Relatives; charity

Early Life

James Gordon Bennett, Jr., was born in 1841 in New York City, the first of four children of James Gordon Bennett, Sr., and Henrietta Agnes Crean. Bennett spent much of his youth in France. After receiving his education from his mother and private tutors, Bennett attended École Polytechnique in Paris. He enjoyed playing polo and yachting, and in 1857 he joined the New York Yachting Club, eventually becoming its commodore. When he returned to New York on May 15, 1861, the nation was engaged in the Civil War. Bennett enlisted in the U.S. Revenue Marine, serving for a year as a third lieutenant on the *Henrietta*, a yacht donated by his father in support of the Union cause.

First Ventures

While still enjoying a lavish playboy lifestyle, Bennett interned with the *New York Herald*. He became the newspaper's managing editor in 1866, the same year he won the first transatlantic yacht race. In 1867, Bennett was made chief executive officer of the *Herald*, which had a daily circulation of ninety thousand and annual profits of $400,000. That same year, Bennett founded the New York *Evening Telegram*, a source of sensational news and a predecessor of tabloid journalism. Bennett had an aptitude for hiring exceptional writers and for making news, and he spared no expense in his quest for exclusive media coverage. He assigned reporter Henry Morton Stanley to cover several stories, including Stanley's discovery of David Livingstone, a physician and a missionary in Africa. Another of Bennett's reporters, Janurias MacGahan, covered the Franco-Prussian War, atrocities leading to the Russo-Turkish War, and attempts to find the Northwest Passage. Bennett's newspaper also provided extensive coverage of George A. Custer's massacre in 1876. In addition, Bennett helped finance expeditions to the Arctic and to the North Pole.

Mature Wealth

James Gordon Bennett, Sr., died in 1872, leaving proprietorship of the newspaper to his son. On January 1, 1877, Bennett committed a scandalous act that virtually barred him from high society and put him in an unfavorable limelight. He was engaged to marry Caroline May, and he urinated into the fireplace at her parent's home. The wedding was canceled, and soon thereafter, Frederick May, Caroline's brother, whipped Bennett and challenged him to a duel, in which neither man was injured. Bennett eventually moved to Paris, where he managed the *Herald* via cable.

Bennett was dissatisfied with the services provided by the existing telegraph cable monopoly, and he and businessman John William Mackay established the Commercial Cable Company. Their new firm effectively reduced the costs of sending international telegrams and ended single company domination. In 1887, Bennett launched a Paris edition of the *Herald*, which promoted good will between the United States and France but was not financially profitable. He similarly founded a London edition of the *Herald* in 1889, but it folded in 1891. By1899, Bennett foresaw the advantages of wireless communication and paid Guglielmo Marconi $5,000 to demonstrate his radiotelegraph system's live reporting of the America's Cup Races.

Absentee management; competition from other publishers, including Joseph Pulitzer of the *New York World* and Adolph Simon Ochs of *The New York Times*; and extravagant spending weakened the *Herald* during the 1900's. However, Bennett's newspaper continued to maintain a reputation for good reporting throughout World War I. On September 10, 1914, Bennett married a widow, Baroness de Reuter, whose father, Paul Reuter, founded Reuters news agency. On May 14, 1918, Bennett suffered a brain hemorrhage and died of heart disease in Beaulieu-sur-Mer, France.

Legacy

Covering breaking news, conducting worldwide interviews, and reporting shocking tales were Bennett's obsessions as a newspaper publisher, and he and the other publishers of his time changed the nature of American journalism. During his lifetime, he spent more than

$30 million financing research expeditions and sporting events and making charitable donations. Bennett bequeathed the majority of his estate to establish the James Gordon Bennett Memorial Home for journalists. However, there were not enough funds in his estate to fulfill all of the bequests specified in his will, and in 1918 his family sold both the *New York Herald* and the *Paris Herald*. Six years later, both newspapers were sold to the *New York Tribune*, and the two New York newspapers merged to become the *New York Herald Tribune*. The *Paris Herald* was renamed the *International Herald Tribune*, an English-language international newspaper which continues to be published in the twenty-first century under the ownership of The New York Times Company.

SILVIO BERLUSCONI

Italian entrepreneur and politician

First elected in 1994, Berlusconi has served several terms as prime minister of Italy. He used his wealth and position as a media tycoon to propel himself into political prominence as the head of a center-right coalition. He later became one of the most powerful individuals in Italy, despite several scandals.

Born: September 29, 1936; Milan, Italy
Sources of wealth: Media; real estate
Bequeathal of wealth: Unknown

EARLY LIFE

Silvio Berlusconi (SIHL-vee-oh behr-lew-SKOH-nee) grew up in Milan, Italy, in a middle-class family, the oldest of three children of Luigi Berlusconi, a banker, and Rosa Bossi. Berlusconi helped to put himself through college as a bass player in a band and a nightclub singer on Mediterranean cruise ships. He graduated in 1961 with a law degree from the University of Milan. In 1965, he married Carla Elvira Dall'Oglio, his first wife. The couple had two children.

FIRST VENTURES

Berlusconi initially made his fortune in real estate in the 1960's. He lacked experience in construction, but he always possessed a remarkable talent for sales. By the 1970's, Berlusconi moved into television. Italian television in this era generally featured cultural and public service programming. Berlusconi added American shows, such as *Dynasty* and *Wheel of Fortune*, while developing such uniquely Italian programs as the world's first nude game show.

By the 1990's, Berlusconi's Fininvest holdings company included the three Italian national television networks; Montadori, Italy's largest book and magazine publisher; the nation's largest film production company; the country's largest department store chain; the most successful soccer team, Milan AC; the Cinema 5 chain of theaters; a major insurance and mutual fund company; and a daily newspaper, *Il Giornale*. His television networks commanded about 45 percent of Italy's viewing audience and about 60 percent of television advertising revenue. The Italian left, concerned about Berlusconi's power, spoke of passing antitrust legislation to break up his empire. In defense, Berlusconi moved into politics.

MATURE WEALTH

On January 26, 1994, Berlusconi embarked on his political career by addressing the Italian people on all three of his national television networks. Shown in the study of his eighteenth century villa behind a commanding desk, Berlusconi gave the impression of already being head of Italy. Within two months, he had created a new political party, Forza Italia (Forward Italy). In May, 1994, Berlusconi took office as prime minister. At the end of 1994, however, Berlusconi stepped down when some members of his center-right coalition left the government amid allegations that he had authorized the payment of bribes while still a private citizen in order to advance his

Silvio Berlusconi. (Bongarts/Getty Images)

business interests. He remained a major political figure and returned to the prime minister's office in 2001; he assumed his third term in office on May 8, 2008.

Forbes magazine named Berlusconi one of the world's richest people in 2005. It is an accolade that he continued to hold in 2010, despite some personal difficulties. Berlusconi had three children with second wife Veronica Lario, whom he married in 1990 after divorcing Dall'Oglio in 1985. Lario filed for divorce in 2009 after charging Berlusconi with romancing eighteen-year-old Noemi Letizia. The episode became a major scandal in Italy, with Berlusconi claiming that his relationship with Letizia was merely paternal, though it did little to dent his enormous popularity among the Italians.

Legacy

Berlusconi has used his charisma and communications skills to create a culture built around the ideas of success, personal wealth, and material well-being. He is representative of changes in both Italy's economy and its culture. As Italy moved away from an industrial economy and began to enjoy a period of extraordinary prosperity, Berlusconi developed his fortune in television by emphasizing the values of affluence and materialism.

While Berlusconi remains alive, it is difficult to predict his legacy, but it is likely that he will be remembered for his optimism and sales ability. He is the most prominent Italian business leader of his generation. As a politician, he united Italy's conservative parties and formed an alliance with the center to push the left wing out of power. He dominated Italian politics at the end of the twentieth and the start of the twenty-first centuries.

Samuel Bernard

French banker and trader

Bernard's wealth enabled France to remain a strong military power and had a significant influence on the politics of Europe, as it financed Louis XIV's major wars. Bernard's life demonstrates how the bourgeoisie began its rise to political and economic power in France.

Born: October 29, 1651; Sancerre, France
Died: January 18, 1739; Paris, France
Also known as: Comte de Coubert
Sources of wealth: Banking; trade
Bequeathal of wealth: Children

Early Life

Samuel Bernard, comte de Coubert, was born in Sancerre, France, on October 29, 1651. He was the son of Jacques-Samuel Bernard, a successful painter. Although Bernard and his father were born in France, the Bernard family was of Dutch origin. The family professed the Protestant faith and was of the bourgeois class. The family initially lived in Sancerre, a Protestant stronghold, and then in Paris. Bernard would have received a standard bourgeois education enabling him to acquire a profession in business or trade.

First Ventures

Bernard began his professional career as a merchant of gold brocade and jewelry. However, he soon became involved in banking. At the time, many Protestants had fled predominantly Catholic France. Bernard received considerable assistance in starting his banking ventures from the Protestant refugees living abroad. In 1676, Bernard publicly renounced his Protestant faith in order to advance his career as a banker. However, it was always known that he maintained his Protestant beliefs, and he became known as the most successful of the Protestant bankers.

In 1685, King Louis XIV created the Compagnie de Guinée, a trading company engaged in the slave trade. Bernard was among the founding members chosen by Louis XIV. The company traded in gold and other merchandise, as well as slaves, and its business made a significant contribution to Bernard's wealth. From 1690 to 1691, his wealth was further increased by a policy of comte de Pontchatrain, France's minister of the marine, which permitted the sale of goods acquired through piracy.

Mature Wealth

By 1695, Bernard had gained a reputation as the wealthiest banker in Europe. While his wealth had continuously increased, the royal treasury of France had fallen into serious debt. Louis XIV needed funds to finance his military campaigns. Consequently, in 1697, Louis XIV, although not happy to turn to a Protestant banker, had his ministers obtain a loan of 11 million francs from Bernard to the royal treasury. In exchange, Bernard received a title of nobility. This ennoblement was granted on the condition that Bernard would not abandon his banking and commercial ventures so his money would always be available to the Crown.

In 1708, Louis XIV again found himself in need of money to finance his wars and turned again to the Protestant banker. This time, Louis's financial controller, Nicolas Desmarets, arranged a meeting of the king with Bernard at the gardens of Marly. Although Bernard was extremely wealthy and had been ennobled, the king felt it beneath his dignity to receive the banker in his palace. Bernard provided a loan of 19 million francs to fund the War of the Spanish Succession. When Louis XV succeeded his grandfather as king, Bernard continued to enjoy his favored position as royal financier. In 1719, Bernard purchased a château and lands in Seine-et-Marne, France. He rebuilt the château from 1724 to 1727 and built another mansion in Paris. Louis XV made Bernard the comte de Courbet in 1725 and five years later appointed him the counselor of state. In 1731, Bernard purchased additional land in Normandy.

At the time of his death on January 18, 1739, Bernard left an estate valued at 33 million francs. The title comte de Courbet was passed to his eldest son, Samuel-Jacques Bernard.

Legacy

As a banker and trader, Samuel Bernard played a significant role in creating the institution of banking. He made important contributions to the French economy by financing both business ventures and government policies, and he influenced the operations of the trading companies. Although born neither a noble nor a Catholic, two attributes of the ruling class in seventeenth and eighteenth century France, Bernard was a powerful figure in the political and economic life of France and its court. His financial success helped change the strict class structure of Old Regime France and laid part of the groundwork for a social system in which success in business and wealth would become equivalent to inherited nobility.

Bess of Hardwick

English aristocrat and landowner

The daughter of a gentleman farmer, Bess of Hardwick rose to become the second-wealthiest woman in England. She built two of the greatest houses in the country and became the forebear of several aristocratic families.

Born: c. 1527; Derbyshire, England
Died: February 13, 1608; Hardwick Hall, Derbyshire, England
Also known as: Elizabeth Hardwick (birth name); Elizabeth Cavendish; Elizabeth St. Loe; Elizabeth Barlow; Elizabeth Talbot; Elizabeth Shrewsbury
Sources of wealth: Marriage; real estate
Bequeathal of wealth: Children; relatives

Early Life

Elizabeth Talbot, Countess of Shewsbury, better known as Bess of Hardwick, was born Elizabeth Hardwick around 1527. The Hardwicks were gentlemen farmers, who at the time of Bess's birth farmed 450 acres in Derbyshire, rented another one hundred acres in Lincolnshire, and leased Hardwick Hall, a country house. Bess's father, John Hardwick, died while she was still a baby. When Bess was two, her mother married Ralph Leche, which made the family's financial situation more secure, although they were not wealthy. Bess received the typical home education of a sixteenth century girl, learning to read and write, figure, and run a household.

At about age twelve, Bess was sent to the Zouche family at Codnor Castle in Derbyshire in order to finish her education. In 1543, she married Robert Barlow (or Barley), a boy two years younger than she, who died shortly after, leaving Bess with only a widow's share of one-third of the Barlow estates, a relatively small amount that was tied up in litigation for several years.

First Ventures

After the death of Barlow, Bess entered the service of Lady Frances Grey, a distant relative and niece to King Henry VIII by his sister Princess Mary and Charles Brandon, duke of Suffolk. Here Bess began to move in the top tier of Tudor society, and it was probably at Grey's Bradgate estate that she developed the interest in decor and furnishings that later led her to build and decorate some of the greatest houses in England. During this time, Bess met Sir William Cavendish, treasurer of the king's chamber for King Edward VI, who was more than twice Bess's age when she married him on August 20, 1547.

Bess likely did not envision founding a dynasty when she married Cavendish, but he certainly represented financial security and social advancement, and their marriage seemed to be a happy one. Bess gained a title and was presented at court; she also learned to manage Cavendish's two houses and became stepmother to his three children. Bess quickly learned to supervise the household accounts, and Cavendish was probably responsible for teaching her the business sense that served her well throughout her life. The Cavendishes lived generously, gambling and entertaining as expected at court, but within their means, a prudent practice Bess continued throughout her life.

Mature Wealth

In December, 1550, the Cavendishes purchased Chatsworth, a fine estate with two manors and a number of houses and land in various towns, for the bargain price of £600, the first of many careful purchases of land in which Bess participated. Chatsworth became Bess's personal rebuilding and decorating project for the next decade.

Sir William Cavendish died on October 25, 1557, leaving Bess a widow for the second time. Bess had six children of her own by this time, and she was still responsible for Cavendish's two daughters. In 1559, Bess married again. Her third husband, Sir William St. Loe (variously spelled St. Lowe, Saintlowe, and Sentloe), was the captain of the guard and chief butler of England, serv-

Hardwick Hall

Hardwick Hall, located on a hill between Chesterfield and Mansfield in the Derbyshire countryside of England, was the birthplace of Elizabeth Talbot, Countess of Shrewsbury, more commonly known as Bess of Hardwick. Bess bought the house in 1583 after it had been held in chancery under the jurisdiction of the High Court of Justice since the death of her brother James Hardwick in 1581. She purchased not only the house but also its lands for £9,500, a significant sum at this time.

Beginning in 1588, Bess had the Old Hall renovated, raising the building to four stories and more than doubling its size. In 1590, Bess ordered foundations dug for a new house at Hardwick designed by Robert Smythson, an architect who also designed Wollaton Hall, Burghley House, and Burton Agnes Hall. Smythson's style was a distinctly English interpretation of Renaissance architecture, and he made extensive use of glass, particularly at Hardwick.

Bess was able to move into the Old Hall in 1592, from which she could see the new house being built with local timber, sandstone, and limestone. Other materials came from Bess's lands, with the lead for the roof and the plumbing coming from mines at Barlow, the iron from Wingfield, alabaster from Tutbury, and black marble from Ashford in the Water. When Bess's stepson Gilbert Talbot, with whom she was on poor terms, proved to be the primary local supplier of glass, she brought in other glaziers to make her own glass.

The new Hardwick Hall was completed in 1599, although Bess moved in on October 4, 1597. Although it was smaller than the Old Hall, with only forty-six rooms compared to the Old Hall's fifty-five, and was not as finely plastered and decorated inside, Hardwick Hall was state-of-the-art architecture for its time. Large windows enhanced the delicate, symmetrical design, giving rise to the old rhyme "Hardwick Hall,/ More glass than wall."

Bess decorated Hardwick Hall luxuriously, with an extensive collection of fine furnishings and embroideries, many of the latter made by her own hand. Hardwick Hall served as the secondary residence to the dukes of Devonshire, Bess's descendants, until 1956, when the structure was donated to Her Majesty's Treasury. In the twenty-first century, Hardwick Hall is a National Trust site administered by English Heritage. It is open to the public and displays many of the original furnishings, a spectacular and historically valuable collection of late sixteenth and early seventeenth century embroideries, tapestries, and furniture.

ing Queen Elizabeth I. St. Loe owned large estates in Gloucestershire and Somerset. Bess and St. Loe seem to have been in love, but St. Loe was also a practical choice for a woman seeking to secure a fortune for her descendants.

Bess's third marriage made her a wealthy woman. St. Loe died without a male heir in either 1564 or 1565, probably poisoned by his brother. He left his entire estate to Bess, to the displeasure of his brother and two adult daughters. As a lady of the bedchamber with the favor of the queen and a large annual income, Bess was an extremely eligible widow.

Her 1568 marriage to George Talbot, sixth earl of Shrewsbury, was preceded by a double marriage of four of their children: Mary Cavendish married Shrewsbury's eldest son, Gilbert, and Bess's heir Henry Cavendish married Lady Grace Talbot. The latter marriage would transfer ownership of Cavendish lands to the Shrewsbury family, and Shrewsbury's own marriage to Bess would give him control of both Cavendish and St. Loe lands during Bess's lifetime.

After three marriages, Bess was a careful woman. Before marrying Shrewsbury, she required a marriage jointure which stipulated that she would keep Chatsworth and some other properties during her lifetime and that the rents for the Shrewsbury manors of Handsworth, Bolsterstone, and Over Ewedon would be provided to her for life. As a result of her fourth marriage, Bess became one of the highest-ranking women at court in her position as the countess of Shrewsbury.

When Shrewsbury became the jailer of Mary, Queen of Scots, at the command of Queen Elizabeth I, he and Bess expected this to be a temporary duty that would gain them the favor of the queen. Instead, Mary's imprisonment was a fifteen-year burden on Shrewsbury that drained his coffers and strained his marriage with Bess. Bess preferred to spend time with her children and grandchildren rather than live in the uncomfortable conditions at Tutbury, where Mary was held prisoner. Bess also pursued her own financial ventures, in addition to encouraging Shrewsbury to purchase land and arranging advantageous marriages for their children.

Shortly after the birth of her first grandchild in 1571, Bess loaned her brother James Hardwick money to secure Hardwick Hall by obtaining a mortgage on the building. She leased James's coal and ore mines, from which she intended to profit after Shrewsbury's example, but it is unclear what she intended to do with Hardwick Hall. She was able to purchase the hall in 1583 after her brother's death two years earlier.

The Shrewsburys' marriage collapsed gradually but bitterly. It is possible that Shrewsbury suffered from dementia, but he may have become bitter and paranoid because of ill health and the trials of caring for Mary, Queen of Scots, for fifteen years. The separation of Shrewsbury and Bess was marked by constant legal wrangling and petitions to Queen Elizabeth I and her advisers. Bess was not allowed to live at Chatsworth, the home she had spent ten years rebuilding. However, the queen resolved a dispute about the money that Shrewsbury owed Bess by ruling in Bess's favor.

Shrewsbury died on November 18, 1590, and while his mistress stole many items of furnishing, plate, and other portable goods, Bess regained ownership of her lands. She still retained incomes from the Barlow, Cavendish, and St. Loe estates, as well as one-third of the income of the Shrewsbury estates, said to be £3,000 per year, a very large sum at this time. Among the properties she controlled were Bolsover Castle and its coal mines, as well as the lead mines, glassworks, and forge of Wingfield Manor. The Shrewsbury estate itself was drained of cash by Mary, Queen of Scots, and by the annual payments to Bess and Shrewsbury's children, so Bess was in a more stable financial situation than Shrewsbury's own heir, Gilbert Talbot.

As Chatsworth was owned by her eldest son, Henry Cavendish, who disappointed her, and Wingfield did not belong to her outright, Bess turned her attentions to Hardwick Hall, renovating the old building and commissioning a new hall. When Bess died on February 13, 1608, she had amassed a fortune worth thousands of pounds to bequeath to her children, a long way from the 40 marks of her original dowry.

Legacy

In life, Bess of Hardwick was the second-wealthiest and most powerful woman in England, after Queen Elizabeth I. In death, she founded an aristocratic dynasty. Of the six children Bess had with Sir William Cavendish who survived to adulthood, their second son, William, was the forebear of the dukes of Devonshire, and their third son, Charles, was the forefather of the dukes of Newcastle and of Portland. Through her daughter Frances, Bess was the forebear of the earls of Manvers and the dukes of Kingston and of Rutland; through her daughter Mary, Bess was the ancestor of the earls of Pembroke and of Kent and the dukes of Norfolk. Bess's Chatsworth manor became the seat of the dukes of Devonshire. In the twenty-first century, Hardwick Hall was considered to be one of the most important English country houses, an early example of the English interpretation of Renaissance architecture. A National Trust site, Hardwick Hall contains one of the largest collections of sixteenth and seventeenth century English embroideries and textiles, preserved for posterity by Bess's descendants.

Jeff Bezos

American entrepreneur, merchant, and computer scientist

After a brief but successful Wall Street career, Bezos followed his dream and founded Amazon.com. Guided by his vision and his commitment to customer service, Amazon became one of the most successful Internet retailers and made Bezos a billionaire before he was forty. He uses his wealth to promote learning by awarding scholarships via the Bezos Family Foundation.

Born: January 12, 1964; Albuquerque, New Mexico
Also known as: Jeffrey Preston Bezos
Sources of wealth: Computer industry; sale of products
Bequeathal of wealth: Spouse; children; scholarship

Early Life

Jeffrey Preston Bezos (JEHF-ree PRES-ton BAY-zohs) was born in Albuquerque, New Mexico. He was a gifted child and spent summers at his grandfather's ranch, where he herded cattle and repaired windmills. He tinkered with electronics and made a few small inventions when he was young. His father, Miguel, was an executive of the Exxon oil company, and Bezos had a privileged upbringing. He was an excellent student in high school and graduated as class valedictorian. He graduated summa cum laude from Princeton University, earning degrees in electrical engineering and computer science, and was a member of Phi Beta Kappa.

First Ventures

Bezos's first position out of college in 1986 was with a start-up company, Fitel. He left the company in 1988 to work at Bankers Trust, where he developed software for fund management. He honed his skills well enough that he became vice president before leaving in 1990 for D. E. Shaw & Company, a global investment and technology development firm. At Shaw, Bezos helped create a successful high-technology system for managing hedge funds. He eventually became the company's youngest senior vice president at the age of thirty. Bezos credits David Shaw, the company's founder, as an inspiration to him and acknowledges Shaw's influence in helping him become a good manager. Bezos left the company in 1994 to start his own business.

Bezos had been researching the burgeoning Internet and was amazed to discover that it was growing at a rate of more than 2,000 percent per year. He did his research and decided that the market for books would be one of the easiest to enter and would benefit the most from the technology of the Internet; the massive number of titles available could not be contained in a traditional brick-and-mortar bookstore. He also discovered that even the largest bookstore controlled only 12 percent of the market, so there seemed to be enough room for another big company, which is what he was planning on starting. He chose his location in Seattle, Washington, since it had a wealth of technically skilled people and was also located near a major book warehouse. He decided on the name Amazon for his company; the world's longest river by volume reflected the concept behind his business.

Jeff Bezos unveils Amazon.com's Kindle electronic book reader. (AFP/Getty Images)

Mature Wealth

Bezos hired four employees and opened his business in the garage of his house. His employees wrote the software for the company and Amazon.com sold its first book in July, 1995. He wanted to create a company that people thought of first when they needed to make a purchase. Although Bezos initially started with books, he wanted Amazon to become a retailer that could provide almost anything. Bezos built his company around two main principles: get big fast and end-to-end customer service. He initially sought to cater to customers by providing access to more titles than any other bookseller. When Amazon launched, its initial offering was more than 1 million titles; even the largest competitor could provide only 300,000 titles because of warehousing constraints. Bezos expanded the company's merchandise to more than three million titles by 1998. He also provided features on the Amazon.com Web site and services, such as e-mails when a customer's favorite author released a new book and online book reviews. He discounted books by10 to 30 percent off their normal purchase price. Amazon.com soon began to sell music compact discs and films in order to better serve its customers. Bezos even had a corporate policy enabling employees to implement features that would benefit the company without having to consult their bosses, known as the "Just Do It" program.

Bezos's eye toward customer service paid off and Amazon.com flourished. Within six weeks of the sale of its first book, Bezos moved himself and his employees into a two-thousand-square-foot space. Within six months, he had to move to a seventeen-thousand-square-foot building. In 1997, there were 614 people on Amazon's payroll, and Amazon.com was receiving 50,000 hits per day. Sales were a big part of what drove the growth. In 1995, annual sales were a little more than $500,000; 1996 sales figures hit nearly $16 million; and sales figures for 1997 climbed to $147 million. Bezos stuck to his "get big fast" philosophy, fueling Amazon's growth by reinvesting much of the money earned back into the company. At one point, Amazon's growth was 3,000 percent per year.

Amazon went public in 1997, with each share initially priced at $18. This price jumped to nearly $100 per share by the end of the following year. All seemed to be going well, but there were some trials that Amazon had to pass. The debt that Amazon had incurred was costing the company $125 million in interest each year. Even though the company had holdings estimated at around $8 billion by the end of 1999, Amazon had yet to turn a profit. The burst of the dot-com bubble saw Amazon's stock drop from its high of $92 per share to less than $15 per share in 2001. Wall Street did not have confidence in either the company or Bezos's business plan, which did not explain how Amazon was going to make a profit from marginal sales transactions. The company had also lost $90 million on roughly $1 billion in sales that year.

Another major bookseller, Barnes & Noble, had entered the online sales arena, and it was forecasted that Amazon would be unable to compete. Bezos stuck to his plan, however, claiming that Barnes & Noble would

The Bezos Family Foundation

Miguel and Jacklyn Bezos originally invested $300,000 in order to help their son, Jeff Bezos, start Amazon.com, and as a result they became wealthy. They had always seen the value of a good education. Jeff Bezos himself was an excellent student and was featured in the 1977 book *Turning on Bright Minds: A Parent Looks at Gifted Education*. Jeff continued to perform well in college, graduating with honors from Princeton University.

Bezos's parents established the Bezos Family Foundation to further the cause of education. The foundation is private and independent. Miguel and Jacklyn Bezos, along with their children and the children's spouses, serve as directors. According to its mission statement, the foundation strives to strengthen educational opportunities for everyone, regardless of economic circumstances, and to cultivate learning as a lifelong process that begins in early childhood.

The foundation created the prestigious Bezos Scholars Program in 2005. The program is hosted at the Aspen Institute and brings together twelve of the country's top public high school juniors at the Aspen Ideas Festival. Twelve educators are also invited to the program. All expenses are paid through a scholarship. The students meet world leaders, thinkers, and artists; past speakers have included President Bill Clinton, Senator Arlen Specter, and Secretary of State Colin Powell. The program is designed to foster leadership skills and to teach those who attend to pass along what they have learned.

In 2008, the Bezos Family Foundation Endowed Chair for Early Childhood Learning was established in order to support research and teaching in the critical area of early childhood education. The organization also aims to disseminate its research to a broad audience of educators, parents, caregivers, and the community at large so that the findings can be used to promote excellence in education.

not focus on logistics and customer service as his company did. Most of Amazon's customers stayed true to the company, with an estimated 70 percent of the firm's revenues being generated from return business.

Amazon implemented free shipping on orders of more than $25 as another customer service measure, and in 2003 the company saw its first profitable year. Bezos partly attributes this profit to the decision to implement free shipping. Amazon.com had forty-three million customers by the end of 2004. That year, a market researcher conducted a survey on customer satisfaction at the top twenty e-commerce sites and Amazon placed first. Amazon grew by acquiring other companies, such as the Internet Movie Database and Back to Basics, a toy retailer. It also forged relationships with other companies in order to expand its merchandise. For example, the company created relationships with retailers Toys R' Us and Circuit City in order to provide a wider selection of toys and electronics.

Through all of this, Bezos has profited well. His net worth was estimated at $12.3 billion in 2010 by *Forbes* magazine, placing him at twenty-eighth on the magazine's list of the United States' four hundred wealthiest citizens.

Legacy

Bezos has blazed a trail for online businesses and proved that an e-commerce company can be both profitable and sustainable. Amazon.com. remains one of the largest-volume e-commerce sites. Bezos identifies customer satisfaction as one of the most important features of his company, and Amazon has grown because of his philosophy. Traditional bookstores have had to adapt and learn from Bezos's strategies in order to compete against the business that he originally launched out of his garage. Amazon's sales continue to grow, while his rivals struggle to compete.

In 2000, Bezos started another company called Blue Origin, hinting that it was developing technologies that could be used in space. Recognizing the importance of education, he also established the Bezos Family Foundation, which sponsors a scholars program for high school students.

Andries Bicker

Dutch banker, merchant, and politician/statesman

Bicker was a member of a prominent family in Amsterdam, rising quickly through the city's political ranks and serving a number of terms as its mayor. Besides wielding political power, he added to his family's considerable wealth as a banker, landowner, merchant, and administrator of the Dutch East India Company.

Born: 1586; Amsterdam, Dutch Republic (now in the Netherlands)
Died: June 24, 1652; Amsterdam, Dutch Republic
Sources of wealth: Inheritance; trade; banking; real estate
Bequeathal of wealth: Unknown

Early Life

Andries Bicker (AHN-drees BIH-ker) was the son of Gerrit Bicker and Alyd Boelens. Christened on September 14, 1586, he grew up in one of the most powerful and distinguished families of Amsterdam. His grandfather Peter was a prominent grain merchant and brewer, and his father, besides carrying on these trades, held the position of town councillor and became a founding director of the Dutch East India Company (Vereenigde Oost-Indische Compagnie, or VOC). Andries's uncle Laurens Bicker was one of the first Dutch traders in West Africa, while his brothers Cornelis, Jacob, and Jan also became active traders in various parts of the world. He married Catharina Gansneb von Tengnagel, the daughter of another influential family, on February 22, 1615.

First Ventures

Bicker's adult years were characterized by steadily growing power and influence in a number of spheres of Amsterdam life. By 1614, he had become a city commissioner, dealing with such matters as small business and marriage contracts. In 1616, he entered the *vroedschap* (city council) of Amsterdam, and in 1622 he was chosen for the higher position of *schepen* (alderman) in the council, a position to which he was returned in 1623 and 1625. In 1624, Bicker served as a commissioner of the Amsterdamsche Wisselbank (Exchange Bank or Bank of Amsterdam), and he held a similar position with the Banken van Leening (Banks of Loans), the first of which had been established in Amsterdam in 1614.

Mature Wealth

It is virtually impossible to separate the story of Bicker's life from that of the Bicker family or from the tumultuous history of the city of Amsterdam and the country of which it was the most important component. Five years before Bicker's birth, the northern provinces of what had been known as the Low Countries had declared their independence from Spain as the Republic of the Seven United Netherlands, or Dutch Republic. The ensuing conflict, which pitted the Protestant Dutch against Catholic Spain, continued intermittently until 1648, when Spain recognized the republic's independence in the Peace of Munster. During the same period, the new country built a large merchant fleet and acquired a vast colonial empire, creating a golden age of prosperity and culture. It was against this backdrop that Bicker accumulated wealth, power, and prestige.

In 1627, after rising through the governing ranks of Amsterdam, Bicker began serving the first of what would eventually be nine terms as *burgomaster* (mayor) of Amsterdam. He was then only forty. He also served on the Board of Admiralty of Amsterdam from 1637 to 1639, and again from 1650 to 1652. He was a member of the Estates of Holland (the *staten*, or parliament of the province in which Amsterdam is located) from 1643 through 1645, and of the Estates-General (Staten-Generaal) of the Netherlands from 1646 through 1648. Besides these governmental positions, Bicker was a colonel in Amsterdam's *schutterij* (town guard) and a leader of the Arminians, or Remonstrants, a religious group criticized by other Protestant denominations as being too closely aligned with the state.

The four Bicker brothers so dominated the international trade of their day that they were commonly said to have divided the world among them. Andries Bicker himself dealt in the fur trade with the Grand Duchy of Moscow and in the spice trade with southern Asia. His father had been one of the VOC's founders in 1602, and his younger brother Jacob had become a director in 1610. Thanks to the manner in which representation on the governing board was allotted, Amsterdam was virtually guaranteed control of the large trading company, and when Jacob withdrew from its administration in 1641, it was only natural that Bicker himself become a director. It was a position he held until his death.

In 1646, Bicker and six other members of the extended Bicker family held positions in the government of Amsterdam, leading to the recognition of a seemingly all-powerful "Bicker League" that ran the city's affairs and determined its direction. The most famous Dutch

THE DUTCH EAST INDIA COMPANY

The Dutch East India Company (Vereenigde Oost-Indische Compagnie, or VOC) was established in 1602 by a number of Dutch traders, including Andries Bicker's father, Gerrit Bicker, as a joint-stock company holding a monopoly over Dutch trade with Asia. In addition, it undertook military operations to oust other European merchants and to dominate intraregional trade. Empowered to act as the legal representative of the Dutch Republic, it also came to exercise a significant degree of overall political control over most of the East Indies (Indonesian Archipelago) on behalf of the republic, and even minted its own coinage.

The Portuguese had been the first Europeans to reach India and the East Indies by sea, and they dominated the enormously profitable spice trade during the sixteenth century. However, they proved unequal to the naval might and commercial vitality of the Dutch. The VOC established its first trading post in the region at Banten on the island of Java in 1603. A fort and settlement at Batavia (now Jakarta, Indonesia) on the same island subsequently became the headquarters of the company's regional operations. In 1641, the year in which Andries Bicker became a director, the VOC drove the Portuguese from Malacca on the Malay Peninsula, and during the remainder of the century the Portuguese were almost entirely ousted from the region. The VOC set up other trading posts in Persia, India, Ceylon, China, and Japan, although it eventually abandoned these posts, along with those in Malaya.

The VOC was administered from the Dutch Republic by a board of delegates known as the Heeren XVII, or Seventeen Gentlemen. Eight of these delegates—a near majority—represented Amsterdam, while the remaining nine were drawn from five other Dutch ports. Potential shareholders could buy stock in the company, and, should they wish, sell the stock on the Amsterdam Stock Exchange, which had been established for that express purpose. Economic historians date the creation of the modern stock exchange, in which participants share profits and losses, to this arrangement, and many have viewed the VOC as the first modern corporation.

The VOC was the largest trading company in the world for the first century of its existence and returned large profits to its shareholders. However, in the early eighteenth century it went into a slow but eventually fatal decline—a condition due in large part to its failure to develop new crops and its increasingly corrupt and inefficient administration. The kingdom of the Netherlands took over its responsibilities in 1796, administering its remaining territories as the colony of the Dutch East Indies.

poet of the time, Joost van den Vondel, celebrated the family and its patriarch by writing:

> As far and wide as Bicker's flag o'ershadowed the vast ocean
> And plied those waters with his mighty vessels richly laden
> To tow the golden harvest of the world to Holland's
> bosom . . .

Bicker's prominence, his reputation for moderation, and his interest in ending conflicts that hindered trade led to several diplomatic ventures. He was involved in negotiating the 1635 Treaty of Stuhmsdorf, which established peace between Sweden and the Polish-Lithuanian Commonwealth. He also worked to establish a new series of trade agreements among the Baltic nations, and in 1643 he helped broker peace between Sweden and Denmark-Norway with the Second Treaty of Brömsebro.

Along with the other members of his family, Bicker was anxious to bring the Dutch conflict with Spain to a conclusion, and at one point he went so far as to finance, have built, and even pay for provisioning a naval fleet for Spain. When criticized for his seemingly unpatriotic actions, Bicker pointed out that if he had not done so, someone else would have provided the money and he would have lost the profit.

Bicker's overriding loyalty to his family and his city eventually brought him into open conflict with William II, prince of Orange, the *stadtholder* (governor) of several of the Dutch provinces, who hoped to strengthen the central government and his own position in wider European affairs at the expense of the provinces. Although the *schutterij* prevented William's troops from entering Amsterdam, fear of loss of trade led the city to sue for peace. Under the terms of the resulting treaty, Bicker and his brother Cornelis were removed from the *vroedschap*, and although they resumed some positions with the death of William in November, 1650, Bicker himself was by that time in failing health. He died on June 24, 1652.

LEGACY

During his life Bicker undertook a number of roles—political, commercial, social, military, and religious—likely to contribute to the survival and growth of his family's fortune. Thus during the 1640's, when the "Bicker League" was at its most influential and the VOC was expanding the vast territory in which it operated, he was arguably one of the wealthiest and most powerful men in the world.

Bicker and his wife had a number of children, and, as was customary at the time, Bicker strove to ensure that his offspring contracted strategic alliances of marriage, either with other branches of the Bicker family or with other, equally wealthy families. In one case he actually exercised his lawful power by refusing to allow his son Gerard to marry Alida Koninks because of her inferior fortune and status; the couple did not marry until several years after the patriarch's death.

Mohammed bin Laden

Saudi Arabian construction magnate and investor

Mohammed bin Laden became a billionaire during the construction boom that resulted from the swift rise in Saudi Arabian oil wealth during the mid-twentieth century. One of his many sons, Osama Bin Laden, became notorious as a leader of al-Qaeda, the Islamic extremist group that was responsible for the September 11, 2001, attacks on the World Trade Center and the Pentagon.

Born: 1908; Rubat, Hadhramaut, Yemen
Died: September 3, 1967; ʾUsrān, Saudi Arabia
Also known as: Moḥammed bin ʿAwaḍ bin Lāden
Sources of wealth: Construction business; investments
Bequeathal of wealth: Relatives

Early Life

Moḥammed bin ʿAwaḍ bin Lāden, also known as Mohammed bin Laden (moh-HAH-mehd bihn LAH-dehn), was born into a poor family in the Hadhramaut region along the coast of Yemen around 1908. The exact date of his birth is not known because celebration of birthdays was not a custom at the time and there was no central government to record births. He was the son of ʿAwaḍ bin Lāden and the eldest of his parents' three sons and three daughters. His father died when bin Laden was young, probably before he reached adolescence. Bin Laden needed to provide income for his family, but the Hadhramaut area offered few opportunities for employment. Bin Laden sailed to Africa probably shortly after 1920, taking a job as a store sweeper in Ethiopia. While there, he lost his right eye; according to differing accounts, he lost his eye either in an accident or when an older man threw a ring of keys at his face. Whatever the cause, bin Laden had a glass eye for the rest of his life.

Bin Laden returned home, but he later followed many other Yemeni youths who emigrated to Saudi Arabia. Around 1925, he traveled to the Red Sea port of Jidda, the gateway to the Islamic holy city of Mecca. Here he initially earned a living as a dockworker and a porter, carrying the bags of affluent pilgrims to Mecca. Initially, bin

The Saudi Binladin Group

Mohammed bin Laden, the patriarch of the bin Laden family, in 1931 founded the construction firm that would later be known as the Saudi Binladin (or Binladen) Group. Throughout the years, the company has built numerous buildings in Saudi Arabia, as well as in other Middle Eastern countries, generating billions of dollars for the firm and the bin Laden family.

After he assumed the throne in 1964, King Faisal of Saudi Arabia gave the bin Laden company a monopoly on national construction, a decision that increased the firm's assets to more than $5 billion (about $20 billion in 2010 dollars). Eventually, the bin Ladens held exclusive contracts for all mosque construction and restoration in Saudi Arabia, as well as in several other Islamic nations. This included a contract to restore the Al-Aqsa Mosque, among the most sacred Islamic sites in Jerusalem's Old City.

The bin Ladens also received contracts to build some of Saudi Arabia's major highways. Before the bin Laden company constructed these roads, many of the connections between Saudi cities had amounted to little more than footpaths. In addition, the firm obtained contracts in the $1 to $2 billion range for military bases, as well as a $1 billion contract for a royal palace in Mecca. Holy venues in Mecca, the world center of Islam, were renovated by the company for more than $4 billion.

Following Mohammed bin Laden's death in 1967, his eldest sons, headed by Salem bin Laden, renamed the company Binladen Brothers for Contracting and Industry. At its height, this company employed as many as forty thousand people in thirty-six countries. Like his father, Salem bin Laden died in an aircraft accident, when the private plane in which he was riding became ensnared in power lines near San Antonio, Texas, in 1988.

After 1990, the company became known as the Saudi Binladin Group, with that name registered by another of Mohammed's sons, Bakr bin Laden. The company maintains extensive interests in engineering, manufacturing, construction, and telecommunications, as well as in real estate development and urban planning. In the twenty-first century, the firm has constructed airports, apartment blocks, bridges, and tunnels, as well as highways.

The Saudi Binladin Group works throughout the Islamic world and is Egypt's largest foreign company. It received some funding from the United States, as well as other countries, in order to rebuild parts of central Beirut that had been ruined in Lebanon's civil war. The company maintains offices in London and Geneva, Switzerland, as well as throughout the Middle East in such major cities Cairo, Beirut, Amman, and Dubai. The firm also has developed business relationships with major multinational corporations, including Unilever, General Electric, Citicorp, and HSBC Bank. By 2009, the company's gross revenues exceeded $5 billion per year. According to some reports, the Binladin Group also owns major equity stakes in Microsoft Corporation, Boeing, and other major American companies.

Laden and his younger brother Abdullah slept in a ditch they had dug in the sand. Later, when he was a rich man, bin Laden hung the scarred leather bag he had used to haul pilgrims' personal effects in his office.

Bin Laden was about five feet eight inches tall, and he was known for his skill at organizing other people's work in a practical and efficient manner. He was a spirited practical joker and an avid dancer of traditional steps, some of which he performed while shooting pistols into the air. He was especially good at cultivating and retaining important friends long before he gained access to the inner circles of the Saudi royal family.

First Ventures

Within a few years, bin Laden no longer was a porter and had became known around Jidda for doing small-scale construction work, such as fixing arches and renovating the facades of old buildings. With the arrival of the Great Depression in the early 1930's, the economy of Jidda collapsed as the pilgrim trade declined. Bin Laden found himself on the road looking for work. He entered the oil business by taking a job as a bricklayer with the oil firm Aramco in Dhahran, Saudi Arabia. The oil revenue that was pouring into the coffers of the Saudi royal family soon would make bin Laden wealthy, as some of that income would finance his construction projects.

After holding several menial jobs, bin Laden shortly after 1930 made the acquaintance of Ibn Saʿūd, who would eventually become the first king of the modern Saudi state. The relationship between the two men enabled bin Laden to become wealthy by constructing buildings for the king. As the "royal builder," a status established by a royal edict in 1950, bin Laden and his family reputedly became the richest nonroyal family in Saudi Arabia. Bin Laden initially built homes for the royal family, learning about construction while on the job, and eventually took on larger projects.

Bin Laden accumulated his fortune through his acute business sense and his ability to cultivate royal contacts, offering the monarchy quality work at a relatively low price. He initially became wealthy by constructing and restoring mosques in Saudi Arabia under contract to the royal family. In 1955, bin Laden's status was solidified when a royal decree named him a minister of state in Saudi Arabia. Bin Laden also became a legend in his hometown in Yemen, where he was an inspiration to the many thousands of Yemenis who had migrated to Saudi Arabia for employment.

Mature Wealth

After performing construction work on King Ibn Saʿūd's palace, bin Laden's firm was contracted to renovate buildings in the city of Mecca. His company built religious structures in other cities as the Saudi oil boom provided revenue for such work after World War II. The bin Ladens became confidants of the royal family, a relationship that involved a high degree of trust, shared secrets, and friendship. The relationship continued after bin Laden's death, with his children establishing ties with the children of the royal family. The elder bin Laden sons often attended the same schools as the children of the king, including the elite Victoria College in Alexandria, Egypt, and the children traveled in the same social circles. Victoria College was widely attended by students from elite families in the Arab nations, as well as by families of other notable people, such as the actor Omar Sharif. The bin Ladens were as close to Saudi royalty as anyone without shared blood.

In 1964, bin Laden's confidant Faisal became king of Saudi Arabia, and this further enhanced bin Laden's wealth by providing him with contracts for more massive construction projects. The kingdom had been mismanaged under King Saud, the son of King Ibn Saʿūd, and Saudi Arabia had a brush with insolvency despite its rising oil wealth. Bin Laden offered his business acumen, and a sizable sum of money, to improve the nation's economy.

After he amassed wealth in construction, bin Laden invested in oil and other ventures. He was killed when his company aircraft crashed near ʾUsrān, Saudi Arabia, on September 3, 1967.

Legacy

Mohammed bin Laden lived simply even after he acquired wealth, and he continued to be a devout Muslim. Moreover, he demanded the same of his children, traits that the world would come to know in Osama, his most militant son. Because Mohammed died before the evolution of the more militant interpretations of Islam, it is hard to know if he would have approved of Osama's jihad, which included the killing of almost three thousand people on September 11, 2001.

Mohammed bin Laden's fortune was passed on to his many sons, and his family continued operating his construction business. He was married twenty-two times and had at least fifty-four children. However, he retained a maximum of four wives at once, as allowed by Islamic law, divorcing former wives as he acquired new ones. A family history written by Carmen bin Laden indicates that Mohammed was flying to the site of his twenty-third wedding the day he was killed in the airplane crash. The direct descendants of Mohammed bin Laden probably number more than six hundred people. Osama Bin Laden was Mohammed's seventeenth child, born in 1957, and his only son with his tenth wife, the Syrian woman Hamida al-Attas.

Ties between the royal family and the bin Ladens occasionally have been tested as the result of radical Islamic activity. In the seizure of the Grand Mosque in Mecca, radicals used bin Laden construction trucks to smuggle weapons into the holy city. In 1990, the bin Laden family disowned Osama. Saudi Arabia later revoked Osama's passport and stripped him of citizenship because he had criticized the state for allowing United States troops onto Saudi soil following the 1991 Gulf War. Osama also is subject to an arrest warrant issued by the Saudi government on May 16, 1993.

Ghanshyam Das Birla

Indian industrialist, entrepreneur, politician/statesman, and philanthropist

Birla was one of the most influential businessmen of twentieth century India. He built his family's business into one of India's major manufacturing conglomerates, and he was intimately associated with the nationalist cause. Publisher, industrialist, educator, philanthropist, and an associate of Mahatma Gandhi, his unique contributions to the development of modern India made him a household name.

Born: April, 1894; Pilani, Rajasthan, India
Died: June 11, 1983; London, England
Also known as: Shri Ghanshyam Das Birla; G. D. Birla
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Children; educational institution

Early Life

Shri Ghanshyam Das "G. D." Birla (shree gahn-SHEHM dahs BIHR-la) was born in 1894 in Palani, Rajasthan, India, one of three sons of Baldev Das Birla (1863-1956), a wealthy Marwari trading caste member from Calcutta and the son of Shiv Naraayana Birla (1838-1910), a moneylender who founded the family business. Ghanshyam was tutored in Hindi and arithmetic and learned the Vaishnav religion from his family. As was the custom, at age eleven he married Durga Somani, who died in 1909 following the birth of their first son, Lakshmi Niwas "L. N." Birla (1909-1994).

As a teenager, Birla worked for his father, a Mumbai cotton dealer. There he learned accounting and English, a language not typically studied by Marwaris at this time. In 1910, Birla left for Kolkata to establish his own jute brokerage, under the tutelage of his father-in-law Mahadev Somani. He was betrothed to Mahadevi Kharva (d.1926), with whom he had three sons, Krishna Kumar, Basant Kumar, and Ganga Prasad. His first enterprise, G. M. Birla and Company, was registered in 1911.

First Ventures

Despite British dominance of cotton and jute mills and discriminatory practices, which included forbidding Indians the use of elevators in British factories, the Marwaris had established inroads into jute and cotton dealerships by the early twentieth century. Jute prices rose considerably during World War I. Birla became wealthy and established an export office in London. After the war he established a new company, Birla Brothers, which would become one of the most well-known Indian-owned companies of the colonial era, and he purchased a cotton mill. He overcame attempts by British producers to stymie his launch of a jute mill, a struggle that began to shape his nationalist politics, and he survived the difficult period of the 1920's rupee devaluation. By his thirtieth birthday, Birla had established successful cotton mills and trading companies, and he had become skilled at training fellow Marwaris as managers rather than relying on Europeans, thereby facilitating Marwari dominance of India's postindependence business community. He assisted in the formation of the nationalist Indian Chamber of Commerce and, soon thereafter, the influential Federation of Chambers of Commerce of India in 1927. He was a sponsor of the Free Press of India, the first national press agency, and briefly ran for local elected office. Birla's reputation as a successful entrepreneur and an important person within the Marwari community emboldened his interest in the nationalist cause.

Mature Wealth

In the early 1930's, Birla expanded into sugar and paper mills, complementing the family's smaller publishing, soap, insurance, and chemical businesses. The companies survived the Great Depression by aggressively competing with the weakening European oligopolies. In the 1930's, Birla became explicitly involved in the nationalist cause, primarily as a major contributor to the Indian

National Congress and as an associate of Mahatma Gandhi, a leader of the Indian independence movement who had met Birla in 1916. Birla accompanied Gandhi to the Round Table Conference in London in 1931 and 1932, where representatives of Great Britain and India discussed the future constitution of India. Birla and Gandhi grew close. Gandhi encouraged Birla and his peers to act as strong supporters of independence, and he supported the industrialists' viewpoint that economic development free from colonial dependence and control was a solution to India's poverty. Birla famously declined to accept a British knighthood, and in this era he established his role as a key link between the Indian worlds of business and politics, going on to become an influential adviser to many policy makers. He was also a generous provider of resources to the independence movement, a fact that irritated the British and caused concern among his brothers.

Birla became friends with many Indian National Congress leaders, including Vallabhbhai Jhaverbhai Patel (1875-1950). As an industrialist, Birla counseled compromise between the Indian National Congress and the British and cooperation between labor and capital. He opposed the socialist leanings of some in the Indian anticolonial movement, and he later had cool relations with the left-leaning Prime Minister Jawaharlal Nehru (1889-1964). Birla believed that the acquisition of knowledge was essential in building a modern India. Toward this end he became a lifelong supporter and advocate of educational institutions.

Birla's industries expanded during and after World War II, supplying essential manufactured goods as the country reached independence and the economy expanded. Prices of jute and other staples again spiked during the war, earning Birla the resources to expand in the postwar period. Transportation, industrial supplies, and agricultural goods dominated the companies' activities. While some of their growth came from the acquisition of European companies, the companies expanded in other ways. In 1942, Birla founded Hindustan Motors of Kolkata, and the company's Ambassador model, based on a British car design, dominated Indian roads for many years in the taxi service and government transport. The car company enjoyed a dominant market position until it began competing with other automakers in the 1980's. Another Birla firm of this era, the Textile Machinery Corporation (TEXMACO), profited from the dearth of equipment imported from England during the war. In short, with the decline of British influence in the Indian economy, Birla's enterprises reached a new level of dynamism.

After Indian independence and the partition of Pakistan from India, Birla's business empire grew to include

The Birla Institute of Technology and Science

Ghanshyam Das Birla's contributions to the field of education stemmed from his perception that his own lack of formal schooling affected his life and from his intense desire to see India build a modern industrial capacity. He saw education as foundational, and he set up hundreds of rural schools. He brought the educator Maria Montessori to his home in Pilani in the 1940's so she could promote the benefits of public schools. A Montessori society was established in Pilani, and the Birla Public School was founded as a Montessori school in 1944.

Birla viewed the lack of an Indian-educated, professional sector as a particular disadvantage to the country's industrial and social development. In 1929, he established a high school in his hometown of Pilani, where he later founded a college focusing on science, business, and pharmacy studies. The college added programs in engineering and electronics in the 1940's and 1950's. Originally registered as a "society" under state registration guidelines, the school was granted university status by the government in 1964, and the various programs were joined into the Birla Institute of Technology and Science, commonly known as BITS. Birla was the institute's chairman.

In the 1960's, BITS became a premier engineering and business school. It received support from the Ford Foundation and entered into an alliance with the Massachusetts Institute of Technology, which transformed BITS into a university similar to those in the United States. The institute was the first in India to build a department of space engineering and rocketry; it also established the Small Industries Entrepreneurs' Park in order to promote effective practices and to aid in funding for business start-ups. The Birla Institute of Management Technology was founded in 1988. Under the chancellorship of Birla's son, Krishna Kumar Birla, institute campuses were established in Goa and Hyderabad, and in 1990 a branch opened in Dubai. Several internationally recognized research centers also were opened, including facilities focusing on robotics, software, and women's studies.

BITS is known for requiring its students to work on real-world projects, and it is prized for its extensive connections with industry. It has remained a privately funded school, renowned for its academic rigor, and it consistently ranks among the top universities in India.

tea, textiles, plastics, and the country's largest cement producer, and he eventually led one of India's largest industrial conglomerates. However, tragedy struck in 1947, when Gandhi was assassinated while visiting the Birla home in Delhi, abruptly ending the men's thirty-two-year friendship. Birla's nationalist credentials and his relationships with Patel and Nehru enabled the industrialist to mold commercial growth to India's development policies. One exception was Birla's desire to found a steel enterprise, which was frustrated in the 1950's by the government's decision to focus on publicly owned steel capacity. By the end of the 1950's, Birla controlled more than 150 companies. His wealth and commercial dominance upset many competitors and those on the Indian left, who accused him of monopolistic practices. That such growth occurred even though Birla's attempts to persuade Nehru to pursue economic liberalization failed is an indication of Birla's resourcefulness.

During the administration of Prime Minister Indira Gandhi, however, Birla's political connections decreased, and he faced increasing pressure from left-wing politicians to share his wealth and his industrial licensing privileges, which accounted for 20 percent of government licenses from 1957 to 1966. By the end of his career, Birla controlled two hundred companies, divided into autonomous entities and managed by family members and allies. Products included railway and other industrial equipment, aluminum (Hindalco), textiles, and agricultural goods, and the group owned foreign enterprises in Africa and Southeast Asia. By the time of his death in 1983, Birla's conglomerate was surpassed in size in India only by the Tata Group of industries. The Birla group's inheritors, in particular the Aditya Birla Group, which was run by Birla's grandson Aditya Birla (1944-1995), ensured that Birla's industrial heritage continued to thrive.

Legacy

Birla combined his skills as an industrialist with the political dream of an independent India. He saw no distinction between his nationalism and his desire for his country to realize its industrial prowess. Through two world wars, an epic anticolonial battle, and struggles over India's economic liberalization, his life is a window into twentieth century India. He established many of India's modern industries, and he was instrumental in initiating its independence in technology and engineering education. His contributions to the transformation of India from a largely rural society, dominated by a strong colonial power, to a society of technology, industry, and education were seminal. His personal generosity, charitable nature, and meager lifestyle have rightly inspired numerous educational awards that bear his name.

JOHN INSLEY BLAIR

American railroad executive

Blair earned a fortune as president of sixteen railroads and board member of at least as many others. He used his vast resources to support causes dear to his heart, particularly the Presbyterian Church and various educational institutions, including the Blair Presbyterian Academy.

Born: August 22, 1802; Warren County, New Jersey
Died: December 2, 1899; Blairstown, New Jersey
Also known as: Plain John I
Source of wealth: Railroads
Bequeathal of wealth: Relatives; charity; educational institution; church

EARLY LIFE

John Insley Blair was the fourth of eleven children born to Scottish immigrants John and Rachel Insley Blair. Blair was a direct descendant of the patriot John Blair, Jr., who in 1720 came to New Jersey from Scotland and was one of the signers of the Declaration of Independence. The Blair family was close-knit, and Blair pursued many of his early business endeavors with a brother or other relative.

Blair's formal schooling was intermittent and ended at age eleven, when he reportedly told his mother, "I have seven brothers and three sisters. That's enough in the family to be educated. I am going to get rich." After that prophetic pronouncement, he went to work in a cousin's store to learn the retail trade. He proved to be a quick study and when the cousin left, Blair became the sole proprietor. In September, 1826, he married Nancy Ann Locke, with whom he had four children, Emma, Marcus, De Witt, and Aurelia.

FIRST VENTURES

Blair opened a general store in Butts Bridge, New Jersey, the community that in 1839 was renamed Blairstown in his honor. At age twenty-eight, he turned this first store into a chain of five. Along with his other business interests, he served as the town's postmaster for twenty-six years. His other business interests included, but were not limited to, wholesaling, flour mills, cotton mills, banking, and mining of both coal and iron. In some of these enterprises, he worked in partnership with one or more of his brothers or brothers-in-law.

Blair correctly guessed that the railroad would hold the key to America's dominance as an industrial nation during the nineteenth century. He also figured that the towns served by railroads would be the ones to prosper. A staunch Republican from the party's birth in 1854, he was a delegate at every nominating convention for the remainder of his life, and he felt especially honored to have participated in the nomination of Abraham Lincoln for president in 1860.

MATURE WEALTH

It was in the growing railroad industry that Blair found his true calling, and he made a name for himself among the other railroad industry giants of the times, including Jay Gould, James J. Hill, George Mortimer Pullman, and Edward H. Harriman, to name just a few. His first foray into the business was with the organization of the Delaware, Lackawanna & Western Railroad (DL&W) in 1852. He became president and remained a board member and major stockholder of the DL&W for the rest of his life. He served as president of other railroad companies, including the Sioux City and Pacific, Cayuga and Susquehanna, Chicago and Northwestern, Liggett's Gap, Sussex Valley, and Warren rail lines. In all, he became president of sixteen railroad companies, and he sat on the board of directors of at least that many more.

Blair recognized the railroads' opportunities resulting from the rapid expansion of the American West. His railroads, including his Sioux City branch of the Union Pacific Railroad, set the pace of this growth. With Congressman Oakes Ames, Blair won the charter for the United Pacific, and he personally oversaw the laying of the first one hundred miles of its track. Ames, as president of the Crédit Mobilier of America, a railroad construction company, was later charged, along with thirteen other members of Congress, with graft, corruption, and fraud. Blair was innocent of any wrongdoing. His sterling reputation for honesty and his strong code of personal ethics kept him from being damaged in the resulting scandal.

Towns sprouted up as soon as railroad tracks were laid. Blair laid out at least eighty new towns along these far-reaching tracks. His responsibilities required frequent travel, and when he was not conducting business from his home in New Jersey, he worked out of the office in his private railcar, an indulgence that was actually a necessity. He is believed to have owned more miles of rail than any other individual owner.

For Blair, retirement was not an option, and he continued working at a pace that men half his age would have had difficulty matching. He never slowed down until he reached age eighty-five, when he decided to reduce his frequent travel from forty thousand to twenty thousand miles per year, though he still started work before daylight and put in a full day. His phenomenal drive stemmed from his genuine love of business in general and the railroad business in particular.

While most of his vast fortune came from his railroad lines, he also founded the Belvidere National Bank in Belvidere, New Jersey, and he continued to own stock in various mining companies. He ran for governor of New Jersey in 1868, but he lost the race to the Democratic candidate, the incumbent Theodore Randolph. He died at age ninety-seven in the house where he had lived most of his life, and in the town where he was widely respected and known as "Plain John I." Despite his great wealth, he lived simply and remained an unpretentious man. He found it ironic that someone with almost no education had been selected to serve as a trustee on Princeton University's board of directors.

Blair was a lifelong member of the Presbyterian Church, and he supported it with the same generosity he had shown various schools, including his beloved Blair Presbyterian Academy. At the time of his death in 1899, Blair's wealth was reported at more than $70 million.

Legacy

A devout Presbyterian, Blair founded more than one hundred churches. Not coincidentally, they were all located in the Western towns in which he had laid out his railroads. His greatest legacy is the Blair Academy, initially called the Blair Presbyterian Academy. For fifty years, he was the school's principal benefactor. His gifts of land and cash funded the school's growth, making the academy the respected institution it remained into the twenty-first century.

Blair also gave generously to colleges, including Princeton University, Grinnell College, and Lafayette College. Princeton's Blair Hall was named for him, and

The Blair Academy

The Blair Presbyterian Academy was founded in 1848 by railroad magnate John Insley Blair, with help from the Presbyterian Church and some residents of Blairstown, New Jersey. Blair, a lifelong Presbyterian, understood the importance of education, even though he had personally eschewed it in favor of going out into the world to work. He wanted to ensure that the children of local farmers and townspeople would receive an education. Blair hoped his private preparatory school would provide instruction based upon the values of the Christian faith and that this schooling would prepare students to be future community leaders.

In 1860, Blair selected outstanding students for what he called Blair Academy's Secret Society, or the Elite 1848, with 1848 apparently referring to the year the school was established. Among other pursuits, the society actively assisted the Underground Railroad and worked to hold the Union together during the Civil War.

The school initially was open to both girls and boys, but it limited admissions to boys in 1915, eventually reinstating a coeducational admissions policy in 1970. By the twenty-first century, girls accounted for about half of its enrollment. The school, now known as the Blair Academy, expanded over the years until its campus contained forty-two buildings on 425 acres. Classes are provided for ninth- through twelfth-grade students who are either day or boarding students. Virtually all of Blair's graduates go on to college.

While academics take precedence over athletics, the school competes successfully in the Mid-Atlantic Prep League, and in 2010 three former students were playing in the National Basketball Association: Charlie Villanueva of the Detroit Pistons, Royal Ivey of the Philadelphia 76ers, and Luol Deng of the Chicago Bulls. Other alumni have held prominent places in government, business, literature, and the arts, including John Sebastian, the lead singer and guitarist for the Lovin' Spoonful band.

Blair Academy has, on average, an enrollment of 450 students. The school boasts of its faculty-student ratio of one teacher for seven students, with average class size limited to ten students. Among the special programs offered are honors courses, independent study, spring break community service trips, and study abroad. Upper grades adhere to a dress code, and attendance at religious services is required. Students and faculty are equally responsible for maintaining discipline. Financial aid to students in need exceeds $3 million annually.

Over the years, the academy has become more diverse, with students from nearly every state, as well as from twenty-three countries. It maintains the Judeo-Christian values of its founder and is still strongly tied to the Presbyterian Church, specifically the presbytery of Newton, New Jersey. Although its character has changed over the years, one thing has remained constant: an ongoing reputation for academic excellence. In 1992, the National Register of Historic Places officially recognized the historical and architectural significance of the campus's original buildings, which are designed in the Romanesque style.

he served on the university's board of directors. Having voluntarily ended his own schooling at age eleven, he felt intuitively that the days of self-made men would soon be a thing of the past, and success in the future would be unattainable without the foundation of a solid education.

After his death, his son De Witt Clinton Blair took over his father's business and philanthropic interests and continued supporting the causes Blair held dear, including making generous contributions to Blair Academy, funding new buildings as the school continued to grow in size and in reputation.

Michael Bloomberg

American politician and media executive

Bloomberg parlayed a $10 million severance payment from Salomon Brothers investment bank into a multibillion-dollar fortune in less than two decades. As founder of Innovative Market Systems, he developed a method of installing messaging terminals in businesses that became the standard in the United States. He used the enormous profits from his business to become a noted philanthropist, and he was elected the mayor of New York City in 2001.

Born: February 14, 1942; Boston, Massachusetts
Also known as: Michael Rubens Bloomberg
Sources of wealth: Sale of products; media
Bequeathal of wealth: Charity

Early Life

Michael Rubens Bloomberg was born on February 14, 1942, at St. Elizabeth's Hospital in Boston, Massachusetts, the older of two children born to William Henry Bloomberg and Charlotte Rubens Bloomberg. His parents were the children of Russian Jewish immigrants. In 2009, his mother was more than one hundred years old and reportedly still in good health. Bloomberg and his family lived in the middle-class Boston neighborhood of Medford, where he finished high school in 1960. Bloomberg was an above-average student, receiving high marks.

After graduation, Bloomberg enrolled in Johns Hopkins University, from which he graduated in 1964 with a B.S. degree in electrical engineering. He then enrolled in the Harvard Business School, from which he graduated two years later with an M.B.A. degree. After graduating from Harvard, Bloomberg took a position with Salomon Brothers, a Wall Street investment bank, where he eventually rose to the position of head of equity trading and then of systems development. After a merger in 1981, Bloomberg was dismissed from Salomon Brothers and opened his own company. In 1975, he married Susan Brown Bloomberg. The couple had two daughters, Emma, born in 1979, and Georgina, born in 1983, before they divorced in 1993.

First Ventures

Bloomberg received a very generous severance package of $10 million from Salomon Brothers, which he used to found his own company, Innovative Market Systems, in 1981.The company installed messaging terminals that supplied businesses with the latest news, real-time financial data, and stock quotes. The giant Merrill Lynch investment bank (now Bank of America Merrill Lynch) was Bloomberg's first customer. Merrill Lynch installed twenty-two terminals in its offices and ultimately invested $30 million in Bloomberg's enterprise. Bloomberg renamed his company Bloomberg L.P. in 1986, and by the next year the firm had installed more than five thousand of these "Bloomberg terminals." As these terminals proliferated, Bloomberg expanded into radio and other media. He founded a cable television network in 1994, went online with Bloomberg.com in 1995, and established the Bloomberg Press publishing company in 1996.

Michael Bloomberg. (Getty Images)

He became a billionaire by 2000, by which time his name was synonymous with business information systems. In 2010, *Forbes* magazine listed him as number twenty-three on its list of world billionaires, with his net worth estimated at $18 billion.

Mature Wealth

Bloomberg eventually turned his attention from business to philanthropy and politics. In 2001, he gave up his position as chief executive officer of Bloomberg L.P. to run for mayor of New York City, seeking to replace incumbent Rudy Giuliani, who was ineligible for a third consecutive term. In order to run, Bloomberg, who had been a Democrat all his life, switched parties and became a Republican.

Bloomberg chose not to accept public campaign funds, and reportedly dedicated more than $73 million of his own money on the race, outspending his Democratic opponent by more than five to one. He urged voters to elect him by insisting that New York City's economy was suffering from the September 11, 2001, attacks on the World Trade Center and needed a mayor who had business experience. He represented himself as being in favor of abortion rights, the legalization of same-sex marriage, stricter gun control laws, and citizenship rights for undocumented aliens, and many saw his positions as a betrayal of Republican principles. Bloomberg won the election by a narrow margin despite what some critics called his "fuzziness" on several key issues. The election was the first time in the history of the city that two Republicans were elected mayor consecutively.

At Bloomberg's urging, New York City was the site of the 2004 Republican National Convention, where he soundly endorsed incumbent George W. Bush for a second term as president. Bloomberg was reelected mayor in 2005 by a 20 percent margin, the largest ever for a Republican mayor of New York City. By some estimates, he spent more than $74 million on his campaign. In 2007, amid further criticism that he was ignoring Republican values, Bloomberg formally left the Republican Party and declared himself an Independent.

During his first term as mayor, Bloomberg concentrated primarily on reforming public education. His statistically oriented, results-based approach has drawn considerable criticism from the teachers' union and praise from the public. He supported an increase in teachers' salaries, including incentives for superior teaching. He opposed social promotion, while supporting after-school programs to help disadvantaged students. During his second term, Bloomberg concentrated on addressing the issues associated with poverty. He also made the human immunodeficiency virus (HIV), diabetes, and hypertension his top public health priorities. He extended a smoking ban to all commercial establishments in New York City and banned restaurants from serving foods with trans fats. He started a $7.5 billion affordable housing plan to aid half a million people who were living in or near poverty. He was also responsible for initiating Opportunity NYC, a program aimed at helping poor New York citizens break the poverty cycle.

Bloomberg also became deeply involved in environmental issues throughout his tenure as mayor. He is convinced that global warming is a reality and that large cities must address the problem of climate change if catastrophe is to be averted. In 2007, he initiated a plan, PlaNYC: A Greener, Greater New York, which calls for the reduction of carbon dioxide emissions through the use of cleaner, more efficient fuels and encourages greater use of public transportation. He hopes his plan will help prepare New York City for a projected population increase of more than one million people by 2030. Bloomberg accomplished all of these reforms while balancing New York City's budget, turning a $6 billion deficit into a $3 billion surplus. His critics point out that in order to accomplish this turnaround, Bloomberg cut public services and increased property taxes.

In 2008, Bloomberg reversed his longtime support for term limits, persuading the city council to change municipal law and enable him to seek a third term as mayor. This move angered many New Yorkers, some of whom voted for his opponent, William Thompson, Jr., in the 2009 mayoral election. This resentment was cited as one reason that Bloomberg won the race by a closer-than-expected margin. Bloomberg, the richest man in New York City, spent $102 million on his reelection, at that time the most expensive self-financed campaign in American history.

Supporters mounted a concerted effort to draft Bloomberg for a presidential run in 2008. Bloomberg seemed interested in running as an Independent candidate but ultimately decided against an attempt. He did not, however, rule out a run in 2012. His blend of fiscal conservatism, social liberalism, and business acumen would seem to make him a desirable candidate for many moderates in the United States.

In addition to his political activities, Bloomberg has been heavily involved in philanthropy since acquiring great wealth. In 2008, he and Bill Gates, cofounder of Microsoft Corporation, gave $500 million to help Third World countries control tobacco use, especially among minors. Bloomberg donated $300 million to his alma mater, Johns Hopkins University, where he chaired the board of trustees from 1996 to 2002. Some estimates put the total amount of money given or pledged by Bloomberg since 2001 at more than $1 billion.

The Johns Hopkins University Bloomberg School for Public Health

John D. Rockefeller and William Howard Welch founded the Johns Hopkins School of Hygiene and Public Health in 1916, and over the years it became the model for schools of public health throughout the world. On April 20, 2001, university trustees renamed the school the Johns Hopkins University Bloomberg School for Public Health in honor of a $300 million gift provided by businessman Michael Bloomberg, who would later become mayor of New York City.

The institution is the largest school of public health in the world, employing 530 full-time and 620 part-time faculty and providing instruction to 2,030 students from eighty-four countries. The school boasts more than fifty research centers and institutes and ranks first in federal research support from the National Institutes of Health. In 2007, it placed first in *U.S. News and World Report*'s rankings of schools of public health.

Located across from the Johns Hopkins Hospital in East Baltimore, Maryland, the school offers master's degrees in public health, health science, health administration, and science, as well as three doctoral degrees. It also provides postdoctoral training and residency programs in preventive medicine and occupational medicine. The institution publishes *The Johns Hopkins Public Health Magazine; Journal of Health Care for the Poor and Underserved*; *Epidemiologic Review;* and *Progress in Community Health Partnerships: Research, Education, and Action*. The *American Journal of Epidemiology* is published by Oxford University Press on the school's behalf. Among the school's more notable alumni are Virginia Apgar, one of the pioneers in the field of neonatology; former Surgeon Generals Leroy Edgar Burney and Antonia Coello Novello; Donald A. Henderson, who was instrumental in the eradication of smallpox; Bernard Roizman, a virologist who is considered the world's leading expert on the herpes simplex virus; and Alfred Sommer, a professor emeritus at the school who has conducted research on the causes, consequences, and control of vitamin A deficiency.

Legacy

Bloomberg's legacy is already well established. Between 2004 and 2007, he pledged more than $600 million to charity. He has been especially active in supporting efforts to combat tobacco use among adolescents worldwide. He has donated tens of millions of dollars to New York City recipients ranging from arts organizations to support efforts for people and families dealing with cancer. He has also endowed a professorship at Harvard University and supported Jewish religious organizations.

In addition to his philanthropic activities, Bloomberg's legacy includes his public service. As mayor of New York City, he has been a leading advocate of educational reform and improving the quality of life for all New Yorkers through crime prevention and public transportation improvements. He has received numerous awards for both public service and philanthropy.

Sultan Hassanal Bolkiah

Bruneian ruler

Sultan Hassanal Bolkiah of Brunei is one of the richest rulers in the world primarily because of his nation's vast oil and natural gas reserves. The sultan and his family are known for building the world's largest palace, enjoying a lavish lifestyle, and providing the citizens of Brunei with generous benefits and tax credits.

Born: July 15, 1946; Brunei Town (now Bandar Seri Begawan), Brunei
Also known as: Haji Hassanal Bolkiah Muʿizzaddin Waddaulah; Sultan and Yang Di-Pertuan of Brunei Darussalam
Sources of wealth: Inheritance; oil; real estate
Bequeathal of wealth: Children

Early Life

Haji Hassanal Bolkiah Muʿizzaddin Waddaulah, better known as Sultan Hassanal Bolkiah (sool-TAHN HAH-sah-nahl bowl-KEE-eh), the twenty-ninth sultan of Brunei, was the eldest son of the late Sultan Omar Ali Saifuddien III and Raja Isteri Pengiran Anak Damit. Little information is available about Bolkiah's early years. The majority of his education was private and was obtained in Brunei, although he attended high school at Victoria Institution in Kuala Lumpur, Malaysia, where he joined the Cadet Corps. He later enrolled at the United Kingdom's elite Royal Military Academy Sandhurst, graduating in 1967. Since becoming sultan of Brunei, Bolkiah has been awarded honorary degrees from universities in Russia, Indonesia, the United Kingdom, Thai-

Istana Nurul Iman

Istana Nurul Iman, Palace of the Light of Faith, is the world's largest palace. It is the official residence of Sultan Hassanal Bolkiah, the ruler of Brunei, and is located on the Brunei River south of the nation's capital, Bandar Seri Begawan. Philippine architect Leandro V. Locsin designed the structure and it was built by a Philippine company, Ayala International. Construction began in 1984 at an estimated cost of $1.4 billion.

Istana Nural Iman contains 788 rooms, 257 bathrooms, 5 swimming pools, an air-conditioned stable for 200 polo ponies, a 110-car garage, a banquet hall that accommodates 4,000 guests, and mosques for 1,500 worshipers. The residence also features 564 chandeliers, 44 stairwells, and 18 elevators. The exterior is decorated with Islamic and Malay motifs of pointed arches, latticework, arabesque and pierced screens, and intricate geometric designs, and the building is topped by twenty-two-carat golden domes and vaulted roofs. Stylized flower motifs are visible in the handwoven carpets throughout the palace and in the glass mosaics. The interior of the building was constructed from native hardwoods, Moroccan red onyx, and an estimated sixteen acres of marble. Istana Nurul Iman's waterfront location gives the palace the appearance of literally floating along the horizon.

In addition to being the residence for the royal family, Istana Nurul Iman is the seat of Brunei's government, housing the prime minister's office, a throne room large enough for two thousand occupants, and rooms for state functions and official audiences with Sultan Bolkiah. The structure measures almost 2.2 million square feet, making it the largest palace in the world, bigger than the Royal Palace in Madrid (almost 1.5 million square feet), Great Britain's Buckingham Palace (828,818 square feet), and France's Palace of Versailles (551,218 square feet). Istana Nurul Iman Palace is closed to the public, except for the annual Islamic celebration of Hari Raya Idulfitri (the festival at the end of the Muslim fasting month), when approximately 110,000 visitors are invited during a three-day period.

land, and Singapore. His father, Sultan Omar, bestowed the title of crown prince on Bolkiah in 1961. Sultan Omar abdicated in 1967, elevating Bolkiah to the position of sultan. By 2009, Bolkiah, who had been married three times, had two wives and was the father of twelve children.

First Ventures

Brunei's economic wealth is based on its extensive reserves of oil and natural gas. The country's royal family has ruled for more than five hundred years, providing national stability. From 1888 to 1984, Brunei was a British protectorate, and the sultanate was allowed to manage the nation's economic resources for domestic consumption. The Brunei constitution of 1959 gave the sultan full executive authority to run the country. Brunei was placed under martial law in 1962, the same year the nation's legislative council was dissolved. Bolkiah reconstituted the legislative council in 2004. Two years later, he changed Brunei's constitution to make him legally infallible. The sultan also holds the government positions of prime minister, minister of defense, and minister of finance.

Brunei's population numbers approximately 225,000 residents. Using some of his nation's oil and natural gas profits, which amount to billions of dollars each year, Bolkiah initiated projects aimed at improving the quality of Bruneians' lives. Education is free from preschool through college, and citizens receive free medical care. Home and auto loan interest rates are considered modest, there is no income tax, and generous pensions are provided. In 2008, the International Monetary Fund ranked Bruneians as having incomes averaging $50,117 annually—the fifth highest income in the world, behind Qatar, Luxembourg, Norway, and Singapore. Oil and natural gas reserves are expected to continue to bring wealth to Brunei well into the twenty-first century. In 1983, the sultan established the Brunei Investment Agency, which invests in foreign oil and natural gas reserves and has holdings in corporations, real estate, and currencies.

Mature Wealth

In the early twenty-first century, Brunei was the fourth largest oil producer in Southeast Asia and the ninth largest exporter of natural gas in the world. Brunei Shell Petroleum, co-owned by the nation of Brunei and Royal Dutch Shell Corporation, is the country's major oil and natural gas production company. A division of this corporation liquefies the majority of the nation's natural gas and sells it to Japan. About 67 percent of Brunei's crude oil is consumed by Australia, Indonesia, and Korea, and Japan and China are also major purchasers. Mitsubishi, Royal Dutch Shell, and the Brunei government collectively invest in a number of international projects with natural gas revenue.

There is no clearly defined distinction between Brunei's revenues and those appropriated by the sultan and the royal family. The sultan has been annually listed by *Forbes* magazine as one of the richest men in the world. The sultanate's revenues permitted construction of the world's largest palace in Brunei's capital city, Bandar Seri Begawan. Bolkiah's wealth also enabled him to purchase the Dorchester Hotel in London and shopping centers and hotels in Singapore. He expanded the runway at Brunei International Airport, making it the longest runway in the world. In 1996, the Dorchester and a group of other luxury hotels, including properties in Beverly Hills, California, Paris, and Milan, Italy, became part of the newly created Dorchester Collection. Bolkiah's other business enterprises include the Nudhar Corporation, which owns an 18 percent stake in Patersons Securities, and the Bahagia Investment Corporation, a Malaysian company that invests in real estate.

In 2002, the Brunei government began developing the nation as an international financial center with an emphasis on Islamic banking. The country is also promoting ecotourism, building a cyberpark that will be used to develop an information technology industry, and is assisting small and medium-sized businesses. These enterprises aim to diversify Brunei's economy and make it less dependent on fluctuating oil and natural gas prices and on the nation's diminishing oil and gas reserves.

Legacy

Much publicity about Bolkiah centers on speculation about his personal wealth and the purchases made by him and other members of the royal family. In 2007, *Forbes* ranked the sultan of Brunei as the world's richest man, with his wealth estimated at $22 billion, and the sultan spends his wealth extravagantly. Photographs of the royal family display members wearing expensive jewelry and carrying symbols of office covered in gold and precious stones.

The sultan is reputed to have amassed one of the largest automobile collections in the world, with between three and six thousand cars worth more than $4 billion. The collection focuses on the purchase of unique and unusual concept cars. *Guinness World Records* estimated that Bolkiah owns five hundred Rolls-Royces, including the last Rolls-Royce Phantom VI, made in 1992. The British newspaper *Daily Mirror* reported in 2007 that the sultan owned 551 Mercedes-Benzes, 367 Ferraris, 362 Bentleys, 185 BMWs, 177 Jaguars, 160 Porsches, 130 Rolls-Royces, and 20 Lamborghinis.

The sultan's private plane, a Boeing 747-400, cost an estimated $233 million, including $3 million in gold-plated furniture. Bolkiah also owns more than two hundred polo ponies transported on Royal Brunei Airlines, the national carrier that he created. In 1997, he purchased a red diamond weighing less than one carat for more than $800,000.

In the first decade of the twenty-first century, however, his wealth was believed to be compromised by his younger brother Prince Jefri Bolkiah, who used revenues from the Brunei Investment Agency to invest in business ventures that eventually failed. The sultan initially accused Prince Jefri of embezzling $15.4 billion from the authority, but the sultan later dropped these charges.

Orlando Bonsignori

Italian banker and merchant

Bonsignori and his brother inherited from their father a thriving banking and wool trade concern. Under Bonsignori's direction, the firm expanded and adopted the name Gran Tavola. Numerous factors (agents) represented Gran Tavola from England to the Balkans, and the firm conducted business with the Papacy. At Bonsignori's death, Gran Tavola was unrivaled among Sienese firms, but its vulnerabilities would lead to its ultimate demise.

Born: c. 1210; place unknown
Died: c. 1273; place unknown
Sources of wealth: Banking; trade
Bequeathal of wealth: Unknown

Early Life

Orlando Bonsignori (Ohr-LAHN-doh Bohn-see-nyor-ee) was born in the early thirteenth century to Bonsignore di Bernardo, a small-time merchant in the city-state of Siena, whose name in its Latin genitive form became the family surname. Very little is known of the family's history or that of Bonsignori himself until he entered the family business on his own. Family records for much of this period no longer exist, and public records regarding members of the merchant class in Siena are scant, except regarding their participation in civic activities. The medieval *Cronaca senese* (chronicle of Siena) ascribes the founding of the Bonsignori *società* (company) to the year 1209, and it would have been around this time that Orlando was born. He most probably would have worked in the family business alongside his brother Bonifazio, accumulating connections, capital, and experience. One of the family's activities included a share in collecting the customs duty for salt entering Siena and Grosseto, and another was small-scale banking on behalf of the Papacy in Rome.

First Ventures

The earliest mention of Orlando Bonsignori appears in Siena's tax records for 1229. His very low civic tax liabilities then and in the 1230's indicate that he had yet to emerge among Siena's major business figures. His emergence as an important businessman remains shrouded, but it seems clear that he and his brother Bonifazio superseded their father and quickly entered the thirteenth century world of international finance. The keys to the brothers' success appear to be their family solidarity and papal banking connections. Along with several other merchants from Siena, the two brothers are mentioned in papal registers from 1235.

Mature Wealth

The Papacy had been a major financial player in Italy and throughout Western Europe. Beginning around 1233, the Piccolomini *società*, headed by Angeliero Solafico, served as the papal depository. These bankers loaned the popes cash to meet their immediate needs wherever these financiers and the Papacy shared business interests. The popes also received infusions of cash from local papal collectors, holding it for use locally or for transfer when needed. The greater the bankers' capitalization, the greater their use to the Papacy.

The Bonsignori brothers began working with the popes through the Bonsignori company under Pope Gregory IX. Bonifazio represented the family business, as well as the city of Siena, at the papal court, while Orlando remained in Siena, managing the efforts of partners and agents who operated in an ever-widening geographic circle. The brothers' business expanded under Pope Innocent IV, earning them special treatment, papal protection, and the court title *familiares nostri* (members of our household). The pope's support was a useful means for the Bonsignori brothers to pressure other debtors to repay their loans.

Pope Alexander IV was engaged in an active struggle with the Hohenstaufen heirs of Emperor Frederick II, and he made much greater demands on the Bonsignori bankers than his predecessors. With Bonifazio's death in 1255 and the restructuring of the firm, Orlando organized the Gran Tavola dei Bonsignori, or "great table of the Bonsignori." The word "table" is equivalent to the Italian *banca*, meaning bench, and was meant to indicate a much grander financial structure than the Bonsignori family had previously operated.

By this time, Bonsignori's firm had reached a high point in its fortunes as a merchant banking company, and it had done so in partnership with members of other entrepreneurial clans. By expanding his partners while maintaining control of the business, Bonsignori controlled a much larger capital base from which to make loans. The Gran Tavola was the largest banking operation in thirteenth century Siena and one of the greatest of its day throughout Europe. It remained in operation until it went bankrupt in 1298.

In 1260, Pope Alexander IV placed an interdict (a communal excommunication) on Siena, which sided with the Ghibellines, a political faction that supported the Hohenstaufen rulers of the Holy Roman Empire against the pope. At the time, Siena was battling the Guelphs, the pope's supporters in his conflict with the Hohenstaufen heirs, in Florence; Bonsignori, whose civic obligations included seven cavalrymen (*cavallata*), was serving in Siena's army. Pope Urban IV confirmed the interdiction against Siena in 1262, but he specifically exempted the Bonsignori family and their Gran Tavola. This papal action forbade observant Christians from repaying loans or debts held by other Sienese companies, which left the Bonsignori firm in the unique position of continuing to conduct business when other Sienese bankers could not.

However, papal banking was only one facet of Bonsignori's commercial activity. Although he generally acted as his company's principal, he usually represented a consortium of merchants or bankers, but since none of their commercial records survives it is impossible to know his investments and profits. In 1253, he gained partial control over the silver mines at Montieri near Volterra, and he probably participated in the cloth trade between central Italy and the annual fairs in Champagne, France. As a banker he served King Henry III of England at least sporadically from 1249; another of his customers was the abbot of Saint-Germain-des-Prés, France, whose

Gran Tavola

After the death of his brother Bonifazio and with increased papal demands for money, Orlando Bonsignori restructured and expanded his Siena-based banking concern, founding the Gran Tavola dei Bonsignori in 1255. Bonsignori's hold over papal finances grew ever tighter during the 1260's, gaining the Gran Tavola a near monopoly on papal business transactions.

By 1260, the Sienese civil government and many of its citizens had developed strong Ghibelline political affiliations, supporting the Hohenstaufen Dynasty in its battle with the Papacy, which was supported by the Guelphs. Bonsignori sided with the Ghibellines, but he continued to conduct business with the Papacy, and the Papacy overlooked Siena's ties to the Ghibellines. In 1265, Bonsignori repaid this papal support by agreeing with Pope Clement IV to form a *società* (company), which included himself and twenty-six other merchants. This newly created business collected 200,000 lire for the support of Charles of Anjou's efforts to drive Manfred Hohenstaufen from Italy.

Bonsignori continued to control the Gran Tavola until his death around 1273, though with his absence from Siena from 1270 to 1273 the organization began to unravel. His son Fazio d'Orlando and nephew Niccolò di Bonifazio took over some of his functions, but nonfamily members gained control and the Gran Tavola entered a long period of decline. In the late 1280's and early 1290's, the Gran Tavola still played a major part in papal finance, but its role was dwindling, and the Bonsignori family's participation in the company was similarly fading. In 1289, a reorganization resulted in a *società* of five Bonsignoris and eighteen outsiders, with capital of 35,000 gold florins; the balance of power shifted even further away from Bonsignori control in 1292. Disagreements over leadership, decision making, and resource allocation, as well as distrust, weakened the firm internally, and outsiders spread rumors that further crippled the company. Rising competition from Florentine bankers, lack of cooperation from the aggressive King Philip the Fair of France, dwindling papal support, and Sienese Guelphs' disaffection with the essentially Ghibelline firm undermined the Gran Tavola's effectiveness.

On August 9, 1298, most of the Gran Tavola's partners who were not Bonsignoris petitioned the Sienese government to protect their assets and delay the payments they owed to Siena. Their assets were scattered all over Europe, and additional time could help them meet their fiscal obligations. Panic set in and demands for restitution intensified. A blue-ribbon panel was formed to decide the Gran Tavola's fate, and the result was the termination of the firm's charter.

In 1302, Sienese officials began an investigation into members' assets, all of which, excluding their wives' dowries, were liquidated to pay creditors. In 1307, the Sienese effort was renewed; in 1308, the French king published his claims that the firm owed him 54,000 *livres tourneois* and jailed Sienese merchants in France as hostages. This led to a general undermining of Sienese fortunes and the collapse of several other Sienese companies, including the Malavolti, Squarcialupi, and Tolomei firms, during the following decade.

During the liquidation of the Gran Tavola, the Papacy claimed a loss of 80,000 florins, restitution of which it sought in 1345 at a time when Florentine banking firms, such as the Bardi and Peruzzi companies, were failing dramatically. A papal interdict placed on Siena resulted in negotiations and an agreement from remaining Bonsignori family members to pay 16,000 florins to the Papal Curia during a thirteen-year period, an obligation the family met.

association with Gran Tavola began in 1250. Good service resulted in success, and both laymen and ecclesiastics who needed cash transacted business with Bonsignori.

In dealing with the pope, Bonsignori could hold funds in deposit, exchange currencies (of which there were scores at the time), transfer funds from deposit to creditors, and make loans in a variety of currencies. Each of these transactions produced income for the Gran Tavola. However, the business experienced risk when its customers did not repay their loans. In the late 1260's, Bonsignori money simultaneously funded both Charles of Anjou, a Guelph supporter, and Henry of Castille, a Ghibelline backer. Bonsignori also invested in land, most of which was located in the vicinity of Sant'Angelo in Colle, Italy, and was worked by peasants through a form of sharecropping.

In 1270, Bonsignori lent money to help Charles of Anjou beat his imperial rival and secure Siena for the Guelphs. Bonsignori, who supported the Ghibellines, and his family fled Siena, overseeing a kind of government in exile in Cortona. This exile severely stressed the Gran Tavola, which continued to operate from Siena. Bonsignori died circa 1273, survived by his wife Imiglia and their seven children.

Legacy

The Gran Tavola began to decline after Bonsignori's death. In his lifetime, however, his vision, organizational skills, and charisma enabled him to secure a place among Italian merchant bankers and eventually to dominate this occupation. He was able to separate his strongly held political beliefs from his professional activities, as evidenced by his financial support for the Guelphs despite his political support for the Ghibellines. He used his wealth to benefit Siena, providing aid to a local hospital, paying hefty taxes, offering thousands of dollars in loans, and helping the local economy by remaining solvent when the rest of Siena was under papal interdict.

Scipione Borghese

Italian cardinal and art patron

Borghese used his position as Pope Paul V's assistant cardinal and the pope's nephew to acquire the finest art and to restore some of the most exquisite monuments in Rome. The paintings, sculptures, and architecture he commissioned remain some of the best examples of Italian Renaissance art in the world.

Born: 1576; Rome (now in Italy)
Died: October 2, 1633; Rome
Also known as: Scipione Caffarelli (birth name)
Sources of wealth: Inheritance; real estate; church
Bequeathal of wealth: Relatives; artistic patronage; museum

Early Life

Scipione Borghese (shih-pee-OH-neh bohr-GAY-zeh) was born Scipione Caffarelli, the son of Marcantonio Caffarelli and Ortensia Borghese, sister of Pope Paul V. He attended Collegio Romano in Rome and the University of Perugia, taking degrees in philosophy and law. In 1605, his uncle, the pope, made him a cardinal and granted him permission to use the Borghese name and coat of arms. The young cardinal has been described as having a jovial personality; he was apparently much more outgoing and sociable than his rather stern uncle.

First Ventures

Borghese benefited immensely from his uncle's nepotism. He occupied many prominent positions in the Roman Catholic Church, including archbishop of Bologna, superintendent *negotiorum sanctae sedis*, prefect of the Tribunal of the Apostolic Signature of Grace, librarian of the Holy Roman Church, protector of Loreto, archpriest of the Lateran Basilica, and *camerlengo* (chamberlain) of the Sacred College of Cardinals. For each office, Borghese accrued revenues through salaries, papal taxes and fees, and gifts. His annual income in 1616 was about 160,000 scudi (a single scudo was equivalent to about 3.5 grams of gold).

He invested in valuable land around Rome, especially in the Alban Hills. In the first part of his career, Borghese commissioned several renovations of religious buildings. His restorations of the St. Andrew and St. Sylvia Chapels near San Gregorio Magno al Celio in Rome are early examples of the ecclesiastical works he sponsored.

Mature Wealth

Borghese used part of his wealth to make a name for himself as a preserver of Rome's glory. His religious architectural projects included the restoration of the San Sebastiano basilica and reconstruction of the San Crisogono church. His secular projects included the renovation and expansion of the Palazzo Borghese and the Villa Borghese. Borghese's gardens were beautiful—canopies of greenery with vineyards, wooded areas, and formal arrangements of flowers. These important projects, however, pale in comparison to Borghese's art collection.

Borghese collected antiquities as well as contemporary art. His collection included artworks by Caravaggio, Raphael, Perugino, Guido Reni, Peter Paul Rubens, and Titian. Borghese acquired a reputation for being ruthless in his efforts to acquire artworks. For example, a painting by Raphael disappeared from a church in Perugia and somehow ended up in Borghese's collection. In another instance, Borghese imprisoned the painter Domenichino for refusing to sell him a painting already promised to another cardinal. Borghese eventually got the painting he desired.

Borghese, however, recognized and supported artistic genius. His early patronage of the sculptor Gian Lorenzo Bernini launched that artist's stellar career. Just before Borghese's death, Bernini captured the rounded face of his patron in bronze twice. These busts were later displayed in the Galleria Borghese. Borghese continued to lavish his wealth on art, religious building restorations, and improvements to his magnificent villas until his death in Rome in 1633. He was buried in Santa Maria Maggiore.

Legacy

In some ways, Scipione Borghese was a typical cardinal nephew of a Renaissance pope: a recipient of unearned wealth, who had to deal with the jumble of business, government, and politics that characterized life in the Papal States. Borghese stands out, however, because of the extraordinary art collection he left behind. After the death of his uncle Pope Paul V in 1621, Borghese moved to the Palazzo Borghese, where he relocated most of his paintings, creating the Galleria Terrena. His sculptures were housed at the Casino Borghese, a museum on the property of the Villa Borghese that was established for his statuary.

Seventeenth century Italian art flourished because of Borghese's largesse. He preserved precious religious architecture and antiquities. His unique style, which was evident in his homes and gardens, could be said to have helped launch an entirely new form of artistic expression—the Roman Baroque.

John Bouvier

American investor, stockbroker, and socialite

One of the heirs to the Bouvier fortune, John Bouvier augmented his wealth with a seat on the New York Stock Exchange. Living in an apartment building in New York known for its wealthy residents and highlighting the city's social scene, "Black Jack" imparted his sense of style to his daughters, Jacqueline Kennedy Onassis and Lee Radziwill.

Born: May 19, 1891; East Hampton, New York
Died: August 3, 1957; New York, New York
Also known as: John Vernou Bouvier III; Black Jack Bouvier
Sources of wealth: Inheritance; financial services
Bequeathal of wealth: Children; dissipated

Early Life

The Bouvier fortune was established by Michel Bouvier, a French émigré who arrived in Philadelphia in 1815 following Napoleon I's defeat at Waterloo. Owning furniture factories, speculating in land and construction, and becoming rich from his interests in coal mines, Bouvier died in 1872 with a fortune equivalent to about $30 million in 2010. This fortune was multiplied several times by his son, Michel Charles Bouvier. John Vernou Bouvier (BOO-vyay-ay) III was Michel's great-grandson, born to John Vernou Bouvier, Jr., and his wife, Maud Frances (née Sergeant) Bouvier.

Young John was raised on the Bouvier country estate, Woodcraft, in Nutley, New Jersey. He had a younger brother, William, and three younger sisters, Edith and the twins Michelle and Maud. John attended the Morristown School and Philips Academy Exeter before enrolling at Yale University. Cole Porter was a classmate, and Bouvier and Porter sang together in the Yale Glee Club, becoming lifelong friends. Upon graduation, Bouvier became a stockbroker on Wall Street, where he earned the nickname "Black Jack" for his perpetual tan, debonair airs, and sense of derring-do. The handsome Bouvier was often noted for his resemblance to the actor Clark Gable. Bouvier served briefly in the army during World War I.

First Ventures

In 1922, Bouvier bought a seat on the New York Stock Exchange for $115,000 (equal to about $2 million in 2010), and he founded his own Wall Street firm. His firm was profitable and he became a man-about-town, touring New York City in a chauffeured Lincoln Zephyr motorcar. He was a highlight of New York high society, known for keeping a stable of racehorses, throwing lavish parties, and dating attractive women. He flew up and down the East Coast in a private jet to attend swanky events. On July 7, 1928, Bouvier married Janet Norton Lee. Their daughter, Jacqueline Lee, was born on July 28, 1929. With the stock market at an all-time high, Bouvier's profits from his brokerage firm approached $1 million a year. A second daughter, Caroline Lee, was born on March 3, 1933.

Bouvier was at first hardly affected by the stock market crash on Black Tuesday, October 29, 1929, because he had sold short about $100,000 worth of securities in order to profit if stock prices declined. In 1932, the Bouviers moved into an eighteen-room duplex apartment at 740 Park Avenue, in a building built and owned by Bouvier's wealthy father-in-law, James Lee. The imposing, nineteen-story, limestone-clad structure, located on Park Avenue between Seventy-first and Seventy-second Streets, was the most extravagant apartment building in New York City. All of the apartments were at least two floors tall and contained every modern convenience. In his apartment, Bouvier added gold plating to the bathrooms and wood paneling to the common rooms. A room of his apartment was converted into a small gym so he could maintain his trim physique.

In addition to their Manhattan apartment, John and Janet resided in the Bouvier family country estates, Lasata and Wildmoor, in exclusive East Hampton, New York, where they were waited upon by a small army of servants, nannies, maids, chauffeurs, and cooks. They dined in New York's finest restaurants, such as Longchamps and La Rue. Bouvier's horse stable continued to grow, and he introduced his daughters, known as Jackie and Lee, to the sport of horseback riding, taking them on jaunts through Central Park. Bouvier was a prominent member of New York's exclusive Maidstone, Yale, and Racquet Clubs, and he had a Stutz touring car custom-built for his leisure. Jackie and Lee enjoyed a privileged lifestyle, traveling in Bouvier's four chauffeured limousines, attending society affairs, and being indulged by their father, who doted on them.

Mature Wealth

In 1933, Bouvier earned $2 million in the stock market (about $24 million in 2010). However, as the Great Depression ground on and the stock market continued to plunge, Bouvier lost this amount and much more. When his grandfather died in 1935, leaving an estate worth $1.65 million, Bouvier was distressed that his father, John Bouvier, Jr., inherited the bulk of the estate, while Bouvier himself received only a small bequest. By 1936, Bouvier's net worth had plummeted to $100,000. To support his lavish lifestyle, he had to borrow money from his father and father-in-law. However, his extravagance soon got the better of him. As a result of his womanizing, he and Janet separated in 1936. By 1939, the separation had become bitter, with John claiming that Janet abused their daughters by spanking them and Janet hiring a detective

John Bouvier walks alongside his daughter Jacqueline while she is riding horseback. (©Bettmann/CORBIS)

740 Park Avenue: The World's Richest Apartment Building

Apartment buildings are usually not associated with the very wealthy; in fact, these buildings originated as tenements for the poor. However, throughout the world there are some apartment buildings that are synonymous with wealth. For example, the Naseef building in Riyadh, Saudi Arabia, constructed by the wealthy merchant Omar Naseef in 1882, contained more than one hundred apartments and rooms for his extended family. For a century, the tree in front of the building was the only tree in Riyadh, which exemplifies the building's prestige and status. The Albert Hall Mansions, built in London in the 1880's, were the most fashionable British apartments for decades.

The Manhattan borough of New York City has long been the site of beautiful apartment buildings designed by some of the nation's leading architects. For example, the stately Dakota building is a National Historic Landmark. However, the apartment house at 740 Park Avenue, highlighted in a 2007 "biography of a building," has earned renown for being the "world's richest apartment building." Its residents are a microcosm of wealthy American society, and the building, like many dense living quarters, has been the site of friendships, jealousies, gossip, love affairs, and rivalries, all of which were magnified by the wealth of its inhabitants.

The 740 Park Avenue building, constructed just before the stock market crash of 1929, was designed to be the most luxurious dwelling on tree-lined Park Avenue. Nicknamed "Croesus's Sixty Acres," Park Avenue in the 1920's was the residence of the world's largest concentration of millionaires, and the street had an aggregate wealth of $3 billion. The building at 740 Park Avenue would become known to some as "Plutocrats Palace." Its builder and owner, James Lee, was John Bouvier's father-in-law, and its architect was Rosario Candela, the city's leading apartment designer. The nineteen-story building was clad in expensive Indiana limestone.

The building is a cooperative, in which residents buy shares in their apartments. The building is actually a series of mansions, built vertically rather than horizontally. It contains thirty-one apartments, and each apartment is a duplex or triplex, with interior staircases, marble floors, fireplaces, servants' quarters, libraries, loggias, spacious rooms with twelve-foot ceilings, and ample sunlight.

John Bouvier and his family were among the first residents of the building. John D. Rockefeller, Jr., moved there in 1936. Other wealthy residents over the years included liquor company magnate Edgar Bronfman, Sr.; businessman Ronald Lauder; financier and investor Henry Kravis; Marshall Field III, a scion of the wealthy retailing family; investor Ronald Perelman and his former wife Faith Golding; bridal gown designer Vera Wang; Irene Guggenheim of the Guggenheim family; J. Watson Webb, a film editor and heir; heiress Flora Whiting; several Vanderbilts and Chryslers; Greek shipping tycoon Stavros Niarchos; Ecuadoran "Banana King" Luis Noboa and his wife Mercedes; and Steven J. Ross, former chief executive officer of Time Warner, and his former wife Courtney. Billionaire industrialist David H. Koch purchased an apartment for $17 million. In 2000, businessman Stephen A. Schwarzman paid $37 million for artist Saul Steinberg's thirty-four-room triplex. In 2008, Courtney Ross sold her apartment for $60 million.

to document John's extramarital affairs. On July 22, 1940, Janet was granted a divorce on the grounds of adultery.

Bouvier was again disappointed when his father died in 1948. John Bouvier, Jr., had inherited the bulk of the Bouvier fortune but had consumed it as the patriarch of the Bouvier dynasty, incurring huge expenses for his Manhattan, New Jersey, and Long Island estates and paying for his often extravagant children. Bouvier did inherit more than $100,000 from his father, as well as a release from the debts he owed the estate. However, he realized that his opportunity to acquire the kind of fortune that was being accumulated by another Catholic American investor—Joseph P. Kennedy, whom the Bouviers regarded with some disdain—had been lost.

For a man whose life had begun with great promise, Bouvier's latter years were marked by a certain pathos. His considerable fortune was overshadowed by his even more considerable expenses. When his former wife Janet remarried into the wealthy Auchincloss family, Bouvier began vacationing in Cuba, forsaking his former Long Island haunts. He drank heavily; he was so intoxicated on the day in 1953 on which his daughter Jacqueline married Senator John F. Kennedy of Massachusetts that he failed to make it to the wedding ceremony, even though he had been scheduled to give his daughter away in marriage. However, upon returning to bachelor life, Black Jack maintained his sense of style. He was well known in New York society for his exquisitely tailored clothes, dressing glamorously in expensive, buttoned-down shirts from Brooks Brothers with club ties from F. R. Tripler & Co., polished black shoes, and suit jackets sporting silk handkerchiefs. In wintry weather, he donned double-breasted overcoats and black homburg hats. He dined in

New York's finest restaurants with his young paramours, and he haunted the Polo Bar of the Westbury Hotel, looking for new conquests. In 1955, he sold his seat on the New York Stock Exchange for $60,000, equal to about $700,000 in 2010. He died two years later.

Legacy

The Bouviers were the first Catholic family of wealth and distinction to enter New York high society. The Bouvier fortune was considerable, but it did not survive John Bouvier, Jr., illustrating the famous American adage about the rise and fall of dynastic wealth going "from shirt sleeves to shirt sleeves in three generations." Neither John Bouvier III's inheritance nor his Wall Street profits were enough to sustain his magnificent lifestyle. Although he lacked the substance of great wealth, Bouvier certainly possessed an abundance of its accoutrements. Handsome and debonair, he illuminated high society in Manhattan and the Hamptons. He was known for his immaculate dress, insouciance, manly glamour, luxury apartments, horses, gambling, soirees, fine dining, and liquor. His romantic adventures were legendary.

By itself, all this would only make him a charming rake of little historical significance. However, by all accounts he passed on his style, charm, and charisma to his two daughters, Jackie and Lee. Lee married Prince Stanislas Radziwill of the Polish royal family. Jacqueline's husband became the forty-first president of the United States, tragically assassinated by Lee Harvey Oswald in 1963. As First Lady, Jacqueline was widely admired for her panache, style, and elegance, inherited from her father. Although John did not have much of the Bouvier fortune with which to enrich his daughters, his daughter Jacqueline was associated with several other historic fortunes—those of her stepfather Hugh D. Auchincloss, Jr., the Kennedy family, and her second husband, Greek shipping tycoon Aristotle Onassis.

Anthony N. Brady

American investor, contractor, and utility magnate

Brady owned public utilities and street railway and other transportation systems, and he was a major investor. He was a primary stockholder, director, and president of more than fifty corporations, including American Tobacco, Brooklyn Rapid Transit, and Standard Oil.

Born: August 22, 1843; Lille, Norde, France
Died: July 22, 1913; London, England
Also known as: Anthony Nicholas Brady
Sources of wealth: Utilities; transportation systems; investments
Bequeathal of wealth: Relatives; charity

Early Life

Anthony Nicholas Brady was born in Lille, Norde, France, on August 22, 1843. He moved with his parents to Troy, New York, in 1857, and he received his elementary school education there. Brady expressed no inclination to pursue higher education, which his parents probably could not have afforded. Instead, he was attracted to business ventures, and at age fifteen he began working in the barbershop of the Delavan House Hotel in Albany, New York.

First Ventures

When he was nineteen, Brady started a tea store and opened branches in Troy, Albany, and New York City. These shops were one of the first examples of a chain store operation in America, although some called his enterprise a monopoly. Because Brady's profits from the tea stores were relatively small, he pursued other business ventures to generate additional income.

Brady became interested in construction in New York State, and he began contracting to build sewers, pavements, and other public improvements. He even purchased granite quarries to furnish materials for his contracts. He later was the Chicago contractor for the Manhattan Oil Company of Lima, Ohio. Brady also became interested in public utilities. He eventually took control of the Albany Gas Light Company, and with some investors he bought gas plants in Troy and Chicago.

Mature Wealth

As his income grew, Brady purchased traction (transportation) lines in Providence, Rhode Island. Eventually, he began focusing his business ventures on New York City, which seemed the most promising area for his commercial activities. In 1887, he helped reorganize the Brooklyn Rapid Transit Company (later the Brooklyn Manhattan Transit Company), and he served as chairman of the company's board of directors for twenty-six years. In 1912, he was influential in expanding Brooklyn Rapid Transit to include both the Coney Island and Brooklyn lines, strengthening his control of the city's public transportation system. Brady also purchased street railways in Washington, D.C., and Philadelphia, and he extended his interests in public electric utilities, notably the New York Edison Company.

Brady was a major stockholder in some fifty corporations, including Standard Oil Company. He also was president of New York Gas and a director of Westinghouse Electric Company, American Tobacco Company, U. S. Rubber, United States Cast Iron Pipe and Foundry, two mining companies, Union Carbide and Carbon Corporation, Mohawk-Hudson Power Corporation, and dozens of power and light companies in New York State and in Japan.

Legacy

Brady died in July, 1913, and left his $85 million estate to his family, including his sons James Cox Brady and Nicholas Frederic Brady, who managed their father's wealth. Nine months before his death, two of his seven children—Flora Brady Gavit and Mary Brady Tucker—and the wife of his son James died in a transit accident in Connecticut. As a result, Brady's estate created the Anthony N. Brady Memorial Medals. In 1914, the American Museum of Safety presented the first of these annual awards to the American electric street railway that made the greatest contributions to accident prevention and industrial hygiene. Brady's heirs also used money from his estate to found the Anthony Brady Memorial Laboratory at Yale University's school of medicine and a maternity hospital and infant care home in Albany, and they helped finance Walter P. Chrysler's automobile company.

Jim Brady

American investor and salesman

Brady, a Gilded Age salesman and investor, supported a lavish lifestyle, collected diamond jewelry, invested heavily and successfully in the New York Stock Exchange, started several businesses, and donated generously to medical institutions.

Born: August 12, 1856; New York, New York
Died: April 13, 1917; Atlantic City, New Jersey
Also known as: James Buchanan Brady; Diamond Jim Brady
Sources of wealth: Trade; investments
Bequeathal of wealth: Friends; medical institutions

Early Life

James Buchanan Brady grew up in Hell's Kitchen in New York City. His father was Daniel Brady, an Irish immigrant who owned Brady's Saloon; the family lived above the bar. When the saloon's profits dwindled after his father's death and his mother's remarriage, eleven-year-old Brady and his thirteen-year-old brother Daniel worked as bellboys at the luxurious St. James Hotel in an upper-class district of New York City.

John M. Touchey, an executive and later the general manager of the New York Central Railroad, took an interest in Brady and paid for his education. Brady continued to work as a bellboy while attending school. With Touchey's help, Brady secured a job in the baggage department at Grand Central Station. After only two years on the job, seventeen-year-old Brady became station agent while continuing his education.

First Ventures

When Brady was twenty-one, he became head clerk at New York Central Railroad and helped his brother Daniel secure a job with the railroad. Unbeknownst to Brady, Daniel began to steal from the railroad, and, as a result, both brothers lost their jobs. In 1879, Touchey once again helped Brady, asking Charles Moore to hire Brady as a salesperson for Moore's railroad supply company, Manning, Maxwell, and Moore.

At this time, Brady began exhibiting the penchant for luxurious living and lavish spending that would earn him the nickname Diamond Jim. He believed that personal appearance was important, and with the help of a friend

Jim Brady. (Archive Photos/Getty Images) who was a tailor, he wore clothes that conveyed success. He also began collecting elegant jewelry, including some pieces with diamonds, to enhance his appearance. He frequented the most exclusive clubs and restaurants in the company of elegant young women, eating heartily but drinking only orange juice. His nights extended into the wee morning hours.

Mature Wealth

Brady eventually became the most successful salesman in America, and his work made Manning, Maxwell, and Moore a financial empire. In 1902, he began to establish some steel companies.

At the same time, Brady continued to lavish friends, associates, clients, and even newsboys with gifts, and he did not neglect himself. He became vastly overweight with his overindulgence in food and unhealthy living habits. Although he never married, Brady's extravagant social life included relationships with Edna McCauley and singer Lillian Russell. He and Russell remained best friends. Brady owned the first automobile in New York City. His treasures included thirty sets of jewelry worth $1 million, which would later be liquidated at his estate sale.

Brady's health declined with his excesses and long nights of celebration. When he had to seek medical help, his doctor admitted him to Johns Hopkins Hospital, predicting he had only one day to live. After the surgical removal of the largest gallstones ever extracted up to that time, Brady survived. In gratitude, he heaped gifts upon his caregivers and exorbitant donations upon the hospital.

However, Brady's health problems eventually forced him to change his occupation. He began investing heavily and successfully in the New York Stock Exchange. His investments vastly increased his wealth, which eventually exceeded $12 million.

Brady's health continued to decline, and he eventually suffered from angina pectoris, stomach ulcers, diabetes, and kidney problems. Instead of reentering a hospital, Brady spent his last months in the Shelbourne Hotel in Atlantic City, New Jersey. He died in Atlantic City on April 13, 1917.

Legacy

Brady's extravagant living and spending epitomize the ostentatious displays of wealth that characterized the Gilded Age in late nineteenth century America. His rise from a poor boy in New York City to a successful millionaire exemplifies the upward mobility that was available to some businessmen in that era and is an important part of his legacy. Photographs of his jewelry collection, with its thirty complete sets of items, including matching belt buckles, tie clasps, cuff links, and bracelets, explain his nickname Diamond Jim. However, he also used his wealth philanthropically, endowing the James Buchanan Brady Urological Institute in 1912 and making contributions to the Cornell Medical Center. The congenial and free-spending Brady could be as generous to charities as he was to his friends and clients.

RICHARD BRANSON

British entrepreneur

In 2010, Branson was listed in Forbes *magazine as the 221st-richest person in the world, with an estimated net worth of $4 billion. A self-made man, Branson became a very successful entrepreneur through a wide variety of business ventures, including music sales, music production, air and rail transportation, banking, and soft drinks.*

Born: July 18, 1950; Shamley Green, Surrey, England
Also known as: Sir Richard Charles Nicholas Branson
Sources of wealth: Entertainment industry; banking; transportation systems
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

Richard Branson was born on July 18, 1950, in Shamley Green, Surrey, England. His father, Edward James Branson, was an attorney; his mother, Eve, was a former airline flight attendant who managed the household after marrying. Branson's parents were loving and supportive, and his mother was fond of setting challenging goals for him. Branson was educated in boarding schools, initially Scaitcliffe Preparatory in Windsor Great Park and subsequently Stowe in Buckinghamshire. He did not attend college. Branson suffers from dyslexia, a learning disorder that results in difficulty with reading and spelling, and he performed poorly in academics. However, he was popular in school because of his ability to converse effectively and connect with others.

FIRST VENTURES

Branson's first significant business venture occurred in 1967, when he and a childhood friend established *Student*, a periodical focused on the interests of secondary school and college students. *Student* was notable because it seemed to bring out the best in Branson's can-do nature. He secured interviews with many notable figures of the time, including John Lennon and Yoko Ono; convinced numerous large corporations to advertise in the periodical; and also managed to get arrested. The arrest was a result of his advertising venereal disease counseling and condom availability in *Student*. The police alleged that Branson violated two statutes, the 1889 Indecent Advertisements Act and the 1917 Venereal Disease Act. He was acquitted on the charge related to the Venereal Disease Act but was later convicted on the Indecent Advertisements Act charge and sentenced to pay a token fine equivalent to $14.

Richard Branson. (Getty Images)

Branson's next significant business venture was the opening of a record store in London in 1969.

He expanded to mail-order record sales the following year and eventually opened additional stores, ultimately creating the huge Virgin megastore chain of music shops. This business venture also resulted in Branson's arrest after British customs officials charged him with selling nontaxed records, which he claimed to export. Branson settled out of court by paying the required customs duties and penalties.

MATURE WEALTH

Throughout the 1970's, Branson expanded his line of Virgin record shops, opening stores throughout the United Kingdom and ultimately throughout the world. The stores boasted extensive inventory and an informal atmosphere that appealed to young people. This formula proved successful and was the start of the Virgin empire.

In 1971, Branson bought a country manor in Chipton-on-Cherwell near Oxford, England, with the intention of converting the home into a recording studio. He felt there was a need for a more relaxed environment in which music artists could record. He also saw the potential for making a profit. Later that year, Mike and Sally Oldfield arrived at the manor to make a recording. Mike Oldfield's choice of the manor as a recording location was fortunate for Branson because Oldfield went on to record the multiplatinum Tubular Bells album at the manor. *Tubular Bells* earned a great deal of money for the new Virgin Records label that Branson launched in 1972. Over the years, income from sales of *Tubular Bells* would pull the Virgin Group, Ltd., back from the brink of bankruptcy and provide vital capital for the establishment of new business ventures.

Throughout the 1970's, Virgin Records struggled to stay solvent. Mike Oldfield was a consistent earner, but other artists did not prove as successful, and in 1980 the company lost \$13.5 million. This financial picture changed drastically in 1982, when Virgin Records signed Boy George and Culture Club to the label. That year, the company earned a profit of \$3 million, and in 1983 profits climbed to \$16.5 million. The little Virgin label that other music publishers had derided was now a major force in the record industry.

Branson established Virgin Atlantic Airlines in 1984 with a single leased Boeing 747 jumbo jet. Virgin Atlantic initially had only one route, from New York's John F. Kennedy International Airport to London's Gatwick Airport. The maiden flight from Gatwick to Kennedy started with a bang, literally, when one of the jet's four large engines ingested birds on takeoff and had to be shut down. Not to be deterred, Branson continued to move forward, ultimately building Virgin Atlantic into a profitable and popular airline. Along the way, he had to endure a lengthy legal battle with British Airways. Branson accused British Airways of libel, and the Virgin Records label had to be sold in order to raise capital to keep the airline viable. The lawsuit against British Airways concluded with Branson and Virgin Atlantic settling for more than \$900,000 in damages.

In 1986, Branson made the decision to publicly trade stock in the Virgin Group. A huge level of interest accompanied this initial public stock offering. Unfortunately, the stock did not appreciate as hoped. In addition, Branson did not like the additional oversight and direction that the operation of a public company entailed. Consequently, in late 1987 all issued stock was bought back at the original purchase price and Virgin once again became a private company.

In 1991, Virgin Records signed Janet Jackson for a record \$25 million single-album deal. The signing of an artist for a single record instead of several was unheard of and the music industry perceived this deal as extremely risky. However, Virgin Records continued to prosper and began looking to purchase another label, Thorn/EMI, in order to gain control of this firm's lucrative record rights inventory. Ironically, when Virgin Atlantic Airlines fell

The Virgin Earth Challenge

On February 9, 2008, Richard Branson and Al Gore, the former U.S. vice president and Nobel Peace Prize winner, announced the Virgin Earth Challenge. The challenge offers a \$25 million reward to the individual or entity that proposes a viable method of mitigating greenhouse gases from Earth's atmosphere.

Greenhouse gases are created by burning fossil fuels and are responsible for retention of solar heating and a resultant gradual warming of Earth's atmosphere. This warming phenomenon is causing climatic changes, including melting glaciers and polar ice caps, which result in rising ocean levels and significant alterations in weather patterns. The predominant greenhouse gas is carbon dioxide. Proponents of the global warming theory suggest that the greenhouse gas phenomenon will be cataclysmic for the Earth.

Specifically, the Virgin Earth Challenge seeks to encourage the development of a commercially viable new technology to remove anthropogenic greenhouse gases from the atmosphere in order to improve the stability of Earth's climate. It is estimated that more than two hundred billion metric tons of carbon dioxide have collected in the Earth's atmosphere over the last two hundred years, a 25 percent increase over pre-Industrial Revolution levels. The technology that will win the Virgin Earth Challenge must be capable of removing significant amounts—defined as one gigaton or more per year—of greenhouse gases from the environment for a period of not less than ten years. The results achieved by the technology must achieve "long-term" benefits, with the prize conditions suggesting a one-thousand-year time period.

Winners of the \$25 million prize will receive an initial payment of \$5 million when their greenhouse gas removal project is initiated, with the remaining \$20 million to be paid at the successful completion of the ten-year project. Judges for the challenge include Branson, Gore, and four internationally recognized scientists and scholars. Branson and Gore are hopeful that the offer of \$25 million will be sufficient to stimulate research resulting in a significant reduction in the rate of global warming.

on hard economic times, it was Thorn/EMI that purchased the Virgin recording label for an astounding $1 billion. This huge infusion of cash allowed Virgin Atlantic Airlines to survive and gave Branson the financial wherewithal to continue expanding his empire.

The 1990's found Virgin expanding into a very diverse collection of business ventures, including Virgin Cola, a soft drink company; Virgin Money, a banking and investment company; Virgin America, an American-based airline; Virgin Mobile, a telecommunications company; Virgin Trains, a British rail provider; and Virgin Galactic, a space tourism company. Although all of the ventures are significant in some way, Virgin Trains and Virgin Galactic are probably the most intriguing. Virgin Trains is Branson's attempt to revitalize and modernize the British rail system. By 2009, Virgin was managing a significant portion of Britain's rail transportation, with the west of England served by a modern high-speed train system designed and implemented by the company. Virgin Galactic is Branson's attempt to beat big government at its own game—namely, spaceflight. In 2004, Branson's partners in Virgin Galactic, Paul Allen, cofounder of Microsoft Corporation, and aircraft designer Burt Rutan, won the Ansari X prize for conducting the first civilian launch of a reusable space vehicle twice within a two-week period. Allen and Rutan were awarded $10 million for their efforts. Rutan also designed a spacecraft in which Virgin Galactic planned to take clients on brief spaceflights. On December 7, 2009, SpaceShipTwo was rolled out in the Mohave Desert—the first public appearance of a commercial passenger spacecraft.

Branson has publicly stated that his goal is to continue to expand his enterprises whenever the Virgin Group has money. This formula has proven highly effective for the Virgin empire, which in 2009 employed more than fifty thousand people in a highly diverse collection of companies.

Legacy

Richard Branson has made significant impacts on each of the industries into which he has ventured. From music to airlines and on to spaceflight, Branson has raised the bar of quality and competitiveness. Consumers have benefited greatly from Branson's Virgin Group by receiving higher quality and lower prices. His adventurous and exciting life are both fascinating and inspirational. Truly a self-made man, Branson triumphed over dyslexia to become one of the richest people in the world.

Like many ultrarich individuals, Branson has turned his efforts toward altruistic causes. He has used his money to build medical clinics in Africa and pledged $25 million to fund the Virgin Earth Challenge, an award designed to stimulate innovation in the mitigation of greenhouse gases in Earth's atmosphere. Branson was instrumental in bringing together a group of worldly intellectuals known as the Elders, including South African leaders Nelson Mandela and Desmond Tutu and Kofi Annan, the former secretary general of the United Nations. The Elders seek to objectively solve difficult global conflicts.

—Alan S. Frazier

Thomas Brassey

British railroad and construction contractor

Brassey's wealth came from his large contracting business, which built railroads, docks, bridges, and ports. He took advantage of the rapid development of railroads in the mid-nineteenth century, bringing to their construction a high degree of business integrity and engineering skill.

Born: November 7, 1805; Buerton, Cheshire, England
Died: December 8, 1870; Hastings, Sussex, England
Sources of wealth: Construction business; railroads
Bequeathal of wealth: Children

Early Life

Thomas Brassey (BRAS-see) was the son of John Brassey, a long-established Cheshire farmer, living just south of Chester. Home-schooled at first, Thomas was then sent to a school in the city of Chester for four years. His father then apprenticed him to William Lawton, a land surveyor who was primarily employed by a Welsh landowner, Francis Price.

Brassey did so well that Lawton took him into partnership and in 1826 placed him in charge of a new business in Birkenhead, Cheshire. This little community was involved in the development of Liverpool as Great Britain's major port and was soon thriving. Brassey helped develop nearby brickworks and quarries. When Lawton died, Brassey took over the business and also became Price's land agent. In December, 1831, he married Maria Harrison, who encouraged him to move into railroad contracting.

First Ventures

Brassey's first venture into contracting was the building of a four-mile stretch of road leading to Birkenhead. Through this project, in 1834 he met George Stephenson, a leading railroad engineer, who persuaded Brassey to bid for the construction of the Dutton Viaduct on the Grand Junction Railway, one of the first long-distance railroads in Britain. Although unsuccessful in this bid, Brassey was awarded the contract for the Penkridge Viaduct on the same line in 1835.

After completing this project, he was asked to bid on additional contracts for the railway. He moved his family to Stafford and then to London in 1836 to facilitate these contracts. He worked with Stephenson and then with Stephenson's engineering pupil, Joseph Locke. Brassey also made successful bids for stretches of other early railroad lines in Cheshire, Yorkshire, and Scotland.

Mature Wealth

Meanwhile, other European countries were moving into railroad construction. Locke was appointed engineer on the new Rouen-Paris line, and in 1841 he invited Brassey to bid for it. Brassey worked with another British contractor, Sir William Mackenzie, on this rail line, thereby setting a precedent of being willing to work with other contractors. Between 1841 and 1844, Brassey and Mackenzie built 437 miles of French railways. In 1846, one of Brassey's viaducts at Barentin collapsed. Brassey rebuilt the viaduct at his own expense. The 1848 revolution in France forced Brassey to look elsewhere for work.

Great Britain was now in the midst of a railway mania, and work was readily available back home. By the time the mania subsided in the early 1850's, it was estimated that Brassey had been involved in the construction of more than one-third of all the railroads built during the decade, his largest undertaking being the Great Northern Railway, for which Brassey employed between five and six thousand laborers, or "navvies."

Between 1850 and 1870, Brassey took on multiple contracts throughout Europe, Canada, Argentina, India, and Australia. He later diversified into the construction of docks, sewerage systems, and ships. For these projects he set up his own building works just outside Birkenhead.

In 1867, failure of a railroad over Mont Cenis caused him much stress and a breakdown. Although he insisted on resuming his labors, his health could not withstand the pace, and he suffered a stroke in 1868. He died from a brain hemorrhage two years later, leaving some $20 million in assets and funds.

Legacy

Thomas Brassey's outstanding legacy was the huge network of railroads he established all over the world. All of these railways were built to the highest standard. He had gained a reputation for total integrity, which extended to the welfare of his workers. He had superb business acumen, as well as an eye for selecting deserving men to whom he could delegate work. Many of his subordinates were able to earn their own fortunes.

However, none of his three sons followed him into the business, choosing instead to enter politics, in which they all became members of Parliament. His oldest son was made a baron and wrote a book on his father's business theory. In his biography of Brassey, Sir Arthur Helps praises Brassey for being the best type of self-made man that industrial Britain had produced.

DONALD BREN

American real estate developer

Bren, the developer of the Irvine Ranch in Southern California and other properties, has given generously to educational causes, especially to the University of California system. In addition, he has contributed greatly to the arts in the Los Angeles area and donated to medical research and environmental projects.

Born: 1932; Los Angeles, California
Also known as: Donald Leroy Bren
Source of wealth: Real estate
Bequeathal of wealth: Educational institutions; medical research; artistic patronage

EARLY LIFE

Donald Leroy Bren is the older of two children born to Milton and Marion (née Newbert) Bren. His father was a real estate developer, best remembered for the development of Sunset Boulevard in Los Angeles, and a producer of motion pictures, including several of the *Topper* films. His mother was a friend of future First Lady Nancy Reagan. His parents divorced in 1947. Bren's father later married Claire Trevor, an Academy Award-winning actor. His mother married Earle Jorgensen, a steel tycoon who became a member of President Ronald Reagan's kitchen cabinet.

Bren attended public schools in Los Angeles. After graduating from high school in 1950, he attended the University of Washington in Seattle on a skiing scholarship. He graduated from college in 1954 with a degree in business administration and economics. In 1956, he tried out for the Olympic ski team but injured himself and failed to qualify. He then served a three-year tour of duty as a Marine Corps officer.

FIRST VENTURES

In 1958, equipped with a college degree, his father's real estate contacts, and $10,000 in borrowed money, he formed the Bren Company and built a house in Orange County, California, on speculation, thus launching a spectacular real estate career. He reinvested the profits from that first house and the others that followed. In 1963, he and two partners started the Mission Viejo Company, which planned and developed a community of eleven thousand acres that became the city of Mission Viejo, California, thus beginning his career as a developer of planned communities. Bren was president of the Mission Viejo Company from 1963 to 1967.

He sold his interest in the Mission Viejo property to one of his partners in 1969 for a substantial profit, and he then bought it back for a much lower price in 1972. He held the property for five years and then resold it to Philip Morris for a large profit. Bren promptly reinvested this profit, and he and a group of partners purchased the Irvine Company, which owned large tracts of land in Irvine, California, and the Irvine Ranch. Bren, the vice chairman of the company's board of directors, was also the largest single stockholder, owning 34.3 percent of the firm's shares. He became the majority shareholder by 1983, and in 1996 he bought all the outstanding shares and eventually became the company's sole owner.

MATURE WEALTH

The Irvine Company grew out of a ranch founded in 1864 by James Irvine, Llewellyn Bixby, and Benjamin and Thomas Flint. The property contains 185 square miles originating from three adjacent Mexican land grants. In 1894, James Irvine II incorporated the land as the Irvine Company. The Irvine Ranch is a separate entity of ninety-four thousand acres, of which the company retains forty-four thousand acres for development and the rest as a wilderness and recreational preserve. The ranch accounts for about one-fifth of Orange County, which is located south of Los Angeles.

The Donald Bren Foundation

Real estate developer Donald Bren formed the foundation that bears his name in order to disperse the huge sums of money he planned to donate to charity, especially to education and to environmental projects and research. The Donald Bren Foundation has given more than $200 million to support education in California, primarily in Orange County. More than $100 million of that amount has gone to kindergarten through twelfth-grade education, including a $20 million donation that expands enrichment programs in art, music, and science; an $8.5 million gift to THINK Together, an after-school program in the Santa Ana Unified School District in Orange County and other areas of Southern California; and millions of dollars in donations for programs that reward outstanding teachers and provide scholarships for worthy high school seniors.

In addition, the foundation has contributed more than $100 million to colleges and universities in and outside the University of California system, especially the University of California at Irvine and the University of California at Santa Barbara. This money has primarily been used to create endowed professorships with the aim of attracting top-rated scholars to the University of California system, but the grants have also endowed chairs at the California Institute of Technology, Chapman University, and the Marine Corps University in Quantico, Virginia. Altogether, the Donald Bren Foundation has endowed fifty chairs. The foundation also gave $20 million to help establish a law school at the University of California at Irvine, and it has donated $20 million to that university's School of Information and Computer Sciences, which was renamed the Donald Bren School of Information and Computer Sciences in recognition of the gift.

In its environmental efforts, the foundation has set aside more than fifty thousand acres in Orange County formerly owned by the Irvine Ranch for wild lands, parks, and trails. The state of California designated these lands a California Natural Landmark and the U.S. Department of the Interior acknowledged them as a National Natural Landmark. The foundation also committed $50 million to support the Irvine Ranch Conservancy and its research programs that aim to promote the protection, enhancement, and public enjoyment of the Irvine Ranch's parks, trails, and wild lands. In 2000, the foundation gave $1.5 million to the San Joaquin Wildlife Sanctuary in Orange County.

In addition, the foundation has donated considerable funds to leading research institutions, such as the Burnham Institute for Medical Research. The Burnham Institute conducts research into cancer, neurosciences and aging, and infectious and inflammatory diseases. Other research projects supported by the Donald Bren Foundation include efforts to find cures for human diseases, to improve the overall quality of life, to discover computer science solutions to improve human lives and corporate operations, and to seek interdisciplinary approaches to solve environmental problems.

The company became prominent during the 1960's as a developer of suburban master-planned communities and continued to operate into the twenty-first century. The Irvine Company owns and manages office buildings throughout Southern California, and it also owns and operates several commercial properties, including the Irvine Spectrum Center, Fashion Island in Newport Beach, California, and The Market Place in Tustin, California.

One of the planned communities developed by the company is the city of Irvine, California, which was formally incorporated on December 28, 1971. By the beginning of 2009, Irvine's population was 212,793, and the community covered almost seventy square miles. Originally planned by architect William Pereira as a community of fifty thousand people surrounding a new University of California campus, the new city turned out to be considerably larger than originally foreseen. Planned communities like Irvine have adequate housing in a variety of price ranges, schools of all levels, places of employment, parks, libraries, communication and transportation facilities, shopping centers, and places of worship. Irvine's streets all have landscaping allowances, with power line rights-of-way serving as bicycle corridors. Parks and greenbelts link ecological preserves, and reclaimed water irrigates the greenery. Irvine and other planned communities are completely self-contained living environments that offer a higher quality of life to their residents than many other areas.

Through the enterprises of the Irvine Company, Bren amassed an enormous fortune. In 2008, *Forbes* magazine's list of the four hundred richest Americans ranked Bren as the wealthiest American real estate developer, estimating his net worth at more than $12 billion.

Bren no sooner accumulated great wealth than he began giving it away to charitable causes. In 2008, *BusinessWeek* magazine ranked Bren at number nine on its list of the fifty most generous philanthropists in the

United States. The magazine estimated that Bren had pledged more than $907 million since 2003 and had given away more than $1.3 billion during his lifetime, mostly to educational institutions. His contributions included the endowment of distinguished professorships and chairs at the University of California, California Institute of Technology, Chapman University, and Marine Corps University. He has also given substantial sums for public kindergarten through twelfth-grade school systems in Southern California, including an $8.5 million gift to THINK Together, an after-school program for at-risk children in Orange County and other areas of the state. In addition, Bren donated $20 million to Orange County schools in order to expand enrichment programs in music, art, and science.

Bren has received many awards and honors for his philanthropy. He was elected a fellow of the American Academy of Arts and Sciences and was awarded the University of California's Presidential Medal, which is the university's highest honor recognizing significant contributions to the university system and to higher education. Bren has also donated to the arts and has been heavily involved in environmental preservation. Some observers have noted that Bren's philanthropic endeavors are more pragmatic than altruistic and seek to improve Irvine by making the community a better place to live and a more desirable place to own property.

Bren also used some of his wealth to participate in politics. He was an early supporter of President George H. W. Bush and later of his son, President George W. Bush. Bren is a skiing buddy and financial supporter of California governor Arnold Schwarzenegger and a donor to Republican legislative candidates and the Republican National Convention. He also became involved in Senator John McCain's unsuccessful bid for the presidency in 2008.

Legacy

Even though his life is far from over, Bren has already assured his legacy through his philanthropy. His donations to the University of California to endow professorships have attracted to the university campuses world-class scientists and scholars who have kept these schools in the forefront of the academic community. His financial support of kindergarten through twelfth-grade education in Orange County has already produced generations of well-educated citizens, prepared for careers in the workforce and for higher education. His gifts to the arts and to cultural and environmental projects have enhanced the quality of life for Southern California residents and secured the continued prosperity of the area. Most of all, his development of well-planned communities balancing workplaces, transportation, education, shopping, recreation, and places of worship has improved the quality of life of thousands of citizens. His motives for his philanthropy may have been selfish, but the results have benefited the entire community.

SERGEY BRIN

American computer scientist and high-tech magnate

Brin and Larry Page, created a global phenomenon—the Google search engine. Google not only is a company and brand name but also has become a verb meaning to access information on the Internet.

Born: August 21, 1973; Moscow, Soviet Union (now in Russia)
Also known as: Sergey Mikhailovich Brin
Source of wealth: Computer industry
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

Sergey Mikhailovich Brin, better known as Sergey Brin (SIHR-gay brihn), was born in Moscow, Soviet Union, on August 21, 1973, to Michael and Eugenia Brin. His parents, both brilliant individuals, wanted to work in the Soviet space program, but the Communist government unofficially barred Jewish people from the top professional positions, including working in university physics and astronomy departments. Michael taught mathematics at a university. In 1978, fed up with the pervasive anti-Semitism in the Soviet Union and the potential limited future for young Sergey, the Brins applied for an exit visa. Michael was fired from his job at the university for filing the exit visa, but the visa was approved in 1979, and the Brins fled to the United States, eventually settling in Maryland.

Sergey, now six years old, went to a Montessori school that would foster his creativity, while Michael became a mathematics professor at the University of Maryland, and Eugenia eventually was employed as a research scientist at the National Aeronautics and Space Administration (NASA). Sergey was a quiet child who quickly learned English and was interested in puzzles, maps, and mathematical games. He had a relatively normal middle-class upbringing, attending public high school and graduating in three years. He graduated near the top of his class at the University of Maryland three years later, majoring in mathematics and computer science. He won a National Science Foundation scholarship for graduate school and earned his master's degree at Stanford University in 1995. Brin chose Stanford for its beauty, prestige, and reputation for supporting high-tech entrepreneurs.

FIRST VENTURES

Brin met Larry Page, a University of Michigan graduate, at a Stanford University doctoral program orientation in

The founders of Google, Sergey Brin (above) and Larry Page at the company's headquarters in Mountain View, California, in early 2004. (AP/Wide World Photos)

1995. Both men were sons of high-powered intellectuals, had strong mathematics and computer science backgrounds, and were Jewish, opinionated, and cocksure. They bonded immediately, relishing intellectual combat.

As a university research project, Brin and Page began to devise a better way to search and harness information on the Internet. At this time, Yahoo!, Inc., and America Online provided the dominant Internet search engines, but these companies focused on offering moneymaking services, like e-mail, news, and weather reports. Brin and Page believed that Internet searching could be improved, and they decided to build their own company, eventually taking a leave from Stanford. Combining Brin's interest in data mining with Page's interest in information linking, they set out to make Internet searching more intuitive and relevant by ranking links between Web pages according to their relative importance. Building upon the academic concept of measuring topicality and value based on citations in research papers, the men devised a system of Web page links that enabled them to rank the importance and relevance of Web sites. They called their system the PageRank algorithm. This system was a major breakthrough in Internet search technology and was the basis for the company they decided to call Googol (later changed to Google), a mathematical term meaning the number one followed by one hundred zeros.

Brin and Page began gathering dozens of inexpensive computers in their dormitory room as their method of searching the Internet by relevance proved to be superior to any other search technique. The initial version of Google was part of the Stanford University Web site, but the computer servers needed to operate Google were in Brin and Page's dormitory room, and the two needed to expand. After soliciting funds from friends, family, and faculty members, the two obtained enough money to purchase additional servers and move their operation into a rented garage in nearby Menlo Park, California. While working in this garage, the garage owner's sister, Ann Wojcicki, became friendly with Brin, and the two later married.

Brin and Page began to introduce their company to executives of other Silicon Valley businesses and landed an audience with Sun Microsystems' cofounder and Silicon Valley investor Andy Bechtolsheim. Bechtolsheim liked what he saw and wrote a check for $100,000 to "Google, Inc." instead of to "Googol." Page and Brin spent two weeks filing the paperwork needed to form a company named "Google," while keeping the $100,000 check.

MATURE WEALTH

Google quickly drew a loyal following of users during the dot-com bubble in the late

GOOGLE.ORG: AN EXPERIMENT IN ACTIVE PHILANTHROPY

Sergey Brin and Larry Page, the billionaire founders of Google, have used their incredible intellect and extreme wealth for a number of philanthropic initiatives, including Google.org, a venture that uses Google's global information reach. The two men committed approximately $1.1 billion to Google.org based on their firm's stock price in 2004, the year that this charitable arm of their company was established.

After taking Google public in 2004, Brin and Page promised investors they would make a social impact on the world that would be greater than that made by Google itself. Google has pledged to donate 1 percent of the company's equity and profits to philanthropy. By early 2010, Google.org had provided more than $100 million in grants and investments to numerous recipients.

In early 2009, Larry Brilliant, the "chief philanthropy evangelist" of Google.org, stated that the charity would establish a stronger alliance with Google's engineers and technicians to take a more targeted approach to issues believed to be of the greatest global importance.

Google.org focuses on providing financial assistance in the broad global areas of clean energy, health, information access, and "special projects." Its clean energy initiatives include grants and investments to discover forms of renewable energy that are cheaper than coal, to reduce greenhouse emissions, and to accelerate the commercialization of plug-in vehicles. Global health initiatives include the prediction and prevention of global outbreaks of diseases, the identification of disease "hot spots," and the provision of a rapid response to emerging threats, such as infectious disease and climate risk. Information access projects, according to Google.org's Web site, seek to use Google's global information technology to "inform and empower," improve public services, and spur the growth of "small- and medium-sized enterprises." "Special projects" includes fundraising for global causes, such as support for global disease eradication efforts and for disaster response and recovery.

Brin and Page are personally involved in Google.org, demonstrating their belief in the necessity of ethical, principled, and peaceful global living. They believe that technology, science, and intelligence will solve the needs of the planet, and to that end, they have opened up their wallets as well as their hearts.

1990's and survived after the bubble burst in 2001. While many other high-tech companies failed, Google pressed on with unrivaled growth and soaring popularity. Brin and Page wanted their company to earn the respect of the Wall Street business community, so they hired seasoned software executive Eric Schmidt as the company's chief executive officer. Schmidt oversaw Google's daily operations, while copresidents Brin and Page continued to devise innovative technologies and services for the firm. Brin and Page joked that Schmidt was the adult influence in a company filled with youth and exuberance.

In the spring of 2004, Wall Street brokers and investors finally took notice of Google when the company filed the necessary paperwork for its initial public stock offering. There had been rumors that the privately held Google was a strong company, but when it released its staggeringly large revenue and profit figures, there was no doubt that the firm was financially successful. The small-text advertisements that Google included in its search results were especially profitable, generating enormous revenues.

Google's stock began to be publicly traded on August 16, 2004, with an unusually high price of $85 per share. This initial public offering raised $1.67 billion, making Google a $23 billion company and Brin and Page instant billionaires. Many Google employees also became millionaires. In 2008, Google's stock price exceeded $500 a share, one of the largest market capitalizations in history (market capitalization measures the size of a business in relation to the price of its stock and the number of shares held by investors). Google is also one of the most successful companies in corporate history, and its success has generated personal fortunes of more than $15 billion each for Brin and Page.

Although he is a young billionaire, Brin does not spend money as lavishly as many would expect. He continues to be heavily involved in the management and growth of Google, the maintenance and funding of the company's philanthropic arm, Google.org, and the Google Foundation, as well as other charities. He has come to embrace his Russian heritage as an active member of the American Business Association of Russian Professionals, an organization founded to support the Russian-speaking professional community in the United States. However, Brin has a few extravagances. He and Page jointly own a number of aircraft, including two Gulfstream 5 business jets, a Dornier-Alpha fighter jet, and a private Boeing 767 purchased in 2005. The purchase of the Boeing 767, which Brin has called the "party plane," occasioned one of the few times that he and Page were criticized by the media. They have also been questioned about housing the Google fleet at NASA's Moffett Field in Santa Clara, near the "Googleplex" corporate offices. Brin's response to this criticism was that the jets needed to be at the NASA facility because they carry devices for specific atmospheric measurements to be conducted during flight. The explanation did little to quell the ire of their critics.

In 2007, Brin made a $5 million down payment to become a space tourist in 2011 as one of at least two passengers onboard the first private Soyuz flight to the International Space Station (ISS). The few previous space tourism flights have been for single passengers and have occurred during official missions to reprovision the ISS. Brin's private flight will not be an official mission but a true space ride, with one or two other passengers onboard. The estimated cost of this flight is at least $50 million.

Legacy

Brin is a third-generation mathematician and a brilliant computer scientist. He and Page are pioneers in Internet search technology, in Web site advertising, and in building one of the most well-known and successful companies of the Internet Age. He is a relatively young billionaire, so his legacy continues to evolve.

Following the philanthropic lead of Bill Gates, cofounder of Microsoft, Brin has actively used his considerable wealth and influence to effect positive change throughout the world. With the creation of Google.org and the Google Foundation, and, to a lesser extent, his assistance of the Hebrew Immigrant Aid Society (HIAS), the organization that helped the Brin family flee the anti-Semitism of the Soviet Union, Brin has pledged to aggressively support causes that are important to him. His contributions to the Michael J. Fox Foundation for research into Parkinson's disease are notable because Brin's mother is afflicted with this disease, and Brin may have inherited the gene for this disorder.

Edgar Bronfman, Sr.

Canadian liquor company magnate

Bronfman and his brother inherited their father's liquor distillery, Seagram & Sons, and increased its business by expanding and diversifying the company's products and holdings. Bronfman next used his wealth and social position to advance Jewish philanthropies and causes throughout the world.

Born: June 20, 1929; Montreal, Quebec, Canada
Also known as: Edgar Miles Bronfman, Sr.; Edgar M. Bronfman
Sources of wealth: Inheritance; sale of products
Bequeathal of wealth: Children; charity

Early Life

Edgar Miles Bronfman (BRONF-mahn), Sr., was born in Montreal, Quebec, to Samuel and Saidye Bronfman on June 20, 1929. He was the third of four children and the older of two sons. Growing up in Montreal, Bronfman attended Trinity College School in Ontario, Canada. As a young man, he rebelled against his father by denying his Judaism, turning his back on his family's liquor distillery, and attending Williams College in the United States. However, he returned to Montreal to attend McGill University, from which he earned his bachelor's degree in history, with honors, in 1951. He reconciled with his father and began to work with him at Seagram & Sons immediately after his graduation.

First Ventures

Bronfman worked at Seagram in Montreal from 1951 to 1957. He initially was an accounts payable clerk, but he was always in his father's shadow. Although Samuel Bronfman seemed to be handing control of Seagram to the next generation, he remained an active and vocal owner, retaining full veto power. In 1957, Edgar Bronfman was given control and appointed president of the company's American subsidiary; his younger brother, Charles, assumed the presidency of the company's Canadian-based business. At this time, the American subsidiary of Seagram & Sons accounted for 81 percent of the company's business.

Mature Wealth

As president of the American subsidiary, Bronfman began restoring Seagram's prestige by resurrecting the defunct Calvert Reserve brand of whiskey, renaming it Calvert Extra. He went on a personal appearance tour and was featured in company advertisements to help market the new product. He expanded into marketing more diverse types of liquor, including vodka, gin, and wine. At the end of 1965, Bronfman had increased Seagram's international presence to 119 countries and the company's sales earnings exceeded $1 billion. Even though the years from 1961 to 1971 saw a 40 percent decrease in the worldwide market for whiskey, under

Bronfman's control Seagram actually increased its market by 9 percent. In 1975, four years after his father Samuel's death, Bronfman changed the name of the firm to Seagram Company Ltd.

Bronfman used the power and wealth he had acquired at Seagram to underwrite his first major venture into a nonliquor industry. In 1969, he became president of MGM (Metro-Goldwyn-Mayer) Studios after having bought $40 million of MGM stock. In one year under his creative control, MGM lost $25 million and Bronfman was forced to resign. This diversion into the film business cost Seagram $10 million.

Edgar Bronfman, Sr. (©CORBIS Entertainment)

After returning his attention to Seagram, Bronfman reorganized the company, naming his brother Charles president of the entire firm, with responsibility for both American and Canadian operations. By 1977, the company earned a profit of $84 million. Although Seagram's product line was doing well, not all of Bronfman's enterprises were as successful. In the 1980's, in an effort to diversify Seagram's holdings, he attempted three corporate takeovers. After his $2.3 billion sale of Texas Pacific, the oil company his father had bought for $50 million in 1963, Bronfman contacted St. Joseph Minerals with a buyout plan, but he was rejected. His offer to take over Conoco Oil Co. also was refused, even though it was more than generous at $17 more per share than Conoco's market price. However, in the bidding process Seagram did acquire a 32 percent share in Conoco, which Seagram traded for a 24 percent share in E. I. du Pont de Nemours and Company. The relationship with du Pont proved to be very lucrative and stable, and it lasted until 1995, when the company was sold by Bronfman's son and heir. In 1981, Bronfman purchased Westmount Enterprises in order to market a new line of gourmet frozen foods, and he teamed with Coca-Cola to produce and distribute bottled mixed drinks and cocktails.

Bronfman was married five times to four different women, none of whom was Jewish. He had five children with his first wife and two with his third (and fourth) wife. He is one of the world's most important Jewish figures and has had an enormous impact on Jewish and Israeli affairs. His long commitment to Jewish causes is evident by his roles in various organizations. From 1979 until 2007 he was the president of World Jewish Congress, an organization dedicated to fighting anti-Semitism and promoting Jewishness. However, the organization also holds some controversial positions, such as supporting a two-state solution in Israel, promoting dialogue between Jews and moderate Muslims, and stopping the construction of new Israeli settlements in contested areas. Bronfman, who worked tirelessly with the organization and received much praise and recognition for his endeavors, left office in the midst of scandal over misuse of funds and his relationship with Israel Singer, the secretary general of the organization, whom Bronfman dismissed in 2007. Bronfman continues to be an outspoken supporter and critic of Israel and plays an important role as adviser to American policy makers on issues concerning Israel.

Bronfman's increasing interest in Jewish philanthropy and the Israeli-Arab peace process prompted him to turn over control of the Seagram company. When he announced his successor, he shocked the business world by naming his younger son, Edgar Bronfman, Jr. Everyone had expected that the college-educated Samuel Bronfman II would be made president instead of Edgar, Jr., who had forgone college in order to break into the entertainment business. Edgar, Jr.'s, disastrous initial foray into this business made him seem unsuitable as the head of a multibillion-dollar family business. Subsequently, this choice had dire effects on the Bronfman empire and fortune. Rifts in the family and the dissipation of the family's wealth have followed as a result of the younger Bronfman's business decisions. In his retirement, Edgar Bronfman, Sr., has been mute on the subject of his son's stewardship of the company and has turned his attention to writing books, Jewish causes, and other philanthropic enterprises.

Bronfman Youth Fellowships in Israel

The Bronfman Youth Fellowships were established by Edgar Bronfman, Sr., in 1987 to create educational experiences that would enrich the lives of American and Canadian Jewish teenagers. Although not a religious Jew himself, Bronfman is a staunch supporter of Zionist and Jewish causes. The Bronfman Youth Fellowships embody his principles and beliefs. He wants to help educate a generation of Jewish leaders and influential citizens who are strongly committed to Israel and connected to their own Jewishness. He further hopes to encourage Jewish pluralism by bringing together teenagers from diverse backgrounds, from the ultraorthodox to the agnostic and atheist and from small communities and large cities. Through these fellowships, he seeks to create discussion among Jewish people with disparate voices, so that despite individual differences the Jewish community can attain a united vision of the importance of perpetuating its heritage.

Every year, twenty-six sixteen-year-old high school juniors are chosen to participate in the fellowship program. It is an intensive, five-week-long experience in Israel, during which students study the Torah, learn about Israel's ancient and modern history, meet with Israeli leaders and politicians, and experience Israeli culture throughout the country. The fellows are also required to attend study sessions in New York City both before and after the trip. As of 2009, there were more than five hundred fellows, half of whom went on to attend Ivy League colleges, fifteen of whom were Rhodes Scholars, and many others who received other scholarships and were beginning their professional lives as leaders in many fields, such as medicine, law, writing, and filmmaking.

The success of the Bronfman Youth Fellowships program led Bronfman to inaugurate an Israeli version of the program, Amitei-Bronfman, in 1998. Young people in this program study together in Israel and spend their senior year of high school attending schools in the United States. The highly successful program Birthright Israel, which annually sends thousands of Jewish college-aged students to Israel for free ten-day trips, is based on the Bronfman Youth Fellowships program and financially supported the Samuel Bronfman Foundation, which Edgar Bronfman, Sr., established in honor of his father. These trips are designed to allow many Jewish students from around the world to visit Israel for the first time, with the goal of infusing them with a sense of connectedness to this nation.

Legacy

Edgar Bronfman, Sr.'s, legacy is almost entirely tied to his connections with Jewish philanthropy. Believing that Jews must maintain a Jewish identity, he devotes much of his money and time to promoting Jewish and Israeli causes. While serving as the president of the World Jewish Congress, he was instrumental in publicizing Jewish concerns and fighting worldwide anti-Semitism. For example, under his presidency, this organization exposed Austrian president Kurt Waldheim's past participation in Nazi activities. Bronfman was also deeply involved in negotiations with the Swiss government concerning Jewish property that was illegally confiscated during World War II. In addition, Bronfman has helped thousands of Soviet Jews emigrate to the United States. As head of the World Jewish Restitution Organization, Bronfman fought for the return of stolen Jewish items confiscated during the war, not simply for financial restitution. He is the largest single supporter of Hillel, the international college-based Jewish organization. In his other philanthropic enterprises, he is a benefactor of McGill University, many museums and fine arts causes, and various other charities.

Samuel Bronfman

Canadian liquor company magnate

Bronfman entered the liquor distributing business at the beginning of Prohibition. By working around legal loopholes, he became the largest liquor distributor in North America and introduced aged whiskey to the Canadian and American markets. He devoted his adult life to philanthropy and Zionism.

Born: February 27, 1889; Soroki, Bessarabia, Russian Empire (now in Russia)
Died: July 10, 1971; Montreal, Quebec, Canada
Source of wealth: Sale of products
Bequeathal of wealth: Children; charity

Early Life

Samuel Bronfman (BRONF-mahn), whose last name means "liquor man" in Yiddish, was born into a wealthy Russian-Jewish family and was one of eight children. The family fled czarist Russia, fearing the anti-Jewish pogroms there, and settled in Canada in 1889. Despite their wealth in Russia, the Bronfmans lived in poverty during their first years in Canada. Samuel's father, Yechiel Bronfman, who had been a tobacco farmer in Russia, soon realized that farming was not going to be his occupation in Canada. He began a series of jobs, first as a laborer, then in a saw mill, and finally as a merchant selling firewood and whitefish. He eventually began trading horses, which led the family to open a small hotel. The railroad boom helped their hotel take off, and soon the family was running three Canadian hotels.

First Ventures

In 1903, Samuel Bronfman purchased his first hotel and began running the family business with his brother Harry. In 1916, Samuel purchased the Bonaventure Liquor Store Company in Montreal. When Canada enacted Prohibition in 1918, the hotel business began to fall off sharply. Bronfman realized that much of the profit at his hotels was actually coming from their bars, and he decided to go into the liquor business full time. Bronfman and his brothers—Harry, Abe, and Allan—began selling spirits throughout Canada at great profit because of their scarcity during Prohibition. In 1918, a Canadian law made the importation, manufacture, and transportation of all liquor illegal, unless it was used for medicinal purposes. In response, Bronfman purchased the contract for Dewar's whiskey from the Hudson's Bay Company and began marketing his whiskey as elixirs and tonics through drugstores.

In 1919, the United States adopted its own Prohibition law, the Volstead Act. Prohibition was taken more seriously in the United States than in Canada, where there was not much actual implementation of the antidrinking legislation. By 1924, all Canadian laws against adult consumption of liquor were repealed. The Bronfman brothers, however, had used the period of Prohibition to build up an efficient distribution system, and in 1924 they founded the Distillers Corporation of Montreal, which sold cheap whiskey. This company's infrastructure allowed Bronfman to supply American bootleggers with liquor from 1919 until 1933, the end of Prohibition in the United States.

Mature Wealth

Because of American Prohibition, Bronfman was able to purchase 300,000 gallons of alcohol in the United States in 1919 and bring it to Canada, where it was used to make 800,000 gallons of liquor. He distilled the product into whiskey, selling it at a 500 percent markup. In 1926, Bronfman sold a 50 percent share in Distillers Corporation to the Distillers Company, a group of British distillers that controlled most of the world's market for Scotch whiskey. This transaction gave Bronfman the sole right to distribute the Haig, Black & White, Dewar's, and Vat 69 brands in Canada. In 1928, Bronfman expanded his Distillers Corporation by purchasing Joseph E. Seagram & Sons, the largest liquor distillery in Canada. With Bronfman as vice president, the new company, Distillers Corporation-Seagram Limited, made $2.2 million in profits in 1928. However, American Prohibition was having a negative effect on sales, and by 1930, profits had declined. Bronfman purchased warehouses all along Canada's eastern border with the United States and founded Atlantic Import and Atlas Shipping, two companies that facilitated the shipping of liquor into the United States. Although it was illegal to receive liquor shipments in the United States, it was not illegal for a Canadian to sell liquor, and in 1934, when the Bronfman brothers were tried for bootlegging, their case was dismissed.

Anticipating the eventual repeal of the Volstead Act in the United States, Bronfman had stockpiled whiskey; this stock was the largest private supply of aged whiskey in North America. In 1933, Bronfman acquired 20 percent of Schenley, a producer of rye whiskey. When Bronfman asked the board of directors of the Scotland-based Distillers Company to increase the price of Scotch whiskey, the board refused. In response, the Bronfman brothers raised enough money to buy out the Distillers Company's holdings in Distillers Corporation-Seagrams Limited, and Samuel Bronfman became president of Joseph E. Seagram & Sons. He then purchased a distillery in Indiana, establishing the American branch of Seagram's business.

Samuel and Saidye Bronfman Foundation

Founded in 1952, the Samuel and Saidye Bronfman Foundation was established by Samuel Bronfman and his wife, in their names and the names of their four children, in order to allocate family money for charitable and philanthropic purposes. Samuel and Saidye Bronfman shared the belief that civilization depended on the development and support of community values, and they dedicated their foundation to the support of these values. The foundation provides venture capital to nonprofit organizations, as well as to deserving individuals, in order to foster cultural and civic projects, with consideration given to sustainable enterprises. The organization is one of Canada's largest private philanthropic funds distributing money from a single family.

Among its contributions, the foundation provided financial support for higher education in Canada, with donations to McGill University and the University of Saskatchewan, among other schools. In 1971, Samuel Bronfman funded the construction of the Bronfman Building at McGill University to house the newly established Desautels Faculty of Management.

The foundation also provided funds for many artistic enterprises, including construction of the Saidye Bronfman Centre for the Arts, a community theater, art gallery, and fine arts school in Montreal commonly known as "the Saidye." By 2009, the structure had been replaced by the new Segal Centre for the Performing Arts. The foundation also donated $1.5 million to the Canada Council for the Arts, and these funds were used to create a trust providing yearly awards to crafts artists.

Both Samuel and Saidye Bronfman were recognized for their commitment to philanthropy by the creation of the Samuel Bronfman Award, presented to a recipient who has excelled in humanitarian work, and the Saidye Bronfman Award, given to artists whose work exemplifies creativity and excellence in execution.

Samuel's son, Edgar Bronfman, Sr., established the Samuel Bronfman Foundation in honor of his father. This organization seeks to inspire a renaissance in Jewish life, to educate young people about Judaism, and to strengthen the Jewish community. The foundation is a major supporter of Hillel, the college-based group devoted to campus Jewish life, and Birthright Israel, which provides free trips to Israel for non-Israeli college-aged applicants.

Relations with Schenley were not always smooth, however, and when Bronfman learned that Schenley would not agree to age its rye whiskey, he ended his associations with this company. For years, the two companies vied for first place in worldwide whiskey sales, with Seagram emerging the victor in 1947. At about this time, Bronfman forced his brothers out of the business and took over company management, insisting that only his sons, Edgar and Charles, would ever inherit or work for Seagram.

Bronfman was committed to changing the face of the whiskey business. He wanted to distance his name from the 1922 murder of his brother-in-law, Paul Matoff, by American bootleggers and remove the perception that his product was cheap rotgut. He insisted that Seagram sell blended, aged whiskey and opened "blending libraries" in New York, Montreal, and Scotland, where scientific processes were used to ensure his products' consistency and quality. To further ensure the quality of his product, Bronfman revolutionized the marketing and distribution of whiskey by selling it when it was already aged and bottled. Until this time, whiskey was shipped in kegs, which allowed for variations in the quality of the final product. Bronfman wanted all of his customers to know exactly what they were purchasing and be able to count on the integrity of the Seagram name. This practice soon became the industry standard. In the 1930's, Bronfman established a large-scale advertising campaign extolling the virtues of moderate and social drinking.

Bronfman purchased Maryland Distillers, including its Calvert brand, in 1934, and in 1936 he opened a distillery in Kentucky. In 1939, he purchased the Chivas brand's distillery in Scotland and created Chivas Regal as a tribute to King George VI when the king and his wife visited Canada. In the 1940's Bronfman expanded his company's product line to include the development and distribution of other types of spirits and wine. He became partners with a German vintner to purchase the Paul Masson vineyards and winery in California. Seagram further expanded by purchasing distilleries in the West Indies that made rum, including the Captain Morgan brand, and the champagne companies that produced Mumm and Perrier-Jouet, among other brands. By 1965, Bronfman's combined worldwide liquor enterprises were operating in 119 countries at a yearly profit of $1 billion.

Bronfman also commissioned architect Ludwig Mies van der Rohe to design his American headquarters in New York, and Mies van der Rohe's Seagram Building, a skyscraper in midtown Manhattan, remains a New York City landmark. In addition, Bronfman purchased Texas Pacific Coal and Oil Company for $50 million; after his death, his heirs eventually sold this firm for $2.3 billion.

Samuel Bronfman died of prostate cancer in 1971. He had always wanted to feel accepted by society and never felt that he achieved this goal. However, his reputation in Canada and the world was so great that upon his death he finally achieved the recognition he desired, when, on the occasion of his funeral, Montreal's airport had to be closed to regular air traffic in order to accommodate the private jets of the dignitaries attending the service.

Legacy

Samuel Bronfman's legacy is seen in many arenas, not simply the liquor business. His lifelong work was centered on philanthropy dedicated to fighting anti-Semitism and supporting cultural institutions. In 1951, he met with Shimon Peres, the future prime minister of Israel, to help procure weapons for Israel. Using his contacts in the Canadian government, Bronfman was able to purchase $2 million worth of guns at half price. When Peres could not pay, Bronfman threw a fund-raising dinner and obtained the money. From 1939 to 1962, Bronfman was president of the Canadian Jewish Congress. He also provided a good deal of support to McGill University in Montreal, despite its history of anti-Semitism. Perhaps his greatest legacy to the country of Canada was the creation of the Samuel and Saidye Bronfman Foundation, which is dedicated to providing private capital for artistic and other ventures. He was made Companion of the Order of Canada in 1967 and awarded the Chevalier de la Légion d'honneur by France in honor of his support of Zionism.

MOSES BROWN

American textile manufacturer, merchant, and abolitionist

Brown was born into a prominent commercial and seafaring family in colonial New England, and he was instrumental in establishing the textile industry there. The most significant of his charitable bequests were to Brown University and to a private preparatory school.

Born: September 23, 1738; Providence, Rhode Island
Died: September 6, 1836; Providence, Rhode Island
Sources of wealth: Manufacturing; trade
Bequeathal of wealth: Relatives; charity; educational institution.

EARLY LIFE

Moses Brown was a member of a business-oriented family that was involved in various commercial enterprises in and around Providence, Rhode Island. While Brown's formal schooling ended when he was about thirteen, he learned business and seafaring skills through his family's business. The Brown family was involved in the African slave trade, although this was never their primary business venture. In 1764, Moses and his brother John Brown organized a slaving voyage of the ship *Sally*, which ended disastrously, with more than half of the slaves dying. This experience turned Brown away from the slave trade, and he eventually became one of the first abolitionists in America.

FIRST VENTURES

Brown ended any direct involvement with the slave trade immediately after the voyage of the *Sally*. He continued to work in the family firm, formally known as Nicholas Brown and Company, until the early 1770's. In 1773, his wife Anna died, prompting a spiritual crisis that led Brown to embrace the Quaker faith. He withdrew from active business work and devoted himself to religion, charity, and social reform, especially the cause of abolition. He moved to an estate named Elmgrove outside Providence and directed farming operations there, raising Merino sheep and experimenting with a variety of crops and techniques of crop rotation. In November, 1773, he freed the six slaves that he personally owned, and he renounced any financial interest in other slaves that were owned in common by the family.

MATURE WEALTH

After the American Revolution, Brown worked to establish the textile industry in the United States. He joined with a son-in-law, William Almy, and another relative to form Almy & Brown in order to begin textile mill operations. In 1789, Brown hired Samuel Slater, an immigrant from Great Britain with knowledge of the cotton textile industry, to examine some cotton spinning equipment that Brown's workers could not get to work properly. Great Britain at this time would not export cotton milling equipment and forbade the export of even the drawings or plans for building such machinery. Slater, however, had smuggled out valuable "mental baggage" and knew how to rebuild Brown's equipment.

In December, 1790, Slater worked with Brown to open the first water-powered cotton textile mill in the United States at Pawtucket, Rhode Island. Three years later, Slater became a partner in Brown's firm. While the milling industry made Slater wealthy, Brown claimed that he never made money from it but had simply recouped his initial investments. By the time both Slater and Brown died in the 1830's, New England had become second only to Great Britain as a center of the cotton milling industry. Brown was also involved in the founding of a bank in Providence in 1791, and he served as an officer of the bank for several years. In the early 1800's, Brown once again retired from active business pursuits.

Legacy

Although he never accumulated a truly massive fortune, Brown made gifts to numerous charities and reform groups throughout his lifetime. His most important legacies were the founding of Brown University and the Moses Brown School. While Brown University received support from many members of the Brown family, it was Moses who led the effort in 1770 to relocate the school, then called Rhode Island College, from Warren, Rhode Island, to Providence. In 1804, in honor of the generosity of Brown's nephew Nicholas Brown, the school took the name Brown University. In the twenty-first century, Brown University has faced considerable controversy over the fact that some of its original bequests were from people involved in the slave trade. Moses Brown also led an effort and donated land to establish a Quaker boarding school in Providence in 1784. In 1909, the school took the name the Moses Brown School.

Warren Buffett

American investor and philanthropist

Buffett, an investor and philanthropist known worldwide as the Oracle of Omaha, parlayed investment savvy with his friends and family's capital into Berkshire Hathaway, Inc., which had the highest-priced stock in the history of the New York Stock Exchange. With an estimated net worth of $47 billion in 2010, Buffett became one of the richest people in the world during the late twentieth and early twenty-first centuries.

Born: August 30, 1930; Omaha, Nebraska
Also known as: Warren Edward Buffett; the Oracle of Omaha
Source of wealth: Investments
Bequeathal of wealth: Relatives; charity

Early Life

Warren Edward Buffett (BUHF-feht) was born on August 30, 1930, in Omaha, Nebraska, the son of Leila and Howard Buffett. Howard (1903-1964) was a Republican member of the House of Representatives, who earned his living trading stocks. He was elected to Congress in 1942, the first of four terms, representing eastern Nebraska as an ardent opponent of President Franklin D. Roosevelt. Howard earned some notoriety in Congress for returning a salary increase to the U.S. Treasury.

At age eleven, Warren Buffett purchased his first stock through his father's firm, three shares of Cities Service (now CITCO) for $37. He sold the stock for $40, and, upon watching the stock's price reach $200, later remarked that he had learned an early lesson in what became his lifelong investment philosophy: find good value, buy, and hold. (Stock in Buffett's company, Berkshire Hathaway Inc., reached $140,000 a share in 2007, and $90,700 in 2009, and in accordance with his philosophy has never been split.) Buffett filed his first income tax return at age thirteen, deducting a bicycle, which he used to deliver newspapers, as a business expense. He graduated from Woodrow Wilson High School in Washington, D.C., in 1947, earned a B.S. degree at the University of Nebraska in 1950, and received an M.S. in economics from Columbia University in 1951.

First Ventures

In 1956, after working briefly for his father and for other investment firms, Buffett opened Buffett Associates, Ltd., his first investment partnership, with $100 from his own pocket and $105,000 from limited partners, all of them family and friends. Between 1956 and 1969, the value of Buffett's portfolio exploded as he earned an average of 30 percent a year, between three and four times the market average, while working from an office in his home.

The "Berkshire Hathaway" name initially belonged to a declining textile firm in which Buffett's firm began buying stock in 1962. Seven years later, Buffett shed the firm's textile mills and made Berkshire Hathaway a holding company for his several partnerships. Early on, Buffett directed his investment acumen at insurance companies because their large cash reserves provided a ready source of investment capital. In January, 1979, Berkshire Hathaway's stock began trading at $775 a share, and by December it nearly doubled to $1,310. By that time, Buffett's net worth of $620 million put him among *Forbes* magazine's four hundred richest people for the first time.

Berkshire Hathaway invests heavily in name-brand companies, such as Coca-Cola, that are dominant in their industries, as well as in smaller businesses that are well managed and have niche markets that help them succeed. Once Berkshire Hathaway buys a company, existing management is usually allowed to run it. However, Buffett himself reserves the right to set the compensation of the chief executive officer.

MATURE WEALTH

Buffett's companies are known for their tight financial operations, and Moody's Investors Service often gives them AAA ratings, the highest possible credit ranking. Buffett often waits for stock prices to fall before investing in assets that he considers top-of-the-line. His success with this approach has spawned a cottage industry of Buffett watchers who emulate his methods. He is also known to withhold investments during periods of stock speculation and rising prices and to avoid buying stock in companies that lack discernable asset value. This approach prevented Berkshire Hathaway from losing money when the dot-com bubble burst in the early years of the twenty-first century.

Buffett taught his children the risks of uninformed gambling by buying them an antique slot machine and a stack of quarters, with the proviso that he would retain the machine's winnings. Soon, the quarters were back in his pocket. This is not to say that Buffett will not take risks. After two devastating Atlantic hurricane seasons in

Warren Buffett. (AP/Wide World Photos)

The Susan Thompson Buffett Foundation

The Susan Thompson Buffett Foundation, with an office in Omaha, Nebraska, manages Warren Buffett's charitable giving. It was named in honor of Warren's first wife after her death in 2004. The foundation initially gave away about $12 million annually from an asset base of about $500 million. Grants increased to about $150 million annually by 2009, as Buffett directed some of his $62 billion in assets to the foundation. Money from Susan's estate, reportedly about $2 billion, also was added to the foundation's asset base.

Buffett also is directing a large proportion of his fortune (about 85 percent, as of 2006) into charities operated by Bill Gates, cofounder of Microsoft Corporation, and his associates, principally the Bill and Melinda Gates Foundation. Buffett has said that the Gates Foundation would be better able to manage large amounts of money than his own foundation. Most of Buffett's wealth comes from his stock in Berkshire Hathaway, Inc., in which he holds about 40 percent of the shares.

Most of the Buffett foundation's awards are by internal nomination only, and they tend to focus on education, health care (notably family planning, including access to abortion), international relief efforts, arts, environment, and civil liberties. Individual grants have ranged from a few hundred dollars to several million. However, some money is given for educational purposes, entirely in Nebraska, for programs that are open to public application. The foundation, for example, provides scholarships covering tuition and fees up to $3,200 per semester, with an added textbook allowance of $400, for undergraduate students enrolled in public universities and colleges, including community colleges, in Nebraska. The foundation each year also recognizes teaching excellence in the Omaha public schools with fifteen awards of $10,000 each. Nominations for these awards are accepted from parents, former students, teachers other than the nominee, school administrators, and members of the general public.

2004 and 2005, he bought heavily into coastal insurance, figuring that an El Niño weather pattern would quell the storms in 2006. He was correct, and he earned millions of dollars for Berkshire Hathaway. Buffett has quipped that he spends a lot of time watching The Weather Channel.

On November 3, 2009, Buffett acquired Burlington Northern Santa Fe Corp., the United States' largest rail transporter of grain and coal, for a record $34 billion. "It's an all-in wager on the economic future of the United States," Buffett said in a statement about the deal. "I love these bets."

Buffett is well known in Omaha as a public citizen. He can occasionally be spotted on any given weekend ordering ice cream with Bill Gates, a cofounder of Microsoft Corporation, at an Omaha Dairy Queen, a chain that Berkshire Hathaway owns. He also may be spotted playing bridge with Gates or taking dozens of business and journalism students from the University of Nebraska at Omaha to lunch. On occasion, he visits Omaha schools to teach children to play the ukulele.

Berkshire Hathaway's annual meetings in early May are cultural events, drawing thousands of investors and filling the Qwest Center, Omaha's largest indoor arena. The annual meeting, timed to coincide with Buffett's often-humorous annual statement to stockholders, can draw fifteen thousand to twenty thousand people, providing a major boost to the local economy that observers have called "the Woodstock of Capitalism."

Buffett is famous not only for his investment acumen but also for his disregard of the ostentatious consumption made possible by great wealth. He is famously frugal, continuing to live in the same home in central Omaha that he bought in 1958 for $31,500. He also owned a larger house in Laguna Beach, California, that he sold in 2004. Having purchased a corporate jet in 1989 for almost $10 million, he named it "The Indefensible" because he earlier had criticized similar purchases by other companies.

Buffett is known as a genial and equitable employer, a longtime Democrat, and a sharp critic of unfair employment practices that take advantage of poorly paid people. He was an early supporter of Democratic presidential candidate Barack Obama. Buffett also has criticized low property tax rates in California, using a home he owned there until 2004 to compare tax rates on the California house with those on his home in Omaha. Buffett is also a self-described agnostic.

A persistent critic of executive overcompensation, Buffett draws an annual salary of $100,000 from Berkshire Hathaway. He believes that widespread debt will hurt the American economy and the country's currency in the long run, and he has been careful about investing in foreign companies.

Buffett is a critic of the market system and the monetary value that it places on certain kinds of work. He believes that the market system unfairly rewards some people, such as a heavyweight boxer who can knock out another fighter, or a Major League Baseball player with a high batting average, while a good teacher or nurse is underappreciated. The Susan Thompson Buffett Foundation sponsors an annual competition for the best teachers in Omaha schools, with monetary rewards.

Buffett and his wife Susan separated in 1977, although they remained married until Susan died in 2004. On his seventy-sixth birthday, Buffett married Astrid Menks, who had lived with him since he and Susan separated. Before Susan left Omaha for San Francisco to pursue a singing career, she had arranged for Astrid, a former housekeeper in the Buffett home, to meet Warren. The three were close friends; they attended social events together at times, and they sent cards to friends that were signed "Warren, Susie and Astrid."

Legacy

Buffett believes that people whose talents are amply rewarded by the capitalist marketplace owe a debt to society. His charitable donations are a return to society for the market value of what he considers to be his own peculiar talent. Several times, Buffett has offered to auction off a meal with him for good causes. Many aspiring investors will pay hundreds of thousands of dollars for an hour or two of Buffett's time; one investor paid $620,000 for a lunch date. During September, 2006, Buffett auctioned his well-used Lincoln Town Car on the eBay Web site for $73,200, and he donated this money to Girls, Inc., a national organization that works to empower girls.

Both Buffett and Bill Gates have become major philanthropists. In June, 2006, Buffett pledged to give about three-quarters of his assets ($30.7 billion) to charity, with 85 percent going to the Bill and Melinda Gates Foundation—the largest donation in the history of corporate philanthropy.

Buffett has established relatively small foundations headed by each of his three children, Susie, Howard, and Peter. He opposes large-scale transfer of big estates within families, and he has vigorously opposed elimination of inheritance taxes on grounds that concentrating wealth is socially dysfunctional.

Angela Burdett-Coutts
British aristocrat and philanthropist

Burdett-Coutts may have been the wealthiest woman in nineteenth century Great Britain. She was a patron of writers, particularly Charles Dickens, with whom she pursued social reforms. Devoting her life to charitable work, she was admired throughout England.

Born: April 21, 1814; London, England
Died: December 30, 1906; London, England
Also known as: Angela Georgina Burdett-Coutts; Angela Georgina Burdett (birth name); First Baroness Burdett-Coutts
Source of wealth: Inheritance
Bequeathal of wealth: Spouse; charity

Early Life

Thomas Coutts, the grandfather of Angela Georgina Burdett-Coutts (buhr-DEHT-coots), was one of the most successful bankers in British history. While presiding over Thomas Coutts & Co. bank for sixty years, he accumulated a personal fortune of £900,000. His daughter Sophia married Sir Francis Burdett, and the couple had five children, of whom Angela was the youngest. Young Angela was raised in the finest aristocratic manner in an elegant London home and two historic country estates, Ramsbury Manor and Foremarke Hall. She traveled throughout Europe and learned several foreign languages.

In 1837, Angela inherited the bulk of her grandfather's fortune from his deceased wife, making her the richest heiress in England. She acquired half-ownership of Thomas Coutts & Co. bank, Thomas Coutts's houses, and his personal possessions, gold, and annuities. The newspapers estimated her inheritance at almost £2 million, with an annual income of £80,000. While this amount may have been exaggerated, there was no doubt that she had inherited an enormous amount of money; her wealth was equal to several billion dollars in 2010 U.S. currency. Although she was not the first woman to inherit a fortune in real property, no other English woman had ever controlled so much liquid wealth. According to the terms of her grandfather's will, she was required to add Coutts to her surname, which was hyphenated as Burdett-Coutts.

First Ventures

For a woman living in the Victorian era, Burdett-Coutts showed unusual independence, setting up her own mansion in London on the corner of Stratton and Piccadilly Streets. She loaned Queen Victoria a large sum of money to enable the queen to pay off her debts. Burdett-Coutts wore expensive clothes and exquisite diamonds that had been inherited from her family, including a tiara that had belonged to Marie-Antoinette. Her art collection contained paintings by Sir Joshua Reynolds and other English portraitists. She owned valuable china. Her library included first folios of the works of William Shakespeare and historic letters from Charles II and Georgiana Cavendish, duchess of Devonshire.

With her unencumbered fortune, Burdett-Coutts was sought after by suitors, but she was skeptical of their motives. She apparently was also ashamed of a skin condition. She was besieged by marriage proposals. Although she rejected each one, she was impressed by a young writer she met in 1838, Charles Dickens. She and Dickens would remain lifelong friends and correspondents. For eighteen years, she was harassed (or in modern terms, stalked) by a psychotic Irish barrister, Robert Dunn, who imagined he was courting her. In the 1840's, she became well acquainted with England's great hero, Arthur Wellesley, the duke of Wellington. Despite her interest, however, he never proposed marriage. Through the intervention of the great scientist Michael Faraday, she joined the Royal Institution of Great Britain 1847. She encouraged the mathematical genius Charles Babbage to publish his children's stories.

Mature Wealth

Burdett-Coutts devoted her wealth to philanthropic work, assisting hundreds of charities. She involved the young Dickens in her charitable works, and he roamed the slums of London looking for impoverished residents worthy of Burdett-Coutts's charity. He brought to her attention the wretched condition of the Field Lane Ragged School, which she then supported for many years. In 1847, Dickens encouraged her to take action to alleviate prostitution in London. With Dickens's guidance, she subsidized Urantia Cottage for needy women who might otherwise resort to prostitution. Urantia Cottage housed thirty women. She also followed Dickens's advice in building model apartments in Columbia Square in the 1860's. In 1864, she built Columbia Square Food Market to improve the food supply of the apartments' residents. She gave generously to the Church of England in her own country and throughout the world. She endowed bishoprics in Australia, Canada, and St. Helena. In Westminster, one of London's worst slums, she built a religious complex with a school, a vicarage, and a church. She also rebuilt St. Stephen's Technical Institute in Westminster.

Burdett-Coutts was eager to fund charities in the British colonies, especially the African colonies in Nigeria and what is now South Africa. In 1847, she became friends with the remarkable James Brooke, who had improbably become the raja of Sarawak, a kingdom near Borneo. She wanted to make Sarawak a protectorate of Great Britain; failing in that, she gave the raja large sums of money to help him govern his unruly subjects.

Burdett-Coutts tried to keep her charity work a secret but was unable to do so. In recognition of her philanthropy, she was made a baroness by Queen Victoria in 1871. Burdett-Coutts was the first woman to be raised to the peerage because of her own efforts, rather than those of a spouse.

On February 12, 1881, having rejected suitors for forty years, she married her secretary, William Lehman Ashmead-Bartlett, to the surprise of English society. Ashmead-Bartlett, who was twenty-nine years old (Burdett-Coutts was sixty-seven), took the surname Burdett-Coutts and was known as W. L. Burdett-Coutts.

Burdett-Coutts died on December 30, 1906, at the age of ninety-two. She was given the honor of a burial in Westminster Abbey. During her lifetime, it is estimated that she donated more than £3 million to charity.

Legacy

For many reasons, Angela Burdett-Coutts was a remarkable woman. She was one of the wealthiest women in nineteenth century England. She pursued her own ideas of how she should use her wealth, rejecting conventional marriage. She formed friendships and close associations with three of England's most remarkable personalities, the duke of Wellington, the raja of Sarawak, and Charles Dickens. She subsidized writers like Dickens, but, more important, she recognized and supported Dickens's de-

Literary Patronage and Wealth

Writers have been assisted by wealthy patrons since antiquity. The most famous classical patron was Gaius Maecenas, a wealthy Roman of the first century B.C.E., who supported Vergil and Horace, as well as other writers. Maecenas's support was of such significance that his name has become synonymous with patronage of literature and art. Maecenas provided more than financial assistance to writers. He also offered valuable advice. Both Vergil and Horace stated that Maecenas's critiques of their writing helped them with their work. Maecenas did not support the arts out of personal vanity, as did many later patrons, but as a civic duty and a means to improve Roman culture.

The Elizabethan writers Christopher Marlowe, Ben Jonson, and William Shakespeare all appear to have benefited from the patronage of the wealthy. Shakespeare dedicated his sonnets to the mysterious W. H., apparently an aristocratic patron. Sir Thomas Walsingham provided patronage to Elizabethan writers Marlowe, George Chapman, Thomas Nashe, and Thomas Watson. Patronage of writers was also common in eighteenth century England. However, unlike other writers of the Augustan Age, the satirist, novelist, and poet Jonathan Swift publicly denounced patronage and refused to accept assistance. In China, the wealthy salt merchants of Yangzhou sparked a literary renaissance in the eighteenth century by vying to be patrons. The Ma brothers, Ma Yueguan and Ma Yuelu, subsidized numerous poets and scholars. Another wealthy salt merchant, An Qi, gave the scholar Zhu Yizun a gift of 10,000 taels in order to write classical works of philosophy. In nineteenth century England, Angela Burdett-Coutts provided some financial support to her friend, writer Charles Dickens, a relationship that also involved their common work to alleviate poverty in London.

One of the most significant literary patrons was the nineteenth century American capitalist Henry Huttleston Rogers. Rogers helped John D. Rockefeller build the Standard Oil Company, from which Rogers made a great fortune, and he also amassed wealth from other oil, mining, banking, manufacturing, and railroad companies. At the end of the century, Rogers's fortune was estimated at more than $100 million, making him one of the twenty-five wealthiest Americans in history. Rogers was known to be ruthless in business, but he could be generous to authors, as exemplified by his relationship with writer Mark Twain. After some failed business ventures in the 1890's, Twain faced bankruptcy. Rogers quietly provided assistance to Twain, who credited Rogers with saving him from ruin. Rogers also paid for Helen Keller's education at Radcliffe College and provided her with a generous subsidy upon graduation. Keller subsequently dedicated her book, *The World I Live In* (1908), to Rogers. Rogers also furnished subsidies for the work of Booker T. Washington. Rogers did not want his donations to be publicized and his gifts have been described as "secret philanthropy."

sire to help the poor of London, an ambition that matched her own. More than anything else, she was a true philanthropist, devoting the majority of her life and fortune to a wide array of charitable works.

Adolphus Busch

American brewer and industrialist

Busch built a beer-brewing empire that eventually became Anheuser-Busch Companies and later was acquired by Belgian brewer InBev.

Born: July 10, 1839; near Mainz, Hesse (now in Germany)
Died: October 10, 1913; near Langenschwalbach, Germany
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Children

Early Life

Adolphus Busch (ay-DOHL-fus buhsh) was born near Mainz, Hesse, on July 10, 1839, the youngest of twenty-one children. As a boy, he began working with his father, a wine merchant and brewing supplies dealer. He was educated in Mainz and Darmstadt and attended high school in Brussels. When he was seventeen, he went to work as a shipping clerk in a mercantile house in Cologne. Here he learned valuable business skills that would allow him to amass his great fortune.

First Ventures

When he became eighteen, Busch left Germany for the United States and set up his own supply store with his brother Ulrich. Two other Busch brothers had already left for America and had settled in St. Louis, Missouri, which was quickly becoming a virtual German colony. He married Lilly Anheuser, and his brother Ulrich married her sister Anna, in a double ceremony in 1861.

Busch went in to the brewing business in 1865 with his wife's father, Eberhard Anheuser, who already owned the struggling Bavarian Brewery Company. Together they created Budweiser, a lighter and sweeter variety of beer than others at the time. Busch worked hard to have his beer sold in taverns, even paying some owners

Adolphus Busch. (The Granger Collection, New York)

to keep it on tap, although it tasted horrible. When the brewers finally created a good-tasting batch, the beer became a sought-after beverage. As Budweiser became popular, Busch gradually reduced the number of beers manufactured by the company in order to focus on the most profitable brands.

When Anheuser died in 1879, Busch took over as president of the company. Busch increased production and turned a small brewing company into a city-sized corporation housed in St. Louis. In the laboratories at Anheuser-Busch, scientists developed a new pasteurization technique that allowed beer to be shipped without refrigeration, which meant that beer could be transported from coast to coast without turning sour. Busch was also famous for his ingenious marketing and sales techniques. He focused on building a brand, and because of this, Budweiser beer remains one of the most recognizable products in the world.

MATURE WEALTH

Busch was able to amass his wealth by keeping ownership of the company within the family When he first went to work for Anheuser, there were 480 shares of stock in the company—238 belonging to him, 2 shares to the brewmaster, and the remaining 240 shares split between Anheuser and his daughter Lilly. After Anheuser's death in 1879, Busch began buying up shares of the company from Anheuser's relatives, increasing his total shares from 238 to 267. He also created a vertically integrated corporation by owning companies that supplied the materials necessary to make his beer. He owned glass bottle plants, ice-making businesses, refrigerated railroad cars, and eventually the railroads themselves. Production increased by more than 200 percent by 1880, with a record production of more than 130,000 barrels of beer. He added workers and buildings at the brewery in St. Louis and employed guides to give tours of the facility to visitors. In the fifteen years since Busch went into business with Anheuser, he had taken a small local brewery and turned it into a national empire that was generating more than $2 million a year.

Busch's heirs continued his marketing legacy, with the most notable and longest-running campaign being the world-famous Budweiser Clydesdales, an iconic eight-horse hitch (team) that travels to more than one thousand events annually. The company also mass-markets its products through major sports sponsorships and partnerships, and since 1980 it has allied with Major League Baseball, the National Hockey League (NHL), National Basketball Association (NBA), twenty-eight National Football League (NFL) teams, Major League Lacrosse, the Professional Golfers' Association of America (PGA), the Ladies Professional Golf Association (LPGA), the U.S. Olympic team, the Olympic Games, and the Fédération Internationale de Football Association (FIFA) World Cup.

LEGACY

While he lived lavishly and never thought twice about spending money to close business deals and expand his enterprises, Busch still managed to amass more than $50 million by his death in 1913, at the age of seventy-four. His estate was the largest ever probated in the state of Missouri. Over the years, he had given generously to education and other charities, but his prime focus was creating an empire out of his small brewing city in St. Louis. In July, 2008, Anheuser-Busch made the decision to sell to Belgian brewer InBev for $75 a share. The acquisition of Anheuser-Busch by InBev, which had more than 120,000 employees in more than thirty countries around the world, created the world's largest brewing company. InBev agreed to reserve a spot on the board for the chief executive officer of Anheuser-Busch, August A. Busch IV, and kept the North American headquarters in St. Louis in order to retain the history of the iconic American brand. In 2009, the company was led by Busch IV, and the Busch family had a total fortune of more than $1.3 billion.

MANUEL CALVO

Spanish planter, merchant, and banker

Born in Spain, Calvo made a fortune in the shipping, sugar, and banking industries of nineteenth century Cuba, which he used to oppose Cuban independence and to support numerous charities.

Born: December 25, 1816; Portugalete, Spain
Died: 1904; Cadiz, Spain
Also known as: Manuel Calvo y Aguirre; Don Manuel Calvo
Sources of wealth: Agricultural products; shipping; banking; slave trade
Bequeathal of wealth: Charity

EARLY LIFE

Manuel Calvo y Aguirre (MAHN-yew-ehl CAHL-vo ee ah-GEER-ray) was born in Portugalete in the Basque region of Spain in 1816. His father Mathias was captain of a ship in the Cantabrian coast guard. Manuel studied seamanship and sailing with his father from the age of twelve to eighteen.

FIRST VENTURES

At eighteen, Calvo moved to Spain's prosperous colony of Cuba to seek his fortune. He worked as a clerk in Cuba's flourishing shipping industry. By nursing his savings through eight years of hard work, he was able to become a shipowner. With his profits he established a company, which by 1850 monopolized shipping from the Vuelta Abajo port district in Cuba to the Isle of Pines (now the Isla de la Juventud). His ships also transported slaves from Africa.

MATURE WEALTH

At the height of his success in shipping, Calvo had the sudden idea to create a sugar conglomerate. At the time, sugar was a leading industry in Cuba, but its production tended to be piecemeal. Calvo established a sugar plantation and mill of almost 120 square kilometers, which he named after his hometown. Calvo's Portugalete mills processed sugar through its entire production cycle, from extracting the sugar from sugarcane to packaging and exporting the finished product. He also processed alcohol from sugarcane. Calvo lived in an opulent mansion on his plantation. As a leading planter, Calvo was necessarily involved in the question of Cuban slavery, which did not end until 1886. In 1870, Calvo communicated his support for emancipating newborn slaves to Julían de Zulueta, Cuba's largest and most notorious slaveholder.

Calvo spent summers in his hometown of Portugalete, and in 1872 he built an imposing neoclassical mansion on the new waterside promenade. He formed a business relationship with another wealthy Basque in Cuba, Antonio López y López, vice president of the Compañía Transatlántica and future marquis of Comillas. Along with other wealthy Catalonians, they started the successful Colonial Hispanic Bank in 1876. Calvo contributed one million pesetas for his shares of the bank enterprise.

With his wealth, Calvo was able to influence politics. He sent money in 1870 to help place Amadeo, the duke of Aosta, on the Spanish throne. Calvo was perhaps the leading aristocratic opponent of Cuban independence, claiming it was merely a pretense for United States' domination. He subsidized the expenses of the Spanish army in quelling Cuban revolts. The Colonial Hispanic Bank also extended a huge loan to the Spanish government in 1876 to pay for the exile of insurrectionist leaders. Apparently, Cuban nationalists burned down Calvo's sugar mills in retaliation. A widower, Calvo decided to emancipate all of his slaves and return permanently to his Spanish birthplace.

In Spain, Calvo provided for charitable works and supported educational institutions in Portugalete, contributing 30,000 pesetas to repair the tower of the Basilica of Holy Mary, destroyed in the civil war of 1874. He also sponsored charitable concerts to benefit soldiers wounded in the imperial wars in Cuba and the Philippines.

Calvo died in 1904. As he had no children, his will left his mansions in Cuba and Portugalete to local governments on the condition that both homes be renovated as hotels and cafeterias, with the revenue from these enterprises used to assist the indigent. His life is commemorated by a beautiful bronze pantheon in the Portugalete cemetery created by the well-known sculptor Josep Llimona i Bruguera (1864-1934). The steamship Manuel Calvo, in operation until 1959, also commemorated Calvo. The Manuel Calvo Foundation in Portugalete exists into the twenty-first century, continuing to promote civic projects and to assist disadvantaged members of society.

LEGACY

Basques from Spain formed a major element of Cuba's emerging capitalist class in the nineteenth century.

Calvo, by his wealth and political involvement, was a leader of this group. His fortune was made first in shipping and then multiplied in sugar and bank holdings. He funded military efforts to suppress Cuban independence, which were often brutal. Returning to his native Spain, however, he became a model of charity, funding projects throughout his hometown of Portugalete on behalf of the poor. The Manuel Calvo Foundation continued it philanthropic efforts in Portugalete in the twenty-first century.

Sebastião Camargo

Brazilian industrialist and conglomerate owner

Camargo led the second generation of Brazilian business leaders who built mammoth conglomerates with international profiles. The Camargo Corrêa Group benefited from consistent and massive government funding, international capital, and Camargo's business acumen.

Born: September 25, 1909; Jaú, São Paulo, Brazil
Died: August 26, 1994; São Paulo, São Paulo, Brazil
Also known as: Sebastião Ferraz de Camargo Penteado
Sources of wealth: Construction business; manufacturing; steel; metals refining
Bequeathal of wealth: Children; charity

Early Life

Sebastião Ferraz de Camargo Penteado, better known as Sebastião Camargo (seh-bash-tee-OWHN kah-MAR-goh), grew up on a plantation in the interior of the wealthy state of São Paulo, Brazil. His family was large and its fortune declined after his father died when Camargo was an adolescent. Supporting himself as a construction worker, Camargo acquired a cart and donkey and hauled debris and earth from construction sites. He profited from burgeoning road construction in the region.

First Ventures

Learning the techniques for construction site preparation, Camargo became a small-scale contractor. In partnership with a lawyer, Sylvio Brand Corrêa, he acquired sufficient capital to set up a modest company, the Camargo Corrêa Engineering and Building Co. Acquiring a tractor, he achieved a strategic advantage over his competitors. In the period after World War II, foreign investment in Brazil increased, stimulating a massive construction boom for new factories, housing, hydroelectric plants, and roads. A consuming magnet for this construction was the building of Brasília (1956-1960), Brazil's new capital, during the presidency of Juscelino Kubitschek. To win a portion of the contracts for this city's construction, Camargo resolved to impress authorities by assembling a fleet of tractors from all of his construction sites. He paraded them at the proposed site for Brasília, demonstrating that his company had sufficient resources for the massive urban undertaking.

Mature Wealth

The profits and publicity that Camargo Corrêio accrued pushed the company into the forefront of major Brazilian building operators. The firm now entered the period of mammoth construction projects under government auspices, with which it became synonymous. Company projects included the building of a hydroelectric dam on the Paraná River in the 1960's, which required construction of a satellite city for workers. The following decade, the company built an eight-mile-long bridge that spanned Guanabara Bay in Rio de Janeiro. The firm laid the multilane interstate highway between Rio de Janeiro and São Paulo through daunting mountainous terrain, and it forged through tropical rain forest to construct the Trans-Amazon Highway. Camargo's company also laid the gas line between Brazil and Bolivia and raised the colossal $15 billion Itaipú dam between Brazil and Paraguay, distributing electricity to the two countries.

Astute in pursuing horizontal and vertical integration of his businesses, Camargo cultivated relations with political leaders and competitors, minimizing risk. The businesses included steelmaking, aluminum, agriculture, and textile operations. In the 1990's, Camargo's personal wealth, valued at more than $1 billion, put him on *Forbes* magazine's list of billionaires. He and his wife had three daughters, and he included their husbands in the management of his companies. Because of his origins, Camargo retained certain rural habits, such as often appearing with a rustic pipe in his mouth. One of his nicknames was "China" because he had certain Asian facial features and an inscrutable business manner. He also had a passion for hunting, leading expeditions in Africa and Alaska.

Legacy

Camargo quite literally constructed modern Brazil. He might be described as the "bricklayer of Brazil," except his companies used reinforced concrete. After the company's work building Brasília, Camargo Corrêa construction sites became omnipresent in Brazil, neighboring countries, and other parts of the world. Thereby, Camargo's enterprises both contributed to and benefited from the rise of Brazil as a regional economic power. However, his dominance resulted more from government patronage than from market competition, and his extreme wealth reflected the chronic income chasm between rich and poor people in Brazil.

Andrew Carnegie

American industrialist, investor, and philanthropist

Carnegie rose from obscurity as a penniless immigrant to become an extraordinarily wealthy industrialist. He created a new form of social philanthropy that sought to improve people's lives through the establishment of museums, libraries, and concert halls.

Born: November 25, 1835; Dunfermline, Fife, Scotland
Died: August 11, 1919; Lenox, Massachusetts
Sources of wealth: Steel; investments
Bequeathal of wealth: Charity; educational institution

Early Life

Andrew Carnegie (AN-drew kahr-NAY-gee) was born in Dunfermline, Scotland, the son of William Carnegie and Margaret Morrison. When hard times fell upon Scotland in the mid-1800's, William, a weaver, decided that America offered a better life. Borrowing money, the family immigrated to Allegheny, Pennsylvania, in 1848, where, at the age of thirteen, Andrew started work as a bobbin boy in a cotton mill. The work was hard and not well paid, so in 1850, when Carnegie's uncle suggested he apply for work at the Ohio Telegraph Company, the young man found a position as a telegraph messenger boy. This job provided Carnegie with free admission to plays and productions at a local theater, sparking his lifelong love of William Shakespeare. A local businessman, Colonel James Anderson, allowed Carnegie to borrow books freely from Anderson's four-hundred-volume library, a practice that convinced Carnegie of the value of lending libraries.

Carnegie continued to seek better employment, and his hard work and careful observation of the Ohio Telegraph Company's equipment enabled him to become a telegraph operator for the Pennsylvania Railroad. His boss at the railroad, Thomas A. Scott, took an interest in Carnegie, and the young man's subsequent rise in the company was swift, culminating in a position as superintendent of the railroad's division in Pittsburgh, Pennsylvania.

First Ventures

However, having a better-paying job did not satisfy Carnegie's desire for success. In 1855, guided by advice from Scott, Carnegie invested $500 in Adams Express. Carnegie later invested in the Pullman sleeping car division of the Pennsylvania Railroad Company. George Mortimer Pullman's invention of the sleeping car allowed businessmen to travel long distances in comfort, and one of Carnegie's earliest successes was his partnership with Pullman. Since Carnegie worked for the Pennsylvania Railroad's western division, he was positioned to benefit financially from improvements to Pullman's service. With America growing exponentially, railroad-related industries seemed to be a wise investment. The railroad became an even more vital service during the Civil War, when trains transported Union army munitions and troops.

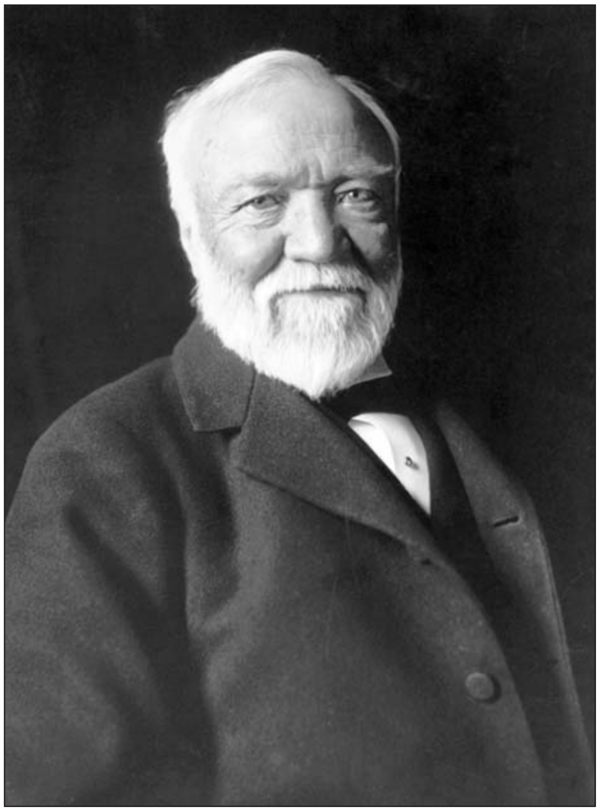
Accumulating capital, Carnegie also invested money in ironworks and bridge-building companies, and his sound business sense enabled him to make money from these and other investments. For example, when he invested $40,000 in Storey Farm in Venango County, Pennsylvania, he garnered a profit of more than 100 percent; the oil wells and cash dividends from the property generated more than $1 million.

Mature Wealth

Carnegie left the railroad company in 1865 to concentrate on other business enterprises.

Because Pittsburgh was a mercantile and industrial center of the North during the Civil War, Carnegie sought to create a highly integrated, centralized plant for the manufacture of steel goods there. In 1875, he opened his first steel plant, the Edgar Thomson Steel Works, in Braddock, Pennsylvania. He carefully planned the 1883 purchase of the rival Homestead Steel Works, a company that included iron and coal fields in its list of assets. He maneuvered his company, renamed Carnegie Steel in 1892, into a position to become the largest producer not only of steel rails but also of pig iron and coke.

Carnegie created the Union Ironworks and the Keystone Bridge Works in Pittsburgh with the stated intent of replacing the city's wooden bridges with steel replacements. He helped build and owned stock in the Eads Bridge, a landmark steel structure crossing the Mississippi River in St. Louis, Missouri. The Eads project exemplified the new applications for which steel could be used. Carnegie solidified his growing fortune by employing the novel concept of buying into different industries related to the same product. He was interested not just in steel but also in the subsidiary processes of coke and pig iron manufacturing, coal mining, and oil refining. This vertical integration of services proved to be lucrative for Carnegie and his colleagues, even though working conditions for Carnegie's employees continued to be harsh and punitive. Carnegie's partner, Henry Clay Frick, had to quell a riot after a strike by workers at the Homestead steel mill escalated into a full-scale melee, resulting in the deaths not only of rioters but also of security workers.



Andrew Carnegie. (Library of Congress)

By 1901, Carnegie was ready to change the focus of his life from the accumulation of wealth to its charitable distribution. J. P. Morgan, a prominent banker, assisted Carnegie in the preparations for what would become one of the largest buyouts in American history. Carnegie had spent years acquiring companies whose products were integral parts of the steel industry, so Morgan bought out not only Carnegie's businesses but also several other steel-related companies. By March 2, 1901, Morgan had conceptualized the founding of the United States Steel Corporation (better known as U.S. Steel), which was capitalized at $1.4 billion. Carnegie personally gained $225,639,000, which was paid to him in fifty-year gold bonds.

Carnegie had been involved in charitable projects for some time prior to the buyout. Two of the pleasures of his early life, books and theater, were areas in which he felt he could make a difference in the lives of working people. To this end, he had established lending libraries, funding more than three thousand of them by the end of his life.

Besides libraries, Carnegie believed that the proper funding of educational institutions, such as colleges, trade schools, and universities, was essential for the improvement of the public. In 1899, he donated £50,000 to establish the University of Birmingham in England. In 1901, he gave $2 million to the city of Pittsburgh to construct the Carnegie Institute of Technology (now part of Carnegie Mellon University) and donated $10 million through the Carnegie Trust for the Universities of Scotland to build institutes of higher learning in his native country.

Perhaps to counter a lifetime of resentment he faced from those who labored in his mills, Carnegie arranged for some of his fortune to be placed in pension funds, which former employees of the Homestead Steel Works could receive after retirement. Always a stalwart defender of the importance of education, Carnegie developed a pension fund for American college professors as an additional incentive for those who desired not only to pursue higher education but also to educate others. This retirement fund, later known as TIAA-CREF, continued to provide sizable benefits for its investors into the twenty-first century. Although Carnegie stipulated that religious schools had to become secular in order to receive his funding, his love of great music, both sacred and secular, led him to finance the building of seven thousand church organs. He participated in other artistic endeavors, including the building of New York City's Carnegie Hall and the Carnegie Museum of Art in Oakland, a suburb of Pittsburgh.

When Carnegie died on August 11, 1919, his solemn promise to disburse the bulk of his estate benefited many charities and made the once-despised tycoon a figure of philanthropy and conscience.

THE CARNEGIE FOUNDATION

An individual's decision to pursue a career in public education was one of the noblest pursuits Andrew Carnegie could envision. However, he recognized that teaching was a profession that lacked the respect it deserved and, for this reason, tended to pay poorly. Consequently, be believed that few people other than idealists and incompetents chose to teach in public schools, preferring the stable pay provided by private schools and universities, In 1905, Carnegie decided to rectify this problem by creating a foundation with the specific goal of improving, enriching, and dignifying the teaching profession. He lobbied for an act of Congress to enhance his foundation's influence, a goal that eventually was met.

The foundation continues to operate in the twenty-first century. It employs teachers, administrators, and researchers who devise the best means of applying universal educational standards in curricula of students and prospective teachers. Throughout its history, the foundation has made several notable achievements in the field of education. Perhaps its most important accomplishment was the establishment of Pell grants, which assist low- and middle-income students in financing their higher educations. The foundation created the Graduate Record Exam (GRE), a test that seeks to provide a standardized benchmark for the acceptance of college students into graduate programs of study. In 1910, the foundation published *The Flexner Report*, which advocated improved standards for American medical schools.

In the beginning of the twenty-first century, the foundation explored new uses for existing technology and the application of new technology in the classroom. By working with other organizations, like the Bill and Melinda Gates Foundation, a "wired" classroom using digital technology has ceased to be a dream for public schools and is being studied for broad implementation. The foundation has also increased its focus on improving basic skills classes for adult learners by providing additional funding for community colleges.

LEGACY

Carnegie was one of the greatest, and richest, captains of industry in nineteenth century America. He played a key role in developing American steel manufacturing, creating what would become a major national industry for many years to come. His business acumen and shrewd investments enabled him to rise from a poor immigrant to a powerful tycoon, typifying the success of other businessmen during America's Gilded Age.

He also set a new standard for charitable donations and public service. A desire to improve people's lives was a keynote of much of Carnegie's philanthropy. He built Carnegie Hall, for example, in order to stage productions that would lift the spirits of New Yorkers, just as Carnegie himself was heartened by the many plays he watched while working for the Ohio Telegraph Company. His early love of reading similarly led him to finance a network of public libraries. He performed an equally needed public service in 1884 by donating $50,000 to Bellevue Medical College in order to establish a new histological laboratory for the study of disease.

Carnegie had a particularly broad view of improving social welfare and was not shy about preaching his ideology to others. When he published his article "The Gospel of Wealth" in the June, 1889, issue of *North American Review*, he intended the article to be a guide for living a full life. He argued that too many wealthy individuals in history had sought fortune only to better their own lives. Instead, he declared, socially responsible individuals should spend only the first half of their lives in the pursuit of riches; the second half should be spent donating their wealth to worthy charities and institutions.

Robert Carter

American planter, merchant, and landowner

Carter was one of the wealthiest men in colonial America, amassing land throughout Virginia that allowed him to generate a fortune from the sale of tobacco and other products.

Born: c. 1663; Lancaster County, Virginia
Died: August 4, 1732; Lancaster County, Virginia
Also known as: King Carter
Sources of wealth: Real estate; trade; agricultural products; slaveholding
Bequeathal of wealth: Children; charity

Early Life

The younger son of well-to-do Virginia planter John Carter, Robert Carter spent his early years at Corotoman, the family farm on Virginia's Northern Neck. The household included his parents (later a stepmother), elder brother John Carter II, and later John's wife, as well as dozens of servants and slaves. John Carter died in 1669, leaving Corotoman to Robert's elder brother, who became Robert's guardian. In 1672, Robert was sent to England for an education in the classics but also to learn the rudiments of the tobacco trade. Six years later, he returned to Virginia to take up life as a farmer and merchant.

First Ventures

In his will, Carter's father left him one thousand acres, land sufficient to allow him to live independently. After returning from England, however, he continued to live at Corotoman, and when he married Judith Armistead in 1688, he brought her to live there. Carter learned from his brother the intricacies of managing vast land holdings. In 1690, John Carter II died, and Robert inherited the six-thousand-acre estate.

Mature Wealth

Carter realized that tobacco depleted the land's nutrients rapidly and that the only way to provide financial security for himself and his family was to increase the size of his land holdings. For the next thirty years, he systematically sought opportunities to purchase other plantations and undeveloped land, both of which he used to produce goods that would generate significant profits when sold in the colonies or abroad. A shrewd businessman, he spent much of his time acquiring land on the Northern Neck and throughout Virginia, hiring overseers to run what quickly became a small empire of tobacco plantations. He was not always a favorite among the gentry, however; he may have acquired the sobriquet King Carter because he often behaved high-handedly in his dealings with others. He was frequently in court, where he brought suit against associates, friends, and even family members in an effort to preserve and expand his holdings for himself and his heirs. Carter sired eleven children—four with his first wife, who died in 1699, and seven more with second wife, Elizabeth Landon.

In colonial Virginia, wealth and land came with political responsibility, and Carter held office for most of his adult life. He served in the House of Burgesses, the colonists' elected assembly, and for a time was Speaker of the House. The king appointed him to the Governor's Council, on which he served a term as its president, and he was acting governor of colonial Virginia for a year. Carter was able to use these appointments to supplement his income from farming; at the time, government officials profited from their appointments to positions that allowed them to receive commissions or stipends for their work. Carter made the most of several appointments, especially as an agent for lands granted by the king to Thomas Fairfax, sixth Lord Fairfax of Cameron, in the region of Virginia where Carter lived. In this capacity, Carter was able to obtain large tracts of land in his sons' names, thereby increasing the family's holdings.

Carter died at Corotomon on August 4, 1732, and was buried in nearby Christ Church.

Legacy

When he died, Carter was considered the richest man in Virginia. His estate included £10,000 and several plantations with more than 300,000 acres and 1,000 slaves. Always concerned for his children's welfare, he divided his property among them, ensuring that they had sufficient land and resources to keep them among the colony's most affluent and influential families. He made small bequests to a number of charities, but his most significant endowment was to Christ Church, the parish to which his family belonged. With his money, religious leaders were able to erect one of the finest churches in the colony.

Yacoub Cattaui

Egyptian banker, industrialist, and landowner

Cattaui prospered under the Egyptian governors in the nineteenth century, each of whom relied on Jewish families to create revenue for the country. Under the governors' favorable auspices, Cattaui was able to own banks and to set up and run other commercial interests.

Born: 1800; Cairo, Egypt
Died: 1883; Cairo, Egypt
Sources of wealth: Banking; trade; real estate
Bequeathal of wealth: Children; medical institution; educational institution

Early Life

Yacoub Cattaui (YAH-coob kat-TOW-ee) was the eldest son of Eliahou Khadar Cattaui, who settled in Cairo, Egypt, as part of an influx of immigrants who arrived in the country during the late eighteenth and early nineteenth centuries. The governor of Egypt, Muḥammad ʿAlī Pasha, invited foreigners to settle there so he could use their skills and knowledge in his attempt to modernize the country. As part of this modernization, Yacoub obtained many concessions from the government, including financial privileges and the right to operate flour mills in the vicinity of Cairo.

First Ventures

After the death of Muhammed Ali in 1849, the new governor, ʿAbbās I, appointed Cattaui director of the treasury, as well as lessee of certain government monopolies, such as the fisheries and customs. ʿAbbās's successor Saʿid used Cattaui as his private banker and appointed him *sarraf bashi* (chief banker), which made Cattaui responsible for all the other bankers employed by the government. Eventually, Cattaui became president of the Jewish community of Cairo.

Cattaui married Mazel Negrin and the couple had three children: Moise, Aslan, and Sembra. Cattaui later married Esther Morgana, and with her had five more children: Gamilla, Youssef, Renee, Ellie, and Elena. The Cattaui residence on Cherifein Street in Cairo was situated in the middle of a large garden overlooking what is now Talaat Harb Square. The street, Kasr al-Nil, was often called Rue Cattaui.

Mature Wealth

An important factor in the growth of the Cattaui family's wealth was the acceptance with which Jews were welcomed in Cairo during the eighteenth and nineteenth centuries. Visitors to Cairo in 1840 remarked that a population more respectful of all religious beliefs would be difficult to find. Eliahu Alghazi, Cattaui's brother-in-law, was instrumental in establishing schools for Jewish children in Cairo, and these institutions were the envy of some European visitors.

This welcoming attitude toward Jews, as well as the implementation of new types of banking, made it possible for the Cattaui family to reach high positions in the Egyptian government. Jews worked to set up various banks, including the National Bank of Egypt, the Egyptian Credit Foncier, and Banque Misr. These banks assisted in international trade, land development, the construction of industrial plants and infrastructure, and other forms of national expansion. An incident in 1880 points to the wealth of Cattaui and of his family. In that year, Crown Prince Rudolf of Austria visited Cairo, and Cattaui used the occasion to endow the construction of a hospital in Rudolf's name. By the time of his death in 1883, Cattaui, his in-laws, his sons Moise and Aslan, and their sons had established themselves as one of the wealthiest families in Cairo.

Legacy

After Cattaui's death, his sons Aslan and Moise carried on the family banking and sugar refining industries in Cairo and in Alexandria. In 1905, the *Egyptian Gazette* reported that Moise's extensive real estate holdings included six thousand square meters of Nile River frontage in the fashionable Cairo district of Kasr al Dubara. Probably the most distinguished member of the family was Cattaui's oldest grandson and Aslan's son, Joseph Aslan Cattaui (1861-1942). Joseph obtained his degree in engineering in France in 1882, and he then spent time in Moravia, where he became familiar with all phases of the sugar refining industry. He returned to Egypt and became a technical and financial adviser, assisting in the construction of the Heluan Railway and the water supply system for the town of Tantah and in the reconstruction and expansion of a major Egyptian sugar refinery and the Wadi Kom-Ombo Company, a sugar firm.

Deborah Cavendish

British aristocrat and businesswoman

Cavendish worked with her husband and then her grandson to restore the family fortunes of the dukes of Devonshire, particularly putting Chatsworth House, the main family residence and one of Britain's stateliest homes, on a sound financial footing.

Born: March 31, 1920; Asthall Manor, Oxfordshire, England
Also known as: Deborah Vivien Freeman-Mitford Cavendish; Deborah Vivien Freeman-Mitford (birth name); Dowager Duchess of Devonshire
Sources of wealth: Inheritance; real estate; tourism
Bequeathal of wealth: Unknown

Early Life

Deborah Cavendish was born Deborah Vivien Freeman-Mitford, the youngest of six talented and extraordinary girls, who, with one brother, constituted the family of David Freeman-Mitford II, Baron Redesdale, and his wife Sydney. The girls were allowed considerable freedom in growing up in their country estate, encouraged to be beautiful and to marry young and well. Two of them, Nancy and Jessica, became writers. Another, Diana, after a scandal married Oswald Mosley, the British fascist leader, and spent three years in prison during World War II. By contrast, Jessica became a member of the American Communist Party. Deborah herself met Nazi leader Adolf Hitler in 1937.

Deborah became the family peacemaker in this divergence of political philosophies. More important, under the tutelage of a neighbor, society leader Nancy Lancaster, Deborah became known as the real beauty of the family, and in 1941 she married Andrew Cavendish, the younger son of the eleventh duke of Devonshire. The Cavendishes were an old, established, aristocratic family, dating back to the sixteenth century. They had been named the dukes of Devonshire in 1694 in exchange for supporting the Glorious Revolution (1688-1689), in which King James II was deposed and William III and Mary II become the new Protestant sovereigns.

At the time of his marriage to Deborah, Andrew Cavendish was serving in the Coldstream Guards. As he had no immediate prospects of inheriting his father's title, Cavendish took a job with the Macmillan publishing house, with which the Cavendishes had family connections. Harold Macmillan, later the British prime minister, was Cavendish's uncle.

First Ventures

However, during World War II, Cavendish's older brother was killed in action in Belgium in 1944, and although he was married to Kathleen Kennedy, the sister of future president John F. Kennedy, the couple had no children. This meant that Andrew, as heir, assumed the title marquis of Hartington, and Deborah became the marchioness. When his father died in 1950, Andrew became the eleventh duke of Devonshire, and Deborah was now the duchess.

The Cavendish family's primary estate was at Chatsworth House, in Derbyshire's Peak District, and was one of the most stately homes in the country. The Cavendishes owned other estates, including Lismore Castle in Ireland, Bolton Abbey in Yorkshire, a London residence in Mayfair, and a London club. The family also had developed the seaside resort of Eastbourne in the nineteenth century, and they still owned large parts of the town.

However, Chatsworth was in bad condition by World War II, when it was used as a girls' boarding school. After Andrew's father died, crippling death duties were imposed on the estate in the 1950's. For a while it looked as if the estate would go the way of many old homes in Great Britain, to be either sold or donated to the nation through the National Trust. Deborah, however, urged Andrew to retain the Chatsworth estate as a family home and to find ways to make it financially viable and to pay off the duties. In 1967, these duties were negotiated at the sum of £7 million and were paid off in twenty-four years. As part of the process, the Cavendishes were required to give the state a number of art treasures, including one of their three Rembrandts, and sell off part of the grounds.

CHATSWORTH HOUSE

The original Chatsworth House was a Tudor-style residence built in the sixteenth century by Sir William Cavendish while he was married to the redoubtable Bess of Hardwick. Cavendish had gained lands in East Anglia from Henry VIII while disposing of the monasteries the king had taken from the Catholic church. Bess, who came from Derbyshire, persuaded Cavendish to sell the East Anglia lands and buy property in the Derwent Valley of England's Peak District. After Cavendish's death, Bess married the earl of Shrewsbury and continued to develop the small manor house originally on site into a five-story mansion. The construction project eventually cost £80,000 and was a point of some contention between Bess and her husband. Mary, Queen of Scots, was briefly imprisoned at Chatsworth House.

The house remained in the family after Bess's death. In 1618, her son William Cavendish was named the first earl of Devonshire. After the Glorious Revolution (1688-1689), the old Tudor mansion was gradually replaced by a substantial new residence, built under the guidance of architect William Talman, and formal gardens were laid out. The first of the gardens' water features, fed by water from the surrounding moors, also were constructed at this time, to be expanded by successive landscape architects. In the eighteenth century, James Paine and Lancelot "Capability" Brown, leading landscape and garden designers, made the setting even more magnificent as the dukes of Devonshire became even more important. For example, between 1750 and 1790, William Cavendish, fourth duke of Devonshire, was prime minister for six months beginning in November, 1756, and five other family members held seats in Parliament. New paintings and furnishings also were acquired. A new wing was built in the nineteenth century, but it was demolished in 1919.

In 1826, William George Spencer Cavendish, sixth duke of Devonshire, appointed a twenty-three-year-old head gardener, Joseph Paxton, who designed an innovative conservatory and other landscape features; Paxton later designed the Crystal Palace, which housed the Great Exhibition of 1851 in London's Hyde Park. The sixth duke was primarily responsible for building the home's seventeen-thousand-book library.

The 36,000-acre Chatsworth estate features a 1,000-acre deer park and 105 acres of formal gardens, with many greenhouses and prize collections of camellias and crocuses. The grounds also contain numerous water features, including fountains, cascades, artificial valleys, ponds, and lakes. The residence itself has 175 rooms, 21 kitchens, 13 acres of roofs, more than 3,000 feet of passages, and 17 staircases. Chatsworth is also the location of a large farm shop, employing more than one hundred people, a restaurant, and a bookstore.

Deborah and her husband chose to restore Chatsworth's house and grounds and to open the estate to the public, charging visitors an entrance fee. The public would be able to view the contents of the house, including the family's art collection, which included paintings by Frans Hals, Sir Anthony van Dyck, and Rembrandt. Deborah saw other business opportunities for the property, such as growing farm produce to be sold at an estate shop; publishing booklets about the house, gardens, and artworks; and opening a restaurant. She later published cookbooks with recipes served at the estate's restaurant. These ventures resulted in the family's loss of privacy, the expense of restoration, and the hard work of operating the estate and its related businesses.

MATURE WEALTH

The Cavendishes set up a charitable trust fund in 1981, endowing it with the proceeds from the sale of a number of artworks, including one painting that was sold to the Getty Museum. These art sales, as well as the income derived from the public tours and other estate-related ventures, generated sufficient wealth to make the estate economically viable.

In all of these enterprises, Deborah provided the entrepreneurial drive and vision, and her sense of style kept the family tradition of elegance and nobility intact. A number of other country estates that did become self-sufficient, including some that became safari parks, lost this sense of style and tradition. However, Deborah's innate aristocracy retained Chatsworth as the "Palace of the Peak."

Her husband, Andrew, was involved in a number of other activities. In the early 1960's, he held several positions in the Conservative administration of his uncle, Prime Minister Harold Macmillan. Andrew also enjoyed horse racing, serving as steward of the Jockey Club from 1966 to 1969. Andrew preferred to live at Chatsworth, while Deborah spent time at their Mayfair house.

Deborah's activities also included buying modern art to replace the artworks she had sold, purchasing works by such artists as L. S. Lowry, Gwen John, and Lucien Freud. She copyrighted some of the wallpaper designs and other decorative features of Chatsworth and marketed them under the imprint of Chatsworth Design, and she also developed several hotels that the Cavendishes owned. She continued her writing, branching out from books about Chatsworth to works about her own life and times.

Legacy

When Andrew died in May, 2004, the estate was inherited by his son Peregrine, who became the twelfth duke of Devonshire. Deborah went to live in an old refurbished vicarage on the Chatsworth estate. However, the new duke did not have the desire to operate Chatsworth, so the dowager duchess, as Deborah was now known, teamed up with one of her fifteen grandchildren, William, earl of Burlington, to continue the work of running Chatsworth as a financial enterprise.

Deborah Cavendish's legacy has been to maintain for both the Cavendish family and the British people a priceless family estate, fully restored to the vision of its previous owners and developers, accessible to the general public, and in a stunningly beautiful part of England. She has been able to retain the best characteristics of the British aristocratic tradition. In 1999, she was appointed Dame Commander of the Royal Victorian Order for her services to the queen's royal collection.

Georgiana Cavendish

British socialite

Cavendish's wealth enabled her to shine in late eighteenth and early nineteenth century England as a leader in fashion and politics. However, the expenses of maintaining her position and her love of gambling (a common vice among the eighteenth century aristocracy) meant that much of her life was lived in financial need.

Born: June 7, 1757; Wimbledon, Surrey, England
Died: March 30, 1806; London, England
Also known as: Georgiana Spencer (birth name); Duchess of Devonshire
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Dissipated

Early Life

Georgiana Spencer Cavendish was born in 1757 to John Spencer, first earl of Spencer, and his wife Margaret Georgiana Spencer. Georgiana enjoyed the benefits of the Spencers' wealth and social status, traveling extensively and gaining a social and cultural polish that would become a hallmark. She met her future husband, the very wealthy and socially prominent William Cavendish, fifth duke of devonshire, while traveling with her family in the Austrian Netherlands in 1772. The two determined to wed, despite concerns over their future compatibility and Georgiana's youth. They were married on June 7, 1774.

First Ventures

The young duchess quickly established herself in London society. A leader of fashion, she was responsible for the introduction of numerous styles of dress, including the ostrich-feather headdress. In 1783, Cavendish rejected her elaborate fashions of previous years in favor of a simple muslin dress, and she again set the tone for many London ladies.

In London, Cavendish acquired a vice that would haunt her life—gambling. She played very heavily and moved in a circle of fast-living aristocratic Londoners who congregated at the duke's London residence, Devonshire House. One heavy gambler who would have a great impact on Cavendish's subsequent career was the Whig politician Charles James Fox, a longtime friend and political ally. Cavendish campaigned vigorously, and controversially, for Fox's election to the House of Commons from the constituency of Westminster. During the energetic campaign of 1784, she was criticized for undue intimacy with working-class voters, including trading votes for kisses. Cavendish also became friends with the heir to the throne, Prince George, the future George IV.

Mature Wealth

Cavendish played a diminished political role after 1784, as the Whigs were out of power. Her private life was also unhappy, as her husband had established his mistress, Lady Elizabeth Foster, in the household. Foster had originally been Cavendish's friend and the relationship between the two women and the duke was complex. Foster used Cavendish's spiraling gambling debts in an unsuccessful maneuver to get the duke to legally separate from his wife. Cavendish was also discredited by the Whig Party's failure in the Regency Crisis of 1788, when the madness of King George III seemed to offer the opportunity for the Whigs' ally, Prince George, to come to power as regent for his father. Following George III's recovery, the Devonshires went into voluntary exile on the European continent.

In 1791, Cavendish became pregnant with the child of the young Whig politician Charles Grey, with whom she had been having an affair for about two years. The duke gave her the choice of divorce or separation, and Cavendish opted to live with her household in Naples, returning to England in 1793 after the birth of her child. During the next decade, Cavendish lost most of her sight because of an infection and lived a more socially retired life, eventually giving up gambling (although her large debts continued to cause great strain) and devoting much of her time to collecting minerals and improving the ducal houses.

After the resignation of the ministry led by Fox's old rival William Pitt the Younger in 1801, Cavendish returned to politics as Fox's ally, helping to promote a reconciliation between Fox and Prince George and attempting to keep the Whig Party together as a coherent body. The short-lived Ministry of All the Talents, a unity government formed in 1806, included Fox and was also viewed as a political triumph for Cavendish. She died of a liver disease shortly after the ministry's formation.

Legacy

Cavendish demonstrated the ability of a wealthy woman to play a leading part in the cultural and political affairs of her time, despite the widespread criticism she received for behavior unbecoming to her gender.

HENRY CAVENDISH

British scientist

Cavendish used his inherited wealth to fund personal scientific experiments. He lived a thrifty existence and in solitude for most of his adult life, but he was a highly respected scientist of the eighteenth century.

Born: October 10, 1731; Nice, France
Died: February 24, 1810; London, England
Also known as: Honourable Henry Cavendish
Source of wealth: Inheritance
Bequeathal of wealth: Relatives

EARLY LIFE

Henry Cavendish was born in 1731 in Nice in the south of France, where his mother was convalescing in the mild climate. His parents came from British aristocracy, although their status was earned though service to the government. Cavendish was raised by his father and servants after his mother died in 1733. He received schooling from home until eleven and then attended a private school near London. He developed an early interest in science and at eighteen entered Cambridge University. Cavendish was extremely shy and uncomfortable around people, especially strangers and women.

FIRST VENTURES

Cavendish left Cambridge in 1753 before graduating and built a private laboratory in his family's London home. Although his father shared his son's interest in science, he was unhappy that his son did not follow a career more typical of nobility, such as political or public service. Consequently, he provided his son with only a modest allowance of £500 a year. It nevertheless enabled Cavendish to equip his laboratory with instruments for his early experiments.

In the 1780's, Cavendish inherited an enormous fortune from a first cousin, who admired his dedication to science. He moved to a mansion in the north of London and rented another home south of London in Clapham Common, where much of his important scientific work was conducted. When his father died in 1783, Cavendish inherited an additional fortune and was reputed to be the wealthiest scientist of his day.

MATURE WEALTH

Having unlimited funds, Cavendish was able to buy or construct the best scientific instruments of the period, which were essential for his accurate measurements in the areas of chemistry and physics. Cavendish studied the properties of gases and was a careful experimenter and analyst. One of his most important discoveries was to show that water—long thought to be an element—was actually composed of two elements, hydrogen and oxygen. He also investigated electrical phenomena and developed an interest in gravitation.

Although he spent a considerable fortune on his scientific instruments and on renovating his homes to accommodate his research, Cavendish was remarkably frugal in all other aspects. He had no desire for fancy food or clothing, generally wearing suits from the previous century. Nor did he have any interest in the things his family valued, such as land acquisition, material wealth, politics, or marriage. Aside from money spent on his re-

Henry Cavendish. (Library of Congress) search, his only extravagance was an extensive personal library. As he grew older, Cavendish became even more reclusive and eccentric. In order to avoid contact with his servants, he built a staircase at the back of his house for his personal use. Rarely did he leave the house, except once a week for professional meetings at the Royal Society. On these occasions, he would go to great lengths to avoid meeting people.

At Cavendish's death, he was reported to be the largest holder of bank stock in England. He left more than £1 million in his will, of which £700,000 went to his cousin Lord George Cavendish. The remainder was distributed to other family members.

Legacy

Science historians regard Cavendish as a brilliant eighteenth century scientist. However, without access to a personal fortune, he would not have been such a productive researcher. Financial independence enabled Cavendish to work in isolation. Many scientists of the time worked in universities as teachers to support themselves, but because of his extreme shyness and other eccentricities it is unlikely Cavendish could have tolerated close contact with people had it been necessary for him to seek employment.

Anne Cox Chambers

American publisher, media owner, and philanthropist

Chambers and her younger sister Barbara Cox Anthony tended and grew their father's media empire during the second half of the twentieth century and into the twenty-first century, with Chambers wielding considerable influence in newspaper, radio, television, and cable subscriber markets from her home base in Atlanta, Georgia.

Born: December 1, 1919; Dayton, Ohio
Also known as: Anne Cox (birth name)
Sources of wealth: Inheritance; media
Bequeathal of wealth: Children; charity; educational institution

Early Life

Anne Cox Chambers was born in 1919, the daughter of James M. Cox, a Dayton, Ohio, publisher who was then the governor of Ohio, and of Cox's second wife, Margaretta Parler Blair. Chambers was raised in a home where she learned how to expand and run a media empire, while also developing a lifelong allegiance to the Democratic Party. Her father, a high school dropout, had become a reporter, bought a Dayton newspaper, exerted his growing influence to become a three-term governor of Ohio, and was the Democratic nominee for president of the United States in 1920, with Franklin D. Roosevelt as his vice presidential running mate.

First Ventures

Although Cox lost his bid for the presidency, he shrewdly expanded Cox Enterprises into the developing radio market in the 1930's and the new television market in the 1940's before his death in 1957. Chambers studied at Finch College in Manhattan, married Robert William Chambers in 1955, and had three children. After her brother Jim, Jr., died in 1974, Chambers, who then co-owned the family company with her younger sister Barbara Cox Anthony, had opportunities to help guide Cox Enterprises, and the corporation would eventually enter the cable and Internet markets. From her home in Atlanta, Georgia, Chambers chairs the board of Atlanta Newspapers, Inc., and has broken new ground for women by serving as a director of the Bank of the South (from 1977 to 1982), a director of Coca-Cola (1981-1991), and the first female member of the board of directors of the Atlanta Chamber of Commerce.

Mature Wealth

In 1988, Chambers ceded control of Cox Enterprises to her nephew James Cox Kennedy, while remaining actively involved as an adviser to the company. In the twenty-first century, Cox Enterprises, a multibillion-dollar media corporation, continued to be a significant force among the select group of major American communications businesses, owning many newspapers, radio and television stations, a large cable company, a used-car retailer, and an Internet company. Anthony, Chambers's last remaining sibling, died in 2007. The following year, Chambers was considered the fourth-richest woman in America, with assets totaling more than $13 billion. After the economic downturn in the closing months of President George W. Bush's administration, her assets were estimated to have dropped to around $9 billion, but this still ranked her in a tie for number forty-three on the *Forbes* magazine list of the world's richest people, and she remained the wealthiest person in Georgia.

Legacy

Chambers has done much laudable philanthropic work in the arts, such as supporting museums, among them the High Museum of Art in Atlanta and the Whitney Museum of American Art and the Museum of Modern Art in New York City. However, her greatest legacy has been her unwavering support as a fund-raiser for the Democratic Party. She provided financial assistance to Barack Obama during his 2008 presidential campaign, and she has offered similar funding to other party candidates, most notably President Jimmy Carter. Carter, who came from Plains, Georgia, and had been governor of that state, appointed Chambers to be American ambassador to Belgium from 1977 through 1981. Chambers's philanthropy subsequently extended to the Carter Center, which Carter developed in 1982 as a policy institute affiliated with both the Carter Presidential Library and Emory University. Chambers also actively supports the Council of American Ambassadors and is a founding trustee of the Southern Center for International Studies, a nonprofit educational institute based in Atlanta.

Fateh Chand

Mughal banker and government official

An immensely wealthy and influential banker to the Bengali nawabs (provincial governors) and Mughal emperors, Fateh Chand was awarded the title of Jagat Seth, or "banker of the world."

Born: c. 1680; Bengal, India
Died: 1744; Bengal, India
Also known as: Jagat Seth; Baidnath; Banker of the World
Source of wealth: Banking
Bequeathal of wealth: Children; relatives

Early Life

Hiranand Shah, the grandfather of Fateh Chand (FAHT-eh chahnd), established a saltpeter trading and banking enterprise around 1652 in Patna, India. His son Manik Chand expanded the business into Murshidabad, the capital of the Bengal province of the Mughal Empire. When Manik Chand died in 1714, his nephew and adopted son, Fateh, succeeded to the business. Like many of the bankers and merchants of the Mughal Empire, Fateh Chand was a Jain.

First Ventures

Chand's moneylending enterprise was headquartered in Murshidabad in eastern India. Governed by a dynastic line of nawabs (provincial governors), Bengal was the wealthiest and most populous of the *subahs* (provinces) of the Mughal Empire. The Mughals had risen to power through conquest and plunder, but they had learned to govern their economy with order, taxes, and a stable currency. The basic coin of the realm was the silver rupee, which would be worth about $20 in 2010 currency.

Chand had banking branches in the cities of Dhaka, Patna, Delhi, and Murshidabad. He made loans, bought and sold gold and silver, repaid loans for merchants, and exchanged foreign currencies. Early in his career, he was made the treasurer general of Bengal. A major source of Chand's revenue was the interest that Bengali *zamindars* (landholders) would pay him on the loans they needed in order to pay taxes due the Mughal government. As Chand grew wealthier, he was also able to bankroll the European trading companies in East India. From 1718 to 1730, the British East India Company borrowed an average of almost 500,000 rupees a year from Chand. The French and Dutch East India Companies similarly borrowed great sums from him. Chand charged a standard interest rate of 12 percent annually. The schedule of shipping left European merchants chronically short of capital and they were forced to pay Chand's rates.

Mature Wealth

Chand's most profitable enterprise was his service as banker to the Mughal rulers. The Mughal Emperor Farrukh Siyar honored Chand with the title Jagat Seth (Banker of the World), which recognized the essential role that Chand's banking house played in the Mughal Empire. The title was passed down to Chand's heirs, although there is also evidence he had to pay the emperor 500,000 silver rupees for the privilege. The great British parliamentarian Edmund Burke called Chand the "Rothschild of India," and the British historian Robert Orme called Chand "the greatest money-changer and banker in the known world."

Chand was entrusted with the operation of the imperial mint at Murshidabad, a central government function and a major source of revenue for his family. It has been disputed whether Chand had exclusive use of the mint and the right to set rates of seigniorage, or government revenue from the manufacture of coins. European traders complained about Chand's control of the Bengali economy and the rapacious use he made of his minting privilege. Chand was the largest purchaser of silver bullion in the Mughal Empire, minting 5 million rupees worth of coins each year. There were other wealthy bankers in Bengal, such as Umichand, who left an estate of 4.2 million rupees. However, the wealth of Jaget Seth was staggering, estimated at around 70-140 million rupees, the equivalent of billions of dollars in 2010 currency.

The wealth of the house of Jagat Seth was so great that it played a role in dynastic changes. In 1727, Fateh Chand helped install Shuja-ud-Din Muhammad Khan as the nawab of Bengal. In 1740, Chand was instrumental in Alivardi Khan's deposition of Nawab Sarfaraz Khan. The house of Jagat Seth assisted the English victory at the Battle of Plassey in 1757, when a British East India Company force commanded by Robert Clive gained sovereignty over East India. After Chand's death, his heirs Mahtab Rai and Swaroopchand headed the house of Jagat Seth.

Legacy

The greatest banker in the history of the Mughal Empire, Jagat Seth Fateh Chand served as the treasurer and minister of the Bengal province and as the chief moneylender to the European trading companies and the Mughal rulers. Assisting the English accession of India, the house of Jagat Seth remained the bankers of the British East India Company until 1773. The descendants of Chand retained the title of Jagat Seth until 1912.

Dhanin Chearavanont

Thai agribusinessman, investor, and landowner

Chearavanont's business accomplishments and fortune benefited his family and helped Thailand secure a significant role in international markets. His financial insights affected the policies of foreign countries, especially China.

Born: January 28, 1939; Bangkok, Thailand
Also known as: Dhanin Chiaravanont
Sources of wealth: Agricultural products; trade; real estate
Bequeathal of wealth: Children; relatives; charity

Early Life

Dhanin Chearavanont (TA-nihn GEE-rah-wah-non) was born on January 28, 1939, in Bangkok, Thailand, the son of Chia Ek Chow and Kimkeea. His parents had emigrated from Shantou, Guangdong Province, in southern China to Siam (now Thailand) in 1919. Chearavanont's father and uncle brought vegetable seeds from their family's Chinese farm to Bangkok. By 1921, the brothers established the Chia Tai seed store. As a boy, Chearavanont helped his three older brothers package seeds for customers. He attended both Thai and Chinese schools. In 1956, Chearavanont studied at Hong Kong Commercial College. He later was a student at National Defence College in Bangkok. Chearavanont married his wife, Tawee Watanalikhi, in 1962. They have five children, sons Supakij, Narong, and Supachai and daughters Varnnee and Thipaporn.

First Ventures

In 1953, Chearavanont's family established a mill in order to manufacture livestock feed and renamed their business Charoen Pokphand (CP) Group. They later opened mills to produce feed for livestock throughout Asia. CP also shipped eggs, ducks, chickens, and hogs to domestic and foreign markets. By 1964, Chearavanont directed CP's agribusiness endeavors.

Impressed with the contributions of scientific research to increasing meat yields, Chearavanont imported chickens bred to mature quickly from Arbor Acres Farm in Hartford, Connecticut. He also contacted nutrition experts to prepare feeds that would enhance the growth of chickens. In Thailand, Chearavanont contracted with farmers to raise chickens he provided them. He introduced his poultry husbandry methods to farmers in nearby Asian countries, increasing CP's profits. Chearavanont also implemented processing techniques enabling CP to earn income from every aspect of producing livestock through delivering meat to markets. He arranged for farmers to use specially prepared feeds to raise shrimp or fish from larvae or eggs. CP purchased harvested shrimp and fish, freezing and exporting yields.

Mature Wealth

Chearavanont strove to identify and pursue entrepreneurial opportunities before his competitors. He invested in land, stores, factories, and gas stations, securing alliances with 7-Eleven, Honda, and other corporations. Interested in developing businesses in China, by 1978 Chearavanont had registered CP in that country. Aware of emerging technologies, Chearavanont invested in petrochemicals and fiber optics in the 1980's, establishing Telecom Asia.

CP's livestock feed business continued to prosper, ranking first in Thailand and fifth globally. CP owned more than one hundred feed mills in Asia, Europe, and North America, with yields averaging fourteen million tons annually in the early 1990's.

CP's success worldwide contributed to Chearavanont's elite financial status. In September, 1992, *Fortune* magazine included Chearavanont on its list of world billionaires. In 1995, *Forbes* estimated Chearavanont's family's wealth at $5.5 billion, the richest in Thailand. CP generated annual revenues of $8 billion. Chearavanont and his brothers each owned 13 percent of CP.

During the 1997 Asian economic crisis, Chearavanont sold numerous CP properties and concentrated on agribusiness income sources. By 2002, CP had survived the crisis and continued to expand, despite the early twenty-first century avian flu epidemic threatening Chearavanont's poultry businesses. Chearavanont responded by quarantining CP facilities. Under Chearavanont's leadership, CP earned revenues totaling $13 billion in 2002.

In 2006, Chearavanont attained the rank of 317 on the *Forbes* list of the world's richest people; CP's sales totaled $14 billion that year. In September, 2009, *Forbes* ranked Chearavanont, who was worth $3 billion, the second-wealthiest person in Thailand.

Legacy

Chearavanont's wealth impacted Asians by providing them an inexpensive source of sustenance with protein and nutrients. Many people had been unable to purchase meat until CP's affordable products were sold. These foods became a regular component of many people's diets, strengthening bodies while reinforcing Asian economies. In an attempt to reduce rural poverty, Chearavanont promoted the payment of equitable prices to rice farmers for their crops instead of demanding low charges that benefited commercial companies like CP. He shared his wealth through donations to schools and charities, such as Synergos, which fights poverty. He also supported hospital and agricultural programs that were sponsored by Thailand's royalty.

Ivan Borisovich Cherkassky

Russian aristocrat and government official

Cherkassky was a nobleman who headed the Russian government for twenty years. He accumulated great personal wealth, particularly in the form of land, and became the richest man in Moscow. Cherkassky used his wealth and political capital to exert great influence on the government, supporting the rising power of the Romanov Dynasty.

Born: c. 1580; Russia
Died: April 4, 1642; Russia
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Relatives

Early Life

Prince Ivan Borisovich Cherkassky (EE-vahn boor-EE-soh-vihch chehr-KAHS-kee) was the only son of Boris Kanbulatovich Cherkassky and Marfa Nikitichna Romanova. His father was a Circassian prince who converted to Christianity and served the czar from around 1575 through 1576. Cherkassky's mother was the sister of Filaret, the patriarch of the Russian Orthodox Church who coruled Russia with his son Michael Romanov from 1619 to1633. Cherkassky had a sister, Irina Borisovna Cherkasskaya.

At this time, the boyars (princes) of Circassian origin were some of the most powerful figures in the Russian court, closely allied with the rising Romanovs. Cherkassky was born into a wealthy, politically active family. In 1599 and 1600, the regent Boris Godunov had Cherkassky and other Romanov supporters arrested. Cherkassky was exiled in 1601 but returned to Moscow the following year.

First Ventures

The Cherkassky boyars maintained close ties to families in their Circassian homeland and with each other, keeping their land and other wealth in the family. This practice helped make them the richest boyar clan in Russia.

While little direct information is available about how Ivan Borisovich Cherkassky built his personal fortune, his management of government money suggests a shrewd monetary sense. At some point between 1600 and 1610, Cherkassky became *kravchy*, an honorary position at court, but Czar Vasily Shuysky removed him from that position. Cherkassky married Evdokiya Vasilievna Morozova, sister of Boris Ivanovich Morozov, a prominent boyar and statesman. Cherkassky's wealth probably helped him survive the Time of Troubles (*Smutnoe Vremya*) between the end of the Rurik Dynasty in 1598 and the establishment of the Romanov Dynasty in 1613.

Cherkassky became a boyar in 1613, shortly after Michael Romanov became czar, but he did not rise to prominence at court until Filaret became coruler with Michael in 1619. Under the joint rule of Filaret and Michael, Cherkassky became head of the Musketeers Chancellery (1623-1642), the Apothecary Chancellery (1624-1642), the Foreign Mercenary Chancellery (1622-1642), and the Great Treasury (1622-1642).

Mature Wealth

By 1624, Cherkassky was already one of the most powerful men at court. He was trusted not only with Filaret's money and military but also with the czar's medical care. Observers from Sweden and Germany readily marked him as the head of government. The German traveler Adam Olearius noted not only Cherkassky's power but also his personal wealth, which included the hamlet of Pavlovo. Contemporaries knew that Cherkassky managed government affairs well, and this skill presumably extended to his personal properties.

Cherkassky's work in the Musketeers Chancellery illustrates both his military and fiscal strategy. Between 1619 and 1642, Cherkassky worked with Filaret to improve the *pomestie* system, which granted the use of parcels of land in exchange for military service. Rents from these lands went to the service member, but the ownership of the land remained with the czars. Under Cherkassky's leadership, servicemen were granted land, cash subsidies, and temporary tax immunities. These measures ensured that the Russian army remained strong without leading to financial problems, albeit at the expense of the peasants.

By 1635, Cherkassky dominated the chancelleries as well as the Boyar Duma, the advisory council of nobles, a position he retained until his death. Cherkassky's wealth, likely derived primarily from land revenues, continued to grow. He died on April 4, 1642, without children, leaving his estate to a cousin.

Legacy

Cherkassky's cousin and heir, Iakov Kudenetovich Cherkassky, was a boyar and powerful figure at court. Iakov played a major role in the political rivalry of 1645-1650, supporting Nikita Romanov against Boris Ivanovich Morozov for leadership of Russia. Iakov came to replace Ivan Borisovich Cherkassky in the Russian court as the wealthiest and most politically prominent member of a wealthy and powerful family. Without their accumulation and management of wealth, it is doubtful that the Cherkassky boyars would have achieved such political preeminence and influence on Russian history.

Agostino Chigi

Italian banker and merchant

Chigi was one of the wealthiest bankers and merchants in late fifteenth and early sixteenth century Europe. Active primarily in Rome as the banker to the pope, he was also an important patron of the arts. His art patronage is epitomized by the Villa Farnesina, the residence he built in Rome.

Born: c. 1465; Siena (now in Italy)
Died: 1520; Papal States (now in Rome, Italy)
Also known as: Il Magnifico
Sources of wealth: Banking; trade
Bequeathal of wealth: Spouse; children; artistic patronage

Early Life

Agostino Chigi (ahg-oh-STEE-noh KEE-jee) was born around 1465, and according to the baptismal rolls of Battistero di San Giovanni in Siena, he was baptized at this cathedral on November 29, 1466. Chigi was born into a wealthy Sienese family of merchants. His parents were Mariano Chigi (1439-1504) and Caterina Baldi. Mariano was well known in Siena and held important political and financial positions, including that of Sienese ambassador to the Holy See. Like his son Agostino, Mariano was a patron of the arts, and he commissioned the painter Perugino, the artist Raphael's teacher, to create a major altarpiece. In addition to receiving a basic education in letters as appropriate to his social standing, Agostino learned the banking and financing business, first at his father's offices in Siena and Viterbo and in 1487 in Rome at Ambrogio Spannocchi's firm, which performed accounting services for the Holy See.

First Ventures

Perhaps as early as 1487, the Chigis, father and son, together with Stefano Ghinucci, opened a banking business in Rome. This newly established financial firm, which was managed by Agostino, flourished in the 1490's. The firm's dealings covered the full business spectrum, from trade in grain, wine, and livestock to currency exchange and tax accounting. The company's most important loan before the end of the fifteenth century was finalized in December, 1499, when Agostino convinced his partners to lend 3,000 ducats to Cesare Borgia, son of Pope Alexander VI, when Borgia was overseeing military campaigns in northern Italy for his father. Agostino had started financing Borgia's operations in 1498.

Since the 1490's, Agostino had achieved considerable distinction on his own. In 1492, he was named director of the papal salt marshes (salt was an important commodity in the premodern world), of the customs operations of the Papal States, and of the taxes imposed by the Holy See. These appointments were crucial for Chigi's development as a businessman and financier. He became inextricably involved with the financial affairs of the pope, and he also developed an extensive network of international connections, which eventually supported the opening of more than one hundred offices of his firm in Italy and branches from London to the Levant. While primarily devoted to doing business with the pope, Chigi also lent considerable sums to Charles VIII, the king of France, who occupied Rome in 1496; to the Medici family (4,000 ducats); and to the *condottiere* (mercenary soldier) Guidobaldo da Montefeltro in 1497 (111,173 ducats).

Mature Wealth

The foundation of Chigi's mature wealth was the concession he received from the pope in December, 1500, to manage the alum mines at Tolfa, leasing them for 34,000 ducats per year. Until then, the alum mineral, a crucial ingredient in dyeing processes in which it serves as the binding agent between the cloth and the dye, was imported in Europe from the Ottoman Empire. In just a few years, during which he also bought all the smaller alum mines in Italy, Chigi gained dominance of the alum market, achieving a virtual monopoly on this commodity in Europe—a monopoly that was made official in Flanders in 1508 for a payment of 85,000 ducats. Chigi extended his sales of alum throughout the East, all the way to China. In addition to improving alum extraction techniques, he assembled a commercial fleet of about one hundred ships to distribute the mineral, harboring the fleet at Porto Ercole in Tuscany, a city-port that he rented from the Republic of Siena for 8,000 ducats. The alum business was particularly lucrative: In 1520, Chigi's net profits from the mineral reached 300,000 ducats.

In 1502, Chigi founded his own financial firm, the Banco Chigi, in partnership with his father and a friend, Francesco Tommasi. The original capital committed to the venture was 8,000 ducats, with 3,250 each from Chigi and his father and 1,500 from Tommasi, and the partners agreed to split their profits and risks according to these proportions. Combining his living and office spaces, Chigi rented the large house that had been occupied by his father's business since 1476. Thanks to

VILLA FARNESINA

Agostino Chigi, the wealthiest financier of Renaissance Europe and an influential banker to several popes, had a villa built as his palace immediately outside the city walls of Rome. The home acquired the name Villa Farnesina in 1573, when the property was purchased by the Farnese family.

Villa Farnesina is the quintessential Italian Renaissance urban villa, with its decoration emulating similar homes built in this period. In building this residence, Chigi was inspired by Florentine palaces, and he viewed the construction of other Italian villas. At the end of the fifteenth century, Chigi also witnessed the creation of important private buildings with complex decorations in Siena and Rome, including the Belvedere of Pope Innocent VIII, the Palazzo della Cancelleria, and the Borgia Apartment in the Vatican. Chigi was impressed by the frescoes painted on the walls of the Sistine Chapel, which were completed by renowned painters called to Rome by Pope Sixtus IV.

The architectural design of Chigi's villa was completed by Baldassarre Peruzzi, who began working on the project in 1505. Chigi moved into the villa in the summer of 1511, the year in which Raphael began to paint the now-famous fresco decorations on its walls and ceilings, which were completed in 1512. The iconography of these frescoes is complex, and scholars remain uncertain about many of the paintings' details. However, it is clear that in *The Triumph of Galatea*, which embellishes the loggia on the main floor of the building, the primary theme of the fresco is Chigi's own horoscope, while the frescoes in the Sala del Fregio allude to the death of Chigi's first wife and his marriage to his second. While Raphael is surely the most famous artist who worked on the building, Chigi invited other leading painters to contribute to his villa's decorations, including Peruzzi, Sebastiano del Piombo, and Il Sodoma. Three artists who studied and worked with Raphael—Giovanni da Udine, Giovan Francesco Penni, and Giulio Romano—helped the master painter complete the decorations on the Loggia of Amore and Psiche.

---

his shrewdness, Banco Chigi prospered even after a Genoese clergyman became Pope Julius II in 1502. Even though Julius gave his business to Genoese firms, Chigi had lent him considerable sums through which he secured his election to the Papacy, and these loans guaranteed Chigi's business with the Holy See.

Chigi remained close to Julius as the pope's trusted friend, banker, financier, political adviser, ambassador, and patron of the arts. He followed the pope in two military campaigns in 1506 and 1510, and it is said that Chigi instigated the second one in order to protect his alum business from the Ferrarese family's interference. Julius excommunicated Chigi's adversaries, and he also entrusted Chigi to handle the financial arrangements that would ally the Venetian Republic with the Holy League against France in the War of the League of Cambrai in 1511. The friendship between the pope and his banker is epitomized by the fact that Julius officially adopted Chigi into the pope's family in 1511. Among the many privileges granted through this adoption, a special benefit was the integration of the oak leaves, the symbol of the coat of arms of Julius's family, the della Rovere, into Chigi's coat of arms.

Perhaps inspired by the patronage policies of Popes Sixtus IV, Alexander VI, and Julius II, Chigi understood that the success of any urban leader is closely tied to his public image. Accordingly, he used his wealth to fashion his public persona in a variety of ways, from holding extravagant parties and memorable processions in Rome to being the supportive patron of celebrated artists and the donor of major public projects. This policy is instantiated early in Chigi's career by his donation to build a new church in Tolfa. In Rome, Chigi's participation in three projects conceived during Julius's term as pope stand out: Chigi provided the funds to build and decorate two prominent chapels, one in Santa Maria della Pace and a second one, his funerary chapel, in Santa Maria del Popolo. He had the pope's favorite painter, Raphael, decorate these churches with frescoes. Chigi also hired Raphael to complete the complex decorative program of his urban palace, Villa Farnesina.

In 1513, Julius was succeeded by Pope Leo X, a Florentine cleric. Chigi managed to remain a primary financial personality in the new pope's administration by lending Leo considerable sums during the papal conclave, at which Leo was elected pope.

Three noteworthy events in Chigi's personal life took place in the early sixteenth century: In 1508, his first wife, Margherita Saracini, died, leaving him childless. His proposal to marry Margherita Gonzaga, the natural daughter of the duke of Mantua, through a gift of 10,000 ducats (Chigi's inheritance at the time was valued in excess of 400,000 ducats) proved unsuccessful. In 1512, Chigi married Francesca Ordeaschi and they had three sons.

In his 1519 will, he left his estate to his sons, none of whom was of age and one of whom had yet to be born.

Chigi died peacefully in his sleep at home after a busy workday in 1520.

Legacy

Of Chigi's three sons, only Lorenzo survived into adulthood. Unfortunately, because of his son's poor business sense and the many lawsuits arising from his estate, Chigi's wealth was basically dissipated by the time Lorenzo died in September, 1573. Surely, as the more than five thousand attendees to his funeral suggest, Chigi's impact on the people and culture of Rome was considerable, his wealth and his business having touched the lives of many. Chigi's patronage had a lasting influence on the visual arts, which was particularly evident in his support of Raphael.

Walter P. Chrysler

American automobile magnate

Chrysler became wealthy almost as a by-product of his lifelong passion for automobile design. His earnings allowed him to take great personal risks in advancing automotive technology, which materially influenced the development of transportation in the United States and ultimately the world.

Born: April 2, 1875; Wamego, Kansas
Died: August 18, 1940; Great Neck, New York
Also known as: Walter Percy Chrysler
Sources of wealth: Manufacturing; sale of products; real estate
Bequeathal of wealth: Children

Early Life

Walter Percy Chrysler (KRIS-lehr) was born in Kansas when that state was just emerging from its days as a frontier outpost. The son of a railroad worker, Chrysler chose to forgo attending college to become a machinist's apprentice with the railroads. In 1901, he married Della Forker, a childhood friend; they eventually had four children. Chrysler rose quickly in the railroad industry, becoming in succession a foreman, supervisor of works, and eventually, at age thirty-three, superintendent of locomotive maintenance for the Chicago & Great Western Railway. A dispute with the company's president led him to move to the American Locomotive Company in Pittsburgh. In 1912, he was in charge of manufacturing, earning a handsome annual salary of $8,000, when he was recruited to become manager of works for the Buick Motor Company in Flint, Michigan. Always a lover of automobiles, Chrysler accepted the offer and began his meteoric rise to prominence in America's new growth industry, personal transportation.

FIRST VENTURES

Executives at Buick and its parent company, General Motors (GM), soon recognized Chrysler's ability to cut costs and improve manufacturing processes. He became general manager and president of Buick in 1916 and executive vice president of GM in late 1918. His compensation rose exponentially, until he was earning $500,000 in annual salary and stock options. Eventually, however, he and William Crapo Durant, the president of GM, had a falling out over issues involving strategic management philosophy. Chrysler walked away from his job at Buick in 1919 and cashed in his stock, netting a profit of $10 million.

Walter P. Chrysler. (Hulton Archive/Getty Images)

MATURE WEALTH

Chrysler was not out of work long. Late in 1919, he agreed to take what was deemed a temporary job, serving as the de facto chief operating officer of Willys Motors at an annual salary of $1 million. He moved his family to New York, where he bought an estate on Long Island in 1923. Over two years he revamped operations at Willys, significantly reducing the company's debt. At the same time he was assisting Willys, Chrysler signed on to help the struggling Maxwell Motor Company improve its fortunes. Maxwell and its affiliate, Chalmers Motors, had fallen on hard times and incurred substantial debt.

At Maxwell, Chrysler worked under terms similar to those at Willys. He sought to streamline manufacturing procedures and restore public confidence in brands that had once been popular until rumors of shoddy production cut into sales. To assist him in identifying and correcting deficiences with the Willys and Maxwell models, Chrysler hired a trio of young engineers: Fred Zeder, Owen Skelton, and Carl Breer. These men solved many technical problems plaguing Willys and Maxwell autos. They also were entrusted by Chrysler to help create the first car to bear his name, the Chrysler Six, the development of which was financed in part with Chrysler's own money. The Chrysler Six was introduced in 1924 as part of Maxwell Motors' annual offerings.

A year later, Maxwell Motors was reorganized as the Chrysler Corporation, with Walter P. Chrysler as its president. Over the next five years, Chrysler made several daring moves to position his company as a direct competitor to the giants of the industry, GM and the Ford Motor Company. The boldest of these initiatives was made in 1928, when Chrysler acquired Dodge Brothers Motor Car Company and introduced a new automobile, the Plymouth. Purchasing Dodge Brothers, a company larger at the time than Chrysler Corporation, allowed Chrysler to develop a product line similar to that offered by GM, with cars available at various price ranges to appeal to different segments of the market. Most important among these brands was the Plymouth, introduced as a direct competitor to Ford and Chevrolet. Even though the stock market crash of 1929 and the ensuing depression affected Chrysler Corporation, by 1933 the company was once again healthy and outselling many of its rivals. By the middle of the decade, Chrysler Corporation had overtaken Ford to become the number-two auto manufacturer in America. However, the introduction of the Airflow line of cars in 1934 proved a modest disaster, as the public never warmed to their radical style, and the line had to be discontinued in 1937.

Great Wealth and the Automobile

During the first four decades of the twentieth century, the American automobile industry went on a roller-coaster ride that produced immense wealth for some and great losses for others. The nascent industry looked to many like a place to make their fortunes. Hence, in 1908, there were 253 auto manufacturers in the United States alone. Over time, innovations in technology, skillful pricing policies, and the development of brand loyalty, combined with significant fluctuations in the nation's economy, led to a drastic reduction in the number of manufacturers. By the beginning of World War II, there were only the "Big Three"—General Motors, Chrysler, and Ford—and half a dozen smaller firms. Henry J. Kaiser and other investors, who were successful in other businesses, lost considerable sums in their ventures into the auto industry. On the other hand, a few people who put money into the major companies made out handsomely. For example, before they began manufacturing automobiles under their own name, parts makers John F. Dodge and his brother Horace Dodge realized a $32 million return from a $10,000 investment in the Ford Motor Company.

Alfred P. Sloan, who took over General Motors from William Crapo Durant in 1923, became a multimillionaire over the course of his career. To avoid paying excessive estate taxes, he began contributing to a number of educational and medical institutions, and he established and endowed the Alfred P. Sloan Foundation with gifts of more than $300 million. Walter P. Chrysler earned tens of millions of dollars, much of which he invested in real estate or put back into the automobile business, as he supported innovative technologies that helped shape the future of the industry. His $8.8 million estate reflects only part of the wealth that he accumulated over his lifetime. Henry Ford may have benefited the most from his involvement in the auto industry. Reports during the 1920's estimated his personal fortune at more than $1 billion, and shortly before his death he established the Ford Foundation with a bequest exceeding $500 million, instantly making it the largest charitable organization in America.

Even among those who were successful in the automotive industry, the men who had risked much did not always keep the wealth they accumulated. For example, Durant had already become a millionaire from auto manufacturing when he founded General Motors in 1908, but he ended up losing virtually everything he had earned in the recession of 1919. Only a bailout by his company's board of directors, which gave him a $3 million stipend to leave the firm, allowed him to start over. In the next decade, he built another fortune at Durant Motors, but he lost everything again in the stock market crash of 1929. He lived the last twenty-five years of his life on a modest pension arranged by Sloan, the man who replaced him at General Motors, and gifts from Chrysler, who had worked for him briefly at General Motors.

While automobiles remained Chrysler's passion, he branched out into other ventures that he saw as either complementary to his principal business interests or worthy of his attention for other reasons. In 1930, he completed construction of the Chrysler Building in New York City, which became the company's principal office complex. Under his direction, the company began manufacturing marine engines, and its partnership with Chris-Craft, a boat manufacturer, proved profitable. Less successful, however, were his efforts in commercial air conditioning and railroad trucking.

Chrysler's success in the automobile industry rested on several key principles. First, he was keen on improving production efficiencies so his cars could be sold at greater profit margins than those of his competitors. Second, he was firmly committed to innovation in engineering and to the delivery of high-quality products. As a result, his cars generally offered buyers more options and more advanced technology than competitors' vehicles for the same cost. Unlike Henry Ford, Chrysler was able to hire highly competent lieutenants and give them the freedom to operate their division free from constant micromanagement. Finally, he was a risk taker who staked his own fortunes on the success of his company, as demonstrated by the structure of his contracts at Chrysler Corporation. In his tenure there, he never received a salary much above $200,000; instead, he augmented his base wage with profit-sharing and stock options. While these benefits provided little income in the lean years of the Depression, in 1928 his share of company profits was approximately $2.5 million.

Chrysler retired as the company's president in 1935, turning over operations to his hand-picked successor, K. T. Keller. Nevertheless, he remained active in the company that bore his name. Notably, in 1937 he helped negotiate an important labor agreement with the United Auto Workers. Shortly after completing these union negotiations, however, Chrysler suffered a stroke. In 1938, his wife Della died suddenly. Chrysler lingered two more years before he died on August 18, 1940.

Chrysler Building, Midtown Manhattan, New York, 1932. (Library of Congress)

Legacy

Shortly after his death, Walter P. Chrysler's estate was valued at $8,854,761. This sum seems rather modest when compared to the fortunes of Henry Ford or Alfred P. Sloan, the president and chief executive officer of GM, but in 1940, the country was just emerging from the decade-long Depression, and the value of stocks, real estate, and commodities, such as art works, had still not recovered their full value. With the exception of a few small benefices, the bulk of Chrysler's estate was divided equally among his four children.

The corporation Chrysler established continued throughout the twentieth century as one of America's "Big Three" automakers, although serious problems brought it to the brink of bankruptcy more than once. It survived for a time on its own, and in 1998 it merged for a brief period with the German firm Daimler-Benz before being acquired by a private equity group in 2007. Attempts to return to profitability after the recession of 2008 centered on a recommitment to the principles that Walter P. Chrysler espoused as important above all others: innovation and quality.

Chung Ju Yung

South Korean entrepreneur, industrialist, and mechanical engineer

Chung founded Hyundai Group, a conglomerate that became the largest business entity in Korea. Concentrating on construction, ship and car manufacture, and technology, Chung's businesses became important employers and helped to build modern infrastructure on the Korean Peninsula. Chung's success in rapidly acquiring foreign technologies was instrumental in shaping the economy of twentieth century South Korea.

Born: November 25, 1915; Tongchon Kangwon, Korea (now in North Korea)
Died: March 21, 2001; Seoul, South Korea
Sources of wealth: Manufacturing; sale of products; construction business
Bequeathal of wealth: Children; relatives

Early Life

Chung Ju Yung (chung jew yeong) spent his early years working, along with his five younger brothers, on his father's small farm in Asan, on the east coast of Korea near what later became the demilitarized zone. Despite hard work, the family remained poor and often did not have enough to eat. Chung received only an elementary education. Hoping to earn more money to support his family, he repeatedly left Asan without his father's permission. First, he worked for a short time as a construction laborer, and later he studied accounting in Seoul. After each of these attempts to improve his circumstances, he returned to the family farm. Finally, Chung left for Seoul again, this time finding work in construction and other jobs. Taking a job as a delivery man for a small rice company, he impressed the owner and customers with his dedication to performing every task exactly to specification.

First Ventures

When the owner of the rice shop decided to sell, Chung had saved sufficient funds to become owner. He ran his Kyungil Rice Store successfully until a government regulation forced him to close in 1939. Shortly thereafter, Chung purchased a car repair shop, financing this acquisition without collateral through a business contact whose trust he had won. Chung's Ado Service Garage prospered until 1943, when it was nationalized by the Japanese. Chung lost most of his investment.

Following the departure of the Japanese at the end of World War II, Chung returned to Seoul and bought another car repair shop. He called his business Hyundai ("modern") Auto Service. Chung noticed that the wealthiest customers in Korea were the United States Army agents. Since most of the American contracts were for construction, Chung used profits from Hyundai Auto Service to found Hyundai Civil Works Company. Starting as a subcontractor, Chung learned every aspect of the business. His trademark was finishing every project on time and on budget, even if Hyundai lost money. Chung believed that he had to build capital in trust, as well as in assets. His strategy paid off; in 1950, with the start of the Korean War, Chung won the trust of the United States Army by successfully completing construction contracts in a challenging wartime environment. Hyundai Construction, the cornerstone of Chung's wealth, was now a respected company.

Mature Wealth

Hyundai Construction built its reputation during the reconstruction following the Korean War (1950-1953). Hyundai's first major contract was to rebuild a bridge on the Nakdong River in 1955. In 1957, Hyundai was hired to build five new bridges over the Han River. Chung aggressively bid on projects in which his company had little experience, compensating by hiring quick learners. Even though Hyundai had never built a highway, it won a contract to build the Pattani-Narathiawat Highway in Thailand. Next, Chung lobbied Korean President Park Chung Hee to build a highway from Seoul to Pusan. Hyundai constructed 40 percent of the Kyungbu Expressway, completed in 1970. Enjoying the confidence of Korea's president, Chung was now in charge of Korea's most powerful construction company.

Chung founded Hyundai Motor Company in 1967, and in 1976 the company built Korea's first export car, the Pony. As the car company grew, Chung continued to diversify his holdings. Hyundai Heavy Industries launched two major ships in 1974. By the mid-1980's, Hyundai was Korea's largest company, holding interests in high-technology firms, as well as in construction. Chung was now one of the wealthiest men in the world.

Legacy

In 1997, the Asian financial crisis forced Hyundai Group to restructure. Chung and his brothers sold much of the company's interests in auto manufacture and concentrated on heavy industry, especially shipbuilding. Hyundai Group continued to prosper. Chung worked until his death in 2001. He left control of the company to one of his eight sons, Chung Mong Hun.

Chung can be said to be the one man who built the South Korea of the late twentieth and early twenty-first centuries. From arrival at Inchon to a drive between any two major cities in South Korea on the Kyungbu Expressway, no one can visit this country without seeing the results of Chung Ju Yung's vision.

Edward C. Clark

American lawyer, industrialist, and real estate investor

Clark, drawing on his background in patent law, helped settle significant patent litigation for Isaac Merrit Singer's sewing machine. As president of the Singer Manufacturing Company, Clark pioneered purchasing and marketing strategies that revolutionized the burgeoning domestic appliance industry. He then used his considerable wealth to develop real estate in both Manhattan and the Catskills region of upstate New York, notably in Cooperstown.

Born: December 19, 1811; Athens, Greene County, New York
Died: October 14, 1882; Cooperstown, New York
Also known as: Edward Cabot Clark; Edward S. Clark
Sources of wealth: Law practice; manufacturing; real estate
Bequeathal of wealth: Children

Early Life

Edward Cabot Clark was born in 1811 in Athens in the foothills of the Catskill Mountains in south central New York. His father was a potter. Clark, a sickly child, attended a private academy in Athens and at twelve was enrolled in Lenox Academy, a public preparatory school, in Lenox, Massachusetts. Homesick soon after arriving, Clark simply departed Lenox and returned home on foot, a trip of almost thirty miles. His father promptly returned him to school. Over time, Clark developed a love of learning through an ambitious self-designed reading program that drew on the resources of the academy's library.

At fifteen, Clark was admitted to Williams College and graduated in 1830. Deciding on law, he entered the firm of Ambrose Jordan in Hudson, New York, and in 1833 he was admitted to the bar. In 1835, he married Jordan's oldest daughter, Caroline, and two years later became a partner in her father's firm, which in 1838 set up a lucrative practice in New York City.

First Ventures

Over the next decade, Clark established a considerable reputation in the contentious field of patent litigation. The firm prospered (Clark's father-in-law served as the state's attorney general). Clark maintained an unassuming social profile (he was a Sunday school teacher), preferring to dedicate his considerable talents to his work and to his devoted wife and their only child, Alfred. Among the clients Jordan & Clark accepted was Isaac Merrit Singer, an eccentric inventor and part-time actor from Boston. In the early 1840's, Singer had invented a revolutionary machine for carving wood and metal into signs, although the sole prototype had been destroyed in a boiler explosion. Litigation involving that design had originally brought Singer to Clark's firm. Around 1850, Singer had tinkered with the existing model of a sewing machine. The machine design had proven stubbornly unworkable. In just eleven days, Singer made three key changes in the design: He redesigned the shuttle to make it go in a straight up-and-down line rather than in a circle; he redesigned a straight rather than a curved needle; and he used a spinning-wheel-style foot pedal rather than a hand crank to move the apparatus. The redesign worked.

Because the redesign depended on elements of other sewing machine prototypes, notably those of Elias Howe, Singer was sued for patent infringement. When Howe subsequently won the suit and tried to bar Singer from selling the so-called Singer machine, Singer appealed to Clark. Recognizing the potential profit from such a machine, Clark resigned from the law firm and became Singer's partner in 1851.

Mature Wealth

In 1856, in a groundbreaking settlement devised in part by Clark, all the pending litigants in a variety of patent infringement lawsuits involving the sewing machine agreed to pool their patents into a single corporation, the Sewing Machine Combination, proceed with production, and divide the revenues. As part of the agreement, I. M. Singer & Co., with Clark as half owner, began to mass-produce sewing machines, and by 1860 Singer led the market, with seventy-four factories producing more than 111,000 machines annually.

Although recognized for his brilliant legal maneuverings against a flurry of potentially crippling patent lawsuits Clark also directed the company with remarkable success. Even as Singer's flamboyant lifestyle and high-profile philandering created controversy (he was a bigamist, with more than a dozen children with four or five women), Clark quietly dedicated himself to the company, relocating its principal facilities to New York City, overseeing expansion into foreign markets, and spearheading an aggressive marketing campaign designed to offset conservative, middle-class resistance to a labor-saving machine designed to give women free time. In addition, Clark devised the "hire purchase plan," the first institutionalized payment program. The cost of a new sewing machine represented a $125 investment at a time when the average domestic income was a little more than $500 a year. To alleviate concern, owners could put $5 down and pay as little as $3 a month until the machine was paid off. The results of this plan were phenomenal.

When Clark's patience with attending to the scandals (and the resulting lawsuits) associated with Singer reached an end in 1863, Clark reorganized the company's management, and with brilliant legal maneuvering he bought out Singer, who retired to southern England, but not before inserting a codicil in the settlement forbidding Clark from running the company until after Singer's death. Thus for more than a dozen years, Clark was the de facto president of the company, making most of its marketing and business decisions and overseeing its rise to international success, including opening plant facilities in Europe, Indochina, and South America. Upon Singer's death in 1875, Clark served seven years as the chief executive officer of a company he had been running for close to fifteen years.

His family fortune now estimated at $25 million, Clark began investing in Manhattan real estate projects, notably funding the controversial Dakota apartment building in 1880, a vast and intricate apartment complex for the rich, its scale inspired by Clark's love of the majesty of the American Plains. The building is located in the upper West Side of Manhattan, so far removed from the urban center of New York City that pundits, deriding the construction as Clark's Folly, suggested that Clark should build it out in the Dakota Territory. Each of the structure's sixty-five lavish apartments (some had more than twenty rooms) was individually designed—no two were alike. With its prominent gables and its Renaissance-style balconies and staircases, the complex quickly became an architectural showpiece.

Clark retired from active leadership of the sewing machine company in 1882, although the Clark family maintained controlling interest in the firm and would run it much like a family business for more than seventy years. Clark retired to the beautiful Glimmerglass region of

National Baseball Hall of Fame

Whether redefining the domestic life of American culture through the marketing of the first practical sewing machine; spearheading the revitalization of picturesque Cooperstown, New York, into a vacation destination affordable for the middle class; redrawing the urban landscape of Manhattan; or funding philanthropic causes in support of the arts and immigrant rights, the heirs of Edward C. Clark viewed his fortune as a vast resource integral to the development of the American way of life. It is perhaps no surprise, then, that the Clark family fortune would become entwined with the Great American Pastime.

In 1908, a blue-ribbon committee commissioned by organized baseball determined that the first baseball game in America had been played under the guidance of Abner Doubleday in the fields near Cooperstown in 1839. In 1935, Ford Christopher Frick, the commissioner of baseball, announced ambitious plans for the approaching centennial of the game that would include a hall of fame commemorating the game's best players.

Stephen C. Clark, Sr., Edward's grandson, who ran the resort hotel his family had built in Cooperstown, was gifted with the same marketing savvy his grandfather had possessed. He saw the potential tourist appeal for the museum in Cooperstown, which was reeling in the depths of the Depression. In 1937, Clark, in fact, had purchased a weather-beaten ball supposedly used during that first game (it had cost him $5) and displayed it in downtown Cooperstown, along with other memorabilia from the early days of baseball. That the 1908 commission's findings would eventually be exposed as unreliable did nothing to hinder the enthusiasm with which Clark, using the commission's conclusions, approached the challenge of selling Frick on the idea of putting the museum in the pastoral village setting of Cooperstown rather than the more obvious urban environs of New York or Boston. Frick was won over. Clark deeded a generous acreage of land for the museum and even financed the $40,000 conversion of a dilapidated school gymnasium into the museum facility.

The museum was dedicated on June 12, 1939, with much fanfare; a country weary of a decade-long economic catastrophe embraced the facility, honoring what had become the national pastime. Clark would serve as the museum's president until his death in 1960. The Clark family continued to maintain a presence on the facility's board of directors into the twenty-first century.

By then, the National Baseball Hall of Fame and Museum was the most visited museum of its kind in the world, attracting more than 350,000 visitors annually. In addition to the hall of fame, the museum and its annex (significantly expanded to more than 60,000 square feet) houses more than 165,000 items relating to the game. Its library and research facility catalog more than a half million books, radio recordings, photographs, transcripts, and television broadcasts, all available to the public. Its mission—to preserve history, honor excellence, and connect generations—has made Cooperstown the shrine of America's pastime.

Lake Otsego near Cooperstown, New York, where his wife's family had long ago settled and where the Clark family summered. Although he maintained estates in Paris and Rome, it was the area around Cooperstown that he loved. Much of the Cooperstown area had been decimated by a massive fire in 1862. It was largely the financial resources and the business acumen of Clark that brought the town back to prosperity, restoring its hospital and university, as well as financing numerous other civic projects, including an art museum.

At the time of his death in 1882, Clark left the majority interest in the Singer company, as well as his real estate investments, to his son Alfred. Alfred lacked Clark's business acumen, but, something of an artist (he studied to be a concert pianist), he shared his father's passion for architecture, building concert halls and music schools. Alfred, however, was known primarily for funding struggling artists, setting up generous salaries for life for painters and musicians he deemed worthy, beginning a tradition of philanthropy that the family would continue, notably in undertaking a public campaign to build affordable housing for New York City's burgeoning immigrant population shortly before World War I.

Legacy

The wealth of Edward C. Clark came largely from his facile business acumen. In an era when the well-being and time management of housewives were marginalized and their ability to run any type of machinery dismissed, Clark created a marketing plan designed to bring efficiency and ease within the financial reach of even the poorest households, reflecting his own modest beginnings. Against the wastrel Singer, Clark was a model of unassuming industry, a classic Gilded Age businessman and a conservative family man who never considered wealth as a license for profligate living.

Most important, Clark, despite being one of the dominant figures in the industrial age, never abandoned his love of the land. A product of the Catskills foothills and raised with a profound appreciation for the scale and organization of nature, he married into a family with a long-standing interest in the wilderness made part of the American imagination by author James Fenimore Cooper. Clark invested most heavily in real estate, which he saw as the responsible and wise stewardship of the land.

William Andrews Clark

American copper mining and railroad magnate and politician

In building a financial empire in the West during more than thirty years of ruthless business negotiations involving mining, banking, and the railroad, Clark epitomized the aggressive capitalist spirit and unabashed greed of the Gilded Age. Clark, who saw wealth as entitlement to political power, admitted that he bribed Montana lawmakers so he could obtain a seat in the U.S. Senate.

Born: January 8, 1839; Connellsville, Pennsylvania
Died: March 2, 1925; New York, New York
Sources of wealth: Mining; railroads
Bequeathal of wealth: Children; museum

Early Life

William Andrews Clark was born in a log cabin in the coal fields of southwestern Pennsylvania on the outskirts of Pittsburgh. Little is known of his childhood; as his influence grew and his wealth accumulated, he worked to keep his early years from public scrutiny. His parents were first-generation Scottish and Irish immigrants, who, hoping for a better life, homesteaded west to Iowa in 1856, when Clark was seventeen. With little taste for farming, Clark, a bright student, considered a career in teaching.

After completing studies at Iowa Wesleyan College, a small Methodist institution, Clark taught school in Missouri and became interested in law. During his time in Missouri, Clark came to believe deeply in the importance of states rights and of controlling the power of a centralized, federal government. Consequently, he enlisted in the Confederate army at the outbreak of the Civil War, but he either deserted or was discharged in 1862.

First Ventures

Restless and eager to make his mark, Clark headed west to take advantage of the area's mining boom. After briefly mining quartz in Colorado, in 1863 he arrived in Bannack, then the capital of the Montana Territory. He had modest success, earning an estimated $1,500 from his gold discoveries in the area's rivers. He made his initial fortune by developing supply lines to Salt Lake City, and later to St. Louis, in order to outfit mining camps with equipment and food. He then used the capital from this venture to invest in banks that owned the land rights to mining stakes in the vast Montana Territory, and, in turn, he took over the rights to this land when the mining companies went bust. Over the next decade, Clark, gifted with uncanny business savvy and driven by an uncomplicated love of accumulating wealth, expanded into numerous mining operations, as well as newspapers, smelting plants, banks, lumbering and ranching interests, utilities, and railroads.

By the early 1870's, when Montana's gold rush appeared to be over, the territory was electrified by news of a massive copper strike. Given the reach of Clark's holdings and his interest in smelting, the copper strike proved his long-anticipated financial bonanza. By the mid-1880's, Clark and Marcus Daly, who had made a fortune in silver and headed a mining conglomerate, the Anaconda Copper Mining Company, became the dominant financiers (and chief rivals) of the cooper-rich Montana Territory.

Mature Wealth

To Clark, it was natural—even inevitable—that wealth brought political power. Using the influence of his newspapers, Clark emerged during the 1880's as a powerful and charismatic voice for Montana statehood. He chaired two conventions, in 1884 and 1889, where participants worked to draft a state constitution. For Clark, however, politics was always an extension of his own interests. He worked most diligently to secure restrictions on the

The William Andrews Clark Memorial Library

Although William Andrews Clark spent his life focused on accumulating wealth, wielding political clout, and managing scores of industries, his son had far different ambitions. William Andrews Clark, Jr., was born into privilege. By the time he was born in Butte, Montana, in 1877, his father was already among the wealthiest men in the West. Despite living in the relative cultural backwater of the American frontier, young Clark developed a love of music, learning to play the violin, and of poetry and fiction.

With his father's blessing, Clark began living part of each year in the temperate climate of Southern California. It was an exciting place for a young man with unlimited wealth. He acquired prime acreage in Los Angeles and built a lavish showplace mansion. He sought to foster the arts in the young community, single-handedly financing in 1919 what would become the Los Angeles Philharmonic and providing a generous endowment to ensure the orchestra's operations.

It was his book collection, however, that became the focus of his cultural activities. During more than two decades, Clark assembled a wide-ranging collection of first editions, rare books, autographed letters, and original manuscripts of the British writers he loved, including William Shakespeare, John Milton, Geoffrey Chaucer, and later works by Charles Dickens and the Romantics, including William Blake and Lord Byron. Originally pursuing acquisitions that intrigued him, Clark eventually concentrated on two areas: seventeenth century British literature and the works of the Irish playwright Oscar Wilde. His interest in seventeenth century England included collections of music and operas, particularly those composed by George Frideric Handel and Henry Purcell, as well as groundbreaking works of scientific investigation from the likes of Sir Isaac Newton and astronomer Edmond Halley. Clark's fascination with Wilde led him to collect not only manuscripts and letters but also a rich trove of photographs and production notes from several of Wilde's plays, as well as artifacts from Wilde's contemporaries, including William Butler Yeats and John Millington Synge.

In 1924, Clark arranged to construct a library on the prime acreage he had originally purchased. He hired Robert D. Farquar, a Southern California architect schooled in classic European design, who would later help plan the Pentagon outside Washington, D.C. When the library opened in 1926, its lavish French Revival exterior, its magnificent foyer and other ornate interior details, and its beautifully appointed gardens made it a prominent cultural showplace. Even before its opening, Clark had decided that upon his death the library and its priceless collection would be donated in the memory of his father to the newly opened University of California at Los Angeles (UCLA). Long after Clark's death in 1934, that bequeathal remained the most generous in UCLA's history.

In the twenty-first centry, the Clark Library, one of UCLA's twelve libraries, anchors the university's prestigious Center for Seventeenth and Eighteenth Century Studies. The center administers numerous scholarships, fellowships, and endowed professorships; hosts international colloquiums; and sponsors an award-winning series of academic publications. Within the library's spacious study rooms, academics and other patrons pursue original research in the collection of more than 100,000 rare books and almost 25,000 original manuscripts.

amount of money that the federal government could tax mining interests. A fiery orator, Clark sought election as the territorial representative to Congress in 1888, only to lose to a virtual unknown, raising suspicions that Daly had tampered with ballots.

After Montana was admitted to the union in 1889, Clark, a Democrat, ran unsuccessfully in both 1889 and 1893 for a seat in the U.S. Senate. At this time, state legislators chose senators, and when Clark ran again in 1899, the Democratic-controlled Montana legislature selected him, only to have the selection immediately challenged when evidence of Clark's massive bribery came to light. Characteristically, Clark admitted that he had paid hundreds of thousands of dollars in bribes, but he argued that influence peddling was an inevitable part of a democratic system. By the time Clark arrived in Washington, D.C., the Senate had already voted to unseat him. He then attempted a backhanded maneuver to return by relinquishing his Senate seat and, after waiting for the governor to be out of state, having the lieutenant governor, a crony of his, appoint him to fill his own vacated seat, only to have the governor nullify the appointment when he returned. Clark was finally elected on his own in 1901, although accusations of fraud were raised involving the powerful miners' bloc. Clark served a single term in the Senate, distinguished only by his fierce fight against federal government protection of the mineral-rich Western lands.

While in office, Clark still worked to extend his business interests, developing new railroad lines to connect the burgeoning populations in Nevada, Arizona, and California with Salt Lake City, as well as speed transportation of his copper ore. Along with the help of his younger brother, a banker, Clark saw the potential for Western development. In contentious rivalry with other financiers, notably Edward H. Harriman of the Union Pacific Railroad, Clark purchased thousands of acres of ranch land and water rights critical to a transportation system and created a line, the San Pedro, Los Angeles & Salt Lake Railroad, which not only placed him among the wealthiest men in America but also helped guarantee the economic development of the Southwest. Clark is credited with establishing what would become Las Vegas, now the seat of a Nevada county that bears his name. Perhaps Clark's most lasting legacy is Clarkdale, Arizona, founded in 1912 as the site for his vast smelting operations. Clark helped design the town, laying out streets and investing in a cutting-edge communications network of telephones and telegraphs, electricity, medical facilities, and sewer systems, making Clarkdale a prototype of a planned community.

Rich beyond measure, after the end of his Senate term in 1907 Clark left the West entirely and moved to a spacious mansion with more than one hundred rooms on fashionable Fifth Avenue in New York City, where over the next fifteen years he spent lavishly to outfit the house. He also invested in more than seven hundred pieces of European art, ranging from ceramics and tapestries from antiquity to canvases by the Old Masters and French Impressionists. Upon his death in 1925, at the age of eighty-six, his entire collection was bequeathed to the Corcoran Gallery in Washington, D.C., along with a sufficient contribution to construct a wing to house the artworks.

At his death, Clark's fortune was estimated at $200 million. After his wife's death in 1893, Clark financed the career of an aspiring starlet, whose unexpected pregnancy the year Clark was elected to the Senate compelled him to marry her. Although his will bequeathed $2 million to her, the bulk of the estate was distributed among the children of his first wife. The children variously sold the assets and diversified their inheritance. After the demolition of Clark's ostentatious Manhattan home in 1928, little remained of his fortune.

Legacy

Clark had the keen eye of a consummate capitalist entrepreneur. As a first-generation Westerner, he was positioned to take advantage of a frontier culture, with its virtually limitless resources ripe for exploitation and little in the way of regulation to disturb the steady aggrandizement of personal wealth. However, his vast wealth left little imprint. For all his political endeavors, he is remembered in the twenty-first century as a cautionary tale of corruption, specifically for the fiasco of his attempt to get appointed to the Senate after he had resigned. His fortune was made largely from his manipulation of two industries—mining and the railroad. By the time of his death, his mining enterprises were exhausted and the railroad had lost its central economic position. Because he saw wealth only in personal terms—endorsing no charity, endowing no university, and supporting no public cause—his legacy extended little beyond his death.

Cleopatra VII

Egyptian monarch

Cleopatra was the last Hellenistic monarch to rule Egypt, the wealthiest area of the ancient Mediterranean world. The potential of Egypt's vast natural resources and wealth drew the attention of Julius Caesar and Marc Antony, each of whom viewed an alliance with Cleopatra as a means to enhance his own wealth and power.

Born: 69 B.C.E.; Alexandria, Egypt
Died: August 3, 30 B.C.E.; Alexandria, Egypt
Also known as: Cleopatra VII Thea Philopator; Cleopatra Philopator
Sources of wealth: Inheritance; agricultural products; trade
Bequeathal of wealth: Confiscated

Early Life

Cleopatra (klee-oh-PA-trah) VII Thea Philopator was born to Ptolemy XII Auletes, a descendant of Ptolemy Soter, the Macedonian general who assumed rule over Egypt following the death of Alexander the Great. In keeping with ancient Egyptian custom, the members of the ruling Ptolemaic Dynasty promoted themselves as divine, and the young Cleopatra was raised in lavish splendor befitting her status as a goddess. She received an excellent education, learned nine languages, and is said to be the only Ptolemaic ruler to learn the native Egyptian language. As she matured, Cleopatra used her divine status, her fine education and strong linguistic skills, and her limitless and sometimes ruthless ambition to establish herself as sole ruler of Egypt, thereby controlling the resources of the richest area in the ancient Mediterranean.

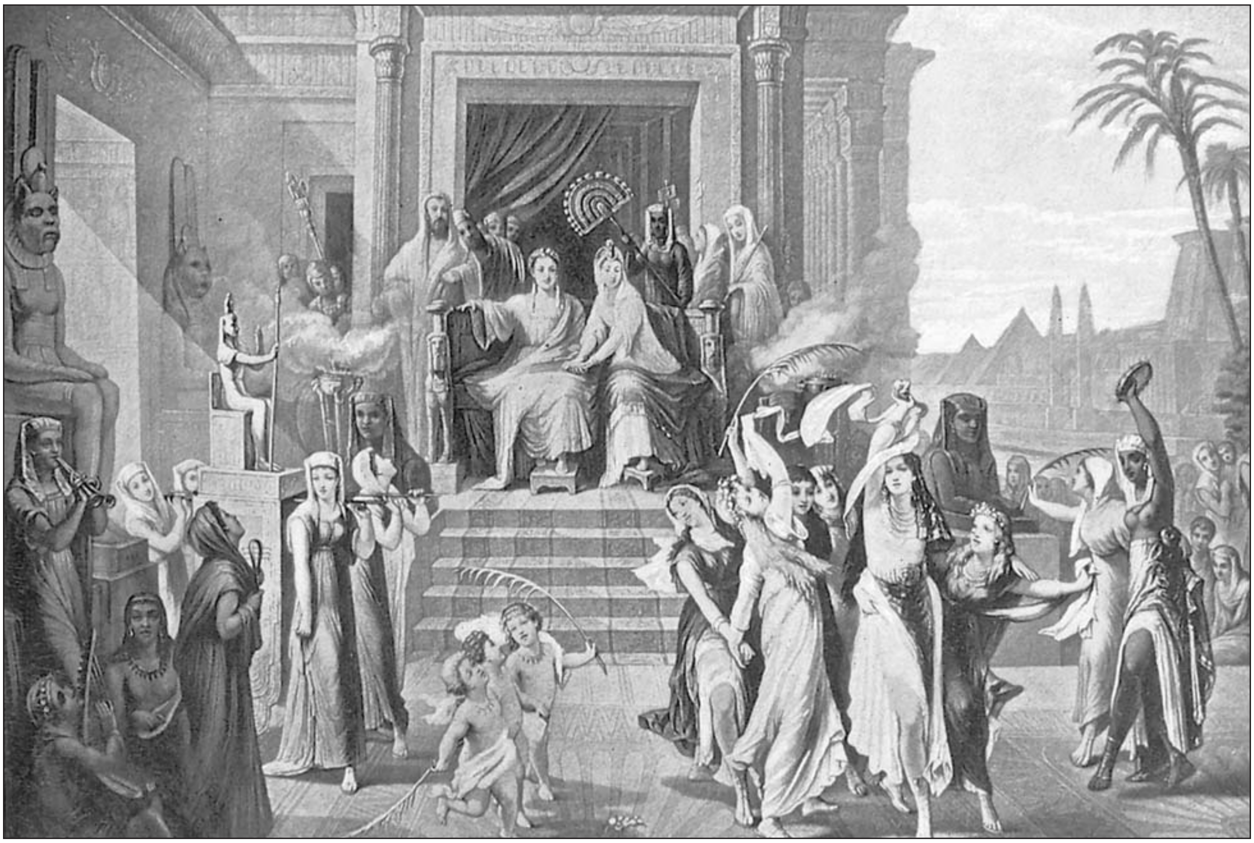
First Ventures

Cleopatra knew well the importance of controlling and manipulating Egypt's vast wealth.

For millennia the Nile River's annual flooding had left rich soil in which crops flourished. Egypt's agricultural abundance provided grain for a significant portion of the peoples of the Mediterranean, earning Egypt the distinction of being the breadbasket of the ancient world. Egypt also had many natural resources, such as flax for oil and linen, stone for construction, papyrus for making paper, salt for preserving foods, and semiprecious stones, such as malachite, carnelian, and amethyst. Egypt's most prized natural resource was gold, which was highly sought after for coinage and jewelry. With its well-developed trade system, Egypt exchanged its produce, goods, and natural resources with far distant lands, thereby increasing the standard of living in all areas, including Egypt itself.

Mature Wealth

Chief among the importers of Egypt's resources was Rome, which by the time of Cleopatra controlled all of the Mediterranean, except Egypt itself. Cleopatra was keenly aware of the tenuous position that Egypt held in regard to Rome; Rome's powerful military machine was capable of conquering Egypt at any time. Cleopatra



The court of Cleopatra VII. (F. R. Niglutsch)

knew it was essential that she maintain Egypt's economic security by continuing trade with Rome, while at the same time preserving Egypt's independence and her own personal power.

When Julius Caesar arrived in Alexandria in 48 B.C.E., the twenty-one-year-old Cleopatra charmed the fifty-two-year-old Caesar with her linguistic skills, intelligence, and lavish display of power. Their close political and personal relationship staved off Roman aggression and benefited the economic status of both Egypt and Rome. When Caesar was assassinated in 44 B.C.E., Egypt's position vis-à-vis Rome was again placed in jeopardy.

In 42 B.C.E., Cleopatra secured another close political and personal alliance, this time with Marc Antony, one of the individuals who came to power in Rome following Caesar's death. Again, Cleopatra used her political expertise and personal charms to win over this powerful Roman leader, thereby holding off a potential Roman military attack on Egypt, and, at the same time, temporarily securing the economic status of Egypt.

Back in Rome, the grandnephew and heir of Julius Caesar, Octavian (the future Emperor Augustus), feared that Antony would use Cleopatra's wealth and power to secure his own dominance over Rome. In 31 B.C.E., Octavian and his forces set sail and met the combined forces of Cleopatra and Antony at the Battle of Actium, where Octavian's forces were victorious. The defeated Cleopatra and Antony retreated to Alexandria, where, a year later, they committed suicide rather than be subject to Octavian.

LEGACY

Cleopatra had used her control over Egypt's wealth in her attempts to stave off Roman aggression and domination. In the end, Rome's determination and military power proved too strong, even against Cleopatra and the wealthiest Mediterranean nation of its time. Upon Cleopatra's death, Rome annexed Egypt and Egypt became Rome's richest province. Throughout its remaining history, Rome used Egypt's agricultural produce, natural resources, and great wealth to sustain its peoples, to extend its boundaries, and to create the largest empire the world had ever known.

ROBERT CLIVE

British merchant and military leader

Clive's military success in India laid the foundations for the British Empire's eventual control of that country. Clive became rich as a result of his Indian service, and as news of his wealth spread, the British government became increasingly interested in India, and businessmen and other individuals dreamed of earning a fortune there.

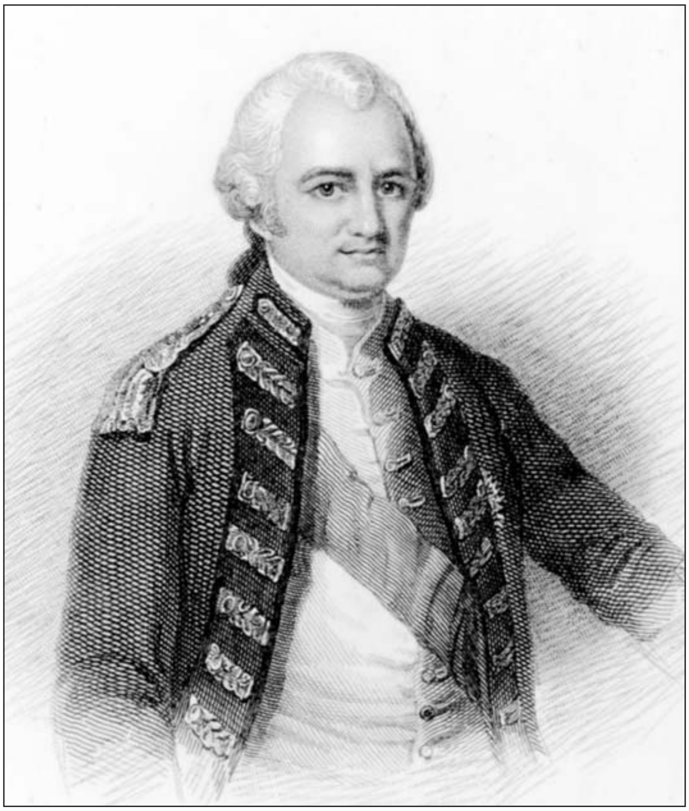
Born: September 29, 1725; Stychei, Shropshire, England
Died: November 22, 1774; London, England
Also known as: First Baron Clive of Plassey; Clive of India
Sources of wealth: Trade; government; conquest
Bequeathal of wealth: Spouse; children

EARLY LIFE

Robert Clive (kliv), son of a minor landowner and lawyer, attended school in Shropshire and in London at Merchant Taylors' School, but he was not a good student. He was a prankster and a troublemaker. He was tall, moody, and sensitive, as well as a daredevil with a fierce temper who loved fighting. He was also, importantly, a lucky person who had numerous close brushes with death throughout his life but survived them all. Clive also suffered from bouts of depression. His father was able to arrange a clerkship for him in the British East India Company (founded in 1600), and in 1743 Clive sailed to India to serve as a writer (clerk) at the British settlement at Fort St. George in Madras (now Chennai).

FIRST VENTURES

At Madras, Clive began to read widely, but he was bored. He reportedly tried to commit suicide, but his gun failed to fire. Two years later, his fortune changed as a result of the British-French rivalry in India. The French attacked Madras in 1746 and captured it. Clive escaped to another British settlement, Fort St. David, where he volunteered for the military and was appointed to the rank of ensign. In 1749, now a lieutenant and an untrained but born soldier, Clive was highly praised for his successful attack on Tanjore. When hostilities ended, the French returned Madras to the British,



Robert Clive. (Library of Congress)

and Clive was appointed steward of Fort St. George, receiving a commission on every supply for the facility. His stewardship made him a very wealthy man.

Clive attained fame when he attacked Arcot in 1751, captured the city, and withstood a siege of fifty-three days. This battle began a series of military victories in south India against the French and their Indian allies. Clive returned to England in 1753, a national hero with a seventeen-year-old wife and a considerable fortune.

Mature Wealth

Clive went back to India in 1756 to become deputy governor of Fort St. David. However, Fort William, the British fort at Calcutta, was captured by Sirāj al-Dawlā, the nawab of Bengal. Sirāj al-Dawlā held 146 British men, women, and children in the fort's guardroom, dubbed the Black Hole of Calcutta. According to some reports, 123 of the captives suffocated during their time in this confined space. The British, determined to obtain revenge and retribution, appointed Clive commander of the punitive force. Clive recaptured Calcutta on January 2, 1757, and took the city of Chandanagar in March. At the Battle of Plassey, on June 23, 1757, Clive defeated Sirāj al-Dawlā, and this victory led to Clive's fame as the founder of the British Empire's control of India.

Following the battle, Clive established the British as the dominant power in Bengal, the richest province in India. He led his ally Mir Jaʿfar to the capital city of Murshidabad, where Mir Jaʿfar was appointed the nawab of Bengal. Clive received £234,000 and the title of *mansabdar* (officeholder), and he was entitled to a rent of £30,000. Overnight, Clive had become one of the richest men in Great Britain. Returning to England in 1760, he purchased two hundred shares of the British East India Company at £500 each and several houses and then returned to Bengal in 1765 to serve as governor for two years. On August 12, 1765, Clive was personally given the grant by the Mughal emperor to collect the revenue of Bengal, Bihar, and Orissa, which, in practice meant he was the government in those areas. This led to the creation of "British India," and the British would expand in all directions to create their empire.

Clive eventually returned to England. Ill, he committed suicide at his London home in 1774 in one of his bouts of depression and was buried in an unknown grave.

Legacy

The wealth that Clive generated in India led the British government to become increasingly interested in this part of the world. The government determined that the British East India Company should hold on to Bengal and its vast wealth, the French should be removed from India, and, if necessary, the British should take over India to safeguard their investments there.

Great Britain eventually created the second British Empire by expanding upon the territory that Clive had captured.

Jacques Coeur

French merchant, statesman, and financier

Coeur, a fifteenth century merchant, trader, and financier, amassed the greatest fortune ever made by an individual Frenchman. His innovations and business methods had lasting effects on medieval commerce and trade. As a wealthy entrepreneur, he created trade routes in France and opened up French trade with the Levant.

Born: c. 1395; Bourges, France
Died: November 25, 1456; possibly Chios, Greece
Sources of wealth: Trade; inheritance
Bequeathal of wealth: Relatives; confiscated

Early Life

Jacques Coeur (jahk kur) was born in Bourges, France, around 1395. He was the son of Pierre Coeur and Dame Bacquelier, the widow of a butcher. Pierre was a furrier of modest fortune; his marriage advanced him in the society of Bourges, since the Butchers' Corporation was one of the more powerful trade guilds in the city. Jacques's brother Nicolas became archbishop of Luçon, and his sister married Jean Bochetel, secretary to the king. Jacques was educated at the École de la Sainte-Chapelle in Bourges but did not attend university. From an early age, he intended to be a merchant like his father.

In 1418 or 1420, Coeur married Macée de Léodepart, the daughter of the provost of Bourges and former valet of the duc de Berry. The marriage placed Coeur in the top tier of Bourges society. He and his wife had five children of whom there is a record. Two of the children, Jean and Henri, entered the Church, with Jean becoming archbishop of Bourges and Henri appointed canon of la Sainte Chapelle. Another son, Geoffroy, entered the king's service as a functionary; Ravand joined his father in business; and Coeur's only daughter, Perrette, married Jacquelin Trousseau, the viconte de Bourges.

First Ventures

Soon after his marriage and with the aid of his mother-in-law, who had been previously married to a banker, Coeur became a manager of one of the twelve exchange houses of Bourges. In 1429, he founded a coinage business with two associates. He was accused of falsifying the quality of his coins and faced imprisonment. However, King Charles VII granted him a pardon.

In 1432, Coeur made his first trip to the Levant with a group of merchants from Montpellier. There is considerable disagreement among scholars of the Middle Ages as to the purpose of his travels. The trip could have been a spiritual pilgrimage, a diplomatic mission for the duc de Bourgogne, an investigative expedition to scrutinize the Muslims in preparation for a Crusade, or a voyage to establish trade with the Levant. Although Coeur did eventually establish a highly profitable trading business with Levantine merchants, he did so twelve years later; it is not very probable that trade was the purpose of the 1432 trip. However, he did return to France with knowledge he would use to build his vast trading empire.

Mature Wealth

Once back in France, Coeur established a trading company and exchange at Montpellier. He quickly built a reputation as an astute financier and trader. He became involved in the silk industry at Florence, where he had a silk-manufacturing facility. He joined the Arte della Seta, the silk makers' guild. In 1436, Charles VII summoned him to Paris and bestowed the office of *argentier* (master of the mint) on him. Coeur served in this office from 1436 to 1451, having complete control of the ordinances governing the coinage of France. In 1438, Charles VII made Coeur the court banker and a member of the king's council. Coeur also became the collector of the salt tax.

Holding these offices placed Coeur in a most advantageous situation for expanding his business activities and increasing his wealth. He was in contact with all members of the royal court and all of the foreign countries with which France dealt politically and commercially. Consequently, he was able to acquire goods from all regions of France and from many other countries. He became involved in the salt market in the Loire and Rhone Valleys and in the wheat market in Aquitaine, and he imported wool from Scotland. He also began to import spices, cloth, and other products from the Levant. He established a trade circuit which commercially linked the French cities of Paris, Rouen, Montpellier, Lyons, Avignon, and Limoges.

In 1444, he outfitted his first ship for trading with the Levant. By1449, he had a fleet of seven trading ships and had established trading houses and exchanges in major towns in France, including Paris, Montpellier, Marseille, Lyons, and Tours. His trade with the Levant increased his wealth through the sale of merchandise, but, more important, it enabled him to make enormous profits from the differences in the currencies of France and other countries. By 1449, Coeur possessed a fortune whose worth no other individual Frenchman would ever match. He established himself as the creditor of Charles VII and the members of the royal court.

Evidence of his wealth was visible throughout France as he purchased and built private houses and chapels in his native Bourges, in Lyons, and elsewhere. Coeur owned property throughout France. In 1443, he began construction of his *grande maison* (great house) at Bourges. The building was extraordinary for its time both in size and in elaborateness of decoration.

In addition to his involvement in trade and finance, Coeur played a very important role in the affairs of state both in France and abroad. In 1444, Charles VII sent him to the Languedoc as one of the commissioners charged with overseeing the newly established parliament there. In 1448, he visited Pope Nicholas V at the Vatican. While there, Coeur succeeded in bringing about an agreement between Nicholas V and Amadeus VIII (Antipope Felix X), which ended the papal schism.

Coeur's relationship with Charles VII provided many of the avenues that enabled him to attain his great wealth, but it also brought about his downfall. Coeur was favored by both the king and his mistress Agnès Sorel, who was the first of the royal mistresses to exert significant political influence. In 1441, the king granted letters of patent to the Coeur family, which gave it status as nobility. The king placed Coeur in a most influential position in his government. Coeur in return provided assistance, primarily in terms of money, to the king. However, he also assisted the king and his mistress in more private ways. Coeur's son-in-law Jacquelin Trousseau owned the Château Bois-Sir-Aimé near Bourges, where Charles VII and Sorel wished to spend their summers. The residence was in very poor condition, and Coeur paid to have it renovated for the king and Sorel. Coeur was among Sorel's favorites, and he served as her confidant. Given her influence over Charles VII, it is very possible that Coeur owed much to her for the favors he received from the king.

Whatever the case may have been, Sorel's death in 1450 brought about Coeur's downfall. With the death of Sorel, Coeur lost his protection at court, and Charles VII lost the one person who was able to dispel his depression. It was rumored that Sorel had been poisoned, and soon accusations against Coeur as the murderer reached the king. Scholars have clearly established Coeur's innocence and emphasized the extreme jealousy and animosity of the courtiers toward Coeur, an ennobled bourgeois and extremely wealthy upstart to whom most of the courtiers owed large sums of money. Another factor which probably influenced Charles VII was his intense hatred of his son Louis. While Coeur remained loyal to the king, he also had an amiable relationship with Louis.

On July 31, 1450, Coeur was arrested at the Château de Taillebourg. He was charged with treason to the king, poisoning Sorel, practicing alchemy, and financial wrongdoing. He was imprisoned at Poitiers, tortured, forced to admit guilt, and brought to trial with the king's prosecutor Jean Dauvet presiding. Coeur's sentence to

Jacques Coeur Palace

Jacques Coeur began construction of his great house in 1443. He always referred to it as his *grande maison*, a term used in his time to designate an extremely large and richly decorated private house. The house was not called the Jacques Coeur Palace until the Bourges tribunal occupied it in 1820.

Coeur hired the very best builders and workmen to build his house. Colin Le Picard, the king's master builder, was in charge of construction. The firms, workshops, and crews Coeur employed had built the palace of Jean, duc de Berry, and this residence was located near the house where Coeur had lived as a child. Coeur's *grande maison* was elaborately decorated with a profusion of sculptures and carvings of his emblem of hearts and shells, in combination with the fleur-de-lis emblem of the king. Coeur was a very loyal subject of Charles VII, priding himself on his relationship with the king, and he had a large statue of Charles VII on horseback placed inside the entry to his new home.

It took eight years to complete the palace. Coeur himself never lived in the house on a permanent basis, although he did host dinners and celebrations there. His arrest and incarceration at almost the exact moment of its completion prevented him from enjoying this elaborate residence, which was the symbol of his success and wealth. The house, along with all of his other holdings, was confiscated by the government. The palace was returned to the family on August 5, 1457, but was sold for the first time by one of Coeur's grandsons on October 7, 1507. From that time, the palace had several different owners, including Jean-Baptiste Colbert (1619-1683), an influential member of Louis XIV's government, and the magistrates of Bourges. In 1923, the French government purchased the palace and declared it a historic monument. In the twenty-first century, the palace is a national monument open to the public.

death was proclaimed on May 23, 1453, and read to him on June 3. Due to the intervention of Pope Nicholas V, the sentence was reduced to imprisonment until such time as Coeur would manage to pay a fine of 550,000 livres. On October 27, 1454, Coeur escaped from Poitiers, and with the help of his family and others he managed to reach Rome, where he found protection with Nicholas V. In 1456, he left Rome on an expedition supposedly to fight the infidels. Coeur died on November 25, 1456, possibly at Chios, Greece.

Legacy

Jacques Coeur was an outstanding businessman and entrepreneur. His activities as a trader and financier created a trade network within France and also opened up new markets in other European countries and in the Levant. His system of setting up separate companies for his various business ventures was revolutionary for his time. By hiring managers and agents to represent him in exchanges and stores in towns throughout France, he developed a multilevel business organization, which was in a sense a precursor of the modern structure of business. In addition, his enormous wealth sustained France and enabled Charles VII to finance the troops necessary to halt the English conquest. Coeur's *grande maison*, which he had built in Bourges at the height of his success as an entrepreneur, is one of the most beautiful and impressive structures in France. As he amassed his fortune, his influence had an important impact on France, and by consequence the world, in the areas of international trade and business entrepreneurship.

John Colet

British philanthropist, theologian, and scholar

Colet's inherited wealth was primarily significant for the philanthropic manner in which he spent it, which set an important precedent in an era when such benevolence was by no means common. The principal object of his spending was St. Paul's School, a pioneering institution that became a model for many others.

Born: c. 1466; London, England
Died: September 16, 1519; Sheen, Surrey, England
Source of wealth: Inheritance
Bequeathal of wealth: Educational institution

Early Life

John Colet (KAHL-et) was the son of Sir Henry Colet of Wendover, who was a leading member of the Worshipful Company of Mercers, the most powerful of the liveried companies of the city of London at the time. The guild had been established to represent general merchants, but its core membership consisted of dealers in textiles, whose business underwent a boom in the late fifteenth century as fine clothing and linen became increasingly important as a means of displaying status and wealth. Sir Henry was knighted by King Henry VII in 1486 in recognition of his support at the crucial battle of Bosworth Field, in which King Richard III was overthrown. He served two terms as the lord mayor of London in 1486 and 1495.

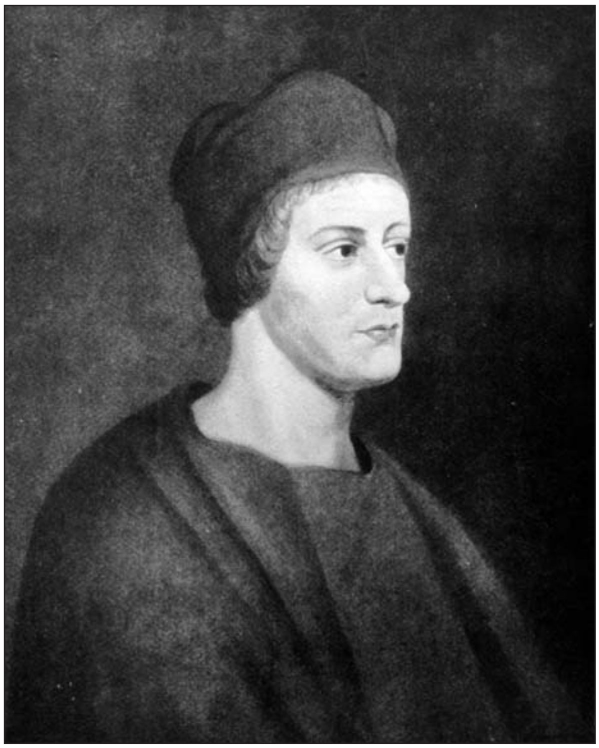
Sir Henry's wife, the former Christian Knyvet, bore him a great many children, although the exact number is not known. The scholar Desiderius Erasmus, who knew and greatly admired "Dame Christian," as well as her son John Colet, recorded the number as twenty-two—eleven boys and eleven girls—but there is no documentary confirmation of that figure. The great majority, at any rate, died in infancy, leaving only two sons, Richard and John, to grow to adulthood.

John Colet's early education included a spell at Saint Antholin's Hospital, but few other documentary details of his youth survive until he went into the Church, which was then a recognized career path for the younger sons of respectable folk. At that time, his older brother Richard was expected to take over Sir Henry's business interests and was regarded as the businessman's heir.

In 1485, Colet became a rector at Dennington in Suffolk, whose living was in the gift of his mother's family, and from 1490 to 1494 he was rector at Thurning in Huntingdonshire, that living being in his father's gift. He traveled on the Continent thereafter, probably as much as a tourist as a scholar, but when he met the celebrated humanist Erasmus for the first time in 1495 he apparently had a change of heart. The subsequent correspondence and friendship of the two scholars extended for more than twenty years. Erasmus evidently made a deep impression on Colet, seemingly galvanizing a religious commitment that had formerly been little more than a useful source of income and transforming it into a genuine vocation.

First Ventures

Colet was ordained as a deacon in 1497 and as a priest in 1498. He was already canon of York by then, and in 1499 he acquired the parish of Stepney, which was then the richest in England. He was said by later commentators to have studied at both Oxford and Cambridge Universities, graduating from Magdalen College, Oxford, in 1501, and obtaining his doctorate in 1504, but again, contemporary documentary evidence is lacking. There is, however, no possible doubt as to the quality of his intellect



John Colet. (Hulton Archive/Getty Images)

St. Paul's School

John Colet founded St. Paul's School in 1509, building the institution on a plot of land north of St. Paul's Cathedral in London. Colet endowed the school with estates that initially provided an income of £112 a year (the sum escalated considerably over time) and appointed the Worshipful Company of Mercers as school trustees. He hired the famous grammarian William Lilye to serve as the first high master at an annual salary of 13 shillings, twice that of the headmaster of Eton College, a British boarding school for boys. St. Paul's was subsequently designated as one of the nine original public schools by the Public Schools Act of 1868, the title referring to the fact that it was supposedly open to anyone.

Initially the school provided accommodation for 153 pupils, that number being determined because of its association with the account in the Gospels of "the miraculous draught of fishes" secured by Peter at Christ's behest. Colet had in mind, of course, Christ's assertion that he would make Peter a "fisher of men," and the school was Colet's instrument for carrying forward that work. Education was provided in "literature and etiquette." The former included the Greek and Latin literature made available within Christendom in association with the Renaissance, whose Aristotelian and Platonic components embraced philosophy and protoscience, as well as the Scriptures and commentary thereon. Etiquette instruction embraced codes of behavior hopefully intended to make civil society more polite, constructive, and, in the most general sense, humanistic. Tuition was free, but the pupils had to pay for their own wax candles—a not inconsiderable expense.

The educational philosophy of St. Paul's School retained the stamp of Colet's ideas for many years after his death, in part because he collaborated with Lilye and other teachers on the perennially reprinted basic textbook that eventually became known, somewhat misleadingly, as the *Eton Latin Grammar.* St. Paul's School survived into the twenty-first century, although it had long since been relocated from the heart of the city of London to a much larger site in the suburb of Barnes.

and education, even if the latter was slightly belated and mostly autodidactic. What is certain is that his prospects underwent a drastic change when his brother Richard died in 1503, leaving Colet and Dame Christian as Sir Henry's joint heirs when the latter died in 1505. Dame Christian, who came from a mercantile family herself, apparently continued to manage the family's business interests and remained a force to be reckoned with in the Company of Mercers, although, as a woman, she was ineligible for membership therein. There was never any question of Colet leaving the Church, and his mother seems to have supported his vocation wholeheartedly.

In 1505, Colet was appointed dean of St. Paul's Cathedral, and his influence within the Church then became considerable. Colet's preaching at St. Paul's gave humanist ideas their most significant platform in England, and his sermons on Paul's Epistles, which attempted to overturn then-conventional scholastic interpretations, became highly controversial. His ideas interacted with those of Thomas More and other important English theologians of the day. However, Colet published very little. Although printing was firmly established in England during his lifetime by his father's fellow Mercer William Caxton, Colet regarded printing more as an asset for education than as a means of preserving his own ideas. For this reason, what survived of his writings was a belated patchwork of oddments, and he left less of an impression behind him than some of his less able contemporaries. His enthusiasm for reform led, perhaps inevitably, to charges of heresy being lodged against him by more conservative clergymen, but he was stoutly defended by William Warham, the archbishop of Canterbury, and was never in any real difficulty.

Mature Wealth

Colet does not seem to have obtained control of his father's fortune when he reestablished St. Paul's School, but when he did begin managing his inheritance he set about employing it in the cause dearest to his heart. There had been a school attached to St. Paul's Cathedral in London since 1103, but it had been used in its early days entirely as a means of training the clergy, and by the early sixteenth century it had fallen into disuse as that role had been taken on by the universities. The school that Colet had in mind was a very different institution, whose primary purpose would be the education of laymen, with a view to extending learning and culture beyond the bounds of the Church establishment, eventually to embrace the whole of civil society—or, at least, its upper strata.

Colet made no attempt to achieve any further promotion within the Church hierarchy, although he became a close ally of the ambitious Thomas Wolsey and did not relax in his reformist agitation while he was part of Wolsey's clique. Colet was chosen to preach the sermon when Wolsey was appointed a cardinal in 1515. Wolsey was influential in having Colet appointed to the privy council of King Henry VIII, who had come to the throne in 1509. Henry thought sufficiently highly of Colet to appoint him as his chaplain for a while, but Colet was a pacifist who steadfastly opposed Henry's French campaigns, and that conscientious opposition eventually proved too much for the king to bear.

Colet began to suffer repeated attacks of what was generally known as "the sweating sickness," or dropsy, in 1517, although the severe attrition the illness inflicted on his physical strength did not bring him to the brink of death until the summer of 1519. Always unostentatious in his dress and frugal in his habits, Colet dutifully made provision in his will for a small grave in the grounds of St. Paul's and a modest commemorative stone. However, his mother, who survived him by four years, was still influential in the Company of Mercers, and the guild eventually paid for the establishment of a much more lavish tomb, which survived the Great Fire of London in 1666 but had to be moved thereafter.

Legacy

Colet's material legacy was, in essence, St. Paul's School and everything it stood for. As a reformer within the Church, he was controversial in his lifetime, and his reputation thereafter was subject to the winds of change associated with the Reformation, which altered direction several times in sixteenth century England. As a pioneer in the educational field, however, his contribution was unchallengeable, and the fact that he spent his money on the values he extolled in his sermons earned him a great deal of well-deserved respect.

Samuel Colt

American inventor and industrialist

Colt's arms manufacturing enterprise earned a fortune, which he and his widow ultimately used for philanthropic and artistic purposes.

Born: July 19, 1814; Hartford, Connecticut
Died: January 10, 1862; Hartford, Connecticut
Also known as: Colonel Colt
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Spouse; charity; artistic patronage

Early Life

Samuel Colt was born in Hartford, Connecticut, the son of Christopher and Sarah Colt. His father was a farmer and would-be silk manufacturer, and his family was financially comfortable. Colt did not do well in school, mostly because he attended more closely to books on scientific and technical subjects than to the regular curricular materials. He became fascinated by guns, gunpowder, electricity, and laughing gas. Some of his youthful experiments with electrically fired gunpowder mines were both spectacular and dangerous. In 1832, at age eighteen, he went to sea. On his first voyage he developed the idea of a repeating firearm with a revolving cylinder. The crucial parts were whittled out of wood; these pieces are displayed at the Colt Firearms Collection at the Museum of Connecticut History in Hartford.

First Ventures

On his return to the United States, Colt persuaded his father to support the development of his invention. Early experiments failed, as Colt tried to deal with the problem of multiple-chamber explosions. He also had trouble making the parts of his revolvers from good quality steel. At one point he was forced to support himself by giving public laughing gas demonstrations, using the name Doctor S. Coult.

In 1835, after further work, Colt, who had by then obtained two patents on his revolver, set up a factory in Paterson, New Jersey. This enterprise failed, but Colt's revolver had not gone unnoticed, and a large order from the Texas Rangers in 1847 enabled him to reestablish his business in Hartford. The business was so successful that he was able to retire his entire debt by 1849. His income enabled him to build a huge factory, as well as a large manor house that he called Armsmear. His success was more the result of his industrial techniques than of his patents. Because of his extensive development of jigs and other manufacturing fixtures to make interchangeable parts, he was able to use semiskilled workers rather than craftsmen to produce his firearms.

Mature Wealth

Colt's employee policies were extremely enlightened by the standards of his time. A significant portion of the company's income was used to provide employee housing, a ten-hour workday, a one-hour lunch break, and rudimentary medical facilities. Even after these expenditures, his arms business was extremely profitable. He traveled extensively; many of his guns were sold to foreign governments, as well as to the United States Army. His company also made thousands of sales to private customers. Colt's income was enormous; when he died in 1862, his estate was valued at $15 million.

Some of Colt's money was used to finance civic projects, including a band, community hall, and other facili-

Samuel Colt. (Library of Congress)

ties. He and his wife, Elizabeth Jarvis Colt, had become patrons of the arts as soon as his company had become profitable. From the outset, their mansion, Armsmear, was intended to be as much museum as private dwelling. It had both public and private rooms, which were richly decorated with commissioned furniture, statuary, Sèvres-style porcelain vases, and paintings. A picture gallery was built, to which the public was given access. A horticultural conservatory also was constructed and was subsequently relocated and rebuilt several times by Elizabeth after Samuel's death. There was, of course, a large arms museum associated with Colt's factory.

Colt was only forty-seven years old when he died, and the bulk of his fortune was managed by his widow, Elizabeth. She continued to support the arts, develop Armsmear, and contribute to Hartford's civic culture until her death in 1905. None of the couple's children survived her death.

Legacy

Colt Manufacturing Company, LLC, the successor to Colt's Patent Firearms Manufacturing Company, continues to survive into the twenty-first century, not quite as grand as it had been during the nineteenth century but still producing profits for its owners. Some of the furnishings and art collected at Armsmear, as well as the large collection of firearms, are under the protection of the Wadsworth Atheneum, the oldest public art museum in the United States. Armsmear itself was converted into a home for Episcopalian women under the terms of Elizabeth Colt's will. Half of the acreage on which Armsmear stood was given to the city of Hartford and is now Colt Park.

Samuel Colt's life and career—and that of his wife—are worth studying for two reasons. One was his gifted development of techniques for mass production and his advanced notions of sound employee relations. The second, and perhaps the more important, was the Colts' dedication of their fortune to public causes, particularly to the fine arts.

Jay Cooke

American investment banker

Cooke has been called "the financier of the Civil War." He led the effort to sell government bonds to pay for the Union war effort. After the Civil War, Cooke became a major backer of the Northern Pacific Railway, until that line's bankruptcy caused the failure of his banking firm.

Born: August 10, 1821; Erie County (now Sandusky), Ohio
Died: February 18, 1905; Ogontz, Pennsylvania
Source of wealth: Banking
Bequeathal of wealth: Relatives; charity

Early Life

Jay Cooke was one of the first children born in a small frontier settlement that eventually became Sandusky, Ohio. His family was prominent in business and politics in Ohio. His father, Eleutheros Cooke, was a lawyer, railroad investor, and real estate speculator, and he served as a member of the Whig Party in the House of Representatives from 1831 to 1833. Cooke began working as a clerk in a local store when he was fourteen years old. In 1836, he went to work in a firm involved with the fur trade in St. Louis, Missouri. When that firm failed during the Panic of 1837, Cooke moved to Philadelphia. He had saved about \$200, and he went into business with other members of his family in the shipping and transportation industries. He worked as a ticket agent for a canal packet boat line and for various railroads.

First Ventures

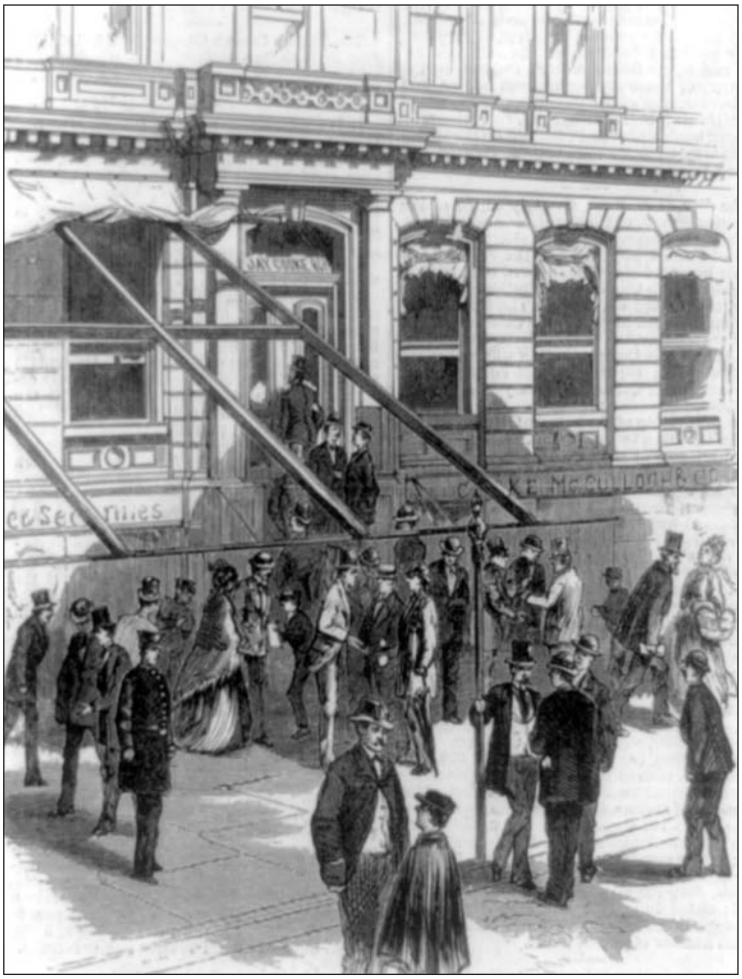
Cooke's entry into the world of banking, where he would make his major mark, was in 1839, when he went to work for the banking house of E. W. Clark and Company, the largest private banking firm in the nation at that time. Clark and Company was heavily involved in railroad promotion and in raising money for new railroad lines being built throughout the eastern United States. While the firm was already large and prosperous when Cooke came to work there, the greatest growth of the company was in the 1840's and 1850's. When the Second Bank of the United States was dismantled as a result of President Andrew Jackson's "Bank War," private firms, such as Clark and Company, became more powerful. The firm also was a major marketer of U.S. Treasury bonds during the Mexican War of 1846-1848. Within a few years, Cooke was promoted to junior partner in the firm. He became known as an expert in valuing the currency issued by various private banks throughout the country and at spotting counterfeit currency. After the Panic of 1857, Cooke left Clark and Company. Over the next few years, he was involved in railroad investments and in the unification of several Pennsylvania canal companies into a single firm. The major source of Cooke's wealth was his banking firm, Jay Cooke and Company, which he opened in Philadelphia on January 1, 1861.

Mature Wealth

Cooke's brother Henry was a good friend of Salmon P. Chase, the former governor of Ohio who became President Abraham Lincoln's first secretary of the Treasury. Chase offered Cooke the position of assistant secretary of the Treasury, but Cooke declined. Later, Chase gave Cooke a contract to sell war bonds for the government during the Civil War. Cooke made such an impressive record selling bonds that in March, 1862, Lincoln suggested that Cooke be made supervisor of all government bond sales.

Cooke is sometimes credited with the invention of the modern war bond drive. He sought to sell bonds to the small investor instead of focusing on the wealthy people who usually made such investments. Cooke believed that patriotic sentiment would lead many middle-class people to make small investments. He sold bonds in denominations as small as $50 and offered credit arrangements for purchasers. At one point, Cooke had more than twenty-five hundred agents selling bonds for him. A large-scale advertising campaign disseminated information about the war bond drive to prospective purchasers. Eventually, other banking firms began to criticize Cooke's virtual monopoly on the marketing of government bonds, and Chase stopped using Cooke as the government's agent. Later, however, when the sale of bonds was declining, Lincoln encouraged William Pitt Fessenden, who had replaced Chase as secretary of the Treasury, to turn again to Cooke. Over the course of the Civil War, the bonds Cooke sold and the bank loans he arranged raised more than $3 billion for the Union war effort.

Cooke had a substantial fortune before the Civil War, but he became much wealthier over the course of the war. The commissions he made for selling government bonds were relatively small—only one quarter of 1 percent—



Jay Cooke and Company's bank during the Panic of 1873. Cooke's bank had invested heavily in the Northern Pacific Railroad. The railroad's bankruptcy resulted in the failure of Cooke's bank and the demise of his personal fortune. (Library of Congress) and he paid the salaries of his staff and the advertising costs out of these commissions. However, his knowledge of how the government would use the money he raised and where purchases would be made allowed him to make extensive investments in firms that were doing business with the government. Such use of insider knowledge was not illegal at the time. By 1870, Jay Cooke and Company had three hundred people working in offices in Philadelphia, Washington, D.C., New York City, and London. By the early 1870's, Cooke's fortune was probably in the range of $7 million to $10 million. With profits from his Civil War bond sales commissions, Cooke built a fifty-three-room, seventy-five-thousand-square-foot mansion on a two-hundred-acre estate in Elkins Park, just north of Philadelphia. He named this home Ogontz for a Wyandot Indian chief whom he had known and admired as a young man. He also purchased Gibraltar Island in Put-in-Bay on Lake Erie, where he built a more modest fifteen-room mansion, which he often favored because of the great fishing in Lake Erie.

When Lincoln was assassinated, Cooke realized that this shocking news might panic investors, who would scramble to sell their government bonds. He sent orders to his agents to buy all government bonds that were offered for sale in order to stem any massive sell-off. He told Fessenden that he would "fully maintain the credit of the nation in this crisis." Lincoln died on Saturday, April 15, 1865. On the following Monday, Cooke walked down Wall Street, buying up government bonds with his own funds; by Wednesday, the bond sell-off was over.

After the Civil War, Cooke became involved in the financing of the Northern Pacific Railway, which was to be built from Duluth, Minnesota, to the Puget Sound region in the Washington Territory. Cooke undertook to sell bonds for the railroad, but the early management of the line was inefficient, and cost overruns were excessive. When the Northern Pacific declared bankruptcy in 1873, Cooke's banking firm also failed, and he lost his personal fortune. In later years, he managed to pay off his debts and acquire a second fortune through various business endeavors, including a gold mine in Utah in which both Cooke and Jay Gould were investors. After leasing his former Ogontz mansion to a girls' school, Cooke built a smaller home nearby and also named it Ogontz. He died there in 1905 after slowly declining health.

The Ogontz School for Young Ladies

When the bankruptcy of the Northern Pacific Railway in 1873 caused the failure of Jay Cooke and Company and eventually led to Cooke's personal bankruptcy, he was forced to sell one of his beloved homes, Ogontz, which was located in Elkins Park, Pennsylvania. Cooke had built this lavish mansion in 1863. A few years after his bankruptcy, Cooke had made a second, albeit smaller fortune through various business ventures, and he repurchased Ogontz. Eventually, he decided he could not maintain both this home and his Gibraltar estate, located on an island in Put-in-Bay on Lake Erie. Cooke arranged for the Ogontz mansion and the surrounding estate to be leased by the Chestnut Street Female Seminary, a finishing school for the daughters of elite families, which had been founded in Philadelphia in 1850. This school moved to Ogontz and was renamed the Ogontz School for Young Ladies. The school leased the Ogontz estate for $15,000 per year and was located there for thirty-four years. The student body was generally from some of the wealthiest families in the United States and averaged around one hundred students per year.

One of the most prominent figures associated with the Ogontz School was Abby Sutherland, a graduate of Radcliffe College who came to Ogontz in 1902. She eventually served as headmistress and president of the school, and in 1912 she purchased the facility from its original owners. Joseph Widener, who owned land next to the Ogontz estate, desired to buy the land from Cooke's heirs, and Cooke's family arranged for Widener to purchase the property. Shortly after buying the Ogontz estate, the Widener family tore down Cooke's original mansion and built another home on the property.

When the Ogontz estate was sold, Sutherland relocated the school to larger facilities in 1916, although the name Ogontz School for Young Ladies was maintained at the new location in the Rydal Park area of Abington, Pennsylvania. Amelia Earhart, who later became a famous aviator, was a student in the first class at this new campus. In 1950, Sutherland decided to close the Ogontz School and made a gift of the Abington campus to the Pennsylvania State University system. By the twenty-first century, this was the site of Penn State Abington.

Legacy

Cooke was one of the first major investment bankers in the United States. Later firms would grow much larger than his, but in many ways, Cooke pioneered the sale of investments to small-scale buyers. He focused on the sale of government war bonds, but later investment bankers would use similar techniques in marketing private stocks and bonds to a broad market of clients. Cooke deserves much credit for helping the federal government tap the wealth of the northern states to finance the Civil War.

While Cooke did accumulate an impressive personal fortune, his career illustrates the volatile nature of the world of high finance. Although he lost his first fortune in the bankruptcy of the Northern Pacific Railway, that line eventually became a major regional railroad, justifying his earlier confidence in its potential.

Peter Cooper

American industrialist, inventor, and philanthropist

Cooper employed his inventing genius and commercial acumen to establish one of the great industrial fortunes of the early United States. With foresight, he used his wealth for civic and philanthropic ventures, notably founding Cooper Union College of New York City.

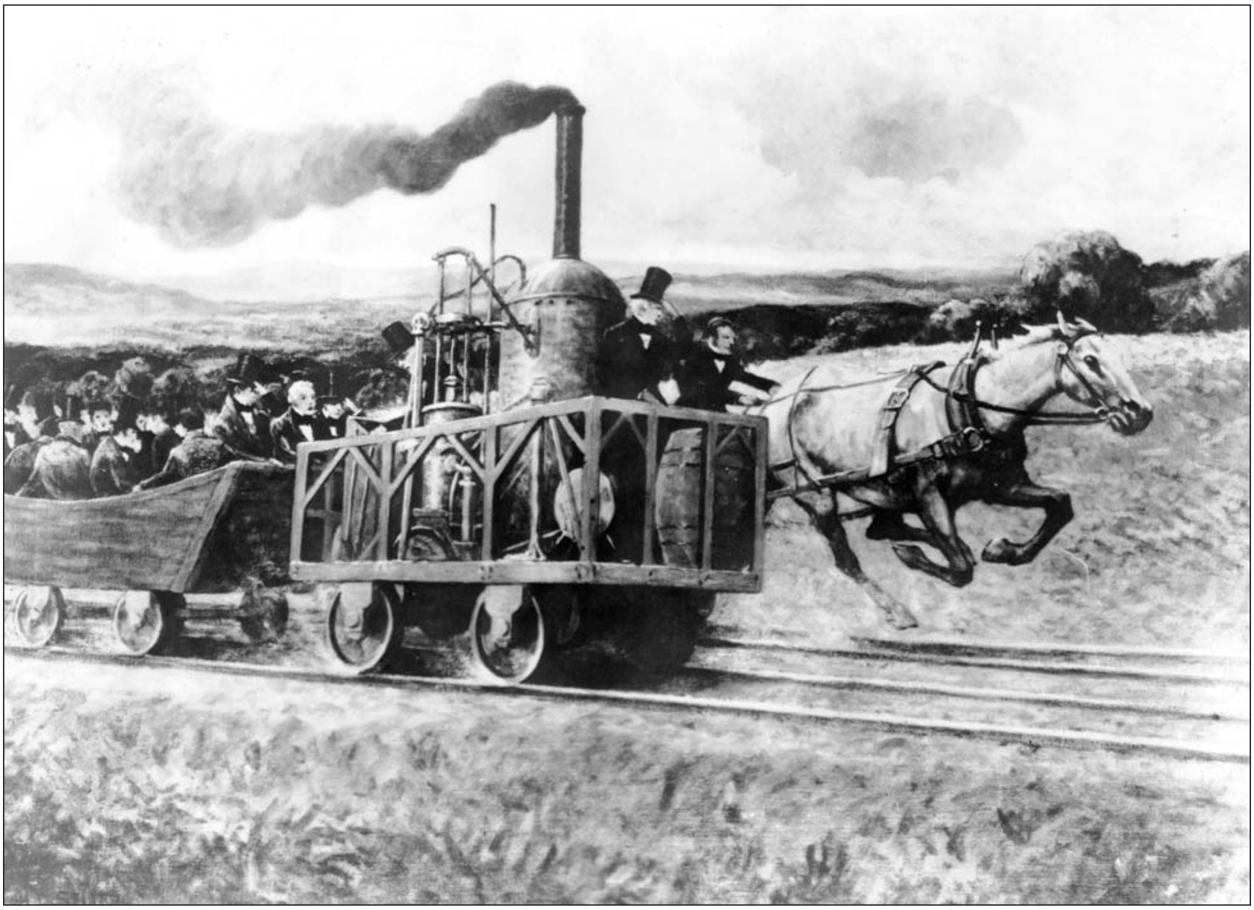
Born: February 12, 1791; New York, New York
Died: April 4, 1883; New York, New York
Sources of wealth: Patents; manufacturing; real estate; investments; steel
Bequeathal of wealth: Children; educational institution

Early Life

Peter Cooper was born in 1791 in New York City, the fifth of nine children of John and Margaret Cooper. When Cooper was a boy, his father moved the family to Peekskill, New York, where John took up a dozen livelihoods as a farmer, shopkeeper, shoemaker, hatmaker, furrier, beekeeper, builder, brewer, and brick maker, among other occupations. The engines of Cooper's future success—mechanical innovation and a shrewd business sense—can be traced to his father's enterprises. However, while John barely made a living for his family, Cooper's ventures would flourish wildly. Although Cooper received little schooling, he tinkered endlessly, his boyhood inventions including a double-wheel washing machine. At seventeen he became an apprentice to a New York City carriage maker.

First Ventures

Cooper's talent for combining mechanical skill with industrial enterprise brought him successive fortunes. Finishing his apprenticeship, he engaged in various ventures. He manufactured a cloth-shearing machine. He opened a furniture shop and a grocery. He bought property and rented out apartments. He patented numerous inventions, including improvements to the construction of steam boilers, marble tabletops, and salt makers. In 1827, Cooper purchased a struggling glue factory with the proceeds from his enterprises. Experimenting with various ingredients, he patented high-quality glues that



Peter Cooper's steam-driven locomotive Tom Thumb races against a horse in August, 1830. Cooper also invented an instant table gelatin that was the forerunner of Jell-O. (Hulton Archive/Getty Images)

could compete with the costly European imports. Capturing the import market, Cooper was soon earning a spectacular income of $100,000 a year.

Cooper added to the factory's success by devising an inexpensive brand of isinglass—a transparent gelatin used in foods—and by inventing and marketing the first instant table gelatin, the forerunner of the fabulously successful product Jell-O.

In 1828, Cooper began speculating in real estate, buying three thousand acres in Maryland near the newly incorporated Baltimore and Ohio Railroad. When the railroad made slow progress, Cooper built a makeshift prototype steam locomotive out of industrial materials on hand—the famous Tom Thumb. After a demonstration drive of Tom Thumb, which showed the potential of railroad steam engines on America's rough terrain, Cooper was able to sell his land at many times the purchase price, acquiring his second fortune. Maintaining meticulous accounts of the growth of his wealth his entire life, Cooper estimated his fortune in 1833 at $123,459, the rough equivalent of $70 million in 2010.

Mature Wealth

By 1846, Cooper had accumulated a fortune of $385,500. In 1837, he built an iron foundry in New York, moving it to Trenton, New Jersey, in 1845 to accommodate its rapid expansion and twenty-five thousand employees. Improving every facet of the iron-making process, Cooper became an innovator in an industry that would make several of America's greatest fortunes: iron- and steelmaking. In 1853, his company pioneered the production of iron rails and lightweight structural iron beams necessary for building New York City skyscrapers. In the 1870's, the company pioneered the open-hearth method of steel production, a process whereby metal is efficiently converted into steel by burning out the impurities in a hearth (basin) heated by a furnace. Out of his profits, Cooper helped finance the laying of the first successful transatlantic cable in 1866.

In 1856, Cooper's real estate and stock holdings were worth more than $1.1 million. His wealth had grown almost tenfold in two decades, and he had become one of the United States' wealthiest industrialists. Cooper, his wife Sarah, and their children lived in a mansion in fashionable Gramercy Park in Manhattan.

Cooper increasingly turned his attention to philanthropic and civic matters. With his belief in scientific progress, democracy, and the benefits of public education, he conceived of endowing a college that would offer a free education to all qualified students, as well as night classes for workers and auditoriums for civic discourse and debate. He purchased a city block at Seventh Street between Third and Fourth Avenues, near the Astor Library and Astor Place Opera House. In 1858, an imposing brownstone building was completed at the site at a cost to Cooper of $630,000. In 1859, the Cooper Union for the Advancement of Science and Art opened to students and laborers alike, regardless of sex, religion, or race. With free tuition and night classes, it was an instant success and a prototype for future American universities. Cooper Union also had a dramatic effect on the political world, when on February 27, 1860, Abraham Lincoln advanced his nomination for president with his brilliant "Cooper Union" address.

While continuing to oversee both his growing industries and Cooper Union, Cooper devoted much of the last quarter of his life to civic activities. Drawing upon a lifetime as a self-made industrialist and ardent democrat, he formed a theory of finance and government, eventually published in his collected works, *Ideas for a Science of*

THE COOPER UNION FOR THE ADVANCEMENT OF SCIENCE AND ART

In the Cooper Union for the Advancement of Science and Art, Peter Cooper founded one of the most innovative educational enterprises in American history. Aware of his own educational shortcomings, Cooper wanted his college to be free to all admitted students. An ardent and practical democrat, he also wanted his school to play a role in the nation's political life and industrial success.

It would be difficult to say that he was not successful. Even before the school opened, the nine-hundred-seat Great Hall of Cooper Union established itself as one of the nation's most important sites for political speech. In February, 1860, the candidate for the Republican nomination for president, Abraham Lincoln, delivered one of his most famous speeches on slavery, which helped propel him to the presidency. Over the next 150 years, the Great Hall auditorium would witness speeches in favor of workers' rights and women's suffrage, as well as the first meetings of the National Association for the Advancement of Colored People (NAACP) and the American Red Cross. Presidential candidates and presidents alike—Ulysses S. Grant, Grover Cleveland, William Howard Taft, Theodore Roosevelt, Woodrow Wilson, Bill Clinton, and Barack Obama—followed Lincoln's example in giving memorable speeches in the Great Hall.

As an educational institution, Cooper Union has been equally successful. Its early years provided wide access to education and established Cooper Union as a model for future American universities. The school was coeducational, making no distinction among races or religions, and free to the children of the working class. Cooper Union offered night classes for laborers and a Female School of Design. Reflecting its founder's practical successes, the school emphasized education that was forward-looking, scientific, and technological, including courses in architecture, electrical engineering, telegraphy, photography, stenography, and oratory. It offered a free library to the public and meeting spaces for artists and inventors. The success of Cooper Union helped inspire Matthew Vassar to found Vassar College for Women in 1861, Ezra Cornell to found Cornell University in 1865, and Andrew Carnegie to launch his various educational institutions.

Throughout its history, Cooper Union continued to provide a top-notch, free education to thousands of students, including inventor Thomas Edison, designer Milton Glaser, "Batman" creator Bob Kane, sculptor Augustus Saint-Gaudens, and Supreme Court Justice Felix Frankfurter. By the twenty-first century, it was organized into three schools—the School of Art, the Irwin S. Chanin School of Architecture, and the Albert Nerken School of Engineering—and it had become one of the most selective colleges in the country, admitting a mere 8 percent of applicants. Located near its original brownstone building in New York's East Village (at Cooper Square and Astor Place), it remains a vital institution in the city's life. Cooper Union celebrated its 150th anniversary on February 12, 2009. Relying on the endowment begun by Peter Cooper, which by that anniversary had surpassed the $600 million mark, Cooper Union continues to offer a full-tuition scholarship to every admitted student.

Good Government (1883). Cooper's proposals rested on a theory of currency, which he believed had to be placed at the service of labor and the business cycle rather than affixed to a rigid standard of gold. In 1876, Cooper ran for president on the Independent Party, better known as the Greenback Party. His platform relied on "financial reform and industrial emancipation," but its heart was the replacement of gold-backed currency by legal-tender dollars, or greenbacks, backed by the credit of the U.S. Treasury. His ticket received fewer than 100,000 votes nationwide, but the twentieth century would see the United States adopt a flexible, fiat currency that resembled Cooper's ideas.

Sarah Cooper died in 1869, and Cooper died in 1883. Their son Peter assumed much of the management of the ironworks. Their daughter Amelia married Abraham Hewitt, who was wealthy in his own right and would serve as mayor of New York City from 1887 to 1888. In Cooper's lifetime, he had endowed Cooper Union with some $1,550,000. In his will, he bequeathed the college an additional $155,350. He also left trusts of $250,000 for the benefit of his children and $350,000 for the benefit of his grandchildren, with the remainder of the trust eventually to be transferred to Cooper Union.

Legacy

Peter Cooper's riches were the result of his many talents. He was a brilliant inventor who enriched the world with gelatin, industrial glues, and a prototype steam locomotive, among other inventions. He turned his best ideas into successive fortunes, demonstrating acumen both as a manufacturer and as an iron and steel industrialist—the most successful in nineteenth century New York. He remained unpretentious and practical. His greenback advocacy was not that of the wealthy eastern establishment, but, Cooper believed, of the common man looking for entrepreneurial opportunity free of debt and a slavish mercantilism. Most of all, in establishing Cooper Union, he showed that for a man of great wealth to be esteemed in American history, he had to be as imaginative and fruitful in bestowing his fortune as he had been in acquiring it.

First Earl of Cork

British aristocrat, landowner, and investor

The first earl of Cork assembled an enormous estate in the southern Irish province of Munster during the late sixteenth and early seventeenth centuries under the English government's official plantation scheme. Using his position within the Irish administration, many of Boyle's gains were illicit and exemplified the rapaciousness of English colonization in Ireland.

Born: October 13, 1566; Canterbury, Kent, England
Died: September 15, 1643; Youghal, County Cork, Ireland
Also known as: Richard Boyle (birth name); Richard Boyle Cork
Sources of wealth: Government; real estate; trade
Bequeathal of wealth: Children; relatives

Early Life

The first earl of Cork was born Richard Boyle in 1566, the second son of Kentish landowner Roger Boyle and his wife Joan (née Naylor) Boyle. Beginning in 1583, Boyle attended Corpus Christi College at Cambridge University and then worked at Middle Temple, London, as a clerk to complete his legal training. At Middle Temple, Boyle gained the confidence of a family friend, Sir Edward Waterhouse, chancellor of the Irish exchequer. Waterhouse was also a chief proponent of settling the Irish province of Munster with English landowners in response to the Desmond Rebellions against English rule (1569-1573, 1579-1583). Through Waterhouse, and with reportedly forged documents, Boyle first traveled to Ireland in 1588, gaining a position as deputy escheator under the patronage of Geoffrey Fenton. In this official position, Boyle was responsible for the valuation, distribution, and sale of recently confiscated Irish estates in Munster. The Tudor policy of confiscating lands owned by Irish lords in rebellion against the Crown and using these lands as plantations for English settlers arose at the same time that Boyle entered government service.

First Ventures

As deputy escheator Boyle dealt with a specific area of confiscation policy known as "concealed lands" that was then under review by the English administration in Dublin. Although plans for the Munster plantations had evolved before Boyle's arrival in Ireland, the complex systems of landholding and legal title among the Irish and the assessment of land values delayed settlement ventures. The primary impediments to settlement were issues about how much land the Irish lords actually owned, under what terms, and its exact worth. Litigation brought by Irish landowners against confiscation clogged the Dublin courts through the 1580's and 1590's. In sifting through the claims, valuations, and boundaries of the approximately 300,000 acres considered to be forfeited to the Crown, Boyle became very familiar with the most productive and fertile regions of Munster. Without hesitation he claimed some of the best lands for himself, and he handed out other claims to friends and associates—for a charge—through the early 1590's. These initial and illegal land claims, though not without numerous investigations of corruption later, secured Boyle's future wealth and enabled him to develop his properties and buy out other English claimants in Munster.

Mature Wealth

To further secure his property, Boyle married Joan Apsley in November, 1595. Boyle's father-in-law, William Apsley, held title to lands near Limerick, of which his daughter was coheir. By the time of his marriage, however, the plantation system in Munster and its administrators were under investigation by the English authorities. Boyle was among those accused of corruption and abuse of power. Boyle was arrested and imprisoned briefly in 1596, but he was released through his growing network of patrons and associates. No charges were brought against him. Disgraced, and with his wife Joan recently deceased after giving birth to a stillborn child, he returned to London and worked for Sir George Carew, the newly appointed lord president of Munster. On Boyle's return to Ireland in 1600 with Carew, he secretly received notice that Sir Walter Ralegh's lands in Munster were up for sale. Taking advantage of the fact that Ralegh needed cash rapidly, Boyle paid £1,500 for some forty-two thousand acres that included County Waterford and most of County Cork, with the majority of the down payment coming from the dowry in Boyle's second marriage, to Catherine Fenton, daughter of his first patron in Ireland. Boyle's second marriage provided him not only with a dowry for a down payment on Ralegh's estate but also with future heirs—seven sons and eight daughters. With this legal purchase of Ralegh's Irish estate, Boyle consolidated his holdings into a small empire across southern Ireland that was valued at some £30,000 per year. For his assistance to Carew, Boyle was knighted on his wedding day in July, 1603.

After his marriage, Boyle placed all his energy into cultivating new patrons and political relationships as added insurance against future claims against his lands and titles. To further secure his claims, Boyle made contacts within the new Stuart Dynasty. In 1605, Boyle was given complete title and control of all his property by King James I.

Boyle used the labor of experienced English and other European settlers in Ireland to develop fisheries along rivers and the country's southern coast, to mine iron, and to create iron foundries. On his newly enclosed estates, cattle rearing; glassmaking; brewing; the production of cheese, cloth, wool, and leather; and his orchards and horse and deer farms enhanced his efforts to turn Munster into a highly profitable and industrious little England. In order to facilitate trade and to export the produce of his estates, Boyle developed the port town of Youghal in County Cork. Southern Ireland's increasing trade connections with English and other Atlantic port cities, such as Bristol and Bordeaux, France, and the area's growing role in supplying food for ships bound for the English colonies in America, all served to expand Boyle's fortune. Boyle succeeded in attracting some four thousand English settlers, many of them skilled tradesmen, to his expansive holdings. By 1641, nearly a third of the estimated twenty-two thousand English-born persons residing in Munster lived on Boyle's property. In addition, he developed several towns, including Bandon, Mallow, and his personal estate lands at Lismore in County Cork, to facilitate local markets and industry. During the 1630's, Boyle spent about £30,000 to purchase English estates in Dorsetshire.

Boyle also invested his time and wealth in political appointments in Ireland and England. He was elected to the Irish parliament and then to the Irish privy council in 1613. These appointments provided him with fruitful contacts among the new Anglo-Irish planter class and with members of the English aristocracy, notably the

English Plantations in Ireland

The English plantations in Munster in the late sixteenth century and in Ulster in the early seventeenth century paralleled the settlement of Virginia and later the Massachusetts Bay Colony, as the British historically considered Ireland a template for other colonization ventures. The plantation system had evolved from several attempts by the English crown, beginning in the twelfth century, to control and pacify Ireland. In the sixteenth century, the granting of noble titles to Irish lords and official recognition of their lands, a policy known as surrender and regrant, produced neither peace nor security in Ireland.

During the Desmond Rebellions against English rule (1569-1573, 1579-1583), English authorities decided on a harsher course of action: the complete forfeit and confiscation of the estates of Irish landlords who participated in the rebellions. In the context of England's ongoing war with Spain, Ireland was viewed as a backdoor to England. Catholic Spain delivered funding and soldiers for Catholic Irish lords battling their English adversaries in 1579, 1595, and 1601. From this broader European perspective, English officials viewed the new Irish plantation policy as both politically sound and financially expedient. The immense bureaucracy that emerged to administer these plantations afforded individuals the chance to profit rapidly in land deals, investment schemes, or graft, and one of the most noted opportunists was Richard Boyle, the future first earl of Cork.

Queen Elizabeth I and her administration began granting lands in Munster to English settlers in 1585. These settlers, also known as undertakers, were often English military veterans in Ireland; poet Edmund Spenser and future American colonizer Sir Walter Ralegh both were rewarded with claims in Munster. The undertakers were limited to holding twelve thousand acres, and they paid no Crown rent for three years and no customs duties. The undertakers were to colonize their newly acquired lands with English-born settler-farmers who would double as a militia. By 1598, some four thousand English had settled in Munster, well short of the projected twelve thousand. The final goal of these plantations was a civilizing mission to assimilate the native Irish into English culture, society, and the Protestant religion.

The reality of the Munster and Ulster plantations was quite different from the theoretical policy. In both places, substantial numbers of Irish tenants remained on the undertakers' properties. However, the development of towns, roads, and ports and the exploitation of natural resources, such as timber, coal, iron ore, and fishing, completely changed the Irish landscape within a generation. The plantation system did succeed in producing immense profits for a small number of landholders, including Boyle, in introducing small-scale industry into Ireland, and in increasing trade contacts for Irish agricultural products with England, Europe, and the Americas. However, the final goal of the plantation system—anglicizing the Gaelic-speaking Catholic Irish population—met with very limited success and fed Irish resentment against English rule into the twentieth century.

first duke of Buckingham, a favorite at the royal court. Boyle's goal was twofold: He sought to secure his holdings in Munster through political friendships and to find suitable spouses for his eleven surviving children. Boyle earned a new patent on his Munster estate in 1614, and he then purchased two noble titles for himself—Lord Boyle in 1616 and earl of Cork in 1620—for the estimated cost of £4,500. He also procured the title viscount of Dungarvan for his heir. Boyle allocated portions of his growing fortune for public and private loans to the English government, and these loans to the cash-strapped Stuart regime halted further court action against his landholdings. By 1629, Boyle also held the posts of Lord Justice of Ireland and Lord Treasurer, and he was promoted to the English privy council in 1640.

In the last decade of his life, Boyle confronted the greatest challenges to his estates, first from Thomas Wentworth, Lord Deputy of Ireland, and then from the native Irish during the Irish Rebellion beginning in 1641. Boyle's heir Sir Lewis "the Valiant" Boyle was killed in military action in 1642. During his later years, Boyle composed a defensive and providential autobiography, *True Remembrances* (1623), on his rise to power in Ireland. On his death in 1643, Boyle's son Roger, Lord Broghill, assumed control of the estate.

LEGACY

The most visible part of Boyle's legacy was the economic development of Munster and the creation of a permanent area of English settlement in Ireland. Although much of this achievement rested on Boyle's exploitation of his political connections and the native Irish population, Munster was the most commercially and agriculturally developed region in Ireland through the eighteenth century. Much of Boyle's energy and funding went toward his children's education and their suitable aristocratic marriages. Boyle's heirs would influence English and Irish politics, as well as British arts and sciences. His daughters Catherine, Lady Ranelagh, and Mary, the countess of Warwick, were both noted intellectuals, as was their youngest brother, Robert Boyle, a scientist and founding member of the Royal Society during the Restoration period. Boyle's second son, Richard, the second earl of Cork, was made an English peer. Several of Boyle's daughters married into aristocratic English families in Ireland, providing ancestral ties to Munster properties and Irish politics; the descendants of these marriages dominated the Irish parliament into the eighteenth century. Among the other beneficiaries of Boyle's career were his brother John Boyle and three male cousins, all of whom he assisted in gaining appointments in the established Church of Ireland in the 1620's.

Boyle was a patriarch who kept a tight hold over his properties, his children, and his growing network of in-laws. Although he has been rightly described as a "buccaneer," he was a caring father and husband. The funerary memorial to his second wife Catherine at St. Patrick's Cathedral in Dublin, and his letters to his children, indicate a compassionate man and contradict what his numerous detractors wrote about him during his lifetime.

Federico Cornaro

Italian merchant, landowner, and aristocrat

Cultivating sugarcane in Cyprus and processing and selling sugar from his commercial base in Venice, Cornaro became rich as the world's first sugar magnate.

Born: c. 1335; Venice (now in Italy)
Died: 1382; Venice
Sources of wealth: Agricultural products; trade
Bequeathal of wealth: Spouse; children

Early Life

Federico Cornaro (feh-deh-REE-koh kohr-NAH-roh) was born to Nicolò Cornaro in early fourteenth century Venice. The Republic of Venice was emerging as the leading commercial port of the Italian city-states; it would soon boast the wealthiest and most dynamic economy of early Renaissance Europe. The Cornaro family was one of the patrician families of Venice, tracing its roots to the famous Cornelli family of classical Rome.

First Ventures

In the late Middle Ages, sugar had become one of the most desired commodities in Europe. Cornaro and his brothers Fantino and Marco entered the sugar trade, establishing commercial contracts with the kingdom of Cyprus, the leading producer of sugar in the Mediterranean. Venice had long had commercial contacts with Cyprus. Around 1360, Cornaro acquired a century-old palace in St. Luke's square on Venice's Grand Canal, in which he hosted the future Albert III, Duke of Austria, during Albert's visit to Venice in September, 1361.

In December, 1361, King Peter I of Cyprus came to Venice to seek aid against the advancing Turks. At the request of Pope Innocent VI, King Peter stayed in the Cornaro palace. In 1365, Cornaro provided the large sum of 60,000 gold ducats to King Peter. In exchange, Cornaro received the Piscopia peninsula on the island of Cyprus as a tax-free fiefdom. Cornaro was also knighted with the Cyprus Order of the Sword and allowed to install the Cypriot royal lion in the Cornaro coat of arms.

Mature Wealth

With a brother stationed in Cyprus and another in Venice, Cornaro was able to take full advantage of his sugar concession. Employing their Venetian wealth, the Cornaro brothers reorganized the sugar industry of Cyprus. They imported a skilled workforce, built new sugar mills, irrigated the sugarcane fields, and improved industrial techniques for processing the sugarcane with immense sixteen-hundred-pound copper kettle boilers. As a result, they were able to manufacture a superior and less expensive sugar product for the tables of Europe. In addition to his sugar monopoly, Cornaro was later granted monopolies in Cyprus's salt and cotton in partial repayment of his loan to King Peter, allowing him to dictate prices in all three commodities.

In 1379, the Venice tax assessments recorded Cornaro's wealth at 150,000 ducats. He was the wealthiest Venetian citizen, and given the commercial prosperity of Venice, he may well have been the wealthiest European merchant of the fourteenth century. Cornaro solidified his status by seeing that his son Pietro married into the Cypriot royal family. Cornaro also assumed several diplomatic posts in Venice. In 1381, he donated a portion of his fortune to support Venice in its wars against Genoa.

Cornaro died in 1382, leaving his vast estate to his wife Bianca and his sons Pietro and Giovanni. In his will, Cornaro requested that he be buried in the Basilica of Sancta Maria Gloriosa dei Frari. His son Giovanni complied with his wishes, building the Cornaro-Piscopa Chapel with a magnificent statuary monument to his father.

Legacy

In the late medieval period, the great merchants of Europe were no longer the itinerant peddlers of earlier centuries but were ship owners and traders operating on routes that connected the great cities of Europe. Federico Cornaro was one of the most successful of these early entrepreneurs. With his brothers, he centralized the processing of sugar, producing the raw sugar on Cyprus, refining it in Venice, and selling it on European trading ships. Receiving a fiefdom on the Piscopia peninsula of Cyprus, Cornaro is considered the progenitor of the distinguished Piscopia branch of the Cornaro family. Among his famous descendants are Cardinal Patriarch Federico Cornaro (1579-1653), who served as the patriarch doge of Venice, and Elena Cornaro Piscopia (1646-1684), the first woman in history to be awarded a doctorate of philosophy degree. The Cornaro-Piscopia Palace, later named the Loredan Palace, was described by the renowned English architectural critic John Ruskin as one of the "loveliest" in Venice, with a "grace almost unrivaled." This building has been incorporated into the Venetian government municipal center.

Bernard Cornfeld

American financier

Cornfeld established Investors Overseas Services (IOS), the largest mutual-fund sales organization outside the United States. However, his improper management of the company and battles with the Internal Revenue Service led to his imprisonment and the loss of much of his wealth.

Born: August 17, 1927; Istanbul, Turkey
Died: February 27, 1995; London, England
Also known as: Benno Cornfeld (birth name); Bernie Cornfeld
Sources of wealth: Financial services; investments
Bequeathal of wealth: Children

Early Life

Bernard Cornfeld was born in Turkey, and his parents immigrated to the United States when he was three years old. The family eventually settled in Brooklyn, New York, where Cornfeld attended public schools and graduated from Abraham Lincoln High School. After graduation, Cornfeld served two years in the U.S. Maritime Service. In 1947, he was successfully treated for stuttering, a problem he had had since childhood. He enrolled at Brooklyn College, where he majored in psychology and graduated in 1950.

First Ventures

Afer graduation, Cornfeld took odd jobs. He drove a taxicab for a while, and in 1954 he spent nine months in Philadelphia working as a youth counselor for B'nai B'rith. Cornfeld's next job was selling mutual funds for Investors Planning Corporation in Philadelphia. He recommended that the company expand overseas, but after company officials declined his advice, Cornfeld left the firm and sailed for France, where he explored opportunities to sell mutual funds abroad. As a result of this trip, Cornfeld created his own mutual-fund sales organization, Investors Overseas Services (IOS), in 1955. Three years later, he moved his company from Paris to Geneva, Switzerland, and in 1960 he registered IOS in Panama. In 1965, Cornfeld purchased Investors Planning Corporation, for which he had once worked. Many of his business operations were beyond the surveillance of any country and outside the reach of many regulators.

Mature Wealth

Cornfeld's company, IOS, became the largest mutual-fund sales organization outside of the United States and channeled hundreds of millions of dollars into American mutual funds. IOS expanded to include an insurance company, real estate interests, and offshore investment funds.

However, the Securities and Exchange Commission (SEC) investigated IOS and accused Cornfeld of breaking American laws governing mutual funds. He and the commission settled out of court in 1967. Cornfeld agreed to cease his operations in the United States and to limit his investments in American mutual funds.

Before IOS's implosion in 1970, when its stock dropped from $18 to $2 per share, Cornfeld's personal wealth was about $100 million, and the company had an estimated value of $2.5 billion. The board of directors of IOS forced Cornfeld from the company. Robert Vesco, the new head of IOS, embezzled $224 million from the company and fled to the Caribbean. Vesco later served thirteen years in a Cuban prison for producing and marketing a "miracle" cancer drug without the government's knowledge.

In the early 1970's, a group of about three hundred IOS employees informed Swiss authorities that Cornfeld and company cofounders had pocketed part of the proceeds of a stock issue raised by employees in 1969. As a result, Swiss prosecutors in 1973 charged Cornfeld with fraud, and he was arrested while on a visit to Geneva. He served eleven months in a Swiss jail before being freed on a bail surety of $600,000. Cornfeld always maintained he was innocent of the charges, blaming the fraud

Bernard Cornfeld. (Hulton Archive/Getty Images)

on other IOS executives. His trial eventually took place in 1979 and lasted three weeks, with the judge finally acquitting him.

Cornfeld spent the rest of his life fighting the U.S.Internal Revenue Service (IRS) after the agency accused him of improprieties regarding his tax payments. In 1976, a California court convicted Cornfeld of employing an illegal device to make long-distance telephone calls without charges. Creditors seized his Beverly Hills estate. In 1990, *Forbes* magazine reported that Cornfeld still owed the IRS $15 million.

From his Swiss castle, Cornfeld began planning a comeback and continued speculating on various international business operations. In 1994, he suffered a stroke shortly before Christmas and did not recover. His friends helped pay his medical expenses after he died on February 27, 1995.

LEGACY

Cornfeld helped popularize mutual funds as an investment option. His mutual-funds sales company, Investors Overseas Services, was worth $2.5 billion before its 1970 collapse. He created the first mutual funds to offer check-writing privileges and the first offshore funds that invested in American mutual funds. His improper business practices, however, eventually eclipsed his accomplishments, destroying both his business and his reputation.

JAMES CRAGGS

British landowner and politician

Craggs amassed a fortune through his financial ability and connections with leading British politicians and generals. His career demonstrates the corruption of early eighteenth century British politics.

Born: baptized June 10, 1657; Wolsingham, Durham, England
Died: March 16, 1721; London, England
Also known as: James Craggs the Elder
Sources of wealth: Government; investments
Bequeathal of wealth: Children; government

EARLY LIFE

James Craggs was born in 1657, the son of Anthony Craggs and his wife Anne. Young Craggs attended a free grammar school in Bishop Auckland. When the family was forced to sell its property, Craggs was thrown back on his own resources. After he had become wealthy and powerful, Craggs's many enemies mocked his early poverty and charged that he had been a footman.

Arriving in London in 1680, Craggs served several noblemen. In 1684, he married Elizabeth Richards, the daughter of a corn merchant, who may have been a domestic servant to Sarah Churchill, who later became the duchess of Marlborough. Whether the connection was through Elizabeth or not, Craggs made his fortune through his ties with Sarah and her husband, John Churchill, who later became the first duke of Marlborough.

FIRST VENTURES

Craggs laid the foundation for his immense fortune when he was private secretary to John Churchill. Craggs speculated in contracts to supply clothing to the British army, then fighting the Wars of the League of Augsburg (1689-1697). He was briefly held in the Tower of London for failure to supply the Parliamentary commissioners of public accounts with information regarding alleged improprieties in his administration of the clothing contracts. He also took a large bribe from Sir Thomas Cooke, the head of the British East India Company. The company was then engaged in a desperate struggle to maintain its monopoly over English trade with India, and Craggs was influential enough to be a valuable asset to the firm. Craggs maintained his connection with the British East India Company into the eighteenth century, serving as a director and negotiating the merger of the old and new companies.

MATURE WEALTH

Like his patron Marlborough, Craggs benefited from the War of the Spanish Succession (1701-1714). He served as secretary to the master-general of the ordnance and the clerk of the deliveries of the ordnance. Craggs was also elected to the House of Commons, where, like his patron Marlborough, he eventually allied with the Whig Party ministers. In addition to looking after his own and Marlborough's interests, Craggs worked to advance the political and diplomatic career of his only surviving son, also named James Craggs (1686-1721). In 1709, Craggs had his portrait painted by Sir Godfrey Kneller, the favorite portraitist of the Whig elite.

When the Whigs were replaced by the Tories, Craggs continued to function as an intermediary between Marlborough and the new ministry. However, as relations between Marlborough and the Tory cabinet deteriorated, Craggs also became politically marginalized, losing his parliamentary seat in 1713. Craggs continued his political alliance with the Whigs, particularly Marlborough's son-in-law Charles Spencer, third earl of Sunderland. When Queen Anne died in 1714 and was succeeded by George I, the Whigs came back into power, and so did Craggs. Craggs received the lucrative position of joint postmaster-general in 1715.

Both Craggs and his son were deeply involved in the activities of the South Sea Company, a firm established to help manage Great Britain's national debt after the War of the Spanish Succession. Occupying a position between the business and governmental worlds, the elder Craggs was a leader in the scheme to convert government debt into South Sea stock and in efforts to bail out the company when its stock began to fall in late 1720. An inquiry revealed that he and Sunderland had received large bribes of stock, for which they had not paid. Adding to Craggs's troubles was the death of his son on February 16, 1721, which had a devastating impact on him. Craggs himself died a month later; his death was widely rumored to be a suicide. His estate was fined £68,920 as compensation for his role in the South Sea "bubble."

LEGACY

At his death, Craggs's estate was valued at £1.5 million. His heirs were his three daughters, Margaret, Elizabeth and Anne, all married to members of Parliament. However, his and his son's complicity in the South Sea bubble left the family's name in disgrace.

Marcus Licinius Crassus

Roman politician, landowner, and military leader

Crassus, one of the wealthiest men in ancient Rome, acquired a vast fortune to further his political career. In doing so, he became one of the most powerful and influential figures of the late Roman Republic, along with Julius Caesar, Pompey the Great, and Cicero.

Born: c. 115 b.c.e.; place unknown
Died: 53 b.c.e.; near Carrhae (now Harran, Turkey)
Sources of wealth: Real estate; slaveholding; conquest; investments
Bequeathal of wealth: Spouse; children

Early Life

Marcus Licinius Crassus (MAR-kuhs li-SIHN-ee-us KRAS-suh), though born into an illustrious Roman family (the Licinii clan), was raised in modest surroundings compared with his patrician contemporaries. His father, Publius Licinius Crassus, a celebrated politician and general in his own right, endeavored to instill the tenets of moderation and temperance in his offspring, most likely because of economic necessity, as well as principle. The young Crassus lived with his father, his mother (Vinuleia), and two married brothers in a single dwelling, quite small in comparison with the houses of other Roman nobility. As the son of a Roman senator, Crassus received an education typical for a young man of his background, one firmly grounded in the rhetorical arts, history, and philosophy. Tragedy struck the Licinii household in 87 b.c.e., when both Crassus's father and an older brother were killed as a result of General Gaius Marius's rise to power. The vicissitudes of a Roman civil war left Crassus both physically vulnerable and financially limited. Forced to flee Rome to the confines of Spain, Crassus, with only 300 talents to his name (a sum roughly equivalent to $4.2 million), joined the forces of Lucius Cornelius Sulla, the political rival of Marius.

First Ventures

The years spent fighting Marius under Sulla's tutelage from 83 to 81 b.c.e. proved revelatory to Crassus, who later remarked that one could not be considered truly wealthy unless one could support an army out of one's personal income. However, Crassus's political ambitions were advanced not by military success but through the acquisition of enormous wealth. After the forces of Marius had been routed, Sulla and Crassus marched on Rome and enjoyed the fruits of plunder, which sprouted from the property of their defeated rivals. Crassus took advantage of any opportunity to enrich himself. In Spain he had pillaged the city of Malaca, and later in Italy he appropriated for himself the spoils from the captured Umbrian city of Tuder.

It was not, however, the treasure from broken cities but the proceeds from real estate sales which became the foundation of Crassus's growing fortune. Crassus had accumulated large amounts of land, buying at low cost the confiscated property owned by Sulla's political foes and selling it at a premium. This kind of questionable profiteering was a practice common to Sulla himself and his followers, but Crassus's avarice was further demonstrated by his blatant manipulation of the proscription lists, which contained the names of those whose property was to be confiscated. Crassus's association with Sulla ended only when he added a man's name to the proscription lists—without Sulla's authorization—for the sole purpose of obtaining the man's property.

Mature Wealth

Crassus used his rapidly increasing fortune to fund his political career, and in the year 70 B.C.E. he was rewarded for his efforts with his first consulship. Much of his wealth came from the sale of valuable real estate in the city of Rome itself. It would be a mistake to say that Crassus was a land developer per se, for he tended to avoid building on the property he purchased. He often said that people who liked to build houses needed no enemies, since they would far too easily ruin themselves. During the years of the late Roman Republic, newly enrolled senators needed houses in Rome rather than estates in the country to maintain their recently acquired status and to have a place to live while the senate was in session. In pursuit of suitable land for the homes of his senatorial clientele, Crassus was utterly relentless. For example, during the year 73 B.C.E. he spent so much time hovering around a Vestal virgin named Licinia in order to pressure her to sell him her lucrative suburban villa that he was accused of impropriety. In the end, Crassus was cleared of any wrongdoing and acquired Licinia's estate. Property in poorer sections of Rome did not escape Crassus's roving eye. He often bought for next to nothing houses damaged or destroyed by fires. Some hostile accounts suggest that the fires' origins may be traced to Crassus himself, as he or his agents often materialized to make an offer just as the fires started. Dealing in real estate was extremely profitable, demonstrated by the fact that Crassus sold a house in Rome to his sometime rival Cicero for the tidy sum of 3.5 million sesterces, or $17.5 million in twenty-first century American currency.

When Crassus became consul in 70 B.C.E., he could afford public displays of his wealth. Although records are not clear as to the total amount of Crassus's fortune at the time, he was able to dedicate 10 percent of this wealth to the Temple of Hercules, to host a public banquet with ten thousand tables, and to provide enough grain to feed every citizen in Rome for three months. Considering that population estimates for Rome number a little less than one million inhabitants for this time period, Crassus's expenditure was considerable.

In addition to assets derived from the sale of land, Crassus possessed a diverse portfolio, which included numerous silver mines, alleged holdings in tax collection companies, and, of course, many slaves. Crassus stated that it was a master's responsibility to care for this valuable "human capital" which was vital for the running of estates. Ancient sources maintain that Crassus owned a small army of highly skilled slaves whose training and education their master personally supervised. Crassus used slaves with masonry, woodworking, and architectural skills in his real estate ventures. Slaves who were trained as administrators, clerks, and readers were also employed by Crassus or hired out for their services.

Crassus's financial investments were all calculated primarily with an eye to his political advancement. These investments enabled him to extend his political aspira-

Slavery and Wealth in Ancient Rome

Slavery existed in Roman society from its beginnings. References to the institution can be found in the earliest inscription, dated to the eighth century B.C.E. However, Rome became more dependent on slave-based labor beginning in the second century B.C.E. as a result of its wars of expansion against the Greeks, Carthaginians, and Macedonians. Large numbers of slaves from captured cities, as well as prisoners from defeated armies, flowed into Rome and other parts of Italy. Studies estimate the slave population in Italy by the end of the first century at around two million.

Roman elites used slaves in many occupations. Slaves toiled as unskilled laborers on the large plantations (*latifundiae*) of Sicily or in Spanish silver mines. Skilled slaves worked as household servants, administrators, and entertainers. Educated Greek slaves were used as tutors. During the first century, wealthy Roman aristocrats used slaves primarily as labor on their country estates, but they also flaunted their status by owning retinues of slaves to attend to their needs in the city. The prices of slaves depended on their skill and education. For example, Cato the Censor, a Roman aristocrat noted for his parsimony, never paid more than 1,500 drachmas for an agricultural slave (roughly $60), while a highly educated Greek grammarian could fetch up to 700,00 sesterces ($3.5 million).

The large number of slaves in Roman society created the potential for large-scale rebellions. Rome experienced a number of slave wars, including two in Sicily (135-132 B.C.E. and 104-100 B.C.E.), as well as the famous slave war of Spartacus (73-71 B.C.E.), put down by Marcus Licinius Crassus, a leading Roman politician.

An important difference between ancient Roman slavery and New World slavery in the modern period is that servitude in Rome was not race-based. In addition, Roman slaves could purchase their own freedom, as well as be freed by their masters. It was customary for manumission clauses to be included in wills. Nevertheless, slaves enjoyed little legal protection and were completely subject to the whims of their owners.

tions far beyond the consulship, as shown by his election to the position of censor in 65 B.C.E. He won a second consulship in 55 B.C.E. Throughout his career, Crassus used his wealth to establish political networks and build alliances that made him one of the Roman Republic's leading political figures. He commonly granted interest-free loans to friends and associates in exchange for favors, engendering obligations that could be used to advance his own ambitions. In 62 B.C.E., for instance, Crassus stood as guarantor of Julius Caesar's debts to the sum of 820 talents (roughly $11.5 million), allowing Caesar to further his political career as praetor of Spain. In doing so, Crassus paved the way for an alliance (the first so-called triumvirate) with Caesar, in which he, Caesar, and Pompey would monopolize political power in Rome from 60 to 53 B.C.E.

In the end, Crassus's ambition proved to be his undoing. Attempting to follow in the footsteps of Alexander the Great, Crassus led and funded a military expedition against the Parthians, Rome's eastern enemy. He and one of his sons died in battle in 53 B.C.E. near the city of Carrahe. Neither his personal estate, which at the time of his death was worth 7,100 talents ($99.5 million), nor the 10,000 talents ($140 million) he had earlier taken from the Temple of Jerusalem could save him from a Parthian's blade.

LEGACY

The ancient sources have not been kind to Crassus. His wealth has become proverbial, and the man himself is portrayed as an example of unbridled avarice. A particularly resonant example is that of the Parthians pouring molten gold down the throat of the decapitated head of Crassus to mock his greed. Yet upon reflection, Crassus's career differed little from those of his contemporaries, such as Julius Caesar or Pompey, who both plundered their way to the top of Roman politics. Even Crassus's wealth, although considerable, was less than that of Pompey or Sulla. What made Crassus different from men such as Pompey, Sulla, or Caesar was the fact that money, and not military command, was the key to his acquisition of political power.

Despite the unsavory origins of his wealth, Crassus conscientiously employed his financial resources as a servant of the Roman people. Moreover, Crassus did not engage in conspicuous consumption or lavish entertainments. True to his upbringing, he always lived modestly, and his dinners were distinguished by the quality of his guests rather than of his table. Crassus maintained that success in life lay not only in the careful management of money but also in the equally astute management of people.

Richard Crawshay

British ironmaster and industrialist

For three decades in the eighteenth and nineteenth centuries, Crawshay ran one of the world's largest ironworks, turning out cannons vital to the British war effort and metallic products instrumental to the cultural changes in the Industrial Revolution. The business earned enormous sums for Crawshay and his descendants until the early twentieth century.

Born: 1739; Normanton, Wakefield, England
Died: June 27, 1810; Cardiff, Wales
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Children; relatives

Early Life

Born near Leeds, England, Richard Crawshay (CRAW-shay) was the son of a Yorkshire farmer. At the age of sixteen, Crawshay left home for London, where he apprenticed at Bicklewith's, a bar iron warehouse, selling flatirons. Upon Bicklewith's retirement in 1763, Crawshay took over the profitable enterprise as sole proprietor. That same year, he married Mary Bourne and would eventually father four children: William, Anne, Elizabeth, and Charlotte. Within a decade, his company was specializing in products that provided a low-cost alternative to expensive Swedish and Russian iron. Now a leading purveyor of iron, Crawshay had grown wealthy, and he began looking for new enterprises in which to invest.

First Ventures

Beginning in the early 1770's, Crawshay continued to expand his iron company. In 1775, he went into business with British-born former tobacco merchant Anthony Bacon, who had founded the Cyfarthfa Ironworks at Merthyr Tydfil, Wales. Employing a process that transformed inferior pig iron into strong bar iron, Bacon won government contracts to produce ordnance—primarily cannons and cannonballs—for the British military. The highly lucrative cannon-making venture continued until 1782, when Bacon became a member of Parliament and was prohibited by law from securing government contracts. Upon Bacon's death in 1786, Crawshay, assisted by his son William, took over management of the Cyfarthfa Ironworks, in partnership with London merchant William Stevens and former Cyfarthfa forge manager James Cockshutt.

Mature Wealth

At Cyfarthfa, Crawshay enhanced and improved the ironworks. He installed a reverberatory furnace necessary for the newly invented process of puddling, which removed impurities from pig iron. He added a rolling mill to shape the molten metal into girders for buildings and bridges, rails for fledgling railways, and weapons of war. Such improvements fueled the Industrial Revolution of the late eighteenth and early nineteenth centuries, made Cyfarthfa Ironworks into one of Great Britain's largest industries, and allowed Crawshay to become one of the nation's wealthiest men.

Crawshay continued to build his business over the next two decades by adding furnaces and rolling mills. To facilitate the transport of his company's iron products, he strongly supported the Glamorgan Canal, which opened in 1794 and sped the delivery of iron to Cardiff, the capital and chief port of Wales. Throughout his lifetime, Crawshay continuously expanded Cyfarthfa, and by 1810 the facility boasted six blast furnaces, employed more than one thousand workers, and produced in excess of twenty thousand tons of iron, becoming one of the world's largest producers.

At his death in 1810, Crawshay left an estate valued at £1.5 million (more than £100 million in 2010). Three-eighths of his estate was willed to his son William; the remainder was bequeathed to a son-in-law, Benjamin Hall, and to a nephew, Joseph Bailey, both of whom had long been involved in iron production at Cyfarthfa.

Legacy

Although Richard Crawshay had hoped his son William would follow him into the iron-making business, William confined himself to acting as agent for the ironworks' products from a London office. William's fortune of some £50 million was left to his five children. His son William II managed Cyfarthfa after his grandfather Richard's death, greatly expanding the business, and he built Cyfarthfa Castle at a cost of more than £2 million. At his death, he divided his vast holdings among his three sons, with the youngest, Robert, acquiring Cyfarthfa Ironworks and Cyfarthfa Castle.

Robert Crawshay converted Cyfarthfa to steel production. Following his death in 1879, Robert's sons continued the business until the company was sold in 1902. The former Cyfarthfa Ironworks produced materials during World War I and ceased operations in 1919. By the twenty-first century, Cyfarthfa Castle was a school. The building is one of few reminders of the enormous wealth once generated from the long-closed ironworks in the economically depressed community of Merthyr Tydfil, once one of Wales's largest towns.

Enrique Creel

Mexican landowner, businessman, and politician

Creel combined outstanding business acumen, a fortuitous union of powerful and wealthy families, and excellent timing to build a political and financial empire in Chihuahua, Mexico, that flourished during the long tenure of Mexican president and virtual dictator Porfirio Díaz.

Born: August 30, 1854; Chihuahua, Chihuahua, Mexico
Died: August 18, 1931; Mexico City, Mexico
Also known as: Enrique Clay Creel Cuilty; Henry Clay Creel (birth name)
Sources of wealth: Trade; mining; manufacturing; railroads; real estate
Bequeathal of wealth: Children; relatives; government

Early Life

Enrique Clay Creel Cuilty, better known as Enrique Creel (ehn-REE-kay kreel), was the eldest of seven children born to American Reuben Waggener Creel, who served as an interpreter in the Mexican War (1846-1848). Reuben had stayed in Mexico following the war, become a successful merchant, grown wealthy after marrying into the prominent Irish-Mexican family of his wife, Paz Cuilty, and served as an American consul in Chihuahua in the early 1860's. Enrique grew up in luxurious circumstances, was privately tutored, and took several educational jaunts abroad before joining his father's business at age fourteen.

First Ventures

While in his teens, Creel became head of the family upon his father's death in 1873. Like his father, he married well. Creel wed Angela Terrazas, the daughter of Don Luis Terrazas, an influential politician, landowner, and rancher. Intelligent and ambitious, Creel emulated his father-in-law. Together, Creel and Terrazas created an oligarchy that ruled Chihuahua, Mexico's largest—and during this era, most strategic—state, bordering New Mexico and Texas. The two men collectively controlled almost nine million acres of land (Creel owned almost two million acres of the total), on which they operated haciendas and ranches that supported hundreds of thousands of cattle, sheep, and horses.

In 1878, after Porfirio Díaz became the president of Mexico, Creel followed Terrazas's example by entering local politics. Creel used his wealth to build a fortune, founding banks and telephone companies and erecting textile mills and granaries. In 1887, he established and served as president of Chihuahua's first Chamber of Commerce, which facilitated trade with foreigners who flocked to Mexico to take advantage of investment opportunities.

Mature Wealth

Creel continued to expand his holdings. He became an executive in a national dynamite and explosives concern, engaged in mining, and built thousands of miles of railroad track to transport raw materials to and from the United States, boosting the Mexican economy in the process. By the turn of the century, he held many important corporate positions, including president of the Monetary Commission, the Central American Railway, the Bankers Association, the Casino of Chihuahua, the state telephone company, and the Mining Bank. In 1904, Creel followed his father-in-law into office as governor of Chihuahua, serving until 1906 and again from 1907 to 1910. Between 1910 and 1911, he was President Díaz's secretary of foreign relations and acted as interpreter when

Díaz and U.S. President William Howard Taft met in Mexico.

When Pancho Villa led the Mexican Revolution that overthrew Díaz, Creel went into exile in the United States in 1913. Much of his land and many of his holdings—particularly his banks and mines—were confiscated. After Álvaro Obregón was elected Mexican president in 1920, Creel returned to Chihuahua and rebuilt his empire. In addition to serving as business adviser to Obregón, Creel recovered his banking and railroad concerns and recouped more than one million acres of land. By the time of his death at age seventy-six in 1931, Creel was able to leave a sizable estate for his children, Alberto, Juan, and Adela.

Legacy

Although his heirs lost a considerable amount of land during the agrarian reforms of the 1930's, the Creel family, through its descendants, continued to wield influence in Mexico. The tradition of marrying into power, used to advantage by the Creel and Terrazas families, was maintained before and after Creel's death. Creel's daughter, Adela, married former Chihuahua governor Joaquín Cortazar. Other prominent figures related to Creel by marriage have included Chihuahua Governor Silvestre Terrazas, industrialist and politician Alberto Terrazas Cuilty, businessman Juan Terrazas Cuilty, the minister of the interior and politician Santiago Creel Miranda, and Intermex Industrial Parks executive Jaime Creel Sisniega. Some physical assets of Creel's empire remained into the twenty-first century, including the Chihuahua-Pacific Railroad and the town of Creel, a tourist destination at Copper Canyon in the Sierra Madre Mountains.

Charles Crocker

American railroad magnate, financier, and real estate developer

Crocker's wealth was derived primarily from his investment in Central Pacific Railroad's construction of a portion of the first transcontinental railroad, which was completed in 1869. In later years, he became a major financier and real estate developer in California.

Born: September 16, 1822; Troy, New York
Died: August 14, 1888; Monterey, California
Sources of wealth: Railroads; real estate
Bequeathal of wealth: Spouse; children

Early Life

Charles Crocker was born to a middle-class farm family in upstate New York. When he was fourteen, his family moved to a farm in Marshall County, Indiana. Crocker had little formal education because he dropped out of school to help support his family. He worked as a farm laborer, in a sawmill, and in an iron forge. He later said that his experiences in supervising work crews in these early jobs were a key to his success in the construction of the Central Pacific Railroad.

Charles Crocker. (Archive Photos/Getty Images)

Construction workers for the Central Pacific Railroad stand on flatcars near Promontory Point in 1868, a year before the transcontinental railroad was completed. The opening of this railroad generated millions of dollars for the "big four" owners of the Central Pacific—Charles Crocker, Mark Hopkins, Collis P. Huntington, and Leland Stanford. (Library of Congress)

First Ventures

In 1845, Crocker established his own iron forge, but he sold this firm in 1849 and went to California to mine for gold. After two years of mining with little success, Crocker went into business selling supplies to miners. By 1854, he had become one of the wealthiest men in Sacramento, where he became acquainted with the other men who would form the leadership of the Central Pacific Railroad—Leland Stanford, Collis P. Huntington, and Mark Hopkins. In 1861, these men, who came to be known as the Big Four, invested $24,000 to establish the Central Pacific Railroad. The following year, Congress passed the Pacific Railroad Act, which chartered the new Union Pacific Railroad to build the eastern end of a new transcontinental railroad. The Central Pacific was given the contract to build the western end of this line.

Mature Wealth

It was railroading that made Crocker truly wealthy, and he later invested that wealth in a variety of other business ventures. The directors of the Central Pacific Railroad contracted with a separate firm that Crocker had formed to do the actual construction of the rail line. What many people did not know at the time was that many of the directors of the railroad were also investors in this construction company, so they were essentially paying themselves for building their own railroad.

After the transcontinental railroad was completed in 1869, Crocker remained affiliated with the Central Pacific but also began investing in other ventures, especially in California real estate. He was a prominent backer of some of the large-scale irrigation projects that turned the San Joaquin Valley into a major agricultural center. In 1871, Crocker became president of the Southern Pacific Railroad, and in 1884 he oversaw the merger of the Central Pacific Railroad and the Southern Pacific, creating one of the largest western rail lines. Crocker also became a major regional financier.

Crocker built a magnificent mansion in the Nob Hill section of San Francisco and had a second home in New York City. He was badly injured in a carriage accident in New York City in 1886, and he never fully recovered. He died in 1888 at a new resort hotel that the Southern Pacific Railroad had built at his urging in Monterey, California.

Legacy

Crocker's legacy was a mixed one. He left a tremendous fortune to his family, estimated at $20 to $40 million, and his wealth contributed to the rapid development of the economy of California in the late 1800's. However, there were many charges of fraud concerning how he acquired this wealth, and the Southern Pacific Railroad, which its opponents dubbed the Octopus, was accused of monopolistic practices. Unlike many industrialists who made philanthropic gifts out of a sense of either gratitude or duty, or at least to forestall public criticism of their great wealth, Crocker gave virtually nothing to charity either during his life or in bequests after his death. His career contributed significantly to the creation of the "robber baron" image of American businessmen.

Croesus

Lydian king and conqueror

Croesus inherited the empire of Lydia from his father Alyattes and expanded it to include the entire area between the Aegean Sea and the Halys River, thus acquiring legendary wealth. He used his fortune to aggrandize his status and to adorn Sardis, his capital. A military defeat to Cyrus the Great of Persia cost him his kingdom, his wealth, and his freedom.

Born: c. 595 B.C.E.; Lydia, Asia Minor (now in Turkey)
Died: c. 546 B.C.E.; Sardis, Asia Minor (now in Turkey)
Also known as: Croisos; Kroisos
Sources of wealth: Inheritance; conquest
Bequeathal of wealth: Dissipated

Early Life

Croesus (KREE-suhs) was born in the twenty-third year of the reign of his father Alyattes, who had conquered and destroyed Smyrna and continued a war begun by his father Sadyattes against the Greek port city of Miletus. During the war, Alyattes caused the Temple of Athena to burn down. When Alyattes became ill and did not recover, he inquired of the Delphic Oracle, which declared that he would not recover until the temple was rebuilt. In response, Alyattes was more generous than required, for he built two temples to Athena and was rewarded not only with the restoration of his health but also with the longest reign of any member of his dynasty, fifty-eight years. No doubt Croesus learned from his father's experience to respect the oracle and to live in accordance with its dictates.

First Ventures

Although Alyattes preferred Croesus, his son by his Carian wife, to his other son Pantaleon, his son by a Greek wife, there was a faction that supported Pantaleon. When Alyattes allowed Croesus to succeed him as king, Croesus killed Pantaleon by drawing him across a carding comb, destroying his half brother with more cruelty than necessary to secure his position against conspiracy.

Croesus assumed power as king of Lydia at the age of thirty-five and immediately attacked Ephesus, a Greek city on the Aegean coast. After attacking Ephesus, Croesus made war on every Ionian and Aeolian state, alleging, as the ancient historian Herodotus explains, "some motives of responsibility upon some, others upon others, greater charges upon those when he could find them, trifling ones upon others." After subduing all the

Greeks of Asia, Croesus imposed tribute on them, and this tribute elevated him to the status of the superrich. The other source of his massive fortune was the natural wealth of Lydia, where the river Pactolus was filled with golden sands and lush, fertile valleys were conducive to agriculture.

Croesus at first planned to continue his acquisition of wealth by conquering the Greeks who lived on the islands of the Aegean, but he was persuaded of the impracticality of Lydia becoming a naval power. Instead, he conquered virtually all the peoples who lived west of the Halys River and annexed them to Lydia. At this point, Croesus and Lydia were at the height of their wealth.

Mature Wealth

One indication of Croesus's great wealth was the change he instituted in Lydian coinage, the world's oldest, traditionally attributed to earlier members of the Mermnadae, Croesus's dynasty. Before Croesus, Lydian coins were made of electrum, a mixture of gold and silver found in nature in the ratio of one part silver to four parts gold. Croesus, perhaps to flaunt the wealth of his land, minted coins of pure gold. There were two kinds of Lydian coins, known as Croeseids, one weighing a little less than four-tenths of an ounce meant for trade inside Asia, and another weighing about one-half of an ounce for trade with the Ionian Greeks.

It was probably during this time that some artifacts, like those of the Karun Treasure, were purchased or commissioned by Croesus. That he was a patron of the arts is attested to by Herodotus, who reports of a silver bowl made by the noted craftsman Rhoikos, a colossal cauldron that could hold 2,700 gallons made by the Spartans, and columns for the Temple of Artemis in Ephesus, later known as the Croesus Temple in homage to its benefactor.

The most famous account of Croesus's wealth comes in the story of the visit by the Athenian statesman Solon to Croesus's kingdom. Solon is received cordially, and on the third or fourth day of his visit, Croesus instructs his servants to give Solon a tour of the treasuries (note the plural), where Solon sees the great objects and evidence of Croesus's prosperity. After Solon has seen the treasures, there ensues one of the most celebrated conversations of antiquity. Croesus asks Solon,

> Guest-friend from Athens, much talk of your wisdom has come to us, and of your wandering for the purpose of seeking wisdom and of seeing the world. Now the desire has come to ask whether someone, of all you have seen, is the most prosperous.

The Karun Treasure

The Karun Treasure, also known as the Lydian Hoard and the Croesus Treasure, consists of about 450 artifacts discovered in the small village of Gure, about fifteen miles from Uşak in western Turkey, where the items are displayed at the Uşak Archaeological Museum. The objects were found by farmers in the mid-1960's in three tumuli, or ancient burial mounds. Many of the objects were sold to the Metropolitan Museum of Art in New York City in violation of both Turkey's laws on antiquities and UNESCO's (United Nations Educational, Scientific, and Cultural Organization) Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property. When the Metropolitan Museum put these items on display, the artifacts came to the attention of Turkish officials, who pursued all legal avenues to have them returned to Turkey. In 1993, the museum returned the items.

Among the most notable objects are a gold brooch in the shape of a horse with wings and a sea monster's tail (called a hippocampus), from which dangle three tassels, each ending in an ornate pomegranate; a silver water jug with a handle in the form of a human figure that arches backward; acorn-shaped pendants on a gold necklace; bracelets with intricately carved lion heads; and ornate silver bowls. Many of the objects are like no others in the world.

No doubt the names "Karun Treasure" and "Croesus Treasure" are used because of the renowned fame of King Croesus, for "Karun" is the name of a rich Persian who has been called the Persian Croesus. Similar names also appear in the Bible in the figure of Korah in Exodus and in the Qurʾān in the figure of Kuran. Both are individuals who, like Croesus, were exceedingly wealthy, exhibited incredible arrogance, and ended badly. For presumptuously leading a rebellion against Moses, Korah is punished by being swallowed up by the earth (Exodus 16.33), and Kuran, for his arrogant devotion to things of this world, is also swallowed up by the earth. In Turkey, there were rumors of divinely sent miseries afflicting the peasants who had sold the Karun treasures to smugglers.

It is extremely unlikely that the objects of the Karun Treasure were actually in Croesus's treasure-houses, for the tumulus mounds in which they were buried date from the seventh century B.C.E., while Croesus lived a century later. Still, as artistic styles were slow to change, the artifacts are probably very much like those that Solon would have seen when he toured the treasure-houses of Sardis.

Herodotus attributes to Croesus the wish to hear that he is the most prosperous of all people. Solon, however, replies that Tellus of Athens, a man of moderate means, is the most prosperous. Solon then declares that not Croesus but two Argive athletes, Cleobis and Bito, are the second most prosperous. The conversation ends with Solon's discourse on the nature of true happiness, which does not depend on wealth and on the precarious nature of worldly prosperity.

Herodotus attributes the eventual fall of Croesus in part to the king's delusion about his own happiness, although this particular misconception is a symbol of Croesus's more general delusion about being able to control events. Croesus believed that because of his wealth he was in control of his destiny. One way for ancients to be in control was to know the future, and they could learn the future by making direct inquiries to the oracle at Delphi. As king of Lydia, Croesus feared the growing power of Persia, which was becoming dominant under its dynamic king Cyrus the Great. Croesus sent to Delphi to ask what would happen if he attacked Persia. The oracle replied with its famous ambiguity, "You will destroy a great empire." Confident that he would destroy Persia, Croesus invaded this country, but he was defeated by the more resourceful Cyrus. The kingdom of Croesus was absorbed by Persia, and Croesus was to be executed by being burned alive. While on the pyre and as the flames were beginning to spread, Croesus remembered Solon's warning about the precarious nature of Fortune, and, the story goes, as if to show that Fortune can turn in positive as well as negative directions, the god Apollo sent a rainstorm that doused the fire, proving to Cyrus that Croesus was beloved of the gods.

Croesus spent the rest of his life as a slave in the Persian court, advising Cyrus and his psychopathic son Cambyses. As adviser, Croesus showed that he had learned wisdom from his suffering, though this knowledge was not always appreciated by the madman Cambyses. Croesus is said by the poet Bacchylides to have been transported to the mythical Hyperboreans by Apollo. The less romantic Herodotus reports Croesus's service as adviser to the Persian monarchs, but he lets Croesus simply disappear, without any mention of his death. In this way, Herodotus is perhaps contrasting Croesus with Tellus of Athens, a man of moderate wealth who died a glorious death fighting for Athens and was rewarded with a state funeral at public expense.

Legacy

Few persons have been so spectacularly conspicuous for a quality that their names exemplify that characteristic. Just as calling someone an "Einstein" signifies that the individual is extraordinarily intelligent, or calling someone a "Hitler" or a "Stalin" means that the individual is ruthlessly evil, so calling someone a "Croesus" suggests that the person either has great wealth ("to be as rich as Croesus") or has suffered a complete reversal of fortune. Starting as the ruler of a prosperous empire, Croesus became overconfident, and in his overconfidence he overreached, both in his kingship and in his family, and lost everything, living out his days in increasing obscurity until dying a death that passed without note. Like Priam, king of wealthy Troy, Croesus became a symbol of Fortune's power to destroy.

Mark Cuban

American entrepreneur, investor, and basketball team owner

Unlike sports team owners who remain quietly on the sidelines (or in plush skyboxes), Mark Cuban is publicly and vocally identified with the Dallas Mavericks basketball franchise. During the games, Cuban sits courtside, often yells at officials or players on the opposing team, and in the eyes of fans and commentators is clearly connected with the Mavericks.

Born: July 31, 1958; Pittsburgh, Pennsylvania
Sources of wealth: Computer industry; media; sports franchise; investments; entertainment industry
Bequeathal of wealth: Charity

Early Life

Mark Cuban was born into a relatively poor family. He started his first job when he was young and worked his way through college by performing a series of odd jobs. He attended the University of Pittsburgh for a year and then transferred to Indiana University, graduating in 1981. After college he moved to Dallas, Texas, where he first took a job as a bartender. He then worked for a short time as a salesman for a computer software company. He was fired from this job, which led him to found his own company, MicroSolutions.

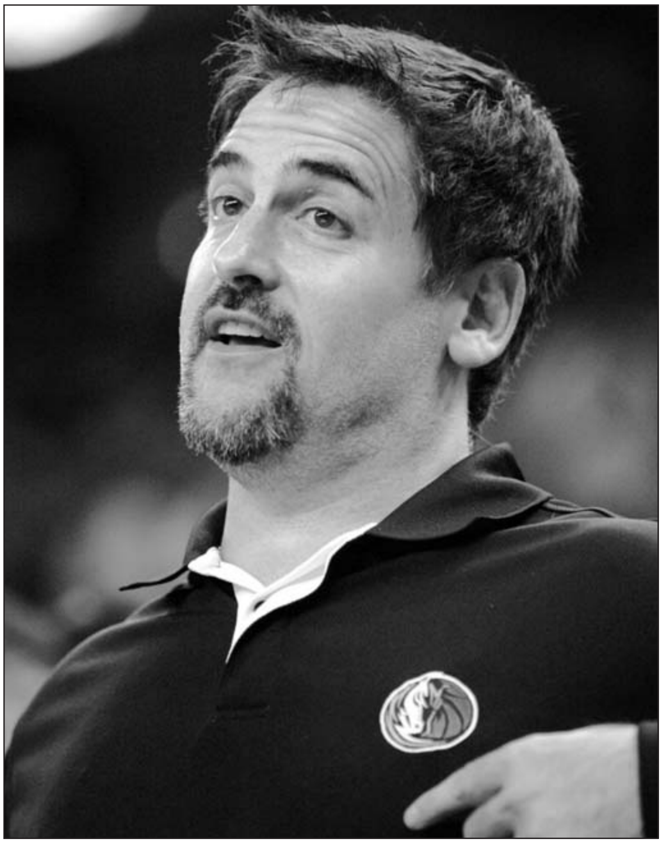
First Ventures

At MicroSolutions, Cuban provided software and other computer services to companies. He admittedly knew very little about software, but both at the software company and at MicroSolutions Cuban taught himself the business after making the sale. In essence, he would tell people that he could provide services that he had no experience delivering. He then would quickly read computer manuals cover to cover so he would be able to offer the services he promised. MicroSolutions grew slowly, with only a few employees during the first few years, but it did manage to grow. One of its most important large clients was Perot Systems, a company founded by H. Ross Perot several years before Perot's first presidential campaign in 1992. Cuban's efforts were fairly successful, even though MicroSolutions never grew into a major software company. In 1990, Cuban sold the company to CompuServe, an Internet services firm. Cuban made about $2 million on the deal, which allowed him to enjoy financial freedom for a time.

Mature Wealth

In Cuban's next large venture, he funded a friend's effort to broadcast college games over the Internet. This enterprise began on a very small scale, but it eventually grew, and less than four years after its creation the company, now called Broadcast.com, employed three hundred people. In 1999, at the height of the dot-com boom, Broadcast.com was sold to Yahoo!, Inc., and Cuban received billions of dollars worth of Yahoo! stock. Cuban and his partner Todd Wagner became rich, but they also shared the wealth with many of the employees who initially came to work for the company, and some sources estimate that hundreds of these employees became millionaires.

Cuban decided to diversify his portfolio, which is why he fared better than many others who made their wealth in technology and saw their fortunes decline when the dot-com bubble burst. Cuban made a number



Mark Cuban. (AP/Wide World Photos)

The Fallen Patriot Fund

The Fallen Patriot Fund of the Mark Cuban Foundation helps families of military personnel who were killed or seriously wounded while fighting in the Iraq War. The patriot fund was established in 2003 at the behest of Mark Cuban, and the Mark Cuban Foundation provided much of its initial funding. Cuban matched the first $1 million in donations, and additional financing was provided by the Bank of America, which matched its employees' donations of $25 to $5,000. Since its inception, many film screenings and other fund-raisers have generated money for the fund, and some musicians have donated proceeds from their songs. As of 2009, the fund had disbursed a little more than $4 million.

The focus of the fund is to provide relief from immediate financial distress for the spouses and children of military personnel who were killed or seriously injured in battle. Many of the grants have been for $10,000, and each award is tailored to the needs of a family. Mark's brother, Brian Cuban, is involved with the fund and also manages the Mark Cuban Foundation. Mark plays an active role in the organization, and he has appeared at a number of its award ceremonies. The fund does not express an opinion on the Iraq War, and it has received favorable publicity and donations from both supporters and opponents of the conflict.

of high-profile purchases, including buying the Dallas Mavericks basketball team from H. Ross Perot, Jr., the son of one of Cuban's major clients at MicroSolutions.

Cuban has been very public about his ownership of the Mavericks. While many National Baketball Association (NBA) franchise owners sit in luxury boxes, Cuban always sits courtside, where he freely expresses his feelings about the referees and rival teams. He has been fined more than $1 million for his behavior; these fines were paid to the NBA and are believed to be a record for a team owner. He matched these fines with donations to a variety of groups, including organizations involved in cancer research and the treatment of enzyme disorders. He also donated more than $1 million to relief efforts after the terrorist attacks on September 11, 2001.

Cuban has upgraded the Mavericks' facilities in order to attract potential free agents and to generally improve the team. During the 2009 NBA playoffs, Cuban gained notoriety for getting into a shouting match with an opposing team's player. Despite his often over-the-top behavior at games, Cuban's ownership has benefited the Mavericks. He took a team that seldom made and rarely won the NBA championship playoffs before his acquisition, and he helped make it a team that frequently competed in the playoffs and advanced to the finals in 2006, losing the championship to the Miami Heat in six games.

Besides the Mavericks, Cuban has also been involved in a variety of technological ventures. He is a significant investor in 2929 Entertainment, a company that aims to control all aspects of a film's production. One of the films produced by the company was *What Just Happened* (2008), directed by Barry Levinson and starring actor Robert De Niro. The firm also owns art theaters and produces television shows. Cuban is also an owner of Magnolia Pictures, a film production company best known for producing *Redacted* (2007), which presented a fictionalized account of the rape and murder of a young Iraqi girl in 2006. *Redacted* generated controversy, and the company had to delete images in the film that might have resulted in lawsuits.

Cuban co-owns HDNet, one of the first companies to provide high-definition satellite television to subscribers. HDNet was founded in 2003, several years before most viewers were familiar with high-definition television. In 2007, Cuban founded HDNet Fights, a company that airs and promotes mixed martial arts and other combat sports on his network. He has said he would like to present mixed martial arts events "in a manner more in line with other professional sports."

Cuban has tried to purchase other enterprises. A long-time Chicago Cubs fan, he made an unsuccessful bid to buy the baseball team when it was up for sale in 2007. He also has expressed interest in buying either the Pittsburgh Penguins hockey team or the Pittsburgh Pirates baseball franchise, having ties to these teams because he grew up in Pittsburgh. In 2010, he bid $598 million to purchase the Texas Rangers, a Major League Baseball team, during the team's bankruptcy auction, but his bid was denied and the team was purchased by an investment group led by Hall of Fame pitcher Nolan Ryan. There also has been speculation that Cuban is trying to start a new football league.

In 2008, the Securities and Exchange Commission (SEC) filed a civil suit against Cuban, claiming he had used confidential information to make a profit. The suit alleged that he had privileged information about Mamma.com, Inc., an Internet search engine company in which he had invested, and that he used this information to sell his stock at a profit. Cuban claimed he had not violated any laws. On July 17, 2009, a federal judge dismissed the lawsuit, ruling that the SEC could not hold

Cuban liable for insider trading because the agency did not allege that Cuban had agreed not to trade based on confidential information he received about the company.

Legacy

In many ways, Cuban is rewriting the role of American sports franchise owner and entrepreneur. Most owners stay out of the headlines and away from their teams. Cuban does neither. He is a very public fan and advocate for his team and is sometimes so noticeable that he distracts from the games themselves. Cuban, however, is generally entertaining and always serves as a topic of conversation. Whether an owner like Cuban is good for a team has yet to be determined, but he definitely has altered public perception of an owner's role.

Cuban is also part of an emerging generation of highly visible, superrich Americans who have no qualms about publicly expressing their beliefs. He seeks attention for his comments and publicity campaigns, not for the conspicuous consumption for which wealthy people previously sought notice. However, like wealthy people in previous generations, he has used some of his wealth in philanthropic endeavors.

Paul Cuffe

American merchant, shipbuilder, farmer, and moneylender

The wealthiest African American in the early United States, Cuffe was a merchant, landowner, shipbuilder, store owner, miller, farmer, and moneylender. He used his fortune in a humanitarian effort to transport freed slaves to West Africa, with mixed results.

Born: Janaury 17, 1759; Cuttyhunk Island, Massachusetts
Died: September 7, 1817; Westport, Massachusetts
Also known as: Paul Slocum (birth name); Paul Cuffee
Sources of wealth: Shipbuilding; trade; moneylending; real estate
Bequeathal of wealth: Spouse; children; relatives; educational institution; charity

Early Life

Kofi, the father of Paul Cuffe (KOO-fee), was born in Ghana, Africa, and was sold into slavery in 1728 to a prominent Quaker family in Massachusetts. Through hard work, Kofi was able to earn his independence by the 1740's. Paul Cuffe's mother, Ruth Moses, was a Native American of the venerable Wampanoag tribe, who had shared a Thanksgiving dinner with the Pilgrims. Kofi, who was known as Cofee Slocum when he was a freedman, married Ruth in 1746 and moved to Cuttyhunk, an offshore Massachusetts island. They had ten children, including Paul Cuffe, who was born in 1759.

When he was fourteen, Paul shipped aboard a New England whaler. On his voyages he learned arithmetic and navigation. The Revolutionary War broke out a few years later, restricting the New England maritime trade, but Cuffe profited as an intrepid blockade runner. On February 25, 1783, Cuffe married Alice Pequit, also of the Wampanoag tribe; they would have seven children. Cuffe was described by his contemporaries as a man of quiet dignity, pious, and unselfish. Although rightly recognized in history for his achievements as an African American, it is important to remember that Cuffe was equally of Native American heritage.

First Ventures

With his profits from his trading voyages, Cuffe expanded his fleet. Forming a shipbuilding and purchase partnership with his brother-in-law Michael Wainer, Cuffe acquired a twelve-ton schooner. Soon he added a twenty-ton schooner. From 1787 to 1795, Cuffe sold some of his smaller boats to obtain larger ships, including a twenty-five-ton whaling schooner, the *Sunfish*; a forty-two-ton schooner, *Mary*; and the sixty-nine-ton, sixty-two-foot square-sterned schooner, the *Ranger*. Besides whaling and cod fishing, Cuffe traded timber, livestock, food, corn, apples, cotton, and flour. His fleet of boats traveled up and down the east coast from Newfoundland to the Caribbean. A single trip to Maryland in the winter of 1795-1796 netted him a profit of more than $1,000. In February, 1797, he purchased a 140-acre farm on the Westport River in Massachusetts for $3,500. By 1800, his holdings had expanded to two hundred acres. He bought a gristmill and a windmill in order to refine the foodstuffs he shipped. His total assets were worth about $10,000, equivalent to several hundred thousand dollars in 2010.

Mature Wealth

By the beginning of the nineteenth century, Cuffe was the wealthiest person of color in the United States. With revenue from his farming, shipbuilding, and trading businesses he was able to donate his time and money to civic-minded enterprises. He was a remarkably farsighted man. Believing in education, he used his own funds to construct and operate a school on his land in order to educate his children and other children residing in the town of Westport, Massachusetts. This institution was one of the first integrated schools in the United States. A Quaker, Cuffe donated $600 in 1813 for the construction of a substantial Friends meetinghouse in Westport. He lobbied the Massachusetts courts in order to obtain voting rights for taxpaying African Americans.

One of Cuffe's most significant ventures was his effort to create overseas colonies for freed American slaves. Given the difficult circumstances facing former slaves in the United States, including possible reenslavement under the fugitive slave laws, many progressive Americans supported the idea of repatriation of freed blacks to Africa. Cuffe's travels convinced him that America's former slaves could prosper in West Africa and he joined efforts to arrange for immigration to Sierra Leone. In 1811, he formed the Friendly Society of Sierra Leone to improve conditions for newly arrived blacks. He traveled to Great Britain to meet with the leaders of the African Institution. In 1812, he met with President James Madison to discuss African colonization. In December, 1815, with the end of the War of 1812, Cuffe spent $4,000 to enable nine families to settle in Sierra Leone, but he had difficulty raising the funds needed to continue with his emigration plans. In 1817, he began collaborating with the newly formed American Colonization Society.

Although increasingly busy with his humanitarian ventures, Cuffe did not entirely neglect his businesses. He had a wharf and warehouse constructed on his river property. From 1802 to 1803, the *Ranger* alone made seventeen commercial landings, netting Cuffe $5,000. In 1802, he built a 162-ton brig, the *Hero*, for his fleet. In 1806, he built a ninety-one foot, 268-ton, double-decked, three-masted ship, the *Alpha*. Cuffe captained the *Alpha* on trips to the South, to England, and to Russia. He opened a store in New Bedford, Massachusetts, to sell the merchandise his ships imported from Europe and the Caribbean. In 1807, he obtained a 109-ton brig, the *Traveler*, and two years later, the *Hero*, refitted and reregistered as a bark, brought Cuffe $1,700 in profits. In 1815, he sold the *Alpha* for $6,550. With his large ships he was able to sail more frequently to the West Indies, Europe, and Africa, transporting cotton, plaster, wood, pitch, oil, clothing, livestock, salt, hardware, spices, and passengers. He built up his landholdings by acquiring two additional farms and several salt marshes, with an eye toward opening a salt mine. He loaned money to his neighbors. However, his dream of yearly passenger trips to Sierra Leone in order to establish and serve a thriving colony of former slaves did not come to fruition.

Legacy

In an era when most blacks in the United States were slaves or were poor freedmen, and when most Native Americans lived in poverty, Paul Cuffe was able to amass a large fortune in a number of businesses that were dominated by white men. His accumulation of wealth was a remarkable achievement, as were his humanitarian ef-

Minorities and Wealth

The story of minorities—ethnic, racial, and religious—and the creation of wealth is one of the more remarkable in economic history. It is a story of both obstacle and opportunity, of frustration and achievement, of discrimination and success. Minorities have faced persecution, but they have also been able to seize opportunities for economic advancement. Ethnic and religious minorities form tight-knit groups. Kinship ties lead naturally to networks of suppliers, traders, and agents. Many rulers were satisfied to see their minority populations engaged in trade and business, especially as these populations' vulnerable status allowed for heavy taxation, and even occasional confiscation.

In medieval Europe, Christians were forbidden from lending money at interest, as a form of usury. Jews, however, were allowed to become usurers, and some Jews made a profit by lending money to non-Jews. For example, as Venice became a great economic power in the fifteenth century, its Jewish population, although confined to a ghetto, served a valuable economic function as moneylenders to Venetian merchants. In the eighteenth and nineteenth centuries, the Rothschilds were able to build their great fortunes while barely out of the ghetto.

The religious minorities of India—the Jains, Parsees, and Ismāʿīlī Muslims—have long been active in commerce. The Jains, who are reluctant to harm living things in husbandry and agriculture, took naturally to commerce. The Mughal emperors, themselves foreign rulers of India's vast Hindu population, encouraged ethnic and religious minorities to continue their commercial ventures. Great fortunes were made by traders, who in turn paid large amounts of taxes to the Mughals.

Armenians were successful merchants worldwide, as were the Christian Coptic businessmen in Muslim Egypt, the Raskolniki Christian minority in Russia, and the Protestant Huguenots in Catholic France. In China, the Hakka minority has earned great wealth in commerce. The Chinese, dispersed from their homeland, have succeeded in business everywhere; their success in Indonesia helped spark a massacre in 1956 that resulted in the deaths of hundreds of thousands of Chinese immigrants. Successful Indian businessmen were expelled from Uganda by Idi Amin in 1972.

The Spanish New World empire depended on Genoese bankers. The Latin American nations succeeding to the Spanish empire have seen the success of many minorities, none more so than the Lebanese, with billionaires such as Luis Noboa and Carlos Slim. In various countries, Pakistanis, Koreans, and West Indians, to name just a sample of ethnic minorities, have achieved the great commercial success denied them in their homelands. The list of minorities who have overcome great odds is endless, proving that any ethnic group can show its entrepreneurial drive under the right conditions.

Societies differ in their treatment of women and wealth. However, in a world where legal title to property was often limited to men, the rise of wealthy women is equally remarkable. The Bible and Qurʾān speak with wonder of the wealth of the Queen of Sheba. Jane Stanford, Laura Spelman Rockefeller, and Joan Kroc are counted among America's greatest philanthropists.

Minorities continue to confront obstacles to success. A minority population is subject to discrimination, isolation, purges, expropriation, and massacre. The African continent was ravaged by slavery. When African Americans were eventually freed from slavery in the United States, they then encountered racist Jim Crow laws, segregation, and sharecropping. These conditions make the achievements of Paul Cuffe, an African American and Native American who lived in the late eighteenth and early nineteenth centuries, all the more remarkable. He not only attained a sizable fortune but also spent his wealth on farsighted ventures in education, religion, and emigration.

forts to transport freed slaves to West Africa and his support of other charities. Cuffe faced many obstacles, but he knew how to seize opportunity, and in so doing he became a very wealthy man.

When Cuffe died in 1817, his estate was valued by the Bristol County probate court at a little more than $20,000, including $4,119 in real estate and $14,023 in personal property. The record of his various property holdings ran to eight handwritten pages. His will left most of his personal goods and income to his wife, with a large portion of his estate to be equally shared among his children. He also left generous amounts of money to his grandchildren, siblings, and cousins, and to the Westport Society of Friends.

Hugh Roy Cullen

American oil magnate

Cullen embodied the daring spirit of the first generation of Texas oil wildcatters. His calculated gambles to find unsuspected oil reserves made him one of the richest industrialists of the 1920's. Cullen distributed more than 90 percent of his wealth to a range of charitable projects in his native state.

Born: July 3, 1881; Denton County, Texas
Died: July 4, 1957; Houston, Texas
Source of wealth: Oil
Bequeathal of wealth: Children; educational institution; artistic patronage

Early Life

Hugh Roy Cullen was born on a farm in Denton County, Texas, just south of the Oklahoma border, the grandson of a prominent politician in the early years of Texas statehood. His father died soon after Cullen was born, and his mother moved the family to San Antonio, then little more than a cattle ranching frontier town. Money was tight, and Cullen completed only the fifth grade before he started working, initially bagging candy for $3 a week. Mindful of the importance of education in the development of character, Cullen maintained a strict regimen of self-imposed studies. However, he was restless. At seventeen, he set out on his own and moved south to Schulenburg, Texas, to pursue the opportunities of cotton brokering, initially as a general office worker but quickly moving into cotton trading, maintaining a significant market in both Texas and Oklahoma.

First Ventures

In 1903, Cullen married Lillie Cranz, the daughter of a wealthy rancher. They quickly had five children, a son and four daughters. Although successful as a cotton broker with a well-earned reputation for hard work and integrity, Cullen wanted roots for his family. He moved his family to Houston in 1911 to pursue interests in real estate. Houston, incorporated only twenty years earlier, offered boom opportunities for land investment, and for more than five years Cullen worked the real estate market with tenacity and diligence, establishing himself as a force in Houston's burgeoning economy. While handling transactions involving vast tracts of open country around the Houston area, Cullen was introduced to the oil business that was just beginning to take off. At this time, southeast Texas was in the first flush of the so-called Gusher Age, in which this area of the state (and Oklahoma) would become, in a ten short years, the center of the world's richest and most lucrative oil deposits. It was an exciting time for those willing to take the risks of drilling. Little was known about the extent of the oil reserves, and companies would often go bankrupt and individual fortunes would be lost before drillers hit significant deposits. With typical daring, Cullen quickly earned a reputation as a wildcatter, willing to finance drilling in fields either outside the range of already marked deposits, and therefore considered a much higher risk, or in fields already abandoned as unpromising.

Mature Wealth

With remarkable luck, Cullen struck large deposits in quick succession in Pierce Junction, Blue Ridge, and Rabb's Ridge, among other areas. His strategy was simple: When confronted with evidence that the drilling was futile and a field was dry, he instructed his men to drill deeper. With the high-risk devil-may-care attitude that typified the first-generation Texas wildcatters, Cullen pursued gushers. He loved prospecting and was uninterested in maintaining whatever oil deposits he might find, preferring to sell them off quickly and putting that money into new ventures. His strategy worked. In 1932, he established the Quintana Petroleum Company to manage his considerable properties and extensive drilling operations. Along with his son, Cullen was a hands-on chief executive officer, visiting oil fields and often taking part in the construction of the giant derricks. He would tell reporters how much he loved to hear a gusher when it would first come in.

By the early 1930's, with the United States in a deep economic depression, Cullen, along with oil tycoons Clint Murchison, Sr., Sid W. Richardson, and H. L. Hunt, became the core of an ultraweathy social class new to Texas, who had at their command millions of dollars and who flaunted their wealth in ostentatious mansions, world travel, art collections, and all the other manifestations of a wealth beyond measure. Cullen alone of the so-called Big Four maintained a relatively modest lifestyle, although he did have a taste for expensive clothing and built a palatial estate outside Houston. Instead, Cullen began to return his considerable wealth to the Houston community he loved, giving sizable donations, notably to hospitals and schools.

In 1937, the newly opened University of Houston sent Cullen a standard fund-raising brochure that touted the new school's mission to make college education accessible to Houston's working class. The idea appealed to Cullen, and thus began his nearly twenty-five-year commitment to the university. Initially, although land had been donated for the campus, there was no money to construct buildings. Immediately, Cullen donated $350,000, sufficient to construct a liberal arts building, named the Roy Gustav Cullen Memorial Building for Cullen's son, who had died in an oil rig accident two years earlier. Cullen never wavered in his support of the university. He eventually dontated more than $20 million, including a most eccentric $2 million contribution in 1954, when the Houston football team defeated rival Baylor University. In recognition, Cullen served for twelve years as the chair of the university's board of regents.

Hugh Roy Cullen. (Time & Life Pictures/Getty Images)

In addition to his support of the university, Cullen in 1948 donated oil properties worth in excess of $160 million to establish the Cullen Foundation, which funded worthwhile projects in the Houston area. After World War II, Cullen provided considerable financing for the arts as Houston struggled to diminish its reputation as a cultural backwater. Cullen funded the city's symphony, and the Cullen Foundation later provided a world-class sculpture garden for the city's Museum of Fine Arts, named for the Cullens, and a state-of-the-art theater, the Worthham.

Although his oil drilling and his largesse became legendary in Texas, Cullen also maintained a presence on the national stage, largely through his support of conservative political causes. Initially a Democrat, reflecting his working-class background, Cullen was associated with the states-rights movement and its deep discontent with the reach of President Franklin D. Roosevelt's New Deal initiatives during the late 1930's. When discontented Southern Democrats broke with the party over the nomination of Harry S. Truman in 1948, Cullen, feisty and plainspoken, was a staunch financial backer of the Dixiecrats. When Truman won, Cullen became a supporter of Dwight D. Eisenhower, a Republican, and he ultimately contributed money to Joseph McCarthy, an ultraconservative U.S. senator. Cullen decried Communism and its threat to the capitalist system, which, in his view, rewarded hard work and commitment. In the last years of his life, Cullen also associated himself with controversial views and was a vociferous opponent of civil rights and welfare.

However, his charity work defined him in his native state. When he died in 1957, although he took generous care of his family and left an estate valued at between $250 and $300 million, it was estimated that he had given away nearly 95 percent of his accumulated wealth.

Legacy

Hugh Roy Cullen was never entirely comfortable with the millions of dollars he accumulated. In his view, nature had put the oil in the ground; he had just found it. He knew that in the oil business, luck played a major role in a person's success or failure, and he attributed his success primarily to his remarkably good fortune. It was this sort of down-to-earth sensibility that endeared Cullen to Tex-

The Cullen Foundation

In the years immediately after World War II, still smarting from his futile efforts to displace the hold of the liberalism of the late Franklin D. Roosevelt on the national Democratic Party, Hugh Roy Cullen turned his attention to Houston, Texas. There, with the advice and support of his wife, he decided to set up a massive charity foundation that would be patterned on another philanthropic institution established with oil money, New York City's Rockefeller Foundation. However, his organization would be different from the Rockefeller Foundation. Cullen directed that the mission of his foundation would be to serve the nonprofit organizations in Texas only, preferably the Houston area specifically.

It was this sort of insular logic that kept the Cullen Foundation, endowed in late 1948 with more than $160 million worth of productive oil properties in south Texas, from attracting wide national attention, even though it was among the five richest philanthropic institutions in the country. Cullen determined his foundation would focus on Texas because he wanted to return to the state what its rich earth had given him. The trustees of his foundation were his three daughters, and the Cullen family maintained an active interest in the foundation's operations into the twenty-first century.

Initially, given Cullen's lifelong interest in supporting university education, much of the foundation's funds were directed to the University of Houston, long a pet project of Cullen. However, the foundation also maintained an interest in funding medical research, and it contributed millions of dollars to the Texas Medical Center and the College of Medicine at Baylor University, among other facilities. The foundation also supported endeavors in the arts, notably the Houston Symphony and the Houston Museum of Fine Arts. In addition, the foundation donated significant amounts of money to public service organizations, such as the Boy Scouts, the Young Men's Christian Association (YMCA), a variety of inner-city athletic programs designed to address Houston's growing problems of delinquency and juvenile crime, adult literacy programs, and vocational training programs.

Unlike most foundations, the Cullen Foundation accepts and reviews grant applications throughout the year instead of during specified times. Grants are awarded nearly continuously according to need, which conforms to Cullen's own fiercely pragmatic sense of putting money to work. Over the years, the foundation has made donations ranging from a few thousand to several million dollars.

In 1970, the foundation diversified, creating three separate branches, one devoted to education, another to health care and medical research, and the third to the performing arts. Although the original oil properties upon which the foundation's wealth rested have long since been depleted, the wise management of investments has ensured that the foundation, and its mission, have survived more than fifty years of boom and bust cycles in the Texas oil business. As of 2009, the foundation had dispersed more than $400 million. In 2005, accounting records placed the market value of the Cullen Foundation at $180 million, making it among the most stable philanthropic foundations in the country.

ans. Cullen, like the other Texas oil barons of his era, had no desire to become a national celebrity. Aware that he lacked the refinement of higher education and culture, Cullen propagated an image of himself as street-smart, direct, and honest. Not surprisingly, he saw his fortune largely as a chance to give back to his community. This civic spirit of practical philanthropy is, in the end, Cullen's most sustained legacy.

Cyrus H. K. Curtis

American magazine and newspaper publisher

Curtis capitalized on Americans' interest in periodicals in the late nineteenth and early twentieth centuries, making the Curtis Publishing Company an influential multimillion-dollar operation. He is best known for his hugely successful magazines, The Ladies' Home Journal *and* The Saturday Evening Post.

Born: June 18, 1850; Portland, Maine
Died: June 7, 1933; Wyncote, Pennsylvania
Also known as: Cyrus Hermann Kotzschmar Curtis
Source of wealth: Media
Bequeathal of wealth: Children; educational institution; medical institution; museum

Early Life

Cyrus Hermann Kotzschmar Curtis was born in 1850 in Portland, Maine, the son of Cyrus Libby Curtis and Salome Ann Cummings Curtis. His family was of average means. Curtis's artistic father named him after a Boston musician, Hermann Kotzschmar. When twelve-year-old Curtis needed money to buy fireworks to celebrate the Fourth of July, he turned to his mother for assistance. Although she gave him some change, she suggested he earn additional money to buy the fireworks. Later, Curtis met a friend trying to sell his last three copies of the *Courier* newspaper on the street. Curtis offered him three cents for all of the copies and then resold them for three cents each. With his nine cents, he bought his own copies of the *Courier* and sold these for a total of eighteen cents. To make more money, he looked for customers with no access to the newspaper and marketed the publication to them. This event marked the beginning of his publishing career.

First Ventures

Young Curtis developed a reputation for his industrious behavior and was contacted by the *Courier*'s rival, the *Portland Press*. The *Press*'s business manager offered

THE SATURDAY EVENING POST

The *Saturday Evening Post* has been published for almost three hundred years, and the publication's longevity can be attributed to the insight and dedication of several visionaries, including publisher Cyrus H. K. Curtis. Curtis was especially interested in the historical roots of the periodical, which was called the *Pennsylvania Gazette* when Benjamin Franklin founded it in 1728.

Curtis believed that men would read business articles related to their work if these pieces were written and presented accurately. When he discussed this idea with peers, he received a negative response, with his critics arguing that there was no market for a men's business magazine. Their comments did not discourage Curtis. To test his idea, he bought *The Saturday Evening Post* for $1,000 when its owner died in 1897. At this time, the magazine was a struggling weekly with only four pages. Employees at the Curtis Publishing Company fondly called the publication "the singed cat."

Curtis hired George Horace Lorimer as the editor and pressed forward with his dream. During the next five years, he spent more than $1 million in advertising costs to build circulation for the *Post*. More than forty automobile manufacturers bought full- or double-page ads in 1914, making the *Post* a national showcase for the growth of industrial businesses in the early twentieth century. The magazine published high-quality business articles and editorials, boosting its circulation to one million readers. By the 1930's, circulation had climbed to almost three million, the largest magazine circulation in the world, and the publication earned $47 million in advertising revenue.

Editor Lorimer deviated from the normal magazine content to place creative artwork on the magazine's cover. Americans soon recognized *Post* covers with Norman Rockwell paintings of family and rural life and looked forward to each issue. Rockwell, a twenty-two-year-old unknown in 1922, painted 319 covers during a fifty-year career with the *Post*, which ended in December, 1963. Inside the magazine, readers found articles and fiction by such famous writers as Sinclair Lewis and F. Scott Fitzgerald.

In 1969, *The Saturday Evening Post* was bought by a new owner who moved the editorial content toward articles about health, medicine, and disease prevention. In 2009, *The Saturday Evening Post* continued to be published six times a year by The Saturday Evening Post Society and had a subscriber base of 350,000.

him a steady income of $2 per week to cover an early-morning newspaper route. Curtis accepted, rising at four o'clock each morning for four years, delivering his newspapers, and getting to school by nine o'clock. Later, a manager at the *Portland Argus* offered him more money, and Curtis went to work for the *Argus*. However, the young entrepreneur began to dream of owning a newspaper and working for himself. In partnership with a friend, fifteen-year-old Curtis wrote and published *Young American*, a newspaper for boys, in 1863. The printing costs left the partnership in debt, and Curtis's parents dissolved the business.

Curtis bought a small handpress for $2.50 in order to print his own newspaper. When a businessman queried Curtis about the cost of advertising in his newspaper, Curtis found a new source of revenue to support his efforts. He began accepting other printing jobs in order to garner additional income. However, on July, 4, 1866, Portland was devastated by a fire that reached Curtis's home. His publishing business was lost as his family escaped with their lives and only a few of their belongings. With the family in financial crisis, Curtis left school at age sixteen to work and never attended college. He became an errand boy for a dry goods store and was later promoted to salesman.

MATURE WEALTH

Curtis moved to Boston, where he earned $2 per week more than he had received from his job in Portland. Soon he was offered an additional 25 percent commission by an advertising agency, and he sold advertisements to make extra money during his lunchtime. After a year, he struck out on his own, developing a partnership to publish the *People's Ledger* in 1872. He eventually bought his partner's interest in this publication for $600. With limited capital to invest in the *People's Ledger*, Curtis was blessed with a benefactor, W. C. Allan. Later, Curtis moved his newspaper to Philadelphia, where his printing costs were reduced by $1,500 a year. Curtis was now a hardworking, optimistic, twenty-six-year-old newspaper publisher.

Curtis eventually sold the *People's Ledger*. The owners of the *Philadelphia Press*, a newspaper with a circulation of thirty-five thousand, asked Curtis to become its manager for $15 per week and a 25 percent commission on the advertising he sold. Although he performed well, Curtis wanted to start his own publication, *Tribune and Farmer*. One specialty column in this publication, "Women and Home," gained such popularity that Curtis decided to make it a separate supplement and sold it by subscription for fifty cents per year. His wife, Louisa Knapp Curtis, who was the author of the column, edited the new supplement, called *The La-*

dies' Home Journal and Practical Housekeeper. The first issue of the publication appeared in 1883; three years later, the last three words were deleted from the title.

Curtis gave up his partnership in *Tribune and Farmer* to devote all of his time to *The Ladies' Home Journal*. The magazine prospered, and its circulation grew to 100,000 readers. Curtis secured the services of well-known writers, such as Louisa May Alcott. When he raised the subscription price from fifty cents to $1 per year, he lost some subscribers but improved his overall financial position. In 1889, Edward W. Bok became the editor, and the magazine had a circulation of 500,000. In 1904, *The Ladies' Home Journal* was the first magazine to have a circulation of more than one million.

In June, 1891, Curtis formed a stock company, the Curtis Publishing Company. The firm's board of directors agreed to buy 4,950 shares of stock with a value of $100 per share, generating capital of almost $500,000. Curtis was president of the board and held a controlling interest in the newly formed company. The Curtis Company of New Jersey was founded in 1900 and assumed the older company's business. In 1907, Curtis Publishing Company had capital of $2.5 million, which increased to $5 million in 1910. In 1929, advertising revenues for the company rose to $73 million, dropping to $67 million during the Great Depression in 1930.

Curtis became interested in *The Saturday Evening Post*, a weekly periodical that had been founded by Benjamin Franklin in 1728. However, by the late nineteenth century the periodical was poorly edited and teetered on the brink of financial demise. Intrigued by its heritage, Curtis paid $1,000 to purchase *The Saturday Evening Post* in 1897. He made the magazine a success. In 1933, *Time* magazine reported that the *Post* had a circulation of 2.9 million. With his creative spirit and sound business approach, Curtis lived to see the *Post* generate more than $22.5 million in revenue in 1932 and $47 million in 1933. In the same years, *The Ladies' Home Journal*'s advertising revenue was about $8.1 million and $15 million, respectively.

Curtis used his wealth to purchase the finer things of life. In 1922, *The New York Times* ran a story about a George Romney painting that Curtis had bought, which was valued between $60,000 and $70,000. In an interview, Curtis said his wife was the art collector, not he. He did speak fondly of his yacht, the *Lyndonia*, where he spent half of his time. The yacht, listed in his wife's name, cost $450,000.

Curtis suffered a heart attack in the summer of 1932 while he was on his yacht and was admitted to a hospital in Philadelphia. He remained in poor health until he died on June 7, 1933.

Legacy

Cyrus H. K. Curtis has been called one of the richest men in history. Adjusted to 2008 inflation rates, he was worth an estimated $43.2 billion. He was a generous man, donating to various causes, including the Franklin Institute ($2 million) and the University of Pennsylvania ($1 million). Curtis Island, for which he donated the land and the building that became the Camden Yacht Club, is where Curtis spent many summers. After his death, his daughter Mary Louise Curtis Bok established the Curtis Arboretum in Wyncote, Pennsylvania, to honor her father, who enjoyed nature. Curtis donated his Kotzschmar Memorial Organ to Portland, Maine, and Bok would later donate the Curtis Memorial Organ to Christ Church in her father's memory.

A world-renowned publisher in his time, Curtis represents the American dream of a person from humble roots with few advantages who works hard to achieve his or her goals. With little formal education, Curtis used his ingenuity and business acumen to invest and secure his goal of building a publishing business. He was known as a man of integrity who refused to allow poor industry practices or unscrupulous marketing schemes to taint his business. He understood the importance of target advertising to finance his publications. He was perhaps the first publisher to develop a research department in order to study the relationship of his subscribers and print media to advertising. Curtis believed in hiring competent editors and managers and then supported their work. He was a kind and approachable man, who used his wealth to move his business forward and to support worthwhile projects.

Marcus Daly

American copper mining magnate

A poor Irish immigrant, Daly learned about mining firsthand and used his experience to develop the incredibly productive Anaconda copper mine in the Montana Territory. The mine made him wealthy, and the diversified industries associated with the enterprise attracted sufficient population to achieve Montana's statehood.

Born: December 5, 1841; Derrylea, County Cavan, Ireland
Died: November 12, 1900; New York, New York
Source of wealth: Mining
Bequeathal of wealth: Spouse; charity; medical institution

Early Life

Marcus Daly was the youngest child born into a large family of poor tenant farmers in rural Ireland. He received a rudimentary education at home from his mother. At the age of fifteen, soon after the devastating famine of 1845, he left Ireland for the United States. Arriving in New York City, he worked for five years at a number of menial jobs until he could save up enough money to travel west to California, where a married sister lived.

First Ventures

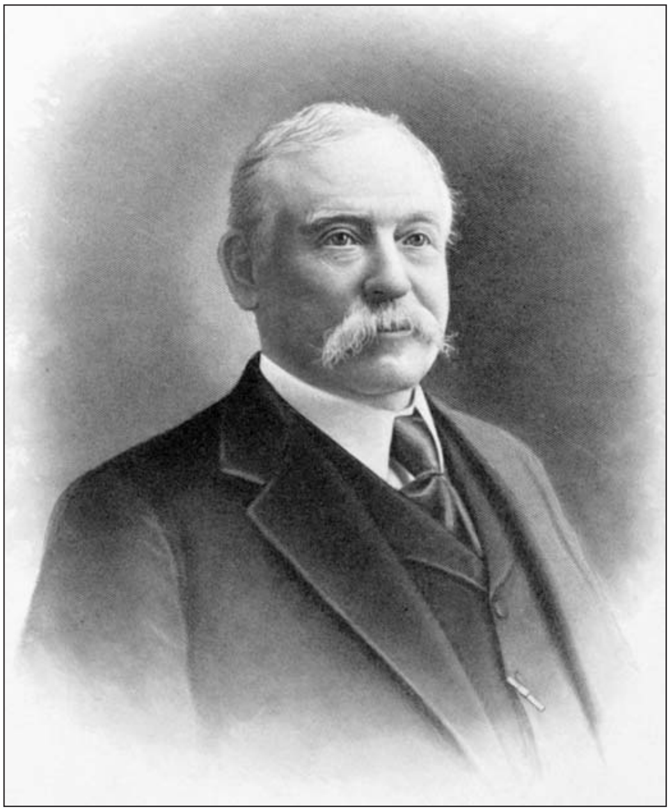
In California, Daly labored in a gold mine and rose to foreman. He used his newfound mining skills to obtain a similar position at the Comstock Lode silver mine in Virginia City, Nevada, and remained there from 1862 to 1868. Daly subsequently managed silver mines in Ophir, Utah, for the Walker brothers, a banking and mining family. At Ophir, Daly met and married Margaret Price "Maggie" Evans in 1872; they would have three daughters and a son. In 1874, Daly became an American citizen.

Late in the 1870's, Daly went to the Montana Territory to investigate other Walker mining interests. He stayed there, invested in a silver claim, and soon sold the mine for a large profit. In 1881, with financial assistance from San Francisco backers, including George Hearst (William Randolph Hearst's father), Daly bought another silver mine known as the Anaconda. The mine's true value proved to be a huge vein of copper, essential to the new industries of telegraphy and electricity.

Mature Wealth

To support the copper mine, Daly built the town of Anaconda, complete with facilities for water and power. He erected the world's largest smelter in Butte, Montana. He also built a railroad between the two towns to transport ore, and he bought up timberlands to provide fuel for the smelter. By 1890, the year after Montana became the forty-first state, Daly's copper mines were producing $17 million in annual revenues.

Daly had by now grown wealthy, and he diversified. He planted fruit orchards, founded banks, began ranching, and started breeding racehorses. His horse *Scottish Chieftain* won the Belmont Stakes in 1897. Daly also established the *Anaconda Standard* newspaper, which he used as a platform to thwart the political ambitions of rival copper magnate William Andrews Clark. He constructed Riverside, a magnificent twenty-four-thousand-square-foot mansion, near the town of Hamilton, which he also developed.



Marcus Daly. (The Granger Collection, New York)

In the mid-1890's, the Anaconda Copper Mining Company was incorporated, with Daly as president. In 1895, a Rothschild syndicate briefly entered into partnership with the company before the Standard Oil Company purchased the mine in 1899. Daly, plagued by diabetes and a heart weakened by years of hard labor, died in New York City at the age of fifty-eight on November 12, 1900. After Daly died, his wife honored his request to destroy his personal records and correspondence, depriving the world of knowledge about a man who rose from rags to riches.

Legacy

Although the Anaconda mine and smelter that Daly founded changed ownership and expanded several times after his death, these enterprises operated continuously for nearly a century, providing employment for thousands of workers before the smelter closed in 1980. In the twenty-first century, the freestanding, 585-foot-high smelter smokestack was all that remained of the facility. The towns Daly established to support his various enterprises, Hamilton and Anaconda, continued to thrive. Although the *Anaconda Standard* shut down in 1931, the Daly Mansion and the Margaret Daly Memorial Gardens and Arboretum remained popular tourist attractions. Daly's widow, Margaret, endowed the Marcus Daly Memorial Hospital in 1929, and she used her late husband's wealth to assist numerous charitable causes, including the Boy Scouts and area churches, until her death in 1941.

Aliko Dangote

Nigerian industrialist and merchant

Dangote, one of the most successful businessmen in West Africa, is said to be worth more than $3 billion. In 2008, Forbes *magazine ranked him as one of the wealthiest black African citizens. Only two people of African descent—Saudi businessman Mohammed Hussein Ali Al Amoudi and African American businesswoman Oprah Winfrey—were wealthier.*

Born: April 10, 1957; Kano, Nigeria
Also known as: Alhaji Aliko Dangote
Sources of wealth: Trade; manufacturing
Bequeathal of wealth: Unknown

Early Life

Alhaji Aliko Dangote (ahl-HAH-zhee ah-LEE-koh dahn-GOH-tay) was born on April 10, 1957, in Kano, Nigeria. His father, Mohammed Dangote, was a successful businessman and politician, and his mother, Hajiya Mariya Sanusi Dantata, was related to the kola nut trader Alhassan Dantata, who died in 1955 as the wealthiest man in Nigeria. As was customary, Dangote was taken from his parents at six months of age and sent to live with his grandfather Sanusi Dantata, a wealthy and successful trader. Dangote was educated at local schools, where he made pocket money selling candy to his classmates. For a time he attended Al-Azhar University in Cairo, Egypt.

First Ventures

Dangote was influenced by his family to go into business. He worked for a time for his grandfather, and in 1977 he borrowed money from Dantata to set himself up as a commodities trader, importing cement and other building materials. At first he worked out of his hometown of Kano, a large city in the north of Nigeria known for its groundnut pyramids. As he gradually expanded his business and his influence, he relocated to the then-capital city of Lagos, where he began importing cars and the massive amounts of cement needed for Nigeria's economic expansion. In 1981, he formed the corporation that later became the Dangote Group.

Mature Wealth

Dangote owns and is chairman and chief executive officer of the Dangote Group, a multinational firm spread across West Africa. The company is, at its core, a commodities trader, dealing in oil, gas, and food commodities, as well as shipping, and it also has interests in banking, vehicle leasing, and real estate. The group controls more than 60 percent of Nigeria's trade in sugar—an essential ingredient in the manufacture of beer and soft drinks. The firm also has industrial interests, including Obajana Cement, Africa's largest manufacturing plant for cement; a flour mill; salt-processing facilities; textiles; and the publicly traded Dangote Sugar Refinery, with Dangote himself as major stockholder. With control of these basic commodities, and with the rapid influx of cash when he took the Dangote Sugar Refinery public, he has made a fortune.

Dangote has used this wealth to establish himself as a key player in Nigerian politics, contributing millions of dollars to election campaigns and to private charities controlled by important politicians. There have long been suspicions that these contributions have functioned as bribes, guaranteeing Dangote favorable treatment, but no formal charges have been brought against him. There has also been criticism that while Dangote has profited, most of his workers continue to live in poverty. However, Dangote is often praised for investing his money in West Africa, rather than abroad.

Legacy

Within Nigeria and neighboring West African nations, Aliko Dangote is a household name. He is Nigeria's largest employer, as well as the man behind the Dangote sugar and Dangote flour in every home and the Dangote freight trucks on every road. As a successful businessman, he is an inspiration to younger Nigerians, who hope to be equally wealthy. Outside West Africa, Dangote is known as one of the world's richest Africans, a full participant in the global economy and an example that the wealth generated by this economy can be available to people everywhere.

Francesco Datini

Italian banker and merchant

Datini rose from modest origins to amass one of the largest fortunes in early fourteenth century Italy, almost all of which he bequeathed to a charitable foundation which existed into the twenty-first century. Of even greater significance is the enormous archive of documents relating to his personal and business life that also survives in Prato, Italy.

Born: c. 1335; Prato, Tuscany (now in Italy)
Died: August 16, 1410; Prato, Tuscany
Also known as: Francesco di Marco da Prato Datini
Sources of wealth: Banking; trade
Bequeathal of wealth: Spouse; charity

Early Life

Francesco di Marco da Prato Datini, better known as Francesco Datini (frahn-CHEHS-co DAH-tee-nee), the son of a Prato innkeeper, was born around 1335. Little is known of him until 1348, when the Black Death struck Italy and all of Europe. Datini was left an orphan as the disease killed his mother, two brothers, a sister, and finally his father. His life was haunted by multiple recurrences of the plague, and his experience as an orphan informed his wishes for the distribution of his wealth after his death. Datini's father left his two remaining sons a small inheritance of 50 florins each, along with a house and a bit of farmland.

First Ventures

Datini, already an apprentice merchant at the time of his father's death, relocated in the company of other Italians to Avignon, France. This town was the home in exile of the popes during the so-called Avignon Papacy (1305-1378), and the papal court was a major center of the luxury trade. Using his meager resources, Datini engaged in the trading of numerous commodities, including armor, religious items, and especially cloth, for which Prato was a center of production. A document suggests that a relative sent Datini an amount of fine cloth, which he sold for a handsome profit. Continuing to buy low and sell high,

The Datini Archives

The legacy of Francesco Datini is twofold: He created a charitable foundation with a bequest of some 70,000 florins that in the twenty-first century continued to perform good works in Prato. Arguably, however, the greater legacy lies in the documents Datini left behind. They constitute the largest surviving collection of business papers of an individual in Europe before the nineteenth century.

In his will, Datini asked that all of his papers be preserved, and it seems that his executors obeyed. The knowledge of these documents' existence was lost in the sixteenth century, however, and they remained undiscovered until renovations were undertaken at Datini's home about 1860. When workmen broke through a wall into an unused stairwell, they discovered the contracts, letters, and account books stored in canvas bags.

The archives consist of more than 500 account books, 300 deeds of partnership, 400 insurance policies, and more than 150,000 letters. It is to the survival of these documents that Datini owes his fame. He left behind more business documents than were left by all other Florentine businessmen during his lifetime. He had branch businesses and partnerships around the Mediterranean in Avignon, Valencia, Barcelona, and Majorca, as well as in the Italian cities of Prato, Florence, Pisa, and Genoa, and he corresponded with his agents in these cities weekly or even daily. This correspondence has been partially published, although most of these publications are in Italian. From them, scholars have learned in exquisite detail the commercial activities of at least one early Renaissance entrepreneur.

While the large number of documents is unusual, it appears that Datini's business practices were similar to those of other, smaller Prato businessmen. Contracts, accounting systems, instruments of credit, and dispute resolution practices were essential to both local and international business. His personal letters—Datini wrote almost daily to his wife and almost as often to his friend, Ser Lapo Mazzei—provide a wealth of information for social and family historians. All these documents are the basis of his biographies, especially Iris Origo's book *The Merchant of Prato: Francesco di Marco Datini, 1335-1410* (1986).

The Datini Archives are housed in the home Datini built in Prato and make up the bulk of the Archivio di Stato di Prato. Since the mid-twentieth century, the Casa Datini has been the site of an annual conference on economic history, the Istituto Internazionale di Storia Economica "Francesco Datini."

he slowly built his resources into significant wealth. Profits in the luxury trade were high, significantly greater than profits from investment in either land or manufacturing.

By the 1360's, Datini owned a shop in Avignon, supplied armor to mercenaries fighting on all sides of the numerous wars, and engaged in maritime insurance and money changing (banking). He had increased his original investment to almost 10,000 florins in less than twenty years.

Datini remained in Avignon for more than thirty years. In 1376, when he was about forty years old, he married sixteen-year-old Margherita Bandini, a Florentine noblewoman in exile. The age difference between the two was typical of marriages in Italian merchant households. They had no children together, though Datini sired at least two illegitimate children. When the papal court returned to Italy in 1378, Datini soon followed. He returned to Prato and set up business in nearby Florence in 1382, leaving partners and agents to manage his affairs at his offices in Avignon.

Mature Wealth

By the time he returned to Prato, Datini was wealthy but not exceptionally so. He continued his practice of patient accumulation and reinvestment of many small profits. Over time, he became the wealthiest man in Prato and one of the richest in all of Tuscany.

His developing business interests can be seen by the guilds he joined. As he invested in the manufacture, import, export, and sale of textiles, he became a member of the cloth guild in 1383. As he sought the higher profits available through the sale of silks and other luxury items, he joined the silk merchants' guild in 1388. As he gradually moved from managing credit between his far-flung branches to handling credit for others, he joined the bankers' guild in 1399. This last membership was short-lived and ended in 1403. In the last years of his life, Datini may have lost his zeal for accumulating more wealth, and his close friends and religious advisers warned him of the sin of usury. He always denied making dishonest gains; however, he left a large sum of money for his executors to distribute to unnamed beneficiaries, perhaps to atone for usurious loans.

Business practices in early Renaissance Italy were the most sophisticated in Europe, and Datini's methods of conducting business were quite advanced. He formed frequent partnerships, both for the production and sale of local goods and for the creation of overseas branches. He and his partners joined forces for a set period of time, each contributing some share of capital, assuming that share of risk, and reaping the same share of profits. An office in Pisa was replaced by one in Genoa in 1392, and in the next year, Datini had offices throughout Spain. He also maintained his ties with Avignon. To conduct business over such distances, he corresponded with each of his agents weekly and required the same of them. He also made use of letters of exchange and letters of credit, and a complex double-entry bookkeeping system kept his accounts straight. As major partner, he insured his own shipments from losses at sea, and he gradually invested excess capital in providing the same insurance for the shipments of other merchants.

Business enterprise was an honored profession at the time, but it was also risky. Many businessmen went bankrupt. Their only protection came from diversification and wide geographical distribution. However, with greater risk came higher profits. Biographer Iris Origo calculated that Datini's profit from the manufacture of local wool was perhaps 7 to 10 percent, while for some silk and luxury goods profit could be as high as 30 percent. Profit from banking and loans was between 15 and 20 percent.

The documentation of Datini's personal account books and letters provides an unusually detailed knowledge of his life. While he was frugal about many things, especially day-to-day expenditures, he lived well and in some areas even extravagantly. Inventories of his property showed that he, his wife, and his adopted (illegitimate) daughter had many clothes, and these clothes were of rich materials compared to the attire of the family's contemporaries. Similarly, Datini ate well and took pride in serving distinguished guests lavish and unusual banquets. To his family, he could be alternately stingy or generous and it pleased him to give lavish gifts to his social betters.

The major extravagance of his mature years was his grand house, or palazzo. He had begun accumulating the necessary land for this residence even before he permanently returned to Prato in 1382, and construction began around 1390. The complex of buildings included the house, his commercial offices, stables, and outbuildings, all set within a garden stocked with exotic animals. The house was a typical arrangement of rooms around an open courtyard on two floors, plus an attic. Datini hired some of the best-known painters of Florence to decorate the interior walls with images. Documents about contracts, bills, and disputes still exist, as do some of the paintings themselves. By 1399, Datini estimated that he had spent 6,000 florins on the house and its furnishings, or about 10 percent of his total wealth at the time.

Legacy

In Datini's life, two things were important: faith and trade. His ledgers always began with some variation of the phrase, "In the name of God and of profit." The conflict between God and profit, plus his experiences with the plague and human frailty, meant that for much of his life he was anxious about his fortunes in this life and in the next. In his will, Datini made provision for both his surviving wife and his illegitimate daughter and her offspring. From the remainder of his estate, he gave a significant gift to establish a foundling hospital, the Ospidale degli Innocenti (hospital of the innocents), in Florence. In addition, he bestowed the vast majority of his wealth, including his house, personal property, and lands, to endow a charitable organization to be administered outside the usual church structures. This foundation (or *ceppo* in Italian) was to help orphans and unwanted children.

In his will. Datini also asked that all of his papers be preserved. These papers are the basis for the detailed knowledge of his business practices and personal life, and they have become known as the Datini Archives of Prato.

Arthur Vining Davis

American aluminum magnate and real estate developer

Davis's vast wealth resulted from his involvement in the evolution of the Aluminum Company of America (Alcoa), of which he was chief executive officer for more than fifty years. He developed markets for aluminum products in both household and industrial uses. In later life, he became an important property developer in Florida and other locations.

Born: May 30, 1867; Sharon, Massachusetts
Died: November 17, 1962; Miami, Florida
Sources of wealth: Metals refining; real estate
Bequeathal of wealth: Relatives; friends; charity

Early Life

Arthur Vining Davis was the son of a Congregational minister, Perley B. Davis, and his wife, Mary Francis. Davis attended Roxbury Latin School in Boston and graduated from Amherst College in 1888. Through a family friend and parishioner, Alfred Hunt, Davis took a job in Pittsburgh in 1888. He earned $14 a week as one of the first five employees of the newly formed Pittsburgh Reduction Company (PRC), which used an innovative electrolytic process to refine aluminum.

First Ventures

PRC was built around an invention of Charles Martin Hall, who in 1886 patented a process for producing inexpensive aluminum. In 1887 this metal was selling for $8 a pound. Hall, with hands-on assistance from Davis, produced PRC's aluminum, a process that required constant expert attention. Both men initially worked twelve-hour days (or nights). They were able to refine about fifty pounds of aluminum a day. The company cut the price to $2 a pound, but still found few buyers.

Nevertheless, PRC's operations were sufficiently successful that it was able to take on more employees, enabling Hall and Davis to pursue more creative activities. By September, 1889, the firm was producing 475 pounds of aluminum per day and was enlarging its production facilities. The firm's fortunes further improved in 1890, when the banking firm of two brothers, Andrew Mellon and Richard B. Mellon, agreed to provide credit. By then, Davis was in charge of internal operations. During the 1890's, Davis's efforts focused on improving the production processes and reducing costs, and he spent much time close to the production line. Davis and other company officials sometimes borrowed money in their own names to cover payrolls.

Davis's effectiveness as a manager led PRC's stockholders to grant him 104 shares of stock in March, 1890. The stock was not traded publicly, but the Mellons valued it at $60 per share. Thus Davis was nominally worth more than $60,000. Another ten thousand shares of company stock were outstanding. Davis was appointed assistant general manager of PRC in 1893. By 1897, PRC was producing eight thousand pounds of aluminum a day. When Hunt died in 1899, Davis became the dominant manager of the firm. In 1910, he was formally designated as president of the company.

In 1896, Davis married Florence Holmes. After her death in 1908, he married Elizabeth Weiman, who died in 1933. Both marriages were childless.

Mature Wealth

In its early years, PRC recognized the crucial importance of patent protection, and it was the target of a patent infringement suit initiated in 1897. In 1903, PRC reached an accommodation with the Electric Smelting and Refining Company, enabling each firm to use the other's patented processes. From its beginning, PRC vigorously expanded its production capacity. By the end of 1892, the price of aluminum had fallen below $1 a pound, and output more than doubled in one year, reaching 138,000 pounds in 1893. Facilities were developed at diverse locations where electric power was cheaply available. In

1893, PRC became the first major customer for electric power from the new Niagara Falls hydroelectric complex. The firm built a facility at Shawinigan Falls, Canada, in 1901.

Expanding production was futile unless the market for aluminum could expand. Davis and his associates experimented with the manufacture of products made from aluminum, converting their oldest plants from refining to fabrication. The plant at New Kensington, Pennsylvania, was equipped with a forge, tube mills, rolling mills, and a significant casting operation. Davis supervised the process by which aluminum was rolled out in sheets to manufacture products like aluminum tea kettles. Quality control considerations led the company to enter the cookware business in 1895, producing under the Wear-ever brand. A wholly owned subsidiary, the Aluminum Cooking Utensil Company, developed door-to-door sales by college students, an activity that was thriving as late as 1938.

By 1898, PRC employed 260 workers. Davis's aggressive pursuit of new markets was demonstrated the following year, when he contracted to provide aluminum cable conductors to a utility company in San Francisco, even though PRC was not set up to make these products. Davis hastily arranged for PRC to install a rod mill and other wire and cable machinery at its plants, and soon the company had become a well-established manufacturer of aluminum wire for electrical uses. PRC also responded aggressively to the opportunities provided by the rapid growth of automobile production after 1900. In addition, the firm acquired bauxite deposits in Arkansas and began processing alumina, a white granular material properly called aluminum oxide, in East St. Louis, Illinois.

PRC's output of basic aluminum pig escalated rapidly, from 216,000 pounds in 1893 to one million pounds in 1896 and five million in 1900. By 1909, the firm had four thousand employees. The company had become profitable by 1893, but almost all of the profit was plowed back into the firm during the 1890's. Significant cash dividends began to be distributed in 1899. In 1907, PRC changed its name to the Aluminum Company of America; by 1910, the firm was commonly referred to by its acronym, Alcoa. Davis's wealth increased alongside the growth and profitability of the company.

Charles Martin Hall died in 1914, leaving two hundred shares of Alcoa stock to Davis. Hall's estate was estimated at $30 million, and most of it went to educational institutions. Davis was designated as one of the two trustees who administered the bequests. Although Davis's wealth at this time probably did not match Hall's, Davis was certainly a millionaire by then.

During its first half century, PRC/Alcoa effectively held a monopoly on aluminum refining. After its basic patents expired in 1909, Alcoa was targeted for antitrust prosecution in 1912. Davis was undoubtedly one of the architects of his firm's nonconfrontational response. The company accepted a consent decree in June, 1912, agreeing to discontinue some practices of which it had been accused, without admitting guilt.

Following America's entry into World War I in 1917, Davis played a central role in negotiations for sales of aluminum to the government. In April, 1917, Alcoa sold two million pounds to the government for 27.5 cents a pound, although the market price was around 60 cents. In September, Davis negotiated a price of 38 cents, but he agreed to refund any excess over costs as determined by the Federal Trade Commission. Most of these sales were ultimately settled for 32 cents. Alcoa's accommodating stance was rewarded, as the company was given wide latitude in determining customer priorities in times of shortage. The war gave strong impetus to the develop-

Arthur Vining Davis. (Getty Images)

ment of aircraft, with aluminum playing a large part in both fuselage construction and engine design.

Davis was involved in many aspects of Alcoa's international expansion after the war. He negotiated with tobacco tycoon James Buchanan Duke to acquire in 1925 Duke's project for hydroelectric development in Canada. This acquisition led to the installation of extensive production facilities at the new town of Arvida in Quebec, with the name "Arvida" derived from the first two letters of Davis's first, middle, and last names. Davis took an intense personal interest in the town, making sure it developed recreational, religious, educational, and medical facilities.

Despite his involvement in the development of this new Canadian town, Davis was the principal influence that led Alcoa to back away from multinational operation. In June, 1928, Alcoa transferred control of thirty-four companies to the newly created Aluminum Limited of Canada. Stock in the new company was distributed pro rata to existing Alcoa shareholders, including Davis. His younger brother Edward became head of the new firm. In 1929, Alcoa's organizational structure was changed, and Davis became chairman of the board, but without reduction in authority.

In 1925, Davis was involved in a scheme to sell off part of the Alcoa stock held by the Hall trust (the estate of Charles Martin Hall, of which Davis was a trustee) to a syndicate, of which Davis was a member. The trust beneficiaries supported the scheme, which enabled them to sell stock that paid very low dividends and receive the proceeds in cash. As a result of these sales, Davis was able to buy 61,000 shares on very advantageous terms. However, when the stock rose in value, the trust beneficiaries complained that they had been swindled. Davis was pressured into relinquishing the bulk of his newly acquired stock, valued at $3 million.

In April, 1937, Alcoa was indicted for antitrust violations, initiating one of the longest cases on record. In the summer of 1938, Davis was the principal witness for his company's defense. He was on the stand for six weeks, and his testimony extended to more than two thousand pages in the trial transcript. In July, 1942, the district court dismissed all the government's charges. In his decision, the judge remarked on "the great number of witnesses . . . competitors as well as customers of Alcoa, who have completely exculpated Alcoa from blame and have praised its fairness as well as its helpfulness to the aluminum industry. . . . Such conduct of those witnesses, nearly all of whom were entirely independent, is in great part a tribute to Mr. Arthur V. Davis." The judge also described Davis as the man "who, chiefly and primarily, has built up and made Alcoa what it is today." The federal government appealed to overturn the judge's decision, and the case continued to be heard in appellate and district courts. Finally, in 1950, a district court judge ruled against the divestiture of Alcoa.

Arthur Vining Davis Foundations

In 1952, Arthur Vining Davis established and endowed a foundation under a living trust. He was one of the foundation's original trustees, along with his brother, a nephew, and his stepson-in-law. Two other foundations, known as No. 2 and No. 3, began operating in 1965, and their structures were modeled on foundation No. 1. The first foundation operated for forty-two years before it merged with No. 2 in 2001, reducing the number of foundations to two.

According to the Web site for these foundations, Davis had "great confidence" in the founding trustees, and he instructed them to use the foundations' earnings "for programs that would, in their best judgment, strengthen our nation's future." However, he specified that the organizations' donations should be made only within "the United States and its possessions."

At the end of 2007, foundations No. 2 and No. 3 had total assets of $256 million. These organizations provide grants to institutions whose activities fall into five areas: private higher education, secondary education, graduate theological education, health care, and public television. The foundations seek to strengthen four-year liberal arts colleges that stress good teaching and where a majority of students major in humanities, science, and mathematics. They also favor schools that serve disadvantaged populations and support innovative professional development programs aimed at high school teachers. The foundations' health care emphasis is on encouraging caring attitudes, and they have provided funding for the Public Broadcasting System (PBS).

In 2007, the foundations awarded $11.8 million in grants. These grants included a donation of $350,000 to a Los Angeles television station for a documentary on Joseph Stalin and his relations with the Allies, $200,000 to Berea College for renovation of residential buildings, $200,000 to Duke University Medical Center for integrative self-care for physicians, $200,000 to Mills College for construction of a natural science facility, $200,000 to the Princeton Theological Seminary for library special collections, and $200,000 to Swarthmore College for endowment of an Arabic program.

During World War II, aluminum was once again a strategic war material, especially for the construction of aircraft. Alcoa expanded production capacity to a vast degree, building twenty-two plants that were temporarily owned and operated by the federal government. Aluminum output climbed to seven times its prewar level. Davis spent much time in Washington, D.C., coordinating aluminum sales with the government. He received a Presidential Certificate of Merit for his wartime achievements. After the war, the disposal of the government's aluminum plants was a critical element in creating new competitors and settling the antitrust case without overt penalty to Alcoa. Davis was instrumental in providing royalty-free patent access for the new competitors.

Davis largely withdrew from direct management of Alcoa by the end of the 1940's and retired from the company in 1957. He moved to Florida and became a major real estate investor. His holdings included significant properties in the city of Miami, and he had other property interests in the Bahamas and Cuba.

Legacy

Davis was a stocky man with a bulldog appearance and personality. He was notoriously egocentric and bullying. His wealth developed as he shaped Alcoa into a remarkably successful firm that provided valuable products and good jobs. Davis was able to identify and motivate talented employees to achieve technological progress and efficiency. By 1935, Alcoa was the nation's twenty-seventh largest industrial corporation. Despite the appearance of monopoly, neither its profits nor its pricing reflected monopoly behavior. Alcoa was remarkably diplomatic in its dealings with customers, competitors, and the government.

Davis left an estate of about $400 million, much of it deriving from his real estate activities through his Arvida Corporation, a Florida real estate development company. He was reportedly the fifth-richest man in America. About $300 million of his estate was distributed to his foundations.

JOHN DEERE

American entrepreneur, industrialist, and merchant

Deere employed blacksmith skills, product insight, and marketing instinct to create an international business. He designed a steel plow that was the founding product for his company, the basis for one of the oldest existing businesses in the United States, and the source of his wealth.

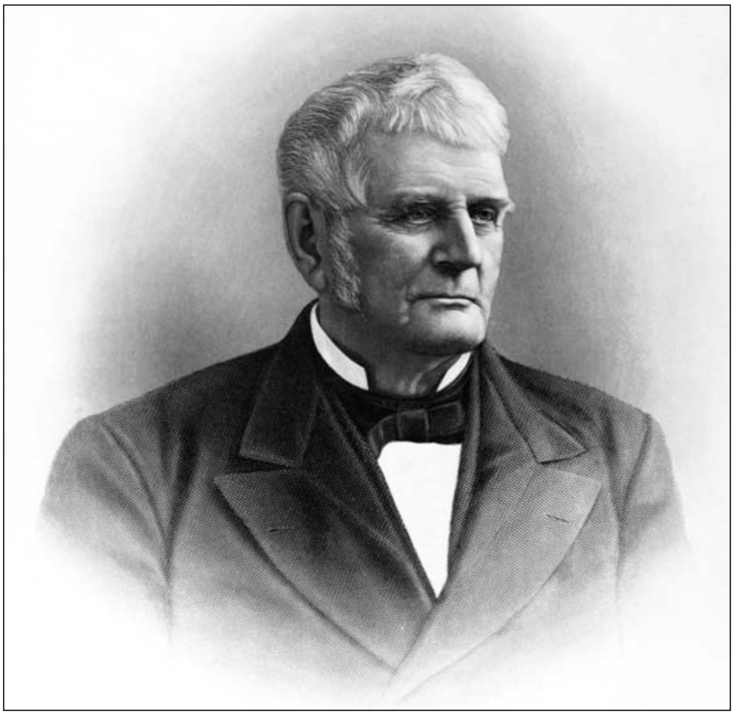
Born: February 7, 1804; Rutland, Vermont
Died: May 17, 1886; Moline, Illinois
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Children

EARLY LIFE

John Deere was born in 1804 in Rutland, Vermont, the youngest of five children of William Rinold Deere and Sarah (née Yates) Deere. A year after John's birth, William, a tailor, moved the family to Middlebury, Vermont. In 1808, William embarked on a trip to England but did not return. Since the family's income was modest, Deere received a basic education at the local school, and at the age of seventeen he was apprenticed as a blacksmith to Captain Benjamin Lawrence. In exchange for four years of service to Lawrence beginning in 1821, Deere earned his room and board, clothing, a modest income, and the essential skills necessary to be a good craftsman. Afterward, Deere honed his skills as a journeyman, working for several other blacksmiths, before opening his own shop.

FIRST VENTURES

Deere continuously sharpened his skills and soon earned a reputation as a fine craftsman. After marrying Demarius Lamb in 1827 and starting a family, Deere borrowed funds to buy land and build his own smithy. On two separate occasions fire destroyed the shop, leaving Deere in debt at a time when Vermont was suffering from an economic depression. Because of bleak local circumstances, Deere chose to venture west to seek his fortune. In 1836, he temporarily left his family behind and followed several other Vermont natives to Grand Detour, Illinois. In this new community, Deere quickly found high demand for his blacksmith skills. Within two days of his arrival, Deere's forge was in operation.

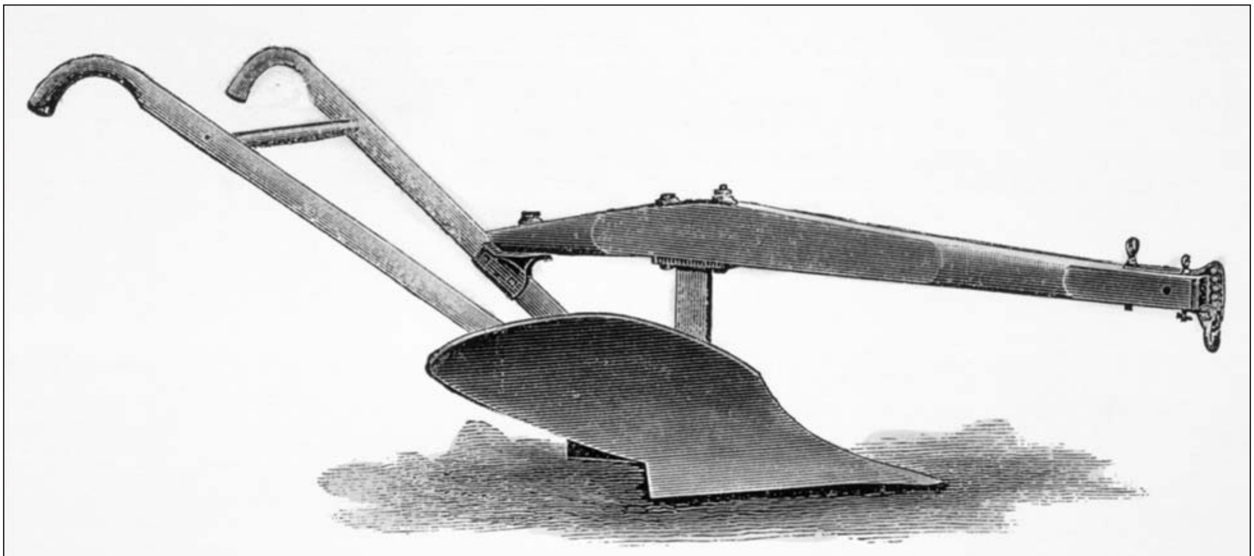


John Deere. (©Bettmann/CORBIS)

MATURE WEALTH

Soon after arriving in Illinois, Deere learned that wooden and iron plows stuck in the rich midwestern soil, making the task of cultivation a difficult one for farmers. Deere experimented, at first using an old abandoned sawmill blade, and he concluded that highly polished steel and a newly shaped moldboard would improve tilling. In 1838, in partnership with Major Leonard Andrus, Deere built and sold three steel plows. Over the next few years, Deere's business continued to grow; by 1846 his company was manufacturing one thousand plows annually.

As the need for raw materials and improved transportation services increased, Deere decided to relocate his business seventy-five miles southwest, along the Mississippi River in Moline, Illinois. Leaving his old partner behind, he took on new associates Robert N. Tate and John M. Gould. This affiliation allowed Deere to concentrate on sales and marketing. The associa-



A wood engraving of John Deere's steel plow. Deere's invention was the founding product for his company and the source of his wealth. (The Granger Collection, New York)

tion lasted until 1852. In the following year, Deere's son Charles entered the company as its bookkeeper.

By 1857, Deere's company was producing ten thousand plows annually but was also suffering from cash flow problems. The firm was in jeopardy during the Panic of 1857, but reorganization gave Charles management control. With John as the president and Charles overseeing daily operations, the company avoided bankruptcy. In 1863, John's son-in-law Stephen H. Velie joined the company, and Deere helped organize the First National Bank of Moline. Demarius Deere died in 1865, and John married her sister Lucinda in 1867.

After operating for thirty-one years as a partnership or single proprietorship, the business in 1868 incorporated under the name John Deere & Company. Deere became the second mayor of Moline in 1873. Thirteen years later, Deere died in Moline at the age of eighty-two.

Legacy

While John Deere was not the first person to manufacture plows from steel, his determination, perceptiveness, energy, and ingenuity resulted in a product that made his name synonymous with the steel plow industry. He designed and sold a workable plow for homesteaders who were transforming American prairie lands into productive farmlands. By designing reliable agricultural equipment, modernizing production, and using innovative marketing, Deere established an industrial empire.

Michael Dell

American entrepreneur, computer engineer, and industrialist

Dell is one of the wealthiest technology magnates in the United States. He proved that a direct-order system for selling computers could work and could also be very profitable. He and his wife have established a foundation that seeks to end world poverty and to improve urban education.

Born: February 23, 1965; Houston, Texas
Also known as: Michael Saul Dell
Sources of wealth: Computer industry; sale of products
Bequeathal of wealth: Charity

Early Life

Michael Saul Dell was born in 1965 in Houston, Texas. He attended school there and was an average student. He was successful in other endeavors, making more than $10,000 by selling the *Houston Post* newspaper. He also gained experience with computers and began thinking about the computer business.

Michael Dell. (AP/Wide World Photos)

Dell attended the University of Texas at Austin, and while in college he started his own computer firm, PC's Limited, in 1984. His company soon proved successful. Dell obtained additional capital from family members and dropped out of school to devote himself to his business. Although he did not graduate from the University of Texas at Austin, he later donated more than $50 million to the school. In 1989, Dell married Susan Lieberman, who had worked in commercial real estate and owned a fashion boutique. The couple had four children and made their home in Austin.

First Ventures

In 1987, PC's Limited changed its name to Dell Computer Corporation, and since 2003 the company has been called Dell, Inc. In its early years, the company initiated a number of innovations. Rather than simply selling personal computers, the company let customers adapt its products to meet their needs. The firm also sold and advertised its products directly to the public instead of in retail stores or other venues, and its advertisements listed product prices. These practices enabled the firm to turn a profit and to generate millions of dollars worth of revenue.

Mature Wealth

Michael Dell continued his practice of advertising prices and selling directly to the public. He also managed to convince the public to buy his computers without testing them first. Conventional wisdom at the time was that people would want to try out a personal computer before purchasing it. Dell, however, gambled that his products' reduced prices and custom-ordered features would outweigh customers' desire for a trial run. He was right, and his business boomed. In addition to selling to individuals, the company garnered lucrative contracts with major businesses and the government.

Dell Computer Corporation grew rapidly from 1987 through the early 1990's, expanding its customer service and technical support departments to keep up with customers' demands. However, in 1993 and 1994 the company had a series of setbacks. The company's rapid hiring failed to keep pace with its sluggish revenue growth. The firm also miscalculated market demand for its laptop computers and other products. As a result, the corporation lost money for the first time in 1993. Michael Dell hired some experienced managers and introduced new products. He also stopped selling his computers in retail stores and refocused his marketing efforts on direct sales, eventually enabling customers to order products via the telephone or the Internet.

After 1995, the company grew quickly; by 1998, it proclaimed itself to be the largest desktop-computer seller in the world and one of the largest overall computer sales companies. The next step was to move into the peripheral market, including the market for printers and servers. Dell Computer sought to become a one-stop shop, where customers could purchase all computer-related products and accessories, and where these products would be compatible. Company sales suffered after the terrorist attacks on September 11, 2001, and Dell had to lay off thousands of employees. The company, however, continued to gain market share. However, by the mid-2000's, other computer companies had caught up with Dell. Starting in 2002, the corporation tried selling its products at retail kiosks and opened a store, but these efforts failed. Dell was more successful in its partnerships with Wal-Mart Corporation, Sam's Club, Best Buy, and other retailers who sold its products.

Michael Dell remained chief executive officer of the company until 2004, when he stepped down and became chairman of the board; he reassumed the position of chief executive officer in 2007. At this time, Dell, Inc., sought to expand into developing markets, including those in Brazil and Russia.

Michael Dell's personal worth significantly declined as a result of the economic recession that began in 2008. It is estimated that his wealth decreased about 25 percent between 2001 and 2009, but he still was worth about $12 billion. He was number 37 on *Forbes* magazine's 2010 billionaires list, with an estimated net worth of $13.5 billion. Dell has been involved in philanthropic efforts. He and has wife established the Michael and Susan Dell Foundation, which seeks to improve education and childhood health and to eliminate urban poverty.

The Michael and Susan Dell Foundation

In 1999, Michael Dell and his wife Susan established a foundation that, in the words of its Web site, supports "children's causes as a way to make an even greater difference in a measurable way, particularly for those children living in urban poverty." The foundation focuses on three areas—urban education, childhood health, and the economic stability of families—and has provided assistance in the United States, Africa, and India.

About one-third of the foundation's grants are allocated to education. The organization has identified areas in the United States where large school districts are underperforming and seeks to improve education through the use of technology and by providing scholarships to encourage children to attend college. In addition, the foundation addresses literacy issues in areas outside the United States.

The organization also seeks to improve childhood health, particularly in India, where there are no health care services in many urban slums. Among its services, the foundation provides meningitis vaccinations and supports clean water initiatives. In the United States, the organization is addressing childhood obesity, which some medical experts claim is epidemic and has increased the incidence of type 2 diabetes in children. Michael and Susan Dell's work on behalf of health care is evident at the University of Texas at Austin, where the couple have financed construction of three medical facilities: Dell Children's Medical Center, Dell Pediatric Research Institute, and the Michael and Susan Dell Center for Advancement of Healthy Living. In the area of family economic stability, the foundation has provided small loans for families and is developing measures to determine whether these loans are effective.

Legacy

Michael Dell was one of the pioneers of the personal computer industry, developing techniques for manufacturing and marketing these products. In the early 2000's, his company was the most profitable computer manufacturer in the world. Although it eventually was eclipsed by other companies, Dell, Inc., remained one of the largest computer manufacturers. The company successfully employed both the direct-marketing concept, selling its products directly to end users instead of offering computers in retail stores, and the customization of computers to customers' specification. Through his foundation, Dell has sought to improve the lives of children, and he has also made generous donations to the University of Texas at Austin.

Elias Hasket Derby

American merchant

Derby contributed to the growth of commerce and prosperity in Salem, Massachusetts, while amassing the largest fortune in the United States in the eighteenth century. The privateers of Salem, many of them financed and owned by Derby, contributed significantly to the sea defense of the colonies during the American Revolution. After the war, duties imposed on imports from the east Indian trade provided revenue for a stable federal government.

Born: August 16, 1739; Salem, Massachusetts
Died: September 8, 1799; Salem, Massachusetts
Also known as: America's First Millionaire
Sources of wealth: Trade; shipping; privateering
Bequeathal of wealth: Children

Early Life

Elias Hasket Derby was born on August 16, 1739, in Salem, Massachusetts, the son of Richard Derby, Sr., a Salem sea captain and shipowner. Derby's two brothers became sea captains, while he was trained as a merchant in his father's counting house. At the age of fifteen, having studied naval architecture and maritime trade, he was already keeping his father's accounts. Richard Derby, Sr., retired by 1760, sending his ships out under other captains, including his sons Richard, Jr., and John, and entrusting Derby with control of the land operations of the family business.

In 1762, Derby married Elizabeth Crowninshield. The couple moved into a brick Georgian-style house that Richard, Sr., built for them. Their home was the earliest brick house in Salem and one of the finest surviving examples of Georgian architecture. From the windows of this house, where his seven children were born, Derby could look out on the Derby Wharf and supervise the loading and unloading of his ships.

First Ventures

Shipping was an enterprising and profitable industry in coastal New England in the mid-eighteenth century. Able captains and shipowners were also traders, buying goods in one port to sell at a profit in another. The Derby ships carried New England products, such as lumber and fish, to the West Indies, where they would take on cargoes of molasses, sugar, and coffee, then sail on to Spain, Gibraltar, and Portugal for luxury goods, such as wine, furniture and, fine textiles. Shipping was a risky business. During the late colonial era, hostilities between the British and French interfered with the trade upon which Salem depended. French privateers in the West Indies captured many Salem vessels, including numerous Derby ships, selling the ships and their cargo and ransoming their crews. In 1760, Derby, his father, and his brother Richard Derby, Jr., were among the signers of a petition to the colonial governor requesting a convoy for protection of the commercial fleet.

Finding the British government's tariffs and restrictions on colonial trade oppressive, the Derbys were among those who supported the movement for independence from Great Britain. Derby and Richard, Jr., were members of the Salem regiment when hostilities broke out in 1775. Captain John Derby, sailing in a fast Derby ship, was the first to carry the news of the Battle of Lexington to London and to return to the colonies with the British response.

Mature Wealth

When war was declared, Derby was ready. His first privateer, the *Sturdy Beggar*, set sail in 1776, capturing several British merchant ships, selling their cargoes, and ransoming their crews. The Salem merchant fleet turned to privateering against the British in earnest. By 1778, privateering had become one of Salem's principal industries, with larger and faster ships being built and armed specifically for the purpose of capturing British ships. The privateers were commissioned by the Provincial Congress to interfere with British commercial and naval operations, but the profits went to the shipowners. Derby underwrote more privateering ventures than any other individual in the American colonies. He was lucky; he lost only one ship during the revolution. He was also an innovator, bringing shipbuilders to Salem to construct the strongest and fastest ships. Privateering during the American Revolution offered employment for Salem's men, provided scarce goods to the colonies, and contributed a considerable part to the American war at sea. Privateering during the revolution also made Derby a wealthy man.

When the war ended in 1783, Derby looked east for new markets, new ports, and new uses for his strong, fast ships. The traditional West Indian ports, controlled by the British, were now closed to the Americans. However, the Indian Ocean was now open to American vessels since they were no longer restricted by the British East India Company's commercial monopoly. Derby was a leader in reinventing American commerce. In 1784, he sent the first American ship to St. Petersburg. Yankee ships began to venture farther east from bases in Cape Town and Mauritius, buying and selling cargoes of tea, spices, silks, and porcelain. By 1785, when he sent his first ship to China, Derby was already the wealthiest merchant in Salem. The ship *Grand Turk* had been built for him as a privateer in 1781; in 1785, it was one of the first American vessels to arrive in Canton.

In 1787, Derby launched his family in the India trade. A Derby ship was the first to fly the American flag in Calcutta harbor, and Derby ships were the first to carry cargoes of cotton from Bombay to China. Derby was the first Salem merchant to employ a supercargo (business agent) on his ships. He sent his son Elias Hasket Derby, Jr., known as Hasket, on the *Grand Turk*. Hasket spent three years on the island of Mauritius, selling the ship's cargo of American products and then selling the *Grand Turk* itself, buying two more ships with the proceeds. Hasket ultimately returned to Salem with goods from India that were sold at an enormous profit at his father's store on Derby Wharf.

Derby ships never took part in the slave trade, and Derby was considered a benevolent employer. He was reputed to provide fresh vegetables to his seamen, a provision that was unusual in his day. He also took care of the

The Derby Summer House

The Derby Summer House was designed for Elias Hasket Derby in 1793 by Samuel McIntire, the most prominent wood-carver, house builder, and cabinetmaker in Salem, Massachusetts. McIntire constructed the house on Derby's farm in Danvers (now part of Peabody), Massachusetts, during the summer of 1794.

The lovely Summer House is a rare and important example of American Federal architecture. It is a two-story structure located in the center of a formally landscaped garden. The lower story is entered by an arched entrance, which was originally open and designed for shelter from the rain. The room above was designed for tea or a light afternoon meal. This peaceful and serene room, with its coved ceiling, paneled wainscoting, built-in cupboards for tea implements, and ornamental Chinese figures, is a cool and lovely place with a view of the beautifully landscaped gardens below.

The Summer House, with its Palladian character and exquisitely carved details, epitomizes the American Federal style of architecture as practiced by McIntire. The roof is dominated by two figures, known as the Reaper and the Milkmaid, which were carved by the Skillin Brothers of Boston. The urns on the roof, the festoons over the windows, and the columns were carved by McIntire himself.

In 1901, Ellen Peabody Endicott, the wife of William Crowninshield Endicott, Sr., bought the Summer House and had it moved to her summer house and farm, Glen Magna, located four miles away in Danvers. The Summer House remained there in the twenty-first century, sited in gardens designed by Frederick Law Olmsted and George Heussler. The Endicott family owned Glen Magna until 1958, when Louise Thoron Endicott, the wife of William Crowninshield Endicott, Jr., willed it to the Danvers Historical Society. The Derby Summer House has been listed on the National Register of Historic Places since 1968. The Glen Magna house and gardens are a popular spot for weddings and other functions, and the gardens and Summer House can be visited and enjoyed by the public.

families of his employees who died or were disabled in his service.

In the postrevolutionary period, some of Derby's wealth was spent on commissioning and building a number of Salem's important Federal-style houses. In 1780, Derby and his wife Elizabeth had commissioned Salem carpenter Samuel McIntire to build them a larger house next door to their brick Georgian house on the waterfront. With Derby patronage, McIntire would become a significant New England wood-carver and architect. The Derbys never occupied the new house. Elizabeth Derby was an ambitious woman who desired a house in a newer, more fashionable neighborhood, away from the noises and odors of the commercial waterfront. An uptown mansion was purchased and restored with many McIntire details. At the same time, a grand mansion house was planned. Initially designed by Boston architect Charles Bulfinch, the final design was executed by McIntire. The ornate Derby Mansion was completed in 1799. Derby and Elizabeth occupied it for only a few months, as first Elizabeth and then Derby died in 1799. At the time of his death, Derby's fortune was worth more than $1 million, earning him the title of America's First Millionaire.

LEGACY

Elias Hasket Derby's legacy was his contribution to the development of an American style of architecture. His patronage gave Samuel McIntire the opportunity to design some of America's most significant eighteenth century buildings. Derby also provided patronage to landscape gardener George Heussler, whom Derby hired in 1790. Heussler worked on both of Derby's town residences and his farm, and he was responsible for a new style of beautifully landscaped gardens at the homes of the wealthy in Essex County, Massachusetts.

Derby died within a few months of moving into his grand mansion, and his eldest son, Elias Hasket Derby, Jr., inherited Derby's farm and mansion. Derby's son lived in the mansion for a decade before putting it up for sale and moving to Charlestown. The trade embargo and the War of 1812 had damaged Salem's economy, and no buyer was found for the large and elaborate residence. In 1815, the mansion was torn down and the land given to the town for a permanent market, which eventually became Derby Square.

Charles Henry de Soysa

Sri Lankan landowner, agriculturist, and merchant

De Soysa, a native of Ceylon born to privilege, distinguished himself during the height of British colonial rule by his efficient development of thousands of acres of fertile farmland, as well as the use of his wealth to fund hundreds of public projects of benefit to his country.

Born: March 3, 1836; Muratuwa, Ceylon (now in Sri Lanka)
Died: September 29, 1890; Muratuwa, Ceylon
Also known as: Sir Charles Henry de Soysa
Sources of wealth: Inheritance; real estate; agricultural products
Bequeathal of wealth: Children; charity; medical institution

Early Life

By the time Sir Charles Henry de Soysa (dah SOY-sah) was born in 1836, his father, Jeronis, was among the wealthiest traders in southwest coastal Ceylon (now Sri Lanka). By cooperating with the British colonial government, Jeronis de Soysa prospered, trading in commodities, such as coffee, cinnamon, and coconut. During the nation's economic downturns, he enhanced his wealth by purchasing thousands of acres of relatively cheap but fertile farmland.

An only child (his sister died in infancy), young Charles grew up mindful that this financial empire would be his inheritance. However, in ways that would foreshadow his later life, the young boy respected the reach and magnitude of his father's financial resources, as well as his father's willingness to dedicate large sums of money to the public good, building roads, irrigation systems, schools, and hospitals in the impoverished towns that serviced his plantations.

First Ventures

At eighteen, de Soysa was among the first class accepted at St. Thomas College in nearby Mutwal. Poor health would compel de Soysa to return to his family estate, and he would complete his general education with tutors. However, his father provided him an invaluable education in entrepreneurship and estate management by arranging for de Soysa to receive additional training from internationally renowned tutors with backgrounds in business and finance.

In 1862, when de Soysa was twenty-six, his father died suddenly. De Soysa was prepared for this death, and he quietly assumed control of his father's multimillion-dollar commodities empire. In 1863, de Soysa married the only daughter of another wealthy Ceylonese planter. The combined wealth of both families gave the young couple a celebrity and influence that were enjoyed by few Ceylonese. However, even as he moved his young bride into a lavish mansion on more than 130 acres on the outskirts of Moratuwa, and even as his family grew to fourteen children, de Soysa had little interest in cultivating an ostentatious lifestyle. One of his few indulgences was the purchase of ornamental birds, like peacocks, and he also enjoyed watching the movements of a herd of his own elephants. Out of respect for his father, he was dedicated to expanding the resources his father had left him in order to pay tribute to the man who had shaped de Soysa's moral vision of wealth as a means to achieve significant public good.

Mature Wealth

With relatively minor investments in cinnamon, citronella, and coconuts, de Soysa recognized the danger of relying too heavily on Ceylon's fickle coffee crop, as his father had done. De Soysa controlled thousands of acres of coffee plantations, enough to survive the crop's numerous cycles of failure. During a cataclysmic coffee bust in the 1880's, when the crop was destroyed by a fast-spreading leaf disease, de Soysa's enterprises were among the few to prosper. However, he looked to expand his agricultural concerns into more stable crops, notably tea, that were amenable to Ceylon's growing season. Within a decade, his tea was among the most popular products in the British Empire, valued for its light color and sweetness.

A savvy and visionary manager, de Soysa reorganized his father's farming estates, reducing staff, expanding benefits for workers, and emphasizing efficient crop storage to lessen the likelihood of spoilage and rot. He expanded his range of agricultural interests by importing cattle from Australia and India; the cows were used for their milk, and the bulls were used to transport produce among de Soysa's more than sixty estates, with a total of nearly twenty-five thousand acres. He purchased tracts of prime land with the hope of future development and invested in mining operations.

His interest in improving the efficiency of his agricultural operations never waned. Indeed, he gave the colonial government a considerable amount of money and nearly one hundred acres near Kanatte in order to set up an experimental model farm, on which agricultural research promoted technological advances in irrigation systems and crop rotation practices. Not everything he tried succeeded, including a catastrophic attempt to raise cotton, but de Soysa became renowned for his entrepreneurial spirit, his support of agricultural research, and his dedication to expanding the cash crop base of his island country.

However, what made de Soysa a legendary figure among the people of Ceylon was his unparalleled interest in philanthropic enterprises. Despite being the richest Ceylonese of any era, de Soysa was known for mingling among working-class people, talking and laughing with the poorest. He made charitable contributions without the expectation of recognition; for de Soysa, wealth was a means to an end, not an end in itself. Modest, self-effacing, and humble, he sought simply to help as many of the needy as he could. From the moment he controlled his family's holdings, he directed that a significant part of his inheritance would be distributed to local communities. Although most of his donations financed public works projects, such as hospitals, schools, road systems, and railroad tracks, he always welcomed individual petitioners who came to his home in search of financial assistance. De Soysa's biography recounts his encounters with people seeking funds and his acts of charity, which were marked by fabulous signs of divine pleasure.

In connection with the much publicized state visit of the Prince and Princess of Wales to Ceylon in 1875, de Soysa financed the construction of and provided funding for the staff and faculty for two preparatory schools in Moratuwa that were named in honor of the visiting royalty when the schools opened in 1876. He constructed clinics to serve the country's poorest inland territories. At the height of the coffee crisis, de Soysa awarded an

De Soysa Hospital for Women

As a generous philanthropist concerned with the welfare of the indigent and passionately committed to public causes for which there were clear and evident solutions, Ceylonese entrepreneur Charles Henry de Soysa took up the plight of poor women, who in the mid-nineteenth century often faced the difficult trials of childbirth without hospital care. Although the medical system, which received the patronage of British colonial officials, provided substantial health care for most Ceylonese, the nation's poorest people did not benefit. Indeed, in the late 1870's, when de Soysa, himself the father of fourteen children, was first made aware of the dimensions of the problem, Ceylon's underclass had one of the highest infant and maternal mortality rates in Asia.

Typical of his legendary magnanimity, de Soysa committed all the funds necessary to begin construction of what would be only the second lying-in hospital in Asia, a facility designed to provide medical care during the final stages of pregnancy and after childbirth. With de Soysa's backing, property was secured in Moratuwa, the home base of de Soysa's economic empire, and on December 13, 1879, the De Soysa Lying-in Home was opened. The facility had twenty-two beds and supervised fifty-two births during its first year of operation. The hospital continued to receive financial assistance during de Soysa's lifetime and after his death in 1890.

The hospital succeeded in its mission, not only providing cutting-edge care without charge to the poor but also serving as a teaching hospital, where midwives and nurses were trained to assist in childbirths. Within fifteen years, the number of deliveries at the facility had risen to more than five hundred annually. During the early twentieth century, the hospital broke new ground in Ceylonese medicine, conducting the nation's first successful cesarean section in 1905, opening the country's first fully equipped operating theater in 1907, and accepting the first class of students trained in obstetrics and gynecology in 1915. By the 1920's, the facility was assisting in more than two thousand births annually and had branched into providing preventative care for a variety of early infant illnesses.

In 1940, a new administrative office building was added to the facility, which was then renamed the De Soysa Hospital for Women. In conjunction with the newly opened University of Colombo, the hospital took the lead in training a new generation of physicians and nurses in maternal and infant care. After Sri Lanka's independence, the facility pioneered the introduction of family planning and education about safe sex practices. Beginning in the 1980's, the hospital expanded its services to treat medical disorders in pregnant women that threatened the health of their babies. The facility opened its first intensive care unit in the early 1990's. De Soysa Hospital for Women has been recognized by UNICEF (United Nations International Children's Emergency Fund) for its exemplary dedication to the welfare of children, its first-rate training program, and its mission to provide Sri Lanka with top-notch maternity care.

acre of prime farmland to each of one hundred families devastated by the economic collapse. An Anglican, de Soysa nevertheless paid for the construction of Buddhist temples, recognizing the central position that this religion held for the Ceylonese people. He donated vast sums to build and staff new hospitals, both in Ceylon and in London, including several facilities devoted to the treatment of children's diseases.

On August 2, 1890, de Soysa was bitten by a rabid street dog and on September 29, he died from complications of the attack. He was only fifty-four years old. His death was an occasion of unprecedented national mourning. His funeral, held two days after his death, was said to be the largest single public gathering in Asia in the entire nineteenth century. His estate was later set at more than a million rupees, excluding his numerous property holdings. It remains the largest individual estate in Sri Lankan history.

Legacy

The achievement of de Soysa, whose accumulated wealth matched or exceeded most Victorian-era magnates, never secured international attention, largely because he did not seek such celebrity. His legacy is his unselfish devotion to his country. At a time when Ceylon, as a British colonial outpost, was uncertain of its own cultural identity, de Soysa emerged as his tiny island's most powerful figure. His interest in developing new technologies for addressing agricultural production problems and his visionary sense of opening Ceylon's economic markets to a wider variety of crops make de Soysa one of the most important Sri Lankans of any era. However, his legendary acts of munificence and his genuine compassion for the problems facing Sri Lanka's poorest classes have secured for him a place of profound respect and near-worship in his home nation, undiminished more than a century after his death.

Clarence Dillon

American investment banker and wine connoisseur

In the era immediately following World War I, a period associated with reckless speculation and extravagant spending among the wealthy, Dillon maintained a quiet, bold, gentlemanly pragmatism that enabled him to broker some of the decade's most significant financial transactions. These deals made his investment bank—Dillon, Read, and Company—among the most influential institutions of its era.

Born: September 27, 1882; San Antonio, Texas
Died: April 14, 1979; Far Hills, New Jersey
Also known as: Clarence Lapowski (birth name)
Source of wealth: Banking
Bequeathal of wealth: Children; relatives

Early Life

Samuel Lapowski, a penniless Polish Jew who had immigrated to the United States in the 1870's, arrived in San Antonio, Texas, in 1878. The town was already shaking free of its cattle culture provincialism. Railroad service enabled the city to become a destination for immigrants searching for opportunities that were disappearing in the industrial Northeast. Lapowski opened a clothing business. He married, and in 1882 his only child, Clarence, was born.

Lapowski, who wanted his son to realize the fullest promise of their adopted country, saw education as the foundation of that success. The family became naturalized citizens in 1891 and Lapowski changed his family's name to Dillon, an Americanized version of his French mother's maiden name. The clothing business thrived and the family relocated to Abilene, Texas. Samuel arranged for Clarence to attend the prestigious Worcester Academy in Massachusetts, a preparatory school considered a feeder campus for Harvard University.

First Ventures

His years at Harvard gave Clarence Dillon his first taste of the sophisticated world of the wealthy. He loved the patrician lifestyle and was given the nickname Baron. When he completed his education at Harvard in 1905, he was the only graduate to own a car. Dillon married Anne McEldin Douglass in 1908. Shortly before his marriage, he had been injured in Milwaukee, when, as he was waiting at a railroad station, an express train rode through at full speed at the same time that a Saint Bernard was crossing the tracks. The train hit the large dog, throwing its body at the crowd at the platform and injuring Dillon's skull, which put him in a coma for a week. The couple took an extended two-year tour of Europe after the wedding, primarily in Switzerland and in southern France, where Dillon came to love the picturesque vineyard country. When Dillon returned, at the recommendation of a Harvard classmate he joined the prestigious brokerage firm of William A. Read & Company, which was among the oldest Wall Street operations, dating back to 1832. Over the next eight years, Dillon demonstrated a remarkably facile mind for banking, quickly rising to partner and then to the presidency of operations. The firm's name was changed to Dillon, Read & Company in 1920.

Mature Wealth

At a time when many bankers and stockbrokers encouraged clients to speculate and pursue high-risk investment strategies in order to make quick fortunes, Dillon was strikingly different. His style was quiet, low-risk, low-key, and conservative. He practiced relationship banking, depending on his expanding network of contacts to influence decisions regarding the direction of bank projects. Dillon buttressed his investment decisions with research, creating a business strategy for his company. His firm's reputation grew, and Dillon, Read was asked to direct the banking operations for Germany's payment of its massive war reparations as part of the armistice that ended World War I.

During the 1920's, Dillon established himself among the foremost financial giants of his era, known for visionary projects, often bold and daring, that he executed with a methodical passion for details. Dillon, Read would buy corporations with outstanding debts, then bring in new management teams to operate these firms, in turn generating huge profits for Dillon, Read.

Dillon's reputation largely rested on his involvement in two headline-making financial deals. Goodyear Tire and Rubber Company, which had made its fortune in bicycle tires, had attempted to expand into the new and potentially lucrative automobile market, but with disastrous mismanagement the company became overextended, verged on bankruptcy, and eventually went into receivership. In 1921, Dillon replaced Goodyear's management team and without court assistance brokered a settlement that satisfied the company's bankers, creditors, stockholders, and employees. Drawing on his network of Ivy

League associates, Dillon raised more than $100 million for the struggling company. Within five years Goodyear was the largest rubber company in the world. In 1925, Dillion outbid the legendary J. P. Morgan to purchase Dodge Brothers Motor Car Company, which was struggling with mismanagement after the deaths of its original founders. Dillon paid $146 million for the automobile firm, then the largest cash transaction in the history of American business. Despite heroic efforts to redirect the company's operations, within three years Dillon arranged the sale of Dodge to the Chrysler Corporation.

During his twenty years directing operations for Dillon, Read, Dillon set a style of quiet negotiations and conservative investment policy. Although not particularly dazzling, this style guaranteed long-term fiscal stability for the firm and a reputation for reliability and success. Indeed, in the financially strapped 1930's, New York City hired the firm to underwrite construction of the Triborough Bridge. In addition, Dillon, himself a connoisseur of European living, directed the expansion of banking operations overseas. By World War II, Dillon, Read was one of the most influential investment banks in the world and Dillon among the richest men in America.

During his half-century tenure at the firm, Dillon maintained an affluent lifestyle that he believed wealth should bring. In negotiations, he was courtly, gentlemanly, and patient. His lifestyle was sophisticated, cultured, always tasteful, and the very embodiment, despite his Jewish heritage, of an East Coast white Anglo-Saxon Protestant. His family was never rocked by scandal, his international banking operations were never investigated, and his reputation was never tarnished with gaudy excesses typical of first-generation wealth. At the sumptuous twelve-thousand-acre estate he built in Far Hills, New Jersey, called Dunwalke, Dillon pursued his passion for elegant living. His interests ranged from breeding prize cattle to garden design. He was an amateur ornithologist and photographer. He loved to hunt and ride horses. However, his primary passion was wine, nurtured

Château Haut-Brion

The lush vineyards of Bordeaux in southwestern France produce some of the world's most exquisite—and expensive—red and white wines. The soil, a thin composite of gravel, limestone, and sand resting atop a clay subsoil, is good for little except raising grapes, and the region's reputation has defined not only fine wine for centuries but also the sophisticated and cultivated lifestyle of the aristocratic wealthy who are its enthusiastic aficionados. Within the Bordeaux region, the Château Haut-Brion is located a mile from Bordeaux and has long been considered a unique operation. It is the only vineyard estate not located in the Médoc region to have received the "first growth" rating—the highest ranking accorded French vineyards. Château Haut-Brion's reputation for wine production has been chronicled during more than four centuries in which it has provided gold medal wines to Europe's wealthy and powerful.

Clarence Dillon, whose profound love for the French culture came as much from his grandmother's family as it did his own experiences in France, appreciated the finer expressions of wealth, notably the love of fine wines. In 1934, Bordeaux, along with the rest of Europe, was reeling from the global economic recession. Times were hard, and the château had fallen into disrepair after a succession of lackluster vineyard directors who were unwilling and financially unable to revive the moribund business. Dillon, who at the time was spending half of each year in his investment firm's Paris offices, toured the vineyard countryside in Bordeaux looking for an investment potential among a handful of châteaux that were in economic straits similar to Haut-Brion's and were up for sale. However, he fell under the spell of Haut-Brion, and he later told interviewers that its wine was his favorite of the Bordeaux clarets. The spacious estate grounds, with more than 125 acres, provided Dillon ample room to indulge his other passion—horse riding.

Dillon, however, was hardly a dilettante. He was able to accomplish for Château Haut-Brion what he had done for any number of faltering companies in the United States. He restructured the vineyard's management team, bringing in experts not only in winemaking but also in the economics of running a global corporation, and he spent millions in modernizing the physical plant, which did not even have electricity. Dillon's financial resources and his business acumen quickly improved the economic condition of the vineyard, and within a decade it was once again a world-class operation.

The Dillon family maintained direct involvement in vineyard operations into the twenty-first century. The château has purchased several rival vineyards and has diversified into a number of premium, award-winning, vintage lines, several bearing Dillon's name. The company continues to use cutting-edge technology to maximize efficiency, including a computer network to tap global distribution possibilities.

by his love of the French countryside. (Dillon, Read maintained a corporate office in Paris where Dillon lived six months of the year.) In 1935, after visiting Bordeaux, he purchased one of its most storied vineyards, the Château Haut-Brion.

Dillon eased into a gentle retirement from the firm he had established as a world-class operation. His only son, C. Douglas Dillon, would begin to manage Dillon, Read's operations in the late 1940's in a smooth transition of authority. Dillon gradually became less involved in the operations of his vineyard, entrusting its management to a nephew, and he enjoyed a lengthy and satisfying retirement, living until the age of ninety-six. Although he would live to see his firm marginalized by the deregulation and speculation of the 1960's and 1970's, he died before Dillon, Read was acquired and then divested by the Bechtel Group in the mid-1980's.

Legacy

One generation removed from the Jewish ghettos of Eastern Europe, Clarence Dillon became the leading American investment banker during both the prosperity of the 1920's and the economic anxieties of the Depression, his wealth estimated at between $150 and $200 million. He embodied the temperament and lifestyle of Old World wealth, taste, and sophistication. As a financier, Dillon thrived on the advice and counsel of his Ivy League contacts. Under Dillon's stewardship, Dillon, Read avoided bold and risky speculations, earning a reputation as a cautious, conservative, and solid firm that relied on the relatively narrow circle of Dillon's network of associates, a practice necessarily abandoned in the increasingly computerized global investment field after World War II.

Walt Disney

American artist and entrepreneur

Disney was only an average artist, but he was a great storyteller and showman who established one of the major media and entertainment corporations of the twentieth and twenty-first centuries.

Born: December 5, 1901; Chicago, Illinois
Died: December 15, 1966; Burbank, California
Also known as: Walter Elias Disney; Retlaw Elias Yensid
Sources of wealth: Entertainment industry; media; real estate
Bequeathal of wealth: Children; educational institution; charity

Early Life

Walt Disney, the son of Elias and Flora Call Disney, was born in Chicago in 1901. While growing up, Disney and his family lived in Chicago, on a farm in Missouri, and in Kansas City. He drew cartoons for his high school newspaper, and his formal training in art came from classes at the Kansas City and Chicago art institutes. Disney tried to join the U.S. Navy during World War I but was rejected because he was underage. He dropped out of high school in 1918 to join the American Red Cross and was sent to France to drive an ambulance.

Walt Disney. (Library of Congress)

He returned to the United States in 1919, settling in Kansas City to begin a career as a commercial artist. After reading a book on animation, he decided to go into the animated cartoon business and made a deal with a local movie theater chain to show his earliest cartoons.

First Ventures

Disney's "Laugh-O-Grams" became so popular in the Kansas City area that he was able to expand his studio and hire additional animators. However, he was an inexperienced businessman, and his first studio eventually went bankrupt. Disney moved to Los Angeles in 1923 with only a suitcase and $40. He tried to get a job with one of the film studios, but after no one hired him he set up his own. He started his studio in a garage and later moved into a building on Hyperion Avenue in the Silver Lake district of Los Angeles. The studio remained there until 1939, when Disney opened a larger facility in Burbank.

His cartoon series Alice Comedies (1924-1927), based on Lewis Carroll's book *Alice's Adventures in Wonderland* (1865), was moderately successful, and in 1927, Universal Pictures contracted with him for a new series. These cartoons, featuring Oswald the Rabbit, were so successful that Disney expanded his studio and hired more animators. In February, 1928, Disney was prepared to renew his contract, but Charlie Mintz, his distributor, wanted to reduce Disney's fee for each cartoon. Disney also discovered that Universal, not Disney, owned the rights to Oswald, and that Mintz believed he could make the cartoons without Disney by hiring away most of Disney's staff. Disney walked away from the deal and from that time on became aggressively vigilant about protecting his intellectual properties.

Mature Wealth

To replace Oswald, Disney based a new character on a mouse he had adopted as a pet while living in Kansas City. The character's name was originally Mortimer but was later changed to Mickey Mouse by Disney's wife Lillian, who did not like the name Mortimer. Disney failed to find a distributor for the first two cartoons star-

Walt Disney World

In 1959, Walt Disney began looking for land for a second theme park to build on the success of Disneyland, located in Anaheim, California. Marketing surveys showed that only 2 percent of Disneyland's visitors came from east of the Mississippi River, where 75 percent of the United States' population then lived. Disney also disliked the businesses that had grown up around Disneyland and wanted control of a much larger area of land for his next major enterprise.

Disney flew over the site southwest of Orlando, Florida, where Walt Disney World eventually was built on November 22, 1963, the day President John F. Kennedy was assassinated. However, the site was not his first choice. He had previously flown over and applied to the Sanford, Florida, city council to allow him to build a theme park near this city, but his application was declined because the council members did not want the crime they believed would accompany tourism.

One of the advantages of the Orlando site was the well-developed network of roads in the area. Three interstate highways and the Florida Turnpike connected Orlando with the rest of Florida, the East Coast, and areas north and west of the state. McCoy Air Force Base (later renamed the Orlando International Airport) was located east of the site.

Disney died in 1966. Construction of the theme park began the following year, and Walt Disney World opened on October 1, 1971, consisting of the Magic Kingdom theme park and two hotels, the Contemporary and the Polynesian. Disney World later added three theme parks: Epcot (in 1982), Disney's Hollywood Studios (1989), and Disney's Animal Kingdom (1998). By 2009, Disney World was the most visited and largest recreational resort in the world, and contained two water parks, Typhoon Lagoon (1989) and Blizzard Beach (1995); thirty-two hotels; five golf courses; a bus service; a monorail train system; and numerous shopping, dining, and entertainment facilities, including Walt Disney World Village Marketplace (1975) and Pleasure Island (1989). The recreation complex employed sixty-six thousand people with an annual payroll of $1.2 billion, making it the largest single-site employer in the United States. At its peak, the resort owned roughly thirty thousand acres, which is about the size of San Francisco, or about twice the size of Manhattan Island. Portions of the original property were sold off, including the land later occupied by Celebration, Florida, a town built by the Disney corporation.

ring Mickey, *Plane Crazy* and *The Gallopin' Gaucho*, which were both silent films. The third Mickey Mouse cartoon, *Steamboat Willie*, added sound in 1928. *Steamboat Willie* was an instant success, and all future Disney cartoons were released with sound tracks. Goofy the dog and Donald Duck were originally supporting characters in the Mickey Mouse cartoons, but they eventually surpassed Mickey in popularity and began starring in their own cartoons in 1937; Mickey's dog Pluto similarly went solo in 1939. Merchandising deals, especially the famous Mickey Mouse watch, generated additional cash for Disney.

Disney began a series of musical shorts called Silly Symphonies in 1929 with *The Skeleton Dance*. *Flowers and Trees* (1932) was the first cartoon filmed in Technicolor, and it was so successful that Disney, who had an exclusive five-year license for the Technicolor process, switched all his cartoons from black and white to color. Disney released his most commercially successful cartoon short of all time, *The Three Little Pigs*, in 1933, and it included the hit song "Who's Afraid of the Big Bad Wolf?"

Disney began developing a full-length feature animated film in 1934, and in February, 1938, released *Snow White and the Seven Dwarfs*, the year's most commercially successful motion picture. *Pinocchio* and *Fantasia* were released in 1940 and *Bambi* in 1942, but they were financial disappointments because World War II had closed off the European market. Only the relatively inexpensive *Dumbo* (1941) made a profit during its initial release. However, *Snow White* was released for a second time in 1944, and Disney learned that animated features could become cash cows by rereleasing them every seven years to a new audience of children.

After the United States entered World War II in 1941, Disney concentrated on making training and instructional films for the military; war propaganda shorts, such as *Der Fuehrer's Face* (1942); and the feature *Victory Through Air Power* (1943), which combined animation and live action. The Disney studios also created inexpensive package films that contained collections of cartoon shorts. These included *Saludos Amigos* (1942), its sequel *The Three Caballeros* (1945), *Fun and Fancy Free* (1947), and *The Adventures of Ichabod and Mr. Toad* (1949).

After World War II ended in 1945, Disney returned to work on full-length animated features. Both *Alice in Wonderland* (1951) and *Peter Pan* (1953), which were begun before the war, were finished and released. *Cinderella* (1950) became Disney's most commercially successful film since *Snow White*. During this period, Disney further developed the concept of feature-length films that combined live action and animation, such as *Song of the South* (1946) and *So Dear to My Heart* (1949). He revived the concept more than a decade later when he made *Mary Poppins*, based on the books by P. L. Travers. *Mary Poppins* was released in 1964 and became the most successful Disney film of the decade. It was also the most technically advanced film to that point in its combination of animation and live action.

While Disney's two daughters were growing up, he and his wife had difficulty finding places to take them on weekends. He got the idea for a children's theme park after visiting Children's Fairyland in Oakland, California, in the late 1940's. This idea eventually developed into a concept for a larger park that became Disneyland, which opened on July 17, 1955, and was immediately successful. Visitors from around the world came to Anaheim, California, to visit Disneyland, enjoying its attractions, such as the Peter Pan ride, which were based on Disney films. Around the same time, Disney expanded into live-action films that would not include animation. *Treasure Island* (1950) was his studio's first live-action feature, and subsequent films, such as *20,000 Leagues Under the Sea* (1954) and *The Shaggy Dog* (1959), did well at the box office.

Disney broke into television with the special show *One Hour in Wonderland*, which aired in 1950. He hosted a weekly anthology series titled *Disneyland*. He leveraged his film library by showing cartoon shorts and excerpts from animated features on his television program. After 1955, the show became known as *Walt Disney Presents;* when it converted from black and white to color in 1961, Disney changed its name to *Walt Disney's Wonderful World of Color. The Mickey Mouse Club*, a syndicated daily variety show which occasionally showed cartoons from Disney's library, debuted on television in 1955.

In his later years, Disney spent significant amounts of his own money on developing the California Institute of the Arts (CalArts), which was formed in 1961 from the merger of the Los Angeles Conservatory of Music and the Chouinard Art Institute. When Disney died in 1966, one-fourth of his estate went to CalArts. He also donated thirty-eight acres of land that he owned in Valencia, California, for the school to construct a campus.

Legacy

Walt Disney helped create the twentieth century entertainment industry. He and his studio elevated the art of animation, raising the standards of animated films and using this medium, which initially focused on short subjects, to produce full-length features. His studio also produced successful live-action films and innovative television programs. Disneyland and its successor theme parks offered the public new attractions where families could spend their leisure time.

The Walt Disney Company of the twenty-first century owns theme parks in California, Florida, France, and Japan; vacation resorts; water parks; hotels; cruise ships; motion-picture and television studios, such as Pixar; Internet sites; record labels; publishing houses; cable television networks, such as ESPN and Soapnet; and the American Broadcasting Corporation (ABC). On August 31, 2009, the company announced it had paid about $1.4 billion to acquire Marvel Entertainment, a comic book and action hero company. The firm also licenses Disney characters to toy, watch, clothing, and other manufacturers.

JOHN F. DODGE

American automaker, industrialist, and entrepreneur

Dodge was the business mind behind Dodge Brothers, using his financial acumen to implement his younger brother's patents and engineering ideas. The brothers' automobile company became known for manufacturing high-quality motor vehicles.

Born: October 25, 1864; Niles, Michigan
Died: January 14, 1920; New York, New York
Also known as: John Francis Dodge
Sources of wealth: Manufacturing; sale of products; investments
Bequeathal of wealth: Spouse; children; educational institution

EARLY LIFE

John Francis Dodge was born in 1864, and his brother and eventual business partner was born four years later. Throughout their lives the brothers were inseparable. They spent their early days in Niles, a town in a poor county of southwest Michigan. Their father, Daniel Rugg Dodge, ran a foundry and machine shop, where he built and maintained engines for riverboats traveling on the St. Joseph River. In the years immediately following the Civil War, riverboats were commonly used to transport goods. As the transportation revolution took hold, automobiles replaced horses and buggies, and railways replaced riverboats as the links between major cities. Both John and Horace learned their father's trade, but John possessed better managerial skills than his brother.

FIRST VENTURES

The family struggled and moved several times before settling in Detroit, Michigan. There, the brothers worked for a boilermaker and later for a typography company. Through his tinkering, Horace devised a sealed ball-bearing device for bicycles that kept out dirt, and he patented his invention. John convinced Horace to use their savings to start their own bicycle business, which struggled to remain open. Rather than suffer with a failing company, the brothers sold it to a Canadian firm. Under the terms of the sale, the brothers continued to make bicycles using Horace's patent, for which they would receive royalties. When the Canadian firm failed and reneged on its promised royalties, John arranged to cancel his claims against the company in exchange for first pick of the machinery left at its plant.

With this machinery, the brothers again went into business, founding the Dodge Brothers Machine Shop in 1902. They manufactured stoves and boilers and contracted with automaker Ransom Olds to build transmissions for his single-cylinder Oldsmobile. In 1903, the Dodge brothers entered into a contract to supply Henry Ford, who was starting his own automobile company, with most of the parts needed to build Ford's Model T. The Dodges provided the chassis for this vehicle, while Ford added the body, wheels, and tires.

MATURE WEALTH

The contract with Ford earned the brothers millions of dollars. According to the contract, Dodge Brothers would be the exclusive supplier of automotive parts for the new Ford Motor Company; if Ford's company went bankrupt, the Dodges would receive all of Ford's assets. Henry Ford was short on cash, so the brothers agreed to provide automobile parts in exchange for $10,000 worth of shares, or 10 percent of Ford Motor's stock. Once the first Model T sold, the Dodge-Ford contract was solid. Ford Motor made half of all the automobiles manufactured worldwide, and Dodge Brothers produced two-thirds of the parts for these vehicles. The brothers profited twice in their business dealings with Ford: first in making and selling him parts, and second in receiving dividends from their stock in his company. John Dodge also served as vice president of Ford Motor Company for several years.

In 1907, John married his third wife, Matilda Rausch. His first wife, Ivy, died in 1901 from tuberculosis, and he was married for only four years to his second wife. Matilda became his secretary after she graduated from

Gorsline Business College in 1902. They had three children.

Demand for Ford cars, and therefore for automotive parts, was growing. By 1910, Dodge Brothers needed to build a new plant. The brothers chose Hamtramck, a Polish community bordering the city of Detroit. By then, the brothers had been supplying Ford with parts for nearly a decade. Horace made many suggestions for improving Ford's vehicle, but Ford would not listen. However, the Dodges continued to supply the parts and earn stock dividends as Ford's company thrived.

When Ford Motor's Highland Park plant was nearly completed, however, John realized that Ford would no longer need the brothers' auto parts. John decided that Horace's ideas could make the automobile easier to drive, especially for women. John resigned as vice president of Ford Motor, and the brothers retooled their Hamtramck plant in order to make their own vehicles.

Using their stock profits from Ford Motors, they financed the Dodge Brothers Motor Car Company, established in 1913. The brothers had such a solid reputation within the automobile industry that they received applications from twenty thousand people for Dodge dealerships before their company was even ready to produce vehicles. The first car rolled out of the Dodge Main plant in Hamtramck on November 14, 1914. It had an electric starter so women did not have to crank-start the car, a sliding-gear transmission, and rear-wheel brakes. Within three years, Dodge Brothers Motor Car Company became the fourth largest American auto manufacturer.

Meadow Brook Hall

Meadow Brook Hall in Rochester Hills, Michigan, is often called America's castle. It is the fourth largest house museum in the United States, known for its grand scale, architectural detail, and fine craftsmanship. Construction began on the manor house in 1926 and was completed in 1929 at a cost of nearly $4 million.

Five years after John F. Dodge's death, his widow Matilda decided to transform the family's country home at Meadow Brook Farm into an estate. The family had been visiting the fifteen-hundred-acre farm since John purchased it in 1908. When Matilda and Anna, John's sister-in-law, sold Dodge Brothers Motor Car Company for $147 million, Matilda decided to reside at Meadow Brook.

While honeymooning with her second husband, lumber broker Alfred G. Wilson, in 1925, Matilda was inspired by castles and manor homes in England. As a result, Meadow Brook Hall was designed in a Tudor Revival style. The 88,000-square-foot mansion has 110 rooms and houses Matilda's vast collections of art and furnishings.

Although it was influenced by the style of sixteenth through eighteenth century English manor homes, Meadow Brook Hall was made from American materials that were commonly used during the Arts and Crafts Movement, a style of architecture that was popular in the final years of the nineteenth and early years of the twentieth centuries. Meadow Brook Hall is constructed of wood timber, brick, and sandstone; clay shingle tiles add to the charm of thirty-nine brick chimneys to create a unique roof line. Carved plaster ceilings and stained-glass window insets accent elaborately detailed wood and stone carvings featured throughout the interior. All of the hardware and ceramic art tiles are handmade.

Every modern amenity available in the 1920's was incorporated into the design, including central heating, two elevators, four kitchens, and a full-size home theater. A few rooms were designed and decorated in specific architectural revival styles. For example, the eighteenth century neoclassical style was selected for the dining room and Matilda's study; one of the bedrooms was designed in American Colonial style; and Matilda's room and another bedroom included French rococo elements. The mansion's beautiful decorations, complete with statues and artwork from various historical periods and styles, represent the lavish lifestyle of American industrialists of the early twentieth century.

To celebrate the end of construction, Matilda and Alfred G. Wilson hosted a housewarming party attended by 850 guests on November 19, 1929. It was only three weeks after the stock market crash that ushered in the Great Depression. Matilda eventually moved to Sunset Terrace, which was built as a retirement home on Meadow Brook Farm, and resided there until Wilson died in 1962. She then returned to Meadow Brook Hall, where she lived until her death in 1967.

In 1957, the Wilsons donated all of Meadow Brook Farm, including the mansion, to establish what would later become Oakland University. Meadow Brook Hall opened to the public in 1971 and remained a popular attraction into the twenty-first century. The facility hosts around ninety events a year and is visited by about 100,000 people annually. The site also houses an outdoor concert pavilion and Meadow Brook Theatre. Both the hall and the grounds are important as significant works of architecture, as well as a tribute to the Dodge family.

During World War I, Dodge Brothers made ambulances and other vehicles for the war effort, along with the delicate recoil firing mechanisms for French cannons that were vital to the Allied artillery. The brothers built and equipped a new factory in Hamtramck solely for the precision manufacturing of these recoil devices.

Meanwhile, Henry Ford was angry that stock profits from his company were funding his competition and stopped paying the brothers dividends. John Dodge responded by filing suit against Ford, who eventually was forced to pay $9 million in back dividends. In 1919, the brothers sold their remaining Ford Motor stock to Ford's company for $25 million.

In less than two decades, Dodge Brothers amassed $200 million, the equivalent of $1.5 billion in 2010. The brothers celebrated their prosperity by purchasing yachts (the largest was longer than two hundred feet) and building mansions. John bought Meadow Brook Farm, a fifteen-hundred-acre property in Rochester Hills, Michigan, and the farm became the family's country getaway. John gave his wife a check for $1 million as a Christmas gift in 1919; Horace bought his wife a pearl necklace once owned by Catherine the Great and valued at $850,000.

In 1920, while at the International Automobile Show in New York City, Horace caught the flu. A worldwide flu pandemic that had begun in 1918 had not abated, and soon John was also sick. John died in January, 1920, and Horace died later that year. Their widows kept the automobile company until 1925, when they sold it for $146 million.

Legacy

John and Horace Dodge were among the pioneers of the American automotive industry. They achieved success through vision and an unflagging dedication to their work. The Dodge name became synonymous with quality vehicles. John was the mastermind behind the business transactions of the brothers' various enterprises, and his shrewd dealings early in their career enabled them to amass enough wealth to finance the formation of their own foray into automobile manufacture. Implementing improvements to make the automobile more convenient and enjoyable rapidly launched the Dodges into the ranks of the top four companies in the automotive industry. The Dodge brand continued after their deaths, eventually becoming part of Chrysler Group, LLC.

John Dodge's fortune is a symbol of the American dream, a rags-to-riches story of entrepreneurial success. In 1957, John's widow and her second husband donated Meadow Brook Farm, which included Meadow Brook Hall and their collections of art and furnishings, and $2 million to Michigan State University for the creation of a new university in Oakland County. The site eventually became Oakland University.

Edward L. Doheny

American oil magnate

Doheny's discovery of oil in Los Angeles was the foundation of the oil boom in Southern California, and thus he played a considerable part in the economic development of the region. He was also instrumental in establishing the oil industry in Mexico.

Born: August 10, 1856; Fond du Lac, Wisconsin
Died: September 8, 1935; Los Angeles, California
Also known as: Edward Laurence Doheny
Source of wealth: Oil
Bequeathal of wealth: Spouse; charity

Early Life

Edward Laurence Doheny (doh-HEE-nee) was born in Fond du Lac, Wisconsin, in 1856, the son of Irish immigrant Patrick Doheny and1 Eleanor Quigley Doheny, originally from Newfoundland, Canada. A bright student, Edward left high school at fifteen, and his father's death not long thereafter obliged him to find work. After about two years with the U.S. Geological Survey in Kansas, he set out to prospect for gold and silver in the Southwest, an enterprise that yielded him little gain after almost fifteen years of effort. His prospecting partner, Charles Canfield, found considerable success on his own, both in prospecting and in real estate.

First Ventures

In 1883, Doheny married his first wife, Carrie Wilkins, and during his prospecting years he met Albert B. Fall, who was to play a major role in his future life. Doheny, Carrie, and their young daughter came to Los Angeles in 1890 or 1891, and after studying law he was admitted to the bar. However, his legal practice was as unsuccessful as his previous venture, and he apparently was almost penniless by the time he reached his mid-thirties.

The story of Doheny's subsequent rise to wealth has somewhat of the aura of a tall tale. In 1892, reduced to doing odd jobs, he supposedly spied a cart with its wheels coated in a certain type of tar or pitch (called "brea" by the Spanish-speaking Angelenos). When he discovered the source of this tar, near what would later be Los Angeles's Dodger Stadium, he and former partner Canfield leased the land. In 1893, with the use of a tool made from the sharpened trunk of a eucalyptus tree, Doheny and Canfield excavated the land until oil was found, and the well they built began producing some forty barrels a day. It was the first major oil discovery in Los Angeles.

Mature Wealth

Despite his previous failures, Doheny proved to be a shrewd businessman. He and Canfield discovered oil at several other sites and began selling it to local businesses. An oil boom ensued that was rife with wild speculation; an estimated twenty-three hundred wells were dug in the city within five years. The partners also persuaded railroad companies to switch their locomotive fuel from coal to oil, and other industries followed suit.

In about 1900, Doheny formed the Pan American Petroleum and Transport Company, a subsidiary of his Mexican Petroleum Company, which he established in order to look for oil in Mexico and which eventually controlled more than 1.5 million acres of Mexican land. Ma-

Edward L. Doheny, left, and his attorney Frank Hogan arrive at the Capitol in 1924 to attend a Senate committee investigation regarding the Teapot Dome scandal. (AP/Wide World Photos) jor oil companies previously had come to Mexico primarily to distribute oil, but Doheny's firm was one of the first to produce oil on a large scale there. Although the company was one of the largest in Mexico, it remained susceptible to the vagaries of Mexican politics and revolution. At one point, Doheny had a private army of more than six thousand men to protect his interests, and he was said to have urged the United States government to invade the country in order to stabilize the Mexican government. Thus, he became a classic imperialist. He used the oil that he could not sell to the railroads or was unsuitable for fuel to pave roads in Mexico. Doheny's fortune grew with the needs of the burgeoning American automobile industry, and he also expanded his operations to South America and Great Britain. In the second decade of the twentieth century Mexico became a net exporter of oil. It is said that during his lifetime, Doheny discovered more oil than any other person in the world.

Now the possessor of a vast fortune estimated to be $150 million, one of the largest in America, Doheny contributed many millions of dollars to Catholic causes, including the construction of churches. He wed his second wife, a telephone operator, in 1900 after his first wife committed suicide. His second wife was also named Carrie (née Betzold), but she was generally known by her middle name, Estelle. The couple lived in the fabled mansion in Los Angeles that Doheny purchased a year after their marriage.

Doheny became involved in Democratic Party politics, losing a bid for nomination as vice president on the party's ticket in 1920. A few years later, his life began a downward spiral as he became embroiled in a scandal involving his longtime friend Fall, now the secretary of interior in President Warren G. Harding's administration. In 1924, a U.S. Senate investigation uncovered evidence of a $100,000 payment from Doheny to Fall in order to obtain a no-bid contract for the U.S. Navy's oil reserves in the Elk Hills of California. Another oil magnate, Harry F. Sinclair, had similarly paid Fall for the oil concession at the Teapot Dome fields in Wyoming. As a result of what was termed the Teapot Dome Scandal, Doheny and the other two men were forever to be associated with a corrupt Harding administration. Although Doheny claimed he had not bribed Fall but had given him an interest-free unsecured loan, he, Sinclair, and Fall were indicted on bribery and conspiracy charges. Following a trial, Fall was convicted of ac-

The Doheny and Greystone Mansions

The 22-room, 10,500-square-foot French château-like home that oil magnate Edward L. Doheny and second wife Estelle purchased in 1901 was originally built from 1899 to 1900 for the Oliver Posey family. The Dohenys purchased it fully furnished for $125,000. The residence was designed by the architects Theodore Eisen and Sumner Hunt and incorporated elements of the Gothic, English Tudor, and California Mission styles. One of its more spectacular features was the fabulous Pompeian Room, which contains art-glass panels, a mosaic floor with marble imported from southern Europe and Africa, Tuscan marble columns, and a dome constructed of more than twenty-eight hundred pieces of gold favrile glass from the Long Island factory of Louis Comfort Tiffany. Doheny Mansion also contained a bowling alley and a shooting gallery. The home is located on Chester Place, a small exclusive street of impressive mansions developed by Doheny near downtown Los Angeles in the West Adams district. Eventually, to discourage casual visitors, Doheny bought all the other houses and gated the street for greater privacy.

The Dohenys lived in the mansion until Edward died in 1935, and Estelle continued in residence thereafter, occupying the home for more than fifty years. She had not liked the house when they moved in and over the years made many renovations, apart from the extensive repairs that were required after the mansion was damaged in the 1933 earthquake. The home was willed to the Catholic Church in 1958 following Estelle's death and since the 1960's has been part of the campus of Mount St. Mary's College, founded in 1925.

Greystone Mansion was the hilltop home of Edward L. "Ned" Doheny, Jr., his wife, Lucy, and their five children. However, three months after moving into the residence, Ned was found murdered there in February, 1929. Greystone Mansion has fifty-five rooms in forty-six thousand square feet, including a recreational wing with a projection room, a bowling alley, and a billiards room. The residence was originally on a site of four hundred acres, took two years to build, and cost some $4 million, equal to about $43 million in 2010 currency. The English Tudor-style mansion was designed by architect Gordon Kaufmann and in its time was compared to Hearst Castle, the fabled estate of William Randolph Hearst. Unoccupied as a private home for many years, by the twenty-first century it was owned by the city of Beverly Hills and had been the setting of scenes in numerous films, including *Spiderman*, and television programs, as well as being the venue for indoor and outdoor concerts. It has also been suggested that Greystone was the prototype for the mysterious mansion in Raymond Chandler's novel *The Big Sleep* (1939).

cepting a bribe and sentenced to one year in prison, but, illogically, Doheny was found innocent of offering the bribe. Despite his acquittal, all of Doheny's government leases were canceled, and he did not finally emerge from under a legal cloud until 1930.

He had by that time retreated from public life and suffered another blow when Edward L."Ned" Doheny, Jr., his son and namesake, was found murdered in February, 1929, at Greystone, Ned's Beverly Hills mansion. It was the house his father had built for Ned as a gift, and Ned had taken possession just a few months before his death. The thirty-five-year-old Ned, who was the father of five, was shot by Hugh Plunkett, his friend and secretary, who then committed suicide. Although speculation ran rife, the motive for the slaying was never conclusively proven.

Doheny became a near-recluse after his son's death, spending most of his time in his estate. He died of old age in 1935 and was buried in a tomb made of Carrara marble, a gift from Pope Pius XI in gratitude for the millions of dollars that Doheny had donated to the Catholic Church.

Legacy

At the time of his death, Edward L. Doheny appeared to be a broken man and much of his good work had been forgotten in the wake of scandal. His wife, a convert to Catholicism who had been named a papal countess by the Church, later endowed the Carrie Estelle Doheny Eye Foundation, a research laboratory and eye bank. She also bought a mansion of thirty rooms that she donated to the Sisters of St. Joseph of Carondelet. It is said that immediately upon her husband's death, Mrs. Doheny had all of her husband's private papers burned, thus presenting substantial difficulties for future biographers.

Doheny almost single-handedly established the oil industry in Southern California and was a significant factor in the economic growth of California and Mexico. He played a large role in persuading major industries to convert from coal to oil, thus vastly enlarging the potential market for oil.

His name lives on in some significant places. Because he was instrumental in developing the city of Beverly Hills, one of its major thoroughfares, Doheny Drive, is named for him. Doheny State Beach is also named in his honor, as are libraries at the University of Southern California and St. John's Seminary. He is said to be the prototype for the character of the ruthless oilman in Upton Sinclair's book *Oil! A Novel* (1927), which was the basis for the 2007 film *There Will Be Blood*.

Captain Robert Dollar

American lumberman and shipping company executive

Dollar, who still ranks as one of Scotland's fifty wealthiest men, successfully built lumber and shipping industries and generously supported many charitable organizations in Scotland, the United States, and other countries.

Born: March 20, 1844; Falkirk, Scotland
Died: May 16, 1932; San Rafael, California
Also known as: The Grand Old Man of the Pacific
Sources of wealth: Lumber; shipping
Bequeathal of wealth: Relatives; charity

Early Life

Captain Robert Dollar was born in 1844 in Falkirk, Scotland, the first son of William and Mary (née Melville) Dollar. When Robert was nine years old, his mother died and his grieving father turned to alcohol for comfort. Three years later, Dollar left school to work a lathe in a machine shop for sixty cents a week. In that same year, his father married their servant girl, Mary Easton. Dollar's second job was in a lumber-shipping company. In 1857-1858, the Dollar family migrated to Canada.

After working in a barrel stave factory, Dollar obtained a position at a lumber camp north of Ottawa. He and his brother used their $26 monthly earnings to buy their parents a farm. To advance his career, Dollar taught himself basic writing and math skills and learned French from the loggers. When he was twenty-one years old, Dollar became manager of the logging camp.

First Ventures

In 1872, Dollar and a partner bought their own lumber camp. This venture was ill fated, as the price of logs fell, leaving the partners with a $5,000 debt. Undeterred, Dollar worked his debt off in three years. During this time, he married Margaret Proudfoot and settled in Bracebridge, Ontario, where he established a Masonic lodge and donated lumber to the Presbyterian Church. The couple eventually had four children: Alexander Melville, Robert Stanley, Mary Grace, and John Harold.

While living in Bracebridge, Dollar formed a partnership with Henry H. Cook and ventured into the export business, transporting wood to England. In 1882, he used his earnings to buy land in Michigan for $1.25 per acre and to set up a sawmill in what became known as Dollarville. By 1884, Dollar had earned enough money to visit his birthplace in Falkirk, where he donated funds to the city's first library.

Mature Wealth

Dollar became a naturalized American citizen in 1888 and moved his family and business operations to California. He added redwood forests and new sawmills to his rapidly growing enterprise. Dollar's lumber business was now a leader in the industry, and he needed a more effective method of transporting lumber along the Pacific coast. He purchased a steamship, *The Newsbo*, which quickly proved its worth, and he then acquired additional ships. He incorporated the Dollar Steamship Co. in 1901-1902 and extended his trade to China and Japan. Frequent voyages and personal appearances in China gained him respect with the Chinese government.

Over the next twenty-five years, Dollar expanded his international shipping business and added a new line of government passenger ships, as well as worldwide cargo and passenger services. He also purchased additional land in Canada and built a timber mill town in British Columbia called Dollarton. Dollar, the lumber giant of the West, had also become the leading American shipowner—the "Grand Old Man of the Pacific." Dollar founded a successful business model that amassed millions of dollars. His propensity for hard work and his business acumen made him a leader in two different industries. His sons joined his businesses, too. On March 19, 1928, one day before his eighty-fourth birthday, Dollar was featured as the cover story in *Time* magazine, and during the next year additional articles about him appeared in *The Saturday Evening Post*.

Dollar died of bronchial pneumonia in 1932. Thousands of friends attended his funeral.

Legacy

Captain Robert Dollar's wealth was the result of his determination and faith. His Scottish Presbyterian values, resourcefulness, and perseverance made a formerly penniless man into an affluent businessman worth $40 million. This self-educated man also became director of several banks. During his lifetime, Dollar donated to charities in the United States, the Philippines, Scotland, and China. His donations helped support orphanages, a seminary, a library, churches, schools, and the Young Men's Christian Association (YMCA) in China. His home in San Rafael, California, is the site of the Falkirk Museum.

Francis Drake

English privateer and navigator

Drake obtained his vast wealth as a commissioned privateer for Queen Elizabeth I of England during the 1570's. By capturing and pillaging Spanish ships and colonies, Drake inspired other Englishmen to become privateers.

Born: c. 1540; Crowndale, near Tavistock, Devonshire, England
Died: January 28, 1596; at sea, off the coast of Porto Bello, Panama
Also known as: Sir Francis Drake, Sr.; El Draque
Sources of wealth: Conquest; privateering
Bequeathal of wealth: Unknown

Early Life

Sir Francis Drake, Sr., was born in Crowndale, near Tavistock, England, around the year 1540. He was the oldest child of Edmund Drake, a yeoman farmer, and Mary Mylwaye. His father was forced to flee Tavistock because of religious persecution for his Protestant beliefs. The family settled in Kent and lived in the hull of a ship. Shortly after the birth of the family's twelfth child, Drake's mother died. His father, who was unable to care for all twelve children, encouraged them to find work at sea when they reached their teen years. Drake apprenticed with a sea captain involved in coastal trade, and when the captain died, Drake inherited his ship.

First Ventures

Drake sold the ship and relocated to Plymouth, where he worked for his relative John Hawkins on one of Hawkins's ships. In 1566, Drake embarked on a slave-trade voyage in the Spanish Caribbean colonies. The following year, as the captain of one of six ships, he sailed to Africa and the Caribbean colonies on an illicit slave-trade mission for Hawkins. Between 1570 and 1571, Drake embarked on two additional exploratory trips, and in 1572, he returned to the Caribbean on a pillaging expedition.

Mature Wealth

In 1577, Queen Elizabeth I commissioned Drake to sail on a secret expedition to the Pacific coast of South America in order to explore and pillage Spanish fleets and colonies. Drake left Plymouth aboard the *Pelican* on December 13, 1577, with a fleet of four additional ships. He added the Spanish ship *Mary* to his fleet after capturing it near the African coast. Because of harsh weather, the death of many of his crew members, and damage to his fleet, by 1578 Drake had only one ship left, which he re-

Francis Drake. (Library of Congress)

named the *Golden Hinde*. He reached the Straits of Magellan on August 20, 1578. Along the way, he continued to amass a fortune by attacking and stealing from Spanish ships and colonies.

On March 1, 1579, Drake captured the Spanish ship the *Nuestra Señora de la Concepción*, and he stole a massive amount of gold, silver, and jewels. Afterward, he sailed toward North America and landed in a small bay in northern California that was named in his honor. Drake named the land the country of New Albion and claimed the area for Elizabeth I. He finished his circumnavigation of the globe by traveling across the Pacific Ocean to the Cape of Good Hope in South Africa. Drake arrived home in 1580, now a very wealthy and famous sea captain. On April 1, 1581, Queen Elizabeth knighted Drake on the deck of the *Golden Hinde*.

Although Drake was now a very rich man, he continued to sail on missions for Queen Elizabeth. In 1585, the queen hired Drake and equipped him with a fleet of more than twenty ships to raid Spanish colonies and ships in the New World. During the yearlong voyage, Drake captured Santiago, Santo Domingo, and St. Augustine in Florida. In 1587, he set sail a third time for Queen Elizabeth with a mission to stop the shipping of supplies in and out of the ports of Spain and Portugal. In 1588, he commanded the English fleet that defeated the Spanish Armada and made Great Britain the world's greatest sea power. Drake returned to England and semiretired. On January 28, 1596, while leading an expedition to Panama, Drake died of dysentery while onboard his ship.

Legacy

Drake's sailing skills and bravery brought him great wealth and also earned him the respect of his country. His successes at sea helped Great Britain establish naval supremacy and inspired others to become privateers. Drake also was the first Englishman to circumnavigate the globe.

Daniel Drew

American investor

Drew was one of the great nineteenth century robber barons. He was involved in insider trading and manipulating stock prices; he also engaged in predatory pricing to maintain monopoly power for his firms. Although he died impoverished, when he was wealthy he contributed money to establish the Drew Theological Seminary, which became Drew University.

Born: July 29, 1797; Carmel, New York
Died: September 18, 1879; New York, New York
Sources of wealth: Railroads; investments; transportation systems
Bequeathal of wealth: Educational institution

Early Life

Daniel Drew was born on a farm in Carmel, New York, in 1797. He grew up poor and virtually illiterate, as did most children of small farmers at that time. During the War of 1812, President James Madison began to draft men into the military; those who did not want to fight were offering $100 to people who would take their place. Regarding this as easy money, Drew became an army substitute. He served three months but saw no combat.

After the war, Drew used his $100 to buy cattle, herd them to New York City, and sell them to city butchers. During one drive he gave his cattle large quantities of salt before they entered Manhattan and let them drink all the water they wanted, thereby increasing their weight. Since he was paid based on the weight of his herd, Drew earned extra money through this scheme. Continually employing this ruse, Drew drove cattle into Manhattan from Ohio, Kentucky, and Illinois and became very wealthy.

First Ventures

This money let Drew purchase the Bull's Head Tavern, a popular watering hole for drovers. The tavern had a thick safe, and guests gave Drew their money for safekeeping. By taking some of this money and investing it, Drew became a banker and a speculator. His small fortune soon became a large fortune.

While on the lookout for good investment opportunities, Drew became aware of Cornelius Vanderbilt. Vanderbilt was part of the Hudson River Association, which ran boats up and down the Hudson River between Manhattan and Albany, New York. Vanderbilt had argued with his partners, and he bought two boats and ran them in competition with association vessels. As a result, the association lost a lot of money, and it eventually had to buy out Vanderbilt.

Drew replicated Vanderbilt's business methods. He started a competing boat line and squeezed the Hudson River Association until it bought him out. Then he started another line under someone else's name, which was also bought out. The association was so weakened by its continual purchase of rival companies that it eventually sold its business to Drew.

As the owner of the sole means of transportation along the Hudson River, Drew pushed up the price on all river trips. When competition would arise, Drew would reduce his prices. Sometimes he would charge nothing, or even pay people to take his boats, knowing that he had the resources to outlast his rivals. When his competition went out of business, Drew would then charge exorbitant rates and accumulate reserves to fight off the next firm seeking to enter the market.

Mature Wealth

During the 1840's, Drew became interested in stock trading. He opened a brokerage business in 1844 that specialized in transportation stock, and he began buying stock in the railroads that were starting to operate in the eastern United States. Drew quickly learned that it was easier to make money trading stock shares than running a business.

He also discovered how easy it was to make money manipulating stock prices. One of his famous schemes was dubbed "the handkerchief trick." Meeting with investors, Drew would pull out his handkerchief to mop his brow. A slip of paper with a large buy order would fall to the floor; Drew would pretend not to notice. When Drew left the meeting, other investors would grab the paper and buy the listed stock. Drew, however, had purchased the touted stock before the meeting. When the other investors bought the stock, driving up its price, Drew sold out at a large profit.

Drew focused most of his attention on the Erie Railroad, then the largest rail network in the world. He acquired competitors of Erie, as well as all the steamboat lines between Manhattan and upstate New York. At the time, trains could not go directly into Manhattan; they stopped just outside, transferring people and goods onto steamships to complete the trip. By monopolizing transport links in and out of Manhattan, Drew was able to squeeze the Erie Railroad. He offered its main competitor, the New York Central Railroad, better rates on his steamboats into Manhattan. This created financial problems for Erie, and company officials were forced to put Drew on Erie's board of directors and make him company treasurer. These positions enabled Drew to make money from his inside knowledge about the railroad. Before favorable information was announced, he bought Erie stock and profited when the stock price rose. Before bad information was announced, Drew would sell Erie's stock short and buy it back at a lower price after the bad news became public.

Not satisfied gaining money from normal price changes, Drew sought to manipulate the price of Erie stock. When he wanted prices to rise, he would spread positive rumors. When he wanted prices to go down because he had sold short, he would circulate rumors that the railroad was in financial difficulty, or he would have someone obtain a court injunction to prohibit Erie from paying dividends.

With his growing fortune, Drew bought a lot on Seventeenth Street in Manhattan, facing Union Square, and built a four-story mansion, a barn, a cow shed, and a horse stable. Drew, however, had even greater ambitions. He sought to acquire the Erie Railroad and become even wealthier. When Erie decided to extend its rail line by connecting New Jersey and Manhattan, Drew created difficulties for the project. He circulated rumors on Wall Street that there were logistical problems building the tunnel underneath the Hudson River and financial problems at Erie. He also sought to tie up the New York State legislature, which had to approve the construction project. As a result of these actions, capital for the project became scarce, which enabled Drew to come to the rescue. He lent Erie the money it needed, taking the railroad line as security for the loan.

Vanderbilt, wary of Drew from previous dealings with him, wanted to keep Drew from controlling the railroad company. Vanderbilt started buying Erie stock in order to control the railroad himself. Drew, however, got the Erie board of directors to approve a $10 million offering of new stock and bonds in order to replace the railroad's iron rails with steel rails and build a third rail allowing narrow-gauge trains to run on Erie lines. Vanderbilt got an injunction from a Manhattan judge prohibiting Erie from issuing any more stock. In response, Drew and his colleagues Jay Gould and James Fisk got a judge from Binghamton, New York, to order Erie to issue more stock. The three men began printing new shares of Erie stock and selling them to Vanderbilt. When it became clear that they could keep printing and selling new shares, the price of Erie stock tumbled.

Vanderbilt lost a small fortune of $7 million, but he obtained a contempt of court order against Drew, Gould, and Fisk and warrants issued for their arrest. Fearing they would be arrested, the three fled to New Jersey. Safe from the legal arm of New York, they attacked Vanderbilt's rail lines. They reduced Erie's rates for the trip between Buffalo and Manhattan in order to compete with Vanderbilt's New York Central Railroad. They also announced a plan to start a boat line that would charge only fifty cents for a trip between these two cities in order to draw customers away from Vanderbilt's Hudson Railroad. The Drew-Vanderbilt battle eventually ended when Vanderbilt agreed to let Drew keep his money, and Drew agreed to relinquish control of the Erie Railroad.

Nonetheless, Drew sought to make one more killing on Erie stock. Drew, Gould, and Fisk deposited $14 million into various banks. They then sold short in Erie stock and withdrew their $14 million from the banks. The banks, however, had already lent out the money. The bankers were forced to call in their loans, while individuals had to sell their Erie stock in order to repay their bank loans. Stock prices tumbled. Gould, Fisk, and Drew made a fortune, but the economic impact was devastating; people blamed the three for the economic mess. Fearing for his life, Drew decided to abandon the scheme and put money back into Manhattan banks.

In the early 1870's, Drew was one of the wealthiest living Americans. However, his fortunes reversed when the 1873 stock market panic resulted in the demise of several brokerage firms in which he was a partner. Drew had to mortgage his home and take as much property as possible out of his name. In 1887, he lost more money after Gould brought him into a plan to increase Erie stock prices; Gould, however, was really arranging to lower prices. Eventually, Drew was forced to declare bankruptcy.

DREW UNIVERSITY

Drew University is located in Madison, New Jersey, about thirty miles west of Manhattan, on a wooded 186-acre campus nicknamed "the university in the forest." In the nineteenth century, the site housed the antebellum estate of businessman Daniel Drew, who donated the estate and $250,000 to establish the Drew Theological Seminary. The first students attended classes at the seminary in 1867. The College of Missions was added in 1920, offering a course of study for women. In 1928, Arthur and Leonard Baldwin donated $1.5 million to help build an undergraduate liberal arts college, and these educational institutions eventually became known as Drew University.

By 2009, the university was providing a range of undergraduate and graduate programs and emphasizing interdisciplinary courses of study. The Caspersen School for Graduate Studies, which opened in 1955, offers masters of arts degrees and doctoral programs in teaching, poetry, arts and letters, and medical humanities; the Theological School provides masters and doctoral degrees in theological studies and prepares students to enter the ministry. About twenty-five hundred students are enrolled at Drew, the majority of them undergraduates, and most of the students live on campus. The annual tuition, more than $35,000 a year, makes Drew one of the most expensive colleges in the United States.

Drew University employs about 155 full-time faculty members. The archives of the United Methodist Church are housed on the campus, and the library has a large number of documents related to author Willa Cather. During the summer, Drew University is home to the New Jersey Shakespeare Festival.

LEGACY

Daniel Drew was one of the great American robber barons. His methods for earning money were certainly illegal by twenty-first century standards. He engaged in predatory pricing, manipulated stock prices for his own gain, and traded stock based on insider information. In the nineteenth century, however, such activities were normal and usually thought to be smart business practices.

Drew's legacy, however, was not entirely negative. Having had many religious experiences throughout his life and professing to be a devout believer, in the 1860's he donated a large sum of money to establish the Drew Theological Seminary in Madison, New Jersey. The school eventually grew to become Drew University, one of the nation's top liberal arts colleges.

Anthony Joseph Drexel

American banker and landowner

Drawing on substantial wealth derived from his successes in banking and real estate ventures, Drexel became a major philanthropist, founding the Drexel Institute of Science and Technology (now known as Drexel University) in 1891. He also established a network of brokerage houses and financial institutions with offices in New York, San Francisco, London, and Paris.

Born: September 13, 1826; Philadelphia, Pennsylvania
Died: June 30, 1893; Carlsbad, Bohemia (now Karlovy Vary, Czech Republic)
Sources of wealth: Inheritance; banking; real estate
Bequeathal of wealth: Relatives; charity; educational institution

Early Life

A member of a prominent Philadelphia family deeply involved in banking, brokerage, and finance, Anthony Joseph Drexel (DREHK-suhl) got an early start in his family's enterprises. At the age of thirteen, he took his first job at the banking institution founded in 1836 by Francis Martin Drexel, his Austrian-born father. Possessed of a singular aptitude for banking and finance, young Drexel was a fast learner and an enthusiastic and imaginative businessman. When he was twenty-one, he became a partner in his father's financial firm, Drexel and Company, the corporation that would soon become Drexel Burnham Lambert, one of the most distinguished financial houses in the United States.

First Ventures

Five years after the death of his father in 1863, Drexel, growing restless and eager to expand, left his father's firm to establish a new banking corporation, Drexel, Harjes and Company, which he founded with his partners, John H. Harjes and Eugene Winthrop, in 1868. This company, based in Paris, had a broad international reach. Drexel had greatly increased his fortune during the post-Civil War building boom, for much of which Drexel's company arranged financing. Investment banker Jay Cooke provided considerable sums for the Union cause during the Civil War, and most of this funding derived from the patronage of Drexel's corporations.

Mature Wealth

Drexel obtained the funding for George Child to purchase the *Philadelphia Public Ledger*, the first newspaper in the United States to be both politically independent and highly successful. Drexel became a partner with Child in the newspaper. When Drexel's former office boy, Henry Codman Potter, became a bishop in the Episcopal Church, Drexel worked with him to bring about the construction of the largest church in the United States, the Cathedral of Saint John the Divine in New York City. Much of the funding for constructing the cathedral was obtained through Drexel's efforts. When his niece, Katharine Drexel, began to establish an innovative network of schools throughout the United States for African Americans and Native Americans, something almost unimaginable in the last half of the nineteenth century, Drexel not only arranged much of the financing for this enterprise but also made substantial personal contributions to these schools. Katharine, founder of the Sisters of the Blessed Sacrament, devoted her life to working with minorities, and in recognition of this work she was beatified, achieving sainthood in the Roman Catholic Church in October, 2000.

Drexel had a unique skill in arranging the issuance of government bonds as they were being prepared for marketing. This was a profitable undertaking and helped to establish Drexel as a trustworthy financier who could be depended upon to deal efficiently and honestly with complex financial matters. He also excelled in helping the rapidly expanding American railway system to garner the extensive financing it required. Meanwhile, Drexel was much involved in providing the American mining industry with the needed financial resources for its expansion. Ever devoted to Philadelphia, Drexel bought considerable real estate in the city and its environs, becoming one of the largest property holders in the area.

Despite his prominence in banking circles, Drexel was an intensely private person. He declined to be interviewed and did not keep a diary or a journal. Although he was often encouraged to enter the political arena, he always refused. He destroyed most of his personal papers. Most important, however, he was a highly moral person about whom there was never any breath of scandal, financial or sexual.

So socially withdrawn was Drexel that when Drexel Institute held its opening ceremonies on December 17, 1891, an event attended by an estimated two thousand people, Drexel declined to attend, explaining that he was still in mourning for his wife, Ellen, who had died three months earlier. The opening of the institution was marked by the attendance of such notables as Andrew Carnegie, Thomas Edison, J. P. Morgan, Vice President Levi P. Morton, three members of President Benjamin Harrison's cabinet, U.S. senator Chauncey Depew, and dozens of other luminaries. The establishment of Drexel Institute was as much Ellen's idea as it was her hus-

Drexel University

The charitable contribution for which Anthony Joseph Drexel is most remembered is his founding of a unique institution of higher learning, the Drexel Institute of Art, Science, and Industry, renamed Drexel Institute of Technology in 1936 and Drexel University in 1970. During the 1880's, Drexel had been toying with the notion of creating an educational institution. He had made substantial contributions to the network of schools established by his niece, Katharine Drexel. These schools, affiliated with the Roman Catholic Church, were created to serve the educational needs of African Americans and Native Americans.

Drexel realized the obstacles faced by members of racial minorities and by women wishing to gain educations. By the end of the 1880's, he began to conceive the idea of establishing an institution of higher learning in Philadelphia that would serve the needs of a broad range of students, most of them from the Philadelphia area. Admission would be open to all students, regardless of race, gender, religious affiliation, or social class—a stipulation unheard of in contemporary private institutions of higher learning. Drexel's idea germinated quickly, and in 1891 construction began on this private institution that was to meet the educational needs of people of limited means, many of whom had little access to higher education. Drexel spent almost $1 million to construct the buildings in which the institution would be housed and an additional $2 million to staff and equip the university.

Drexel was a practical man. He realized that his university would attract the greatest number of students if it differed from existing private schools of higher learning. To this end, Drexel Institute initiated cooperative programs in which students took time off from their classes to work, for remuneration, in fields related to their studies. The institution also offered a broad selection of night courses, thereby enabling students with full-time jobs to pursue their education while maintaining the jobs needed to support themselves. Generous scholarships were also available to those in need.

Drexel also built his institution within walking distance of a nearby railway station and near several tramlines, enabling students to have accessible transportation to the campus from anywhere in the area. Drexel Institute was largely a commuter's college. Its working-class student body was diverse in backgrounds and ages. Students typically earned their undergraduate degrees in five or six years, compared with four years at most other private colleges.

Drexel University has consistently been at the forefront of many innovative educational programs. Since 2000, it has had the largest medical school in the United States. The medical school, located on two separate campuses, was created by merging two existing institutions—the Hahnemann Medical School and the Women's Medical College of Pennsylvania—with Drexel University.

band's. The last public event that she hosted in her suburban Lansdowne home, Runnymeade, was a reception for people who had been instrumental in establishing the school.

Although Drexel had derived a great deal of his educational philosophy from his niece, Katharine, he had definite ideas regarding education. He had the good sense, however, to realize that conditions change and the institutions that serve people best are those that remain flexible. He did not, therefore, impose his ideas on Drexel Institute.

Drexel's greatest gift was his ability to help people discover their own deep-seated potential and flourish as a result of such discoveries. Prominent among those he influenced in this way were Morgan, Cooke, Child, and his niece, Katharine, who was close to her uncle. Morgan was an underachiever. He lacked self-confidence and seemed to be headed nowhere until, at the urging of his father, Junius Spencer Morgan, Drexel became involved in the young man's life. However, Drexel did not receive full credit for affecting Morgan's life, largely because all of the papers relating to Drexel were destroyed on his orders, whereas the Morgan papers have been preserved.

J. P. Morgan and Company, which became one of the world's most celebrated banking establishments, was actually founded by Drexel, not by Morgan. Drexel and Morgan became partners in 1871 with the founding of Drexel, Morgan and Company. This new partnership was based in New York City, but it served as an agent for Europeans investing in the United States. When Drexel, Morgan was established, Drexel Harjes, now in business for three years, became the French affiliate for the banking corporation that would eventually be called J. P. Morgan and Company and was later known as J. P. Morgan Chase.

The Drexel-Morgan partnership was very strong and had a vast impact upon the growth of industry in the United States. Drexel, Morgan and Company and J. P. Morgan and Company were responsible for the financing that led to the establishment of three corporate giants, General Electric Company, International Harvester Corporation, and United States Steel Corporation (better known as U.S. Steel), to say nothing of many smaller companies. United States Steel, which Morgan took over from Carnegie, became the world's first billion-dollar corporation.

Legacy

Drexel died in 1893. Upon his death, it was revealed that he had left Drexel Institute $1 million and much of his valuable art collection. He also provided every clerk at Drexel and Company with $100 for every year of service. He had established three trusts for family members. His estate was valued at between $25 and $35 million, the largest on record in Pennsylvania at that time.

Besides his corporate contributions, Drexel's legacy was firmly established with his founding of the Drexel Institute of Technology. This institution embodied an educational and social philosophy that was unique at the end of the nineteenth century, a philosophy completely compatible with the democratic ideals of the United States.

Doris Duke

American socialite, philanthropist, and investor

Duke was a generous philanthropist during her lifetime. Her will endowed the Doris Duke Charitable Foundation, which provides grants for medical research, wildlife preservation, child abuse prevention, and the performing arts. Her foundation also supports three estates that are educational or recreational centers open to the public.

Born: November 22, 1912; New York, New York
Died: October 28, 1993; Beverly Hills, California
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Charity

Early Life

Doris Duke was born in New York City on November 22, 1912. She was the only child of American tobacco and energy tycoon James Buchanan Duke and his second wife, Nanaline Holt Inman, a southern aristocrat and widow of William Patterson Inman. At her birth, Duke was called the world's richest baby. She had a loving relationship with her father, who treated her as an adult. She had personal servants, including a chauffeur, bodyguards, maids, nurses, and private tutors. Duke led a sheltered life without close friends of her own age. She developed a love for gospel singing on a trip to Harlem in New York City with her father. On his deathbed, Duke's father told her to trust no one. He died on October 10, 1925, before her thirteenth birthday, leaving her $100 million ($1.25 billion in 2008).

First Ventures

Duke's father left only a small trust fund to his wife, so the mother-daughter relationship was strained. When her mother began selling family assets, the fourteen-year-old Duke sued her mother in order to stop her. After her father's death, Duke read bags of mail that he had hidden from her. Death threats and demands for money made Duke realize there were people who hated her for her wealth. For the rest of her life, she would value privacy and security. However, the media was fascinated with the lives of the rich and relentlessly pursued Duke.

When the stock market crashed in 1929 and many of Duke's affluent friends lost their fortunes, she helped them financially, often secretly. Duke anonymously purchased organs for thousands of small churches in the United States. At the age of twenty-one, Duke used money from a trust fund to establish her first foundation, Independent Aid, later called the Doris Duke Charitable Foundation. This foundation was established to perform primarily anonymous philanthropy throughout Duke's life.

Doris Duke in her car. (NY Daily News via Getty Images)

Mature Wealth

In February, 1935, Duke married thirty-eight-year-old Jimmy Cromwell, a playboy with political ambitions. His family had lost much of its fortune, so he needed Duke's financial support. She gave him a monthly allowance of $10,000 (the equivalent of $125,000 in 2008). Their honeymoon was a two-year trip around the world, during which Duke developed a passion for Southeast Asian and Islamic culture. She purchased priceless art treasures. Their last stop was Honolulu, Hawaii, where Duke built a winter home, Shangri La, in 1937.

Shangri La became Duke's private retreat, where she could escape unwanted publicity. She built it to house her collection of Islamic art and to create a unique blend of Islamic and Hawaiian architecture and landscape. For more than fifty

The Doris Duke Charitable Foundation

Doris Duke was famous for her vast wealth and often scandalous life, but she was also a generous philanthropist, dancer, musician, art collector, and environmentalist. On October 28, 1993, Doris Duke died at the age of eighty. She wanted the bulk of her $1.2 billion estate to be donated to charity for the improvement of humanity. After years of bitter litigation and numerous claims to her fortune, her estate was finally settled. The Doris Duke Charitable Foundation (DDCF) was created in 1996 to improve the quality of people's lives. In keeping with Duke's wishes, DDCF set up grant programs in four areas: performing arts, environmental conservation, medical research, and child abuse prevention.

Her will also called for three operating foundations to be funded by the DDCF in order to manage and preserve three properties. The Duke Farms Foundation manages the twenty-seven-hundred-acre Duke Farms in Hillsborough, New Jersey. Duke's father, tobacco and energy tycoon James Buchanan Duke, had developed this family estate as a public park for the enjoyment of nature, and Doris, a lifelong conservationist, had designed greenhouse gardens reflecting diverse areas of the world. The Doris Duke Foundation for Islamic Art preserves Shangri La, Duke's palace in Honolulu, Hawaii. The Newport Restoration Foundation manages historic houses in Newport, Rhode Island, and Rough Point, her summer home in Newport. All properties are educational or recreational resources open to the public.

The first grants were awarded in 1997. From 1997 through 2008, DDCF approved 947 grants totaling more than $648 million to nonprofit organizations in the United States. In 2008, grants totaled almost $66 million.

In its first decade, the foundation's endowment nearly doubled to $2 billion. However, with fluctuations in portfolio returns and economic downturns, the foundation's financial assets totaled about $1.4 billion as of December 31, 2008. On March 18, 2009, a letter from DDCF's president Edward P. Henry addressed how declining assets and uncertain economic conditions would affect the foundation's future work. He stated that in 2009, internal operating costs would be reduced by 20 to 25 percent, total grant spending would be reduced by 25 percent, and special initiatives in climate change and African health would progress at half the previously planned budget.

In April, 2009, DDCF awarded $3.6 million in grants to four organizations to help states safeguard nature in an era of climate change. The recipients were the Association of Fish and Wildlife Agencies, Defenders of Wildlife, National Wildlife Federation, and the Theodore Roosevelt Conservation Partnership. In May, 2009, the foundation awarded a $2 million grant to the Environmental Defense Fund's Center for Conservation Incentives to enable the center to provide private landowners with incentives to conserve farms, forests, ranches, and other natural areas critical for the nation's wildlife.

years, Duke purchased or commissioned pieces for the collection of about thirty-five hundred artifacts. The five-acre Shangri La overlooks the Pacific Ocean and Diamond Head and showcases a seventy-five-foot saltwater pool and exotic gardens.

Cromwell became the U.S. ambassador to Canada in 1939, and the couple was often separated. Convinced that Cromwell was a fortune hunter, Duke was unhappy and had scandalous affairs. In 1940, she gave birth to a premature baby girl, Arden, who lived only one day. Her doctors told Duke she would not be able to have more children. For the rest of her life, Duke grieved for Arden. Cromwell and Duke divorced in 1943.

In 1945, Duke became a foreign correspondent for the International News Service. After World War II, she was a writer for *Harper's Bazaar* in Paris, where she met Porfirio Rubirosa, a Dominican diplomat, race car driver, and polo player. They married in September, 1947. He was a notorious playboy, and Duke allegedly had paid $1 million to his previous wife Danielle Darrieux to divorce him. Rubirosa and Duke divorced in 1948.

During her lifetime, Duke made wise investments in real estate. She owned five homes, managed by a permanent staff of more than two hundred people. Her properties included Shangri La, the twenty-seven-hundred-acre Duke Farms in New Jersey, a Beverly Hills mansion, a Park Avenue penthouse, and Rough Point, her summer home in Newport, Rhode Island.

In 1988, at the age of seventy-five, Duke legally adopted thirty-five-year-old Charlene "Chandi" Heffner, whom Duke believed was the reincarnation of her deceased daughter, Arden. Heffner's friend Bernard Lafferty became Duke's butler, and James Burns, Heffner's boyfriend, became Duke's bodyguard. In 1990 in Hawaii, Duke became mysteriously sick and was knocked unconscious during a fall. Lafferty agreed with Duke that Heffner and Burns were plotting against her. Lafferty and Duke moved to her Beverly Hills mansion. In 1991, Duke ended her relationship with Heffner, who filed a breach-of-contract lawsuit.

During her last years, Duke was a recluse, mistrustful of friends and relatives. It was rumored that Lafferty isolated and controlled her. At his suggestion, she had a series of operations. In 1992, she fell and broke her hip days after getting cosmetic surgery. During recuperation, she took antidepressants, painkillers, and tranquilizers.

In April, 1993, Duke signed her final will, which named Lafferty as the executor of her estate. She also stated that she regretted the adoption of Heffner, who should not be allowed to inherit from Duke's estate or the two trust funds set up by Duke's father.

After a knee operation in July, 1993, she suffered a stroke, was hospitalized, and was put on feeding and breathing tubes. After returning home in September, 1993, she was an invalid and had to be heavily sedated with high doses of morphine. Duke died on October 28, 1993, and was cremated within twenty-four hours. Her ashes were scattered into the Pacific Ocean. Duke left most of her $1.2 billion estate to charity.

Probate lasted nearly three years. The litigation involved numerous claimants and complex issues. Duke's nurse, Tammy Payette, asserted that Lafferty had hastened Duke's death with high doses of morphine in order to keep Duke from changing her will. As Lafferty's health deteriorated, he agreed to resign as executor of Duke's estate for a cash settlement. Heffner sued the trustees and eventually settled for $65 million. Probate ended in 1996 with the establishment of the Doris Duke Charitable Foundation. Estate and legal fees had already reached $10 million by 1997.

Legacy

During her lifetime, Duke was an extremely generous and often anonymous philanthropist. She left most of her $1.2 billion estate to create one of the world's most richly endowed foundations. The Doris Duke Charitable Foundation was established in 1996 to improve the quality of people's lives by awarding grants and preserving Duke's historic estates as educational, environmental, and cultural resources.

Her controversial life, wealth, and mysterious death entered popular culture, including the film and television industries. In 1999, CBS (Columbia Broadcasting System) presented the four-part miniseries *Too Rich: The Secret Life of Doris Duke*, starring Lauren Bacall as Duke and Richard Chamberlain as Lafferty. In 2008, HBO (Home Box Office) broadcast *Bernard and Doris*, a semifictional drama starring Susan Sarandon as Duke and Ralph Fiennes as Lafferty, which received numerous Screen Actors Guild, Emmy, and Golden Globe awards.

James Buchanan Duke

American tobacco and hydroelectric industrialist

Duke emerged as a typical rags-to-riches success in the cigarette and hydroelectric power businesses in the post-Civil War South. His trust fund, the Duke Endowment, has greatly contributed to the welfare of the Carolinas in the areas of health care, child care, religion, and higher education.

Born: December 23, 1856; Durham, North Carolina
Died: October 10, 1925; New York, New York
Also known as: Buck Duke
Sources of wealth: Manufacturing; sale of products; utilities
Bequeathal of wealth: Children; relatives; educational institution; charity

Early Life

James Buchanan "Buck" Duke was born in 1856 in Durham, North Carolina, the youngest son of Washington Duke and his second wife, Artelia Roney Duke. He received some schooling at local academies and attended New Garden School in Greensboro, North Carolina (now Guilford College), and the Eastman Business College in Poughkeepsie, New York. Duke, however, spent more time working on his father's farm and later in the family's tobacco product business than pursuing his education.

First Ventures

When Washington Duke returned from military service after the Civil War, he found that his farm had been ravaged by Union troops, but a load of tobacco stored in a shed somehow escaped confiscation. At that time tobacco was so scarce that Washington's load of tobacco sold quickly, and he switched from farming to tobacco production. He was the first person to plant tobacco in Durham, in 1858, and he founded William Duke and Sons Company in 1865 to process tobacco. By 1872, the Duke family sold 125,000 pounds of tobacco annually.

James Duke and his brother Benjamin Duke took over the company in the 1880's. Having difficulty competing with another well-established tobacco firm, Blackwell and Co., they decided to switch from tobacco production to cigarette manufacture, since cigarettes were then a new product. To compete with the four companies that produced 80 percent of cigarettes for the market, James Duke acquired a license to install two machines invented by James Albert Bonsack, which would roll his company's cigarettes, enabling him to produce cigarettes more quickly and efficiently than his competitors. Three years later, he moved his company to New Jersey to take advantage of the state's corporation laws and to exploit the markets in the northern and western United States.

Mature Wealth

By 1890, Duke's company provided 40 percent of the cigarettes marketed in the United States. Using the Bonsack machines, the company could produce more cigarettes than all its competitors combined. In addition, Duke merged with his four competitors, forming the American Tobacco Company, and then gradually obtained control of the American cigarette business. His next step was to enter the international market in order to compete with British companies. Duke reached an agreement with the British companies that enabled him to control the American market, while the British firms would dominate the market in British territories; Duke and the British firms also established the British-American Tobacco Company in order to cooperate in the sale of tobacco to the rest of the world. As a result of this agreement, by the beginning of the twentieth century Duke controlled 90 percent of the American and half of the international tobacco markets.

In 1906, the U.S. Supreme Court found Duke's company guilty of violating the Sherman Antitrust Act and ordered the corporation to divide into three separate companies: Liggett and Myers, the P. Lorillard Company, and the American Tobacco Company. According to the Court, Duke's business used illegal secret agreements and false public promotions to monopolize the market. In 1911, the Court again divided the American Tobacco Company into smaller companies. Duke now controlled only three companies, but with a capitalization of more than $500 million his power within the tobacco business remained strong. Around this time, Duke also sold his company's shares in the British-American Tobacco Company.

Another source of Duke's wealth was his hydroelectric business. He founded the Southern Power Company (now known as Duke Power) in 1905 to provide electricity to the Duke family's textile factory, which opened in 1892 and was managed by his brother Benjamin. Southern Power gradually became the sole electric supplier to cotton mills and other industrial companies, as well as to

Duke University

Trinity College, a Methodist-related school, was established in Randolph County, North Carolina, in 1838. Businessman Washington Duke helped the school relocate to Durham, North Carolina, in 1892. His son James Buchanan Duke helped build a new university near the school, providing $21 million from the Duke Endowment for construction. At the insistence of William Preston Few, the president of Trinity College, James Duke agreed to name the new school Duke University, with "Duke" referring to both Washington and James Duke.

Duke's original campus (now called East Campus) was rebuilt with Georgian-style buildings at a cost of $4.8 million, with construction beginning in 1925 and ending in 1927. The university's building committee expended more than $16 million for the Gothic-style buildings in the West Campus, the site of Duke Chapel, and for the purchase of more than five acres of land. The 210-foot chapel was the most expensive building on campus, built at a cost of $2.3 million, with construction completed in 1935. In 2008, the Duke Endowment provided $50 million to enable the Duke Medical Center to construct a building for medical education and to develop a state-of-the-art inpatient facility for pediatric patients.

In 1972, Trinity College merged with the Woman's College to become Trinity College of Arts and Sciences, the undergraduate liberal arts college of Duke University. Many of Duke University's goals are identical with the educational goals of the Duke Endowment. For example, in order to attract talented faculty, the university provides endowment funds for faculty chairs. In past decades, it has had the sixth highest number of Fulbright, Rhodes, Truman, and Goldwater scholarship recipients in the nation. Duke recruits top students from around the country, accepting about 20 percent of applicants, 96 percent of whom rank in the top 10 percent of their high school classes. The school has adopted a need-blind admissions policy, which accepts students based on their academic performance and potential without considering applicants' financial status or ability to pay for a college education. After a student is admitted, the university then commits to providing 100 percent of his or her financial need for all four years of undergraduate education.

In 2004, Duke University's research expenditures topped $490 million, and funding since then has increased 14.5 percent. In 2007, Duke launched a $30 million program called Duke Engage to provide students with community service opportunities. The school has also developed a joint medical program with the National University of Singapore.

cities and towns in the Piedmont region of North and South Carolina. From 1907 to 1925, the company built eleven power plants. In 1915, Duke purchased hydroelectric power resources on the Saguenay River in Quebec, Canada. He also increased his wealth with extensive investments in textile mills and corporations that produced cotton and wool.

Duke owned homes and estates in Charlotte, North Carolina; Somerville, New Jersey; New York City; and Newport, Rhode Island. These homes and estates were large and housed Duke's sculpture collections. The Charlotte mansion, for example, had forty-five rooms and twelve baths. With more than twenty-seven hundred acres of woods, lakes, and fields, Duke Farms in Hillsborough remained the largest private landholding in New Jersey into the twenty-first century. Duke acquired control of the Raritan Water Power Company partly as a means of supplying water to a chain of lakes, fountains, and streams on this estate.

The Duke family was well known in North and South Carolina for their generous philanthropy. Washington Duke helped relocate Trinity College from Trinity to Durham in 1892, and he gave the school a $100,000 endowment in 1896. James Duke's first gift to the school was a library building and $10,000 for books. On December 11, 1924, he established the Duke Endowment, a $40 million trust fund with designated beneficiaries in the Carolinas. His indenture of trust specified four educational institutions as beneficiaries: Trinity College (now Duke University); Furman University in Greenville, South Carolina; Johnson C. Smith University in Charlotte; and Davidson College in Davidson, North Carolina. Other beneficiaries included nonprofit hospitals and child-care institutions in the Carolinas, Methodist churches, and retired Methodist preachers in North Carolina. On his death, Duke left about half of his estate, or $67 million, to the trust fund, increasing the Duke Endowment to $107 million.

Duke became ill with pneumonia and died in New York City on October 10, 1925. Like his father and brother, he was buried in the Memorial Chapel on the campus of Duke University. The remainder of his estate, or the equivalent of about $1 billion, went to twelve-year-old Doris Duke, his only child from his second marriage, to Nanaline Holt Inman. As a result, Doris became the richest girl in the world, while her mother received only a small trust fund. In addition, Duke allocated $2 million to other relatives, including the children of his father's brothers and sisters.

LEGACY

James Buchanan Duke exemplified the American entrepreneurs, who, despite a lack of education, could rise from rags to riches through confidence and business acumen. While he was certainly an inspiring person in the business world, he was more important for the societal contributions made by his Duke Endowment. His practice of financial stewardship was inspired by his Methodist faith and his father, who was also a generous benefactor.

By the twenty-first century, the Duke Endowment, based in Charlotte, North Carolina, was one of the largest charitable foundations in the United States, valued at more than $2.7 billion. The endowment supported child care, health care, the Methodist Church, and higher education in the Carolinas. Its goal in promoting education was to educate people of principle and promise whose future contributions would benefit society. Funding from the Duke Endowment has allowed select colleges and universities to construct landmark facilities, attract talented faculty, recruit top students, improve affordability, support research, encourage innovation, and pioneer new roles for other universities and communities.

ALFRED I. DU PONT

American industrialist and real estate developer

Du Pont used the wealth he acquired in his family's gunpowder works to develop the Florida panhandle. After his death, he bequeathed funds to provide care for chronically ill children in Delaware, eventually becoming the nation's largest single benefactor for children's health care.

Born: May 12, 1864; Brandywine Valley region, Delaware
Died: April 28, 1935; Jacksonville, Florida
Also known as: Alfred Irénée du Pont
Sources of wealth: Inheritance; patents; manufacturing; sale of products; investments; real estate
Bequeathal of wealth: Spouse; children; charity

EARLY LIFE

Alfred Irénée du Pont (dew pont) was born on May 12, 1864, the eldest of five children. His grandfather, Eleuthère Irénée du Pont (1771-1834), founded the family gunpowder business in the Brandywine Valley region of Delaware, and the business flourished because it obtained lucrative government contracts during the War of 1812. Alfred's father, Eleuthère Irénée du Pont II (1829-1877), was a senior partner in the family business. Because of his leadership and the large contracts obtained during the Crimean War and the Civil War, the business thrived. The du Ponts controlled much of Delaware politics, and by 1872 they were able to drive most of their rivals out of business, thus gaining a monopoly. Alfred frequently visited the gunpowder works with his father.

Life dramatically changed for Alfred at an early age. He began to lose his hearing after a boyhood swimming incident. When he was thirteen, his mother and father died within a month of each other. The five du Pont children were sent to boarding schools. Alfred attended the prestigious Andover Academy and then the Massachusetts Institute of Technology (MIT), where he joined his cousin, T. Coleman du Pont. Alfred was on the Andover Academy boxing team, played the violin, and had a talent for musical composition and for understanding the intricacies involved in the operation of machinery. At MIT, he studied chemistry, mathematics, and German, which at the time was a necessary language for understanding chemistry.

First Ventures

In 1884, upon completing his sophomore year, du Pont went to work in the family business. Within five years he had worked his way up from an entry-level common laborer at the Hagley Gunpowder Mills to the position of yard supervisor. By then, his loss of hearing was nearly complete and people had to communicate with him in writing. Nevertheless, du Pont quickly gained a reputation as a gunpowder expert, inventing new machinery to improve the efficiency and safety of the gunpowder manufacturing process. During his life, du Pont registered more than two hundred patents, most of which were related to gunpowder production. Within five years he was made a junior partner at the firm, along with his cousins, Coleman and Pierre, and the company was renamed E. I. du Pont de Nemours and Company.

Alfred I. du Pont. (The Granger Collection, New York)

In 1889, du Pont negotiated a license for "smokeless" gunpowder from a Belgian firm. The company made large profits from European sales and from government contracts during the Spanish-American War of 1898. By the end of the war, du Pont gunpowder was the first choice of the American armed forces. With the death of Edward du Pont in 1902, the other three senior partners considered selling the company to a rival firm. However, Alfred and his two cousins convinced the senior partners to turn the company over to the three younger men in exchange for promissory notes and shares of stock. As a result, Coleman became president, Pierre became treasurer and executive vice president, and Alfred served as vice president for operations and was also in charge of gunpowder production. Unfortunately, Alfred's hearing impairment was compounded by an additional physical problem, when in 1904, he lost an eye in a hunting accident.

Mature Wealth

As the older generation of du Pont managers made way for the new, the very nature of the family business was dramatically transformed. The three cousins, all MIT graduates, strongly believed that the company should diversify and pioneer innovative products, such as new types of paints, dyes, and plastics. Alfred supported research to create these products. The company had to decide if it would conduct research in departmental or general laboratories. Alfred argued that the company could do both, and he was able to get his way. However, Alfred's cousins generally considered him to be entirely too conservative in his business decisions and embarrassingly radical in his personal life. While Alfred was the undisputed "czar" of gunpowder operations, it was Coleman who was the master of the increasingly complex organizational structure and Pierre who was the financial wizard of the corporation as it became heavily involved in new technologies.

Increasingly, Albert's views ran contrary to those of his cousin Pierre. Alfred's personal life was also a divisive factor in his deteriorating relationship with his two cousins. Alfred divorced his first wife, the mother of his four children, in 1906, and the following year he married Alicia Bradford, a second cousin whose former husband worked for the company. To add to family concern, Alfred built his new wife a forty-seven-thousand-square-foot mansion in Wilmington, Delaware, housed on three hundred acres and designed in eighteenth century château style by renowned architects. The estate was named Nemours after the ancestral French town from which the du Ponts originated. For a leading national family in turn-of-the-century America, Alfred's personal life was embarrassing, if not scandalous.

The outbreak of World War I in 1914 caused a tremendous acceleration of gunpowder shipments, particularly to England and France, and increased prosperity for the three cousins. However, another war was brewing. In 1915, Alfred's two cousins decided to sell a large block of stock to company officers and directors. The company was clearly headed toward becoming a public corporation instead of a family-owned business. Alfred protested, and he then sued Pierre and Coleman. When the case was decided against Alfred in 1917, he resigned from the corporation and maintained lifelong enmity toward Coleman and Pierre.

Deciding to use his fortune to pave his own way in the financial world, du Pont established an investment firm, Nemours Trading Corporation, and an import-export operation in New York. He also invested in banks. Ultimately, he acquired a 60 percent interest in Delaware Trust Company.

In January, 1920, du Pont's wife Alicia died of a heart attack. One year later, he married Jessie Ball, a descendant of George Washington's mother, and moved to Florida. Jesse was a high school teacher and thirty-six years old when she married the nearly deaf fifty-seven-year-old du Pont. They began life together by building an elegant mansion in Jacksonville, Florida, and investing in south Florida real estate. Aiding his investment strategies was Jesse's brother, Edward Ball, who involved du Pont in the purchase of tens of thousands of acres in the Florida panhandle, including most of the city of Port St. Joe, the Apalachicola Northern Railroad, the St. Joseph Telephone & Telegraph Company, and several banks. In 1927, du Pont created the Gulf Coast Highways Association as a lobbying agency to obtain government funds for highway construction in the panhandle. However, the onset of the Great Depression forestalled most of these ambitious development plans. In 1929, du Pont helped save the Florida National Bank by giving the bank $15 million of his own funds to maintain its solvency.

Du Pont died in Jacksonville, Florida, in 1935, at the age of seventy. His wife Jessie continued his philan-

The Nemours Foundation

When Alfred I. du Pont died in 1935, he left an estate valued at $40 million and a will setting up a charitable foundation to provide health care services to children. Exactly why he chose this as the focus of his philanthropy remains a mystery, since there is no record of his involvement with chronically ill children during his lifetime. The foundation was to be named after his French ancestral home, Nemours, and was to devote its attention to the needs of children in du Pont's native state of Delaware.

Originally the foundation operated the Alfred I. du Pont Hospital for Children in Wilmington, Delaware, founded in 1940 to provide health care for crippled children. The hospital maintained this focus for the next four decades and then expanded to offer health care services to the elderly.

The death of Alfred's third wife, Jesse Ball du Pont, in 1971 greatly increased funding for the Nemours Foundation. In addition, Alfred du Pont's brother-in-law, Edward Ball, expanded the foundation after his death in 1981, when he left much of his vast estate for the care of children in Jacksonville, Florida. The bequest resulted in construction of the Nemours Children's Hospital in Jacksonville and the creation of dozens of pediatric clinics in Delaware, Florida, New Jersey, and Pennsylvania. Ball's bequest also led to significant funding for medical research aimed at discovering new means of treating diseases affecting children. In 2004, the foundation founded Nemours Health and Prevention Services, which takes a holistic approach to children's health and is focusing its initial efforts on a childhood obesity program in Delaware and an early dyslexia detection program in Jacksonville

The Nemours Foundation also maintains the popular *Kid's Health* Web site, which provides information about children's mental and physical health spanning the period from birth to adulthood. The three-hundred-acre Nemours Mansion and Gardens in Wilmington, Delaware, is also operated by the foundation. The forty-two-thousand-square-foot mansion, located on the grounds of the Alfred I. du Pont Hospital for Children, was built in Louis XIV château style and is furnished with antiques and many works of art. It is open for public tours, which conclude with a visit to the chauffeurs' garage, where the family's antique cars are on display. The Nemours Mansion and Gardens completed a $39 million restoration in 2008.

In 2009, the trust founded by Alfred I. du Pont was valued at $4.6 billion. Since 1940, 3 percent of the trust's funds have been distributed annually for health care, earning Alfred I. du Pont the distinction of being the nation's largest single benefactor for children's health care.

thropic interests until her death in 1970, while her brother, Edward Ball, managed du Pont's investments. By the time of Ball's death in 1981, du Pont's $40 million trust had increased to more than $2 billion.

Legacy

Alfred I. du Pont's expertise in gunpowder production and his role in helping to save the du Pont corporation from dissolution resulted in the growth of one of America's major and most enduring businesses. Although personal choices caused him to be regarded as the "du Pont family rebel," his life accomplishments earned him a place in history as an important member of an illustrious American family. The construction of two elegant mansions, one in Delaware and one in Florida, indicates that he did not stray too far from the lifestyle of opulent American families.

Du Pont's later entrepreneurial role in trying to stimulate economic growth in the Florida panhandle earned him recognition from the Florida Department of State in 2000, when he was named one of the "great Floridians." However, his greatest legacy is as a philanthropist. By establishing the Nemours Foundation, du Pont contributed his considerable financial resources to benefit the health of children.

Henry Francis du Pont

American art collector, horticulturist, and philanthropist

Du Pont amassed the world's most extensive collection of American antique furniture, furnishings, and decorative arts. He housed the objects in Winterthur, his Delaware mansion, where he used the estate and the collection to create the Winterthur Museum and its extensive gardens for the enjoyment and education of the public.

Born: May 27, 1880; Winterthur, Delaware
Died: April 10, 1969; Winterthur, Delaware
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Children; museum; educational institution

Early Life

Henry Francis du Pont (dew pont) was born into one of the wealthiest and most prominent families in the United States. His autocratic father, Henry Algernon du Pont, valedictorian of his class at the U.S. Military Academy at West Point and later a U.S. senator from Delaware, was disappointed in Henry Francis (better known as Harry), a shy boy who loved flowers and collecting birds' eggs and stamps. The only surviving son of seven children, Harry was very close to his mother, Mary Pauline Foster du Pont.

At age thirteen, the young du Pont was sent to board at the Groton School in Massachusetts. Never a good student, he graduated last in his class. Du Pont went on to Harvard University, where he studied planting procedures, the cultivation of shrubs and trees, and greenhouse maintenance at the Bussey Institution, Harvard's college of practical agriculture and horticulture. He graduated in 1903.

First Ventures

For the first time in 1901 and then almost every summer until the outbreak of World War I, du Pont traveled to Europe with his father to visit the great gardens, nurseries, and exhibitions of the times. He was particularly impressed with the design and color of English formal gardens.

After his father's election to the U.S. Senate in 1906, du Pont relocated to Washington, D.C., to serve on the senator's staff. However, a nervous condition that caused his fidgeting, poor handwriting, and mumbled speech made him unable to perform his job. His heart was at his family's Delaware mansion, Winterthur, where he had already planted daffodils in the estate's March Bank. It was not long before Senator du Pont realized that he should cede management of the estate's grounds and gardens to his son.

Du Pont worked assiduously at developing the two-thousand-acre farm. He raised a prizewinning herd of Holstein-Friesian cattle (the familiar black and white dairy cows), and he engaged landscape architect Marian Cruger Coffin to help him integrate planned gardens with the natural environment. By the early 1920's, the Winterthur estate had become almost a village unto itself. The approximately 250 inhabitants worked at the dairy farm and managed the estate's turkeys, chickens, Dorset sheep, hogs, purebred Percherons and other horses, guinea hens, Muscovy ducks and mallards, wheat fields, vegetable and flower gardens, greenhouses, a sawmill, tennis courts, a golf course, a railroad station, and a post office.

In 1916, du Pont married Ruth Wales, a New York neighbor of future president Franklin D. Roosevelt. The couple had two daughters, Pauline Louise and Ruth Ellen.

Mature Wealth

On tax returns and travel documents, du Pont listed his occupation as "farmer," but in 1923 a visit to friends J. Watson and Electra Webb in Vermont stimulated the career that would win him world-class recognition. Electra Webb collected American antiques, and a huge cupboard and its Staffordshire dishes caught du Pont's appreciative eye. For the next thirty years he sought out and acquired examples of historic American craftsmanship. (Both the cupboard and the Staffordshire dinnerware are displayed at the Winterthur Museum.) He became known as a discriminating connoisseur who always acted as his own agent, personally inspecting, judging, and negotiating every purchase.

When he inherited the Winterthur estate and another $50 million in 1927, du Pont conceived the idea of housing a great collection in a great mansion, and he expanded his father's house. Between 1929 and 1931, construction progressed on a $4.3 million, 150-foot-long addition that doubled the size of the main house at Winterthur. More than one hundred stonecutters and masons worked on the project, and much of the stone was quarried on the estate's property. Other, smaller expansions and renovations were contracted between 1931 and 1951.

As he worked at filling his 175 rooms with themed collections, du Pont could not help but compare his acquisitions to those of the new American Wing at the Metropolitan Museum of Art in New York City. In 1949, as befits a member of a hugely competitive family, he hired Joseph Downs, curator of the American Wing, to be the full-time photographer and cataloger of his holdings. He also employed Charles Montgomery, a Harvard graduate and antiques collector, to establish a professional staff to manage Winterthur as a museum.

Before Winterthur could be opened to the public, however, the du Ponts needed a place to live. Du Pont initiated construction of a new home to be called The Cottage a few hundred yards from the mansion. Hardly a "cottage" by any standards, the multistory stone building was designed in the Regency style by architect Thomas Waterman. The house had 21,345 square feet of living space.

In his report to classmates at his fiftieth Harvard reunion, du Pont wrote, "I have not wandered very far afield." Indeed, he spent his entire eighty-eight years deeply attached to Winterthur. After opening the museum in 1951, he devoted most of his time to his gardens. One of his greatest pleasures was walking among his plantings. He also loved the sunlit meadows, the paths through the woods, and the peaceful quiet of perhaps the finest country estate in America.

In 1961, du Pont was asked by First Lady Jacqueline Kennedy to chair the committee overseeing the renovation of the White House. Using his extensive contacts and his expertise, du Pont was able to obtain many donations of fine art and antique furniture. He frequently disagreed, however, with the consulting interior designer, Stéphane Boudin.

Henry Francis du Pont died in 1969, a month before his eighty-ninth birthday, and is buried in the Du Pont de Nemours Cemetery in Wilmington, Delaware.

Legacy

The rare and exquisite objects of du Pont's Winterthur collection are a magnificent gift to the American people, a gift that chronicles the evolution of the nation's aesthetic development and its lifestyle preferences. Perhaps

The Winterthur Museum

The Winterthur Museum in the Brandywine Valley of Delaware holds the world's foremost collection of antique American decorative arts and furniture. Its sixty acres of themed and color-balanced gardens and its nine-story mansion, with historically accurate and insightful displays of Americana, were the life work of Henry Francis du Pont. The buildings and the 983 acres upon which they stand had been home to five generations of the du Pont family. In 1951, du Pont gifted them to the Winterthur Museum Corporation for the enjoyment of the public and the preservation and appreciation of historic American lifestyles.

The Winterthur permanent collection comprises approximately eighty-nine thousand objects that were created or used in America between 1640 and 1840. The holdings include furniture, glass, textiles, quilts, embroidery, jewelry, silver, pewter, ironworks, ceramics, clocks, sculpture, paintings, and other works of art on paper. Tankards by Paul Revere; furniture by Newport, Rhode Island, cabinetmakers; paintings by Gilbert Stuart and Benjamin West; and a sixty-six-piece dinner set once owned by George Washington are among the notable items.

More than 200,000 visitors annually tour Winterthur. The 175 rooms in the mansion are organized either thematically or chronologically. Because Henry Francis du Pont insisted that no fences, ropes, or other control devices be allowed to mar a guest's enjoyment of the collection, most rooms are open to the public only on guided tours for small groups. An advance appointment is required.

During the 1990's, more than fifty-three thousand square feet of public space was built adjacent to the main museum building. Called the Galleries and the Visitors Center, these facilities feature self-guided tours through a permanent exhibition of eight hundred household objects. Items on display range from tea services to toys, from long rifles to musical instruments, from necklaces to tankards, and from chairs to armoires. The Galleries also provide space for rotating exhibits, such as the American quilts collection of 2008.

The Winterthur Library and Research Center (almost seventy thousand square feet) includes more than eighty-seven thousand volumes and approximately half a million manuscripts and images, most of which are relevant to American decorative arts, material culture, and architecture. The building also houses extensive conservation, research, and education facilities, including the Winterthur Program in Early American Culture and the Winterthur/University of Delaware Art Conservation Program.

Outdoors, the paths through the garden areas are open to the public. By choosing and placing plantings with consideration to seasonal blooming and color, du Pont created an ever-changing but permanent landscape of beauty. Among the named gardens are the Azalea Woods, the March Walk, the Sundial Garden, the Pinetum, the Lookout, the Quarry, and the Goldfish Pond and Waterfalls. Winterthur's rhododendrons are famous worldwide. There is also an Enchanted Woods area for children.

The name "Winterthur" comes from a town in Switzerland that was the ancestral home of James Antoine Bidermann, husband of Evelina Gabrielle du Pont. Bidermann designed the first residence on the estate and began building in 1837. The property remained in the du Pont family until the creation of the Winterthur Museum.

equally important, however, is the estate itself. By observing the mansion and other buildings and the breathtaking gardens, visitors can learn what it meant to be an incredibly wealthy person living in the United States during the first half of the twentieth century. In addition to the pleasures and treasures of Winterthur, du Pont contributed to the development of courses of study in American culture and art conservation at Winterthur and at the University of Delaware. The Society of Winterthur Fellows, established in 1951, continues to function in support of du Pont's ideas and goals.

Despite his passions for art, collecting antiques, horticulture, and breeding livestock, du Pont also took an active part in the management of both E. I. du Pont de Nemours and Company and General Motors. In everything he did, he reached for excellence or perfection. His life exemplifies the American ideals of leadership, generosity, public service, and outstanding planning and management.

Irénée du Pont

American chemical engineer and industrialist

Du Pont helped build his family's company from a gunpowder producer to one of the nation's major chemical manufacturers. His wealth was passed on to immediate family members, with a fraction of it allocated to build an elegant mansion in Cuba.

Born: December 21, 1876; Brandywine Valley, Delaware
Died: December 12, 1963; Wilmington, Delaware
Sources of wealth: Inheritance; manufacturing; sale of products
Bequeathal of wealth: Children; relatives

Early Life

Irénée du Pont (IHR-eh-nay dew pont) was born in 1876, the seventh of eleven children. His great-grandfather, Eleuthère Irénée du Pont (1771-1834), founded the family gunpowder business at Brandywine Valley, Delaware. The company initially flourished when it obtained lucrative government contracts during the War of 1812, and its business became even more profitable during the Crimean War (1854-1856) and Civil War (1861-1865). Irénée's father, Lammot du Pont (1831-1884), was a partner in the family corporation, and his mother, Mary Belin du Pont, came from a family that had headed the du Pont company's accounting department.

Irénée spent his first five years at the family mansion, Nemours. The residence was owned by the du Pont company, as were all the nearby homes of his uncles, cousins, and important but unrelated company managers. In the winter of 1881, Lammot moved his large family to West Philadelphia in order to head a plant designed for the production of a new explosive, nitroglycerin. On March 29, 1884, the seven-year-old Irénée learned that his father and five others had been killed instantly in an explosion at the nitroglycerin plant. Although fatherless, the family was financially secure. Male leadership of the family fell to Irénée's older brother, Pierre, who maintained a close and lifelong relationship with Irénée and their younger brother Lammot.

Irénée studied at Andover and then followed Pierre in attending the Massachusetts Institute of Technology (MIT). He joined the Phi Beta Epsilon fraternity. Ultimately, he gained recognition as one of the first of the du Pont brothers to contribute more than $400,000 to the fraternity. Irénée graduated in 1897 with a bachelor's degree in chemical engineering and went on to earn a master's degree the following year. Upon graduation, he was hired by Pierre's former MIT roommate and close friend, William H. Fenn, to work for Fenn's construction company in Wilmington, Delaware. Irénée married in 1900 and raised a family consisting of five girls and one boy. By the time of his death in 1963, he had thirty-five grandchildren and five great-grandchildren.

First Ventures

In 1902, du Pont carried out Fenn Construction's expansion of the E. I. du Pont de Nemours and Company headquarters in the Equitable Trust Company Building in Wilmington, designing an additional two stories for the

Xanadu

In 1927, Irénée du Pont decided to search for the ideal place to build a retirement retreat. He found his location in Varadero, Cuba, in the form of 1,328 acres of tropical splendor, with five miles of pristine beaches backed by the San Bernardino crags. Here he built his mansion, Xanadu, on a cliff fifteen yards from the ocean. Xanadu was designed by the architects Evelio Govantes and Felix Cabarrocas and constructed by the Frederick Sneard Corporation. The residence was completed on December 30, 1930, at a cost of $1.3 million.

This four-story mansion contained eleven bedrooms with adjoining baths, three large terraces, and seven balconies. Each room had an ocean view. The floors were made of Cuban, Italian, and Spanish marble, and precious woods were used for the ceilings, staircase rails, and columns. In front of the house was a private dock. In 1932, Irénée installed the largest privately owned organ in Latin America in Xanadu's basement, and the organ piped music to different sections of the mansion. The elegance of Xanadu was matched by its beautiful location and lush landscape. The property featured gardens with tropical plants and coconut and other fruit trees. Parrots and cockatoos were transported to the gardens in abundance to make the gardens appear even more exotic.

Irénée spent several months a year at Xanadu, usually escaping the cold Delaware winters after New Year's Day. Important corporate guests were often invited to Xanadu and were awed by the manmade and natural beauty. Varadero, Cuba, attracted many other notable people, both famous and infamous. Cuban leader Fulgencio Batista y Zaldívar and mobster Al Capone built mansions there, and the area was a site of resort hotels and casinos frequented by film stars and an assortment of gangsters. After Fidel Castro wrested control of Cuba from Batista in 1959, Castro eventually confiscated Xanadu and nationalized the mansion and the property on which it was located.

Irénée last visited Xanadu in March, 1957. He died on December 12, 1963, the same day that his former mansion opened as the restaurant Las Americas, with Soviet cosmonaut Valentina Tereshkova among the diners. In 1999, Xanadu housed the Varadero Golf Club, which was the site of the European Tour Grand Final in 1999 and 2000. By 2009, the golf club had been remodeled by the Cuban government and converted to a clubhouse with six rooms for rent, a restaurant on the first floor, and a wine cellar in the basement.

structure. Within a year he was recruited by his first cousin T. Coleman du Pont, the president of the family firm, who wanted Irénée to head the company's engineering division. Irénée was also put in charge of appraising gunpowder operations. In 1904, Pierre appointed Irénée to the company's board of directors. Pierre's rise in the company meant increasing responsibilities for his brothers Irénée and Lammot.They had Pierre's complete confidence, and in turn he received their unqualified loyalty. Irénée soon became assistant general manager, and he and Lammot were considered the brightest of the new generation of du Pont leadership.

In 1907, the federal government filed an antitrust suit against the du Pont company, alleging restraint of trade in the explosives industry. A federal court ruled against the firm in 1911, and a year later du Pont agreed to divest itself of enough assets to create two competing gunpowder and dynamite manufacturers. As a result of this litigation, Irénée maintained a lifelong hatred of "big government." During the Great Depression, he became an outspoken critic of President Franklin D. Roosevelt's policies, which involved the government in the nation's economic recovery. There has been speculation that in 1933 Irénée may have participated in a plot by prominent businessmen to remove Roosevelt from office.

As a chemical engineer, Irénée was always excited about the possibilities of new products. In 1908, he became fascinated by a new way to use guncotton to make nitrocellulose-based artificial leather. The du Pont company expanded its manufacture of this product in 1910 by acquiring the Fabrikoid Company, the largest maker of artificial leather.

In 1914, as World War I loomed on the horizon, an entirely new executive committee was appointed at du Pont, with Irénée as chairman. Coleman's interests turned to other business matters, and Pierre was responsible for the firm's day-to-day operations. Meanwhile, a decision to issue common stock and create a bonus plan for corporate management split the family, as Pierre du Pont fought Alfred I. du Pont in a major court battle.

World War I was of major significance to the du Pont company. The war created an enormous demand for explosives that necessitated a rapid expansion of the firm's production. By 1916, World War I had generated such huge profits for du Pont that the company was able to give all of its shareholders a 100 percent return on dividends. Following America's entry into the war in April, 1917, Pierre sent Irénée to Washington, D.C., to negotiate a fair price for du Pont company gunpowder with the War Industry Board.

Mature Wealth

In 1915, Pierre, who owned stock in General Motors (GM), was elected chairman and a director of the automobile company. After World War I, du Pont's directors invested $25 million in GM, and GM became a major customer for du Pont's new durable quick-drying lacquer paint, marketed under the name Viscolac and later refined under the names Duco and DuLux. In 1920, Pierre became president of GM, and Irénée succeeded him as president of the du Pont company.

During his term as company president, Irénée reorganized the management structure at du Pont, allowing daily management decisions to be made by individual departments, each with its own production, sales, and research departments, as well as general managers who were answerable to the firm's executive committee. Under this decentralized management structure, the du Pont company earned a fortune by manufacturing durable paint for cars, cellophane, and a host of other products. The firm's management structure soon became a model for many other large corporations. Irénée also made department managers responsible for worker safety, which became an aspect of daily operating procedures.

On March 15, 1926, Irénée was succeeded by his brother Lammot as president of du Pont, and Irénée was elected chairman of the board of directors. One year later, he decided to enter into semiretirement and sought a location to build a sumptuous estate. He found such a site on the white sand beaches of Varadero, Cuba, where he built a mansion named Xanadu, after the legendary palace of the Mongol ruler Kublai Khan. Xanadu was completed in late December, 1930. Irénée spent several months each year at Xanadu and remained on the du Pont board of directors until his full retirement in 1958. At this time, his personal wealth, tabulated by *Fortune* magazine, was between $200 and $400 million, making him one of the two richest members of the du Pont family and one of the twenty richest Americans. At the time of his retirement, the du Pont Corporation employed ninety thousand workers in seventy-four plants worldwide.

Legacy

Irénée du Pont, along with his bothers Pierre and Lammot, played a major role in the growth of E. I. du Pont de Nemours & Company, transforming the corporation from a large gunpowder producer to one of the world's largest chemical manufacturing conglomerates. Irénée helped steer DuPont (as it is commonly known) into diversified production and instituted a decentralized management system that became a worldwide model for large corporations. In doing so, he became one of the twenty wealthiest Americans, enjoying his semiretirement in a mansion on a luxurious 1,328-acre estate. However, his possible involvement in a corporate conspiracy to overthrow the presidency of Franklin D. Roosevelt and his alleged strong positive feelings for the antisocialist policies of Adolf Hitler have relegated this corporate giant to historical obscurity.

George Eastman

American inventor, industrialist, and philanthropist

Eastman was the inventor of roll film, the founder of the Eastman Kodak Company, and the popularizer of photography as a hobby and leisure activity. He used his wealth, amassed as head of a premier American business, to support educational institutions and medical advances by donating large sums of money to colleges, universities, and hospitals.

Born: July 12, 1854; Waterville, New York
Died: March 14, 1932; Rochester, New York
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Educational institution; charity

Early Life

George Eastman was born July 12, 1854, in an upstate New York village about twenty miles from Utica. His father, George Washington Eastman, died in 1862, leaving the family in such dire financial straits that when young Eastman reached his teens, he had to drop out of high school to support his mother, Maria Kilbourn Eastman, and his sister. He worked as a messenger and office boy for insurance agencies, eventually progressing to better-paying positions as policy filer and occasional policy writer. He studied accounting at night in order to get a better paying job. By 1874, he was working as a junior clerk at a savings bank in Rochester, New York.

At the age of twenty-four, Eastman was solvent and planned a vacation to Santo Domingo, where he intended to invest in property. Advised by a friend to take photographs of the properties in which he was interested, Eastman purchased photographic equipment and was immediately fascinated by photography. He did not get to Santo Domingo, but he continued to develop his interest in photography.

George Eastman. (Smithsonian Institution)

First Ventures

At that time, photography was such a complicated process and the equipment was so cumbersome that Eastman decided to make photography more user-friendly. He began studying about photography and experimenting with formulas resulting in a high-quality emulsion and a machine that produced dry photographic plates, which were less difficult to use than the wet plates employed by photographers. It took him three years of experimentation, but by 1880 he had a patent for his machine and had set up a small company in Rochester, where he manufactured the dry plates that photographers soon preferred.

He soon realized that while his dry plates made taking pictures easier for professional photographers, professionals were about the only people who could use the huge, complicated cameras. He began looking for a way to make photography more accessible to amateurs. As he saw it, three things were needed: The photographic plate must be made of a lighter-weight, less breakable material than the conventional glass; the camera must be smaller and lighter, so it would not require a tripod; and the photographic image needed a simpler developing process. All photographs taken the conventional way had to be processed within minutes of exposure, which required photographers to transport all the necessary chemicals and equipment to their photo shoots in order to immediately develop their images.

When Eastman finally developed roll film and a small handheld camera that addressed the first two concerns, he conceived the idea of having the users simply mail the roll of exposed film to his company for developing. He advertised that his business, which he named the Kodak Company, would enable the people who used his cameras and film to merely "press the button; we do the rest." By 1897, the name "Kodak" was known worldwide. Amateur photographers embraced the easy-to-use camera and film. When in 1889, Eastman worked with Thomas Edison to develop a strong, flexible roll film for use in Edison's motion-picture camera, the kinetograph, Eastman's company began to grow into the Kodak empire and Eastman became one of the wealthiest men of his time.

A British advertisement for Kodak's Brownie camera, which sold for five shillings, equivalent to about $1.25 in U.S. currency. This camera and George Eastman's other innovations made photography accessible to the general public. (Hulton Archive/Getty Images)

Mature Wealth

Through dynamic advertising and sound business practices, Eastman made Kodak a prosperous company. He was one of the first businessmen to provide dividends to his employees in a form of profit sharing. He also established disability benefit plans, retirement annuities, and life insurance for his workforce. He believed these policies engendered worker goodwill and loyalty to the company, which, in turn, helped ensure high productivity and increased profits.

Although his first Kodak camera cost $25 in 1888, Eastman developed the one-dollar Brownie camera, which anyone could afford and use easily. He soon had Americans of all kinds buying his cameras and film. The profits of his company were enormous.

Perhaps because Eastman never married or had children, he was an extremely generous donor to various charities. A firm believer in the value of good dental care, perhaps because both he and his mother had suffered from tooth problems, he established a dental clinic and a dental program for children in Rochester. He sent donations abroad to England, France, and other countries to establish dental clinics in large cities. He was responsible for creating a school of dentistry at the University of Rochester. The fact that his mother suffered from a debilitating disease that confined her to a wheelchair, and an older sister contracted and died from polio at a young age, no doubt encouraged his support of hospitals and other health-related institutions.

Eastman was especially interested in educational institutions. His father in 1854 established and began operating a business school, Eastman's Commercial College. However, when his father died in 1861, his father's partner took over control and management of the school, and the Eastmans had no further connection to it. Eastman, a high school dropout, understood the value of education and sought to help several institutions. He gave magnanimous donations of as much as $54 million to the University of Rochester. He also gave more than $25 million, anonymously, to the Massachusetts Institute of Technology because he was impressed by the caliber of its graduates, several of whom he hired for his company. His parents had been raised by abolitionist parents involved with the Underground Railroad. With such a background, Eastman donated $2 million each to the predominantly African American colleges Tuskegee Institute and Hampton Institute.

His inclination toward philanthropy started early in his life. At a time when he was still working for others and his salary was only $60 a week, he gave $50 to a small school, Mechanics Institute of Rochester, that went on to become the Rochester Institute of Technology, a school with more than ten thousand students by the twenty-first century.

Eastman was a community-conscious booster of Rochester. He wanted to improve the quality of people's lives and provide opportunities for them to enjoy natural beauty and beautiful music well played. With that in mind, he channeled some of his money to the support of a city symphony orchestra. To ensure that there would always be well-trained musicians to play beautiful music, he established a school of music at the University of Rochester, where students could study and train to become expert musicians. He also supported the public parks, where everyone could enjoy the pleasures of nature.

Eastman retired from daily management of the Kodak Company in 1925 at the age of seventy-one, becoming chairman of the board. He spent much of his retirement in philanthropic pursuits that placed him in the same league as the better-known philanthropists of the time, such as Andrew Carnegie and John D. Rockefeller. Eastman also traveled to Europe, where he avidly toured art galleries. He bought many paintings, acquiring one of the best private collections in the country. He went on safari in Kenya and Uganda and bagged a white rhinoceros and an elephant.

By 1930, he had developed a degenerative spinal cord disease that caused him intense pain. When he began having trouble standing and walking after always being an active person, he became depressed. His mother's final years were spent in a wheelchair, and he had no desire to suffer the same unhappy fate. He proceeded to put his affairs in order by reviewing his will and making changes. He invited some friends to his home to witness the will changes and to say what they did not realize at the time would be their last good-byes. After they left, he went to his room, took an automatic pistol, and committed suicide with a shot to the heart. He was seventy-seven years old.

EASTMAN SCHOOL OF MUSIC

George Eastman always loved music and thought music appreciation could be cultivated if music was made accessible to the community. Hiring musicians, he said, was easy, but it was "impossible to buy" the appreciation of music. He believed that if more people enjoyed music, more people would support community efforts to make music resources, like symphony orchestras, available. Because he felt supporting such aesthetically enriching opportunities for a community was worthwhile, he established the Eastman School of Music and a concert hall within it.

The Eastman School of Music is located at the University of Rochester in Rochester, New York. Eastman established the school in 1921 for the purpose of providing, for those who wished to become musicians, a musical education in an environment most conducive to their attaining excellence and professionalism.

The school's first director was Norwegian pianist Alfred Klingenberg, who was succeeded in 1924 by American composer Howard Hanson. During Hanson's four decades as director, the school made great strides in its development to become a reputedly fine school. By 2008, it was listed in the Kaplan/*Newsweek* college guide as the "hottest school for music" in the United States. Other national rankings place it first in music education, composition, and piano performance; second in instrumental performance, conducting, jazz, and piano/organ/keyboard; and fourth in opera/vocal performance.

The school offers bachelor of music degrees in performance, music education, composition, musical arts, theory, and jazz and contemporary music; master of arts and master of music degrees in ethnomusicology, music theory, and pedagogy; and doctoral degrees in composition, music education, musicology, and theory. In 2009, it had more than ninety-five teachers and an enrollment of about five hundred undergraduates and four hundred graduate students. About 25 percent of these students were from foreign countries. The Eastman Community Music School had about one thousand students ranging in age from preschoolers to people in the eighties.

LEGACY

By developing and producing an easy-to-use camera and handy film, George Eastman enabled amateur photographers to capture their memories in realistic pictures. His innovative roll film also made possible the development of motion-picture entertainment. These inventions brought him great wealth, which he used for the betterment of his own and other communities.

Eastman said that people with wealth either could hold on to it to leave for others to deal with after they died, or could "get into action and have fun" while still alive, "adapting" their wealth to the "human needs" they saw around them. He said he chose to "get into the action."

Eastman gave away more than $100 million to educational institutions, medical facilities, and cultural organizations. He founded the Community Chest, later the United Way, to help support his city of Rochester. He pioneered the first profit-sharing program for employees in America. He promoted music appreciation with his support of the Eastman School of Music and the Rochester Symphony Orchestra. He endowed learning with his gifts to colleges and universities, and he promoted better health with the many dental clinics he helped establish. A modest and unassuming man, he nonetheless left a mark of distinction on the business world and many other aspects of American society.

Thomas Edison

American inventor and entrepreneur

Edison's wealth accumulated from investors' ongoing support, corporate stocks, and the sales of his inventions. Although often impoverished, he eventually gained personal fortune and prosperity through obsessive work habits that resulted in new advances in technology. His inventions revolutionized industry, communications, and business.

Born: February 11, 1847; Milan, Ohio
Died: October 18, 1931; West Orange, New Jersey
Also known as: Thomas Alva Edison; The Wizard of Menlo Park; The Napoleon of Invention
Sources of wealth: Patents; sale of products; investments
Bequeathal of wealth: Spouse; children; scholarship

Early Life

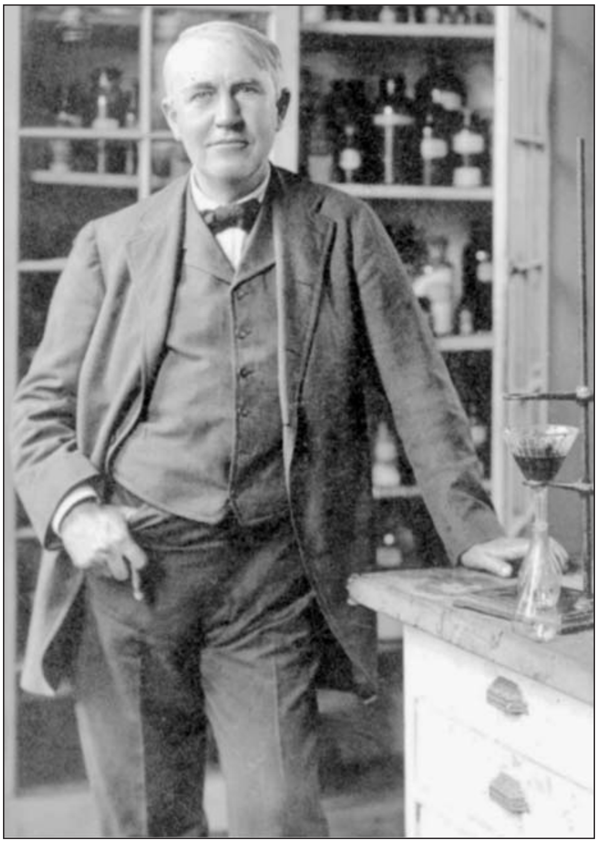
Thomas Alva Edison was the seventh and last child of Canadian emigrants Samuel and Nancy Edison. The family was forced to flee Canada and move to Ohio because Samuel supported a failed revolt against the Canadian government. Young Edison developed a keen interest in learning and discovery due to his parents' scholarly influence. Nancy, a teacher, home-schooled Edison and encouraged his use of the local library, where he was reputed to have read every book in the collection. Of early interest to him were Sir Isaac Newton's theories of physics. By age fourteen, he was already an entrepreneur, earning more than $10 a day selling snacks at a railroad station and publishing his own newspaper, *The Weekly Herald*.

In his early twenties, Edison was a freelance inventor while working for the Western Union Telegraph Company in Boston and New York. Ambitious and hardworking, he forged a path that would eventually bring him fame, notoriety, and fortune.

FIRST VENTURES

While employed with Western Union, Edison acquired his first patent, for a machine to automatically record the votes of legislative bodies. Financially, the machine was unsuccessful because politicians preferred the roll-call vote, which gave them an opportunity to state their opinions. Edison vowed never again to invent something that would not sell.

Destitute, Edison borrowed $35 to travel to New York. He repaired a malfunctioning stock ticker machine in an office and was hired there for $300 a month. After Edison sold his redesigned Edison Universal Stock Printer in 1874 for $40,000 (more than $800,000 in 2010), he constructed a laboratory in Newark, New Jersey, to manufacture the machines. In 1876, he moved to his new Edison Laboratory in Menlo Park, where he and five thousand employees would work on more than forty inventions. Edison became known as the Wizard of Menlo Park.



Thomas Edison in his laboratory. (Library of Congress)

MATURE WEALTH

Edison took risks, remained optimistic, and was persistent. For him, failure was not permanent but only represented a first unsuccessful attempt. His genius was valued enough at the time to attract willing contributors to fund his projects. In 1875, the Atlantic and Pacific Telegraph Company provided Edison with $13,500, and Western Union supplied another $5,000, so he could continue his work on automatic telegraphy. The gift funded his laboratory in Menlo Park, an enterprising venture requiring considerable backing.

In Menlo Park, Edison invented the carbon-resistance telephone transmitter (1876) and the phonograph (1877). Now regarded as an eminent inventor, he received $10,000 from five investors to establish the Edison Speaking Phonograph Company for further development of the phonograph. In 1879, Edison burned a carbonized sewing thread filament for more than thirteen hours and developed the Edison dynamo, which provided a constant electric current. Edison found wealth and fame with the success of the incandescent lamp when it became commercially viable. In 1878, one share of stock in his Edison Electric Light Company was worth $3,500. A staff physicist, who was hired at $12 a week, sold five shares in the company for $5,000 each.

In 1882, the first commercial central power station using incandescent lamps provided lighting for one square mile of New York City, initiating the electric age. Transportation and industrial markets began to rely heavily on the use of electricity, and night lighting evolved into a twenty-four-hour service. The newly formed Edison General Electric Company merged with other manufacturing companies. Although the company bore his name, Edison was just a partner. J. P. Morgan, members of the Vanderbilt family, and other investors provided the necessary capital. Edison received stock valued at $3.5 million. Eventually, Edison General merged with Thompson-Houston in 1892 and was renamed General Electric Company. General Electric supported Edison with an annual grant of $85,000, far less than the $250,000 he expected. Years later, he learned that his stake in the company was worth about $4 million.

In 1882 and 1883, Edison contracted for power stations in Brockton, Massachusetts, and Sunbury, Pennsylvania. He secured a patent for the "Edison effect," which effectively regulated the flow of electric current. This revolutionary discovery became the foundation for the manufacture of diodes, radios, televisions, and computer transistors.

In 1887, Edison constructed the first and largest research and development center in West Orange, New Jersey. His newest project was the kinetoscope, the predecessor to a motion-picture camera. The kinetoscope was a crude machine that enabled viewers to see magnified and backlit film moving past a small opening. As with the phonograph, Edison failed to realize the entertainment potential of the kinetoscope to the general public. However, his distributor formulated a successful publicity plan which required Edison to lend his name to the new Vitascope, an early film projector, but to otherwise remain in the background. The first film screening using a Vitascope was held in Los Angeles and attracted twenty thousand viewers, with another ten thousand who showed up but were not admitted. The new industry of film production was born.

The 1890's was a profitable time for Edison because he established a phonograph and phonograph recording business, capitalizing on the home entertainment market. Coin-in-the-slot phonographs occupied railway stations, arcades, and phonograph parlors throughout the United States; a San Francisco distributor of these products claimed $4,000 in revenue within six months. Edison's additional inventions included the fluoroscope (an X ray fluorescent screen) and concrete molds for precast buildings. From 1900 until 1910, Edison's primary and formidable challenge was the development of a storage battery that was suitable for electric vehicles. However, by the time work was completed on the alkaline battery, vehicles had switched to gasoline power. Developing the battery appeared to be a losing proposition, but Edison's patience paid off. Soon, railway cars, signals, ships, and even miners' lamps were using the alkaline battery. Edison's investment compounded, and the alkaline battery proved to be his most lucrative product. In 1911, Edison formed Thomas A. Edison, Inc., which controlled most of his enterprises, including phonographs, records, motion-picture equipment, and batteries.

By age sixty-four, Edison had ceased to work long hours and was entrusting associates to operate his business ventures. Emphasis was placed on improving existing products rather than inventing new ones. With World War I approaching, Edison was appointed to the Naval Consulting Board for scientific work with submarines and related naval operations. Friends Henry Ford and Harvey Firestone urged Edison to discover an alternate source for rubber automobile tires, but this final project was not completed. In his eighties, he spent more time in his Glenmont, New Jersey, home in declining health. He lingered near death for about two weeks with kidney failure before succumbing on October 18, 1931. Out of respect, President Herbert Hoover asked communities

The Edison Medal

In 1904, a trust fund was established in honor of Thomas Edison to award a gold medal each year to an individual with meritorious accomplishments in the fields of electrical science, electrical engineering, or electrical arts. Nomination criteria for this award include patents, leadership and contributions in an individual's field of endeavor, honors awarded, duration of dominance, and originality. Such prestigious recognition is a testament to Edison, who demonstrated these criteria throughout his lifetime.

Edison secured 1,368 patents between the ages of fourteen and eighty-four, about one patent every two weeks. His patents pertained to numerous inventions in the fields of communications, entertainment, medicine, and various industries. He gained and lost fortunes in some of his endeavors, but he had the unique ability to withstand severe monetary losses and recover quickly. He died a millionaire because he held to the principle of inventing something only if there was a need for it and people would buy it. Edison was cantankerous, disagreeable, and overly competitive. However, he was also an organizer, a visionary, meticulous to detail, and an excellent business promoter. To raise financial backing he made sure his inventions were featured on the front pages of newspapers and often arranged impressive demonstrations. Edison was adept at managing his fame. He capitalized on his reputation as the world's greatest inventor, which rewarded him financially.

The Edison Medal reflects contributions to society by distinguished and notable individuals. The first award, consisting of a gold medal, a small gold replica, a certificate, and an honorarium, was presented in 1909 by the Institute of Electrical and Electronics Engineers (IEEE). Among past honorees are George Westinghouse, Alexander Graham Bell, and Nikola Tesla. Other awards have been presented for research in microwave and radar remote sensing technology, programmable read-only memory, and broadband optical fiber communications. The medal serves as a symbol for men and women who have turned ideas into reality for the benefit of humankind.

across the country to extinguish all electric lights at ten o'clock in the evening, eastern time, on the day of Edison's funeral.

Legacy

For Edison, money had value only if it was used to benefit others. Since Edison was not independently wealthy, he relied on associates to support his endeavors. Accordingly, his financial situation ranged from bankruptcy to prosperity depending on the success of his business ventures related to the design and marketing of his inventions. His partnerships with others, however, allowed him to continue his work toward new discoveries and to achieve recognition as "the Napoleon of invention."

Edison's wealth provided the creation of the world's first industrial research laboratory that encouraged staff teamwork and strengthened mass production at unprecedented levels. He invented better communication devices, introduced home entertainment through phonographs and motion-picture cameras, and improved countless industrial commodities.

Eleanor of Aquitaine

French royalty and landowner

Eleanor's wealth was based on the vast properties she owned in France. She received income from Aquitaine and Poitou as well as from other properties owned while she was queen of France and later of England.

Born: c. 1122; Bordeaux or castle of Belin, southern France
Died: April 1, 1204; the Abbey of Fontevrault, Anjou, France
Also known as: Eleanor of Guyenne
Sources of wealth: Inheritance; marriage; real estate
Bequeathal of wealth: Children; church

Early Life

Eleanor of Aquitaine (EL-eh-nor uhv AK-wuh-tayn) was one of three children born to William X of Poitier, and Aquitaine and Aenor of Chatellerault. She was named after her mother, who died when Eleanor was eight; Eleanor's name "alia-Aenor" means "the other Aenor." There is some disagreement among scholars as to when and where Eleanor was born. She was the older daughter, and when her brother died, under the laws of the land, Eleanor became heir to her family's estate. There is no argument as to the wealth she inherited. The county of Poitou and the duchy of Aquitaine covered a vast area of what is now southwest France. Aquitaine, whose name means "land of waters" in Latin, is so named because of the number of rivers there. Its temperate climate promoted agriculture, and the domain was fertile, producing grain, fruit, and wine. The export trade in wine and salt contributed to the wealth of the duchy.

Growing up, Eleanor became used to luxuries and was fascinated by the troubadour culture adopted in aristocratic circles. Her grandfather William IX wrote what is considered the first troubadour poetry, celebrating love and the beauty of women. The court of the dukes' of Aquitaine was frequented by poets and musicians and was the center of western European culture. Unlike other noblewomen, Eleanor was taught to read and write in her native tongue, *langue d'oc*, the language of southern France, and given instruction in Latin. When her father died in 1137, she became countess of Poitou and duchess of Aquitaine; she was barely fifteen and the richest heiress in Europe. Before her father died, he had appointed the French king, Louis VI, also known as Louis the Fat, as her guardian. To avoid other suitors, Louis, whose territory was much smaller than Eleanor's, promptly betrothed her to his son.

Eleanor of Aquitaine. (The Granger Collection, New York)

First Ventures

Eleanor's father had died on Good Friday, April 9, during an Easter pilgrimage, and King Louis, who was not well, pushed for a quick marriage. His son Louis had been destined for the Church, but he became heir to the French crown when his older brother died. Young Louis was sixteen, and he and Eleanor married on July 25, 1137, in the cathedral of Saint André in Bordeaux. As a well-bred young woman, Eleanor had no choice in her bridegroom. Before the summer's end, Louis VI had died. Eleanor's husband, now Louis VII, ascended to the throne and Eleanor became queen of France. She relocated to Paris and exerted her influence, bringing music and verse from the south into the court. She learned Parisian French and showed a capacity for Aristotelian logic, highly popular with the university students of Paris. She failed at her principal occupation—to provide an heir. However, in 1145 she gave birth to a daughter, Marie.

When Pope Eugenius III asked the king to go on a Crusade to the Holy Land, the king readily assented, and Eleanor insisted on participating. They left France in June, 1147. Eleanor was enchanted with the bright clothes and the exotic nature of Byzantine culture in Constantinople, and at Antioch the king and queen were hosted by Eleanor's uncle Raymond. Again speaking the language of her childhood and surrounded by luxury, Eleanor refused to leave for Jerusalem and had to be dragged from her uncle's palace. This event was the climax to a failing marriage. There was a brief reconciliation, and in 1150 Eleanor gave birth to a second daughter, but the marriage was over. Her failure to provide a male heir and Eleanor's efforts to secure an annulment due to consanguinity within the fourth degree of kinship resulted in an annulment on March 21, 1152. Her lands were returned to her.

Mature Wealth

On May 18, 1152, less than two months after her divorce, Eleanor married her second husband, and this time the bridegroom was her chosen mate. She married Henry Plantagenet, duke of Normandy and count of Anjou. Although both Henry and Eleanor were technically vassals of the king of France and should have sought his permission to marry, they did not, realizing that the king would have forbidden their union. As the result of their marriage, Eleanor was now the duchess of Aquitaine and Normandy and the countess of Poitou and Anjou; Henry acquired by marriage almost half of what is now France. Although Henry was eleven years younger than Eleanor, the marriage suited both.

In 1154, with the death of King Stephen, Henry became King Henry II of England, and Eleanor was again a queen. Her list of titles was impressive: queen of England; lady of Ireland; duchess of Normandy, Aquitaine, and Gascogne; and countess of Poitou, Saintonge, Angoumois, Limousin, Auvergen, Bordeaux, Agen, Anjou, Maine, and Touraine. Henry also endowed her with numerous manors, consequently increasing her already substantial wealth. As queen, Eleanor was actively involved in political life and traveled extensively in England and France. She acted as regent in England when Henry was abroad and continued to act as feudal lord in Poitou and Aquitaine. She also provided Henry with heirs. They had eight children—five sons and three daughters.

As her children grew, Eleanor's marriage to Henry weakened. In 1168, when Henry returned full control of Aquitaine to Eleanor, she relocated to Poitiers and established a court where she had grown up. Her court extended beyond governing into a center of culture and the arts. Enabled by her wealth, Eleanor served as a patron of the arts. Poets gathered, and the concept of courtly love flourished, as did conspiracy.

When Henry divided his continental possessions among his sons, providing them with titles but not true power, trouble began. In 1173, Eleanor, aided by her former husband King Louis VII, stood behind her sons when they rebelled against Henry. Henry defeated his challengers, pardoned his sons, and removed Eleanor from France. He considered divorcing her, but he chose not to because he did not want to lose her lands in Aquitaine and Poitou. Henry tried to make Eleanor become a nun; she refused. Consequently, Eleanor was virtually held prisoner in Salisbury Castle for fifteen years. For a woman whose wealth enabled her to travel freely, who was accustomed to having political power, and who was used to the luxuries of fine clothes, foods, and wines and of interesting and stimulating visitors, the period of imprisonment was difficult. Her financial resources were cut off, and her lifestyle was described as "Spartan."

When Henry II died, the heir to the English throne, Richard I, immediately freed his mother. Eleanor again became regent of England when Richard went on a Crusade, and it was Eleanor who worked to raise the ransom of 100,000 marks of silver when Richard was imprisoned. When Richard was returned, she retired to the abbey at Fontevrault but continued to be involved in ruling her lands. After Richard died, Eleanor again became politically active, working to have her last son John accepted and crowned king of England. King John rewarded her support by proclaiming she was to retain Poitou and Aquitaine for the rest of her life and be "lady" over all his possessions. Over

The Palace of Justice in Poitiers

The Palais du Justice, or Palace of Justice, was originally the ducal palace for the dukes of Aquitaine. Located in Poitiers, the capital of Poitou, France, it was the second palace on the site. The first palace was built during the ninth century at the highest spot in town, above a Roman wall. During Merovingian times, the structure served as the seat of justice. After the first palace was completely destroyed by a fire in 1018, a new palace was built by the dukes of Aquitaine. In 1104, William IX, Duke of Aquitaine, added a tower on the town side, known as *tour Maubergeonne*. It was named for his mistress Amauberge ("the dangerous"), whom he installed there. Amauberge was the grandmother of Eleanor of Aquitaine, and Eleanor spent her childhood in the palace.

Between 1191 and 1204, Eleanor refurbished the structure, creating sumptuous domestic spaces and constructing a dining hall, the *Salle des pas perdus*. This "hall of lost footsteps," so named because of its vastness, measured fifty meters in length and seventeen meters in width. Eleanor created a proper setting for a queen. The palace was full of music, poetry, chivalric behavior, and expensively dressed aristocrats who drank fine wines and ate exquisite food.

The palace was also where Eleanor, with her daughter Marie, countess of Champagne, presided over the Courts of Love. A young knight would petition the court, which consisted of Eleanor, Marie, and other high-born women, about an aspect of his behavior toward his lady, and the court of women would decide his fate. The second book of Andreas Capellanus's *Liber de arte honeste amandi et reprbatione inhonesti amantis* (1184-1186; book of the art of loving nobly and the reprobation of dishonorable love) was based on one of Eleanor's rulings.

Over the years there were changes to the palace. Eleanor's great hall was remodeled; the original beamed ceiling was covered, and the walls were painted. Jean, duc de Berry (1340-1416), rebuilt part of the palace that had been destroyed by a fire. Over the years, various reconstruction projects were carried out, and Eleanor's court of love eventually became a court of law.

the years, Eleanor had provided financial support to the abbey at Fontevrault. It was here that her husband Henry and son Richard were buried. Eleanor spent her last days at the abbey. There is some speculation that she took the veil and became a nun, but this has never been substantiated. Eleanor died in April, 1204, and was buried beside Henry.

Legacy

Eleanor of Aquitaine's lands were inherited by her sole surviving son, John. They would eventually be lost, as was the rest of the Angevin Empire to France in a war that would last one hundred years. Eleanor left a legacy in her contribution to and fostering of the literature of the times, specifically her involvement in the Courts of Love. Her principal legacy was her sons and daughters and their offspring, who reigned on the thrones of Europe

Elizabeth II

British monarch

The wealth of Queen Elizabeth II of Great Britain, the best-known monarch of the twenty-first century, has been estimated at $420 million, although the extent of her fortune has never been publicly documented.

Born: April 21, 1926; London, England
Also known as: Elizabeth Alexandra Mary (birth name); Princess Elizabeth; Lilibet; Elizabeth Windsor; Elizabeth Alexandra Mary Mountbatten-Windsor
Sources of wealth: Inheritance; real estate; government
Bequeathal of wealth: Unknown

Early Life

Elizabeth II was born into the royal British Windsor family in 1926. Her father, the duke of York, was second in line to the British throne. However, the abdication of King Edward VIII propelled the duke into the monarchy as King George VI in 1936. From 1940 until 1945, Elizabeth lived at Windsor Castle, and she served a stint in the army during World War II. The British royal family lived modestly in a time of great deprivation, both during and after the war.

Shortly after the war, Elizabeth was reunited with and subsequently married a distant cousin, Philip Mountbatten, who was then living off his navy pay. He was named the duke of Edinburgh and allocated an annual allowance from the civil list, the funds that the government of Great Britain provides for numerous members of the royal family. Elizabeth and Philip married in November, 1947, and they moved into a small palace in London. The young couple soon had two children, Charles and Anne. In February, 1952, George VI died, and Elizabeth ascended the throne with Prince Philip as her consort.

First Ventures

On her accession, Queen Elizabeth II received two different forms of wealth. The first was in the form of possessions that were attached to the monarchy, and this wealth was placed in a trust. Elizabeth could not dispose of these possessions, which consisted of a number of the

Elizabeth II at the opening session of Parliament in 2010. (AP/Wide World Photos)

royal palaces, other real estate, treasure, and collections of art and jewelry, including the crown jewels, kept at the Tower of London. The best known of the palaces are Buckingham Palace, Windsor Castle, and Holyrood House in Edinburgh, Scotland.

The second form of wealth, inherited from her father, was private and at her own disposal. This inheritance included several buildings, notably Balmoral Castle and its estates in Scotland and Sandringham House and estate in Norfolk, England. She also was bequeathed artworks and various treasures. In addition, Elizabeth obtained a large annual sum from the civil list in order to supplement the income derived from the duchy of Lancaster, her hereditary property.

Mature Wealth

Over time, both sources of Elizabeth's wealth grew through a natural increase in value and the many gifts the queen received regularly. The queen was also given the best financial advice concerning investments, which were limited primarily to blue chip bonds and stocks, and the value of these investments has increased considerably during the many years of her reign. She has been renowned as a careful money manager, with her one indulgence being the development of her stables. She has hired the best horse trainers, and her horses have always performed well.

After a serious fire at Windsor Castle spurred a national debate about who should bear the costs of restoration, the queen agreed to pay income tax beginning in 1992. At the same time, she began assuming some of the payments to her children that had been included in the civil list, with the exception of funds for her son Charles, Prince of Wales, and for some of the minor royalty.

The queen's finances are kept secret, so the amount of even her private wealth remains a subject of conjecture. In 2001, *Forbes* magazine judged her private wealth to be about $420 million, which was much lower than most previous estimates. This figure consisted of her private property, valued at $150 million; her art, jewelry, furniture, and horses, with a value of about $110 million; and the remainder obtained through investments.

Legacy

Queen Elizabeth II has been able to move the British monarchy into the twenty-first century as a significant and honored institution. Part of this respect derives from the conservative display of her wealth, which she exhibits just enough to maintain her dignity as head of state, while refraining from the public extravagance that would invite criticism. The secrecy of her finances and lack of accountability for her wealth have invited ongoing criticism, but every indication is that her fortune is well managed.

John Ellerman

British shipping magnate, businessman, and investor

Ellerman quietly forged a vast corporate empire from his careful acquisitions of a variety of ailing enterprises, notably shipbuilding firms and newspapers, and in the process accumulated the largest personal fortune in British business history.

Born: May 15, 1862; Hull, Yorkshire, England
Died: July 16, 1933; London, England
Also known as: Sir John Reeves Ellerman, first baronet
Sources of wealth: Shipping; real estate; investments
Bequeathal of wealth: Spouse; children

Early Life

Although he would become by most records the wealthiest British citizen in history, Sir John Reeves Ellerman, first baronet, unlike other Victorian magnates who thrived as celebrities, was fiercely protective of his private life. Thus, little is known of his early years. He was born in the village of Kingston upon Hull in northeast England. His father, a first-generation German immigrant who worked as a corn merchant with modest interests in commodities shipping, provided a quiet middle-class upbringing. His father died when Ellerman was nine. Ellerman attended but did not graduate from King Edward VI School, a prestigious preparatory school in the heart of Birmingham. As an adolescent, he resisted what he perceived as the arbitrary authority of teachers and maintained a close relationship with his mother. These difficulties stemmed from his embrace of nonconformity, his determination to go his own way.

First Ventures

Ellerman began to live on his own when he was fourteen. He moved to Birmingham and was licensed as a chartered accountant, which was unusual in an era when such work was frequently performed by bankers and secretaries. He relocated to London, where, by the age of twenty-four, he was directing his own accounting firm. He worked diligently to establish his company's reputation as one of London's most trusted accountancy firms. Most important, his work gave him access to financial records of distressed companies. With a savvy business acumen, Ellerman arranged to purchase the most promising of these floundering firms, drawing for the most part on his own capital but networking throughout London's most affluent circles for investors. He then restructured the firms' operations to give them, as well as himself, new opportunities for profit.

In 1892, upon the death of millionaire Liverpool shipbuilder Frederick Richards Leyland, Ellerman made his boldest move. As the head of a consortium of investors, he purchased the massive Leyland Line, with its fleet of twenty-two cargo and passenger ships. At the time, Ellerman had little background in shipping, but the opportunity presented by this company, which was experiencing a power vacuum after Leyland's death, was promising. Over the next decade, Ellerman became engaged in the management of the shipping line and he doubled the size of its fleet. Ellerman's shipping operations supplied critical naval carriers for ammunition and troops that helped ensure a British victory in the Second Boer War (1899-1902).

Mature Wealth

In 1901, American financier J. P. Morgan purchased the Leyland Line from Ellerman, although Ellerman continued directing operations and maintained direct ownership of half of the ships. Ellerman recognized the financial potential in shipping, which was the most efficient way to move goods, and during a time of relative peace the potential for international trading was clear. He used his considerable assets to purchase small shipping lines, forming the London, Liverpool and Ocean Shipping Company. Ellerman acquired smaller shipping lines until he eventually changed the name of his company to Ellerman Lines in 1903; the shipping firm would continue to expand. Ellerman became known for his relentless appetite for acquisition, notably his purchase in 1916 of more than sixty ships belonging to Thomas Wilson Sons, at the time among the largest private shipping firms in the British Empire.

Eventually, Ellerman branched out into other business ventures. At the height of his financial operations just before World War I, he controlled more than seventy breweries and twenty mines, and he had controlling interest in a number of major newspapers, notably *The Times*, *Daily Mail*, and the *Financial Times*. In addition, he bought up numerous lots of prime real estate in the heart of London with an eye toward development. His wealth was estimated at close to £70 million, or roughly $300 million, and as his fortune accumulated, he wielded an increasing influence in worldwide trade.

The John Ellerman Foundation

The son of Sir John Reeves Ellerman, first Baronet, did not share his father's considerable business acumen, nor was he interested in the operations of his father's vast financial empire. Although Sir John Reeves Ellerman, second Baronet, passed the bar exam, the junior Ellerman was far more interested in zoology than in law. He pursued this interest, and by the time of his father's death in 1933, he had become a world-recognized authority on small rodents. Ellerman conducted his research on rodents in places as far away as South Africa and Asia. He was equally devoted to the arts, particularly music, the theater, and light opera.

Upon inheriting the majority of his father's estate, however, Ellerman assumed the responsibility for its management by turning a significant portion of it over to charitable institutions that assisted a wide range of causes, including veterans' homes, hospitals for the blind, educational institutions in London's poorest neighborhoods, and commissions that funded promising artists. By the mid-1950's, when his own poor health compelled him into a kind of semiretirement in the balmy climate of South Africa, the junior Ellerman had become known as one of London's foremost philanthropists.

In 1973, shortly before his death, Ellerman restructured his majority interest in Ellerman Lines, taking 79 percent of his shares and establishing two trusts chartered to make grant money available for any registered charity in the United Kingdom. Like his father, Ellerman was uninterested in publicity, and he strongly vetoed the idea of naming the trusts after his family, instructing the trust funds to be known as the Moorgate Fund and the New Moorgate Fund.

During the next two decades, these funds would become among the most sought-after grant providers in the United Kingdom, providing sums ranging from £10,000 to £100,000 in areas that included, but were not limited to, health and disability charities, social welfare bureaus, arts councils, and conservation and environmental enterprises. Unlike other large foundations, the Moorgate funds welcomed unsolicited applications from any service or charitable organization. Despite the enormous financial resources of the funds and their ambitious mission, they required only that an applying charity strive to make a real difference in its community, with special interest in those enterprises that sought practical ways to help the poor and disadvantaged.

In 1992, the two funds merged to become the John Ellerman Foundation, named for both father and son. Although the Ellerman Lines, which were the source of the family's fortune, had declined as the global market moved away from shipping in the 1970's and 1980's, the foundation itself remained financially healthy into the twenty-first century. By 2009, the foundation had distributed, on average, more than £5 million a year to between 160 and 200 separate charities.

Ellerman never pursued celebrity, nor did he seek to promote himself, his family, or his operations for public acknowledgment. When he was made a baronet in 1905 in recognition of his contributions to the Boer War effort, he actually turned down a far more prestigious peerage. He never lived in an ostentatious estate, never hosted sumptuous gatherings, never traveled, and never used his wealth to accumulate possessions or indulge expensive tastes. He and his family lived a simple, private life in Mayfair, an exclusive area in west London. His guarded sense of privacy had much to do with protecting his family from public scrutiny. He maintained what in the Victorian era was an unconventional relationship by living for nearly two decades with Hannah Glover, whom he had not married and with whom he had a daughter, born in 1894, and a son, born in 1910. In an effort to make clear the line of inheritance to his son, Ellerman in 1911 established his relationship with Glover as legal by taking advantage of an obscure Scottish law, applicable throughout the United Kingdom, that said a man and woman living together for twenty-one days were married.

Ellerman maintained hands-on direction of his expanding empire, although he moved its headquarters from London to Liverpool and later opened an operations office in Glasgow, Scotland. By the outbreak of World War I, Ellerman Lines controlled critical trading routes throughout the Mediterranean Sea, as well as important new lines to the American markets and to Asia and Africa. During World War I, Ellerman again provided naval support for the British government, with his fleets of more than one hundred ships assisting the Royal Navy by providing troop ships and ammunition carriers. His own trading enterprises declined, compromised by the security risks of wartime.

However, after the war, Ellerman, although nearing sixty, committed himself to rebuilding the Ellerman Lines. He negotiated with the defeated German government to purchase its decommissioned ships, and within five years of the 1918 armistice Ellerman was again in command of one of the most successful shipping conglomerates in the world. In 1921, Ellerman was named to the Order of the Companions of Honour, an exclusive recognition bestowed by the monarchy in order to commend civilian contributions to the welfare of the British Empire.

Although the global economic catastrophe of the 1930's took its toll on his empire, when Ellerman died in 1933 he was regarded as the wealthiest individual in British history, with the exception of the nation's monarch. Yet few people in Great Britain knew him, and the newspapers, even those he owned, scrambled to find a photograph to accompany his obituary. Ellerman's estate was assessed at a £38 million, or roughly $140 million, excluding his considerable liquid assets, and was more than three times the size of what had previously been the nation's largest estate. Although he provided for both his wife and his daughter, who was by then an accomplished novelist, two-thirds of his estate was left to his son.

Legacy

Despite his considerable wealth, John Ellerman sought neither power nor recognition. With the confident, careful logic of a trained accountant, Ellerman constructed a business empire, an example of the methodical accumulation of wealth based not on daring but rather on study and professional care. During five decades, Ellerman came to define a new kind of entrepreneurship. He embodied two characteristics that would later be considered antithetical: He was both a corporate raider and a white knight. Opportunistic and with an insatiable appetite for acquiring floundering businesses, Ellerman would pounce on promising companies that were either too small or too deeply in crisis to resist him, and he would then, with managerial savvy and a knack for efficiency, make these firms profitable, while using these profits to finance newer, wider acquisitions.

LARRY ELLISON

American computer magnate

Ellison's brilliance and aggressiveness created Oracle Corporation, one of the most successful and powerful technology companies, and made him a multibillionaire. Known as a brutally tough businessman, he also has contributed to numerous charities and founded the Ellison Medical Foundation.

Born: August 17, 1944; Bronx, New York
Also known as: Lawrence Joseph Ellison
Sources of wealth: Computer industry; sale of products
Bequeathal of wealth: Children; charity; medical institution

EARLY LIFE

Lawrence Ellison was born in the Bronx borough of New York City on August 17, 1944, to a nineteen-year-old single mother named Florence and an unknown father. Young Larry contracted a severe case of pneumonia, prompting Florence to send the nine-month-old child to live with her aunt and uncle, Lillian Spillman Ellison and Louis Ellison, in Chicago. The Ellisons, Russian-Jewish immigrants, welcomed Larry into their family and adopted him. Louis was very demanding of Larry, and when Larry learned that the Ellisons had adopted him, he became more independent and tough-minded.

Ellison excelled at math and science, aspiring to be a doctor. He attended the University of Illinois at Urbana-Champaign for two years, quitting when his adoptive mother succumbed to cancer. He later attended the University of Chicago for a semester but never graduated.

FIRST VENTURES

Ellison moved to California's Silicon Valley in 1966, and during the next eight years he worked at various technol-

Larry Ellison delivers the keynote address at the Oracle Open World Conference. (AP/Wide World Photos)

The Ellison Medical Foundation

Billionaire Larry Ellison, a founder and the chief executive officer of the Oracle Corporation, founded the Ellison Medical Foundation in 1998, teaming up with his friend scientist Joshua Lederberg to fund research in the biological processes of aging. These studies include examining illnesses like Parkinson's disease, Alzheimer's disease, and cancer. Ellison is the sole financier of the foundation, having contributed hundreds of millions of dollars to the organization.

Ellison, a science and health buff, was attending a weekend seminar on the Human Genome Project at Stanford University in 1992 and was mesmerized by Lederberg's eloquence and intelligence. Lederberg, the former president of Rockefeller University in New York City, was a cowinner of the Nobel Prize in Physiology or Medicine in 1958. The scientist won over Ellison immediately, and Ellision invited Lederberg to lunch, thus beginning a friendship based on each man's deep love of science and desire to learn more.

Ellison accumulated massive wealth throughout the 1990's but had no set philanthropic goals. He decided, with Lederberg's help and vision, to fund a medical foundation to support top scientists in their research without the documentation and effort needed to obtain government grants. Ellison, who lost his adoptive mother to cancer and has a brother-in-law with Parkinson's disease, has always been consumed with maintaining a healthy lifestyle. For this reason, he established the Ellison Medical Foundation to conduct research in the basic biological sciences relevant to understanding the human life span and age-related diseases and disabilities.

The Ellison Medical Foundation partnered with the American Federation for Aging Research (AFAR), creating the Ellison/AFAR Postdoctoral Fellows in Aging Research Program. The program is designed to encourage and further the careers of promising postdoctoral fellows in the biological and biomedical sciences and to establish these fellows in the field of aging research.

During the 2003 America's Cup race, Ellison was asked to explain the differences between his passions for business, sailing, and the progress made by his foundation. Ellison said that molecular biology held more appeal than racing sailboats because the biology "race" and the people in it were more interesting and the prize was larger.

Lederberg died in 2008 at age eighty-two. He was awarded the Presidential Medal of Freedom, the highest civilian award in the United States, in 1996. The Ellison Medical Foundation continues to pursue the mission that Lederberg envisioned.

ogy jobs. While working at Ampex, a small technology firm, Ellison teamed with Robert Miner and Edward Oates to write a database program for the Central Intelligence Agency (CIA). The three partners named the program Oracle.

Ellison left Ampex for Precision Instruments (later named Omex), which, like Ampex, was in the business of converting microfilm to videotape. Omex was looking for contractors to program their mass storage system, so Ellison, then vice president of the company, formed Software Development Laboratories in 1977 with his friends Miner and Oates. They won the $400,000 contract at a third of the price of the next lowest bid; Ellison put up just $2,000 to fund the business.

Ellison hoped to build and market his own product and was inspired by a series of International Business Machines (IBM) white papers that detailed System R, the prototype database that IBM was building. System R was a relational database management system, and the white papers outlined the specifications and structured query language needed to organize and access the system's data. Ellison scrapped his database model and used the IBM white papers as the blueprint for his new and improved Oracle database.

Software Development Laboratories changed its name to Relational Software, Inc. (RSI), in 1979. Ellison owned 60 percent of RSI, with Miner and Oates each owning 20 percent. Ellison traveled relentlessly in the following years, successfully marketing his company and its Oracle database. He became a millionaire, acquiring cars and boats. RSI was later renamed the Oracle Corporation after the firm's flagship program.

Mature Wealth

Oracle beat IBM to the market for relational database management systems by more than two years, creating a product that could be used across a broad range of computer hardware and software systems. Oracle became profitable by 1982 with $2.5 million in earnings, and it then doubled its profit in 1983 when it expanded to Denmark.

As the use of computers increased in the early to mid-1980's, businesses scrambled to manage data, and Oracle fought and outsold its competitors. Company revenues in 1985 climbed to $23 million, and the following year sales doubled to $55.4 million, with Ellison's stake in the company now worth $90 million. Oracle went public in 1986, one day before another technology firm, Microsoft Corporation, also became a public company. While Microsoft became a hit with its Windows software, which was sold primarily to individuals, Oracle sold its products to companies and governments. The stage was set for a competition between the two companies and their two soon-to-be-billionaire founders: Microsoft's Bill Gates and Oracle's Ellison.

Oracle ended the 1980's as the top company name in database management systems, attaining the largest number of end users in the world, top-level customers, and a reputation as a technology innovator. Oracle became a member of Standard & Poor's 500 and was one of the largest and most powerful software companies in the world. Ellison accumulated hundreds of millions of dollars during the 1980's.

Oracle's unstoppable growth was halted in early 1990, however, when its aggressive expansion plans revealed flat earnings because of an accounting error, and the value of the company's stock dropped precipitously. Problems were exacerbated in April, 1990, when a dozen shareholders brought suit against the company for allegedly making false and misleading earnings forecasts. The lawsuit led to an internal audit and management restructuring, with Ellison taking on the additional role of chairman of the board, along with his positions as president and chief executive officer. The once-praised company and its founder were criticized when Oracle reported its first quarterly loss in mid-1990, and the company scrambled to avert a possible bankruptcy. Ellison came under fire for his company's combative sales and marketing practices and his lavish lifestyle. Oracle's stock lost more than $2.7 billion in market value in six months and, consequently, Ellison's net worth, mostly tied to his company's stock, took a big hit.

Oracle acknowledged that it had grown too rapidly, restated 1990 earnings, and shed more than 10 percent of its employees. During 1991, the company regrouped and rebuilt, attaining sales of $1 billion. Oracle added $1 billion to its revenues annually from 1992 to 1998, and Ellison, now a multibillionaire, continued to burnish his playboy image by buying exotic cars, yachts, and private jets, including two fighter jets. He also spent ten years building an estimated $200 million, twenty-three-acre estate in Woodside, California, designed in a style based on Japanese medieval architecture.

Ellison has always been a calculated risk taker in business and in his personal life, with several children from several marriages. His thirst for adventure has led him all over the world, where he has flown, sailed, explored, climbed mountains, and lived a life few others could rival. He is a licensed instrument-rated pilot and an accomplished sailor. He had a life-changing experience during the harrowing Sydney to Hobart Yacht Race in 1998, when a strong storm ravaged the racing fleet, costing six sailors their lives. His yacht, the eighty-foot *Sayonara*, and his crew were relatively unscathed in the storm, and he won the race. However, Ellison swore he would no longer compete in sailing competitions. Still, he remained involved in the sport, becoming the second largest investor in BMW Oracle Racing, a team that is a perennial challenger in the America's Cup race. Ellison's love of the ocean extends beyond sailing to high-end yachting. He and entertainment executive David Geffen co-own one of the largest private yachts in the world, the *Rising Sun*, a 452-foot superyacht launched in 2004.

Legacy

Larry Ellison is a pioneer in the software industry. He has had a tremendous impact on global business information management, and he has also created a personal fortune rivaled by few others. His inventions and business practices will be studied for generations, and his tens of billions of dollars and eccentric lifestyle will probably be criticized equally long. At one point in 2000, Ellison was the richest person in the world, briefly surpassing rival Bill Gates, when Ellison's net worth reportedly exceeded $60 billion.

Charles Engelhard, Jr.

American industrialist and racehorse owner

Engelhard built the largest precious metals refining company in the world, with major operations in the United States and South Africa. He and his wife Jane lived lavishly on several estates, racing an army of thoroughbred horses and making donations to the American Wing of the Metropolitan Museum of Art.

Born: February 15, 1917; New Jersey
Died: March 2, 1971; Boca Grande, Florida
Also known as: Charles William Engelhard, Jr.; The Platinum King
Sources of wealth: Metals refining; horse breeding
Bequeathal of wealth: Spouse; children; charity

Early Life

Charles William Engelhard (EHN-gehl-hahrd), Jr., was born to wealth, which he greatly increased. His father, Charles Engelhard, established the Hanovia Chemical and Manufacturing firm in 1902, which processed gold and other precious metals, such as platinum and silver. Charles, Sr., and his wife lived in a mountain estate they called Craigmore, located in New Jersey. In 1940, they established the Charles Engelhard Foundation for charity. Charles, Jr., was their only child. Charles, Jr., was raised in a strict atmosphere that prepared him to inherit his father's business. He graduated from Princeton University. In World War II, he was a bomber pilot with the U.S. Air Force. After the war, he went to work in his father's firm. In 1947, he married a widow, Jane Reiss, who also came from a wealthy family. She was born Marie Annette Jane Reiss in 1917 in Shanghai, the daughter of Hugo Reiss, who ran a successful worldwide import-export company. In June, 1939, Jane married Fritz Mannheimer, the leading banker in Europe, who had built an art collection worth tens of millions of dollars. Several months after the wedding, Mannheimer died in mysterious circumstances. During their marriage, Charles and Jane raised five daughters: Annette, from Jane's first marriage to Mannheimer, and the couple's own children, Susan, Sophie, Sally, and Charlene. In 1949, the couple bought a 172-acre estate in New Jersey, called Cragwood.

By the time of his death in 1950, Charles Engelhard, Sr., had expanded his firm to become the world's largest refiner and fabricator of gold, silver, and platinum, as well as the world's largest precious metals smelter. He left his $20 million estate to Charles, Jr.

First Ventures

Charles, Jr., expanded the family business many times during the following decades. He raised revenue through his astute use of technology, applying important innovations to the precious metals refining industry. In 1948, Engelhard opened a branch in South Africa in order to sell art objects and jewelry made of gold. During the next thirteen years, Engelhard became an industrial giant in South Africa. His success in refining and selling platinum earned him the nickname the "Platinum King." His gold, silver, and platinum bars became world-famous and were a widely accepted form of precious metals currency. In South Africa, he also traded uranium, diamonds, and timberland.

In 1958, Engelhard amalgamated his holdings into Engelhard Industries, which had $200 million in annual sales. In addition to metals refining, Engelhard Industries sold ceramic products, jewelry, pharmaceuticals, medical and dental equipment, automotive and aircraft parts, and equipment for the nuclear, petroleum, and plastics industries. In 1959, Engelhard's precious metals operations alone netted $3.7 million, and his net worth was estimated at $100 million. In 1961, he began selling shares of his company to the public, retaining a 43 percent ownership; the company's revenues that year were $1.43 billion. Within a few years, revenues had climbed to $10 billion. Engelhard Industries conducted business in fifty countries. It is widely believed that author Ian Fleming based the villainous character of Auric Goldfinger in his James Bond novel *Goldfinger* (1959) on Charles Engelhard, Jr. As one of the largest foreign operators in South Africa, Engelhard came under criticism because of that nation's policy of apartheid. He sold his South African operations shortly before his death in 1971.

Mature Wealth

Charles and Jane Engelhard employed their wealth ambitiously and strategically. They were large-scale contributors to the Democratic Party and friends with Lyndon B. Johnson, the party leader who later became president and for whom the Engelhards often hosted gatherings at their estate. Charles entered politics in 1955 when he ran for the New Jersey State senate. He was narrowly defeated by another multimillionaire, editor Malcolm Forbes. In 1961, Jane was appointed to the White House Redecoration Committee.

The Engelhards lived amid luxurious surroundings. Charles and Jane owned homes in New Jersey, Quebec, Florida, Maine, Paris, and Johannesburg, South Africa.

Wealth and Gold

Nothing symbolizes wealth as much as gold. From the beginning of civilization, gold has been desired, hoarded, fought over, shaped into exquisite jewelry and decorations, and, most important, considered the ultimate currency and source of wealth. Gold is a metal with the symbol Au on the periodic table of the elements. This precious metal is treasured because of its unique qualities. Gold is lustrous and brilliant to behold, and it does not tarnish with use or wear. It is impervious to almost any other element, and it is thus almost indestructible. Gold is rare. It also is soft and malleable, and it can be molded into almost any conceivable shape, however fine.

The legendary status of gold dates back to antiquity. In Greek mythology, Perseus sought the Golden Fleece. King Midas of Phrygia was famed for his "golden touch." King Croesus of Lydia minted gold coins, which were a part of his vast wealth. The ancient Romans extracted large amounts of gold from the Las Medulas mine in Spain. Even Aesop's goose laid golden eggs.

The medieval Mali Empire was built on huge quantities of gold, to the amazement of the world. At the same time, alchemists sought to turn base metals into gold; they did not succeed, but they did contribute to the development of chemistry. In later years, the Spanish conquistadors demanded the gold of the Aztec emperor Montezuma II and the Inca emperor Atahualpa. Other conquistadors brought themselves to destruction searching for El Dorado, the lost city of gold. In the nineteenth century, Aga Khan I, imam of the Ismāʿīlī Muslims, was weighed against a pile of gold bullion, donated by his followers to match his weight.

Archaeological finds became famous when they uncovered objects made of gold. When archaeologist Howard Carter discovered the mummy of Pharaoh Tutankhamen, the ancient Egyptian leader was entombed in a solid gold casket weighing 296 pounds, and he was wearing a solid gold funerary mask weighing 24 pounds. The Karun Treasure, a collection of ancient Lydian objects from the seventh century B.C.E., included golden birds and horses.

Throughout history, treasure hunters searched for Valverde's gold, rumored to be the remainder of Atahualpa's gold, hidden from the Spanish; the buried gold treasure of seventeenth century pirate William Kidd; gold from the treasure ship *Republic*, lost when it sank in 1865; and the gold stolen by the Nazis. Once gold is found, hoards of miners rush in to seize it. The gold rushes in California in 1849, Australia in 1851, South Africa in 1886, and the Klondike in 1897 have become legendary for having attracted hundreds of gold seekers eager to strike it rich.

The most beautiful and valuable coins in history have been made of gold: the aureus and solidus of ancient Rome, the Venetian ducat, the Byzantine bezant, the Islamic dinar, the British sovereign, the South African Krugerand, and the American "double eagle" twenty-dollar gold piece, designed by sculptor Augustus Saint-Gaudens. The Chinese emperor Xianzong is credited with the first use of paper money in the ninth century, but paper money was backed by gold. For example, the U.S. dollar was supported by gold reserves in Fort Knox, Tennessee, and other locations. In the twentieth century, both Great Britain and the United States went off the gold standard, as did most of the world's nations, as a result of the Bretton Woods Agreement of 1944. Economist John Maynard Keynes labeled the gold standard a "barbarous relic." However, time has yet to tell whether fiat currency—money declared legal tender—can remain useful if it is not backed by gold.

Their chief residence was Cragwood, a Germanic turreted castle on an estate in New Jersey. This estate boasted a menagerie of animals, including lions, parrots, peacocks, and prize golden retrievers. Charles paid $1 million to create a salmon river for his personal fishing. The couple also owned apartments in Rome, New York City, and London. When they traveled, they were waited upon by a team of secretaries, drivers, butlers, valets, and chefs. The Engelhards owned three jets and a helicopter. They accumulated a multimillion-dollar art collection, which included works by Edgar Degas, Pierre-Auguste Renoir, Édouard Manet, and Paul Cézanne.

The Engelhards were an important couple in New York society. Jane was an elegant woman, who was perennially included on lists of the ten best-dressed women. Charles became passionate about horse racing, spending more than $15 million for 240 thoroughbred racehorses. Engelhard was one of the most successful racehorse owners, and his horses scored 213 victories in nine years. He owned stables in North Carolina, England, and South Africa. His best-known horse, Nijinsky II, is considered one of the greatest horses in thoroughbred history. Nijinsky II won the English Derby several times and was a British Triple Crown champion. At the end of Nijinky II's racing career, Engelhard sold the horse to a stud farm for $5.4 million.

Along with their lavish lifestyle, the Engelhards were generous philanthropists. Jane was a devout Catholic and contributed to Catholic causes. She also donated valuable antiques to the White House's collections, including an eighteenth century Neapolitan crèche. The Engelhards gave $500,000 to Boys Town of America and $1.25 million to Rutgers University, and they provided funds to construct a library at Harvard University's Kennedy School of Government. (The library does not bear the Engelhard name because of controversy about Charles's involvement in South Africa during the years when apartheid was the government's official policy.) The Engelhards also made large donations to development projects in South Africa.

Because of his lavish lifestyle, Charles gained weight, and this increase may be an explanation for his sudden heart attack, and death, at the age of fifty-four. He left a fortune of $250 million. Jane continued to run the Charles Engelhard Foundation, which in 2003 had assets of approximately $100 million. She gave $10 million to the American Wing of the Metropolitan Museum of Art in New York City. The wing's Charles Engelhard Court is one of the highlights of the museum, and it contains a reflecting pool, nineteenth and twentieth century American sculptures, and elegant plants. Jane died on February 2, 2004.

Legacy

Charles Engelhard, Jr., gained his fortune from his worldwide metals refining and smelting operations, and he spent much of his wealth on lavish living and horse racing. His wife, Jane, who had an equally remarkable personal history, was a driving force in the Engelhard operations, especially in the couple's charitable donations. The Charles Engelhard Foundation financed various environmental and substance abuse programs. Jane also provided funding to build the Charles Engelhard Court at the Metropolitan Museum of Art. This court underwent a major renovation from 2007 to 2009.

Béatrice Ephrussi de Rothschild

French aristocrat, heiress, and socialite

Ephrussi de Rothschild used her wealth to indulge her passions for travel and art. She amassed a vast art collection during her travels, which she left to the French Academy of Fine Arts, along with her estate in Saint-Jean-Cap-Ferrat, France, for the creation of a public museum.

Born: September 14, 1864; Paris, France
Died: April 7, 1934; Davos, Switzerland
Also known as: Charlotte Béatrice Ephrussi de Rothschild; Charlotte Béatrice de Rothschild (birth name)
Sources of wealth: Inheritance; marriage
Bequeathal of wealth: Museum

Early Life

Charlotte Béatrice Ephrussi de Rothschild (shahr-LUHT bay-ah-TREES eh-frew-SEE deh ROTH-child) was born in Paris, France, in 1864, a member of the French branch of the Rothschild banking family. She was the second daughter of Mayer Alphonse James Rothschild, who headed the French Rothschilds; his wife, Leonora de Rothschild, was a British Rothschild and his first cousin once removed. Béatrice and siblings Bettina Caroline de Rothschild and Édouard Alphonse James de Rothschild were raised at the family mansion at 2 rue Saint-Florentin in Paris and at the Château de Ferrières, a historic nineteenth century château located east of Paris. Her father was an avid art collector, and Béatrice came to share his passion for works of art.

First Ventures

Through her family's business interests in the Baku area of present-day Azerbaijan, Béatrice became acquainted with Maurice Ephrussi, a Russian-born French banker, art collector, and racehorse breeder who was fifteen years her senior. She and Ephrussi were married in Paris in 1883. They established residences in Paris, the Reux municipality in the Basse-Normandie region of France, and Monte Carlo, Monaco. The couple would have no children.

Ephrussi de Rothschild traveled extensively, befriending art dealers and experts and building a collection of paintings, sculptures, antique furniture, porcelain, and objets d'art. In 1902 she commissioned the Rothschild Fabergé egg, one of the few made for anyone outside the Russian imperial family, which she gave as an engagement present to her brother's future wife, Germaine Alice Halphen.

Mature Wealth

When her father died in 1905, Ephrussi de Rothschild inherited a substantial portion of his immense fortune. She purchased about seventeen acres of French Riviera land on the Saint-Jean-Cap-Ferrat peninsula, where, between 1905 and 1912, she oversaw the painstaking construction of a fanciful Italianate villa with elaborate gardens and stunning views of the Mediterranean Sea. She named her retreat Île-de-France after a favorite cruise ship, and she reproduced the sense of being aboard a ship at sea by designing the main garden to resemble the deck of an ocean liner, complete with gardeners dressed as sailors.

Ephrussi de Rothschild filled her villa with her extensive collections, and she kept a small menagerie of exotic animals in her gardens. She acquired eighteenth century furniture that had belonged to France's Queen Marie-Antoinette, and she had a Temple of Love erected in her garden that was a replica of the one near the queen's Petit Trianon château at Versailles.

Despite the attention she lavished on its creation, Ephrussi de Rothschild only occasionally stayed at the Île-de-France. After her husband's death in 1916, she left Saint-Jean-Cap-Ferrat behind, residing instead at the couple's Monte Carlo villa. Near the end of her life, she lived in Davos, Switzerland, where in 1934 she died of tuberculosis at the age of sixty-nine. In her will she bequeathed her art collections and her estate at Saint-Jean-Cap-Ferrat to the Academy of Fine Arts of the Institute of France, with instructions that these donations be used to create a museum with the ambiance of a private home.

Legacy

Béatrice Ephrussi de Rothschild is remembered as the hugely wealthy, somewhat eccentric Rothschild who built and inhabited Île-de-France, now better known as the Villa Ephrussi de Rothschild. Thanks to her bequest to the French Academy of Fine Arts, her seaside retreat has become a Saint-Jean-Cap-Ferrat landmark enjoyed by more than 150,000 visitors a year. It is the French Riviera's only great Belle Époque estate of its kind that has been opened to the public. As such, it provides a window onto a vanished era, when European aristocracy and the wealthiest international elite dominated the resort towns of the French Riviera. Her villa and collections also afford the visitor insights into the life and lifestyle of the art-loving Ephrussi de Rothschild herself.

Charles Ergen

American telecommunications magnate

Ergen and two partners pooled their resources and began their business by selling full-size satellite television dishes in rural Colorado. This joint venture, eventually called EchoStar Corporation, and another company, Dish Network, became giants in the telecommunications industry, and Ergen became a billionaire.

Born: March 1, 1953; Oak Ridge, Tennessee
Also known as: Charles William Ergen
Sources of wealth: Media; telecommunications; investments
Bequeathal of wealth: Charity

Early Life

Charles William "Charlie" Ergen (EHR-gehn), the fourth of five children of William K. and Viola S. Ergen, was born in 1953 in Oak Ridge, Tennessee. When he was four years old, Ergen and his father, a nuclear physicist, witnessed the Soviet satellite Sputnik 1 in orbit. Ergen attended the local public schools and graduated from Oak Ridge High School in 1971. That same year his father died, and Ergen had to work his way through college. He graduated from the University of Tennessee in 1975 and the Babcock Graduate School of Management at Wake Forest University in 1976. After receiving certification as a public accountant, Ergen worked as an auditor for a textile company and then as a financial analyst for PepsiCo's Frito-Lay division. In 1978, Ergen quit his job and became a professional gambler, but he and his partner James "Jim" DeFranco got into trouble in Las Vegas after being charged with counting cards at the blackjack tables.

First Ventures

In 1980, Ergen, DeFranco, and Candy McAdams, who would later marry Ergen, began marketing television satellite dishes from the back of their truck. They spent $60,000 to start their company, initially called EchoSphere, because the satellite dish was shaped like a sphere, and later renamed the EchoStar Corporation. The business profited by selling satellite dishes in rural areas of Colorado, Utah, and Wyoming.

With hard-nosed tactics, a gambling nature, and a quick intelligence, Ergen worked mercilessly to advance his business. His strategies included avoiding competition by maintaining low prices, staying attuned to legislative proceedings that affected the media and telecommunications industries, and eagerly providing lawmakers with evidence in support of reforms and improvements that would benefit his company. Ergen demonstrated technological knowledge in the telecommunications business and insisted upon providing his customers with cutting-edge services. By 1987, Ergen had concluded that the future of his business depended upon extending his enterprise beyond merely selling equipment and hardware. In order to have more control of the delivery of television programs, Ergen opted to have EchoStar invest in direct satellite broadcasting.

Mature Wealth

In the early 1990's, Ergen expanded his business to include small-dish satellite services, and he founded Dish Network as the broadcasting services division of his business. Having obtained a direct broadcasting satellite license from the Federal Communications Commission, Ergen's company could now provide national broadcasting services. In the mid-1990's, EchoStar launched the first of several satellites, began selling its stock publicly, and created a Dish Network infomercial with Ergen as the host of Charlie Chat. During the late 1990's, Dish Network became the first company to broadcast local television channels via satellite.

Throughout the 1990's and early twenty-first century, Ergen's business flourished. Millions of people subscribed to Dish Network, and he became one of the richest men in America. By 2002, EchoStar employed fifteen thousand people and was worth $10 billion. In 2007, he was the wealthiest Colorado resident and the twenty-seventh-richest person in the United States, but the zealous Ergen wanted more. He ruthlessly pursued merger deals with other companies, including Rupert Murdoch's News Corporation. This merger failed, but Ergen managed to gain News Corporation's satellite assets.

Ergen worked to provide discount prices while offering customers the latest technologies. These tactics garnered 13.7 million subscribers. However, inadequate marketing campaigns, litigation, high-definition television, and cable television competition during a period of economic downturn caused Ergen to lose more than $2.2 billion in 2008.

Legacy

In the process of building EchoStar and Dish Network, Ergen became a wealthy telecommunications tycoon. His philanthropy has included political contributions to both major political parties and donations to the Colorado Mountain Club and Children's Hospital in Colorado.

PABLO ESCOBAR
Colombian drug trafficker

Escobar rose to power during a time of great violence in Columbia's history. His ruthlessness enabled him to control the world's most powerful—and lucrative—cocaine cartel. Escobar used some of his ill-gotten wealth to benefit the poor.

Born: January 12, 1949; Medellín, Colombia
Died: December 2, 1993; Medellín, Colombia
Also known as: Pablo Emilio Escobar Gaviria; El Doctor; El Patron
Sources of wealth: Narcotics trafficking; real estate
Bequeathal of wealth: Spouse; children; government

EARLY LIFE

Pablo Emilio Escobar Gaviria (PAH-bloh ee-MEEL-ee-oh EHS-koh-bahr gah-VEER-ee-ah) was born in 1949 in Medellín, Colombia, the son of Abel de Jesus Escobar and Helmilda Gaviria. His family would have been considered middle class. He grew up in Envigado, a suburb of Medellín, during a period referred to locally as "the violence," a time of great bloodshed and ineffective law enforcement. Escobar was involved in criminal activities in high school. He eventually dropped out.

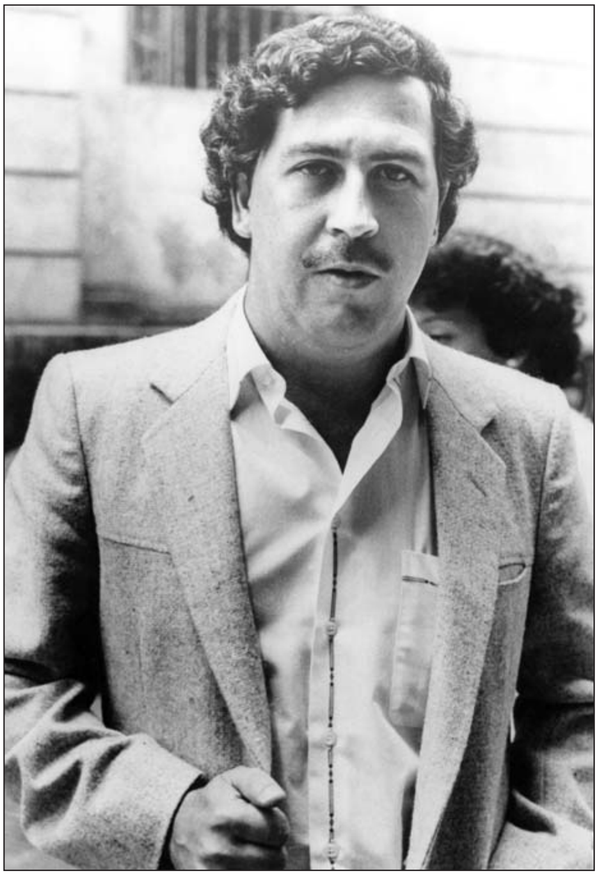
FIRST VENTURES

Escobar moved up to stealing automobiles and selling them for parts. However, he found he could make more money by bribing officials to provide new titles for the cars and then reselling the vehicles. By 1976, Escobar moved into the world of drug smuggling. He was arrested shortly after his marriage to Maria Victoria Henao Vellejo after he was caught smuggling thirty-nine kilograms of cocaine. He then showed the cunning and ruthlessness that would become his trademark. After rejecting a bribe, the judge on the case recused himself as the result of a ploy by Escobar. The officers who arrested Escobar were murdered. When Escobar finally decided to move into cocaine distribution, he simply murdered the local drug kingpin, Fabio Restrepo, and took over his business.

MATURE WEALTH

Escobar organized the other cocaine smugglers into a cartel. He made sure the laboratories which processed the cocaine were hidden in the rainforests. He organized the drug cartel like a corporation and personally supervised every stage of the drug-dealing process. He adopted a philosophy of *plata o plomo* (silver or lead) as a way of dealing with his enemies. People who did not take his bribes were killed with no remorse.

As his empire grew, he started to purchase airplanes and managed to get two airlines under the Medellín cartel's control. He supervised a network of drug distribution points throughout North America. The profits of the cartel were comparable to those of the largest multinational corporation. Drug traffickers in Medellín and surrounding areas were giving Escobar between 20 and 35 percent of their profits. He invested in real estate in the United States and had numerous estates in Colombia, one of which boasted a private zoo and twenty artificial lakes. *Forbes* magazine estimated his wealth to be close to $25 billion in 1989, which ranked him as the seventh-richest man in the world. He controlled roughly 80 percent of global cocaine distribution.



Pablo Escobar. (AP/Wide World Photos)

Despite his criminal background, Escobar gave freely to the poor and was seen as a Colombian Robin Hood. He built low-cost housing and lighted sports arenas for the public. He funded the construction of many churches. He was so popular that he was even elected to the Colombian congress.

However, the violence he created eventually caught up with him. In 1993, aided by a local organization of people who had been affected by Escobar's activities, the U.S. Drug Enforcement Administration and Colombian police tracked him down after an arduous search. He was killed in Medellín during a gunfight.

Legacy

The Colombian government seized many of Escobar's properties and either gave them to the poor or used them for government purposes. Escobar's activities were one of the reasons President Ronald Reagan initiated his war on drugs. The depth of the corruption caused by Escobar's wealth and his influence were far-reaching and took years to ferret out.

Escobar continued to be held in high esteem by some, particularly the poor, because of his public works. His wife inherited some of Escobar's vast wealth and was later jailed for money laundering. His daughter inherited the remains of Escobar's estate after a long legal battle.

Nikolaus Esterházy

Hungarian aristocrat, military leader, and art patron

Esterházy was born into wealth as a member of the house of Esterházy, a noble family with a considerable fortune. His thirty-year financial commitment to support the eminent composer Joseph Haydn established his reputation as a significant patron of the arts.

Born: December 18, 1714; Galanta, Kingdom of Hungary (now in Slovakia)
Died: September 28, 1790; Vienna, Austria
Also known as: Nikolaus Joseph Esterházy
Sources of wealth: Inheritance; real estate
Bequeathal of wealth: Children; employees; charity

Early Life

Nikolaus Joseph Esterházy (EHS-ter-hah-zee) was the son of Prince Joseph Simon Antal (1688-1721). Esterházy's ancestors, Count Nikolaus Esterházy (1583-1645) and his son Prince Paul Esterházy (1635-1713), acquired the family's fortune through marriage, by acquiring land from the Protestants during the Counter-Reformation, and from the conquest of the Turks. Because of their loyalties to the Habsburg Dynasty and the Roman Catholic Church, the Esterházy family accumulated enormous wealth and became the largest landowners in the Habsburg Empire.

Nikolaus Joseph Esterházy was educated by the Jesuits, a religious order of priests and scholastic students known for its commitment to education. Esterházy's exposure to music and philanthropy at an early age influenced his later decision to become a patron of the arts. In 1737, he married Maria Elisabeth, the daughter of the count of the Holy Roman Empire.

First Ventures

Esterházy distinguished himself in an Austrian military career. As commander of an infantry brigade at Kolín in 1757, he successfully led his men to victory and was rewarded with an appointment as captain of Empress Maria Theresa's Hungarian bodyguard. He also received the coveted Order of the Golden Fleece. Following the death of his older brother Prince Paul Anton in 1762, Esterházy assumed the title of prince.

Mature Wealth

Schloss Esterházy, a grand palace in Eisenstadt, Austria, served as the primary residence for the Esterházy family.

In 1762, Esterházy began construction of the Esterhaza Palace in Fertőtó, Hungary, that became known as the Hungarian Versailles because of its unrivaled splendor. A benefactor to his employees, Esterházy distributed his wealth among them by paying pensions to the elderly and supplementing the incomes of widows. He also donated funds to hospitals in Eisenstadt and Fertőtó and supplied medicine.

Esterházy retained the services of composer Joseph Haydn, who had been hired by Esterházy's brother Paul Anton. For thirty years, Haydn repaid his new employer by transforming Esterházy's orchestra into one of the finest in Europe and by composing symphonies, operas, orchestral and chamber works, and music for a puppet theater. Esterházy revered Haydn, often rewarding him with gold ducats and twice restoring the composer's burned home.

In addition to being a supreme patron of the arts, Esterházy was renowned for his jewels and extravagant clothing. The Esterházy jewels included rubies, topazes, pearls, and emeralds. His hussar's cap was adorned with approximately five thousand diamonds that simulated plumes. His sword and sheath sported jewels, as did a belt of pearls and diamonds. All the armor worn by male family members was decorated with precious jewels.

When his wife Princess Maria Elisabeth died in February, 1790, Esterházy became despondent. Haydn's music failed to restore the prince's spirit and Esterházy died seven months later.

Legacy

A nobleman and aristocrat who possessed enormous wealth as a member of the house of Esterházy, Nikolaus Esterházy could have lived a secluded and pampered life without regard to the plight of others. Instead, he assumed the role of benefactor to one of the most prestigious and prolific composers of the time—Joseph Haydn. In the history of music, there are few composers who have benefited from such generous financial support and creative encouragement as Esterházy provided Haydn. Haydn composed 106 symphonies, almost all of which were completed at Esterhaza Palace, in addition to his many other works. Because of his steadfast devotion to Haydn, Esterházy is rightfully considered to be a monumental figure in eighteenth century music.

James G. Fair

American mining magnate, real estate speculator, investor, and politician

Fair and his three colleagues made a fortune mining the rich deposits of silver on the Comstock Lode. However, some observers claimed that his great wealth ruined his character, earning him the nickname Slippery Jimmy.

Born: December 3, 1821; Clogher, County Tyrone, Ireland
Died: December 28, 1894; San Francisco, California
Also known as: James Graham Fair; Slippery Jimmy
Sources of wealth: Mining; real estate; investments
Bequeathal of wealth: Children; relatives; charity

Early Life

Born into a peasant family in a small village near Belfast, James Graham Fair immigrated with his family to the United States in 1843. He grew up on a farm in Illinois, receiving what education he obtained in the public schools. He moved to Chicago in his mid-teens, where he received training in business.

At nineteen he set out for the California gold fields, where he prospected for gold in the Feather River region. He apparently learned much about gold mining in California. People who knew him at the time described him as very mechanically inclined and hardworking, with a sharp business mind. He married Theresa Rooney, the daughter of an Irish saloon owner, in 1861. Rooney was Catholic and Fair was a Protestant, which caused tension in their marriage, as the couple disagreed about the faith in which to raise their children. Fair eventually moved to Nevada, where he operated a mill on the Washoe River and became superintendent of several mines in the region of Virginia City.

First Ventures

In 1867, Fair became the superintendent of the Hale and Norcross Mine in Virginia City, one of the largest and most prosperous enterprises in the area. At that time he and three other Irishmen—James Clair Flood, John William Mackay, and William S. O'Brien—formed a company popularly known as the Bonanza firm and began to acquire shares in the silver mines on the Comstock Lode. Fair's partners were Irish Catholics, while he was a Protestant, and this would be a future source of conflict between them.

Between 1867 and 1873, the Bonanza firm made large fortunes for the four partners. In 1873, Fair was instrumental in the discovery of the so-called big bonanza, one of the largest silver strikes ever found. From 1873 to 1882, the big bonanza produced more than $105 million worth of silver ore (almost $2.5 billion in 2010). After 1882, the production of the Comstock rapidly declined, although ore continued to be extracted from the mines until the 1940's.

Mature Wealth

Fair later claimed most of the success of the Comstock operation derived from his own efforts, and most of its failures from the mistakes of his partners. Fair's claims are not without a basis in fact. His mechanical aptitude and flair for organization were instrumental in the successes of the Bonanza firm. A tireless worker, Fair spent most of his time belowground in the mines during the years of greatest productivity.

The Bonanza partners greatly augmented their earnings from the mines by collateral enterprises. They organized three major companies: the Pacific Mill and Mining Company, which owned and operated the mills that processed the ore; the Pacific Wood, Lumber and Flume Company, which supplied the millions of dollars worth of timber needed by the mines; and the Virginia & Gold Hill Water Company, which supplied water to the mines. These subsidiary enterprises made the four principal owners of the Bonanza firm many millions of dollars.

Fair invested much of the profits he made from the Comstock discoveries in San Francisco real estate; Nevada Bank; the South Pacific Coast Railroad, which ran down the east side of San Francisco Bay; and manufacturing. His real estate holdings prospered, making him another fortune. The Nevada Bank for a time became the largest bank in the United States during the height of the silver boom. The South Pacific Coast Railroad became one of the most profitable lines in California. All of these ventures together made Fair one of the wealthiest men in the United States.

According to some observers, the acquisition of great wealth ruined Fair's character, making him selfish, avaricious, and duplicitous and earning him the sobriquet "Slippery Jimmy." Those who knew him at this time said he took pride in being more clever and trickier than other men. Although Fair had the reputation of "knowing the value of a dollar," he did indulge himself and his family

The Comstock Lode

The Comstock Lode was the first great silver discovery in the United States and one of the greatest mineral discoveries in the history of the world. Mormons on their way to the California gold fields made the initial discovery of minerals in northern Nevada during the spring of 1850. These earliest discoverers continued on to California in search of richer pickings, and they were followed by others on their way to the California fields during the next few years. By 1853, around two hundred men were actively mining the area.

In 1857, two brothers from Pennsylvania, Ethan and Hosea Grosh, discovered the mine that was later called the Comstock Lode. The Grosh brothers died of injuries sustained while crossing the Sierra Mountains, and Henry T. P. Comstock claimed their cabin and lands. Several other prospectors also filed claims on area mines. All of these early discoverers of the Comstock Lode's wealth eventually died in poverty.

When news of the gold and silver discoveries spread, a stampede of prospectors ensued. More than seventeen thousand fortune-seekers rushed to Nevada between 1859 and 1865. The usual claim-jumping and litigation resulted. During those years, an estimated $50 million worth of ore (more than $250 million in 2010 dollars) was extracted from the area, while about $10 million was spent on law suits. Beginning in 1865, men later called the "bank crowd" began acquiring mine shares and mills in the area of Virginia City, Nevada. They built the Virginia and Truckee Railroad in order to link the mines with other areas, and the railroad drastically reduced transportation costs. The bank crowd also took over or started land, water, and freighting companies.

Four Irishmen—James G. Fair, James Clair Flood, John William Mackay, and William S. O'Brien—formed a partnership popularly known as the Bonanza firm in 1867. In 1873, the Bonanza firm, led by Fair, made the largest single silver discovery in history, the "big bonanza." Between 1873 and 1882, the partners' mineral strike produced more than $105 million worth of silver ore (almost $2.5 billion in 2010 dollars).

During its most productive years, the Comstock Lode produced approximately $305 million worth of ore (around $75 billion in 2010 dollars), which financed much of the industrial expansion of the United States during the latter part of the nineteenth century. The technological innovations made while exploiting the Comstock had ramifications far beyond the mining industry. For example, A. S. Hallidie's development of a flat-woven, wire rope used to haul ore from deep underground was later adapted for use in San Francisco's cable cars. However, the development of the Comstock Lode also resulted in the deforestation of many surrounding mountain ranges and had other negative environmental consequences for the Western United States.

in the luxury of a world tour. By ocean liner and railway, they visited most of the famous tourist areas of the world in 1880.

After Fair returned to the United States in 1881, his wealth won him election to the U.S. Senate. He served an undistinguished six years, focusing on silver issues at a time when other senators were moving to demonetize silver. Fair's one speech in the Senate was delivered during discussions about the Chinese Exclusion Act of 1882; he fulfilled his campaign promise to uphold white supremacy. Fair's wife divorced him in 1882 on the grounds of habitual adultery. He did not stand for reelection to the Senate in 1886 and returned to San Francisco, where he took up residence in two rooms on the third floor of the Lick House, which he had bought in the early 1880's.

Back in San Francisco, Fair concentrated on his real estate and banking investments and his railroad enterprises. In 1888, the usually parsimonious Fair paid Hubert Howe Bancroft $15,000 to write a short, very flattering biography of him. Fair lived a solitary life, making no close friends. In 1890, when his daughter married the scion of another wealthy family, she did not invite Fair to her wedding. Nevertheless, he gave the couple a wedding present of $1 million, or so he told a San Francisco newspaper.

Fair continued to be interested in mining ventures, buying holdings in Wyoming, Idaho, Arizona, Georgia, and abroad. By 1893, he owned sixty acres of San Francisco's most fashionable areas. He bought office buildings, rooming houses, warehouses, small hotels, and other income-producing properties, all of which he allowed to run down, claiming that San Francisco real estate taxes were so high that they precluded him from making any improvements to his holdings. By the time of his death in 1894, his income from rents averaged almost $250,000 a month (more than $10 million in 2010 dollars).

Fair died alone and friendless, with only his physician and his nurse at his bedside. The coroner's report listed his cause of death as heart failure. Fair's obituary in the San Francisco *Chronicle* said he did not have an intimate friend in the world, and the *Examiner* published a scathing account of his life and character and his unhappy relations with his wife and children.

Legacy

Fair's will left small sums to his sister and two brothers and smaller amounts to his nurse and two office workers. Three orphan asylums (Catholic, Protestant, and Hebrew) received $125,000. The bulk of his estate was left in trust for his three surviving children. Another will came to light, this one handwritten and leaving his estate directly to his children without the trust. The ensuing litigation by his children and by a host of people claiming to be his wives, his daughters-in-law, his illegitimate children, and various other relatives reduced his estate by an estimated $2 million in legal fees.

His business efforts did advance the industrialization of the United States, but Fair himself made no efforts to benefit humanity in any direct way. None of his descendants who were the beneficiaries of his wealth made any meaningful contributions to society. As far as can be told, Fair's great accumulation of wealth—approximately $45 million, or more than $1 billion in 2010 dollars—benefited only the creature comforts of him and his family.

Sir John Fastolf

English military leader and landowner

Sir John Fastolf was one of the first English knights to make a fortune as a professional soldier and convert it into income-producing investments, thus reflecting crucial changes in the gradual transformation of the feudal system of English social organization into a protocapitalist society.

Born: c. 1378; Caister, Norfolk, England
Died: November 5, 1459; Caister, Norfolk, England
Sources of wealth: Conquest; real estate
Bequeathal of wealth: Friends

Early Life

Little is known about the early life of Sir John Fastolf (FAW-stolf) except that he was the son of a Norfolk gentleman, John Fastolf of Caister. Sir John might have served as a squire to Thomas Mowbray, duke of Norfolk, before entering upon a military career. He served in Ireland in 1405-1406 under the duke of Clarence, the younger brother of the future King Henry V, and Fastolf seems to have remained with Clarence for about ten years.

Fastolf's financial fortunes received their first significant boost when he married on January 13, 1409, presumably for money. His wife Millicent was the daughter of Robert, Lord Tiptoft, but she had recently augmented her own fortune considerably upon the death of her first husband, Stephen Scrope of Castle Combe in Wiltshire. In consequence, Fastolf came into possession of lands that brought in a handsome annual income of £240.

FIRST VENTURES

Fastolf obtained a new opportunity to enhance his fortunes when Henry V began campaigning vigorously in France, with the intention of recovering England's lost possessions there. Fastolf was never an intimate of the king, although he did fight with him at the Battle of Agincourt in October, 1415. His first French campaign appears to have been with Clarence in Aquitaine in 1412-1413, when he was rewarded with the appointment of deputy constable in Bordeaux. He was also captain of Soubise and Veyres in 1413-1414.

Fastolf did not stay with Henry's army after Agincourt but returned to Harfleur with the duke of Exeter. He fought at Valmont while it was besieged by the French, and he was present at the sieges of Caen and Rouen with both Clarence and Exeter. Fastolf became captain of Harfleur and Fécamp, and he was granted four lordships in the vicinity of Caux in 1419. As well as obtaining the title to various holdings of captured land, Fastolf was able to augment his purse with ransoms demanded for influential captives seized in battle. Although there is no reason to doubt the honesty of his patriotism, he was essentially a professional soldier, who expected to make capital out of his endeavors, and he did so on a scale that made him one of the most successful mercenaries of all time.

When Henry V died in 1421, having returned to France to assist Clarence after the latter's defeat at Baugé, Henry's son was a mere infant. One of Henry's brothers, John, duke of Bedford, became regent. Bedford immediately formed a new military organization to continue the French campaign, with Fastolf and other experienced professionals at its core. Fastolf was a member of the regent's council from 1422 until Bedford's death in 1435, and he remained one of Bedford's most trusted military commanders.

MATURE WEALTH

Bedford rewarded Fastolf with additional captaincies, and Fastolf distinguished himself during Bedford's victory at Verneuil in August, 1422. Fastolf boasted that he ransomed the prisoners he took in that battle for 20,000 marks, but he only managed to collect part of the sum. He was made a Knight of the Garter in 1426, and his military triumphs in France continued apace. He took part in an assault on Maine in 1427, and he was appointed governor of Le Mans after capturing it. He also took the title of baron from one of several fiefs he was granted in the area. Fastolf began sending considerable sums of money back to England, which were used to add more land to his holdings, mostly around Caister in Norfolk.

In February, 1429, while transporting provisions to English troops besieging Paris, Fastolf was attacked at Rouvray and won what came to be known as the Battle of the Herrings after using barrels loaded with fish as a stockade. In June of that year, however, he took part in an attack on Beaugency with John Talbot, earl of Shrewsbury, which went badly. During the retreat, the English forces were overwhelmed at Patay and the rearguard was massacred; only the vanguard, led by Fastolf, escaped. Although the French historian Jehan de Waurin put the blame squarely on Shrewsbury's recklessness, Shrewsbury accused Fastolf of cowardice. Fastolf was eventually vindicated and continued to enjoy Bedford's full confidence, but the accusation tainted Fastolf's reputation in England.

When Bedford died in 1435, the English campaign in France suffered a dire blow, from which it never recovered. Fastolf did everything possible to retain his French lands and the income they provided. He retained a full-time attorney at the Court of Paris, Jean de Paris, to press his claims for land, ransoms, and jurisdictions, but the tide had turned and his holdings there were steadily worn away by a process of attrition. The fact that he was one of Bedford's executors kept Fastolf very busy for the next three years, and he was unable to defend his French claims as forcefully as he might have wished. He eventually decided to return to England permanently. He bought the Boar's Head tavern in Southwark, along with a town house, as well as expanding and improving his lands in Norfolk.

Fastolf appears to have spent nearly £14,000 buying property in England and an additional £9,500 improving it. In 1445, his English holdings brought him an annual income of £1,061; his remaining French lands still brought him £401, a fraction of their worth ten years before. He invested and spent on a lavish scale, but his background and former alliances made him suspect in a new political climate, as the Wars of the Roses became increasingly bitter, and he became the target of determined enmities. In 1452, he paid for the construction of Caister Castle, which was intended to serve as his country seat. It was one of the first English castles to be built out of brick, although it was otherwise orthodox—which

Shakespeare's Falstaff

According to all of the evidence, Sir John Fastolf was an expert military commander and an efficient businessman, austere in his habits, and not at all given to hypocrisy. Was it not for the unjust and self-serving accusation of cowardice of John Talbot, first earl of Shrewsbury, and the duke of Suffolk's avaricious persecution, Fastolf might have enjoyed a long-lasting reputation that was not only unsullied but heroic. Writings survive that describe Fastolf as cruel and ruthless, and perhaps he was in and after battle, but he does not seem to have been a violent man when not engaged in military service. However, the fact that a lingering taint still clung to his reputation long after his death was undoubtedly partly responsible for the fact that William Shakespeare, under pressure from a descendant of Sir John Oldcastle, changed a character's name from Oldcastle to Sir John Falstaff between the first and second drafts of *Henry V* (pr. 1598-1599; pb. 1600).

Oldcastle really had been a friend of "Prince Hal" (Henry V) during the king's younger and wilder days. Oldcastle might possibly have encouraged Henry in the sowing of his youthful wild oats, but Oldcastle was probably not the self-indulgent, cowardly, mendacious, and hypocritical character that Shakespeare described, and who was, in essence, depicted as being the exact opposite of everything that Henry V eventually became. Oldcastle would not have been the first actual individual that Shakespeare had comprehensively trashed in the interests of dramatic effect; Richard III came off worst of all in that respect. However, the fact that Oldcastle had a surviving descendant who might take umbrage as far as violence forced the playwright to improvise.

Falstaff was a fictitious name, but its origin was clear enough, especially given the fact that Fastolf was known to have owned the Boar's Head tavern in Southwark. Because of Falstaff's depiction in Shakespeare's play, Fastolf's posthumous reputation was blackened far more deeply than the earl of Shrewsbury or the duke of Suffolk could ever have imagined possible. Things might have been different if Fastolf had managed to found a college in Caister to serve as his memorial. However, in the absence of such a monument, the image of Falstaff—which took on a strange life of its own, evolving far beyond Shakespeare's original intention—superimposed itself so completely on Fastolf's identity as to almost efface the memory and reputation of the real man, at least until the twentieth century rehabilitation.

is to say, quandrangular in shape, with towers at the corners and equipped with a moat.

The construction of Caister Castle was obstructed by troubles that had begun in 1447, when the duke of Suffolk launched a long campaign attempting to seize various lands in Norfolk and dispossess the owners, including Fastolf. Suffolk eventually went so far as to lay a charge of treason against Fastolf, although Fastolf does not appear to have been politically active. While defending himself against this continual harassment, Fastolf formed a strong alliance with a neighboring landowner, John Paston. Paston's care in preserving his family's correspondence enabled future historians to know much about Fastolf and about much else that happened in Norfolk in the fifteenth century, although the original bound volumes of "the Paston letters" were dispersed and lost, and the authenticity of later printed editions became somewhat controversial.

Fastolf's great ambition during the last ten years of his life appears to have been the founding of a college at Caister, but his political and financial troubles prevented him from doing so, and with that end in mind he made Paston the executor of his will. Paston was still engaged in economic warfare with the duke of Suffolk, however, and Fastolf's death in 1459 only made the task of defending Fastolf's holdings more difficult. It was not until 1470 that a small parcel was eventually handed over to Magdalen College, Oxford University, by which time the Caister project had been conclusively abandoned, and the rest of Fastolf's fortune had been eroded by the expenses of its defense.

Legacy

Because his attempt to found a college came to nothing, and most of the money he left for that purpose was dissipated by Paston, Fastolf's principal material legacy was Caister Castle. The castle eventually fell into ruins, along with most of the other relics of the twilight of English feudalism. In the twenty-first century, what remained of the building, augmented with subsequent additions, was a private museum, home to the largest collection of motor vehicles in Great Britain. The difficulties that the humbly born Fastolf experienced in hanging on to his wealth, under harassment from the traditional aristocracy, reflect the awkwardness of the English transition from feudalism to protocapitalism. Fastolf also left a very peculiar "legacy" of another sort, thanks to the adaptation of his name by William Shakespeare for one of the playwright's most memorable but least worthy characters, and that, too, might be a reflection of aristocratic antipathy to the new breed of upwardly mobile moneymakers.

Mohamed al-Fayed

Egyptian investor and businessman

Fayed, an Egyptian-born businessman, emerged victorious after a long battle for control of Harrods department store. His son Dodi al-Fayed died with Diana, Princess of Wales, in an automobile crash in Paris in 1997.

Born: January 27, 1929; Bakos, Alexandria, Egypt
Sources of wealth: Retailing; investments; real estate
Bequeathal of wealth: Unknown

Early Life

Mohamed al-Fayed (moh-HAH-mehd al-FI-ehd) was born in 1929 in Alexandria, Egypt, which at that time was under British administration. Fayed claims he comes from an old, wealthy, and distinguished family, but critics argue otherwise. His father was an elementary schoolteacher. Fayed's earliest business endeavors were selling soft drinks to his friends and selling sewing machines door-to-door.

First Ventures

After World War II, Fayed and his two younger brothers founded Genavco (General Navigation Company), a shipping firm that ran ferries on the Mediterranean and Red Seas. When Egyptian leader Gamal Abdel Nasser nationalized much of the nation's economy, Genavco re-

Mohamed al-Fayed holds a bottle of Imperial Majesty, the most expensive commercially available perfume ever sold, which cost more than $198,000. (AP/Wide World Photos)

Harrods department store at Christmas, 2000. (Getty Images)

located in Genoa, Italy. Fayed's first marriage was to a sister of Adnan Khashoggi, a notorious international arms dealer, whom some critics credit for Fayed's initial business successes. The Fayeds had one son, Dodi, before the couple's marriage ended in divorce.

Mature Wealth

In the 1960's, Fayed became a principal adviser to Rāshid ibn Saʿīd Āl Maktūm, the ruler of the emirate of Dubai. Not a modest man, Fayed claims that he was primarily responsible for the emirate's emergence as a major financial center. He encouraged British investment in the territory, and he also invested in construction and shipping operations, the latter through his company International Marine Services (IMS).

Fayed apparently also became an adviser to Sultan Hassanal Bolkiah of Brunei, one of the world's richest men. It was later rumored that Fayed illegally acquired $1 billion from the sultan's various business accounts. With his British contacts, relocating to London in 1974 was an obvious move for Fayed. There he added "al-" to his name, with its allusions to the elite, and some in the British press consequently referred to him as the "phony pharaoh." Generally, however, the British political and social establishment accepted Fayed's claims that he was a legitimate businessman.

In London, Fayed invested in Lonrho, Plc., which was heavily involved in the African mineral industry. Lonrho was headed by R.W. "Tiny" Rowland, a flamboyant businessman who was committed to diversifying Lonrho's investments and sought to gain control of the House of Fraser, which included Harrods, the world-famous London department store. In 1984, Fayed bought 30 percent of the House of Fraser's shares, and in a bitter contest he succeeded in acquiring the remaining shares the following year by outbidding Rowland. The dispute continued for years, during which Fayed and Rowland suborned politicians and resorted to inflammatory claims about each other in the media. Fayed was arrested, accused of bribing Conservative members of Parliament and cabinet officials. He later unsuccessfully sued for false arrest. The conflict was finally resolved in favor of Fayed in 1992, and he subsequently removed from Harrods' food halls a shark's head on which the word "Tiny" was written.

Fayed became executive chairman of Harrods in 1989, and he claims that he spent £400 million to refurbish and upgrade the iconic store. The House of Fraser went public in 1994, selling its shares on the London Stock Exchange, but Fayed retained Harrods as his personal property.

Some of his other acquisitions include L'Hôtel Ritz in Paris, the villa of the duke and duchess of Windsor, and Britain's Fulham football (soccer) club.

Legacy

Fayed had four children with his second wife, a Finnish woman. His entire business career has been controversial, particularly as recounted in the British media, which has accused him of being a serial liar and a thief. After the death of his son Dodi and Princess Diana, Fayed accused the British royal family of murdering the two in order to prevent Diana from marrying Dodi and converting to Islam. In 2008, an official investigation dismissed his allegations, ruling that the deaths were accidental. Because of his notoriety, neither Conservative nor Labour governments have been willing to grant him British citizenship.

Cyrus West Field

American paper merchant and transatlantic telegraph cable builder

Field built a profitable paper business in New York in the 1840's and 1850's. He then gained international renown as the organizer and driving force in the effort to lay an underwater telegraph cable connecting Europe and North America.

Born: November 30, 1819; Stockbridge, Massachusetts
Died: July 12, 1892; New York, New York
Also known as: Cyrus W. Field
Sources of wealth: Trade; telegraph
Bequeathal of wealth: Dissipated

Early Life

Cyrus West Field was born in Stockbridge, Massachusetts, in 1819. His father was a stern, influential Congregational minister. All of Field's brothers who survived to middle age achieved notable success in occupations ranging from writing to serving as a justice of the U.S. Supreme Court and president of the Massachusetts Senate. At age fifteen, Field moved to New York City to begin an apprenticeship in the city's leading dry goods store, where he quickly rose to become a senior clerk. At age eighteen, he returned to western Massachusetts, working for his brother as bookkeeper, general assistant, and then sales representative at a paper mill.

First Ventures

At age twenty, Field married and became the junior partner in Root & Company, a wholesale paper dealer in New York City. Within six months, Root went bankrupt, but Field settled the debts of his former employer at thirty cents on the dollar and reorganized the firm under his own name. The company purchased supplies for papermakers and marketed their products. Field used his knowledge of the industry, close ties with Massachusetts papermakers (especially Crane & Company), and rising demand for paper to build an immensely successful business. Putting in exceptionally long hours and rarely delegating work, Field became the "uncontested dean" of New York paper merchants, amassing a net worth of almost $250,000 ($7.2 million in 2010 currency) by 1852. At this point, although it was not legally required, he paid off his company's old debts at their face value plus 7 percent interest, turned business duties over to a junior partner, and took a lengthy trip to South America with noted landscape painter Frederick Church.

Mature Wealth

Semiretirement did not suit the energetic Field. In 1854, Field's brother Matthew introduced him to Frederick Gisborne, whose Newfoundland Electric Telegraph Company owned rights to run a telegraph line to the eastern-

Cyrus West Field holds a section of his transatlantic cable. (The Granger Collection, New York)

most point in North America. Gisborne was a fugitive from fraud charges because his company had run out of funds to pay its workers after making little progress stringing a telegraph line through the rugged Canadian region. Field seized on the idea of buying out the company and using it as a springboard to lay a cable across the Atlantic connecting Europe and North America from Newfoundland to Ireland. He contacted Samuel F. B. Morse, inventor of the telegraph, to assess the project's plausibility and Matthew Fontaine Maury, head of the U.S. Naval Observatory, who explained that the ocean floor in this region of the Atlantic was ideal for a cable. Next, Field turned to wealthy New York City residents for funding, convincing Peter Cooper, Moses Taylor, Marshall Roberts, Chandler White, and others of the plan's merits.

Field then bought Gisborne's company, negotiated a new charter with the Newfoundland government, and recommenced construction of the original line. As expenses mounted, he traveled to England to find additional investors. An attempt to lay the Atlantic cable in 1857 failed after the line snapped, sending half a million dollars worth of material to the ocean floor. Success in laying the cable in 1858 brought transatlantic jubilation, and Field was hailed as the Columbus of America. Unfortunately, sending signals through the cable proved difficult and it went completely dead within a month. Skeptics claimed the cable never actually delivered any messages and alleged that Field was engaged in a hoax enabling him to make a substantial profit while preventing the company's charter from expiring. While these charges were rebutted, some historians maintain that Field's claims of successfully sending news over the wire were fraudulent.

Although Field was determined to see the project's successful completion, an official inquiry into the causes of the cable's failure and the outbreak of the Civil War caused delays. As the war ended, Field obtained use of the *Great Eastern*, the world's largest steamship, arranged new funding, and obtained a more advanced cable. Again, in 1865, the cable snapped in mid-ocean. Unbowed, Field arranged a fourth attempt in 1866 that succeeded, as did the recovery of the 1865 cable from the ocean floor. With two cables in operation and a monopoly on transatlantic service, the Anglo-American Telegraph Company began earning substantial profits.

Field remained busy for the next twenty years, investing in a range of businesses, including ownership of substantial telegraph holdings and a New York daily newspaper, the *Mail and Express*, and management of the Manhattan Railway, an elevated commuter line whose fortunes he turned around. His wealth reached about $6 million ($140 million in 2010 currency). He played a significant role in politics and may have inadvertently helped swing the 1884 presidential election when he arranged a gala dinner at Delmonico's restaurant for the Republican candidate, James G. Blaine, and many of his wealthy supporters. The opposition press depicted Blaine as a friend of the privileged and Grover Cleveland eked out a win in New York and the electoral college.

Inexplicably, in 1887 Field began speculating in the stock market, touting the Manhattan Railway in his newspaper and borrowing money to buy company shares on a thin margin, as his purchases pushed its price up. When the price began to fall, he was overextended and lost virtually his entire fortune within a few days. The press portrayed the collapse as a vile plot by Field's friend and associate Jay Gould, but a fairer reading shows that this was not the case. Field sank into illness and depression, abetted by a series of family losses and the collapse of his son's brokerage firm amid evidence of substantial fraud.

Legacy

As Field's assets evaporated, his primary legacy is the example of his relentless energy, vision, enthusiasm, and organizational talent in successfully laying the transatlantic cable. His name will forever be linked with that major breakthrough in long-distance communications.

Marshall Field

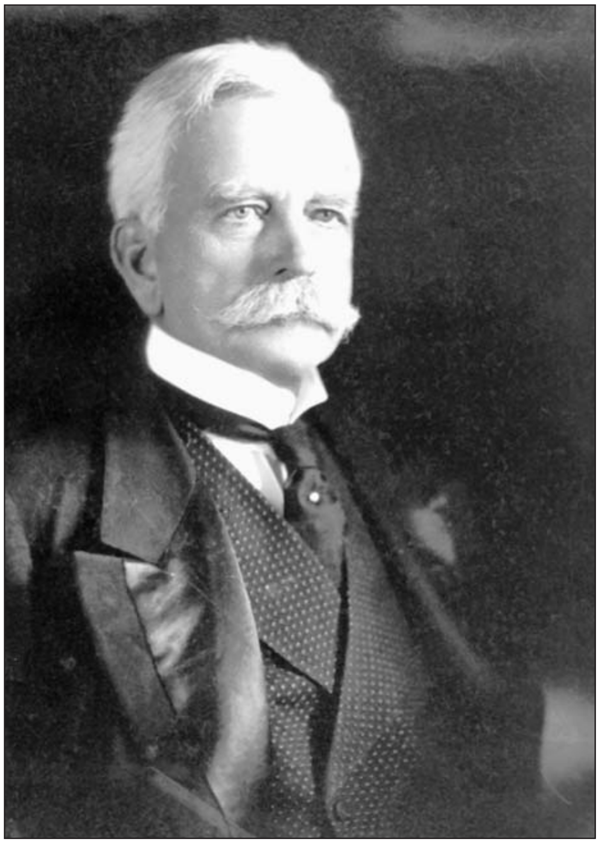
American retailer

Field introduced an innovative approach to the dry goods industry by transforming the need to purchase everyday items into a pleasant shopping experience. The introduction of exotic foreign imports, consistent pricing, and an inviting store environment became the hallmark of Marshall Field and Company. This approach not only made Field's personal fortune but also revolutionized the mercantile industry.

Born: August 18, 1834; near Conway, Massachusetts
Died: January 16, 1906; New York, New York
Sources of wealth: Retailing; real estate
Bequeathal of wealth: Children; charity

Early Life

Marshall Field was born in 1834 on a farm near Conway, Massachusetts, the son of John Field IV and Fidelia Nash. The Fields were direct descendants of the Puritans who arrived in Massachusetts in the seventeenth century. Field's family valued education, and he received his early schooling at the local public school and later at a nearby academy. At the age of seventeen, he moved to Pittsfield, Massachusetts, where he took a position in a dry goods store. Ironically, Mr. Davis, his first employer, felt that because of his shyness, Field would not have a future in merchandising. Despite his boss's opinion, Field learned a great deal from this job.



Marshall Field. (Library of Congress)

First Ventures

Field left Pittsfield after a year and headed west to make his fortune. He arrived in Chicago in 1856 and lived with his brother. He obtained employment as a clerk at Cooley, Wadsworth & Company, one of Chicago's largest dry goods firms. In 1863, he married Nannie Douglas Scott, and they had two children, Marshall Field, Jr., and Ethel Field. From 1856 to 1865, Field, with his frugal lifestyle and hard work ethic, was able to save more than $30,000, enough to buy into a business partnership.

Mature Wealth

Within four years after becoming a clerk at Cooley, Wadsworth & Company, Field advanced to the position of junior partner. In 1864, John V. Farwell, senior partner of Cooley, Farwell, & Company, offered both Field and the company bookkeeper, Levi Leiter, the opportunity to become partners in the firm. They readily accepted his offer and the firm became Farwell, Field & Company. Shortly thereafter, the new partners heard that Potter Palmer, one of Chicago's leading businessmen, was looking to dispose of several of his commercial interests. Instantly, Field and Leiter saw an opportunity to become Palmer's business partners. The three men began negotiating in late 1864 and reached an agreement in January, 1865. As part of their agreement, they created a new dry goods store, Field, Palmer, Leiter & Company. The new company proved to be so successful that Field and Leiter were able to pay Palmer back in full within two years. In 1867, Palmer withdrew from the partnership in order to

The Field Museum of Natural History

The Field Museum of Natural History was called the Columbian Museum of Natural History when it was founded in Chicago in 1893. It was housed in the Fine Arts Building, one of the structures built for the 1893 World's Columbian Exposition, which was held in Jackson Park. The museum's concept originated from a concern that the various biological and anthropological exhibits featured at the exposition would be lost to posterity. Citizens and business leaders came up with the idea of creating a permanent museum to exhibit these scientifically valuable specimens and to create educational displays for public enjoyment. Reluctant at first to become involved in such a project, merchant Marshall Field was finally persuaded in 1893 by fellow millionaire Edward D. Ayer to contribute $1 million toward the establishment of such a museum. Field subsequently made a bequest in his will of $8 million to ensure the museum's continued existence.

In 1905, the museum's name was changed to the Field Museum of Natural History in honor of its principal benefactor. The museum quickly grew in both scope and size as it began acquiring additional specimens through donations and collection expeditions throughout the world. In 1921, the museum moved a few miles south from its Jackson Park location to Grant Park, where it remained into the twenty-first century.

The museum is one of the most important natural science museums in the world. It has four major departments—botany, zoology, anthropology, and geology—which house more than twenty-four million specimens. The institution promotes collections-based research and offers scientists from around the world the opportunity to access its collections. Its exhibition halls offer the public a wide variety of exhibits ranging from insects to Egyptian mummies. The museum is perhaps most famous for Sue, the nearly complete skeleton of a *Tyrannosaurus rex*.

Another source of pride is the museum's Pritzker Laboratory for Molecular Systematics and Evolution. The laboratory's mission is to collect and analyze genetic data. The museum also houses the Robert A. Pritzker Center for Meteoritics and Polar Studies, which combines the traditional study of meteorites with biological research about polar regions. The center preserves meteorite collections belonging to the Field Museum and other institutions and conducts research expeditions to the Arctic and Antarctica.

concentrate on his real estate holdings, and the store became Field, Leiter & Company.

Field, Leiter & Company prospered until its six-story building, located at State and Washington Streets, was destroyed in the great Chicago fire of October, 1871. Field and Leiter acted quickly and saved a considerable amount of their merchandise. Within weeks of the fire, they were able to open a temporary store, and six months later, they moved into an unburned building, providing merchandise to Chicago residents as the city began to rebuild. Benefiting from Chicago's revitalization and construction boom, Field, Leiter & Company was back in business on State Street by October, 1873. Another fire destroyed the store in 1877, and once again, Field and Leiter moved quickly, opening a nearby temporary store within a month of the fire. This store would occupy this site until 1879, when the business moved into a new structure built on the site of their original shop. The partnership of Field and Leiter lasted until 1881, when Field and his junior partners bought out Leiter's interest in the business. Now Field was in complete control of his new firm—Marshall Field & Company.

Over the next twenty-five years, Marshall Field & Company expanded its business to such an extent that it became the largest wholesale and retail dry goods enterprise in the world, with annual sales of more than $60 million. Later expansion would include branches in New York, France, Germany, Great Britain, Japan, and Switzerland. The success of Marshall Field & Company was based on its combination of retail and wholesale merchandising. In conjunction with his prominent retail store on State Street, Field also operated a nearby wholesale facility that sold merchandise in bulk to smaller businesses across the country. The wholesale store made huge profits for the company because its Chicago location enabled it to provide merchandise for the growing markets in the Midwest and West. Never content with his success, Field was always looking for ways to lower costs and increase profits. One of his ideas was to manufacture his own merchandise in factories located in Australia, China, Germany, Italy, and Spain, an approach that eventually would become standard practice for many other businesses.

In Chicago, Field's State Street store remained the premier destination for quality shopping. It provided customers with such innovative services as an interior design department, personal shopping assistants, an easy return policy, home delivery, and a bargain basement. In later years, this store would feature The Walnut Room, a high-quality restaurant, and would gain renown for its festive appearance and holiday decorations. In addition to his merchandising, Field made a fortune in real estate. He was a leading advocate for the development of downtown Chicago, and at the time of his death, it was estimated that more than half of his $125 million wealth was invested in land. Field died of pneumonia in New York City on January 16, 1906.

Legacy

Initially, philanthropy was not one of Marshall Field's principal interests. At times he could be very generous, and at other times his actions could be somewhat inhumane. On one hand, Field was the stereotypically tyrannical nineteenth century capitalist. He was notorious for paying his workers the lowest possible wages and he hated labor unions. He opposed clemency for the defendants in the May, 1886, Haymarket Riot in Chicago, and he was a strong advocate for the use of the federal soldiers to break up the 1894 Pullman railroad strike.

On the other hand, he gave millions of dollars to support education and cultural development. As his fortune grew, and at the urging of other wealthy Chicago businessmen and civic leaders, Field eventually became a noted philanthropist. Among his philanthropic projects were a charter membership in the Art Institute of Chicago, the donation of ten acres of prime land for the establishment of the University of Chicago, and, in 1893, a $1 million contribution to the founding of the Columbian Museum of Natural History, which later became Chicago's Field Museum of Natural History. In addition, his will contained an $8 million bequest to the museum to ensure its future existence. Field's philanthropic legacy continues into the twenty-first century through his descendants, who remain faithful supporters of Chicago's educational and cultural activities.

Harvey Firestone

American inventor and industrialist

Firestone's rubber tire innovations and business savvy made him one of the wealthiest tire entrepreneurs in the United States during the advent of the automobile industry.

Born: December 20, 1868; Columbiana, Ohio
Died: February 7, 1938; Miami Beach, Florida
Also known as: Harvey Samuel Firestone
Sources of wealth: Patents; sale of products; real estate
Bequeathal of wealth: Children

Early Life

Harvey Samuel Firestone was born in 1868 on his family farm in Columbiana, Ohio. He was the second child of Benjamin Firestone and A. Catherine Flickinger. Firestone graduated from Columbiana High School and then completed a business college course in Cleveland, Ohio. In 1895, he married Idabelle Smith, a composer and songwriter from Jackson, Michigan. The couple had five sons and one daughter.

First Ventures

After completing his business course, Firestone took a job with his uncle's business, the Columbus Buggy Company. By 1892, he had become the district manager in charge of Michigan sales. However, in 1896 the buggy company went bankrupt.

That same year, with financial support from a friend, Firestone moved his family to Chicago, where he opened a rubber wheels company. In 1899, he sold the company and earned a profit of almost $42,000. Firestone continued to be interested in the tire business and how it would be affected by the emerging automobile industry. By the beginning of the twentieth century, he had acquired a patent for a process of attaching rubber tires to wheels.

Mature Wealth

In 1900, Firestone relocated his family to Akron, Ohio, where many of the country's tire manufacturers were based. With $10,000 and his tire patent, Firestone and a group of investors opened the Firestone Tire & Rubber Company on August 3, 1900. At the company's inception, Firestone owned 50 percent of the corporation. During the first few years in business, the company sold tires manufactured by other firms and did not make much of a profit. In 1903, Firestone not only began to manufacture his own tires but also started to make a specially designed pneumatic tire for automobiles. In 1906, Henry Ford ordered two thousand sets of tires from Firestone. In 1907, Firestone's growing company sold 105,000 tires at a profit of $538,177. That same year, Firestone began marketing a tire with dismountable rim that allowed both the wheel and the tire to be removed together. This innovation eventually became known as the spare tire.

By 1913, Firestone's tire sales had exceeded $15 million, and he was ranked as one of the Big Five in the tire industry, alongside Goodyear Tire and Rubber Company, B. F. Goodrich, U.S. Rubber, and Fisk Rubber. In 1923, Firestone introduced the balloon tire, which eventually became the standard for most American automobiles. In 1924, he and Ford worked together to break Great Britain's monopoly on the world's rubber supply.

Harvey Firestone. (Hulton Archive/Getty Images)

In 1926, they purchased a million acres of land in Liberia and developed a plantation that provided them with an independent source of rubber.

In 1928, Firestone opened his first "one stop service center" that provided customers with numerous automobile-related services, including gasoline, oil changes, brake services, and tires. In 1932, Firestone stepped down as company president, while his five sons continued to take active roles in the business. By 1937, the company was supplying more than a quarter of all automobile tires in the United States and had capital in excess of $108 million. Firestone died of a coronary thrombosis at his winter home in Miami Beach, Florida, on February 7, 1938.

Legacy

Harvey Samuel Firestone's interest in rubber tires and their use on automobiles made his family-owned tire manufacturing business a leader in the tire industry. Many of his innovations became standards for the automobile industry, including the creation of his company's own rubber supply and the conception of the modern garage, where numerous automobile services could be offered to customers at one location. Firestone's business ingenuity and his tire inventions earned him the distinction of being one of America's wealthiest industrialists.

Henry M. Flagler

American entrepreneur, industrialist, and philanthropist

Flagler used a fortune acquired in the oil industry to build railroads and luxury hotels in Florida, thus establishing that state as a prime destination for tourists and enabling his heirs to pursue numerous philanthropic endeavors.

Born: January 2, 1830; Hopewell, New York
Died: May 20, 1913; West Palm Beach, Florida
Also known as: Henry Morrison Flagler
Sources of wealth: Oil; railroads; real estate; tourism
Bequeathal of wealth: Spouse; children; charity

Early Life

Henry Morrison Flagler was born into the family of a Presbyterian minister in Hopewell, New York. His father, the Reverend Isaac Flagler, married Elizabeth Caldwell Morrison Harkness after the death of her first husband, providing a family connection that would give young Flagler his start in business. Flagler left school after the eighth grade and moved to Bellevue, Ohio, where he worked in his cousin's grain business, L. G. Harkness and Company, for $5 a month plus room and board. By the time he left this company in 1849, Flagler had demonstrated his worth as a salesman, increasing his salary to $400 a month. In 1852, he joined another family business, D. M. Harkness and Company, and soon married Mary Harkness. Their first child, Jennie Louise, was born on March18, 1855, and their second child, Carrie (who would die at the age of three), on June 18, 1858. On December 2, 1870, Mary gave birth to Henry's only son, Harry Harkness Flagler, who would later become an important philanthropist in his own right.

First Ventures

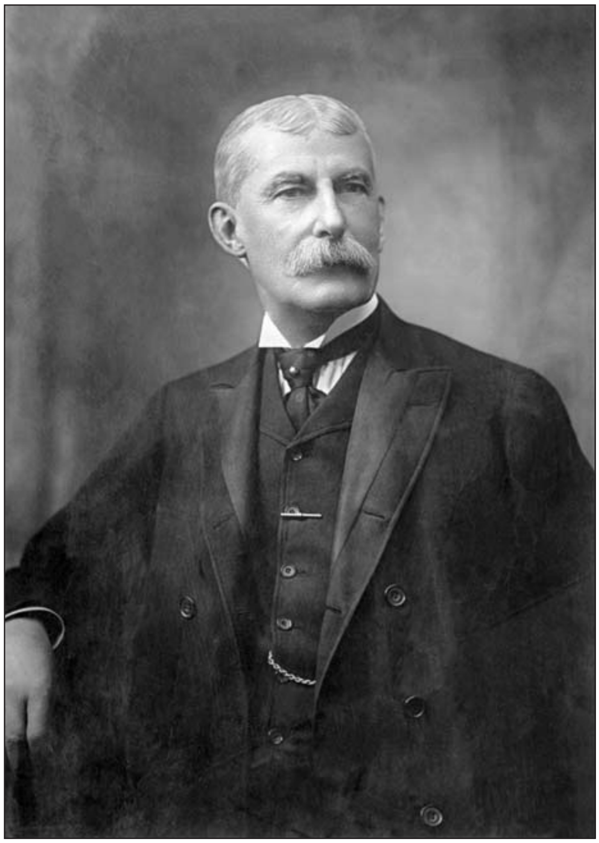
Flagler's entry into the salt business failed with the declining price for salt that followed the Civil War. His small fortune eliminated, Flagler returned to another Harkness family businesses,where he met John D. Rockefeller, who was working at that time for a firm that sold grain and other produce on commission. When Rockefeller left the grain business to enter the emerging petroleum industry, he approached Flagler for a loan to support his new venture. Stephen Vanderburgh Harkness agreed to become a silent partner in Rockefeller's company only if Rockefeller gave Flagler a position as partner. In 1870, the chemist Samuel Andrews joined with Rockefeller, Harkness, and Flagler to create the company that would soon be known as Standard Oil.

Within two years, Standard Oil had purchased or merged with all other oil companies in Cleveland and embarked on a plan to become a major national industry. The company's headquarters was relocated to New York, and by 1879, Standard Oil had captured 90 percent of the American oil market. By producing only the amount of oil needed to maintain a consistently high price, the original partners in the company all became extremely wealthy. Flagler and his wife purchased a spacious home on Fifth Avenue, but because of Mary's poor health the couple also spent part of each year in Florida on the advice of Mary's doctor. Through their winters in the Jacksonville area, Flagler became convinced that the region had potential for development and began formulating plans that would eventually introduce him to yet another source of wealth.

Mature Wealth

Flagler's wife Mary died on May 18, 1881, the year before the Standard Oil Trust was formed. This trust pioneered a new concept in business: Rather than functioning as the property of any individual owner, Standard Oil would be owned in common by a group of stockholders, with major decisions rendered by a board of trustees. Instead of receiving profits directly from the company's operations, Rockefeller, Flagler, and the other partners received their incomes from trust certificates, which became more valuable as the business continued to expand. On June 5, 1883, Flagler married Ida Alice Shourds, who had cared for Mary in her final illness. Because of Flagler's familiarity with Florida, the couple honeymooned in St. Augustine, which Flagler found distressingly lacking in convenient hotel accommodations.

With the trust now in charge of Standard Oil's day-to-day operations, Flagler began building a hotel worthy of St. Augustine's history and charm. Named the Hotel Ponce de Leon, Flagler's 540-room resort started the trend of making Florida a tourist destination for America's elite. Realizing that a major hotel would prosper only if it were easy to reach, Flagler purchased and extended local railroad lines, eventually forming the Florida East Coast Railway. The almost instantaneous success of the Ponce de Leon after it opened in 1888 caused Flagler to continue expanding his tourist empire. He proceeded south to Daytona with the Hotel Ormond in 1890 and extended his railroad to West Palm Beach in 1894, which he initially believed would be the southernmost point to which tourists would travel. Flagler's Royal Poinciana Hotel on the shores of Lake Worth boasted 1,150 rooms, and in 1896, he opened the Palm Beach Inn on a pristine stretch of Atlantic coastline.



Henry M. Flagler. (©Bettmann/CORBIS)

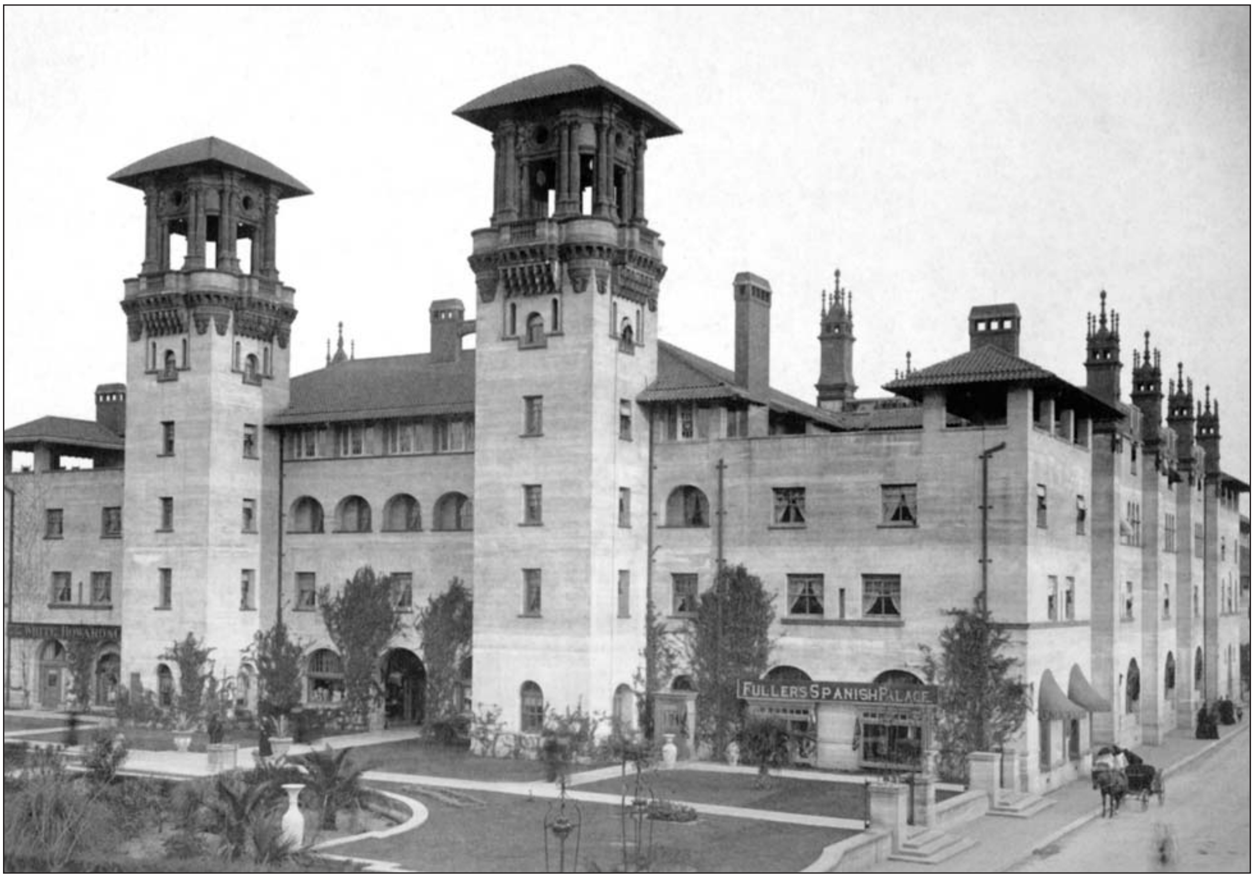
In addition to the Ponce de Leon, Flagler operated two other hotels in St. Augustine: the Alcazar, which later became the Lightner Museum, and the Cordova, which had been built by Franklin Smith in 1888 and originally named the Casa Monica (the name it was given once again following its 1997 restoration). Flagler's hotels were innovative for their features and luxurious appointments. At one time, the Cordova had the largest indoor heated pool anywhere; the Alcazar was one of the earliest examples of poured concrete construction in the United States; and the Royal Poinciana Hotel once boasted that it was the largest wooden structure in the world. Flagler's guests would frequently arrive at his hotels in private railcars, attended by a sizable household staff and equipped with numerous trunks of clothing. Guests would often change their clothing for each meal and wear the latest fashions for the numerous parties, balls, and social gatherings held in the hotels and at nearby estates.

Flagler's hotels originally remained open only from mid-December through late February, since Florida summers proved too hot for the elite clientele from Philadelphia, Boston, and New York. However, when cold winters hampered business in 1894 and 1895, Flagler decided to extend his railroad south to Biscayne Bay Country, a site that avoided the frigid conditions farther north. Julia Tuttle, a local citrus grower, offered Flagler a substantial land grant in order to develop the area, and by 1896 Flagler had provided the infrastructure necessary for a city to thrive. When it was proposed that the new town be called Flagler, the industrialist demurred, preferring the name Miami after the tribe of Indians that had given their name to a local river. It was thus in the new city of Miami that Flagler opened his Royal Palm Hotel in 1897.

For several years, Ida Alice's mental health grew increasingly unstable, and in 1901 Flagler took advantage of a new law that allowed him to divorce her on the grounds of insanity. On August 24 of the same year, Flagler married Mary Lily Kenan, the sister of the philanthropist William Rand Kenan, Jr. As a wedding present, Flagler built Mary Lily a lavish estate, which she named Whitehall, not far from the Palm Beach Inn, later renamed The Breakers in honor of the waves that continually lapped its sandy beaches. Flagler then spent seven years extending his railroad to Key West. He and his wife also became central figures in the Palm Beach social scene and helped inaugurate what became known as the season, an annual period when the wealthy would migrate from the north to Flagler's luxurious hotels along the eastern coast of Florida. In 1913, Flagler suffered a severe fall at Whitehall and died on May 20. He was buried in St. Augustine in a plot that he shares with his first wife and his eldest child, Jennie Louise.

LEGACY

Henry Morrison Flagler's influence on Florida was substantial. He helped transform what had been a largely un-



Alcazar Hotel, St. Augustine, Florida, in 1889. Henry M. Flagler built three hotels in this city in order to promote tourism in the area. (©Bettmann/CORBIS)

FLAGLER MUSEUM, WHITEHALL

Created as a wedding present for Henry M. Flagler's third wife, Whitehall is today regarded as a leading example of Gilded Age architecture. When construction of the palatial Palm Beach, Florida, residence was completed in 1902, the *New York Herald* described Whitehall as "more wonderful than any palace in Europe, grander and more magnificent than any other private dwelling in the world."

Flagler entrusted the project to the architects John Carrère and Thomas Hastings, whose first major commission had been Flagler's in St. Augustine and who later went on to design the New York Public Library. Carrère and Hastings's design featured an entry hall where guests would be met by a marble image of the emperor Augustus (based on the marble statue *Augustus of the Prima Porta*, now in the Vatican), an ornate clock by the cabinetmaker François Linke, and a full-length portrait of Flagler by Raimundo de Madrazo y Garreta. Overhead, the domed ceiling was adorned with a massive painting depicting the Oracle of Delphi surrounded by a number of mythological and allegorical figures. This juxtaposition of styles from various periods reflected the tendency of Gilded Age patrons to combine symbols of luxury irrespective of their divergent styles. Elegant spaces for formal and casual dining, individually designed guest bedrooms, more than twenty bathrooms, and central heating suggest the house's primary role in receiving and entertaining Flagler's friends. Whitehall's technological features included telephones and electric lighting, making the mansion highly advanced for its time.

The sixty-thousand-square-foot primary structure consisted of fifty-five rooms centering on an open courtyard in imitation of Italian villas, and the residence was filled with marble and gilded surfaces. To the right of the courtyard on the first floor were a drawing room, dining room, and breakfast room; to the left were a library, music room, and billiard room. On the second floor the bedrooms were named for their decor, such as the Yellow Roses Room, the Silver Maple Room, and the Heliotrope Room.

After the death of Flagler's widow in 1917, Whitehall became the property of her niece, Louise Clisby Wise Lewis, who later sold the property to investors. The new owners transformed the property into a hotel, and once Palm Beach became a popular tourist destination they built a three-hundred-room hotel annex at the back of the building. This additional structure was demolished in 1963, and the mansion was restored to its original state, becoming the Flagler Museum. The building is listed on the National Register of Historic Places. In 2005, a pavilion in the style of a grand railway station of the Gilded Age was added to the grounds, in part to house Flagler's private railroad car.

inhabited region into a major tourist destination, established a standard for luxury in the hotel industry that would be imitated by many successors, and helped create the city of Miami. Flagler's wealth also became the basis for numerous philanthropic enterprises through the efforts of his third wife and his son. The William R. Kenan, Jr., Charitable Trust, named for the brother of Mary Lily Kenan Flagler, became a major benefactor of the University of North Carolina at Chapel Hill and has funded numerous other educational and cultural endeavors at such institutions as Florida Atlantic University, Sweet Briar College, Princeton University, and the Smithsonian Institution. In 1968, another of Flagler's heirs, Lawrence Lewis, Jr., founded Flagler College, using the former Hotel Ponce de Leon as its central building. The fortune developed by Henry Morrison Flagler through his enterprises in oil, railroads, and the hotel industry thus continues to benefit the educational and cultural activities throughout the region that Flagler once called home.

JAMES CLAIR FLOOD

American silver mining magnate

Flood, one of the silver kings, became rich through his investment in Nevada's famed Comstock Lode. Typical of wealthy people in the Gilded Age, Flood engaged in spectacular consumption, becoming one of the leading citizens of San Francisco during the city's maturation in the 1870's.

Born: October 25, 1826; Staten Island, New York
Died: February 21, 1889; Heidelberg, Germany
Sources of wealth: Mining; investments
Bequeathal of wealth: Spouse; children

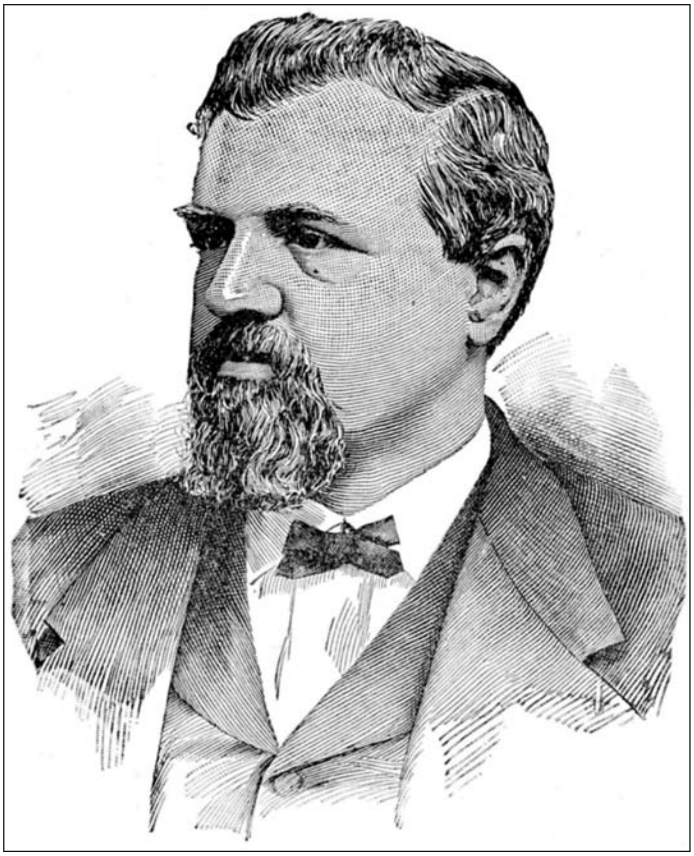
EARLY LIFE

James Clair Flood, the son of poor Irish immigrants, attended New York City public schools for a few years before becoming apprenticed to a carriage maker. In 1849, he joined the rush to California's gold mines by taking the route that sailed around Cape Horn. Flood did not aim to make his fortune by mining gold but instead hoped to sell custom-built carriages to the rich miners. He soon discovered, however, that there was no demand for his carriages. Flood worked for a few months as a carpenter before trying his luck with placer mining in the Yuba River. He had more success than most and returned to San Francisco with $3,000 in gold dust. Flood used the money to buy a farm in Illinois but did not care for farming. He married in 1853 and decided to engage in another enterprise.

FIRST VENTURES

Flood returned to San Francisco in 1854, where he repaired wagons. He went bankrupt in the recession of the 1850's, as did his neighbor, William S. O'Brien. Flood formed a partnership with O'Brien that would continue for the rest of their lives. Having concluded that men drank in good times as well as in bad, they opened a saloon, the Auction Lunch, in 1857.

Flood picked up tips from the stockbrokers who visited his saloon. Flood then studied the stock market, and



James Clair Flood. (The Granger Collection, New York) he and O'Brien made a considerable fortune through speculation by 1868. The two owners sold the Auction Lunch and went into business as full-time stockbrokers. In this capacity, they met two speculators from Virginia City, Nevada, James G. Fair and John William Mackay, who were trying to take over a Comstock Lode silver mine. The four men formed a partnership that would turn them into silver kings. By 1872, Flood had an estimated income in excess of $500,000 a month.

Mature Wealth

Flood celebrated his wealth by buying the most expensive carriage on the market, as well as the handsomest team of horses. He traded his modest house for one that had been owned by John Selby, the former mayor of San Francisco. The Selby house, named Fair Oaks, became the first in a series of mansions that Flood would own. As he continually traded up and spent millions of dollars on each renovation, the silver king captured the attention of San Franciscans. Linden Towers, one of the Flood mansions, long stood as one of Northern California's foremost examples of Baroque architecture. The Floods frequently held dinners, and almost every distinguished visitor to San Francisco stopped at the Flood mansion. Visitors to Linden Towers saw a drawing room finished in carved walnut with walls of embossed velvet, a music room in rosewood and satinwood, and a dining room paneled in English mahogany with ceiling frescoes by an Italian artist. They admired a sixty-foot fountain and an artificial lake stocked with game fishes, as well as a private racetrack.

Flood, who had joined his three silver partners in opening the Bank of Nevada in 1875, believed that wealth brought philanthropic obligations. He sent Christmas checks to San Francisco's orphan asylums and old people's homes. However, he refused to dole out "unearned" cash because he believed these gifts would destroy the recipients' initiative and self-respect. After years of poor health, Flood died of Bright's disease in 1889.

Legacy

Flood's legacy is that of many rich men in America's Gilded Age. He came rather quickly to incredible wealth and spent his money almost as quickly as it came in. To maintain his wealth, Flood periodically manipulated silver stocks and disrupted the economy of the Northern California coast. Contemporary critics blamed him for impoverishing thousands. Flood's life shows the best and the worst of the excesses of his era.

Samuel Fludyer

English textile merchant

Fludyer dominated the West Country woolen-cloth trade in the mid-eighteenth century. He used his wealth to climb the social and political ladder of eighteenth century England.

Born: 1704 or 1705; London, England
Died: January 18 or 21, 1768; London, England
Also known as: Sir Samuel Fludyer, first baronet
Source of wealth: Trade
Bequeathal of wealth: Children

Early Life

Sir Samuel Fludyer (FLUHD-yehr), first baronet, was born in 1704 or 1705 to the London clothier Samuel Fludyer and his wife, Elizabeth de Monsallier. As was the custom, young Samuel was trained in his family's business and did not receive a formal education. In addition to learning the wool textile trade in London, he accompanied the pack trains that moved merchandise between the London merchants and the cloth production areas of the West Country—predominantly the counties of Wiltshire and Gloucestershire. Since he did not come from the upper class, it is not surprising that his early life is poorly documented.

First Ventures

At an unknown date, Fludyer entered an independent cloth-trading partnership with his brother Thomas. The two brothers are listed as "warehousemen" or wholesalers in London directories of the time, but they also received woolen cloth on consignment from manufacturers in their positions as Blackwell Hall factors. (Blackwell Hall was the site of the Woolcloth Exchange.) The brothers sold cloth far beyond London, exporting their trade to other locations in Great Britain and to Britain's colonies in America. As the papers of their business do not survive, many aspects of its day-to-day operations are unknown. Fludyer seems to have been the more important of the two brothers. By 1750, the brothers' credit and economies of scale were so well established that Fludyer's notes circulated as currency in the wool country, and the brothers had become the dominant force in the British wool trade. At the same time Fludyer married Jane Clerke.

Mature Wealth

Such was Fludyer's power as a purchaser that he began to exert control over production, assigning manufacturers to produce specific kinds of cloth at specified prices in a manner unprecedented in the wool trade. He also began to contract directly with dyers rather than sell white cloth which customers would arrange to have dyed. By 1760, he had branched out from his original base in the West Country to Yorkshire, another key area of woolen production. Fludyer also ventured into other areas of business, bidding with several others for a concession for the coal mines at Cape Breton, which Britain had won in the Seven Years' War.

Fludyer's wealth led to political power and influence. He was elected a director of the Bank of England, the central financial institution of the British Empire, in 1753, and he served as the bank's deputy governor from 1766 to 1768. He was also a London alderman, and in 1761-1762 he served as the city's lord mayor, the highest position for members of the city's business elite. In 1754, Fludyer was elected a member of the House of Commons, representing the Wiltshire borough of Chippenham, a major cloth center. Fludyer would promise to supply Chippenham manufacturers with wool and buy their cloth on favorable terms in order to secure their votes. He then used his position in Parliament to support his highly profitable work as a government contractor during the Seven Years' War.

Fludyer moved into England's social, economic, and political elite. His second wife, whom he married on September 2, 1758, was Carolina Brudenell, a niece of the earl of Cardigan. In 1755, Fludyer was knighted, and in 1759 he was made a baronet with a seat at Lee in Kent County. He was reportedly worth £900,000 when he died in 1768.

Legacy

Fludyer's career demonstrated the opportunities for businessmen to advance themselves socially and economically in eighteenth century England. Although Fludyer was not associated with technological advances in cloth manufacture, the enormous scale and centralization of his enterprises helped set the stage for the massive transformations of the textile industry that would take place during the Industrial Revolution. However, as was common during the eighteenth century, his descendants lived as landed gentry rather than carrying on his cloth business.

Henry Ford

American industrialist, inventor, and entrepreneur

Ford established an automotive manufacturing firm that became one of America's most successful businesses in the first half of the twentieth century and was the largest privately held company in the country. During his lifetime, Ford amassed a personal fortune that made him one of America's first billionaires.

Born: July 30, 1863; Springwells Township (near Dearborn), Michigan
Died: April 7, 1947; Dearborn, Michigan
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Relatives; charity

Early Life

Henry Ford was born in 1863 on a farm outside Dearborn, Michigan. Although his formal education was limited, his keen interest in mechanical devices, especially engines, led him at age sixteen to leave home for Detroit, where he obtained an apprenticeship in a factory. Returning to Dearborn a few years later, he worked on farm machinery and ran a lumber business, spending his leisure hours experimenting with the construction of a horseless carriage. In 1891, he married Clara Bryant; two years later she gave birth to their only child, Edsel. Ford returned to Detroit in 1891 to work for the Edison Illuminating Company, rising quickly to become chief engineer of a power substation. His real passion, however, lay in developing a motorized vehicle, a feat he accomplished in 1896 when he successfully tested his Quadricycle on Detroit streets.

First Ventures

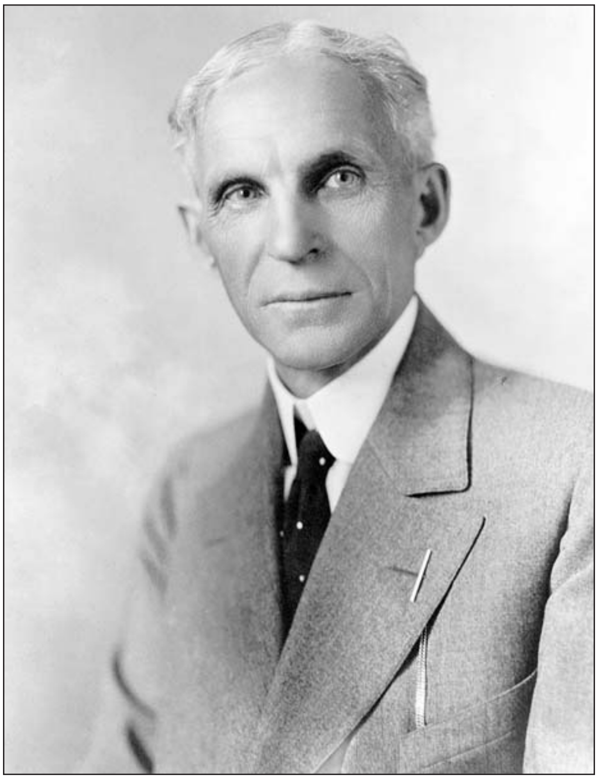
Almost immediately after Ford completed his first prototype vehicle, he began seeking financing to establish an automobile manufacturing firm. Several prominent Detroit businessmen underwrote the formation of Ford's Detroit Automobile Company, which began operating in 1899 but closed down eighteen months later. Undaunted, Ford began building and racing high-performance vehicles, using his success to persuade a new group of investors to create the Henry Ford Company. Unfortunately, that enterprise failed as well, chiefly because Ford was unable to develop a reliable vehicle that could be mass-produced inexpensively. For the next two years, he continued experimenting with chassis and engine design, and in August, 1903, twelve men, including Ford and Andrew Malcomson as principal shareholders, launched the Ford Motor Company. Ford did not invest his own money; instead, he was named general manager at an annual salary of $3,000.

Mature Wealth

The Ford Motor Company was an immediate success, largely because Ford's Model A vehicle appealed to the American public. It was easy to operate and inexpensive, especially when compared to other companies' models. During the next four years, Ford and his team developed additional models, several of which were also well received by buyers. Shrewdly, Ford also created the Ford Manufacturing Company to produce and supply parts for his automobile firm, keeping those profits for himself. In 1906, Ford bought out Malcomson, giving Ford a majority of stock in the Ford Motor Company. He then had virtually free rein to direct the company's future.

Within less than a decade, what was a respectably successful firm among dozens of American automobile manufacturing operations became the dominant company in the industry. Ford's meteoric rise began in 1907 with the introduction of the Model T. Ford's vision was to make a car that most working-class Americans could afford. Over the next two decades, Ford would consistently increase production and reduce the price of this automobile, taking advantage of the Model T's popularity to build a national network of dealerships. Ford was able to produce the Model T efficiently and profitably by developing the moving assembly line, allowing workers to remain at their work stations while partially assembled cars came to them for further work. At the same time, he established a number of innovative labor practices to recruit and retain workers in his assembly plants. The company expanded rapidly to meet demand, constructing a major facility at Highland Park in 1910 and another one at River Rouge in 1915-1919. Between 1907 and 1927, fifteen million Model T's were manufactured.

The profitability of Ford's operation skyrocketed. Company profits in 1909 were approximately $2 million. By 1914, that figure exceeded $16 million; in 1915, the company declared a $60 million dividend. In 1918, some shareholders began to question Ford's decision to reinvest most of the profits from the company into plant expansion. After a lengthy lawsuit and behind-the-scenes negotiations, Ford managed to buy out all the other shareholders. For the next forty years, all Ford stock was held by the Ford family. By 1929, the company was showing an annual profit of $90 million, and it earned a $40 million profit the next year despite the onset of the Great Depression.



Henry Ford. (Library of Congress)

Although precise figures on the value of Ford's holdings were never available, most business analysts agreed that by 1927 his net worth exceeded $1 billion. During this same period he became a popular national figure; at one point, there was even a movement to draft him as a presidential candidate. Admiration for him waned somewhat during World War I, however, when he lobbied to keep the United States out of the conflict, although he did eventually agree to manufacture vehicles for the government. At about this time, he began a series of vicious attacks on Jews, promoting his anti-Semitic ideology in the Dearborn *Independent*, a newspaper he owned for nearly a decade. Ford reached the nadir of his popularity in 1938, when he agreed to accept an award from Adolf Hitler's government.

Although Ford made his son Edsel president of Ford Motor Company in 1919, he continued to direct the corporation's ventures while taking on a number of other projects in which he had special interest. Ford always wanted to control all aspects of automobile manufacturing, so over time he acquired steel mills, lumber and mining operations, a rubber plantation, and various transportation assets. He also began Fordson Tractor in 1910, and at one time or another was engaged in agricultural research, wireless communications, hydroelectric power generation, and housing development. Eventually, Ford's business operations extended to Canada, Mexico, South America, and across Europe. Closer to home, Ford built the Henry Ford Hospital in Detroit from his own funds in 1915, and he supported several educational institutions that aided immigrants and underprivileged children. After World War I, he began collecting antiques and other objects of Americana; to display these artifacts, he created the Edison Institute and Greenfield Village in Dearborn.

Ford was always a hands-on manager, a technique that served his company well in its early years but began to be a liability during the 1920's. By 1923, the Model T, which had captured 40 percent of the automobile market, began to lose market share. Ford had to be prodded to drop this line and produce more modern vehicles in response to competition, especially from General Motors' Chevrolet division. During the 1930's, Ford became something of an absentee director, frequently relying for advice on his close associate Harry Bennett, a former security guard whose high-handed methods of dealing

Ford Foundation

Prompted by a change in tax laws that would have deprived his family of a significant portion of his wealth upon his death, Henry Ford established the Ford Foundation in 1936, and he changed his will so the foundation would receive a substantial share of Ford Motor Company stock when he died. Upon Ford's death in 1947, the foundation obtained stock valued at more than $500 million, making it one of the largest philanthropic organizations in America. Ford's grandson Henry Ford II became chair of a board that included a number of nationally respected business and educational leaders as trustees.

Initially, the foundation supported causes in which the Ford family had a special interest, but after World War II its scope began to widen. Its headquarters was moved to Pasadena, California, and the board began implementing a strategy geared toward social activism, supporting causes such as civil rights and urban planning. In the mid-1950's, the foundation moved its headquarters to New York City. Eventually, the foundation became independent of the Ford family, although Henry Ford II remained a trustee until 1976. From 1966 to 1979, the foundation was led by McGeorge Bundy, a former adviser to President John F. Kennedy, whose strong stance on a number of social issues prompted Ford dealers around the country to complain that the foundation's activities were hurting sales of Ford products.

During the 1950's and 1960's, the foundation's assets grew to more than $3 billion, but a recession and zealous spending dropped its value to $1.5 billion by the mid-1970's. Subsequently, however, the foundation recovered its financial health and continued to support charitable causes worldwide. Foundation funds brought economic reforms to developing nations around the world, improved the lives of the poor, and supported environmental initiatives worldwide. At the same time, sound investments and a growing economy allowed the foundation to improve its finances, so that in 2008 its assets exceeded $11 billion.

with both union organizers and other Ford executives caused great turmoil within the organization. By the outbreak of World War II, the company was losing money on automobile production; however, $6.5 billion in government contracts kept the company afloat during the war when auto production was halted. Ford Motor Company made a major contribution to the war effort by producing jeeps, tanks, trucks, and the B-24 Liberator bomber.

Unfortunately, Ford never provided his company with a strong succession plan. When his son Edsel died unexpectedly in 1943, Ford was required to reassume the presidency of Ford Motor Company. Two years later, prompted by his wife and other family members, he agreed to turn over operations to his twenty-five-year-old grandson. Henry Ford II immediately fired Bennett and restored some order to the company, obtaining managerial assistance from a team of former Army officers who had helped direct logistics for America's expeditions in Europe and Asia during World War II. By the time Henry Ford died in 1947, the company seemed to be returning to prosperity.

Legacy

Throughout his life, Henry Ford kept information about his personal wealth guarded from the public, but estimates place his net worth at the time of his death at a figure exceeding $1 billion, including his homes, investments in various businesses, and a personal bank account worth $26.5 million. To protect this vast fortune from the large inheritance tax that would have been imposed under laws passed in 1933, Ford added a codicil to his will in 1936, dividing up Ford Motor Company stock into two types: Class A stock, 95 percent of the company's total assets, would be transferred to the Ford Foundation at Ford's death; this stock would not provide foundation directors any voting rights within the Ford Motor Company. The remaining 5 percent of stock, designated Class B, was to be held by family members, who would retain the right to direct company operations. In less than a decade after Ford died, however, Henry Ford II and other Ford Motor Company executives decided to convert the company to a publicly owned corporation, although the family retained control of the firm's operations for many more years.

Nicolas Fouquet

French aristocrat and government official

Fouquet used his wealth to replenish the royal treasury and sustain the French monarchy. His wealth provided the financial support for seventeenth century artists, writers, musicians, and other talented individuals. He created Vaus-le-Vicomte, the model for Versailles, giving France two magnificent châteaux.

Born: 1615; Paris, France
Died: March 23, 1680; Pignerol, France
Also known as: Nicolas Foucquet
Sources of wealth: Inheritance; marriage; banking
Bequeathal of wealth: Spouse; artistic patronage

Early Life

Nicolas Fouquet (nee-koh-lah few-KAY) was born in 1615 in Paris, France. He was a member of an affluent family belonging to the *noblesse de la robe* (court nobility). His grandfather had been a merchant in Nantes; his father François had risen in rank to be an adviser to Cardinal de Richelieu, prime minister during the reign of Louis XIII. Nicolas was educated by the Jesuits and entered the legal profession at a very young age. In 1628, he was admitted as a lawyer to the parliament of Paris.

First Ventures

In 1636, Fouquet purchased the post of *maître des requêtes*, a court office. In 1641, Fouquet's wealth was already such that he purchased the village of Maincy and the château Vaux-le-Vicomte, located not far from Paris. At the time, the château was small and unpretentious, but Fouquet would later make it the most elaborate home in France.

As a *maître des requêtes*, he belonged to the group of court officers from whom the *intendants* were chosen. *Intendants* were court officials whose duties were to oversee the provincial governments' financial, policing, and judicial activities. Fouquet was first appointed as an *intendant* in 1642 by Prime Minister Jules Mazarin. He held various intendancies from 1642 to 1650. The Wars of the Fronde, the rebellion of a certain faction of the nobility against Mazarin and the young King Louis XIV, broke out in 1648. It lasted until 1653; during this time, Mazarin had to leave Paris and Fouquet not only remained loyal to him but also ensured the safety of his property.

Mature Wealth

In 1650, Fouquet obtained the prestigious and powerful office of *procureur général* (attorney-general) to the Parliament of Paris. The following year, he married Marie de Castille, who also belonged to a wealthy family of the *noblesse de la robe*. The marriage made him the owner of Belle Asize, his wife's estate, and added considerably to his wealth. With the end of the Fronde in 1653, Mazarin returned to Paris. In return for his loyalty and because of his ability, Mazarin appointed Fouquet *surintendant de finance* (finance minister). The combination of the offices of *procureur général* and *surintendant de finance* made Fouquet the most powerful man in France, since he controlled the king's finances and also the judicial court's activity.

The royal treasury had been virtually depleted in 1648; the private investors who had loaned money to the king had not received a profit on their investment and were unwilling to invest more. As prime minister, Mazarin was in desperate need of money to finance the administration, the war with Spain, and the costs

The Vicomte of Bragelonne

Nicolas Fouquet appears as one of the characters in *Le Vicomte de Bragelonne* (1848-1850; *The Vicomte of Bragelonne*, 1857), the third volume of Alexandre Dumas *père*'s three-volume historical romance about d' Artagnan and the king's musketeers. Dumas's novel is set in the 1660's, the time during which Louis XIV was establishing himself as an absolute monarch. It was also during these years that the king arrested and imprisoned Fouquet. The main characters of the novel are d'Artagnan and his three comrades, the musketeers Athos, Porthos, and Aramis. Dumas mixes fact and fiction in his tale. Among a tangle of plots, including efforts to restore the English throne to Charles II, an attempt to place Louis's brother Philippe upon the French throne, and the love affair of Louis and Louise de la Vallière, Dumas weaves into the story the account of Fouquet's downfall at the hands of Louis and his adviser Jean-Baptiste Colbert.

Dumas also involves Fouquet in the intrigue that places Philippe on the throne of France. Aramis is the main conspirator in the plot and kidnaps Louis so that Philippe can become king. Hoping to obtain help from Fouquet, Aramis tells him that he has kidnapped Louis and imprisoned him in the Bastille and that Philippe is now king. Contrary to what Aramis had expected, Fouquet immediately liberates Louis, an action which just happens to take place on the evening of the party Fouquet has thrown for Louis at Vaux-le-Vicomte. Colbert has convinced Louis that Fouquet has stolen money from the royal treasury to build Fouquet's great château and to finance the elaborate party. With no regard for the fact that Fouquet rescued him, Louis has him arrested and imprisoned.

The characterization of Fouquet in the novel reflects his ambition and enormous financial success, as it depicts the party at Vaux-le-Vicomte and both Colbert and Louis's envy of Fouquet. It also reflects Fouquet's almost naïve loyalty to King Louis XIV.

of entertainment and maintenance for the court. Thus, Fouquet's duty as *surintendant de finance* was to raise a large sum of money quickly. Since Fouquet was in charge of both raising the money and prosecuting any financial misconduct, he had a wide-open field in which to generate funds. Fouquet was loyal to Mazarin and the king, but he was also interested in increasing his own wealth. He employed two methods to enlarge his personal fortune. Fouquet negotiated loans using his own property as security. What he was actually doing was borrowing the money himself and then loaning it to the royal administration. He also obtained other loans directly on the security of the state. His techniques were legal and allowed him to make considerable profits. Fouquet was stricken seriously ill in 1658. Unable to perform his duties and raise money by negotiating loans, he sold Belle Asize to provide the funds necessary for the army.

In 1657, Fouquet had begun to renovate Vaux-le-Vicomte. As a member of the *noblesse de la robe*, he had to deal with the fact that his nobility was not inherited. The *noblesse de l'épée* (inherited or old nobility) refused to accept the *noblese de la robe* as their equals; in their opinion, the *noblese de la robe* were and would always be upstart bourgeois who had purchased their titles. Consequently, appearances were very important to Fouquet. He needed to parade his wealth in order to show the old nobility that he lived in the same or in a better manner than they did. Added to this desire, Fouquet actually had an appreciation for beauty and artistic quality. He was very generous in his support of artists and writers, and by 1657 he was extraordinarily rich.

Thus when he began the renovation of Vaux-le-Vicomte, he obtained the services of the very best architect of the time, Louis Le Vau; the very best painter and decorator, Charles Le Brun; and the most talented landscape gardener, André Le Nôtre. The renovations took four years and were not completed until 1661. Once the magnificent château and grounds were finished, the house and other buildings occupied almost one hundred acres of land, with highly elaborated gardens that extended for more than a mile. Vaux-le-Vicomte was the most beautiful and luxurious château in France.

As *surintendant de finance*, Fouquet had performed his duties well. He had replenished the royal treasury and provided funds for the royal administration and for the wars and extravagances of the court. He fully expected Louis XIV to name him prime minister upon the death of Mazarin, who was in failing health. However, Fouquet was to be disappointed in this ambition. Mazarin's private secretary Jean-Baptiste Colbert also had ambitions to become the king's foremost adviser and administrator. Louis XIV, who had been terrified by the Fronde, feared the power of the nobility; for Fouquet to become prime minister was not an eventuality that either the king or the nobles favored. Louis XIV decided to rule personally without a prime minister. As Mazarin's death approached, Colbert began to indicate to the king that Fouquet was not to be trusted.

Although some of his friends tried to caution him in regard to Colbert and the king, Fouquet did not perceive any danger. When the king expressed a desire to visit Vaux-le-Vicomte, Fouquet, who was proud of his château and eager to show it to the king and the nobles, immediately set about arranging a festive party for the king and the court. On August 17, 1661, Fouquet welcomed the king and his entourage to Vaux-le-Vicomte, where he entertained them with a tour of his gardens, a dinner, a ballet-comedy by Molière with music by Jean-Baptise Lully, and an abundance of fireworks. Fouquet entertained six thousand guests at a cost of 120,000 livres. This was the high point of Fouquet's career; he was the richest man in France, and as *procureur général* and *surintendant de finance*, the most powerful.

The magnificence of the château and its gardens and the elaborate festivities only served to intensify Louis XIV's extreme jealousy and hatred of Fouquet. Everything Fouquet possessed and offered totally eclipsed what the king owned. Louis XIV took his council of ministers to Nantes for a meeting. He had already persuaded Fouquet to relinquish his office of *procureur général*. In Nantes on September 5, 1661, Fouquet was arrested by his friend Charles de Batz de Castlemore, known as d'Artagnan, captain of the king's musketeers. The king called for a special court session and had Fouquet tried on charges of theft from the royal treasury. The trial lasted for three years and finally produced a verdict of guilty and a sentence of banishment. Louis XIV commuted the sentence to life imprisonment. Fouquet was sent to the citadel at Pignerol and his wife was exiled. The Crown sequestered all of Fouquet's wealth. Nicolas Fouquet died in prison on March 23, 1680. Vaux-le-Vicomte was eventually returned to Fouquet's wife.

Legacy

Nicolas Fouquet is the most successful example of an ambitious bourgeois who rose in seventeenth century French society. He not only acquired great wealth through his financial expertise but also recognized and appreciated excellence in the work of creative individuals and employed his wealth to assist them. While Fouquet was ostentatious and took pleasure in exhibiting his wealth, he also helped establish standards of good taste, even in excess. His château Vaux-le-Vicomte and its gardens stand as a model of beauty in architecture and landscape gardening. Although Fouquet attained both enormous wealth and power, he always remained loyal to the French crown.

STEPHEN FOX

British government official, financier, and politician

Fox rose from obscurity to become one of the wealthiest men of his day. His financial savvy enabled the Restoration government of Charles II to function and survive, and Fox continued throughout his life to provide his economic acumen to the British court.

Born: March 27, 1627; Farley, Wiltshire, England
Died: October 28, 1716; Chiswick, England
Also known as: Sir Stephen Fox
Sources of wealth: Government; moneylending; real estate
Bequeathal of wealth: Spouse; children

EARLY LIFE

Stephen Fox was the son of William Fox and Margaret Pavy Fox, one of ten children in the Fox household, most of whom lived to maturity. The concept of family loyalty that Fox developed while growing up in relative poverty remained a strong influence on him throughout his life. He was educated under the auspices of his mother's uncle at Salisbury Cathedral choir school. Although he had no university education, he is believed to have received a gentleman's upbringing, to which was added a sound education in bookkeeping and financial management. He joined his brother John at court and remained there as his brother's helper for two years, informally taking over his brother's office as closet keeper in the chapel at St. James's. From this position, Fox became a page to Lady Stafford, then the countess of Sutherland; the earl of Leicester; and finally Henry, Lord Percy, a favorite of Queen Henrietta Maria, the wife of King Charles I.

FIRST VENTURES

When he was nineteen, Fox became gentleman of the horse to Percy, who was in exile on the Continent. In this position, Fox for the first time publicly demonstrated the money management that would mark the foundation of his wealth. Fox used his time abroad to study foreign languages. When King Charles II joined the exiled queen in France, Fox became associated with his court and traveled with Charles. Fox did not go to Scotland with Charles, but remained in Holland, where he gained a reputation as an accountant who controlled every detail of expenditure. Returning to England, Fox went to work for the earl of Devonshire, helping the earl handle his estate receipts. When the exiled Charles II asked Fox to resume his services in 1653, Fox left Devonshire and returned to France to serve in an impoverished British court, financed by an irregularly paid pension from the French monarch. This movement from certain employment to an uncertain venture marked Fox as a man willing to take risks—either because he remained loyal to the monarchy or because he envisioned a day when Charles's loyal followers would reap the benefits of their support during the king's exile.

MATURE WEALTH

The Restoration of Charles to the British throne brought Fox the opportunities he had anticipated, although not always speedily. Fox earned significant notice because he was the first to tell Charles II of the death of Oliver Cromwell, who had ruled Great Britain during the king's exile. Back in England, Fox expected to obtain a high office as reward for his faithful services to Charles, but like many others he had to accept a lower office and wait until court protocol and the deaths of older officers would allow him to rise. Although Fox apparently wanted the position of cofferer, controlling the money of the royal household, he was offered junior offices, first as the chief clerk comptroller and then as the second clerk of the Green Cloth—stepping stones to senior offices in the royal household. These offices provided small salaries but lucrative perquisites and allowances. Many who held these offices also accepted gratuities; Fox refused these as ungentlemanly and advised his own protégés to avoid them. Fox was also granted an estate for his loyal services.

Fox's career ascendancy and personal fortune began with his position as an informal financial agent, raising and dispensing "secret service"—the term for money that went directly to the royal household instead of being disbursed by the Exchequer (government treasury). Most of these funds were not actually "secret," and they allowed the royal family to have more flexibility in its expenditures than the Exchequer system afforded.

Fox subsequently received the position of paymaster of the king's guards, which led to his ever-greater participation in the financial transactions of the realm. As the officer who paid the king's armed forces, Fox had to engage in considerable planning, for money was not readily available, and a delay in payment might lead to a breakdown in the guards' morale, or even mutiny. Fox demonstrated his ability as paymaster, and as a result received additional responsibilities with regard to funding what was becoming a royal standing army. Fox developed "the

Undertaking" to ensure prompt payment. Using this system, he borrowed substantial sums of money to pay the army, in return receiving interest on these loans until the army's pay was issued by the government, at which point Fox received a small portion of the soldiers' pay. Fox was able to raise money on the scale necessary to finance the king's army because of his personal pledge to stand behind his loans and his reputation for financial probity. Throughout his financial career, although he did make private loans to individuals, much of his wealth came from arranging loans to the government, or, increasingly, directly loaning the government money from his rapidly growing fortune. Fox eventually rose to other positions in the government, culminating in his becoming First Lord of the Treasury, although, to his chagrin, the position of cofferer eluded him. He was able to buy or obtain many positions for members of his extended family. He also served in Parliament.

One of Fox's most enduring legacies was his involvement in founding the Royal Hospital Chelsea, one of many charitable institutions he established or influenced. Fox started acquiring land during the middle part of his career, probably with a view to establishing his sons in estates when they came to a marriageable age. Fox outlived many of his children, however, and apparently at one time despaired of leaving a son to carry on his name. At this point, he made plans to provide for the children and grandchildren of his daughters, at least one of whom he had supported throughout her marriage until her death. Fox's marriage to Christiana Hope, however, provided him with a male heir to inherit the bulk of his estate.

His favorite house, built at Chiswick, was to be his country home. He made the house comfortable with expansive gardens and beautiful furnishings. He retired to Chiswick, where he spent the last years of his life, and there he died in 1716, having become one of the richest men of his time.

THE ROYAL HOSPITAL CHELSEA

The legacy of Stephen Fox is nowhere greater than at the Royal Hospital Chelsea. Although the idea of establishing the Royal Hospital is sometimes attributed to Charles II's mistress Nell Gwyn, the facility was undoubtedly conceived by Charles II, who was well aware of the Hôtel Royal des Invalides founded by Louis XIV in France. The plight of military men who had served Charles and his father was readily apparent throughout the kingdom, as most of the soldiers who were no longer able to serve were released without adequate pensions. These men often were reduced to begging as a means of support, or they remained in the military beyond their ability to perform their duties, thus weakening the armed forces.

Although Charles had the inspiration to build the hospital and proposed its founding in 1681, government money was not readily available. At this point Charles turned to Fox, on whom he had relied in other financial matters, and Fox came up with a means of financing the project. Money was regularly deducted from the army's pay, and Fox allocated some of these funds to the hospital. Charles contributed some of the money that Fox held in "secret service" accounts to the project; these accounts contained funds that were directly disbursed to the royal household instead of being dispensed by the Exchequer (government treasury). Additional funding was raised through donations and by charging fees on military officers' commissions. Fox offered to buy the site on which the hospital would be built. This land was once held by the Crown and was subsequently given to the Royal Society, which had not constructed a building on the property. Fox also loaned money without interest, perhaps as much as £6,000 pounds, for the project.

Charles II set the first foundation stone in February, 1682, and he continued to support the hospital until his death in 1685. Fox guided the project in its initial years, overseeing its building plans, operation, and staffing, as well as providing financial support, and the project was completed under the guidance of the earl of Ranelagh. By the time the hospital admitted the first pensioners in 1692, the military had implemented a pension system. Since more retired military men wanted to live at the facility than could be accommodated, hospital residents were required to surrender their pensions; these residents were called "in-pensioners," while nonresidents were termed "out-pensioners."

The hospital was designed by architect Christopher Wren, and his buildings remained on the site into the twenty-first century. By that time, the hospital site also housed the National Army Museum, and the Chelsea Flower Show had been held on the property every year since 1913. In 2010, the facilities were being renovated and redesigned to meet the needs of twenty-first century in-pensioners.

LEGACY

Stephen Fox was a prudent and honest financier who provided faithful and reliable service, often at risk to his own fortune. He helped establish a more sophisticated financial system for the British government, serving that government during periods of tremendous challenge, including the Restoration and the Glorious Revolution (1688-1689). He used his fortune to help others gain wealth, both by investing money for others and by helping others—including members of his family—embark upon careers in the government. Although he lived well, he was a model of fiscal responsibility both at home and in his government, keeping tight and honest accounts throughout his life.

Benjamin Franklin

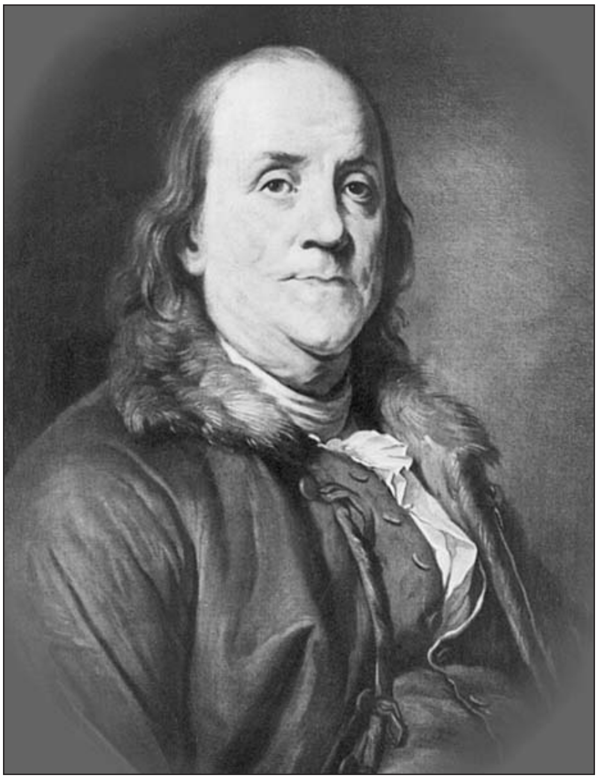
American inventor, author, publisher, politician, and statesman

Franklin described many ways for achieving financial success in his most famous work, Poor Richard's Almanack, *but he mostly identified wealth as the end result of some individual's hard work and thrift. Such aphorisms as "a penny saved is a penny earned" have become so common that few recognize it as a misquote of a popular saying written by Franklin.*

Born: January 17, 1706; Boston, Massachusetts
Died: April 17, 1790; Philadelphia, Pennsylvania
Also known as: Poor Richard; Richard Saunders; Timothy Turnstone; Mrs. Silence Dogood; Harry Meanwell; Alice Addertongue
Sources of wealth: Media; writing
Bequeathal of wealth: Children; educational institution; charity; cities of Boston and Philadelphia

Early Life

Benjamin Franklin was born to Josiah Franklin and Abiah Folger on January 17, 1706, the youngest of ten sons and the fifteenth of seventeen children. Josiah was a tallow chandler (soap and candle maker), but he wanted his youngest son to become a minister and somehow managed to send Benjamin to Boston Latin School for two years before the family's educational funds ran out. This brief schooling nevertheless instilled in Benjamin a love of reading and writing, which, for a time, seemed to suit him for an apprenticeship at his brother James's newspaper, the *New England Courant*. By 1721, however, Franklin was taking more interest in the content of the newspaper than in its production and wanted to contribute his own thoughts to the newspaper's columns. Refused permission to submit a letter for publication,



Benjamin Franklin. (Library of Congress)

Franklin instead adopted the persona of Mrs. Silence Dogood, a wealthy widow, and attached this pseudonym to writings he submitted to the newspaper. Given Franklin's natural bent for literature and language, Mrs. Dogood turned out to be a popular correspondent for *Courant* readers. However, when James found out that Mrs. Dogood was, in reality, his fifteen-year-old brother, he was furious and administered a beating that, quite literally, sent Franklin packing.

First Ventures

Abandoning his apprenticeship, Franklin escaped to Philadelphia with, he often remarked, only enough money in his pockets to buy a few loaves of bread. Franklin relished the change of scene, however. He already knew the printer's trade from his years in his brother's shop, so while he earned his keep working in a printing house, he endeavored to find out if there was sufficient interest in the literary circles of Philadelphia to support another newspaper. An encounter with Pennsylvania governor Sir William Keith encouraged Franklin in his pursuit, but after having traveled to London and seen the cost of presses, ink, and paper, Franklin discovered that Keith had no interest in actually paying for any of the newspaper's expenses. He worked for a time as a typesetter in the Smithfield suburb of London, but he grew despondent and returned to Philadelphia in 1726 under the sponsorship of Thomas Denham, who hired Franklin to be the bookkeeper and clerk in his trade business.

Perhaps because he was temporarily stymied in his desire to run his own publishing company, Franklin founded the Junto, a group of tradesmen and artisans like himself who were interested in reading the great works of literature and discussing the political and social issues of the day. Franklin's impulse to write was stirred by the regular exposure to like minds. Given that books were expensive, the Junto pooled its resources first to jointly store their own books and then to buy books of interest to the group. Always one to provide structure to any system that seemed ill-defined, Franklin wrote out a charter to form the Library Company of Philadelphia and hired Louis Timothee, the first true librarian in America, to look after the expanding collection. A new building, constructed in 1791, formalized the arrangement, which, having no competition for its services, proved to be surprisingly profitable as a subscription library.

Mature Wealth

Loyal to his friend Denham, Franklin was not able to realize his dream of publishing his own newspaper until after the tradesman's death. In 1730, having learned firsthand that he could not count on the nebulous promises of the typical patron, Franklin established the *Pennsylvania Gazette* by himself from his earnings. This newspaper was Franklin's first real success. Just as he had hoped, sales of *Poor Richard's Almanack* (1732-1757) were brisk. The almanac included not only the typical meteorological data available in other farmers' almanacs but also Franklin's brand of folk wisdom, sprinkled liberally with his humorous asides. He consistently sold around ten thousand copies of this work each year it was published, which more than adequately supported Franklin's new common-law wife, Deborah Read, and their children. He even felt comfortably settled enough to provide a home and education for his illegitimate son, William.

The 1740's and 1750's were prosperous times for Franklin. Because of the success of the *Gazette*, he was able to sell newspaper franchises in cities outside Philadelphia. Once financially established, Franklin was free to pursue his many other interests. He was fond of inventing practical items, like bifocals, swim fins, the lightning rod, and the Franklin stove. Partly because he had no need for additional income and partly because of his Puritan upbringing, Franklin never chose to patent his most potentially lucrative inventions. He seemed to consider the free availability of his ideas as being essential for the betterment of society. In a similarly public vein, much of Franklin's later life, concerned with politics and public affairs, became the stage on which his earlier idealism was put into action.

In June, 1749, Franklin became a justice of the peace in Philadelphia, and on August 10, 1753, he was appointed to be joint deputy postmaster general and immediately started instituting postal reforms. By 1757, Franklin had been sent to London by the members of the Pennsylvania Legislature to act as a colonial agent and demand that the Penn family, the colony's titular proprietors, stop interfering in Pennsylvania's internal affairs. Because of this appointment, Franklin's former tolerance of British corruption became strained. In the beginning, although Franklin had suffered many personal disappointments in London, he had Loyalist sympathies of his own. England, in comparison to the more rustic American colonies, was a nexus for culture and literature. He might have even considered living there permanently were it not for the fact that his wife intensely feared travel by ship and would not leave home. These feelings notwithstanding, the colonies' virulent hatred of the Stamp Act of 1765 shocked Franklin and made him reconsider his assumed loyalties.

The Hutchinson affair finally caused Franklin to support America's break from Great Britain. Having been selected by the monarchy to govern Massachusetts, Thomas Hutchinson not only ignored the desire of his constituency to demand Parliamentary representation; he also secretly sent letters to the king requesting the removal of the colonists few "British" freedoms. Franklin had remained in London after his intercession for the Pennsylvania colony failed, acting as a representative for Georgia, New Jersey, and Massachusetts. While in London, he managed to obtain several of Hutchinson's letters and was incensed by their lack of integrity. He subsequently made sure that the letters were brought to America and shown to politically powerful and influential colonists. The English foreign ministry publicly condemned Franklin for stealing the letters.

Back in Philadelphia, Franklin was elected to the Second Continental Congress, working with Thomas Jefferson and the other Framers to draft the Declaration of Independence. In 1776, having signed the politically explosive document, Franklin accepted a post as ambassador to France and the court of Louis XVI.

After a popular term of service in France in support of the newly independent American government, Franklin returned home one last time to Philadelphia, where he died on April 17, 1790, at the age of eighty-four. At his funeral, more than twenty thousand mourners paid their final respects to Franklin, who had left much of his fortune to his daughter Sally Franklin and her husband Richard Bache in recognition of her tender care of him in his old age.

Legacy

Franklin believed that because he owed his wealth and talents to the beneficence of an appreciative public, he needed to actively improve people's lives. For this reason, he refused to patent inventions he believed would benefit society, and he declined to accept a salary for the

Benjamin Franklin Institute of Technology

In 1785, French mathematician Charles-Joseph Mathon de la Cour wrote an essay mocking Benjamin Franklin's wildly popular *Poor Richard's Almanack* called "Fortunate Richard." A parody of American optimism, Mathon de la Cour's Richard donates £1,000 to his hometown, Boston, and the same amount to his adopted home, Philadelphia—a sum of about $4,400. The single caveat for this donation is that it must remain untouched in a trust for five hundred years; both interest and principal could not be disbursed until the end of the specified period.

Although intended as a joke, Franklin was amused and intrigued by Mathon de la Cour's idea. He did, in fact, establish separate trusts for Boston and Philadelphia, each containing the sum of £1,000 and each with the similar restriction that the money be allowed to earn interest for two hundred years before final disbursement. By 1990, the Philadelphia trust contained a sum of more than $2 million, while the Boston trust yielded almost $5 million. In gratitude for such a fortuitously foresighted gift, the city of Boston used Franklin's accumulated donation to establish a school that would be named the Franklin Technical Institute. The institute opened in 1908, and it remained in operation into the twenty-first century, renamed the Benjamin Franklin Institute of Technology. The institute has always been a trade school that focuses on providing a solid, practical education for its attendees.

Philadelphia also used Franklin's delayed donation for public edification. The city appropriated its trust funds to establish the Franklin Institute, a museum that in the twenty-first century presents exhibits about science and technology.

work he performed in some of his political appointments. Similarly, in his will he stipulated that some of his fortune should go to the creation or improvement of educational institutions. Unlike many of the other Founding Fathers, Franklin never sought the presidency. He had an impartial view of American politics and society that allowed him to remain a member of the common folk, even when he was an elder statesman.

HENRY CLAY FRICK

American industrialist, entrepreneur, and art patron

Frick embodied the American Gilded Age robber baron in the means he employed to amass his fortune. This image, however, contrasts with the primary use of his wealth, which was collecting art and providing for the museum that displays his collection.

Born: December 19, 1849; West Overton, Pennsylvania
Died: December 2, 1919; New York, New York
Sources of wealth: Steel; investments
Bequeathal of wealth: Children; museum; educational institution; charity

EARLY LIFE

Henry Clay Frick was born in 1849 in West Overton, Westmoreland County, Pennsylvania, where he was also raised. The second of six children of Elizabeth Overholt and John Frick, Frick was named in honor of Henry Clay, the U.S. senator from Kentucky and the leader of the Whig Party. Described as a frail child, Frick was prone to bouts of "inflammatory rheumatism," which left him in a weakened state for extended periods of time.

While considered an average student, Frick excelled in mathematics. For a brief period in 1866, he attended Otterbein College in Westerville, Ohio. His interest, though, was in obtaining the knowledge that would help him attain his childhood dream of being a millionaire before he died. He was inspired by his grandfather, Abraham Overholt, who owned a distillery and was one of the richest men in Westmoreland County.

FIRST VENTURES

While Frick's grandfather was a wealthy man, his immediate family was not. The opportunities available to Frick paid rather modestly, but he was a hard worker, which caught the eye of his grandfather, who offered him a better paying job as a bookkeeper in the distillery. It was not long, however, before his grandfather died, and Frick was once again looking for a job.

He found a new one with a cousin, Abraham Tintsman, who owned coal fields southeast of Pittsburgh, Pennsylvania, and was in the business of producing coke, which is made by baking coal to remove impurities and is used in the production of steel. Only a marginally profitable business at the time, Frick got in on the ground floor of the growing steel industry in the Pittsburgh area. Initially borrowing from his family, who had inherited money from his grandfather, Frick became a partner in Tintsman's business in 1871. Frick's determination and business acumen expanded the business and his share of it.

The recession of 1873 devastated the steel industry, and, in turn, the coke business. However, through his vigilance in keeping costs low and his ties to lenders, such as Thomas Mellon, Frick was able to expand his business during these difficult times and emerge from them with about 25 percent of the nation's coke-producing capacity and much of the best coal. By his thirtieth birthday in 1879, Frick had attained his childhood dream and was worth $1 million.

Mature Wealth

With the expansion of the steel industry in the Pittsburgh area, Frick's coke business continued to grow. Given coke's importance in the production of steel, it seemed natural that the two industries would forge closer ties. Frick's largest buyer was Andrew Carnegie's growing steel empire. In 1882, Frick and Carnegie joined forces, with Frick acquiring an interest in Carnegie's small coke business and Carnegie acquiring an interest in Frick's company. Closer ties between the two companies proved to be very profitable for both but trying for each.

In Carnegie, Frick gained a partner with funds to allow the further expansion of his coke business; with Frick, Carnegie gained a talented businessman with the ability to cut costs and enlarge his steel business. The union of these two self-made men, though, was not always harmonious. In 1887, workers in the coke industry went on strike. Siding with his fellow coke producers, Frick would not give in to their demands. The disruption in coke production idled steel production, which prompted Carnegie, with his now controlling share in Frick's company, to settle with the workers. In response, Frick choose to resign rather than give in to Carnegie's demand for a settlement.

When the strike was finally settled, and the other coke producers conceded to provide a lower wage than the salary Carnegie had agreed to pay, Carnegie found that Frick had been right and wanted to get him back. By early 1889, Frick not only was back running the coke business but also was the chairman of the steel business, which came with a larger share of ownership. With Frick now firmly in control of the management of both businesses, he continued to apply his aggressive strategy of containing costs and buying out competitors when opportunities arose.

As the demand for steel for railroads and construction expanded, Frick's strategy for growth and integration of the various parts of the business proved to be very profitable. By 1891, Carnegie Steel was producing more than 20 percent of the steel in the United States. Growing profits did not lessen Frick's resolve to cut costs when possible. His determination was demonstrated in 1892, when workers went on strike at the Homestead steel mill. Unwilling to continue negotiations with the union representing the striking workers once his offer was rejected, Frick brought in employees of the Pinkerton National Detective Agency to regain control of the mill. When the detectives were confronted by the armed striking workers, the battle that ensued resulted in the deaths of ten people, with another sixty wounded. Ultimately victorious in crushing the union, Frick helped tip the balance in the struggle between labor and management in favor of management.

The growth in profits did not lessen the on-again, off-again tension between Frick and Carnegie. With Frick resigning as chairman of Carnegie Steel in 1894 and Charles M. Schwab in charge and adding to the profitability of the company, the relationship between Frick and Carnegie continued to deteriorate. Following an unsuccessful attempt by a group that included Frick to buy Carnegie's share of the business, and continued tensions between Frick's coke company and Carnegie's steel company over the price of coke, Carnegie in 1900 attempted to use a provision of the partners' agreement to force Frick to sell his shares of the business at book value, only a fraction of the market value. Frick triumphed in the fight that followed, and all the partners profited when J. P. Morgan bought Carnegie Steel and integrated it into the newly formed United States Steel Corporation (better known as U.S. Steel) in 1901.

Frick's share of the new company amounted to $61.4 million, of which about half represented his share of Carnegie Steel and the remainder his share of the coke company. This amount was significantly more than the $1.5 million that Carnegie offered for Frick's shares in the steel company when he had tried to force him to sell.

In the years before his death, Frick sold off nearly all of his shares in U.S. Steel to buy interests in railroads, which he referred to as the "Rembrandts of investment."

FRICK COLLECTION, NEW YORK CITY

Inspired by the Wallace Collection in London, which Henry Clay Frick first visited with Andrew Mellon in 1880, and by Isabella Stewart Gardner's activities at Fenway Court in Boston, the Frick Collection is the lasting legacy of Frick's passion for collecting art. Frick bequeathed 131 paintings and numerous drawings, prints, and decorative objects to establish a public gallery after his death. Housed in the collector's New York City mansion on Fifth Avenue at Seventieth Street, the museum showcases Frick's excellent taste in fine art and his personal preferences in acquiring works. Frick's move to New York in 1905 was, in part, a result of his desire to move his growing art collection out of Pittsburgh, with its soot-filled air.

Frick first began to collect art in the early 1880's, purchasing a clock designed by Louis Comfort Tiffany and a landscape painting by local artist George Hetzel for his Pittsburgh apartment. Like most of America's captains of industry during the Gilded Age, as his wealth increased, his tastes turned mainly to the Old Masters, with a focus on Italian, French, English, Spanish, Flemish, and Dutch art of the sixteenth through eighteenth centuries. He began to acquire such works beginning in the mid-1890's, purchasing paintings primarily from established dealers, Roland Knoedler and Joseph Duveen in New York.

Like many of his era, he sought and followed the advice of famed connoisseur Bernard Berenson. However, unlike some of his peers, who collected art only as a symbol of their cultural "arrival" or as an investment, Frick approached his hobby with a deep personal interest, asking to have works sent to his mansion "on approval" so he could live with them and see how he liked them prior to finalizing a purchase. Many of the works in his collection served as visual reminders of important events, places, or people in Frick's life, such as his daughter Martha, who died at a young age, which had a profound impact on him.

Among the highlights of the collection are Diego Velázquez's painting of Philip IV of Spain; works by Giovanni Bellini, El Greco, Agnolo Bronzino, Rembrandt, Jan Vermeer, and Sir Joshua Reynolds; and a room from Grasse, France, decorated by French rococo-style painter Jean-Honoré Fragonard with a series of panels depicting *The Progress of Love*, which once belonged to J. P. Morgan. The latter purchase was especially fitting, as Fragonard's work is also among the highlights of the Wallace Collection. However, Frick also exhibited more progressive taste in art, purchasing works by Édouard Manet and Edgar Degas and amassing a notable collection of works by American expatriate James McNeill Whistler.

In addition to the legacy of his own collection, Frick also influenced his younger friend from Pittsburgh, Andrew Mellon, to collect art, personally introducing him to the dealer Joseph Duveen in Manhattan. Mellon's collection is today the centerpiece of the National Gallery of Art in Washington, D.C., and reveals the same excellent taste and eye for quality exhibited by his mentor.

By 1906, Frick was the largest private owner of railroad stocks in the world.

At the time of his death in 1919, Frick's estate was estimated to be worth nearly $150 million, with financial assets valued at $77.5 million and his art collection at $50 million. His New York City home and $15 million were destined to become the Frick Collection, the museum that in the twenty-first century continued to house a substantial part of his art collection. In addition, about one-sixth of his estate went to family members, with his daughter Helen Clay Frick the major beneficiary. The remainder of his estate was distributed to Princeton University, Harvard University, the Massachusetts Institute of Technology, a number of hospitals in the New York City and Pittsburgh areas, and various other public philanthropies.

LEGACY

The name of Henry Clay Frick is associated with the means he used to acquire his wealth and the institution he endowed to display it. In his legal but ruthless dealings with labor and competitors, Frick's business life helped define the term "robber baron." In the final year of his life, he played a role in the defeat of the League of Nations, which he felt would subordinate the United States to the will of lesser countries. The Frick Collection stands as his most enduring legacy, displaying the passion he had for art and his desire to share it with the public.

Archduke Friedrich of Austria

Austrian aristocrat and military leader

A member of the house of Habsburg, Archduke Friedrich was reputed to be the wealthiest Habsburg from a junior line of the dynasty. His wealth derived from land, investments, palaces, and an extensive art collection.

Born: June 4, 1856; Brno, Moravia (now in the Czech Republic)
Died: December 30, 1936; Ungarisch-Altenburg (now Mosonmagyaróvár), Hungary
Also known as: Archduke Friedrich of Austria; Duke of Teschen
Sources of wealth: Inheritance; real estate; investments
Bequeathal of wealth: Children; confiscated

Early Life

Archduke Friedrich (FREE-drihk) of Austria, duke of Teschen, was born at the Castle Gross-Seelowitz in the Moravian kingdom of the Austrian Empire. Friedrich was the eldest son of Archduke Karl Ferdinand and Archduchess Elizabeth Franziska of the Teschen line of Habsburgs descended from Karl, the first duke of Teschen, a younger son of Holy Roman Emperor Leopold II. Friedrichs' mother was the daughter of Archduke Ferdinand of the Habsburgs' Italian Modena line. His only sister, Maria Christina, married King Alfonso XII of Spain and was the mother of Alfonso XIII. His younger brothers were Eugen, a military officer and the leader of the Teutonic Knights, and Charles Stephan, a naval officer and landholder in Austrian-ruled Poland.

First Ventures

Archduke Friedrich was educated by private tutors and pursued a career in Austria's imperial army. He married Princess Isabella of Croÿ, who was from an aristocratic Belgian family, on October 8, 1878. The couple had eight daughters and one son. The death of Friedrich's uncle, Albrecht, duke of Teschen, in 1895 gave Friedrich and his brothers vast estates throughout the Austro-

Archduke Friedrich of Austria. (Hulton Archive/Getty Images)

Hungarian Empire. As the eldest son, Friedrich inherited extensive landholdings at Ungarisch-Altenburg (now Mosonmagyaróvár), Hungary; Belleje and Saybusch (now Żywiec), Poland; Seelowitz (now Židlochovice) and Frýdek-Místek, now in the Czech Republic; and Pressburg (now Bratislava), now in Slovakia, making him one of the largest landowners in the Austro-Hungarian Empire. Friedrich was given his uncle's Vienna residence, the Albertina Palace, with its extensive art collection. Their dynastic status and financial wealth positioned Friedrich and Isabella to pursue advantageous marital alliances for their children.

Mature Wealth

With six marriageable daughters (two died in infancy), Archduchess Isabella hoped to marry her eldest daughter, Maria Christina, to Archduke Francis Ferdinand, the nephew and heir to Emperor Francis Joseph I of Austria. The plan backfired when Francis Ferdinand married Isabella's lady-in-waiting, Countess Sophie Chotek, in 1900. None of Isabella's daughters achieved a major dynastic alliance. The family's political ambitions were directed toward the future of their only son, Archduke Albrecht.

The assassination of Francis Ferdinand and Sophie in 1914 resulted in the outbreak of World War I and led Emperor Francis Joseph I to appoint Friedrich the supreme commander of the Austro-Hungarian army. Friedrich was promoted to the rank of general field marshall on December 8, 1914. Friedrich's appointments were viewed as ceremonial, with the actual control of the battlefield in the hands of Franz Conrad von Hötzendorf, chief of staff of the Austro-Hungarian army. Emperor Karl I took over as supreme commander in February, 1917.

Legacy

The collapse of the Austro-Hungarian Empire in November, 1918, led to the empire's dissolution into the kingdom of Hungary and the republics of Poland, Czechoslovakia, and Austria, as well as the confiscation of much of Archduke Friedrich's wealth. Austria seized the Albertina Palace and its art collection, eventually permitting Friedrich to remove the palace's furnishings. In 1921, an American syndicate gained control of Friedrich's confiscated property, which had an estimated worth of $200 million. The syndicate argued that this property was private, not state property associated with the former imperial family. It remains unclear how much Friedrich ultimately received from the syndicate's transaction. In 1929, Czechoslovakia reached an undisclosed financial settlement with Friedrich over confiscated land; Hungary permitted the archduke to retain control over his lands there. The furnishings of the Albertina Palace were removed to Friedrich's estate at Mosonmagyaróvár.

Since Hungary was a kingdom without a designated king, Friedrich and Isabella used their financial resources to promote their son Albrecht for the throne. Their plans dissolved when Albrecht made a nondynastic marriage in 1930. Isabella died in 1931 and Friedrich in 1936. His funeral testified to his once influential and financially powerful position, with the largest assemblage of international royalty attending an event in Hungary since World War I. What remained of his Teschen estates was divided among his surviving children, with Albrecht receiving the largest share.

Jakob Fugger

German banker and merchant

Fugger created the most famous and wealthy family merchant enterprise in Europe in the early sixteenth century. Through his banking system, he established a close financial relationship with the Habsburg rulers, who allowed him to gain a monopoly on the copper and silver trades. His money helped elect German emperors and archbishops and allowed him to establish an Augsburg settlement for the working poor.

Born: March 6, 1459; Augsburg, Bavaria (now in Germany)
Died: December 30, 1525; Augsburg, Bavaria
Also known as: Jakob the Rich; Jakob Fugger II; Jacob Fugger
Sources of wealth: Banking; trade
Bequeathal of wealth: Relatives; charity

Early Life

Jakob Fugger (YAHK-ob FUHG-ehr) was born on March 6, 1459, in the free imperial city of Augsburg, Germany. He was the seventh and youngest son of Jakob Fugger the Elder and Barbara Basinger and the grandson of Hans Fugger, a weaver. Hans moved to Augsburg in 1367 and nine years later became a weaver guild master and subsequently a merchant. His two sons, Andreas and Jakob the Elder, carried on the family trade and worked together for almost two decades. After they separated in 1454, Andreas's son eventually went bankrupt, while Jakob the Elder founded a prosperous family textiles business. After Jakob the Elder's death in 1469, his ten-year-old son Jakob prepared for an ecclesiastical career, and he later took his first orders in a Franconian monastery. After all but two of his brothers died, Jakob was recalled from the monastery to join the family business in 1478.

First Ventures

Textile trade and production was the key to Augsburg's wealth in the fifteenth century. Locally produced linen was combined with cotton imported from Venice to produce a mixture called *Barchent*. After the death of Jakob the Elder, who was the seventh-richest man in Augsburg, his oldest son Ulrich and his widow continued the family business. In 1478, the surviving sons Ulrich and Georg introduced Jakob the Younger to the family business and sent him to be apprenticed in Venice and Rome. In 1479, Jakob returned to Augsburg and was put in charge of the firm's Italian trade, and during the next two years he traveled to the various branches of the firm. Most important for the future development of the Fugger fortune, by the mid-1480's he was urging the firm to take part in the iron, silver, and copper mining trade in Salzburg and Tyrol (a region in the Alps that is now part of Austria and Italy).

Mature Wealth

Trade in woven goods, silks, and velvets continued to be important to the Fugger business, but far more valuable for the massive expansion of the firm's wealth was its involvement in credit and mining operations. While Jakob's older brothers proposed some of the firm's credit transactions with Rome and the Habsburgs, the successful and astonishingly profitable trade in copper and silver resulted from Jakob's initiatives. He was the driving force behind the Fugger exploitation of the copper and silver production in central and Eastern Europe. Until the 1550's, when the Spanish American mines produced significant amounts of silver, Tyrol and Hungary had the largest silver and copper mining production facilities in Europe.

Banking and mining were closely interwoven, since the Fuggers obtained mining interests and general support from rulers in exchange for loaning these nobles money. The Fuggers had had mining interests in Salzburg since 1480, but Jakob in 1485 was instrumental in directing the firm into the precious metal trade in Tyrol. On December 5, 1485, the Fuggers entered into a business arrangement with Count Sigmund of Tyrol, who was deeply in debt because of his war with Venice. The Fuggers quickly gained control of most of the silver trade in Tyrol. Jakob, who was considered the representative of the firm in Tyrol, played a crucial role in protecting the firm's metal interests in the region after Count Sigmund was forced to give up his throne on March 16, 1490. A secret Fugger financial arrangement with Sigmund's successor as ruler of Tyrol, the Habsburg emperor Maximilian I, protected the firm's interest in the region.

Between 1487 and 1497, the Fuggers earned more than 400,000 gold gulden from the silver trade in Tyrol. In 1522, Jakob expanded his silver and copper trade in the region by obtaining and directly exploiting mining properties. The symbiotic relationship between the Fuggers and the Habsburg rulers was crucial for the welfare of the Fugger firm over the next four decades and it was

THE FUGGEREI ENCLAVE

Jakob Fugger established three foundations—two for religious institutions and the third, the Fuggerei, for the working poor. The Catholic religious foundations—a chapel in St. Anna Monastery and a sermon fund for St. Moritz Church in Augsburg—were lost to the Protestants, but the housing project, the Fuggerei, survived the Protestant Reformation in Augsburg and continued the memory of the Fuggers.

On February 26, 1516, Jakob purchased property from a widow on the outskirts of Augsburg. At the same time, he made a contract with the city council which mentioned the housing foundation. He (and his heirs) agreed to pay taxes for the settlement area, but he was given tax relief on the structures he built and improved in that space. In an additional stipulation, the housing project was never to be under the control of the church.

Between 1517 and 1523, fifty-two single-story row houses were constructed. Forty-three houses were duplexes, with one family living downstairs and another upstairs. Each family had a living space of forty-five square meters. With one exception, all had backyard gardens where residents could keep small animals.

In 1521, Jakob issued a document establishing rules for the settlement. The housing project was designed for citizens of Augsburg who were pious Catholics and poor workers or artisans. The residents could not be welfare recipients. Each family was obligated to pay one gulden rent a year, which was equal to the monthly salary of a day laborer. The tenants signed a written commitment to pray daily for Jakob and his family; unlike residents of medieval poor houses, Jakob's tenants prayed in the privacy of their homes. A caretaker, whose residence was the gatehouse of the settlement, was hired to maintain the buildings. The settlement was administered by two male members of the Fugger family and two men selected from outside the family. In a subsequent testament in 1525, Jakob obligated his nephews to maintain the homes.

In 1531, Alexander Berner first referred to the settlement as "the Fuggerei." The settlement had a wider range of residents than traditional housing for the poor, which accommodated only old men or widows. Moreover, it provided more than the traditional one room by offering three rooms to a family, and each family had its own entrance. Most of the inhabitants were artisans or day laborers with families. Jakob's motive for establishing the Fuggerei was both religious and social. The project aimed to help hard workers and their families who were "house poor."

On February 25, 1944, Allied bombers destroyed half of the original homes and damaged the rest. In 1946, reconstruction began with the support of the original foundation capital, and during the next five years much of the facility was rebuilt and modernized, eventually becoming an old-age settlement limited to married couples and widows.

The housing complex continues to operate into the twenty-first century. Residents must be Catholic, at least fifty-five years old, and have lived in Augsburg for twenty years, and they are required to pray. The original Latin inscription at the entrance of the Fuggerei continues to pay homage to Jakob and his brothers, Ulrich and Georg.

fundamental to the Habsburgs' European political ambitions. In 1519, Jakob bribed the German electors to ensure the election of the Habsburg ruler Charles I of Spain as Charles V, Holy Roman Emperor.

Jakob's business ventures in Hungary proved to be even more profitable than those in Tyrol. Exploiting the rich copper mines in Slovakia (then part of Hungary) required both technical knowledge and vast investments. Jakob established a relationship with a Hungarian mining specialist, Johann Thurzo, who had leased several mines near Neusohl, Hungary (now in Slovakia) and was able to extract water from the mines. In 1495, Jakob organized a Fugger-Thurzo consortium to mine and trade the Hungarian copper and silver. To cement the business arrangement, Thurzo's son and daughter married members of the Fugger family. The mined copper was later sold as sheets and plates, while the silver went to the Hungarian mint, Venice, Nuremberg, and Leipzig. The Hungarian operations were immensely profitable, earning a total of 1.5 million gold gulden. When the Imperial Diet of Germany attempted to charge the Fuggers with illegal monopoly practices, the Habsburg rulers Maximilian I and Charles V protected the family firm. On May 13, 1523, Charles V issued a mandate from Toledo, Spain, declaring that the concentrated wholesale trade in ores was not a monopoly.

In 1494, Ulrich, Georg, and Jakob pooled their capital and formed a family trading partnership, granting equal rights to all of the brothers. In honor of the oldest brother, the firm was named Ulrich Fugger and Brothers of Augsburg. In 1502, when the contract was renewed, Jakob emerged as the clear leader of the partnership. After the death of his last surviving brother in 1510, Jakob on December 30, 1512, negotiated a contract with his nephews and renamed the firm Jakob Fugger and Brothers' Sons.

In addition to his metal trade, Jakob continued to profit from the transfer of church funds from Germany to Rome. Jakob also obtained financial interests in Spain from Charles V. Between 1511 and 1527, the income of the Fugger family firm increased by 927 percent. Jakob used some of his wealth to acquire vast landholdings, and in 1511 and 1514 he was granted titles of nobility from the Habsburg emperor. His marriage to Sybille Artzt in 1498 lasted for almost three decades but the couple did not have any children. Suffering from a growth below the navel and realizing that little time was left, Jakob wrote his last will on December 22, 1525, naming his nephew Anton as his successor as the head of the Fugger family firm. Jakob died on December 30, 1525, remaining true to the Catholic faith in an increasingly Protestant Augsburg.

Legacy

In 1460, the Medici Bank of Florence was the most influential business organization in Europe. One century later, the Fugger firm had replaced the Medici as Europe's largest firm. These capitalists of the Renaissance played a key role in the economic expansion of Europe in the fifteenth and sixteen centuries. However, after the death of Anton Fugger, the Fugger commercial fortune declined and eventually vanished when the bankrupt Habsburgs defaulted on their loans. The Fuggers became titled landlords.

The prosperity of central Europe during Jakob's lifetime was undermined by the religious conflict between Catholics and Protestants. Jakob inadvertently contributed to this conflict by financing the election of Albrecht von Brandenburg as archbishop of Mainz. In order to recoup Jakob's investment, the pope increased the sale of indulgences and allowed the Fuggers to collect half of this income, a decision that unleashed the fury of Martin Luther and his followers. After Jakob's death, Augsburg became a Protestant city.

ERNEST GALLO

American vintner

The son of Italian immigrants, Gallo was the driving force and business genius behind the wine company that he founded with his brother Julio. From the cheap Thunderbird to wine coolers to expensive imports, the E. & J. Gallo Winery shaped wine tastes in contemporary America.

Born: March 18, 1909; Jackson, California
Died: March 6, 2007; Modesto, California
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Children; medical research

EARLY LIFE

Ernest Gallo (EHR-nehst GAL-loh) was born in 1909 in Jackson, California, the first of three sons of Italian immigrants Giuseppe "Joe" Gallo and Assunta "Susie" Biano Gallo, whose parents ran a family winery. After a five-year separation provoked by Joe's violence, Susie and Joe reconciled and the family moved to Oakland, where Joe ran a small wine company, a retail liquor business, a saloon, and a hotel. When Prohibition neared, Joe sold his businesses and bought vineyard property in Antioch, California, anticipating that raising and selling wine grapes would remain a legal activity. Ernest and his younger brother Julio were forced to work from sunrise to after dark in the vineyards, attending public schools in the middle of the day. During Prohibition, Joe became involved in various bootlegging schemes with his brother, Michelo (Mike), a flamboyant hustler who served several prison sentences.

In 1925, after purchasing forty acres in Modesto, California, that would become the enduring home base of the Gallo family, Joe went into the grape shipping business. Ernest accompanied his father and the wine shipments to the Chicago exchange. The teenager immediately plunged into selling and demonstrated his abilities as a shrewd businessman. He returned to high school, graduated with honors, and enrolled in agricultural courses at Modesto Junior College. In 1927, Ernest went to Chicago alone, delighted with his new responsibilities and independence, for his father still bullied him at home.

FIRST VENTURES

In 1929, Joe built underground tanks to save his harvest, essentially starting a winery, which was illegal. He shipped wine under the legal "juice" label. Ernest wanted to partner with his father but was rejected. Another source of tension was Joe's treatment of his youngest son. Born in 1919, Joe, Jr., was his father's favorite and suffered none of the abuse leveled at the two older boys.

In 1930, Ernest announced his plans to enter the wine business after Prohibition was repealed and to marry Amelia Franzia, the daughter of a wealthy winery owner. The couple spent their honeymoon at the 1931 grape market in Chicago. Anticipating the December, 1933, repeal of Prohibition, Ernest filed an application to open a bonded wine storeroom, but the petition was denied because he did not own a bonded winery. That same month, Joe and Sallie were found dead of gunshot wounds at the run-down home in Fresno to which they had moved suddenly and secretly months before. Officially the deaths were recorded as murder-suicide, but there was speculation then and later that the Gallos had been ordered killed by the syndicate. The older brothers became guardians of young Joe, Jr., and Ernest imposed a code of silence on the family regarding the shocking deaths.

Twenty-four-year-old Ernest was granted permission to continue his father's business. He and his brother Julio formed a partnership, the E. & J. Gallo Winery, excluding Joe, Jr. During an interview with an inspector from the Bureau of Alcohol, Tobacco, and Firearms, Ernest claimed he did not know Mike Gallo, an uncle who was serving a prison sentence for bootlegging, later amending his statements to say that Mike "had been removed from us as a relative." With a craving for respectability and a knack for revisionist history, Ernest moved forward with his grandiose plans to build Gallo into the largest winery in the state and then the nation.

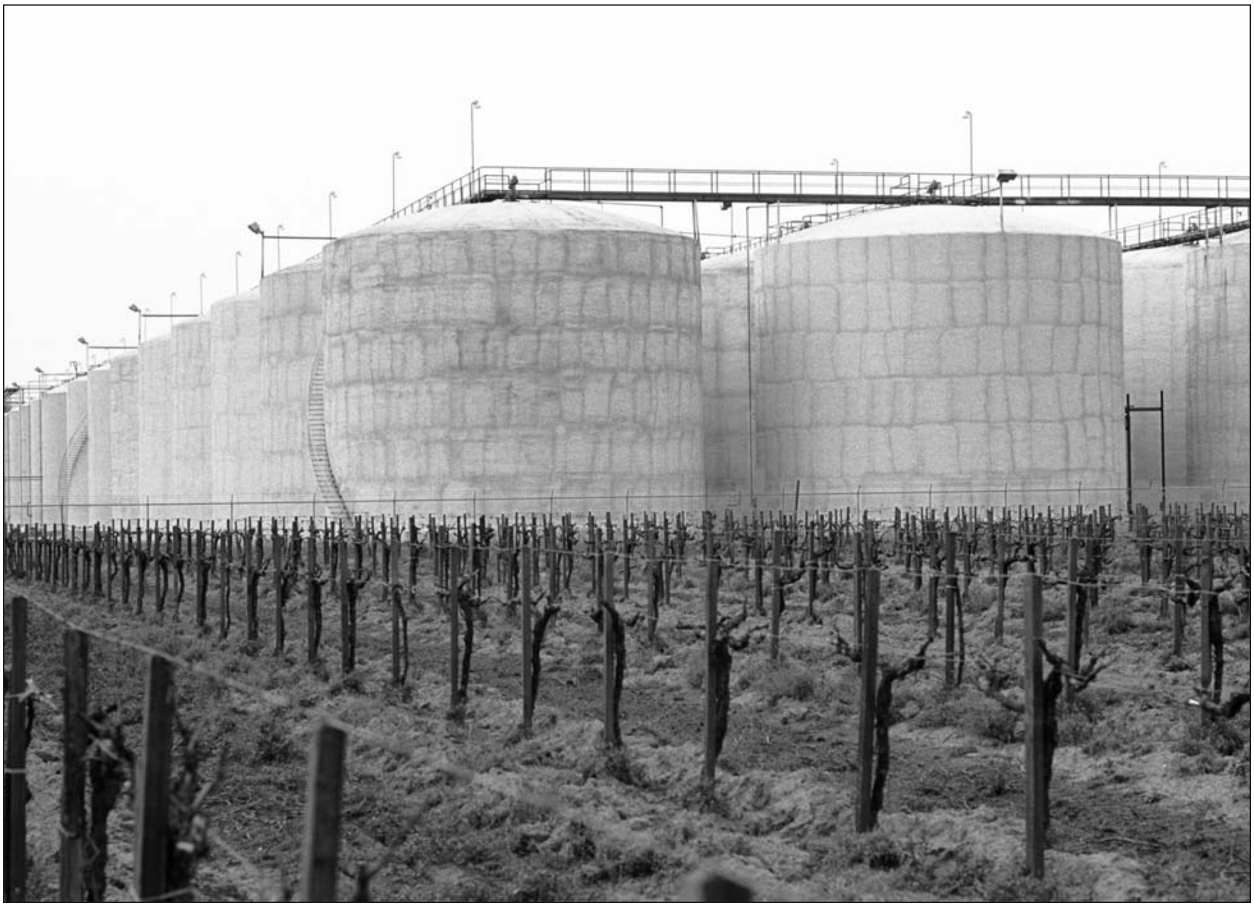
By 1935, the Gallo winery was producing an annual yield of 350,000 gallons. Ernest sometimes traveled five months at a time, working grueling hours and expecting others to do likewise. In the winter of 1936, he was hospitalized for exhaustion; his six-month hospital stay became one of many Gallo secrets. After his convalescence, Ernest returned with his typical vigor, adding a distillery, expanding production to a full array of sweet, fortified wines and table wines, and purchasing a distribution company in New Orleans, making it the first Gallo-controlled distributor. The entrepreneur was determined to learn how to build, market, and sell a brand. He spent the winter of 1940-1941 interviewing businessmen; from these contacts Ernest devised an intensive and carefully structured sales program that broke new ground in marketing strategies. In March, 1942, Ernest applied for the first trademark Gallo name and claimed it had been used continuously by his family since 1909. Company restructuring papers filed in 1944 listed the winery's capital stock at $500,000, with the home and vineyards valued at $760,000. A division of labor had been set, with Ernest in charge of sales and marketing and Julio supervising the vineyards, the laboratory, and wine production. Their oft-repeated boasts that Julio would "make all the wine you can sell" and Ernest would "sell all the wine you can make" made the arrangement public.

Mature Wealth

After World War II, the brothers developed lighter wines sold with aluminum screw-tops to ensure consistent taste. In the 1950's and 1960's, the Gallos used a huge blending vat to create a uniform blend, making the wine's vintage irrelevant. By the early 1950's, the Gallo winery was America's largest winemaking facility. A light, mellow, red table wine called Vino Paisano di Gallo, sold in a rounded jug bottle, was Gallo's signature product. A bottling plant built in Modesto added to the company's vertical integration pattern.

A micromanager, Ernest demanded full loyalty from his employees, and all middle management reported directly to him. The "three Rs" of Gallo salesmanship, described by one writer as "rigorousness, relentlessness, and ruthlessness," summarized Ernest's approach. In the summer of 1957, Gallo introduced a flavored, fortified wine called Thunderbird that sold for sixty cents a quart. It became an instant hit, especially in poor, urban neighborhoods, and its success pushed production levels to thirty-two million gallons that year. Several years later, Gallo developed Ripple, another low-end product popular with college students.

Although hugely profitable, these street wines undercut Ernest's desire to be seen as a respectable, discerning



Wine storage tanks at the Gallo Winery in Modesto, California, in 1972. (©Bettmann/CORBIS)

The Ernest Gallo Clinic and Research Center

In 1980, Ernest Gallo, cofounder and co-owner of the E. & J. Gallo Winery, provided a $3 million endowment to establish the Ernest Gallo Clinic and Research Center at the University of California, San Francisco. The facility was founded to investigate the effects of alcohol on the brain and to conduct research in other aspects of neuroscience. The founding director of the clinic and center, physician Ivan Diamond, developed a cellular and molecular biology research program to study the fundamental mechanisms of alcohol. In the late 1990's, after carefully scrutinizing the facility's program, California lawmakers made a major financial allocation to the center. These funds enabled the center to expand its staff and facilities. In 1999, the center moved to a newly built space in Emeryville, California.

The second director, Raymond White, joined the center in 2002. White, an expert in human genetic mapping, and his colleagues in the human genetics laboratory developed large sets of genetic data from which they could identify key components of susceptibility to alcoholism. Under White's leadership, the center's mission to translate scientific discoveries into clinical applications had been strengthened.

By 2009, the center had grown to employ a staff of more than 155 in its Emeryville location. Facilities included major laboratories in cell biology, biochemistry, molecular biology, pharmacology, neurophysiology, behavioral pharmacology, and physiology, as well as in invertebrate, mouse, and human genetics. The center had expanded beyond its initial research in alcoholism to study the effects of substance abuse. In addition to its research mission, the center's goal is to play an important part in the development of new and more effective therapies to treat the serious national health problems of alcoholism and substance abuse.

vintner. He launched a "Beautiful Wines" campaign, featuring Gallo's first champagne, Eden Roc, in 1966, as well as "Gallo's Gourmet Trio": Hearty Burgundy, Chablis Blanc, and Pink Chablis. Delighted to be featured with his brother on the cover of *Time* in 1972, Ernest was dismayed by the story's emphasis on Gallo's "pop wine." In an effort to change the company's image, Ernest also began hiring executives with master's degrees in business administration and experience in consumer sales.

The 1970's began with enormous expansion and a stream of successful new products. However, the company suffered from the national boycott against Gallo wine that César Chávez, leader of the United Farm Workers, began in 1973 because of Gallo's support of the International Brotherhood of Teamsters. In February, 1974, 100,000 people marched on the Gallo "temple" in Modesto to protest the company's policies. Chávez finally terminated the boycott in 1978. During this same period the winery was investigated by the Federal Trade Commission (FTC) for alleged intrusion into distributors' business and alleged illegal practices by its sales force. The FTC ordered monthly inspections of Gallo records in order to monitor company activities. Sales leveled during the tumultuous 1970's, but by 1981 Gallo led nationally in wine sales, shipping 131 million gallons.

Ernest increased his involvement in politics. During 1989 and 1990, the Gallo family contributed more to federal candidates ($294,110) than any other American family. While his sons attended Norte Dame and Stanford Universities, Ernest gave large gifts to each school. He also provided a $3 million endowment to establish a clinic and research center in his name at the University of California at San Francisco.

In 1983, Ernest and Julio's younger brother, rancher Joe Gallo, Jr., launched Joseph Gallo Cheese Company. After a series of unresolved negotiations regarding the use of the Gallo name on these cheese products, Ernest and Julio filed a complaint against Joe and his son Mark, who was co-owner of the company. Joe and Mark countersued to obtain one-third of the winery's ownership, which was valued at more than $200 million. Litigation continued for several years until a final injunction enjoined Joe and Mark from using the Gallo name as a trademark. The brothers remained estranged for the rest of their lives.

In the early 1990's, the winery expanded its vineyard properties, which would eventually encompass ten thousand acres, and continued its pattern of buying grapes from independent growers. New Gallo vintage-dated varietals and premium wines were introduced, increasing the Gallo share of the premium market. The company ranked number one in sales, with an estimated 4.3 million cases sold in 1991, but the majority of Gallo profit continued to come from street wines. In the next decade the company shifted its emphasis, importing wine and also exporting millions of cases of wine to scores of countries each year.

In 2006, *Forbes* magazine estimated Ernest's net worth at $1.2 billion. The next year Ernest died at his home in Modesto, just days before his ninety-eighth birthday.

Legacy

Along with his brother Julio, Ernest Gallo created a wine empire during seven decades. Known for his somber dedication to work and his often ruthless practices, Ernest was a skilled entrepreneur and a master of marketing strategies. However, this single-minded ambition resulted in bitter litigation against his youngest brother and tore the family apart.

Isabella Stewart Gardner

American art patron

Gardner was a fashionable figure in Boston society and a patron of the arts. She befriended famous writers and artists and was the subject of a celebrated portrait by John Singer Sargent. In 1903, five years after her husband's death, she used his wealth to open her world-renowned museum.

Born: April 14, 1840; New York, New York
Died: July 17, 1924; Boston, Massachusetts
Also known as: Isabella Stewart (birth name); Mrs. Jack; Donna Isabella; Isabella of Boston
Source of wealth: Inheritance
Bequeathal of wealth: Museum

Early Life

Isabella Stewart Gardner was born in 1840 in New York City. Her father, David Stewart, made his fortune in the Irish linen trade and in mining investments, and her mother, Adelia Smith, came from a successful farming family. Educated in private schools, Gardner developed an interest in art at a young age and even then dreamed of creating some sort of house for her art. She spent part of her early life in Paris, where she met Julia Gardner, the sister of her future husband, John ("Jack") Lowell Gardner, who would be quite willing to place his fortune at her disposal in acquiring the art that quickly became the focus of her life.

The friendship with Julia led directly to Isabella's marriage to Jack, whom she met at a family gathering in Paris. The couple settled in his hometown of Boston. Depressed after the early death of her son, Gardner traveled widely in the United States, Europe, Asia, and the Middle East. However, Venice, a meeting ground for many expatriate American artists, became her favorite place. Her love of antiques and Italian art by the Old Masters and her admiration for the intimate palazzi of the city all contributed to her decision to establish her own highly personal museum at her residence, Fenway Court, and to make that site a place where the public could appreciate art masterpieces.

First Ventures

Unlike many other wealthy men and women of her generation, Gardner did not merely collect art. She also sponsored and lavishly entertained artists, buying their work and making a public spectacle of how she used her wealth. She was treated like American royalty and given nicknames, such as Donna Isabella and Isabella of Boston. Indeed, she claimed (without much foundation) to be a descendant of the Stuart royal family of England and Scotland.

Gardner and her husband began buying art in the 1880's. Although Gardner would eventually be known for her collection of famous paintings, she initially spent her fortune on tapestries, sculpture, antiques, stained glass, mantelpieces, silver, ceramics, doors, photographs, and manuscripts—all kinds of items that resulted in the rebuilding on American soil of a European style of life and architecture. In this way, Gardner became the forerunner of other great American art collectors like William Randolph Hearst, whose "castle" not only contained great works of art but also was constructed along the lines of classical European architecture.

Mature Wealth

In 1891, Gardner's father died, and she inherited a fortune of $2.1 million (estimated to be worth as much as $40 million in 2010). Although it was already clear to Gardner that she wanted to create a very personal and intimate home and museum that would showcase her art, she had to consider carefully how her scheme could compete with the collections of other wealthy art patrons, especially Henry Clay Frick, Andrew Mellon, and J. P. Morgan. These men possessed fortunes that were easily thirty times as large as hers.

Just as worrisome were the art brokers, who often bilked their clients by selling them fake masterpieces. Indeed, Gardner and her husband had been so victimized in 1888. Not until Gardner began dealing in 1894 with Bernard Berenson, an art collector himself and considered a world authority on Italian Renaissance art, did Gardner begin in earnest to acquire a collection of great works that would eventually take their place in her museum. With Berenson's guidance, Gardner began to acquire the work of Rembrandt, Titian, Édouard Manet, and other Renaissance and modern masters—in all nearly seventy pieces that would attract worldwide attention and praise.

When Jack Gardner died in 1898, Isabella acquired another fortune that accelerated her plans to open her own museum. She did not, however, simply want a grandiose building to house her art. On the contrary, she wanted a structure built on an intimate scale, so that anyone visiting the museum would think of it as a home of art, which indeed it was, since Fenway Court, the name of Gardner's residence, was indeed her domicile, as well as the site of her art collection.

In the first years of the Isabella Stewart Gardner Museum's existence, it functioned as a rather exclusive site open less than one month a year on days when the public was invited to visit the collection. It was important to Gardner that the display of her wealth and art reflect her own personal sense of beauty and place. In the first two decades of the twentieth century, she established the location for each work of art, a location that was never to be changed, a tribute to the way Gardner used her wealth to shape her sense of beauty and culture.

A case in point is the Dutch room, featuring the work of Rembrandt and his disciples, which became the site of pilgrimage for art lovers. She cunningly had the room placed at the top of a staircase and gave it a Dutch guildhall look, with well-worn ceramic floor tiles, carved wood paneling, silk green-gold fabrics, and late sixteenth cen-

Isabella Stewart Gardner. (Library of Congress) tury tapestries. Here, paintings by Albrecht Dürer, Hans Holbein the Younger, Sir Anthony van Dyck, and Peter Paul Rubens could be viewed in a setting that resembled the world in which they were created. It was this room that became the main target of a robbery that occurred on March, 1990, when thieves disguised as policemen stole paintings and other artwork estimated to be worth $600 million. Gone were the Gardners' most precious possessions: works by Rembrandt, Jan Vermeer, and other world-famous artists. As of 2010, the case had never been solved, even though there was an outstanding reward of $5 million for information leading to the recovery of the paintings.

These works and many of the others that were not stolen have appreciated in value—so much so that their true worth in monetary terms is almost incalculable. During her lifetime, Gardner might pay $100,000—then a seemingly extravagant sum—for a single painting that would decades later be appraised for millions of dollars.

In 1919, Gardner suffered the first of a series of strokes that would ultimately end her life on July 17, 1924. Aware that she would need to create the financial means to perpetuate her art collection and her museum, she established a $1 million endowment. In the first decades after her death, this endowment, carefully managed, was sufficient to the purposes Gardner had in mind. By the 1960's, however, the Gardner Museum began to suffer from the restrictions placed upon it in her will. Neither the art nor its placement could be significantly altered or sold; for this reason, the Gardner, unlike other museums dealing with a fluctuating economy and art market, as well as the vagaries of fundraising for public institutions, had strained its ability to preserve its collection. The museum also could not acquire art that did not fit into Gardner's range of interests. Similarly, the shrinking endowment resulted in the lax and inadequate security system that made the museum vulnerable to the most spectacular art robbery of the twentieth century.

Isabella Stewart Gardner Museum

Isabella Stewart Gardner designed her home and museum to evoke Venetian architecture, in particular the Grand Canal's Palazzo Barbaro. However, instead of attempting to duplicate a Venetian street, in which her building would be approached through a series of arches and columns, she employed the arches and columns motif in an inner courtyard filled with foliage and flowers.

The success of this building has much to do with Gardner's hands-on design. Although she employed an architect, she visited the construction site daily, supervising and, when necessary, even arguing with workmen about various details. She thought nothing of demolishing her own plans when they proved visually unappealing. As a result, her guiding hand created one of the most romantic places in Boston, suffused with the fragrance of jasmine trees and orchids.

Gardner took an entire year to situate her artwork into her new museum-home, making sure that the vases, tables, and other furniture and furnishings were an exact and exquisite match for the paintings, sculpture, and textiles she wanted to display. As many art critics have noted, the building and its art become a kind of performance that is entirely the product of a woman who enjoyed her role as a public figure and benefactor.

Gardner was not shy about showing off her wealth and the world she could create with it. Unlike many accomplished, wealthy persons, she did not elude the press or publicity. She wanted her name, acquisitions, and wealth to meld together in the public mind. Owning and enjoying art, in her view, was one of the great pleasures of the world that the public ought to embrace. She used her fortune for many other charities, and through her museum she established programs for the public that associated her great fortune with the improvement of her community and world.

Legacy

In spite of the restrictions that Gardner placed on her museum and the 1990 robbery, the Gardner Museum remained one of the great treasure houses of world art. Under astute leadership, temporary exhibits of contemporary art have enhanced the institution's broad appeal to the public. Because the basic physical structure cannot be changed, the museum has maintained a historic character that remains an attraction in its own right. Gardner's wish to make the museum seem like a home has been perpetuated by displaying paintings without labels or attributions and with the kind of dim lighting associated with a home rather than with a public building. Thus the proximity to great art that Gardner sought to foster has been honored. In March, 2009, a controversial decision by a Massachusetts court allowed the museum to go ahead with plans for a new building—a clear deviation from Isabella Stewart Gardner's will. Museum officials planned to devote much of the new space to temporary exhibitions and amenities designed to appeal to contemporary museum visitors.

JOHN W. GARRETT

American railroad and shipping executive

Garrett, president of the Baltimore and Ohio Railroad during its most prosperous period, transformed it into a profitable company and established Baltimore as a thriving seaport. He also contributed to the founding of Johns Hopkins University and the university's medical school.

Born: July 31, 1820; Baltimore, Maryland
Died: September 26, 1884; Deer Park, Garrett County, Maryland
Also known as: John Work Garrett
Source of wealth: Railroads
Bequeathal of wealth: Children; charity

EARLY LIFE

John Work Garrett was born in Baltimore, Maryland, in 1820. He and his brother Henry eventually became partners with their Irish immigrant father, Robert Garrett, in a mercantile and shipping business, which eventually evolved into banking. John Garrett had an affinity for business, and at nineteen he left college to work with his family. The Garretts were visionary and entrepreneurial, and they expanded their business, acquiring hotels and warehouses, building a steamship that traveled between Baltimore and San Francisco, and developing Baltimore's port so American goods could be exported to Europe and South America and merchandise could be imported from aboard.

FIRST VENTURES

Garrett's interest in shipping prompted him to become an active stockholder in the Baltimore and Ohio Railroad (B&O). His desire to ensure a positive return for stockholders motivated him to speak out at directors' meetings, asserting his ideas about the railroad's financial operations. His speeches impressed another large stockholder, Johns Hopkins, who nominated Garrett for the presidency of B&O. After being elected to this position, Garrett immediately instituted economic practices that earned the stockholders large dividends, and he promised this would be his consistent goal. Garrett's attention to detail and his many business connections enabled him to fulfill his promise. He maintained the rails in good condition, added train cars, and took advantage of business possibilities which benefited B&O and increased his personal fortune.

MATURE WEALTH

For Garrett, opportunities to strengthen both B&O and his fortune abounded. At the beginning of the Civil War, he realized his business could prosper by its support of the Union. He made the B&O an instrumental force in the war by using the railroad to move troops. He kept workers busy repairing the right-of-way, which was often a target of Confederate attacks. After the war, he purchased old warships, some of which he refitted in order to transport rail materials from Liverpool to Baltimore and to carry grain and coal to Europe. Some of the other warships were adapted for use as passenger ships that brought immigrants to Baltimore. Many of these immigrants were subsequently employed at the B&O. Garrett also invested in coal mines in Cumberland, Maryland, and in the construction of dry docks and grain silos in order to export grain and coal from the Locust Point area of Baltimore. Garrett consistently provided B&O stockholders with better than average dividends.

The most influential man in Maryland, Garrett shaped much of public life in Baltimore. He brought together two of Baltimore's wealthiest men—Hopkins, who was looking for future investments, and George Peabody, a former Baltimore resident who founded the city's Peabody Institute. At Garrett's suggestion, Peabody persuaded Hopkins to appoint a board of trustees, with Garrett as one of its members, in order to establish a university and medical school. The result was the founding of Johns Hopkins University and Johns Hopkins Medical School and Hospital.

Garrett died in September, 1884, at the age of sixty-four, exhausted and bereaved by the death of his beloved wife ten months earlier.

Legacy

Garrett created a thriving railroad and seaport in Baltimore. He demonstrated how to make money, wield influence, and use his wealth philanthropically. He served on the boards of various charitable organizations, brought the Young Men's Christian Association (YMCA) to Baltimore, and organized the Economic Relief Association of the Baltimore and Ohio Railroad. He facilitated the founding of Johns Hopkins University and its medical school through his influence and his successful railroad, which greatly contributed to the fortune of university namesake Johns Hopkins.

Garrett left his fortune to his children. His daughter Mary Elizabeth raised funds for Johns Hopkins University School of Medicine, providing much of her own fortune to the institution with the stipulation that it admit women. Garrett's grandson bequeathed one of Garrett's magnificent estates, the Evergreen House, to Johns Hopkins University.

BILL GATES

American businessman and philanthropist

Gates, cofounder of Microsoft Corporation, earned his vast wealth through his pioneering work in the personal computer industry. In the twenty-first century, he and his wife Melinda pledged to direct their personal and corporate funds toward ending poverty and disease in Third World countries.

Born: October 28, 1955; Seattle, Washington
Also known as: William Henry Gates III
Sources of wealth: Inheritance; computer industry
Bequeathal of wealth: Spouse; charity

EARLY LIFE

William Henry "Bill" Gates III was the second of three children born to William H. Gates, Sr., an attorney, and Mary Maxwell Gates, a board member of First Interstate Banc System. As the only son of upper-middle-class parents, he was expected (and encouraged) to become a lawyer like his father. He was sent to Lakeside School, an expensive preparatory school, where he was first exposed to computers in the form of an ASR-33 teletype terminal and some time on the General Electric server. His early attempts at computer programing produced a number of simple programs, including a tic-tac-toe game, and impressed school officials. In 1971, Gates's early manifestation of talent encouraged the Lakeside administration to hire him to write programs for the school's computers, using a programing language that would automate the lengthy process of class assignments. He graduated in 1973, scored 1590 out of 1600 on the Scholastic Aptitude Test (SAT), and decided to continue studying computers at Harvard University.

FIRST VENTURES

At Harvard, Gates continued to exhibit the talent that would enable him to succeed in the developing computer industry. In 1975, Micro Instrumentation and Telemetry Systems (MITS) developed a new microcomputer, the Altair 8800, and Gates, along with partner Paul Allen, saw this as an opportunity to start their own company, Microsoft Corporation. Microsoft provided the Altair with a suitable operating system called Altair BASIC (Beginner's All-Purpose Symbolic Instruction Code). The company subsequently developed MS-DOS (Microsoft Disk Operating System), which Gates eventually sold to International Business Machines (IBM) for a one-time fee of $50,000.

Altair BASIC and MS-DOS were not, in themselves, particularly profitable to Gates. He was more determined to stalwartly retain the copyrights to these systems in complete disregard for programming conventions of the time, which leaned toward the open-source approach, allowing wide accessibility to a software's source code. Gates cleverly retained all rights to his software in order that he could market MS-DOS not only for use on IBM's personal computers but also for the many IBM imitators that subsequently flooded the market. Gates foresaw an untapped demand for personal computers that even the computer manufacturers themselves had missed, and it was this remarkable foresight and protectiveness over his product that would guarantee him massive returns for his minuscule outlays. Given Gates's immediate success, it is not surprising that when he decided to leave Harvard to

Bill Gates testifies in 2010 before a Senate Foreign Relations Committee hearing on global health. (AP/Wide World Photos) focus on running Microsoft, his parents gave him their full blessing to pursue his dreams.

Bill and Melinda Gates Foundation

As Bill Gates rose from relative obscurity to extreme wealth, a great deal of social pressure was placed on him to turn his attention to the needs of others. Agreeing that he should be more socially responsible, Gates studied the lives of famous philanthropists like John D. Rockefeller and Andrew Carnegie to decide how his wealth could be invested for its maximum social impact. Discussions with his fiancé, Melinda French, whom he married in 1994, convinced him to sell some of his personal Microsoft Corporation stock and found the William H. Gates Foundation. Although the foundation provided computer equipment to schools serving disadvantaged students throughout the United States, Gates was dissatisfied with the organization's inability to address more deeply rooted global problems. In 2000, his wife persuaded him to combine three family trusts into a larger and more comprehensive entity—the Bill and Melinda Gates Foundation—which would seek global rather than national change in the lives of the impoverished.

The Bill and Melinda Gates Foundation is the largest "transparent" global charity; every dollar donated is openly accounted for, and the foundation's methods are open to the scrutiny of its benefactors. The organization has chosen as its particular project the eventual eradication of malaria, and the foundation is one of the largest purchasers of vaccines for preventable diseases in the Third World. Warren Buffett, a longtime friend and chief executive officer of Berkshire Hathaway, Inc., was so impressed with Gates and his wife's enthusiasm and candor that in 2006 he donated $44 billion to charity, the majority of it earmarked to be released in installments of $1.5 billion per year, to the couple's foundation. By 2007, Bill and Melinda Gates had donated almost $28 billion, making them the second most generous philanthropists in the country.

Mature Wealth

Microsoft went through an extensive restructuring and reincorporation in 1981 with the intention of buttressing the solid sales of MS-DOS, as well as creating a new and more visually oriented version of the system that would appeal to consumers who were not computer programmers and were unhappy with the technical feel of computers. Microsoft and IBM initially created a new operating system, OS/2, but Microsoft eventually dropped out of this project and IBM obtained the exclusive license to this system. OS/2 failed to significantly improve sales of personal computers. On November 20, 1985, Microsoft successfully launched its newly developed Windows OS for retail sale. The new operating system enjoyed immediate and explosive success. After ten years in business, Microsoft made an initial public stock offering in 1986. Eventually, the stock's price would skyrocket, making four of the company's employees billionaires and twelve thousand other employees millionaires. Gates also continued to form inroads into other technological products, like Corbis, a digital imaging company, which he established in 1989.

As he became accustomed to the heady experience of managing such a highly and immediately lucrative business, Gates in 1994 decided to pursue more personal goals. He married Melinda French on January 1 and assisted her in the formation of the influential Bill and Melinda Gates Foundation. With the subsequent birth of three children—two girls and a boy—the couple purchased a sixty-six-thousand-square-foot home in Medina, Washington, and outfitted it appropriately. The $125 million house overlooks Lake Washington, has a sixty-foot swimming pool, and boasts an extensive library intended to house such treasures as Leonardo da Vinci's *Codex Leicester* (one of Leonardo's scientific journals written between 1490 and 1519), bought at auction for $30.8 million. Despite the trappings of wealth implied by its twenty-five-hundred-foot gym and its one-thousand-foot dining room, the home has been described as a welcoming retreat for its family from the notoriously draining aspects of public life. For a man listed in *Forbes* magazine as the wealthiest American from 1995 to 2007, and again in 2009, Gates has resisted the more tawdry temptations of a billionaire's life. He values his privacy and avoids the limelight, having felt the scorn of the media in 1998, when Microsoft was on trial for alleged antitrust violations and Gates was labeled as arrogant and evasive under questioning.

The federal government's antitrust litigation focused on many legal issues regarding Microsoft's allegedly noncompetitive practices. Gates had resolved to remain the exclusive marketer of his company's software. He knew he could not maintain complete and perpetual control over the many aspects of the computer industry, but he was surprised when he failed to anticipate a new demand for user-friendly "gateways" to computer servers and the various communications between servers known as the Internet superhighway. A competing company had launched its entry program, Netscape, to a pleased and appreciative market. Gates responded by making agreements with computer manufacturers to offer his proprietary Internet software, Internet Explorer, to consumers as part of a hardware and software package deal. The creators of Netscape, and others in the computer industry, complained that Gates was monopolizing the available hardware vendors by requiring exclusive contracts—a predatory way of ensuring his product's sales. Judicial review confirmed that Microsoft was maintaining a monopoly and needed to be divided into smaller companies. The federal government filed suit against Microsoft, alleging that Gates's anticompetitive practices enabled him to monopolize the market for computer operating systems.

While division into two companies would not greatly harm Gates, he did not want Microsoft to be split. Fortunately for Gates, in 2001 President George W. Bush offered Microsoft a settlement that would prevent the forced division that Gates's opponents desired. Bush accepted Gates's proposal to step down as chief executive officer of Microsoft and instead become an adviser, assisting the company in its software production. This agreement reduced Gates's workload, providing him more time to focus on philanthropic work.

Legacy

Gates has said that when he dies, he does not intend for his children to inherit anything more than the relatively small sum of $10 million each, The vast majority of his fortune will be dispersed to a variety of charities performing a wide range of activities, including improving computer facilities in public schools and purchasing and distributing vaccines for use in Third World countries. He prefers that his legacy be a world less ravaged by disease than the provision of funds that could tempt his children to become profligate spendthrifts, interested only in the pursuit of pleasure. Gates has also pledged to work with other charities in order to address public needs that cross traditional boundaries between these organizations. For example, investor Warren Buffett so admired the compassion of Gates and his wife that Buffett also pledged to distribute the bulk of his $44 billion estate toward charitable goals after his death.

Key to Pronunciation

Many of the names of personages covered in *Great Lives from History: The Incredibly Wealthy* may be unfamiliar to students and general readers. For these unfamiliar names, guides to pronunciation have been provided upon first mention of the names in the text. These guidelines do not purport to achieve the subtleties of the languages in question but will offer readers a rough equivalent of how English speakers may approximate the proper pronunciation.

Vowel Sounds

Symbol	**Spelled (Pronounced)**
a	answer (AN-suhr), laugh (laf), sample (SAM-puhl), that (that)
ah	father (FAH-thur), hospital (HAHS-pih-tuhl)

Great Lives from History

The Incredibly Wealthy

Piers Gaveston

English aristocrat and government official

Gaveston received his wealth through his close friendship and presumed homosexual relationship with King Edward II of England. The favoritism the king showed to Gaveston antagonized other aristocrats, prompted several revolts against Edward II, and ultimately led to Gaveston's murder and Edward's deposition.

Born: c. 1284; Béarn, Gascony, France
Died: June 19, 1312; near Warwick, Warwickshire, England
Also known as: Piers Perrot Gaveston; Earl of Cornwall
Sources of wealth: Real estate; government
Bequeathal of wealth: Children; government

Early Life

Piers Perrot Gaveston (peerz peh-ROH GAHV-ehs-tuhn) was the third and youngest son of Gascony knight Arnaud de Gabaston and his wife, Claramonde de Marsan. As a Gascon, Gaveston was by birth a subject of the English crown. Arnaud served Edward I of England in several capacities and Piers followed in his father's footsteps. The first recorded mention of Piers appears in 1297, when he served in Edward I's army in Flanders. It is likely that he had arrived in England prior to this time, possibly when Arnaud came to the country in 1296.

First Ventures

Gaveston became a yeoman in the king's household before joining his father and brother in a military campaign in Scotland in 1300. Gaveston had clearly risen in stature and wealth, with at least one servant of his own and a horse that was valued at three times the figure assigned to his Flemish mount in 1297. By the end of that year, Gaveston had been transferred to the household of Edward of Caernarvon, the future Edward II. According to an anonymous chronicler, Edward I had been considerably impressed with Gaveston's conduct in Flanders. He apparently saw Gaveston, a graceful, sharp-witted, refined man with good military skills, as a role model for young Prince Edward. The transfer did not affect Gaveston's financial status, as he continued to receive the same rate of pay, but new possibilities for advancement opened.

On December 14, 1302, Edward I identified Gaveston as a member of his household and ordered robes for him for each season. Gaveston joined both the king and prince in Scotland on another military campaign in 1303. While in Scotland, Gaveston received an increase in his wages, as well as money for the purchase of unspecified goods. The fact that the king also entrusted Gaveston to pay small sums to others indicates that he was held in high regard. In 1304, at the request of Edward of Caernarvon, Edward I granted Gaveston custody of Edmund Mortimer's lands until Mortimer's heir reached the age of majority. In 1306, Edward I knighted Gaveston.

Mature Wealth

Over the years, Gaveston became increasingly close to Prince Edward, a development that led to discontent among other aristocrats. Contemporaries described the love shown by the prince for Gaveston as "immoderate," "excessive," and "beyond measure." The relationship may have been homosexual or adoptive brotherhood—the records support both conclusions. In 1307, Gaveston was sent into exile largely because of the favoritism shown to him. Edward I likely viewed exile as more of a punishment for Prince Edward than for Gaveston. Upon Edward I's death, the new king, Edward II, recalled Gaveston from exile, named him the earl of Cornwall, and granted him all of the lands that had belonged to Edmund, the late earl of Cornwall.

Now elevated to the peerage, Gaveston received the honor of being appointed regent in anticipation of the king's absence at his wedding to Isabella of France. Gaveston played a prominent role at Edward II's coronation in 1308, preceding the king and carrying the crown of Edward the Confessor. The king's new brothers-in-law were reportedly offended by Gaveston's ostentatious dress and behavior at the banquet that followed the coronation.

Meanwhile, the English barons had become dissatisfied with Edward II's governance. In 1308, they issued the Boulogne declaration, setting out their arguments for reform. The aristocrats, especially the earl of Lincoln, blamed Gaveston for leading Edward astray, and they wanted Gaveston to leave the country. With the threat of civil war high, Edward sent Gaveston into exile in May, 1308. Edward immediately began to arrange for Gaveston's return while compensating him for his loss of lands. During Gaveston's exile, he continued to receive grants of land, including the county of Gaure; the castles of Talmont, Tantalon, and Mauleon; the city of Bayonne; and the island of Oléron. He also received the manors of Aldborough, Roecliffe, and Burstwick and the castle of Knaresborough, among many other properties. Gaveston was expected to draw an income of 3,000 marks from these English properties, with any surplus going to the king. Gaveston held most of the properties only for life, with reversion to the king upon Gaveston's death. The king also gave Gaveston 1,180 marks to pay his expenses.

On June 16, 1308, Edward appointed Gaveston as the king's representative in Ireland. The post carried substantial power. Gaveston accounted himself well, particularly in military affairs. By the spring of 1309, Gaveston had returned to England, but the problems that had led to his exile remained. He behaved just as arrogantly as in the past, while the barons continued to complain about his conduct. In 1310, Edward agreed to the election of a group of lords who had the power to maintain the well-being of the realm and the royal household. Little changed except for the worsening situation between Edward and the barons.

The English barons viewed Gaveston as an obstacle to reform of the household system of governance. Several of the Ordinances of 1311 that were drafted by the nobility and presented to Parliament were personal attacks upon the royal favorite. Gaveston was charged with providing the king with evil counsel, draining the royal treasury and sending the money abroad, making alliances, estranging the king from his own people, removing good officials in favor of his own men, receiving lands and other gifts to the detriment of the Crown, obtaining royal protection for criminals, leading the king into hostile lands, and obtaining sealed blank charters. Moreover, after being exiled by Edward I, Gaveston allegedly returned without the proper baronial assent. The ordinances called for Gaveston to be perpetually exiled from England and from all English possessions by November 1, 1311. None of the charges were substantiated with evidence, however, probably because Gaveston's notoriety was considered proof enough of his guilt.

Edward opposed the implementation of the ordinances and refused to uphold them. The writers of the ordinances had no power to enforce them. Gaveston did lose his lands, but they were entrusted to the care of Gaveston's own officers by the king. After spending no more than two months abroad, Gaveston returned to England, apparently because of the birth of his first child. Gaveston and the king journeyed to York to see Gaveston's wife and daughter. They remained in the area while the barons organized forces to oppose the king and his favorite. Gaveston set up residence at Scarborough Castle in Lancaster while Edward remained in York. Several lords attacked Scarborough, prompting Gaveston to surrender. Three of the lords guaranteed his safety. On June 10, several of the lords condemned Gaveston to death. On June 19, 1312, he was led along the road to Kenilworth until the group reached Blacklow Hill, where an executioner cut off Gaveston's head.

THE DEPOSITION OF EDWARD II

Edward II, also known as Edward of Caernarvon (1284-1327), king of England and lord of Ireland, and duke of Aquitaine, was the son and successor of Edward I (1239-1307). In 1326, Edward II experienced serious conflict with France and with English aristocrats. Edward's wife, Isabella of France, joined with Edward's son Prince Edward to invade England to purportedly free the king, the church, and the realm from the ruin caused by the king's favorites. Meanwhile, King Edward II took flight to Wales to rally supporters. Captured in Wales, he was placed in the custody of the earl of Leicester. Parliament, summoned by Prince Edward, considered several articles that outlined Edward's defects as a king. The charges make it clear that Edward was widely regarded as an incompetent ruler and did not command much respect.

Edward was charged with being personally incapable of governing; allowing himself to be led and governed by others who advised him badly; refusing to remedy the defects when asked to do so by the nobility; devoting himself to unsuitable work and occupations while neglecting the government of his kingdom; exhibiting pride, covetousness, and cruelty; losing, for lack of good government, the kingdom of Scotland and lands in Gascony and Ireland; forfeiting the friendship of the king of France; destroying the church and imprisoning clergy; failing to observe his coronation oath through the influence of evil counselors; abandoning his kingdom and doing all in his power to cause the loss both of it and of his people; and being incorrigible and without hope of improvement.

On January 20, 1327, under pressure, Edward resigned in favor of his son, Prince Edward. The deposed king remained in custody until his death on September 21, 1327. Despite an official announcement that Edward had succumbed to natural causes, most people quickly came to believe that he had been murdered to remove the embarrassment of a former king's existence.

Edward II buried the remains, dressed in three cloths of gold, at the Dominican house at Kings Langley two years later. The king showed his continued loyalty to Gaveston by providing for the dead man's family and servants. He endowed Gaveston's widow, Margaret, with the castle of Oakham and the manors of Kirkton and Burstwick, along with all of their members, towns, hamlets, and other contents. Edward paid for the education of Gaveston's daughter Joan until her death at the age of thirteen.

Legacy

Gaveston proved unpopular chiefly because he controlled royal patronage and favors during the first five years of Edward's reign. The close relationship between Gaveston and Edward II doomed both men. It also had significant political consequences for England. Gaveston became a symbol of the corruption of Edward II. By the twenty-first century, Edward was remembered chiefly for being one of the rare English kings to lose his crown. His deposition is blamed on his favoritism of Gaveston.

For Edward, his unwillingness to appease the barons by removing Gaveston from England and all its possessions ultimately unraveled his reign. The Gascon knight became the central issue in a baronial campaign for governmental reform. Although Gaveston committed no crimes, ostentation and arrogance proved to be his undoing.

David Geffen

American entertainment company executive

Geffen became the first self-made billionaire in the American entertainment industry through a shrewd understanding of popular tastes and an ability to negotiate lucrative deals with artists and industry executives. In 2004, the visionary businessman pledged to donate his future earnings to charity.

Born: February 21, 1943; Brooklyn, New York
Source of wealth: Entertainment industry
Bequeathal of wealth: Medical institution; educational institution; charity

Early Life

David Geffen was born in 1943 in Brooklyn, New York, the second son of Batya Volovskaya Geffen, originally from the Ukraine, and Abraham Geffen, originally from Lithuania. The couple had met in British-mandated Palestine and married in Tel Aviv in 1931, eventually immigrating to the United States. Abraham had little ambition and held a series of low-paying jobs. David learned his first entrepreneurial skills from his mother, who made and sold women's undergarments in her shop, Chic Corsetry by Geffen. A shrewd businesswoman, Batya was the primary breadwinner. She called her favorite son "King David" and spoiled the talkative youngster, who was fascinated by show business.

Geffen was an indifferent and easily distracted student whose full attention was captivated by his involvement in a student musical comedy production. After

David Geffen. (AP/Wide World Photos)

graduating from New Utrecht High School, he attended—and soon dropped out of—a series of schools: Santa Monica City College, Brooklyn College, and the University of Texas at Austin.

First Ventures

Geffen's first entertainment-related job was as an usher at CBS (Columbia Broadcasting System) Television City in Los Angeles, followed by a short-lived position as a receptionist for a CBS television series. In 1964, he landed a job in the mail room of the New York office of the William Morris Talent Agency (WMA), claiming he had earned a degree in theater arts from the University of California, Los Angeles. Intensely ambitious and eager to ingratiate himself with his superiors, Geffen worked in the WMA office in Los Angeles during his vacations. Geffen became a junior agent-at-large eighteen months after joining WMA, at first focusing on television talent and then on promising musical acts.

In 1968, Geffen left WMA, doubling his salary at the Ashley Famous Agency. He became a personal manager for singer-songwriter Laura Nyro and other developing musicians, including Crosby, Stills and Nash. The young businessman made his first $1 million with the sale of the music publishing venture he had begun with Nyro.

In 1970, now living in Los Angeles, Geffen cofounded Asylum Records. He quickly became known for his ability to recognize new talent and to predict trends in musical taste when he signed Joni Mitchell, Jackson Browne, The Eagles, Bob Dylan, Tom Waits, and Linda Ronstadt on the Asylum label, which was distributed by Atlantic Records. In 1971, Geffen sold Asylum Records to Warner Communications in a noticeably lucrative transaction. Warner Communications, Atlantic's parent company, merged Asylum with Elektra Records in 1972. Geffen stayed on as president of Asylum during the merger and until 1975, when he accepted a position as vice chairman of Warner Bros. film studio. In contrast to his great success as a record executive with a free rein, Geffen was less adept in the corporate decision-making environment of the film industry.

He retired from the studio and soon after was diagnosed with terminal bladder cancer. During the next several years, he received medical treatment and briefly taught business studies at Yale University. After the discovery that his diagnosis was wrong, Geffen received a clean bill of health and returned to the music industry with renewed zest.

Mature Wealth

Still associated with Warner, Geffen founded Geffen Records in 1980. Among the risky, but profitable, decisions on Geffen's part was to record John Lennon and Yoko Ono's album *Double Fantasy*, released shortly before Lennon's assassination in December, 1980. Geffen Records soon became an influential label with a roster that combined new and established musicians, including Olivia Newton-John, Sonic Youth, Aerosmith, XTC, Peter Gabriel, Lone Justice, Blink-182, Pat Metheny, and Sloan. Into the mid-1980's, Geffen continued to deal directly and supportively with older artists, such as Cher and Neil Young, but he relied on the opinions of younger colleagues regarding new musicians, signing stars-in-the-making, such as the band Guns 'N Roses. At the conclusion of a six-year contract with Warner, Geffen sold his recording company to the Music Corporation of America (MCA) for $6.13 million and $50 million in stock options. When Matsushita (now Panasonic) bought MCA, Geffen earned $710 million, and according to one writer emerged as "the single biggest benefactor of a Japanese acquisition of a U.S. company in history."

Back in business for himself, Geffen founded a new record label, DGC, with the stated objective of attracting innovative, young bands. One of the first bands Geffen signed was Nirvana, which scored a hit with the album *Nevermind*. In the 1990's, the popularity of grunge rock propelled the profits of DGC. Once again, Geffen was ahead of the curve. During this period the entrepreneur did not limit himself to the music business. In 1982, again with support from Warner, he launched the Geffen Film Company. Its first production, *Risky Business* (1983), made a star of young actor Tom Cruise. Other successes followed, including *Little Shop of Horrors* (1986), *Beetlejuice* (1988), *Interview with the Vampire* (1994), and *Beavis and Butthead Do America* (1996). During the 1980's, Geffen also bankrolled a series of long-running, award-winning Broadway and Off-Broadway shows: *Dreamgirls* (1981), *Little Shop of Horrors* (1982), *Cats* (1982), *M. Butterfly* (1988), and *Miss Saigon* (1991).

In 1994, Geffen joined with two of his friends, film producer and director Steven Spielberg and former Walt Disney Company executive Jeffrey Katzenberg, to form DreamWorks SKG, a film studio and entertainment production company. This ambitious enterprise combined the talents of three of the most powerful men in the entertainment industry, each of whom contributed $33 million, along with $500 million from Microsoft cofounder Paul Allen, to launch the studio. Its first two releases—*The Peacemaker* (1997) and *Amistad* (1997)—were not very profitable, but they established DreamWorks in the high-stakes world of studio filmmaking. Soon another drama, *Saving Private Ryan* (1998), earned both critical acclaim and huge audiences. Although that film did not win the Academy Award for Best Picture, as expected, DreamWorks went on to win three consecutive Academy Awards for Best Picture for *American Beauty* (1999), *Gladiator* (2000), and *A Beautiful Mind* (2001).

Although the studio also found success in television production with the situation comedy series *Spin City* (1996-2002), among other shows, DreamWorks Animation was the most consistently profitable unit, producing some of the highest-grossing animated films in film history, including *Antz* (1998), *The Prince of Egypt* (1998), *Shrek* (2001), *Madagascar* (2005), *Bee Movie* (2007) and *Kung Fu Panda* (2008). These successes resulted in DreamWorks Animation eventually becoming a separate and publicly traded company.

Surprisingly, given Geffen's impressive accomplishments in the recording industry, DreamWorks Records never thrived and was sold to the Universal Music Group in 2003. Several DreamWorks films with huge budgets were failures in 2004 and 2005, and the studio came close to bankruptcy. Even the company's "dream team" of Geffen, Spielberg, and Katzenberg could not change Hollywood. In February, 2006, Viacom's Paramount Pictures purchased the live-action DreamWorks studio for approximately $1.6 billion, which included about $400 million in debt assumption. Between 2007 and 2009, there was speculation that Geffen had plans to buy the *Los Angeles Times* or a substantial interest in *The New York Times*, an indication that the ever-restless en-

The David Geffen School of Medicine

In 2002, media mogul David Geffen, a member of the University of California Board of Regents, announced an unrestricted endowment of $200 million for the University of California, Los Angeles (UCLA) School of Medicine, after which the medical school was renamed in Geffen's honor. At the time of its award, the billionaire entrepreneur's gift constituted the largest single donation ever made to an American medical school.

The now celebrated school was founded shortly after World War II, far later than other medical schools with which it is now ranked. The first dean was appointed in 1947; two years later, construction began on the medical center and medical school. The first classes were held in 1951, attended by twenty-six men and two women, but the medical center did not officially open until 1955. Growth was swift and unprecedented, with the creation of the Neuropsychiatry Institute, the Brain Research Institute, the Marion Davies Children's Center, a school of dentistry, and an independent school of public health. By the end of the 1960's, the medical school had nearly four hundred medical students, more than seven hundred interns and residents, and nearly two hundred M.S. and Ph.D. candidates. In the 1970's, the school affiliated with the Venice Family Clinic, which would become the largest free clinic in the United States. Expansion continued in the 1980's with the addition of the Doris and Louis Factor Health Sciences Building and the Comprehensive Cancer Center. The Gonda Neuroscience and Genetics Research Center was constructed in the 1990's.

By the twenty-first century, the UCLA David Geffen School of Medicine had more than 2,000 faculty members, 1,300 residents, more than 750 medical students, and almost 400 Ph.D. candidates. Ranked "Best in the West" for fourteen consecutive years in the *U.S. News and World Report*'s annual survey of the best hospitals in America, the school is an international leader in biomedical research, medical education, and community service.

trepreneur had not satiated his desire for new media challenges.

Since the late 1980's, Geffen had been a generous contributor to acquired immunodeficiency syndrome (AIDS) research and AIDS action causes and a lobbyist for gay rights and AIDS research funding. In 1992, he received the Commitment to Life award from AIDS Project Los Angeles; in his acceptance speech, he publicly described himself as a gay man for the first time. In May, 2007, *Out* magazine ranked Geffen at the top of its list of the "Most Powerful Gay Men and Women in America." An enthusiastic contributor to Bill Clinton's presidential campaign and a frequent guest at the White House, Geffen later split with Clinton over the president's policy on gays in the military, but the billionaire has continued to be an active contributor to and fund-raiser for Democratic candidates.

With the advice of Atlantic Records executive and personal mentor Ahmet Ertegun, a twenty-seven-year-old Geffen bought his first artwork, a small painting by Pablo Picasso. Geffen embraced art collecting with his typical gusto and sagacity, developing a collection that by the mid-1990's ranked as one of the best private collections of postwar American painting in the world. When Geffen sold Jackson Pollock's *No. 5, 1948*, for $140 million in 2006, it was the most expensive sale of a single painting to date.

Geffen is one of the wealthiest people in the American entertainment industry, with a net worth estimated at $6 billion in 2007 and $5 billion in 2010.

Legacy

David Geffen has been an influential force in American popular culture since the 1970's. Although his greatest mark has been on popular music, he has also shaped tastes in television programming, Broadway shows, and feature films. Like many media moguls before him, Geffen is known for his energy, ambition, shrewdness, and the tenacity of his friendships and animosities. The David Geffen Foundation has contributed millions to AIDS research and action causes. The Geffen Playhouse and the David Geffen School of Medicine, both at the University of California, Los Angeles, attest to Geffen's generosity.

J. Paul Getty

American oil magnate and art collector

Getty accumulated a fortune that made him the richest living American by 1957, and he eventually was worth more than $2 billion. His interest in art and antiquities led him to acquire an enviable collection of paintings, sculpture, and other art objects that formed the basis of his outstanding Getty museums in Los Angeles and Malibu.

Born: December 15, 1892; Minneapolis, Minnesota
Died: June 6, 1976; Sutton Place, Surrey, England
Also known as: Jean Paul Getty
Source of wealth: Oil
Bequeathal of wealth: Charity; museum

Early Life

Jean Paul Getty was born in 1892 to George Franklin Getty, a lawyer, and his wife, Sarah Catherine McPherson Risher. The couple's daughter, Gertrude Lois, died in the 1890 typhoid epidemic. In 1904, George moved the family to Oklahoma, a major oil-producing state, with the intention of getting into the oil business, and he successfully attained this goal. Two years later, he moved the family again, this time to California. Jean Paul attended the Harvard Military Academy and in 1909 graduated from Polytechnic High School. At seventeen, he was strong and athletic, an amateur boxer and weightlifter, and a fine swimmer. Physically capable of handling the job of an oil field roustabout, he worked during the summer on his father's Oklahoma oil rigs.

Getty began his college education at the University of Southern California and then briefly attended the University of California at Berkeley, where he studied political science and economics. In 1912, he transferred to Magdalen College at Oxford University in England, graduating in 1914 with a degree in economics and political science. He took time to travel around Europe before returning to the United States to begin working.

First Ventures

Getty settled in Tulsa, Oklahoma, where he started his own oil company with his father's financial support. His father's business, the Minnehoma Oil Company, was thriving. Getty had a shrewd talent for buying and selling oil leases, and in 1916, when one of his own wells struck oil, he made his first $1 million.

When Getty was in his early twenties, he decided to take some time off to enjoy his money. He went back to Los Angeles, where, as a wealthy young bachelor, he lived a playboy's life. Hollywood offered film stars, such as the Gish sisters, Norma Talmadge, Mary Pickford, Gloria Swanson, Cary Grant, and Charlie Chaplin; the attraction of celebrity; beautiful women; and an exciting social life—all heady stuff for a young man with plenty of money. Within a decade, Getty managed to meet, marry, and divorce three women. His father disapproved of his lifestyle and lost respect for him.

Getty apparently either tired of this Hollywood life or could not resist the lure of business, because he returned to work in 1919, continuing to buy and sell oil leases and drill his own wells. He went to Mexico, studied Spanish, and acquired oil leases there. During the 1920's, his fortune grew to more than $3 million, and Getty became owner of a one-third interest in the firm he would soon name the Getty Oil Company.

After his father died in 1930, Getty became the president of the George Getty Oil Company, the changed name of the Minnehoma Oil Company. His mother, who like his father had become concerned about the lifestyle

J. Paul Getty. (AP/Wide World Photos)

The Getty Villa and Getty Center

J. Paul Getty established the museum that bore his name in a wing of his Malibu, California, home in 1954. Another building on this property, designed as a replica of an ancient Roman villa, was completed in 1974, and Getty's extensive art collection was moved there. In addition, the Getty Center, a 110-acre campus in the foothills of Los Angeles's Santa Monica Mountains, was completed in 1997 and is a complex of buildings containing a library, archives, and facilities to support interdisciplinary research, training, and other activities related to the conservation of art, architecture, and archaeological sites. The Getty Center museum houses collections of European paintings, drawings, sculpture, illuminated manuscripts, decorative arts, and European and American photographs.

The Getty Villa in Malibu is both a museum and educational center where forty-four thousand antiquities from ancient Greece, Rome, and Etruria are stored and exhibited. With its gardens, fountains, a reflecting pool, authentic Roman sculpture, and flora, the villa enables visitors to step into the past. Ancient Greek and Roman art, such as marble busts and statues, bronze pieces, murals, and frescoes, are displayed on one level of the building, while another level contains rooms decorated entirely in French Baroque and rococo furniture, carpets, clocks, and other furnishings.

The Getty Villa and Getty Center are among the world's richest museums. Upon Getty's death in 1976, the Malibu museum obtained a bequest of $600 million from Getty's estate. Since then, funding has grown and by 1982 was around $1.2 billion. This financial base has made it possible for the museums to expand their collections by purchasing many works and receiving donations from other art collectors.

The Getty art collection has caused controversy over the years. The Italian and Greek governments have claimed that many pieces of the collection's art were stolen from their countries. It was also alleged, and in some instances substantiated, that traffickers in stolen antiquities had acquired pieces from archaeological sites or by other means and illegally moved them into the international art market, where they were purchased by unsuspecting or unscrupulous art dealers. In 2006, the Getty returned twenty-six items claimed by Italy; in 2007 another forty artifacts were returned.

In spite of such issues, the museum buildings remain beautiful structures in fabulous settings, providing patrons with exhibits, public programs, and training opportunities in art research and conservation. The trust fund established after Getty's death has become a $6.4 billion foundation that supports the two museums, Getty Conservation Institute, Getty Information Institute, Getty Leadership Institute of Museum Management, Getty Research Institute for the History of Art and the Humanities, and Getty Grant Program. The grant program awards funds each year to art scholars and artists.

Getty adopted during his Hollywood sojourn, retained controlling interest in the company. Getty, however, continued to increase the business's profits and expanded its holdings. During the Depression, he shrewdly bought shares in companies with depressed stock prices. He acquired controlling interest in one of California's largest oil companies, the Pacific Western Oil Corporation, and in 1933 he bought shares in the Petroleum Corporation of America. His mother was finally persuaded to give him controlling interest in the company his father had started.

Mature Wealth

While still expanding his company's oil business and holdings, Getty also ventured into real estate, purchasing the Hotel Pierre in New York City. During World War II, he volunteered to serve in the U.S. Navy (he was an accomplished yachtsman), but he was rejected. The federal government, however, recognized his exceptional business acumen and persuaded him to take leadership of the Spartan Aircraft Company, which produced aircraft components and the NP-1 trainer airplanes that made a major contribution to the nation's war effort.

One of Getty's most audacious moves occurred in 1949, when he obtained the Saudi Arabian oil rights in the "neutral zone" between Saudi Arabia and Kuwait; the zone was an area of land between the borders of both nations. Dealing directly with King Ibn Saʿūd of Saudi Arabia, Getty paid $9.5 million in cash and committed to pay $1 million a year for sixty years for the land, on which oil had yet to be found. For four years, Getty's company looked for oil on the land, spending $30 million before striking oil on the Wafra tract in 1953. This oil field produced sixteen million barrels a year, helping to make Getty one of the richest people in the world.

By this time, he had also acquired control of Mission Corporation, as well as its holdings in Tidewater Oil Company and the Oklahoma-based independent Skelly

Oil Company, both connected to the beleaguered Standard Oil Company. Tidewater was a particularly significant acquisition as it was an integrated oil company with its own refineries, transport facilities, and gas stations.

Getty developed the Getty Oil Company into one of America's largest corporations and had what almost amounted to a monopoly on North American and Arabian oil concessions. The company maintained the world's largest fleet of oil tankers. Getty was described as the "world's richest private person" in 1957, with a personal fortune estimated at about $10 billion in stocks, corporate assets, and real estate.

By 1960, he had moved his home and offices to England, where he lived out the rest of his life in a sixteenth century Tudor estate. He died of heart failure in 1976 at the age of eighty-three.

Legacy

As early as 1938, Getty began collecting fine artworks. One of his first significant purchases was the Ardabil carpet, a sixteenth century Persian rug for which he paid £14,000. Around the same time, he also purchased paintings by Thomas Gainsborough and Raphael. His collection soon included rare watches, furniture, Roman and Greek sculpture, European paintings, tapestries, and other objets d'art. He kept his collection in his homes in England and California, until in 1954 he converted a wing of his home in Malibu, California, to the J. Paul Getty Museum.

By the twenty-first century, Getty's collections and many other artworks were exhibited in two museums—a Roman-style villa on his Malibu property and a major cultural institution in Los Angeles. Getty had said that art was a "civilizing influence in society" and as such should be available to the public. These museums and the other institutes he supported were the generous legacy of his wealth.

Abdul Ghafur

Mughal merchant

With a fleet of ships plying the Indian Ocean maritime trade, Ghafur was a wealthy "merchant prince" of the Mughal Empire.

Born: c. 1622; Gujarat, India
Died: 1718; Surat, India
Also known as: Mulla Abdul Ghafur
Sources of wealth: Trade; real estate
Bequeathal of wealth: Children

Early Life

Mulla Abdul Ghafur (AHB-dewl gah-FOOR) was born into a poor Muslim family in the recently annexed Gujarat *subah* (province) of the Mughal Empire in the early seventeenth century. His family belonged to the Bohra sect of Ismāʿīli Shīʿite Islam. Many Bohras were traders in the Mughal Empire, and the city of Surat in Gujarat was a leading commercial port of the Mughal Empire. Although beginning its decline, the Mughal Empire remained one of the richest empires in the world during Ghafur's lifetime. Silks, cottons, textiles, and spices flowed in and out of Surat on their way to India, the Near and Far East, and Europe. Ghafur soon became the leading merchant of this vast international trade.

First Ventures

Ghafur harbored his ships at the wharf in the village of Athwa near the wharves of French, Dutch, Turkish, and African fleets and not far from the English trade settlement. With the decline in the military power of the Mughal emperors, pirates infested the Red Sea and Indian Ocean. Throughout the 1690's, Ghafur lost many valuable ships to pirates. Skillfully playing on the ambitions of the Dutch East India Company, the allegiance of other merchants, and the Islamic sympathies of the Surat citizens, Ghafur organized convoys to protect his ships and devised a method of compensation for his pirated merchandise.

By 1700, Ghafur owned seventeen merchant ships that were capable of carrying more than five thousand tons of goods, rivaling the largest foreign trading companies. Ghafur's ships were commanded by relatives and trusted associates and swept a trading arc from the Indian Ocean to Arabia and to the China Sea, Malay, and Sumatra. Ghafur built a mansion in Saudagarpura and a luxuriant garden just inside the Variao gate to the city of Surat. Nearby, Ghafur constructed his family cemetery. Ghafur entertained visiting dignitaries in his gardens; the newly appointed *subahdar* (governor) of Gujarat was hosted in Ghafur's gardens for several days before taking command.

Mature Wealth

Ghafur was awarded the title *Umdat-ut-tujjar* (most eminent merchant) by the Mughal court. He was astute in employing imperial politics in order to advance his business interests and was renowned as a "merchant prince." His ships were exempted from many of the custom duties on exports of merchandise. He pressured another merchant, Abdul Wahab, to denounce his own son and leave his inheritance to Wahab's daughter, who was married to Ghafur's son. Ghafur's biographer, the distinguished Indian historian Ashin Das Gupta, describes Ghafur as temperamental and vindictive. However, many of Ghafur's outbursts seem to have been calculated displays of anger designed to concentrate Gujarati and Islamic hostility against his trading rivals. Indeed, the records of the Dutch East India Company indicate that Ghafur continually outmaneuvered European traders.

Ghafur died in 1718 at the supposed age of ninety-six. At his death Ghafur left an immense fortune of eighty-five lakhs of silver rupees (as a lakh represents 100,000 rupees, this sum is the equivalent of approximately $600 million), vast property holdings, and a still flourishing trading empire. His entire estate and his business were bequeathed to his son Mulla Abdul Hai.

Ghafur's grandson Mulla Muhammad Ali was increasingly at odds with the Mughal rulers. After skirmishes in which Ali employed an army of paid mercenaries, Ali was imprisoned and died on July 10, 1733. Ali's sons Mulla Fakhruddin and Mulla Aminuddin were able to preserve some of the family's shipping privileges. In turn, Fakhruddin's sons Mulla Waliuddin and Mulla Abdul Fath were also successful merchants, but the bulk of the fortune of Abdul Ghafur, one of the most spectacular built from the Indian Ocean maritime trade, had been lost.

Legacy

Descended from a line of conquerors and raiders, the Mughal rulers of the seventeenth century learned that there was stable governance in economic production, trade, and tax revenue. Abdul Ghafur was one of the leading "merchant princes" to emerge from this environment, employing his wealth to exert influence in the cosmopolitan Mughal court and to operate on behalf of his business interests and coreligionists.

Stephen Girard

American banker and merchant

Girard, one of the nation's earliest bankers, was the richest American of his time, and he used his wealth to establish a school for orphans.

Born: May 20, 1750; Bordeaux, France
Died: December 26, 1831; Philadelphia, Pennsylvania
Sources of wealth: Banking; trade; real estate
Bequeathal of wealth: Educational institution

Early Life

Stephen Girard (zhuh-RAHRD) was born in France in 1750. He was blind in one eye and affected by people's reaction to his condition. His father was a merchant who taught him about business and sparked his love of the sea. After his father's death, Girard decided to go to sea. He started as a cabin boy on a ship and worked his way up. Girard eventually became a part owner of a vessel that sailed near the British colonies, which would soon become the United States. He was visiting the colonies at about the time that the United States declared independence from Great Britain. Unable to leave during the Revolutionary War, Girard settled in Philadelphia and eventually became an American citizen.

First Ventures

Girard resumed his trade business soon after the end of the revolution. He was quite successful in his efforts and gained a large fortune. In 1776, Girard met and married Mary Lum. About ten years into the marriage, Mary began to suffer from mental illness. Girard had his wife institutionalized in 1790, and Mary died in the institution in 1815. Girard never remarried. He continued his international trading in the 1780's and early 1790's, and around 1790 he started to build ships.

In 1793, Girard was instrumental in fighting a yellow fever epidemic in Philadelphia. Unlike many other wealthy residents who left the city, Girard remained in Philadelphia, and he paid to convert a private home into a hospital. His efforts during the epidemic were quite successful and led to his becoming one of the most well-respected men in Philadelphia.

Mature Wealth

After the yellow fever epidemic, Girard resumed his trading activities and built numerous ships, maintaining a fleet of no more than nine vessels. He also chartered additional ships from others. Among the items he traded were coffee, tea, wine, and tobacco. Girard's business was often affected by the events of the late eighteenth and early nineteenth centuries. For example, his ships were seized by Barbary pirates during the Napoleonic Wars, but he also profited during the conflict by selling his goods at higher prices. Much of his trade was conducted in the East Indies.

Girard's personal fortune and reputation grew. He began corresponding with some of the leading figures of the time, including Thomas Jefferson. By 1795 he was worth about $250,000; this figure doubled five years later, and by 1810 his fortune was valued at $2 million, making him one of America's first millionaires. He continued to prosper financially during the War of 1812, increasing his wealth to $4 million in 1819.

In the early 1800's, as tension increased between the United States and Great Britain, Girard anticipated a war, so he moved a portion of his assets from the shipping industry into banks. He invested some of his funds in the First Bank of the United States, which was located in Philadelphia. After the bank's charter expired in 1811, he bought its building, obtained its assets, retained many of its employees, and opened a private bank. Girard was the sole owner of his bank, which enabled him to avoid the restrictive laws that pertained to unincorporated banks with multiple owners.

Girard purchased other properties. In 1807, he bought an entire city block in downtown Philadelphia, initially intending to build an educational institution for orphans. However, he later decided to build this school on another property he purchased in 1831, and he changed his will to reflect this decision. A very private man, Girard delighted in writing his will in secret and did not allow anyone to know its contents. He was also a very particular man, writing detailed specifications of the size and shape of the school's buildings and the height and length of a wall to be constructed on the site. Besides his large number of properties in Philadelphia, he also purchased real estate in other parts of Pennsylvania, as well as in Kentucky and Louisiana.

Girard's bank was the principal financier of America's military effort during the War of 1812, generating the money the country needed in its conflict with Great Britain. His bank extended credit to the government to support its war loans. After the government chartered the Second Bank of the United States in 1816, Girard bought stock in the bank and became one of its directors.

During the latter years of his life, he contributed widely to charitable causes, including the orphans asylum and the Pennsylvania Hospital, where his wife had been committed. Although he was not a churchgoer, he made donations to many different churches. Girard died in 1831. His will bequeathed most of his wealth to various charities, including what would later become Girard College.

Girard College

Stephen Girard had no children of his own to whom he could bequeath his fortune. Instead, he left most of his money to establish a school for orphans in Philadelphia, stipulating that city officials appoint trustees to manage the institution. His original will dictated that the money must be spent to educate "poor, white, male, orphans." In his time, the term "orphan" defined children raised in female-headed households, and these children were among those admitted to the school.

Girard College opened in 1848, about thirteen years after Girard died. The project was delayed in part because Girard's French relatives legally challenged his will, hoping to inherit the money appropriated for the school. However, in a landmark opinion issued in 1844, *Vidal v. Girard's Executors*, the U.S. Supreme Court upheld the will's bequeathal provisions, as well as another condition of the will that was challenged in the litigation. Girard had stipulated that no ministers of any denomination could teach or visit the college. Opponents maintained that this restriction prohibited the college from teaching Christianity and violated Pennsylvania's constitution, which generally included Christianity as part of the state's common law and barred the operation of institutions deemed hostile to this religion. The Supreme Court, however, upheld the will's restrictions on ministers and maintained that the will did not ban the teaching of Christianity.

Girard College originally was intended to train students in mechanical trades. Students received job training and were then placed students in apprenticeships. Enrollment remained small throughout the nineteenth century.

After the U.S. Supreme Court ruled in *Brown v. Board of Education* (1954) that racially "separate but equal" schools were unconstitutional, several African American boys applied to Girard College. Despite the court decision, college officials denied admission, maintaining that Girard's will limited enrollment to white students. A group of African Americans sued, initiating a lengthy battle waged in both state and federal courts. Finally, the U.S. Supreme Court in 1968 upheld a district court ruling mandating racial integration. Girard College admitted its first black students in 1972.

Over the years, enrollment further expanded to include girls and students from single-parent households headed by men. In 2009, Autumn J. Atkins became the first African American and the first woman president of Girard College. By then, the college was a boarding school with about seven hundred students.

Legacy

Girard left two legacies to future generations. He helped establish the American banking system, setting it on a stable footing after the Revolutionary War. He also founded the school that bears his name and continues to operate in the twenty-first century, serving the needs of poor children. The money he left to create Girard College was the largest private charitable donation up to that time in American history.

Godric of Finchale

English merchant and saint

Godric of Finchale is generally remembered as a saint in the Roman Catholic Church, but he is also known for his early entrepreneurship, rising from poverty to wealth through sales, investments, and shipping.

Born: c. 1070; Walpole, Norfolk, England
Died: May 21, 1170; Finchale Priory, near Durham, England
Also known as: Saint Godric of Finchale; Saint Goderic
Sources of wealth: Sale of products; shipping; investments
Bequeathal of wealth: Unknown

Early Life

Godric of Finchale (GAW-drihk uhv FIHN-chayl), the son of father Æilward and mother Ædwen, was born into a medieval peasant family. From an early age, Godric helped supplement his family's sustenance through a variety of means, including scavenging for food. Although details are scanty, what is known about his early life comes from his hagiographical biography written by Reginald of Durham, his contemporary.

First Ventures

Godric's first business ventures were no doubt a result of family poverty. One of the earliest stories of his commercial enterprise describes how he scoured the mudflats for food to bring home to his family. He once walked for three miles, dragging home a dead dolphin as the tide rose behind him; he believed he was miraculously sustained and kept from drowning.

Apparently unwilling to participate in agricultural labor, or believing he could earn more money through other efforts, Godric became a pack peddler, initially selling his goods locally, probably on the farms around his home. He then expanded his territory and improved his wares, selling his merchandise in larger venues, in towns, at fairs, and, finally, in urban markets. It is believed that during this time he began to associate with other peddlers, no doubt to provide additional protection as well as to promote all of their products.

Mature Wealth

Successful sales on a limited scale apparently inspired Godric to enlarge his operations. As a result, he appears to have combined with others, and they chartered a boat for trade in Scotland and England, expanding their ventures to Denmark, Brittany, and Flanders. Due to his physical vigor (as described by his biographer), he was able to participate in this venture not only as a merchant but also as a sailor. He demonstrated outstanding abilities of seamanship and eventually became a steersman. He was also known for a remarkable ability to forecast the weather. Reginald of Durham describes how Godric was eventually elected captain on the basis of his abilities, both nautical and mercantile.

Godric had developed a serious nature by this time, inspired by visits to saints' shrines during his travels. His leadership qualities were probably bolstered by the fact that his colleagues knew him to have high standards of conduct. Ultimately, Godric is believed to have had a half ownership in one ship and a partnership in the goods shipped on a second one.

After sixteen years of these business ventures, he went on pilgrimage to Jerusalem, where, ironically, he was described as a "piratu," a term which probably combined both the meaning of "pirate" and the general description of a seafarer. Returning to England, Godric began to devote himself more seriously to his religious life, although he continued to support himself, first as the steward of a local estate (a position he gave up when he realized his employer's servants were stealing from local farmers) and then through sales. Ultimately, he sought a retired religious life as a hermit at Finchale, near Durham, where he built an oratory. Godric appears to have retained significant wealth, as demonstrated by an incident that occurred during the invasion of England by David I of Scotland. David's soldiers ransacked Godric's possessions and beat him in an attempt to find his treasure. Godric died in 1170 after being bedridden for the final years of his life.

Legacy

Godric of Finchale's major legacy is usually attributed to his religious life, but his business ventures also deserve attention. He seems to have been well ahead of his time in venturing into speculation and other areas of early entrepreneurship. Although it is difficult to estimate the magnitude of the wealth he made from his commercial enterprises, it appears to have been significant and makes him a worthy subject for study.

Ogden Goelet

American real estate investor

Goelet was second only to the Astors in the amount of property he owned in New York City during the nineteenth century. He was one of the major developers and builders of Manhattan.

Born: June 11, 1846; New York, New York
Died: August 27, 1897; Cowes Roads, Isle of Wight, England
Source of wealth: Real estate
Bequeathal of wealth: Spouse; children; relatives

Early Life

Ogden Goelet (AHG-dehn goh-LEHT) was born in 1846 in New York City. He and his older brother Robert were heirs to a fortune started by their grandfather Peter Goelet (1727-1811). Peter had been an ironmonger, selling hardware and knives during the Revolutionary War. With his profits from this enterprise, Peter began buying Manhattan real estate. When he died in 1811, his sons, Robert (Ogden's father) and Peter, inherited his properties, which were worth $400,000. Robert and Peter continued to buy property and rarely sold any of their real estate, thus continually increasing the value of their holdings.

First Ventures

In 1878, Ogden Goelet married Mary Rita Wilson (1855-1929), the oldest daughter of Richard Thornton Wilson, a prominent banker and stockbroker. Years later, Mary's sister Grace married Cornelius Vanderbilt, Jr., making the younger Vanderbilt Goelet's brother-in-law. Ogden and Mary had two children—Mary "May" Wilson (1879-1937) and Robert (1880-1966).

Ogden and his brother inherited their fortune in 1879, the year that both their father, Robert, and their bachelor uncle, Peter, died. Robert and Peter had substantially added to their father's Manhattan real estate holdings. Among their more important purchases were eighty vacant lots above Forty-second Street between Fifth and

Sixth Avenues, which they bought for $600 per lot. Much of the property they inherited was located along Broadway, north of Fourteenth Street. One of Ogden's first building ventures was constructing a mansion for his family at 608 Fifth Avenue.

Mature Wealth

Ogden and his brother, Robert, began developing many of the properties they inherited. Some of the construction projects they undertook were the Gorham Building at Broadway and Nineteenth Street (1883), the Goelet Building at Broadway and Twentieth Street (1886), and the Judge Building at Fifth Avenue and Sixteenth Street (1889). The brothers managed these buildings, along with other properties they inherited, such as the Knickerbocker Theater at 1400 Broadway, the Hotel Imperial at 1250 Broadway, and the San Carlo Apartment Building at Broadway and Thirty-first Street. Following their grandfather's and father's leads, they rarely sold property and continued to amass real estate.

Goelet was one of the founders of the Metropolitan Opera, and he was known to be a financial supporter of the arts and many charities. In 1892, the Goelet brothers built neighboring mansions on Ochre Point in Newport, Rhode Island. Goelet's mansion, Ochre Court, was second only in size to Cornelius Vanderbilt's mansion The Breakers.

Goelet was an avid yachtsman and a member of the New York, Knickerbocker, Metropolitan, Union, Racquet, and Seawankaka Yacht clubs. His first schooner was the *Norseman*, and in 1896 he commissioned the building of the *Mayflower.* After several years of poor health, he died onboard the *Mayflower* while it was anchored at Cowes Roads, England. At the time of his death in 1897, his estate was estimated to be worth $80 million.

Legacy

Ogden Goelet was an important landowner and developer of New York City, notably the borough of Manhattan. Goelet family members retained their wealth in the twentieth and twenty-first centuries and remained prominent in the development of Manhattan and other parts of New York City. Ogden's grandson Robert and his wife, Alexandra, a member of the Gardiner family, inherited Gardiner Island in Suffolk County, New York; their son, Robert Gardiner Goelet, was a manager of the Lower Manhattan Development Corporation. Another branch of the family became vintners, producing the Clos Du Val wine brand in California's Napa Valley and four other brands in Australia and France. In 2007, the Goelet family announced the formation of Goelet Wine Estates, a new business venture that would globally market its brands.

ROBERTO C. GOIZUETA
American corporate executive

Goizueta, a Cuban immigrant, rose through the corporate ranks to become president of the Coca-Cola Company, increasing the corporation's stock price and expanding its market share. A major philanthropist, he made significant contributions to the city of Atlanta, Georgia.

Born: November 18, 1931; Havana, Cuba
Died: October 18, 1997; Atlanta, Georgia
Also known as: Roberto Crispulo Goizueta
Sources of wealth: Inheritance; manufacturing; sale of products; investments
Bequeathal of wealth: Spouse; children; educational institution

EARLY LIFE

Roberto Crispulo Goizueta (roh-BERH-toh KREES-pew-loh goy-ZWEH-tah) was born in Havana, Cuba, to well-to-do parents. His architect father, Crispulo D. Goizueta, owned a construction business, and his mother, Aida Cantera Goizueta, was a sugar plantation heiress.

Young Goizueta attended Belen, a private, Jesuit-run school in Havana. He met Olguita ("Olga") Casteleiro while the two were students. Before the two left Cuba in 1948 to attend American preparatory schools, they agreed they would marry.

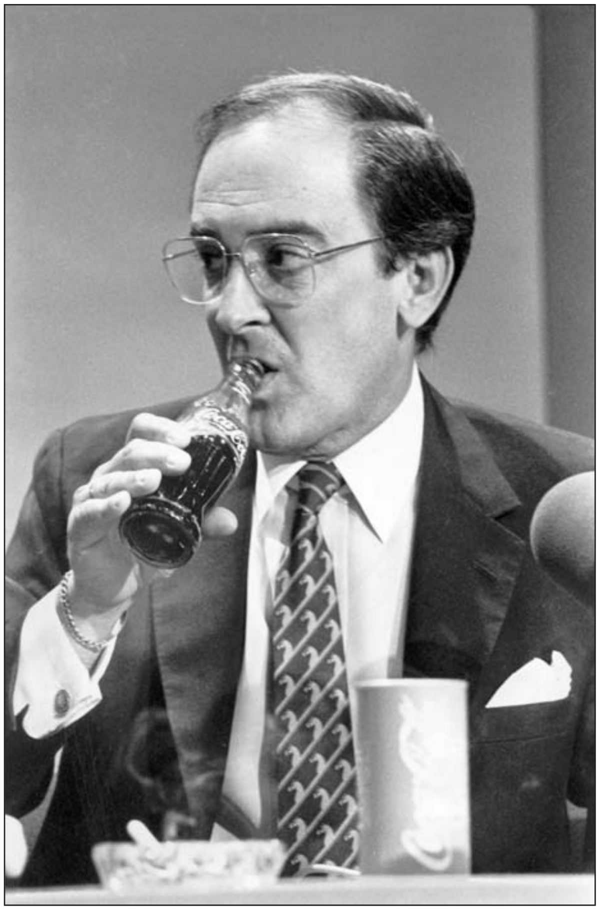
Goizueta was valedictorian of Cheshire Academy in 1949, and he then entered the chemical engineering program at Yale University. He and Olga married in Havana after his 1953 graduation from Yale. The couple had four children: Roberto S., Olga Marie, Javier, and Carlos Alberto, who died from leukemia at the age of four.

FIRST VENTURES

Goizueta became his father's assistant in Havana. In 1954, he answered an advertisement for an English-speaking chemical engineer at an American company. After interviewing, he accepted the job—overseeing production in Cuba's three Coca-Cola Company plants. With an $8,000 loan from his father, Goizueta purchased one hundred shares of Coca-Cola stock.

After Fidel Castro took control of Cuba in 1959, he began threatening wealthy families and nationalizing large companies. In 1960, Goizueta sent his children to live with his wife's family, who had relocated to Miami. Not long after that, Goizueta and his wife also fled to Miami, taking only $200 and their Coca-Cola stock. A few days after their departure, Castro seized the Cuban Coca-Cola plants and prohibited executives from leaving the country.

Goizueta worked as an assistant to the senior vice president of Coca-Cola's Latin American operations. He commuted from Miami to Nassau before relocating in 1964 to Atlanta, Georgia, the location of Coke's corporate headquarters. At the age of thirty-five, Goizueta was promoted to the position of vice president of technical research and development. He became an American citizen in 1969, and five years later he was made senior vice president of Coca-Cola's technical division. Goizueta was one of only two people in the company who knew Coke's secret formula for making its soft drink. He was promoted to vice president of the company in 1979, re-



Roberto C. Goizueta sips a Coca-Cola during a news conference to announce the introduction of "Classic Coke." (AP/Wide World Photos) sponsible for operating its laboratories and the legal department.

Mature Wealth

In 1980, after more than twenty-five years of employment at Coca-Cola and continual promotion, Goizueta took over as president and chairman of the board of directors; the following year he became chief executive officer. He held these positions until his death in 1997. During his presidency, Coca-Cola became the world's largest producer, distributor, and marketer of nonalcoholic beverage syrups and concentrates. His marketing skills created more wealth for shareholders than they had received during the administration of any other chief executive officer. In 1982, the company introduced a new drink, Diet Coke. The company began marketing its products in Eastern Europe and became a major sponsor of the 1992 Olympics. Goizueta also approved his company's purchase of Columbia Pictures; Coca-Cola earned $1.5 billion when it sold Columbia to the Sony Corporation in 1989.

Goizueta's marketing and managerial skills resulted in record dividends for shareholders, with the company's stock increasing 7,000 percent during his presidency. An investor who purchased $1,000 worth of shares in 1981 would own stock valued at $71,000 by 1997. Goizueta himself had bought additional Coca-Cola stock through the years. By 1997, he owned sixteen million shares. He was the first American to become a billionaire at a company he had neither founded nor taken public.

Goizueta was diagnosed with lung cancer in 1997, but he continued to work, conducting business from a hospital room equipped with a stock terminal and fax machine. He died on October 18, 1997, survived by his wife, three children, and eight grandchildren.

Legacy

Goizueta was one of the most important executives in the history of the Coca-Cola Company. During his tenure as president, the price of the company's stock increased and Coke significantly expanded its products and markets.

Goizueta was an equally impressive philanthropist who made major contributions to the city of Atlanta. He and his wife established the Goizueta Folklife Gallery at the Atlanta History Center in memory of their son Carlos Alberto Goizueta; he founded the Goizueta Foundation, which makes grants to assist charitable and educational organizations in Atlanta. He helped support other institutions, such as the Boys and Girls Clubs and the Atlanta Symphony Orchestra, and he served as a trustee of Emory University. In 1994, the university's business school was renamed in his honor.

Jay Gould

American railroad magnate and stock speculator

Gould rose from a modest background to become a major railroad owner and stock market speculator. His sharp business practices were widely criticized and contributed significantly to the growth of the "robber baron" image of American businessmen.

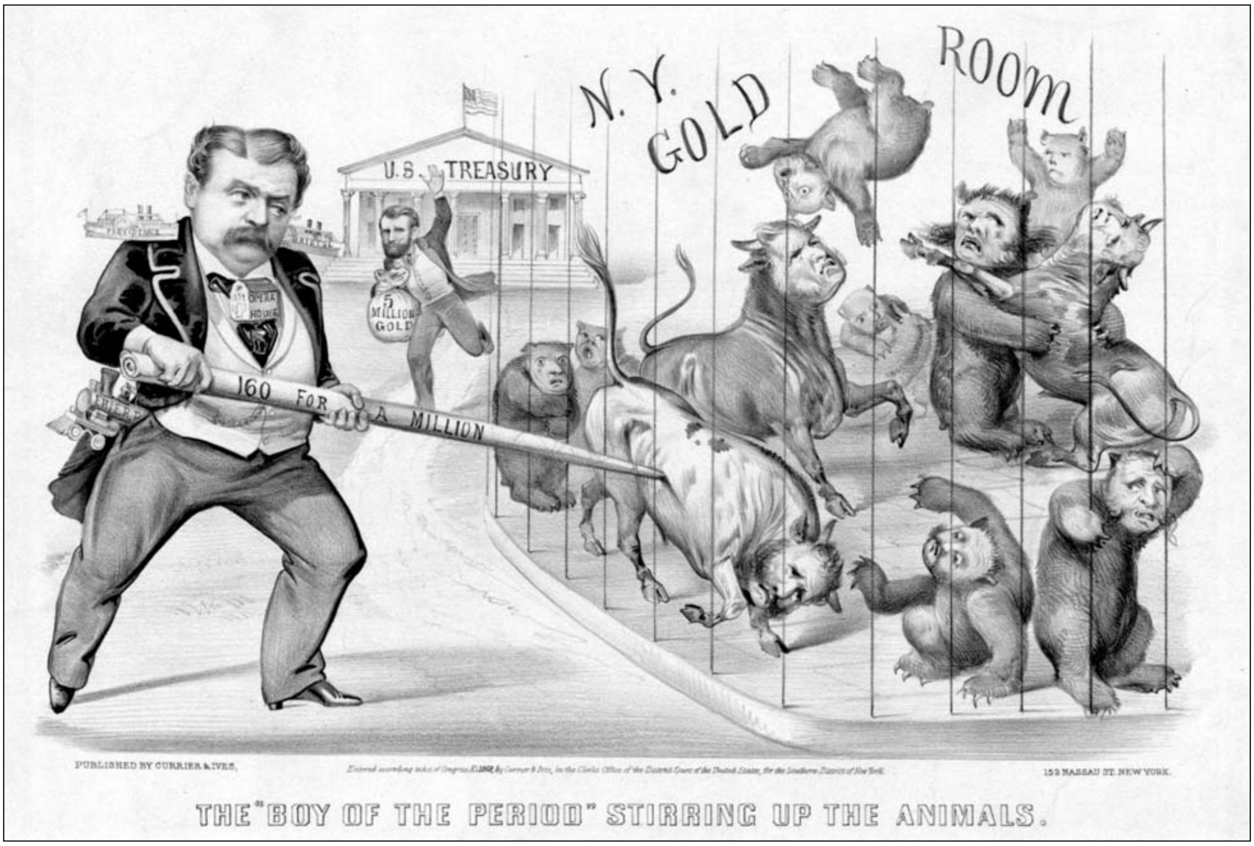
Born: May 27, 1836; Roxbury, New York
Died: December 2, 1892; New York, New York
Also known as: Jason Gould
Sources of wealth: Railroads; investments
Bequeathal of wealth: Relatives

Early Life

Jay Gould, who was christened Jason Gould by his parents, was born on a small farm in upstate New York. His parents also ran a small country store. Gould considered his youth an impoverished one and recalled it in his later years as bleak. He attended a local school, and while working as a clerk in his father's store, he taught himself mathematics and the rudiments of surveying. He arranged to attend Hobart Academy by agreeing to live with a nearby blacksmith in return for doing the bookkeeping for the blacksmith's business. Between the ages of eighteen and twenty-one, he conducted surveys of several regions in New York, Ohio, and Michigan. By the time he was twenty-one, he had saved about $5,000 and sought to establish a business of his own.

First Ventures

Gould's first major business undertaking was a tannery he established near Lehigh, Pennsylvania, in 1856. His partner in this business was Zadock Pratt, a New York farmer and businessman with experience in the tanning industry. Pratt apparently supplied most of the capital, while Gould was to manage the tannery. When Pratt



This Currier & Ives print from 1869 depicts Jay Gould attempting to corner the gold market, represented by bulls and bears in a cage. (Library of Congress) became dissatisfied with Gould's performance in the business, Gould bought out Pratt's interest in partnership with two New York City leather merchants, Charles M. Leupp and David Lee. These new partners, however, soon fell out over Gould's plans for expansion and speculation. Leupp committed suicide in 1859, and Gould and Lee fought in court for several years over control of the firm before Gould finally sold out his interest in 1868. In 1859, Gould entered into a partnership with three other men to deal in hides and leather in New York City.

After this firm broke up, Gould bought $50,000 worth of bonds of the Rutland and Washington Railroad, a New England line that had never prospered, from D. M. Wilson, one of his former partners. Convinced the line was a losing proposition, Wilson sold his bonds to Gould for ten cents on the dollar. Gould eventually took control of the railroad. He later merged Rutland and Washington with a New York line, the Rensselaer and Saratoga, and eventually sold his interest in the line for a considerable profit. Gould said that when he got into the railroad business, he "left everything else." Although this remark was not entirely truthful, owning and operating railroads and speculating in railroad securities would be Gould's major occupation for the remainder of his life.

Lyndhurst Mansion

In 1880, Jay Gould purchased the Lyndenhurst Estate from the family of George Merritt, who had been the second owner of the mansion. Gould used it as a summer home until his death in 1892, and it remained in the Gould family until the 1960's. The mansion, which overlooks the Hudson River near Tarrytown, New York, is considered one of the most impressive examples of Gothic Revival architecture in the United States.

The home, which was designed by architect A. J. Davis, was built by former New York City mayor William Paulding in 1838. Paulding named his estate Knoll, but critics often referred to the mansion as "Paulding's Folly" because the elaborate style of the home, with turrets and towers, was so markedly different from anything else in the country at the time.

Merritt, a wealthy New York merchant, was the second owner of the estate. He named it Lyndenhurst because of the linden trees on the property. Merritt engaged Davis to do a major enlargement of the mansion, doubling its size in the mid-1860's. Merritt also hired the English landscape architect Ferdinand Mangold to plan the layout of the grounds of the estate.

When Gould purchased the estate, he shortened the name to Lyndhurst, the name it retained into the twenty-first century.

When Gould died, he left the estate to his daughter Helen Gould, who later married Finley J. Shepherd, an official of the Missouri Pacific Railroad. They made Lyndhurst their home for the rest of their lives. When Helen Gould Shepherd died in 1938, her sister Anna, who had married a French aristocrat and acquired the title duchess of Talleyrand-Perigold, returned from France, purchased Lyndhurst from her sister's estate, and lived there the rest of her life. She arranged to bequeath the estate to the National Trust for Historic Preservation, and this bequest was carried out upon her death in 1961. In 1966, Lyndhurst was placed on the National Register of Historic Places and designated a National Historic Landmark.

In the twenty-first century, the mansion continues to be open for public tours, and a variety of educational programs are offered to teach elementary, middle school, and high school students about the Gilded Age and the Industrial Revolution of the late nineteenth century. Because the mansion symbolizes much of what many regard as typical Gothic architecture, it has been a popular setting for several films and television episodes.

Mature Wealth

In the 1860's, Gould became a stock trader in New York City, devoting special attention to railroad securities. His worth at this time was estimated to be around $80,000. Still, at this point he was a relatively minor figure in the New York business world. His rise to prominence began when he was elected to the board of directors of the Erie Railroad in the fall of 1867. James Fisk was elected to the board at the same time; Daniel Drew was the treasurer and controller of the Erie. Together, Gould, Fisk, and Drew desired to take complete control of the Erie and to block attempts by Cornelius Vanderbilt to gain control and merge Erie with his New York Central railroad system. Gould and his fellow conspirators issued a huge amount of new Erie stock, without any legal authorization to do so. They then made numerous bribes to New York politicians and judges to get retroactive approval for these stock offerings. With his own holdings in the Erie devalued because of these new stock issues, Vanderbilt eventually gave up his efforts to take control of the railroad and sold his holdings. After Gould had obtained virtually total control of the Erie, he expanded the company and took on excessive debt. This forced the company into bankruptcy in 1875, but by that point, Gould had made much money from speculating in the line's stock.

In 1869, Gould took control of the Wabash Railroad, a midwestern "granger" line that hauled considerable quantities of farm commodities. Gould believed that if he could push up the price of gold, this would weaken the U.S. dollar; favorable exchange rates would lead foreign merchants to buy more American grain, thus increasing the amount of freight on the Wabash. Therefore, he attempted to corner the market on gold in the United States in the summer and fall of 1869. When the U.S. Treasury realized what Gould was doing, it began selling gold from the government's holdings, driving the price downward. A panic hit Wall Street on September 24, 1869, or "Black Friday." Gould had speculated in both gold and Wall Street stocks, and he lost a great deal of money in this panic.

Due to a downturn in business during the Panic of 1873, about half of the railroads in the United States went into bankruptcy over the next few years. Gould and Vanderbilt, working on their own and often at odds with one another, bought controlling interests in many of these lines. Gould bought much stock in the Missouri Pacific and Union Pacific Railroads when stock prices were low, and a few years later when prices rebounded he sold out and reaped great profits. It was estimated that he made $10 million from his sale of Union Pacific stock alone. By the mid-1870's, Gould's fortune was thought to be in the range of $30 to $50 million.

At one point in his career, Gould controlled about half of the total railroad mileage in the Southwest, with his control of the Missouri Pacific, the Texas and Pacific, the St. Louis Southwestern Railway, and a short line known as the International and Great Northern Railroad. In 1881, he bought partial control of the elevated street railway system in New York City, and by 1888 he controlled virtually all of it. While railroads were his major business focus, Gould also owned the *New York World* newspaper from 1879 until 1883. In 1879, he bought American Union Telegraph Company, merging it into Western Union Telegraph Company in 1881; by the end of the 1880's, Western Union dominated the American telegraph industry.

Gould made relatively small gifts to various charities throughout his lifetime. In his later years, his daughter Helen oversaw the dispersal of such gifts. Gould never sought to impress or placate the public through large philanthropic gestures, and in fact he was often criticized by opponents in the press for gifts that were perceived as too small for a man of his wealth, or purely hypocritical given his reputation for ruthlessness in business.

After a long battle with tuberculosis which gradually weakened him, Gould died in 1892. His estate was estimated at more than $70 million. His wife had predeceased him, so his fortune was left to his children, each to receive an equal one-sixth share after certain special bequests were made.

Legacy

Gould rose from modest beginnings to become a major figure in the railroad industry and in stock trading in the United States. However, he was widely scorned as a sharp operator who manipulated the stock prices of the companies he controlled with no concern for the long-term health of the companies or the dividends paid to investors. When he died, the obituaries in many major American newspapers were openly critical. The *New York Herald* opined that Gould's wealth "had been purchased at too high a price."

In an era known for the excesses of the wealthy leaders of big business, Gould became one of the most hated of the "robber barons." However, business historian Maury Klein has argued that Gould should be considered one of the two or three most important figures in the development of the American economy in the late nineteenth century.

Katharine Graham

American newspaper publisher

Graham inherited The Washington Post *from her father and husband and then used her knowledge and experience to increase her wealth and improve her newspaper.*

Born: June 16, 1917; New York, New York
Died: July 17, 2001; Boise, Idaho
Also known as: Katharine Meyer (birth name); Kay Graham
Sources of wealth: Inheritance; media
Bequeathal of wealth: Children

Early Life

Katharine Meyer Graham was born in 1917 in New York City, the fourth of five children of Agnes (née Ernst) and Eugene Meyer. During Graham's preschool years, her wealthy parents lived in Washington, D.C., and left their children in New York under the care of nannies, governesses, and tutors. In later years, the children joined their parents in Washington and summered in Mount Kisco, New York. Despite their financial privilege and closer physical proximity, the Meyer children still received minimal attention from their parents.

Graham attended elite schools, including the prestigious Madeira School for Girls. At Madeira and during her one-year stay at Vassar College, Graham worked on the school newspapers. For her sophomore year of college, Graham transferred from Vassar to the more liberal University of Chicago. During summer intersession Graham worked at *The Washington Post*, a once financially strapped newspaper that her father had purchased at auction in 1933 for $825,000.

First Ventures

After receiving her B.A. in 1938, Graham spent several months earning $21 a week as a reporter for the *San Francisco News*. The following year Graham's father persuaded her to return to Washington to join the editorial staff of the *Post* for $25 a week. On June 5, 1940, Katharine married Philip Leslie Graham and took on the more traditional role of wife and mother to their children—Elizabeth, Donald, William, and Stephen. During World War II, Philip joined the army, and Katharine followed him from base to base. Later, when Philip was stationed overseas, Katharine returned to work at the *Post*.

Katharine Graham. (Time & Life Pictures/Getty Images)

When Graham's husband was discharged, her father ignored his daughter and offered his son-in-law the position of associate editor of the newspaper. In 1948, the Grahams gained controlling interest in the *Post* through a $1 sales and purchase agreement. In this transaction, Philip received a far greater portion of the newspaper's stock and ultimately leadership rights. Six years later, Philip purchased the *Washington Times-Herald* and merged it and the *Post*. He later acquired *Newsweek* magazine, a news service, and radio and television stations. As the Washington Post Company grew and the stature of the newspaper increased, Philip's health failed. Manic depression and alcoholism resulted in a downward spiral that ultimately ended in his suicide.

Mature Wealth

On September 20, 1963, Katharine Graham was named president of the Washington Post Company. While a bit unsure at first, Graham soon familiarized herself with the company, made the right contacts, and began transforming the *Post* into a highly respected national newspaper. In 1965, the newspaper gained further prestige when Graham hired Benjamin C. Bradlee as its managing editor. Graham became publisher in 1969.

During the 1970's, Graham's company began publicly trading its stock, and she took an active role in negotiating labor issues. She challenged a court order and won the right to publish portions of the Pentagon Papers. She supported reporters Carl Bernstein and Bob Woodward in their aggressive coverage of the Watergate scandal, earning her newspaper even greater prestige. Graham remained as president until 1973, when she took on the new role of chair of the board of directors and chief executive officer of the Washington Post Company. Throughout the decade that began in 1975, the company's profits increased more than twenty percent each year.

While Graham continued as chief executive officer until 1991 and board chair until 1993, her son Donald took over as publisher in 1979. In 1989, the Washington Post Company was listed in *Fortune* magazine as one of the nation's most profitable businesses.

Legacy

During Graham's years of leadership, the Washington Post Company's revenue increased from $84 million to $1.4 billion. Upon her retirement, Graham's personal assets were worth more than $500 million. In 1997, Graham published her Pulitzer Prize-winning biography, *Personal History*. During these later years, her philanthropy centered on public education, day care, a teenage shelter, and a senior-citizen center. She also helped raise funds for breast cancer research.

Graham's management of her company began during the women's movement of the 1970's, and she became a role model for many other women who sought careers as business executives. She also proved her journalistic savvy by hiring Bradlee as the *Post*'s managing editor and supporting his efforts to improve the newspaper's coverage. Her commitment to quality journalism enabled her newspaper to take the lead in covering the Watergate scandal and to improve its reporting in many other areas, becoming one of the nation's great newspapers.

Hetty Green

American financier and investor

A successful businesswoman in an era when few women ventured into the male world of Wall Street, Green made millions of dollars through savvy investing, judicious lending, and careful guarding of the family fortune, but she was better known for her extreme parsimony. The Guinness Book of World Records *named her among the world's greatest misers.*

Born: November 21, 1834; New Bedford, Massachusetts
Died: July 3, 1916; New York, New York
Also known as: Henrietta Howland Robinson (birth name); Witch of Wall Street
Sources of wealth: Inheritance; investments; real estate
Bequeathal of wealth: Children

Early Life

Henrietta Howland Robinson Green was born into the bustling, commercial world of New Bedford, the city described in Herman Melville's novel *Moby Dick: Or, The Whale* (1851). A small city in Massachusetts, New Bedford was the center of the worldwide whaling industry, and Green's grandfather, Isaac Howland, Jr., founded one of the city's most important whaling firms. Green's father, Edward Mott Robinson, married Isaac's daughter Abby, inherited the whaling company, and continued its success. Robinson wished for a son to carry on the family business, but the only son born to Abby and Edward died in infancy. Their daughter, Hetty, born in 1834, received the scanty education deemed sufficient for a young society woman: a few years at a Quaker boarding school and a few more at a finishing school, where she learned to dance and play piano. Green, however, was not content to spend her life dancing and playing piano. From an early age, she showed a keen interest in her father's business, and she accompanied him on his rounds of the wharves, warehouses, and commissaries of New Bedford. In later life, Green claimed that she learned to read sitting on her father's knee as he read business news and stock market reports, listening and absorbing everything.

First Ventures

When Abby Robinson died in 1860, Edward Robinson, foreseeing the decline of whaling, joined a New York shipping firm. Green remained in New Bedford with her invalid aunt, Sylvia Ann Howland, whose $2 million fortune Green hoped to inherit outright. Instead, Howland's 1865 will divided her estate among servants and charities, with only $1 million in trust for Green. Despite having just inherited $6 million from her father's estate, Green was furious. She spent years in a legal battle to challenge the will. She claimed that her aunt's earlier 1862 will, which left the bulk of her fortune to Green, was valid, and Green produced a document, known as the "second page," that revoked all wills made before and after the 1862 will. Opposing lawyers claimed Howland's signature on this document was forged. The case was finally settled in 1868; Green lost, but by then she had moved on.

In 1867, thirty-three-year-old Hetty Robinson married forty-six-year-old Edward Henry Green, a successful businessman. Perhaps fearing she could be charged with forgery, Hetty sailed to London with her husband and lived abroad for several years. In England, she continued the investment strategy she had begun with United States bonds and also started to invest in railroads. As America grew following the Civil War, so did her fortune. At a time when a fortunate worker earned an average weekly wage of $5, Green boasted of making $200,000 in a single day. Yet her appearance belied her wealth. Some accounts describe Green in shabby dress, bargaining with shopkeepers for free bones for her dog.

Mature Wealth

The Panic of 1873 caused havoc in the stock market. Edward and Hetty Green were not affected, but they decided to return to America in order to keep a close eye on their investments. With their two children, Ned (born 1868) and Sylvia (born 1871), they moved to Edward's hometown of Bellows Falls, Vermont. For a few years, Hetty lived a relatively conventional life, raising her family while Edward traveled to New York to tend to business. Another financial crisis ended this domestic phase of her life and thrust her into the spotlight as America's richest woman. When Cisco and Son, a Wall Street firm, collapsed in 1885, Hetty was its largest creditor; its largest debtor was her husband, Edward Green. Hetty withdrew her holdings and refused to cover her husband's debts. It was, in effect, the end of the marriage, though the couple never officially divorced.

From this point on, Green was determined to control her own destiny, financial and otherwise. She threw herself into the intensely competitive world of finance. Green proved to be the equal of the great Gilded Age capitalists in all but her style of living. While some millionaires built Fifth Avenue mansions, Green and her children shuttled through a series of working-class flats in Brooklyn and Hoboken, New Jersey. By having no fixed residence, Green hoped to avoid paying taxes. She even was said to have left Hoboken after she was served a summons for refusing to pay a $2 license fee for her dog. While Green's penny-pinching ways seemed like amusing eccentricities to some, her frugality had a darker side. Her son Ned had injured his leg in a childhood accident and continued to suffer from pain and lameness. Green, dressed in her oldest clothes, would beg doctors to treat Ned as a charity case. When one specialist learned the truth, he demanded Green pay in advance. She refused. Eventually, in part due to delays in treatment, Ned's leg had to be amputated. Although Ned never publicly blamed his mother for the loss of his leg, he went on to live a life that belied Green's frugality.

Green took up unofficial headquarters at the Chemical National Bank in New York, where she was said to heat oatmeal on an office radiator to avoid paying restaurant prices. There, she managed her ever-growing empire, which included real estate in New York, Boston, and Chicago, as well as railroads, government bonds, and municipal lending. Acting as a one-woman bank, Green loaned money to cities ranging from Tucson, Arizona, to New York, allowing them to finance civic improvements. During financial panics, when banks refused to lend and many businesses were in danger of failing, Green continued to give loans to businesses she considered sound, trusting that her investment would be returned when the crisis passed. Despite her reputation as a miser, she charged a fair rate of interest. She also showed compassion to her estranged husband, nursing him during his final illness in 1902.

Interviews with Green show a no-nonsense, unpretentious woman with a sense of humor and a surprisingly forward-thinking outlook. She expressed sympathy for striking workers and criticized child-rearing conventions that encouraged boys to be active, while girls were encouraged to focus on pretty clothes. However, this human side of Green was seldom seen in the press, as the image of a female Ebenezer Scrooge came to dominate her public persona. Articles described her as a dour, wizened skinflint. Perhaps in response to these stories, Green made a few ventures into society, at least long enough for her daughter Sylvia to meet and marry an appropriate man. In a photograph taken on Sylvia's wedding day, Green appears as a respectable dowager in a feathered hat and lace-trimmed dress. Since she had been assured that her son-in-law would lay no claim to Sylvia's inheritance, Green approved the marriage. She was less approving of her son Ned's long-term relationship with Mabel Harlow, a former showgirl and reputed prostitute; wisely, Ned waited until after his mother's death to wed Mabel. Still, he proved himself his mother's son: He had Mabel sign a prenuptial agreement before the wedding.

Prenuptial Agreements

Hetty Green was frugal and cautious in every aspect of her life, including marriage. When she wed, she chose a well-to-do businessman who brought his own income to the marriage. It was rumored that Hetty also took another step to ensure that Edward Henry Green was no fortune hunter. Many biographers claim she had Edward sign a prenuptial agreement waiving all claim to her estate should she die before him. No record of this agreement has been found, but given that Hetty later asked her daughter's suitor to sign a similar agreement, the story is probably true. After her long court battle to overturn her Aunt Sylvia's will, Hetty was obsessed with keeping the Howland family fortune in the family. Matthew Astor Wilks, who married Hetty's daughter Sylvia, was a great-grandson of millionaire John Jacob Astor and a millionaire in his own right, but Hetty left nothing to chance. In her will, she left Wilks a $5,000 bequest to thank him for renouncing all rights to Sylvia's estate.

Prenuptial agreements, sometimes known as antenuptial agreements or premarital contracts, are designed to protect the assets of one or both spouses during marriage and after divorce or death. They may specify assets to be exempted from community property, protect family property, make provisions for children of a previous marriage, or outline specific financial responsibilities for each partner. While prenuptial agreements have become more popular since the late twentieth century, older marriage contracts, such as the ancient Hebrew *ketubah* and the medieval dowry, have existed for thousands of years. Although hardly romantic, such contracts are undeniably practical and may prevent costly, protracted lawsuits following the dissolution of the marriage.

As a woman living in nineteenth century America, Hetty Green would have been well aware that the law often favored men. By insisting on a prenuptial agreement for her daughter (or, as rumored, for herself), she protected hard-won assets and ensured financial independence at a time when many women still relied on husbands or male relatives to handle their finances.

Green remained active in business into her eighties, but shortly after her eighty-first birthday, she suffered a stroke. Legend claims that Green died following an argument with her friend's cook over the virtues of skimmed milk, but this may be an exaggeration. It is known that Green suffered a series of strokes over several months. She died on July 3, 1916, and was buried with her husband, Edward, in Bellows Falls. Estimates valued her estate at between $100 and $200 million.

Legacy

Hetty Green's name is seldom mentioned among the great capitalists of the Gilded Age—men like John D. Rockefeller, Andrew Carnegie, and J. P. Morgan—yet she was their peer and equal. Refusing to accept the domestic role her society assigned to women, Green built her whaling inheritance into a Wall Street fortune through her own daring and persistence. Her motto "Buy cheap and sell dear" served her well, allowing her to weather financial panics without losses.

While Green inherited $7.5 million, she left her children a fortune of $100 to $200 million. Yet as much as Green enjoyed creating wealth, she seemed to lack the ability to enjoy the benefits of her labor. Green did not merely eschew luxuries; she often denied herself and her children such basic necessities as adequate clothing, comfortable housing, and even medical care. Wearing the same faded black dress year after year, washing only the dusty hem to save on laundering, she earned herself the miserly "Witch of Wall Street" label that has overshadowed her undeniable accomplishments.

SIR THOMAS GRESHAM

English merchant banker and government financial official

Gresham was a merchant banker who understood the financial forces of the later sixteenth century. He was thus able to service England's foreign debt and maintain a steady flow of money to the government. One of his final projects was to build the Royal Exchange, thus helping to establish London as a world financial center.

Born: 1518 or 1519; London, England
Died: November 21, 1579; London, England
Sources of wealth: Inheritance; banking; government
Bequeathal of wealth: Spouse; charity; educational institution

EARLY LIFE

Sir Thomas Gresham (GREHSH-ahm) was one of four children and the younger of two sons born to Sir Richard Gresham. Thomas's father and uncle were mercers—merchants in cloth and textiles—with European connections, especially in the Netherlands and in Paris. Thomas probably attended Gonville Hall in Cambridge before he was seventeen. At that age, he was apprenticed to his Uncle John in the company firm, the House of Gresham, where he learned the clothing and textile trade. His older brother, also named John, preferred to become a country gentleman, his family having acquired property in Norfolk. This gave Thomas the opportunity to take over the family business.

FIRST VENTURES

During the period from 1535 to 1547, Richard sent Thomas to Paris, where Thomas was to perfect his knowledge of French and to become acquainted with his family's business contacts. Thomas was also admitted to Gray's Inn, a law college, to study the legal side of the business. Most important, Richard taught Thomas about the family's trade with the Netherlands, which at that time was ruled by the Habsburg Dynasty and included both the Netherlands and Belgium. Since the Middle Ages, the Netherlands had been central to the textile industry, and in the sixteenth century, the city of Antwerp (now in Belgium) was an important port and the trade center of northern Europe. As the city was under the rule of Holy Roman Emperor Charles V, who was also king of Spain, most of the gold from the New World flowed from Spain and Portugal through Antwerp. Thomas learned Flemish, a variant of Dutch, which would later be one of Belgium's two languages.

Sir Thomas Gresham. (Hulton Archive/Getty Images)

In 1543, Thomas Gresham had completed his apprenticeship and was admitted to the freedom of the Mercers' Company, which meant he was free to trade on his own account. By this time, Thomas Cromwell, King Henry VIII's chief minister, and other royal officials had noted Gresham's dealings on behalf of his father. Soon, he was entrusted with small government commissions abroad. In 1544, Gresham married Anne Fearnley, the widow of another mercer, and took over her late husband's business and property. They had one son, Richard, born in 1547.

Gresham's career was threatened by an incident that occurred in 1545. Charles V seized Gresham's goods in Brussels because of delays in payment, but this merchandise eventually was returned. By the next year, Gresham was in charge of all of the Gresham commercial operations in the Netherlands, which had expanded from textiles to tapestries, armor, and weapons.

The period from 1546 to 1551 was a difficult time for English trading companies. Henry VIII and his son, Edward VI, were overspending. Subsequently, the English currency became debased. A bimetallic system of currency was introduced and resulted in English textiles becoming overpriced when sold in other nations. Gresham tried to sell cheaper woolen garments in order to keep prices down, but this was only partially successful and his volume of trade declined. Gresham was able to make up for this loss by trading in metals, and by 1551 the House of Gresham had secured a leading place in Anglo-Netherlands commerce.

Mature Wealth

Beginning in 1551, Gresham served as royal agent for the English crown, borrowing money on the foreign exchange and managing the nation's national debt. In assuming this position, Gresham should not have had conflicting interests, and therefore should have stopped running the family business abroad. However, royal favor was fickle, and government officials were inexperienced in dealing with the rapidly developing money markets. Gresham often lost his government post, only to be reappointed when government officials were encountering financial difficulties. Invariably, Gresham managed to sort out the nation's finances and renegotiate its debt on more advantageous terms. However, he wisely kept a discreet hand on the activities of his family's business while performing his government duties. Gresham was making a lot of money, both from the family business and through fees from the Crown. He bought a town house, managed his wife's property, and looked after his aging father's estates at Inwood in Norfolk, which he inherited in 1549. The 1550's were the busiest time of his life.

When Elizabeth I ascended to the throne in 1558, Gresham had the trust of her chief minister, the first earl of Salisbury, and for the first time Gresham was able to act on his own initiative on behalf of the Crown. He was knighted in 1559 and was appointed ambassador to the court of the duchess of Parma, the most important Spanish grandee in the Netherlands. In 1560, he helped reform the English coinage system, and the following year he reorganized the Custom House in London. By 1565, Gresham had reduced England's debt abroad, which at one time was £336,113, to only £20,000.

Gresham's Law

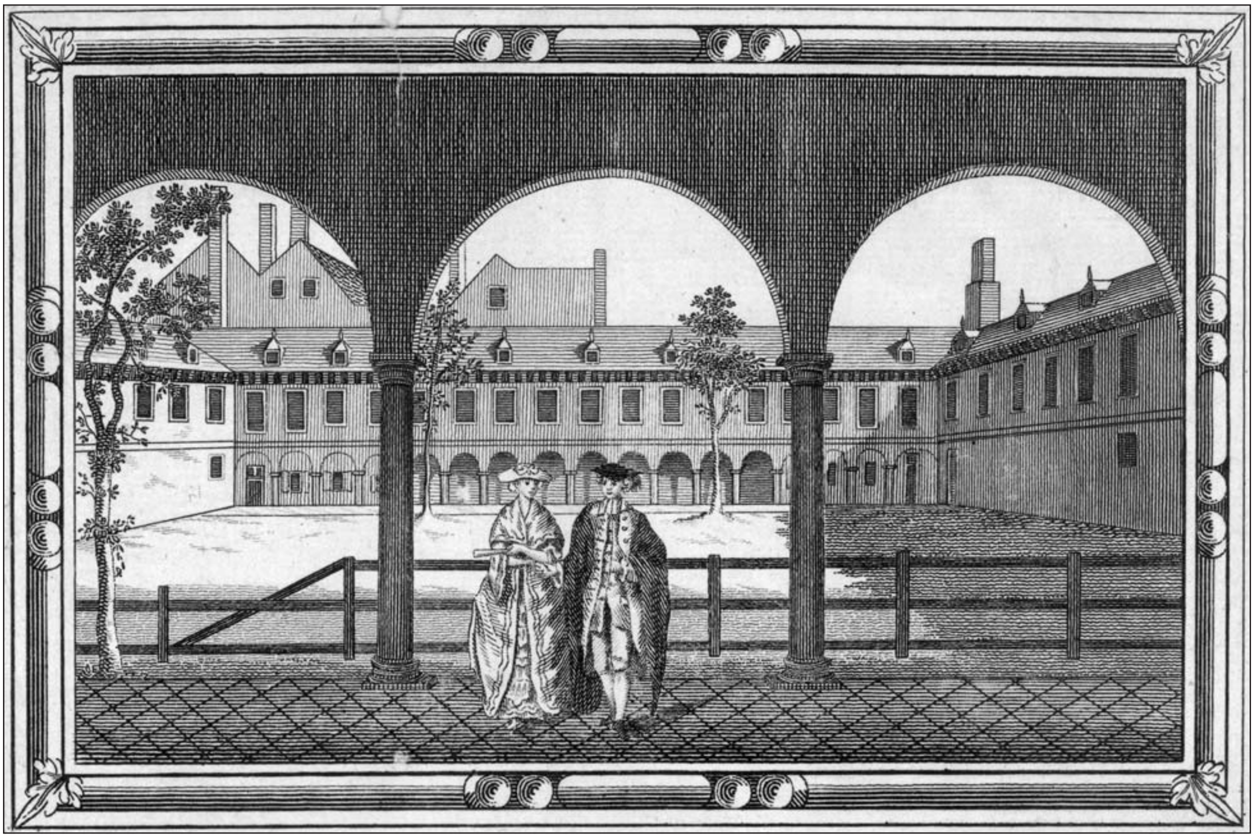
Sir Thomas Gresham did not formulate thelaw that is commonly stated as "bad money drives out good." Instead, this economic principle was named after Gresham by British economist Henry Dunning MacLeod in 1858. MacLeod noted Gresham's letter to Queen Elizabeth I on her accession, in which he explained why English gold appeared to be disappearing abroad.

Gresham lived during the reigns of Henry VIII and Edward VI, when the English used two sets of metal currency: gold and silver coins ("good" money) and bimetallic coins of less intrinsic value. At this time, the intrinsic value of money equaled the actual value of the metal from which it was made, and there was no currencypaper currency. Henry VIII, however, ruled that the debased bimetallic coinage, or "bad" money, was to be accepted as legal tender for the value stamped upon it, even if intrinsically it was worth less than the gold and silver coins.

English citizens tended to use the debased coins and keep the good ones for themselves. When English traders conducted business in other countries, foreign merchants preferred to receive the "good" coins in exchange for providing their goods to the English. The only alternative to paying for merchandise with "good" coins was for English merchants to pay a higher price when purchasing goods with "bad" coins, which in turn drove up the prices of merchandise sold in England.

When Queen Elizabeth I ascended to the throne in 1558, Gresham advised that the nation reform its currency system. Under Gresham's supervision, English currency was changed so that all coins were "good." However, neither he nor the queen could stop another abuse of "good" currency. Many English people would snip or cut off little bits of metal from coins, and the snipped coins still had to be accepted as legal tender. The coin bits would be melted down and used to make jewelry or counterfeit coins, which probably were mixed with base metals. During Elizabeth's reign, England introduced laws to stop this practice, to little avail.

Governments no longer issue "good" coins, and paper bills have become a common form of currency. The paper itself has no intrinsic worth and therefore is technically "bad" currency, made good only by a nation's laws that recognize these bills as the country's legal tender and the promise of that government to back their face value.



Gresham College. (Hulton Archive/Getty Images)

Gresham bought two large country houses near London and began to entertain lavishly at his new London residence, Gresham House, built in 1566. His old house on Lombard Street remained his company's headquarters. At the same time, misfortune struck. His son died in 1564, and Gresham himself became lame and somewhat blind in one eye. Perhaps to memorialize himself, Gresham established an exchange in London, which eventually became the Royal Exchange, the center of the city's commerce. Gresham promised to pay for an exchange building if others would subscribe to a fund to purchase property for the structure. The building's foundation was laid in June, 1566, and the exchange opened in 1568. Queen Elizabeth I visited in 1571 and gave the building its royal title.

Gresham's lavish spending resulted in rifts with his wife, who was expected to manage and be hostess at his various properties. When he conceived the idea of turning Gresham House into a college, she opposed the move, although unsuccessfully. Gresham died at Gresham House in 1579.

LEGACY

Sir Thomas Gresham's main legacy to England was to provide sound financial management for the nation at a time when its rival, Spain, was bankrupting itself. It has been suggested that Gresham's fiscal acumen gave England the financial backing for the military resources needed to defeat the Spanish Armada in 1588. The construction of the Royal Exchange created a climate in which London became one of the world's leading financial centers, shifting the balance away from the Netherlands, southern Germany, and Italy. Gresham did create a college after his wife's death, and Gresham College continued to operate into the twenty-first century. Gresham envisioned that the school would be devoted to the sciences, then still in their infancy in institutions of higher learning. The college helped make London a center for scientific study.

Gerald Grosvenor

British aristocrat, landowner, and philanthropist

In the early twenty-first century, Grosvenor was the richest property developer in the United Kingdom and one of Britain's largest landowners, who expanded upon the real estate holdings acquired through successive generations of his family.

Born: December 22, 1951; Omagh, County Tyrone, Northern Ireland
Also known as: Major-General Gerald Cavendish Grosvenor, sixth duke of Westminster; Gerald Cavendish Grosvenor, sixth duke of Westminster
Sources of wealth: Inheritance; real estate; investments
Bequeathal of wealth: Charity

Early Life

Gerald Grosvenor (GROHY-nuhr) is the son of Robert George Grosvenor, fifth duke of Westminster, and his wife, the Honorable Viola Maud Lyttelton. Gerald was born on the family's estate in Northern Ireland, and he spent his early boyhood there while the family's main house, Eaton Hall, near Chester in northwest England, was demolished and rebuilt. He attended Sunningdale School before going to Harrow, a leading British private school. Grosvenor was not a top student and failed the entrance examination for the Royal Military Academy Sandhurst. However, by joining the Territorial Army as a private he was able to enroll at Sandhurst in 1973. In 1978, he married Natalia Ayesha Phillips, a descendant of the Russian poet Alexander Pushkin. The couple had three daughters and a son.

First Ventures

His father died in 1979, leaving Grosvenor an inheritance consisting of vast amounts of property and considerable wealth that his family had steadily accumulated since the seventeenth century. The Grosvenors owned real estate in London, Cheshire, and Lancashire, England; Scotland; Northern Ireland; the United States; Canada; and Australia. The foundation of the family's wealth and its most profitable estates were located in the West End of London. During the nineteenth century, the Grosvenors acquired property in the most fashionable London neighborhoods—Belgravia, Mayfair, and Pimlico. The Grosvenors had formed a company which leased its properties for a period of ninety-nine years. This company was set up as a series of trusts, which enabled it to remain with the family.

Mature Wealth

However, legislation adopted in the 1980's allowed tenants the right to buy the properties on which they held leases, and Grosvenor holdings declined. In response, Gerald Grosvenor reorganized his company, and it began to acquire new portfolios of property and other investments. The company diversified by buying real estate on the Continent, acquiring valuable property in Spain and Paris, France. The firm also expanded into Hong Kong and Japanese construction and developed its Australian property.

By 2009, the Grosvenor Group employed more than 420 people in twelve offices and operated in seventeen countries. The group is privately owned and does not publicize its finances, so it is difficult to know its worth. However, its assets worldwide are estimated to be about £9.1 billion ($13 billion), with its assets in the United Kingdom valued at about £2.8 billion ($4 billion).

The Sunday Times Rich List for 2010 estimated Grosvenor's wealth at £6.75 billion ($12 billion), making him the third-richest man in the United Kingdom and Ireland. According to *Forbes* magazine's list of billionaires, Grosvenor was the forty-fifth-richest person in the world in 2010, with an estimated net worth of $12 billion.

Grosvenor has continued his family's tradition of aristocratic philanthropy. His main residence at Eaton Hall contains an office that deals with requests for donations and has given charitable grants ranging from £1,000 to £500,000. Grosvenor has retained a close connection with the Territorial Army, and he was promoted to the rank of lieutenant colonel of a number of regiments. From 2004 to 2007, he served as an assistant chief of defense, a post with the rank of major-general. Grosvenor became chancellor of the newly founded University of Chester in 2005.

Legacy

Gerald Grosvenor has continued in the best traditions of the Grosvenor family, increasing his family's wealth but using it responsibly, not extravagantly. Although he is a very rich man, he has fulfilled his aristocratic responsibilities through philanthropy and public service.

Hugh Grosvenor

British aristocrat and landowner

In his day, the first duke of Westminster was one of the richest men in England, adding to his inherited wealth with money acquired through marriage, wise investments, and land development.

Born: October 13, 1825; Chester, England
Died: December 22, 1899; London, England
Also known as: Hugh Lupus Grosvenor, first duke of Westminster
Sources of wealth: Inheritance; real estate; horse breeding
Bequeathal of wealth: Children; charity

Early Life

Hugh Lupus Grosvenor (GROHV-nuhr), first duke of Westminster, came from an old, aristocratic family. The French derivation of the family name, literally meaning "fat hunters," suggests a Norman origin, although the first recorded instance of the name is in the twelfth century, when Robert Grosvenor received a grant of land from the earl of Chester. The family continued to live in the county of Cheshire, in northwest England. Sir Thomas Grosvenor (1655-1700) acquired land east of London's Hyde Park and in what was then the western edge of the city. As London expanded in the eighteenth century, Richard Grosvenor (1731-1802) built the family's fortune by developing his London real estate in what would later be the fashionable areas of Mayfair, Pimlico, and Belgravia.

Hugh Grosvenor's father was also named Richard (1795-1869), and he inherited the title second marquess of Westminster; Hugh's mother was Lady Elizabeth Mary (1797-1891), who also came from an aristocratic family. Hugh was the oldest surviving son of his parents' twelve children. Hugh was educated at Eton College, the leading school in Britain, and he then attended Balliol College, Oxford University. He did not stay and take his degree at Oxford because his father was anxious for him to enter politics. One of the seats representing Chester in the House of Commons had become vacant, and with his father's patronage, Hugh safely secured the position in January, 1847.

First Ventures

British parliamentary rules at the time allowed Grosvenor to sit in the House of Commons, as his father occupied the family seat in the House of Lords. Grosvenor appears to have been little interested in politics, not making his first speech until 1851. However, he did remain a member of Parliament until his father's death allowed him to serve in the House of Lords.

Grosvenor married his first cousin, Lady Constance Sutherland-Leveson-Gower (1834-1880), in April, 1852. Her mother was a mistress of the robes for Queen Victoria, and Constance became a favorite with the queen, who, with her husband Albert, attended Constance and Grosvenor's wedding. Victoria also was godmother of the first of the couple's eleven children. Grosvenor was not paid for his parliamentary duties but lived on an allowance from his father of £8,000 per year, which Grosvenor complained was insufficient for his needs. Grosvenor's primary interests were hunting, particularly in the Scottish Highlands, breeding horses, and traveling, especially to India. In the late 1860's, however, Grosvenor began to take politics seriously. The family had always sided with the Whig Party aristocracy. As that party developed into the Liberal Party, he naturally sided with William Ewart Gladstone, who in the nineteenth century served several terms as prime minister of Great Britain. In 1869, he inherited his father's title and estate; five years later, Gladstone named him the first duke of Westminster.

Mature Wealth

Grosvenor inherited one of the richest estates in Great Britain, which was worth some £152,000. His father had always lived well within his means, and Grosvenor continued this tradition. However, he developed his London house in Mayfair, as well as the Cliveden estates outside London that he inherited from his mother. (He later sold the lucrative Cliveden properties to William Waldorf Astor.) He had been renting several shooting lodges in Scotland from his cousin, and he developed them as sporting and hunting estates. Grosvenor further increased his wealth by breeding racehorses and by enlarging his grandfather's art collection.

Grosvenor's ambition was to be king of the turf. In this he succeeded, winning the Derby, the most prestigious horse-racing event in Britain, no less than four times. In twenty-five years as a breeder and racer, Gros-

Eaton Hall

Eaton Hall is the primary residence of the dukes of Westminster. It is located about three miles south of the city of Chester in the northwest of England. The residence is sited on an eleven-thousand-acre estate adjacent to the River Dee, stretching from the river toward the Welsh border. The property includes one thousand acres of parkland surrounding the residence and twenty acres of gardens.

The estate was originally the property of Joan Eaton, who married a member of the Grosvenor family in the early fifteenth century. The house on the estate has been rebuilt several times. Between 1804 and 1812, Eaton Hall was reconstructed in the Gothic style by the first marquess of Westminster. Further extensions were added from 1823 to 1825 and again in 1845 and 1846.

Hugh Grosvenor, first duke of Westminster, renovated and extended the residence at a total cost of £600,000. He employed a leading Victorian architect, Alfred Waterhouse, who maintained the integrity of the building as a Gothic structure but made extensive use of cast iron. The rebuilding project started in 1870 and took ten years to complete. By all accounts, the reconstructed residence was of massive proportions and one of the grandest ducal properties in Great Britain. As part of the project, Grosvenor, a horse breeder and racer, built a racing stable that employed about thirty people. He also constructed a light railway that was linked to the nearby Chester-Mold railroad so his guests could be more easily transported to his residence. Eaton Hall featured three magnificent driveways and an equally beautiful clock tower with twenty-eight bells. Much to the annoyance of guests, these bells chimed every quarter of an hour, twenty-four hours a day. The gardens, which had been laid out in the eighteenth century by the noted landscape architect Lancelot "Capability" Brown, were redesigned by Edwin Lutyens at the end of the nineteenth century.

During both world wars, Eaton Hall was used as a hospital, and it served as a training school for military officers after World War II. The Grosvenor family eventually decided the building was too large to maintain and it was demolished in 1961, replaced by a more modest home designed in the style of a French châteaux.

In the twenty-first century, the clock tower, chapel, and stables are all that remains of the original residence. A portion of the estate is managed as farms and is rented to farmers.

venor won hundreds of races and prize money of more than £300,000. He never gambled, but he viewed horse racing as part of his ducal lifestyle.

The major source of Grosvenor's wealth was his property. The estates at Eaton, all with rich agricultural land, brought in a reasonable income. However, it was the London real estate, managed by the Grosvenor Estate Board, that generated the lion's share of his income, and he adamantly refused to sell these properties to other developers. Under his leadership, the board developed these properties or leased them for development for ninety-nine-year periods, with Grosvenor deriving income from the rents. The Belgravia-Mayfair area was the most fashionable part of London in the late nineteenth century and commanded high prices for rentals; the area includes the site on which the American Embassy is located.

Grosvenor believed that as an aristocrat, it was his duty to develop housing for working families on his land, including his property in the West End of London. He also built schools and churches. Substandard housing was replaced by buildings in the Queen Anne Revival style, as well as redbrick homes in London's South Kensington area. By the twenty-first century, these homes were among the most elegant in London as a result of Grosvenor's high standards of architecture.

Grosvenor became a strict teetotaler after the death of an alcoholic younger brother. He also promoted temperance societies, and he reduced the number of pubs in his London estates from forty-seven to eight. Grosvenor was a major philanthropist, chairing the boards of five London charity hospitals, the Royal Society for the Prevention of Cruelty to Animals, and many other organizations. He served as the lord lieutenant of Cheshire (1883-1888) and the lord lieutenant of the county of London (1888-1892); in 1892, he became president of the Royal Agricultural Society.

In 1880, his wife Constance died. Two years later, he married twenty-four-year-old Katherine Caroline Cavendish, daughter of the second Baron Chesham. The couple would have four children. Grosvenor died a few days before Christmas in 1899. His personal fortune was estimated at about £594,229, with his real estate valued at £6 million ($24 million). Grosvenor's eldest son died before him, so his inheritance went to his grandson, Hugh Richard Grosvenor.

Legacy

Grosvenor was an aristocrat in an age when the aristocracy had lost much of its political power, but it was still held in great respect and was expected to enjoy a lavish lifestyle. He managed to both increase his wealth and use that wealth in a responsible, even philanthropic, manner. He retained the sense of aristocratic responsibility that was highly regarded in the Victorian era. Subsequent generations of his family continued to accumulate valuable property, and by the twenty-first century family members were among the richest people in Britain.

Meyer Guggenheim

American mining magnate and industrialist

Guggenheim rose from obscurity to dominate copper, silver, and lead mining, as well as refining, establishing one of the wealthiest families in the United States. His descendants rose to positions of prominence and became patrons of the arts and sciences, promoting many of the twentieth century's most important figures.

Born: February 1, 1828; Lengnau, Switzerland
Died: March 15, 1905; Palm Beach, Florida
Sources of wealth: Mining; investments
Bequeathal of wealth: Children; relatives; charity

Early Life

Meyer Guggenheim (MI-yehr GOO-gehn-him) was born in Lengnau, Switzerland, on February 1, 1828, to a poor family of German-Jewish descent. At this time, the ghetto in Lengnau was one of only two Swiss villages in which Jews were permitted to live. There life was restrictive in terms of career options and personal choices. Guggenheim's father, Simon, was a tailor. Simon wanted to remarry after the death of his first wife, but he was prohibited because he lacked sufficient financial means. His intended had seven children by a previous marriage, and Meyer and his five sisters would make this a family of thirteen children.

Wanting the right to remarry and to obtain new opportunities, Simon emigrated from Switzerland to Philadelphia in 1847. The nineteen-year-old Meyer started his life in the New World by peddling household goods in the coal towns of northeast Pennsylvania. He supplemented his income by manufacturing an effective stove polish and lye, as well as an early type of instant coffee, in which coffee beans mixed with chicory were boiled down to a syrup that dissolved in warm water. This instant coffee proved to be a popular item. Simon's effectiveness as a salesman was limited by his inability to speak English, so his customers primarily came from the German-speaking neighborhoods of Philadelphia. Guggenheim and his father earned enough money to take care of the needs of their large family. Their profits were rechanneled into building a successful wholesale business in household merchandise.

First Ventures

In 1852, the twenty-four-year-old Guggenheim felt financially secure enough to take a wife, Barbara Meyers, and buy a modest house in Roxborough, a working-class area in northwest Philadelphia. Between 1854 and 1873, Barbara gave birth to seven sons and four daughters. All but three of the children were born in Roxborough. Guggenheim was a strict disciplinarian and raised his sons to have good business skills and assist him in commercial ventures. Barbara was a loving mother and tried to instill in her children a love for art, music, and literature.

Guggenheim's merchandising business established him as a solid member of the middle class. His business greatly expanded during the Civil War. Forming a partnership with two other investors, Guggenheim became a major importer and a dealer in spices.

By the late 1870's, having more money than he actually needed, Guggenheim began to look for lucrative stock investments. He purchased two thousand shares of stock in a railroad line, which, within a few years, became essential for the railroad construction plans of Jay Gould. In 1881, he sold the stock to Gould for $320,000. Guggenheim immediately took this money and invested in a new technology, developed in Germany, to make fine "needle lace" by machine. His brother-in-law Morris Meyers opened a factory in St. Gall, Switzerland, and Guggenheim made a fortune by importing and selling the fine lace. Soon he sent three of his sons, Daniel (1856-1930), Murry (1858-1939), and Solomon R. (1861-1949), to Switzerland to establish lace factories. Company headquarters were moved from Philadelphia to New York, where Guggenheim was assisted by his oldest son, Isaac (1854-1922). The lace business was named M. Guggenheim's Sons and it made a fortune for the family.

More important, in 1881 Guggenheim reluctantly accepted half interest in two Colorado mines in payment for a debt. It was mining that would propel the Guggenheim family into the ranks of America's fantastically wealthy.

Mature Wealth

When Guggenheim first went to look at his mine in Leadville, Colorado, in 1881, it was filled with water, and he felt foolish for acquiring an interest in it. He had to invest about $20,000 to pump the water from the mine. Discouraged, one of his partners sold his share to the other partners, thus giving Guggenheim controlling interest in the mine. However, it soon became apparent that

The Guggenheim Foundation

The Guggenheim Foundation consists of four separate foundations, each one established by a descendant of Meyer Guggenheim. The John Simon Guggenheim Memorial Foundation was founded in 1925 by Guggenheim's sixth son, Simon Guggenheim (1867-1941), in memory of his son, in order to provide funds for creative individuals in the natural sciences, social sciences, humanities, and arts (excluding the performing arts). The awards provide short-term financial support, ranging from six months to one year, to enable individuals with proven creative potential to make significant contributions to their fields. The awards are presented annually, in two separate competitions. One competition selects candidates in the United States and Canada, while the other covers Latin America and the Caribbean. Each competition is chaired by six distinguished scholars or artists. The average number of fellowships awarded is 220 per year and the average grant in 2008 was $43,200.

Meyer Guggenheim's fourth son, Solomon R. Guggenheim (1861-1949), founded the Solomon R. Guggenheim Foundation in 1937 for the advancement of art. This foundation operates the Solomon R. Guggenheim Museum for modern art, which opened its doors in 1959 and is one of the best-known museums in New York City; the Peggy Guggenheim Collection in Venice, Italy; and the Guggenheim Museum in Bilbao, Spain, among other institutions.

The Daniel and Florence Guggenheim Foundation awards grants in the field of criminal justice to qualified groups or individuals. It also runs summer internships for qualified students in criminal justice. Founded in 1924 by Daniel Guggenheim (1856-1930), Meyer Guggenheim's second son, it is the oldest of the Guggenheim foundations.

The Harry Frank Guggenheim Foundation was established by Harry Guggenheim (1890-1971), Meyer Guggenheim's grandson, to support research on violence and aggression in the modern world. Average grants are about $30,000 per year. This foundation also awards at least ten fellowships of $15,000 to doctoral candidates in the final year of completion of their doctoral dissertations.

Guggenheim had stumbled into investing in two of the richest mines in Colorado, with vast lodes of silver and lead. By 1887, some nine million ounces of silver and eight-six thousand tons of lead were extracted from the two mines.

Guggenheim was quick to realize that much of the profit in mining was derived from the processing of ore. To this end he built a large smelter in Pueblo, Colorado, completed in 1888 and supervised by Simon Guggenheim; two smelting operations in Monterrey and Aguascalientes, Mexico; and a refining works at Perth Amboy, New Jersey. The Mexican smelters enabled the Guggenheims to circumvent tariff restrictions on the importation of Mexican ore. In 1891, the Guggenheims consolidated about a dozen of their smelting operations as the Colorado Smelting and Refining Company. By this time, the family was completely out of the fine lace business and five of Guggenheim's seven sons were intimately involved with mining and smelting operations.

By 1901, the Guggenheims gained control of the rival American Smelting and Refining Company. Daniel Guggenheim helped organize a trust company and became its president. At the same time, a separate firm, the Guggenheim Exploration Company, was formed to develop mining opportunities not only in the United States but also in the rest of the world. Hence by the turn of the century, the Guggenheims controlled the most important silver smelting company in the world and held virtual control over the American copper industry.

Meyer Guggenheim retired in 1895, leaving the mining and smelting operations to his sons, whom he had trained so well. He spent his summers at the New Jersey shore to escape the oppressive New York City heat, and he now had much time to be a doting grandfather. His wife Barbara, who suffered from diabetes, died in 1900. Her sons donated $200,000 to Mt. Sinai Hospital in New York for the construction of a building in her name, and Guggenheim donated $80,000 for a building in her name at Jewish Hospital in Philadelphia.

For the next four years, Guggenheim was a widower, cared for by his cook and housekeeper, Anne Poppee. He suffered from a slow-growing prostate cancer. By late winter of 1904, his prostate gland had to be removed. While the surgery was successful, Guggenheim caught a bad cold. He was moved to the warmth of West Palm Beach, Florida, to recuperate. However, his cold turned into pneumonia and he died on March 15, 1905. He was buried next to Barbara in an elaborate family mausoleum in Salem Fields, a Jewish cemetery in Brooklyn, New York.

Legacy

The life of Meyer Guggenheim is a case study of the American Dream, in which a poor immigrant becomes wealthy through a combination of pluck and luck. Guggenheim established a business and trained his seven sons to continue its operation. The fact that this family business changed from a merchandising store to linen production and, finally, to mining and processing is incidental. The end result was a dynasty that dominated American mining and refining operations in silver, copper, and lead and went on to play a major role in mining operations in places as diverse as Chile, Mexico, and the Congo. Twenty-first century corporations, such as the American Smelting and Refining Corporation (ASARCO); Corporación Nacional del Cobre, Chile; Grupo Mexico; Nabors Industries; and Phelps Dodge trace their origins to the Guggenheims. Meyer Guggenheim's descendants also became some of America's leading philanthropists, using the Guggenheim Foundation to finance contributions to American art and science.

Peggy Guggenheim

American art collector and patron

Guggenheim was a visionary art collector and patron who used her wealth to support twentieth century artists. The Peggy Guggenheim Collection is one of the most significant modern art museums in the world.

Born: August 26, 1898; New York, New York
Died: December 23, 1979; Padua, Italy
Also known as: Marguerite Guggenheim
Source of wealth: Inheritance
Bequeathal of wealth: Children; relatives; charity; artistic patronage

Early Life

Marguerite Guggenheim (GOO-gehn-him), better known as Peggy Guggenheim, was born on August 26, 1898, in New York City, the daughter of Benjamin Guggenheim and Florette Seligman Guggenheim. Her father's family had made a fortune in international mining, and her mother's father was a banker. Guggenheim and her sisters, Benita and Hazel, took European tours and attended operas. Their mansion near Central Park was filled with expensive artwork. Their father was a philanderer and had secretly squandered his fortune. However, Guggenheim adored her father, and when he died aboard the RMS *Titanic* in April, 1912, she was devastated.

The Guggenheim uncles helped her family financially. She attended the Jacobi School, an exclusive academy committed to women's rights and other progressive ideas. At sixteen, she studied with Lucile Kohn, whose radical ideas on labor reform convinced Guggenheim that the wealthy should help improve the world. In February, 1916, she made her debut, and in 1919, she inherited a trust fund of $450,000, the equivalent of $5 million in 2010.

First Ventures

Guggenheim first learned about modern art in 1920, when she worked in The Sunwise Turn, an avant-garde bookstore. Through her cousin Harold Loeb, she met novelist F. Scott Fitzgerald and photographer Alfred Stieglitz. At Stieglitz's gallery, she saw the work of painters Georgia O'Keeffe, Paul Cézanne, Henri Matisse, and Pablo Picasso. At twenty-one, she traveled to Europe, settled in Paris, and became an art lover. She would live the life of an American expatriate for the next twenty years.

In 1922, she married writer Laurence Vail, nicknamed the "King of Bohemia." Before they divorced in 1930, they had two children, a son Sinbad and a daughter Pegeen. Their friends included legendary dancer Isadora Duncan, anarchist Emma Goldman, and sculptor Constantin Brancusi.

Peggy Guggenheim. (WireImage/Getty Images)

Guggenheim was fascinated with the art world and wanted to help artists sell their work. With advice from her friend, surrealist artist Marcel Duchamp, she learned about modern art movements. On January 24, 1938, Guggenheim opened her Guggenheim Jeune Gallery in London with an exhibit of thirty drawings by the writer Jean Cocteau. Open from 1938 to 1939, the gallery presented the works of Picasso and Max Ernst. Russian artist Wassily Kandinsky's first London show was at this gallery. A contemporary sculpture exhibition featured the works of Brancusi, Hans Arp, Henry Moore, and Alexander Calder. However, the dangerous military developments in Europe forced Guggenheim to close this gallery.

Mature Wealth

Guggenheim dreamed of opening a museum of modern art in London. Settling in France, she collected funds and purchased a painting every day. Through the spring of 1940, as the German forces advanced in Europe, she frantically bought works by Picasso, Brancusi, Ernst, Georges Braque, Salvador Dalí, Piet Mondrian, Joan Miró, and others. However, with the Occupation of France, she had to ship her collection of more than fifty surrealist, cubist, and Dadaist works to New York City. As the German military advanced in France, it became too dangerous for her to stay in Europe. In July, 1941, Guggenheim and her lover, surrealist Max Ernst, left for the United States. She married Ernst, and they divorced five years later.

In October, 1942, Guggenheim opened her celebrated Art of the Century museum-gallery in New York City. One of the most significant galleries in art history, Art of the Century showcased her collection of works by now-famous European and unknown American artists. It brought American abstract expressionist art and European surrealism together. She sponsored many struggling American artists, including Clyfford Still, Mark Rothko, and Robert Motherwell. Her patronage of "drip painter" Jackson Pollock established his career.

After World War II, Guggenheim returned to Europe. In 1948, her expanding collection was given an entire pavilion at the Venice Biennale exhibition. Along with the European masterpieces she had collected earlier, she gave the painters Rothko, Pollock, and Arshile Gorky their first European exhibit. Her collection grew and was displayed throughout Europe, with exhibitions in Brussels, Florence, Milan, Zurich, and Amsterdam.

In 1949, Guggenheim purchased the Palazzo Venier del Leoni, an unfinished, eighteenth century, white stone palace on the Grand Canal in Venice. This palace would be her home, but she converted the garden, cellar, and other rooms into museum spaces. Consisting of more than 260 pieces, the Peggy Guggenheim Collection included the century's greatest pioneers of surrealism, abstract expressionism, and cubism. The modern artists included in the collection were Braque, Kandinsky, Mondrian, Picasso, Moore, Francis Bacon, Umberto Boccioni, Marc Chagall, Giorgio de Chirico, Joseph

Cornell, Willem de Kooning, René Magritte, Kazimir Malevich, Man Ray, and Kurt Schwitters. She established the Peggy Guggenheim Foundation in order to finance the operation of this museum.

From 1951 to 1979, the "last duchess" (*l'ultima dogaressa*), as she was called, opened her home and collection to the general public each summer. Guggenheim and her extraordinary collection were huge tourist attractions. Beginning in the early 1960's, she sponsored traveling exhibitions of her collection in order to bring art to the masses. After 1973, Guggenheim stopped making major art purchases and hardly traveled. In 1974, she arranged for her palazzo and collection to be transferred after her death to the Solomon R. Guggenheim Foundation, which her uncle had established in 1937. The conditions of her donation required that the collection remain in the palazzo. The Peggy Guggenheim Foundation approved the donation on July 17, 1975.

After suffering poor health for a few years, Guggenheim died on December 23, 1979. Her ashes were buried in the palazzo garden.

Legacy

Peggy Guggenheim's descendants inherited millions of dollars, but her art collection and palace were transferred to the Solomon R. Guggenheim Foundation, which reopened the Venice museum on Easter, 1980. At the time of her death, the Peggy Guggenheim Collection was estimated to be worth between $30 and $40 million. The permanent collection includes masterpieces of metaphysical painting, cubism, European abstractionism, American abstract expressionism, Futurism, and surrealism. A respected cultural institution and one of Europe's most significant museums of modern American and European art, the Peggy Guggenheim Collection continues to be open year-round to the public, attracting thousands of visitors each year.

An independent thinker, Guggenheim had a passion for contemporary art and artists. As one of the most significant art patrons in history, she helped shape twentieth century art. She transformed culture by making her priceless art collection accessible to the masses. From June 12 through September 2, 1998, an exhibition at the

Great Wealth and Art Patronage

Peggy Guggenheim's wealth in relationship to her art patronage was a unique historical anomaly. For centuries, art had existed in the service of wealth. Individuals and families, such as the house of Medici in Renaissance Florence, often hired or retained artists to create works for their private enjoyment, for portraiture, or as symbols of their power and prestige.

In the early twentieth century, with accelerating changes in society and technology, another pattern was established: the concept of art as an investment and a generator of wealth. In several cases, these investments became much more valuable after the artists died; their deaths prevented their works from being devalued because of overabundance. For some people, such as Vincent van Gogh's nephew, art became a form of inherited wealth; for others, such as dealers in the works of Amedeo Modigliani, art was an active, conscious investment.

Peggy Guggenheim's connection to art differed from the master-servant relationship of preindustrial society, or the modern investment mode. She was a collaborator, living in the world of the artists whose works she collected. She was a bohemian socialite who had rejected her bourgeois lifestyle and privileges in favor of the unconventional world of avant-garde artists and writers. In fact, she established romantic relationships with many members of the intelligentsia, including writer Samuel Beckett and artists Max Ernst (her second husband), Yves Tanguy, and Constantin Brancusi. Guggenheim played a dynamic, personal role in the evolution of art patronage.

Art patronage was a noble cause for Guggenheim, who believed that the works she collected were worth preserving and exhibiting. She did not actively shape the artists' subject matters, styles, or artistic processes but rather helped enable them to pursue their own innovative directions. She collected much art that was considered unmarketable and ignored or rejected by the art establishment of the time. Thus, she enabled the survival and development of major modern art movements, including cubism, American abstract expressionism, European abstract art, surrealism, and Futurism. For instance, she gave Russian abstract artist Wassily Kandinsky his first London exhibition. She discovered unknown American artists Robert Motherwell, Mark Rothko, Clyfford Still, and Jackson Pollock, and she gave them their first shows at her Art of the Century gallery in New York. She also brought European avant-garde art to America. She gave Arshile Gorky, Pollock, and Rothko their first European exhibitions. Her collection grew to be valued at more than $30 million during her lifetime, but making money from art was never her primary motivation.

Solomon R. Guggenheim Museum celebrated the one hundredth anniversary of Peggy Guggenheim's birth. This exhibition featured personal memorabilia, as well as paintings and sculpture from her collection.

Guggenheim's candid autobiography, *Out of This Century* (1979), added to her notoriety and mythology. On March 10, 2005, Lanie Robertson's four-part play, *Woman Before a Glass*, opened on Broadway in New York City. Based on Guggenheim's autobiography, this one-woman show starred Mercedes Ruehl, who won an Obie Award for her portrayal. Guggenheim was also a character in Ed Harris's *Pollock* (2000), a film about Jackson Pollock, and in May, 2004, the British Broadcasting Corporation (BBC) presented a documentary, *Peggy: The Other Guggenheim*.

Solomon R. Guggenheim

American mining magnate and art collector

Guggenheim made a vast fortune in his family's mining interests, and their mineral holdings at one time were among the most extensive in the world. He became a significant collector of modern art, and he built one of the world's great modern art museums in which to exhibit his artworks.

Born: February 2, 1861; Philadelphia, Pennsylvania
Died: November 3, 1949; New York, New York
Also known as: Solomon Robert Guggenheim
Source of wealth: Mining
Bequeathal of wealth: Relatives; charity; museum

Early Life

Solomon Robert Guggenheim (SAHL-uh-muhn GOO-gehn-him) was born in Philadelphia in 1861, one of eleven children born to Meyer and Barbara Guggenheim. He was the fourth of eight sons and was known to his family as "Sol." By the time of his birth, the Guggenheims were already quite prosperous from their ownership of a Swiss factory. At the age of fourteen, after having attended Philadelphia public schools, Solomon was sent to a private school in Zürich, Switzerland, the country from which his parents had emigrated about 1847. There he was to learn proficient German and be instilled with sound business practices.

First Ventures

When he was about twenty years of age, Guggenheim joined his three older brothers as a partner at M. Guggenheim's Sons, the family's embroidery and needlework manufacturing and import firm in Switzerland. Guggenheim was selected to operate a branch of the business in Saxony, Germany. The company was eventually sold, and in his late twenties, at his father's urging, he became involved in the mining industry in which his father had heavily invested. Beginning in 1889, Guggenheim was trained in Leadville, Colorado, where his father had a major interest in a lead and silver mine. It was this mine that gave rise to the family's vast fortune and eventually resulted in their becoming the owners of the world's most extensive mining interests, including gold.

Guggenheim went to Mexico in 1891 and remained there for several years, often in rather primitive conditions, operating family-owned silver and copper smelters. He also had the responsibility of locating new sources of ore, negotiating optimal shipping deals with railroad companies, and obtaining concessions from the Mexican government on taxes, the purchase of land, and other matters vital to the family's business interests. By 1895, these Mexican operations were netting more than $1 million a year.

Mature Wealth

The Guggenheim family had set up their headquarters in New York City, and it was there that Guggenheim came to live in 1895 after his years spent in Mexico. During that year he married Irene Rothschild, a member of one of the world's greatest banking families; they were to have three daughters, Eleanor, Gertrude, and Barbara. By 1901, when the Guggenheims attained control of the American Smelting and Refining Company, they had become the largest refiners of metal in the world. Guggenheim became a director of this company and also headed metallurgical firms in South America, Asia, and Alaska, as well as in the mainland United States, and he was regarded as a strong-willed but personable leader.

In his private life, Guggenheim was known for his sociability, gourmet tastes, and sense of humor. He was generous in charitable giving, particularly to hospitals; a political conservative, he made large donations to the Republican Party. By the time of his retirement he owned palatial homes on Long Island, New York, and in New Jersey and South Carolina, as well as an Idaho cattle ranch, a Scottish hunting lodge, and a thousand-acre plantation.

Following his retirement from full-time work in 1919, Guggenheim remained an avid sportsman and devoted much of his time to his passion for collecting art, an activity in which his wife had initially interested him. He had begun seriously collecting in the early 1900's. His collections initially focused on early American and European art, but his meeting in the mid-1920's with the artist Baroness Hilla von Rebay directed his passion toward modern art. It was also widely speculated that his passion extended to Rebay, who was almost thirty years his junior. Guggenheim became an ardent collector of such avant-garde artists as Pablo Picasso, Marc Chagall, Jackson Pollock, René Magritte, Willem de Kooning, Wassily Kandinsky, Piet Mondrian, and Paul Klee. He owned more than 150 pieces of Kandinsky's work alone. Guggenheim's modern art collection was housed in his large suite in New York City's Plaza Hotel. In 1936, under Rebay's auspices, the collection began touring to various East Coast and southern cities, where it was showcased in museum exhibitions.

In 1937, he established the Solomon R. Guggenheim Foundation for the "promotion and encouragement of art

The Solomon R. Guggenheim Museum

Following architect Frank Lloyd Wright's original commission in 1943, it was sixteen years before the Solomon R. Guggenheim Museum finally opened in October, 1959, on tony upper Fifth Avenue in Manhattan. At an estimated cost of $3 million, the museum is considered the architect's last major work; he died several months before its opening. Wright stated that he wanted no distractions from his design, not even curtains or carpeting, and wittily averred that his building would make New York City's famed Metropolitan Museum of Art look like a "Protestant barn." He is said to have wanted the exterior, which is made of gunite, a mixture of sand and cement, painted crimson. However, the color ultimately used was tan, later covered over by gray paint.

Construction did not begin until 1956, and by that time Solomon R. Guggenheim himself had been dead for several years. The facility initially was called the Museum of Non-Objective Painting, the name of the facility that Guggenheim had established in 1939. However, in 1952 the new building was renamed the Solomon R. Guggenheim Museum. Like many of Wright's other structures, the museum's architecture was not without controversy. Its interior design is basically a six-story corkscrew spiral ramp within an open central space, and the building is wider at the top than at its base. It bears some resemblance to an upside-down ziggurat, a type of ancient Mesopotamian temple.

Although visually striking, the Guggenheim's suitability as a museum has been questioned by many critics, who believe its design overwhelms the art. One critic called it "a war between architecture and painting in which both come out badly maimed." Another said it was "an indigestible hot-cross bun," and yet another said it resembled an inverted oatmeal dish. In 1992, a rectangular ten-story tower annex was erected next to the original building, and the exterior of the museum was renovated in the early twenty-first century at a cost of $29 million. A satellite branch was also opened in the Soho neighborhood of Manhattan, but it later closed.

The museum initially displayed Solomon Guggenheim's private artworks, but its collection eventually expanded to contain more than three thousand works, including statuary, which range in origin from the 1890's to the present day. More than 150 works by painter Wassily Kandinsky are an essential part of the collection. The Solomon R. Guggenheim Museum's credo is to exhibit art "from the materialistic to the spiritual . . . from objectivity to non-objectivity." Two of its more colorful exhibitions were a collection of more than one hundred motorcycles arranged along the building's spiral ramp and the creation of a revolving "hotel room," in which paying guests were allowed to spend the night.

and education in art and the enlightenment of the public." In 1939, the foundation founded the Museum of Non-Objective Painting to showcase much of Guggenheim's private collection, with Rebay as its curator. By this time, he had sold off most of his previous collection of older artworks. The museum was not intended to be permanent and was housed in rented quarters. In 1943, architect Frank Lloyd Wright was commissioned to design a permanent modern art museum.

Legacy

At his death in 1949, Guggenheim reportedly bequeathed between $8 and $10 million to his foundation, which had diligently promoted abstract art during the late 1930's, awarded scholarships and grants to artists in need, and financed displaced European artists in the 1940's. The foundation continues to operate into the twenty-first century. Among its activities, it stages an annual exhibition of works by New York City elementary school children at the Solomon R. Guggenheim Museum. The organization remains influential in the art world through its programs in art scholarship, research, and conservation; it has materially assisted in the founding of several museums, including the Guggenheim Museums in Bilbao, Spain (designed by architect Frank Gehry), Berlin, Abu Dhabi, and Las Vegas, and the museum housing the collection of Solomon Guggenheim's niece, the art collector Peggy Guggenheim, in Venice, Italy. Some of these museums are distinguished by their unusual architectural styles. Rebay served on the foundation's board after Guggenheim's death, but she was eventually ousted for reasons apparently related to her rather eccentric personality.

An enormously successful businessman but not considered one of the "robber barons," Solomon R. Guggenheim came into his extreme wealth through a combination of family ties and his own proven expertise in business. If he exploited those who labored in his mines it is not recorded, and by all accounts he was a strict but fair employer. He retired while still a relatively young man and used his fortune not only to accommodate his own tastes but also to bring an appreciation of art to the general public. His foundation was the chief means of accomplishing these goals, and the museum he founded continued to operate programs for the public's enjoyment into the twenty-first century. One of the museum's activities is a popular program called "Art After Dark," which features gala festivities at the museum. The Guggenheim Museum also sponsors art appreciation programs taught by professional artists at New York City schools. Guggenheim's fervent support of the work of modern nontraditional artists helped bring their art to the attention of a wider audience. Although it has sometimes created controversy, the Solomon R. Guggenheim Museum stands as a monument to his devotion to fostering the arts.

Edward Cecil Guinness

Irish aristocrat and brewer

During Guinness's lifetime, his eponymous family brewery was the largest in Ireland and among the largest in the world. Guinness donated some of his almost £11 million fortune to the working poor, the arts, hospitals, Trinity College Dublin, and scientific research about infectious diseases and brewing techniques.

Born: November 10, 1847; Clontarf, Ireland
Died: October 7, 1927; London, England
Also known as: Edward Cecil Guinness, first earl of Iveagh; Viscount Elvedon
Sources of wealth: Manufacturing; sale of products
Bequeathal of wealth: Spouse; children; charity; educational institution; medical institution

Early Life

The Guinness family had been brewers in Ireland for three generations when Edward Cecil Guinness (GIHN-ehs) was born in 1847. According to family lore, the recipe for the stout that made the Guinness fortune was actually the brainchild of Arthur Price, archbishop of Cashel, Ireland. When Price died in 1752, he gave £100 to his servant, Richard Guinness, and to Guinness's son Arthur. In 1759, Arthur Guinness signed a lease on an unused brewery in Dublin and began brewing porter and ale. Arthur's grandson, Sir Benjamin Lee Guinness (1798-1868), inherited the brewery upon the death of his father, Arthur Guinness II, in 1855. Benjamin was the father of Edward Cecil and three other children.

In 1855, Benjamin bought Ashford Castle in County Mayo, which he expanded with a second house on the site when Edward was seven years old. At the age of fifteen, Edward joined the brewery management team. Upon his father's death, he and his brother Arthur became joint owners of the brewery until Edward bought Arthur's share after Arthur became the first Baron

Ardilaun. In 1873, Edward married a cousin, Adelaide Maria Guinness (1844-1916), who was accomplished in social circles. The couple, who had the most profitable brewery business in Ireland, lived on £150,000 a year while raising three sons, Rupert, Ernest, and Walter.

In 1876, Edward began serving in political positions that were incumbent upon one of his rank, wealth, and social standing. He initially was the sheriff of Dublin and became high sheriff of the city in 1885. In 1886, he was given his first honorary law degree from Trinity College Dublin, and in 1891 he received the same degree from the University of Aberdeen.

FIRST VENTURES

In 1876, Guinness increased the size of his brewery, adding another sixty-four acres, and he extended the brewery's product line with three types of stout—two that were sold only in Ireland and another that was an international export. In 1886, the brewery was incorporated as Arthur Guinness Son & Co. Ltd. and began trading its stock on the London Stock Exchange. While he assumed various management positions over the years, Guinness always kept his finger on the pulse of the business, contributing to and being consulted about all aspects of strategic planning and marketing. In the later years of the nineteenth century, the brewery produced more than one million barrels and was valued at almost £500,000. One of Guinness's most successful and profitable business strategies was his decision not to own taverns, which would have served as the primary sites for sale of his beers. Instead of buying taverns, he invested the brewery's profits in research aimed at improving the quality and manufacture of his beers.

MATURE WEALTH

As industrialists and politicians, the Guinness family has always been committed to philanthropic and charitable works to improve their communities. Following the example of his father, Edward financed construction of housing for working people in urban areas of Ireland through his Guinness Trust in 1890 and the Iveagh Trust in 1900, in one decade spending about a £500,000 for these homes. He used £250,000 of his personal funds for the clearance of Dublin's notorious Bull Alley, replacing derelict buildings with a market and the Iveagh Play Center.

Guinness, whose business continued to profit despite the British government's efforts to raise taxes, diversified his holdings and increased his income by purchasing

KENWOOD HOUSE

Kenwood House, a London estate, dates from around 1700, with its gardens dating from 1745. In the middle years of the eighteenth century, its owner, William Murray, first earl of Mansfield, hired prominent architect Robert Adam to modernize the house and transform its appearance following the popular neoclassical style. The second and third earls of Masefield continued renovations through 1796. Over the years, the house fell into disrepair and was slated for demolition when it passed out of the Masefield family, at which time brewer Edward Cecil Guinness bought it in 1925 for £108,000.

The property has a main house, a farm, and mannered gardens that are partially designed as a heath but also include a flower garden and hay meadows. At Guinness's death in 1927, Kenwood House was bequeathed to the British government, along with an annual maintenance budget of £50,000 from the Guinness fortune. In 1929, the Iveagh Bequest Act made the house and its grounds a permanent possession of Great Britain, managed by the English Heritage preservation agency.

Guinness's bequest included sixty-four artworks and a furniture collection. Upon Guinness's death, these holdings were moved from his Grosvenor Square, London, house to his Kenwood estate. Guinness acquired much of his artwork through London auction houses, primarily purchasing seventeenth century Dutch and Flemish paintings by notable artists, including Rembrandt, Jan Vermeer, and Sir Anthony van Dyck. Guinness eschewed the sporting theme paintings that were popular with so many aristocrats in favor of portrait paintings and miniatures that he initially purchased between 1871 and 1891. Critics agree the *Self-Portrait* of Rembrandt is the collection's masterwork. Other notable works are Vermeer's *Woman Playing on a Lute* and *The Guitar Player,* George Romney's *Lady Hamilton at the Spinning Wheel* and *Mrs. Musters*, and Thomas Gainsborough's *Mary, Countess of Howe* and *Venus Chiding Cupid*.

Of the sixty-four paintings Guinness bequeathed, ten were by Romney, eight by Gainsborough, and fifteen were by Sir Joshua Reynolds. These works were valued at nearly £2.5 million and were deemed irreplaceable. Many of the eighteenth century English paintings had been exhibited by the artists and are considered either representative of their styles or innovative in their composition techniques. By the twenty-first century, the Iveagh Bequest had expanded the collection to more than two hundred paintings and miniatures, supplemented by a large furniture collection.

properties in Great Britain and the United States. In 1894, Guinness bought his fourth home, Elveden Hall, located in the west of Suffolk, England, and turned it into a twenty-three-thousand-acre shooting estate. Throughout the 1890's, his financial acumen enabled the brewery to outstrip its Irish and international rivals by producing limited, high-quality products, conducting ongoing research into beer making, and maintaining sound business practices. In 1895, he was made a knight of the Order of St. Patrick and a knight of the Order of St. John of Jerusalem.

From 1902 until 1927, he again served as chairman of the board of the Guinness brewery. In 1905, Guinness became Viscount Iveagh. The following year he was elected a fellow of the Royal Society, and two years later he was appointed to serve as a chancellor of Trinity College Dublin, from which he earned his two college degrees in 1870 and 1872. During World War I, Guinness's personal income was about £700,000 a year. In 1910, he became a Knight Grand Cross, Royal Victorian Order, and in September, 1919, he was given the titles first earl of Iveagh and viscount of Elveden.

Guinness created large trust funds for his three sons. His brewery earned more than £1 million annually during the first three decades of the twentieth century. After World War I, as the brewery business declined, Guinness worked to retool its product line, improve marketing strategies, and engage in necessary cost cutting while maintaining the beers' reputations for freshness, taste, and quality.

Legacy

Edward Cecil Guinness was the beneficiary of great wealth, and he kept up the tradition of philanthropy inherited from his father. At his death in 1927, he left an estate valued at between £11 and £13 million. He created trusts for the support of the working poor; he bequeathed Kenwood House, a stately London residence, to the British government, which operates it as a public art museum; and he sponsored research by the Lister Institute aimed at inhibiting the spread of diseases in Dublin. His funding also created the Chadacre Agricultural Institute in west Suffolk in 1921 in order to teach farmers and farmworkers effective agribusiness practices.

Calouste Gulbenkian

Turkish oil magnate

Gulbenkian made his fortune in the international petroleum business, working to organize the world's first oil cartel, the Iraq Petroleum Company, in the 1920's. At the time of his death in 1955, Gulbenkian left $70 million in cash and a £5-£10 million annual endowment and sizable art collections to establish an international charitable foundation.

Born: March 29, 1869; Scutari, Ottoman Empire (now Üsküdar, Istanbul, Turkey)
Died: July 20, 1955; Lisbon, Portugal
Also known as: Calouste Sarkis Gulbenkian; Mr. Five Percent
Source of wealth: Oil
Bequeathal of wealth: Children; charity

Early Life

Calouste Sarkis Gulbenkian (kahl-LOU-stay SAHR-kihs guhl-BEHN-kee-an) was the son of Sarkis and Dirouhie Gulbenkian. He came from a family of bankers and merchants long established in what is now Istanbul, Turkey, where his Armenian father was an important oil magnate. The young Gulbenkian's early education was at the French lycée in Istanbul. He showed little initial acumen in finance, being more drawn toward mechanics and engineering. These interests laid the groundwork for later success, as he learned to apply scientific and mathematical techniques to business problems. This methodical approach would distinguish him throughout his career, making him a superb negotiator.

In 1886, his father sent him to London to study petroleum engineering at King's College. Upon the death of his father, Gulbenkian and the other heirs dissolved the family banking business, and Gulbenkian formally immigrated to England, becoming a naturalized British citizen in 1902.

First Ventures

Despite his excellent education and the initial contacts provided by his family, Gulkenkian could not be considered truly wealthy at the inception of his business career. The best early estimate of his net worth was £500,000 in 1908. Gulbenkian quickly learned the importance of developing personal relationships, two of which were with Henri W. A. Deterding and Marcus Samuel, first Viscount Bearsted. Both men had been involved with separate oil ventures, with Bearsted's merchant house having built the first oil tanker in 1892. Gulbenkian met both these men soon after settling in London. After several years of fruitless competition and initial rejection of a Turkish-based franchise, Gulbenkian convinced Deterding and Samuel to join forces with him in what became known as the Royal Dutch Shell Corporation. In 1907, he induced his American law firm to sponsor the new company's listing on the New York Stock Exchange. This listing resulted in the creation of the giant Shell Corporation of America and provided millions of dollars to the new firm, which became a major competitor of Standard Oil Company. This was Gulbenkian's first international venture, for which he received a 2 percent commission and, according to some sources, 5 percent of the equity, leading to his nickname of "Mr. Five Percent."

Mature Wealth

In addition to his early realization that the automobile would have a significant impact on worldwide demand for oil, Gulbenkian had a major advantage over his European and American counterparts. Unlike most of them, he was familiar with the Middle East, because he had spent a year studying the Baku oil fields. He understood that the Ottoman Empire was weak, and he recognized the opportunities that would be available to an astute investor after the empire would fall.

Once again relying on his personal contacts, Gulbenkian in 1910 became technical adviser to Great Britain's financial mission to Istanbul, as well as executive director of the National Bank of Turkey, which ultimately became an all-British venture. Subsequently, the National Bank merged in 1912 with the Turkish Petroleum Company, a joint venture of the largest European oil companies, which sought to obtain exclusive development rights in key areas of the Ottoman Empire. Here Gulbenkian's ability to take the long view was demonstrated as he first surrendered 25 percent of his original 40 percent of holdings in Turkish Petroleum to incorporate Royal Dutch Shell into the consortium and subsequently yielded an additional 10 percent to the British government's Anglo-Persian Oil Company. Although this divestment reduced his personal interest to the legendary 5 percent, he acquired long-term relationships with both the Turkish Petroleum and Anglo-Persian companies.

In handling business negotiations, Gulbenkian displayed his intelligence, unflagging industry, and energy. Almost as important as these attributes was his detailed, mathematical mind, which at times seemed almost brooding as he examined the relevant data before him. Combined with his background as a naturally suspicious ethnic Armenian, he was a formidable adversary in complex negotiations. Some people described him as ruthless in his business dealings.

Gulbenkian's character traits were particularly prominent when the Ottoman Empire was dismantled following World War I. At this time, present-day Iraq, the area that was a primary site of Turkish Petroleum's operations, came under British mandate, and it was fortunate that Gulbenkian had earlier acquired British citizenship. Although he had worked before the war to bring Deutsche Bank and other German interests into Turkish Petroleum, he now brought French businesspeople into the oil consortium, a move that effectively founded the French oil production industry. He continued to develop Turkish Petroleum throughout the 1920's, resulting in the integration of American interests and culminating in what became known as the 1928 "red line agreement," whereby Gulbenkian reportedly mapped the boundaries of the consolidated venture with a red pen. Thus was formed the world's first oil cartel—renamed the Iraq Petroleum Company—which shaped the Middle East oil industry for the next twenty years. As usual, Gulbenkian emerged with his legendary 5 percent of this venture.

The 1930's continued to be a successful period for Gulbenkian, but storm clouds were emerging. He benefited handsomely from Iraq Petroleum's escalating revenues, but like any successful entrepreneur, he had made enemies, partially because he had moved his permanent residence from London to Paris during the 1920's. Perhaps as a result, disagreements with the British frustrated his participation in a Saudi Arabian oil concession in 1931. At the outbreak of World War II, he fled his Paris residence, taking up domicile in Vichy France, the puppet state established in southern France. According to British wartime legislation, this move was considered an enemy act and resulted in his being stripped of both his 5 percent interest in Iraq Petroleum and his British citizenship.

Gulbenkian had been a commercial counselor in the Persian (Iranian) diplomatic service for many years, and he assumed Persian citizenship. However, his citizenship became an issue when Persia declared war on the Axis countries, and he moved to neutral Portugal, taking up

The Calouste Gulbenkian Foundation

Despite the urging of his family and others, Calouste Gulbenkian did not establish a museum or memorial during his lifetime. He did loan some his art collections, notably in Great Britain from 1930 to 1950, even though his British citizenship was revoked during World War II.

In his will, drawn up in 1953, he provided for the formation of the Calouste Gulbenkian Foundation. Like everything else he did in his life, his will was clearly detailed, outlining how the foundation was to operate. Recognizing that neutral Portugal permitted him to immigrate to Lisbon during the war, Gulbenkian made this country the primary beneficiary of his estate. His will states that the foundation is to be permanently headquartered in Lisbon and operate under the laws of Portugal and that a majority of the members of the board of directors are to be Portuguese citizens. However, he permitted the foundation to have branches in other countries, as the directors saw fit.

The stated objective of the foundation, established in 1956, is to support worldwide projects in the fields of art, education, science, health, and social welfare. The centerpiece of the foundation is the Calouste Gulbenkian Museum, located in central Lisbon on approximately twenty acres of land. Opened in 1969, the museum has three major buildings: the museum itself, the foundation's headquarters, and the grand auditorium. The Lisbon museum is supplemented by branches in England and France, a reflection of Gulbenkian's nearly sixty years of residency in London and Paris.

Gulbenkian developed his love of art and culture early in life, and he continued to pursue these interests throughout his business career. He endeavored to visit museums every time he traveled, and he was able to do so without detracting from his business pursuits. The results of his interest in art are evidenced by his art collection, with items from 2800 B.C.E. through the twentieth century. In addition to numerous paintings by some of the world's great masters, there are many impressive sculptures. Overall, his collection totals some six thousand items, ranking it among the largest ever amassed by a single collector.

There is also a smaller museum and church in Armenia, demonstrating his devotion to the Armenian Christian faith.

The Gulbenkian Museum contains far more than works of art. The facility has a music department, comprising three resident groups—an orchestra, choir, and ballet company. These groups regularly organize dance and concert performances in Lisbon and other cities in Portugal. In 1999, the foundation arranged to loan about eighty of its works to the Metropolitan Museum of Art in New York City, which helped enhance the international reputation of Gulbenkian, who is generally not well known in the United States.

residence in Lisbon at the exclusive Hotel Avis in 1942. During the period from 1945 to 1948, Gulbenkian obtained the right to recover his Iraq Petroleum investment, although he never reapplied for British citizenship. Gulbenkian was very careful with his money, which he devoted to art and other cultural pursuits. His collections included paintings by Rembrandt, Edgar Degas, Pierre-Auguste Renoir, and Thomas Gainsborough; Jean-Antoine Houdon's sculpture of Diana; and J. P. Morgan's collection of ancient Greek coins.

Gulbenkian was physically healthy into the early 1950's, and the continued success of Iraq Petroleum continued to add to his wealth. However, in 1953, he was bedridden, assisted by numerous nurses. His last visit outside the hotel was at Christmas in 1954. He died peacefully on July 20, 1955, at the age of eighty-six.

Legacy

Calouste Gulbenkian's attained his success in part because he understood the importance of developing relationships with people from a wide range of nationalities. Armenian by ethnicity, he adapted quickly to Western life, living in London and Paris for almost sixty years but quickly relocating to Lisbon when the situation required it. Throughout his life he retained his Middle Eastern contacts, which served him well when he was forced to become a Persian citizen during World War II. Gulbenkian was equally flexible in his negotiating skills. He never engaged in an important business discussion without having a fallback position, which allowed him to quickly consider alternatives. Overall, it might be said that he was a forerunner of the modern global businessman. His legacy is the museum he endowed in Portugal, with branches in England and France, where millions of visitors have enjoyed the fruits of his labor.

Thomas Guy

English bookseller, printer, and speculator

Guy was a successful bookseller, specializing in Bibles, but earned even greater wealth by speculating in the stock of the South Sea Company. Although regarded as a miser in his lifetime, he nevertheless founded one of London's most prestigious teaching hospitals, endowing it as a charity for the incurable.

Born: 1644 or 1645; Southwark, London, England
Died: December 27, 1724; London, England
Sources of wealth: Sale of products; investments
Bequeathal of wealth: Relatives; friends; charity; medical institution

Early Life

Thomas Guy was the eldest of three children born to Thomas Guy, a coal merchant, carpenter, and barge operator, and Anne Vaughton. The elder Thomas was a Baptist at a time when Baptists were known as "dissenters" and were a small and despised group. He worked out of a small wharf in Southwark, near London Bridge. Young Thomas, his brother, and sister were born and lived nearby the wharf in a relatively poor part of London. The elder Thomas died when young Thomas was only eight, and Anne returned to her birthplace, Tamworth, in the Midlands, where her family had good standing.

It is generally believed that Guy attended Tamworth Free Grammar (high) School during the Commonwealth period (1650-1660), where he would have been taught Latin and Greek and probably math. In 1660, the year of the restoration of King Charles II, Guy returned to London to be apprenticed to John Clarke, a bookseller in Cheapside, next to St. Paul's Cathedral. At the end of his apprenticeship in 1668, Guy bought a bookstore in Cornhill and its stock of £200 worth of books. The store was situated in the financial heart of London, near Mansion House. That year he was admitted as a freeman of the Stationers' Company, becoming a liveryman five years later. These positions gave him the credentials to sell and print books. In 1670, he was made a freeman of the city of London, and he also served the city as an alderman.

First Ventures

One of Guy's main concerns as a bookseller was to sell Bibles. He saw the market for cheap but well-produced Bibles. However, the Stationers' Company, along with the Oxford University Press, had a virtual monopoly on printing Bibles. The Bibles the Stationers' Company produced were either very poorly printed or very expensive. The university press was not interested in the Bible market, and so did nothing with its printing permit.

At first, Guy tried importing Bibles from Holland, but this was technically illegal, as it broke the monopoly agreement. However, Guy's efforts attracted the attention of two clergymen who shared his concern. They negotiated with the university press to allow Guy to print Bibles for them. This venture succeeded, and Guy was soon making a good profit of some £15,000.

Guy began to show the characteristics of his life that marked him for future fame. He remained unmarried and lived very frugally. He was accused by a rival bookseller of paying low wages and not giving money to charity. However, Guy did engage in philanthropic ventures with his new wealth. The first such venture was providing for the extension of the grammar school at Tamworth. He next bought land in Tamworth in order to establish an almshouse for six poor women. This building was completed in 1678 at the cost of £200. The structure was enlarged in 1693 in order to provide six places for men. Guy also paid to build a workhouse for the destitute of Tamworth and a spinning school, a sort of early industrial school for women.

Mature Wealth

Selling Bibles continued to be Guy's main trade and source of income. He used the wealth derived from it in a number of ways. He started to loan out money at a time when there was not a permanently established banking system in London. He tried to enter politics, running as a candidate from Tamworth in the 1690 parliamentary elections. His election came at a time when being a member of Parliament was an unpaid position. Guy was unsuccessful in 1690, but in 1695 he was elected as a member of the Whig (liberal) Party, remaining as one of Tamworth's two members of Parliament until 1708. In 1694, he was elected against his will as sheriff of London, and he preferred to pay a £400 fine rather than accept the office. He was defeated in the 1708 elections, and he became so embittered against Tamworth that he withdrew from performing any further philanthropy for the town.

Guy supplemented his mature wealth by engaging in two ventures, both of which used his bookselling profits as his capital. The first venture was trading in seamen's pay tickets during the War of the Spanish Succession

(1701-1714), which Great Britain waged against France and Spain. This activity was a type of speculation in futures.

The second venture was his investment in the South Sea Company. The company had been founded in 1711 by Robert Harley, first earl of Oxford, as a way of managing the national debt incurred by the War of the Spanish Succession. The company was given a monopoly to trade with the Spanish colonies of South America, in return for which the company would give the British government £10 million. The government would then pay the company a 6 percent return on this sum. The South Sea Company raised the £10 million by selling shares at £100 each. However, what trading the company did was mainly in slaves; in fact, it did very little trading, and rather gradually took on more government debt. By 1720, the value of the company's shares skyrocketed, climbing from £128 per share in January to more than £1,000 by the end of August. At this time, companies and stock transactions were unregulated, and the general public had little experience of the stock market. Guy perhaps intuitively was able to read the market, and he sold his shares at an enormous profit before the "South Sea bubble" burst, the first major collapse of a publicly traded company. The parliamentary report on the collapse implicated many politicians in a generally corrupt scheme, and a number of people were prosecuted. The profits Guy earned by selling his South Sea Company stock dwarfed the fortune he obtained by selling Bibles. It is variously estimated that he bought his shares in the company for between £42,000 and £54,000, and he sold them in 1720 for about £234,000.

By 1704, Guy had retired from active trade, and he began to take an interest in St. Thomas's Hospital, one of the main hospitals in London, located near his birthplace. That year he became one of the hospital's governors, and

This cartoon satirizes the frantic investment in the South Sea Company, depicting gambling priests, speculators being "taken for a ride" on a merry-go-round, and a monument to the destruction of the city "by the South Sea." Thomas Guy made a large profit by selling his shares in the company before the "South Sea bubble" burst. (Hulton Archive/Getty Images)

Guy's Hospital

In the twenty-first century, Guy's Hospital continues to be one of London's leading hospitals and has a worldwide reputation for excellence. The facility is administered as a part of the Guy's and St. Thomas's (Hospital) NHS (National Health Service) Foundation Trust. The facility is allied to King's College, London, as a teaching hospital for doctors, nurses, and dentists. Guy's Hospital specializes in dentistry and is the largest dental hospital in Europe.

The hospital's founder, bookseller Thomas Guy, was a generous benefactor to St. Thomas's Hospital. Richard Mead, a physician, persuaded Guy to build a hospital for those patients who had been discharged from St. Thomas's because they were deemed incurable. In 1721, Guy leased land from St. Thomas's Hospital in Southwark, on the south bank of the Thames River, near London Bridge. Construction of the new hospital began on this site in 1722.

The original buildings cost £18,793 to construct when they opened for business in 1724. Many of these first buildings erected by Guy continue to stand, including a chapel and two forecourts containing his statue. The structures are excellent examples of early eighteenth century Georgian architecture.

Various other benefactors helped enlarge the hospital. In 1829, William Hunt provided £200,000 for an additional one hundred beds. In the twentieth century, Lord Nuffield financed extensive redevelopment, and the Wolfson Foundation provided funds for the Wolfson Centre for Age-Related Diseases. In 1974, the thirty-four-story Guy's Tower was erected, making the facility the tallest hospital building in the world.

A long list of distinguished physicians have worked at the hospital. Three have had diseases named after them: Thomas Addison, Thomas Hodgkin, and Richard Bright. Sir Alexander Fleming, the discoverer of penicillin, was also a physician there. The Romantic poet John Keats studied at Guy's Hospital in the 1820's with the intention of becoming a surgeon but decided to become a poet instead.

he looked for ways to donate some of his wealth to the facility. He gave £1,000 to build three new wards and £100 per year to fund them. A few years later, he donated an additional £3,000.

While Guy was seeking ways to benefit St. Thomas's Hospital, a leading London physician, Richard Mead, persuaded Guy to build a new hospital to care for those patients at St. Thomas's who were pronounced incurable. In 1721, Guy leased land from St. Thomas's in Southwark, on the south bank of the Thames River, near London Bridge. The lease was for a period of 999 years. At first, Guy saw the new hospital as remaining a part of St. Thomas's, but he eventually decided to found an entirely new facility, which would be called Guy's Hospital. Construction work started in 1722, and the new buildings were roofed just before his death in 1724. The facility's first matron, Ann Rainey, was from Tamworth, and Guy had known her from boyhood.

Guy was buried at St. Thomas's Parish Church, Southwark. At the funeral, there were more than forty carriages and a large number of poor people who saw Guy as their benefactor. About fifty years later, his body was reburied in the crypt of Guy's Hospital Chapel, which continued to stand in the twenty-first century. A portrait of Guy, painted in 1706 by John Vanderbank, hangs inside the crypt.

Legacy

Thomas Guy was worth about £300,000 at his death. More than two-thirds of this sum went to the foundation of Guy's Hospital in order to maintain the upkeep of four hundred beds. A ward for twenty insane patients was also included in this bequest. To mark his benevolence, a statue of Guy was erected in front of the hospital alongside statues of Christ and the Good Samaritan.

The rest of his fortune was dispersed in a number of other ways. Friends and relatives received bequests of £1,000 each. Christ's Hospital, a school for poor children in London, received funds to provide £400 worth of scholarships each year for four students. In addition, a fund was established to help release poor debtors from prison.

Guy's primary legacy is the establishment of the hospital that bears his name. He is perhaps the first person from a humble background to single-handedly found such a prestigious institution, setting an example of philanthropy for self-made men for the next two centuries. His insight into handling stocks showed how others could amass personal fortunes in the stock market. He also demonstrated that self-made men do not have to live ostentatiously in order to gain social respect and honor.

Armand Hammer

American merchant, industrialist, oil magnate, and art collector

Hammer made fortunes throughout his life, but he amassed great wealth when he changed Occidental Petroleum from a small company to a large worldwide oil and gas corporation. His contributions to charities were as diverse as his business ventures and included donations for an art museum and school.

Born: May 21, 1898; New York, New York
Died: December 10, 1990; Los Angeles, California
Sources of wealth: Oil; manufacturing; trade
Bequeathal of wealth: Children; educational institution; museum

Early Life

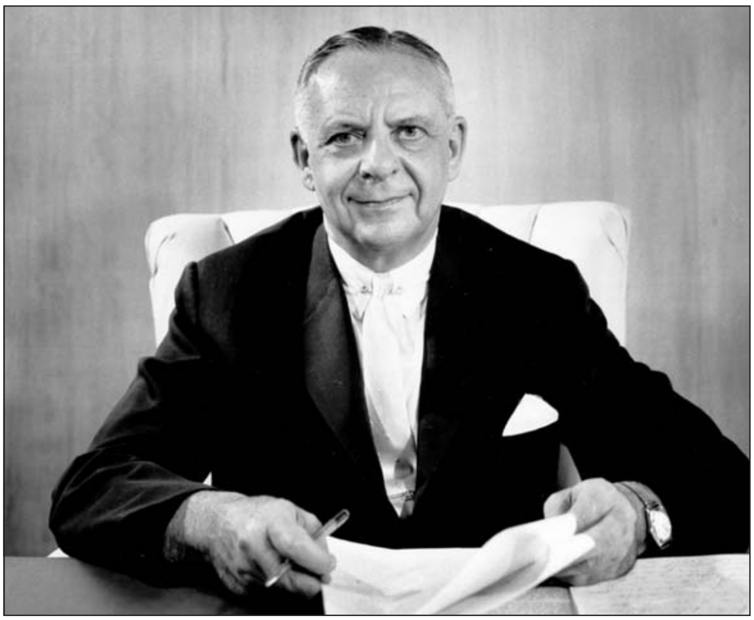
Armand Hammer (AHR-muhnd HAM-uhr) was born in New York City to Julius and Rose Hammer in 1898. Julius emigrated from Odessa, Russia, in 1875, settled in the Bronx, New York, and earned his living by practicing medicine and running a number of drugstores. Hammer received a B.A. degree from Columbia College in 1919. While he was attending the College of Physicians and Surgeons at Columbia, he earned his first fortune through speculation. He and his family bought up medical supplies after the prices had dropped and then resold them when the prices rose. Hammer earned $1 million as a result of this speculation.

In 1921, Hammer visited the Soviet Union as a medical volunteer, helping victims of starvation and typhus in the Ural Mountains. Hammer knew that American farmers were burning surplus grain. After witnessing the Soviet famine, he sent the Soviet government one million bushels of American-grown wheat that he had bought for one dollar a bushel in exchange for Russian furs and caviar. Hammer received his medical license in 1924, but he had already decided to conduct business with the Russians, and he never practiced medicine.

First Ventures

Through his father's political connections, Hammer met the Soviet leader, Vladimir Ilich Lenin, who offered Hammer numerous trade concessions. Hammer was permitted to establish an import-export business, and he imported a variety of Russian goods and exported medical supplies to the Soviet Union. He later managed an asbestos mine in Siberia and manufactured pencils. To start his pencil business, he smuggled German pencil-making machines into Moscow by breaking them down piece by piece. His plant not only produced cheap pencils for Russians but also exported pencils to neighboring nations. The A. Hammer Company made a profit of $1 million at the end of its first year. After he built more plants and the business became profitable, the Russian government bought him out for a large sum of money.

Hammer left the Soviet Union when Joseph Stalin came to power, and he stopped doing business with foreign countries. He made another fortune in the United States by selling czarist works of art he had bought in Moscow at bargain prices. He first sold these artworks at galleries in New York City and latter marketed them in department stores during the Depression. After the repeal of Prohibition, he earned millions of dollars worth of profits by making whiskey barrels with Russian oak and commercial alcohol and whiskey with rotting Maine potatoes. He founded the J. W. Dant Distilling Company after he acquired eleven distillers. He garnered $3 million in annual profits from these distilleries until he sold



Armand Hammer. (AP/Wide World Photos)

The Armand Hammer United World College of the American West

The Armand Hammer United World College of the American West—more commonly known as United World College-USA (or UWC-USA)—is located in the historic Montezuma Castle in Montezuma, New Mexico. Formerly known as the Montezuma Hotel and owned by a railroad company, the castle became the property of the Baptist Church and then the Catholic Church. Armand Hammer paid $2 million to buy the 110-acre property in 1981 and to renovate the building, and he founded the school the following year. The college underwent a $10.5 million renovation in 2000-2001.

UWC-USA is one of thirteen United World colleges in North America, Central and South America, Europe, Asia, and Africa. In 2009, UWC-USA was a two-year, independent, boarding school with about two hundred students between the ages of sixteen and nineteen. Of these, 50 students were Americans, while the remaining 150 students came from more than eighty other countries. Moreover, of the fifty places reserved for American students, twenty-five students attended classes at the New Mexico campus, while the other twenty-five were enrolled at one of the twelve other UWC campuses, including schools in Canada, Costa Rica, India, Swaziland, the United Kingdom, and Bosnia and Herzegovina.

The college's mission is to teach international understanding by bringing students of diverse ethnic and social backgrounds into an environment in which they must work together for success. School programs emphasize community outreach, wilderness experience, and Southwest studies through regularly scheduled community and wilderness service commitments. UWC-USA also offers the international baccalaureate (IB) program, which is one the world's first international curriculua. To fulfill the IB requirements, students perform course work in six subjects and participate in various forms of extracurricular activity. Another program called Constructive Engagement of Conflict seeks to assist students in developing skills that will enable them to understand privilege and power and to alleviate social inequities. Many UWC graduates go on to attend top institutions of higher education in countries all over the world.

them in 1954. Hammer also went into the Angus cattle raising business, and in 1954 he auctioned off his herd for more than $1 million.

Mature Wealth

By the mid-1950's, Hammer had retired and was living in California. In 1956, he and his third wife, Frances, invested $100,000 in two California oil wells that Occidental Petroleum planned to drill. Occidental owned only eight nearly played-out wells and had sales of only $30,000 a year. After both wells struck oil, Hammer decided to come out of retirement and become involved in the company's operations; he became president and chairman of Occidental in 1957. At the same time, he acquired the moribund Mutual Broadcasting System and sold it a year later for $1.3 million. Two years later, Hammer acquired Gene Reid Drilling Company of Bakersfield, California. In 1961, when the company drilled the Lathrop field in San Francisco, it found natural gas worth hundreds of millions of dollars. Occidental Petroleum scored a major victory in 1966, when the company, which had been granted the rights to explore and use Libya's natural resources, discovered a billion-barrel oil field. In another important deal, Occidental acquired Cities Service Company, an oil firm in Oklahoma, for $4 billion in 1982. This transaction made Occidental the eighth largest oil company in the United States. Other acquisitions included Midcon, a gas pipeline company for $3 million in 1985, and Cain Chemical for $2.2 billion.

Hammer did not focus only on oil and natural gas ventures. For example, he bought Iowa Beef Packers, the biggest meatpacking business in the United States, for $750 million in 1981; six years later, he sold 40.5 percent of this company for $960 million. He also transacted important business deals with other countries, such as selling phosphate fertilizers to the Soviet Union in exchange for ammonia and urea, constructing a phosphoric acid plant in England, and developing a coal mine in China.

Forbes magazine ranked Hammer as one of the wealthiest Americans in 1987. His fortune diminished substantially after that year and was estimated to be between $100 million and $180 million. He owned less than 1 percent of Occidental stock, and he used his unchallenged power as the company's chief executive officer and chairman to fund his personal spending. He bought one of Leonardo da Vinci's notebooks, *Codex Leicester* (written between 1490 and 1519), for $5.3 million. Occidental paid more than $80 million to build the Armand Hammer Museum; the company also provided the museum with a $36 million endowment to pay for operating expenses. The museum, opened to the public in November, 1990, housed Hammer's art collection, which was valued at $300 million. He also donated to charities, although there was some question if these donations were made from his personal funds or from Occidental's money. Some of his important philanthropic contributions included $14 million to the charities of Charles, Prince of Wales; donations to the Armand Hammer Center for Cancer Biology at the Salk Institute in La Jolla, California; and the Hammer Prize for cancer research, a ten-year, $1 million program.

Hammer died at his home in Los Angeles, California, in 1990 at the age of ninety-two after suffering from chronic anemia, bronchitis, a kidney ailment, prostate enlargement, an irregular heartbeat, and bone marrow cancer. He had established a confidentially administered fund to provide the proceeds of his fortune to two institutions—his museum and the Armand Hammer United World College of the American West. According to his employment contract, Occidental had to pay him a $2.3 million salary until his ninety-ninth year. A grandson from his second marriage, Michael Hammer, was the executor of his estate and the administrator of his living trust. Michael dealt with inheritance disputes and claims from charities against Hammer's estate. At least two cases were settled. Hillary Martha Gibson, Hammer's former mistress, claimed he had promised to support her for the rest of her life. Her claim was settled out of court in 1996, and she received $4.2 million. In addition, a political organization to which Hammer had pledged $50,000 in 1990 received the money in 1997.

Legacy

Armand Hammer left a significant legacy as both a businessman and philanthropist. He controlled Occidental Petroleum for more than thirty years, and in that time he transformed it from a small local firm to a major worldwide oil and gas company. In 2009, Platts, a leading energy information provider, placed Occidental at twenty-one on a list of the top 250 global energy companies.

As a philanthropist, Hammer donated a large collection of Old Masters and Impressionist art to the Armand Hammer Museum. This facility, managed by the University of California, Los Angeles, has contributed to the intellectual life of the campus and the community at large. The United World College of the American West, founded by Hammer in 1982, continued to pioneer innovations programs in multicultural and global education into the twenty-first century.

Wade Hampton

American planter, military leader, and politician

Born into a rich South Carolina family, Hampton gained wealth of his own as a planter before the Civil War. Suffering financial losses because of emancipation and the war, he afterward became a symbol of Southern honor.

Born: March 28, 1818; Charleston, South Carolina
Died: April 11, 1902; Columbia, South Carolina
Also known as: Wade Hampton III
Sources of wealth: Inheritance; real estate; slaveholding
Bequeathal of wealth: Unknown

Early Life

The wealth Wade Hampton III possessed before the Civil War originated with his grandfather Wade Hampton I, a backwoods businessman in South Carolina who grew rich during the American Revolution. When he died in 1835, his estate was worth $1,641,065, making him one of the foremost American planters. His son Wade Hampton II became the owner of thousands of acres of lands and hundreds of slaves, with property in Mississippi as well as South Carolina. Wade Hampton III was born in Charleston, South Carolina, on March 28, 1818, and he learned to ride and hunt and be a gentleman. In addition, he studied Greek and Latin at South Carolina College, from which he graduated in 1836, and later studied law.

First Ventures

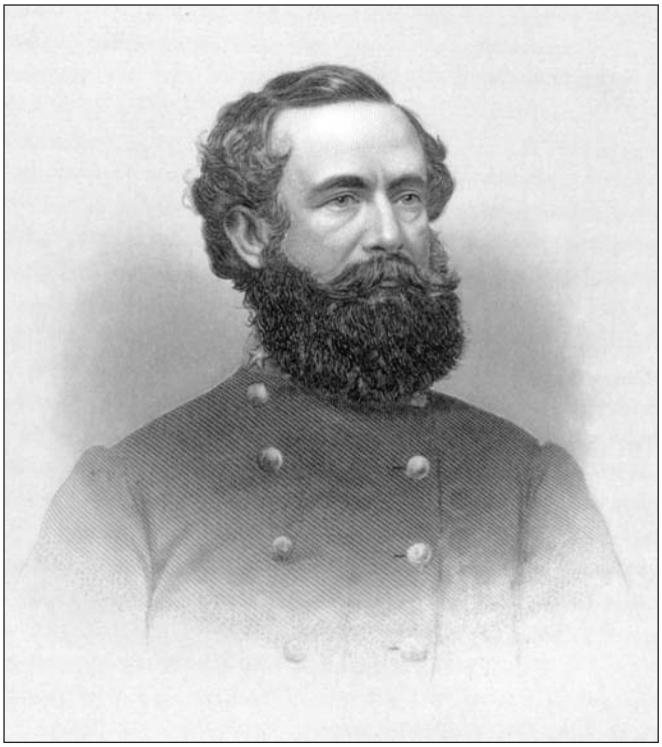
During ten years in the 1840's and 1850's, Hampton invested deeply in the raising of cotton in Issaquena and Washington Counties, Mississippi, where the soil was better than in South Carolina. In Mississippi, he bought four plantations with a total of eight thousand acres, in addition to a hunting preserve of more than two thousand acres. In 1855, he borrowed $170,000 from the Bank of Louisiana. When his father died in 1858 without a will, he worked with his brothers and sisters to divide their inheritance equitably. Through this agreement, he acquired the Walnut Ridge Plantation and its slaves in Mississippi, but he also acquired four-fifths of his father's $500,000 debt.

Mature Wealth

At the beginning of the Civil War, Hampton owned nine hundred slaves and twelve thousand acres of land. Although he thought secession was unwise, he believed the South had a right to secede when President Abraham Lincoln in 1861 called for soldiers to crush Southern resistance. Hampton viewed Lincoln's remarks as a declaration of war against the Confederate states. Despite Hampton's financial trouble, he promised his cotton crop of 1861 to the Confederacy, organized the thousand-man Hampton Legion, and paid for much of his men's equipment.

Starting the war as a colonel, Hampton rose to lieutenant general and proved he was an officer who skillfully led his men in battles and tried to ease their sufferings off the battlefields. The war, however, was a disaster for him. A brother and a son were both killed in action, he himself was wounded, through necessity his debts went unpaid, and Union troops devastated his Mississippi property. In 1865, Union soldiers burned the mansion at his Diamond Hill Plantation in South Carolina, and Hampton's outnumbered army had to retreat from Columbia, South Carolina, leaving it to burn under enemy occupation.

Bankruptcy came in December, 1868, when Hampton owned real estate worth $235,500 and personal property



Wade Hampton. (Hulton Archive/Getty Images) worth $7,905 but owed $1,012,328 and had received nothing for his freed slaves. Eventually, Hampton's household goods were auctioned in Columbia for a total of $118.65. As the only bidder for Diamond Hill, Hampton himself bought what was left of it for $100. Embarrassed at his financial trouble, Hampton still wanted to pay his creditors in full but found that he could never do so.

Legacy

The life of Wade Hampton III as a materially rich man ended in 1868, but as a man of modest means he became rich in the esteem bestowed upon him by most Southerners and even some Northerners. After the Civil War, he served as governor of South Carolina and as a U.S. senator from this state. A Democrat born into the ruling class of the Old South, he believed that he and men like him should govern for the good of everyone, regardless of race. He remained faithful to his state and his former comrades in arms, and while acknowledging Southern military defeat, he defended what he considered the justice of the Confederate cause. Upon his death from heart disease on April 11, 1902, in a house his fellow South Carolinians had given him in Columbia, the South mourned.

John Hancock

American merchant, landowner, and politician

As one of the wealthiest men in colonial America, Hancock's business ventures placed him in direct conflict with Great Britain's taxation and commerce laws, propelling him into political action during the American Revolution.

Born: January 12, 1737; North Braintree (now Quincy), Massachusetts
Died: October 8, 1793; Quincy, Massachusetts
Sources of wealth: Trade; real estate
Bequeathal of wealth: Spouse

Early Life

John Hancock was born January 12, 1737, in North Braintree (now Quincy), Massachusetts, to Reverend John Hancock and Mary Hawke Thaxter Hancock. When his father died in 1744, Hancock was sent to live with his father's brother and wife, Thomas and Lydia Hancock. Thomas owned a large estate, Hancock Manor, and ran a highly successful importing business, the House of Hancock, which made him one of the richest men in Boston. Thomas and Lydia were childless and raised young Hancock as their own son. Hancock graduated from Harvard University in 1754 and then went to work for his uncle.

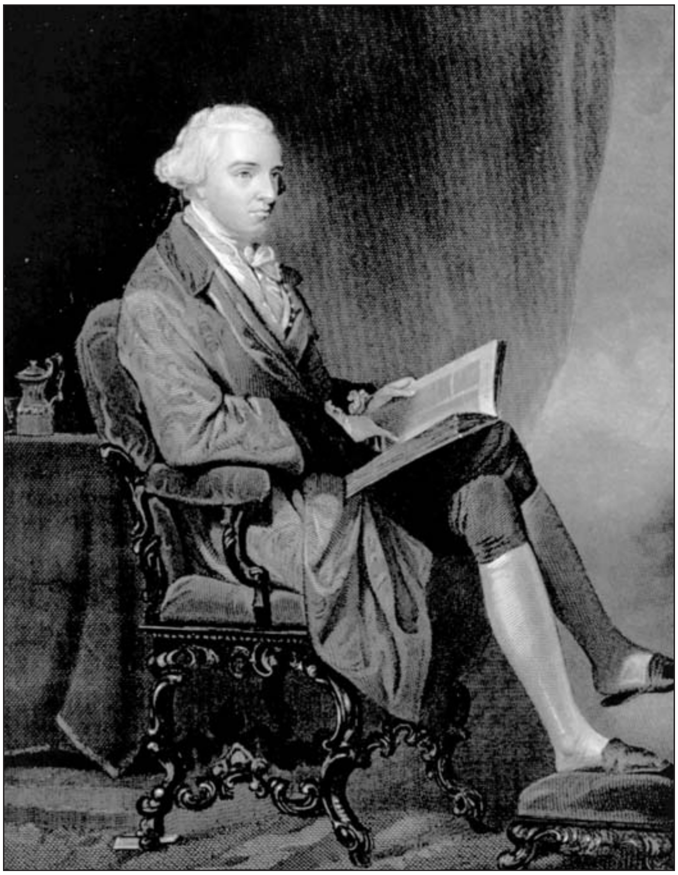
First Ventures

Hancock lived in England from 1760 to 1761, and while there he made many profitable connections with merchants who were interested in exporting their goods to the colonies on his ships. In 1764, Thomas died, leaving John the House of Hancock. John also inherited Hancock Manor, Thomas's estate covering more than one thousand acres. John Hancock was now one of the wealthiest men in Boston.

In 1764, England enacted the Sugar Act in order to obtain tax revenues from the colonies. Many Bostonians opposed the act, protesting that they were being taxed without receiving government representation. Hancock, however, considered himself to be a loyal British subject, and he believed that England had a right to tax the colonies. However, with the imposition of the Stamp Act in 1765, Hancock joined the boycott of British merchandise to protest the new tax, although his main objection was not political but was based on the adverse economic impact of the tax on his business.

Mature Wealth

When Hancock joined the protest against the Stamp Act, he became very popular among Bostonians, who elected



John Hancock. (Library of Congress)

him to the Massachusetts House of Representatives. The British finally repealed the Stamp Act, but in its stead placed burdensome duties on imports through the Townshend Acts of 1767. British customs officials targeted Hancock, one of the wealthiest colonial merchants, by charging that he was smuggling goods on his ship *Lydia* and later on his ship *Liberty*. The British seized *Liberty*, causing riots and elevating Hancock to even greater popularity among Bostonians.

The British revised the Townshend import taxes in 1770, which quieted the protests until 1773, when they imposed the Tea Act. Hancock did not directly participate in the Boston Tea Party on December 16, but he supported the action. The British then enacted the Boston Port Act and appointed a new governor, actions that led Massachusetts to form a provincial congress with Hancock as president. On May 24, 1775, the Continental Congress, meeting in Philadelphia, elected Hancock as its president. He went on to be a major player in the American Revolution. As the president of the Continental Congress, he was the sole signer of the original copy of the Declaration of Independence before it was sent to the printer.

In 1775, Hancock married Dorothy Quincy. The couple had two children; baby Lydia died at ten months and her brother John died when he was nine. After the American Revolution, Hancock was elected governor of Massachusetts. While the war depleted much of his wealth, he still was able to loan money to his friends and to be a generous philanthropist. Hancock died in his home on October 8, 1793, with his wife at his side.

LEGACY

Hancock's wealth and his desire to protect his business ventures inexorably drew him into the conflict with Britain that resulted in the American Revolution. Perhaps Hancock's most memorable legacy in the birth of the United States is his prominent signature on the Declaration of Independence. The phrase "putting your John Hancock on it" is popular slang for signing a document. In his honor, several states have cities and counties named Hancock, and two U.S. Navy ships were named for him, as was a Boston-based insurance company founded in 1862.

Edward H. Harriman

American railroad magnate and speculator

Although Harriman made his great fortune manipulating railroad stock, his genius for reorganizing poorly run lines and his modernization of railroads benefited the American transportation network.

Born: February 20, 1848; Hempstead, New York
Died: September 9, 1909; Orange County (now Tuxedo), New York
Also known as: Edward Henry Harriman; E. H. Harriman
Sources of wealth: Railroads; real estate; investments
Bequeathal of wealth: Spouse; children

Early Life

Edward Henry Harriman (HAR-ree-muhn), widely known in adulthood as E. H. Harriman, was born in 1848 in Hempstead, Long Island, New York, to Orlando Harriman, an Episcopal clergyman, and his socialite wife Cornelia Neilson Harriman. Much of Edward's boyhood was spent in New Jersey. The family had been established in America since Edward's great-grandfather William emigrated from England in 1795. William became well-off in commercial ventures, so the Harriman family was in comfortable circumstances at the time of Edward's birth. By the age of fourteen he had already ended his schooling at a New York private school and went to work as an errand boy on Wall Street, where his Uncle Oliver had established himself. Edward swiftly advanced to a position as managing clerk, and by the age of twenty-one he had purchased a seat on the New York Stock Exchange with $3,000 borrowed from his uncle.

First Ventures

In his twenties, Harriman purchased a Hudson River steamboat. In 1879 he married Mary Williamson Averell, the daughter of a banker and president of a railroad. The marriage apparently was one catalyst for Harriman's continuing interest in transportation companies. In 1881, at the age of thirty-three, he was well on his way to becoming a railroad magnate after buying a failing New York State railroad company, the Lake Ontario Southern Railway, and turning it around. He made a substantial profit from selling the line to the Pennsylvania Railroad, and in 1883 he purchased the Illinois Central Railroad. It was during this time that he deepened his intimate knowledge of railroad operations and his line prospered even through the economic downturns of the 1890's.

Mature Wealth

Since 1897, Harriman had been a director of the Union Pacific Railroad, a once healthy line but in receivership since the Panic of 1893. Beginning in 1898, he was chair of the railroad's executive committee, which put him in a position of almost absolute authority over the company's operations. Already a rich man, this venture increased his wealth considerably. He invested an estimated $25 million in Union Pacific and by 1901 had successfully revived the company. Union Pacific's control of two Oregon railroads gave it an outlet to the West Coast, and thus

Arden House

In 1885, Edward H. Harriman, known as a great lover of nature, began to purchase land in Orange County, New York, near the towns of Woodbury and Tuxedo, to protect the area against encroaching lumber interests. The area of his purchases, originally known as Greenwood, had been noted for the iron works established by Robert Parker Parrott and his brother Peter Parrott in the early nineteenth century. Harriman bought the initial 7,863 acres of the Parrott estate, including a small cottage, at auction for a price of $52,500. The sale was undoubtedly facilitated by the fact that New York's iron industry, and hence the Parrotts' commercial enterprises, had gone into decline. Harriman eventually established an estate on his property of some forty thousand acres, including a lake, and built an imposing granite house of 100,000 square feet, resembling a stone castle, which he called Arden. The residence was designed by the architectural firm of John Carrère and Thomas Hastings. Located atop Mount Orama, the mansion had sweeping views of the Ramapo River and the Hudson Highlands.

Construction of the house began in 1905 and was completed in 1909, only months before Harriman's death. During its construction, Harriman had a cable railroad built up the side of the mountain in order to transport workmen and materials. In 1915, his widow Mary Harriman gave Arden House to her son Averell, and she also donated ten thousand acres and $1 million for a state park, which was ultimately named for the family. The idea for this donation had originally been her husband's. As a result of the donation, some seventy thousand acres of what had once been Harriman landholdings are preserved by the state of New York as parkland and wilderness.

During World War II, the U.S. Navy used the estate as a convalescent hospital, and in 1950 Averell and his financier brother E. Roland Harriman sold Arden House to Columbia University. The residence was designated as a National Historic Landmark in 1966 and has also been placed on the National Register of Historic Places. Columbia University operated Arden House until 2005 as part of its Arden Conference Center, which also included the Arden Homestead. In 2007, Columbia sold the vacant house and 450 acres to the Open Space Conservancy for approximately $4.5 million. The Arden Homestead was then sold to a private buyer, who planned to make it a family residence.

enabled it to benefit from the West's increasing role in commerce. In recognition of his role in strengthening the company, Harriman was made president of the line in 1903.

Harriman went on to acquire both the Central Pacific and Southern Pacific lines following the death of Collis P. Huntington in 1900. Harriman consummated the purchase in 1901 with $100 million in bonds that the Union Pacific board had authorized him to spend as he saw fit. As he had with past acquisitions, he greatly improved these lines' operations by upgrading their trackage and overseeing the construction of alternate routes. With these purchases he controlled most of the West Coast's rail traffic, as well as lines headed east to New Orleans.

With Harriman's purchase of the Chicago and Alton Railroad in 1899, there were accusations of stock watering when he issued stock that seemed to have no benefit other than his own self-enrichment. To cement his position in the Midwest, he launched an effort to gain control of the Chicago, Burlington, and Quincy line. Railroad magnate James J. Hill, backed by powerful financier J. P. Morgan, also coveted the railroad and a stock buying frenzy ensued, which ended with each controlling a portion of the company's stock. Their contest caused a financial panic in 1901, and their battle was ultimately settled by the formation of the Northern Securities Company, in which each had a stake. In 1904, the U.S. Supreme Court ruled that this company was a combination in restraint of trade and ordered it to dissolve and dispose of its stock. Harriman, with his strong business acumen, eventually profited from this setback to the tune of more than $50 million.

Harriman used his enormous assets to purchase stock in other railroads all over the United States. Even though many of his purchases did not result in his controlling the lines, they did reinforce his great influence in the railroad industry. In 1906, the Interstate Commerce Commission (ICC) opened an investigation of his financial dealings and ultimately determined that they were "contrary to public policy." Harriman believed that the investigation sprang from the personal animosity that trust-busting President Theodore Roosevelt felt for him. Their enmity apparently dated to a Republican campaign contretemps in New York State in 1904. However, whether or not a personal motive may have been involved, Roosevelt was a strong proponent of curbing combinations and monopolies and Harriman was an obvious target. Amendments that strengthened the Interstate Commerce Act were passed in his administration, as well as more effective regulation of railroads. With the Northern Securities court decision fresh in the public mind, the ICC also reopened the Chicago and Alton stock watering issue and the commission described Harriman's stock transactions as "indefensible financing." One result of the investigation was the public disclosure of many of Harriman's financial manipulations and his use of the railroads he controlled for financial gain.

Harriman's testimony before the ICC revealed his overweening ambition and negatively reinforced the public's image of him as one of the leading "robber barons" of his day. He was pilloried in the press as the personification of all the wealthy businessmen who used unscrupulous methods to gain their fortunes. He reacted to this with a silence that most considered to be the height of arrogance. However, public perceptions did not deter him from his goal of controlling much of the transportation system in the United States. He owned a fleet of steamships that sailed to Asia, and he had an unfulfilled scheme for a line that would sail around the world. He also became involved in the running of banks and insurance companies. His interest in the latter industry brought another investigation of his activities, which revealed no obvious wrongdoing.

It was not only the pursuit of wealth that occupied Harriman. He used some of his money in philanthropic ways, funding such ventures as a club for boys of foreign parentage in New York. He also had great scientific interests that resulted in his cofunding, with the Smithsonian Institution, an 1889 expedition by ship to Alaska, where a fjord was named for him. Among the twenty-five scientists and naturalists on the expedition with Harriman were naturalists John Muir and John Burroughs. The ship journeyed for two months, traveling a total of nine thousand miles, with much valuable scientific research and a lengthy series of publications as the result of the voyage. Harriman also provided generous monetary assistance to victims of the San Francisco earthquake of 1906 and the flooding of the Colorado River in California's Imperial Valley.

Upon Harriman's death in 1909 at the age of sixty-one, his widow Mary and his three sons and three daughters survived him. One of his sons was William Averell Harriman, later to become famous as Averell Harriman. The younger Harriman had a distinguished career serving as an ambassador and negotiator under presidents from Franklin D. Roosevelt to Lyndon B. Johnson; he also served as governor of New York from 1954 to 1958.

Legacy

Although Edward H. Harriman was reviled toward the end of his life as an exemplar of the ills of capitalism, he was a genius in his own way. His grasp of details was masterful and he used this talent to control both people and events. He has been called the last great individualist, and if he was hated by many he also was admired by many, including those who knew him well. In the twenty-first century, he was still considered to have been one of the towering figures among nineteenth century industrialists. His charitable works continued to be appreciated in the enjoyment of the parks his money made possible. In 1913, his wife financed the E. H. Harriman Award for outstanding achievement in railroad safety, an award still presented in the twenty-first century.

Hārūn al-Rashīd

Persian king

Hārūn al-Rashīd was the fifth ruler of the Muslim ʿAbbasīd Dynasty. He inherited great wealth and added to it during his reign, using his fortune to make Baghdad the intellectual and economic capital of the Middle East.

Born: February 763/766; Rayy, Persia (now in Iran)
Died: March 24, 809; probably Khorāsān (now in Iran)
Also known as: Hārūn al-Rashīd ibn Muḥammad al-Mahdi ibn al-Mansur-al ʿAbbasi; Hārūn ar-Rashīd; Aaron the Upright
Sources of wealth: Inheritance; conquest; trade
Bequeathal of wealth: Unknown

Early Life

Hārūn al-Rashīd (hah-RUHN al-rah-SHEED) was born into wealth. He became caliph (king) when he was in his early twenties. Although never conclusively proven, rumors at the time of his succession accused his mother, a Yemenite concubine, of poisoning other possible successors in order for Hārūn al-Rashīd to inherit the caliphate and its riches unopposed.

First Ventures

The ʿAbbasīd armies controlled much territory throughout the Middle East. Hārūn al-Rashīd acquired a reputation as a daring raider, who obtained wealth from captured Byzantine trade caravans, spreading this looted treasure throughout Anatolia to ensure loyalty among his subjects. His court and the other residents of the city of Baghdad quickly became famous for their luxurious lifestyles.

Mature Wealth

ʿAbbasīd rule reached its pinnacle during Hārūn al-Rashīd's reign (786-809). He provided stable governance that enabled his kingdom to expand its trade. As a

Representatives of Hārūn al-Rashīd present Charlemagne with extravagant gifts to impress him with the wealth and power of Hārūn's court. (F. R. Niglutsch) result, enormous amounts of money in tribute and tax receipts flowed into the ʿAbbasīd court in Baghdad. Hārūn al-Rashīd was also a patron of the arts and an intellectual. He surrounded himself with scholars, poets, architects, and engineers. He built an enormous palace to house the hundreds of servants and laborers necessary to run his court in the style he desired. He also liked to impress visitors with the wealth of his court. His table service included only gold and silver dining and serving pieces, many of them decorated with precious stones. Diplomatic relations and trade with China increased during his reign so that Chinese luxuries were common in Baghdad.

When Charlemagne crowned himself Holy Roman Emperor in 800, Hārūn al-Rashīd sent luxurious congratulatory gifts designed to dazzle the Carolingian court and impress it with the wealth and power of the ʿAbbasīd caliphate. In addition to sending an elephant and many Chinese silks, Hārūn al-Rashīd gave Charlemagne a water clock as an example of ʿAbbasīd engineering superiority; upon the hour, bronze balls dropped into a dish that turned a gear, opening a door on the face of the clock from which emerged figures of Arabian knights. Hārūn al-Rashīd's extravagant gifts made such an impression on Charlemagne and his court that descriptions of these presents were included in Charlemagne's official biography.

Each year, Hārūn al-Rashīd received seventy thousand gold pieces in tribute from Saint Irene, the Byzantine empress, in exchange for Hārūn al-Rashīd's promise not to sack the Byzantine capital at Constantinople. The annual reception of this tribute in Baghdad was a civic holiday and the cause of lavish entertainment for the Byzantine ambassador and troops who brought the tribute to the city. When the usurper Nicephorus I overthrew Irene, he demanded the return of the tribute money that the Byzantines had paid over the years. In response, Hārūn al-Rashīd led a large army into Byzantine territory. His army looted everything of value it could capture. Nicephorus falsely promised to restore the annual tribute payment. This falsehood caused Hārūn al-Rashīd to send his army on other looting expeditions through the wealthy heartland of Byzantine territory.

Legacy

Hārūn al-Rashīd improved both the political and economic conditions of his kingdom. He avoided unnecessary and costly military campaigns and obtained additional sources of court revenue. He died leaving a substantial surplus in the court treasury. *The Arabian Nights' Entertainments* (fifteenth century; also known as *The Thousand and One Nights*) is based on an idealized version of Hārūn al-Rashīd's life at court.

JOHN HAWKWOOD

English mercenary soldier and landholder

Hawkwood from all accounts was the most successful of the foreign mercenaries, or condottieri, *who amassed great fortunes from payments for military service to the various rival governments in fourteenth century Italy. He used his earnings to purchase vast landholdings in Italy and England, accumulating an estate that rivaled, and in some cases exceeded, those of European royalty.*

Born: c. 1323; Sible Hedingham, Essex, England
Died: March 16 or 17, 1394; Florence (now in Italy)
Also known as: Giovanni Acuto; John the Sharp
Sources of wealth: Government; real estate; investments
Bequeathal of wealth: Spouse; children

EARLY LIFE

John Hawkwood was the second son of a well-to-do merchant in rural England. When his father died, Hawkwood left home and worked briefly as a tailor before joining the army of King Edward III. He fought with the English forces in France during the last stages of the Hundred Years' War; he was almost certainly involved in the fighting at the Battles of Crécy (1346) and Poitiers (1356). When peace was declared, Hawkwood joined a group of discharged English soldiers who chose to stay on the Continent and offer their services to the leaders of rival factions engaged in civil wars in Italy. Leaders of these mercenary bands came to be known as *condottieri* because they signed a *condotta*, or contract, to fight in the service of one or another of these factions for a specified period of time. Sometime before Hawkwood left England for good he married and had a daughter; she would eventually marry one of Hawkwood's lieutenants and inherit a portion of his English estate.

FIRST VENTURES

Hawkwood began his career as a soldier of fortune as a member of the group known as the Great Company, which first earned notoriety by traveling to Avignon to extort money from the pope, who was in exile there. As temporal ruler of the Papal States, a large section of central Italy, the pope was frequently engaged in disputes with other rulers of the various city-states in the north and the Kingdom of Naples in southern Italy. The pope hired the Great Company to fight against the Milanese, who were threatening his control over a portion of the Papal States. Hawkwood went with this force to Italy, where it soon came to be called the White Company. Initially he was a minor offi-

A monument to John Hawkwood, who is known here by his Italian name, Giovanni Acuto, or John the Sharp. (The Granger Collection, New York) cial in this force, but by 1364 he was commander of the company and in a position to negotiate contracts that would make him very wealthy.

Mature Wealth

From 1364 until his death, Hawkwood served as a soldier-for-hire. His first leadership position came in service to Pisa. Although his first campaign was not auspicious, within five years Hawkwood had earned a reputation as a loyal employee, a sound tactician, and a hard negotiator. Over the next two decades he was at times in the employ of both the pope and the city of Milan, in which the autocratic and bellicose ruler Bernabò Visconti eventually rewarded Hawkwood by allowing him to marry Visconti's illegitimate daughter Donnina. In 1379, while employed by Padua, Hawkwood achieved a great victory at Castagnola. During the 1380's he secured employment with Florence and remained on that city's payroll until he died.

Hawkwood was able to negotiate lucrative contracts for himself and the forces that served him because he mastered the art of war as it was practiced in the Middle Ages. In addition to assembling a competent fighting force and hiring trustworthy lieutenants, many of whom were English like himself, he developed a network of informants that kept him abreast of military and political affairs throughout the country. He was a shrewd tactician adept at battlefield maneuvers developed during England's fight against France. Skilled at preserving his forces, he was a master of feints, delay tactics, strategic retreats, and night movements. By the 1370's he was the most sought-after leader among the dozens of *condottieri* available to rulers wishing to extend their influence or defend their territory from rivals.

Because the Italians had difficulty pronouncing his English name, he became known by a dozen or more appellations, but one reflects something of his professional personality: "Giovanni Acuto," or John the Sharp, a title testifying to Hawkwood's military and political acumen. Hawkwood always considered himself an Englishman, and at times he served as an ambassador for the English kings in various negotiations with Italian and papal leaders.

Hawkwood was adept at negotiating with both sides in a conflict, driving up the bidding for his services. He was not above resorting to veiled threats of retaliation if his financial demands were not met. Although he had initially earned a reputation for loyalty by refusing to desert Pisa in favor of a more lucrative proposition from a rival city, throughout his career Hawkwood showed a willingness to accept offers based on the size of the payment rather than the justness of an employer's cause. Like most mercenary commanders of his day, he accepted personal payments outside the terms of the contract—

Mercenaries, Pirates, and Soldiers of Fortune

John Hawkwood and his fellow *condottieri* were not the only fortune-seekers who chose warfare or brigandage as the path to riches. Classical accounts abound with tales of mercenaries fighting for the Greek city-states and the Roman Empire. In the later Middle Ages, mercenaries were often the preferred solution for cities and even empires intent on waging war. Only a handful of soldiers for hire were as fortunate as Hawkwood's contemporary, Werner von Urslingen, who earned enough money to purchase great estates in his native Germany and retire there after years of fighting in Italy.

While the number of independent companies of soldiers dwindled during the Renaissance, the practice of governments hiring mercenaries persisted well into the nineteenth century, although most who signed on did not gain the riches they sought and many died in penury and debt. Mercenaries were active throughout the twentieth century, particularly in Africa and Latin America. A more sophisticated form of mercenary activity developed in the United States, where private firms like Blackwater Worldwide received contracts from the government for more than $1 billion, adding to the fortune of the company's chief executive Erik Prince.

On the high seas, pirates formed their own societies aimed at earning wealth through plunder, and a number of their captains amassed notable fortunes. The seventeenth century pirate Jan Janszoon van Haarlem, known as Murad Reis, parlayed his service to the Ottoman Empire into a lucrative position as head of the Republic of Salé (now in Morocco), from which he directed a thriving pirate trade. Both Edward Teach, the notorious Blackbeard, and the Louisiana pirate Jean Lafitte accumulated significant wealth, although both lost their holdings to government bounty hunters. One of the most lucrative ways sailing captains could amass great fortunes during the seventeenth and eighteenth centuries was through privateering; commissions from various governments gave them authority to seize ships of rival nations and keep a large portion of the cargo for themselves, and several privateers retired as wealthy gentlemen. In the twenty-first century, the lure of quick riches has led many poor Somalis to take up piracy in the Indian Ocean, seizing ships for which corporations have shown a willingness to pay millions in ransom money.

what would later be termed bribes—to commit his forces. Typical of this kind of negotiating tactic was Hawkwood's effort in 1375. He extracted a payment of 130,000 florins to withhold his forces from attacking Florence, then obtained a payment of 30,500 florins from Pisa for the same reason, identical payments from Lucca and Siena for the same guarantee, and similar payments from Pisa, Bologna, and Naples. While some of this money went to his troops, Hawkwood certainly pocketed a notable percentage of these settlements. Hawkwood also learned early in his career the value of intimidation, and he parlayed his reputation as a successful commander into substantial annual retainer fees. By the time he sold his services to Florence, he was already collecting "pensions" from a number of cities, including Lucca, Naples, and Milan. These annual payments were actually a form of extortion paid by city officials to guarantee either that Hawkwood would lead their forces or that he would refrain from attacking their cities if he were not in their employ.

Most frequently Hawkwood was paid in cash, usually gold florins, the most widely used currency of the day. During the thirty years he served as a captain of forces, his earnings ranged between 6,000 and more than 80,000 florins annually. By comparison, the annual earnings for the chief executive of Florence were approximately 100 florins per year, and for a skilled craftsman were about 30 florins. Hawkwood supplemented this income with bribes and with ransoms collected for prisoners taken during military operations. From time to time he was awarded entire towns as part of his pay, so he was able to generate additional revenues from taxes and fees paid by the towns' citizens.

Hawkwood invested a large portion of his money in land. During his career he accumulated estates throughout Italy, chiefly in Lombardy, Romagna, Umbria, Pavia, Naples, and Tuscany. For years he made a practice of purchasing property in England near his boyhood home in Essex. He was also involved as an investor in Venice and Florence, putting some of his money to work in financing public debt. In his later years Hawkwood began making provisions for the children he had with Donnina. He convinced Florentine officials to provide generous dowries for his three daughters and to allow his son to inherit his Italian property.

Legacy

Hawkwood did not make a will before he died, so it is exceedingly difficult to estimate the value of his estate. In the years before his death he began liquidating his holdings in Italy, ostensibly so he could return to England with his fortune. After Hawkwood's death his widow, Donnina, made an attempt to claim his English holdings, but she met with little success. With the help of the Crown, however, his son John was able to establish his claims to Hawkwood's English landholdings and eventually took over sizable manors and other properties.

Although the era of the *condottieri* came to an end soon after Hawkwood's death, his legacy as a soldier of fortune is easier to document. He was celebrated in Florence after his death as one of the city's greatest champions, and his career is chronicled by a number of late medieval and Renaissance historians. Additionally, his exploits have served as the basis for a number of novels.

George Hearst

American mining magnate and politician

Hearst made his fortune by prospecting the California gold mines. His acquisition of the San Francisco Examiner *would eventually enable his son, William Randolph Hearst, to become one of the most powerful newspaper publishers of the twentieth century.*

Born: September 3, 1820; Franklin County, Missouri
Died: February 28, 1891; Washington, D.C.
Source of wealth: Mining
Bequeathal of wealth: Spouse; children

Early Life

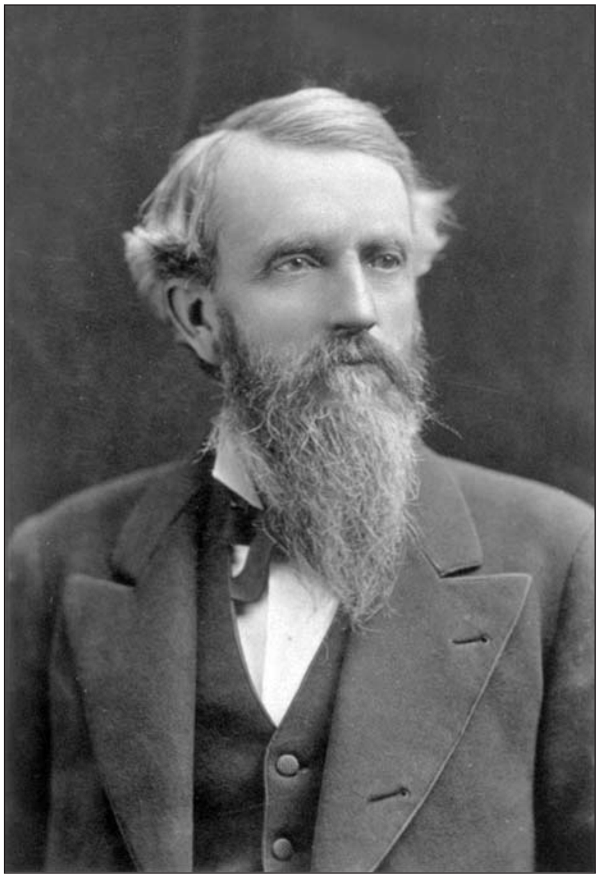
George Hearst, the son of William G. and Elizabeth Collins Hearst, was born on September 3, 1820, on his parents' farm near Sullivan, Missouri. He was the oldest of three children. Starting at an early age, Hearst worked on the family farm. He had little public education but was schooled by his mother. He enjoyed reading books about mining that he borrowed from the family doctor, Silas Reed, who was also a lead miner.

In 1846, when Hearst was twenty-six, his father died, leaving the family $10,000 in debt. Hearst opened a small general store and leased and mined lead and copper mines. Within two years he had earned enough money to pay off his father's creditors.

First Ventures

Hearst first heard about gold in California in 1849, and in 1850 he set out for California with sixteen other men, including his cousins Joseph and Jacob Clark. At first, the group tried placer mining near Sutter's Mill, but after a cold winter with little to show for their efforts they moved on to Grass Valley, California. Here Hearst established the Merrimac Hill and the Potosi Mines, which he sold in 1852 for a healthy profit. Hearst and his cousins continued to discover ore lodes and then sell them, continuously making profits.

In 1857, Hearst discovered and established the LeCompton Mine near Nevada City, California. Two years later, he moved on to the Washoe Diggings in Nevada, where he bought a share of the Gold and Curry Mine for $450. He continued to prospect silver and gold and bought a one-sixth share of the Ophir Mine for about



George Hearst. (Courtesy, The Bancroft Library, University of California, Berkeley)

$300. He solved the problem of how to separate gold and silver from the ore in these mines. News of his success spread and miners flocked to the area, which was to become known as the Comstock Lode. Almost overnight, Hearst was a millionaire.

Mature Wealth

Hearst established Hearst, Haggin, Tevis & Co., and this firm eventually owned interests in mines in Nevada, Utah, South Dakota, Montana, and Peru. His Ontario Mine in Utah alone paid dividends of more than $1 million a year. His firm became the largest mining company in the United States. Although he had become one of the wealthiest men in America, Hearst still dressed in casual clothing and enjoyed his poker games, liquor, and cigars.

In 1860, when he was forty years old, Hearst returned to Missouri to be with his dying mother. There he met nineteen-year-old Phoebe Elizabeth Apperson. Her parents objected to Hearst because of his age, so the two eloped on June 15, 1862, and they moved to San Francisco, California. They had one son, William Randolph Hearst, born on April 29, 1863.

Hearst was elected to and served in the California Assembly from 1865 to 1866. He purchased a forty-eight-thousand-acre ranch in San Simeon, California, and built a home there for his family. In 1887, Hearst was elected to the U.S. Senate and moved to Washington, D.C. He died on February 28, 1891, while still serving his Senate term.

Legacy

George Hearst had a major influence on mining in the United States. His Homestake Gold Mine in South Dakota became the most productive gold mine in the United States, and his Montana Anaconda Copper Mine produced 20 percent of the world's copper supply by the turn of the century.

Perhaps his greatest legacy, however, arose from his acquisition of the *San Francisco Examiner* as payment for a gambling debt in 1880. In 1887, his son William Randolph Hearst, who had an interest in journalism, asked his father if he could run the newspaper. George Hearst agreed, with trepidation. His son eventually developed the Hearst publishing empire that had enormous influence on American politics and existed into the twenty-first century, owning newspapers, magazines, and cable television networks. In 2008, the media empire was run by George Hearst, Jr., George Hearst's great-grandson, who was ranked 215 on *Forbes* magazine list of the four hundred richest Americans, with an estimated net worth of $2.1 billion.

Phoebe Apperson Hearst

American socialite and philanthropist

Upon the death of her husband George Hearst, Phoebe Apperson Hearst took control of his fortune, becoming a strong businesswoman and generous benefactor of cultural and educational pursuits. She endowed the University of California with scholarships for women, buildings, and research funds.

Born: December 3, 1842; Franklin County, Missouri
Died: April 13, 1919; Pleasanton, California
Also known as: Phoebe Elizabeth Apperson Hearst; Phoebe Elizabeth Apperson (birth name)
Source of wealth: Marriage
Bequeathal of wealth: Children; charity; educational institution

Early Life

Phoebe Apperson Hearst was born Phoebe Elizabeth Apperson on December 3, 1842, in Franklin County, Missouri. She was the third child of Randolph and Drusilla Apperson. While living in Franklin County, the middle-class Apperson family had become friends with the Hearst family and named Phoebe after Elizabeth Hearst, who would eventually become Phoebe's mother-in-law. Phoebe was a quiet child who socialized mainly with her own family and the Hearsts. Well educated, she became a schoolteacher at a young age.

At seventeen, she fell in love with George Hearst, who had left the family home to make his fortune and returned to care for his dying mother. Hearst was twenty-two years older than Phoebe, and her parents were not happy with their daughter's choice, so the couple eloped on June 15, 1862, when Phoebe was nineteen. They moved to San Francisco, California, where a year later, on April 29, 1863, William Randolph Hearst, their only child, was born.

First Ventures

Phoebe Hearst began her cultural leadership in the early years of her marriage, as husband George worked on creating his place in the business world through mining ventures. George earned the family's wealth through investments in mines throughout the United States and Peru, including silver mining in the Comstock Lode in Nevada and gold mining in the Homestake Mine in South Dakota. While her husband built their wealth, one of Phoebe's first projects was a trip to Europe with her young son. While touring Europe, Phoebe began a lifelong appreciation of the arts, which would later influence the direction of her philanthropy. Upon returning home, she took her place as a leading socialite in San Francisco, throwing generous parties and donating to a number of charities.

On March 4, 1887, George Hearst began his national political career as a U.S. senator, and the family relocated to Washington, D.C. During her years in the nation's capital, Phoebe was involved in many philanthropic activities, including the building of the Washington National Cathedral and financing the Washington Cathedral School for girls. She was also involved in the implementation of free kindergarten programs for all children and in founding the Congress for Mothers, which later became the National Parent Teacher Association. Her work continued until George's unexpected death on February 28, 1891. When George Hearst died, he left a fortune approximated at $20 million.

Phoebe Apperson Hearst. (The Granger Collection, New York)

Phoebe A. Hearst Museum of Anthropology

Phoebe Apperson Hearst in 1901 endowed the University of California, Berkeley, with the money to create the Lowie Museum of Anthropology, now known as the Phoebe A. Hearst Museum of Anthropology. Hearst's goal in creating the museum was to share archaeological and ethnological studies as the department of anthropology developed at the university. Under Hearst's funding, the museum's collection amassed more than a quarter million objects collected by archaeologists, such as Max Uhle and George Reisner.

The museum was located in San Francisco from 1903 until 1931 and opened to the public in 1911. In 1931, its collection was moved to a building on the campus of the University of California, Berkeley, where it remained until 1959, when it was moved to the campus's Kroeber Hall. Frederic Ward Putnam was the museum's first director, serving in this position until 1909. Alfred Kroeber, a prominent anthropologist, became the second director, leading the museum from 1909 until 1947. The museum is accredited by the American Association of Museums.

The facility, which endorses education and research about history and cultural diversity, is home to an extensive collection of artifacts from around the world. The collection contains approximately 3.8 million artifacts, as well as field research, pictorial records, and visual and audio recordings. Important collections include Native American, African, Peruvian, Egyptian, Asian, and Oceanic objects.

The California collection is the largest; it contains information and artifacts collected by Kroeber and Philip M. Jones, among other anthropologists and archaeologists who worked closely with Hearst herself. Much of the early collection was gathered, cataloged, and organized by the university's first doctoral student in anthropology, Samuel A. Barrett, along with other faculty and students. The California collection also contains a number of items assembled by Ishi, who is known as the last Yahi Indian and who actually lived at the museum during the last years of his life. The museum also houses an extensive archive of field notes from archaeologists and anthropologists dating from 1900.

The museum's name was changed in 1991 to honor its founder, Phoebe Apperson Hearst. The Robert H. Lowie Gallery commemorates the professor for whom the museum was originally named.

Mature Wealth

Becoming a widow at forty-eight years of age, Phoebe would learn to control her family's wealth. She moved back to California and fell ill from the pressures of handling all of the operations George had controlled. Once she recovered her health, she returned to her former interests in art and education. In 1891, she established a scholarship for female students at the University of California, Berkeley; this led to additional gifts to the university, totaling an estimated $1.5 million. On October 22, 1896, she told the university regents that she would fund a contest to select an architectural design for the campus. She later paid for the Hearst Mining Building, honoring her late husband. She would also become one of the first women regents, serving from 1897 until 1919.

Hearst's personal expenses in the last part of the nineteenth century included the remodeling and design of George's hunting lodge in Pleasanton, California. She hired the architect Julia Morgan in 1891 to rebuild the estate into a large hacienda. She moved into the home in 1899. The residence was an art showcase in its design and contents. Here, Hearst would continue to promote cultural events as she hosted entertainment performances in the music room.

In 1895, Hearst suffered a heart attack and was treated by William Pepper, who was also provost of the University of Pennsylvania and head of the university's archaeology museum. This relationship started her interest in archaeology, anthropology, and ethnology. Through this newfound pursuit, Hearst met and studied with prominent people in these fields, such as Frank Hamilton Cushing, Philip M. Jones, Alfred Kroeber, and George Reisner. She first encouraged and supported the study of Native American artifacts in Florida and California, and she especially promoted collections of basketry and textiles. Later, as a result of having toured Egypt in 1899 with her son, she became fascinated with ancient Egyptian culture. She even traveled to Egypt to observe and participate in an archaeological dig under Reisner's leadership in 1905.

In 1906, she spent time with her family. She traveled to Europe to further her study of art and architecture, this time with her niece Anne Drusilla Apperson. She was in Europe during the earthquake that devastated much of San Francisco, including her son's publishing building, which she would later rebuild. This same year brought the birth of her first grandchild, George.

In 1912, Hearst's attention to women's needs directed her to volunteer her home for a benefit to raise money for the Young Women's Christian Association (YWCA). She not only allowed the association to host a camp on her property but also provided the tents, furniture, and sanitary systems necessary to run the camp. She also promoted small businesses by ordering all of the camp's provisions from local vendors. Her participation in this YWCA project was a result of her strong interest in promoting the healthful benefits of exercise for women.

As Hearst aged, her interests in women's topics became stronger. Although she did not support suffrage in its early stages, she had begun to see the reasoning behind it in relation to a woman's political power, especially after she took over the handling of her family fortune. As always, her first priority was motherhood, so when political issues in California began affecting women and children in negative ways, she became a supporter of women's equality, aiding in the campaign to gain women the right to vote in California a number of years before the national right was granted to women.

World fairs were a place to air topics of interest to many groups, and Hearst's pet subjects of women's roles in the home and work world were often showcased in this venue. In an effort to continue to promote women's involvement in cultural events, Hearst petitioned Congress to select San Francisco as the location for the Panama Pacific International Exposition of 1915. She used her role as honorary president of the women's board for this exposition to create a showcase of women's progress in education, culture, and service.

Hearst traveled to New York in 1919. While there, the seventy-six-year-old woman contracted the Spanish influenza during the epidemic of 1918 to 1919. She died in Pleasanton, California, on April 12, 1919.

Legacy

Phoebe Apperson Hearst's legacy can be seen in many ways. She left her wealth to her son, grandsons, niece, and various charitable organizations. She had spent her life promoting culture and education, and took a strong role in women's rights issues late in her life. Her interest in family led to her advancement of causes that would promote the well-being of women and children, including the YWCA and women's suffrage. Her interest in women's intelligence can be seen in the endowments she provided to the University of California, Berkeley; in her hiring and promotion of women professionals; in her founding programs, such as the Congress for Mothers; and in her participation in and financial support of charities, such as the Girl's Training Home in San Francisco, the California Society for Prevention of Cruelty to Children, a free kindergarten program in Washington, D.C., and the Hearst Free Library. She also founded the Lowie Museum of Anthropology at the University of California, which was renamed in her honor in 1991.

William Randolph Hearst

American newspaper publisher and media magnate

Inheriting a fortune from his father, Senator George Hearst, as well as additional wealth from his mother, William Randolph Hearst created a media empire, a chain of nationwide newspapers credited with influencing major public events, political movements, and cultural attitudes of readers of the so-called yellow press—media that sensationalized and exploited public interest in war, crime, and scandal.

Born: April 29, 1863; San Francisco, California
Died: August 14, 1951; Beverly Hills, California
Sources of wealth: Inheritance; media
Bequeathal of wealth: Spouse; children; charity; educational institution

Early Life

William Randolph Hearst grew up in California, the son of a self-made millionaire, George Hearst, who became a United States senator. The son quickly absorbed and perpetuated his father's populist politics. In 1887, after a brief period of study at Harvard University, Hearst prevailed on his father to allow him to run the *San Francisco Examiner*, a newspaper George Hearst had been unable to transform into a profit-making business. To the astonishment of his father and almost everyone else, the young Hearst built up the newspaper's circulation and eventually its profits.

Hearst's achievement set a pattern for his later behavior as an entrepreneur and media mogul. He spent lavishly on the latest printing equipment and hired the best reporters at high salaries, but he also devoted countless hours to hands-on editing of his newspapers. Hearst thought of himself as an editor first, a newspaper proprietor second. He also saw no contradiction between providing the public with sensational stories and championing causes that would improve the lives of millions of Americans. He used his wealth, in other words, not only for his own pleasure but also for the opportunity to make a difference in the lives of ordinary Americans.

William Randolph Hearst. (Library of Congress)

First Ventures

In 1896, Hearst decided to expand his business by acquiring the debt-ridden *New York Journal*. In order to do so, he had to secure the financial help of his mother, Phoebe, because the terms of his father's will (George Hearst died in 1891) did not allow his son free access to the family fortune. Although Phoebe would fret throughout her life about her son's extravagant investments in newspapers, she continued to support him, at one point guaranteeing him a $5 million line of credit.

Again, to everyone's surprise, Hearst was able to compete in New York City's crowded newspaper market. He had the daunting task of outperforming the *New York Sun*, then under the outstanding editorship of Charles Henry Dana, and the *New York World*, owned by Joseph Pulitzer, the giant among New York media moguls. In order to prevail, Hearst had to countenance hundreds of thousands of dollars of losses in his newspaper's first years of operation. However, by cutting the price of the *Journal* from two cents to one cent and hiring away virtually the entire staff of the *New York World*, Hearst proved that he could use his wealth in shrewd ways that appealed to the public's imagination. *The Journal* eventually turned a profit, and it became the base of Hearst's media empire.

Mature Wealth

The high point of Hearst's achievement as journalist and newspaper proprietor was his reporting of the Spanish-

American War. Hearst not only was on the ground filing his own dispatches from Cuba but also was hiring outstanding journalists like Stephen Crane and Richard Harding Davis to serve as war correspondents. Because of his flamboyant style, many early biographers and historians have actually given him too much credit for fomenting the events that led to the war that aggrandized his image and his media empire. Later historians have discounted the idea that Hearst had a decisive role in maneuvering the U.S. government to declare war on Spain, but he certainly spent lavishly to produce up-to-the-minute reports on military action and political developments, setting the pace for the other New York dailies.

Beginning in 1896, Hearst began to expand his publishing empire, initially buying a Chicago newspaper as a means of supporting William Jennings Bryan, the Democratic candidate for president. Hearst was the only important East Coast newspaper proprietor to support the populist Bryan, who lost the election, while Hearst enhanced his reputation as a man of the people, getting elected to two terms in Congress.

After acquiring his Chicago newspaper, Hearst expanded to other cities, including Los Angeles, Boston, Atlanta, Detroit, and Seattle. Hearst newspapers were often called part of the "yellow press" or tabloids that sensationalized the news and sometimes verged on making it up or at least exaggerating stories to sell newspapers. Headlines in Hearst newspapers could be quite misleading, even if they had a factual basis.

By the mid-1920's Hearst owned twenty-eight newspapers, as well as magazines, including *Cosmopolitan*, *Harper's Bazaar*, and *Good Housekeeping*. These publications hired the best writers, and though Hearst maintained a progressive and populist line, he welcomed writers of various persuasions to write both fiction and nonfiction. Similarly, he expanded his media interests by purchasing radio stations and investing in the motion picture industry, forming his own company, Cosmopolitan Pictures.

As a profitable media mogul, Hearst hit his peak in 1928. Thereafter his empire began to disintegrate, suffering losses during the Great Depression that began to engulf the country after the stock market crash of 1929. That Hearst's empire did not crumble is due to profits from the mining enterprises he had inherited from his father and mother (Phoebe died in 1919).

In 1937, the Hearst Corporation was forced into a court-ordered reorganization. Hearst's own private fortune remained intact, but he was no longer in the same powerful position as a media proprietor who could influence public opinion. His increasingly conservative political views also put him at odds with the majority of Americans, who generally supported the liberal administration of President Franklin D. Roosevelt. Hearst had to liquidate several of his newspapers, shut down his

Hearst Castle

In 1919, William Randolph Hearst began work on what came to be known as Hearst Castle. He had parts of the castles and palaces of Europe dismantled and shipped at enormous cost to his ranch in San Simeon, California. Over the next thirty years he acquired a spectacular collection not only of artwork but also of entire rooms of furniture and furnishings. The castle had fifty-six bedrooms and sixty-one bathrooms, indoor and outdoor swimming pools (one modeled after a Roman temple), a 1920's-style motion picture theater, an airfield, and a private zoo.

In the 1920's and 1930's, Hearst and his mistress, Marion Davies, hosted a succession of famous guests, including Charlie Chaplin, Charles Lindbergh, the Marx Brothers, Franklin D. Roosevelt, and Winston Churchill. The lavish entertainment and the grounds became so well-known that director Orson Welles felt compelled to include a version of them in the Xanadu estate depicted in his film *Citizen Kane*.

In the late 1930's, as Hearst's media empire began to shrink, he had less readily available income to lavish on his collection of Greek vases, oriental carpets, European sculpture and painting, and the building and furnishing of his "castle." Most acquisitions ceased in 1942, although Hearst continued to maintain the grounds and buildings and to use the property as one of his domiciles.

In 1957, the Hearst Corporation, no longer able to maintain Hearst's extravagant domain, sold the property to the state of California for a nominal sum, stipulating only that family members would still be able to use it when they wished. On June 22, 1972, Hearst Castle was placed on the National Register of Historic Places, and it became a U.S. National Historic Landmark on May 11, 1976.

Hearst Castle has proven to be a very popular destination for tourists and tour companies. Enough of Hearst's original establishment remains to provide a good insight into his grandiose ambition to create a world of wealth sufficient to itself. The grounds include six residences with a total of more than ninety thousand square feet, including fifty-six bedrooms, nineteen sitting rooms, forty-one fireplaces, and sixty-one bathrooms.

filmmaking company, and even sell some of his prized works of art that were part of his palatial residence in San Simeon, California, popularly known as Hearst Castle.

The advent of World War II helped the Hearst empire recover from some of its losses, but Hearst's own personal popularity and influence continued to decline—in part, because of negative press and the publication of biographies castigating his cutthroat methods and extravagance. Certainly, the release of director Orson Welles's film masterpiece, *Citizen Kane* (1941), drew heavily on Hearst's biography and portrayed a charming but isolated and tyrannical man who had grown increasingly out of touch with the very public he had initially sworn to serve and entertain.

When Hearst died of a heart attack in 1951 at the age of eighty-eight, he had become the personification of the reckless capitalist, using his enormous wealth to trick the public, start wars, and promote his pet causes. Thus he had lowered the standards of journalism and of public discourse about politics. He became, in effect, a kind of object lesson of a wealthy man whose good intentions had gone awry. Even his avid collection of artworks became merely part of the myth of a selfish man hoarding the world's treasures and brooding over his rejection by a public that he had wooed but that had ultimately scorned him.

Legacy

The legacy of William Randolph Hearst is far more complex than the myth of his triumph and eventual defeat. While it is undeniable that Hearst newspapers did sensationalize the news and engaged in fierce competition, it is also true that he was a great media innovator, insisting on the best equipment and, in many instances, on writers that actually raised journalism to a higher standard. His entry into the newspaper world of New York City, for example, forced his competition to produce better work and to cover news with a renewed fervor and commitment. Hearst drove his journalists relentlessly, but in the process he pioneered a new on-the-scene reporting in Cuba, for example, that led to many breakthroughs in investigative journalism. The charge that Hearst used his enormous wealth merely for invidious purposes is clearly not true, although his growing conservatism did result in rather scurrilous political columns in some of his newspapers. Many men of Hearst's generation used their wealth for far worse purposes. However, and although he certainly outspent most of his rivals, Hearst did not succeed by money alone. He had a wit, spontaneity, and shrewdness that money cannot buy. He discovered and promoted great talent. At his best, he gave the public a voice that had rarely been heard in the media before his time.

—*Carl Rollyson*

Further Reading

Nasaw, David. *The Chief: The Life of William Randolph Hearst*. New York: Houghton Mifflin Harcourt, 2000. This well-received epic biography corrects some of the errors of previous biographers. Even more detailed but not better written than Swanberg's biography.

Procter, Ben H. *William Randolph Hearst: The Early Years, 1863-1910*. New York: Oxford University Press, 1998. Especially insightful on Hearst's political campaigns for Congress, governor, mayor of New York City, and president of the United States.

_______. *William Randolph Hearst: Final Edition, 1911-1951*. New York: Oxford University Press, 2007. Argues that Hearst had good intentions but failed to influence the politics of twentieth century America. Procter's assessment is far more favorable than most other accounts.

Swanberg, W. A. *Citizen Hearst: A Biography of William Randolph Hearst*. New York: Scribner, 1970. Still one of the best biographies of the controversial Hearst, even though it is a little too reliant on the myth that Welles's *Citizen Kane* perpetuated. Swanberg perhaps overemphasizes some of the negative stories about Hearst, but overall this is a reliable and comprehensive biography.

Whyte, Kenneth. *The Uncrowned King: The Sensational Rise of William Randolph Hearst*. New York: Counterpoint, 2009. An inspiring revisionist and iconoclastic biography. Whyte takes issue with Swanberg and Nasaw, Hearst's best biographers, claiming that they have relied too heavily on biased contemporary reports of Hearst's nefarious practices. Whyte depicts a Hearst who was a much shrewder manager of his own money than previous biographers allow, and a Hearst who made significant contributions to the development of modern journalism. This biography concentrates on the first part of Hearst's career and acknowledges that the negative criticism of his subject is more appropriately applied to the second half of Hearst's life.

F. Augustus Heinze

American miner, banker, and speculator

Heinze used his wealth from cooper mining to become a banker and broker. The failure of his speculations helped bring on the economic Panic of 1907.

Born: 1869; Brooklyn, New York
Died: November 4, 1914; Saratoga, New York
Also known as: Fritz Augustus Heinze; Frederick Augustus Heinze
Sources of wealth: Mining; banking; investments
Bequeathal of wealth: Children

Early Life

F. Augustus Heinze (aw-GUST-uhs HIN-zuh) grew up in New York City. He graduated from the Columbia University School of Mines in 1889 with an engineer of mines degree. Heinze worked as a mining engineer in Butte, Montana, and later took advanced courses in geology and mining at the University of Freiberg, Germany.

First Ventures

In 1892, Heinze formed the Montana Ore Purchasing Company, which constructed an efficient smelter in Butte. He purchased and leased mines that previous owners believed were exhausted, demonstrating his geological skills by finding rich new ore deposits.

The Boston and Montana Mining Company sued Heinze in 1896, seeking an injunction to prevent him from extracting copper from a mine the company had sold him. The suit was based on the apex law, which stipulated that whoever owned the highest point of an ore bed owned the entire bed, even where it extended into another mine. Heinze countersued, filing similar claims against his opponent's mines. When Standard Oil Company officers formed the Amalgamated Copper Mining Corporation in 1898, they bought Boston and Montana, inheriting the legal battle.

Heinze proved as tough and unscrupulous a competitor as his Standard Oil rivals. He filed multiple lawsuits, winning most of them. Miners battled competing miners underground, using water hoses and occasionally dynamite to extract ore. When Amalgamated strong-armed the Montana legislature into passing a law that gave the company the right to choose judges, Heinze realized he had lost and sold his Butte holdings in 1906 for $12 million (about $250 million in 2010 dollars), twenty-four times Amalgamated's original offer.

Mature Wealth

Heinze operated his remaining mines as the United Copper Company, organized in 1902 with a nominal capital of $80 million. He moved to New York City, where he purchased control of the Mercantile National Bank, becoming its president. He also speculated on Wall Street.

Heinze's swashbuckling career as a Wall Street operator was brief and disastrous, both for him and for the national financial system. In October, 1907, Heinze joined with other speculators to establish a monopoly on United Copper stock. He and his partners bought every share offered for purchase on the stock exchange, pushing the price up in order to force speculators, who sold stock they did not own expecting the price to fall, to buy back stock at higher prices. The stock price rose to unheard-of heights, and speculators were desperate as they faced massive losses. However to the surprise of Heinze and his partners, high prices brought a flood of stocks to market, sending the price down precipitously. Instead of reaping profits, the partners lost heavily. News that the monopoly had collapsed led depositors to withdraw funds from Heinze's bank. He appealed to the New York Bank Clearing House for aid, but he was told his bank would get no help unless he resigned as president. Heinze's biographer believes the whole affair was manipulated by Standard Oil officials in order to punish Heinze.

Legacy

Heinze lost most of his wealth in the stock market fiasco and the subsequent flurry of lawsuits. When he died of cirrhosis of the liver at age forty-four, he left his son a $1.5 million estate.

The consequences of Heinze's disaster did not stop with his bank but spread like a contagion over the entire United States banking system, revealing its instability. News of the trouble at Heinze's bank started runs at other banks, resulting in the bankruptcy of New York City's largest trust company. This bankruptcy frightened bankers across the country, leading them to withdraw their deposits from the city's banks. Only a forceful intervention by financier J. P. Morgan drew bankers together in order to pool funds and prevent collapse of the nation's banking system during the Panic of 1907. Demands for reform following the crisis led to enactment of the Federal Reserve Act six years later, a legacy Heinze never intended.

—Milton Berman

LEONA HELMSLEY

American real estate and hotel mogul

Leona Helmsley and her billionaire husband Harry Helmsley owned a chain of luxury hotels and much prime New York real estate. The couple were convicted of tax evasion and Leona was nicknamed the Queen of Mean. However, the Helmsleys used their wealth to fund a charitable trust worth billions of dollars for the benefit of medical institutions and other worthy causes.

Born: July 4, 1920; Marbletown, New York
Died: August 20, 2007; Greenwich, Connecticut
Also known as: Lena Mindy Rosenthal (birth name); Leona Mindy Roberts; the Queen of Mean; Leona Panzirer; Leona Lubin
Source of wealth: Real estate
Bequeathal of wealth: Relatives; her dog; charity

EARLY LIFE

Leona Helmsley (lee-OH-na HEHLMZ-lee) was born Lena Mindy Rosenthal in 1920 to Morris and Ida Rosenthal, lower-middle-class Jewish immigrants from Poland who resided in suburban Marbletown, New York. Her father was a manufacturer of hats. Lena was the youngest of three girls; her only brother, to whom she was close, was the youngest child. After her father fell on hard economic times the family moved frequently, first to Brooklyn and then to Manhattan. In time she and her ailing brother grew closer as she and her sisters grew apart. Reputed to be a beauty in her younger years, and determined to make her mark, Lena dropped out of either high school or college (some of the facts of her early life cannot be substantiated) and soon changed her name to Leona Mindy Roberts.

During this time, Roberts claimed she had already had a successful career as an advertising model for a cigarette company. She married attorney Leo Panzirer, with whom she had her only child, Jay, before the couple divorced. She then wed garment industry executive Joseph Lubin, to whom she was married and divorced twice.

FIRST VENTURES

Roberts was hired by a New York real estate firm as a secretary and worked her way up to senior vice president, specializing in the sale of upscale Manhattan cooperatives and condominiums. She was very successful and became a millionaire in her own right. It was at this time that Roberts got into her first legal problems after being sued by tenants of one of the buildings in which she sold apartments. After the judgment went against her, she was forced to compensate the tenants for damages and her real estate license was temporarily suspended.

About 1969 or 1970, Roberts went to work for one of the companies of Bronx-born real estate tycoon Harry Helmsley (1909-1997). Among other properties, Harry owned the legendary Empire State Building and many luxury hotels. He divorced his wife of more than thirty years not long after meeting the dynamic Leona. She not only became Harry's wife but also evolved into a full business partner, who was to proffer much sound advice about his real estate transactions, particularly the hotel holdings, of which she was made the president.

MATURE WEALTH

Leona's 1972 marriage to Harry began her own rise to fabled wealth and to years of increasingly strident controversy. While the retiring Harry was content to stay behind the scenes, the extroverted Leona was widely featured in advertising as the "queen" of the Helmsley hotel chain, particularly the flagship Helmsley Palace in Manhattan, described in advertisements as "the only palace where the queen stands guard." These ads emphasized the luxurious nature of the accommodations and her attention to the most minute of details. Helmsley claimed she knew when a lightbulb had burned out, and she said she read and responded to every guest evaluation card personally. Given her preferred management—or, more accurately, micromanagement—style, those statements almost bore the ring of truth. Behind her regally smiling public persona, however, lay a hard-charging woman referred to by downtrodden employees as the Queen of Mean, among other soubriquets.

Helmsley became infamous for her instant rages and spewing of obscenities over trifles, as well as the lengthy list of employees she had dismissed, ranging from top executives to maids. The turnover among her staff was tremendous. She even claimed that she and Harry had been stabbed in their bed, probably by a disgruntled former employee, although this was never verified. Helmsley was sued by some of her former employees, including a man claiming he was terminated because of his homosexuality.

She and Harry resided in Dunellen, their twenty-eight-room estate in Greenwich, Connecticut, and in a lavish New York penthouse. They owned a private jet that was reputed to seat one hundred passengers. Estimated to be worth more than $1 billion, the couple was much seen at New York high-society functions. They also contributed heavily to medical causes, including hospitals, and various charities. However, Helmsley's seemingly charmed life was soon to change.

In 1982, her only child, Jay, died in his early forties, and she garnered unfavorable headlines when she had her daughter-in-law and eldest grandson forcibly removed from the Panzirers' Florida home. The Helmsleys also sued for the proceeds of her son's modest estate.

In 1988, Harry and Leona Helmsley were indicted for evading $4 million in state and federal taxes over a three-year period earlier in the decade. Two of their top employees were also charged with criminal conduct. After many delays due to motions from her lawyers, Leona's case came to trial in 1989, and she was convicted of thirty-three felony counts, including tax evasion and filing false returns. Harry, by then almost eighty years of age, was also convicted of tax evasion but was adjudged mentally incompetent to stand trial. During Leona's trial, much evidence was provided about her personal foibles. Probably the most damaging statement was made by a former housekeeper, who quoted her as saying, "We don't pay taxes; only the little people pay taxes." Even Leona's own lawyer referred to her as abrasive, demanding, and "a tough bitch" but hastened to add that these characteristics did not make her guilty as charged. More than forty people, mostly former employees, testified against her. The judge, perhaps improperly, said she had acted with "naked greed."

It was ultimately proven that Leona had charged personal expenses ranging from nail care to a multimillion-dollar renovation of her Connecticut estate to business accounts. The renovation had instigated the Helmsleys' legal problems. After a dispute with some of their contractors over payments, the couple was sued, and as a result of these proceedings, their tax evasion was discovered. Initially sentenced to sixteen years in prison, Helmsley had her sentence reduced on appeal to four

Leona Helmsley leaves court after an appearance during her trial on charges of tax evasion. (AP/Wide World Photos) years at a medium-security prison, and she was released after eighteen months and a payment of some $7 to $8 million in fines.

Because she was a convicted felon and therefore could not have a liquor license, Helmsley could not continue to run the hotel chain that had made her famous. She spent her last years in luxurious isolation and at her death was survived by four grandchildren and twelve great-grandchildren. She was then said to be worth between $4 and $8 billion, most of it from the estate left to her by Harry. A bequest of about $35 million was allocated to her survivors, and $3 million was earmarked for the upkeep of the Helmsleys' lavish columned $1.4 million mausoleum. Initially, two of her grandchildren were to be left nothing, but upon appeal they were awarded several million dollars. She also left several million dollars for the care of her beloved dog.

The Leona M. and Harry B. Helmsley Charitable Trust

Upon her death in 2007, Leona Helmsley bequeathed some $4 billion to the Leona M. and Harry B. Helmsley Charitable Trust, which had originally been established in 1999, two years after Harry's death. The trust is administered by five trustees, and among the original trustees personally appointed by Leona were her brother Alvin Rosenthal, two of her grandsons, her lawyer, and an adviser. During Leona's lifetime, the trust made grants to several worthy causes, among them the Red Cross for victims of Hurricane Katrina, various medical facilities, and families affected by the September 11, 2001, World Trade Center bombings. She stipulated that upon her death all of her assets, including the sale of her homes, be placed in the trust. It was her stated wish that the trust's funds be primarily used for the care of dogs. However, the trustees went to court to request that the trust not be bound by her wishes and that they be allowed to distribute funds as they saw fit. The trustees were duly granted the discretion to do so by a Manhattan judge. Although awarding funds across many areas of human endeavor, as of 2009 the trust has focused mainly on health-related issues.

In April, 2009, the trust announced its first round of grants since Helmsley's death, some $136 million, of which $115 million would be allocated to medically related causes, such as rural health care and the research and treatment of diseases like diabetes, heart disease, and digestive disorders. The remainder would go to such areas as antipoverty programs, conservation efforts in Central and South America, and increased access to education.

When the terms of the trust were first made public, the stipulation of $12 million for the lifetime care of Leona Helmsley's Maltese dog, Trouble, had been widely ridiculed by those not involved in animal welfare. Jokes that contained variations of "the Helmsley fortune is going to the dogs" were widespread. The bequest for Trouble was reduced to $2 million, the remainder going back into the trust. As of 2009, only about $1 million had been awarded to charities providing canine care.

Legacy

Despite her undoubted business acumen and works of charity, it is almost a certainty that Leona Helmsley will be remembered as a symbol of greed and by the pejorative nicknames, especially Queen of Mean, bestowed upon her by a legion of detractors. Even during her lifetime, in 1990 a television film titled *Leona Helmsley, the Queen of Mean* starred Suzanne Pleshette in the title role. Helmsley's business savvy and self-starred advertisements probably helped to increase the revenues of the Helmsley hotels, at least until her negative reputation became the object of public ridicule and scorn. However, the Helmsley Charitable Trust will distribute the billions she bestowed upon it to worthy causes, and because of her largesse her reputation may someday, at least partially, be restored.

Heshen

Chinese government official

Heshen rose from humble circumstances to become the most powerful and influential official during the reign of Qing Dynasty emperor Qianlong. Before his sudden and precipitous downfall, he amassed a fabulous fortune that made him the richest person in China.

Born: 1750; China
Died: February 22, 1799; Beijing, China
Also known as: Shanboa (birth name); Ho-Shen
Source of wealth: Government
Bequeathal of wealth: Dissipated; confiscated

Early Life

Heshen (heh-shehn), whose birth name was Shanboa, was born into the Niohuru (wolf) clan, a prominent Manchu tribe. He was the son of a military officer stationed at Beijing who fought under the Plain Red Banner, part of a hereditary conscription system of professional soldiers, grouped by tribal units and arrayed in red armor, symbolizing fire. Heshen was educated in a government school and afterward qualified for the Chinese civil service.

First Ventures

At the age of twenty-two, Heshen was assigned to be an imperial bodyguard in Beijing. Within a short time, he caught the eye of Emperor Qianlong and quickly became a favorite at court. There are several probable reasons that he was chosen to be an imperial bodyguard. Heshen was of the same clan as the emperor's mother, Xiao Sheng Xian. He was fluent in several languages. He was also skilled at poetry, one of the emperor's favorite pastimes. Most important, he was well spoken and attractive, with fair, pale skin and red lips; it is possible that Heshen and the emperor became lovers.

Whatever the true reason for his selection, Heshen advanced rapidly within the hierarchy of Chinese government. Early in his career he was considered conscientious and was well respected. By the age of twenty-five he was given a high rank on the Board of Revenue. Within months he had gained the titles of grand councilor and minister of the imperial household, and he was regularly granted additional privileges normally accorded only to those of advanced seniority. The emperor also showered him with expensive gifts. Heshen grew wealthy, and he did not hesitate to take advantage of his elevated position. He was said to have accepted bribes, embezzled government funds, and extorted money.

Mature Wealth

Heshen eventually took charge of the Board of Revenue and the Civil Council, and he ultimately held some twenty significant government posts simultaneously, which gave him virtual financial control of the empire. To solidify his status, he appointed friends and family members as assistants. In the early 1780's, his son Fengshenyinde married Qianlong's favorite daughter, Gulunhexiao. Despite growing complaints about Heshen's corruption, the aging emperor believed Heshen could do no wrong. Emboldened, Heshen grew less circumspect in his larceny. During the White Lotus Rebellion (1796-1804), he pocketed large amounts of money intended to pay government troops to fight the rebels.

Heshen's demise was swift. In 1796, Qianlong formally stepped down as emperor in favor of his son Jiaqing, though he continued to rule from behind the scenes until his death on February 7, 1799. Within days of Qianlong's death, Jiaqing had Heshen arrested, tried, and condemned to "the death of a thousand cuts." However, the fallen official was allowed to commit suicide, and he hanged himself. Heshen's property was confiscated. The treasure seized included estates and mansions incorporating 3,000 rooms and housing 600 concubines, 8,000 acres of land, 100 gold ingots, 9 million silver ingots, more than 50,000 pounds of foreign currency, great quantities of precious stones, 100,000 porcelain vessels, nearly 500 European clocks, 14,000 bolts of silk, and 7,000 sets of clothing. It is estimated that the value of Heshen's accumulated property was more than the value of the Qing government's entire treasury.

Legacy

More than two centuries after his ignominious death, Heshen still serves as an example of absolute power corrupting absolutely. In China, he is often portrayed as a villain—sometimes purely evil, sometimes humorously bumbling—on stage and in films and television programs. He is something of a national symbol of the raw greed and degeneracy that marked the Qing, China's last dynasty, which ended its rule in 1911. Although Heshen's wealth was absorbed into the imperial treasury, one of his former possessions can still be seen: the magnificent Prince Gong Mansion in Beijing.

James J. Hill

American railroad and shipping magnate

Hill began his career shipping merchandise on a small Minnesota railway, and he eventually owned railroads throughout the upper Midwest, Great Plains, and Pacific Northwest. The influence of his rail lines in these areas of the country earned him the nickname the Empire Builder.

Born: September 16, 1838; Rockwood, Upper Canada (now in Ontario, Canada)
Died: May 29, 1916; St. Paul, Minnesota
Also known as: James Jerome Hill; J. J. Hill; the Empire Builder
Sources of wealth: Railroads; shipping; investments
Bequeathal of wealth: Spouse; children; charity

Early Life

James Jerome Hill was born into a Scotch-Irish family in southern Ontario, Canada. He had a happy childhood on the farm, surrounded by extended family. At age seventeen, he went to St. Paul, Minnesota, landing by boat there on July 21, 1856. He got his first job as a shipping clerk, then called a "mud clerk." Hill worked hard on the levee in St. Paul, where steamboats arrived and employees loaded and unloaded tons of goods. Many supplies were headed north after traveling along the oxcart trails in the Red River Valley. Carts would come down the trail in June with furs, hides, and pelts and return with winter supplies for valley residents and the military. The growing population and farming enterprises of the valley and the supplies needed at Fort Garry, located in what is now Winnipeg, Manitoba, kept up the demand for supplies that landed on the levee in St. Paul.

First Ventures

After seven years in St. Paul, Hill opened his own warehouse on the Mississippi River. He began a shipping business that continued for twenty years. Hill transported flour from Minneapolis mills and other freight, as well as immigrants and passengers, along the cart trails. Instead of oxcarts, however, he used the latest technology of wagons, steamboats, and flatboats. Hill began a pattern of development that would serve him well in many endeavors. He was always interested in doing something better, faster, or more economically than his rivals. He read everything he could on a topic and kept up with the latest news. He traveled extensively and built strong social relationships with colleagues. He fearlessly broke new ground where commerce did not exist before.

Norman W. Kittson, who opened a trading post in Pembina, North Dakota, in 1843, shipped furs with Hill and then turned over the business to him. From about 1856 to 1870, a good portion of the furs traveling east through St. Paul were buffalo robes. Hill would broker goods like these, whether from the United States or England, traveling east or west, from the point of purchase

The James J. Hill Reference Library

The library that James J. Hill founded in St. Paul, Minnesota, was intended to rival the elite libraries of the East, such as those established by his friend, businessman J. P. Morgan. Hill believed that current, accurate information was vital to business success, and he went to great lengths to seek out information, including traveling to Canada to get a firsthand knowledge of business conditions and borrowing books from libraries in the East. Hill read books every day, authored several of his own works, and was inexhaustibly curious about different topics, such as land use, agriculture, and business matters. A room in his mansion, Hill House, was set aside as a school for his younger children. Servants in Hill House were allowed to borrow books from Hill's private library so that they, too, could be well informed.

Hill first conceived the idea for his library in 1887, and he described his concept in correspondence to his friend, Edward Duffield Neill, president of Macalester College. In 1983, when St. Paul officials wanted to throw a lavish celebration to commemorate the extension of Hill's Great Northern Railway to Seattle, Hill suggested the city finance the building of a library instead. He also offered to contribute twice the amount of the city's contribution to build the new facility. However, the city was experiencing economic difficulties throughout the 1890's, and the project was delayed.

Construction began in 1913. Hill envisioned a library that would enable scholars from the area to obtain reference materials without having to borrow books from faraway libraries, as he had done. He personally selected materials by preparing lists and guidelines for books on philosophy, religion, and science, excluding law and medicine. He also appointed Joseph Gilpin Pyle as librarian and as his official biographer. The project, however, was again delayed after Hill's sudden death in 1916.

The James J. Hill Reference Library opened on December 20, 1921, one month after the death of Hill's wife, Mary. Originally named the Hill Reference Library, it was built in a combination of Beaux Arts and Italian Renaissance styles, and it was located adjacent to the public library and separated by a wall. A door on the second floor adjoins the public library, facilitating access. The library houses the Hill Center for Ethical Business Leadership and supports community and professional endeavors.

to their destination. He would personally involve himself in all correspondence connected to the purchase and sale of this merchandise.

In the early 1870's, Hill used more sophisticated forms of transportation to eliminate competition from the powerful Hudson's Bay Company, a Canadian-based firm that dominated trade in the Red River Valley. He shipped goods by rail from St. Paul to St. Cloud, Minnesota, then by stage to the Red River, and then moved merchandise north by steamer to Winnipeg. The Hudson's Bay Company, by comparison, trekked in goods by oxcart between Fort Garry and the new settlement in Pembina. Hill eliminated the need to use oxcarts, building a railroad to travel between St. Paul and St. Cloud that was a cheaper and more efficient means of transportation. The route from the South to the Great Lakes to St. Paul to St. Cloud surpassed the Hudson's Bay route to the Red River Valley from the north.

When the Northern Pacific Railway declared bankruptcy during the Panic of 1873, Hill took control of this line and began to build a major railroad empire. He continually improved his rail lines, installing heavier rails, increasing tonnage per car, and lowering rates, and these actions would enable him to compete successfully with other railroad magnates and to survive the Panic of 1873.

Mature Wealth

In 1878, Hill and four other investors purchased the St. Paul & Pacific Railroad, which had gone bankrupt. Renaming it the St. Paul, Minneapolis & Manitoba Railway, the investors profited from its running to St. Cloud, where it joined with the Red River Valley and northwestern trade routes. Encouraging immigrants to travel on the railroad proved to be a stabilizing factor for the line, establishing the location of clients along main routes and branches who guaranteed continued business dealings.

In 1880, Hill became an American citizen. However, he was instrumental in developing the Canadian Pacific Railway from 1880 through 1883. Hill took a position with the railroad, helping to reorganize it out of bankruptcy. The Canadian Pacific's westward expansion would parallel the westward extension of Hill's other railroads. He continued to attract new business partners and relationships because those businesses profited by association with his railroads.

The St. Paul, Minneapolis, & Manitoba Railway kept growing. When Hill became president of the line in 1882, it went as far west as Montana. Hill renamed the line the Great Northern Railway when he became president and chairman of the board in 1890. By 1893, the westernmost point of the line had extended to Seattle, Washington, and the railroad connected this city with Minneapolis and St. Paul.

The success of his rail lines financed many of Hill's other profitable ventures, including companies involved in agriculture, milling, banking, finance, and coal. He knew that England's successful economy was tied to the cheap and efficient transportation of coal as the preferred fuel for home heating and iron production, so he worked with Pennsylvania coal producers through sales agents in Chicago. He replaced wood with coal as a source of fuel for his rail engines and other businesses. He insisted that his railroads have reputations of reliability and efficiency, which was a source of pride for him. His gutsy, feisty business acumen was matched by his strong work ethic and brilliant economic maneuvering. He was respected by friends and competitors alike.

At the beginning of the twentieth century, Hill purchased the Chicago, Burlington & Quincy Railroad. In 1904, he attempted to unite his three large railways—the Great Northern, Northern Pacific, and Chicago, Burlington & Quincy—but the U.S. Supreme Court prohibited this move. However, these railroads did merge in 1970 to form the Burlington Northern Railroad.

Hill's son Louis took over the chairmanship of the Great Northern Railway when Hill retired in 1912. While in retirement, Hill bought and merged two banks and then brought Louis into the banking business.

Hill's wealth was evident in the lifestyle that he and his family enjoyed. He and Mary Hill were married in St. Paul by Bishop John Ireland in 1867. The couple had ten children: Mary Frances, James Norman, Louis, Clara, Katherine (who died as an infant), Charlotte, Ruth, Rachel, Gertrude, and Walter. In addition to the family's mansion, Hill House, in St. Paul, the Hills maintained a New York town house and a home in Paris. Their properties in or near St. Paul included the five-thousand-acre North Oaks farm, a summer home, which later provided land for the city of North Oaks, Minnesota. Hill owned two other farms in the Red River Valley.

Hill's large family would travel abroad, attend school in the East, and winter in at the Jekyll Island Club in Georgia. Club members included J. P. Morgan, a fellow financier and loyal supporter of Hill. Hill's yacht, the *Wacouta*, was used to take him on summer trips to his lodge in Quebec, where he fished for salmon on the St. John River. Hill died in 1916 at the age of seventy-seven.

Legacy

Hill's Great Northern Railway opened the Pacific Northwest to transportation and commercial development from the east. His railroad and shipping business exerted economic dominance not only in the Pacific Northwest but also in the upper Midwest and the Great Plains.

Another of Hill's achievements survived after his death. Hill House was declared a National Historic Landmark in 1961. The residence, which Hill constructed from 1888 to 1891, had its own power plant, pipe organ, art gallery, and electric lights and contained thirty-six thousand feet of living space. The Minnesota State Historical Society acquired Hill House and renovated it during a five-year period beginning in 1979, financing the rehabilitation with state, federal, and private funds. The home is open for public tours and events.

Hill was a generous philanthropist who wanted to elevate public knowledge. He donated the funds for a public facility, the James J. Hill Reference Library, which continues to operate in the twenty-first century. He donated millions of dollars to found the St. Paul Seminary, construct the St. Paul Hotel, and help establish Macalester College. He also made contributions to the Little Sisters of the Poor and other charities.

Hipponicus II

Greek politician, statesperson, and military leader

Hipponicus, probably the least-known member of one of the wealthiest families in ancient Athens, maintained the family fortune and passed it on to his son, Callias II.

Born: c. 510 b.c.e.; Athens, Greece
Died: c. 450 b.c.e.; Athens, Greece
Also known as: Hipponicus Ammon
Source of wealth: Inheritance
Bequeathal of wealth: Children

Early Life

Nothing is known about the early life of Hipponicus II (hihp-PON-ih-kuhs), not even his exact birth date. What is known is derived largely from what is written about his great-grandson. Hipponicus II was a member of the Callias-Hipponicus family, in which the eldest son in each generation was given one of these names in turn. Thus, Hipponicus's father was Callias I, his son was Callias II, and his grandson was Hipponicus III. The family, members of a group known as the *palaeoplutoi* (old rich men), held the hereditary right to carry a torch at the Eleusinian mysteries, a privilege reserved for high-ranking families.

Hipponicus II was born into wealth. His grandfather, the first Hipponicus, had engaged in some shady land deals when Solon, an Athenian statesman, was canceling debts to prevent a political crisis in Athens in 594 b.c.e. According to the biographer Plutarch, Hipponicus I knew of the plan in advance, borrowed money to buy land, and then kept the land when Solon canceled debts. Callias I, father of Hipponicus II, depleted the family fortune to some degree with his passion for racehorses. He also gave his three daughters enormous dowries and, according to Herodotus, allowed them to choose their own husbands. However, he was also known as an opponent of the tyrant Pisistratus and his son Hippias of Athens, whose expulsion set the stage for the Athenian democracy in 510 b.c.e.

First Ventures

The meager historical sources do not provide enough information to know how Hipponicus II replenished the family fortune. A dubious story says that he enriched himself with treasure taken from a Persian general in 480 b.c.e. This story is told by Athenaeus, a rhetorician who lived in the second and third centuries c.e. and is generally regarded by scholars as unreliable. Equally dubious stories were told about the dishonesty of Hipponicus's son, Callias II.

Mature Wealth

The family's considerable wealth seems to have made it the target of gossipmongering inspired by the jealousy of poorer Athenians. All that can be known is that Hipponicus passed an enormous fortune on to his son. This son, Callias II, seems to have added to the family fortune by mining for silver. His nickname, Lakkoploutos, means "wealth from a pit." Hipponicus II may have engaged in a similar enterprise. His wealth was so great that the writer Andocides, in a speech delivered around 400 b.c.e., can refer to a period "when Athens was mistress of Greece and at the height of her prosperity and Hipponicus was the richest man in Greece."

Legacy

Hipponicus II left such an enormous fortune that when his son, Callias II, was impeached by the Athenian assembly for accepting bribes and fined the enormous sum of fifty talents, the fine was only one-fourth of Callias's assets. (The purchasing power of a talent is variously estimated at between $13,000 and $20,000 in 2010 currency.) Hipponicus III, grandson of Hipponicus II, fathered a daughter who married the statesman Alcibiades of Athens with a dowry of ten talents, the largest known to that time. The last important member of the family, Callias III, was infamous for his extravagance. He appears as an intellectual dilettante in the writings of Plato and Xenophon in the early fourth century B.C.E., and he is reported to have reduced himself to the state of a beggar by spending huge sums on women and philosophical teachers known as Sophists. Plato's dialogue, *Prōtagoras* (399-390 B.C.E.; *Protagoras*, 1804), takes place in Callias's house, which is called "the greatest and most prosperous in town." Apparently all the family's money went to one son. Callias's brother Hermogenes appears in Plato's dialogue *Cratylos* (388-368 B.C.E.; *Cratylus*, 1793) but no mention is made of any great wealth.

Moritz Hochschild

German mining magnate

An important German-Jewish mining entrepreneur during the first half of the twentieth century, Hochschild built a corporate empire in Bolivia based on the mining and trading of tin. Along with fellow tin barons Simón Iturri Patiño and Carlos Victor Aramayo, Hochschild controlled Bolivian tin mining before the 1952 Bolivian revolution.

Born: 1881; Biblis, Germany
Died: 1965; Paris, France
Also known as: Mauricio Hochschild
Source of wealth: Mining
Bequeathal of wealth: Children; charity

Early Life

Moritz Hochschild (MOH-rihts HOK-chihld) was born in 1881 in Biblis, Germany, the first child of Ludwig Hochschild and Jeanette Hirsch. He was a nonpracticing Jew who studied at the Bergakademie, a mining school in Freiberg, Germany, earning a degree in mining engineering in 1905. After graduation, he went to work at Metallgesellschaft AG, a mining concern based in Frankfurt, Germany.

First Ventures

Hochschild's first attempt to obtain a doctorate in mining engineering was rejected by the Bergakademie in 1906. A subsequent attempt, based on a dissertation that examined global copper production, was accepted by the Bergakademie in 1921. Hochschild went to Chile in 1911 and established a business dedicated to the purchase of copper ore from small mining companies. When World War I broke out, Hochschild was in Germany. He was active in the procurement of metals for the German military effort.

In 1918, Hochschild married Kathe Rosenbaum, who died of tuberculosis in 1924. Their only child, Gerardo, was born in Valparaiso, Chile, in 1920. Hochschild returned to Chile in 1919. In 1921, he moved to Bolivia and involved himself in the *rescate* business, the buying of ore from small-scale producers. He supplied the miners with tools, food, and loans, often providing the supplies on credit.

Mature Wealth

Much of Hochschild's wealth came from the purchase of ore from small-scale tin miners in Bolivia. It was during the 1920's that he became known as Don Mauricio, an honorific title added to the Spanish version of his first name. By 1926, Hochschild's company, with its headquarters in Valparaiso, Chile, was a multinational enterprise with eleven subsidiary offices located throughout Chile, Bolivia, and Peru. Between 1922 and 1927, the international price of tin doubled, thus affording Hochschild the capital to begin acquiring tin mines. The early years of the Great Depression, however, severely reduced Hochschild's profits.

The international demand for tin recovered by 1932. At the same time, Hochschild's mining interests expanded into Argentina. He also increased his presence in the Bolivian tin industry during the 1930's, eventually controlling 40 percent of this nation's tin market by the

1940's. As his economic influence in Bolivia grew, so, too, did his impact on the political scene. Hochschild and two other tin barons, Carlos Victor Aramayo and Simón Iturri Patiño, were involved in a lucrative symbiotic relationship with Bolivian military dictators. As a result, the three men obtained favorable tax concessions.

In 1933, as anti-Jewish propaganda increased in Germany, Hochschild acquired Argentine citizenship. Throughout the 1930's, Hochschild facilitated the emigration of more than two thousand European Jews to Latin America. Because of Hochschild's influence, most of these Jews were resettled in Bolivia and given employment in his company.

Following the Bolivian revolution of 1952, the government nationalized the Bolivian tin industry. More than 80 percent of Hochschild's holdings, valued at $30 million, were in Bolivia. After 1952, Hochschild expanded his commercial interests in South America. At the time of his death, his holdings were valued at approximately $200 million. The money was placed in a trust, with half of it allocated to his son and the remainder to officials of his company. In 1984, firm officials disbanded the company and created the Lampadia Foundation, one of the wealthiest philanthropic organizations in South America, with an endowment of $193 million.

Legacy

Hochschild was a successful entrepreneur in the international metal trade. Although portrayed in Bolivian history as an imperialistic bandit, he helped to strengthen the nation's economy. A pragmatic businessman, Hochschild built an economic empire out of a modest initial investment.

Thomas Holloway

British merchant and investor

Holloway employed his keen sense of the power of advertising to establish one of the foremost patent medicine companies in England. He used the immense fortune gained from this enterprise and from his shrewd investments in stocks for major philanthropic endeavors to support treatment of the mentally ill and women's education.

Born: September 22, 1800; Devonport, Devonshire, England
Died: December 26, 1883; Tittenhurst, Berkshire, England
Sources of wealth: Sale of products; investments
Bequeathal of wealth: Relatives; educational institution; medical institution

Early Life

Thomas Holloway was born in 1800, the eldest of Thomas and Mary Chellow Holloway's six children. His father was a merchant who was running a bakery in Plymouth Dock, later renamed Devonport, when Thomas was born. In 1811, the elder Holloway became proprietor of the Turks Head Inn in Penzance, and he subsequently opened a bakery and grocery in the town.

Young Thomas was educated first at Camborne and later in Penzance. In 1816, he began an apprenticeship, most likely with a local druggist. Although he worked for a time in Penzance, by 1828 he had moved to London, where he thought there would be greater opportunities for financial gain. At about the same time, his family also moved to the city.

First Ventures

Holloway initially worked in various commercial positions. Between 1828 and 1836 he spent three years in Roubaix and Dunkirk, France, where he became fluent in French. Upon his return to London he went to work as secretary and interpreter for an import-export firm. In 1837, he made the acquaintance of Felix Albinolo, an

Italian entrepreneur who was trying to gain endorsements for a medicinal ointment he had created. Holloway may have attempted to provide Albinolo some assistance, but Albinolo eventually ended up in debtor's prison and his business failed. Nevertheless, Holloway was convinced that money could be made in patent medicines if products were properly advertised. Using some of his mother's kitchenware, he created his own ointment, which he began advertising in 1837. Holloway quickly overextended himself, however, and like Albinolo ended up in debtor's prison. Fortunately, creditors who thought his business had potential bailed him out, and with renewed vigor he reestablished his business.

Mature Wealth

Holloway initially set up shop on the Strand in London. After being released from prison, he expanded his line of offerings from ointments to pills, seeking endorsements from medical professionals and developing promotional materials that stressed the nearly miraculous effects of these remedies. In 1840, he married Jane Driver, who would prove an excellent partner. She understood his need to be constantly at his business, and she willingly accompanied him on calls to prospective distributors and clients. The couple had no children, a fact that had significant impact in later years when Holloway was deciding what to do with the fortune he had accumulated.

Holloway's prior experience in the import-export industry made him keenly aware that sales could be increased substantially if he could ship his product abroad. In the 1840's he began an aggressive campaign to establish distributorships worldwide, traveling to Europe to find reliable agents and eventually sending members of his wife's family to represent his firm in places where he did not travel himself. He could often be seen at the London docks negotiating with ship captains and merchants to take his products aboard their vessels in order to be sold at ports of call. He had labels printed in numerous languages so potential customers could easily identify his products. He even went so far as to produce a pamphlet for missionaries, instructing them on ways to improve the health of the populations they encountered in the jungles of Africa and Asia, emphasizing a regimen that included generous use of his products.

The business grew quite rapidly. By 1851, Holloway had thirty employees on the premises and scores of sales and delivery people on his payroll. He expanded his facilities on the Strand several times before finally moving to a more spacious location on Oxford Street in 1867. A decade later on-site employees numbered more than one hundred, with a corresponding increase in the outside sales and delivery force. Holloway was reported to be a tough taskmaster not only in demanding hard work but also in requiring employees to demonstrate high moral character. At the same time he exhibited concern for his workers, to the point of initiating a form of pension for loyal employees. He was less kind to competitors, even suing his brother Henry in 1850 for marketing products in packaging strikingly similar to that being used by Holloway's own firm.

By the mid-nineteenth century in England there were dozens of purveyors of patent medicines, each claiming that their "secret formulas" cured numerous ailments. Holloway realized that the key to financial success in this industry lay in advertising, creating what would later be called "brand awareness" among the populace at large. In his first years he spent as much as £5,000 to place notices in newspapers throughout England. That sum seemed remarkably large at the time, but it would pale by comparison to Holloway's future outlays—£50,000 a year by the 1880's, paid to newspapers around the globe who carried notices of Holloway's Pills and Holloway's Ointments.

By the 1880's Holloway could justify such an expense because it was the principal reason for his ability to generate profits virtually unheard of in business at the time. Over the years, modest earnings grew rapidly to immense sums by Victorian standards, so that at the height of his company's production Holloway was realizing a staggering net profit of £50,000 annually. Rather than squander his money on opulent living, Holloway invested in stocks and bonds, diversifying his holdings to include interests in entities as diverse as the Great Indian Railway and Turkish defense funds. He provided well if not lavishly for his wife and her family, purchasing Tittenhurst Park, a grand estate that he made his home, and numerous other properties. His net worth in all probability exceeded £1 million by the 1870's. In fact, Holloway was wealthy enough to loan money to the government of France in 1871 to finance its war against Prussia. He remained active in his business all his life, although he began to rely more heavily on relatives, especially his brother-in-law George Martin, to carry out a number of business and philanthropic tasks.

Because Holloway had no children, he and his wife began planning early for the disbursement of their fortune upon their deaths. In the 1860's he became interested in helping the seventh earl of Shaftesbury alleviate the problem of mental illness among the middle classes. His involvement eventually led to his underwriting of the Hol-

Royal Holloway College

When Thomas Holloway decided in the 1870's that he would use a part of his vast fortune to create a college for women, he acted with zeal characteristic of Victorian gentlemen. He threw himself personally into the project, securing the services of architect William Henry Crossland and soliciting advice from politicians and educators both in England and in America. He was especially interested in what was happening at Vassar College in New York and even sent an emissary to meet with Vassar's president to glean information that would guide Holloway in shaping the facilities and program of studies at his new institution. In 1876, he deeded ninety acres in Egham, Surrey, southwest of London, to be used as a site for the college.

Holloway was personally involved in designing what is now known as the Founder's Building, a massive quadrangle structure modeled on the Château de Chambord, a residence for French royalty for centuries. He also helped design the curriculum, which he insisted should rival those of Oxford and Cambridge Universities in providing liberal arts education for women. Unfortunately, the initial design of the building clashed with educational requirements, and shortly after the college was opened renovations were required to create additional lecture halls and science laboratories. Nevertheless, the institution opened to much fanfare in 1886, with Queen Victoria presiding over inauguration ceremonies.

In 1900, Royal Holloway became a part of the University of London, Great Britain's premier teaching university. In 1965, the college became coeducational, and in 1982 it merged with Bedford College, another institution within the University of London that had been established to educate women. The newly merged entity was officially renamed Royal Holloway and Bedford New College, but in 1992 the shorter title Royal Holloway, University of London, was adopted for common use. In the twenty-first century the college has a typical annual enrollment of nearly eight thousand students from more than one hundred countries.

loway Sanatorium southwest of London. He was not too busy at work to devote considerable time to supervising construction at the building site. By most estimates, he provided approximately £300,000 for the venture. That alone might have been enough to secure his place among the nineteenth century's most important philanthropists, but Holloway was not finished with his charitable contributions. Prompted by his wife, he decided to establish a college for women. After her death in 1875, he threw himself into the project with exceptional vigor, eventually pledging in excess of £750,000 to build and endow what would become known as Royal Holloway College, one of England's first institutions of higher learning for women. During the last two years of his life, he assembled a collection of artwork valued in excess of £80,000 for display at the college because he thought young women should be exposed to the arts as part of their education.

Sadly, Holloway did not live to see the opening of either of the institutions that he established. He died from lung congestion in December, 1883. The first patients were admitted to Holloway Sanatorium in 1885, and the Royal Holloway College was officially opened by Queen Victoria in 1886.

Legacy

Upon his death, the Holloway Sanatorium and Royal Holloway College received the sums not yet paid out from the amounts Holloway had designated for their construction and endowment. His sister-in-law Mary Driver received the bulk of Holloway's estate, including the business, which survived for nearly half a century, providing income for his heirs and comfort to the millions of customers who found relief in his concoctions. Although developments in medicine have made all-purpose curatives like Holloway's pills and ointments virtually obsolete, his ventures into philanthropy made a significant impact in two fields: the treatment of mental illness and education for women. From its opening in 1885 until well into the twentieth century, the Holloway Sanatorium met the needs of thousands of mentally ill patients from various social classes. Holloway's venture into higher education proved even more enduring. Almost from the day its first students entered, the Royal Holloway College became a mainstay of women's education in England. Additionally, the works of art Holloway assembled during the last years of his life specifically for the college have been recognized as one of the finest collections of Victorian painting in the country.

SOICHIRO HONDA

Japanese mechanical engineer and automobile magnate

Honda founded the Honda Motor Company, which became a major world exporter of motorcycles and automobiles. His firm was the largest of the Japanese-based companies that were established after World War II.

Born: November 17, 1906; Iwat-gun, Japan
Died: August 5, 1991; Tokyo, Japan
Also known as: Honda Soichiro
Sources of wealth: Patents; manufacturing; sale of products
Bequeathal of wealth: Relatives; charity

EARLY LIFE

Soichiro Honda (soh-ee-chee-roh hohn-dah) was born in 1906 in a small village located near the larger Japanese town of Hamamatsu. He was the first of nine children, five of whom died of malnutrition and lack of proper medical care. His father was a blacksmith who also engaged in the bicycle repair business. Honda disliked school and at the age of fifteen left his hometown for Tokyo, where he became an apprentice in the Art Shokai auto repair shop. During this period he also acquired what was to be a lifelong interest in automobile racing, serving as a mechanic for the Japanese auto racer Shinichi Sakibahara.

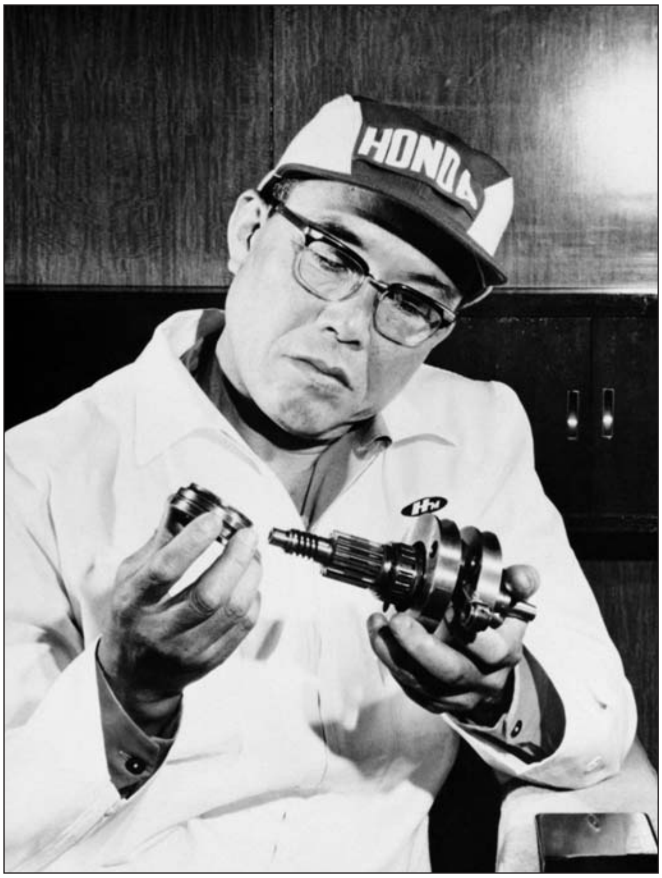
FIRST VENTURES

In 1928, Honda returned to his home region and opened an Art Shokai shop in Hamamatsu. As a business owner he was known for demanding a high level of performance from his employees, although management itself was never one of his strengths. Honda's greatest abilities were his engineering acumen, his innovativeness, and his entrepreneurial vision. Three years after opening his shop he received a patent for the use of cast-iron spokes on automobile wheels; this would be the first of the 150 patents he would be granted over the course of his career. In 1939, he took a managerial position in a piston ring factory in Hamamatsu, and he remained in this job until the end of World War II.

MATURE WEALTH

Struggling to exist in Japan during the difficult postwar years when little gasoline was available, Honda attached a small kerosene-driven motor to a bicycle and created a simple but functional motorcycle. He soon designed a motor that could be used for this purpose, and in 1948 he launched the Honda Motor Company. By means of a well-designed advertising campaign, the Honda motorcycle, known as the Dream D, was marketed to middle-class Japanese as a convenient and inexpensive mode of transportation, and Honda's business flourished. At this time, Honda also turned over the day-to-day operation of the company to his friend Takeo Fujisawa, who remained in that position for the remainder of their respective careers. During the decades that followed, Honda motorcycles achieved world renown and became market leaders both in Japan and abroad.

In 1962, Honda expanded into automobile production, and during the decades that followed the company achieved great success with such models as the Civic, introduced in 1972, and the Accord, introduced in 1976. In the early 1970's, Honda also entered the American auto market, and within a relatively short period of time he was competing successfully with the Japanese export giants Toyota Motor Corporation and Nissan Motor Company. At the end of the decade, Honda opened the first Japanese-owned production plant in the United States, establishing a pattern that other automobile companies would follow in the years to come.



Soichiro Honda works in one of his company's research laboratories. (AP/Wide World Photos)

Legacy

Soichiro Honda was an outgoing, personable, and frequently eccentric individual, earning a reputation as a risk taker in both his business ventures and his personal life. In the latter area, he engaged in automobile racing throughout most of his active years and continued to be interested in sports like skiing, hang gliding, and ballooning well into his seventies. In addition to his 150 patents, he is credited with at least 470 inventions. After retiring as president of his company in 1973, Honda continued to play a role in its affairs as a director, ultimately taking the title of "supreme adviser."

At the time of his death from liver failure in 1991, the company he started had a net value of $30.5 billion and was considered the largest company founded in Japan during the postwar era. Much of his personal wealth went into two organizations that he founded, the International Association of Traffic and Safety Sciences, which he cofounded with Fujisawa in 1974, and the Honda Foundation, established in 1977.

Johns Hopkins

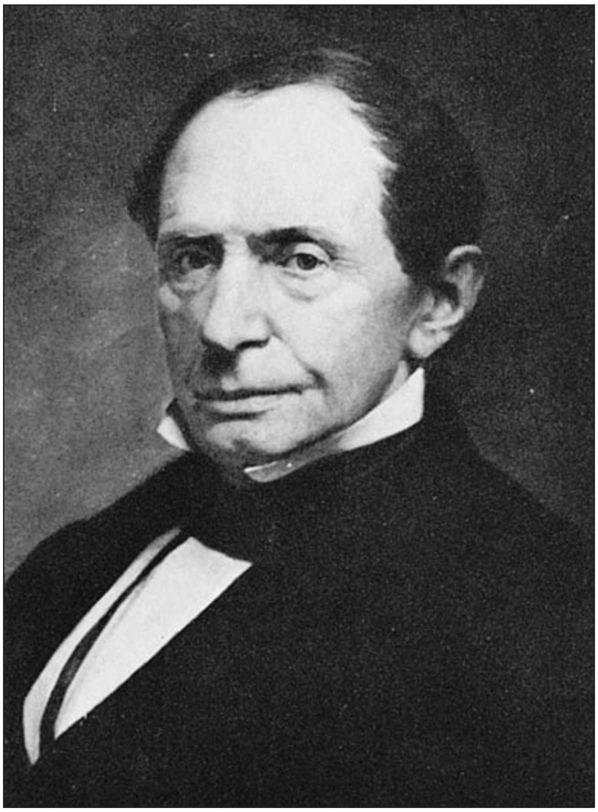
American banker and merchant

Hopkins's bequeathal of $7 million, railroad stock, and his Clifton estate created and endowed Johns Hopkins University and Johns Hopkins Medical School and Hospital, among the most renowned institutions of their kind in the United States.

Born: May 19, 1795; Whitehall Plantation (now Whitehall Manor), Anne Arundel County, Maryland
Died: December 24, 1873; Baltimore, Maryland
Sources of wealth: Trade; banking; real estate; investments
Bequeathal of wealth: Relatives; educational institution; medical institution

Early Life

Johns Hopkins was the second of eleven children born to wealthy parents, Samuel Hopkins and Hannah Janney Hopkins, on a tobacco plantation between Baltimore and Annapolis. His first name, Johns, was the surname of Margaret Johns, the daughter of a wealthy landowner in Calvert County who married Gerard Hopkins, Johns Hopkins's great-grandfather. Johns Hopkins and his family enjoyed wealth and comfort. Situated in a beautiful area of streams, rolling hills, and trees, the home where he was raised was the site of frequent social gatherings. Family members and neighbors enjoyed fox hunting. While the Hopkins family had come to America from England as members of the Church of England, his great-grandfather Gerard Hopkins joined the Society of Friends (Quakers) after hearing preacher George Fox in 1671.



Johns Hopkins. (The Granger Collection, New York)

Hopkins's family fortune and his life changed in 1807, when his parents, deciding to abide by the Quakers' support of abolition, freed their slaves. The leisure time his family had enjoyed was now directed toward working the plantation, and though Hopkins had been an avid student and reader, he now had to stop attending school. At seventeen, he was sent to live with his uncle Gerard Hopkins and work in his wholesale grocery business in Baltimore.

First Ventures

Hopkins proved himself to be a valuable employee for his uncle. His early experience of a change in fortune developed in him a carefulness and frugality that would characterize his business dealings throughout his life. He demonstrated these traits early when he was left to tend to the grocery business and the family, while his uncle and aunt traveled for several months to attend a convention of Quakers in Ohio.

Working and living in his uncle's household, Hopkins fell in love with his uncle's daughter, Elizabeth, who returned his love. When his uncle refused to approve the marriage of first cousins, Hopkins set out on his own. With monetary support of $10,000 from his uncle Gerard, and the same amount of money from both his mother and a maternal uncle, John Janney, Hopkins opened a mercantile establishment with three of his brothers called Hopkins Brothers. This venture was immediately successful, partly because of Hopkins's willingness to accept whiskey as payment for goods purchased, even though the Society of Friends disapproved of this practice and his uncle Gerard refused to engage in it. Hopkins bottled and resold the whiskey as "Hopkins Best."

Johns Hopkins University and Johns Hopkins Medical School and Hospital

With the sum of $7 million, his suburban estate, and fifteen hundred shares of Baltimore and Ohio Railroad stock to create and endow Johns Hopkins University and Johns Hopkins Medical School and Hospital, Johns Hopkins left the largest single bequest ever made to a university. Although he specified few stipulations, his bequest did state that the university benefit the Baltimore community, promote advanced education, and provide scholarships for worthy individuals.

In 1875, the university's trustees selected Daniel Coit Gilman, a forty-three-year-old experienced organizer, teacher, writer, and educational visionary, as the university's first president. To help him develop goals for the new school, Gilman traveled across the United States and Europe, studying other universities, seeking faculty, and writing letters to the new university's trustees in which he explained the principles of educational excellence. He and the trustees placed special emphasis on the development of graduate education. Ultimately, however, they agreed to admit undergraduates, offer both bachelor and graduate degrees, and serve the community with special courses and lectures.

Selection of active scholars became essential to meeting the university's newly defined mission. Gilman searched for experts in their fields—authorities who were engaged in research, willing to teach their research processes, and eager to publish the results. From the outset, the university provided laboratories and financial support for the faculty's continued education, research, and publication. Committed to producing new information, the university introduced new teaching methods that emphasized active student engagement by introducing both the laboratory and the seminar. Wanting to make use of libraries and local residences to house students, the university trustees located the university in the heart of Baltimore rather than at Clifton, Johns Hopkins's suburban estate, where he had proposed the university situate its campus. The campus was later relocated to an area called Homewood near the Homewood estate of Charles Carroll, an eighteenth century politician.

The hospital opened in 1889, but the medical school opening was delayed because the facility needed additional funds after the Baltimore and Ohio's stock declined in value. Mary Elizabeth Garrett, daughter of John W. Garrett, the president of the Baltimore and Ohio, promised to raise the additional money if the medical school would agree to establish the highest admission standards and to admit women. Under her leadership, the Women's Memorial Fund raised almost all of the needed money, and she contributed more than $300,000 to meet the shortfall. The school became the first graduate-level medical school to admit women.

John Shaw Billings, a Civil War battlefield surgeon and pioneer in hygiene and public sanitation, became the intellectual architect of the medical school, planning its first buildings and deciding how the school and the hospital would work together to advance knowledge and benefit the sick. He urged Gilman to hire pathologist William Henry Welch, the first of the four famous doctors who were associated with the institution. The other three were William Stewart Halsted, a surgeon; Sir William Osler, an internist; and gynecologist Howard Kelly. A portrait of these men by John Singer Sargent, appropriated titled *Four Doctors*, hangs in the medical school's Welch Medical Library.

Mature Wealth

Hopkins remained with Hopkins Brothers for twenty-five years, and in the process he established a reputation as a thoughtful, careful, and creditworthy businessman. As his business thrived, he accumulated enough money to lend to others in whom he recognized a potential for success and to purchase properties for development and building. He oversaw the building of dozens of warehouses close to the waterfront, where he stored the goods he purchased and sold. At the time of Hopkins Brothers' success, Baltimore was developing into a thriving port, propitiously situated at the mouth of the Chesapeake Bay. Hopkins and other business owners took advantage of the city's centrality for moving goods from the South and West overseas or to other locations in the United States that were most accessible by water.

As Baltimore developed, so did Hopkins's fortunes as he moved into banking and lending. As a merchant he had used Conestoga wagons, capable of transporting four tons of merchandise overland. He immediately recognized the value of a more efficient mode of transportation that presented itself with the newly created Baltimore and Ohio Railroad, in which Hopkins invested and which he supported enthusiastically. In 1847, he became a director of this railway, and in 1855 he was appointed its chairman of finance, a position he held for the rest of his life. He also held between fifteen and seventeen hundred shares of stock in this rail line. As the railroad developed, he recognized the business and financial acumen of a young Baltimore businessman, John W. Garrett. He nominated Garrett for the presidency of the Baltimore and Ohio and promoted his election. Garrett became president and made the Baltimore and Ohio one of the most prosperous railroads of its day, consistently earning profits for investors.

Hopkins repeatedly demonstrated his ability to recognize and support a potentially promising person or venture. In 1857 and 1873, he pledged his personal fortune to support the Baltimore and Ohio Railroad during economic downturns. He also assisted the city of Baltimore in trying economic times, leading other bankers in an effort to lend Baltimore $1 million for the city's defense at the beginning of the Civil War. His support enabled both the railroad and the city of Baltimore to flourish. He earned a reputation as a shrewd judge of character, reputedly driving a hard bargain but making possible many business enterprises that would not otherwise have been financed. Hopkins served for many years as president of Merchants Bank. Recognized as a financial authority, he was sought out to serve as director or treasurer of many other financial organizations.

Hopkins was a thrifty man who cared little for clothes and never bought an overcoat. However, he did love his properties. He purchased and lived in two beautiful residences in Baltimore, one close to the harbor on Saratoga Street, the other a five-hundred-acre estate he named Clifton, several miles from the harbor. Here he decorated his home lavishly and tastefully and oversaw the creation of beautiful gardens, which he invited the public to visit on weekends. Even though he was a Quaker, he indulged his love of good food and wine and presided over elaborate dinners, hosting many guests and members of his large extended family.

Neither Hopkins nor his first love, Elizabeth, ever married, but they remained close friends throughout their lifetimes. His bachelorhood enabled him to devote his energy and enthusiasm for life to his business ventures. As he grew older, he longed to serve the public good in some lasting way. Valuing education and observing public health problems in Baltimore, particularly the effects of epidemics, he developed a desire to contribute to the education and health of his beloved city. He determined to create a university and hospital, which he referred to as his two children. He sought advice from others on ways to facilitate his goals and was encouraged in this venture by his friend Garrett. Garrett set up a meeting between Hopkins and George Peabody, a London investment banker, who, with financial roots in Baltimore, became the city's first philanthropist, founding the Peabody Institute, a cultural center and library. In 1867, soon after this meeting, Hopkins appointed trustees and set out the terms of funding for a university and hospital. Eventually, the Peabody Institute would become a division of Johns Hopkins University.

Legacy

A man who had always cared for his relatives, providing homes for his mother and sisters during his lifetime, Hopkins left money and/or property for his sister and other relatives, his former sweetheart Elizabeth, his servants. and several Baltimore charities. He left the bulk of his estate to create the Johns Hopkins University and the Johns Hopkins Medical School and Hospital. Before his death in 1873, he appointed trustees for both the university and hospital, including businessmen, college-educated men, and fellow Quakers. Several trustees served both institutions. While he left specific instructions that the university should develop educated, capable community members and become a model of scholarly endeavors, and that the medical school and hospital should train doctors and nurses and provide care for the poor, he left most of the practical decisions of establishing both institutions to the respective boards of trustees.

MARK HOPKINS

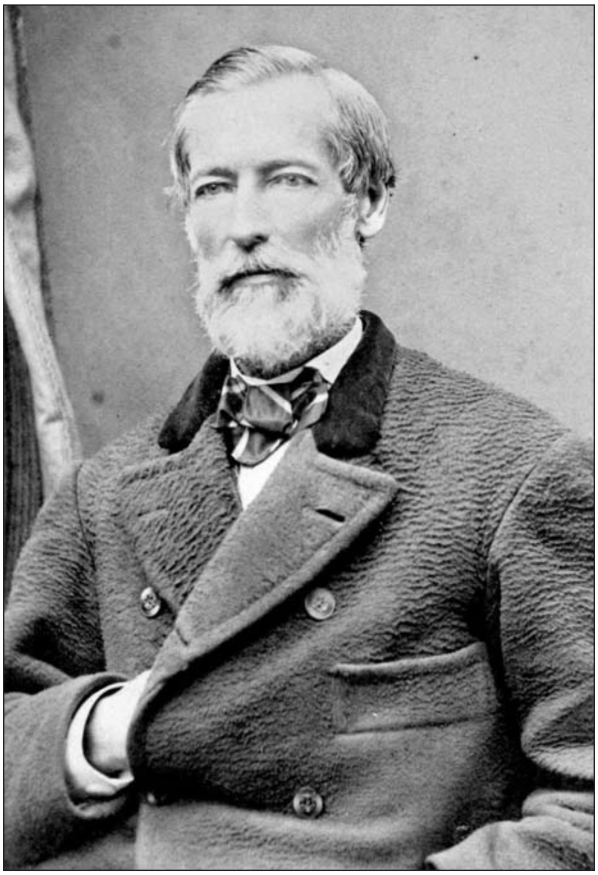
American railroad magnate

Hopkins is one of the men who helped build California by bringing the transcontinental railroad to the state. As treasurer of the Central Pacific Railroad, he made millions of dollars, but much of his fortune resulted from the political corruption typical of America's Gilded Age.

Born: September 1, 1813; Henderson, New York
Died: March 29, 1878; Yuma, Arizona Territory
Also known as: Mark Hopkins, Jr.
Source of wealth: Railroads
Bequeathal of wealth: Spouse

EARLY LIFE

Mark Hopkins, Jr., grew up on Lake Ontario's eastern shore in upstate New York, the son of a shopkeeper. In 1825, the family moved to St. Clair, Michigan Territory, where Hopkins continued his schooling. Upon his father's death in the late 1820's, Hopkins left home to become a clerk in a mercantile house in upstate New York. He then briefly studied law and worked as a traveling salesman before becoming a bookkeeper. In 1848, Hopkins contracted California gold fever and sailed to San Francisco.



Mark Hopkins. (AP/Wide World Photos)

FIRST VENTURES

After landing in California, Hopkins put up a tent in which he sold mining supplies and building materials. After making some money, he decided to try his luck at gold mining, but he could not find any gold. He then became a partner in a Sacramento grocery store. This business thrived, but in 1855 the partnership ended amicably and Hopkins joined Collis P. Huntington in operating a hardware firm. Huntington and Hopkins soon dominated the trade on the Pacific coast.

As one of the wealthiest men in Sacramento, Hopkins was approached by engineer Theodore Judah with plans for a transcontinental railroad. Hopkins, Huntington, Leland Stanford, and Charles Crocker organized the Central Pacific Railroad in 1861, with Hopkins as treasurer. The quartet, known as the "Big Four" or "the Associates," completed the railway in 1869. Their payments to politicians resulted in legislation favorable to the railroad and helped the associates turn a handsome profit.

MATURE WEALTH

Hopkins excelled at managing both money and his colleagues. Within the Big Four, he acted as a peacemaker and a counterweight against the excesses of the other men. He stood apart from his flamboyant, aggressive, and often arrogant associates. He spoke softly and with a lisp. He hated waste, and even when he was a multimillionaire he would chastise clerks for throwing away blotting paper that could still be used. He could often be seen bending down in the street to pick up a rusty bolt or some other piece of scrap iron. Hopkins apologized for his wealth and hesitated to spend it. He lived in a small rented cottage, kept no carriage, and took no vacations. He rose early, walked to work, walked home, and continued to work until the early hours of the morning. He had no interest in the competitive spending of the Gilded Age. However, his wife Mary had different ideas about spending. At her insistence, he joined the rush to erect a mansion on Nob Hill in San Francisco. The Hopkins mansion, which cost $3 million, boasted several turrets and an observation tower. Unfinished at Hopkins's death, the residence was a casualty of the San Francisco earthquake of 1906.

Hopkins opposed Huntington's plans for railroad expansion in 1878, believing that the new track would not generate profits for many years. However, at Huntington's insistence, Hopkins agreed to examine the area of the proposed expansion. Already on his sickbed, Hopkins traveled in a private railroad car to the California-Arizona border. While the car stood in a siding at Yuma, he died in his sleep on March 29, 1878. He left his $30 million estate to his wife Mary. Timothy, Hopkins's adopted son, later brought suit against Mary Hopkins's estate in order to obtain some of the money.

Legacy

California would be a less prosperous state without the transcontinental railroad. This railway enabled goods and people to move easily across the country. However, Hopkins and his colleagues were notorious "robber barons," charging such high prices to ship freight that they helped generate a populist revolt. The Big Four also corrupted the political process with bribes. Despite his quirks and personal frugality, Hopkins is essentially representative of the excesses of the Gilded Age.

Huang Zhiyun

Chinese salt merchant and government official

Huang was one of the wealthiest of the Yangzhou salt merchants who made great trading fortunes in eighteenth and nineteenth century China. He built Ge Yuan, one of China's great gardens, since preserved as a cultural treasure.

Born: 1770; Zhaozhou, China
Died: 1838; Yangzhou, China
Also known as: Yunfen; Geyuan; Huang Yingtai; Geyuan Yunfen
Sources of wealth: Trade; government
Bequeathal of wealth: Children

Early Life

Huang Zhiyun (hwang zhee-yuhn) was born in 1770 in Zhaozhou, Hebei Province, China. His parents were from Zhejiang Province but moved to Zhaozhou, where Huang's father served as a magistrate. When Huang was fourteen his father died, leaving the family destitute. With a letter of recommendation from a friend of his father, Huang presented himself to an administrator in the flourishing salt industry of Lianghuai (now Jiangsu Province). Impressed with Huang's intelligence, the administrator gave Huang his first appointment as a bureaucrat in the imperial salt trade.

First Ventures

The province of Lianghuai was the site of one of China's great trading centers, the ancient city of Yangzhou. Located at the junction of the Chang (Yangtze) and Huai Rivers and the Grand Canal, Yangzhou linked north and south China. Yangzhou merchants exchanged rice, silk, salt, and other goods. Extracted from salt fields and seawater, salt was a lucrative commodity. Essentially a government monopoly, the salt trade made Yangzhou's salt imperial officials and merchants vastly wealthy. Between 1738 and 1804, salt merchants contributed more than 1.3 billion grams of silver to the imperial Qing government. Huang Zhiyun became a leading imperial official in charge of commerce in Lianghuai Province.

Mature Wealth

As a commerce chief and merchant in the Yangzhou salt industry for more than fifty years, Huang accumulated a great fortune. He spent his wealth to become a classic Chinese gentleman, bringing up his family according to Confucian norms. At great expense he hired one of China's leading Confucian scholars, Jian Pan, to educate his four sons, Huang Xiqin, Huang Shi, Huang Xiqi, and Huang Xixi, in the classic arts of poetry, calligraphy, and painting. (Huang Shi would become a noted compiler of classical Chinese texts.) Huang could afford to retain a Chinese opera troupe, with performances in the great hall of his home.

The greatest manifestations of Huang's wealth were his house and gardens. His home originally consisted of five structures arranged around central courtyards, with a reported two hundred rooms, including bedrooms, studies, children's rooms, embroidery rooms, banquet halls, and a great hall for theatrical events and the memorial tablets of Huang's ancestors. One story of Huang's refined tastes—and his means to satisfy them—relates that because Huang loved fresh bamboo shoots, a Chinese delicacy, his cooks would travel to a distant mountain with stoves and kitchen equipment. Once there, they would dig out the bamboo shoots, wash and cut them, stew them with pork, and return to Yangzhou to serve Huang his favorite repast.

Huang set his house in a ruined garden, Shouzhi Yuan, built by the painter-monk Shi Tao during the Ming Dynasty. In 1818, Huang had the garden landscaped into a scholarly retreat exemplifying Confucian tastes. Comprising almost six acres, Ge Yuan, as Huang's garden is known, contained three plots—one for his house, one for an exquisite bamboo garden, and one for a rock garden, with a variety of rocks arranged in different patterns to suggest the four seasons. Huang's house and gardens served as both an impressive site for his business administration and a private retreat for his family.

Legacy

Yangzhou merchants in the Qing Dynasty's imperial salt trade were wealthy enough to finance the compilation of classical literary works, and Huang's family contributed to this enterprise. The merchants also built some of the most beautiful gardens in China, of which the most famous is Huang's Ge Yuan garden. Preserved as a cultural attraction, Ge Yuan was promoted by the government in 1998 as one of Jiangsu Province's historic treasures, especially celebrated for its elaborate rock and sculpture gardens. Now a major tourist site of Yangzhou, Ge Yuan, along with Beijing's Summer Palace, the Chengde Mountain Resort, and the Zhouzheng garden in Suzhou, is classified as one of China's four great historic gardens. It is also a memorial of the wealth and noble aspirations of the Yangzhou salt merchants.

H. L. Hunt

American oil magnate

Hunt, an oil tycoon, was the richest man in America in 1948. Using some of his wealth, he promoted his ultraconservative political opinions through newspaper columns, books, pamphlets, the radio program Life Line, *and the right-wing radio and television programs produced by his Facts Forum foundation.*

Born: February 17, 1889; Ramsey, Illinois
Died: November 29, 1974; Dallas, Texas
Also known as: Haroldson Lafayette Hunt, Jr.
Source of wealth: Oil
Bequeathal of wealth: Spouses; children

Early Life

Haroldson Lafayette Hunt, Jr. (HAR-uhld-suhn LAH-fee-eht huhnt), was the last of eight children born to Haroldson Lafayette Hunt, Sr., a farmer, and Ella Rose Myers Hunt, a teacher. Young Hunt received his schooling at home. At fifteen, he began traveling through Colorado, California, Arkansas, and Texas. To support himself, he worked as gambler, dishwasher, herder, farmer, and lumberjack. After his father's death in 1911 brought him an inheritance of $6,000, Hunt opened a gambling parlor and bought an Arkansas cotton plantation. In 1914, he married Lyda Bunker; the couple eventually had six children.

First Ventures

When the end of World War I caused a collapse in the cotton market, Hunt's assets plunged. He began new business ventures, developing an Arkansas oil well and working as an oil lease broker and real estate agent. By 1925, he was worth $600,000. Around the same time, he had an affair with Frania Tye, whom he may or may not have married and with whom he had four children.

By 1930, Hunt was nearly bankrupt as the result of business misfortunes, including a scarcity of oil strikes. However, he continued his oil speculation ventures, incorporating the Hunt Oil Company in 1936 and leasing and purchasing wells.

By 1942, his financial situation had improved. He owned nine hundred wells in eastern Texas, and he expanded his petroleum business into other parts of the state and country, eventually becoming the largest independent oil producer in the United States. His net worth was $20 million. The demand for oil during World War II enabled Hunt to open additional gasoline stations and to purchase a cattle ranch. *Fortune* magazine declared Hunt the richest man in America in 1948.

Mature Wealth

In the 1950's, Hunt, an adamant anticommunist and a right-wing conservative, used some of his assets to espouse his politics. He advocated assigning votes in American elections according to the amount of taxes one paid, denounced big government, and encouraged Senator Joseph McCarthy's search for Communists. From 1951 until 1956, he financed his own foundation, Facts Forum, which produced radio and television programs proclaiming his views. His self-published book *Alpaca* (1960) further expressed his political views, and Hunt personally sent copies of the book to world leaders. Another book, *Alpaca Revisited* (1967), and his *Life Line* radio programs also reiterated his positions.

In 1957, Hunt wed Ruth Ray, who claimed that her two children born before the marriage were Hunt's, and the couple subsequently had another two children. In the 1960's, Hunt began another business venture, HLH Products, which, among other things, manufactured foods and cosmetics.

In 1960, Hunt backed Lyndon B. Johnson's presidential campaign because of Johnson's support of the oil depletion allowance. However, when John F. Kennedy was nominated as the Democratic Party's presidential candidate, Hunt used his *Life Line* programs and his newspaper column, "Hunt for the Truth," to criticize Kennedy, to warn against Catholicism and Communists, and to urge support of the Republican presidential candidate, Barry Goldwater.

After President Kennedy was assassinated in Dallas, Texas, on November 22, 1963, the Federal Bureau of Investigation (FBI) questioned Hunt and some of his family about the murder. These investigations were triggered by Hunt's verbal attacks on Kennedy and the fact that Hunt's name was listed in the address book of Jack Ruby, the man who had killed Kennedy's alleged assassin, Lee Harvey Oswald. The allegations that the Hunts were involved in the assassination were never proven, but the family continued to receive death threats from those who disagreed with their political views and who believed they had participated in Kennedy's murder.

Toward the end of Hunt's life, this former gambler became a Baptist and encouraged others to set priorities and work to achieve them. He died on November 29, 1974.

Legacy

At his death, Hunt left an estate valued at $2 billion. His surviving two wives and numerous children and grandchildren spent years arguing about the distribution of his estate. Hunt's businesses continued after his death. He also left a political and social legacy, using his wealth to advocate conservative positions that would later gain greater acceptance and become an important element in American politics.

Collis P. Huntington

American railroad magnate

Huntington accumulated one of the greatest fortunes created in the United States' railroad industry. Through investments of his assets in California business ventures and real estate, he helped to spur the early development of that state's economy.

Born: October 22, 1821; Harwinton, Connecticut
Died: August 13, 1900; Raquette Lake, New York
Also known as: Collis Potter Huntington
Sources of wealth: Railroads; real estate
Bequeathal of wealth: Spouse; relatives; museum

Early Life

Collis Potter Huntington was born to a New England family of modest means, although both his father and his mother had ancestral roots going back to the early colonial period in America. His father, William Huntington, was a tinker—a maker of kitchen housewares. Rather than seeing the relative poverty of his youth as a disadvantage, Huntington later noted that it allowed him to see the potential of the "homely work" that was near at hand, whereas young people with money and more formal education often overlooked such possibilities. When he was fourteen, Huntington began to support himself, working on a neighbor's farm for $7 a month plus room and board.

Collis P. Huntington. (The Granger Collection, New York)

FIRST VENTURES

After a few months working on the farm, Huntington had saved some money and entered his first commercial venture. In 1836, with a small amount of his own capital and a $3,000 line of credit from a New York bank, Huntington bought a supply of watches, watch findings, and clocks, and traveled throughout the eastern United States peddling these goods. Over a period of several years, he made enough from this business to repay his creditor and have the capital to start a general store in Oneonta, New York, with his brother Solon Huntington, in 1842.

In 1849, Huntington went to California during the gold rush. Although he often told the story of how one day of pick and shovel work in a mine convinced him to pursue other endeavors, he went to California with the intention of setting up a store to sell supplies to miners. He brought with him a supply of trade goods. To travel to California, he sailed by ship to Panama, crossing the isthmus overland and then sailing in another vessel up the West Coast. While in Panama waiting for a ship to California, Huntington bought a small vessel and made several local trading voyages; in three months, he more than quadrupled his capital for the California trade.

He settled in Sacramento, California, and went into the hardware business. In 1855, he formed a partnership with Mark Hopkins. Their firm, Huntington and Hopkins, became one of the largest businesses in California by 1860.

MATURE WEALTH

In Sacramento, Huntington and Hopkins became acquainted with Leland Stanford and Charles Crocker. Together these men, often called the Big Four, became the principal backers of the Central Pacific Railroad. In 1861, they invested $24,000 in this new rail line. In July, 1862, Congress passed the Pacific Railroad Act, which

THE HUNTINGTON LIBRARY

The Huntington Library in San Marino, California, was established in 1919 by Henry Edwards Huntington, the nephew and one of the principal heirs of Collis P. Huntington. In 1872, Henry Huntington had gone to work for his uncle in the management of the Southern Pacific Railroad, and in 1892 he moved to San Francisco in connection with this position. On his way to San Francisco, he visited the San Marino estate of J. DeBarth Shorb, a rancher, vineyard owner, and real estate developer. Huntington was greatly impressed with the beauty of this estate, and in 1902 he purchased the land. In 1911, he had a large Beaux Arts-style mansion built there, designed by the architect Myron Hunt. By the twenty-first century, this mansion housed one of the several art galleries that are part of the Huntington Library.

Huntington was an avid collector of books and manuscripts, especially those dealing with the history of California and of the American West. In 1910, he retired from business and spent the rest of his life building the collection of books and manuscripts that would form the basis of the Huntington Library's collection. Many important collections in the United States and Europe were purchased in their entirety. Huntington had agents throughout the world on the lookout for significant books or collections and for dealers that would offer him first choice of important items.

In 1913, Henry married Arabella Worsham Huntington, the widow of his uncle Collis P. Huntington. Arabella was an ardent collector of art, and she played a significant role in assembling the initial collections for the galleries at the Huntington Library. The Huntington family never made public how much was spent amassing the initial collections of the institution; some estimates suggest as much as $30 million. An endowment of $8 million was established for the ongoing support of the library.

The Huntington Library is a major resource for scholars and researchers, housing one of the finest collections of books and manuscripts in the United States, especially in the areas of California history, the gold rush era, and the American West generally. More than twenty authors of Pulitzer Prize-winning books have done research at the facility. The library publishes a quarterly research journal and awards more than one hundred grants a year through a peer review process to fund research at the institution.

Besides the library, the institution includes four major art galleries and a 120-acre botanical garden divided into more than a dozen special gardens. In the first decade of the twenty-first century, a partnership with Chinese landscape architects led to the creation of the most important Chinese garden in the Western Hemisphere. The library is also famous as home to the Ellesmere manuscript of Geoffrey Chaucer's *The Canterbury Tales* (1387-1400), Johann Gutenberg's Bibles, and many other rare manuscripts and books, as well as many seventeenth and eighteenth century European furnishings and paintings.

Educational programs at the Huntington Library serve more than twelve thousand students a year, and the institution as a whole has more than half a million visitors annually.

chartered the new Union Pacific Railroad to build the eastern end of a new transcontinental railroad. The Central Pacific was given the contract to build the western end of this line. The Central Pacific faced the daunting task of crossing the Sierra Nevada, and progress on this early stretch of the road was painstakingly slow. When the Central Pacific tracks met the Union Pacific line at Promontory, Utah, on May 10, 1869, the transcontinental railroad was completed.

It was railroading that provided the bulk of Huntington's fortune. His role in the building of the Central Pacific was to act as the eastern agent for the company. All the supplies and equipment for the railroad had to be purchased in the East and shipped by water to California. He also did a great deal of work selling bonds to help finance the construction of the railroad. Huntington undertook the political lobbying needed to protect the company's interests in Washington, D.C. He often spoke frankly (although privately) about the necessity of bribing officials to accomplish what he wanted. When some of his correspondence on these matters was revealed in court cases in the 1880's, many Americans came to regard Huntington as one of the preeminent "robber barons."

After the Central Pacific work on the transcontinental railroad was finished, Huntington wanted to sell his interests in the line. He could not find a buyer, so he believed he had no alternative but to operate the railroad in such a way as to make a profit and protect his investment in it. Throughout his career, Huntington reveled in the challenge of making an investment pay off. The man who did this, he believed, enriched not only himself but also society in general.

The Big Four eventually gained control of the Southern Pacific, another western railroad that had been built across the Southwest from El Paso, Texas, to Los Angeles. In 1885, the Central Pacific was merged into the Southern Pacific, and Southern Pacific became a major railroad serving the American West, eventually controlling nine thousand miles of track. With the wealth created by his initial investments in these Western railroads, Huntington eventually invested in other railroads, shipping lines, shipbuilding, coal mines, timber, and southern California real estate. In 1869, he bought a controlling interest in the Chesapeake and Ohio Railroad. Because of his interest in this railroad, he invested heavily in the building of the port and shipbuilding facilities at Newport News, Virginia. At the height of his career in the railroad industry, Huntington could travel from San Francisco to Newport News entirely on the track of lines that he controlled.

The exact size of Huntington's personal fortune was never made public. Toward the end of his life, when a journalist suggested the amount of $70 million, Huntington replied that this figure was about as good an estimate as any. In his later years, Huntington developed an interest in art, and when he died he left an impressive collection of art to the Metropolitan Museum of Art in New York City.

Huntington was married twice but had no children of his own. He raised his first wife's niece, Clara Elizabeth Prentice, after the child's mother died. His niece later married Prince Frances Hatzfeldt of a minor German noble family. After his first wife died, Huntington married Arabella Worsham in 1884. She had a son, Archie, from a previous marriage. Archie took the Huntington name and later became well known as a philanthropist and scholar.

Toward the end of his life, Huntington purchased a rural retreat known as Pine Knot, on Raquette Lake in the Adirondack Mountains of New York. He built a twenty-six-mile railroad spur to serve this camp. He was suddenly stricken ill there and died on August 13, 1900. Huntington left the bulk of his estate to his wife and to his nephew Henry Edwards Huntington, the son of his brother Solon. Henry Huntington later endowed the Huntington Library in San Marino, California, which eventually became the best-known recipient of gifts from the Huntington fortune.

Legacy

Although Huntington may never have envisioned a career in the railroad industry, he became one of the most important railroad moguls of his era. When he died, he controlled more miles of railroad trackage than any American ever had, and he had accumulated one of the greatest personal fortunes made in the railroad industry. However, his reputation as a ruthless competitor and his involvement in paying off politicians for favorable treatment of his business interests led to much criticism of Huntington's wealth. The Southern Pacific Railroad monopolized railroad transportation in California and became a favorite target of reformers and politicians. This line was often referred to as the Octopus because its tentacles controlled so much of the commerce of the state. While Huntington made relatively few charitable gifts during his lifetime, the Huntington Library created by his heirs became his major philanthropic legacy.

—Mark S. Joy

Diego Hurtado de Mendoza

Spanish nobleman and military leader

With the inheritance of his parents and his two wives and aided by his own political moves, Hurtado de Mendoza became one of the most influential ricos hombres *(grandees) in the fourteenth century court of Castile.*

Born: c. 1367; Guadalajara (now in Spain)
Died: June, 1404; Guadalajara
Also known as: Admiral of Castile
Sources of wealth: Inheritance; marriage; government
Bequeathal of wealth: Children; relatives

Early Life

Diego Hurtado de Mendoza (DYAY-goh uhr-TAH-doh day mehn-DOH-sah) was born in Guadalajara around 1367, the eldest of eight children born to Pedro González de Mendoza and Aldonza López de Ayala. Members of the low Basque nobility, Hurtado's parents moved to Guadalajara, where their wealth increased with the rents and benefits granted by King Henry II of Castile in exchange for their support of Henry in his conflict with his half brother Pedro I. Their newfound wealth enabled his parents to live well and to purchase houses, estates, jewels, weapons, and horses. In 1379, Hurtado married Maria de Castilla, the illegitimate daughter of Henry II. The king contributed two towns to her dowry, while Hurtado's father gave the couple three villages.

First Ventures

After his father's death in the Battle of Aljubarrota in 1385, Hurtado became the head of the Mendoza clan, but he would come into his fortune only after his mother died in 1389. His uncle and tutor Juan Hurtado acted as the king's high steward before this position passed to Hurtado. An active supporter of the monarchs in the Trastámara Dynasty, Hurtado enjoyed great power at the royal court. He was granted positions, property, and privileges by the monarchy, and he came into abundant material wealth. According to author Fernan Perez de Guzman, Hurtado was an ambitious, intelligent, and troublemaking character. When King Henry III was still a minor, Hurtado, with the help of a group of ambitious noblemen, took over Guadalajara's sources of revenue.

Mature Wealth

In 1392, Hurtado was given the chief bailiwick, a position that granted the holder power over a town, village, or small region. Sometime before 1395, he was granted the right to appoint the *procuradores*, or members of Guadalajara's governing body, and to decide who would hold all public posts in this province, which resulted in the Mendoza family holding total power over Guadalajara and enabled them to increase their rents and lordly rights.

In the Madrid legislature in January, 1394, the king gave Hurtado the *real de Manzanares*, a large land grant in what is now the Spanish provinces of Segovia and Madrid. The king also appointed Hurtado to be the high admiral of Castile, and in this position Hurtado conducted successful maritime expeditions against the Portuguese in 1396 and 1397 and the Berbers in 1400.

Hurtado's first wife died soon after they were wed, and about 1395 he married Leonor de laVega, a member of an important Basque family, whose numerous properties in Biscay, Santander, and the Asturias of Santillana brought additional wealth into the Mendoza patrimony in the form of counties, towns, seigniories, pastures, salt mines, seaports, and other possessions. In June, 1404, after a painful illness, Hurtado died while he was decorating his magnificent palace. Aldonza, his daughter by his first marriage, and his cousin Mencia de Ayala, who reputedly was his lover, were his only company. His wife Leonor, tired of his infidelities, had moved with their children to Carrion.

Legacy

The estate and fortune built by Hurtado were in peril after his death. His children and his cousin Mencia were the main beneficiaries of his will, written in 1400, and codicil, written in 1404. A bitter legal battle ensued in which Leonor strived to secure her children's inheritance. It took Hurtado's son Iñigo López de Mendoza, the future marquess of Santillana, an entire lifetime to recover the family fortune.

It is difficult to quantify the value of Hurtado's estate. Suffice it to say that his will mentioned fifty properties, including five towns and ten villages. By the time of his death, the Mendozas, once members of the lower nobility, were at the heart of the Castilian aristocracy. The family started on its spectacular rise in both politics and society that would make them one of the most powerful and influential clans in Spain.

Barbara Hutton

American heiress and socialite

Hutton, whom the press dubbed the Poor Little Rich Girl, dissipated her inheritance with her lavish lifestyle and seven failed marriages. However, she also contributed to charitable and artistic institutions and gave financial support to the Allies during World War II.

Born: November 14, 1912; New York, New York
Died: May 11, 1979; Beverly Hills, California
Also known as: Barbara Woolworth Hutton; Poor Little Rich Girl
Source of wealth: Inheritance
Bequeathal of wealth: Dissipated

Early Life

Barbara Woolworth Hutton was the only child born to Edna Woolworth (1883-1918), the daughter of Woolworth chain store founder F. W. Woolworth, and Franklyn Laws Hutton (1877-1940), the cofounder of the banking and stock conglomerate E. F. Hutton and Company.

Franklyn was abusive, a womanizer, and an alcoholic, and his wife Edna was very unhappy in her marriage. When Barbara was six years old, she found her mother's dead body on the parlor floor; Edna had died from the poison she had deliberately ingested. Franklyn did not want the responsibility of a daughter, so for a while Barbara lived with her aunt, the cereal heiress Marjorie Merriweather Post, and her cousin Dina Merrill, who later became an actor. Ticki Tocquet was Barbara's governess and principal caretaker. Barbara's closest friend and confidant was her cousin Jimmy Donahue, the son of her mother's sister.

Barbara Hutton. (Hulton Archive/Getty Images)

Hutton attended private schools from 1924 until 1928 in California and New York, graduating from Miss Porter's School for Girls in Farmington, Connecticut, in 1930. By the time of her graduation, Hutton had no close friends and a very poor self-image, despite her good looks and wealth.

First Ventures

In 1924, Hutton inherited $28 million from her grandparents, and her father invested the funds for her. By the time she was twenty-one, her investment had earned her $50 million. However, Hutton was unhappy, and she traveled, often with Tocquet for a companion, and sought happiness, social standing, and attention.

Plagued by poor physical and emotional health, Hutton sought happiness through marriages that would fail, alcohol, drug addiction, and lavish spending. In 1933, she married Prince Alexis Mdivani, a Georgian prince and polo player, who divorced Louise Astor Van Alen of the Astor family and received $1 million to marry Hutton. Hutton and the prince divorced in 1935, and the next day Hutton married a Danish count, Curt Heinrich Eberhard Erdmann Georg von Haugwitz-Hardenberg-Reventlow. Before their 1938 divorce, Barbara gave birth to her only child, Lance Reventlow. Hutton's marriage to the count ended after a beating that left her hospitalized and her husband in jail.

Mature Wealth

During the 1940's, Hutton contributed to the American and British Red Cross to support the Allies in World War II. She also donated her yacht and her London mansion to the United States government, helped promote the sale of war bonds, and donated money to the Free French Forces. She married actor Cary Grant, the third of her seven husbands, in 1942, and divorced him in 1945. Two years later, she wed Russian Prince Igor Troubetzkoy, a race car driver, and the couple lived in Tangier, where she established an education fund for needy students. Troubetzkoy tried unsuccessfully to help Hutton with her drug and alcohol addictions, but the couple divorced in 1951.

Her 1953 marriage to Dominican race car driver, polo player, and diplomat Porfirio Rubirosa lasted only fifty-three days. By now, the media had dubbed Hutton the Poor Little Rich Girl. However, her marriage in 1955 to German tennis star Baron Gottfried Alexander Maximilian Walter Kurt von Cramm provided her with some emotional support until their 1959 divorce. During her marriage to Prince Pierre Raymond Doan in the 1960's, her addictions worsened. Her physical, emotional, and financial conditions further deteriorated after her son Lance died in an airplane crash in 1972. Hutton died in self-chosen seclusion at the Beverly Wilshire Hotel in Beverly Hills, California, in 1979 at the age of sixty-six.

Legacy

Barbara Hutton, the Poor Little Rich Girl, spent her life seeking love. Her $50 million had dwindled to only a few thousand dollars at the time of her death. While she spent much of her fortune on her extravagant lifestyle, she made generous financial contributions to support the Allies during World War II. She also donated funds to the

Musicians Emergency Fund, New York Philharmonic, New York Foundling Hospital, Metropolitan Museum of Art, Whitney Museum, San Francisco Opera Company, and the Juilliard School.

CARL ICAHN

American stockbroker, corporate executive, and corporate raider

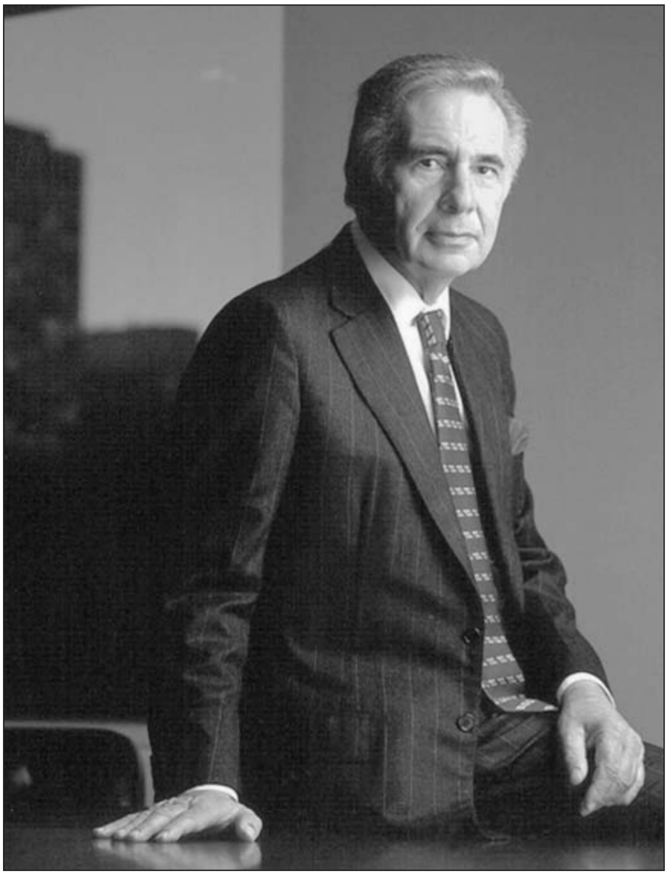
With a net worth estimated at $10.5 billion in 2010, Icahn remained active in business into his seventies. He was a notable philanthropist, financing such charitable enterprises as the Children's Rescue Fund and the Icahn Scholar Program at a New England preparatory school.

Born: February 16, 1936; Brooklyn, New York
Also known as: Carl Celian Icahn; Carl C. Icahn
Sources of wealth: Investments; real estate; horse breeding
Bequeathal of wealth: Spouse; charity

EARLY LIFE

Carl Celian Icahn (I-con) was born in 1936 to Michael Icahn, a lawyer and part-time cantor, and Bella Icahn, a schoolteacher in Bayswater, a middle-class neighborhood in the borough of Queens, New York, where Icahn was raised. The Icahns valued education. Both parents had disdain for what they considered the "robber barons" who lived north of them in Westchester County and Connecticut.

Young Icahn did not share their attitude, especially after he visited his uncle, Elliot Schnall, who had taken a wealthy wife and was installed by his father-in-law as president of the family-owned Cole Steel Company. The Schnalls displayed the outward vestiges of prosperity, such as a beautiful home, servants, and expensive cars. Once exposed to such luxuries, Icahn set his sights on living the high life, with his uncle as his role model. Icahn had an exceptional intellect combined with drive and ambition. After high school, he entered Princeton University, from which he graduated in 1957 with a bachelor's degree in philosophy.



Carl Icahn. (AP/Wide World Photos)

FIRST VENTURES

Icahn then entered New York University Medical School, but he soon discontinued his studies in favor of Wall Street, where he served an apprenticeship at the Dreyfus Corporation from 1960 until 1963. He then worked as an options broker for Tessel, Patrick, and Company, and from 1964 until 1968 he was an options trader with Gruntal and Company. These early experiences helped establish Icahn as a prime mover in the world of finance. In 1967, Icahn asked Schnall to lend him money so he could buy a seat on the New York Stock Exchange, estimating a seat would cost between $300,000 and $500,000. Icahn offered to reimburse Schnall at 8 percent annual interest, plus an additional $20,000 a year, during the course of the loan. Schnall had confidence in his nephew, who had already made Schnall money in options trades. Schnall gave Icahn a check with the amount left blank and authorized him to bid for the seat he wanted on the exchange and fill in the blank with the amount agreed upon, which turned out to be $400,000.

With this help, Icahn in 1968 was able to launch his own brokerage house, Icahn and Company, of which he was chairman and president. This company specialized in risk arbitrage and options trading, both chancy fields in which the risks are great but the rewards can be astronomical.

Mature Wealth

Icahn was like a shark smelling blood in dark waters, waiting to make its strike. He ferreted out large corporations that were in danger of failing. Indeed, some of them had already failed and were awaiting rescue by a white knight. In other cases, however, some companies could have survived without Icahn's intervention, but he pushed impatiently and was responsible for the ultimate failure of some of these firms. By 2007, Icahn's company held majority positions in five major companies, including his own Icahn Enterprises.

Beginning in 1978, Icahn, through Icahn and Company, took large, sometimes controlling, positions in more than two dozen companies, including RJR Nabisco, Phillips Petroleum, Western Union, Trans World Airlines (TWA), Viacom, Uniroyal Tires, Revlon, ImClone, Texaco, Gulf and Western, Samsonite, Time Warner, Motorola, Kerr-McGee, Fairmont Hotels, Marshall Field & Co., American Can Company, and Marvel Entertainment.

In the twenty-first century, Icahn attempted to take over Yahoo!, Inc., with the aim of ousting the company's chief executive, Jerry Yang, who had rejected Microsoft Corporation's offer to buy out his firm. If Icahn succeeded in ousting Yang, he could then clear the way for Microsoft to purchase control of Yahoo! under conditions favorable to the stockholders, including Icahn himself, who held about fifty million shares. With these shares in hand, Icahn announced on May 15, 2008, that he would soon direct a proxy fight to wrest control of Yahoo! from its present management. By July 21, 2008, however, Icahn had agreed to become a member of the board of directors of Yahoo!, with the stipulation that the company would expand the size of the board to eleven members, eight of whom were to stand for reelection immediately. Icahn would occupy one of the three unoccupied seats and would recommend people to occupy the two other vacancies. Such machinations are typical of how Icahn operates to gain control of the companies in which he has a strong financial position.

Icahn and Company held substantial positions in Nevada gaming companies. The firm's American Gaming Casino and Entertainment Properties had taken over four casinos in the late 1990's and early 2000's: Stratosphere Las Vegas, two Arizona Charlie's casinos in Las Vegas, and the Aquarius Casino Resort in Laughlin, Nevada. In February, 2008, Icahn sold these positions to Goldman Sachs for an estimated $1.3 million. Shortly thereafter, there was a precipitous decline in casino equities. As usual, Icahn walked away considerably richer than he was when he began accumulating these holdings.

Not all of Icahn's forced acquisitions have worked out. He attempted to take over Marvel Entertainment Group, the parent company of Marvel Comics, from Marvel's owner, Ronald Perelman, after Marvel went bankrupt in 1996. Dan Raviv's book, *Comic Wars: How Two Tycoons Battled over the Marvel Comics Empire—and Both Lost* (2002), provides a full account of Icahn's efforts. In 1997, after a long legal battle, Isaac Perlmutter, owner of the Marvel subsidiary Toy Biz, took control of Marvel, a defeat for both Icahn and Perelman.

Icahn often works quietly behind the scenes in his attempts to gain control of companies he considers taking over. An example of this is his purchase in 2004 of a huge

The Children's Rescue Fund

Carl Icahn, regarded by many as a fearsome corporate raider, has also been a generous philanthropist, as best exemplified by his work on behalf of the Children's Rescue Fund. Icahn established this foundation in 1988, and the organization initially had annual revenues of about $2.6 million. The fund's mission is to provide shelter for homeless families, particularly for pregnant women and their children.

The fund initially was housed in a sixty-five-unit complex in the Bronx borough of New York City. However, as the organization addressed the needs of the many homeless people seeking assistance, Icahn realized the necessity of expanding into other areas of New York. He subsequently opened Icahn House East and Icahn House West in Manhattan.

Icahn has also founded three charter schools, provides scholarships to students at the Choate Rosemary Hall preparatory school, and contributes to several other educational programs, and he takes a strong personal interest in these enterprises. He was able to combine his enthusiasm for raising outstanding thoroughbred horses with his desire to help the needy people who flocked to his charter schools and to the facilities of the Children's Rescue Fund. In the late 1980's, Icahn bought a valuable thoroughbred named Meadow Star that was training to be a racehorse. He promised that all of Meadow Star's winnings, plus any side bets he had made on the horse, would be allocated to the Children's Rescue Fund. In 1990 alone, Meadow Star garnered winnings of $992,250, establishing a record for a single season. In 1992, Meadow Star won eleven races out of twenty starts and earned an amazing $1,415,740, every penny of which went to the Children's Rescue Fund.

number of Mylan Laboratories' shares following Mylan's announcement that it planned to acquire King Pharmaceuticals. Icahn emerged from the sidelines with the threat of a proxy fight, contending that Mylan was offering too much money for King's shares. He also said that Mylan's chief executive officer was significantly overpaid and the company's administration was ineffective. In early 2005, Mylan abandoned its plans to acquire King. Mylan denied that Icahn's revelations about the company had influenced its decision to back out of the deal, but it is clear that this was not the case.

LEGACY

Many people whose careers were damaged or utterly destroyed by Carl Icahn's ruthless rapacity will remember him as a ferocious corporate raider. It is clear that Icahn regards his business transactions as elements of an enormous competitive game that he has learned to play almost flawlessly. Certainly he has little need to increase his personal wealth. Nevertheless, he revels in shrewdly engaging in complicated financial schemes. He has a deep understanding of finance, arbitrage, and the laws governing business transactions.

Many other people who have benefited from Icahn's widespread benevolence will remember him as a generous man with an obvious desire to help improve society. Among his charitable contributions, perhaps the most far-reaching is the Children's Rescue Fund. He has also made donations to enable Princeton University to establish a laboratory for genomic studies, called the Carl C. Icahn Laboratory. The Icahn Scholar Program at Choate Rosemary Hall, a New England preparatory school, covers the full expenses for ten needy students every year for the entire four years of their secondary education at a total cost of about $160,000 per student. In any given year, forty Icahn scholars are in residence at the school. Icahn has made large contributions to New York City's Mount Sinai Hospital, which has named the Icahn Medical Institute in his honor. Icahn Stadium on Randall's Island also bears his name, as does the Carl C. Icahn Center for Science.

SAMUEL INSULL

Anglo-American electric utility magnate

Insull earned his fortune by developing the business model and infrastructure for the electrical system of the United States, profoundly changing the way Americans lived and worked. The collapse of his holding company after the 1929 stock market crash spurred legislation to prevent similar abuses in the electric utility industry.

Born: November 11, 1859; London, England
Died: July 16, 1938; Paris, France
Source of wealth: Utilities
Bequeathal of wealth: Spouse; children

EARLY LIFE

Samuel Insull (IHN-suhl) was born in London, England, on November 11, 1859. At age fourteen, he finished his formal education and apprenticed himself to a clerk. He held several clerking posts until he was twenty-one and met inventor Thomas Edison in London. Edison hired Insull to work as his personal secretary, and Insull immigrated to the United States in 1881 to assume the position. He so impressed Edison that Edison sent Insull to run the factory at the General Electric Company in Schenectady, New York.

FIRST VENTURES

Working at General Electric, Insull quickly learned the electricity industry, and he took on more responsibilities in Edison's various business ventures. When in 1892 a merger pushed Edison out of General Electric and the Western Edison Light Company became Chicago Edison Company, Insull was made president of the new company and moved to Chicago. At this time, electricity was very expensive and was considered a luxury. Chicago had about twenty power stations that supplied electricity to only about five thousand customers who could afford it. Insull invested $250,000 of his own money to buy out his competitors. In 1897, with the acquisition of the Commonwealth Electric Light & Power Company, he established the Commonwealth-Edison Company.

MATURE WEALTH

Insull realized that electricity would have to become more affordable in order for his company to provide service to a greater number of people. He upgraded the equipment in his utility's power stations, adding improved turbines to generate greater amounts of electricity. He increased the network of power lines in order to bring power to more of Chicago's neighborhoods. Because wealthy customers used most of their electricity in the evening hours, when they were home, Insull decreased the charge for use during daytime hours, providing small businesses and other customers with greater access to power. He gave free electrical appliances to households in order to encourage customers to use electricity. As he acquired more customers and more power stations, he used economies of scale to continue to lower the price of electricity, thus making it even more affordable.

Insull married twenty-four-year-old Margaret Ann Bird, an actor whose stage name was Gladys Wallis, on

Samuel Insull reads a newspaper article about his 1934 return from Europe in order to stand trial in Chicago for alleged antitrust violations and mail fraud. (N.Y. Daily News via Getty Images)

May 22, 1899, when he was thirty-nine. The couple lived in a mansion on the outskirts of Chicago and had one son, Samuel, Jr.

By the end of the 1920's, Insull's Chicago electrical monopoly earned about $40 million per year, employed more than six thousand workers, and served about half a million customers. He was involved in other utility ventures in thirty-two states that served more than four million customers. Insull financed the expansion of his utility business by selling stocks and bonds to more than one million middle-class investors.

However, his clients' investments were wiped out in the stock market crash of 1929, when Insull's holding company collapsed. With charges of antitrust and mail fraud looming, Insull and his wife fled to Greece. Insull returned to the United States to face the charges in 1934 and was acquitted, but his reputation was damaged and he lived out the rest of his life in Europe. He died of a heart attack in a Paris subway station on July 19, 1938. After his death, his wife returned to Chicago to be with her son and grandson.

Legacy

Samuel Insull is largely responsible for the development of the integrated infrastructure that provides electricity to millions of Americans—one of the major technological achievements of the twentieth century, with a profound influence on all aspects of American life. The failure of the holding company that financed Insull's utility ventures led to the enactment of the Public Utility Holding Company Act of 1935, which regulated utility holding companies in order to prevent another financial collapse of the industry.

Insull also financed the building of the Chicago Opera House. The film *Citizen Kane*, in which the lead character builds an opera house, is partially based on the lives of Samuel and Gladys Insull.
