INTRODUCTION

Under the general heading “Gnosis and Western Esotericism”, this Dictionary brings together a great range of historical currents and personalities that have flourished in Western culture and society over a period of roughly two millennia, from Late Antiquity to the present. By doing so, it intends not only to provide a comprehensive reference work, but also to question certain ingrained assumptions about the history of Western religion and culture, and promote new agendas and analytical frameworks for research in these domains. What is at stake in such a shift of perspective can best be illustrated by taking a short look at the main terminological conventions that have traditionally been dominant.

The term *Gnosticism* was originally a pejorative term, coined in the 17th century by the Cambridge Platonist Henry More. In adopting it as a purportedly neutral scholarly category, historians also largely took over the assumption that there had actually existed a distinct religious system which could be called Gnosticism, and which could be clearly defined in opposition to the early Christian church. In recent decades it has become increasingly clear, however, that any such reification of “Gnosticism” is untenable¹ and leads to historical simplifications; the idea of a clear-cut opposition of Christianity versus Gnosticism in fact reflects heresiological strategies by means of which certain factions and their spokesmen sought (successfully, as it turned out) to cement their own identity as “true” Christians by construing a negative other: the adherents of “the Gnosis falsely so called”, demonized as the enemies of the true faith. It is historically more accurate, however, to see the latter, who often adhered to mythological gnostic systems, as representatives of a much broader and variegated movement or type of religiosity ‘characterized by a strong emphasis on esoteric knowledge (gnosis) as the only means of salvation, which implied the return to one’s divine origin’.²

To this much broader movement of *Gnosis* in Late Antiquity belonged not only “Gnosticism”, but also, in their own ways, Christians such as Clement of Alexandria and, notably, the currents that inspired the Hermetic literature. In the domain of *Hermetism*, too, scholarly research has long been influenced by artificial black-and-white distinctions based upon normative agendas. The great pioneers of this field, Walter Scott and André-Jean Festugière, sharply opposed a “learned” or “philosophical” Hermetism against a “popular” hermetism: the worldviews belonging to the former category deserved the respect of serious scholars, but although the “occult” and “superstitious” practices belonging to the latter (nowadays referred to more neutrally as “technical” hermetica) also needed to be studied, they were referred to with contempt as no more than ‘masses of rubbish’.³ A no less important bias concerned the almost exclusive focus of scholars like Festugière on the Greek and philosophical dimensions of the Hermetic literature, at the expense of their Egyptian backgrounds – an emphasis that echoes long-standing perceptions of Egypt as the homeland of paganism and idolatry pitted against Greece as the origin of Reason and Enlightenment. Progress in the study of Hermetism in more recent decades has essentially consisted in correcting these biases on the basis of careful philological and source-critical research. The central importance of Egyptian religion for understanding the Hermetic literature is now no longer in any doubt; and it has become clear that the “philosophical” and “technical” Hermetica are in fact products of one and the same pagan intellectual milieu in Graeco-Roman Egypt, and must therefore be seen as closely connected.⁴

¹ See notably Michael Williams, *Rethinking “Gnosticism”: An Argument for Dismantling a Dubious Category*, Princeton: Princeton University Press, 1996; and the entry “Gnosticism I” in this Dictionary.

² See entry “Gnosticism I” in this Dictionary.

³ W. Scott (ed.), *Hermetica*, I, Oxford, 1924, 1.

⁴ See notably Jean-Pierre Mahé, *Hermès en Haute-Égypte* (Bibliothèque Copte de Nag Hammadi, Section “Textes”,

In the context of Late Antiquity, and notably in Hellenistic Egypt, we are therefore dealing with a complex type of religiosity based on the pursuit of gnosis or salvific esoteric knowledge. This phenomenon cannot be reduced to either Gnosticism or Hermetism but includes both; and it may manifest itself in pagan, Christian, as well as Jewish contexts. Moreover, with respect neither to Late Antiquity nor to later periods is it possible to study the history of these currents in isolation from that of the so-called *occult sciences*. This fact adds considerable complexity to the domain covered in this Dictionary, since it implies a large overlap between theories and practices focused on “gnosis” and pertaining primarily to the domain of religion, and others pertaining more obviously to that of science. That much attention is given in the present reference work to astrology, alchemy and *magia naturalis* does not reflect any wish to recast these disciplines as essentially religious currents focused primarily on gnosis and spiritual pursuits, or to deny their grounding in natural philosophy and science. On the contrary, the intention is to highlight the complexity of the relations between science, natural philosophy, cosmology and religion in the period from Antiquity through the 17th and even 18th centuries, against the tendency of earlier generations to deny this complexity in the interest of simplifying “religion versus science” oppositions. Thus, for example, the attempt (associated with C.G. Jung and his school) to present alchemy as not a scientific but a spiritual pursuit is no less reductionistic than the tendency of positivist historiography to ignore religious dimensions of alchemical literature as irrelevant. This Dictionary seeks to highlight the importance of the natural sciences for the study of “Gnosis and Western Esotericism” as well as the relevance of the latter to the history of science and philosophy; for only by multi- and interdisciplinary research that is attentive to all the various dimensions of these complex domains will it be possible to correctly assess their importance in Western culture.

Processes of acculturation by means of which a variety of originally “pagan” systems of ideas – such as e.g. those originating in hermetic, neoplatonic, and even aristotelian contexts – became integral parts of Christian culture during the Middle Ages and Renaissance are an obvious focus of interest for the study of “Gnosis and Western Esotericism”. Major examples during the Middle Ages are the reception of Hermetic literature by a range of Christian theologians,⁵ the strange phenomenon of ritual magic flourishing in the context of the medieval “clerical underworld”,⁶ and the revival of the “occult sciences” during the later Middle Ages as a result of a flood of translations from Arabic into Latin.⁷ These developments provided the indispensable foundation for what has been referred to as the *Hermetic tradition* of the Renaissance, starting with Marsilio Ficino’s epoch-making translation of the *Corpus Hermeticum* in 1463 (published in 1471, and with numerous reprints throughout the 16th century), in the context of his life-long project of recovering the supreme religious philosophy of the “divine Plato” and a long chain of *prisci theologi* who were believed to have preceded him. Since Ficino saw Plato as a religious author and read him through neoplatonic lenses, his new Christian-platonic philosophy was bound to give a new legitimacy to late-antique theurgy and related occult practices, incorrectly but influentially attributed to ancient authorities like Zoroaster and Hermes Trismegistus. The resulting mixture of hermetic, neoplatonic and occult traditions (all, of course, integrated within a Christian framework) was further enriched by a heady infusion of Jewish traditions: the so-called *Christian kabbalah*, pioneered by Giovanni Pico della Mirandola, Johannes Reuchlin and many other authors in

3 and 7), 2 vols., Quebec: Presses de l’Université Laval, 1978 and 1982; Garth Fowden, *The Egyptian Hermes: A Historical Approach to the late Pagan Mind*, Princeton: Princeton University Press, 1986.

⁵ See entry “Hermetic Literature II” in this Dictionary.

⁶ The term was introduced in the standard textbook by Richard Kieckhefer, *Magic in the Middle Ages*, Cambridge: Cambridge University Press, 1989 (ch. 7).

⁷ Mention should be made here of the pioneering and still indispensable multi-volume work by Lynn Thorndike, *A History of Magic and Experimental Science*, 8 vols., New York: MacMillan & Columbia University Press, 1923-1958.

their wake, left an indelible mark on all later developments of the tradition. Thus the 16th century saw the birth of a new type of syncretic religiosity that could make its appearance in various confessional contexts, and was based on Jewish, Christian and pagan components. Traditional disciplines like astrology, *magia* and alchemy now came to be understood as integral parts of a comprehensive religious philosophy and cosmology on neoplatonic, hermetic and kabbalistic foundations, sometimes referred to as *philosophia occulta*. The innovative (al)chemical philosophy based upon the writings (real or spurious) of Paracelsus left a particularly strong mark on subsequent developments, as represented notably by the Rosicrucian current of the early 17th century and its continuations over the next centuries, and the Christian theosophical tradition linked to Jacob Boehme and his followers, that emerged around the same time and found multiple adherents until the early 19th century and beyond.

It is again due to ingrained ideological biases – ultimately grounded in the biblical and theological rejection of paganism as idolatry – rather than for scholarly reasons that this entire domain was severely neglected by academic research until far into the 20th century. In 1938 Paul Oskar Kristeller first called attention to the importance of the Hermetic literature for Renaissance culture, and Italian scholars began to study some of the sources⁸ (although specialists still tended to look at the occult dimensions of Renaissance hermetism as an embarrassment which they preferred to ignore as much as possible);⁹ but it was only in 1964 that the “Hermetic Tradition” was definitely put on the agenda of scholarly research – particularly in the context of the history of science¹⁰ – due to Frances A. Yates’s extremely influential *Giordano Bruno and the Hermetic Tradition*.¹¹ In a series of later books, notably *The Rosicrucian Enlightenment* (1972) and *The Occult Philosophy in the Elizabethan Age* (1979), she further explored the development of Hermetic philosophy and related traditions such as the “Christian kabbalah” and the Rosicrucian furore of the early 17th century. While Yates’s work has been of the greatest importance in bringing these subjects to the attention of a wide audience, particularly in the anglophone world, her grand narrative of “the Hermetic Tradition” as a coherent and quasi-autonomous counterculture based upon magic and leading to science has been called into question by subsequent research: what is nowadays referred to as *hermeticism* (an umbrella concept that in fact comprises much more, as we have seen, than the hermetic literature only)¹² was by no means limited to some magical

⁸ Paul Oskar Kristeller, “Marsilio Ficino e Lodovico Lazzarelli: Contributo alla diffusione delle idee ermetiche nel rinascimento”, *Annali della R. Scuola Normale Superiore di Pisa, Lettere Storia e Filosofia* 2:7 (1938), 237-263, repr. in Kristeller, *Studies in Renaissance Thought and Letters* I, Roma, 1956. See discussion in Wouter J. Hanegraaff, “Lodovico Lazzarelli and the Hermetic Christ: At the Sources of Renaissance Hermetism”, in: Wouter J. Hanegraaff & Ruud M. Bouthoorn, *Lodovico Lazzarelli (1447-1500): The Hermetic Writings and Related Documents*, Phoenix: Arizona Medieval & Renaissance Texts & Studies, 2005.

⁹ Paul Oskar Kristeller, “L’état présent des études sur Marsile Ficin”, in: *Platon et Aristote à la Renaissance* (XVI^e colloque international de Tours), Paris: J. Vrin, 1976, 63: ‘grâce à l’oeuvre de Thorndike, de Miss Yates et d’autres, nous ne sommes plus épouvantés quand nous rencontrons des idées scientifiques bizarres ou des conceptions astrologiques, alchimique ou magiques chez les penseurs des siècles passés. Si nous découvrons des idées de ce genre dans l’oeuvre de Ficin, nous ne lui en faisons pas reproche, mais nous le plaçons simplement dans une vaste tradition intellectuelle qui avait été négligée et évitée trop longtemps par les historiens, et qui est représentée par une littérature étendue et difficile qui a encore besoin, même après les recherches récentes, d’un grand effort d’étude et d’exploration’.

¹⁰ On this debate about the “Yates thesis” (inspired in particular by Yates’s article “The Hermetic Tradition in Renaissance Science”, in: Charles S. Singleton [ed.], *Art, Science, and History in the Renaissance*, Baltimore & London, 1967, 255-274), see e.g. Brian P. Copenhaver, “Natural Magic, Hermeticism, and Occultism in Early Modern Science”, in: David C. Lindberg & Robert S. Westman (eds.), *Reappraisals of the Scientific Revolution*, Cambridge, 1990, and H. Floris Cohen, *The Scientific Revolution: A Historiographical Inquiry*, Chicago & London, 1994, 169-183.

¹¹ Frances A. Yates, *Giordano Bruno and the Hermetic Tradition*, London & Chicago: Routledge and Kegan Paul & University of Chicago Press, 1964.

¹² Hence the distinction made in this Dictionary between “Hermetism” (as referring to the philosophical Hermetica and their commentaries) and “Hermeticism” (as a concept referring to the entire syncretic mixture that emerged

subculture but was abundantly present in “mainstream” religious, philosophical and scientific discourse as well, and its great representatives were complex thinkers whose perspective can by no means be reduced to hermeticism and magic alone.¹³ As a result, the simple and dramatic picture of a quasi-autonomous counter-tradition of “hermeticists” or “Renaissance magi” fighting against the establishment (theologians, rationalists, scientists) has given way to a less romantic but more accurate perception of “hermeticism” as a traditionally underestimated dimension of *general* religious and cultural developments in pre- and early modern Western society.

In a manner very similar to what happened in Late Antiquity, with the reification of “Gnosticism” as a distinct heretical system opposed to Christianity, the concept of a distinct system or tradition of “Hermeticism” (comprising, as we have seen, the entire mixture of hermetic literature, neoplatonic speculation, kabbalah, alchemy, astrology, and magic outlined above) seems to have emerged in the 17th century and to have been taken up especially in Protestant contexts.¹⁴ It is mainly against this background that the proponents of the Enlightenment came to present it as the epitome of unreason and superstition. Once again, the process was one of cementing one’s own identity by construing a negative “other”: the very project of Enlightenment required a wholesale rejection of “the occult”. But in this case, too, careful historical research reveals a much more complex picture. The more we learn about the relationship between the Enlightenment and phenomena such as Freemasonry and related associations (such as the Bavarian Illuminaten or the Gold- und Rosenkreuzer) or the variegated field referred to as 18th-century Illuminism, the clearer it becomes that the boundaries between reason and its “other” were in fact blurred and shifting, with many important figures finding themselves with one foot in each camp. As the historical evidence thus forces us to re-evaluate and problematize traditional concepts of the “Age of Reason”, we also need to reconsider the effects of those concepts on subsequent historiography.¹⁵

The reification mainly by Protestant and Enlightenment authors of “Hermeticism” as a coherent counterculture of superstition and unreason, followed by its exclusion from acceptable discourse, forced its sympathizers to adopt similar strategies. From the 18th century on and throughout the 19th, as a by-product of secularization and the disenchantment of the world, one sees them engaged in attempts at construing their own identity by means of the “invention of tradition”: essentially adopting the Protestant and Enlightenment concept of a hermetic or magical counterculture, they sought to defend it as based upon a superior worldview with ancient roots, and opposed to religious dogmatism and narrow-minded rationalism. Here, too, the process was a highly complex and ambivalent one, with hermetically-oriented authors making frequent reference to “reason”, “science” or “historical facts” in order to defend the notion of an ancient and

in the wake of Ficino’s translation of the *Corpus Hermeticum*, and that included many currents and ideas that are not actually derived from Hermetic sources).

¹³ Wouter J. Hanegraaff, “Beyond the Yates Paradigm: The Study of Western Esotericism between Counterculture and New Complexity”, *Aries* 11:1 (2001), 5-37.

¹⁴ See in particular the polemics of Ehregott Daniel Colberg against what he referred to as “platonisch-hermetic Christianity” (*Das Platonisch-Hermetisches* [sic] *Christenthum, Begreifend Die Historische Erzählung vom Ursprung und vielerley Secten der heutigen Fanatische Theologie, unterm Namen der Paracelsisten, Weigelianer, Rosencreutzer, Quäcker, Böhmisten, Wiedertäufer, Bourignisten, Labadisten, und Quietisten*, 2 vols., Frankfurt & Leipzig: M.G. Widmann, 1690-1691), and the defense of the same currents by Gottfried Arnold (*Unpartheyische Kirchen- und Ketzer-Historie: Vom Anfang des neuen Testaments bis auf das Jahr Christi 1688*, Frankfurt a.M.: Thomas Fritsch, 1700). Note that the Roman Catholic Marin Mersenne already attacked the opinions of the ‘platonists, rabbis and magi’ earlier in the century (*Quaestiones celeberrimae in Genesim*, esp. the separate final section, entitled *Observationes et emendationes ad Francisci Georgii Veneti “Problemata”*, Paris, 1623). Mersenne clearly targets the entire compound (represented for him by authors such as Giorgio da Veneto and Fludd) that eventually came to be referred to as “hermeticism”, but does not yet refer to it as such.

¹⁵ Monika Neugebauer-Wölk (ed.), *Aufklärung und Esoterik* (Studien zum achtzehnten Jahrhundert, 24), Hamburg: Felix Meiner, 1999; Christopher McIntosh, *The Rose Cross and the Age of Reason: Eighteenth-Century Rosicrucianism in Central Europe and its Relationship to the Enlightenment*, Leiden, New York, Köln: E.J. Brill, 1992.

superior tradition of “magic and the occult” that had been present since hoary antiquity and had continued through the ages. The term *occultism*, a neologism first attested in 1842, was quickly picked up in these circles as an appropriate label for their own perspectives. Eventually the term has also come to be adopted by scholars, as a historical label for these same 19th-century circles and their 20th-century continuations.¹⁶

It is likewise in the first half of the 19th century that the term *esotericism* (French: “ésotérisme”) emerged as well, having been coined by the Protestant historian Jacques Matter in his *Histoire critique du gnosticisme et de son influence* published in 1828. The term therefore did not originate as a self-designation by which certain religious authors or currents identified themselves or their own perspectives, but as a scholarly label applied *a posteriori* to certain religious developments in the context of early Christianity. To the present day, the term “esotericism” tends to be used by scholars in two different senses, that should be clearly distinguished: in a typological sense it refers to traditions of secrecy or (mainly among authors inspired by “religionist” agendas) to what is seen as the deeper “inner mysteries of religion” as opposed to merely external or “exoteric” religious observance, but in a strictly historical sense it functions, rather, as a general label for a series of specific currents in Western culture that display certain similarities and are historically related.¹⁷ The term *Western Esotericism* in the title of this Dictionary refers to this second meaning. Particularly in French scholarship, “l’ésotérisme occidental” has long been used by scholars as the preferred umbrella term covering the entirety of currents and traditions that have been sketched above; and since the 1990s this terminological convention has rapidly been gaining ground in international academic discourse.¹⁸ This process has been accompanied by a theoretical and methodological debate about definitions and demarcations, which is still in full development at the time of writing.¹⁹

Since the eventual outcome of these discussions is as yet far from clear, it would have been unwise to link the present Dictionary too specifically to one particular definition or theoretical approach. Such an attempt would, moreover, have been unnecessary, because – as in the study of “religion” generally – scholars in this domain often strongly disagree about abstract theoretical definitions although they in fact share a broad consensus about the historical phenomena covered by the term. Specialists may quibble about boundary issues, disagreeing about whether this or that specific current or personality should or should not be included under the broad labels “Gnosis” and “Western Esotericism”, but experience shows that by and large they think of the same domain and the same currents when they are using these terms.

The major exception, which therefore needs to be addressed here, concerns the important question of “gnosis” and “esotericism” in the context of Jewish and Islamic culture. As for the Jewish context, it is significant that in his Hebrew publications Gershom Scholem preferred to speak not of Jewish mystics but of *ba’aley sod* (lit. “masters of the secret”, translatable as “esoterics” in the typological sense referred to above);²⁰ accordingly,

Hanegraaff, “Empirical Method in the Study of Esotericism”, *Method & Theory in the Study of Religion* 7:2 (1995), 99-129; Antoine Faivre, “L’ésotérisme et la recherche universitaire”, in: *Accès de l’ésotérisme occidental*, 2nd revised ed., II, Paris: Gallimard, 1996, 13-42; several contributions in Antoine Faivre & Wouter J. Hanegraaff (eds.), *Western Esotericism and the Science of Religion: Selected Papers presented at the 17th Congress of the International Association for the History of Religions, Mexico City 1995*, Louvain: Peeters, 1998; Monika Neugebauer-Wölk, “Esoterik und Christentum vor 1800: Prolegomena zu einer Bestimmung ihrer Differenz”, *Aries* 3:2 (2003), 127-165; Kocku von Stuckrad, *Was ist Esoterik? Kleine Geschichte des geheimen Wissens*, Munich: C.H. Beck, 2004, 9-23.

²⁰ Joseph Dan, “In Quest of a Historical Definition of Mysticism: The Contingental Approach”, *Studies in Spirituality* 3 (1993), 62-63.

the English translation of his classic introduction as *Major Trends in Jewish Mysticism* (1946) might be considered unfortunate. From both a historical and a theoretical perspective, excellent arguments could be adduced for including the entire domain of “Jewish gnosis and esotericism” within the context of the present Dictionary, and along similar lines one might argue in favour of including the domain of Islamic gnosis and esotericism, which likewise tends to be referred to as “mysticism”.²¹ The editors are aware of the cogency of the arguments that can be adduced in favour of a concept of “Gnosis and Western Esotericism” that fully and systematically includes the three great Religions of the Book; and they are acutely conscious of the fact that doing otherwise might be perceived by some readers as reflecting a Christianity-centered bias that incorrectly seeks to exclude Judaism and Islam from the domain of “European history of religions” or from “Western culture” as such. No such exclusion or marginalization is intended here. The decision to discuss the Jewish and Islamic dimensions as “influences upon” rather than as integral parts of Gnosis and Western Esotericism was made not for theoretical but for entirely pragmatic reasons. It reflects the fact that (partly due to linguistic barriers) the disciplines studying Jewish and Islamic “mysticism” have so far developed relatively independently and have already succeeded in achieving a certain degree of academic recognition, at least in comparison to the field here referred to as “Gnosis and Western Esotericism”. With respect to the latter, it is true that many specific currents covered by the present Dictionary (particularly those pertaining to earlier periods) have long been subjects of serious academic study, but only very recently have conditions begun to be created – in the form of e.g. multidisciplinary conferences, academic institutions, monograph series, or academic journals²² – that allow them to be seen in a larger historical context, so that their numerous historical interconnections are seriously explored and these various currents can be perceived as so many aspects of a much larger domain. Academic research into the later phases of the historical spectrum, from the Renaissance and *a fortiori* from the 18th century on, has been most seriously neglected by earlier generations (mostly due to the influence of the now discredited “secularization thesis” according to which these domains could not be anything more than marginal “survivals” that would eventually succumb to the pressures of rationalization and secularization);²³ and again it is only quite recently that this situation is beginning to improve.²⁴ By giving equal attention to these later and quite recent historical developments as to those belong-

²¹ E.g. Annemarie Schimmel, *Mystical Dimensions of Islam*, Chapel Hill: University of North Carolina Press, 1975; Alexander Knysh, *Islamic Mysticism: A Short History*, Leiden, Boston, Köln: E.J. Brill, 2000.

²² Large and successful symposia on Western esotericism have been organized in the context of the quinquennial congresses of the International Association for the History of Religions (I.A.H.R.) in 1995 (Mexico City), 2000 (Durban) and Tokyo (2005). Since 2001, E.J. Brill publishers brings out an academic journal *Aries: Journal for the Study of Western Esotericism*. Peeters publishers (Louvain) have been publishing a monograph series “Gnostica: Texts & Interpretations” since 1997. An America-based “Association for the Study of Esotericism” was recently established and organized a successful conference in 2004, and a Europe-based counterpart is in the process of being established. Finally, an academic chair for the study of Western Esotericism having existed since 1965 at the École Pratique des Hautes Études (Sorbonne) in Paris, a second chair connected with a complete subdepartment and teaching program (Bachelor and Master) was established at the University of Amsterdam in 1999 (see www.amsterdamhermetica.com).

²³ The decline of the classic secularization thesis, the “return of religion”, and the concomitant emergence of new theoretical frameworks (e.g. rational choice theory) have been much discussed in recent years, and this is hardly the place for an overview of the debate and the pertinent literature. For an application to the study of Western Esotericism, see e.g. Wouter J. Hanegraaff, *New Age Religion and Western Culture: Esotericism in the Mirror of Secular Thought*, Leiden, New York, Köln: E.J. Brill, 1996/Albany: SUNY Press, 1998; and idem, “How Magic Survived the Disenchantment of the World”, *Religion* 33:4 (2003), 357–380.

²⁴ A new interest in the relevance of 19th-/20th-century esotericism for understanding processes of modernization is demonstrated by e.g. Joscelyn Godwin, *The Theosophical Enlightenment*, Albany: SUNY Press, 1994; Corinna Treitel, *A Science for the Soul: Occultism and the Genesis of the German Modern*, Baltimore, London: John Hopkins University Press, 2004; Alex Owen, *The Place of Enchantment: British Occultism and the Culture of the Modern*, Chicago, London: University of Chicago Press, 2004.

ing to earlier periods, and thus establishing a “referential corpus” of primary and secondary texts pertaining to the complete historical spectrum, the present Dictionary hopes to contribute to the current academic emancipation of “Gnosis and Western Esotericism” as a comprehensive domain of research. Furthering collaboration with parallel disciplines focused on Jewish and Islamic “mysticism” is part of that development, and may well end up transforming our perception of all of them. As the hoped-for outcome of such a future development, perhaps one day the time will be ripe for a Dictionary even much larger than the present one, and which will fully include the Jewish and Islamic along with the Christian and secular dimensions of “Gnosis and Western Esotericism”.

The above overview is based upon the premise that seemingly innocuous terminological conventions are often the reflection of hidden or implicit ideological agendas. Perhaps no other domain in the study of religion has suffered from such biases as seriously as the one to which this Dictionary is devoted, for it covers more or less all currents and phenomena that have, at one time or another, come to be perceived as problematic (misguided, heretical, irrational, dangerous, evil, or simply ridiculous) from the perspectives of established religion, philosophy, science, and academic research. Often these perceptions have led to serious distortions of the historical evidence, usually in the form of simplified pictures of complex realities and the creation of imaginary “enemies”. The label “Gnosis and Western Esotericism” is proposed here as part of a deliberate attempt at overcoming such biases and moving towards a more neutral, accurate and balanced reading of Western history of religion and culture; but obviously it would be extremely naive to think that any terminology can be entirely free from such problems. The editors are acutely aware of the fact that usage of the terms “Gnosis” and “Western esotericism” is not limited to academic contexts, since both are also used in popular literature to promote various “spiritual” agendas and aspirations. Likewise they are painfully aware of the ironical fact that the very attempt at gathering an enormous variety of currents and personalities under one general umbrella might easily be mistaken, against all their intentions, for just another attempt at reification and simplification, suggesting the presence of some “universal gnosis” or abiding “esoteric truth”.²⁵ Fortunately, however, the very contents of this Dictionary provide the best antidote against such misperceptions: rather than a repetitive series of variations on the same essential “truths”, the reader will find here a dazzling variety of ideas and practices, reflective of ever-changing historical contexts and testifying to the remarkable creativity of the religious imagination. We hereby offer this reference work to our readers in the hope that it will inspire them not only (if it is permitted here to quote Gene Roddenberry’s Star Trek saga) “to boldly go where no one has gone before”, but also to re-visit seemingly well-charted territories and discover how much we still have to learn about them.

Wouter J. Hanegraaff
Amsterdam, September 2004.

²⁵ See discussion of a number of representative cases in Wouter J. Hanegraaff, “On the Construction of ‘Esoteric Traditions’”, in: Faivre & Hanegraaff, *Western Esotericism and the Science of Religion*, 11-61.

ACKNOWLEDGMENTS

The idea for this *Dictionary of Gnosis and Western Esotericism* was born in 1996, and over the following years the editors have incurred debts to many people who by their valued contributions have helped bring it to realization. In the first place, we want to thank Hans van der Meij, senior editor at Brill publishers, for suggesting the very idea of this reference work, for actively engaging himself in its conceptualization, and for steering and supervising the editorial and production process from the publisher's side. We are no less grateful to the other people at Brill's office, whose professional input has been widely instrumental in making that process run smoothly. In particular, we want to thank Alinda Damsma, Sanne Massier-Wagner, and Wilma de Weert. Thanks to all of them, over that period of more than eight years the collaboration between editors and publisher has been a most pleasant and constructive one.

From 1999 on, the subdepartment of History of Hermetic Philosophy and Related Currents at the Universiteit van Amsterdam functioned as administrative center for the editorial process. We want to thank its two successive secretaries, Andréa Kroon and Hilda Nobach, for their efficiency in mediating between authors, editors and publisher and for assuming the many administrative and other tasks that a complex process like editing a large Dictionary entails. Without their work this Dictionary would never have seen the light of day.

Many contributions to this Dictionary were written in a language other than English. We owe a great debt of gratitude to the translators: Joscelyn Godwin (French, Italian, German), Nicholas Goodrick-Clarke (German), Christine Rhone (French), and Mirjam Westbroek (Dutch). The first two of these are important scholars in the field, and have written a significant number of contributions to the Dictionary in addition to their translations. The latter were made possible in no small measure by a generous subsidy from the Foundation "Chair of History of Hermetic Philosophy and Related Currents", for which we are particularly grateful. Finally, the chief Editor of this Dictionary would personally like to thank the Foundation, its founder, and the Universiteit van Amsterdam: the present work would not have materialized had it not been for the unique academic context they have created, which has proved to be so stimulating in the study of Gnosis and Western Esotericism.

The Editors

LIST OF CONTRIBUTORS

- Allen, M.J.B., University of California, Los Angeles, U.S.A.

Abellio, Raymond (ps. of Georges Soulès), * 11.11.1907 Toulouse, † 26.8.1986 Nice

At the end of World War II and a development that had led him from the left wing of the Socialist Party, through Deloncle and Déat's collaborationist parties, to the Resistance Movement, Georges Soulès, a trained engineer, left politics for esotericism. He did so under the influence of Pierre de Combas, a man well versed in esoteric traditions, whom he met in 1943. Considered one of the great French prose writers of his time, Soulès published his works from 1946 until his death under the pseudonym Raymond Abellio; they comprise a play, novels, autobiographical writings and theoretical essays. By means of these various genres he has developed an all-encompassing system for interpreting the world and history, sustained by elements from the various esoteric traditions to which Pierre de Combas had introduced him, and by the Husserlian phenomenology that he encountered in the 1950s.

In 1965 Abellio published his book *La Structure absolue* (The Absolute Structure) which may be considered the key to his philosophical system. The "structure" in question is partly inspired by arithmological traditions [→ Number Symbolism] and "kabbalistic" gematria [→ Jewish Influences V], along with other influences such as the *I Ching*, the → Tarot, and → astrology; and partly it is inspired by Edmund Husserl's phenomenological philosophy. The structure is visually presented as a sphere, similar in some respects to the one presented by → René Guénon in his *Le Symbolisme de la croix* (1931), and which can be described as follows. First, a horizontal cross (four angles of 90 degrees). Second, a vertical line which runs across that cross, passing through its middle. Third, the cross and the line are enclosed within a sphere whose center is the point of intersection between the horizontal cross and the vertical line. By the same token, the sphere has six poles (the four extremities of the cross, and the two extremities of the vertical line); the point of intersection is not a pole proper, but is considered as important as the poles themselves. This three-dimensional figure is supposed to provide important insights into any domain (science, metaphysics, philosophy, psychology, history, etc), and into the relationships between them, provided that whenever one uses it, the poles have been properly "qualified" in accordance with the kind of enquiry one has chosen to carry out (i.e., the terms or

notions one has decided to impart to each of the six poles, whenever one makes use of the sphere, must have been chosen in a pertinent way). Ontologically, as it were, the basic idea that underlies the figure may be summarized as follows. The two lines of the horizontal cross represent two dualities. The extremities of the one line stand respectively for our sense organ(s) and our body; the extremities of the cross's other line stand respectively for the "object" and the global "world" (the object "detaching" itself, in husserlian terms, from the "world"). As a result we have two dualities, which are said to be "turning" or "moving" around; but not only horizontally, for they are also constantly either tending upward toward the upper part of the horizontal line (the "assumption" toward unity) or descending along its lower part (descent toward multiplicity). As for the center of the sphere, it stands for the "transcendental Self".

This structure Abellio claims to be "absolute" because he considers it to be applicable – in the context of a doctrine of "universal interdependence" or universal → correspondences – to all areas of reality, including even history. It is supposed to reveal the "invisible history", or "metahistory", of civilizations, interconnected with psychology, politics, physics, biology, etc., as well as of the transcendental Self of the human being. Two main elements are said to distinguish the Abellian absolute structure from the Husserlian scheme. First, the fact that he considers his notion of "interdependence" and "intersubjectivity" to be the starting point of the gnostic experience to be achieved, not as its end. Second, his notion of "intensifying dialectic", by which he means the dynamic movement to be imparted to the sphere, it being understood that, as already noted, its poles have been properly "qualified".

Abellio's essays, works of fiction and autobiographies all must be understood in the context of this dynamics. They are reflective of an ongoing process whose final term he calls the "assumption" (Abellio readily uses Christian terminology: baptism, communion, assumption, etc.) of the world's multiplicity into the "inner Man". Man is thus supposed to be able to achieve the complete unification of that multiplicity, a unification that will end up providing the subject with a "gnostic consciousness", also called "second memory", by the same token leading to the "transfiguration of the world". History – the real one as well as Abellio's historical fictions – then comes full circle, the past being connected to the future in a present beyond time.

The various literary genres that comprise Abellio's work are closely interconnected. They all tend

toward the same spiritual goal: the emergence of a transcendental Self. The essays proceed analytically and tend to use autobiographical material. The autobiographical work describes the genesis of the novels and of the essays, and integrates various theoretical elements. Abellio considers the novel to be the most complete form of writing, because it is the most synthetic one. It is not strictly analytical like the essay – it shows more than it demonstrates –, and it is not unfinished like the autobiography. This is why Abellio ascribes to his novels, which are meant to be ‘a call to the reader’s active awareness’ (*Visages immobiles*, 11), a particularly potent initiatic value. Due to this primacy given to novelistic fiction and its supposed power of initiation, Abellio’s work occupies a place apart in 20th-century esotericism: it is certainly one of the rare cases where novelistic material is presented as the catalyst for a gnostic “transmutation of consciousness”. Indeed, although Abellio announced the “end of esotericism” through disoccultation (*La fin de l’ésotérisme*, 1973) and systematically distanced himself from the esoteric authorities of the past, his thought presents all the elements typical of Western esotericism: the notion of a transmutation of consciousness, the interdependence of various degrees of reality, a particular interest in natural phenomena, the creative → imagination, symbolic hermeneutics, and so forth. By virtue of this, he remains one of the more interesting figures in French esotericism in the 20th century. In addition to his fame as a writer, he is also noted as an epistemologist whose views continue to be instrumental in fostering interdisciplinary research and reflections.

JÉRÔME ROUSSE-LACORDAIRE

AE (ps. of George William Russell),
* 10.4.1867 Lurgan, † 17.7.1935
Bournemouth

Theosophist, poet, prose author, artist, journal editor, officer of the Irish Agricultural Organisation Society, and member of the Irish Convention of 1917. George William Russell is best known by his pen-name *AE*, which he adopted after a compositor was unable to read more than the first two letters of *Æon*, the Gnostic word for a higher being with which he signed a letter to the editor of the Theosophical journal *Lucifer* in 1888. Russell was born into a Protestant family in the north of Ireland, and from adolescence onwards he experienced visions of superhuman beings and of scenes from the past and future, visions of which he sought explanations in exoteric and esoteric literature. Soon he came to believe that he possessed memories of previous lives. Around the age of twenty, he was drawn towards the teachings of Madame → Blavatsky, and he joined the Dublin Theosophical Lodge about 1890. Thereupon he embarked on seven years of intense study and systematic meditation. During this period, he made his living as a retail cashier and shared a house, at least intermittently, with other zealous Theosophists. Among these, from 1895, was Violet North, whom he married in 1898. On one wall of the house, he painted a still surviving mural of visionary figures, and in 1894 he published *Homeward: Songs by the Way*, the first of his many collections of poetry. By the following year, having decided that ancient Irish mythology embodied Theosoph-

ical doctrine, he was becoming an enthusiastic patriot. In 1896 he deduced from a vision that there was about to appear in Ireland an avatar who would recreate the nation after the imminent crumbling of the British Empire, and for the rest of his life he hoped to see in the flesh the face that had risen before his inner eye. From 1895 to 1896, he was the student of the visiting American Theosophist James Morgan Pryse (1859-1942), who knew Greek and expounded the esoteric meaning of the New Testament.

In 1897, Russell was persuaded by his intimate friend the poet → W.B. Yeats (1865-1939) to accept employment in the agricultural co-operative movement, which was designed to raise the Irish peasant farmers out of material and mental poverty. Russell believed that, like all human beings, they had fallen from a higher state into the cycle of → reincarnation, and he strove through this work to bring out the buried nobility within them. For more than seven years he persuaded poor men to help themselves by forming credit banks, planned schemes to ameliorate hardship, and shouldered administrative work. But his literary gift was not wasted, for in 1905 he was appointed editor of the *Irish Homestead*, the weekly journal that existed to support the agricultural co-operative movement, and he held the appointment till the paper ceased publication in 1923. Meanwhile, disillusioned with the Theosophical Society, he left it in 1898 to found his own Hermetic Society [→ Hermeticism and Hermetic Societies], in which he taught his followers in Dublin at weekly meetings. He continued to publish poetry, assisted other poets, painted landscapes and visionary figures, and helped to found the Irish National Theatre. As a patriot who combined his nationalism with pacificism, he campaigned for complete self-government for a united Ireland within the British Empire. From 1923 to 1930, he edited the *Irish Statesman*, a weekly designed to foster the cultural and political life of the newly independent Irish Free State. In 1930, while lecturing in the U.S.A., he rejoiced in a brief reunion in Los Angeles with James Pryse. His wife died in February 1932, and eighteen months later, unhappy with the narrow-minded provincialism engulfing the Free State, Russell moved to London. He died in a nursing home in Bournemouth in 1935.

Russell's early esoteric writings were published in the *Irish Theosophist* from 1892 through 1897. His principal mystical book is *The Candle of Vision* (1918), which shows that his beliefs were as firmly rooted in his own visionary experiences as in the syncretism of Blavatsky's *The Secret Doctrine*. Towards the end of his life, disappointed that he

had never encountered the Incarnation of his vision of 1896, he described the imagined impact of such a being in his romance *The Avatars* (1933). Even in his editorial articles in the *Irish Homestead*, evidence of his Theosophical world view occasionally peeps out. Thus his reference to 'the guardians of humanity' who will not allow the human race to flee permanently from nature into city life (Notes of the Week, 5.3.1911) refers to the Masters, perfected individuals who have ascended to a higher plane to watch over human life on earth. Similarly 'the secret Ruler of the World', who seems to be guiding farmers all over the earth into the co-operative movement, is the Planetary Spirit of Theosophy (Notes of the Week, 7.1.1911). Russell's recommendation that systematic thought should entail approaching any matter from three viewpoints – its relation to consciousness or the human spirit, to forces or energies, and to material things – is based on the Theosophical trinity of primal emanations from the Deity: the Logos or Divine Mind, the Light of the Logos or the Divine Energy, and the Archæus or that aspect of the Divine from which matter evolves. Russell's poetry contains many comparable allusions couched under such seemingly vague phrases as "the Ancient One" (the Planetary Spirit) and "the Mighty Mother" (the Archæus). In *The Interpreters* (1922), written during the Anglo-Irish War and the Irish Civil War, Russell traces socialism, nationalism and imperialism to their roots in the Logos, the Archæus, and the Light of the Logos respectively.

Although Russell sought to spread the spiritual knowledge that he found in Theosophy and the science of penetrating to reality through inward meditation, he probably had more success in promoting the arts in Ireland, and he played a part in the widespread quest in the early 20th century for economic democracy as a means of stemming the rural exodus. Most of his poetry has faded, but his book *The Candle of Vision* continues to impress many readers.

HENRY SUMMERFIELD

Agrippa, Heinrich Cornelius, * 1486 Nettesheim, † 1535 or 1536 Grenoble

German Humanist and theoretician of → magic. Agrippa's family belonged to the middle nobility in Nettesheim, near Cologne. He studied in Cologne from 1499 to 1502, when he received the degree of *magister artium*, and later in Paris. During his studies in the latter city, Agrippa seems to have taken part in a secret circle or self-help society, the members of which were interested in studying *res arcanae*, and with whom he tried to remain in contact in later years. In 1508 he traveled to Spain, where he got involved in an adventurous military campaign to seize a fortified castle near Barcelona. From there he continued traveling, by way of Valencia, the Balears, Sardinia, Naples, Avignon, and Lyon. Agrippa's family was by tradition in the service of the Roman Emperors, and thus in his early years as well as later he served as a captain in the army of Maximilian I, Holy Roman Emperor, who awarded him the title of *Ritter* or knight. His irregular career as a university professor began at the university of Dôle (Burgundy) in 1509, where he was given the opportunity to lecture on → Johannes Reuchlin's *De verbo mirifico*, and wrote his *De nobilitate et praecellentia foeminae sexus* (On the Nobility and Excellence of the Feminine Sex), partly no doubt in an attempt to win the

favour of Margaret of Austria. Agrippa's lectures attracted much interest and earned him a doctorate in theology, but he was forced to leave the city in 1510, after having been attacked by the Franciscan prior Jean Catilinet for judaizing heresy. His study of Reuchlin's work first suggested to Agrippa the project of a radical restoration of magic. In the winter of 1509-1510 he discussed this with → Johannes Trithemius, to whom he dedicated the first draft of his *De occulta philosophia* (On the Occult Philosophy), which remained unpublished for the time being. Trithemius – whose own experiences had taught him caution – advised him to persevere with his studies but to 'talk about arcane secrets only with proper friends'.

Having left Dôle, Agrippa went to London, from where he wrote his *Expostulatio super Expositione sua in librum De verbo mirifico* (*Opera* II, 508-518) in an attempt to defend himself against Catilinet's accusations. He repeated his ideas about Reuchlin's *De verbo mirifico*, and affirmed that his Christian faith was in no way incompatible with his appreciation for Jewish thought and exegesis: 'I am a Christian, but I do not dislike Jewish Rabbis'. While in England, he met the Humanist and Platonist John Colet, with whom he studied the Epistles of Paul; and we know that in the following years he was working on a commentary on the Epistle to the Romans. Having returned to his hometown Cologne, at the Faculty of Theology he gave some religious disputations – unfortunately lost – on religious practices in the contemporary church.

From 1511 to 1518 Agrippa lived in northern Italy, and was involved in the conflict between the French and Imperial armies: first in the service of the Emperor Maximilian and later in the circles of William IX Paleologus. In these years he came into contact with Agostino Ricci and perhaps Paolo Ricci, and deepened his knowledge of the writings of → Marsilio Ficino, → Giovanni Pico della Mirandola, and the kabbalah [→ Jewish Influences III]. He took part in the schismatic Council of Pisa (1512), but his loyalty to the Roman Church is attested by a letter (Agrippa, *Opera* II, 710) in which Pietro Bembo, the secretary of Pope Leo X, thanks him and acknowledges his orthodox position. Afterwards he lived for several years in Pavia, where he lectured at the University. His first course was probably devoted to Plato's *Symposium* (1512), and in 1515 he lectured on Ficino's *Pimander*. Around the same time he composed the *Dialogus De homine*, which remained unpublished during his lifetime and has survived only in a fragmentary state; based upon Pico della Mirandola's *Heptaplus*, it is full of references to the → Hermetic liter-

ature. Agrippa married his first (Italian) wife in Pavia, and experienced here one of the happiest periods of his life.

As a consequence of the 1515 French victory at Marignano, where the duchy of Milan was reconquered and the imperial army defeated, Agrippa had to flee from Pavia. He had to leave behind many of his manuscripts, which were later recovered by one of his friends. He moved to Casale, where he wrote his *Liber de triplici ratione cognoscendi Deum* (Book on the triple way of knowing God) dedicated to his protector William Paleologus. As in earlier and later works, he refuted scholastic theology and emphasized faith rather than human reason as the exclusive way to approach God. His *Dehortatio gentilis theologiae*, probably written in this period, was based upon a convivial talk given by Agrippa to some friends a few years after his course on the *Pimander*. He significantly warned them, and all intellectuals, not to go too far in their admiration for the Hermetic writings and neglect the primacy of Christian revelation: ‘if, by taking away secretly, so to speak, the rich spoils from their illegal possessors, the Egyptians, and by elevating yourselves with their riches, you enrich the Church of God, then I no longer advise against pagan literature, but I recommend it to you’. In Turin, his last Italian stay, he lectured on the Epistles of Paul in 1516: it was to be his last appearance in a university context.

After a short intermezzo at the court of Charles III, Duke of Savoy, Agrippa was employed in 1518 as public advocate and defense lawyer in the free imperial city of Metz. On the eve of the Reformation the religious and theological debate was explosive. Agrippa and his humanist friends followed the developments with great interest and often with sympathy for the Reformers, without going as far as supporting the schism. It is worth noting in this context how in *De peccato originale* (1518), as in some other writings, Agrippa addressed the problem of salvation: faith is central, while reason is accorded only a secondary role. Agrippa was quite original, furthermore, in suggesting that original sin had consisted in the act of sexual intercourse, and in holding Adam rather than Eve responsible for the Fall. In this same period he also got into a conflict with the Dominicans, Claude Salin in particular, over his support of → Lefèvre d’Etaples’s *De una ex tribus Maria*. Lefèvre had argued against the popular opinion that Saint Anne had been married three times and had given birth to three daughters: Mary the mother of Jesus, and two other Marys who were considered to be mothers of Apostles. The conflict turned very nasty, with professional

teachers sermonizing against Agrippa from the pulpit.

In his capacity of legal advisor to the magistrate of Metz, Agrippa played a crucial role in a famous witch trial in 1519, where he defended a woman accused of witchcraft and, as a result, got into great trouble with the Inquisition. The woman was accused because her mother was considered a witch, and the pact with the devil was believed to be hereditary; but Agrippa argued that the sacrament of baptism was stronger than the pact with the devil. He implicitly accused the inquisitor not only of acting contrary to human decency, the law, and the spirit of Christianity, but also implied that his implicit denial of baptism as a sacrament was heretical. Although Agrippa succeeded in saving the accused’s life, his conflict with the Dominican authorities made his position in Metz untenable and forced him to leave.

Agrippa moved with his wife and child back to Cologne, where he stayed for a year, apparently without regular employment. Here his wife fell ill, and she died soon after, probably during the travel with her husband to Geneva, where Agrippa became a citizen and worked as a physician. He remarried a few months later, with a woman from Geneva who would bear him six children. They traveled to Fribourg early in 1523, where Agrippa continued to work as a physician and gained increasing recognition as a progressive thinker.

He made the mistake of leaving Fribourg in 1524 and accept a position in Lyon, as physician to Louise of Savoy, Queen Mother of France. Agrippa’s expectations were disappointed, for the Queen forced him to write astrological prognostications – a practice he despised – and suspected him of being a partisan of Charles of Bourbon, who was fighting against the King on the side of the Emperor. The Queen’s treasurers refused to pay him his salary, and the court ridiculed him behind his back; at the end of 1527 Agrippa finally left his employment, but his criticisms of the Queen later caused him to be imprisoned for a time. In spite of his troubles in Lyon, Agrippa managed to remain productive. He wrote a commentary to → Llull’s *Ars Brevis* and a declamation *De sacramento matrimonii* (On the sacrament of marriage); and in september 1526 he completed one of his most important works: the declamation *De incertitudine et vanitate scientiarum et artium atque excellentia verbi Dei* (On the uncertainty and vanity of sciences and arts, and on the excellence of the word of God). Apart from his financial troubles, his wife was ill as well, and *De incertitudine* certainly reflects his depressed mood at the time.

In 1528 a new and more successful phase in Agrippa's life began, with his appointment in Antwerp as advisor and historiographer to the governor of the low countries, Margaret of Austria. He wrote speeches, historiographical works and a document with instructions about an expedition to the Turks. Among the increasing number of students who sought him out was Johann Wier (1515–1588), who would study with him for four years. At the Imperial Court Agrippa had an influential friend, Eustache Chapuys, an Erasmian humanist (later Charles V's ambassador in England) to whom he later dedicated his *Querela*. The first years in Antwerpen seem to have been relatively peaceful and happy for Agrippa. He was able to devote himself to studies in the occult sciences, and in 1529 managed to publish a volume of collected writings; they contained largely theological writings, but also a text on the treatment of epidemic disease. A second edition published in 1532 also contained treatises on monastic life and on the relics of Saint Antony. In August 1529 Agrippa's peace was interrupted when his wife died of the plague that was sweeping Antwerp. While most of the town physicians fled the city, Agrippa remained on his post, only to be accused by his colleagues later, for illegal practice.

Agrippa had obtained an Imperial Privilege to publish several of his works, including *De incertitudine*; but after it had been published, in 1530, Princess Margaret began to suspect him of heresy and solicited the opinion of the Theology Faculty of Louvain. She died in December, before her suspicions could be confirmed by the theologians, but Agrippa's troubles were not over: Charles V's brother, Ferdinand, detested the contents of *De incertitudine* and wrote about it to the Emperor. The inquiry was continued, and the Louvain theologians judged parts of his work heretical. Agrippa wrote an *Apologia* in his defense, and a *Querela* against those who were attacking his good reputation with the Emperor; but meanwhile the Sorbonne theologians attacked and banned *De Incertitudine* as well, for favouring Lutheranism. As a result of this increasing hostility, including accusations of black magic, Agrippa's position at the court became unstable and he no longer received payment. In August 1531 he was briefly imprisoned for debt in Brussels.

In the same year appeared the first book of his *De occulta philosophia*, dedicated to the progressive Archbishop elector of Cologne, Hermann von Wied, who played an important role in supporting his work in spite of the opposition. However, the

Inquisitor of Cologne, Konrad Köllin, denounced *De occulta* and its author as heretical before the City Council. In his response to the Council, Agrippa accused the theologians of hindering the reform of the Church with their battle against humanists such as Reuchlin and Erasmus (who in a letter to Agrippa praised *De incertitudine*, but did not want to get involved in the controversies). Against the witch-hunters, whom he claimed were more interested in their own profit than in matters of faith, he seems to have issued a pamphlet denouncing the dangerous misdeeds of the Dominicans; but we only know of this work thanks to a reference in Sisto da Siena's *Bibliotheca Santa*. Finally, Agrippa wrote a preface to a work by a Cistercian monk, Godeschalcus Moncordius, in which he opposed the Cistercian methods against those of the Dominicans.

According to Johannes Wier, Agrippa married a third time, but his wife (a woman from Malines) betrayed him and he repudiated her in 1535. From 1532 on he seems to have resided mainly in Bonn. In 1533 appeared the final and complete version of *De occulta philosophia*, as well as his commentary on Lull's *Ars Brevis*. Agrippa's last surviving letter dates from the middle of 1533, and for the final years of his life we are dependent on Wier's account. According to him, Agrippa went to Lyon, where he was briefly imprisoned by King Francis, but released thanks to the intercession of friends. He died in Grenoble in 1535 or 1536 and his body is – ironically – buried in a Dominican church.

In spite of his profound religiosity and his deep knowledge, Agrippa was always in danger of being considered a dangerous outsider by the representatives of mainstream Renaissance culture. He lived in an age marked by religious turbulence and never-ending wars. While he liked to adopt an attitude of being “above the parties”, Agrippa did not hesitate to criticize Catholics and Lutherans alike. Nominally a Catholic, he appreciated Luther, whose attack against the abuses of the church and initiatives for reformation he claims were never intended to destroy the idea of the Church itself. Agrippa's epistolary reflects his ambiguity in this regard: in a letter to his friend Campeggi (*Opera* II, 1010–1012), he expresses his hope that the Church will soon be reunified and ‘freed from the impiety of the heretics and the darkness of the Sophists’ (that is to say: the scholastic theologians). The successive letter, dated 17 September 1532, is addressed to Melancton and is famous because of its reference to ‘that unconquered heretic Martin Luther’ (a formulation repeated in *De incertitudine*, but in a less

favourable context). Discussing Agrippa's relation to contemporary Reformation currents, Paola Zambelli (1967) has placed him in the context of the radical Reformation and the spiritualists, nicodemism in particular.

In the *De nobilitate et praecellentia foeminae sexus* (published in 1529) Agrippa argued, against the traditional misogynic perspective, that women are superior to men, even though the representatives of the public sphere from which they had long been excluded did not accept this point of view. At the beginning of the 15th century a feminist trend had emerged in France, Italy and Spain, contradicting the traditional idea of female inferiority, and the responsibility of woman for original sin; inspired by the Roman de la Rose, it presented women as good, noble and pure. The originality of Agrippa's treatise lies in his use of kabbalistic and neoplatonic sources [→ Neoplatonism], according to which woman is an immediate manifestation of the divine, a principle of original life. For Agrippa all the virtues of Nature were evident in woman, considered superior by him because of her proximity to the divine. The treatise is important for having introduced into France the Platonic and Ficinian cult of beauty, according to which woman is the mediator between the human and the divine. As to the question of why women were excluded, he argued that this had to do with social conditions, education, and the prejudices of the age: obstacles that could be removed.

Agrippa's most notorious work, his masterpiece, and the one which gave rise to his undeserved reputation as a black magician, is his *De occulta philosophia*, whose final version in three books was published in 1533. It is a systematic synthesis of "occult philosophy" or "magic" (Agrippa originally wanted to call it *De magia*): the first book treats of the natural magic relevant to the sublunar or elementary world; the second book discusses → number symbolism, mathematics, → music and → astrology as relevant to the celestial world; and the third book is largely Christian-kabbalistic, focusing on angelology and prophecy as relevant to the highest or intellectual world. Magic emerges from Agrippa's magnum opus as the most perfect science, by means of which one may come to know both nature and God. Prior to the final version of 1533, Agrippa's thinking as reflected in *De occulta philosophia* passed through several stages. The book has been called "a neoplatonic credo": the influence of Ficino and Pico is evident, but less famous authors such as → Lazzarelli play a significant role as well. The first version – an ency-

clopaedic review rather than a treatise – most clearly reveals Agrippa's profound dependence on his predecessors, Reuchlin in particular. The final draft, as pointed out by Perrone Compagni, reveals a more mature grasp of the subject and of his claims about spiritual rebirth as necessary for religious reform. The latter should take place step by step: one must progressively remove one's ties to the blinding theology (scholasticism in particular) that conceals the real meaning of the Holy Scriptures. Through continuous contemplation of divine things, the soul may free itself from the lure of the senses. In his dedicatory letter to Trithemius, Agrippa seeks to explain how magic, which the ancient philosophers considered the highest science, could have fallen into such disrepute; he argues that 'by a certain corruption of times and men', many dangerous errors and superstitions crept in, and false philosophers prefixed the title of "magic" to their heresies and wicked practices. It is now necessary to restore magic to its former state of the purest kind of religion; and from the Third Book one can deduce that Agrippa conceived of the latter largely in terms of Christian kabbalah.

In his other great work, *De incertitudine*, Agrippa seeks to show the relativity of all human knowledge, as compared to God's word as the only foundation of true certainty, by means of an incisive attack on all the sciences and arts. Echoing Erasmus' *Encomium Moriae*, Agrippa satirizes various beliefs, deploring the superstitions that have ruined the original purity of the Christian Church. The work has been incorrectly interpreted as a revival of Greek scepticism; but actually, Agrippa's aim was to build a new concept of faith, based on divine revelation more than on Church interpretation, and to expose the blindness and arrogance of the school-theologians. The Bible should be restored to a leading role in Christian belief and practice. Marc van der Poel has located Agrippa within the Ciceronian tradition, and shows how *De incertitudine* can be considered the culmination of Agrippa's battle against the scholastic theologians.

There has been much scholarly debate about what might seem to be a contradiction between Agrippa's defense of the occult sciences in *De occulta philosophia*, and his description of all human sciences as "vain and uncertain" in *De incertitudine*. However, the contradiction can be largely resolved by recognizing how sharply Agrippa distinguished between reason and faith: he criticized the scholastics for ignoring this distinction and thereby confusing the study of created

things with the study of divine things. The authority of God's revelation in the holy Scriptures 'cannot be grasped by any judgment of our senses, by any reasoning of our mind, by any syllogism delivering proof, by any science, by any speculation, by any contemplation, in short, by any human powers, but only by faith in Jesus Christ, poured into our soul by God the Father through the intermediary of the Holy Spirit' (*De incertitudine*, in *Opera*, 299). Divine matters are not a matter for debate but an object of faith; in contrast, we are permitted 'to philosophize, dispute, and formulate deductions by means of our intellect concerning all created things', as long as we do not put our faith and hope in them (*De originale peccato*, in *Opera*, 553). From that perspective, one understands how the occult sciences can be a legitimate object of study, even though they must be considered "vain and uncertain" as a basis for absolute religious certainty. Accordingly, *De occulta philosophia* ended with a discussion of how to live a religious life that may make one worthy of receiving divine revelations.

Many unsubstantiated rumours began to circulate about Agrippa already during his life. The most influential portrait was presented by Paolo Giovio (1483-1552) in his *Elogia virorum illustrium*, which describes him as a man with a powerful mind, through which he tried to destroy the *République des lettres*. The most enduring part of Giovio's portrayal concerns Agrippa's death and the legend of his black dog. Agrippa's love for animals and his passion for his dog (whom he called "monsieur") was interpreted by the Italian humanist as proof that the dog was no one else than the devil. Two later authors, Andreas Hondorff and André Thevet, accepted the story and contributed to its diffusion. The legend was disputed by Agrippa's pupil Johann Wier, in his *De praestigiis daemonum ac incantationibus* (1563). Wier also attacked the attribution to Agrippa of a magical text known as the "Fourth Book of Occult Philosophy", the contents of which seemed to confirm his reputation as a black magician. A different literary tradition, influenced by several thinkers from Rabelais to Apollinaire and Thomas Mann, and including → Goethe, looks at Agrippa as an archetype of the Faust figure.

As Pierre Bayle wrote in his *Dictionnaire*, despite his great knowledge Agrippa was considered *malheureux* because of his great curiosity, his all too free spirit, and his unstable mood. With his restless journeys, he indeed seems to embody the spirit of the Renaissance. It is regrettable, although perhaps

not surprising, that this outstanding thinker has gone down in history as little more than a magician, for precisely Agrippa's ambivalent position with respect to various religious and intellectual issues central to his time, and the very ambiguity of his combination of magic and skepsis in the search for truth, make him a fascinating representative of Renaissance culture. In any case, his *De occulta philosophia* is considered the standard *summa* of Renaissance magic, and has exerted an incalculable influence on later magical and esoteric traditions.

AND MAGICIAN

1. LIFE

German philosopher and theologian, one of the most influential Aristotelian [→ Aristotelianism] synthesizers of the 13th century, Dominican friar, teacher of Thomas Aquinas (c. 1225-1274). Albert was born into a Swabian family of knights and joined the Dominican order when he was a student at Padua, receiving the habit from Jordan of Saxony in 1223. It seems likely that he was sent to Cologne to make his novitiate and study theology from the local *lector*. Later, probably in the early 1240s, he was sent to Paris to lecture on the *Sentences* under the Dominican Master Guéric of St.-Quentin (Dominican Master 1233-1245). In 1245, Albert succeeded Guéric as Dominican Regent Master, a position he held until 1248. During this period Albert met Thomas Aquinas, who arrived in Paris in 1245 during Albert's first year as Regent Master. In 1248 Albert returned to Cologne with Thomas to establish the first Studium Generale in Germany in association with the new Dominican cloister of Heilige Kreuz. He remained in Cologne as Regent Master of the Studium Generale from 1248-1254 (Thomas returned to Paris in the fall of 1252, becoming Regent Master there in 1256).

Among the earliest works certainly known to have come from Albert's hand are public lectures he delivered during this period as Master at Cologne on → Pseudo-Dionysius Areopagita's *De divinis nominibus* and (although he was engaged to teach theology, not philosophy) on Aristotle's *Ethics*, a work lately made available in translation by Robert Grosseteste (c. 1175-1253). Albert appears to have been unworried by the Parisian bans on Aristotle early in the century and the papal reiteration of the need to purge the Aristotelian corpus of error in 1231. An independent thinker whose interest in the natural sciences and Aristotelian philosophy were lifelong, Albert saw no essential conflict between science and theology, believing that philosophical truth, faithfully sought, could only support, not detract from, the truth of theology. By the mid-1250s, the acceptance of at least some of Aristotle's works into the official Parisian curriculum was likely influenced by the interest shown in the Aristotelian corpus by Albert, Thomas, and others of their contemporaries who

had taught at Paris and shared similar views on the need to maintain a productive relationship between philosophy and revealed truth.

In 1254, Albert was elected Prior Provincial of the Province of Teutonia. The province at that time included something over 50 priories, all of which Albert engaged to visit personally on foot (Dominicans being forbidden the use of horses or wagons). He resigned from this job in June of 1257 in Florence and by 1258 he had returned to Cologne to resume his position as *lector* at Heilige Kreuz. It was not long, however, before another set of arduous administrative duties imposed themselves. In 1259 Albert was requested by the Papal Curia to fill the position of Bishop of Regensburg (also called Ratisbon). Albert had already shown skill as a mediator of conflicts, and a diplomatic touch was needed for this post, since the unpopularity of the previous Bishop had resulted in a forced resignation, and the acephalous diocese was now torn by strife and bankrupt. After consideration Albert decided to accept the position against the advice of the Master General of his order, putting himself under direct obedience to the Pope. Though technically this move released him from obedience to the Master General, it is clear that Albert never ceased to regard himself as a Dominican, obeying the rules of the order so far as it was in his power to do so, and also that the order did not cease to consider him one of their own.

By 1261 the affairs of the Regensburg diocese had been sufficiently organized for Albert to feel able to hand his duties over to a locally chosen bishop. He headed toward Italy to deliver his resignation to the Pope, whose unexpected death resulted in a year's delay before the election of a new bishop could be confirmed under the auspices of the new Pope, Urban IV (1216-1264). Nothing is known with certainty of Albert's activities during the remainder of 1261 and 1262, though it is presumed likely that he remained in Viterbo to wait for the outcome of the election, renewing his acquaintance with Thomas Aquinas and others he had known in Paris. In 1263, Pope Urban IV appointed Albert Preacher of the Crusade in Germany, Bohemia and all German speaking lands. Dutifully undertaking the commission, Albert traveled through Germany and the Netherlands, laying down (one imagines with relief) his peripatetic preaching office on the death of Urban IV in October of 1264.

From 1264-1267 Albert retired to the Dominican cloister in Würzburg. There is evidence that he took part in mediation of local disputes while

working to finish the corpus of Aristotelian paraphrases. In 1268 Albert was in Strasbourg resolving a dispute at the request of Pope Clement IV (Pope 1265-1268), and in 1269 he was called back to Cologne by the Dominican Master to reside there as *lector emeritus*. In the last years of his life in Cologne he worked on his paraphrase of the pseudo-Aristotelian *Liber de causis* and several late theological works while being called upon at intervals to act as mediator and to consecrate churches and other ecclesiastical structures. The legend that he went to Paris in 1277 to register his protest against the rumored condemnation of the ideas of his disciple Thomas Aquinas (who predeceased him in 1274) is probably unfounded. Albert was over eighty years old when he died in Cologne on November 15th, 1280.

2. WORKS

Albert's corpus is substantial (his *Opera omnia* takes up 38 volumes in the Borgnet edition) and contains a roughly equal quantity of theological and philosophical writing, including lectures and commentaries on the Bible, on Lombard's *Sentences*, on the Pseudo-Dionysius, and a large and important body of commentaries on or "paraphrases" of Aristotelian works. In addition to the writings definitely known to belong to Albert, there are several treatises which were attributed to him through the later Middle Ages and Early Modern period, but which are now considered to be of questionable authenticity. The questions surrounding attribution are not straightforward, since in some cases works unlikely to have been composed by Albert still seem to be under his influence. In one case (that of the *Speculum astronomiae*) the attribution to Albert is still a matter of active scholarly debate. These works will be dealt with in a separate section.

Of the authentic works of Albert, the Aristotelian paraphrases are probably the most important, not only to subsequent natural philosophy, but also to the history of Western Esotericism. As Albert explains at the opening of the *Physica*, these works were undertaken at the request of his Dominican brothers who wished to have all of Aristotelian natural philosophy laid out for them in an accessible way. Albert tried to follow the order of Aristotle's works, using the Aristotelian titles but paraphrasing (rather than citing and commenting on) Aristotle's words, presenting additional information at appropriate points to clarify and supplement the Philosopher's ideas, and adding in new material where discussions of topics appeared to be left incomplete. The paraphrases thus ad-

hered to the spirit of Aristotle (as Albert understood it) more than to the letter, not only because Albert freely included new material, but also because he was not shy about contradicting Aristotle's opinions when he felt they were inconsistent either with his personal experience or with facts he had learned from other sources.

In his understanding of the natural sciences, Albert drew on a broad range of material extending from the Church Fathers to the works of Arabic philosophers, and including not only the major commentators on Aristotle, but also anonymous treatises on various natural subjects, works of image → magic, → alchemy, and other medieval Hermetica [→ Hermetic Literature II]. While skeptical of the extraordinary claims of magical and alchemical texts, Albert's quest for information about the natural world included perusal of many such works, and he respected the facts they reported when these seemed consistent with his own general or experiential knowledge. He refers to alchemy and alchemical operations repeatedly in the *De caelo et mundo*, the *Meteora*, and in the *Mineralium libri V*, where Book IV is particularly concerned with alchemical categories, and → Hermes Trismegistus is a frequently cited authority. In Book II of the same work, he discusses sigils and image magic, calling it 'that part of necromancy which is dependent on astrology' (Wyckoff, 127) (here and elsewhere in his philosophical writings Albert uses the word "necromancy" in the benign sense indicated by Charles Burnett). Consistent with the practice of many who compiled herbals and books of remedies, Albert included in his *De vegetabilibus* a final section (part VI) devoted to uses of plants less theoretically plausible, but presumably empirically attested, which contains over a dozen references to magic arts and *incantatores*. Albert's works generally bear the stamp of a wide-ranging mind which enjoyed taxonomy and systems of classification. He rejected no plausible source of information out of hand, and preferred, where he could, to reconcile attractive philosophical systems rather than champion one at the expense of another.

For all these reasons Albert's paraphrases played an important part in putting the Aristotelian cosmos together for subsequent thinkers. He was one of the earliest and most important writers to integrate Arabic Aristotelianism into Christian natural philosophy, and his influence on medieval and Renaissance thinkers following him was profound. Less idiosyncratic than friar → Roger Bacon, less of a rigorous Augustinian than Thomas Aquinas, his natural universe remains wide open to influences

from the heavens. No doubt in part for this reason he is something of a favorite among the medieval *auctoritates* in the Early Modern period, praised by → Ficino, relied upon by Pomponazzi, an Aristotelian cornerstone of → Pico della Mirandola's 900 *Conclusiones*, and cited as an authority in over a dozen places in → Agrippa's *De occulta philosophia* (where, to give comparative examples, Thomas is cited in six loci and Roger Bacon only in three – not that the influence of any of these thinkers should be considered as strictly confined to loci where they receive citations). It was probably advantageous that Albert's diplomatic gifts, Christian life of service, and reputation for saintliness conspired to make his name eminently citable; there were few other medieval philosophers so friendly to Hermetic thinking whose names could so unimpeachably be used to adorn the esoteric claims of Renaissance philosophers.

3. WORKS OF QUESTIONABLE AUTHENTICITY

Works attributed to Albert but of doubtful or questionable authenticity include two Books of Secrets (the *De secretis mulierum* and the *Secreta* or *Experimenta Alberti* also called the *Liber aggregationis*), a *De mirabilibus mundi*, around thirty alchemical treatises, and the important bibliographic work known as the *Speculum astronomiae* which categorizes texts of image magic according to their dependence on astral influence. Some of these works have been shown to be dependent in whole or in part on Albert's authentic writings. Lynn Thorndike demonstrated that the *De secretis mulierum* – a gynecological manual that was used as a medical textbook – is in part a compilation of medical information extracted from Albert's paraphrase the *De animalibus* (possibly by a student or disciple of Albert's), and the *Experimenta Alberti* lifts some of its material from Albert's *Mineralium libri V* in its section on the uses of stones (though other sections of the work do not depend on Albert's authentic writings).

Concerning the treatises on alchemy, the most important both in terms of manuscript count and potential likelihood of correct attribution is the *Semita recta* or *Libellus de alchimia*, a version of which was included in the Borgnet edition of Albert's *Opera*. Concerning its attribution, Pearl Kibre suggests that 'its clear, concise, and well ordered account of the subject resembles Albert's treatment of other topics of natural science in his authentic compositions' (Kibre 1942, 500). It is a feature of all the earliest alchemical texts attributed to Albert (including the *Semita recta*, the *Alkimia*

minor, the *De occultis naturae*, and the *Compositum de compositis*), that they show a deference to his style, many of these works putatively composed (like the Aristotelian paraphrases) at the request of Albert's Dominican brothers who wish to have the scientific elements of alchemy explained to them in an accessible way.

The question of attribution of the *Speculum astronomie* is so difficult to resolve with any certainty that it is worth briefly summarizing the issues at stake. While objections have been raised concerning the work's attribution to Albert from the early part of the 20th century, some suggesting that it might have been composed by Roger Bacon, these objections were countered by convincing arguments in favour of Albert's authorship by Lynn Thorndike and subsequently by Paola Zambelli. In brief, the *Speculum* resembles Albert's thinking; it shows the same style of preoccupation with taxonomy; it refers to works he is known to have read. It is impossible to nail the attribution down as firmly as might be wished, however, because the manuscript tradition does not begin to attribute the *Speculum* to Albert until the mid-14th century, nor is it mentioned as Albert's work in any texts dating from prior to that time (though attributions after the mid-14th century are consistent; that is, no manuscripts of any period are known which attribute the text to anyone else). From the earliest period of the controversy it has been pointed out that certain statements in it are inconsistent with Albert's views as expressed elsewhere in his writings, but arguments from attitude can go both ways. As Thorndike pointed out early on, there is considerable inconsistency in any case between Albert's views as expressed in his authentic works; in general he tends to express himself more conservatively in his theological mode than he does in his philosophical mode (Thorndike 1955, 426).

More recently it has been argued by Bruno Roy that the *Speculum* is the work of Richard of Fournival – a suggestion more plausible than the arguments in favor of Roger Bacon (since it is known that the author of the *Speculum* consulted Richard of Fournival's library), but suffering from the same lack of certitude in the area of manuscript attribution as trouble the arguments in favor of Albert's authorship. Roy suggests that if Albert did not write the work, he may well have read it – something which is almost a necessary postulate for those who do not believe that Albert wrote it, given the fact that Albert mentions so many of the works that are listed in it. The debate cannot be conclusively settled except by the discovery of further manuscript evidence, but in the meantime, it

remains as difficult to dismiss the idea of Albertine attribution as to prove it. The *Speculum* was an important touchstone for Renaissance Esotericism; many of the Albertine citations in Agrippa's *De Occulta Philosophia Libri Tres* are to this work.

4. SAINT AND MAGICIAN

Like other natural philosophers of his era, Albert was the subject of numerous posthumous legends which made him into a magical and alchemical adept. If all that was said of his reputation in this regard was not strictly justified by the facts, nevertheless there is some continuity between his real life and his reputation, just as some continuity is observable between his questionable works and his authentic writings. Albert had perused volumes of magical and hermetic writings as already noted, and had also observed alchemical procedures in laboratory conditions, as he mentions in several places in the *Book of Minerals*, though it is probably not true (as one manuscript suggests) that he was a teacher of alchemy who took Roger Bacon as a disciple. Albert was also known for working miracles of another sort, and in the end the growth of his reputation for sanctity outstripped the growth of his reputation for magic. It is interesting that a *Vita* composed in the mid 1480s with a view to his eventual canonization devotes about a quarter of its pages to the refutation of the exaggerated magical claims laid upon him. In 1484, the Pope gave permission to the Dominicans of Cologne to celebrate Albert's Feast on November 15 – a gesture that was equivalent to beatification, though Albert was not finally canonized until 1931.

CLAIRE FANGER

Alchemy I: Introduction

1. FROM ALCHEMY TO ALCHEMIES
2. THE "SPIRITUAL" INTERPRETATION
3. ALCHEMY AND THE SCIENTIFIC REVOLUTION
4. ALCHEMY AND CHEMISTRY

Alchemy is a subject of enormous intrinsic interest but one which has long proven difficult to grasp properly. The last thirty years, however, have witnessed a remarkable florescence of scholarly work on the subject, which has shed much new light on this obscure subject and brought forth significant revisions and advances in our understanding of it.

Whereas it was common just half a century ago for historians of science to dismiss alchemy out-of-hand as a "pseudo-science" or to deploy it merely as a foil against which to set the origins of modern science, the unsuitability of such attitudes has now become apparent among serious scholars, and such prejudiced readings of alchemy are in the process of passing away. An enormous amount of work, nevertheless, remains to be done in the field, for many aspects and developments of alchemy remain very incompletely understood. One important part of the remaining work is the continued dismantling of erroneous views of alchemy promulgated since the Enlightenment which have, despite their dubious qualifications and origins, deeply tinted a major part of the literature on alchemy written during the 19th and 20th centuries. Four interrelated, and now increasingly rejected, features of these earlier treatments are identifiable: first, the notion or assumption that alchemy is a largely monolithic tradition, bearing little significant internal articulation or dynamic development over time or cultures; second, the concept of alchemy as an essentially or primarily spiritual, psychic, or self-transformative

endeavor; third, the idea that alchemy ran counter to, was a non-participant in, or non-contributor to the scientific developments of the period characterized as the Scientific Revolution; and fourth, the belief that alchemy was something clearly distinguishable (in terms of goals, practices, and practitioners) from chemistry prior to the 18th century.

1. FROM ALCHEMY TO ALCHEMIES

The idea of alchemy as largely monolithic in character comes partly from the rhetoric of early modern alchemical writers themselves. Oft-repeated mottoes such as “the Sages all say one thing”, the drawing of mythic histories and genealogies of alchemy to stress its supposed antiquity, and the desire of aspiring alchemists to uncover the secret knowledge known to and hidden by their predecessors (for example, preparing the Philosophers’ Stone) conspire to give the impression of a tradition that remained largely constant over time, cultures, and practitioners. The ambiguity of alchemical writings, moreover, allowed for their broad reinterpretation by subsequent alchemists (and others) to create the appearance of a harmony of views among authors who, when treated critically, show very little actual agreement. In fact, the diversity and dynamism within historical alchemy is sufficiently extensive that historians have now begun to group individual authors and practitioners within “schools” and to see the differences among their practices and goals. Many alchemists, for example, were interested predominantly in bringing about metallic transmutation, generally by means of the Philosophers’ Stone. Others, like → Paracelsus or Alexander von Suchten, downplayed this aspect of alchemy in favor of medicinal applications. Some emphasized productive processes of all sorts – distillation, refining, salt or pigment manufacture, etc. – along the lines of an early chemical industry. Some emphasized the theological implications of alchemical work, while others ignored this dimension entirely. Many writers and practitioners pursued several or even all of these goals, and this brief catalogue does not even mention the important intersections of alchemy over its long history with fine art, theatre, literature, religion, political and social movements, and many other areas of culture and society.

Even within any one of just the early modern European groups there exist diversities of theoretical, philosophical, or operational frameworks. We can speak of, for example, Mercurialists, who sought the matter for the Stone in common mercury, and contrast these with Sendivogians who sought for it in some sort of niter. Likewise,

Scholastic → Aristotelianism appealed as a system to some alchemists – like Geber and Gaston Duclou – while Neoplatonic [→ Neoplatonism] or other notions appealed to others. Some alchemists took a rigidly mechanistic view of their processes, while others adopted non-mechanical or vitalistic views, with yet others falling at all the possible gradations in-between. The critical point is that we cannot blithely extend the example of a single individual or group of individuals to make claims broadly about alchemy as a whole. While this situation renders a comprehensive understanding of alchemy far more difficult, it also makes it a far more interesting subject of study, and in fact, one less alien from other branches of human inquiry.

2. THE “SPIRITUAL” INTERPRETATION

The idea of a monolithic, constant, and ancient “tradition” within alchemy received a boost from the development of the spiritual interpretation of alchemy in the 19th century. A key event here was the publication of Mary Anne Atwood’s *Suggestive Inquiry into the Hermetic Mystery* (1850). Atwood reduced all “true” alchemy to a quest for spiritual elevation operating through Mesmeric trances, the knowledge of which, along with → animal magnetism, she believed to be a secret tradition dating back at least to the ancient Greeks. Alchemical writers who apparently busied themselves with actual laboratory operations, were, according to Atwood, mere “literal souls” who failed to perceive the hidden truth of alchemy, and were not “real” alchemists at all; they were in fact, in her words, as “blind” as the chemists and other scientists of her day. Such a division – which plays upon a common rhetorical device employed in early modern alchemical texts where the wise author routinely differentiates himself from imposters and false alchemists – helped give rise to a putative division of alchemy into “esoteric” and “exoteric” aspects. These terms are still encountered today, but when they are applied to early modern alchemy their validity is questionable. There is no evidence that a majority, or even a significant fraction of pre-18th century European alchemical writers and practitioners saw their work as anything other than natural philosophical in character, as even the prolific occultist writer → A.E. Waite (1857-1942) was forced to admit toward the end of his career in 1926. Nonetheless, Atwood’s treatise touched off a surge of interest in alchemy within the context of Victorian occultism [→ occult/occultism]. Although Victorian and subsequent alchemy is extremely interesting in its own right, its popularity

has become an obstacle to understanding earlier alchemy because the spiritual interpretation's universal historical claims about the intent and content of pre-18th century alchemy are untenable.

It is important to clarify the distinction between 19th century occultist views of a self-transformative "spiritual" alchemy and the actual religious dimensions of pre-18th century alchemy. Many early modern alchemists stressed how alchemical truths and religious truths support and reveal one another. Likewise, the language of alchemy is full of religious terminology such as death and resurrection, glorification, and extensive parallels with Biblical texts, the life of Christ, and even the sacred liturgy. The power of fire or the Stone to purify metals is sometimes related to Christ's freeing men from sin. And of course, early alchemists frequently stressed the sanctity and divine favor needed for success. Yet such expressions of piety, as well as the synoptic, analogical view of the truths of the universe (whether natural or supernatural) typical of early modern thought (not just of alchemy) and the extensive use of religious imagery as a source of metaphor is widely different from the 19th century's identification of alchemy with Mesmerism, self-illumination, and psychic transformation. Indeed, the majority of alchemists (though not all) were at pains to stress that their art operated naturally upon natural substances. Even if among the broad diversity of alchemists one could identify a few who seem to promote a view more or less akin to the 19th-century interpretation, this feature could not be proposed as characteristic of alchemy since the majority of alchemists clearly did not hold it.

A major (and, in a critical historical sense, deleterious) outgrowth of the Victorian occultist fascination with alchemy is the psychological interpretation put forth by → Carl Gustav Jung. According to Jung, alchemy is not about physical (chemical) processes at all but rather about psychological developments occurring within the practitioner. The metaphorical language and strange phenomena filling alchemical tomes actually record hallucinatory 'irruptions of the unconscious' which are 'projected' from the alchemist's psyche onto the contents of his flasks. Despite the inherently unlikely character of this notion, it has had enormous influence on the understanding of alchemy even among otherwise sober historians of science. Besides the fact that there are few outside the ranks of avowedly Jungian analytical psychologists who continue to assent to Jung's views, recent scholarly investigations of alchemy have undermined Jung's

construct. In the first place, there is now no question that the vast majority of early modern alchemists were deeply involved in practical pursuits, which they carried out and interpreted with clear-headed, conscious thought. Studies of obscure alchemical language show how even some of the most bizarre metaphorical expressions and emblems can be comprehensively "decoded" into chemical operations. Some of these decoded processes have even been reproduced in modern chemical laboratories, providing occasionally evocative visual results – such as the growing of a spectacular "Philosophical Tree" from gold. The physical appearance of such results, taken together with the delight and fertility of early modern culture in drawing analogies and similitudes affords more immediate and more likely explanations for the origins of at least some alchemical imagery than the invocation of so shaky a construct as irruptions of a collective unconscious. Moreover, the inspection of private manuscript materials, for example the laboratory notebooks of George Starkey (1628-1665, alias Eirenaeus Philalethes, a favorite example for Jung), indicate clearly how he consciously encoded laboratory results in extravagant allegorical guise for public view while he maintained clear, precise expressions for private circulation, and even how he went about deciphering the metaphorical texts of his predecessors into chemical operations he could test practically in the laboratory. The affinity of Jung's interpretation with the 19th-century occultists' spiritual interpretation is clear in their common sundering of alchemy from practical chemical processes and their description of alchemical transformation as taking place within the practitioner; neither has withstood critical historical scrutiny.

3. ALCHEMY AND THE SCIENTIFIC REVOLUTION

Given the currency of spiritual and psychological interpretations of alchemy, it is not surprising that many in the early generation of 20th-century professional historians of science, especially those most influenced by positivist tendencies, denied to alchemy any place in the history or origins of modern science save perhaps as a counter-example. Their dismissal of alchemy often echoed sentiments voiced against alchemy in the 18th century, e.g. that it was entirely fraudulent, or that it was simply part of the "occult" (a word poorly defined in this context) which was supplanted by the progress of reason. Thus, influential figures like George Sarton cast alchemy into the scorned bin of "pseudo-

sciences” alongside → witchcraft, black → magic, and necromancy, bedfellows alchemy had acquired predominantly by the writings of the 18th-century *philosophes*.

Yet the last three decades of the 20th century have witnessed a major shift in this perception. First, the profound alchemical interests and commitments of several thinkers recognized as key to the development of the physico-mathematical sciences central to master narratives of the Scientific Revolution were revealed. → Isaac Newton, → Robert Boyle, John Locke, and others were shown to have invested enormous time and energy in traditional alchemical pursuits. Other notable scholars such as Daniel Georg Morhof, Pierre Gassendi, and Olaus Borrichius are now known to have taken alchemy seriously and seen it as no less a part of natural philosophy than astronomy or natural history. Second, a closer, more contextualized study of individual alchemists has shown not only the inadequate – indeed, sometimes caricatured – portrayals of them current in the secondary literature, but also the significant contributions which alchemy has brought to the development of early modern science. For example, alchemy brought forth such principles as an emphasis on the determination and conservation of weight in chemical processes, well-developed and explanatory particulate matter theories, analysis and synthesis as tools for understanding nature, the power of human artifice to create new or improved products over natural ones, and perhaps even the notions of force key to Newton’s physics.

4. ALCHEMY AND CHEMISTRY

The last of the obstacles to understanding alchemy which were mentioned at the outset can be seen as a parallel to the segregation of alchemy from the scientific mainstream (both in the 18th and the 19th to 20th centuries). This is the frequent division of alchemy from chemistry as if the two were only marginally contiguous. This division was made quite clearly by the work of Hélène Metzger in the 1920s, with alchemy as vitalistic and inherently “primitive” on the one side, and chemistry as mechanistic and “scientific” on the other. The division was recapitulated in Marie Boas’ studies of Boyle and in quite a bit of historical writing down to the present. Yet until about the end of the 17th century, the terms alchemy and chemistry were used largely interchangeably, and did not carry their modern definitions and distinctions. The division between the two terms dates from around 1700, and is tied up with a number of

issues, including the professionalization and institutionalization of chemistry at this time and the desire to insulate the newly professionalizing field from the criticisms to which earlier transmutational endeavors had been prone. Thus “alchemy” then became equated with gold-making (and generally fraud), while “chemistry” encompassed most everything else which could previously have been called either alchemy or chemistry. The important point is that it is distorting and historically inaccurate to read our current distinction between the terms back into the 17th century and earlier, and thus to imagine the existence of “chemists” and “alchemists” as distinct groups at that time. Use of the archaic (and inclusive) term *chymistry* for speaking comprehensively about the undifferentiated alchemy/chemistry of the early modern period has been suggested as a solution. Likewise, for the sake of greater clarity, a revival of archaic, but more precise, terminology has also been advocated, for example, *chrysopoeia* (gold-making) and less commonly *argyropoeia* (silver-making) to describe metallic transmutational chymistry, *iatrochemistry* or *chemiatria* to describe medicinal applications, *spagyria* to label Paracelsian-inspired attempts to create more potent substances by analysis and resynthesis, and so forth.

Much work is still required (and on-going) to fill out our understanding of so difficult and diverse a field as alchemy. Such fresh understanding will be advanced when we avoid making unnecessarily broad statements about the intent and content of alchemy *as a whole*, and instead carry out studies which adequately localize alchemical thought – of whatever century – in its due context of time and place. In particular, the new understanding now being gained of pre-18th century alchemy (or “chymistry”) requires the recognition and rejection of preconceptions arising from anachronistic and untenable interpretations which date from the 19th and 20th centuries.

A. HISTORY

1. INTRODUCTION

Alchemy possesses both a practice and a theory. The theory can appear as a speculative nature-philosophy of Greek origin, or as a metaphorical code for processes of purification and initiation occurring both in the alchemical work and in the soul of the alchemist. Such recurrent metaphors of suffering, death and resurrection are rooted in the mysticism of ancient myths and mystery-cults. It is no accident that these stages of the alchemical work are already present in the first available alchemical text from the 3rd century A.D., the *Physika kai Mystika* of Pseudo-Democritos, which derives from Bolos of Mendes in the 3rd century B.C. A further variety of the concept "alchemy" concerns the alchemists' quest for the panacea, which heals both men and metals like a medicine. This medicinal aspect has its origin in Arab alchemy and becomes very significant in Western alchemy, where it influences → Jean de Rocquetaillade (Rupescissa) and then → Paracelsus and the Paracelsians [→ Paracelsianism]. The panacea can be produced from plant or animal matter, or from minerals alone.

One cannot simply speak of "alchemy", but must distinguish its practical, theoretical, nature-philosophical, mystical and medical aspects. Among alchemists there are, correspondingly, scientists, medical men and mystical seekers after truth, and even charlatans.

The West took over the concept of "alchemy" from the Arabic (*al-kimiya*) and its Latin forms include "alkimia", "alquimia", "alchimia" and "alchemia". The prefix "al-" is simply the definite article in Arabic, but the etymological root of "chimia" is controversial. Its attribution to a mythical hero or prophet cannot be taken seriously. Equally untenable is its application to one of the "sons of God" in Genesis 1 and Joshua 2, named as Chemes, Chimes or Chymes in the apocryphal Book of Enoch, as → Zosimos and Olympiodoros report. Even its derivation from the Egyptian word

keme (black), denoting the black soil of Egypt and thus a metonym for Egypt itself, whereby alchemy would signify “the Egyptian Art”, has not been widely accepted. Nowadays it is usually traced back to the Greek work *cheo* (to pour). Accordingly, *chymeia* or *chemeia* would mean the craft of pouring molten metal. In view of what we understand by “alchemy” today, it is possible that the Greek word *cheein* (pouring) became confused with the Egyptian *kem* (black) in Hellenistic Egypt.

If one looks for the Greek word *chemeia* in the usage of Hellenistic and Byzantine alchemists, one finds it to be disappointingly rare, for they prefer to speak of a “holy art”. By contrast, the Latin word *chymia* is frequently encountered in the medieval West, moreover synonymously with the introduction of the Arabic term, thus “alchemy” (Lat. *alchimia*). Not until the advent of the modern period is *chymia* used for the more practical art to distinguish it from the more theoretical *alchemey*.

2. THE ALCHEMICAL WORK

Alchemy endeavours to produce noble metals, precious stones, the panacea, and above all the Philosopher’s Stone. On the one hand, it seeks to do this by finding the right mixture (*Eukrasia*) of natural substances according to the ancient doctrine of elements and qualities. Alternatively, it adds the Philosopher’s Stone, usually a powder or elixir prepared from an unknown substance, to the base metal. But first of all this unknown substance must be reduced to the *prima materia* (first matter). This occurs in the alchemical process, the “Great Work” (*opus magnum*) which passes through various stages. According to the colours that appear, these are called *nigredo* (black), *albedo* (white), *citrinitas* (yellow), *rubedo* (red) among others. This change of coloration may be observed when an amalgam of copper and mercury is heated. According to the amount of evaporating mercury, white, yellow, red, and with further heat, grey and black colours are seen, described by alchemists as the *cauda pavonis* (“Peacock’s Tail”). These stages are described in various numbers and orders, but most often appear as follows:

1. Calcination, i.e. oxidation by heating. Metal oxides are thus known as “metal calcinates”.
2. Solution, i.e. dissolution in sharp (“mercurial”) liquids.
3. Putrefaction, i.e. decomposition. The solution in the closed vessel is gently heated in warm compost or a warm water bath to induce fermentation and thus stimulate digestion. The resulting black colour (*nigredo*) is seen as death,

depicted as the “black raven”, which is shortly resurrected as the “white dove” (*albedo*).

4. Reduction, i.e. the recovery of the fugitive “spirits” during the calcination process by means of a fluid (“philosophical milk”), whereupon a yellow coloration (*citrinitas*) appears.
5. Sublimation, i.e. by adding the “spiritual” substance the matter in the glass vessel attains a higher level than the *prima materia*. This violent reaction is seen as the raging of the “red dragon”. A red coloration (*rubedo*) occurs.
6. Coagulation or Fixation, i.e. the solidification of the elevated and purified matter according to the principle “solve et coagula”.
7. Fermentation is only rarely mentioned, it means the addition of a small amount of gold (“yeast of gold”) to accelerate the process.
8. *Lapis philosophorum*, i.e. the Philosopher’s Stone, the *prima materia* elevated and purified into *ultima materia* (supreme matter). It is usually described as a heavy, dark red, shining powder. When heated, it acquires a waxy consistency (*ceratio*), but it solidifies again on cooling.
9. Multiplication, i.e. a greater amount of Stone can be made from a little of its residue.
10. Projection, i.e. the throwing or strewing of the Stone powder onto a base metal, which is thereupon allegedly transmuted into gold (silver in the Lesser Work). This process is also called *Tinctura* or “tingeing” (colouring) and is analogous to the application of the panacea or elixir in medicine.

It is thus evident that a base material is supposed to be reduced to *prima materia* and then ennobled. There are parallels for this in the individuation process described by → C.G. Jung as the development of a mature personality, as well as in the myths of Osiris and Isis, mystery-cults, → mysticism, and solar and cosmic symbols of eternity (e.g. the Ouroboros symbol). However, the processes described are only comprehensible against a background of nature-philosophy. Its basis is the nature-philosophy of Aristotle [→ Aristotelianism].

A thing only exists, when the “form” (*eidōs*) is added to “matter” (*hylē*). “Matter” is the passive principle in things, “form” the motive, pure activity. One can even say that “matter” is pure potentiality (Gk. *dynamis*; Lat. *potentia*) which is realised through “form” (Gk. *energeia*; Lat. *actus*). Only formed matter is real as an individual thing and reality consists of such individual things making up “substance” (*ousia*). Aristotelian “form” means not just the external shape of things, but its essential form, its type. As an entelechy (*entelecheia*,

something that contains or realises a final cause), it carries its own purpose within itself, which leads to the external form of the thing. In a universal hierarchy of purposes, each thing becomes “matter” again, once it reaches a higher essential form, as the seed becomes the tree. Ascending this hierarchy, the share of “matter” is constantly decreasing, while that of “form” increases, up to the purest, quite immaterial form of God. In this Aristotelian teleology, God is not only the end, but also the cause of the chain of movement, the first unmoved mover, who always maintains movement and in this manner continually shapes the world with a purpose.

The Aristotelian idea that all things are striving teleologically towards more complete forms exercised a fundamental influence in all alchemical theory. The associated notion of a passive *prima materia*, however, does not appear among alchemists as an Aristotelian metaphysical principle, but as a substance as among the Stoics and akin to the *apeiron* of the Pre-Socratic Anaximandros or the primal clay in Plato's *Timaios*.

Alchemy destroys a base metal by eliminating its specific nature, and then infusing the remaining matter with a new, nobler essence. The oldest Hellenistic literature describes the base metal as being cured of its “sickness” and restored to *prima materia*. Then one adds a tincture (colouring *pneumata*, “spirits”), which produces a white or yellow coloration as in silver and gold. This could be either a serious imitation of nature or mere trickery. Magical interpretations of metallurgical observations underlie these early attempts at transmutation, which went no further than coloration. The early metallurgists making alloys established that the alloy exhibited other properties than the molten metals. Copper and tin have a different colour and are softer than bronze, and likewise golden brass is produced from red copper and earthy zinc oxide.

The idea of a single ennobling agent, the best known being the *Lapis philosophorum*, is a further development in which ideas of natural → magic may have played a role. The production of the Stone through the stages of the Great Work (*opus magnum*) is also based on the notion of reducing an initial substance to *prima materia*, and then giving it a new, more perfect form. A small quantity of the Stone so produced is then projected onto the base metal, so that this loses its “sick” form and is transmuted into the *ultima materia* of the Stone, the latter acting as a yeast in a fermentation process. As a symbol of eternity and the eternal life of the gods among the Egyptians, gold alone among the metals possesses this perfect “form”.

The idea of *prima materia*, summoned into being

by the formative spirit and constituting all material existence implies that everything is one, as is expressed in the famous 11th-century Greek copy of a Hellenistic alchemical manuscript (No. 299, fol. 188 verso, Biblioteca Marciana, Venice). Here one sees the Ouroboros symbol, the snake or dragon consuming its own tail, signifying eternity, endless change and renewal, with the caption *hen to pan* (everything is one). If everything has arisen from the One and is one, then all things must be transmutable into anything.

Alchemical theory was thus based on these early procedures, first in Greek and later in Arab alchemy, together with the Aristotelian notion of being (prime matter being given form). To these ideas were added further theories drawn from Greek nature-philosophy.

3. THE DOCTRINE OF THE ELEMENTS

The Ionic nature-philosophers regarded each one of the elements as the primary substance. In his didactic poem *On Nature*, Empedocles of Agrigento (c. 500-430 B.C.) created the classical doctrine of the elements. Adopted by Aristotle, this doctrine dominated the natural sciences and medicine until the late Middle Ages. It holds that all things consist of the “four root powers”, namely the elements Fire, Air, Water and Earth, in a particular mixture. Two basic forces, “conflict” and “love”, separate them and bring them into new combinations. However, these four elements are not identical with the fire, air, water and earth of empirical experience. They are rather invisible basic materials, the principles of solidity (Earth), fluidity (Water), vaporosity (Air) and combustibility (Fire). Only their chief properties (solid, fluid, vaporous, burning), but in a mixed rather than pure form, can be seen in the empirical elements.

Using his basic doctrine of the elements, Empedocles sketched out a theory of matter in which the four philosophical elements were composed of imperceptible small parts, elementary corpuscles, theoretically divisible but immutable. Variations of this theory are found in Anaxagoras of Klazomenai (c. 500-425 B.C.) and Plato (427-348/7 B.C.).

Classical atomic theory is distinct from such corpuscular theories. It is rather a further variant of corpuscular theory, distinguishing itself in that the atoms are indivisible, differing in form and size and scattered through empty space. It derives from Leukippos from Miletus (mid-5th century B.C.) and Democritos from Abdera (c. 460-370 B.C.), who extended the theory.

Aristotle's criticism of corpuscular theories, especially the mechanistic conception of atoms as

in Democritus, tended to inhibit their acceptance. Nevertheless, corpuscular theory can be seen in Epicurus of Samos (341-270 B.C.), Titus Lucretius Carus (c. 560-633), the leaders of the 12th-century schools of northern France like Adelard of Bath (c. 1070-after 1146), William of Conches (c. 1080-1154), and even Hugo of St. Victor (end of 11th century-1141) and likewise among Salerno doctors like Alfano, archbishop of Salerno (d. 1085) and Urso (second half of 12th century). Scholastics, e.g. → Roger Bacon (c. 1219-c. 1292), even succeeded in deriving a kind of corpuscular theory from Aristotle (*Physics*, Book I, Chap. 4) and spoke of the smallest particles of all things (*minima naturalia*). Above all, corpuscular theory plays a role in the *Summa perfectionis* of the Latin Geber at the end of the 13th century, theoretically the most solid medieval alchemical text, and the one most widely read in this period. The scientific methodology of Aristotle is fundamentally empirical, but unlike the atomists he does not conceive of natural processes in a mechanical and quantitative manner, but as an interaction of principles and qualities. This physics of qualities dominates the theory of alchemy and medicine until the advent of modern science.

Aristotle supplements the fourfold scheme with a fifth element, the *quinta essentia*, “quintessence” or “ether”, which constitutes the heavens and stars. This “ether”, also known as *spiritus*, and as *pneuma* by the Neo-Platonists, regulates the correct mixture of the sublunar elements, when forming terrestrial things from *prima materia*.

The notion of an ideal mixture of elementary qualities is present not only in the preparation of the Philosopher’s Stone but also dominates the Hippocratic and Galenic medicine of the Middle Ages. Ever since Hippocrates of Kos (c. 460-377 B.C.), and also evident in the *Corpus Hippocraticum*, rational medical treatment was directed towards the maintenance or restoration of health, conceived as *Eukrasia*, i.e. the correct mixture of the four cardinal bodily humours of blood (*sanguis*), yellow gall (*cholera*), black gall (*melancholia*) and phlegm (*phlegma*). By contrast, sickness was *Dyskrasia*, the wrong mixture. These basic components of humoral pathology, which prevailed during antiquity and the Middle Ages, already appear around 400 B.C. in the text *On the Nature of Man* (Chap. 4), by Polybos, known as the son-in-law of Hippocrates.

The perfect mixture of the elements, qualities and humours plays a prominent role in both the alchemy and medicine of the Middle Ages until Paracelsus’ dethronement of humoral pathology. Both sciences are based on Pre-Socratic and Aris-

totelian nature-philosophy as well as on the fundamental view that everything is a unity. In Aristotle, the ether influences the sublunar world. From its Mesopotamian and Egyptian origins onwards, → astrology seeks to establish relations between the stars – principally the seven ancient planetary gods Moon, Sun, Mercury, Venus, Mars, Jupiter, Saturn – and terrestrial events and destinies. It has many connections with alchemy and medicine. Like magic, it sees divine and demonic forces at work everywhere. Such animistic notions are rooted in pre-scientific times and were passed on through the mythologies of the Babylonians, Egyptians, Greeks and others. Based on the idea of → correspondences, even the metals were matched, because of their appearance, to the planets and their powers: gold to the Sun, silver to the Moon, mercury to Mercury, copper to Venus, iron to Mars, tin to Jupiter, and lead to Saturn.

The earth with its “perfect” spherical form stands at the centre of the Aristotelian world-picture. Around it revolve the seven planets and, in a counter-rotation, the sphere of fixed stars. The earth is the primal mother Gaia, constantly giving birth to new things. Aristotle described the origin of the metals in his *Meteorology*, as being formed in the earth’s interior from dry earthy and moist watery evaporations. With the exception of gold, all are imperfect due to an earthy mixture and their solidification without sufficient watery constituents. He attributes the fusibility of metals to the element of water, their solidity to the element of earth. In Arab alchemy, indeed already in the *Liber misericordiae* within the *Corpus Jabirianum* (8th-10th century), the composition of all materials, even metals, is traced back to the two principles of Sulphur and Mercury, which are in turn composed of the four elements. Sulphur, the principle of combustibility, consists of Fire and Air; Mercury, the principle of fusibility, of Water and Earth. These terms do not denote natural sulphur and mercury. From this time on, the Sulphur-Mercury theory dominates alchemy, only being briefly rivalled in the 14th century by the Pure Mercury theory. However, the latter is really only a variant of the Sulphur-Mercury theory, as it assumes that the principle of Sulphur is already contained in that of Mercury. The purest and finest substance of this Mercury gives permanence to the metals (and all things), while Sulphur corrupts them.

Animistic tradition regards everything as alive, as moved by demons and spirits and their energies (*dynamis*). In this view, Sulphur is represented as the Sun, masculine, and linked to the element Fire (hot and dry). Mercury is seen as the Moon,

feminine, and assigned to the element Water. Their mixture is conceived as sexual intercourse. The Arab *Turba philosophorum* (9th-10th century) describes the elixir for producing gold as the union of masculine and feminine.

Through Arab alchemy based on its Greek predecessor, this dualistic conception of matter reaching far back to prehistoric and mythological sources was extended into a triad of body, soul and spirit, which was in turn related to all of creation and applied to the idea of the Philosopher's Stone. In the 16th century the triad appears as Salt, Sulphur and Mercury, denoting the principles of matter, in the work of Paracelsus (1493-1541).

Considered in the context of psychology and mysticism, alchemy expresses in word and image a supreme spiritual endeavour to reach a goal that moves ever further away, the more costly the efforts. Speaking in images, and leading to paradox, alchemy has much in common with mysticism, in respect of this process of endless purification leading towards a goal. In an objective sense, this goal is always receding and can only be perceived subjectively. The mystical search for the hidden god is paralleled by the quest for the hidden Philosopher's Stone or panacea in alchemy. The salvational quests of both mysticism and alchemy lead through purification and illumination by contemplation to the goal of *unio mystica* or the Philosopher's Stone, respectively. This search for salvation fills the greater part of all mystical and alchemical literature. Actual mystical experience, the apprehension of God, is vouchsafed to few. The union with God in female mysticism revolves around constantly new images of the sexual act (*conubium spirituale*). Thus Mechthild of Magdeburg has the Holy Spirit say to God that he should take the soul as a bride to a wedding bed. Similar metaphors are found concerning the combination of Sulphur and Mercury in alchemy.

However, their imagery can only be compared. They both spring from the common root of syncretic Hellenistic soteriology in late antiquity, as recorded in → Gnosticism, → Neoplatonism and the *Corpus Hermeticum*. As formulated in Greek nature-philosophy, alchemy does not recognise the direct spiritual intervention of man on matter, e.g. through spells or incantations, and is thus quite distinct from magic, although its theory shares much with the world-picture of *magia naturalis*. If magic seeks to dominate the material world through spiritual forces, alchemy seeks to understand the inner coherence of matter and, from this insight in the reaction of material substances, proceeds towards the mastery of the material world. But the mystical

path of salvation does not lead to any exercise of power in the material world; rather, it leads out of this world to an unworldly life of spiritual elevation and perfection in the search for God. The common Gnostic legacy in mysticism and alchemy is this spiritual path from material imperfection through purification and illumination to perfection. This is their only point of contact.

Leaving aside fraudulent alchemists, alchemy essentially has two aspects. Besides its theoretical superstructure, it develops its practice.

4. ALCHEMICAL PRACTICE

For the completion of the Great Work through four to twelve stages – preferably seven or twelve in number – instruments were used, known from illustrations in the papyri of late antiquity and medieval manuscripts. Laboratories in the West, where equipment developed by Arab alchemy was in use, were first established alongside the pharmacy in monasteries, as an extension of university pharmacies in the late Middle Ages, and at princely courts. Instruments included mortars (Lat. *mortuarium*, a vessel for pulverization), crucibles (Lat. *tigillum*), scales, scissors, tongs. The vessel for the performance of the Work was the aludel (Arab. *Al-utal*, Gk. *Aithalion*), occasionally known as a cucurbite (Lat. *curcubita*), a convex vessel with openings above and below made from clay, glass, iron or copper; aludels could be arranged in a series, one upon the other. When it was hermetically sealed with clay to a still-head or alembic (Arab. *Al-anbiq*, Gk. *Ambix*, Lat. *caput mauri*, i.e. Moor's head), the apparatus could be used for sublimation or recurrent distillation. If a separation was performed by distillation, the alembic with its extended spout (Lat. *alembicus rostratus*) was placed upon the vessel containing the matter to be distilled. The distillate streamed through the spout into a receiving vessel (Lat. *receptaculum*). The retort (Lat. *retorta*, *cornus Hermetis* [horn of Hermes], *matrix* [womb]) combined the aludel and alembic in a single vessel. There was further technical development in the apparatus of the Work in the 14th and 15th centuries, demonstrating the practical gains for chemistry later on. The "Pelican" was a still that enables continuous distillation by returning a distillate to its residue for re-distillation. Cooling systems were also constructed.

The raw materials were heated according to requirements in various ways with lamps or candles, but usually with a furnace charged with wood or charcoal. If an even warmth was required, a basin of fermenting horse-manure was advised, occasionally the reflection or refraction of sun-

beams, or a sand-bath (Lat. *balneum arenae*), a steam-bath (Lat. *balneum vaporis*), ash-bath (Greek. *Thermospodion*), or water-bath (Lat. *balneum Mariae*), frequently and wrongly attributed to Mary the Jewess in Egypt, allegedly the sister of → Moses.

The materials used by alchemists remained largely unchanged from the time of Rhazes (865-925) onwards. They were joined in Western alchemy by salpeter, alcohol, nitric acid and sulphuric acid. Rhazes lists the following materials in his major work *Kitab al-Asrar* ("The Book of Secrets"):

- a) Four "Spirits", i.e. volatile substances: i. Mercury, recognised as a metal by the 14th century, ii. Sal ammoniac (ammonium chloride), iii. Auripigment, Arsenic (arsenic sulphide), iv. Sulphur,
- b) Seven Bodies, i.e. the seven metals recognised by Rhazes,
- c) Thirteen Stones,
- d) Six Atraments, see Schneider (1962), 66,
- e) Six kinds of borax (Arab. *Bauraq*, sodium tetraborate),
- f) Eleven Salts,
- g) Nascentia, i.e. ingredients from plants,
- h) Viventia, i.e. ingredients from animals.

5. ALCHEMICAL IMAGES AND SIGNS

Already in Greek alchemical literature signs are found for substances (and even equipment), whose derivation is still largely obscure and which are often ambiguous. They are especially frequent in the later medieval and early modern periods. The use of planetary signs for the seven metals is of course self-evident. Furthermore there are pictograms (e.g. a retort), ideograms (e.g. the Ouroboros as a symbol for the unity and cyclical renewal of the cosmos as well as the cyclicity of the alchemical Work), and logograms (e.g. a death's head, derived from the term *caput mortuum* for the residue of distillation).

There were two channels for passing on the practical and theoretical knowledge of alchemy. On the one hand, there is an open (*aperte*) objective language as with Rhazes, and, on the other, an obscure (*tecte*), image-laden language as with Ibn Umail (c. 900-960). The latter involved cover-names (*Decknamen*) which came from Greek into Arabic and thence into Western alchemy, e.g. for chemical substances: "red rose" for the elixir used to make gold; for chemical properties: "eagle" for the evaporation of volatile substances; for the colours of the alchemical process: "raven" for black. These were useful as codes only as long as they remained

unknown to a broader public. Although polysemy (*aqua* is not only water but every fluid substance) already caused enough confusion for the user, there were further codes, anagrams and acrostics, creating an arcane language accessible only to a small circle of initiates. Not only single terms were veiled in concealed language, but there was also a prolific use of metaphor and allegory. From the 3rd to the 8th century, alchemy made use of many genres, including recipe, revelatory vision, allegory, riddle, didactic poems and letters, dialogue, commentary, and later debate (e.g. *Turba philosophorum*).

Traditional images of the world as a large organism (e.g. conception, birth, growth, maturity and death) were passed on. In addition, there were images based on Christian beliefs (e.g. Christ's Passion and Resurrection in *Buch der heiligen Dreifaltigkeit*) and, in the Renaissance, images from ancient mythology (e.g. → Michael Maier, *Atalanta fugiens* (1618), plates 23-24, 44-46).

The tendency towards secrecy has clung to alchemy since its origins. Zosimos of Panopolis (c. 300), whose works represent the earliest alchemical documents, already warns alchemists against the greed of kings and humanity in general. Such demands for secrecy run like a thread through alchemical literature. Nevertheless there were occasional bans, ever since Diocletian (296) (LMA II, 331), which multiplied in the late medieval period, and there were always plenty of opponents. Selfish interests, e.g. commercial monopoly, played their part, and possibly even altruistic efforts to protect humanity from the misuse of dangerous knowledge.

6. ALCHEMY IN MEDIEVAL SCIENCE

Any attempt to classify alchemy among the medieval *artes* is confronted by the problem of its multifaceted nature. In its European beginnings, only → Daniel of Morley (c.1140-1210) dares to attempt such a classification in his *Liber de naturis inferiorum et superiorum*, moreover as a subdivision of astronomy in the Quadrivium, the four mathematical arts of the seven *artes liberales*. Dominicus Gundisalpinus (12th century), using the Arabic classification of sciences, regards alchemy as *scientia naturalis* in his work *De divisione philosophiae*. Alchemy was never able to establish itself as a discipline at the medieval colleges and universities. However, until around 1300 it was discussed at a university level and had its place in the great encyclopaedias, such as the *Speculum naturale* of Vincent of Beauvais (c. 1190-1264), who not only described its practical merits, but also defined it as a science.

Alchemy could be regarded as a field of philosophy on the basis of its theory and called a liberal art or even a natural science, while its craft practice assigned it to the mechanical arts. To the medieval scholastics, however, it was neither a mechanical art nor a magical art forbidden by the Church.

7. HISTORICAL SURVEY OF ALCHEMY UP TO 1200

The following overview summarises some important aspects, facts and specialist works in the development of alchemy.

(a) Its beginnings in Hellenistic Egypt are characterised by the imitation of noble metals and pearls in temple science contained in the recipe literature of the Leiden and Stockholm papyri (c. 3rd century A.D.) and in Bolos of Mendes (3rd century B.C.), and passed on to Pseudo-Democritus (c. 300 A.D.).

(b) Alexandrian alchemy. Greek and Middle Eastern, especially Egyptian influences, combine in a syncretism, to be seen in all areas of knowledge in Alexandria, the greatest cultural centre of the Hellenistic world. Between 100 and 300 Greek nature-philosophy blends with mythology, Gnosticism and Neoplatonism in apocryphal works and such pseudepigraphic authors as → Hermes Trismegistus (although alchemy is least evident in the *Corpus Hermeticum*), Isis, Agathodaimon, Cleopatra, Mary the Jewess, Ostanos, Pammenes, Iamblichus, and Moses. In his major work *Physika kai Mystika*, Pseudo-Democritus (3rd century) not only transmits Bolos of Mendes and gives recipes for tinctures, but also provides a syncretic, mystical alchemy, abundant in metaphor with quotations from Ostanos and Pammenes; there is a commentary on this by Synesius (4th century). Alchemical allegory is first found in Zosimos of Panopolis (4th century), the earliest biographically documented alchemist, whose work found a wide readership, largely in commentaries, especially by Olympiodoros (6th century), and is accessible through Arab quotations.

(c) Byzantine alchemy begins with Olympiodoros, who displays a thorough familiarity with practice and equipment, and is continued by Stephanos of Alexandria (7th century), Heliodoros (8th century), Psellus (11th century) up to Nikephoros (13th century). Early texts of this Byzantine alchemy with its rich symbolism, specialist terminology and illustrations of instruments are collected in the famous Greek Codex 299 (11th century) in the Biblioteca Marciana, Venice. This served as a model for later copies. Byzantine alchemy not only develops the full range of its lit-

erary forms, mentioned above, but also elaborates its metaphorical codes.

(d) Arab alchemy derives directly from Alexandrian alchemy through translations from the Greek or Syrian. The doxographical *Turba philosophorum* reflects Greek nature-philosophy, mythology and magic. This is also true of the extensive *Corpus Jabirianum* (8th-10th century), attributed to Jabir (the Arab Geber, not to be confused with the Latin Geber of the 13th century), which first propounds the Sulphur-Mercury theory and also first uses plant and animal matter besides minerals for the production of the elixir. The Jabirian *corpus* is the first to contain the idea that the elixir can cure human diseases as a panacea as well as transforming base metals into noble ones. Although Jabir offers no fully developed system of iatrochemistry for producing remedies by chemical means, his work represents its beginnings. The twofold division of Alexandrian alchemy into a recipe literature and metaphorical, coded texts is now quite evident in an exoteric, pragmatic form of alchemy and its esoteric, image-laden, veiled counterpart. The esoteric literature of alchemy includes the *Tabula Smaragdina*, whose roots reach back to Hellenistic times, the basic esoteric text for all subsequent alchemists; the writings of the “Brethren of Purity from Basra” (10th century), which demonstrate a Gnostic influence; the *Epistola solis ad lunam crescentem* (“Tabula chemica”) of Senior Zadith, i.e. Mohammed ibn Umail (c. 900-960) and others like the astrological-alchemical sections of the *Secretum secretorum* (10th century), a pseud-Aristotelian compendium of considerable influence. The exoteric aspect is initiated by Rhazes (865-925), especially with his *Liber secretorum* (not to be confused with the compendium *Secretum secretorum*), followed by others including al-Farabi (c. 873-950) and the great → Avicenna (c. 980-1037), who denied the possibility of transmutation in his *Book of the Remedy*, and anticipated iatrochemistry, the alchemical preparation of medicines, long before Paracelsus.

(e) Western alchemy until 1200. In early medieval Europe, artisan crafts combine with parts of alchemical practice, as described by Pliny the Elder (c. 24-79) in his *Naturalis historia*. An ennoblement of matter is not intended in any way, nor any forgeries, and there is no theory of transmutation. This is therefore not really alchemy, but rather metallurgy, glass-making, bell-casting, mosaic work and producing colours, as represented in the following works: *Compositiones ad tingenda musiva* (9th century), *Mappae clavicularia* (9th-10th century), *Schedula diversarum artium* (or *De diver-*

sibus artibus) of Theophilus Presbyter (c. 1100), *De coloribus et artibus Romanorum* of Heraclius (11th century). This is the literature of the *artes mechanicae*, which later extends through other chemical fields to mining, pyrotechnics and distillation by the 15th century.

The history of Western alchemy in the medieval period begins with the reception of Arab alchemy after the 12th century. Its advent is marked by the translation of the alchemical doctrines of Morienus Romanus for the Umayyad prince Khalid (Halid ibn Yazid ibn Mu'awiya) († 704), both pseudepigraphic, by Robertus Castrensis (also Ketenensis), i.e. → Robert of Chester from Ketton in 1144. It bears the title *Liber de Compositione alchemiae quem edidit Morienus Romanus, Calid regi Aegyptiorum: quem Robertus Castrensis de Arabico in Latinum transtulit*. Toledo in Spain became a centre of such translating activity, led by Gerard of Cremona (c. 1114-1187).

Important early translations (12th-13th century) are *De aluminibus et salibus* of Pseudo-Rhazes, both exoteric and esoteric in its symbolism of the Ouroboros, as well as *De congelatione et conglutinatione lapidum* (c. 1200), the geological section on the origin of metals in Avicenna's *Book of the Remedy*, by Alfred of Sarashel. A Latin edition of Rhazes' *Liber secretorum* is available from the 13th century onwards, and also of *Liber lumen luminum* (also known as *Liber claritatis*), pseudepigraphically attributed to Avicenna or Rhazes. The *Tabula smaragdina* is then also translated. Arab alchemy, the *ars nova*, was also available through translations and compilations made in Sicily, like the *Ars alchemiae* of → Michael Scot (c. 1180-1235).

Pseudepigrapha not only circulated under the names of Rhazes and Avicenna but also under those of → Albertus Magnus, Thomas Aquinas, ("Of Multiplication"), → Arnau de Vilanova, → Ramon Llull, of whom several were actually opponents of alchemy.

B. LITERATURE

1. INTRODUCTION

Founded by Alexander the Great in 332 B.C., Alexandria was the intellectual centre of both Egypt and the whole Hellenistic world, with its Museion and famous library. Here the ancient Egyptian monotheistic religion blended with its thousand-faced personifications of the deity – the One and the Many. Here again ancient Egyptian temple wisdom encountered not only the Greek pantheon, philosophy and science, but also Judaism, Christianity, Gnosticism and Neoplaton-

ism. Myths and cults co-existed, influencing each other and becoming interwoven. This contact between different cultures was not limited to the less educated classes but reached up to the learned elites of the Museion and the library. The ideas of Greek alchemy, which overarched traditional metallurgical practices, grew out of this rich cultural humus. The myth of Isis and Osiris provides an example of this Graeco-Egyptian syncretism, which corresponds with many elements of alchemical imagery and nature-philosophical thought.

The Isis-Osiris mythology essentially consists in a message of salvation known to the mystical tradition of all great world-religions: through the surrender of the temporal self (dismemberment), the inner person attains a higher, eternal life (Horus, Serapis). This idea of purification from the worldly and incomplete is present in the mystery-cults of antiquity, in mysticism and in the "solve et coagula" of alchemy.

Such parallels in the development of alchemical theory in Hellenistic Egypt might lead one to expect corresponding esoteric ideas in the oldest papyri. However, the findings are meagre. The metallurgical skills of ancient Egypt are documented, indeed at a late stage (3rd century), in the formulae of the Leiden (X) and Stockholm papyri. These are chiefly concerned with the counterfeiting of precious stones, pearls, silver and gold through alloys and imitations using colouring, with tinctures playing a major role. There is no trace of the spiritual elevation and clarification found in the mystery-cults and mysticism. Only all-too-human concerns are evident in the temple arts and industry. Here one discerns no philosophical endeavour to discover the innermost constitution of matter, but rather the frank admission of fraudulent tricks.

However, quite similar recipes for the production of gold and silver are found in the first alchemical writer known by name, Bolos of Mendes (3rd century B.C.), transmitted in the fragmentary *Physika kai Mystika* of Pseudo-Democritus (c. 300). Bolos/Democritus is said to have publicised the secret alchemical temple wisdom of the Egyptian priests, according to Zosimos of Panopolis. Similar recipes surface later on in the Latin *Mappae clavicularia*. As our earliest source, Bolos already interprets the processes described in the recipes in terms of natural magic, ideas of sympathy and antipathy in the cosmos. These recipes deal with the imitation and transformation of natural substances based on the simple theory that the cosmos is a unity in which everything must be convertible into everything else. Here speaks a practically oriented alchemy, concerned with the mastery of nature.

Such an imitation of nature, where tinctures play a special role, should be distinguished from purely metallurgical and mineralogical techniques, as described by Pliny the Elder (d. A.D. 79) in his *Naturalis historia*, and which were used in the West for the purposes of casting bells, and producing stained glass and church ornaments in the early Middle Ages up to the 12th century. However, between the 1st and 3rd centuries, Alexandrian alchemy develops a unity of theory and practice by assimilating elements of the most diverse philosophical currents, especially Gnosticism and Neoplatonism, as well as the doctrines of purification and salvation in myths and mystery-cults. The enigmatic language of alchemy with its pseudonymous authors appears at the same time. It is significant that only pseudepigraphic and apocryphal authors, named after figures in Egyptian, Jewish and Greek mythology, religion and magic, feature in these first three centuries of alchemical literature.

Isis reveals the secrets of making gold and silver to her son Horus and gives recipes in the text *Isis the Prophetess to her Son Horus*. To the Egyptian queen Cleopatra, who is also credited with a pharmaceutical-cosmetic work and a gynaecological tract, was attributed the *Chrysopoeia* (Gold Preparation), a rich symbolic and metaphoric text in one of the most important collections of sources for Greek alchemy, the Codex 299 of the Biblioteca Marciana in Venice (11th century; Ploss 1970, 18), fol. 188 verso. On a single page the basic axioms of alchemy are combined with practice: three concentric circles form two rings, containing the words: ‘One is the All and through it the All and in it the All and if it does not contain the All it is nothing’, and ‘The Serpent is One, he who has the Venom with two Compositions’, beside it an image of the Ouroboros with the caption ‘One is the All’. The practice of alchemy, emphasised by Mary the Jewess, is additionally represented by a double-funnelled alembic and a furnace. This Mary the Jewess, known to some alchemists as Miriam, the sister of Moses, known to Muslims as the Coptic Mary, the slave of Mohammed, who bore him a son, is another of these historically unidentifiable authorities. Her name is wrongly attributed to the “Balneum Mariae” (*bain-marie*), a tripod vessel, which is placed in the fire and filled with a mixture of oil, wax and sand in order to produce a higher temperature than boiling water. The *bain-marie* is likewise illustrated in Codex Marcianus 299, fol. 195 verso. Another alchemical author, Ostanes, the Persian magician, is equally intangible from a historical point of view. Bolos/Democritus describes himself as having been a pupil of Ostanes in *Phy-*

sika kai Mystika. Even the serpentine god Agathodaimon, literally “good spirit”, whose symbol is the Ouroboros, appears as the author of a commentary to the Gnostic “Oracle of Orpheus”, in which he discusses tinctures and the whitening and yellowing of metals. All these mythical grandees remain a constituent part of alchemical literature throughout its entire history. But none has attained a greater importance than Hermes Trismegistus, the “Thrice-Greatest Hermes”, whose name has clung to the “Hermetic art”, and even to such technical terms as the “hermetic seal” of a laboratory vessel in the alchemical work or the *aves hermeticae* for the “volatile”, rising vapours in the process of distillation. This deity appears yet again as an exemplary product of Hellenistic syncretism in Egypt. The seventeen tracts of the *Corpus Hermeticum*, however, make no reference to alchemy. This suggests that Hermes Trismegistus entered the theory of alchemy owing to parallels with his cosmic philosophy of purification, redemption and immortality. The *Corpus Hermeticum* proclaims a specific kind of redemption, a liberation of the spirit by knowledge. Besides the theosophical *Hermetica*, there are also medical-scientific treatises, which deal with alchemy among other subjects. The alchemical *Hermetica* are mostly preserved as fragments. A longer one entitled “Anepigraphos”, that is “untitled”, attributes the preparation of silver, here called the “moon”, to Hermes and Agathodaimon.

The influence of the *Hermetica* was enormous. In the first instance, this tradition was fostered in the Middle East, by the Sabaeans of Harran and the Muslims, together with other aspects of Greek philosophy and science. The best-known Hermetic text, the *Tabula Smaragdina* (Emerald Tablet), the “Bible of the alchemists”, which began to circulate in the West from the 13th century onwards, is also attributable to Islamic engagement with the alchemical *Hermetica*. Its earliest source is in Arabic versions, for example the final part of the “Book of the Secret of Creation” (also known as “Book of Causes”, 9th century) by Balinas, the Pseudo-Apollonios of Tyana. The intellectual world of the *Tabula Smaragdina* derives from the Hermetism of Graeco-Egyptian alchemy.

This condensed *summa* of Graeco-Egyptian alchemy shines like a precious stone imbedded in one of the recurrent legends of discovery. The work bears the motto *hen to pan*, the unity of everything. All things have proceeded from this One, whence it follows that everything can be transformed into anything. Macrocosm and microcosm correspond to each other and turn into each other. The Philosopher’s Stone has the Sun (Fire, philosophical Sul-

phur, which bestows a gold colour) for its father, the Moon (Water, philosophical Mercury, which gives a silver colour and is the matrix of the Stone) for its mother. The wind (Air, the “Volatile” that is the rising vapour in a heated distillation still, or aludel, a Hermetic vessel known as the Philosopher’s Egg) carries the Stone aloft like a seed, and the earth (Mother earth, in which the minerals grow, likewise the mercurial humus of the Stone) nourishes the Stone and brings it to maturity. Here are clearly delineated the basic substances of philosophical Sulphur and Mercury according to the Sulphur-Mercury theory, besides the operation of the four elements in the Philosopher’s Stone: Fire, Water, Air and Earth. These individual components are not just listed, but dynamically related to each other according to *theorica*, thus producing a coded description of the alchemical Work, the *opus magnum*. The process of purification is clearly described, from the coarse to the subtle, up to pure fire (Gold), elevated above the earthly. The circular movement up to heaven and back to earth is indicated, just as the alchemical elaboration of the symbol of the unity of the universe in eternal change, the ancient Egyptian Ouroboros, expresses the circular processes of the alchemical *opus*.

After Augustine (354-430) had declared his discord with everything connected with Hermes (*De Civitate Dei* 18.23), interest in this literature was checked in the Christian West, until it was unleashed again by translations from the Arabic in Spain and Southern Italy during the 12th-century Renaissance.

Wolfram von Eschenbach created his epic poem *Parzival* in the first decade of the 13th century under the influence of the School of Chartres. Here Parzival’s wise hermit uncle Trevrizent recalls the mystagogic figure of Hermes Trismegistus. He guides the protagonists towards inner purification, moreover on the Hermetic-Gnostic path of understanding oneself, the microcosm as well as the macrocosm. Wolfram’s Hermetism is combined with alchemical knowledge.

2. ZOSIMOS OF PANOPOLIS

The first historical alchemist, Zosimos of Panopolis (Akhmim) in Egypt, who was active around A.D. 300, knew the *Hermetica*. Latin (Western) alchemy calls him Rosinus. The *Suda* (“Souda”, c. 1000), the most important, comprehensive Byzantine encyclopaedia, credits him with an alchemical encyclopaedia in twenty-eight volumes entitled *Cheirokmeta* (“Handles”). Only Greek and Syrian fragments have survived, somewhat distorted in a Christian sense, for Zosimos was not a Christian.

There is also a series of Arabic quotations. We have particular knowledge of Zosimos from the commentary of the Byzantine alchemist Olympiodoros (6th century).

On the one hand, Zosimos was a practical alchemist. Like Mary the Jewess, he places great value on apparatus, e.g. his book *On Apparatus and Furnaces*, and many alchemical recipes of his have survived. On the other hand, he gives the first instance of alchemical allegory and a coded language, because he pleads that the alchemical art be kept secret and charges Bolos of Mendes with having made it public. An example of his enigmatic language would be the following “description” of the Philosophers’ Stone in dichotomous paradoxes: ‘This stone which isn’t a stone, this precious thing which has no value, this polymorphous thing which has no form, this unknown thing which is known to all’. In one of his works, the “Commentary on the Letter Omega” which probably belongs among the twenty-eight books of the alchemical encyclopaedia, he debates with his sister Theosebeia, that a sage who has self-knowledge needs no kind of magic to influence something. In contrast, he allows everything to develop according to the necessity of nature and thus produces permanent “natural tinctures”. Zosimos’ portrait of the true alchemist, e.g. in the book “On the Treatment of Magnesia”, displays obvious Hermetic features. Zosimos introduces not only Hermetism together with reminiscences of current myths and religions to alchemy, but also the allegorical encoding of his ideas concerning the redemption of the corporeal, transient existence, of metals as well as men, into the immaterial realm of the spirit. Zosimos’ endeavours are most clear in his alchemistic “Dream” or “Vision”, the title of his allegory of the alchemical work. In fact, this is neither a dream nor a vision, but Zosimos chooses to use the literary form of an allegorical dream. With his ideas of clarification and *metanoia*, linked to a serial progression through purification to illumination and perfection, Zosimos stands at the beginning of a tradition – at once mythical, mystical, religious, philosophical, scientific, metallurgical and alchemical – which has been repeated a thousandfold by alchemists ever since. Zosimos’ dream allegory presents all these traditions so clearly, that one may speak of a didactic text, artfully divided into three parts, and intentionally written in a coded linguistic form.

3. ALEXANDRIAN AND BYZANTINE ALCHEMICAL LITERATURE

After Zosimos of Panopolis, Greek alchemy exhausts itself in the repetition of old theory, in the

elaboration and development of imagery in literary formulations, as well as wearisome descriptions of practical work. However, this has left a valuable legacy. Greek alchemy has been handed down to us in collections of manuscripts, including the already quoted Codex Marcianus 299 (11th century), as well as the Greek Codices 2325 (13th century) and 2327 (15th century) of the Bibliothèque Nationale in Paris. All other Greek survivals derive from these manuscripts. Greek alchemy exhibits the following literary genres: recipe, allegory, riddle, revelatory vision, didactic poem or letter, a tract in dialogue, and commentary. The Greek alchemists of the 4th century, especially Pelagros, Dioscoros, and Synesius are not proven historical figures. Only Synesius, who directs his commentary on Pseudo-Democritus to Dioscoros, can be identified with some probability as the Neoplatonist Synesius of Cyrene (c. 370- c. 414), bishop of Ptolemais in 410-411.

The transition from Alexandrian to Byzantine alchemy took place in the 5th century. Olympiodoros, a pagan historian and alchemist from Thebes in Egypt, inaugurates this process. The work entitled "The philosopher Olympiodoros on Zosimos, Hermes and the Philosophers" is attributed to him. It exhibits Gnostic influence as well as a knowledge of practical alchemy, especially in the description of equipment, but contains nothing new otherwise. He broadly concerns himself with the philosophical bases of alchemy, especially the Greek philosophers of nature, and repeatedly quotes extracts from Zosimos, described as the "Crown of the Philosophers".

The rhetorical and metaphorical expansion of alchemy, already present in Olympiodoros to an unprecedented degree, culminates in Greek alchemy with Stephanos of Alexandria (7th century). During the reign of emperor Herakleios (610-641) he taught philosophy, especially Plato and Aristotle, geometry, arithmetic, astronomy and → music. Besides a commentary on Aristotle and a work on astronomy, he composed an alchemical tract in nine lectures. In an eclectic fashion, he combined a mystical Christianity with ideas of the Pythagoreans, Platonism and other philosophical currents. He presents alchemy not as practical laboratory work but as an intellectual and spiritual process. He interprets the practice of alchemy in a mystical way as the clarification of the soul, following in Zosimos' tradition. He stylizes the transmutation of base metals into gold as a symbol for the perfection of the human spirit through understanding in a Gnostic sense. He uses the ancient metaphorical tradition, but disguises its sexual symbolism, which occurs overtly in Cleopatra as coitus, pregnancy and birth.

In the ensuing period, Christian ideas and images as well as references to the New Testament become increasingly prominent in the metaphorical usage of Greek alchemy. Overall, the interest in practical laboratory work recedes, while the poetic and allegorical ornament increases. Poems of this "allegorizing" tendency by Heliodoros, Theophrastos, Hierotheos and Archelaos have survived from the 8th and 9th centuries. The old practice of encoding continues, but also basic ideas, e.g. the composition of all things from body, soul and spirit, as in Archelaos.

Now alchemy, ever since Zosimos, manifests in a mythologised and psychologised form. This transmutation was linked with notions of death and reawakening in the oriental mystery-cults, crowned by the Gnostic idea of redemption through knowledge. This combination of practical knowledge and the esoteric formulation of mythological, psychic and soteriological ideas is continued in this period by Salmanas (9th-10th century) and Psellus (11th century), through whom alchemical knowledge reached the Latin West. However, unlike the innovations which Arab alchemy introduced to the Christian West, Byzantine alchemy brought no new theoretical ideas.

4. ARAB ALCHEMICAL LITERATURE

Translations from Greek and Syrian into Arabic made by Syrian-speaking Nestorians in Nisibis and Edessa and the Sabaeans in Harran proliferated under educated rulers like Harun al-Rashid (c. 764-809) and Al-Ma'mun (787-833). Besides these centres of learning, Greek science entered the Islamic world through the Academy of Gondishapur founded during the Sassanid dynasty (224-651) in west Persia and through Egyptian centres, especially Alexandria.

Since the end of the 8th century there were also sufficient numbers of Muslim translators proficient in Greek. As far as alchemical literature is concerned, several Persian and even Babylonian-Assyrian ideas and concepts found in Arabic versions are attributable to their translation in Persian and Mesopotamian locations. The newly developing Arabic literature of alchemy relied on these translations and so transmitted both authentic material, above all Zosimos, as well as pseudepigraphic works, which were not recognised as such. These included, for example, Thales, Pythagoras, Leukippos, Empedocles, Democritos, Socrates, Plato, Aristotle, but also "Agathodaimon", "Chimes", "Hermes" and Hermetic writings, such as the already cited *Tabula Smaragdina*, which originally stood at the end of "The Book of the Secret of Cre-

ation” by Balinas (Pseudo-Apollonios of Tyana), and further authorities like Cleopatra, Mary the Jewess, Ostanes and others. Such pseudepigrapha in Arabic alchemy have still not been adequately researched.

From the 8th century onwards, Islamic scholars enter the historical stage. Only several of the great number of Muslim alchemists, who produced original and representative work, can be given as examples. Arab historiography is problematic, as legend is not always distinguishable from historical truth. The most important historical source is the “Fihrist” (kitab-al-Fihrist) of Ibn [-Abi-Yakub]-an-Nadim (second half 10th century).

Ibn an-Nadim introduces the Umayyad prince Khalid (Halid b. Yazid b. Mu’awiya) at the turn of the 7th to the 8th century as the first Arab alchemist. He claims to have seen works by him and his alchemical testament to his son. There are similar reports by other Arab historians. It is still an open question whether the historical Khalid is identical with this alchemist. However, Khalid’s principal importance is his legacy to the Christian West, as the dialogue of Khalid with his alchemy teacher Maryanus (i.e. Morienus Romanus) was the first alchemical text to be translated from Arabic into Latin by → Robert of Chester in 1144, later printed under the title *Liber de compositione alchemiae quem edidit Morienus Romanus, Calid regi Aegyptiorum: quem Robertus Castrensis de Arabico in Latinum transtulit*. It is true that Khalid is credited with several alchemical works, among them “The Paradise of Wisdom”, a divan of alchemical didactic poems, which were frequently quoted later.

5. JABIR AND THE *CORPUS JABIRIANUM*

The reception of Greek learning swiftly led to remarkable achievements in Arab alchemy, first evident in the extremely influential *Corpus Jabirianum*. Evolving from the 8th to the 10th century, its authorship is attributed to Jabir (ibn Hayyan), who is the subject of much scholarly debate owing to scant historical evidence. In any case, this Jabir or Arab Geber must have been succeeded by the Latin Geber of the 13th century, who is credited with a text which was produced in Italy. Jabir provides evidence of himself as a historical personality in the 8th-9th century by repeatedly asserting that he is a pupil of Ja’far as-Sadiq and that he followed the latter in the content and structure of his writings. The Imam ‘Abd Allah Ja’far al-Sadiq (c. 700-765) lived a reclusive life in Medina. He must have enjoyed a high reputation, because a great number of legendary pseudepigrapha have gathered around his name. In one such attributed work, “The Open

Letter of Ja’far as-Sadiq regarding the Science of the Art and of the Noble Stone”, one encounters in Arab alchemical literature the earliest subdivision of the metals as of all things into the triad body, soul and spirit, which plays such an important role in → Paracelsus as “Salt, Sulphur and Mercury”.

The *Corpus Jabirianum* is extremely voluminous and treats of all ancient sciences. Three thousand titles in total are known, of which many relate to chapter-headings. The most important writings of Jabir are the following:

- “The Compassion”, also known as “The Foundation”, appears to be the oldest work in view of its archaic terminology. Ja’far is not named in this work.
- “The Hundred and Twelve Books”, which continue and offer a commentary on “The Compassion” have only survived in fragmentary form (thirty “books” are preserved). The description of the elixir as made not only of mineral but also from organic, that is animal and vegetable substances, is especially significant for the further development of alchemical ideas. Ja’far is named here.
- “The Seventy Books” contain the most uniform and systematic plan of Jabirian alchemy. Greek authorities are frequently quoted. Ja’far is named only once. This general survey of Jabirian alchemy also contains, like “The Compassion”, the Sulphur-Mercury theory, which Jabir probably derived from Balinas (Pseudo-Apollonios of Tyana). Parts of the “Seventy Books” were translated into Latin by Gerard of Cremona as *Liber de Septuaginta* and then used widely in the Christian West.
- “The Ten Books of Rectifications” are concerned with improvements in alchemy by specific authorities. Such “rectifications” are written by various alchemical authors under the assumed names of Pythagoras, Socrates, Plato, Aristotle and Democritus among others.
- “The Books of the Balances”, originally one hundred and forty-four in number, of which forty-four survive, deal not only with alchemy but also with → astrology, medicine, logic, physics, metaphysics, arithmetic, music, grammar and prosody. Jabir gleans insights from all these sciences for his special theory of “balance”.
- “The Seven Metals”, whose contents continue the discussion of the theory of “balance”.
- “The Development of the Potential into the Actual” is concerned with the theoretical assumptions of contemporary natural science such as the doctrines of the elements and qualities,

astronomy, meteorology and “klimata”, that is the latitudinal zones of the earth. Here one finds the fundamental questions of all Jabirian texts arising from such fields as medicine, alchemy, sympathetic influences, theurgy, → astrology, the science of balances and the artificial creation of life.

- “The Great Book of Properties” appears disordered in its seventy-one chapters, because in its composition fifty core chapters were supplemented by slightly abridged chapters. This book contains the important innovation of iatrochemistry, that is the alchemical preparation of medicines, so crucial for the further development of Western alchemy (→ Jean de Rocquetaillade, Paracelsus).

Concerning sources, it is evident that Jabir chiefly relies on Arabic translations of Greek pseudepigraphical literature, which he wrongly assumes to be authentic. This is usually the case with Pseudo-Socrates, Plato, Porphyry, Democritus, Agathodaimon and Pseudo-Apollonios of Tyana (Balinas). The only genuine quotations stem exclusively from Aristotle and Galen – Jabir is familiar with the humoral doctrine of medicine – as well as from the only real alchemist, Zosimos. Jabir’s alchemical theory may be sketched as follows:

The foundation and touchstone of all traditional as well as discovered theory is experiment. Aristotle’s doctrine of the elements, which derives from Empedocles of Agrigent, is combined in the *Corpus Jabirianum* with the doctrine of qualities in its early form as in Galen. The alchemist must endeavour to produce a state of equilibrium. The goal of transmutation is to achieve the same composition of the elementary qualities as obtained in gold. Jabir wanted to achieve this with elixirs. When preparing elixirs, the raw material should first be broken down into the four elements, e.g. by dry distillation, which are then added in an appropriate manner to the specific elixir with reference to the “lack” in the material which is to be transmuted. In this way, Jabir considers it possible to “heal” the “sick” matter or metal, by bringing its elementary qualities into the same equilibrium as of gold. For all that, quantitative thought enters alchemical theory here. In Jabir, the elementary qualities are carried by the two philosophical principles Mercury and Sulphur, from which the metals arise under the influence of the planets. Jabir’s Mercury-Sulphur theory may have been prompted by the Arab encyclopaedia of his revered Balinas (Pseudo-Apollonios of Tyana), which was known as “The

Causes”, “The Collector of Things”, but mostly as “The Book of the Secret of Creation”.

Jabir’s basic conviction that natural events are ordered according to measure and purpose leads him to place no limits on the alchemist’s ability to imitate the world-creating demiurge. Everything is possible, even artificial procreation, that is the homunculus. One merely needs to produce the right mixture of elementary qualities through elixirs. The innovation of the *Corpus Jabirianum*, as in “The Seventy Books”, in the preparation of such elixirs for transmutation consists in the use, besides minerals, of organic, animal and plant substances: blood, hair, sperm, bones, lions’ urine, poisonous snakes, foxes, oxen, gazelles, asses, as well as parts of olive, jasmine, onion, ginger, pepper, mustard, pear, anemone and aconite.

A further idea from the *Corpus Jabirianum*, which only blossomed fully in Western alchemy, was the use of the elixir in medicine as a remedy, even as a panacea. In the sixth maqala of “The Great Book of Properties”, Jabir reports that he healed a thousand patients on a single day with the aid of the elixir. He also used it with success against snake bites and poisonings.

The *Corpus Jabirianum* is based on empirical results, but it does not achieve the level of Rhazes, especially regarding alchemical equipment and substances. The *Corpus Jabirianum* divides minerals into the following classes: 1) “spirits”, that is volatile substances like sulphur, arsenic (arsenic sulphide, realgar, auripigment), mercury, camphor and salmiac (Sal ammoniacum), which was scarcely mentioned in earlier Arab alchemical literature, and whose production from organic substances, e.g. hair, is described in the *Corpus*. 2) Metals, namely gold, silver, lead, tin, copper, iron and “khar sini” (“Chinese iron”, still unidentified). 3) Eight further groups of minerals. The empirical aspect of the *Corpus Jabirianum* also demonstrates highly practical techniques, e.g. the production of steel and refinement, dyeing, protection from corrosion, and the making of “gold” ink from marcasite for the illumination of manuscripts.

Apart from the corpuscular theory, Jabirian alchemy contains the principal ideas of all ensuing alchemy. The *Corpus Jabirianum* knows of the esoteric, metaphorical, occult as well as the exoteric aspect of alchemy. It offers both theory and empirical practice.

6. RHAZES

The great Persian physician and alchemist Rhazes (865-925) offers the most striking example

of a thoroughly exoteric, sober, and practical alchemy. His full name is Abu Bakr Muhammad ibn Zakariyya al-Razi, that is “the man of Ray” (ancient Rhagae) near Teheran. Together with Jabir, the alchemist Rhazes exercised the greatest influence on Western alchemy. He based his thought largely on Jabir, but did not accept his theory of balance. He compiled his alchemical works in a list called “Pinax”. Towards the end of his life he abridged his major work “The Book of Secrets” (*Kitab al Asrar*) as “The Secret of Secrets” (*K. Sirr al Asrar*) with an almost identical introduction. Here “secret” must be understood in the sense of technical knowledge. A collection of twelve further books belongs to the alchemical corpus of Rhazes, including “The Book of Propaedeutic Introduction” (written c. 900-910), which presents contemporary alchemy in a clear and systematic fashion like a modern introduction to chemistry.

Rhazes was chiefly devoted to practical alchemy and experiment. Although his thinking is far removed from the allegory of Greek alchemy or an Ibn Umail and is reticent in speculation, he follows the theory of Jabir in particular. He accepts the Aristotelian doctrine of elements, also the Mercury-Sulphur theory of Balinas realised by Jabir, regards “Sulphur” as non-inflammable oil and adds to Mercury and Sulphur a third constituent of a salty nature, a triad which is naturally reminiscent of Paracelsus. Like Jabir, he uses plant and animal products for the preparation of elixirs, with which the base, “sick” metals can be “healed” into gold, and furthermore systematically classifies all chemical substances into animal, vegetable and mineral. A corpuscular theory is manifest in Rhazes’ “Book of Secrets”, more sharply defined than its vague beginnings in the *Corpus Jabirianum*: bodies consist of the smallest indivisible parts, that is atoms. These are eternal and have a definite size. The qualities of the perceived elements, lightness, heaviness, colour, softness, hardness, depend on the density of the atoms, that is on the amount of the empty space between them.

Rhazes’ ideas concerning the theory of matter later influenced the corpuscular theory of the Latin Geber towards the end of the 13th century. Armed with this theory, Rhazes describes the alchemical work in precise terms: distillation, calcination, solution, evaporation, crystallisation, sublimation, filtration, amalgamation, ceration, i.e. a process for making substances into a waxy solid. For the transmutation, the substances are purified by distillation and calcination. They are then amalgamated. Following their purification they are next

prepared in a waxy state, without any evolution of fumes. There follows the solution in “sharp waters”, not generally acids (lemon juice, sour milk), but rather alkaline and ammoniacal solutions. Finally, a coagulation or solidification was performed to produce the elixir.

7. AVICENNA

After Rhazes came → Avicenna (980-1037), i.e. Abu ‘Ali al-Husain ibn Abdullah ibn Sina, the supreme medical authority among Islamic doctors. Like Rhazes, he was widely educated in many fields including alchemy – although he wrote no work on the subject and was no alchemist. However, his name was used pseudepigraphically for a number of alchemical books. His most important philosophical work, a kind of Aristotelian encyclopaedia dealing with the sciences of logic, physics, mathematics and metaphysics, bears the title *Book of the Remedy*, which refers to the recovery from ignorance. Here he treated of the natural generation of the metals and thundered his famous invective against the alchemists, which the Latins quote as “Sciart artifices”, i.e. “The alchemists should know . . .” Avicenna took a position contrary to Jabir’s belief in limitless feasibility. The products of nature are better than those produced artificially. Alchemical art never measures up to nature. For this reason, neither can it transmute base into noble metals. Like Jabir, but as an opponent of the art of making gold, Avicenna signposts the purpose of alchemical elixirs as remedies in human medicine, a challenge first fulfilled in the Christian world.

8. THE *TURBA PHILOSOPHORUM*

The *Turba philosophorum* or “Convention of Philosophers” (as adepts called themselves) has enjoyed the greatest favour among alchemists up to modern times, despite or possibly because of its obscure language, which has still not been adequately explained up to the present day. The *Turba* first appears in manuscripts of the 12th century, a Latin edition was first printed at Basle in 1572, and the first German translation by Paul Hildenbrandt appeared at Frankfurt in 1597. Surviving fragments of the lost Arabic original bear the title “The Book of the Convention”. The doxographic work, written in Arabic around 900, is entirely based on Greek alchemy. The *Turba* quotes entire passages from Pseudo-Democritus and Olympiodoros. There are also textual parallels with the first book of the *Refutatio omnium haeresium* by the Church father Hippolytus (3rd century), in which nine of the *Turba* discussants appear. There are no

references to Arab alchemists nor any mention of the Mercury-Sulphur theory. The text is manifestly an Arab edition of an original Greek work.

The Latin edition presents the *Turba* in a fictional narrative framework as the report of Archelaos, called “Arisleus”, on the “Third Pythagorean Synod”, to which Pythagoras allegedly invited his pupils across the world. Pre-Socratic philosophers, their identity masked by gross distortions of their names, speak predominantly in debate with the convention: Anaximandros, Anaximenes, Anaxogoras, Empedocles, Archelaos, Leukippos, Ekphantos, Pythagoras and Xenophanes, besides Socrates and Plato.

There is little in the *Turba* relating to alchemical procedures. The four elements must be mixed. Only then can they combine in new substances. Thus, “our copper” must first be transmuted into silver, before one can proceed with the preparation of gold. Coded names obstruct further interpretation. The author of the *Turba* has clearly not practised alchemy himself, as indicated by his recommendation of alchemical literature instead of experiment – a statement he puts in the mouth of Parmenides in the eleventh chapter. There is a wide gap here with the thought of Jabir and Rhazes, and the scholars of Salerno and Chartres in the 11th and 12th centuries.

9. IBN UMAIL

The most prominent representative of allegorical alchemy is Abu ‘Abdullah Muhammad ibn Umail at-Tamimi (c. 900-c. 960), whom the Latin writers called Senior Zadith Filius Hamuel. He wrote two influential major works besides various poems. The first is entitled *The Book of Silvery Water and Starry Earth*, while its Latin translation is known as *Tabula chemica* or *Senioris antiquissimi philosophi libellus*. Both express Ibn Umail’s allegorical and encoded manner of expression. In this book he claims to be interpreting the secrets of alchemy, revealed to him when visiting the temple in Sidr Busir. He particularly enlarges on the alchemical doctrines of ancient, pre-Islamic authorities, including Zosimos, Mary the Jewess and the *Hermetica*, as well as the *Turba philosophorum*. Among Islamic alchemists he quotes only Jabir, occasionally engaging in polemics against him, and appears well acquainted with several books of the *Corpus Jabirianum*. He either knows nothing of Rhazes, which is hardly conceivable, or else he wishes to ignore him as the leading exoteric authority. He is wholly indebted to metaphorical Greek alchemy and closes his eyes to the achievements of Islamic alchemy.

In his introduction he refers to his second major work, “Epistle of the Sun to the Crescent Moon”, in which he gives poetic expression to his alchemical insights at the temple in Sidr Busir. There are ninety strophes and a total of 448 verses of “extraordinary wooden doggerel” about the sun, the great elixir and the half-moon, namely mercury. The first work is presented as a commentary on the poetic, second work.

The “Epistle” also exists in a Latin version under the title *Epistola Solis ad Lunam crescentem*. This second work of Ibn Umail was used in the late medieval period as a source for a widely circulated, anonymous German poem, which was integrated into the Latin and German editions of the *Rosarium philosophorum*. Its contents revolve around the relationship dictated by nature between Sol and Luna, seen in sexual terms as the love-play of cock and hen.

In retrospect it is evident that Arab alchemy knows both theory and practice, the esoteric aspect with its metaphorical language and the exoteric with its struggle to understand matter and experimentation expressed in sober, objective language. There are divergent opinions concerning the possibility of transmutation, with Jabir and Rhazes pro and Avicenna contra. Innovations include the preparation of the elixir from plant and animal substances, the doctrine of the correct mixture of the four elements, the medicinal use of elixirs as remedies, even as a panacea, and the Mercury-Sulphur theory in particular, as well as practical improvements in instruments, especially distillation apparatus.

From the 12th century onwards, Arab alchemy produces only commentators and compilers. The Christian West begins to absorb the greatest and momentous wave of ancient science, in the 11th century in southern Italy, especially at Salerno, and in the 12th century in Spain, notably at Toledo. This was primarily mediated by Arabic sources, and to a lesser extent, especially in southern Italy, by Greek sources. In this way alchemy came to Europe as an *ars nova*.

10. ALCHEMICAL LITERATURE IN THE LATIN MIDDLE AGES UNTIL THE END OF THE 12TH CENTURY

The natural philosophers of the School of Chartres, “physici” as they called themselves, sought to understand God’s corporeal world in a rational manner. Both William of Conches and Adelard of Bath rebuked the ancient scientists, who had neither studied the writings of the *physici*, nor recognised the natural virtues (*vires naturae*), nor trusted

their own reason (*ratio*). William's critique shows that this was not a mere rationalist impulse derived from the *Timaeus*, but reflected a wider receptivity to new knowledge: he implied that there were still hidebound scientists who relied on the elementary doctrine of the old *Timaeus* (of Chalcidius), when Constantinus Africanus was now available as a source.

William of Conches therefore supplements his knowledge of the doctrine of elements, in this case the corpuscular theories, with influences from Salerno, particularly Galen's doctrine of the elements in the *Liber regalis* of 'Ali ibn Al-Abbas al-Magusi (*Lat.* Haly Abbas, d. 994), entitled *Liber pantegni* (The Whole Art) in the translation of Constantinus Africanus (1010-1087). His widely diffused "Philosophia mundi" offers a systematic treatment of all existence based on this corpuscular theory.

Constantinus Africanus, the first major and world-renowned translator of Greek-Arabic science into Latin, is synonymous with Salerno as the oldest university centre of Europe and the foremost centre for the reception of Arabic scientific and medical literature. This leading school of medicine cultivated a tradition of rational scientific thought united with observation and experiment in the spirit of Hippocrates and Galen. At the same time as Constantinus, Alphanus of Salerno (c. 1015-1085) translated the tract *Peri physeos anthropou* of Nemesios of Emesa (5th century) from Greek into Latin under the title *Premnon physicon*. Like Constantinus, he was concerned with establishing a corpuscular theory of matter as the basis of Western medicine, because the text offers one of the most extensive descriptions of the Platonic atomic theory in the Middle Ages. It was widely disseminated.

The networking, from the 10th century onwards, of educational centres, especially of Salerno in southern Italy with those in northern France, was flanked and eventually superseded by the reception and assimilation of translations from the Arabic at Toledo in Spain soon extended throughout Europe.

From the end of the 12th century, Latin writers had access to the leading authors of Arab philosophy, → al-Kindi, al-Farabi, Avicenna and al-Ghazali, as well as the giants of medicine like Rhazes with his compendium *Ad Almansorem* and especially Avicenna's *Canon medicinae*. Much was introduced from other fields, including the *Hermetica*, superstitious material, and not least alchemy, presented as the *ars nova* by Robert of Chester. Alchemy therefore owes its existence in the West to this 12th-century wave of reception and assimilation. The gradual Arab-Latin transla-

tion of Aristotle's complete works was especially epoch-making.

Arab science was introduced into the West by the enormous translating activity of Gerard of Cremona (1114-1187) and his circle in Toledo. His pupils compiled a list of 71 of his translations. Among these are three alchemical titles: Jabir (Jabir ibn Hayyan), *Liber divinitatis de LXX* (Berthelot 1906), Pseudo-Rhazes, *De aluminibus et salibus* (Ruska 1935) and Pseudo-Rhazes, *Liber lumen luminum* (Lippmann 1954, III, 27). In addition, there are Rhazes' "Book of Secrets" and pseudepigraphic texts like Pseudo-Avicenna's *De anima in arte alkimie* or the treatises on alchemy in the *Secretum secretorum*, the Arab encyclopaedia of Pseudo-Aristotle.

The reception of Arab alchemy in Europe commences with the same story of Morienus Romanus for the Umayyad prince Khalid, which marked the Islamic reception of Greek alchemy. Robertus Ketenensis (Robertus Castrensis), i.e. Robert of Chester (from Ketton) translated it in 1144 as *Liber de compositione alchemiae* and introduced in its foreword "alchymia" as a hitherto unknown art into Europe. He and his friend Hermann of Carinthia were studying alchemy while staying near the Ebro in Spain. Both men were influenced by the School of Chartres.

The number of early translations of alchemical writings from Arabic into Latin was not that great, and the well-received "Book of Alums and Salts" represents the foundation text of alchemy in the West, combining theory, allegory and practice. The Arab original was probably written in Spain in the 11th or 12th century. Its contents are as follows: the unknown author generally follows the line of Jabir and Rhazes, but also quotes from a poem attributed to Khalid and, not unexpectedly, appends the Mercury-Sulphur theory. However, he repeatedly reverts to his own experiments. The work is predominantly practical and treats the basic substances according to Rhazes's classification: sixteen chapters on spirits (mercury, arsenic, sulphur, sal ammoniac), forty-nine on bodies, i.e. metals (gold, silver, iron, lead, tin, copper), eight on stones and twelve on salts. This sober and objective chemical exposition is, however, mixed with the use of cover-names and esoteric, allegorical codes. In his description of mercury, for example, empirical observation initially prevails. But then analogy is invoked to conclude that the mercurial spirit penetrating another metal, which it clearly is able to tincture by giving it a different appearance, may also be able to act as an elixir by clarifying this other metal into silver ("white") and gold ("red").

This description is known as the Pure Mercury

theory, already encountered among other theories of the transmutation of metals in Jabir's *Liber de septuaginta*. But then the language grows more obscure and a series of cover-names ensues ("water of life", "colouring herb"), as found in the *Turba philosophorum*, followed by a list of the properties of mercury deriving from its twofold nature. This twofold nature is conveyed by an image, entirely in the style of Ibn Umail's allegorical alchemy or the *Turba philosophorum*. The snake impregnating itself, giving new birth from itself, when its time has come, unites the opposites of masculine and feminine in itself and renews itself. This is an allegory of the Ouroboros symbol. The toxicity of the mercury vapours is emphasised and then an easily understood representation is given of red mercury oxide being slowly heated. A torrent of cover-names is used, as if to make the point. The ensuing allegorical dialogue between gold and mercury is traditional, as found in Jabir's "Book of Seventy". Once again, mercury is presented as the origin of all metals, even of gold, as well as its hermaphroditic nature. According to whether it is regarded as masculine or feminine, mercury should be wedded to the feminine (sister) or masculine (brother). This idea might appear to favour the Mercury-Sulphur theory rather than the Pure Mercury theory. However, as a hermaphrodite, mercury contains both principles, which can each enter into a new relationship and thus both theories can harmoniously co-exist. By means of arsenic and sulphur, mercury can thus transmute base metals into silver and gold.

The introduction of alchemy to the scholarly world of Europe in the 12th and 13th century immediately provoked controversy. Alfred of Sareshel (Alfredus Anglicus) stirred up opposition against the *ars nova* at the turn of the 12th and 13th century. He was a member of Gerard of Cremona's circle and was responsible for some of the new translations of Aristotelian writings from Arabic. In the fourth book of his translation of Aristotle's *Meteorologica* he added the meteorological section of Avicenna's *Book of the Remedy* under the title *De congelatione et conglutinatione lapidum* ("Concerning the Coagulation and Conglutination of Stones"), without acknowledgement. But this contains the "Sciart artifices", Avicenna's famous rejection of transmutation. With these first translations of the 12th century the entire Arab theory of alchemy together with its imagery and terminology entered the Latin West.

BERNARD D. HAAGE

Alchemy III: 12th/13th-15th Century

I. MAIN DEVELOPMENTS 2. LITERATURE

I. MAIN DEVELOPMENTS

The transition from Arabic to Western alchemy in the 12th and 13th centuries did not create an abrupt rupture. Its Hellenistic and Arabic foundations were adopted and developed further, leading to new theoretical speculation and more practical knowledge. Research on this period is still developing as the surviving manuscripts have not yet been thoroughly investigated and evaluated. Research is still needed to ascertain attributions and borrowings and to distinguish traditional theories and innovative ideas. Further biographical study would be necessary to investigate putative or legendary medieval authors, such as Basilus Valentinus, Bernhard von der Mark, → Nicolas Flamel, Vincentius Koffshki or Salomon Trismosin.

Medieval alchemy was not a natural science in the modern sense but a doctrine of nature, which tried to discover and apply the laws of nature through theory and experiment. Its fundamental assumption was a holistic concept, which united the macrocosm of the stars and the microcosm of man and nature. The teachings of authentic or legendary authorities such as Aristotle or → Hermes Trismegistos served as theoretical bases. New discoveries had to be harmonised with traditional teachings and this was a slow process. Speculation and practical experience formed a unity. Theory set the context and determined the direction of the

work. Experiment either confirmed theory or occasioned new considerations.

The goal of the medieval alchemists was not just the exploration but the perfection of nature, regarded as a divine task or duty. This applied chiefly to the base metals which were classified as ill, impure or immature. They had to be purified and perfected into silver or gold, a goal achieved by stages of a longer process (*opus magnum*). They had to be destroyed in their outer form and reduced to a common prime matter (*prima materia*) from which they would arise renewed through the proper treatment and the favourable influence of the stars. The Philosophers' Stone (*lapis philosophorum*) played a varied role: it was either the additional ingredient which accelerated and brought about transmutation or it was the result of the process, and was then applied to other metals. It was not only ascribed healing powers towards inanimate nature but was regarded as an elixir, which could heal human diseases and prolong life. The desire to produce gold or silver was not the pre-eminent goal of serious alchemy and the intentional forgery of precious metals was opposed to it. The boundary between alchemy and related sciences such as astrology, medicine, or pharmacy was not a sharp one. Because the constellation of planets was allegedly responsible for the growth of metals and their properties, astrological knowledge was important for the alchemist. The link to medicine and pharmacy followed on a theoretical level, which set up an analogy between the alchemical process and the healing of the human body, or in practice, in which alchemy contributed towards the preparation of medicines.

Western alchemy began in the middle of the 12th century with translations from Arabic into Latin. The centres of this translation activity were Toledo in Spain, and the territories of Emperor Frederick II Hohenstaufen in southern Italy and Sicily. The most important translated works included the pseudo-Aristotelian book *Secretum secretorum*, the *Liber de Septuaginta* attributed to Jabir ibn Hayyan, the *Liber de Secretorum* of Rhazes, and a text entitled *De aluminibus et salibus*, also allegedly by Rhazes.

The development of alchemy was greatly influenced by the interest of two eminent 13th-century scholars. → Albertus Magnus also dealt with the growth of metals in his work *De mineralibus*. He evaluated alchemy as an activity, capable of changing the colour, weight or smell of matter. But he regarded this only as an apparent transmutation because its fundamental nature was immutable. → Roger Bacon came to a different conclusion, distinguishing between speculative and operative al-

chemy in his *Opus minus* and *Opus tertium*. While speculative reason could be given to explain the growth of matter from the elements, Bacon considered the principal task of operative alchemy as the preparation of medicines for the prolongation of life. Alchemy thereby became an established part of medieval knowledge, as represented in the encyclopaedias of Bartholomaeus Anglicus (*De proprietatibus rerum*, c. 1230), Thomas von Cantimpré (*De rerum natura*, c. 1240) or Vincenz von Beauvais (*Speculum maius*, c. 1250).

At this time, the first independent Latin monographs were written, but their authors are mostly unknown. These texts frequently appeared under the name of a famous scholar such as Thomas Aquinas (1224/25-1274), → Arnau de Vilanova (c. 1230-1311) and → Ramon Llull. The authors and their readers were evidently untroubled by the fact that these pseudepigraphic authors had written critically on alchemy or even been its determined opponents.

One work stands out within this growing literature, namely the *Summa perfectionis magisterii* (c. 1300), attributed to Jabir ibn Hayyan. Its author, whom scholarship knows as Latin Geber, may be identical with the Italian Franciscan Paulus de Tarento. His text dealt with applied alchemy but also provided new theoretical approaches. According to the Latin Geber, matter is composed of small and separate individual corpuscles. Even the four elements are composed of such corpuscles, but they exist in the elements as identical components. Quicksilver (mercury) and sulphur are composed from these elementary particles which then form the bases of other metals. Geber explained the variable chemical properties of individual substances by the size and density of the corpuscles. The possibility of an authentic transmutation of metals was supposed to result from the purification of the fundamental substances quicksilver and sulphur. Quicksilver or mercury thus acquired a special significance and Geber equated it with the *Lapis philosophorum*. Further texts bearing Geber's name were not necessarily written by the same author.

Among the authors influenced by the Latin Geber was Petrus Bonus (Pietro Bono or Buono), a physician and alchemist who probably came from Ferrara. The most important of his works is the text *Margarita pretiosa novella* (c. 1330). He aimed at creating a theoretical basis by presenting arguments for and against alchemy. He thereby distinguished between scientific knowledge in alchemy and divine illumination, which he equated with religion. This association was perhaps the reason for religious analogies with the alchemical process.

An important theoretical contribution came from the French Franciscan → Jean de Rocquetaillade (Johannes de Rupescissa), who is historically identifiable and also the author of prophetic books. In his *Liber de consideratione quintae essentiae omnium rerum*, he described the preparation of the quintessence of various substances which transcended the properties of the four elements. Through solution and multiple distillation, the substances were supposed to be separated and purified whereby their effectiveness was greatly increased. According to Rupescissa, this quintessence could be produced from minerals as well as from organic matter. He considered the preparation of alcohol through the distillation of wine as particularly important. This newly-won substance, liquid and flammable, united the contrary properties of the elements water and fire. Alcohol was moreover useful for preservation purposes and for the extraction of active ingredients from plants. The *Liber de consideratione quintae essentiae omnium rerum*, preserved in some hundred manuscripts, belongs to the most widespread alchemical works of the Middle Ages.

Western alchemy underwent an important expansion through its involvement with Christianity through several phases. It began with comparisons and analogies between the chemical process and the content of Christian doctrine. Alchemy thereby gained credibility and meaning, and confirmed Christian beliefs. A further stage involved the alchemical interpretation of Biblical passages, in which → Moses or Solomon were regarded as authorities, and Genesis, the Song of Solomon or the Apocalypse of St John were construed as alchemical allegories. This development began in the 14th century with Petrus Bonus and in the writings attributed to Thomas Aquinas (*Aurora consurgens*) and Arnau de Vilanova (*De secretis naturae, Exempla de arte philosophorum*). In these works the alchemical process was identified with the Passion and Resurrection of Christ and expounded in great detail. Later works like the *Buch der heiligen Dreifaltigkeit* continue these parallels between Christ and the Stone, which appears as an alchemical interpretation of the Christian Mass in the Hungarian Melchior Szebeni (*Processus sub forma missa*, before 1530). The close link with religion became an essential component of esoteric and theosophical alchemy in the 17th and 18th centuries.

The 15th century brought a further expansion of alchemy, evident in the growing number of manuscripts and the increasing use of vernacular languages. Latin still dominated, but works were

translated into national languages and increasingly composed in the latter. The introduction of printing in the 15th century had actually not much impact, a fact that may be explicable by the persistence of secrecy concerning alchemical knowledge. Not until the 16th century did alchemical writings appear in print.

The focus of practical work was the alchemical process which was presented as a work of several stages in many and varied versions. The most frequently occurring numbers seven or twelve and details regarding the length of the process had more symbolic or astrological than practical significance. In principle any substance could serve as a starting point but metals were preferred and quicksilver or gold used frequently. According to the simplified principle of “Solve et coagula”, the process began with the regression of the materials to their prime matter, which was supposed to be achieved through solution or combustion (“Solutio”, “Calcinatio”, “Putrefactio”). Next individual components had to be combined anew in several stages (“Coagulatio”, “Coniunctio”, “Fixatio”). The result was an improved substance, as a rule a precious metal. Changes of colouration corresponded to the individual stages, which passed through black (“Nigredo”) through white (“Albedo”) to red (“Rubedo”), using pictorial images as well as metaphors (raven, dragon, peacock, queen, king).

Even if the process never led to the desired goal, the work led to a continual growth of chemical knowledge through the countless experiments necessitating precise observation and notes. The vessels inherited from the Arabs were developed further, above all distillation apparatus. The alembic or aludel (“Cucurbit”), which served as a receiving vessel, was a broad full-bellied vessel made of clay or glass, later also of copper or iron. For distillation purposes, it acquired a helmet (“alembic”) for collecting the distillate which was then conducted into a further vessel (“Rezipient”, “Receptaculum”) through a long, beak-shaped extension. This apparatus was gradually improved whereby the helmet was increased in surface area to assist cooling (“Rose Hat”) or an arrangement for condensation (“Moor’s Head”), before this was replaced by a cooling coil. Special distillation apparatus included retorts with a curved neck (“Pelican”), an arrangement with two reversionary tubes, permitting a continual circulation during distillation. An airtight (“hermetic”) seal on the vessels by a special substance (“lutum sapientiae”) prevented the escape of the distillate. Distillation required an even temperature for which one usually employed an air, water sand, or ash bath, but also sun beams,

or the warmth produced by the fermentation of horse dung. The most important result of distillation was the extraction of alcohol from wine.

Another discovery was the preparation of alum from aluminous minerals, which was used for tanning leather and the bleaching of wool before dyeing. Acids and alkalis were investigated and their properties thoroughly explored, leading to far-reaching improvements in pharmacy and metallurgy. It was first possible to separate gold and silver with the help of nitric acid. The most significant innovation of Western medieval alchemy was the preparation of gunpowder, already known in China.

Berthold Schwarz, a monk and gunsmith at Freiburg, first succeeded about 1370/75 in discovering the correct proportions for the explosive mixture of sulphur, salpêtre and charcoal and using it in a weapon. This invention revolutionised weaponry for the next two hundred years. The production of canons and later firearms required a complete transformation in the equipment of armies, new military tactics and defensive fortifications. Chivalry lost its military significance, leading to major social changes.

The social and professional status of individual alchemists is difficult to establish owing to scant biographical data. However their circle must have been limited, considering the preconditions necessary for alchemy. These included literacy, proficiency in Latin, and access to manuscripts. Financial means were also necessary in order to acquire manuscripts, apparatus and chemicals, a room in which a laboratory could be set up, and a regular income to pursue the "Great Work" exclusively for months or even years. These preconditions were chiefly available at two locations: monasteries and princely courts.

There are biographical data for alchemists in both settings. Monks included Jean de Rocquetailade, Ulmannus, the author of *Buch der heiligen Dreifaltigkeit*, Berthold Schwarz and perhaps the Latin Geber. Manuscripts and rooms were available and the monastic community provided board and lodging. Alchemists were also active at the medieval princely courts, and several princes were themselves alchemists. These include Friedrich I, Margrave of Brandenburg, Johann "the Alchemist", and Albrecht Achilles, but also Barbara von Cilli, the wife of Emperor Sigismund. It is debatable whether monarchs pursued alchemy as a result of philosophical and religious interests or with a view to riches. Alchemists first appear among the urban middle class in the course of the 15th century.

As alchemy spread, so did its criticism. This was directed less against its theoretical foundations,

which were hardly doubted, but rather against particular alchemists, who surfaced as "gold-makers" or deceived others with forged precious metals. The papal bull "Spondent quos non exhibent" (c. 1317) of Pope John XXII is one of the earliest bans, through which he possibly wished to restrict monastic alchemy. Over the next two hundred years bans followed from such princes as King Charles V of France (1380) and Kings Henry IV (1403/04) and Henry VI of England (1452), and from the cities of Venice (1488) and Nuremberg (1493). The town council of Nuremberg did not doubt alchemy itself but forbade its practice because people were deceived by it and injured by its practice. Many poets expressed criticism. In the *Divine Comedy* (1307-21) → Dante included the alchemists among the deceivers who must remain in the lowest circle of Hell and in Sebastian Brant's *Narrenschiff* (Ship of Fools, 1494), they appear as fools who deceive themselves. Brant quoted Aristotle as an authority who regarded the transmutation of metals as impossible. Neither bans nor criticism had any enduring effect.

The end of the Middle Ages represents a profound shift for alchemy as indeed for other sciences. The Renaissance interest in → Neoplatonism and → Hermetism had a positive influence on alchemy but there was a simultaneous but critical approach to traditional sciences. The work of → Agrippa von Nettesheim chiefly shows this. In his first great work *De occulta philosophia* (written 1510, revised and printed 1531) he advanced the doctrine that occult sciences such as alchemy → Astrology, Kabbalah [→ Jewish Influences] and → Number Symbolism could make an important contribution to knowledge of the world. But later he rejected all sciences, including alchemy, on account of their contradictions in his book *De incertitudine et vanitate scientiarum et artium*.

→ Paracelsus is a representative figure of this scientific upheaval. He adopted the Mercury-Sulphur doctrine of Arabic alchemy and complemented these principles with the principle of Salt, identified as the incombustible, non-volatile residue of the alchemical process. He distinguished between the "Alchemia transmutatoria", which he rejected and the "Alchemia medica" which he considered valid. He saw its real task as the preparation and application of medicine. In this process, "chemiatry" separated from alchemy and developed into pharmaceutical chemistry.

Other fields, previously part of alchemy, now became independent and practical sciences. These included the "Ars destillatoria", on which numerous printed books on distillation soon appeared.

Michael Schrick published the text *Nützliche Materie von mancherley ausgebrannten Wässern* (1480). This was followed by the Strasbourg physician Hieronymus Brunschwig's *Liber de arte Distillandi de Compositis* and Philipp Ulstadt's distillation book *Coelum philosophorum* (1525), which foresook theoretical speculation despite its alchemical title.

One can observe a parallel development in books on pyrotechnics and mining and prospecting. They also omitted alchemical theories, limiting themselves to experiment and experience. Fundamental works in this respect were the books *De la pyrotechnia* of Vannoccio Biringuccio (Venice 1540) and *Alchimi und Bergwerck* of Peter Kertzenmacher (1534). A complete compendium of chemistry and metallurgy was written by Georg Agricola in his posthumous work *De re metallica libri XII* (Basle 1556). This signalled the emergence of chemistry as an independent exact science. In 1597, the first chemistry textbook was published by Andreas Libavius, which still bore the title *Alchemia*, and in 1609 Markgrave Moritz of Hesse-Cassel established a "laboratorium chymicum publicum" at Marburg University, where the mathematician Johannes Hartmann taught the subject of "Chymiatric".

Even if alchemy and chemistry separated from the 16th century onwards, medieval alchemy remained a vital tradition in numerous ways and formed the basis for the next three hundred years. The works written between the 12th and 15th centuries were distributed as manuscripts or as printed books, either as monographs or in collections such as the *Theatrum Chemicum* (1659-61), which comprised more than 200 texts. Medieval authors had an enduring influence and were frequently quoted in later works. The high estimate of medieval alchemy can be seen not least in the works of the 16th and 17th century being issued as those of legendary alchemists.

2. LITERATURE

The alchemical literature of the 12th to 15th centuries was largely written in Latin. It began with translations from Arabic, soon followed by independent monographs. An analogous process occurred two centuries later with translations from Latin into the vernacular languages. Vernacular language works ensued, often in collective volumes of manuscripts together with Latin texts. Latin was most important for the development of a professional vocabulary, as the vernacular adopted its words, concepts and translated terms. Individual survivals included words from the Greek (chem-

istry, elixir, theriac) or from the Arabic (alembic, amalgam).

Alchemical language is peculiar inasmuch as it has two forms of expression. Many procedures in the experimental field were expressed in an objective and sober language, so making them comprehensible and easy to perform. These related to the special operations, substances and apparatus used in alchemical work. This discourse is scarcely distinguishable from the professional languages of other medieval sciences such as medicine or pharmacy. An arcane language prevails in other writings, with statements that are intentionally obscure and incomprehensible. Their use is paramount in theoretical and speculative alchemy but also in practice. The arcane language is typified by the polysemantic use of words like "water", which could simply mean water, but also an acid or quicksilver. An abundance of synonyms are also used for the same object, for instance, the Philosophers' Stone which has more than several dozen names. They extend from the names of substances (e.g. "Antimonium") to symbols ("Phoenix") and code names ("Rex regum", "Philosophical Gold").

The use of metaphors, personifications and allegories involving concepts and actions was particularly favoured. There were borrowings from the plant and animal world (dragon, wolf, serpent, rose, lily) and also from the correspondence of metals, planets and their deities, from ancient mythology and Christian symbolism. Texts in this arcane language often used an ecstatic tone, which approached the language of → mysticism. They were not only concerned with veiling alchemy and keeping its results secret. Whatever had to remain incomprehensible or meaningless to an uninitiated reader could give an expert in alchemy important information. The term "dragon" for quicksilver was not just a codename but also referred to the reactivity and toxicity of the metal.

The arcane language was also characterised by Number Symbolism, often expressed in geometrical forms. Every number and its corresponding form had a meaning. The number 1 (circle) embodied the Philosophers' Stone as the whole purpose of the Work. The number 2 signified polar opposites (male-female, solid-liquid). The favourite was number 3 (triangle) on account of its religious reference to the Trinity. This could stand for the fundamental Principles (Sulphur-Mercury-Salt), for the natural kingdoms (mineral-vegetable-animal), or for the progression of colours (black-white-red). The number 4 (square) stood for the four elements and their properties, the number 5 (pentagon) for the "Quintessence" as an elaboration of the four

elements. The number 7 signified the seven planets, the seven metals, or the seven stages of the Work. The phrase “squaring the circle” stems from this number symbolism.

A further characteristic of alchemical language is the use of signs for processes, substances, and apparatus. The oldest signs were the planetary symbols for gold and silver, followed by those for the other metals. Further signs developed as logograms or pictograms, made of letters and tironic notes. In contrast to modern usage, these signs were ambiguous as various signs could be used for specific concepts and the same signs did not always express the same content. There were more than 40 signs in use for quicksilver alone and over 30 for antimony, arsenic, gold, borax or *Weinstein* (tartar).

In terms of literary genres, medieval alchemy used recipes, prayers and riddles for shorter works, and tracts, allegories and didactic poems for longer works. The recipe was closely associated with the recipe literature of other sciences. Its title usually repeated the content in the form of a caption (“A recipe . . . to make”). The necessary ingredients often with their quantities are listed and the method of preparation is described briefly. The result is named at the end, followed by a prayer, formula, or exclamation (“Deo gratias”). Simple recipes were expanded into a description of the Work, its individual stages and observable changes of colour. They represent an attempt to describe a scientific event with some precision and resemble the tract.

The prayer was a special form of alchemical literature. It not only served to rebut charges of godlessness or heresy but showed the close connection between alchemy and the Christian faith. Most alchemists saw the collaboration of God as a precondition for the success of their work. Even riddles, often in rhyme, occur frequently in alchemy. The obscure statements of the arcane language, paraphrases or pictures provided sufficient material. It is probable that the cyphers using code-names, metaphors or secret scripts were understood as riddles.

Besides the recipe, the tract was the important genre of alchemical literature. It served the objective and discursive treatment of the theme but could also contain reflections and speculations. The simple treatise was accompanied by a letter containing a didactic conversation between two or more persons or giving answers to fictitious questions, a favourite device of scholastic philosophers.

Distinct from the tract, the allegory clothed alchemical theories or the course of the Work in a story which was understood as a simile or para-

ble. These stories often possessed the features of a tale and followed a similar pattern. They began with the death of a person or a couple (man and woman), who are then awakened through several stages to a new and better life.

A theme could also be handled in rhyme. Short and important statements were made more impressive through verse. Longer poems employed metric forms, even if the literary quality was often poor. The content of such a poem might be a synopsis of alchemical doctrines or a description of an alchemical process. The poetic form was particularly favoured in allegories, often fashioned as pictorial poems where verse and pictures accompanied each other.

While the illustration of Greek and Arabic manuscripts was limited to simple symbols and apparatus, the 14th century witnessed an increasingly elaborate illustration of alchemical writings. These images represented the practical work or the interior of a laboratory, a theme continued in painting from the 16th century onwards. They chiefly served to make the theory of alchemy and the Work more graphic. It was but a small step to transform the metaphors, personifications or allegories of the arcane language into images, reflecting the colourful phenomena of the alchemical Work.

To begin with, individual pictures had little connection with the text, but they developed further into pictorial sequences in which the alchemical process was reproduced in all its stages. Some examples are the poem *Sol und Luna*, and the prose text *Donum Dei*. *Sol und Luna* was a short German-language poem, probably dating from the 14th century and bound with the collective manuscript *Rosarium philosophorum* which was first printed in 1550. In its original form there were 78 verses and 20 pictures, which complemented one another. They tell the story of Sun and Moon as King and Queen who unite in a bath to form an Hermaphrodite, before they die and their soul leaves the body. After a heavenly dew has washed the corpse, the soul returns. A winged Hermaphrodite arises and the process repeats. S/he is reborn and finally appears as a crowned and enthroned royal couple.

The pictorial series *Donum Dei* was also composed around 1400. Despite many similarities with *Sol und Luna*, it is an independent work. Here again the pictures are the main focus while the text derives chiefly from quotations in ancient writings and simply forms the commentary. The process is represented in twelve stages, which occur in a glass flask and are additionally explained with flowers and colours. *Donum Dei* depicts the union of a

King and Queen, who are reborn after a phase of immolation and death.

The German-language didactic text *Splendor solis* was another favorite pictorial series composed of seven tracts with 20 pictures and longer text quotations. The author is named Salomon Trismosin about whom nothing certain is known. His traditional biography making him the teacher of Paracelsus is fictional. Most of the pictures have decorated borders displaying themes or concepts, for instance, alchemy is compared with “women’s work” or “child’s play” and appeared in 16th-century manuscripts as splendid folio miniatures. Meanwhile a picture sequence is interposed showing the alchemical Work passing through seven stages in the glass flask. Every stage is ruled by a planet and the pictures portray the character and professions of the “children” born under the corresponding planetary sign.

The breadth and literary variety of medieval alchemical literature is exemplified by four German-language works of the 15th century. The most remarkable work is the *Buch der heiligen Dreifaltigkeit*, which survives in numerous manuscripts, although it was never printed. The author was a Franciscan, who called himself a “virgin” and is named Ulmannus in several manuscripts. He wrote his book between 1410 and 1419 and dedicated it to Friedrich von Hohenzollern, later Margrave of Brandenburg, whom he probably met at the Council of Constance. He prepared a copy or an abridgement for Emperor Sigismund. The author possessed remarkably good chemical knowledge, perhaps from personal experience. The illustrated manuscripts show chemical vessels and furnaces. The *Buch der heiligen Dreifaltigkeit* offers an example of the Christ-Stone correspondence, represented in numerous pictures. The symbols of the Evangelists are used for the four elements; the Passion of Christ, his Resurrection and the Crowning of Mary are analogous to the alchemical Work. The book is also a religious document written in a passionate, evocative, and even ecstatic language where prose often gives way to verse. Ulmannus called his work a heavenly gift, that he wrote at God’s command and which the Devil tried to hinder. He attributed incredible properties to the Philosophers’ Stone: it is said to heal all diseases, give invisibility, and lend its owner the ability to float in the air and land again safely. Finally the book is related to prophetic and eschatological writings of the Reformation such as the *Reformatio Sigismundi*, which also indicates a relationship between the author and Emperor Sigismund. He clearly imagined that alchemy would produce the necessary financial and

political resources to enable the Emperor to carry out a reform of Church and Empire.

The “Lamspring Figures” are among the great pictorial poems of the Middle Ages. The hitherto unidentified author probably lived in the second half of the 15th century in North Germany. His *Tractatus de lapide philosophorum* consists of 15 pictures explained in verse. The fundamental idea derives from Arabic alchemy, according to which the volatile components of a substance (“Spiritus” or “Anima”) must be separated from the solids (“Corpus”), purified and then recombined as a new substance. Lamspring described this doctrine in two cycles. The first cycle consists of 10 pictures in which the separation of matter is portrayed by a pair of animals (fishes, lions, birds, wolf and dog, stag and unicorn) in a loose sequence. The crowned King and the fire-dwelling salamander represent the climax of this cycle. The last five pictures return to an allegory derived from the Arabic alchemist Alphidius. It describes how a father obtains for his son a guide who is to show him the whole world. Both climb a great mountain and from its peak contemplate Heaven and Earth. But the son yearns to return to his father, who consumes him in sheer joy. A divine shower of rain transforms the father first into water and then into earth, whence father and son arise anew. They have now become immortal and rule a great kingdom together with the guide. The final image resembles Christian representations of the Trinity. Lamspring’s work became widely known through a printed Latin translation, published at Leiden in 1599, followed by further editions. The pictures can be found in several collections of the 17th century.

The cathedral dean and notary Johann Sternhals resident at Bamberg between 1459 and 1488 chose another literary form to present alchemical knowledge. His prose work *Ritterkrieg*, surviving as a manuscript and in printed editions (Erfurt 1595, Hamburg 1680), used a court case as the narrative frame for his tract, containing his alchemical experience over twenty years. In the trial, Gold (“Sol”) appears before Mercury (“God and Judge”) to accuse Iron as the “child of a whore” because it is of base descent. However, Iron can defend itself cleverly by proving that Gold is impure and listing many of its own advantages and achievements. Through the iron nails on the Cross, it had its own share in redemption. The Judge wants to pass no verdict but delegates the decision to the “Virgin Nature”. But even she gives no metal preference, but admonishes both to modesty and harmony.

A more sober example is the manuscript didactic poem entitled *Der Stein der Weisen*, written by

Hans Folz, a Meistersinger resident in Nuremberg. Folz had acquired knowledge in many fields and repeats them in rhyme form as well as a plague regime and a balneological booklet. His poem on alchemy comprising 600 verses displays well-founded knowledge, but probably did not stem from personal experience. He appears to have studied specialist literature and quotes it extensively. The poem gives a survey of the theory and practice of alchemy, in which the various kinds of distillation and furnaces are described, even if the author considers one furnace and one vessel sufficient. The poem ends with directions for the preparation of the Philosophers' Stone.

Poetry as well as alchemical writings evidence the widespread and increasing interest in alchemy from the 14th century onwards. Already at the beginning of the 13th century there are occasional echoes in Wolfram von Eschenbach and Gottfried von Straßburg, although they indicate no precise knowledge of alchemy. The works of John Gower (1330-1408), William Langland (1332-1400) and Johann von Tepl (c. 1330-1414) contain brief references to alchemy, showing it to be a controversial part of contemporary knowledge.

Alchemy appears extensively in the continuation of *Roman de la Rose* (c. 1275/80), of Jean Chopinel (Jean de Meun). In his reflections on the relationship between art and nature, the poet also dilates on alchemy, saying that it is a real science only pursued properly by a few masters. He compares the transmutation of metals with the production of glass, in which potash produced by burning fern was used.

The role of alchemy is even more important in the work of the court poet Heinrich von Mügeln (c. 1320-1372). In his poem *Der meide kranz* (c. 1355) he describes a contest of the liberal arts in which "Alchemia" enters. She describes her special abilities, namely the production of colours and the transmutation of metals. However the Emperor-Judge does not give her the desired prize with the justification that he has seldom met a rich alchemist. Heinrich von Mügeln also deals with alchemy in one of his shorter poems, and quotes Geber as his authority.

A critical satire occurs in Geoffrey Chaucer's *Canterbury Tales* (c. 1480). In "The Canon's Yeoman's Tale" the pilgrims meet a canon and his servant. While the cleric remains silent and soon leaves the group, the servant speaks at length about their alchemical activities. He says he has worked seven years for his master, but the unsuccessful experiments have cost him his health and fortune. Alchemists can be recognised by their

shabby clothing and the "pungent brimstone smell".

He readily reveals the results of the Work and their treatment. In a second Tale he reports how a canon won over a cleric to alchemy through lies and deception and ruined him. At the end he refers to the statements of ancient alchemists, who stress that the "Great Work" may only be performed by divine grace.

Jean Chopinel, Heinrich von Mügeln and Geoffrey Chaucer describe alchemy so precisely, that they were soon themselves quoted as alchemical authorities, while their verse – disconnected from the original work – enters specialist alchemical literature.

The works of medieval alchemy start to appear in print with few exceptions from the 16th century on, several as independent monographs but most as part of multi-volume collections such as *Theatrum chemicum* (6 vols, Strasbourg 1659-61), Jean-Jacques Mangets *Bibliotheca chemica curiosa* (2 vols., Geneva 1702) or *Eröffnete Geheimnisse des Steins der Weisen oder Schatzkammer der Alchymie* (Hamburg 1718). The pictures were often published separately. The two best-known works are → Michael Maier's *Atalanta fugiens* (Oppenheim 1618) and Daniel Stoltzius von Stoltzenberg's *Chymisches Lustgärtlein* (Frankfurt 1624). In both collections the pictures are explained by new verses, and in Maier's case by melodies and longer commentaries. By these means alchemical literature survived the Middle Ages and influenced authors from the 16th to the 18th century and also poets from the age of Baroque to the present.

Alchemy IV: 16th-18th Century

1. ALCHEMICAL THEORY AND PRACTICE
2. FROM ALCHEMY TO CHEMISTRY
3. SPIRITUAL ALCHEMY 4. ALCHEMICAL LITERATURE

Not enough is yet known to write a complete history of alchemy in the early modern period. What can be said is that there was, at that time, an explosion of interest in the subject marked by the publication of an enormous number of alchemical texts. A relatively marginal pursuit in the Middle Ages, alchemy became more and more, over the 17th and 18th centuries, a mainstream occupation, influencing many scientists and philosophers as well as artists, poets, mystics, freemasons, theosophers, and spiritualists. Although scholars generally agree that alchemists contributed to the origins of early modern science, more work needs to be done to establish the precise nature of their contributions.

Up to the beginning of the 18th century the terms “alchemy” and “chemistry” were used interchangeably to describe activities ranging from practical laboratory experiments to mystical and psychological speculation. During the 18th century, however, the two words increasingly assumed their modern meaning in terms of two developments: first, metallic transmutation and gold-making (*chrysopoeia*) were identified as the distinctive goals of alchemy and dismissed by many as fraudulent activities, while “chemistry” was defined in broader terms as the science of analyzing and synthesizing substances; second, the mystical and spiritual aspects of alchemy flourished as never before, but they became increasingly separated from practical laboratory work. A clear distinction consequently emerged between gold-making and theosophical alchemy, on the one hand, and the science of chemistry on the other.

1. ALCHEMICAL THEORY AND PRACTICE

The traditional view that alchemy gave way to chemistry once occult, vitalistic theories of matter were replaced by the “mechanical philosophy” has been qualified by scholars who emphasize the existence and variety of both corpuscular and vitalistic theories throughout the medieval and early modern period and the difficulty of making a clear-cut distinction between the two. Like their ancient and medieval predecessors early modern alchemists accepted transmutation as an observable fact of life, and a diversity of alchemical schools arose with a wide variety of theories derived from Greek,

Arabic, and medieval sources to explain why it occurs and how the process could be duplicated in the laboratory. Although much more work on the theories of individual alchemists needs to be done before a complete picture of early modern alchemy will emerge, it is clear that from the 16th to the 18th centuries alchemists had at their disposal an array of theories that ranged from a view of matter as inanimate corpuscles moved by external forces to various vitalistic corpuscular theories in which non-material forces played decisive roles. Aristotle provided alchemists with a number of models to explain transmutation. The notion that matter was composed of the four elements – earth, air, fire, and water – convinced some alchemists that transmutation involved varying the proportions of the constituent elements in a base metal to emulate the proportions in gold. This could be accomplished through a potent transmuting agent known as the philosopher’s stone. Aristotle expressed the same theory in another way. Each substance consisted of prime matter and a specific “form” that determined the characteristics of the substance, including the proportions of the elements it contained. Changing one substance into another on this model involved reducing a substance to prime matter and converting this into gold by means of the philosopher’s stone.

Early modern alchemists also accepted the theory of Arabic alchemists from the school of Jabir ibn Hayyan (b. 721/2) that metals and minerals were formed from an “ideal” sulfur and mercury, sulfur accounting for flammability and mercury for the fusibility and volatility of substances. This theory originated in Aristotle’s suggestion that the immediate constituents of minerals and metals were two “exhalations” formed below the surface of the earth, an “earthy smoke”, which was later identified with sulfur, and a “watery vapor”, identified with mercury (*Meteorologica*, III, 6 378a). The 13th century author writing under the name Geber and mistakenly identified with Jabir viewed sulfur and mercury as complex, inanimate corpuscles, which united to produce different minerals and metals. Geber’s corpuscular theory was also indebted to the notion of “least parts” in Aristotle’s *Physics and Meteorologica*, an idea developed in scholastic physics with the concept of *minima naturalia*. In his *Summa perfectionis* Geber claimed that the philosopher’s stone was composed of “philosophical mercury”, the tiny corpuscles of which were able to penetrate the pores of a base metal, transmuting it into gold. Diverse alchemical schools developed to explain the nature, preparation, and use of this mercury. The so-called “Mercurialist”

school was the most popular of these during the 17th century and led → Boyle and → Newton, among others, to undertake experiments with mercury that may have contributed to their ill health. Geber's corpuscular theory influenced the later theories of Andreas Libavius (1540-1616), Daniel Sennert (1572-1637), and Gaston DuClo (c. 1630-?).

During the 16th century the sulfur/mercury theory was modified by → Paracelsus (1493/4-1541), who added a third element, salt. The salt, sulfur, mercury theory became characteristic of Paracelsians [→ Paracelsianism], who identified the tripartite nature of substances with the body, spirit, and soul and the Trinity. The vitalism and religious element inherent in Paracelsianism was not a novel aspect of alchemy. The tendency to view chemical processes in organic terms was characteristic of alchemy from its origin, but biological models became more prevalent from the Renaissance onwards as stoic, hermetic, neoplatonic, and kabbalistic influences became increasingly dominant. According to the Stoics each material entity contained its own specific "pneuma" or "seminal principle" (*logos spermatikos*), which molded formless matter in predictable ways. The idea that metals grow from seminal elements, or seeds, was reinforced by the neoplatonic concept of "seminal reasons" (*rationes seminales*), which contained blue-prints, so to speak, for constructing specific bodies from elementary matter. Augustine had posited that seminal principles existed in matter and germinated to produce different species of corporeal beings (*De Genesi ad litteram*). Paracelsians were particularly receptive to the idea that active forces, variously described as *archei* (from the Greek *archeus*, beginning, origin, first cause) or *semina* existed in bodies. The Danish Paracelsian physician Petrus Severinus and the Belgian Paracelsian → J.B. van Helmont accepted this idea, and their work influenced the corpuscular philosophy of Pierre Gassendi and Robert Boyle. This realization has led historians to appreciate the vitalistic elements persisting in 17th century "mechanical", "atomistic", or "corpuscular" philosophy. A notable example is the acknowledgment of the way Newton's alchemical studies contributed vitalistic elements to his concept of the forces of attraction, cohesion, and repulsion between material particles.

The obvious discrepancies between these various alchemical theories about exactly what and how many elements constituted matter was compounded by those like Etienne de Clave, Thomas Willis and Nicholas Lemery who postulated the existence of five elements: salt, sulfur, mercury, phlegm or water, and earth. Far from dismaying

most alchemists, however, this apparent confusion fit nicely with the ancient and basic alchemical doctrine of *έν το παν*, "One in all and all in one", derived from the neoplatonic conviction that every created substance developed from one divine source. This was the message of the *Emerald Table* (*Tabula Smaragdina*), a series of oracular precepts of unknown date attributed to the legendary founder of alchemy in the West, Hermes Trismegistus: 'As all things were produced by the one word of one Being, so all things were produced from this one thing by adaptation'. This text had enormous influence in the medieval and early modern period. The phrase "one in all" and "all in one" became an alchemical mantra. → Elias Ashmole's (1619-1692) heraldic motto was "ex uno omnia".

The practical operations necessary to produce the philosopher's stone and transmute base metal into gold were as varied as the theories upon which they were based. The enigmatic and secret nature of alchemical writing compounded the difficulty of knowing exactly what ingredients, procedures, and methods early modern alchemists employed. Although at odds about what to transmute and how to do it, they generally agreed that their work must follow a sequence of color changes from black to white to red, with occasional colors in between. The final red stage symbolized the advent of royalty, "the young king", or the philosopher's stone. Alchemists disagreed, however, about the nature and number of chemical processes necessary to produce these color changes. The most optimistic claimed the stone was made from one substance, in one vessel, in one operation, but this was a minority view. Salomon Trismosin describes seven processes in his *Splendor Solis* (16th century). George Ripley expanded this to twelve in his *Compound of Alchemy* (1591). In his *Dictionnaire Mytho-Hermétique* (1758), Dom → Antoine-Joseph Pernety associates each process with a sign of the zodiac.

2. FROM ALCHEMY TO CHEMISTRY

The traditional view that chemistry experienced a "postponed scientific revolution" (Butterfield) until the 18th century when Antoine-Laurent Lavoisier (1743-1794) overthrew the phlogiston theory has been questioned by historians who stress the evolutionary nature of developments in chemistry during the early modern period. According to this latter view, the transition from alchemy to chemistry extended over the course of two and a half centuries and occurred in two broad stages. During the first stage (c. 1500-1700) alchemists/chemists made considerable progress in identifying

and classifying substances and reactions. In addition to making gold alchemists became increasingly interested in discovering medicines and commercial and manufacturing processes. During the second stage (c. 1700-1800), chemists like Herman Boerhaave (1668-1738) and Georg Ernst Stahl (1659-1734) distinguished between the chemical and physical properties of matter, focusing attention on the chemical molecule and its composition. Lavoisier built on the work of these predecessors. Nevertheless, his work was revolutionary inasmuch as he established new concepts (e.g. oxidation, vaporization) and new quantitative methods to determine chemical composition, all of which fragmented the scientific community.

During the 16th century the tradition of practical, laboratory alchemy can be found in the many works dealing with mining, metallurgy, smelting, glass making, distilling, dyeing, pharmacology, and other arts and crafts (H. Brunschwig, *Liber de arte distillandi*, 1500; G. Agricola, *De re metallica*, 1556; V. Biringuccio, *Pirotechnia*, 1540; P. Kertzenmacher, *Alchimia*, 1534). Andreas Libavius's *Alchemia* (1597) emerged from this tradition and has been described as the first systematic textbook of chemistry. These works are particularly useful for their detailed descriptions of the preparation and analysis of chemical substances and for illustrations of the variety of equipment used: alembics flasks, crucibles, baths, burners, bellows, and various kinds of furnaces producing different degrees of heat. Alchemical genre painting (H. Weiditz, D. Teniers, J. Steen, Rembrandt, A. van Ostade, G. Metsu) gives a clear indication of the array of apparatus in alchemical laboratories.

Somewhat akin to these works were treatises devoted to the so-called "secrets of nature", which were extremely popular in the 16th and 17th centuries. These offered procedures for such diverse things as transmuting metals, producing exotic plants and animals through grafting and crossbreeding, cutting, conserving, and cooking food, staving off baldness, eliminating wrinkles, and engendering beautiful children (J.B. della Porta, → C. Agrippa, A. Mizaldus, J.J. Wecker). Although these works described many processes of dubious worth, they were important inasmuch as their publication provided readers with information that could be tested.

Paracelsus was an important figure in the transition of alchemy to chemistry. Paracelsus and his followers broadened the scope of alchemy to encompass investigations of the composition, structure, properties, and reactions of matter. They were particularly interested in chemical medicines. As

experimenters, text-book writers, and systematizers, Paracelsians such as Daniel Sennert (1572-1637), Michael Sendigovius (1566-1636), and J.B. van Helmont (1579-1644) had a significant impact on medicine, pharmacy, and chemistry. Their interest in medicine led to the establishment of a school of "iatrochemistry", or medical chemistry that became an accepted part of the curriculum of medical schools during the 17th century.

While the idea that alchemy could shape and improve nature for human benefit had been an aspect of medieval alchemy, it gained greater prominence in the early modern period. From the second half of the 16th century the theme of restoration and renewal was an important component in the thought of an emerging number of Paracelsians and Pansophists, who combined alchemy, → magic, and the Kabbalah with Renaissance Hermetism. Characteristic of this genre were the *Rosicrucian Manifestos* (*Fama Fraternitatis*, 1614; *Confessio Fraternitatis*, 1615), which mix hermetic, neoplatonic, and alchemical themes into a potent proclamation of the dawning of a new age. While highly critical of alchemists whose only goal is gold-making, they emphasized the role of alchemy in prolonging life and health and employed alchemical symbolism to describe the spiritual and political regeneration of society. The conviction that scientific knowledge could restore man and the world to something approaching prelapsarian perfection is a common theme in the 17th century. → Francis Bacon (1561-1626) made this claim in *The Advancement of Learning*. In *The New Atlantis*, he envisioned a vast and well equipped scientific complex called "Solomon's House", which was dedicated to the investigation of nature for 'the relief of man's estate'. Bacon's ideas were championed by a number of English and continental millenarians and reformers who practiced alchemy. By emphasizing the crucial role played by human beings in improving and transforming nature, early modern alchemists contributed to the Enlightenment idea of scientific progress.

17th century alchemists/chemists such as J.R. Glauber (1604-70), Robert Boyle (1627-1691), J.J. Becher (1635-82), J.F. Helvetius (1625-1709), Hermann Boerhaave (1668-1738), and G.E. Stahl (1659-1734) made significant progress in understanding chemical reactions through experimentation and quantitative analysis. Although they continued to attempt transmutation, their work contributed to the growing fissure between alchemy and chemistry and illustrated the practical contributions alchemists made to manufacturing and commerce. Becher's career is instructive. He

was one of many alchemists to enjoy the patronage of rulers and nobles (such as → Rudolf II, Elizabeth I, Henry IV, Louis XIII, and Landgraf Moritz of Hessen Kassel), who employed alchemists to shore up their power both symbolically and financially. Appointed by Leopold I as “Imperial Commercial Advisor”, Becher proposed a variety of money-making schemes involving the manufacture of porcelain and chemicals, silk and wool weaving, wine and glass making, and the production of medicines. He also designed laboratories for testing alchemical claims and processes. A major factor in the transition of alchemy to chemistry was this kind of testing and the accumulation of negative evidence. Boerhaave, for example, performed an experiment in which he heated mercury at 100 degrees Fahrenheit continuously for fifteen years and six months. At the end of this period he rejected the sulfur/mercury theory, concluding that it was neither possible to transform ordinary mercury into the mercury of the philosophers by heat alone nor to fix mercury into anything approaching gold and silver. As more refined laboratory techniques and apparatus were developed in the 18th century, the testing of alchemical claims continued and they were increasingly found to be dead ends.

While there were notable advances in chemistry during the first half of the 18th century in terms of mineral analysis, metallurgical techniques, and the isolation of new substances such as phosphorus, there was still no clear idea of exactly what the elementary constituents of matter were. In investigating this question, the phenomenon of combustion received considerable attention. Alchemists had generally explained the transformations produced by heating and burning as a separation of bodies into the four elements of Aristotle, the three Paracelsian principles, or the five elements of Willis and others. Van Helmont was the first to challenge this assumption. He was followed by Boyle. Both discovered that different substances were produced during combustion and that many of these did not preexist in the material burnt. These observations were not correctly interpreted until Lavoisier. For the intervening hundred years the phlogiston theory suggested by Becher (*Physica subterranea*, 1669) and elaborated by his pupil Stahl provided the most popular explanation for combustion. Stahl maintained that when anything burned, phlogiston (“burning” in Greek) was released. The original substance could be restored if the lost phlogiston was recombined with the burnt residue. Stahl had the actual order of events backwards. What he described as a loss of phlogiston was actually a gain in oxygen, while the addition of phlo-

giston was in reality a loss of oxygen. Although mistaken, Stahl’s suggested a plausible theory linking together a large number of facts, which suggested new experiments and led to new discoveries. These culminated in Lavoisier’s experiments with mercury and his discovery of the role of oxygen in combustion. Lavoisier’s work was made possible by the earlier discoveries of Joseph Black (1728-1799), Henry Cavendish (1731-1810), and Joseph Priestly (1733-1804), but he synthesized their findings into coherent theories that put chemistry on a firm quantitative basis. However, it was not until the elaboration of atomic theory in the following century by John Dalton (1766-1844) that alchemy and chemistry reached a final parting of the ways. The realization that each element had a specific atomic weight reflecting its structure and ability to react opened the way for modern theoretical chemistry.

Despite the denunciation of alchemy by such figures as Fontenelle (*Histoire de l’Académie des Sciences*, année 1722), Etienne-Francois Geoffroy (*Des supercheres concernant la pierre philosophale*, 1722), and Chevalier de Jaucourt (“Pierre philosophale”, *Encyclopédie*, 1765), enthusiasm for alchemy continued in the 18th century. Reports of successful transmutation were given by such people as by James Price (1752-1783), a fellow of the Royal Society, and the respected German theologian J.S. Semler (1725-1791). Alchemy was studied and practiced especially in Germany, where it was closely connected to some forms of → Pietism and to the resurgence of Paracelsianism and → Rosicrucianism. Alchemical imagery and symbolism (combined with elements of → Freemasonry, → Hermeticism, Kabbalah, and pietistic Christianity) played a central role in the philosophy and rituals of the *Gold- und Rosenkreuz*, whose members were expected to engage in laboratory work in the hope of finding the quintessence or vital essence of the universe. Such a goal was clearly at odds with the rational, experimental, and essentially secular chemistry practiced by Lavoisier and his colleagues. This Rosicrucian order attracted a strong following throughout the German-speaking world as well as in Poland and Russia. It reached the height of its influence in the Prussia of King Frederick William II (1786-97), who was a member of the order, but by the end of the century it had all but disappeared. Leading figures of the late German Enlightenment such as the Marburg Professor of medicine F.J.W. Schröder (1733-1778), the anatomist S.T. von Sömmering (1755-1830), and his friend the naturalist Georg Forster (1754-1794) were drawn to alchemy and Rosicrucianism,

although Sömmerring and Foster eventually became disenchanting with both. → Goethe's "Pflanzenlehre" drew partly on alchemical ideas. During his pietistic period (1768/69) he read Paracelsus, Basil Valentine, J.B. van Helmont, Eirenaeus Philalethes (George Starkey), and A.J. Kirchweger's *Aurea catena Homeri* (1723). Among the more flamboyant alchemists of the period were the Count of → Saint-Germain (1701-1784), Giuseppe Balsamo, better known as → Cagliostro (1743-1795), and his teacher, the enigmatic kabbalist, magician, and alchemist, → Samuel Jacob Chayyim Falk (c. 1710-1782). General Charles R. Rainsford (1728-1809), a member of the Royal Society who was involved with Falk, left hundreds of texts in five languages dealing with alchemy, Kabbalah, magic, medicine, and → astrology. Ebenezer Sibly (1751-99), who received a medical degree from Aberdeen Medical College, read Newton, Priestly, Lavoisier, Aristotle, → Hermes Trismegistus, → Khunrath, and Paracelsus and attempted to combine them in *A Key to Physic and the Occult Sciences* (1792).

Although Alain Mothu has demonstrated that Paracelsian naturalism appealed to some libertine authors of clandestine literature in their fight against religion, for the most part the resurgence of alchemy in the 18th century constituted a backlash against aspects of the Enlightenment, especially the emphasis on reason to the exclusion of human spiritual and emotional needs. It was a backlash that appealed increasingly to philosophers and theosophers rather than scientists. While the attempt to transmute base metal and produce the elixir remained legitimate laboratory objectives for some people, alchemy became increasingly detached from practical chemistry and more closely associated with spiritual, theosophical, and philosophical currents.

3. SPIRITUAL ALCHEMY

The tendency to interpret physical change in spiritual terms was part of alchemy from its inception in the ancient world. Beginning in the Middle Ages and well into the 18th century parallels were drawn between alchemical processes and the mysteries of Christianity (see e.g. George Ripley in the prologue to his *The Compound of Alchemy*: 'O Unity in the substance, and Trinity in the Godhead . . . As thou didst make all things out of one chaos, so let me be skilled to evolve our microcosm out of one substance in its three aspects of Magnesia, Sulphur, and Mercury'). The preparation of the philosopher's stone was described in terms of death and resurrection and equated with the death and resurrection of Christ; the constituents of the stone,

for example, the salt, sulfur, and mercury of the Paracelsians, were identified with spirit, soul, and body as well as the Trinity. The religious nature of many alchemical texts makes it difficult at times to distinguish those that describe actual laboratory processes from those employing alchemical language for purely spiritual ends. Nevertheless, there was a clear tendency among "spiritual" alchemists to distinguish themselves from those they disparagingly described as "puffers" or "sooty empirics". The English physician, alchemist, and Rosicrucian sympathizer → Robert Fludd (1574-1637) dismissed the work of practical alchemists as "chymia vulgaris". Only their imagery and symbolism kept these alchemists in touch with the fire and the furnace.

The upsurge in spiritual alchemy coincided with the breakdown of religious unity during the Reformation. Alchemical symbolism provided an ideal framework for individuals seeking new schemes of salvation both for themselves and the world at large. The books written by → Jacob Boehme illustrate how well alchemical symbolism served spiritual and theosophical ends. Boehme's writings fuse alchemical, Paracelsian, hermetic, and kabbalistic themes into a theosophical exhortation to spiritual rebirth. His collected works were republished six times between 1677 and 1769, and they influenced 18th and 19th century Romantics, philosophers, spiritualists, and theosophers.

Much of the spiritual side of western alchemy was rooted in the notion that the world was a battle ground, in which the forces of evil (matter) battled the forces of good (spirit). This idea came from a variety of sources, neoplatonic, kabbalistic, and Christian. Alchemists were sometimes presented as quasi-Gods in their laboratories, as saviors redeeming base matter, equating the philosopher's stone with Christ and identifying themselves with both (see e.g. Agrippa's discussion of Geber in *De Occ. Phil.* III, 36). One of the most daring appropriations of Christian symbolism appears in the alchemical mass devised by Nicholas Melchior of Hermanstadt (*Theatrum Chemicum*, vol. 3). Abbot → Johannes Trithemius (1462-1516), → Valentin Weigel (1533-1588), A. von Franckenberg (1593-1652), → John Pordage (1608-1681), → Thomas Vaughan (1621-65), Angelus Silesius (1624-1677), Q. Kuhlmann (1651-1689), and → J.G. Gichtel (1638-1710) were among the 17th century authors who employed alchemical symbolism to describe spiritual transformations.

Although many alchemists were members of the clergy, their ventures into theology affronted a number of orthodox Catholics and Protestants.

There was a potential conflict between alchemy and mainstream Christianity that arose from the hermetic elements inherent in alchemy. Many alchemists believed that man not only has the power to become divine himself, but because he is a microcosm representative of the macrocosm, or world at large, he has the power to redeem matter as well. Not all alchemists embraced such extreme and heretical views. → Michael Maier (1568-1622), for example, was a committed Lutheran who believed the philosopher's stone was a gift of faith. But alchemy and alchemical symbolism could and did have unorthodox, even heretical implications. For example, the Catholic librarian and skeptic Gabriel Naudé (1600-53) criticized alchemy for both its impiety and obscurity. The Minim Marin Mersenne (1588-1648) and his friend Father Pierre Gassendi (1592-1655) accused alchemists of proposing a "chemical" religion in opposition to true Christianity. In 1625 the Sorbonne condemned Khunrath's *Amphitheatrum sapientiae* on the same basis, and the Inquisition initiated proceedings against J.B. van Helmont for attributing the healing powers of holy relics to magnetic virtues, akin to the lodestone and weapon-salve. Luther was one of the few Churchmen to praise alchemy both for its practical uses and its verification of Christian doctrine, but the bitter condemnation of Andreas Osiander (1498-1552) for his 'new alchemistic theology' reveals the hostile view of alchemy among many Lutherans. In 1690/91 the Lutheran theologian E.D. Colberg wrote a diatribe against the fanatical and unorthodox beliefs of those he derisively labeled "Alchymistery" (*Das Platonisch-Hermesische Christenthum*).

Spiritual alchemy proliferated in the 18th century. Alchemical themes and symbols were integrated into Masonic and Rosicrucian rituals, among such groups as the → Asiatic Brethren, the Lodge of the Amis Réunis, the → Illuminés d'Avignon, and various Rosicrucian orders in Germany. In *L'Étoile flamboyante* (1766) Baron de Tschoudy claimed that the goal of masonry and alchemy was identical. Among the most widely read works of spiritual alchemy were the collected works of Jakob Boehme, which were republished in Germany and England; J.P. Maul, *Medicina theologia, chymico- irenica et christiano-cabbalistica* (1713); the anonymous *Die edelgeborne Jungfrau Alchymia* (1730) of J.C. Creilung; → G. von Welling's *Opus mago-cabalisticum et theosophicum* (1735); A.J. Kirchweger, *Aurea Catena Homeri* (1723), which was translated into Frech in 1772 and reissued by the Gold- und Rosenkreuz as *Annulus Pla-*

tonis oder physicaklisch-chymische Erklärung der Natur (1781) and the *Compaß der Weisen* (1779). Scholars have noted the influence of alchemical ideas on → Romanticism, 18th-century philosophies of nature and history, and a wide variety of theosophical societies and organizations. → Novalis (1772-1801) read extensively in alchemical as well as theosophical literature. J.G. Herder's (1774-1803) philosophy of history was influenced by hermetic ideas. The vision of a golden age of social equality, political justice, and moral integrity characterizing the thought of Johann Albrecht Bengel (1687-1752) and his pupil → Friedrich Christoph Oetinger (1702-82) was fostered by alchemical expectations of universal restoration and renewal. Their work, along with that of Boehme, had a decisive influence on → F.W.J. Schelling's (1775-1854) "Naturphilosophie" as well as on G.W.F. Hegel's (1770-1831) philosophy. Hegel's friend → Franz van Baader (1765-1841), known as "Böhme redivivus", also utilized alchemical themes in his eclectic theosophy. → Martine de Pasqually (1727-1774) founded the freemasonry rite of the → Elus-Coëns, which combined elements of alchemy and theosophy. He introduced → Louis Claude de Saint-Martin (1743-68) to the alchemical and theosophical idea of the God-man, who works in concert with God to restore humanity to its prelapsarian perfection. John L. Brooke has documented the widespread interest in alchemy in 18th century America and the influence alchemical ideas had in the later development of Mormon cosmology and theology.

4. ALCHEMICAL LITERATURE

The demand for alchemical literature reached its height during the early modern period and is reflected in the publication of numerous individual tracts and substantial collections of alchemical treatises such as *De alchemia opuscula* (1550), published by Cyriacus Jakob; G. Gratarolo, *Verae Alchemiae . . .* (1561); *Theatrum Chemicum* (1659-1661), published by L. Zetzner; the *Musaeum Hermeticum Reformatum et Amplificatum* (1678); Elias Ashmole, *Theatrum Chemicum Britannicum* (1652); J.J. Manget, *Bibliotheca Chemica Curiosa* (1702); Friedrich Roth-Scholtz, *Deutsches Theatrum Chemicum* (1728), and F.J.W. Schröder, *Neue Alchymistische Bibliothek* (1771-1774) and *Neue Sammlung der Bibliothek für die höhere Naturwissenschaft und Chemie* (1775-1780). The Benedictine Antoine Joseph Pernety (1716-1801) published a key to alchemical symbolism in his *Dictionnaire Mytho-Hermétique* (1758). With *Les Fables Egyptiennes et Grecques dévoilées et réduites*

au même principe he followed in the tradition of G.A. Augurelli (1454-c. 1537), Salomon Trismosin (16th century), and Michel Maier (1568-1622), interpreting Greek and Egyptian myths in terms of operative alchemy. Alchemy was so popular in the early modern period that a new genre of literature emerged, the “transmutation history”, which provided detailed eye-witness accounts of successful transmutations. Robert Boyle witnessed one such event and was afterwards so convinced of the possibility of transmutation that he was instrumental in obtaining the repeal of the English law against Multipliers (Henry IV, 1404) in 1689.

Reflecting its dual nature as both a laboratory science and a spiritual quest, alchemical literature appeared in a variety of forms ranging from straight forward descriptions of laboratory procedures to poems, autobiographies, dialogues, reports of alchemical meetings, catechisms, romances, parables, visions, prayers, and even the occasional play emphasizing its spiritual aspects (Knorr von Rosenroth’s alchemical masque *Conjugium Phoebii et Palladis* [1677]) or ridiculing it as fraudulent (Ben Jonson’s *The Alchemist*). Before the early modern period most alchemical texts were in Latin and restricted to the educated. The growth of vernacular alchemical literature made it accessible to a broader segment of society and helps to explain the proliferation of texts.

One of the major ways historians traditionally distinguished between alchemy and chemistry was on the basis of language. Alchemical texts were identified by their obscure, metaphorical style, chemical texts by their plain descriptions of chemical processes. However, more recent discussions have shown that it is not always possible to make such a sharp distinction. Many alchemical authors employed secret codes, anagrams, paradoxes, and allegories and deliberately confused readers by leaving out important words, including misleading information, employing exotic synonyms for the materials and processes discussed, and breaking off or changing the subject at crucial points to resume it in a seemingly unrelated place. Nonetheless, esoteric texts of this nature have been successfully decoded to reveal descriptions of actual chemical processes, and even in those instances when laboratory chemistry is clearly the subject of discussion alchemists tended to hide their message and even themselves under a veil of inscrutability. The works of Basil Valentine are a case in point. Whoever wrote these treatises hid under the pseudonym “mighty” or “valiant king” and tried to pass himself off as a monk living in the 15th century rather than someone (probably Johann Thölde) living in

the 17th. The use of pseudonyms and claims to belong to an earlier age are typical of alchemical authors. Both practices underline the claim that alchemy embodied a powerful secret wisdom originating in a divine revelation granted solely to the spiritually worthy. The texts attributed to Basil Valentine contain a mix of spiritual admonitions and obscure allegorical statements together with good laboratory directions for preparing such things as metallic antimony, hydrochloric acid, solutions of caustic alkali, acetates of lead and copper, gold fulminate, and many other salts. The author was also interested in the medicinal uses of compounds of antimony and mercury. Secrecy and obscurity is therefore not the hallmark of alchemical texts. Even Robert Boyle condoned secrecy in certain cases and purposely obscured reports of some of his alchemical experiments.

The propensity of alchemists to conceal their message was partly due to prudence. In an age before patents they were anxious to protect their chemical secrets and thus enhance their worth in the eyes of potential patrons. Alchemists were also cautious about expressing themselves too freely lest they be held hostage by avaricious men. Alchemical literature is filled with stories of imprisoned alchemists or those disguised to elude potential captors.

In addition to trying to protect themselves, many alchemists expressed themselves in ways that are obscure to the modern mind because they subscribed to what has been labeled “an emblematic worldview”. They viewed the universe holistically: everything was related through a system of symbolic → correspondences linking the heavens to human beings, animals, plants, minerals, and metals. A prime example of this way of thinking appears in → John Dee’s *Monas Hieroglyphica*. Dee considered this symbol a talisman embodying all the powers of the universe. By contemplating it, men would simultaneously absorb these powers and experience a spiritual transformation. For Dee, as for many alchemists, symbols offer direct access to hidden knowledge and a way to harness this knowledge for human advantage. In alchemy, a picture is literally worth a thousand words, which explains the popularity of alchemical emblem books, such as *Aurora consurgens* (15th century), *Splendor solis* (16th century), *Rosarium philosophorum* (1550), *Mutus liber* (1702), and the works of Michael Maier (1568-1622) and J.D. Mylius (1585-1628).

Alchemical emblem books reveal a worldview in which nature is alive, and human beings supply the model by which everything is measured. The cre-

ation of the philosopher's stone is envisioned as a birth resulting from the sexual union of male and female "seeds", depicted in the form of a King and Queen. Alchemical vessels are "wombs", inside of which the "Royal Child" develops. The chemical wedding and sexual union of the King and Queen are therefore central motifs in many alchemical texts. The beautiful sequence of illustrations in the *Splendor Solis* (16th century) depicts the drama of this carefully orchestrated birth. The conception and birth of the philosopher's stone is not, however, a straightforward affair. The chemical wedding requires the sacrifice, death, and rebirth of the couple, who are an extraordinary pair, for not only are they husband and wife, they are also mother and son, brother and sister, or father and daughter. This apparent endorsement of incest underscores the great alchemical truth that every created thing emanates from a single, divine soul-substance. This truth was illustrated by one of the most popular alchemical symbols, the *ouroboros*, or tail-eating serpent.

In the course of the 17th and 18th century the kind of symbolism characteristic of an emblematic worldview gradually gave way to less emotive and metaphorical descriptions of laboratory reactions for a variety of reasons. The great interest in alchemy encouraged the publication of an increasing number of textbooks in which laboratory operations were classified and substances and alchemical terms more clearly defined (for example, J. Beguin, *Tyrocinium chymicum* [1612]; N. Le Febvre, *Traité de la Chymie* [1660]; C. Glaser, *Traité de la Chymie* [1663]; N. Lemery, *Cours de Chimie* [1675]). The defense of esotericism and secrecy became less useful and profitable as new career opportunities developed for court alchemists, textbook writers, university teachers, private tutors, public lecturers, and purveyors of chemical medicines, all of whom had an economic incentive to make their knowledge public. A new rhetoric of clarity and openness arose, and even though it was not always practiced, it reinforced the idea that knowledge of chemistry should be available to the educated public.

Alchemy V: 19th-20th Century

1. SURVIVALS INTO THE 19TH CENTURY
2. EMERGENCE OF THE CONCEPT OF "SPIRITUAL ALCHEMY"
3. THE LATE-19TH CENTURY REVIVAL
4. THE 20TH CENTURY

1. SURVIVALS INTO THE 19TH CENTURY

The decline of alchemy, already underway in the 18th century, reached its low point in the 19th, as testified by the miniscule number of treatises published throughout the latter period. Several factors explain this. The scientific revolution of the end of the 18th century had definitively separated chem-

istry from alchemy, to which it denied any scientific validity. Alchemical treatises were consequently given no serious consideration. Secondly, the end of the 18th century saw the death of several figures prominent in alchemy: Touzay-Duchanteau († 1788), → Etteilla (=Jean-Baptiste Alliette, 1738-1791), → Cagliostro (Giuseppe Balsamo, 1743-1795), Johann Daniel Müller (ps. Elias Artista, 1716-after 1786), → Dom A.-J. Pernety (1716-1796), J.-L. Salverte de Toux († 1797), Ebenezer Sibly (1751-1799), etc. General Charles Rainsford († 1809), Marie-Daniel Bourrée de Corberon (1748-1810), and → Francis Barrett († ca. 1810/15?) did not survive much longer. Typically, after a leader dies, the members of his group lose their enthusiasm for their object of study – in this case, practical alchemy. The dispersion of the members of the → Illuminés d'Avignon after the death of Pernety is a perfect example.

With the exception of a few isolated “adepts”, most of whom published nothing in their lifetime, alchemy's survival at least up to the 1890s depended on its integration within larger bodies of doctrine. Around 1760, → Freemasonry had incorporated alchemical symbols and teachings into some of its high degrees. Rosicrucian currents [→ Rosicrucianism] (in the broad sense), from → Michael Maier to the Gold- und Rosenkreuz, had always been closely related to alchemy. The theosophic current that started with → Jacob Boehme contained the seeds of a “spiritual” alchemy that was destined to play a major role in Western esoteric traditions; but with such diversity of conceptions that one should speak rather of “spiritual alchemies”. Lastly, the current of → *Naturphilosophie*, limited to Germany, included elements and reflections of an alchemical nature.

During the transitional period (from the 19th to the 20th century), one short item among the events recorded in the press raised quite a stir. It was the announcement, in 1796, in the journal *Reichsanzeiger* (published in Gotha), of a secret society (the “Hermetische Gesellschaft” [→ Hermeticism and Hermetic Societies]) entirely devoted to the study of alchemical practice. The Hermetische Gesellschaft encouraged the readers to communicate with it, and among themselves, about the results of their alchemical experiments. The journal received many responses, so much so, that in 1799 both founders of the Hermetische Gesellschaft (Karl Arnold Kortum [1745-1824] and Friedrich Bährens [1765-1831]) withdrew from the *Reichsanzeiger* and created their own periodical, the *Hermetisches Journal*. Apparently, only two issues were published, in 1799 and 1802 respectively.

Notwithstanding, Kortum et Bährens remained very active, keeping up a lengthy correspondence with many people. They even granted diplomas, one of them to the theosopher and alchemist → Karl Von Eckartshausen, who had approached the Hermetische Gesellschaft in 1799. Kortum left the Society and was replaced in 1805 by a certain L.F. von Sternhayn, about whom little is known. Henceforth, the activities of the Hermetische Gesellschaft took on a more discreet character, but they seem to have continued up to 1810.

Apart from very general treatments such as → Barrett's *The Magus* (1801), the 19th century opened with Louis Gassot's publication in 1803 of *La Philosophie Céleste* (Bordeaux, An XI). He writes there of Unity, God, analogy, and alchemy in practical terms, also calling it “natural Philosophy”, resulting in an interesting and original *summa* marked by borrowings from theosophy [→ Christian theosophy]. In England, *The Lives of the Alchymistical Philosophers* appeared anonymously in 1818. It is generally attributed to Barrett, though according to Francis King, John P. Kellerman (1779-18?) was probably the author.

A French alchemist, Cyliani, published *Hermès dévoilé* in 1832: a very short text written in romantic style. The anonymous author presents himself as an operative alchemist who attained the Great Work in 1831 ‘after spending 37 years at it’, and states definitively ‘that there are two ways, the dry way and the wet way’ (see below, a propos Fulcanelli). If he himself followed the wet way, it was ‘by preference’ and ‘by duty’, although he was familiar with the dry way. In the 1960s, Bernard Husson revealed an unpublished manuscript (*Récréations hermétiques*, written after 1815) preserved in the Chevreul Collection (Paris, Musée d'Histoire Naturelle), which was ‘very likely the most important source of *Hermès dévoilé*’.

In general, those who worked at alchemy and wrote about it were reluctant to offer the fruits of their labor for publication, with the result that several treatises of this period are known only in manuscript form (no census of them exists). One such is *L'alchymie du Maçon* (The mason's alchemy) by François-Nicolas Noël (1761-18?), dated 1813, of which Jean-Pierre Laurant writes that it is the work ‘of an entire life of reflection, or the contribution of a group under the single name of Noël’. Other reasons, however, may have caused it to remain unpublished, along with the rest of Noël's work which includes the manuscripts *Géométrie du Maçon* (The mason's [plane] geometry), *Physique du Maçon* (The mason's physics), and *Stéréométrie du Maçon* (The mason's solid geometry).

The same case obtains with the *Compendium Hermeticum* (Hermetic compendium) by the theosopher Friedrich Herbart (1764-1833), who signs it with his initiatic name *Theodore a Silva*. This remained in manuscript until 1988. It belongs at the junction of several influences: theosophy (→ Saint-Martin was an important discovery in Herbart's life), Rosicrucianism (the society that Herbart founded in 1812, *Les Pèlerins de Salem* [The pilgrims of Salem], had both masonic and Rosicrucian roots), Christian kabbalah [→ Jewish Influences III] and → mysticism (as a good theosopher, Herbart regarded the Bible as the authoritative Book). Herbart was a disciple of → Eckartshausen – himself the author of an alchemical treatise, *Chimische Versuche* (Regensburg 1801), and of a *Katechismus der Höheren Chemie*, published posthumously in 1819 – and very close to → Johann Friedrich von Meyer (1772-1849), with whom he corresponded for many years. Von Meyer himself left a small alchemical manuscript dated 1801, discovered and published by Jacques Fabry in 1988, which is in fact an exposition of the doctrine of his own master, Louis Schmid – of whom nothing further is known.

Another manuscript, dated Amiens, 1832 and now in the Biblioteca dei Lincei, Rome, is *Les arcanes ou secrets de la philosophie hermétique dévoilé . . . revu et corrigé par Lenain* (The arcana, or secrets of the Hermetic philosophy unveiled . . . revised and corrected by Lenain). Lazare Républicain Lenain (1793-ca. 1874) was also the author of *La Science Cabalistique* (Amiens 1823) and of a *Hommage à la Vierge Marie* (Homage to the Virgin Mary, Amiens, 1874).

The last important treatise of practical alchemy from the earlier 19th century was the work of Louis-Paul-François Cambriel (1764-ca. 1850), published in 1843 in the form of a *Cours de philosophie hermétique ou d'alchimie en dix-neuf leçons* (Course of Hermetic or alchemical philosophy in 19 lessons). Cambriel examines the sculptures and bas-reliefs of Notre-Dame Cathedral in Paris, which he says represent 'as clearly as possible all the work and the whole product or result of the Philosopher's stone'. In this, he was the successor of the alchemist Esprit Gobineau de Montluisant, the 17th century author of *Explications très curieuses des énigmes de Notre-Dame de Paris* (Very interesting explanations of the enigmas of Notre Dame of Paris).

2. EMERGENCE OF THE CONCEPT OF "SPIRITUAL ALCHEMY"

At mid-century, two works appeared almost simultaneously which would strongly influence the

whole Western esoteric current. The first was *A Suggestive Inquiry into the Hermetic Mystery* (1850) by Mary Ann Atwood née South (1817-1910), daughter of Thomas South (ca. 1785-ca. 1855). Father and daughter, as joint authors, recall the main traits of alchemical history and develop their own vision, which is purely spiritual and greatly influenced by Boehme. They state that 'the Hermetic Philosophy is a process of experimentation into the Universal Spirit through man'. The method of experimentation, discreetly hinted at in Atwood's book and confirmed from other sources, was in fact the Mesmeric trance [→ Animal Magnetism]. Some additional documents, preserved by Atwood's friend Isabelle de Steiger (1836-1927), were incorporated into the second edition (1918), edited by Walter Leslie Wilmshurst (1867-1939).

The second seminal work was *Remarks upon Alchemy and the Alchemists . . .* (1857) by Ethan Allen Hitchcock (1798-1870). General Hitchcock was a graduate of West Point and a professional army officer until 1855, when he retired to devote himself to writing (though he returned to service for the Civil War and became President Lincoln's military advisor). He wrote that the previous year he had come across an old alchemical volume in a New York bookshop. It was a revelation to him: he continued to collect alchemical books and manuscripts, ancient and modern, often ordering them from London. He quickly became aware of modern European works, citing Hermann Kopp's *Geschichte der Chemie* (History of chemistry, 4 vols., Braunschweig 1843-1847), Louis Figuier's *L'Alchimie et les alchimistes* (Alchemy and the alchemists, Paris 1854), and the 2nd edition of Grove's *Correlation of Physical Forces* (London 1855). Hitchcock stated his theory briefly thus: 'My proposition is, that the *subject* of Alchemy was *Man*; while the *object* was the perfection of Man'.

The path opened by Atwood and Hitchcock had a powerful impact on the esotericism of the end of the 19th and beginning of the 20th century. The key to alchemy that they offered accorded with the Theosophical and Spiritualist [→ Spiritualism] doctrines so popular at this time. → A.E. Waite discussed it, cautiously at first, then in 1926 declared that the hypothesis was invalid. It entered the milieu of the → Theosophical Society through Dr. Alexander Wilder (1823-1908), who early on discovered Hitchcock's works on alchemy and → Swedenborg. Wilder was mostly responsible for writing the preface 'Beyond the Veil' for → H.P. Blavatsky's *Isis Unveiled* (1877), which mentions the alchemists. The theory also influenced the Viennese psychiatrist Herbert Silberer (1882-1922).

3. THE LATE 19TH-CENTURY REVIVAL

Alchemy revived at the end of the 19th century, most of all in France. Theoretical or spiritual alchemy played an important part in the groups founded by → Papus (Gérard Encausse, 1865-1916), but among his associates only → Stanislas de Guaita seems to have practiced it. In the *fin-de-siècle* period, the man who most answered to the traditional image of the alchemist was Albert Poisson (1865?-1894). He abandoned his medical studies at quite a late stage in order to pursue alchemical research, and worked in the laboratories of the Faculty of Medicine in Paris. He devoted his leisure to seeking out alchemical books and manuscripts (of which some reappeared years later in the collection of Lionel Hauser), experimentation, writing, and editing ancient texts (→ Ramon Llull, → Albertus Magnus, → Roger Bacon, → Arnau de Vilanova, and → Nicolas Flamel, whose legend Poisson faithfully believed). By the end of his short life, Poisson had laid the foundation for a vast encyclopedia of alchemy, divided into several volumes of which four appeared. Beside *Cinq traités d'alchimie* (Five treatises on alchemy, 1893) and *Histoire de l'alchimie au XIV^{ème} siècle* (History of alchemy in the 14th century, 1893), his conceptions were most clearly explained in *Théories et symboles des alchimistes* (Theories and symbols of the alchemists, 1891). He writes: 'The matter of the Great Work was Gold and Silver, united to Mercury and prepared in a special fashion'. These materials, being respectively a Sulfur, a Mercury, and a Salt, prepared 'according to certain procedures', were placed in a glass vessel or Athanor. Then, Poisson explains, the cooking could begin; the matter's color changed in conformity with the length of cooking, and the appearance of red indicated the end of the experiment. One had then to 'communicate' to the matter thus obtained a greater 'power of transmutation', through an operation called 'fermentation'. The result, in theory, was the Philosopher's Stone.

This idea that gold and silver must form the prime matter, or components of it, was taken over by Poisson's successor and in a way his disciple, François Jollivet-Castelot (1874-1937) in his first major work, *Comment on devient alchimiste* (How to become an alchemist, 1897). This book, strongly influenced by contemporary occultism [→ occult / occultism], defended some fantastic theses, e.g. that alchemy 'came from the Temples of Chaldaean-Egyptian antiquity, and before that from the initiatic Colleges of Atlantis, of Lemuria, and of the Aryans (which takes us more than 40.000 years

into the past!)'. Jollivet-Castelot's exposition essentially followed Poisson's work, but included ideas from Tiffereau and did not disdain the scientific (or pseudo-scientific) discoveries of its time. Jollivet-Castelot worked tirelessly from the end of the 19th century until the 1930s, and edited several journals originating from a 'Société alchimique Française' (SAF) which he founded on Poisson's principles.

In Venice, Eduardo Frosine founded a "Società Alchemica Italiana" in 1909 on the model of the SAF. In London, the Alchemical Society was founded in 1912 'for the Study of the Works and theories of the Alchemists in all their aspects, philosophical, historical and scientific, and of all matters relating thereto'. Its presidents were John Ferguson and Herbert Stanley Redgrove (1887-1943). A.E. Waite, Isabel de Steiger, and J.B. Craven were among the vice-presidents, and published several articles in its *Journal of the Alchemical Society*; but both journal and society ceased all activity after two years, in 1914.

Some of the members of the → Hermetic Order of the Golden Dawn showed a genuine interest in alchemy. The Reverend William Alexander Ayton (1816-1908) joined the Order together with his wife in 1888; he was also a Freemason (1866) and a member of the → Hermetic Brotherhood of Luxor. A passionate devotee of alchemy, which he had practiced since about the 1850s, he was continually pursuing alchemical books and manuscripts, some of which he translated. Ayton corresponded with Frederick Leigh Gardner (1857-ca. 1930), author of a *Catalogue raisonné of Rosicrucian Books* (1903), and with Julius Kohn (ca. 1850-?), an Austrian émigré with whom Ayton exchanged or lent manuscripts, both for his personal use and for including elements in the Golden Dawn rituals.

Apart from W.A. Ayton, → A.E. Waite stands out as the other major representative of the Golden Dawn who took an interest in alchemy. He made many translations and editions of ancient texts (→ B. Valentine, → Paracelsus, E. Kelley, etc.), the publication of which was paid for by another devotee of alchemy, Lord Stafford. Waite's *The Secret Tradition in Alchemy* (1926) is still in print. An interest in alchemy is also evident in the works of the poet → William B. Yeats, likewise a member of the Golden Dawn (see e.g. *Rosa alchemica*, 1897).

In the 1920s, another Golden Dawn member, E.J. Langford Garstin (ca. 1893-1955), developed the principles of a spiritual alchemy in two books, *Theurgy* (1930) and *The Secret Fire* (1932), while in Italy → Julius Evola also expounded an exclusively spiritual conception of alchemy in his *La*

Tradizione Ermetica (1931), under the dual influence of → Arturo Reghini (1878-1946) and → René Guénon.

4. THE 20TH CENTURY

After World War I, alchemy experienced a resurgence, especially in the practical field, first in Europe then in the United States. An idiosyncratic English laboratory alchemist was Archibald Cockren (ca. 1880?-after 1960), a medical practitioner and author of *Alchemy Rediscovered and Restored* (1940). In this work he describes his alchemical procedures, including the making of ‘philosophic gold’, in semi-scientific terms, but without disclosing vital details such as the nature of the prime matter.

In France, the publication in 1926 of *Le Mystère des cathédrales* (The mystery of the cathedrals) first made known the name of → Fulcanelli, though to a fairly small public, since the book appeared in only 300 copies. The title announces the main theme: that the Gothic cathedrals of the Middle Ages were the vehicles for a Hermetic or overtly alchemical message, carved in stone by anonymous artisans. Fulcanelli treats the cathedrals of Paris and Amiens, and also two buildings in Bourges: the Palais Jacques-Coeur and the Hôtel Lallemand. Following Cyliani, he describes the two ways leading to the Great Work: one wet, also called ‘long’, which uses the ‘vase of the art’, requires ‘uninterrupted work for 12 to 18 months’, and starts from ‘prepared natural gold, dissolved in philosophic mercury, which is then cooked in the glass vessel’. Fulcanelli writes that this is the way most often described in the treatises, and the most noble because of the rich materials it employs. The second way, called ‘dry’, is reduced to ‘a single matter, a single vessel, a single furnace’, in which one uses a crucible. It is considerably shorter, lasting one week, according to Basil Valentine, Salomon Trismosin, Philalethes, and Cyliani, among others.

Fulcanelli’s disciple, → Eugène Canseliet (1899-1982), discovered alchemy in his adolescence through Cyliani’s treatise. He supposedly met Fulcanelli in Marseille in 1915, and between 1921 and 1928 rewrote the texts given him for publication by Fulcanelli – or, as is widely believed, by the alchemist and artist Jean Julien Champagne (1877-1932). After the latter’s death, Canseliet began to write independently, first in the form of articles for journals (1934 onwards), then his first book, *Deux logis alchimiques* (1945), which he began around 1935. For him, the alchemist responds to a divine call or ‘vocation’. The Philosopher’s Stone, crown of the alchemist’s labors, is itself a ‘gift of God’

(probably a reminiscence of the 15th century treatise *Donum Dei* attributed to George Aurach). Till the end of his life, Canseliet considered it his mission to maintain the tradition of practical alchemy. This he did with conviction, giving many interviews and devoting much time to answering innumerable enquiries, to the detriment of his own work and alchemical advancement.

Canseliet was friends with other alchemists, including André Savoret (1898-1977), author of an attempt to define alchemy (*Qu’est-ce que l’alchimie?* [What is alchemy?]) Paris 1948) which is regarded today as the most concise introduction; José Gifreda, known as ‘Magus Gifreda’, doctor and engineer, who died in his native Barcelona in 1980, leaving a superb library; and, around 1948/1950, René Alleau and Bernard Husson († 1997).

In Germany, the writer, poet, and translator Baron Alexander von Bernus (1880-1965) discovered alchemy at the beginning of the 1910s. In 1912 he met → Rudolf Steiner. During World War I, through → Gustav Meyrink’s agency, Bernus came into possession of a chest of alchemical texts including Christian August Becker’s *Der Geheime Weingeist der Adepten (Spiritus Vini Lulliani s. Philosophici) und seine Medizinische Anwendung für Ärzte und Chemiker* (The secret wine-spirit of the adepts . . . and its medicinal usage for doctors and chemists, Mühlhausen 1865). Already a rare book when Bernus discovered it, this guided him to an understanding of the mystery of Salt. In 1921, after several years of studying ancient treatises, he founded the Soluna laboratories and gradually developed about 30 tinctures. In 1936 he published the first edition of *Alchymie und Heilkunst* (Alchemy and the healing art), dedicated to the medicinal applications of alchemy. Other alchemists visited Bernus at Donaumünster, including Henri Hunwald (1908-1961) and René Alleau. The French writer Michel Butor, in *Portrait de l’artiste en jeune singe* (Portrait of the artist as a young monkey, Paris 1967), has written of his travels in Germany on the eve of World War II, and of his visit to Bernus, to whom he gave several books including those of Fulcanelli.

Following Canseliet, René Alleau (b. 1917) promoted alchemy within the Surrealist movement, to which he remained attached from 1946 to the present. In 1952 he gave lectures on alchemy and alchemical texts at the Geographical Society in Paris, attended first by André Breton (1896-1966) alone, then by many of the surrealists, brought there by Breton, who became his most assiduous auditors. In 1953 Alleau published an inspired work in the Fulcanellian tradition: *Aspects de*

l'alchimie traditionnelle (Aspects of traditional alchemy). There he defended the idea of an alchemical theory that has remained essentially the same from antiquity to the present. The techniques of encoding and, in general, all the procedures of phonetic kabbalah, were intended to be incomprehensible except to those alchemists who possessed the keys. For Alleau, 'it is beyond doubt that the alchemical manipulations used material supports for an inner ascesis'. And he adds that 'the "mystico-moral" interpretations familiar from authors such as → Eliphas Lévi, → Péladan, → Guaita, and Oswald Wirth' make no sense, because 'if one wants to reconstitute the mental chessboard of alchemical thought, one must admit... that this thought corresponds to an autonomous discipline, and that outside its framework no interpretation of its symbols can have any coherent sense'.

A very different path was followed by Armand Barbault (b. 1906), brother of the astrologer André Barbault and himself an astrologer as well. He was attracted as early as 1948 to plant alchemy – the elixir of life drawn from plants – although he was familiar with the principles of a more traditional alchemy that used only minerals and metals. Twenty years later he published the result of his experiments in *L'or du millième matin* (The gold of the thousandth morning, 1969). Barbault's plant elixir has been used successfully in the treatment of various illnesses and infections.

In the United States, especially from the 1940s onwards, Orval Graves († 1996), a member and librarian of the AMORC [Ancient and Mystical Order of the Rose Cross] and the Rose+Cross University, directed experiments for small-scale seminars, and published articles on alchemy and transmutation in *The Rosicrucian Digest*. One of the students at these seminars, Albert Richard Riedel (1911-1984), went on to play a prominent role in promoting alchemy in the USA under the pseudonym of 'Fratres Albertus'. Born in Dresden, Riedel emigrated to the USA shortly after publishing *Drei Novellen* (Three short stories, 1932), and followed Graves's courses before developing his personal vision. In 1960 he published *The Alchemist's Handbook*, and simultaneously founded the Paracelsus Research Society. The activities of this group from 1960 to 1984 were enormous: the training of hundreds of pupils, most of whom were members of the AMORC or the Golden Dawn; the preparation of tinctures, publishing of numerous bulletins reserved for members (*Alchemical Bulletin Codex* 1960-1972; *Parachemy* 1973-1979; *Essentia* 1980-1984); and the publication by

Albertus of several ancient and modern texts, including *The Hermetic Art: The Teaching concerning Atomic Transmutation* (c. 1948), which was given to Albertus during a seminar in Austria in 1971. This very short treatise was by V.L. Volpierre (alias Nikolaus Burtschell, 1892-1952), an alchemist who had been in contact with Surya (alias Demeter Georgiewitz-Weitzer, 1873-1949) and who apparently published nothing else during his lifetime. The authorities to which Albertus largely refers are Basil Valentine (especially *Triumph Wagen Antimonii*, Leipzig 1604), Cockren's *Alchemy Rediscovered*, and Richard Ingalese (1863-ca. 1934).

Albertus had a surprising influence on Israel Regardie (1907-1985), who in *The Philosopher's Stone* (1938), under the influence of → C.G. Jung, had attributed a purely spiritual value to alchemy. His view of alchemy changed during the 1970s, when he frequented Albertus and other alchemists of the Paracelsus Research Society. The same years saw the emergence of the Scotsman Adam McLean (b. 1948), whose activities explicitly included the three realms of spiritual, soul, and physical alchemy. McLean's *Hermetic Journal* (1978-1992) and series of texts 'Magnum Opus Hermetic Sourceworks' (23 vols.) gathered contributions from former Golden Dawn members and from younger scholars and practitioners throughout the English-speaking world.

The FAR+C (Frères Aînés de la Rose Croix), led by Roger Caro (1911-1992) offered an "initiatic" teaching from the end of the 1960s through the next decade. Here Rosicrucianism and alchemy were closely associated with theology, notably in Kamala-Jnana's works: *Dictionnaire de philosophie alchimique* (Dictionary of alchemical philosophy, 1961), *Pléiade alchimique* (Alchemical Pleiad, 1967), and *Tout le Grand Oeuvre photographié* (The whole Great Work photographed, 1968).

Among Canseliet's many readers, after 1970 several took the plunge into practical alchemy combined with writing: Michel Binda (*La Vierge alchimique de Reims* [The alchemical Virgin of Reims], 1996), Jean Laplace († 1997), Séverin Batfroi (b. 1946, *Alchimie et révélation chrétienne* [Alchemy and Christian revelation], Paris 1976; *Alchimiques métamorphoses du mercure universel* [Alchemical metamorphoses of the universal mercury], 1977); Guy Béatrice (*Sainte Anne d'alchimie* [Saint Anne of alchemy], 1978; *Des mages alchimistes à Nostradamus* [From the alchemical magi to Nostradamus], 1982), Bernard Biebel, and Patrick Rivière (*Alchimie et spagyrie* [Alchemy and spagyrics], 1988).

Shortly after Canselier's death in 1982, some works appeared under the name "Solazareff" (see Bibl.), advocating a practical alchemy following the 'dry way' of Fulcanelli and Canselier, and devotion to the Virgin Mary. In the mid-1980s the Solazareff movement counted as many as 500 members or sympathizers, but no publication seems to have appeared since the mid-1990s. While the Fulcanelli-Canselier school has been dominant in France and especially visible through publications, other schools exist, though in a more confidential fashion. This is the case with the "Philosophes de la Nature" (Philosophers of Nature), founded by Jean Dubuis in 1979, which also defends practical alchemy with a strong contribution from kabbalah. An American branch was founded, independent of the French one, which has ceased its activity in 1995.

RICHARD CARON

Al-Kindī, Abū Yūsuf Ya'qūb ibn Ishāq, * 800? Kufa or Basra, † 866

Al-Kindī is considered the first Arabian philosopher. We know little about his life. He was born maybe at Kufa, maybe at Basra; in any case, it was in Basra that he studied languages and theology before moving to Baghdad, where he took active part in the rich cultural life of the city, under the protection of the 'Abbāsīd caliph al-Ma'mūn (813-833) and his successor, al-Mu'tašim (833-842). The 'Abbāsīd dynasty encouraged interest in the arts, science and philosophy, and the caliph al-Ma'mūn had founded the *bayt al-ḥikma* ("house of knowledge") in Baghdad in 830 A.D., where the first translations from the Greek were accomplished. It was in this centre that al-Kindī played an important role as chief translator of Greek philosophical works into Arabic and as an author of original philosophical works.

Greek writings provide one of the richest sources

of al-Kindī's own work. Aristotle's *Metaphysics*, in Arabic translation, was to become one of the major influences on his thinking. Al-Kindī himself worked on the translation of the *Theology* attributed to Aristotle but actually a summary of the *Enneads* IV-VI by Plotinus. Some of Proclus' works, amongst which the *Elements of Theology*, were translated into Arabic in al-Kindī's circle; and furthermore the writings of Hippocrates, Galen and above all Ptolemy are among the sources of al-Kindī's thought. In addition to Greek philosophy, the philosopher appears to have been influenced by that of India and Persia as well. Moreover the hermetic sect of the Sabāeans of Ḥarrān appears also to have had an impact on our philosopher, who sought to integrate astrolatrical and ceremonial elements of harranian origin within a scientific vision of reality.

Al-Kindī lived in an age of conflicting ideas in the Muslim world: the Ash'arite school of thought represented orthodox Sunnite Islām in opposition to the Mu'tazilite, and the *Kalām*, theological science, was stimulated by the newly-available Greek philosophy. Al-Kindī accepted the fundamental elements of Muslim religion such as divine unity, prophetic wisdom, the creation of the world, and the oneness of God. Elements of Mu'tazilite doctrine are found in some aspects of al-Kindī's thought, for example concerning the relationship between philosophical truth and truth revealed by prophetic wisdom. Although al-Kindī underlined the importance of pure reason in knowledge of the "unique truth", he never gave priority to reason over revelation. Rather, he showed that the different methods by means of which one could reach philosophical truth require painstaking research, whereas revealed truth comes as a divine gift that requires neither effort nor time and is a quality peculiar to the prophets. That al-Kindī tended towards the Mu'tazilite doctrine is shown by his friendship with the caliphs al-Ma'mūn and al-Mu'taṣim and likewise by his conflict with al-Mutawakkil (847-861), an opponent of the Mu'tazilites. This conflict caused al-Kindī to end up in a situation of political isolation, which would last until the end of his life.

Al-Kindī's interests were wide-ranging and varied: from natural to metaphysical philosophy, from medicine to → astrology and astronomy, from → music to → alchemy, from precious stones to meteorology. More than 260 works are attributed to al-Kindī in the *Fihrist*, the basic catalogue of Arabic works (written in the 10th century). Of these only a small part are still extant; for example the *Book on the first philosophy*, the *Epistle on the intellect*, the *Epistle on the substance of sleep and dream*, the

Discourse on the soul, the *Epistle on the reason why the ancients correlated the five geometric shapes to the element*, the essay *On the cause of the azure colour that is seen in the air towards the sky and is thought to be the colour of the sky*, the essay *On the true, first, perfect agent and the imperfect agent that is metaphorically so*, the essay *On definitions and descriptions of things*, the *Epistle on the difference of perspectives*, the *Epistle on the rays*, the *Book on the introduction to the science of the stars*, the *Epistle on knowledge of the strengths of compound medicaments*, and the *Book on the chemistry of perfume and distillation*.

The sheer quantity of al-Kindī's writings, the multiplicity of their sources, and his attempts to reconcile them with the dictates of the Islamic faith certainly do not make it easy to follow the development of his personal opinions. However, in his doctrine of rays, known in Latin Medieval culture by his treatise *De radiis*, the originality of al-Kindī's thought fully emerges. According to this theory, the four elements together with composite bodies and the planets make up a unified reality, in which all parts seem to be constituted by the very act of their continuous relationship: every object projects its own nature outwards, by means of "rays" which transmit that nature to other objects. According to al-Kindī, absolutely everything (elements, bodies, objects, planets, images, words, musical notes, souls, etc.) transmits rays. Thus the relationships between the stars, the elements and the composite bodies derive from and express the causal interactions which exist between the various levels of being; such relationships are made possible by the continuous radial flux which passes between them, for it is only by means of this flux that stars, elements and bodies can mutually connect. While accepting some aspects of Aristotelian cosmology, al-Kindī thus integrates them within a generalized context based upon the radical interconnectedness of all parts of the universe. Thus elements of → magic derived from the hermetic tradition (talismans, invocations and magical formulae, emblems and magical characters, animal sacrifices) are placed in a philosophical context based upon the concept of universal cosmic rays: the magician can use his knowledge of their relationships in order to attain a specific purpose.

Al-Kindī is also considered to have been the first to develop a doctrine of the "acquisition of the intellect", which was to have an enormous impact on the Islamic world and heavily influenced the philosophers al-Fārābī and → Avicenna. Al-Kindī believed that perfect knowledge occurred at the moment when the human faculty of reason joined

the active intellect that originates from God: a theme which has continued to preoccupy Arab philosophers up to Averroes. Important works of al-Kindī were translated into Latin during the 12th century by Gerardo of Cremona, John of Seville, Robert of Ketton and Hugo of Santalla. In the Renaissance, al-Kindī was well known as a mathematician and physician. The *De Radiis* influenced the cosmologies of → Marsilio Ficino and → Giovanni Pico della Mirandola; and Gerolamo Cardano listed al-Kindī among the twelve greatest spirits. In Medieval and Renaissance culture, the doctrine of rays was interpreted as a rationale for magic.

1. INTRODUCTION

Amulets (Lat. *amuletum*; Gk. *phylaktērion*) are small devices usually worn on or attached to the body for protection and a variety of other purposes. In the ancient Mediterranean world, particularly during the later Roman Empire (ca. 2nd-5th cent. C.E.), a widespread industry of amulets proliferated. Amulets were comprised largely of inscribed texts written on a number of more or less permanent media (papyrus, metal strips, semi-precious gemstones, and occasionally organic materials). They display a great diversity as to type and manufacture, although a considerable stylistic uniformity in the industry is evident. Our major source for the use of amulets comes from the preserved collections of the Greek Magical Papyri, principally the longer formularies, or manuals, that give specific instructions for performing various magical rituals (*Papyri Graecae Magicae*² = PGM, with supplements in *Supplementum Magicum* = SM). Ancient Christian magical texts, mostly in Coptic (Meyer-Smith 1994), represent a natural development out of the older pagan traditions. Actual finds of amulets on papyrus, metal phylacteries (*lamellae*), gemstones, and other materials provide a resourceful supplement to our under-

standing of the interrelationship between the “theoretical” formulas of the handbooks and the “applied” magic itself (cf. “Applied Magic”: *SM I*, nos. 1-51; *SM II* nos. 52-66; “Formularies”: *SM II*, nos. 70-100).

In addition to inscribed magical amulets (Kotansky 1991[a]), the manuals presuppose an extended tradition of “unlettered” amulets, organic or mineral-based periapts (Gk. *periapton*, “tied onto; fastened on” [as an amulet]) used for healing and protection. Based on universal principles of sympathetic and antipathetic magic, these kinds of amulets have not usually survived, or when they have, are difficult to identify. Still, the side-by-side use of “uninscribed” versus “inscribed” amulets has continued unabated from antiquity down through the Middle Ages and even into modern times. Why amulets were required to be made or written on certain materials is in most cases unclear, although it is widely recognized that gold and silver, for example, was reserved for writing protective phylacteries, whereas lead was used for curses (gold and silver were popularly believed to be astral elements related to the sun [Helios] and moon [Selene], respectively; lead was the metal of Saturn). Distinctions were also made with certain gemstone materials. Hematite, for instance, the sesquioxide ore of iron (Fe 2 O₃), was commonly used for uterine amulets (Hanson 1995:290). Understandably, some cross-overs exist in ambiguously defined arenas of magic (e.g., with victory spells where subjection of one’s enemies is concerned [Kotansky 1991 (b)]). Numerous written rituals, too, are described in the magical papyri that do not involve the making of amulets, per se (written curses, divinatory spells, invocations, and so on). Here, the definition of what an amulet is can become blurred. Conversely, spoken charms to heal, and so on, are also commonly mentioned in the papyri without any specific mention of the ritual act of engraving a text (cf. *PGM LXXIX*, *LXXX*, *LXXXI*, for example; see further, below).

Important precursors to the written or “lettered” type of amulet in the magical papyri can be identified in extant ancient Egyptian and Near Eastern sources. The texts of the papyri, although combining elements from Egyptian, Babylonian (Persian), Greek, Jewish, and Roman beliefs, remain largely *sui generis*. Although any taxonomy is wrought with difficulties, extant magical texts, with few exceptions, can be readily identified as belonging to that class of text commonly referred to as “Graeco-Egyptian”.

The primary function of amulets is both therapeutic (healing) and apotropaic (protective). Speci-

fic problems addressed may include the healing and curing of named diseases and medical complaints, as well as the warding off of danger and the general prophylaxis against harm. Ancillary roles of amulets may be subsumed under a number of acquisitional, or “talismanic” functions: the procurement of love, popularity, and favor (in virtually all areas of life); the winning of victory in legal and agonistic contests; and the requisition of all-around good luck. Sometimes within the papyrus record it is difficult to identify a written prescription as being “amuletic” in function. Spells for use in divination, incubation, and memory, for instance, would aim to acquire a kind of supernatural relationship (*charis*) with a numinous power, or god, rather than serve to protect the body. Related to this are amulets prescribed for a number of more esoteric rituals, including special meetings with one’s personal *daimōn*, or “spirit-guide”, to adopt the apropos → New Age terminology. Here the amulets procure the god’s presence or otherwise protect the practitioner from any untoward presence of power. How all these “higher”-type rituals relate to the use of → magic in the late antique traditions of → Neoplatonism, theurgy, and → Gnosticism remains a desideratum. Little of this more “theurgic” use of amulets is detectable in the preserved amulets.

In the following survey, we shall examine each major categories of amuletic material – papyrus, metal phylacteries, and gemstones – and see first what the magic handbooks have to say about their use. Next we give an overview of the actual objects as the archaeological record has preserved them. A supplementary category of the organic amulets is also surveyed, including both *inscribed* and *uninscribed* organic materials. This survey is intended to be representational and makes no claim at being comprehensive. The various corpora of magical texts are continually being expanded, and many pieces, both published and unpublished, have not been consulted. Comparatively poorly represented categories of materials (e.g., parchment, ostraka, engraved nails, etc.) are also not included and would require a separate study.

2. PAPYRUS

The ancient Greek magical formularies often detail the manufacture of actual amulets on papyrus and other materials. Before the Daniel-Maltoni editions, it was not always distinguished whether a published papyrus represented an example of an actual spell or amulet (“applied magic”) or was merely a fragment from a handbook (“formularies”). With the larger codices (e.g., *PGM IV*, *XII*, *XIII*, *XXXVI*, etc.) this is seldom an issue;

however, with the smaller preserved fragments, one must be careful to differentiate between fragments of a handbook, however small, and actual amulets worn as personal objects. The telltale signs, of course, are whether the standard “personalized” formulas have been filled in or not (e.g. “so-and-so [NN] whom so-and-so bore” versus “Sophia whom Calpurnia bore”). Sometimes such distinctions were not carried out in actual practice. Many “applied” texts preserve fragments from formularly instructions, as if erroneously copied from their models by their scribes, a fact that proves that formularies were indeed used.

2. A. INSTRUCTIONS FROM FORMULARIES

The following spells specify a text to be written on a piece of “hieratic” or “new” papyrus, or the like. The formularies themselves often carry incipits or rubrics that name the medical complaint; otherwise, the nature of the written spell identifies the disease, using any variety of standard formulas. In some cases, a set of incantatory verses is recorded, but no mention of the actual writing of an amulet is specified. Here, it is entirely possible that the incantation is merely spoken, although the purpose still remains “amuletic”. In the *PGM* citations below, the context of the entire spell is given, not the precise reference to the amulet itself.

a. *Medical complaints*: discharge from the eyes (*PGM* VII. 197-98: magic word); breasts and uterus pain (*PGM* XXIIa. 9-10: Homer verse); a contraceptive (*PGM* XXIIa. 11-14: Homer verse, tied with hairs of mule); easy child birth (*SM* II. 94: written formula, on papyrus?); elephantiasis (*PGM* XXIIa. 15-17: Homer verse); fever (*PGM* VII. 218-21: magic names in “wing-formation”; *SM* II. 94: written formula, on papyrus?; *SM* II. 96: a magic formula for shivering); flux of blood (*PGM* XXIIa. 2-9: Homer verse); headache (*PGM* XX. 1-4; 13-19: Greek metrical verses; *PGM* LXV. 4-7 [migraine]: symbols; *Suppl.Mag.* II. 72: verses [written?]; cf. *Suppl.Mag.* II. 94); inflammation (*PGM* XX. 4-12: verses [written?]); scorpion sting (*PGM* VII. 193-96: inscribed “characters”; *PGM* XXVIIIa-c: set of three invocations; from a formulary? Cf. *SM* II. 89, but with no actual written amulet); uncertain (*SM* II. 80: formula to be worn around the neck: ‘Protect so-and-so . . .’ [frag.]; *SM* II. 84: fragmentary formulary for making amulets for various diseases [demons, epilepsy, prolapse of the uterus?], with no mention of writing). Similarly, *SM* II. 88 (against *erysipelas* and various skin eruptions) seems to preserve only spoken, not written, formulas.

b. *Favor and victory charms*: An invocation to

Helios (no instructions for writing) preserves a standard formula for favor (*PGM* XXIIa. 18-27). Similarly, a magic name with a prayer for protection is called a ‘Favor charm, a charm to dissolve a spell, a phylactery, and a victory charm’ (*PGM* LXX. 1-4). This spell serves as an incipit for another, the ‘Charm of Hekate Ereschigal against fear of punishment’ (see Betz, 1980). Oddly, a “Charm to restrain anger and Charm for Success” mentions inscribing a papyrus ‘to augment the words’, but in fact invokes certain angels and magic names ‘to protect me from every bad situation that comes upon me’ (*PGM* XXXVI. 161-77). For a similar blurring of distinctions, another “phylactery”, apparently to be written on papyrus but with no specifics, asks that ‘favor’ be granted from Ablanathanalba, but requests only protection from ‘every evil thing’ (*PGM* LXXI. 1-8).

c. *Other, Miscellaneous, and Uncertain Rituals*: The 100-lettered name of Typhon, inscribed for use in the powerful “Bear Charm”, accomplishes any matter; it is used along with a phylactery of the plaited hairs from a bear (see below) (*PGM* IV. 1331-89); an inscribed papyrus strip is also used in a love divination (*PGM* IV. 1872-1927); the *hide* of an ass, a *leaf of flax*, along with an inscribed papyrus strip, are used in “Pity’s *Spell of Attraction*” – in truth, a form of skull cup enquiry (*PGM* IV. 2006-2125); a *hieratic papyrus*, inscribed with a spell for protection against every evil demon(!), is used in a dream revelation as part of a larger spell of attraction (*PGM* IV. 2441-2621); the *blood* from the foot or hand of a pregnant woman is used to inscribe magic names on clean papyrus and tied to the left arm with *linen* as a phylactery in a rite to summon a god (*PGM* IV. 52-85); a papyrus strip engraved with magic names is washed off in water from seven springs and drunk in a memory spell (*PGM* I. 232-247); further, in a form of dream divination, requiring memory, a strip of papyrus inscribed with the Headless God is placed beside the head, with engraved laurel leaves (*PGM* II. 1-64); a phylactery against demons is presumably to be written on papyrus (*PGM* IV. 86-87); a new sheet of papyrus inscribed with a spell that subjugates demons, enchantments, and ‘scourge which is from God’ is used in the so-called “Stele of Jeu”, apparently a type of ritual against demonic forces, perhaps those afflicting the Ascent of the Soul (*PGM* V. 96-172); an inscribed piece of lead (the usual material for *defixios* and other binding spells) is used to break a spell (*PGM* XXXVI. 178-87). Similarly, a triangular sherd found at the fork of a road is to be engraved to ‘dissolve every enchantment’ (*PGM* XXXVI. 256-64); a figure drawn

on *papyrus* serves an uncertain purpose (*PGM* XXXVI. 264-74); a piece of *papyrus* with which a spotted lizard (?) has been picked up is engraved with five magic characters and placed under a table, for an unstated purpose (*PGM* LXIII. 21-24). Additional phylacteries, for which no writing material is mentioned, include a spell against nightmares and air-demons (*PGM* VII. 311-16), with an apparent variant (*PGM* VII. 317-18). Similarly, seven magical characters are used (written?) for protection in a “dismissal” formula in a revelation invoking Light; the bearer is to be ‘healthy, free from terror and free from demonic attacks’ (*PGM* LXII. 24-46). Noteworthy is the fact that a number of the preserved formulas above, although written against demons, appear in contexts other than healing or exorcisms. A recently published formula, *P. Oxy.* LXV. 4468 (late 1st century C.E.) contains rites for a phylactery ‘probably intended to protect from bad encounters (men or evil spirits?)’ (Maltomini 1998:121). For rites combining *papyrus* and other materials, see, further, section 5.

2. B. ACTUAL PAPYRUS AMULETS

a. *Medical complaints*: discharge (*SM* I. 26, 32); exorcism (*SM* I. 24); discharge from the eyes (*SM* I. 26); fever (and shivering) of various kinds (*PGM* XVIIIv. 1-7; *PGM* XXXIII. 1-25; *SM* I. 2, 3, 4, 9, 10, 11, 12, 13, 14, 18, 19, 21, 22, 23, 25, 28, 29, 31, 34, 35); fever and headache (*SM* I. 14, 22; II. 92 [formula?]); headache (migraine) (*PGM* XVI-IIa. 1-4; *SM* I. 32 [with discharge]); scorpion sting (*SM* I. 16); inflammation of the uvula (*SM* I. 1); healing (general) (*SM* I. 20, 30, 33, 36 [?]). It is clear from the actual *papyrus* amulets that fever-amulets predominate.

b. *Favor and victory charms, etc.*: a long Jewish invocation of six heavens, etc. for favor, influence, victory, and strength is an actual amuletic text in that it preserves the name of its bearer, Paulus Julianus (*PGM* XXXV. 1-42). Another favor charm (*charitēsion*) invokes a number of desirable attributes associated with Jewish (Solomon, etc.) and mythic Greek figures (Adonis, Kypris); it seeks favor, success, repute, beauty, love, charm, for the bearer (*SM* II. 63). Although it is non-personalized, its format suggests an “applied” amulet.

c. *Other, miscellaneous, and uncertain rituals*: An amulet with magic names and the formula ‘protect the bearer’ ostensibly serves for general protection (*SM* I. 15; general deliverance for Artemidora is also requested in an amulet naming Lord Serapis as “victor”, *SM* I. 7); salvation is addressed in a non-specific formula (*SM* I. 27); another asks protection of a grave and mummified

body belonging to Phtheious alias Saioneis (*PGM* LIX: no writing mentioned [the text is fragmentary]). An image of Kronos, obtained from a vision of a star, is used for protection in a rite involving Isis/Providence (*PGM* LVII: to be copied on *papyrus*?). Finally, some *papyrus* slips are inscribed with magic names and/or symbols only (cf. *PGM* XVIIc. 1-14; *PGM* XXV. a-d; *PGM* LX).

3. PHYLACTERIES (METAL AMULETS, LAMELLAE)

Gold (Au), silver (Ag), tin (Sn), copper (Cu), iron (Fe), and lead (Pb) are all media described in the magical *papyri* for engraving amulets. Lead, and sometimes tin, are often used for a variety of non-protective rituals. These include *defixios* (curses), spells to arrest anger, restraining spells, and certain aggressive love-charms (cf. *PGM* VII. 411-16). Tin is also used in aggressive magic (cf. *PGM* VII. 459-61; 462-66). Although no actual amulets of tin have been recorded, it is important to recognize that many metals remain unanalyzed. Furthermore, most cases of leaden phylacteries turn out to be silver that has tarnished black. Similarly, copper is almost always mistaken for bronze (cf. *GMA* I. 32) because it oxidizes to a greenish patina. Generally speaking bronze, being an alloy of tin, copper, and other metals, is unsuitable for amulets, which require the use of only the “pure” metals and *papyrus*.

3. A. INSTRUCTIONS FROM FORMULARIES

a. *Medical complaints*: an inscribed *tin lamella* is used ‘For Ascent of the Uterus’ (*PGM* VII. 260-71: to be ‘clothed in 7 colors’); a *tin* tablet is also used for sciatica (*SM* II. 74: engraved with *Iaeō*-formula and prayer for deliverance from pain in tendons, sinews, and bones); another is used for strangury (*SM* II. 94: magic name?), and possibly a second, as well (*SM* II. 96).

b. *Favor and victory charms*: A *gold* or *silver lamella* is engraved with a design of magic names and symbols for use in a charm to restrain anger; it works against ‘enemies, accusers, brigands, phobias, and nightmares’ (*PGM* X. 24-35: diagram of symbols and names); a *gold* leaf is inscribed with angel-names for good luck in part of the ritual called the “Sword of Dardanos”, in truth a spell to attract the soul of another (*PGM* IV. 1716-1870); a *gold lamella* is also required for popularity and love (*PGM* IV. 2145-2240); and a “solar” (*gold*) amulet is inscribed with symbols and prayer in “Hermes’ Wondrous Victory Charm” (*PGM* VII. 919-24). A *silver* leaf is required for favor and crowds and works for demons (*PGM* XXXVI. 275-83: names and symbols, used with frankincense); a

strip of *tin*, inscribed in “Stele of Aphrodite” is to be used for friendship, favor, success, and friends (PGM VII. 215-18).

c. *Demon possession and the Evil Eye*: A gold, silver, tin, or piece of *hieratic papyrus* is needed for a phylactery against demons, phantasms, sickness, and suffering (PGM VII. 579-90: a “protective” formula). A tin tablet, inscribed with magic names and a spell of protection, is to be worn on a demoniac, following the exorcism (PGM IV. 1227-1264); a phylactery of tin, inscribed with magic names, is also used in the “Tested Charm of Pibechis for those possessed by demons” (PGM IV. 3007-86); and fragmentary rituals on a formulary against demoniacs includes the possible writing of a Solomonic formula, but no actual writing material is preserved (SM II. 94 [frag.]). A tin lamella is also inscribed for wrecking chariots (PGM IV. 2145-2240), but this genre belongs to the arena of aggressive magic.

d. *Other, miscellaneous, and uncertain rituals*: For divination, an inscribed gold, silver or tin leaf is needed in a foreknowledge spell (PGM III. 282-409: magic symbols only); an inscribed strip of tin-foil, crowned with myrtle, fumigated, and placed under the pillow secures a dream oracle (PGM VII. 740-55: magic names); both a gold and silver lamella, inscribed with vowels, are used in an initiation performed to the sun, in the “Book of Moses” (PGM XIII, see below); a strip of tin inscribed with a protective spell anticipates the visitation of a personal angelic being (PGM VII. 478-90); and a gold tablet, written as a “stele”, delivers from death (PGM IV. 1167-1226). For general protection, a silver leaf is required (PGM III. 410-423: for memory); another silver one is used against a divine encounter (PGM IV. 154-285: inscribed with 100 letters with bronze stylus and strung with thong from ass-hide); again, a silver leaf in the “Slander Spell to Selene” gains protection against the deity (PGM IV. 2622-2707: magic characters). For victory (in courts, etc.) and for use in various favor and victory contexts a silver lamella is to be worn in one’s garments (PGM XXXVI. 35-68). A “leaf” tied with linen and enclosed in a capsule with some substance of a black wolf is also mentioned in a fragmentary papyrus formulary (SM II. 81). Finally, an iron lamella is inscribed with Homeric verses for a variety of purposes (for runaways, as a counter-charm, in court, for favor, and various protective measures) (PGM IV. 2145-2240).

3. B. ACTUAL METAL PHYLACTERIES (LAMELLAE)

a. *Medical complaints*. The following examples represent what kinds of medical complaints and

issues are addressed on the actual inscribed amulets of gold, silver, and copper (Kotansky 1994 = GMA I; et al.). Their texts preserve a host of different prayers and formulas (see Kotansky: 1991a): 1) *Medical Complaints*: “elephantiasis” (GMA I. 18: silver. Graeco-Latin); eye complaints (GMA I. 31: gold, Latin; GMA I. 53: gold, for ophthalmia); epilepsy (with headache: GMA I. 57: gold, from Syria, 4th-5th cent. C.E.; Kotansky 1980; cf. Bevilacqua 1999: 18-27: silver); feet complaints (Jordan-Kotansky 1997: no. 339: silver); fever, using various types of formulas (GMA I. 56: copper, Hebrew-Greek. From near Kibbutz ‘Evron, Israel; GMA I. 59: silver, from Oxyrhynchus, 3rd cent. C.E.) (see also the “Phylactery of Moses”, below); headache (migraine) (GMA I. 13: silver, “Antaura” *historiola*); “wandering” of the uterus Beirut (GMA I. 51: gold, adjuration/exorcism formula), for which a rare Latin parallel on a lead sheet comes from Roman Britain (Tomlin 1997; see Aubert 1989; Hanson 1995; Betz 1998 for general studies). For health, see the gold plaque under “Favor and Victory Charms”, and for sickness related to demons, see the section “Demonic Possession and the Evil Eye”.

Multiple complaints: The so-called “Phylactery of Moses” (GMA I. 32: copper?), with its new fragment of Aquila (Deut. 32: 1-3), is a remarkable, albeit fragmentary, text that seems to preserve an initiatory rite for protection against all kinds of sorcery, binding-spells, evil spirits, as well as fever, the evil eye, and any apparition (*phantasia*). Similarly, a remarkably long Greek invocation of angelic spheres and realms (GMA I. 52: silver, Beirut), seems to be liturgical in nature. It seeks protection for Alexandra whom Zoe bore, from demons, compulsion of demons, sorcery, binding-spells, and various forms of love-magic. A kindred example seeks to protect the body, soul, and limb of Thomas, whom Maxima bore from all witchcraft (*goēteia*), sorcery (*pharmakeia*), curses, those who have died untimely and violently, and from every evil matter (Heintz 1996: silver). The so-called “Basilidian” lamella describes deliverance from ‘the spirit of fever, all epilepsy, all hydrophobia, every evil eye, every violent sending of spirits, all poisoning’ (Bonner 1950:100; et al.). A silver Greek-Aramaic bilingual text from Egypt preserves a lengthy incantation against a variety of demonic afflictions plaguing John, son of Benenata. The text preserves angelic invocations, fragments of various Biblical stories (*historiolae*) and citations to rid the bearer of every evil spirit, demon, dead person, and evil sorcery, along with quotidian fever and hectic fever (Kotansky-Naveh-Shaked 1992).

b. *Favor and victory charms*: A gold *lamella* from Thessalonika (2nd cent. C.E.) invokes “Aphrodite’s Name” for favor and success (GMA I. 40); an Oxyrhynchus *silver* amulet requests ‘favor, friendship, success, loveliness to him who bears the amulet’ (GMA I. 60; 2nd-3rd cent. C.E.). Another, a long spell invoking a host of angel-names on a kind of house-amulet (from Phthiotis in Thessaly, 4th-5th cent. C.E.) requests victory and grace (*charis*); however, the context also mentions driving out demons, protecting ‘the house and souls of John and Georgia’, and ‘turning away all harm from this house’ (GMA I. 41: *gold*); an early *gold* amulet from Rome (ca. 1st cent. C.E.), found near the tomb of the Scipios, carries the formula ‘give a victory over the names written below’ (GMA I. 28); a Christian *gold* plaque from Syria (5th-6th cent. C.E.) is written for ‘health and favor’ (GMA I. 45); finally, a long spell on a *gold* leaf seeks protection for Proclus in a lawsuit before Diogenianus, the *dux* of Bostra in Arabia, and before Pelagius, the *assessor* (GMA I. 58; Kotansky 1991: 41-60); furthermore, an unedited phylactery in the former Amati collection appears to be a favor and victory charm (Bevilacqua 1989).

A relatively early *silver lamella* from Emesa, Syria (possibly, 1st cent. B.C.E.), cites a list of names related to that found in I Enoch, “Book of the Watchers”. The spell requests that the divine names be “propitious” to the wearer (whether male or female) (GMA I. 48). Related to favor-magic is a *gold* spell from Nubia containing an invocation of Isis, Queen of Denderah, for fertility and conception (GMA I. 61). Similarly, a gold leaf from Zian (Tunisia, 2nd-3rd cent. C.E.) depicts a sword surrounded by magic names; it appears to invoke a kind of angel of “sexual frenzy” to drive a woman mad with love (GMA I. 62).

c. *Demon Possession and the Evil Eye*: A liturgical exorcism against the spirit named Phōath-phro is preserved on a *silver* piece from Antioch in Pisidia (GMA I. 35); a *gold* amulet from Amphipolis in Thrace includes magic formulas for protection against “every male and female demon” (GMA I. 38); the “Phylactery of Moses,” mentioned above, protects against an evil spirit (*pneuma ponēron*), among other things a *bronze* (*copper?*) phylactery from Sicily (GMA I. 33), with its angelology, seems to also protect from an evil demon; a demon sent to ‘menace’ a named victim occurs on an unusual *gold* amulet from Rumania (GMA I. 24, Latin); a spell ‘to drive away (*apelaunein*) every harmful and destructive spirit’ occurs on a now lost *gold* amulet from Rome (GMA I. 25; cf. Bevilacqua 1991: 37f.). The same

verb is found on a *silver* phylactery from Xanthos, using the formula, ‘drive away every wicked demon, occurrence, happening, encounter, or evil eye, drive and chase them away’ (Jordan-Kotansky 1996: addressed to the ‘Holy Elements; Holy Characters’); a second, Christian, adjuration of Solomon and angels found at Xanthos (Jordan-Kotansky 1996) is probably *copper*, not *bronze*, and is contemporary with the piece mentioned above, despite the printed dates (III-IV? / IV-VI? Both are probably 4th cent. C.E.). A very difficult, fragmentary reading on a *gold* leaf found at Epiphania in Syria (4th-5th cent. C.E.), seems to preserve an adjuration of Pantokrator (GMA I. 47); a pair of phylacteries, one called a “Phylactery of the Living God” (*gold*), and the other “A Phylactery for every disease and sicknesses” (*silver*) were found together in the tomb of Abbagaza in Theodosia in the Crimea (GMA I. 65-66; 2nd-3rd cent. C.E.); similarly, from the Sea of Azov region of the Crimean Peninsula comes a *silver* “exorcism” of ‘every spirit, *phantasma* (apparition), and every beast from the soul of this woman’ (GMA I. 67); finally, a fragmentary *silver* leaf from Cyprus (4th cent. C.E.) invokes Jesus the Nazorean, his angels, and holy apostles in an apparent exorcism. In the later magic of the Byzantine period, lead seems to have become the standard material on which Christian exorcisms were copied (Manganaro 1994; cf. GMA, p. xvi).

d. *Other, miscellaneous, and uncertain rituals*: A list of magic names and “sovereign angels” are invoked to ‘Save the one whom Atalante bore, Euphiletos’ (GMA I. 39). This could be an amulet for protection in the afterlife (see below). General protection, too, is suggested by various formulas found on a number of phylacteries: ‘Protect me, Alphianus’ (GMA I. 2: *gold*, Segontium, Wales, 1st-2nd C.E.); a *silver* leaf from Badenweiler with mention of protection from “all danger” (*omni periculo*), perhaps written for a group (of litigants? GMA I. 7); a Greco-Latin *silver* charm for ‘strength and life’ writes to ‘protect Justina whom Sarra bore’ from unstated problems (GMA I. 8; near Poitiers, 4th cent. C.E.). A *silver lamella* from Amisos in Pontus may have been written for a lawsuit or unstated “matter” (*hypothesis*); it also guards against poison or witchcraft (*pharmakon*, GMA I. 36). A pair of *bronze* hailstorm amulets (GMA I. 11) represent types of amulets that were not worn on the body but set up in fields.

A large percentage of the published magical *lamellae* preserve enigmatic texts with no indication of their specific purpose. These, for the most part carry nothing other than magical “characterēs”,

vowels, and/or divine-names and angels: *GMA* I. 1; 3; 4; 5; 6; 9; 10; 12; 14; 15; 16; 17; 19; 20; 21; 22; 23; 26; 29; 30; 34; 37; 42; 43; 44; 49; 55; 63; 64; cf. Parca 1997; Phillips 1997, etc. (*GMA* I. 54 seems to preserve some sort of unidentifiable astro-magical fragment). Some of these more puzzling texts with magic names or symbols may have been written specifically for protection in the afterlife, much like the spells of the Egyptian Book of the Dead, Coffin Texts, and Pyramid Texts which helped the deceased Pharaoh navigate specific perils in the next world. Oblique references to Egyptian deities like Osiris Khentamenthes (in *GMA* I. 30), for example, may force us to rethink the thanatological context of many of these amulets. The epithet of Osiris as Khentamenthes points to his rulership of the “Western Half”, the Realm of the Dead in the Egyptian afterlife. In this respect, the phylacteries may be continuing the tradition of the “Orphic” gold leaves, texts deposited in late Classical-Hellenistic graves to assist the departed soul in the next world. Among the corpus of phylacteries, there comes from Rome a late example of an Orphic leaf used specifically as an “afterlife” talisman (*GMA* I. 27).

4. ENGRAVED GEMSTONES

Magical gems of semi-precious material (quartzes, jaspers, chalcedonies, hematites, among many others) represent a special category of amulets that owes its flowering to the early centuries of the Common Era. The literature is quite extensive, but the principal corpora include Bonner 1950; Delatte-Derchain 1964; Philipp 1986. By the 2nd century C.E., the manufacture of magic gemstones began to increase exponentially. Magical intaglios, unlike seal-rings, were written orthographically and not in retrograde; hence, they were usually worn openly so that their designs and lettering could be read and interpreted. Although there is some disparity between what the papyrus instructions inform us about the gemstone types, the difference has been overstated (e.g. in Smith 1979). It is remarkable enough that the papyri describe, in several instances, actual gemstone types, not that every type known needs to be recorded in the extant manuals.

In a number of cases, it appears that texts normally intended for writing on papyrus have also been recorded on gemstone surfaces. There are also longer spells, evidently copied from papyrus formularies, that address magic operations not falling under the strict category of protective, healing magic (i.e., they are not amulets). Examples are discussed in Bonner 1950, chapter VIII, and include

Spells to Restrain Wrath (*thymokatocha*), a Spell to Cause a Separation (*diakopos*), Spells to Fetch a Lover (*agogai*), and various spells intended to harm.

4. A. INSTRUCTIONS FROM FORMULARIES

The papyrus formularies describe magic gemstones in a variety of procedures, mostly ritualistic rather than therapeutic. A full study is given in Smith 1979, who suggests there may have existed separate manuals just for gemstone magic. In *PGM* IV. 1596-1715, in particular, the consecration and empowerment of a phylactery or amulet (of stone or other material), is described in detail. Other examples of the use of engraved magic stones include the following: A pebble numbered 3663 (the isopsephic value of the god Bainchōōōch) is required in a direct vision spell (*PGM* IV. 930-1114); a *magnet*, cut in form of a heart and engraved with Hekate and vowels, is used in the “Slander Spell to Selene” *PGM* IV. 2622-2707; a *lodestone* carved with three-faced Hekate and properly consecrated with natron, water, and blood, is used in the “Prayer to Selene” (*PGM* IV. 2785-2890); a detailed description of how to carve, consecrate, and use a scarab of ‘costly green stone’ is provided in a rite to empower the practitioner with powerful divinatory abilities (*PGM* V. 213-303); similarly, a jasperlike agate, engraved with Sarapis is used in some form of dream-divination (*PGM* V. 447-58). For the “oblong” stone of Heliorus, see section 5, below.

4. B. ACTUAL GEMSTONES

The preserved magic gems are characterized by a rather canonical inventory of widespread designs: the Anguipede-figure (“snake-legged cock-headed” soldier), Chnoubis, Pantheos-deity, Harpocrates, Reaper-figure, and so on. Although these are studied in the standard corpora, more thorough-going treatments are also available (Post 1979: Anguipede). Scores of other minor types and variations proliferate, as well, so that each stone, in a sense, is unique. The gems types often carry more or less standardized “undecipherable” magical words, names, alphabetic series, using the Greek alphabet alongside the strange system of magical *characterēs* – a traditional magic “hieroglyphic” system of entirely unknown origin and derivation.

a. *Medical complaints*: Inscriptions on a variety of gemstones address the following representative examples of medical complaints: colic (Bonner 1950: 62f. Delatte-Derchain 1964: 206); digestive and stomach problems (Delatte-Derchain 1964: 67; 72; 149; Bonner 1950: 51-62, with reference to certain ancient writers on stomach amulets and

the Chnoubis gems); fever (Bonner 1950: 67-68; Kotansky 1980); inflammation (Bonner 1950: 68); eye complaints (Bonner 1950: 69-71); liver-pain (Bonner 1950: 66; Delatte-Derchain 1964: 317); gout, or feet-problems (Bonner 1950: 75-76); hydrophobia (demonic) (Bonner 1950: 78); sciatica ("Reaper"-design gems with 'for the hips': Bonner 1950: 71-75; Delatte-Derchain 1964: 196-200: 'I work but don't strain'); scorpion sting (Bonner 1950: 77); wasting disease (*phthisis*: Bonner 1950: 78); uterine and related problems (Bonner 1950: 81-94, 183; Delatte-Derchain 1964: 245-258, of which the most common is the "Ororouth"-type); and even inflammation of the uvula (Daniel-Maltomini 1989). Some types, of course, such as the Chnoubis-gems and certain "womb"-gems, rely more upon the glyptic design for their interpretation, although occasionally inscriptions support the interpretation. A more complete survey of all the gemstone literature for additional iatromagical inscriptions would make a useful study.

b. *Favor and victory charms (including "Good-luck" charms)*: Inscribed gems regularly request *charis* ("grace"/"favor") for the bearer, ostensibly for business, law-court, or other social settings, often on gems depicting Horus-Harpocrates (Bonner 1950: 48; Delatte-Derchain 1964: 97, 105, 153, with an example of a longer formula: "Give grace, beauty, victory to Sphyridas whom Thinousiris bore"). Some examples cross over into the arena of love and sexual magic (Delatte-Derchain 1964: 239, 242), but in all respects apply to social settings.

Perhaps related, though less social, are general requests for good luck, fortune, or that the god be "propitious," or "merciful," to the wearer (Neverov 1978: no. 47; Bonner 1950: 46f.; Delatte-Derchain 1964: 218). It is unclear whether the divine favor in these instances applies to everyday life, the afterlife, or both. In this respect, the widely attested formula 'protect (me)', written with various forms of (*dia*)*phyllassō* (e.g., Bonner 1950: 45-47), 'protect me from all harm' (e.g. Delatte-Derchain 1964: 137), or less often, 'help me' (e.g. Delatte-Derchain 1964: 144, 312), appear on the surface to be banal "good-luck" charms for day-to-day life; they may in fact have served, as well, as post-mortem amulets to be buried with the deceased.

Gems that carry commonplace religious slogans, acclamations, and epithets such as 'One God', 'One God Iao', 'One god who conquers all', 'Isis conquers', 'Serapis conquers all', 'Great is the name of Serapis', 'Great is Nemesis', and so on (Bonner 1950: 46; 167-85; Delatte-Derchain

1964: 101, 160, 162, 287; 266, this last with a longer, liturgical formula) represent prayer-like requests for divine favor that may function apart from social contexts (victory over demons, bad planetary influences, etc.), or they may serve as abbreviated victory charms against human adversaries. A more careful study of these types would be useful. Various healing and protective formulas are also commonly found on Byzantine bronze pendants that carry similar slogans (Barb 1972). Included here should be the widespread proliferation of the "Seal of Solomon"/"Seal of God" types, depicting a militant figure mounted on horseback (Spier 1993; Delatte-Derchain 1964: 261-264; etc.).

c. *The Evil Eye and demonic possession*: Deliverance on gems from Envy (*Phthonos* or *Baskosynē*) and the 'much-suffering eye' is common (Bonner 1950: 96-99). Specific mention of protection from an evil demon is relatively rare on gems (cf. Bonner 1950: 95f.; Mastrocinque 1998; Kotansky 1991; 1995). The text of a long exorcistic formula, liturgical in nature, is preserved on a carnelian (Delatte-Derchain 1964: 316).

d. *Other, miscellaneous, and uncertain rituals*: A divination formula on a basalt tablet with vowels and magic names (*Mauar*/*Mar*-permutations) and the formula 'reveal to me this very night, with truthfulness and remembrance' represents a rare example of a papyrus-type text written on a gem material (Tomassetti-Wuensch 1899). The warding off of drugs/poison, as well as health, headache, neckpains, and toothache on an agate marble provides another example of longer, papyrus-text spells written on stone (Neverov 1978: no. 50, p. 848). To this one may compare a hematite falcon amulet inscribed against evil (harm), the wrath of gods and demons, and sorcerers (*SM I. 6*).

Liturgical material from various more literary contexts, including hymnic or invocational fragments, are also found on gems and require independent analysis as a genre (Keil 1940; Bonner 1950: 181-185; Delatte-Derchain 1964: 98, 119, 140, 188, 381; Philipp 1986: 119; Bevilacqua 1991: 32 [for healing?]; Kotansky 1995; Kotansky-Spier 1995). Long inscriptions, too, written with Greek letters but preserving unintelligible sequences of text may indeed preserve known foreign texts, liturgical in nature, such as Egyptian or Hebrew. Some, too, may be corrupted forms of Greek (cf. Delatte-Derchain 1964: 337-342). The phenomenon of actual "fragments" of magic formularies being accidentally copied onto various amulets requires a systematic study (Blanchet 1934-1937 = Bonner & Youtie 1953 [1982]; Delatte-Derchain 1964: 98, 317; Philipp 1986: 119).

5. OTHER INSCRIBED MATERIALS

Here the use of ritual and amulet are sometimes indistinguishable. Small offerings or rituals involving organic and amuletic materials may be burned as protective gestures. In this sense the whole ritual of sacrifice and offering is prophylactic in nature.

Instructions from Formularies: A circle, on which one stands, is engraved with magic characters, while one is crowned with the *tail of a cat*, in a spell to acquire the “Shadow of the Sun” (PGM VII. 846-61); eggs, two “male”, inscribed with myrrh ink, are used in a protective rite in a ‘Meeting with your own daimon’ (PGM VII. 505-28; cf. XII. 100); inscribed eggs, one placed in a latrine, the other buried in a house are also used in a favor charm (SM II. 97); a *Gothic ring* is inscribed with a formula to cure the eyes (SM II. 94); a *grape-vine leaf*, inscribed, for tumors (?), is boiled, etc. (SM II. 94); the *hide of a sheep*, one black, one white, one for the right and one for left arm, respectively, are each inscribed with magic names and Homeric verses in myrrhed ink (PGM IV. 475-829: “Mithras Liturgy”). The *hide of an ass* is also inscribed in a love-spell of attraction (PGM XXXVI. 361-71), although this is not an amuletic function, per se; the *hoofs of a horse* are inscribed with a spell in a “Victory charm for the races” (PGM VII. 390-93); the *hide of a hyena* is inscribed for coughs (PGM VII. 203-5; VII. 206-7); a seven-leafed *laurel* sprig is engraved with seven characters ‘for deliverance’ (from death?) in an Apollonian invocation (PGM I. 262-347); leaves of *laurel*, inscribed and held in the hand in an invocation serves for divine protection (PGM II. 1-64); a second garland of laurel, inscribed with magic names is also used for protection (*ibid.*); an alternative procedure (PGM II. 64-184) requires a twelve-leaf sprig, inscribed, along with a wool garland; a 12-leaf branch of *laurel* crown is inscribed with signs of the zodiac for protection in a dream divination (PGM VII. 795-845). Furthermore, for insomnia a leaf of *laurel* is inscribed with a magic names and placed under a pillow or mattress (SM II. 74); another *laurel* leaf is inscribed for insomnia (SM. II. 96). The leaf of a *Persea tree*, engraved with vowels protects against the manifestation of a god (PGM IV. 475-829: “Mithras Liturgy”). An *olive* leaf, inscribed on either side with a symbol for the sun and moon, heals fever (PGM VII. 213-14); an *olive* leaf is also used in a spell for *fever with shivering* (SM II. 81). *Linen*, the sacred fabric used for mummification, is required in several recipes instead of papyrus: In a certain “Charm for a Direct Vision”, a piece of *linen* taken from a statue of Harpocrates is inscribed with a protective prayer, enclosed with an

“everliving” plant, and entwined with Anubian thread (PGM IV. 930-1114); a *linen* rag, inscribed with characters, is used for hardening of the breasts (PGM VII. 208-9); a *linen* cloth is also used in a “Charm for a Direct Vision” (PGM VII. 335-47) and in a “Request for a Dream Oracle” (PGM VII. 359-69); these do not appear to serve amuletic functions. A *linen* strip, inscribed, and placed on the left side of the head while asleep obtains a Dream Revelation (PGM VII. 664-85).

Additional engraved materials from the recipes include the following: *mud* smeared on doorposts of a bedchamber, of which the right is then inscribed with a stylus with magic names and characters, is used in the form of an Apollonian divination (PGM II. 64-183); lime wood – inscribed with ink of vermillion with magic names and a prayer against aerial demons, angels, phantoms, ghostly visitations, and enchantments, and then enclosed in a purple skin and worn around the neck – protects the wearer against Selene (!) in a “slander spell” (PGM IV. 2622-2707); *oil*, invoked, and smeared on the body, is used for fever (PGM VII. 211-12); an *ostrakon* inscribed with a Christian *historiola* and placed on the right thigh, eases labor (SM II. 96); a *golden scepter* in a metrical “Prayer to Selene” is mentioned in an *historiola* of Kronos (PGM IV. 2785-2890: for steadfastness); a *scarlet parchment*, inscribed and plastered onto the side of the head, heals migraine headache (PGM VII. 201-2); the *rib of a young pig*, inscribed with a figure of Zeus and a magic name, is used to protect against a deity in the “Oracle of Kronos” (PGM IV. 3086-3124); a *seashell* is inscribed with a love charm (PGM VII. 300a-310), and another is used in a love-charm “to induce insomnia” (PGM VII. 374-76); these, properly speaking, are not amulets. A previously buried *skull of an ass*, inscribed with characters and a magic name (using the blood of a black dog) is used along with an *ass’s tooth* (fastened with *silver*) and an *old lady’s tooth* (fastened with *gold*) to protect the practitioner against the power of the goddess invoked (PGM XI.a 1-40); a *tassel*, attached to a garment, and invoked directly, is used as an amulet ‘Against every wild animal, aquatic creature, and robbers’ (PGM VII. 370-73); a *wick*, inscribed and used in ‘another (Charm to induce insomnia)’ (PGM VII. 376-84) is non-amuletic.

6. UNINSCRIBED MATERIALS (ORGANIC AMULETS: PLANTS, MINERALS, ANIMAL MATERIALS, ETC.)

The use of root- and other vegetal iatromagical remedies presumably goes back to prehistoric

times. The following inventory of organic materials used as amulets stands in the same tradition of herbal remedies as that found in Theophrastus, Pliny, Dioscorides, Aelian, Aelius Promotus, Alexander Trallianus, the *Cyranides*, and many others.

The *eye of an ape* (or the *eye of a corpse* died violently), mixed with peony (Rose) and oil of lily, is required for an "Invisibility Spell" (PGM I. 247-262); a *bean*, with a small bug in it, can be worn as a contraceptive (PGM LXIII. 24-25); another contraceptive requires a *pierced bean* tied with *mule hide* (PGM LXIII. 26-28; cf. also PGM LXV. 1-4); the hairs of a *bear*, plaited into a cord and worn as a diadem, serves as a protective amulet in a "Powerful Spell of the Bear" (PGM IV. 1331-89); a *beetle* is used as an amulet for illness; (SM II. 78); the *whiskers* of a *cat* are used as a phylactery (!) while making a curse-spell using inscribed *lamellae* (PGM III. 1-164); a *falcon*, drowned in a honey-milk mixture and wrapped in a cloth along with one's fingernails, hair, and an inscribed *papyrus* strip, is formed into a plaster of frankincense and old wine and then set up in a little juniper wood shrine in a rite to acquire one's own spirit-*daimon* (PGM I. 1-42); a rite involving a *falcon's head*, held in the right hand along with a black Isis band over the eyes, causes a real falcon to drop an oblong stone from the sky (PGM I. 42-195). This, in turn, is to be engraved as an amulet (with a lion-faced figure, Heliorus, and magic names) for protection in the use of another rite to acquire an assistant "spirit" guide; a *gecko* is used in a "Favor and Victory Charm" (PGM VII. 186-90); the eye of a *lizard* placed in a *goat* (?) *skin* may be used for eye affliction (SM II. 78: fragmentary); the *fat* of an *owl*, or the *eye* of a *nightowl*, along with the *ball of a dungbeetle* in unripe *olive oil*, is to be smeared on the entire body for protection in an "Invisibility Spell" (PGM I. 222-231); the heart of an *owl* may be used for eye affliction (SM II. 78: as above, fragmentary); *palm*, *palm fiber*, and male *date of palm* are used as a protective amulet in the "Charm of Solomon" (PGM IV. 850-929); three *peonies* wrapped around the left arm are used for general protection in a lamp spell to attract a woman (PGM LXII. 1-24); a white *rooster*, held in the hand with *twelve pinecones*, is used in an Invocation to the Sun (PGM III. 633-731); a *red rag* is possibly used for eye affliction (SM II. 78: as above); similarly, a *tick* from a black cow, in *goat* (?) *skin*, is used for eye affliction (SM II. 78: fragmentary, as above); a garland of *wool*, with alternating red and white strands is used in an Apollonian divination rite (PGM II. 64-184: as above, with mud); the *tooth of a hyena* is used in a

victory charm (SM II. 96); *wormwood*, ground up with *sun opal*, a *magnet-stone*, *heart of hoopoe*, and *honey*, aids memory in a divinatory rite (PGM II. 1-64); finally, in the rite above, requiring the white rooster, *wormwood* is held protectively in the right hand with a *snakeskin* held in the left as one invokes the sun (PGM III.633-731).

7. AMULETIC BUNDLES

In addition to these uninscribed, "organic" amulets, several passages in the papyri describe more complex amulets that involve a number of different operations, including the inscribing of papyrus texts and other objects. These can be largely described as "amuletic bundles" or "packets". For example, for business, a phylactery to be placed in one's shop is made up of a three-headed statuette of *Etruscan wax* that has been molded into a *sea falcon*, *baboon* and *ibis*; each of these figures is given certain divine attributes. This figure is then wrapped as an Osirian mummy, with a "heart" of *magnetite* and an inscribed hieratic *papyrus* placed inside. The whole is then set up onto an *iron* base, is installed in a miniature temple of *juniper* (at moonrise on the third lunar day), is given sacrifice and libation, is crowned with olive, and, finally, is invoked with the names written on the papyrus strip (PGM IV. 3125-71). Similarly, in PGM VIII. 1-63 a *baboon* figurine is carved of *olive wood* with the attributes of Hermes (= Thoth) and enclosed with an inscribed papyrus for good business and set up in a workshop; another such fetish is found in SM II. 97 (cf. further, the *skin of a mouse* kept in a workshop, for business, in the fragmentary SM II. 99). See further, PGM IV. 3172-3208; PGM V. 370-446. Related is the so-called Eighth Book of Moses (PGM XIII), a complex set of rites that obtains from the god a secret name that can be used in a variety of subsidiary magical rituals of the standard kind (healing, casting our demons, breaking spells, restraining anger, and so on).

8. AMULETS, GNOSTICISM, AND THEURGY

Although early collectors and savants often referred to the magic gemstones and *lamellae* as "Gnostic", such a designation has long fallen out of favor (cf. Bonner 1950: 1f.). No enduring connection between specific Gnostic groups and our preserved corpora of amulets has been conclusively established. An exception seem to be the amulets found among the ruins of the Manichaean houses at Kellis (Mirecki, et al. 1997), and this may point to a more widespread practice. Owing to the fact that many of the deities, angels, vowels, and magical

charaktēres preserved in Gnostic documents (e.g., the Nag Hammadi texts) are the same as those found in the magical texts, the subject needs to be revisited (cf. Jackson 1989). Plotinus – disinterested in matters pertaining to theurgy – was one of those who complained that Gnostics composed magic incantations, presumably for the elevation of the soul past menacing demonic forces (*Enneads* II, 9, 14). In the *Books of Jeu* (ed. Schmidt-MacDermot), adherents seal themselves with magic “characters” and invoke mystic names while holding an especially designed numerical pebble (*psēphos*) for just such protection in the higher dimensional realms (cf. Iamblichus, *De myster.* III, 14, 41, on the use of magic *charaktēres*). Further, among the Nag Hammadi Codices (NHC) there is persistent evidence of the use of magic names, symbols (*charaktēres*), angel-names, and vowels in common with the magical amulets (e.g. *Iaō*, *Sabaōth*, *Abrasax*, *Sesengenbarpharangēs*, *Akramachamari*, etc.); cf. the *Apocryphon of John*, esp. NHC II, 15, 30-19, 10; *Gospel of the Egyptians*, NHC III, 52, 9-26, IV, 64, 2-23; the *Hermetic Discourse on the Eighth and the Ninth*, NHC VI, 56, 17-22 (a “magic” prayer; cf. 61, 10-15). Also, the *Pistis Sophia*, esp. Book IV, presents the wholesale use of papyri incantations, presumably borrowed directly from magical handbooks. All this suggests that Gnostic groups would have written amulets to be used along with their magically invoked hymns (cf. *Gospel of the Egyptians* NHC III, 43, 20-44, 9; IV, 53, 17-54, 13, for mention of a secret name written on a tablet). It is also possible that they used amulets for specific healing rites (cf. the fever-amulets in *P.Kell.G.* 85-88).

Conversely, some of our preserved amulets may actually derive from Gnostic groups. The occurrence of some names and ideas peculiar to Gnosticism rather than to magic identifies the talismans as specifically Gnostic. The *Ialdabaōth*-gem discussed by Bonner (1950: 135-138) is certainly a Gnostic amulet, as he himself admits (see further, Kotansky-Spier 1995; Kotansky 1980, on *Elēlēth*, the principal Gnostic ‘Light-Aeon’, on a gold *lamella*; cf. Heintz 1996, on the *Pisandrapētēs*, etc. on a silver *lamella* – a name found elsewhere only in the Gnostic *Apocryphon of John*, NHC II, 17, 16).

The issue of the mystic union (*systasis*) of the practitioner with his personal deity involves a kind of ritual common to both the “higher” forms of magical operations of the papyri and to specific theurgic undertakings (Eitrem 1942); however, what requires further study – contingent, of course, upon future discoveries in the field – is to what

extent the amulets used for these rites by either group would have looked the same. Additional research, therefore, may yield closer correlations between practitioners of magic and late antique philosophical schools, whether they be Gnostic, Neoplatonic, Hermetic, or Theurgic. Marinus of Neapolis, the successor of Proclus († 485), attributes to him the use of magic operations to control the weather, including the depositing of amulets (*phylaktēria*) for earthquakes (*Vita Procli*, 28; Eitrem 1942, 73). To what extent this kind of practice penetrated Neoplatonism is difficult to say, but it is indicative of the sort of overlap among competing philosophical systems common in late antiquity.

Andreae, Johann Valentin, * 17.8.1586 Herrenberg (Württemberg), † 27.6.1654 Stuttgart

Johann Valentin Andreae was the fifth son of a dean of the Lutheran Church. His grandfather was Jakob Andreae, Chancellor of the University of Tübingen and one of the principal authors of the Formula of Concord, which was to become the doctrinal basis of Lutheran orthodoxy. After losing his father at age 15, the young Andreae began a brilliant career as a student at Tübingen, became *Magister artium* in 1605, and following in his ancestors' footsteps, studied theology. During this time his career as a writer began, with two plays (*Esther* and *Hyacinth*), some writings on politics and → astrology, and the novel *Chymische Hochzeit Christiani Rosenkreutz* (The Chemical Wedding of Christian Rosenkreutz; see below) whose success has lasted to this day.

However, these brilliant beginnings were darkened in 1607 as Andreae entered an *atra tempestas* (somber tempest). It seems that his critical disposition incited him to write a lampoon against one of the close advisers to the Prince of Württemberg, which led to a judiciary inquest, interrupted his studies, and resulted in his being rejected as a candidate for ecclesiastical office. Between 1609 and 1611 he went on a long journey to Strasbourg, Lyon, Paris, and then Switzerland, where the Calvinist organization of the city of Geneva made a strong impression on him, and where he seems to have drafted the *Fama Fraternitatis* (Fame of the [Rosicrucian] Brotherhood) and the remarkable comedy entitled *Turbo* (Whirlpool). In fact, this Latin title evokes the turmoil or the vortex in which the young Andreae found himself swept away. In 1613, after a long trip to Italy, he was at last able to recommence his studies of theology. The following year he obtained a post as deacon (adjunct pastor) at Vaihingen; this was the same year of his marriage, and of the beginning of his correspondence with Johann Arndt.

During the Thirty Years War, his ecclesiastical and diplomatic career took on new impetus: he was named Dean at Calw and went on a mission in Austria to defend the positions of Lutheranism there. Also at Calw, he created the *Färberstift* (Dyers' Foundation), a charitable association whose goals included helping the poor and sick, giving grants to young students, creating a library, promoting the learning of foreign languages, financing apprenticeships, paying for the education of children from insolvent families, and supporting aid for the mentally and physically handicapped. This foundation

lasted until 1979. However, after the Battle of Nördlingen in 1634, Imperial troops completely devastated the town of Calw, leaving numerous casualties and causing grave epidemics. Andreae related this drama in *Threni Calvenses* (Calvian Lamentations), published in 1635. After the devastation, Johann Valentin Andreae's two daughters married notables of Calw and had so many offspring that an inquiry has established that in 1936, ten percent of Calw's high-school students were descended from the Andreae line.

After 1614, continuing his pastoral, social, and diplomatic activities, Andreae published a number of important literary and theological works, mostly written in Latin. Their common denominator was the desire to combat three principal scourges of his era in Württemberg: the blind rigor and sterile theological disputes of the Lutheran orthodoxy; the interference of temporal power in the life of the church; and the profound moral decadence of Christian society in his time. To fight these problems, and to propose a more authentic Christianity to his contemporaries, Andreae found a model in the *Vier Bücher vom wahren Christentum* (Four Books of True Christianity), published between 1605 and 1610 by the theologian Johann Arndt, who became Superintendent General of the Principality of Lüneburg in 1611. These "four books" were the Book of Scripture (the Bible), the Book of Life (Christ), the Book of Conscience, and the "Grand Universal Book of Nature". Arndt, whose texts contained extracts from mystics such as Tauler and Angela di Foligno, can be considered the pioneer of Protestant → Pietism, and he exercised a strong influence over Andreae. In Strasbourg, around 1615, Andreae published some extracts from Arndt's "Four Books" translated into Latin. In an apologue of his *Mythologia christiana* (Christian Mythology; 1619), Andreae applauded Arndt's emphasis on the necessity for Christians to actually lead their lives in accord with the faith they professed. The same year, Andreae dedicated his *Reipublicae Christianopolitanae descriptio* (Description of the Republic of Christianopolis) to Johann Arndt. In a hundred chapters, this work describes an ideal Christian society called *Caphtar Salama* (in Hebrew, "village of peace"), built on a triangular island symbolizing the Holy Trinity. The inhabitants have realized in themselves the mystery of regeneration; in fact, they constitute the *Ecclesia in hac vita occulta* (Church concealed in this life) of which Luther wrote. Thus *Christianopolis* is a portrait of a city of regenerated Christians as Andreae, under Arndt's influence, imagined it. He continued to describe this city in the alchemical allegory of

Rosicrucian myth, in the *Invitatio Fraternitatis Christi* (Invitation of the Brotherhood of Christ; 1617-1618), in *Civis christianus* (Christian City; 1619), in *Christenburg* (1620), and in *Christianae Societatis Imago* (Picture of Christian Society; 1620). In *Theophilus*, written in 1622 but not published until 1649, Andreae proposed the means of establishing the actual Christian City whose image he had so often portrayed. Three conditions were necessary: temporal authority must be favorable to its birth; education must develop moral integrity as well as culture; and each citizen must be *renatus* (born again). But Andreae did not delude himself; in *De Christiani Cosmoxeni genitura iudicium* (Judgment on the Nativity of Christian Cosmoxenus), which appeared around 1615, he had presented this ideal citizen as a purely imaginary being.

To emphasize this contrast between the ideal city and the real world, Andreae was not content with presenting his readers with the image of an ideal Christian society. An important part of his work, beginning with the myth of the Rose-Cross [→ Rosicrucianism], is a satire on the oddities of his era. In 1617, he published in the fictitious place of *Helicone juxta Parnassum* (“Helicon on Parnassus”, but in fact Strasbourg) about a hundred satirical dialogues under the title of *Menippus*, recalling the famous pamphlet of the *Satyre Ménippée* (Menippean Satire), published in France in 1594, paving the way for the triumph of Henri IV over the League. Menippus was a famous Greek Satirist of the 1st century B.C.E., who was imitated by Meleager, Varro, and Lucian, among others. Andreae situated himself in this tradition, criticizing the various orders of society of his time, and his satire created such a stir that one professor of philosophy at Tübingen, Caspar Bucher immediately published an *Antimenippus*, while Andreae himself resolved to have an expurgated version of his *Menippus* printed the following year.

One of the targets of Andreae’s satire was the pretentious erudition of the savants of his era, the hollow eloquence of professors in need of more sense and less arrogance, who were nothing but *asinocretores*, “donkey-makers” who did not know how to teach dialectic or rhetoric, while their pupils discovered Aristotle’s Heavens, but not God’s.

In the domain of religion, Andreae estimated in *Menippus* that the “Reformation” was nothing but a “Deformation” which had replaced a Pope with “*papelli*” (popelets), diminished the power of Peter’s Keys, and made the Church dependent on a temporal power that preached the doctrine of Christ, maybe, but not the imitation of Christ or the cultivation of a pious life.

As an appendix to *Menippus*, Andreae published *Institutio magica pro curiosis* (Magical Institute for the Curious), which stated his position vis-à-vis the fantastic commentaries inspired by the Rosicrucian writings, notably the novel mentioned above, *Chymische Hochzeit Christiani Rosenkreutz*. It is a dialog between Curiosus, who hopes to be initiated into the secrets of → magic, and Christianus, who reveals to him that magic resides in the grand Temple of Nature illuminated by three torches: that of divine Providence, that of society, and that of the anatomy of the world. This satire, once again, is aimed at the false erudites of his time, imbued with Latin, theology, and abstract formulae. In retaliation, Andreae praised those who worked with matter, architects, geographers, and astronomers, astounding the young enquirer who longed for nonexistent mysteries.

Along with this satire, Andreae used a less scouring and more subtle method for opposing the follies of his era and the calumnies he had suffered, namely the literary device of fables and fiction. Such was the object of the work entitled *Mythologiae christianae sive Virtutum et Vitiatorum vitæ humanæ imaginum Libri tres* (Three Books of Christian Mythology, or Image of the Virtues and Vices of Human Life), which appeared at Strasbourg in 1619. After the manner of Trajano Boccalini (1556-1613), who published the *Raguagli di Parnaso* (Reports from Parnassus) in 1612, Andreae presented his critique of society in the form of myths and fairy-tales. His goal was to better the people of his time with fables. In an apologue entitled *Lusus* (Manipulus V, 27), he imagines a dialog between *Scurrilitas* (Scurrility) and *Lusus* (Play). The first is negative, impudent, and mocking, while Play (to whom Andreae defers) only mocks religion, the state, and erudition when they display imposture and barbarity, ‘in order to make it clear that one writes satires not for pleasure or from a taste for carping, but out of necessity, indicating a religious, honest, moderate, intelligent spirit, concerned for the future of society’.

As a supplement to the *Mythologia christiana*, Andreae published a dialogue entitled *Alethea exul* (The Exile of Truth), in which Alethea, interrogated by Philalethes about the mystery of the Rose-Cross, says that she has observed ‘not without pleasure [*non sine voluptate*] a somewhat spiritual game [*lusum quendam ingeniosiore*]', but that she has thereafter eclipsed herself so as to not be involved in an ‘uncertain and dangerous affair [*rei incertæ et lubricæ*]’. This dialogue reveals Andreae’s position in regard to the myth that he had at least helped to create. The character Christian

Rosenkreuz takes his name from the escutcheons both of Luther and of the Andreae family. Two later autobiographical writings by Andreae place the creation of the *Chymische Hochzeit* between 1603 and 1605. With an incontestable literary talent, the author describes the extraordinary dream-like adventure of Christian Rosenkreuz, witness to the alchemical reincarnation and union of *sponsus* and *sponsa* (bridegroom and bride), whom → Carl Gustav Jung later named the *animus* and *anima*. However, the text does not have any of the technical aspects of an alchemical treatise; it is a vivid account, punctuated with enigmas, mysterious episodes, and erotic allusions. But this is only what they appear to be, inasmuch as Christian, braving the ban against entering the basements of the royal palace, discovers Venus naked, for in fact she symbolizes the new invisible body of the soul. Spiritualized matter also appears in the description of the fountain of Hermes, at which the chosen ones drink. The water of Hermes is Mercury, the substance of all transformation, all redemption, both in man and in nature. This is why Christian Rosenkreuz, after having lived the regeneration of *sponsus* and *sponsa*, is called *Eques aurei Lapidis* (Knight of the Golden Stone). And if at the end of the novel he is supposedly condemned to become a gate-keeper at the royal palace, it is for the purpose of announcing to those who are worthy the redemptive of the soul into transformed nature.

The *Fama Fraternalitatis*, which circulated across Europe in the form of manuscripts around 1610 and was printed in 1614 at Kassel, also magnifies the grandeur of the human-microcosm and cites → Paracelsus. Christian Rosenkreuz appears in this work as the heroic founder of an omniscient brotherhood capable of redeeming all of nature. Given Andreae's ambiguous declarations, the *Fama Fraternalitatis* cannot be totally attributed to him. In the funeral oration for his friend Tobias Hess, who died in 1614, he evoked the deceased's liking for secret societies. As for the *Confessio Fraternalitatis* (Confession of the Brotherhood), published at Kassel in 1615 in Latin and in German translation, its genesis is equally linked to Tobias Hess, for reasons that follow. A collection of essays entitled *Theca gladii spiritus* (Scabbard of the Sword of the Spirit) and published at Strasbourg in 1616 was attributed in the preface to Hess, whereas Andreae, twenty-six years later, admitted to having been its author. No fewer than twenty-eight sentences from the *Confessio Fraternalitatis* figure in this collection beside extracts of other works of Andreae, such as *Invitatio Fraternalitatis Christi* and *Bonæ Causæ Fiducia* (Trust in a Good Cause). From these docu-

mented elements we can conclude that the *Chemical Wedding* was authored by Andreae and that the *Confessio* resulted from Andreae's cooperation with Tobias Hess, whereas the *Fama Fraternalitatis* is a collective work written by more than two authors. In the last chapter of the *Turris Babel* (Tower of Babel), a pamphlet published by Andreae in 1619, the author writes about numerous texts released under the name of the Rose-Cross: '... there are those which are ... jokes ...; some are poor ones, ... some are pious and devout. ... While I certainly repudiate even the company of the Brotherhood, you will never make me renounce the true Christian Brotherhood, that which under the cross exhales a perfume of roses'.

Andreae had attempted to realize this "true Christian Brotherhood" in many repeated efforts, and his vision of the Rosicrucian myth had been its literary and utopian translation, just as many other writings including *Christianopolis* (1619), *Christenburger Schlacht* (The Battle of Christenburg; 1620), *Christianæ Societatis Imago* (1620), and *Christiani Amoris Dextera porrecta* (The Extended Right Hand of Christian Love; 1620). These were no longer a matter of simple literary fiction, for Andreae had long dreamed of founding this Christian brotherhood under the patronage of Duke August of Brunswick (1579-1666). We recall that Johann Arndt, whose influence on Andreae has been emphasized above, exercised his pastoral activity in the Principality of Brunswick-Lüneburg. Moreover, at Tübingen Andreae had met a student related to the Lüneburg nobility, Wilhelm von Wense, born like him in 1586, but who died in an accident in 1641. In 1642, Andreae expressed his sorrow in a funerary oration in the honor of this friend. It was at Wense's instigation that August of Brunswick had been chosen as protector of the *Societas Christiana*.

Andreae had met Duke August for the first time in 1630. An important correspondence between the two men began in 1640, each one writing about 600 letters to the other. In one letter dated June 17, 1642, Andreae announced to August of Brunswick the arrival of the *Christianæ Societatis Imago* and the *Christiani Amoris Dextera porrecta*, and on July 26, the Duke acknowledged receipt of these 'lovely little treatises'. Scholars of Andreae had long thought that these works had disappeared, and as late as 1973 one specialist questioned whether the two treatises had truly been published, until the present author discovered the actual copies received and read by the Duke. The Christian society that they describe was placed under the protection of this nobleman, 'vir Pietate, Probitate et Litte-

ratura Illustrissimus' (a man illustrious in piety, uprightness, and letters); its goal was to develop knowledge in the different domains of religion, the sciences, and society, which would then be concretized by the publication of an encyclopedia in the vernacular. Thus Andreae belonged in the line of learned societies such as the French Academy, the Royal Society, and the Fruchtbringende Gesellschaft (Fruit-Bearing Society) to which he was admitted in 1646, thanks to the recommendation of the Duke of Brunswick. By then in his sixties, he was admitted with the pseudonym of "Fracidus", a Latin adjective used to designate an overripe olive; the German version, "der Mürbe" (the Ripe One), was no more complimentary. However, the emblem that he was given, a tree covered in moss, and the motto "etiamnum viret" (he is still green), may have consoled him. Andreae declared to Philippe Heinhofer, a patrician of Augsburg and intermediary between him and Duke August, that he felt neither old nor weary. In 1650 he became Abbot and Prelate of Bebenhausen, the next year he was named Superintendent General (the equivalent of an archbishop), and he died in 1654 at Stuttgart.

Thanks to his brilliant invention of the Rosicrucian myth, Andreae's name is still cited in numerous contemporary works, from the United States to Europe and even Japan. Paradoxically, he seems to be less well known in the Christian milieu, except in the microcosm of Lutheran theologians. However, his writings played an important role in the evolution of Christianity after the Reformation. Whereas Luther, especially in *Von weltlicher Obrigkeit* (On Worldly Authority), established the so-called "theory of two realms", affirming that the Christian is simultaneously subject to two totally separate kingdoms, the spiritual in his religious life and the temporal in his societal life, and in consequence the notion of the ideal city was completely foreign to him, we have seen that Andreae never ceased to work in favor of a *respublica christiana*. Certainly he did not hesitate to castigate the princes whom he named idolaters, and in a satire entitled *Apap proditus*, he mercilessly criticized Caesaro-papism. On the other hand, he praised in his *Theophilus* the sovereign who acted for the furthering of public religion in his state. That which he valued above all was the free manifestation of the *praxis pietatis* (devotional practice) within a Christian society. In this sense, he anticipated the first generation of Pietists, who, with Jakob Spener (1635-1705), reconciled the ecclesiastical structure with the *collegium pietatis* (college of devotion) and worked for the formation of *ecclesiolae in ecclesia* (small churches within the Church). Finally, as the

present author has shown in many studies dedicated to Andreae's work, his beautiful narrative of the *Chemical Wedding of Christian Rosenkreuz* is articulated around three axes: God, Man, and Nature. According to Antoine Faivre, it is to this triangle that theosophic thought applies itself. Theosophy, as taught in the lecture-halls of *Christianopolis*, is a school of humility and obedience, docile receptivity, a revelation directly infused by God. The itinerary of Christian Rosenkreuz, like those of Christian Cosmoxenus and the elect of *Christianopolis*, is the theosophic miracle of salvation.

Animal Magnetism/Mesmerism

1. FRANZ ANTON MESMER
2. PUYSGUR
3. FRANCE
4. ENGLAND
5. UNITED STATES OF AMERICA
6. HYPNOSIS
7. ESOTERICISM AND MAGNETISM
8. RELATED DEVELOPMENTS
9. CONCLUSION

The cultural movements covered by the terms “mesmerism” and “animal magnetism” are so complex that a long treatise would be required to cover them fully. Here we shall only outline the main cultural currents, and describe the directions they have taken in France, Germany, the British Isles, and the United States of America.

I. FRANZ ANTON MESMER

Mesmer's major accomplishments are fairly well known. He was born on May 23, 1734 in Iznang, near Lake Constance. He studied theology and medicine, and in 1766 defended a thesis in which he asserted the influence of the planets on human maladies, which earned him the title of Doctor of Medicine. In 1767 he settled in Vienna to begin his career as a doctor, and the following year married Maria Anna von Posch, a rich widow from an influential family.

During 1773-1774 he first tried using magnets for medical purposes (an idea that came from England) in an attempt to cure one of his patients, Miss Österlin. The sick woman felt a sensation like a strange current passing through her, and her symptoms vanished. From this experience, Mesmer began to draw the first outlines of his theory. He believed that the magnets themselves were not solely responsible for the effect obtained, but that they had served to amplify and channel a “fluid” accumulated within his own body, which he had transferred to his patient through an act of will. He named this discovery “animal magnetism” (*Tiermagnetismus* or *tierischer Magnetismus*), a term that would soon become part of the current vocabulary. The theory he deduced from his discovery amounted to these principles: an impalpable fluid permeates the entire universe and connects human beings to animals, plants, objects, and to each other. All human maladies are caused solely by poor circulation of this fluid within the human organism. For healing, it is necessary to re-establish the equilibrium of the cosmic fluid. This is what the magnetizer does, as he projects his fluid by means of passes over the organism of the sufferer. However, the concept of animal magnetism is much more complex than one might think from this brief summary. It comprises: (1) a psychological, anthropological, and cosmological theory describing the intricate relationship between man and the universe; (2) the techniques practiced by the magnetizer to relieve his fellows; (3) the phenomena of magnetic somnambulism, described later; and (4) the cultural currents set in motion by Mesmer that would continue throughout the 19th century.

Mesmer's reputation as a doctor and healer soon

began to grow. In 1775, Prince Elector Max Joseph of Bavaria invited him to assist in an investigation of séances of exorcism held near Constance by Father Johann Joseph Gassner, a priest who was attracting crowds and performing what appeared to be miraculous healings, laying on his hands to expel evil spirits. On November 23, 1775, after observing Gassner, Mesmer undertook to reproduce the same phenomena. He found that he could produce seizures in an epileptic patient merely by a touch of the finger, and could cause the sick to have apparent convulsions. On the strength of this, he concluded that Gassner was sincere, but did not understand what he was doing; his cures were real, but explainable by the effect of a mysterious agent, hitherto unknown: the “animal magnetism” that he, Mesmer, had just discovered. Thus mesmerism was born from an unlikely combination of efforts: the attempt to interpret exorcism from a rational standpoint; experimentation in magnetic medicine; and the first tentative theories of electricity and magnetism. What Mesmer did not admit was that he had found himself, in a way, in the same situation as Gassner. Essentially, while Gassner, as a religious healer, validated his power of suggestion using liturgical décor and the symbolic system that accompanied it, Mesmer drew on the prestige of science and the aura of mystery that always surrounds new discoveries.

Mesmer's reputation grew, but it also attracted difficulties that forced him to leave Vienna. In February 1777, he moved to Paris to promote his grand discovery there. He settled in a private mansion in the Place Vendôme, where he received patients from high society and charged them exorbitant fees for his services. A few initial successes in curing the maladies of influential people assured a continued influx of distinguished clients. He also gained the devotion of some zealous but self-seeking disciples, such as Dr. d'Eslon, personal physician to the Comte d'Artois (one of the King's brothers), and author of *Observations sur le magnétisme animal* (Observations on Animal Magnetism, 1780). Mesmer's residence became a fashionable haunt; ailing great ladies swooned there, and were seized by spectacular convulsions. Numerous healings were reported. But fashion became tinged with scandal. In 1784, on the demand of the King, an official committee was formed with the purpose of throwing light on Mesmer's controversial methods of treatment. The committee included several renowned experts, such as the chemist Antoine Laurent de Lavoisier, the astronomer Jean-Sylvain Bailly, and the American statesman Benjamin Franklin. The committee's

verdict was paradoxical. Essentially, it affirmed that while the members could not objectively detect the fluid, some of the alleged cures were genuine. However, it did not encourage the practice, because in its view, Mesmer's success must be due only to the deceptive powers of the → imagination, which constituted a bad method of healing, especially in this era, when medicine was undergoing a complete revision at the hands of scientists. A confidential report was even given to the King, concerning the possible sexual undertones of magnetism.

Laurent de Jussieu, one of the committee members, challenged the commission's conclusions, writing a personal memorandum in which he asserted that the phenomena observed could not all be attributed to mere power of imagination, and suggested the action of an unknown power, which he called "*chaleur animale*" (animal warmth). 1784 was a year of apotheosis for Mesmer, but also the beginning of the end. Challenged by the official savants, he faced a revolt among his disciples. In 1785 he left Paris for an unknown destination. He spent his last years forgotten, and died in seclusion in 1815.

2. PUYSGUR

No sooner had the royal committee given its ambiguous verdict than the emergence of new, even stranger phenomena rekindled the debate. In April 1784 Armand Marie Jacques Chastenet, Marquis de Puységur, Colonel of Artillery and a prominent landowner, began to spend his spare time healing his employees by magnetizing them according to the principles of Mesmer's doctrine. He was called to the bedside of a young peasant suffering from an inflammation of the lungs. Suddenly and unexpectedly, he plunged his patient into a mysterious state of unconsciousness. The Marquis, along with his two brothers, had been among the first to subscribe to Mesmer's lessons, and while performing magnetic healing on this young man, he anticipated the effects that Mesmerian magnetism was known to produce – yawning, sweating, and convulsions, followed by an improvement of the state of health. But things did not develop in the way he expected. The patient's personality changed; a new self emerged, which seemed to overhang his waking consciousness. Furthermore, the young man appeared to be able to predict the course of his malady, to establish its stages, and to read the thoughts of his healer, even before they were fully formed.

Such a state of consciousness had not been reported by Mesmer, but it seems probable that he had encountered it. If he had not reported its existence, it was probably because it contradicted his

materialistic assumptions. Be that as it may, Puységur established, in repeating the experiment upon more patients, that this state of consciousness could be reproduced fairly regularly, and that other somnambulists were equally capable of diagnosing maladies, reading thoughts, and perceiving events outside normal consciousness. By way of contrast with natural somnambulism (sleepwalking) known since antiquity, he named this new state "magnetic" or "artificial" somnambulism. The following year he published his observations in Paris and London, in a memoir that sparked an explosive chain of events. Magnetic somnambulists emerged all over France, and a vast argument on the subject began, which would occupy the educated world for most of the 19th century.

3. FRANCE

During the French Revolution and the First Empire, interest in magnetism entered a latent phase. Many of the aristocrats were forced into exile, and the public's attention was preoccupied by more pressing things. However, with the Restoration in 1815 and the return of many of the nobles, magnetism arose from its ashes. Puységur himself, who had stayed in France, resumed his studies and published some new works. In October 1825, Dr. Foissac, at the request of some medical students, directed a petition to the Academy of Medicine pleading for a re-examination of magnetism. He was not heard, but one of his colleagues, Dr. Husson, chief doctor of the Hôtel-Dieu, went to plead the cause before the Academy. When the report came that judgment had already been passed, Husson argued that it had been Mesmer's practices that had been judged – not somnambulism, of which Mesmer had been ignorant. The argument hit home, and in February 1826, Husson was made director of a new official commission. After five years of work, in June 1831, this commission produced an astonishing verdict, recognizing as genuine most of the somnambulistic phenomena alleged by the magnetizers.

The scandal surrounding the issue was such that the commission's report was printed but never distributed, and the anti-magnetists regained the lead. In 1837 Frédéric Dubois d'Amiens was chosen to head a new commission. Dubois was a young doctor who had become known four years earlier for a violent pamphlet in which he declared war on magnetism. Didier Berna, a physician and magnetizer, was chosen by the committee to coordinate its efforts, but the tension between him and Dubois was such that no agreement on protocols could be reached, and most planned experiments could not

be performed. The committee gave a completely negative verdict in August 1837: none of the phenomena alleged by the magnetizers could be observed, and everything amounted either to trickery or to effects of the imagination.

In October of the same year, the conflict came to a head around a twelve-year-old girl from Montpellier, Léonide Pigeaire. Léonide, the daughter of a local physician, was reputed to be able to see through opaque objects. Her abilities had been attested to by many doctors, including Dr. Lordat, a well-known Montpellier physician, and her father had brought her to Paris to present her to the commission, which had defiantly offered a prize of 3,000 francs to anyone who could read text through an opaque object. Unfortunately, the protagonists could not even reach an agreement on the best method of hiding the text from the reader (a cowl or velvet blindfold fastened at the edges with sticky paper), and the test could not take place. Dr. Pigeaire lost by default, and Dubois d'Amiens' friends seized the opportunity to do away with magnetism in general. On June 15, 1842, after a turbulent session, the Academy of Medicine decided to have nothing further to do with animal magnetism, and not to accept any more papers on the subject.

But magnetism, defeated on the institutional level, continued to flourish in the culture. The doctors had retired from the scene, leaving the stage to writers, judges, theologians, and philosophers, who continued to think about and experiment with magnetism. Among their subjects was Alexis Didier, the famous somnambulist and most marvelous clairvoyant of the 19th century.

4. ENGLAND

During these times, the movement was spreading outside of France. In 1837, the magnetizer Dupotet, who had conducted the experiments for the Husson commission, exported magnetism for the first time to England, which had hitherto been preserved from the Mesmerian craze. After a brief period of mistrust, crowds flocked to his demonstrations. In 1840, he was joined by Charles Lafontaine, another renowned magnetizer. Soon the English developed a passion for mesmerism, and what had happened in France repeated itself, but more quickly. Dr. John Elliotson, a professor at University College in London and a rising star of British medicine, undertook with the aid of Dupotet to perform some public experiments upon two somnambulist women, which unleashed passions and scandals. After a dazzling ascent, Elliotson suffered a brutal fall due to suspi-

cions of fraud on the part of his somnambulist subjects. Dropped by a number of his fellow magnetizers, he was forced to resign from his official functions. However, he continued to pursue the subject, later founding a high-level journal, *The Zoist*, which became the European authority on the subject of mesmerism.

Thus magnetism was expelled from the temples of the British Establishment, but, unlike in France, no official decree was issued to impede or limit its practice. And, just as in France, the subject impassioned writers and intellectuals, and gave rise to intense debates.

5. UNITED STATES OF AMERICA

Also in 1837, the Frenchman Charles Poyen left for the United States to propagate magnetism there. In this country, the resources of institutional protectionism were still in the embryonic stage, and therefore did not hinder the development of mesmerism as they had in France. Many reasons might explain its rapid success. For a nation with a mentality still firmly structured by religion, animal magnetism offered an understanding of the human spirit that was detached from theology but at the same time open to pneumatology. To a mentality obsessed with the concept of liberty, it offered the idea of an autonomous somnambulism. For a population disoriented by industrialization, it offered a method for mending social bonds.

Few official stumbling blocks hindered the spread of magnetism. Unlike in France, scientific hypnology did not set itself up to control magnetism and reject materials that could not be assimilated. Ultimately, it was the materialistic and utilitarian society, rather than institutional barriers, that stopped the spread of magnetism in America. The movement died out at the end of the 19th century.

6. HYPNOSIS

In 1843, James Braid, a Scottish doctor, proposed the term "hypnosis" to define a practice inspired by magnetism, but more limited in its effects and different in its conception. Braid had been inspired by Lafontaine's public demonstrations. According to the theorists of magnetism, it was the influence of the magnetizer that put the patient into a magnetic sleep. Braid, however, believed that the subject entered this state independently by means of auto-suggestion; there was no fluid, no occult influence of one human being on another; and consequently it did not matter by what method the sleep was attained. Braid remained reserved about the "higher magnetic phenomena" that the magnetizers claimed to produce,

but he did not reject them, as is often thought. He contented himself with saying that he had not produced these results with his particular method. At first his method had little success, but after 1878, when the French medical institution decided to lift the decades-old academic taboo and accept the phenomena formerly called “magnetic”, it became the obligatory reference. After its English reform, a change of terminology, a selection of phenomena deemed acceptable, and a materialistic remodeling of its phenomenology, what was formerly known as magnetism was accepted by so-called official medicine.

Around 1860, a few young doctors, including Eugène Azam and Paul Broca, had attempted to promote Braid’s theory in France, but their attempts had remained isolated and without consequences. It was in 1878 that, under Charcot’s leadership, hypnotism rocketed to success. First considered a useful tool for studying hysterics, the practice posed so many questions to psychology and medicine that it became, in the space of a decade, one of the biggest areas of research in the sciences of the mind. The medical establishment now began to embrace a part of what it had condemned fifty years before. Psychiatry, psychology, philosophy, and theories of art and education all found themselves appealed to by the question of hypnosis. Nevertheless, the phenomena that triggered this enthusiasm were nothing but an expurgated and attenuated version of the old magnetic phenomena. In Charcot’s wake, though, physicians such as Julian Ochorowicz and philosophers such as Emile Boirac came to doubt the claim that hypnotism could completely explain away the phenomena produced by the old magnetizers.

At the end of the 19th century, under the impulse of these authors, animal magnetism made a new return to learned discourse, now colored by the scientific and materialistic orientation of that period. With this return was born the research program that the English named “psychical research” and the French, *métapsychique*: a problematic and controversial area of study, but one which aroused great theoretical hopes. Psychical research in Britain began around 1876 at Trinity College in Cambridge, thanks to the initiative of the philosopher Henry Sidgwick, an eminent professor of moral and political philosophy. *Métapsychique*, in France, was thus named in 1919 by the Nobel Prize-winning physiologist Charles Richet. Two decades of theoretical and experimental abundance followed, before the discipline gave way to the incoming tide of new ideologies that followed the Second World War.

7. ESOTERICISM AND MAGNETISM

This broad historical outline should not lead one to think that we are faced with a uniform current. In reality, the magnetic movement, in France, Germany, Britain, and America, has always contained multiple, and sometimes conflicting, schools of thought. In France, before the Revolution, the way mesmerism developed reflected the political and social instability of the era. In the years following the discovery of somnambulism by the Marquis de Puységur, the movement developed three principal divisions: on the “left” were the materialists, on the “center” the psycho-fluidists (Puységur’s disciples), and on the “right” the esoterically oriented magnetizers. The materialists were disciples of Mesmer or of doctors who, like Dr. Jacques Pétéin, wanted to rid themselves of the mesmerian “fluid” and preferred to talk of “vital electricity”. In explaining the somnambulist state, they emphasized the importance of this material vehicle that they thought produced it. The psycho-fluidists, disciples of Puységur and Deleuze, maintained that somnambulism revealed a hidden self and, although they were spiritualists, rejected all reference to entities outside of human consciousness; they saw the fluid only as a vehicle, and emphasized the *will* that set it in motion. The third category, finally, split into several branches. The importance of this last current, esoteric in nature, should not be underestimated.

The study of esoteric magnetism had its nucleus in the city of Lyon – rightly or wrongly reputed to be the esoteric capital of France. Its aristocratic adepts mixed the idea of progress with eschatological expectations, → mysticism, science, Christian esotericism, Jewish Kabbala [→ Jewish Influences], and → alchemy. The writings that they have left recall how simplistic our modern ideas of the Age of Enlightenment often are. They themselves were divided into several schools of thought. Some, like the Chevalier de Barberin, did not envisage entities external to human consciousness, but claimed to act directly upon the patient by will and prayer, without the mediation of any material fluid. Others, such as the famous Jeanne Rochette (whose “sleeps” were recorded by → Jean-Baptiste Willermoz), reported having contact with angelic entities during their trances.

If the esoteric branch of magnetism was born in France, it was in Germany that the movement reached its greatest development. The German mystics, philosophers, and writers carried magnetism to new metaphysical heights. It had an ideal terrain upon which to unfurl: the pre-romantic theologies of light and electricity, developed as early as 1765 by Prokop Divisch, → Friedrich

Christoph Oetinger, and Johann Ludwig Fricker. Most of the promoters of → *Naturphilosophie* (the “philosophy of nature”) integrated magnetism into their theories and dedicated many studies to it, believing in the existence of a “universal connector” – the “inner sense” that, during the magnetic trance, put the somnambulist in communication with the whole of nature. One major example is → Gotthilf Heinrich Schubert, with his *Ansichten von der Nachtseite der Naturwissenschaft* (1808, Views from the Night Side of Natural Science) and *Die Symbolik der Träume* (1814, The Symbolism of Dreams).

Other theorists sought to anchor the mysteries of somnambulism in physiology, in terms of theoretical oppositions between the cerebro-spinal system, the organ of diurnal thought and rationality supposedly dominant in men, and the ganglion system, the support of the nocturnal forms of life, that they believed to predominate in women. Around 1779, Eberhard Gmelin discussed his views in *Neue Untersuchungen bei den thierischen Magnetismus* (New Studies in Animal Magnetism, 1789). His views have caused many authors, such as Ricarda Huch, to affirm that most somnambulists were women or effeminate men.

There were many great German theorists of animal magnetism in the Romantic Era – for example, Dietrich Georg Kieser and Carl August von Eschenmayer, co-directors of the review *Archiv für den thierischen Magnetismus* (Archive for Animal Magnetism, 1817-1824). Kieser also wrote the important *System des Tellurismus oder thierischen Magnetismus* (System of Tellurism, or Animal Magnetism, 1826). Among the writings of Eschenmayer figures *Mysterien des inneren Lebens, erklärt aus der Geschichte der Seherin von Prevorst* (Mysteries of the Inner Life, Explained by the Story of the Seeress of Prevorst, 1830). There were also Friedrich Hufeland, who tried to understand the sympathy between beings (*Über Sympathie; On Sympathy*, 1811); Johann Carl Passavant (*Untersuchungen bei dem Lebensmagnetismus und das Hellsehen; Researches in Animal Magnetism and Clairvoyance*, 1821); and Karl Friedrich Burdach, who in *Zeitrechnung des menschlichen Lebens* (Chronology of Human Life, 1829) maintained the existence of a transpersonal mental space to which the magnetic trance provided access.

The Swabian physician and poet → Justinus Kerner has a special place here; his name is bound up with that of the famous somnambulist Friederike Hauffe, the Seeress of Prevorst. This young woman is the archetype of the somnambule who, beset by various bodily ills, draws mystics,

writers, and doctors to her bedside. Living in a semi-permanent state of somnambulistic trance, Hauffe presented the whole gamut of magnetic endowments: the gifts of second sight and of precognition, predicting deaths, revealing maladies, prescribing remedies, and being extremely sensitive to certain substances. She even saw spirits of the dead and maintained a semi-permanent communication with them. The speeches she made during her altered states of consciousness included many ideas of a clearly theosophic character. They were recorded by Justinus Kerner in his book *Die Seherin von Prevorst* (The Seeress of Prevorst, 1829), which had a great impact, notably thanks to its publication in English in a translation by Catherine Crowe (*The Seeress of Prevorst*, 1845). But of all the Germans of this era, it was certainly → Franz von Baader who authored the most noteworthy writings devoted to the connection between animal magnetism and theosophy [→ Christian Theosophy] (cf. inter alia: *Über die Extase oder das Verzücktsein der magnetischen Schlafredner; On Ecstasy, or the Rapture of Magnetized Sleepwalkers*; 1817-1818). Compared with facts accumulated in France in the same era, the German magnetic body of work presents a striking and instructive difference. In effect, most of the French somnambulists famous for their clairvoyant gifts (notably Alexis Didier), exercised their second sight directly, without using supernatural entities as a relay. Their discourse while in a trance was turned towards earthly reality more than towards the celestial spheres or theosophical speculation, as tended to be the case in Germany.

8. RELATED DEVELOPMENTS

Connections between magnetism and spiritualism were drawn in the English-speaking world as well, although in this somewhat more materialistic culture the dominant approach was marked by positivism and a careful attention to scientific fact. In England, around 1838, Dr. Herbert Mayo, professor at King's College, London, experimented with magnetic somnambulists in the hope of counteracting the growth of materialism through proof of the existence of the soul and its independence from organic life. Around 1850, the experiments performed over distance with the famous Alexis Didier convinced him that the spirit was truly able to detach itself from the body. The Rev. Chauncy Townshend, a writer, painter, poet, and a friend of Dickens, also experimented with Alexis and published the result of his personal studies in *Facts in Mesmerism* (1844 – a work that would later inspire Edgar Allen Poe). Finally, in the United States of

America, the development of magnetism was marked by the exaltation of the individual typical of this young nation. Henceforth the somnambulists had no more need of magnetizers, but magnetized themselves. The American version of the “Magnetic Heroes” represented in France by Alexis Didier or in Germany by Friederike Hauffe appeared in figures like → Andrew Jackson Davis (*The Great Harmonia*, 1852) and Phineas P. Quimby, whose new interpretation of magnetic healing was at the basis of the movement of “mind cure” (→ New Thought).

9. CONCLUSION

For mainstream Western culture, animal magnetism was a shock and a challenge whose magnitude and effects are too often forgotten today. For the participants it brought great hopes, not only for a scientific breakthrough, but for a moral and social renovation and a deepening of spiritualist philosophy. For the movement’s adversaries, it threatened to subvert reason and to pervert the social order; therefore it must be combated in every possible way. The result was a cultural battle that led to the repression of magnetism, and its eventual oblivion. While the phenomena of somnambulism have never been completely objectified or explained in a satisfying manner, they have certainly stimulated and/or disquieted all aspects of culture. Psychiatry, psychoanalysis, the psychology of altered states of consciousness, philosophy, the history of religion, ethnology, art, literature, and theories of education – all have been affected by this current and still bear its mark. And the questions posed by magnetism do not belong only to a movement that died out long ago; they remain highly pertinent even today.

The bibliography of animal magnetism is immense. It consists of a series of very diverse writings: brochures, pamphlets, theoretical studies, case studies, and accounts of séances. There are certainly over 5,000 titles in English, French, and German alone. The most complete bibliography is that of Adam Crabtree: *Animal Magnetism, Early Hypnotism, and Psychical Research, 1766 to 1925: An Annotated Bibliography* (Kraus International Publishers: New York 1988), but it is still far from covering all the relevant literature. The works mentioned below concern the essential episodes in the history of magnetism, but are meant only to serve the reader as a first orientation in this labyrinth.

animal, ou Sur la théorie du monde et des êtres organisés, d’après les principes de M. Mesmer, The Hague, 1784 ♦ Jean-Sylvain Bailly, *Rapport des commissaires chargés par le Roi de l’examen du magnétisme animal*, Paris: Imprimerie Royale, 1784 ♦ Armand Marie Jacques de Chastenet, marquis de Puysegur, *Mémoires pour servir à l’histoire et à l’établissement du magnétisme animal*, Paris, London: Dentu, 1784-1785 ♦ Laurent de Jussieu, *Rapport de l’un des commissaires chargés par le Roi de l’examen du magnétisme animal*, Paris: Veuve Harissart, 1784 ♦ Chevalier de Barberin, *Système raisonné du magnétisme universel*, Ostend: Société de l’Harmonie d’Ostende, 1786 ♦ Armand Marie Jacques de Chastenet, marquis de Puysegur, *Recherches, expériences et observations physiologiques sur l’homme dans l’état de somnambulisme naturel et dans le somnambulisme provoqué par l’acte magnétique*, Paris: Dentu, 1811 ♦ Jacques-Désiré Pétetin, *Electricité animale*, Paris: Bruno-Labbe et Gautier, 1808 ♦ Joseph-Pierre Deleuze, *Histoire critique du magnétisme animal*, 2 vols., Paris: Mame, 1813 ♦ Etienne d’Hénin de Cuvillers, *Le magnétisme animal retrouvé dans l’Antiquité, ou Dissertation historique, etymologique et mythologique sur Esculape, Hippocrate et Gallien; sur Apis, Sérapis et Osiris; suivie de recherches sur l’origine de l’Alchimie*, Paris: Barrois, 1821 ♦ Pierre Foissac, *Mémoire sur le magnétisme animal, adressé à MM. les membres de l’Académie des sciences et de l’Académie royale de médecine*, Paris: Didot, 1825 ♦ Justinus Kerner, *Die Seherin von Prevorst: Eröffnung über das innere Leben des Menschen und über Hereinragen einer Geisterwelt in die Unsere*, 2 vols., Stuttgart: J.G. Cotta, 1828 ♦ Frédéric Dubois (d’Amiens), *Examen historique et résumé des expériences prétendues magnétiques faites par la commission de l’Académie royale de médecine*, Paris, 1833 ♦ Joseph-Pierre Deleuze, *Mémoire sur la faculté de prévision*, Paris: Crochard, 1836 ♦ Didier Berna, *Magnétisme animal: Examen et réfutation du rapport fait par M.E.F. Dubois (d’Amiens) à l’Académie royale de médecine, le huit août 1837, sur le magnétisme animal*, Paris: Rouvier, 1838 ♦ Jean Pigeaire, *Puissance de l’électricité animale, ou du magnétisme vital, et de ses rapports avec la physique, la physiologie et la médecine*, Paris: Dentu et Baillièrre, 1839 ♦ Jules Dupotet de Sennevoy, *Le magnétisme animal opposé à la médecine: Mémoire pour servir l’histoire du magnétisme en France et en Angleterre*, Paris: Roret, 1840 ♦ Aubin Gauthier, *Histoire du somnambulisme chez tous les peuples, sous les noms divers d’extases, songes, oracles et visions, examen des doctrines théoriques et philosophiques*, 2 vols., Paris: Dentu et Baillièrre, 1842 ♦ James Braid, *Neurypnology or the Rationale of Nervous Sleep, Considered in Relation with Animal Magnetism, Illustrated by Numerous Cases of its Successful Applications in the Relief and Cure of Diseases*, London: John Churchill, 1843 ♦ John Elliotson, *Numerous Cases of Surgical Operations without Pain in the Mesmeric State; with Remarks upon the Opposition of Many Members of the Royal Medical and Chirurgical Society and Others to the Reception of the Inestimable Blessings of Mesmerism*, Philadelphia: Lea and Blanchard, 1843 ♦

Friedrich-Anton Mesmer, *Mémoire sur la découverte du magnétisme animal*, Geneva, Paris: Didot, 1779 ♦ Nicolas Bergasse, *Considérations sur le magnétisme*

Chauncey Hare Townshend, *Facts in Mesmerism, with Reasons for a Dispassionate Enquiry into it*, London: Longman, 1844 ♦ Charles Lafontaine, *L'art de magnétiser, ou le magnétisme animal considéré sous le point de vue théorique, pratique et thérapeutique*, Paris: Baillière, 1847 ♦ Joseph-Pierre Durand, called Durand de Gros, *Electrodynamisme vital, ou les relations physiologiques de l'esprit et de la matière démontrées par des expériences entièrement nouvelles et par l'histoire raisonnée du système nerveux*, Paris: Baillière, 1855 ♦ Jean-Martin Charcot, *Contribution à l'étude de l'hypnotisme chez les hystériques*, Paris, 1881 ♦ Julian Ochrowicz, *De la suggestion mentale*, Paris: Doin, 1887 ♦ Emile Boirac, *L'hypothèse du magnétisme animal d'après les recherches récentes*, Paris, 1895 ♦ Phineas P. Quimby, *The Quimby Manuscripts*, New York: Thomas Crowell, 1921.

Lit.: François Azouvi, "Sens et fonction épistémologique de la critique du magnétisme animal par les Académies", *Revue d'Histoire des sciences* (1976) ♦ Albert Beguin, *L'âme romantique et le rêve*, Paris: Librairie José Corti, 1939 ♦ Ernst Benz, *Theologie der Elektrizität*, Mainz: Akademie der Wissenschaften und der Literatur, 1970 ♦ Christine Bergé, *L'Au-delà et les Lyonnais, Mages, médiums, et Franc-Maçons du XVI^e-II^e au XX^e siècle*, Lyon: Lugd, 1995 ♦ Adam Crabtree, *From Mesmer to Freud: Magnetic Sleep and the Roots of Psychological Healing*, New Haven, London: Yale University Press, 1993 ♦ Robert Darnton, *Mesmerism and the End of the Enlightenment in France*, Cambridge, Mass.: Harvard University Press, 1986 ♦ Henri Ellenberger, *The Discovery of the Unconscious: The History and Evolution of Dynamic Psychiatry*, New York: Basic Books, 1970 ♦ Antoine Faivre, *Philosophie de la nature: Physique sacrée et théosophie XVIII-XIX^e siècle*, Paris: Albin Michel, 1996 ♦ Robert C. Fuller, *Mesmerism and the American Cure of Souls*, Philadelphia: The University of Pennsylvania Press, 1982 ♦ Alan Gauld, *The Founders of Psychical Research*, New York: Schocken Books, 1968 ♦ idem, *A History of Hypnotism*, Cambridge: Cambridge University Press, 1995 ♦ George Gusdorf, *L'homme romantique*, Paris: Payot, 1984 ♦ Wouter J. Introduction to A.M.J. de Puységur", *Mémoires pour servir à l'histoire et à l'établissement du magnétisme animal*, Paris: Les Empêcheurs de penser en rond, 1999 ♦ Maria M. Tatar, *Spellbound: Studies on Mesmerism and Literature*, Princeton NJ: Princeton University Press, 1978 ♦ Alison Winter, *Mesmerized, Powers of Mind in Victorian Britain*, Chicago: University of Chicago Press, 1998.

BERTRAND MEHEUST

Anthroposophy

1. OCCULT PHYSIOLOGY
2. CHRISTOLOGY
3. PLANETARY EVOLUTION
4. REINCARNATION AND KARMA
5. THE SPIRITUAL PATH
6. THE ANTHROPOSOPHICAL MOVEMENT

The term anthroposophy has been used by various hermetic and philosophical authors in the modern era, the earliest one being the English alchemist → Thomas Vaughan (1622-1666). In the 19th century the title was used by, among others, the philosopher Immanuel Hermann Fichte (1797-1879), son of the famous Johann Gottlob Fichte, and Robert Zimmermann (1824-1898), professor of philosophy at the university of Vienna. One of his students was → Rudolf Steiner, with whom the term anthroposophy is now usually associated. Steiner used the term to refer to his own esoteric doctrine, as distinguished from the older theosophy of the → Theosophical Society with which he broke in 1913. According to one of the definitions that Steiner has given of anthroposophy, it is 'a path of knowledge that connects the spiritual in man with the spiritual in the cosmos'. Steiner claimed that anthroposophy is not a matter of revealed religious doctrine, but of 'spiritual science' that one has to develop oneself: it does not teach 'the wisdom of man' but tries to awaken the 'consciousness of one's own humanity', not only as a key to understanding the macrocosmos but especially as a means of bringing about a spiritual transformation of daily life. This article gives a thematic survey of key topics in Steiner's anthroposophy. For information about Steiner's biography and the development of anthroposophy, see the article on Steiner.

1. OCCULT PHYSIOLOGY

One of the key elements of Steiner's anthroposophy is a spiritual or occult [→ occult/occultism] physiology of man. Steiner did not have one single physiological system, but developed several versions over the course of time. These different perspectives serve different purposes and for the most part they overlap only partially. They have their basis in the concept, provided in his book *Theosophy* (1904) and elsewhere, of a tripartition of body, soul and spirit. The human soul mediates between the eternal spirit or Self and the perishable physical body. In *Theosophy* and elsewhere, however, this tripartition is transformed into a four-fold distinction between physical body, etheric body, astral body and I, which is reminiscent of

Paracelsian medicine [→ Paracelsianism]. Macrocosmically, the physical body is what links us humans to the mineral world, while the etheric body links us to the plant world, the astral body to the animal world, and the I is uniquely human. The etheric body is roughly equivalent to what Aristotle calls the organic soul: it is responsible for growth and life, and is the bearer of heredity. As such it is essentially plastic, endowing the physical body with a specific form and shape. The astral body is sometimes simply referred to as “the soul” and is roughly equivalent to Aristotle’s sensitive soul. It is the basis for interiority and subjectivity, giving rise to the whole range of emotions and desires, but also of unconscious impulses. Whereas the etheric body has a natural tendency towards unity and wholeness, the astral body is the principle of differentiation and specialization. Steiner sometimes compares the relation between these two “bodies” as that between the convex and the concave: the etheric body has the task of harmonizing and unifying the body, whereas the astral body carves out inner spaces, providing room for interiority. The I is Steiner’s equivalent of the Aristotelian intellectual soul. It is the eternal, imperishable Self that reincarnates in a new physical body and is the bearer of karma. It is not just our spiritual core which is added to the other “bodies”, but in a quite Aristotelian fashion also functions as an entelechy, unifying, organizing and harmonizing our physiology, and giving our lives purpose and direction. In this connection Steiner speaks of the “I-organization”, referring to the relation of the I to the several “bodies”, as distinct from the I taken as an entity in itself. For instance, with respect to the physical body the I’s activity can be seen in two typically human activities, namely speech and erect movement. In the case of the etheric body, the strength of the I and its grasp of the etheric body can be gathered from the way a child grows: harmonious growth is evidence for a strong grasp by the I, whereas irregular growth points to a weak one. The I can also pacify and harmonize the astral body, creating emotional stability and a sense of direction and purpose. From these examples it becomes clear that Steiner’s I combines Schopenhauer’s and Nietzsche’s unconscious will and the Cartesian *cogito*. Clear and distinct awareness of the self is but one of the many functions exerted by the I, albeit a crucial one.

The human soul, according to Steiner, consists of several further subdivisions, the sentient soul (*Empfindungsseele*), the intellectual soul (*Verstandesseele*) and the spiritual soul (*Bewusstseinsseele*). These souls are the products of the I’s transforma-

tion of, respectively, the astral body, the etheric body and the physical body. The sentient soul is the first stage of sentient and emotional life, in which the soul is completely absorbed by outer impressions and inner sentiments. The intellectual soul exhibits the first vestiges of thought activity by which we can turn outer impressions into clear perceptions and concepts, and can bring structure to our inner life. Thus, we create room for emotions such as sympathy, which go beyond the mere egoistic sense of self-preservation. This is why Steiner also refers to this soul as the sensitive-emotive soul (*Verstands-Gemütsseele*). The intellectual soul still has a sense of immediately belonging to the external world, without experiencing any ruptures. The spiritual soul, by contrast, emancipates itself from the external world. In this case, the I turns to sense perception coming from the physical body, experiencing a kind of alienation that can be remedied only by finding its spiritual core within itself. The spiritual soul, in other words, develops a high sense of self-consciousness that not only stands in opposition to the external world but also individualizes itself with respect to fellow human beings, loosening the collective ties of family, nation, religious community etc. Through self-consciousness, the spiritual soul is also able to take a more objective and less emotional stance towards external events, determining our actions by objective judgments rather than by sympathy and antipathy. In Steiner’s view not only each human life but, as will become clear below, human culture as a whole as well, pass through these different stages.

Next to these three souls that present human beings have developed, Steiner also mentions three soul organs that will be cultivated in a distant future, but on which we can already partially work in our present stage of evolution, by means of spiritual exercises and moral conduct. Using theosophical vocabulary, Steiner calls these souls Manas or Spirit self (*Geistselbst*), Budhi or Life spirit (*Lebensgeist*) and Atman or Spirit man (*Geistesmensch*), which represent, respectively, the full transformation by the I of the astral body, the etheric body and the physical body. Steiner devoted special attention to the Spirit self, which can help us overcome the potential materialism and anti-social tendencies of the spiritual soul.

Next to his four-fold physiology, Steiner propounded a tripartition of soul activities, which also have an organic basis. Steiner divided the human organism into the region of the head or nervous-sense system (seat of the activity of thought), the heart-lung region or rhythmic system (seat of the activity of feeling) and the metabolic

system (seat of the activity of will). This partition also has a macrocosmic counterpart, consisting in the three persons of the Trinity: Father (will), Son (feeling) and Holy Spirit (thought). This brings us to Steiner's Christology.

2. CHRISTOLOGY

Steiner vehemently campaigned against Adolf Harnack, David Friedrich Strauss and other representatives of contemporary Protestant *Leben Jesu Forschung* for robbing Jesus Christ of his divine status and reducing him to a mere prophet. For Steiner, Jesus Christ was essentially the divine Logos incarnate. Christ is the spirit of the sun who descended to the earth in order to redeem not only mankind but the earth in general. According to Steiner, mankind has fallen prey to the forces of evil, that have made him mortal and have thrown his diverse "bodies" into decadence. In order to revitalize humankind, Christ had to taste death himself and bring the ultimate sacrifice, thus becoming the "inner sun" or spirit of the earth and restoring its sense and purpose. According to Steiner, through the blood of Christ after the Crucifixion the whole earth began to shine. Though Steiner's emphasis on Jesus Christ's divine character could be called Gnostic [→ Gnosticism], he avoided docetism by affirming that Jesus Christ had really died in human shape and had risen from the dead. Nevertheless, he made a distinction between the human person Jesus, and Christ as the divine Logos. In fact, according to Steiner we can only legitimately speak of Jesus Christ from the Baptism in the Jordan onwards, which he sees as the moment in which Christ truly descended into Jesus and became man. Jesus' corporeal nature was a vessel which had been prepared over thousands of years. In an attempt to square the gospel according to Luke with the gospel according to Matthew, Steiner speaks of two children with the name Jesus and two pairs of parents called Joseph and Mary. He refers to the child of the gospel according to Luke as the Nathanic Jesus, after one of the sons of David, in whose bloodline he stood. He describes this child as Adam-Kadmon, the human nature that had not gone through the Fall; his very being was therefore complete innocence, which was only reinforced by the fact that Buddha had reunited himself with its astral body. On the other hand, the Solomonian Jesus – named after David's other son – had inherited the I of Zarathustra [→ Zoroaster]. When these children were twelve, the I of this second child merged with the other bodies of the first child, an event which according to Steiner is evi-

denced by the biblical story of Jesus teaching in the temple. The fact that his parents did not recognize him is explained by Steiner in the sense that the innocent child all of a sudden had turned into one of the wisest persons on earth. At birth, the first child was venerated by the shepherds who received Buddha's message of peace, while the second child was venerated by the three Magi, former pupils of Zarathustra who recognized their Master, offering him the results of his teachings: gold (transformed thought), incense (transformed feeling) and myrrh (transformed will). In this sense, Jesus reunited the two currents of shepherds or priests (descendants of Abel) and that of the kings (descendants of Cain).

Christ's task is to help man overcome evil, which according to Steiner has the two-fold character of Lucifer and Ahriman (after the Persian Ahura-Mazdao). Lucifer stands for the forces that try to lift man from the earth by accelerating normal development. He works through the powers of phantasy, → imagination, enthusiasm and sympathy. Lucifer is the devil who was responsible for the Fall, bringing us not only death and egoism, but also a sense of the self and of liberty, the possibility of taking decisions without the consent of God. Ahriman, by contrast, stands for the forces that fetter man to the earth by retarding normal development. Ahriman works through the powers of cold, materialist intellect, the will for power and domination, and antipathy. Whereas Lucifer tries to change men into bird-like, pseudo-angelic entities without any real connection to and concern for the earth, Ahriman attempts to change the earth into a machine, killing all vegetal, animal and individual human life. In a quite manichaeistic manner [→ Manichaeism], Steiner describes Christ's task as consisting not in eradicating this two-fold evil, but in transforming and redeeming it. Christ is the world-I that can find the balance and harmony between these two powers, using them for a good purpose. Steiner expressed this character in a huge wooden statue, the Representative of Mankind (*Menschheitsrepräsentant*), meant for the first Goetheanum and still on display in the present Goetheanum in Dornach, Switzerland. Christ there holds a middle position between the Luciferic and Ahrimanic forces. This explains why in some contexts, Steiner gives a very positive account of Lucifer as the light-bringer who has brought us knowledge and science, who presided over all pre-Christian initiation, the guide of the soul through the planetary spheres after death etc. Thanks to Lucifer man has become free, but thanks to Christ

he can use this freedom in order to voluntarily do good, transcending the egoism that forms the shadow side of Lucifer's gift of freedom.

In this context, Steiner also developed his version of the distinction between higher and lower Self or "I". The lower self is the product of Lucifer, who is responsible for the ego-centred, daily consciousness that is tied to our blood. Christ inhabits our higher I; He is the universal I that purifies the egoistic forces of the blood and reunites humankind as a whole. Nevertheless, Christ is above all our example to emulate. With his help we humans can transform the earth into a "cosmos of love", restoring the gross, material earth to its original spirituality, freed of all gravity, decay and opaqueness. Thus we can create the new Heavenly Jerusalem of the Apocalypse. In this sense, Steiner was close to the Pelagianism of early modern spiritual → alchemy and to → Rosicrucianism.

Not unlike → Jacob Boehme, Steiner stressed the different characters and tasks of the three Persons of the Trinity, that not only pervades the natural world and human physiology (thought being connected to the Sprit, feeling to Christ, will to the Father) but is also reflected in the Celestial Hierarchies Steiner adopted from → Pseudo-Dionysius Areopagita. The first Hierarchy (Seraphim, Cherubim and Thrones) reflects the Father, the second (Dunamis, Kyriotetes, Exousiai) the Son, and the third (Angels, Archangels and Archai) the Holy Spirit. Steiner devoted special attention to the third Hierarchy, the "Hierarchies of personality" which stand closest to the human spirit. The Angels guide the individual person in accordance with his personal destiny, the Archangels are the leaders of nations and historical periods, while the Archai direct humankind as a whole. Among the Archangels, Michael occupies a central place. Steiner calls anthroposophy "Michaelic", referring to Michael's apocalyptic battle with the dragon. According to Steiner, St. Michael is the keeper of cosmic intelligence, which is formed by the diverse mutual relations between the planets, stars and Hierarchies. In order for us to become free, this cosmic intelligence has been bequeathed to man, who from the Greek period onwards has been able to develop human science and wisdom. Ahriman, the dragon that has been chased out of the heavens by Michael, tries to seduce us to use this intelligence for his own materialist, anti-human purposes. In answer, Michael challenges us to transform terrestrial intelligence into a new cosmic, Christianized intelligence that employs the powers of clear thinking in order to build a more just and harmo-

nized world. He does not do so by direct inspiration but by appealing to our I that has to find an independent spiritual and moral path. Michael is the archangel guiding the present epoch, that according to Steiner started in 1879, the end of the so-called Kali Yuga or dark period, in which human kind could only with great difficulty gain access to the spiritual world.

3. PLANETARY EVOLUTION

Steiner obviously had a very essentialist view of history, which, according to him, not only has well-defined periods, but also a clear sense and purpose. In fact, human physiology developed over eons in which the earth and our planetary system as a whole went through several phases, which Steiner calls Saturn-phase, Sun-phase, Moon-phase, the present Earth-phase and the future Jupiter-, Venus- and Vulcan-phases. Not only these names but also the description of the earth's planetary evolution itself have much in common with previous theosophical literature, especially the writings of → Mme Blavatsky. Steiner's description of the first three epochs of the earth phase owe a lot to theosophy as well. According to Steiner, Saturn, Sun and Moon are recapitulated during the respective phases of that he calls the Polarian, Hyperborean, Lemurian and Atlantean epoch. Steiner situates the biblical story of the Fall in the Lemurian epoch, in which Lucifer seduces the ancestors of man into using their I for their own, selfish purposes. They were thus able to cause enormous fires in their environment, which ultimately destroyed the mythical continent of Lemuria. Only a very small group was able to escape to the continent of Atlantis, where they became the ancestors of the fourth "root-race" of humankind, as Steiner refers to it, using theosophical vocabulary. Atlantis had planetary Oracles, places of initiation where a few chosen ones were taught about the evolution of the Cosmos and the importance of Christ therein. However, a few initiates became corrupt through the influence of Ahriman. They used their "mystery knowledge" in order to exploit and abuse the forces of nature for their own pleasure, which ultimately led to another gigantic backlash: according to Steiner the biblical story of the Flood is a legendary account of what really happened to Atlantis around the 10th millennium BC. Again, a small group of initiates were saved from the flood. Under the leadership of Manu, the great sun-hierophant, they founded the culture of the present 5th, post-Atlantean epoch of the earth phase. This epoch itself is again subdivided into several so-called

“culture-epochs”, namely the ancient Indian culture-epoch, the ancient Persian epoch, the ancient Egyptian epoch, the Greco-Roman epoch and the present spiritual soul epoch that started in the middle of the 15th century. Steiner situates the ancient Indian epoch before the origins of Vedanta philosophy, which is but a shadow of the wisdom of the Rishi’s (the Indian masters described in theosophical literature). The Persian epoch is also situated well before the documented history of Zoroastrianism, which again is a reflection of the original wisdom of this period, in which man became more attached to the earth, inventing agriculture and founding cities. The Egyptian epoch is described by Steiner as the period in which the sentient soul was developed, for Egyptian culture was guided by its founding myths, spiritual images that pervaded daily life, and especially the sphere of life, death and the life after death. By contrast, the Greco-Roman epoch found its way out of the images of mythology into the clear thoughts of philosophy, marking the beginning of the epoch of the intellectual soul. Our present epoch, that of the spiritual soul, is determined above all by the development of natural science, by means of which we have been able to conquer and command nature, thereby alienating ourselves from the spiritual world. It is also the period in which old social, national and religious structures crumble, creating a void that has to be filled by the human I that acts in accordance with Christ.

The Death and Resurrection of Christ in the Greco-Roman culture epoch is thus the “mid-point” of planetary evolution, providing a remedy for the decay that had set in through Luciferic and Ahrimanic influences. From that moment on, humanity and earth in general have been able to make a U-turn, finding a new way up towards the New Jerusalem. Although this “U-shape” version of evolution going from original purity through decay and back again to a new form of purity is common to many forms of esotericism and especially prominent in modern theosophy, the central place accorded to the coming of Christ in the planetary evolution makes anthroposophy different from older theosophical accounts of planetary evolution, with which Steiner otherwise has a lot in common. In fact, apart from his esoteric perspective on the history of Persians, Egyptians, Greeks etc., Steiner also outlined an esoteric history of Christianity. Not unlike his theosophical predecessors Steiner more or less included all the known spiritual “Masters” in this history. For instance, he speaks about a “Council” taking place in the 4th

century, in which participated the great esoteric leaders of the West: Manes, representing the I, Zarathustra, representing the astral body, Buddha, representing the etheric body, and Skythianos, representing the physical body. These four Masters mapped out the future development of Christianity from the perspective of the old initiatory knowledge of the Egyptian and Greek mysteries, that had prepared Christ’s coming. The basic question during this meeting was how the ancient secret knowledge could be saved and transformed in the light of Christ’s redemptive act. These masters thus founded “esoteric Christianity”, which according to Steiner appeared on earth in the form of the grail current (under the leadership of Percival) [→ Grail traditions in Western esotericism] and, subsequently, → Rosicrucianism under the leadership of Christian Rosencreutz.

Steiner thus showed himself as obsessed with the concept of evolution as all other members of the cultural elite in the 19th and early 20th centuries. In this connection he has often been accused of implicit or even explicit racism. His evolutionary logic, which is quite reminiscent of Hegel’s philosophy of world history, implies that some “culture epochs”, and also some races, are higher – closer to the nucleus of contemporary world development – than others. The vanguard of the present evolutionary epoch, for instance, is mainly to be found in Middle Europe, other nations being seen as less relevant or even as “decadent” survivals from earlier periods. Steiner’s opponents point to a few very unfortunate passages which, for instance, speak of native Americans being decadent and more or less “ready” for the mass murder committed by the Europeans. Furthermore, Steiner speaks of the Jewish people as having fulfilled its mission and facing no other choice than either complete assimilation or extinction. This is not the place to draw a final conclusion about Steiner’s alleged racism, but a full discussion should take into account some additional factors: his explicit rejection of social Darwinism, his philosophy of freedom that speaks of the moral person acting on the strength of individual moral intuitions and breaking away from the collective morality of nation and religion, and his emphasis on the notion that we live in the epoch of the spiritual soul, in which the human I – which is common to all humankind – more and more comes to dominate the forces of race and religion that divide human beings. Moreover, Steiner actively combated anti-semitism in his Berlin years and opened the newly founded Anthroposophical Society in 1923/24 for everyone, regardless of sex, race or religion.

4. REINCARNATION AND KARMA

In order for us to be able to experience planetary evolution and, above all, to further it, Steiner thought we need more than one life, in other words, we need to reincarnate. The theme of → reincarnation and karma is a central ingredient of Steiner's teachings, and underwent a fair degree of metamorphosis over the years. In fact, the last great lecture series before his death was devoted to yet another revision of his original conceptions. Karma, the law of cause and effects that connects our present life with previous ones is formed in the life between death and the new incarnation, to which Steiner devoted a lot of attention. His descriptions of the path of the soul through the diverse regions of the spiritual world has similarities with theosophical doctrines and pre-modern Western sources such as Macrobius and other Platonists. Again, however, Steiner's doctrine stands out not only for its highly systematic character but also for its attempt to integrate ideas about reincarnation and Karma within a Christian framework.

After death, the first body that we lose is the etheric one, which contains the memories of the past life. During the first three days after death, while this body is shed off, the soul re-experiences all the events of the past life in reverse order. Next, the soul enters the world to which Steiner refers by the theosophical term Kamaloka. Here, it is the astral body that is purged from its experiences in the past life. The Kamaloka confronts us with everything we have done out of egoism; it is the sphere of guilt, spite and retribution, showing us all the emotional and other damage we have caused in other people's souls. However, this almost Old Testament notion of tit for tat (in fact, Steiner says that the soul experiences → Moses as a kind of Guardian of this region) has been substantially transformed by Christ's Resurrection. The more we have lived our life with Christian love, the shorter this period will be. Moreover, Christ does not so much punish us for our failures as that he looks at them from the perspective of moral improvement.

Then, the I enters the lower and subsequently the higher Devachan – yet another theosophical term. The lower Devachan is basically the Platonic world of Archetypes, whereas the higher Devachan contains the cosmic intentions or thoughts behind these Archetypes. The higher Devachan stretches out over the Zodiac. Here we experience the “Sun at Midnight”, the point between the upward movement after death and the downward movement towards a new incarnation. In this region Karma is formed in conjunction with the Celestial Hierar-

chies. Having worked through all of its past in the way up to the Sun at Midnight the I now goes back through the planetary spheres, forming its new bodies that contain the karmic consequences of the past life. In this connection, Steiner speaks about a three-fold karma: the karma of events that is linked with the physical body, the natural karma linked with the etheric body, and the karma of sympathy and antipathy linked with the astral body. The natural karma encompasses everything that has to do with health and disease, but also with the specific family or nation one has chosen to be born into etc.; sympathy and antipathy refer to our professional and other interests or affinities; whereas the karma of events refer to crucial experiences that shape or change our lives. In this context, Steiner does not tire of stressing that everything that happens to us has sense or purpose. Steiner essentially depicted a symbolic cosmos in which the Hierarchies continuously emit signs that gives us guidance for our actions, provided of course that we are able to read these signs. For instance, anthroposophists are supposed not to curse a train that gets broken on one's way to a highly important job interview, but to see it as a wake-up call by the Hierarchies, suggesting reflection on the question whether this particular job is really what one should be doing in life. This example also makes clear that karma according to Steiner is not just a matter of Leibnizian pre-established harmony, concocted in heaven, but is also the outcome of direct intervention by the Hierarchies in our daily lives.

Steiner urged anthroposophists to look for certain red threads running through a person's biography (including our own), with respect to the various forms of karma that in a next step can be explained in terms of karmic laws. For instance, in regard to natural karma, a certain susceptibility to smallpox is the result of one's past life's tendency to act without love or real interest. Actually, most of the many karmic laws that Steiner describes stretch out over various lives. Nevertheless, Steiner had anything but a deterministic or pessimistic outlook on karma. Again, the crucial fact here is the presence of Christ, whom Steiner calls “Lord of the Karma”. Thanks to Christ, karma is no longer a deterministic cycle, from which we can only strive to escape as soon as possible. Karma and reincarnation are seen in the light of moral and spiritual perfectibility. Humans reincarnate in order to work on their own purification and especially on that of the earth. Christ thus transforms the karmic laws from laws of retribution for past sins, into possibilities for moral improvement. For instance, one may

be confronted with a strong antipathy or open enmity by a certain person, which is the result of a negative act one has oneself committed against this person in a previous life. By trying not to respond by giving in to antipathy, fear or other negative emotions, but rather, by using the I to find common ground, one makes up for past sins. In this connection, Steiner also speaks of old or “moon”-karma and “new” or sun-karma. Thanks to Christ’s presence in our I we can take the initiative to step beyond old karmic laws, creating a new and more positive karma that also extends to persons one has never met in previous lives.

Steiner tried to harmonize the doctrine of reincarnation and karma with the traditional theological doctrines concerning God’s Grace and the forgiveness of sins. What Christ forgives or remedies is the objective consequences of our immoral acts: by committing sin, we not only hurt fellow human beings but also the spiritual sphere of the earth. Christ ensures that we are confronted with the subjective karmic consequences of our actions, in view of improvement, thereby preventing us from facing the objective effects that we would never be able to manage.

5. THE SPIRITUAL PATH

According to Steiner himself, all the doctrines discussed so far are the outcome of independent spiritual research, based on his innate clairvoyant capacities. In fact, Steiner emphasizes that he has found e.g. all the information concerning the dual biography of Jesus in the Akasha-Chronicle, the earth’s planetary record in the spiritual world. Although Steiner taught all these doctrines to his followers, he certainly did not think that spiritual knowledge was confined to a few initiates or Masters. Quite on the contrary, scholars have described Steiner’s esoteric doctrine as a “democratization” of spiritual experience as compared to older theosophy, even paving the way in this particular respect for the do-it-yourself-spirituality of the → New Age Movement. In many places in his work, Steiner gave indications for a systematic personal spiritual path that would lead to knowledge of the higher worlds. He gave particular meditations or mantras (especially in the form of the meditations intended for the First Class of his School of Spiritual Science) that could be used in order to develop the higher spiritual organs: imagination, inspiration and intuition. Imagination stands for a transmuted thought process, the so-called “vivid thinking” (*lebendiges Denken*) that transforms abstract thinking into dynamic spiritual images. Inspiration arises when we erase all imaginative elements and start “hear-

ing” spiritually the spiritual forces that stand behind these images. It consists in a spiritualized process of feeling. Intuition, finally, leads to direct knowledge of spiritual entities and is brought about by a transformation of the will.

However, it is quite typical for Steiner that his concrete indications concerning the development of higher knowledge are outweighed by his consistent stress on the *conditions* for obtaining this knowledge. In works such as *Theosophy*, Steiner gives a whole series of so-called “side-exercises” (*Nebenübungen*) that are all geared to stimulating emotional and moral stability. Steiner never tired of emphasizing that meditation should not lead us away from our daily life, but is meant to give more depth to daily life itself. The basis of any meditative practice is our faculty of objective thinking, which prevents us from drifting off into a mystical fog of vague spiritual feelings. In his anthroposophical, post-philosophical career, Steiner stated that his own *Philosophy of Freedom* could and even should be used as a meditative text. He claimed that by developing imaginative, spiritual thought or *lebendiges Denken*, one should be able to gain independent confirmation of all the doctrines he had revealed to his followers.

Steiner thus had the same ambiguous attitude towards modern science as many other occultists of the 19th and early 20th century. On the one hand, science was viewed as a materialist threat to true humanity. On the other hand, there is the claim that anthroposophy is a spiritual science (*Geisteswissenschaft*), meeting scientific standards of objectivity, lack of prejudice etc. Nevertheless, there is an inherent tension within anthroposophy between Steiner’s demand that one develop one’s own spiritual capacities and conduct independent spiritual scientific research, on the one hand, and the need to come to terms with his revelations contained in the ca. 400 volumes of his *Gesamtausgabe*, on the other hand. Steiner frequently warned his followers that his texts should not be venerated as revelations, but should be used as heuristic tools in dealing with everyday experience. His occult physiology for instance, should be employed in categorizing empirical observation of a person’s posture, way of walking etc.

6. THE ANTHROPOSOPHICAL MOVEMENT

The present Anthroposophical Society was founded under the Presidency of Steiner at the so-called Christmas Conference (*Weihnachtstagung*) of 1923/1924, as the successor of the earlier Society which Steiner did not lead himself (see →

Steiner). This Conference is still very important to contemporary anthroposophists, as Steiner not only laid the factual foundation of the Society but also the spiritual one; he did this in the form of the so-called Foundation Stone Meditation (*Grundsteinspruch*), which links tripartite man with the macrocosmos of the Hierarchies and the Trinity, and contains Steiner's version of the Rosicrucian Motto *Ex Deo nascimur, in Christo morimur, ex Spiritu Sancto reviviscimus* (we are born from God, we die in Christ and we are resurrected in the Holy Spirit). After Steiner's death in 1925, the Society soon became the scene of tremendous personal conflicts and disputes about the Society's future course. Moreover, very early on the Society was forbidden by the Nazis. Nevertheless, it survived all of this, resolved past conflicts, and witnessed a new period of growth in the 1970s and 1980s, especially thanks to the practical applications of anthroposophy such as Waldorf Schools, biodynamic farming, anthroposophical medicine, curative pedagogy (for the mentally handicapped) and various kinds of social initiatives, such as shops, enterprises and "green" and social banks. In this sense, what anthroposophists refer to as the Anthroposophical Movement is much wider than the membership of the Anthroposophical Society. Especially since the break with the Theosophical Society in 1913, anthroposophy and the later Anthroposophical Society have had a strongly – though not exclusively – Middle European, German-speaking character. In recent years, the Anthroposophical Society and Movement have had a wider international expansion, with more room for English-language conferences at the Society's headquarters in Dornach, Switzerland, official publications in English and a stronger presence in North- and South America and Asia. For more information on the Anthroposophical society, one may consult www.goetheanum.ch.

CEES LEIJENHORST

Archontics

The Archontics were adherents of a Christian Gnostic sect [→ Gnosticism] of the 4th century, named after the archons, the rulers of the seven heavens, who played an important role in their system. The sect is only known through the refutation by its staunch opponent from the beginning, bishop Epiphanius of Salamis (*Panarion*, 40, to which the references below refer), from whom all information in later authors derives. Since it is not likely that these Gnostics called themselves after the evil planetary rulers they abhorred, their name may have been invented by Epiphanius himself, because of the great variety of names they used for the archons (40, 8, 7).

The founder of the sect was a certain Peter, a former Palestinian priest, who had been excommunicated because of his heterodox views, then lived for a long time in Arabia, and finally returned to Palestine where he, unrecognized, lived the life of a hermit. Epiphanius, however, who was head of a monastery in Eleutheropolis (ca. 335-ca. 365), discovered Peter's true identity from his secret teachings and expelled him from the church. But Peter remained in his cave and attracted many people. One of them was a certain Eutaktos from Armenia Minor (eastern Turkey). On his way home from a pilgrimage to Egypt he visited Peter and was converted to his Gnostic views, which happened to the end of Constantius' reign († 361). Back in Armenia, he succeeded in winning over many Armenians, especially rich dignitaries, to his heretical ideas (40, 1-8).

The Archontics made use of many books, of which they themselves had compiled two, the *Lesser Harmony* and the *Greater Harmony*. The former may have been no more than an abstract from the latter, since in 40, 2, 3 Epiphanius simply

speaks of 'the book entitled *Harmony*'. They also used books that already circulated in heterodox circles, for instance the apocryphal *Ascension of Isaiah* and a work called *Strangers (Allogeneis)* (40, 2, 1-2). The latter certainly belonged to a special kind of literature of which they also had other specimens in their possession: works written in the name of Seth, or of Seth and his seven sons, who were called 'strangers' (*allogeneis*) (40, 7, 4). This is strongly reminiscent of the book *Allogenes* ("Stranger") which was used by Plotinus' Gnostics (Porphyry, *Life of Plotinus*, 16) and recovered in Cod. XI, 3 of the Nag Hammadi Library. The Archontics also held two prophets in high esteem, Martiades and Marsianos, who had been caught up into the heavens and had come down after three days. The name Marsianos may be no more than a variant of the name Marsanes, known, *inter alia*, from the title of another Nag Hammadi writing, *Marsanes* (Cod. X, 1). The books *Allogenes* and *Marsanes*, together with the *Three Steles of Seth* and *Zostrianus* (NHC VII, 5 and VIII, 1), form a group of late Gnostic works which combined traditional elements of Sethian gnosticism with Neoplatonic ideas [→ Neoplatonism], in particular those of Iamblichus. The Gnostics behind these books were no longer interested primarily in the origin of the bad material world and the soul's deliverance from evil but in the soul's experience of the divine through a ritual for heavenly ascent.

There are strong indications that the Archontics shared the same ideas and, therefore, were not an independent Gnostic group but a special Palestinian and Armenian brand of later Sethian Gnosticism [→ Sethians]. Their mythology and their interpretation of the first chapters of the Bible have much in common with Sethian writings such as the *Apocryphon of John* (NHC II, 1; III, 1; IV, 1; BG 8502, 2) and, in particular, the *Hypostasis of the Archons* (NHC II, 4). The *Harmony* explained that there are seven heavens, each ruled by a special archon and his band of angels. The soul has its origin in the eighth heaven, the abode of the high, good God, called the Father of All, and the Mother on high, also called the Luminous Mother, whence it descended into this world (40, 2, 3 and 8). The Archontics held that the soul is the indispensable food of the planetary rulers and their retinue: they cannot live without it since it comes from the moisture on high and provides them with power (40, 2, 7). The highest archon, Sabaoth, rules over the seventh heaven and is said to be the father of the devil (40, 5, 1). This feature of the myth might be due, however, to a misunderstanding of Epiphanius. In the *Hypostasis of the Archons* (NHC II, 95,

13-26), Sabaoth is the son of the devil who rebelled against his father and received authority over the seventh heaven as a reward. Just as the *Hypostasis*, the Archontics taught that Sabaoth was not as evil as the devil but far below the goodness of the highest God. He is identified with the God of the Jews and the non-Gnostic Christians (40, 5, 2).

Just as in the *Apocryphon of John*, the birth of Cain and Abel is due to the sexual union of the devil and Eve. In support of this view the Archontics cited John 8:44. They taught that both brothers desired their sister and that it was for that reason that Cain slew Abel. Seth, however, was born from the union of Adam and Eve, whereupon the power and the ministers of the good God caught him up lest he be killed too. After a long time he was brought down again, i.e. he was reincarnated, in such a state that neither Sabaoth, nor the authorities and principalities of the creator-god could prevail over him. On the contrary, he exposed their evil nature and solely recognized the unnameable power and the good God on high (40, 7, 1-3). In this way, Seth, the "Stranger" *par excellence*, became the Gnostic revealer and saviour.

The Archontics rejected the sacraments of the church in general and baptism in particular, as being instituted in the name of Sabaoth (40, 2, 6). They denied the resurrection of the flesh and only taught a resurrection of the soul by means of its heavenly ascent (40, 2, 5). If the soul has attained a state of Gnosis and has separated itself from the baptism of the church and the lawgiver Sabaoth, it is able to ascend to the eighth heaven of the Mother on high and the Father of All. It passes unharmed through the seven heavens, by virtue of its knowledge of the necessary passwords or words of defence to be said to the planetary rulers, a feature well known from other Gnostic texts (40, 2, 8). This was the core and kernel of the Archontics' doctrine of salvation. Their negative view of the material world led them to a docetic Christology, i.e. the doctrine that Jesus had only a carnal body in appearance (40, 8, 2). In accordance with their depreciation of the body, many Archontics practised sexual abstinence. Epiphanius had to admit this, but he immediately added that this was all feigned in order to deceive the simpler folk; according to him other Archontics 'polluted their bodies by licentiousness' (40, 2, 4).

The Armenian Archontics may have had some influence on the ideas of the Paulicians and other heterodox groups in Armenia and the Balkans and, through their intermediary, on those of the medieval Bogomils [→ Bogomilism] and the Cathars [→ Catharism] (dualism, rejection of water-

baptism, use of the *Ascension of Isaiah*, the ascent of the soul to its heavenly origin, *et al.*)

Ariosophy

1. LANZ VON LIEBENFELS'S SYSTEM
2. THE ORDO NOVI TEMPLI 3. RUDOLF JOHN GORSLEBEN 4. HERBERT REICHSTEIN
5. ARIOSOPHY AND THE THIRD REICH

A dualistic-gnostic racial religion which attracted followers in Austria and Germany during the first half of the 20th century. The term "Ariosophy", meaning esoteric wisdom of the Aryan race, was first coined by → Jörg Lanz von Liebenfels in 1915. He earlier used the terms "theozoology" and "Ario-Christianity" and founded the Ordo Novi Templi (ONT) at Vienna in 1900 as a Christian gnostic order to celebrate an Aryan cult of pure race. → Guido von List, whose ideas on the occult heritage of the Aryans supplied further inspiration for Ariosophy, actually called his own doctrine "Wotanism" or "Armanism". During the 1920s and 1930s Ariosophy embraced the expanded ONT under the leadership of Lanz von Liebenfels, and an associated group of writers who combined theories of Aryan supremacy and racial purity with → astrology, numerology [→ Number Symbolism], kabbalism [→ Jewish Influences], graphology and palmistry.

Ariosophy elaborated a gnostic form of Christianity based on the divinity of the Aryans, supported by 19th-century anthropology, zoology and archaeology. Its doctrine also embraced ideas taken from the Theosophy of → Helena Petrovna Blavatsky. Ariosophy described a golden age (both prehistoric and medieval), when religious orders had

governed racially pure Aryan societies on the basis of a racial gnosis. The Ariosophists claimed that an evil conspiracy of anti-Aryan agents (variously identified as inferior non-Aryan races of bestial origin, the Jews, or even the Church) had sought to undermine and ruin this pristine Aryan race by emancipating the non-German inferiors in the name of a spurious egalitarianism. The resulting racial confusion gave birth to the modern world with its wars, economic conflict, political uncertainty and the frustration of German world-power. The Ariosophists cultivated the esoteric knowledge and racial virtue of the ancient Aryans, in order to oppose the modern world and so prepare the way for a new pan-Aryan world order.

1. LANZ VON LIEBENFELS'S SYSTEM

The doctrine of Ariosophy was first formulated by Jörg Lanz von Liebenfels, who entered the Cistercian novitiate as Frater Georg at Heiligenkreuz Abbey near Vienna in 1893. Here Lanz made good progress, taking his solemn vows in 1897 and assuming teaching duties in the seminary in 1898. However, Lanz harboured heretical ideas concerning the literally bestial nature of sin, an idea suggested to him by a tombstone relief showing a knight treading on a strange animal. Convinced that Christianity had betrayed its original racial doctrines, he left the order in 1899 and immersed himself in contemporary anthropological studies relating to the Aryan race, such as Carl Penka, *Origines Ariacae* (1883), Matthäus Much, *Die Heimat der Indogermanen* (1902), and Ludwig Wilser, *Die Germanen* (1904).

In 1903 Lanz published a long article 'Anthropozoon biblicum' in a periodical for biblical research. From his analysis of mystery cults described by Herodotus, Euhemerus, Plutarch, Strabo and Pliny, Lanz concluded that the ancient civilisations had practised an orgiastic cult involving sexual intercourse with small beasts or pygmies. Reliefs excavated at Nimrud in 1848 by the British orientalist Sir Austen Henry Layard showed such beasts (*pagatu, baziati, udumi*) being sent as tribute to the Assyrians. According to Lanz, the writings of the ancients, the findings of modern archaeology, and substantial sections of the Old Testament corroborated this terrible practice of miscegenation. He articulated a theology in which the Fall denoted the racial compromise of the divine Aryans due to wicked interbreeding with lower animal species, deriving from an earlier primitive branch of animal evolution. These persistent sins, institutionalized as satanic cults, led to the creation of several mixed races, which threatened the sacred and legitimate

authority of the Aryans throughout the world, especially in Germany, where the Aryans were still most numerous. In 1905 Lanz published his fundamental statement of gnostic doctrine as *Theozoologie oder die Kunde von den Sodoms-Äfflingen und dem Götterelektron*, which again combined traditional Judaeo-Christian sources with the new life-sciences: hence theo-zoology. The first section of the book presented the evil realm by examining the origin and nature of the pygmies. The first pygmy, called Adam, spawned a race of beast-men (*Anthropozoa*), which gave rise to the various species of apes in the world. Quite distinct in origin were the earlier and superior god-men (*Theozoa*). Following Euhemerus and Saxo Grammaticus, Lanz believed that these superior forms of life were gods. Impressed by current scientific discoveries in electronics and radiology, Lanz saw electricity as a form of divine revelation and inspiration and attributed to *Theozoa* extraordinary sensory organs for the reception and transmission of electrical signals. These organs bestowed powers of telepathy and omniscience upon the *Theozoa*. True religion in Lanz's view consisted in endogamous cults of racial purity in order to maintain these divine powers and to counter the temptations of lecherous acts with the bestial apelings, pygmies and their cross-breeds.

Lanz's exegesis of the Old Testament led him to conclude that Jehovah, the God of Israel, was just such a prehistoric electrical being, who regularly manifested as a cloud, fire and lightning. The electrical nature of the Ark of the Covenant was evident, while 'God has both properties of electrical rays, he enlivens and he kills, he heals and he makes ill' (*Theozoologie*, p. 97). By contrast, the heathen deities of Israel were all throwbacks to the evil cults of bestiality. Moving on to the New Testament, Lanz also identified Christ as an electrical being, who came to redeem a fallen mankind from bestial miscegenation through a revival of the gnostic racial religion. According to Lanz, Christ was one of the last god-men but not God. Christ's miracles and magical powers and the transfiguration confirmed his electronic nature. Lanz substantiated this view with quotations from the apocryphal Acts of John and the Gnostic *Pistis Sophia*. Lanz interpreted the Crucifixion as the attempted rape of Christ by pygmies urged on by adherents of the bestial cults devoted to interbreeding.

In place of the originally distinct species of *Theozoa* and apes, there had developed several mixed races, of which the Aryans were the least corrupt. The marvellous electrical organs of the *Theozoa* had atrophied into the supposedly superfluous

pituitary and pineal glands in modern man owing to miscegenation. Throughout all recorded history, the apelings and pygmies had sought to destroy the Aryans by dragging them down the evolutionary ladder by means of their promiscuity. The history of religion recorded a constant struggle between the bestial and endogamous cults. Besides Lanz's citation of Gnostic sources, his racial religion also betrays gnostic features. '[The gods] once walked physically on earth. Today they live on in man. The gods slumber in the racially degraded bodies of men, but the day will come when they arise once more' (*Theozoology*, p. 91). The entrapment of the divine electrical spark within racially inferior bodies transposes gnostic ideas into the modern discourse of physical anthropology and eugenics. Lanz claimed that a universal programme of segregation and breeding could restore these divine powers to the Aryans as the closest descendants of the god-men.

Lanz's radical interpretation of Scripture logically embraced the Judaeo-Christian notions of linear history, apocalypse and salvation. At the end of this manichaeian temporal scheme stood the promise of final redemption. Lanz painted a grim portrait of modernity characterised by racial confusion, the decline of traditional elites, the emancipation and promotion of inferiors, and the rule of money. 'Why do you seek a hell in the next world! Is the hell in which we live and which burns inside us [the stigma of corrupt blood] not dreadful enough?' (*Theozoology*, p. 133). These "messianic woes" were the apocalyptic prelude to the millennium, when the ascendancy of the inferior races both in Europe and its colonial orbit would be reversed. Lanz fulminated against the (false) Christian tradition of compassion and social welfare and demanded that the state deal ruthlessly with the indigent. Women in particular were regarded as a special problem as they were supposedly more prone to the sexual attraction of racial inferiors. Socialism, democracy and feminism were the downfall of a racially pure world.

Lanz's millennium was a pan-German world-empire ruled by the aristocracy. As the original Aryan homeland, Germany had always been the nation of kings and heroes, while its Latin, Slav and Byzantine neighbours had fostered racial degeneration. Lanz claimed that traces of the holy electronic power still prevailed in the old princely dynasties of Germany. Provided their pedigree remained thoroughly noble, these aristocratic families were the closest living descendants of the former god-men. The princes had always cultivated genius, innovation and art at their castles and

courts. In the modern age the racial inferiors constantly sought to compromise this progress by intermarriage and demands for a share in power. Lanz prophesied a millennium of aristocratic rule, underpinned by an aggressive programme of German imperialism to reconquer the world and vanquish the racial inferiors.

Lanz's religious ideas were strongly influenced by the political circumstances of Habsburg Austria at the turn of the century. Representative government had been introduced in 1867 under constitutional changes whereby the emperor shared power with a bicameral legislature, elected by a restricted franchise under which about 6% of the population voted. The franchise was widened in 1897 and universal male suffrage was introduced in 1907. The advance of representative democracy challenged traditional German dominance in the multinational empire of Germans, Czechs, Poles, Ukrainians and Slovenes. Lanz's hostility towards other races, his condemnation of democracy and call for the subjection of all nationalities in the empire to German aristocratic rule indicate his profound reaction to the political developments of his time. His political concerns were evident in his own journal *Ostara* (named after the pagan Germanic goddess of spring), which he began publishing in 1905. *Ostara*, subtitled "Library for Blonds and Fighters for Men's Rights", initially addressed the political and economic problems of the Habsburg empire from a racial and pan-German perspective. From 1908 until 1918 Lanz wrote seventy-one issues himself. Their stock themes were racial somatology, anti-feminism, anti-parliamentarianism, and the spiritual differences between the blond (higher) and dark (lower) races in sexual behaviour, art, philosophy, commerce, politics and warfare. The First World War was documented as an eschatological struggle between the blonds and the darks.

Theosophy was a further ingredient of Lanz's early doctrine. One of Lanz's contributors was the Theosophist, Harald Grävell van Jostenoode (1856-1932), who wrote two *Ostara* issues outlining a pan-German empire and a programme for the restoration of Aryan authority in the world. Lanz also made direct use of Theosophy in his *Bibel-dokumente* series (1907-1908). The second number of the series, *Die Theosophie und die assyrischen "Menschentiere"*, gave an selective exegesis of → Helena Petrovna Blavatsky's major text *The Secret Doctrine*, newly translated into German between 1897 and 1901. He compared her occult anthropogeny favourably with the findings of modern palaeontology, incorporated the sunken continents of Lemuria and Atlantis in his own view of prehis-

tory, and recognised his *pagatu, baziati, udumi* of Assyrian lore in her account of prehistoric monsters. In Blavatsky's eighth stanza of *Dzyan*, verses 30-32, the early Lemurians first developed into two sexes but interbred with attractive, inferior females to produce monsters and demons. Lanz validated Blavatsky's scheme of five root-races (to date), concluding that the fourth root-race of Atlanteans had divided into pure and bestial sub-species, corresponding to the anthropoids and the anthropomorphic apes. The fatal sin of the former's descendants, the fifth root-race of the Aryans, had been persistent interbreeding with the latter's descendants.

2. THE ORDO NOVI TEMPLI

In 1900 Lanz founded the *Ordo Novi Templi* (ONT) to propagate his ideas of "theozoology" and "Ario-Christianity". His decision to organise his sect as a chivalrous male order in the Templar tradition [→ Neo-Templar Traditions] drew on his own monastic experience and the contemporary vogue of the grail-knight figure in neo-romantic music and literature (Richard Wagner, Erwin Kolbenheyer, Friedrich Lienhard). The Templars were closely associated with the Cistercian order. St Bernard of Clairvaux, the Cistercian founder, had composed the Templar rule in 1128 and later addressed a laudation to the knights for their martial championship of Christianity in the Holy Land. Lanz believed that the Templars represented a pan-Aryan initiative to create a 'Greater Germanic order-state, which would encompass the entire Mediterranean area and extend its influence deep into the Middle East'. The trial and brutal suppression of the Templars in 1312 signified to Lanz the triumph of the racial inferiors who were determined to undermine the racial cult. Armed with his gnostic-racial interpretation of Scripture, supposedly suppressed since the 14th century, Lanz refounded the lapsed military order for a new racial crusade.

The ONT combined Christian piety with modern notions of racial eugenics and pan-Aryanism in a gnostic religion of redemption through pure blood. In 1907 Lanz purchased Burg Werfenstein, a small medieval castle on the River Danube near Grein in Upper Austria, as the priory of the ONT, and developed a liturgy and ceremonial. The order rule described the ONT as a racial-religious association, which could be joined only by (male) persons of predominantly pure blood, who were blond-haired, blue-eyed and possessed of an "ario-heroic" figure according to Aryan racial somatology outlined in *Ostara*. Brothers were admitted to

the ONT in a hierarchy of orders, according to their degree of racial purity: Servers (SNT), persons less than 50% racially pure, or persons under twenty-four years who had not undergone a racial test; Novices (NNT) included all members aged over twenty-four years and being more than 50% racially pure, who had not yet been tested for advancement to the superior orders; these were Masters (MONT) and Canons (CONT) who possessed respectively 50-75% and 75-100% degrees of racial purity. The two highest orders of the hierarchy were Presbyter (pONT) and Prior (PONT). Any Master or Canon was eligible for promotion to Presbyter once he had founded a new house for the ONT. His rights included the saying of office and celebration of mass, but excluded the reception and investiture of brothers. A Presbyter whose chapter exceeded five Masters or Canons was eligible for installation as a Prior. Lanz devised vestments and heraldic devices for each order of the hierarchy, while brothers assumed an order-name upon reception, e.g. Fra Asmund MONT ad Werfenstein.

Order ceremonial was developed from 1908 onwards. Lanz composed devotional songs and verse and had the Werfenstein priory decorated with votive paintings of Hugo de Payns, founder and first Grand Master of the Templars, St Bernard embracing the suffering Christ, and images of the apelings or pygmies. In 1915-1916 Lanz published a New Templar breviary in two parts containing "Ario-Christian" psalms and canticles written by himself and other brothers. While based on traditional Christian texts, these texts reflected the dualist gnostic-racial doctrine with supplications to Christ-Frauja (a Gothic name for Jesus) for racial salvation and the sacrifice and extermination of the inferior races. Lanz also composed several ritual books. The basic text was the *Hebdomadarium*, which contained the three offices of matins, prime and compline for each day of the week. Each office had a space for readings relating to "Ario-Christian" doctrine from the *Festivarium NT*. This book of festival readings comprised three volumes: the *Legendarium* provided readings describing the historical and cultural traditions of the racial religion for matins on each day of the year. The materials for its 1400 pages were drawn from orthodox Christianity, modern science and the acts of the New Templars. The other volumes, the *Evangelarium* and the *Visionarium*, performed the same function in the prime and compline offices. These ritual books were supplemented by a hymnal (*Cantuarium*), a book of psalms, and an *Imaginarium NT* of devotional pictures. ONT liturgy fused the

forms and beliefs of Catholicism with the racial gnosis.

The defeat of the Central Powers and the disintegration of the Habsburg empire in November 1918 confirmed Lanz's fears about the ascendancy of racial inferiors over the Aryans. In his view, the abdication of monarchs, revolutions, new national states, and inflation signalled the destruction of historic political entities and aristocratic elites, and the demoralisation of the upper and middle classes throughout Europe. Henceforth, anti-Semitism and a belief in a "Jewish-Masonic-Bolshevik" conspiracy underpinned his "Ario-Christian" religion. In the late 1920s he articulated a millenarianism based on cosmic periods of approximately 730 years within the Platonic Year. In the period 480-1210 society had been ruled by "spiritual-chivalrous orders" (Benedictines, Cistercians, Templars and Teutonic Knights). In the period 1210-1920 aristocratic rule was eclipsed by the rise of the masses. The Turks and Jews weakened the European polity and the spread of towns, capitalism, and the ideologies of nationalism and democracy encouraged the ascendancy of racial inferiors and the proletariat, culminating in Bolshevism and revolution. Lanz foretold that the period 1920-2640 would see the revival of hierarchies, patricians, and secret orders. He hailed the right-wing dictatorships of Spain, Italy and Hungary in the 1920s as precursors of the global counter-revolution.

During the late 1920s and 1930s Lanz continued to elaborate the doctrine of Ariosophy with numerous volumes of scripture and extensive booklet-series. His ten-volume *Bibiomystikon oder Die Geheimbibel der Eingeweihten* (1930-1935) was a major re-interpretation of the Bible in the light of the racial gnosis. In the booklets of his *Ariomantische Bücherei* and *Elekrotheologische Handschriften* series, Lanz outlined an "electrotheology" according to which divine "electrotheonic" beings (angels, grail-doves, muses, valkyries and norms) had physically represented the eucharist as a form of sexual sacrifice to breed up the "ario-heroic" race in prehistoric times. The bread and wine of the Christian mass symbolised the "electrotheonic" nature of Christ-Frauja, while the Holy Grail was actually a grail-dove. Lanz assimilated Orpheus, Moses, Pythagoras, Plato, Brahma and Apollonius of Tyana into his mystery-religion of electricity and race. He also wrote an esoteric key to the Gothic Bible of Ulfilas (c. 311-383), having identified Ariosophy with the Arian heresy which had flourished among the Germanic tribes during the great migrations.

Lanz's "History of Ariosophy" traced the racial

religion from Atlantis to the ancient world, through → neoplatonism and → gnosticism, to the reformed monastic and military orders of the Middle Ages, which represented a final climax of “Ario-Christian” civilization. The Moors in Spain, the Mongol invasions and the rise of the Ottoman Turks represented external racial challenges to the “Ario-Christian” domain of medieval Europe, which were matched by internal enemies. Lanz condemned the mendicant orders (Franciscans, Dominicans) for their plebeian spirit, intolerant dogmatism and hostility to the old monastic orders. By contrast with the “ario-heroic” culture of the Middle Ages, Lanz dismissed the Renaissance as a period of decline, characterised by increasing Jewish economic, political and cultural influence. The former strict ariosophical morality of Christianity was superseded by a universal doctrine of humanity which accelerated the rise of lower castes. Lanz regarded both the Jesuits and the Freemasons [→ Freemasonry] as revolutionary agents committed to cosmopolitanism, equality and liberalism, which favoured the dominance of racial inferiors.

In order to posit the underground continuity of Ariosophy, Lanz’s “Ario-Christian” mystical tradition included → Hildegard of Bingen, Mechtild of Magdeburg, Meister Eckhart, Jan van Ruysbroeck and Thomas à Kempis. In the early modern period, these mystics were succeeded by → Jakob Boehme, Angelus Silesius, Nikolaus von Zinzendorf, and → Emanuel Swedenborg. In the 19th century, Lanz’s roll of Ariosophical initiates included J.B. Kerning, the mystical Freemason; Carl von Reichenbach, the Viennese investigator of → animal magnetism; the French occultists → Eliphas Lévi, Gerard Encausse [→ Papus], and → Edouard Schuré; and the Theosophists Helena Petrovna Blavatsky, → Franz Hartmann, → Annie Besant and → Charles Webster Leadbeater. The tradition finally led to Guido von List, Rudolf John Gorsleben, and the contemporary mythologists of an Aryan Atlantis, Karl Georg Zschaetzsch, and Hermann Wieland.

Before 1914 ONT activity revolved around Lanz and some fifty brothers in Vienna and Werfenstein, but during the interwar years further order-houses were founded in Germany and Hungary, where Lanz resided after 1918. Wickeloh (near Uelzen, Germany) was established by Georg Hauerstein Jr. in 1925; Marienkamp-Szt. Balázs (near Lake Balaton, Hungary) founded by Lanz in 1926; Hertsburg (on the Darß peninsula, Germany), also founded by Hauerstein in 1927; Staufenberg (near Sigmaringen, Germany) founded by Friedrich Franz von Hochberg (1875-1954); Petena (near Waging

am See, Germany), also founded by Hauerstein in 1935; Pilisszentkereszt (northern Hungary) in 1937. According to *Tabularium O.N.T.*, the regular order newsletter detailing receptions, chapters and donations, ONT activity reached its peak between 1925 and 1935, having established at least seven sites and received some three to four hundred brothers. In 1942 Hauerstein and Lanz founded the Vitalis New Templars (NT Vit) with Petena as its seat and archpriory. In contrast to the ONT, the NT Vit accepted female members. Order activity at Petena continued until 1973.

Besides providing the basis of ONT doctrine and liturgy, Ariosophy was also publicized during the 1920s by German esotericists interested in characterology and divination [→ Divinatory Arts]. In October 1925 Lanz began collaborating with the publisher Herbert Reichstein (1892-1944) on a new periodical devoted to Ariosophy initially entitled *Zeitschrift für Menschenkenntnis und Menschen-schicksal* at Düsseldorf. Here Lanz summarized Ariosophy as a emanationist doctrine of “pan-psychic” energy, which animated the whole universe but found its most perfect manifestation in the microcosm of the blond-haired, blue-eyed Aryan. Ariosophy was concerned with the scientific study of the differences between the blonds and the darks with the aid of the esoteric sciences of palmistry, astrology, numerology, phrenology, kabbalism and heraldry (an idea taken from his colleague Guido von List). Lanz claimed that heraldic devices and names were hieroglyphs, in which the Aryan ancestors had recorded the history and karma of their families. Lanz thereby linked Ariosophy with the burgeoning interest in characterology and divination which had arisen in response to the anxieties and disruptions of postwar Germany. The chief contributors to the magazine were a Berlin group of esotericists known as the “Swastika Circle” and included Ernst Issberner-Haldane (1886-1966), a palmist; Frodi Ingolfson Wehrmann (1889-1945), an astrologer and ardent supporter of Guido von List’s ideas about an ancient Germanic priesthood, who was also versed in numerology and the study of karma; Robert H. Brotz, a graphologist; and Wilhelm Wulff, an astrologer, whom Heinrich Himmler consulted during the last weeks of the Second World War.

3. RUDOLF JOHN GORSLEBEN

Rudolf John Gorsleben (1883-1930), also an ONT brother, made further contributions to Ariosophy. He had long been fascinated by the Edda and other secret survivals of the Aryan heritage, while his doctrine was also indebted to → occultism and

Theosophy. From 1920 Gorsleben published his own periodical *Deutsche Freiheit*, in 1927 re-named *Arische Freiheit*, which featured articles on the runes, crystals, number-mysticism and the Cheops pyramid. In 1928 this periodical amalgamated with Reichstein's characterological magazine under the new title of *Zeitschrift für Geistes- und Wissenschaftsreform* (entitled *Ariosophie* from September 1929). Through astrology, kabbalism and → magic, Gorsleben thought it possible to reactivate the occult powers inherent in each Aryan individual, thus enabling him to master the natural world. Gorsleben envisaged the advent of a new age, in which the Aryan would regain his former splendour and authority in the world. His major work *Hoch-Zeit der Menschheit* (1930) presented Atlantis, the megalithic stone circles of Europe, archaeological finds, astrology and mathematical theorems as evidence of the high civilisation of the Aryans. Their wisdom was held to have survived in a wide variety of cultural forms, including the runic shape of beams in half-timbered houses, coats-of-arms, countless symbols and words. These ideas of secret survival owed their inspiration to Guido von List and Philipp Stauff.

4. HERBERT REICHSTEIN

In December 1925 Herbert Reichstein began to publish a book-series, *Ariosophische Bibliothek*, to publicize Lanz's theories on subjects ranging from astrology to heraldry. By early 1926 Reichstein changed the name of his characterological institute to the Ariosophical Society, which fostered esoteric Aryan sciences of characterology and divination for the benefit of Aryans. Ariosophical characterologists were identified as heirs of the ancient Germanic priest-kings (*Armanenschaft*), rediscovered by Guido von List. Lecture-tours to major German cities were organized between 1928 and 1931, when Reichstein moved his operations to Preßbaum near Vienna to open an Ariosophical School as a conference centre for retreats and courses. Lanz von Liebenfels remained the intellectual leader of the Ariosophical movement throughout this whole period. Like Lanz, Reichstein practised name-kabbalism, based upon the Chaldean-Jewish notion of correspondences between letters and numbers: the sum of the numerical equivalents of the letters in a person's name disclosed information regarding his nature and destiny. After the Nazi seizure of power in Germany, Reichstein moved in April 1933 to Berlin, in order 'to be at the centre of the revival of a nationally awakened Germany'. There he published *Arische Rundschau*, a weekly newspaper which professed the struggle against

Judah, Rome, and Freemasonry in the context of ariosophical racism and occult predictions.

5. ARIOSOPHY AND THE THIRD REICH

Despite its esoteric and sectarian nature, Ariosophy had some influence on National Socialism in Germany. Philipp Stauff, a close friend of Guido von List and Lanz von Liebenfels, held high office in the Germanenorden, a secret quasi-masonic racist society founded in 1912 to counter Jewish influence in Germany. In 1917 the Bavarian chapter of the Germanenorden was taken over by Rudolf von Sebottendorff (1875-1945), who was also an admirer of List, Lanz von Liebenfels and Stauff. Under Sebottendorff's leadership the Germanenorden in Munich assumed the cover-name of the Thule Society and played a significant role in the Bavarian counter-revolution of April 1919. As early as autumn 1918 the Thule Society had fostered a political workers' circle. In January 1919 members of this group founded the German Workers' Party (DAP), which was renamed the German National Socialist Workers' Party (NSDAP) in February 1920. While the Thule Society and Germanenorden remained conspiratorial esoteric groups, the DAP embraced mass political activity. The use of the swastika as a Nazi party symbol may be traced back to the Germanenorden, Lanz von Liebenfels and Guido von List before 1914.

There is some evidence that the young Adolf Hitler read and collected Lanz's *Ostara* magazine while living in Vienna between 1908 and 1913. It is likely that he was impressed by Lanz's empirical studies of racial differences between the blonds and the darks, and the harmful influence of non-German races within the multinational Habsburg empire. Lanz's preoccupation with women as race-defilers, feminism and sexuality was mirrored by Hitler's concern that the Jews were seducing Aryan girls and drawing them into prostitution. Given his lifelong enthusiasm for Wagner's operas, especially *Parsifal*, Hitler would have identified with Lanz's notion of a knightly order committed to the holy grail of pure Germanic blood. Lanz's dualist-manichaeic fantasy of a millenarian struggle between the blonds and the darks for racial and political world-supremacy could have laid the "granite foundation" of Hitler's own racist outlook for life.

Ariosophical ideas of a secret gnosis of the blood and occult survivals made a stronger impression on Heinrich Himmler and the SS, which cultivated the Aryan-Nordic heritage as an instrument of Nazi cultural policy. Karl Maria Wiligut [pseud. Karl

Weisthor, Jarl Widar] (1866-1946), an officer in the Habsburg army, had some contact with ONT brothers in Vienna around 1908, a link that was renewed in 1920-1921. Wiligut claimed to be descended from prehistoric Germanic sages of the Irminist religion. His purported ancestral-clairvoyant memory enabled him to recall the history of his tribe over thousands of years back to 78,000 BC. Richard Anders, an ONT brother and SS officer, introduced Wiligut to Heinrich Himmler, who decided to exploit this unique source on ancient Germanic religion and traditions. Wiligut's interest in the runes, symbols and other cryptic survivals of ancient Germanic priest-kings place him in List's tradition of the *Armanenschaft*. Wiligut was given officer rank in the SS, where he supplied rune-poetry and studies of cosmology and prehistory based on his family traditions. He also undertook land surveys of ancient Germanic sanctuaries, and was instrumental in the design of the SS *Totenkopfring* and the elaboration of Irminist wedding, spring, harvest and solstice rituals at the SS Staff College of Wewelsburg Castle. He also influenced Himmler's conception of the Wewelsburg as a SS vatican in a future revival of pagan Germanic religion.

During the Third Reich, Ariosophy was discouraged by the Nazis in common with other secret societies and lodge-like organisations. The ONT was suspended at Werfenstein and Vienna in December 1938, but activity continued at ONT houses in Germany and Hungary. Lanz continued to publish ONT material privately until his death in 1954. He was succeeded as Prior of the ONT by Theodor Czepl, who died in 1978. Czepl was succeeded by Walther Krenn who died in 1979, and Rudolf J. Mund held the office of PONT from 1979 until his own death in 1985. Owing to its racial and anti-Semitic content, Ariosophy remained a minute movement in postwar Austria. However, since the 1990s neo-Nazi groups have discovered an interest in List, Lanz von Liebenfels and the Thule Society.

NICHOLAS GOODRICK-CLARKE

Aristotelianism

From the second half of the 12th century the Latin West witnessed an enormous wave of translations of Aristotle's works from Arabic and Greek,

which reached its peak around the middle of the 13th century with William of Moerbeke. As a consequence, philosophers and theologians were faced with the formidable task of reconciling this new influx of pagan wisdom with Christian faith. They did so in the institutional context of one of the most enduring inventions of the Middle Ages, namely the university. These new institutions developed curricula dominated by the *Corpus Aristotelicum*. Just like medieval Platonism [→ Neoplatonism: Middle Ages], however, Aristotelianism is a complex historiographic category. The *Corpus Aristotelicum* not only comprised genuine works such as the *Categories*, the *Physics*, the *Metaphysics* or the *Nicomachean Ethics*, but also a wide range of pseudo-Aristotelica, among which the *Theologia Aristotelis*, the *Liber de Causis*, and the *Secretum Secretorum*. Moreover, a number of commentaries carried almost the same authority as Aristotle's own text, such as those by Greek commentators like Simplicius. By far the most prestigious of all commentators was the Andalusian Arab Averroës, whom the medievals simply referred to as *the* Commentator, analogous to Aristotle himself who was known as *the* Philosopher (*Philosophus*). Aristotelianism not only determined the content of medieval learning, but also the formal models by which the teaching was structured. The boundaries between the various disciplines, such as physics, metaphysics, ethics and medicine, but especially those between theology and philosophy, were settled using the criteria of Aristotelian philosophy of science. Aristotle had defined science in terms of a deduction of causal demonstrations on the basis of self-evident principles that could only be intuited and not demonstrated within each separate discipline. This proved to be an excellent model in safeguarding the disciplinary autonomy of theology, while at the same time strengthening its rational, scientific profile. The principles of theology were a matter of revealed truth which could not be scientifically demonstrated but had to be accepted on faith. Just like any other science, theology thus had to work with indemonstrable first truths that could not be provided by any other science. Equally, however, theology made use of Aristotelian logical procedures in order to deduce scientific truths from these first principles. Medieval theology and philosophy employed what is known as the scholastic method of determining questions by means of a complex of *pro* and *contra* argumentations. This method was put to use in the commentary tradition on Peter Lombard's *Sentences*, the main textbook of scholastic theology. In this model, philosophy, the discipline that was taught at the medieval Arts

faculties, was subservient to theology, which together with medicine, canon and civil law constituted the so-called higher faculties. However, not all Masters of Arts were prepared to accept this subordinate role of philosophy as *ancilla theologiae* (handmaid of theology). For instance, a group of 13th century Parisian Masters known under the collective name of Latin Averroists claimed full autonomy for philosophy, even to the extent of allowing philosophy to reach conclusions that were not in conformity with faith.

The disciplinary framework of medieval Aristotelianism might be one of the explanations for why it had relatively few points of contact with → Hermetism. In the 12th century, Hermetism had mainly been associated with Platonism, which did not make a sharp distinction between theology and philosophy, especially metaphysics. → Hermes Trismegistus was seen as part of a tradition of pagan learning that had adumbrated important elements of Christian faith, especially the dogma of the Trinity. It is probably no coincidence that Thomas Aquinas (1225-1274), one of the champions of medieval Aristotelianism, not only insisted on the distinction between philosophy and theology (on whose collaboration he nevertheless insisted as well), but also vehemently rejected the claim, expressed by Alan of Lille and others, that Hermes had intuited the Trinity. With regard to the definition of God in (pseudo-)Hermes' *Liber XXIV Philosophorum* as the monad that generates a monad in itself, Aquinas says that this statement only pertains to the relation between God and His creation (*Summa Theologica*, Part I, Question 32, Article 1, ad 1). Natural reason can prove that the world has been created by God, but we need the revealed truth of Scripture in order to enlighten us on what God is, most notably with respect to His tri-une character. Parallel to this denial of Hermes' prophetic gifts was the acceptance by Thomas Aquinas and the majority of post-12th century theologians and philosophers of → Augustine's condemnation of Hermes' idolatry in *De Civitate Dei* rather than Quodvultdeus' more positive account. Finally, the very fact that Aristotle replaced Plato as the great authority in philosophy may also explain why many post-12th century philosophers and theologians were less attracted to Hermes, who had been so closely associated with Platonism. It is therefore no surprise that we find a large-scale acceptance of Hermetic tenets only in philosophers with overt Platonic or even anti-Aristotelian tendencies, such as Berthold of Moosburg. It seems that the only philosopher who consistently tried to reunite Aristotelianism, Platonism and Hermetism

was → Albertus Magnus. Obviously, there was one area in which Aristotelianism and Hermetism did meet, namely → alchemy. Alchemical literature of the Middle Ages made abundant use of the basic concepts of Aristotelian natural philosophy, such as hylemorfism, the potency-act distinction, and Aristotelian mineralogy. It is therefore no surprise that many alchemical tracts were attributed to (pseudo-)Aristotle. The connection between Aristotelianism and Hermetism can thus mainly be found outside the formal framework of the academic disciplines at the medieval universities.

In some handbooks we still find the once popular image that the philosophical innovations of the Renaissance were due to → Marsilio Ficino's translation of the *Corpus Platonicum*, while the Aristotelianism of the universities sank away into moribund sterility. Paul Oskar Kristeller, Charles Schmitt, Charles Lohr and others have shown that this conception is thoroughly misguided. To begin with, Aristotelianism was anything but moribund. Charles Lohr has established that (thanks to the invention of the printing press) the 16th century not only produced more translations of Aristotle's works than all the previous centuries taken together but also composed an immense amount of new commentaries. Moreover, recent studies have demonstrated that the Renaissance commentary tradition on Aristotle displayed a diversity and innovative potential that in certain of its aspects formed the bridge to the new philosophy and science of the 17th century.

One of the most interesting phenomena of the late 15th and 16th century is the Aristotelianism cultivated at the university of Padua. Since Padua did not have a theological faculty, the faculty of Arts was not constrained by any theological considerations and developed a secular Aristotelianism with a strong emphasis on natural philosophy, which among other things prepared the students for higher studies in medicine. The best known representative of this tradition was Pietro Pomponazzi (1462-1525). In his *De naturalium effectuum causis sive de incantationibus* of 1520 (published 1567), Pomponazzi accepts miracles and other wondrous events as long as witness reports were reliable. His main point is to develop a scientific explanation of these events along the lines of Aristotelian philosophy, which he combines with a strong version of Stoic determinism. Pomponazzi is prepared to accept the agency of angels and demons as an article of faith. Nevertheless, he argued, Aristotelian *philosophy* has to rule such agencies out, since angels and demons on account of their being immaterial do not have contact with

physical objects, while all physical action must occur by direct contact. What does count as a viable explanation is, by contrast, the influence of the stars which determine completely the sublunar realm and in so doing also produce miracles and other wondrous events. In this context, Pomponazzi makes use of the Aristotelian notion of occult quality [→ occult/occultism], which designates an imperceptible, but nonetheless perfectly natural cause, such as stellar influence, the power of the imagination and hidden qualities of minerals and other natural objects. In so doing, Pomponazzi famously raised the scientific status of → astrology in the same way as the Bolognese philosopher Alessandro Achillini – who had briefly been his colleague at Padua – had raised the status of physiognomy and chiromancy in his *Quaestio de subiecto physiognomiae et chiromantiae* (1503).

Nor was the philosophy that developed outside of the schools in all respects anti- or even un-aristotelian. True, when Ficino speaks of the venerable tradition of *pia philosophia* or *philosophia perennis* [→ Tradition] he is primarily thinking of the current that he takes to have been inaugurated by Hermes and so admirably continued by Plato. Nevertheless, Aristotle also had an – albeit modest – place in this typically Renaissance harmony model. Following the schemes of the ancient Neoplatonist commentators on Aristotle, Ficino depicts Aristotle as the best of the *physici*. As far as metaphysics is concerned, he recommends that one had better consult the Neoplatonists. However, for the lower realm of being Aristotle's physics is an excellent guide. Echoing humanist attacks on Peripatetic philosophy, Ficino states that his issue is not with Aristotle, but with his contemporary scholastic disciples, whose two competing sects, the Alexandrists (following Alexander of Aphrodisias) and Averroists haunt the universities (*Opera Omnia*, Basel 1576; reprint Torino, 1959, p. 1537). Albeit in opposite ways, both sects denied personal immortality, the very cornerstone of Ficino's philosophical speculation. There is, however, an undeniable presence of scholastic philosophy in Ficino's own philosophy, especially in his *opus magnum*, the *Theologia Platonica* (1469-1474). During his study at the university of Florence, Ficino must have imbibed quite a lot of Aristotelianism, especially in its Thomist form. Thomas Aquinas provided the building blocks of Ficino's metaphysical structure in the form of his dialectics of being and non-being, his distinction between matter and form, his view of causality and other central topics. But even more remarkable is the presence of Aristotelianism in Ficino's works on → magic, especially

his *De vita libri tres* (1489). In the absence of an elaborated Hermetic or Platonist natural philosophy and in line with his appreciation of Aristotle's physics, Ficino uses the basic concepts of Aristotelian hylemorphism in order to explain the powers of → amulets and other magical devices. It has to be remarked, though, that he seems to be particularly dependent on Neoplatonic doctrines he found in → Avicenna's and Albertus Magnus's works. Brian Copenhaver has established that Ficino integrates the doctrine of substantial form as the imperceptible carrier of occult qualities, the notion of dispositive cause to account for the preparation of matter for the eduction of a form which is ultimately drawn from the celestial bodies, and other central tenets of Aristotelian hylemorphism.

An even greater presence of Aristotelianism can be discerned in Ficino's young friend, → Giovanni Pico della Mirandola, whom Ficino praises as one of the few who are still able to interpret Aristotle in the right, pious, way (*Opera Omnia*, p. 1537). Pico's *Conclusiones* were part of his grand project to reconcile all pagan and Christian learning. Though recent scholarship has established that Pico was far less unorthodox than his traditional portrayal, the fact remains that the Church of Rome was not particularly amused by the enthusiasm of this brilliant young man. In the *Apologia* (1487), which Pico wrote against accusations by Church authorities, he defended his conclusions regarding the eucharist and other theological topics by means of a wide display of scholastic theology and philosophy. In fact, it seems that Pico soon gave up on his attempt to integrate all available learning and limited himself to the less ambitious plan of reuniting Plato and Aristotle. The first result was his *De Ente et Uno* (1492), an exercise in metaphysical speculation about the convertibility of the terms "being" (the highest genus for the Aristotelians) and "oneness" (the highest genus for the Platonists). This limitation also explains why Hermetism (to which in fact only nine out of the nine hundred *Conclusiones* had been devoted) disappeared increasingly from his works, and eventually gave way to an outspoken rejection in the unfinished *Disputationes adversus astrologiam divinatricem*. Here, Pico presents the wisdom of the Egyptians, which includes Hermetism, as a practical discipline of worship and not as theoretical science. Hermetism is at best a first inadequate sketch of the superior physics and metaphysics of Plato and especially Aristotle, since it lacks the defining characteristic of true science, namely rational argument (*Disputatio adversus astrologiam divinatricem*, in *Opera Omnia*, Basel 1575;

reprint Hildesheim 1969, pp. 721-722). Interestingly, Pico thus seems to make room for scientific progress, contrary to the retrograde *ad fontes* of his mentor Ficino. In any case, Pico's *Disputationes* contain a scathing attack on astrology, which is based on an anti-determinist version of Aristotelian philosophy. In line with Aristotle, Pico does admit stellar influence, but limits it to the lower faculties of the human soul. Stellar influence explains the behaviour of prophets, whose imagination is particularly susceptible. It cannot, however, determine man's free will, which is linked to the superior part of our soul.

With → Francesco Patrizi (1529-1597) Renaissance Neoplatonism gets a vehemently anti-Aristotelian twist. Like Ficino, Patrizi laments the spectacle of the division of academic Aristotelianism into two competing sects of which both deny the immortality of the human soul. In order to restore the unity of reason and faith, Patrizi presented a three-fold Hermetic-Platonist project. First, Patrizi developed a new edition of the *Corpus Hermeticum*, the *Chaldaean Oracles* and other *Hermetica*, which he attached to the second part of his enterprise, namely the *Nova de Universis Philosophia* (1591). In this all-encompassing philosophical system, he tried to explain the Hermetic "revelation" by means of philosophical, especially Platonist, arguments. Thirdly, the *Discussiones Peripateticae* (1581) takes up Ficino's idea of a philosophical concord and the tradition of *prisca sapientia*. Patrizi thoroughly revolutionized this notion. Usually, the idea of a basic philosophical concord was made plausible by showing the fundamental harmony of Aristotle's and Plato's philosophy. The *Discussiones* elaborate this programme in a radically polemical, anti-Aristotelian way. Patrizi attempts to demonstrate that everything valuable in Aristotle is downright plagiarism, whereas all his original contributions are mere humbug. Aristotle adopts all important themes of *philosophia perennis* in general, and of Plato in particular. By leaving his source unmentioned while at the same time explicitly criticizing Plato, Aristotle tried to achieve fame at the expense of his preceptor. The *Discussiones* condemn virtually all aspects of Aristotle's life and work. Among the allegations is that Aristotle was involved in a plot to kill Alexander the Great. Interestingly, Patrizi excludes Aristotle's logic and natural philosophy from his devastating criticisms. In fact, the first part of the *Nova de Universis Philosophia*, entitled *Panaugia* (All-encompassing Light) makes use of an "Aristotelian method". Here Patrizi points to the Aristotelian methodological *adagium* that in

natural philosophy we should begin with experiential phenomena, which constitute the *primum quoad nos*, in order to gain knowledge of nature's causes, principles and elements, the *primum quoad natura*. The *Panaugia* is "Aristotelian" in the sense that it tries to develop an alternative to Aristotle's inference of the existence of the Immovable Mover on the basis of perceptible motion. This part of the *Nova de Universis Philosophia*, however, starts with perceptible light and gradually climbs to the source of all corporeal as well as incorporeal light, God. It unfolds a wide-ranging Neoplatonist light metaphysics, culled from traditional sources like Philo, Grosseteste and Ficino. In this sense the *Panaugia* exemplifies Patrizi's attitude towards Aristotelian philosophy, especially his physics and metaphysics: rather than a wholesale alternative, Patrizi propounds a complete reinterpretation of the traditional Aristotelian doctrines and their vocabulary along Platonist-Hermetic lines.

A final offshoot of Renaissance Aristotelianism blossomed at the German universities at the end of the 16th and beginning of the 17th century. After the Reformation the universities in the German lands had been reorganized according to confessional lines, i.e. following the Lutheran, Calvinist, and Roman-Catholic (mainly Jesuit) creeds. Paradoxically the strong confessional emphasis led to a much more liberal, very eclectic attitude towards Aristotle, whose philosophy always had to be measured against the canons of the diverse confessions. Hermetism was just one of the many elements that entered in the eclectic mixture that was taught at Protestant, especially Calvinist, universities and *Hohe Schulen*. The best-known representative of this tradition is Johann Heinrich Alsted (1588-1638), professor of theology and philosophy at the Academy of Herborn. Alsted combined solid Aristotelianism with Lullism, Hermetism and alchemy in his grand encyclopedic project that was aimed at restoring man's original dignity. This optimistic variety of Calvinism was to receive a devastating blow at the Council of Dordt and in the Thirty Years War which in most cases meant the closure of the more liberal universities. Alsted's eclectic and conciliatory programme can already be fathomed from his early *Physica Harmonica* (1616), which tries to reunite a number of different physics, in particular Mosaic physics (i.e. the account of the book of Genesis), Peripatetic physics and Hermetic physics (especially alchemy). The touchstone of this conciliatory programme is Mosaic physics: Alsted only accepts those elements of Peripateticism and Hermetism that can be squared with the biblical account. But the most impressive

synthesis of Aristotelianism and Hermetism can be found in his enormous *Encyclopaedia* (1630), which recalls the common Renaissance idea of a tradition of *prisca sapientia*, which according to Alsted includes the Indian Brahmins and Egyptian prophets, such as Hermes Trismegistus (*Encyclopaedia*; Herborn, 1630, p. 110). The *Encyclopaedia* not only lists a whole range of "Hermetic" disciplines such as astrology and the art of memory [→ Mnemonics], but also fuses Hermetism and Aristotelianism in its discussion of specific themes. An example is his description of prime matter, which Alsted deals with in the part devoted to physics. Alsted borrows the notion of matter as a *non-ens* from the Aristotelian tradition, combines it with the "Mosaic" idea of a primordial chaos, the notion of a vivifying world soul taken from the *Asclepius*, and a whole range of alchemical descriptions of matter which Alsted explicitly attributes to Hermes (*Encyclopaedia*; Herborn, 1630, p. 673). Alsted's *Encyclopaedia* is certainly not the only example of a synthesis between Aristotelianism and Hermetism at German universities. Other examples include Heinrich Nollius, professor of philosophy and medicine at the *Gymnasium Arnoldinum* at Steinfurt from 1616 to 1621. Given the influence of the textbooks by Alsted and others on modern philosophers such as Leibniz, we are forced to rethink the relations between Aristotelianism, Hermetism and modern philosophy.

CEES LEIJENHORST

Arithmology → Number Symbolism

Arnau de Vilanova, * ca. 1240 Daroca (Lower Aragon), † 6.9.1311 Genoa

Vilanova was one of the most extraordinary figures of the Latin Middle Ages. Many questions on his personality remain unanswered even today, so much has legend and hearsay intermingled with reality. Arnau de Vilanova was born in Lower Aragon toward 1240. He became a Master of medicine and married in the 1260s. He then entered into the service of Peter III of Aragon as a doctor. During his years of intellectual formation, he took courses in Christian exegesis from the Dominicans of Barcelona and Brother Raymond Marti introduced him to Hebrew and rabbinical literature. His knowledge of Arabic was such that he translated several medical works by → Avicenna, Galen, and Albuzale into Latin. From 1289 to 1299, Arnau de Vilanova was the master regent of medical studies at the University of Montpellier. It was during this period that he composed most of his books on medicine. Besides his teaching, marked by Galenism, Arnau de Vilanova continued to assist, as a doctor and a counselor, princes (James II of Aragon, Frederick III of Sicily) and popes (Boniface VIII, Clement V). Although he enjoyed indisputable authority as a doctor, his religious and philosophical ideas were another matter, and they brought him many disappointments.

In 1292, he wrote a short work in which he set

forth some of his key ideas. It was called *Introductio in librum Joaquin de semine Scripturarum*, and is a commentary on a book falsely attributed to Joachim de Flore. In particular, Arnau there defends the idea that any form of knowledge expresses a *mysterium* and consequently falls within the domain of prophecy as much as of knowledge itself. The mission of a doctor or an astrologer is not only restricted to giving treatments or designing horoscopes but also includes the task of truly working as a prophet in the exercise of his profession. Arnau de Vilanova had a reputation for spectacular healings. It is easy to imagine that in the eyes of some he was a perfect incarnation of that noble soul of whom Avicenna speaks in *De anima*, endowed with prophetic powers and whose gift is to heal the sick and transmute the elements. In his *Medicationis parabola*, Arnau de Vilanova states that an effective remedy, a medicine, always proceeds from the Supreme Good. The doctor, he adds, who has received the grace of dispensing care, uses a symbolic language to arrive at the *occulta* from the *sensibilia*. The goal of medicine, indeed, is to start from observation of the *sensibilia* in order to rise to the government of the Almighty; but the *sensibilia* alone are no substitute for the intelligible and universal principles. Whence the introduction of mathematical calculations that helped Arnau build some of his medical theories; as in *Aphorismi de gradibus*, where, using the mathematical solutions put down by → al-Kindi, he tries to resolve the delicate question of the dosage of qualities in the composition of medicines. He repeated this approach in *De dosi tyriacalium*, in relation to dosing the simples that the doctors used to make theriac.

His ideas on the necessity of a symbolic language and the permanence of the *occulta* (defined as the unexplained properties of natural objects, known either by chance or by revelation) are also basic to his views on → astrology. Astrology is basic to both a chemicomedical work such as *De aqua vitae simplicis*, and a well-known therapeutic cure effectuated on the very person of Pope Boniface VIII. In *De parte operativa*, he declares that knowing the characteristics and arrangements of the Zodiac in order to liberate the astral influences makes it possible to accomplish marvels here on earth. Arnau strictly distinguishes such knowledge from magical practices, related to demons, which are misleading and ineffectual. Similar ideas (in particular the recourse to symbolic language) also underlie an alchemical text such as the *Tractatus parabolicus*, attributed to him, and from which → Jean de Roquetaillade drew inspiration in his *Liber lucis*. It

remains unknown though whether Arnau himself practiced alchemy, and we do not know whether he personally composed treatises such as the *Tractatus parabolicus*, the *Defloratio philosophorum*, and the *Epistola super alchimia*; suffice it to say that some of them must have emanated from his secretariat. Arnau also composed an *Allocutio super significatione nominis Tetragrammaton* that consists of a reflection on the letters of *Yahweh* with the aim of proving the truth of the Holy Trinity by a method close to that of the Jewish Kabbalists. He states that the secrets of Holy Scripture are contained in Hebrew and Latin script. Such notions are supported by his views about the economy of dynamic salvation: he saw it as an active process in which, beginning with the Father and moving on through the Son, the Christian revelation is fulfilled in the age of the Holy Spirit, when all the enigmas of the Book will be resolved and the *renovatio* of the world will be accomplished. Here he is influenced by Joachim da Fiori and, even more pregnantly, by an abundant apocalyptic sublitterature including, among others, the *Sermo sancti Methodi de regno gentium et in novissimis temporibus certa demonstratio*, the *Epistola ad Cyrillum*, the *Vaticinium Sybillae Erithraeae*, and so on. The reading and study of such contemporaries as → Roger Bacon, → Ramon Llull and especially Pierre Dejean Olieu, the spiritual master of the Franciscans, complete his educational background – even if he mostly took his distance from them and followed his own path. Arnau de Vilanova was certain of the imminent manifestation of the Antichrist. Turning his personal revelations to advantage, with varying success he divulged his convictions, in the hope of being recognized as a theologian and prophet as much as a doctor. No doubt he sometimes succeeded in this. Frederick III of Sicily, for instance, disturbed by a dream, consulted Arnau to enlighten him and relieve him of his doubts and distress. Criticized, attacked by the Dominicans, and suspected of heresy, he was imprisoned and finally, unwilling to compromise his boldest concepts, was repudiated by his protectors. He found refuge with Frederick of Sicily, and died on 6 September 1311 off Genoa.

To most modern scholars, Arnau de Vilanova remains the exemplary representative of medieval Galenism. However, he was much more than that. If he never wastes an opportunity to vilify the enchanters and magicians, Arnau nevertheless refuses to consign the domain of knowledge to reason alone. His whole work pleads for the recognition of the intimate and illuminating revelations that experience (whether of a healing or a trans-

mutation) brings to light. For him, in the words of → Clement of Alexandria, ‘without faith there is no gnosis’. A counselor to princes and popes, an ambassador, a traveling companion of the Spiritu-als, an exegete and theologian, a dream interpreter and active mystic, he is remembered as a sage versed in many areas of knowledge, closer to the magus and the heresiarch than to the philosopher, but also a friend of the poor, and a partisan of evangelical frenzy. An important corpus of alchemical, astrological, magical and medical works is generously attributed to him. Many have seen in him one of those high and mysterious medieval figures prefiguring Renaissance humanists such as → Marsilio Ficino.

ANTOINE CALVET

Arnold, Gottfried, * 1666 Annaberg (Saxony), † 1714 Perleberg (Brandenburg)

Arnold studied theology in Wittenberg and afterwards worked as a private tutor in Dresden. In 1697 he became professor at the University of Gießen, where he stayed only one year. He then tutored in Quedlinburg (Saxony). From 1701 until his death, he exercised the pastoral ministry. Arnold died as a church inspector, but his work as a historian of Christianity has made him a major figure of German → pietism.

Arnold long hesitated about becoming a pastor, because he was reluctant to swear on the Augsburg Confession. He took a strong aversion to all clergy. However, this protégé of Spener, the founder of

Lutheran pietism, finally resigned himself to becoming a minister of "Babylon". He was to be mortified! Because he believed the true Church to be the inner Church, Arnold has been classed among the spiritualists: those who wanted to adore God in spirit and in truth, and not in temples made by human hands. But according to the doctrines that he sympathetically described, the inner Church is no more abstract than is the inner Man identifying with it. It is seen by him as a true communion of the faithful identifying with a single truth. It is secret for those who are not yet part of it. And in the end, it is the soul itself that becomes the true temple of God, at least for the few, and as long as the plenitude at the end of history has not yet arrived. The distinguishing feature of Arnold's Christian esotericism is precisely that it is not institutional. An invisible line thus separates those who are "converted" from the ordinary faithful, even when they all assemble in the same place for worship in the visible Church.

The "converted" are those Christians who have received the baptism administered by the Holy Spirit. This second baptism is not a visible sacrament. But through the grace that it dispenses, Man is born again, according to Jesus' explanation to Nicodemus. The Holy Spirit chooses to dwell in the heart of a person, who thereby becomes a "new Man". For him, the Holy Spirit is the presence of God incarnated by Wisdom. It is by this presence that Man is reconnected with God.

Created before humanity and the world, Sophia/Wisdom is the image of God. The sinner does not perceive her, but she shines in the heart of the regenerated Man. She is the thought of God, and the Man inhabited by the Holy Spirit is her mirror. She embodies the true doctrine written down in the Bible and in the teachings transmitted through the ages. The resulting gnosis, in the noble sense according to which Arnold understood it, is a synonym of holiness. A Man who is not "born from above" is necessarily a sinful person, the "old Adam", who cannot receive the Spirit of God. The holiness of the Man united with God is in fact the mirror of Wisdom. In his work as a historian of Christianity, Arnold was looking for the tradition of "true Christianity" in this sense, understood as the communion of the saints in Adam's posterity. This communion of saints is his version of the universal ministry, of which Luther had an idea, but of which the Lutheran clergy is merely a counterfeit.

Besides many poems and religious songs, often characterized by a baroque lyricism (see notably those in his collection *Göttliche Liebesfunken*, 1698), Arnold composed a good number of other

works, among which we will here mention only a few that pertain to → Christian theosophy. First of all there is his monumental *Unpartheyische Kirchen- und Ketzerhistorie* (Impartial History of the Churches and Heresies, 1699-1700). It is clear from this work that the true Church also includes heretics. Without approving of them in every respect, Arnold generally argues in their defense. He categorizes many of them as belonging to the "witnesses to truth" that form a chain throughout the ages. They may be Catholic or Protestant. → Paracelsus, Schwenckfeld, → Weigel, and → Boehme have a place of honor among these reprobates, and Arnold's book contains extensive discussions of Boehmenist and neo-Boehmenist theosophy as well as of → Rosicrucianism; but Arnold in fact attempts to trace the entire lineage of mystical theology from the first centuries on. In this manner he creates a complete referential corpus of "true religion". Nobody before this *Impartial History* had ever attempted to provide such a systematic treatment of so many esoteric currents taken together. By doing so, the book in its turn came to exercise a notable influence on the further development of the very religious tendencies it described.

"Mystical theology" is supposed by Arnold to be communicated by inner channels; the converted person is instructed in it directly by the Holy Spirit. Nevertheless, Arnold also attempts to make it known through the human channel of writing; and this makes him, together with → Pierre Poiret (twenty years his senior) the great publisher of Christian mysticism in Protestant society. Arnold considered mystical theology, or *theologia regentorum*, as a specific discourse. Although opposed to scholastic or dogmatic theology, and the confessions of faith of the visible Churches, he does explain mystical theology as a doctrine. He traces its history in two crucial works published in 1702: *Das Geheimnis der göttlichen Sophia* (The Mystery of the Divine Sophia) and *Historie und Beschreibung der Mystischen Theologie* (History and Description of Mystical Theology).

Wisdom, as Arnold explains in the former work, personifies the doctrine issued from the mouth of God before anything had been created. She is the divine intelligence, identified with the Word. From generation to generation, she is communicated to those people who are capable of receiving her. Priests who have no share in her revile the secret theology, but it perennially germinates and flowers in the spirit of the holy. It is always the same truth, whether found among Catholics or Protestants. It alone can end the quarrels between the theologians. Peace can reign among believers only through the

communion of the saints. The book on the Divine Sophia pertains to Christian theosophical literature by its content and by the very nature of its theme. Arnold frequented the theosophers, and published, notably, the writings of → Gichtel in 1701, and the *Cherubinscher Wandersmann* by the theosopher poet Johannes Scheffler, *alias* Angelus Silesius. His form of writing and inspiration is nonetheless very different from that of Boehme or Gichtel. Compared with these theosophers, Arnold proves to be, in his work, “scholarly” and theological rather than properly visionary. Contrary to them, too, he is rather distant from any form of mystical naturalism – thus the idea of the creative → imagination, so prominent in Boehme or Gichtel, with all its implicit consequences, is almost absent from Arnold.

The young Luther, who glorified the 14th-century mystic Tauler, had once adhered to the tradition of “mystical theology”. At the dawn of the Reformation he had published the *Theologica Germanica*, an anonymous treatise believed to have emanated from Tauler’s associates. However, the Reformer had later turned away from these beginnings. Arnold attributed the decline of the Reformation to this reversal. In contrast, he saw in the doctrine of pure love, from Molinos to Madame Guyon, a flowering of mystical theology: the quietist heresy, flourishing in the context of German → Pietism, seemed to him to redeem Luther’s mistake.

True Christianity according to Arnold unites only a small minority of the faithful here on earth. It must be considered first and foremost from the perspective of the end of time. Arnold nursed hopes for a universal restoration, or *apocatastasis*, at the end of a process of purification that would progressively extend, in the hereafter, to all of creation. Hell would come to an end. This concept of the *Wiederbringung aller Dinge* (re-establishment of all things) attracted quite a following at the time of Pietism, and was condemned in article twenty-three of the Augsburg Confession. It would reappear with Zinzendorf, but under the cover of a “secret theology”, and was later incorporated to some extent into the theology of the Enlightenment period, which in the name of reason rejected the dogma of eternal suffering. In Arnold’s time it was strictly prohibited.

Arnold’s works have had a wide influence. Its later impact on the strictly esoteric plane of Christian theosophy aside, it must be noted that posterity has mainly retained its criticism of established religion and of the dogmas that bound the faithful. In reading the *Impartial History of the Churches and Heresies*, the young → Goethe would later conclude that an individual can create his own reli-

gion – an idea that greatly appealed to him. Arnold’s opinion, however, was entirely different. For this fervent supporter of mystical theology, there could only be a single true doctrine, the one personified by Wisdom. The liberty of the Christian was that of the person who, freed from dogmas, had chosen the only true religion while completely renouncing his own will.

PIERRE DEGHAÏE

Ashmole, Elias, * 23.5.1617 Lichfield,
† 18/19.5.1692 Lambeth

Antiquary. Son of Simon Ashmole, a saddler and soldier, and Anne Bowyer. Educated at Lichfield

Grammar School, then privately in London, where he qualified as an attorney (1640). After the sudden death of his first wife, Eleanor Manwaring (1603-1641) and the growing threats of civil war, he left London for Cheshire, the home of his in-laws. In 1644 Ashmole was appointed an army officer and Commissioner of Excise (taxes and customs collector) by the Royalist Parliament, which was then in exile in Oxford. Ashmole moved to Oxford and became a member of Brasenose College from 1644-1646, but did not take a degree. In 1646 he joined a masonic lodge in Lancashire, in one of the earliest known records of speculative → Freemasonry. Ashmole spent the years 1646-1649 avoiding political troubles arising from his royalist loyalty, and achieving financial security through marriage. His second wife was Mary Forster, formerly Lady Manwaring (1597-1668). During the Commonwealth period, Ashmole spent much time traveling with friends to country houses and parish churches, where he would copy inscriptions, records, and heraldic achievements. Out of this interest in genealogy and the dignities of ancestors came Ashmole's decision to research and compile a history of the Order of the Garter, Britain's first Order of knighthood.

With the restoration of Charles II (1660), Ashmole was well placed for royal favor. He was appointed Windsor Herald and Comptroller of the Excise, and became a founding member of the Royal Society (1660). In 1669 he was made honorary M.D. at Oxford. His third and happiest marriage (1668) was to Elizabeth Dugdale (1632-1701), daughter of his friend Sir William Dugdale, but no children were born alive to them. Ashmole inherited a large collection of ethnographical and natural curiosities from the estate of John Tradescant (1608-1662), the naturalist, gardener, and antiquary. In 1675 he offered this collection to Oxford University, and a purpose-built museum housing them (now the Museum of the History of Science) was opened in 1683. It was the first public museum in Britain. A fire in the Middle Temple (1679) destroyed much of Ashmole's library, his coin and seal collections, and all his notes on antiquarian subjects. However, at his death a substantial library of books and manuscripts remained, which was bequeathed to Oxford's Bodleian Library.

Ashmole was a late example of the Renaissance polymath. Although a member of the Royal Society, he never contributed any discovery or invention in the spirit of the new science. His sciences were the historical ones of heraldry, genealogy, and numismatics, and the natural ones of botany and

medicine. His medicine was also antiquarian, being a blend of herbalism with old wives' cures based on the principles of sympathy and → magic. His magic was not mysterious or spiritual, but a practical application of the doctrine of → correspondences according to which he believed the universe to work. Ashmole made sigils and talismans in metals corresponding to the desired planetary influences, at the appropriate astrological times. Having learned goldsmiths' techniques, he would cast models of rats and insects, which he placed in his house and garden to repel vermin. His entire outlook on life was dominated by → astrology. When in London, he seldom missed the annual Astrologers' Feast. Among his closest friends were Sir George Wharton (1617-1681) and William Lilly (1602-1681), who did much to keep astrology alive and in the public eye during a period of waning belief. At every turn of events – personal, political, financial – Ashmole would draw a horary chart, connect it with the nativities of the people or events concerned, and attempt to predict the outcome for them.

Ashmole's regard for → alchemy was even less in tune with his times. He was not a practical, laboratory alchemist, but a profound student of alchemical literature, making an important collection of old English poems on the subject (*Theatrum Chemicum Britannicum*, 1652), including Thomas Norton's *Ordinall of Alchimy*. In his Preface to this anthology, Ashmole writes of the Philosophical Mercury and of the various types of Stone in terms that display his own belief in transmutation. His mentor in alchemy was William Backhouse (1593-1662), a landowning gentleman and a collector, who in 1651 adopted Ashmole as his philosophical "son". In 1653 Backhouse, believing himself to be near death, told Ashmole the true secret of the Philosopher's Stone, but no more is known than that. It seems most probable that the secret was spiritual, rather than chemical in nature.

Ashmole was also interested in the career and angelic conversations of → John Dee, and returned to this topic throughout his life. Intending to write a biography of the Elizabethan magus, Ashmole collected Dee's manuscripts and corresponded with his son, Dr. Arthur Dee (1579-1651). The biography was never completed, but in his other writings Ashmole propagated some lasting legends about Dee and his assistant Edward Kelley. Ashmole has done an invaluable service to historians in preserving the alchemical tradition through his editions, transcriptions, and the rich collection now in the Bodleian Library. The memory of the destruction of the monasteries and their records by Henry VIII, and the living example of Puritan vandalism, deter-

mined him in the duty of preserving all he could of the past. He was above all an antiquarian, and his philosophical convictions were partly those of a passing age. Perhaps his most lasting legacy was the idea of a museum, as a public collection of historical, exotic, and mind-expanding objects. Thus he is justly commemorated in Oxford's Ashmolean Museum, and in the countless other museums of which his was the prototype.

JOSCELYN GODWIN

Asiatic Brethren

Hans Heinrich von Ecker und Eckhoffen (1750-1790), a Bavarian Officer, established two of the various so-called "fringe-masonic" (in German: "winkel-maurerischen") Orders (or Systems) which flourished in the second half of the 18th century. The first, called the *Ordo Rotae et Aureae Crucis* (The Order of the Wheel and of the Golden Cross) was founded in 1776. When Adam Weishaupt had the idea of founding his famous Order of the → Illuminati shortly afterwards, it was partly as a reaction against the esoteric orientation of the O.R.A.C. The latter did not attract many people and disappeared in 1779. Having been expelled in 1780 from another Order, the Gold- und Rosenkreuz (Gold and Rosy Cross) to which he also belonged, Ecker und Eckhoffen attacked it in a pamphlet published in 1781 (*Der Rosenkreuzer in seiner Blösse*). That year he moved from Munich to Vienna. Once in Vienna, he laid the foundations of a second System, the *Orden der Ritter und Brüder des Lichts* (Order of the Knights and Brethren of the Light). This was a new, albeit more elaborated version of the O.R.A.C. It soon took on the name of *Die Brüder Sankt Johannes des Evangelisten aus Asien in Europa* (The Brethren of Saint John the

Evangelist from Asia in Europe), or *Asiatische Brüder* (Asiatic Brethren). In establishing Orders of his own (the O.R.A.C. and the Asiatic Brethren), Ecker und Eckhoffen had followed the trend shared during that period by many other Masons who claimed to possess the best esoteric knowledge. In establishing the Asiatic Brethren, he probably also wanted to take his revenge on the Gold- und Rosenkreuzer.

Like most Systems with higher degrees (or "higher grades"), the Asiatic Brethren recruited among Master Masons (which is the third degree of Freemasonry proper, and gives access to the higher ones) already initiated in a regular masonic lodge. The initiatory organization of the Asiatic Brethren was comprised of five degrees. The first two were designed as a kind of introduction to the following three, namely: 1) The Knights and Brethren of St. John the Evangelist from Asia in Europe. 2) The Wise Masters. 3) The Royal Priests, or "True Rosicrucians". The members of all degrees were supposed to "work" by themselves, outside the pale of the Asiatic Brethren lodge meetings proper, at kabbalistic interpretations of symbols, combinations of words and letters, etc.

One of the striking originalities of the Asiatic Brethren is that it seems to have been the first association of a masonic character in central Europe to recruit Jews. The pro-jewish attitude of the Asiatic Brethren is conspicuous in the Order's name itself, the term "Asia" referring to Jerusalem. Furthermore, the rituals were not designed by Ecker und Eckhoffen alone, but also by Jews supposedly well versed in Kabbalah, like Thomas von Schönfeld and Ephraim Joseph Hirschfeld. Schönfeld, a man of many parts, had been a follower of the Sabbatian movement (the cult of the 17th-century pseudo-Messiah Sabbatai Zvi). He had met Ecker und Eckhoffen in Innsbruck and then settled in Vienna (1785) in order to live close to him and actively participate in the workings of the Asiatic Brethren. In theory he was merely the archivist of the Order, but in fact he was instrumental in introducing kabbalistic elements and Jewish institutions into the rituals. For example, the supreme council of the Order was called the "Synedrion", i.e., Sanhedrin. The mingling of Christian and Jewish observances may have been easier for the Christian Brethren to accept than for the Jewish ones; but a number (albeit a small one) of Jews of the time belonging to the intellectual elite in Germany were imbued with the spirit of the Jewish Aufklärung, the Haskalah, and therefore prone to cast aside some norms of their faith. Furthermore, Schönfeld and Hirschfeld may have introduced some Sabbatian antinomian (both non-Christian and non-Judaical) elements

into the Order's doctrine and rite; for example, according to the "Laws" of the Order its adepts were to partake of a festive meal including pork.

In the "instructions" of these rituals we learn that the Order is the continuation of a very ancient alchemical, theosophical and magical tradition transmitted over the centuries through various channels, not least the Knight Templars. Prevalent are a cosmogony and a cosmology of a theosophical character, blended with arithmology [→ Number Symbolism]. We find, among other mythical narratives, a vivid description of the original Fall, in which a "Son of the Dawn" (Luzifer) plays a major part. The symbolism of these rituals resonates with those of the Gold- und Rosenkreuz, which interpreted the first degree regular masonic symbols in an alchemical sense. Gershom Scholem has demonstrated that these texts borrow heavily from various sources (which they do not cite) belonging to Jewish kabbalistic literature, → Louis Claude de Saint-Martin's *Des Erreurs et de la vérité* (1775), and → Georg von Welling's *Opus mago-Cabbalisticum et theosophicum* (first published in 1718, complete editions in 1729 and 1785).

By 1785 the Asiatic Brethren were spreading rapidly far beyond Vienna, mostly in central Europe and Germany (Prague, Innsbruck, Berlin, Frankfurt, Hamburg). It is possible that it counted as many as several thousand members at that time. Quite a few were aristocrats or dignitaries of high ranks, like Duke of Liechtenstein, Count Joseph von Thun, a Minister of Justice in Austria, Prince Joseph von Linden, Prince Otto von Gemmingen, and Duke Ferdinand von Braunschweig. Nevertheless, since its inception in 1781 the System came in for its share of criticism and was attacked by rival fringe-masonic organizations with a similar esoteric orientation, such as the "Gold- und Rosenkreuz", which had gained a strong foothold in Berlin. This resulted into a flurry of published pamphlets: a quantitatively impressive body of literature, which is a welcome source of information for historians researching the esoteric organizations of that period. For example, when Ecker und Eckhoffen tried to present his System at the famous Masonic Convention of Wihelmsbad (in Hanau, 1782), his application was turned down, partly because he was discredited by his rivals, who presented him as a magician dealing with dangerous occult powers. Besides, the Masons at the Convent were for the most part Christians, and as such did not appreciate the fact that Ecker und Eckhoffen introduced Jews into Masonry. The success of the Asiatic Brethren aroused the special animosity of two prominent freemasons of the established rites,

Prince Johann Baptist Karl von Dietrichstein, Grand Master of the Austrian Lodges, and the famous masonic and Aufklärung figure Ignaz von Born. Partly due to their pressure, Joseph II passed a law (the "Freimaurerapaten", 11. Dec. 1785) imposing stricter controls on Masonic activity in Austria. As a result, the Asiatic Brethren and other similar higher degree Systems in Vienna dealing with esoteric matters like alchemy had to suspend their meetings.

Such events did not put an end to the Asiatic Brethren. Hampered in Austria, it continued to spread far and wide – albeit with unequal success –, particularly in North Germany (Hamburg, Hannover, Lubeck), Prague, Innsbruck, Berlin, Frankfurt, and Wetzlar. Prince Karl von Hessen Kassel became its official Grand Master in August 1786, which is why the same year the headquarters of the Order moved over from Vienna to Schleswig. For some obscure reasons, Hirschfeld was expelled from the Order in 1790, but the texts he had written for the rituals stood him in good stead when he later used them in his book *Biblisches Organon* (1796), one of the most interesting theosophical works of the late 18th century.

After Ecker und Eckhoffen's death (1790) the Asiatic Brethren only maintained itself in an apparently limited number of lodges, but they were spread all over Europe throughout the first Empire. This survival was due in part to the never weakening efforts of Hirschfeld, and in Scandinavia to the tenacity of Karl A.A. Boheman. Furthermore, its discreet but enduring presence is documented well into the 20th century in a variety of similar Systems who took their inspiration from it. The → Hermetic Order of the Golden Dawn in England, Francesco Brunelli's Arcana Arcanorum in Italy, and even Theodor Reuss's original → Ordo Templi Orientis idea, were all more or less inspired by the Asiatic Brethren. Interestingly enough, the Asiatic Brethren, along with the Illuminaten (Adam Weishaupt's politically oriented fringe-masonic Order) has become the mainstay of 20th century antisemites who see both as the vehicle that spread the Jewish revolutionary plots and inspired the *Protocols of the Elders of Zion*.

ANTOINE FAIVRE

Astrology I: Introduction

Astrology presupposes a relation between the positions and movements of the planets, stars and celestial orbs and zones on the one hand, and earthly events and/or human life on the other, and claims to explain this relation and predict future events in terms of the properties and relative positions of these heavenly agents. The most general idea behind this is expressed in the *Emerald Tablet* as “as above, so below”.

The questions why such a relation should exist, how it works, how we can know it, and of what use it might be to human beings have been answered in

rather diverse ways. Throughout the ages, the astrological view of the universe and of the nature of the relation between celestial and terrestrial phenomena has been essentially religious in nature, and it still is. Originally, astrology is supposed to have been mythical in character: the planets (traditionally including the sun and moon) and stars were thought to be living and divine beings, visible gods in the sky, whose great powers inspired awe and veneration. Gradually, the heavenly bodies became part of a hierarchical cosmology, in which the cause of their influences acquired a more transcendent character.

Basically, we might describe the most influential and long-lasting Western theories of celestial influence as either (more or less) “platonic” or (more or less) “aristotelian” in character; but in practice, the distinction is often problematic, as these views were often “harmonized”. While both theories presuppose a transcendent and eternal Deity as the ultimate mover of the universe and regard man as a microcosmos, the “internal” organization of the universe is described in very different terms. The “platonic” universe is a living and animated organism, moved by the World Soul; the planets are “lesser gods”, each of which performs his or her task by exerting a specific, innate influence on humankind by way of intermediaries. “Aristotelian” cosmology is more concerned with physical explanation of movement, light and influence of the heavenly bodies and orbs; although Aristotle does not explicitly discuss astrological theory as such, some of his views (especially from *De caelo* and *De generatione et corruptione*) could be used as a rational basis of astrological ideas. By way of Latin translations of Arab astrological literature, which was mainly aristotelian, these views gained great authority in Western Europe (Lemay 1962; 1987).

During the long period (12th- 17th/18th c.) in which celestial influence was part of the official Western European scientific paradigm, the why and how of these influences were seldom explained in a specific astrological context, as they belonged to the fields of cosmology, natural philosophy and metaphysics (Grant 1994, 569-617). Mainstream astrology had a rather practical approach; its theory was usually limited to an explanation of the qualities and influences of the planets, signs and other relevant elements according to astrological tradition, which claimed to be based on ages of experience and remained remarkably stable. Many texts are exclusively focused on methods of astrological interpretation and prediction.

Astrological statements are usually based on a diagram (chart, horoscope) depicting the state of

the planets, stars and orbs for a specific place and time. This requires a detailed knowledge of the astronomical state of the heavens, which may be acquired by observation or (usually) by calculation on the basis of tables. For the interpretation of the figure, the astrologer could rely on traditional information about the meaning of the data. A chart may be drawn for several astrological purposes, of which the most prominent fields are: mundane astrology (revolutiones), horary astrology (interrogationes), natal astrology (genethliology) and elections of times (katarchen). *Mundane astrology* is concerned with general predictions about political power and changes of government, warfare, what will happen to nations, regions and classes of people. The charts from which these predictions were drawn usually represented the exact astronomical beginnings of solar years, seasons or months. Some were based on phenomena like eclipses, comets and conjunctions of the superior planets. *Astrometeorology* (astrological weather prediction) is a more specialized part of mundane astrology. Over long periods of time, general astrological predictions were popular as an indispensable element in almanacs. *Horary astrology* is based on the assumption that the heavens contain the answer to any question for the exact moment on which it is asked. The subject matter of the question decides in which of the *loci* or celestial houses the astrologer will find the answer. *Natal astrology*, which uses a person's natal chart to draw conclusions about his character and life, has always been and still is the most popular type of Western astrology. *Electional astrology* is concerned with choosing the most favourable moment for the beginning of an activity – a journey, a marriage, the building or buying of a house, and so on. Sometimes the “planetary hours” are observed: each planet rules one day of the week, and every hour of the day has its own planetary regent, which gives it a certain quality that makes it unfit for certain actions but excellent for others. The moon's phase, its zodiacal position, or the day of the lunar cycle are also considered important. Some parts of medical astrology, especially the choice of the right moment for medication, purging or bloodletting, are of this type, although the constellation at the moment that the patient fell ill is usually also taken into consideration. With regard to all these types of practical astrology, it is important to realize that they were not objects of belief, but constituted rational and systematic methods that were simply taken for granted as long as the concept of celestial influence was generally accepted. They became “pseudo-science” only at a time when this was no longer the case.

The main philosophical issue raised by astrology was the problem of free will and fate. Belief in astral determinism or fatalism, which was adopted by some of the ancients, was unacceptable in Christian Western Europe. The standard solution was found in limiting the influence of the planets and stars to man's “mortal” frame, which includes his body, passions and appetites, while asserting that it did not have power over his immortal and immaterial soul. The usual aphorism quoted in this context is *Vir sapiens dominabitur astris* (‘the wise man will rule his stars’). Although this may be understood as ‘the wise man is free from celestial influence’, it could also be (and often was) interpreted as: ‘the wise man will, by his self-knowledge, succeed to make the best of his potential as indicated by his birth chart’.

A. HISTORY

1. INTRODUCTION: ASTROLOGY, ASTRONOMY, AND METEOROLOGY

The term “astrology”, in its present sense, refers to a complex system of sidereal divination for the benefit of human affairs, but originally its meaning was more variegated. The term has long covered at least three different meanings: the present meaning, mentioned above, but also the scientific observa-

tion of the stars, that is, astronomy, and still earlier, the same observation of the stars for very practical purposes, in agriculture and in particular for weather prediction: meteorology.

The modern notion of astrology separated very slowly and confusedly from the two other notions. We could situate around the time of Aristotle the differentiation between the Greek terms astrology and meteorology, and only after the beginning of our era, the progressive differentiation between those of astrology and astronomy. However, the confusion of these two would persist practically until Kepler. Sometimes, to avoid such confusion, or to better define their methods, the technicians of ancient astrology attributed new terms to it (toward the 2nd century A.D.): “genethliology” and “apotelesmatica”, which concentrate on the planetary influences studied at the birth of a subject, or again the “art of the Chaldaeans”, referring to the most renowned source of ancient planetary divination.

2. FROM THE MESOPOTAMIAN SYSTEM TO HELLENISTIC FAITH

Elements of astrology, understood as astral observation from which predictions can be deduced, seem already to have existed as a complement to the Sumerian practice of haruspicy, but it was in Mesopotamia, toward the 2nd century B.C., that the elements of an astrological system were truly formed. It was founded on the idea of a sympathetic coincidence of the world, heaven and earth, and the realm of the gods; and on the obedience of each one, as part of the whole, to a pre-established destiny. Thus, for example, each celestial event, precisely observed, is considered as auspicious or inauspicious for the people, or for their leaders. A great number of such predictions, recorded on tablets, have been rediscovered in the library of Assurbanipal at Nineveh.

The greatest divinities were the stars, and the Mesopotamian sidereal cult, along with astrological practices, spread widely, from Nineveh to Babylon. In addition, there was developed a precise subdivision of time, which assigned the months and the days to the dominion of astral divinities. These still presided, in what was a rudimentary beginning of geography, over each of the four parts dividing Mesopotamia inside an ideal circle. Let us first note that the Moon, *Sin*, presided over the hierarchy of the planetary divinities, and the portents drawn from its observation were comparatively numerous. The Egyptian priests, in contrast, later followed by the Greek astrologers, gave primacy to the Sun. Finally, ancient astrology

owes the zodiac and its subdivision into “signs”, which include the constellations, to Mesopotamian technique.

Celestial observation in Egypt, before the Hellenistic era, did not concern the influence of the stars upon a single individual, any more than it did according to the Mesopotamian method. Rather, it provided orientation, on the basis of the planetary movements and the horary tables of the risings and settings of stars, for the establishment of the ceremonial calendar of divine worship (favourable and unfavourable days, exact hours for services) and for the determination of sacred space by means of the cardinal points, needed to build the temples. We also owe to priestly Egyptian science the *Tables of the Thirty-Six Decans*, which mark the rhythm of the year and make it possible to calculate stellar risings.

Starting with the colonizing waves of Greeks moving to the East, from the eighth to the 6th century B.C., the amount of contact between the Chaldaeans and the Greeks increased, especially with Babylonia under Nabuchadnezzar. As early as that period, the Greeks began to draw from the oriental breeding ground all the astrological techniques that they were lacking. Moreover, an oriental understanding of the world began to permeate religious practices and even philosophical thought. Thus, the school of Pythagoras, probably connected with Orphism, drew inspiration from the sidereal cults of the East; it saw in numbers, which establish harmonious cosmic relationships, the essence of all things. The repercussions of this astral vision of the world, attributed to Pythagoras, continued well into the Roman Empire, in → Neoplatonism and in commentaries on Plato's *Timaeus*.

In the 3rd century B.C., in the *oikoumene* opened by the conquests of Alexander the Great, many Eastern Mystery religions spread through the Hellenistic world and found a favourable reception there. In their context, the astrological techniques became more than a means to an end. Revering Cybele, Attis, Atargatis, and Serapis, and especially Isis, to whom the faithful in quest of individual salvation adhered unanimously, these Mystery Religions had two faces. Their *exoteric* cult was open to everyone, and was often stamped with → magic; another, *esoteric* cult addressed a few initiates, and often involved a teaching of astrology, or even astrolatry.

Moreover, the weakening of civic religion in the Greco-Roman world favoured new individualistic aspirations, soon supported by certain tendencies in the Socratic, Platonic, and Stoic philosophies,

and this opened up a terrain favourable to astral determinism. The discoveries of the Hellenistic scientists were numerous and genuine; they included the precession of the equinoxes, an outline of the heliocentric theory of the universe, and the exact measurement of the circumference of the Earth. Simultaneously, the Egyptian priest Manetho, at the court of the Ptolemaeans, and the “Chaldaean” historian Berossus, a protégé of the Seleucids, wrote histories of their civilizations that included astrology, notably in the genealogies. Berossus settled on the island of Cos at the beginning of the 3rd century B.C., where he opened a very famous and busy school of astrology. A true “astrological science” was born, whose mythical founding fathers were the “Hellenized Magi”, Zoroaster, Ostanes, and Hystapes, whose “philosophy” and methods J. Bidez and F. Cumont have analysed.

From this period, we can date both a metamorphosis of astrology and its consolidation in the minds of people. It gained the sanctity of a faith in addition to its foundations as a science, while losing some of its traditional characteristics as a result of contact with the Greek spirit and the use of certain facts of astronomical discovery. It was also from the Hellenistic era on that astral divination was no longer applied solely to entire peoples and monarchs, but – responding to the new individualistic aspirations – came to include predictions for particular persons.

3. ASTROLOGICAL SYNCRETISM IN THE ROMAN EMPIRE

Astrological beliefs had not been absent in Rome before the imperial period, as shown by edicts condemning certain astrologers and practitioners of the occult sciences during the Republic. But it was due to the imperial conquests of the Orient, as early as the 1st century A.D., that astrology found a very broad following among all the classes of Roman society, including some of the emperors, such as Tiberius. Whole dynasties of astrologers, for example that of Thrasyllus, enjoyed celebrity. Yet, some sceptics raised their voices, such as the philosopher and scholar Carneades in the 2nd century B.C., or Lucian in the 2nd century A.D., the satirical poets of the Roman Empire, and the voices of Christianity.

The notion that the fate of living beings was absolutely determined by the laws of the planetary movements, and that humanity was completely subject to this sidereal fatality – the theoretical foundation of astrology – long ensured it a credible philosophical backing. Moreover, astrolatry, already practised in the Pythagorean school,

spread to Rome with the syncretic religion of the Syrian Baals and that of Mithra, a solar god who promised his worshippers heavenly immortality. Following the example of these religions, almost all the religions of salvation used astrological methods as a means of divination and as sacred elements of worship.

In accordance with the syncretism of the mystery religions, a kind of compendium of ideas came into being, characterized more by belief than by rationality, and the influence of which extended to the educated classes. Among the philosophical systems appropriated to serve as a substratum for these new forms of thought, Stoicism takes the first place. The Stoic notion of submission to fatality – but developed into a moral duty of renunciation –, its notions of a harmonious order of the world, universal sympathy, pantheism, and the migration of souls to the stars blended with the belief in sidereal divination and became a moral system propagated by a Syrian Stoic, Poseidonius of Apamea, teacher of Cicero. Indeed, the notion of universal sympathy, cornerstone of the Stoic system, made it possible to accept the influence of the stars on the natural elements (e.g. in the phenomenon of the tides, as demonstrated by Poseidonius) and even on human beings.

Thus the weakening of the critical spirit, which already inaugurated the era of the annotators and compilers at the turn of the Christian era, was as perceptible in astrological beliefs as it was in the writings that propagated them. This was true notably of two scholars of the 2nd century A.D., whose works have survived. The first, Vettius Valens of Antioch, fits the image of the scholarly compiler, more an astrologer and a priest than a scientist and an astronomer, although his work is cited with admiration by the Arab astrologers, such as Masallah in the 8th century A.D., and was much copied and annotated. His astrological tract, the *Anthologies*, is a didactic manual in nine books intended for his disciples, which methodically teaches how to set up a birth theme. The greatest merit of this work is that, although of Egyptian obedience, it attempts to reconcile the two rival astrological doctrines that were still mutually exclusive in the Hellenistic period: Egyptian (the tradition issued from the *Liber Hermetis* and from the teaching of Nechepsos-Petosiris) and Babylonian (the doctrine of the Chaldaean magi transmitted by Berossus).

His contemporary, Claudius Ptolemy, who also followed the Egyptian tradition, was a compiler equally lacking in originality. However, his famous *Tetrabiblos* or *Apotelesmatika* is a methodical

work and more critical than that of Vettius Valens. It is also a precise pedagogical manual, which covers genethliology and the establishment of a birth theme and provides a meticulous classification of the fixed stars, the planets, the signs, and their aspects.

If we find in Ptolemy an aspiration to technicality, a “scientific” intent, such is not at all the case in Vettius Valens or his contemporaries. We already noted the sacred character of astrology as early as its Mesopotamian origins. Despite its pretensions as to the rigorous observation of the stars, at no time did it ever lose its religious aspect. The “Chaldaean” who delivered predictions most often mixed their calculations with religious considerations. Firmicus Maternus, in his *Mathesis*, proclaimed the faith that motivated him and all his colleagues who were ‘initiated’ into the ‘divine science’. Vettius Valens reminded his disciples of the necessary obedience to Fatality and the sacred rites (*Anthologies*, VII, 5 and IV, 2). Like a priest who initiates his mystes, he entreated them not to divulge his teaching (*ibidem*, VII, *proomion*), for immortality will be assured to astrologers loyal to their faith.

Like Vettius Valens and his colleagues, and like the *Chaldaean Oracles* in the 2nd century A.D., the Neoplatonic philosopher Iamblichus granted astrology a prominent place in his *Mysteries of Egypt* (VIII, 4 sq.), not only as a technique of divination used in theurgy, but also as an essential part of hermetic metaphysical beliefs. Indeed, the astrological “revelation” of an astral cosmogony and of the sidereal influence on the world relates closely to the philosophical revelation of Hermetism and its moral substratum of a sympathy between the universe and humanity, the celestial and sublunar worlds. Furthermore, the principal aim of theurgic practice was to *influence* the invoked divinity, by any possible astrological and magical method.

Astrology, as a kind of knowing and as technique, thus became a favoured means of access to knowledge and gnosis, and hence a means of union with the divinity: the ultimate goal of Hermetic experience. The astrologer, or the magician, shared in the divine power, which he claimed came directly (through revelation) from the great Hermetic god Hermes-Thoth.

4. SOME ESSENTIAL TERMS AND NOTIONS FOR UNDERSTANDING THE ANCIENT ASTROLOGICAL SYSTEM

We have seen that the basis of astrology is the principle of solidarity between the celestial and the terrestrial parts of the universe: from this, the

astrologers drew the conclusion of a necessary influence of the stars on human destinies.

The planetary aspects. Each star exercises a particular influence by its nature and position, and its aspects with respect to other stars exercise another influence. Certain planets are benefic (Jupiter, Venus, and the Moon); others are malefic (Saturn and Mars). Only the planet Mercury can have both qualities. Anthropomorphized and endowed with feelings, the stars stand in “opposition”, “conjunction”, or “exaltation” to each other, or in “depression” in a sign. They are part of a team or group, of the solar “sect” (“sect” of day, of the masculine gender: the Sun, Saturn, Jupiter and Mars) or of the lunar “sect” (“sect” of night, of the feminine gender: the Moon and Venus). The planet Mercury can again take part in both “sects”, according to its situation. Likewise, human beings and animals, minerals and plants, as well as all parts of the known world, find a place in the solar or lunar “sect”, within an organization of the world that considers itself rational and ordered.

The planets exercise determining influences, according to their relative positions. They can be in “opposition” or “squared” (two unfavourable aspects), or in “trine”, “sextile”, or “conjunction” (favourable aspects). The exact distribution of the parts of the human body under the rule of a planetary divinity and the signs of its “sect” is called *melothesia*. The geographical distribution of the regions of the *oikoumene* is called “chorography”.

The zodiac and the birth theme. The Chaldaean invented the band of celestial space that touches the solar or ecliptic orbit, which is inclined 24 degrees 27 minutes on the plane of the celestial equator. The two intersections of the ecliptic and the equator form the *equinoctial points* (in the signs of Aries and Libra); their opposing points are the *solstitial* or *tropical points* (in the signs of Cancer or Capricorn). On this circle are distributed the twelve signs, often zoomorphic, borrowed from Babylonian mythology; Greek tradition simply took over the figure of the zodiac and adapted it.

There are two principal systems of astrological divination. First there is the “apotelesmatic” or “genethliological” system, which informs the seeker about the most important events of his life. Second there is the system of “Initiatives”, which defines the effects of a planetary configuration on a specific action to be undertaken.

To determine the events in the life of an individual, one must establish a “birth theme”. This term is not equivalent to the modern sense of “horoscope”. One establishes a birth theme by calculating the four points situated at the intersection of the

planes of the horizon and the meridian for a given birth; four “Centers” are thus determined, and the planet and the sign that appear at these “Centers” reveal the subject’s personality. There is first the “Horoscope”, the “Ascendant point” (point I), which determines the beginning of the cycle of the twelve “Houses” and the thirty-six “Decans”, each subdivision being dedicated to a particular area of human life; this is the point where the Sun was rising at the moment of the subject’s birth, on the eastern horizon. Next are calculated the “Lower Culmination”, “Imum Caeli” (IMC; point IV), the “Setting” or “Dysis” (point VII), and the “Upper Culmination” or “Medium Caeli” (MC; point X). These points are important in a birth theme and correspond with the subdivision of the “Houses”.

5. HITTITE AND INDIAN ASTROLOGY

Hittite astrology did not originate from an invention proper to the peoples of Anatolia. The texts rediscovered at Boghaz-Köy, such as lists of portents derived from the aspects or the eclipses of the Moon, are all translations of Babylonian writings. We know that contacts were established very early between Mesopotamia and Anatolia, which permitted the Chaldaean culture to exercise a strong influence not only in all the → divinatory arts, but also in literature and in medical practice.

Likewise, even though the Pythagorean legend made the philosopher of Samos a disciple of the Brahmins, we may assume that Mesopotamian technique largely influenced Indian astrology, as early as the conquests of Alexander, and that, during the Hellenistic period, Graeco-Egyptian astrology blended with that of India.

Finally, both Hittite and Indian astrology, which lacked an originality specific to their culture, rarely practised individual divination; they devoted their calculations to the destiny of a whole country or of its rulers.

6. CONCLUSION

The system of apprehending the world suggested by astrological methods and their theoretical foundations was recognized, in Antiquity, from the Mesopotamia of the second millennium B.C. to the Hellenistic and Byzantine worlds, as a form of knowledge and often even as a sacred science.

The only discordant voices came from the intellectual elite. There was opposition to astrology from genuine astronomers and philosophers, and sometimes, for completely political purposes, even from certain rulers, hindered by astrological investigations in their desire for absolute power. Voices rose in opposition to astrology especially in the

Graeco-Roman world, because this art pretended to appropriate the rational Greek spirit. It was held to be misguided because it proclaimed astrology as a science. Thus, Hipparchus, in the 2nd century B.C., wholly refuted the idea of using planetary observation to predict the future, even though he believed in the celestial nature of the human soul. Similarly, while Stoic philosophy, with which Hipparchus identified, was appropriated to serve as a “philosophical” substratum to astrology, the Stoics could not accept the divinatory formulas of the “mathematici” developed from stellar observation. The Cynical, Sceptic, and Epicurean philosophers also rejected any form of “astrological science”; Carneades, in the 2nd century B.C., ridiculed astrology and astrologers.

However, we have seen how much astrology was part of the mystery religions as early as the Hellenistic period, and how its methods served to discover the future in every area of life: birth, death, marriage, length of life, and so on. Even the juridical codes acknowledged it, if only to sanction its use as prescribed for magical practices. Frequently used in public life and political controversies, astrological consultation could also provide the name of a new emperor: the rulers, moreover, often availed themselves, as Augustus or Tiberius did, of personal astrologers. Thus, opposed and revered, science as well as faith, astrology conquered all of Antiquity despite discordant voices.

B. LITERATURE

I. INTRODUCTION

Astrological literature appears in the form of archeological documents (tablets and temple inscriptions) or texts (most often fragmentary). All are put under divine patronage, i.e. of a deified planet or a god already worshipped; the god most frequently invoked was → Hermes Trismegistus, associated with his Egyptian homologue Thoth, in a syncretic concern for venerable authenticity. Among the surviving texts we can distinguish between “technical” works and “mystical” revelations. The first not only deal with the simple ideological basis of sidereal divination, the belief in the sympathy of all the constituents of the universe, but also treat of the various “mathematical” ways to predict the future through the observation of the stars. The second group of astrological compilations, of later date, expresses the authors’ faith in a revelation of a mystical nature and introduces astrological knowledge as a means of access to the union with the divine desired by the initiate. This is Hermetic astrology, more religious than “scientific”.

2. "TECHNICAL" ASTROLOGICAL TEXTS

2A. FROM MESOPOTAMIA TO THE HELLENISTIC WORLD

Though one of the most ancient astrological documents known is a Babylonian tablet from the 2nd millennium B.C., most of the tablets conserved in the library of Assurbanipal at Nineveh are more recent and date from the 7th century B.C. The observations inscribed on these tablets are of a "scientific" nature: lists of planetary risings and settings, eclipses, and descriptions of planetary movements. However, the predictions drawn from them are very different from the strict deductions that one might perhaps expect, and all pertain to astrological method. These tablets already give a description of the zodiac, which Graeco-Roman astrology would later use and complete. However, the first birth theme (today incorrectly called "horoscope") conserved is more recent; it is Babylonian and dates from about 410 B.C., when Babylon was under the yoke of the Achaemenian Empire. Before this period, a similar astrological practice does not seem to have existed.

After the conquests of Alexander, toward the middle of the 3rd century B.C., we see an increasing interest in these individual themes in Babylon, while in Hellenistic Egypt we find them only from the last decades of the 1st century B.C., inscribed on papyrus. However, the best-known birth theme is Syrian, and it also dates from the 1st century B.C.: it is a pictorial document on the monumental tomb of King Antiochus I of Comagena at Nimrud-Dagh. Depicting a lion covered with stars, it is moreover a "theme of conception" (a royal theme par excellence) and it represents the situation of the planets, not at the birth of the king, but at the supposed moment of his conception, in the sign of Leo.

Finally, the Hellenistic period is especially rich in collections of pseudepigrapha that, under the name of legendary heroes or deities, dispense astrological and magical teachings of an encyclopedic character. Often, only the titles of these collections have survived.

Some astrological texts reflect a tradition strongly tinged with religiosity, issued from Greco-Egyptian circles of the Hellenistic period. They have come down to us as fragments, attributed to the pharaoh Nechepsos and his supposed confidant, the priest Petosiris. These tracts probably appeared in Alexandria toward 150 B.C. and could be inspired from somewhat earlier sources, even though Petosiris claims to represent the Hermes-Thoth revelation itself. In any case, the fragments transmitted to us, along with the citations of these tracts by many astrologers, such as Firmicus Maternus or Vettius

Valens, reveal them as a true sum of both astrological technique and texts considered as sacred. Their authors moreover present them as a heavenly revelation; it is, for example, a "divine voice" that grants Petosiris the privilege of knowing the essence and the influence of the stars on the world.

At the same period also appear other writings claiming the direct authority of Hermes Trismegistus; the most "scientific" one of them is the *Liber Hermetis*, of which there exists only a Latin translation. This work deals particularly with the "twelve *loci* of the sphere", gives a detailed list of decans, and introduces many practical exercises, notably to calculate the death date of a subject. Astrologers like Thrasyllus, Vettius Valens, and Firmicus Maternus used it extensively. In the 3rd century A.D., the philosopher and astrologer Iamblichus of Chalcis stated that the number of works inspired by the *Hermetica* exceeded fifty thousand (*Mysteries of Egypt*, I, VIII). Likewise, an anthology conserved under the name Pseudo-Manetho, whose beginning dates to about the 1st century B.C., with interpolations written until the 2nd century A.D., was also strongly influenced by the tradition of the *Hermetica*. It mixes the authority of Asclepius, Petosiris, and the Egyptian priest Manetho and mainly deals with the system of "Initiatives" (on a specific action to undertake) and the calculation of a subject's lifetime. Also well known during the Hellenistic period were collections of the → Iatromathematica of Hermes, which study medical astrology (predicting notably the outcome of an illness), and the *Salmeschoiniaka* (*Papyrus Oxyrhinchus* III, 128), which place the division of time and favourable dates into the astrological context of the thirty-six decans. However, these two types of text show almost no characteristics of astrological technique, but instead are reflections of Hermetic faith. They are left to us in a fragmentary state. W. Gundel has published some of them; others appear in the *Catalogus Codicum Astrologorum Graecorum*.

During the same period, a Babylonian astrological theory transmitted by the "Chaldaean" channel (chiefly the Syrian priests and perhaps the astrological school of Cos, where Berossus, whose work is lost, was teaching) came to enrich planetary divination. It was to become foundational to astrological doctrine by affirming the influence of the stars on the inhabited world, and particularly on humanity, as well as their divine nature. This was, it seems, the only original "Chaldaean" contribution to Hellenistic astrology. From the same "Chaldaean" tradition issued the apocryphal texts written under the pretended Persian authority of the "Hellenized

magi”, as J. Bidez and F. Cumont have called them: Pseudo-Zoroaster, Ostanes, and Hystapes. Many of these works were in the Library of Alexandria; sometimes we still have their titles or some references transmitted by Arab astrologers.

At the very beginning of the Christian era, a religious sect established on the shores of the Dead Sea at Qumran left us manuscripts written in Hebrew and Aramaic. Some contain birth themes established according to the Essene belief in the determinism of human life and its predestination to a “Destiny of Light” or a “Destiny of Shadows”, and are strongly tinged with spirituality. On the basis of the time of birth, Essene astrology could determine the character of a being, then its destiny and spiritual evolution. Some themes, studied and published by A. Dupont-Sommer, are those of personalities of great moral qualities, one of whom is even supposed to have been an “Elect of God”. If their style and form recall those of Chaldaean themes, these texts show us to what extent Essenian Judaism was open to the influences of the great spiritual and esoteric currents of the Hellenistic world.

2B. FROM THE ROMAN EMPIRE TO THE BYZANTINE PERIOD

The development of astrology in the Roman Empire was to a great extent connected with the success of Eastern religions, which supplanted civic religion. With the religion of Isis and its mystery cult, astrology found a prominent position. In Egypt, pictorial astrological literature was represented by the zodiacs decorating the temples of Denderah, Esnah, and Akhmim in Upper Egypt. These zodiacs are all from the Roman era, despite the claims by the priests and astrologers connected to the temples, who wanted to trace them back to remote Egyptian antiquity. They were copied from Hellenistic zodiacs, as also happened in other traditions and cultures (Indian or Chinese). The most complete (circular) zodiac is that of Denderah. On view at the Louvre in Paris, it shows the division into zodiacal signs and decans, with the constellations and the planets in the signs.

By the end of the 1st century B.C., senator P. Nigidius Figulus had already worked to disseminate astrological theories in Rome, even trying to reconcile the “Chaldean” and “Egyptian” doctrines in the light of neo-Pythagoreanism. Likewise, a Syrian philosopher, Posidonius of Apamea, a reputed scholar who was the teacher of Cicero and a commentator on Plato’s *Timaeus*, broadly contributed to give astrology the support of Stoicism as a philosophical foundation. He was to inspire, among others, the theories of Ptolemy in his *Tetrabib-*

los. The rulers themselves, from Caesar to the Severi, furthered the influence of astrology on the minds of their subjects. These rulers included Tiberius and Hadrian, who believed in the power of the stars and employed the services of reputed astrologers, such as Balbillus or the “dynasty” of Thrasyllus. Some fragments of their astrological exercises are still extant in the *Catalogus Codicum Astrologorum Graecorum* (CCAG, VIII, 3); Balbillus, for example, has left us an original method to calculate the length of an individual’s lifetime.

Similarly, the poet Manilius, who identified with Poseidonius among others, provides in the five chants of his *Astronomica* a description of the planets and the signs, their relationships and their influence on people. The court of Augustus or Tiberius seems to have commissioned this work of little originality. During the Empire, in an intellectual atmosphere that favoured commentaries and exegeses, most of the writings were astrological compilations and protreptic manuals for the purpose of training disciples. We have already mentioned the *Apotelesmata* of Pseudo-Manetho, of Petosirian persuasion, whose composition extended from the 1st century B.C. to the end of the 2nd century A.D. This collection displays analogies with the manuals of Claudius Ptolemy, Vettius Valens, and Firmicus Maternus. This is because they all borrow from the same earlier sources, those of the Hellenistic vulgate. From Ptolemy, a methodical theoretician and good pedagogue, we have inherited an influential tract on astronomy, the *Mathematical Syntax* or *Almageste*, which in thirteen books develops a geocentric vision of the world, despite the teachings of his master Hipparchus. His *Apotelesmatica*, or *Tetrabiblos* teaches in a critical and methodical manner all the areas of astrological technique (planets and signs, aspects, genethiology, the art of establishing a birth theme, and calculations on the length of lifetime). His work influenced many later astrologers, such as Firmicus Maternus, Hephæstion of Thebes, Paul of Alexandria, Rhetorius of Egypt, Palchus, and even the Arab astrologers.

His contemporary, Vettius Valens of Antioch, left us *Anthologies*, a work in nine books, less critical than the *Tetrabiblos*. The collection, very mutilated, was a practical manual intended for his disciples. It is rather monotonous in its structure and form, mixing practical recipes with mystical injunctions to silence for students initiated into the “sacred science”. Vettius Valens especially follows the tradition of Petosiris, but he has the recognizable merit of having attempted to reconcile the two rival astrological doctrines, “Egyptian” and “Chal-

dean”, even though he was often content to compile rather than reconcile them. He remained, until the Middle Ages, an unrivaled master in both astrology and astral mysticism, held in great esteem by Antiochus of Athens, the Anonymous of 379, Hephaestion of Thebes, Palchus, Rhetorius, Theophilus of Edessa and many Arab astrologers. He would even be a subject, in the 16th century, of attentive study by → John Dee, the astrologer of Queen Elisabeth I of England.

We also still possess two works by an astrologer known as Firmicus Maternus, from the time of Constantine. The first, called *Astronomica*, is a paraphrastic commentary on the same work by Manilius. The second, *Mathesis*, is a compendium inspired by the *Orasis* of Critodemus and the *Hermetica*, and it describes in eight books the art of genethliology and of establishing a birth theme. The religiosity of the era and a syncretistic “mystical” theosophy strongly colours the whole work.

Besides the two summaries of Vettius Valens and Ptolemy, most of the other astrological tracts until the Byzantine period have survived in fragments, either as references in the better-conserved astrological manuals, or as astrological manuscripts. An inventory has been made, and the texts have been published, in the *Catalogus Codicum Astrologorum Graecorum* (CCAG; 12 volumes) by several philologists, including F. Boll and F. Cumont. This edition is still authoritative and cannot be neglected by anyone who wants to study ancient astrology.

In the “Chaldaean” astrological tradition, we must mention Critodemus, to whom Vettius Valens often refers, and who introduced Babylonian astrology in the 1st century A.D. His major work, the *Orasis* (the Vision), of which fragments remain (CCAG, VIII), often blends astrological description with speculations of a vague religiosity: astrology appears in it as a religion of salvation. Another work, contemporaneous with those of Vettius Valens and Ptolemy, has come down to us as fragments: the *Chaldaean Oracles*, a compendium of the “Chaldaean” theurgists attributed to a certain Julian the Theurgist, presented as a path to salvation through mystical union with cosmic and sideral divinities.

From the 2nd century A.D. on, astrological literature was further distinguished by the works of Antiochus of Athens and Dorotheus of Sidon, who refer to “Egyptian” authority. In the 4th century came the contributions of the Anonymous of 379, as well as Hephaestion of Thebes, who was an uncritical compiler, and Paul of Alexandria, who restored Ptolemy. Finally, in the 6th century, Palchus, another disciple of Ptolemy and Rhetorius,

produced a work that included many astrological citations and thus restored the two astrological traditions. All these tracts have come down to us as fragments, published in the CCAG.

3. ASTROLOGY AS REVELATION: HERMETIC ASTROLOGICAL LITERATURE

Within the philosophical and religious syncretism that characterized thinking from the Hellenistic period onward, the religions of salvation stimulated the individual to seek knowledge of the divine and revealed to him the means to arrive at it. The mystes often hoped to obtain a beneficent revelation from the divinity. This could be a metaphysical or teleological revelation, concerning the origin of the world and the fate of souls; it could be a proreptic revelation, concerning a particular technique of astrology, → magic, → alchemy, or medicine; or a revelation concerning a specific life event, associated in this case with a prayer to obtain a favourable outcome.

From these individual requirements derived collections of different revelations: firstly, from about the 3rd century B.C., works concerning astrology, magic, and alchemy; secondly, more recent texts, toward the 2nd and 3rd centuries A.D., which reveal doctrines that are more philosophical and theological. In the first case we are dealing with a “popular” Hermetic literature, and in the second, with a “learned” one. If we use this classification derived from Festugière, we must nevertheless observe that the two groups of texts sometimes overlap; hence, we often find astrological observations in the “learned” treatises and, inversely, religious considerations in the “popular” ones.

3A. ASTROLOGY IN THE “POPULAR” HERMETIC TREATISES AND THE NEW AIM OF SCIENTIFIC OBSERVATION

We have already mentioned the *Liber Hermetis*, which is preserved in a Latin translation of a now lost Greek original (in a manuscript of 1431, cod. *Harleianus latinus* 3731). The original was written toward the 3rd century B.C. and attributed to Hermes-Thoth. It is a compendium permeated by the Hermetic faith in a divine revelation to the initiate, and intends to teach him an astrological doctrine and relevant exercises. The work treats of the fixed stars, the planets and their aspects, their positions in the zodiacal signs, the theory of the twelve houses of the sphere and examples of calculations to determine life events: birth, death, illnesses, etc. It also treats the theory of planetary “terms”, gives a list of decans, and predictions on length of lifetime and violent deaths.

The astrological tracts on medicine (iatromathematics) and on botany, which are related to the former, are part of the “popular” hermetic writings and seem to date from the 1st century before our era. It should be remembered that the notion of “science” of the classical Greek era does not exist in these works. The “scientist” here is anything but “disinterested”. He seeks to benefit from his observations and discoveries; he wants to know future events or become a master of nature through magic, by discovering the relationships of sympathy or antipathy that unite all the parts of the universe, including people. This explains the religious colouring and the appeal to mystery that “scientific research” often adopts as early as the end of the Hellenistic epoch.

Medicine was not exempt from this conception of the world and this perspective. Hermes’ *Iatromathematica* (ed. Gundel) thus gives recipes for zodiacal and planetary melothesia by which the doctor can treat illnesses. Moreover, *The Sacred Book of Hermes to Asclepius on the Plants of the Seven Planets* (CCAG, VIII, 3, 153) puts the plants in close relationship with the decans, the zodiacal signs, the planets and the fixed stars. The book provides a list of recipes based on one or several plants, adapted to the patient’s birth theme and the exact time of the beginning of the illness.

It was divine revelation again that enabled doctor Thessalus of Tralles, a religious author of the 1st century A.D., to be initiated by Asklepios himself into the knowledge of correspondences uniting twelve plants with twelve zodiacal signs and seven plants with seven planets (CCAG, VIII, 3, 163). After a spiritual preparation of fasting and silence and then a magical ritual presided over by an officiating priest, Thessalus entered into visual and oral communication with the god, who required secrecy from him in exchange for the revelation. We find again, as in all the Hermetic tracts, the mark of the same religious belief: truth can emanate only from the gods. Hence scientific research, considered as a quest for revelation and knowledge, must refer to them alone.

3B. ASTROLOGY IN THE “LEARNED” HERMETIC TREATISES

The teaching dispensed in the Graeco-Egyptian temples to groups of initiates should be primarily understood as religious knowledge. The corresponding ideas nourished a whole literature that flowered during the first three centuries of our era: it provided “revelations” in the form of dialogues on cosmogony, the gods, and the means of entering into communion with them. These “learned” treatises, such as the *Corpus Hermeticum*, the *Ascle-*

pius, and the text gathered in the *Anthology* by Stobaeus (→ Hermetic Literature I), evince the same religious and moral attitude as the so-called “popular” treatises. They are *logoi* of teachings revealing a cosmogonical aspect, or descriptions of the narrator’s spiritual experience, affirming the regeneration of the mystes through initiation. All these texts, essentially “learned” and initiatory, contain numerous references to astrological theories and techniques. The most striking example is the fragment of Stobaeus (*CH*, III, fragm. VI, ed. Festugière) on the *Logos from Hermes to Tat*, explaining the doctrine of the thirty-six decans, in a description of the celestial world.

From the same perspective, *De Mysteriis Aegyptiorum* of Iamblichus of Chalcis, in the 3rd century A.D., defended the “Egyptian” doctrine and theurgic practices. In this work also, astrology was linked to hermetic astral theology (*De Mysteriis*, VIII, 4-7), and this system was taken up again in the Italian Renaissance, when → Marsilio Ficino translated and used the text. Thus, we can say that the division between the two literatures of hermetic astrology remained clearly intact in esoteric and exoteric teaching, but the analogies between them were evident in content and form. In content, “technical” and “learned” literature both purported to be apocalypses, revealed truths, often by the same god: Hermes Trismegistus, prophet of the word, was assimilated with the Egyptian god Thoth to gain greater authority. In their form also, the two types of literature are often related: based upon one faith, they both employ the language of the mystery religions, with the same divine invocations and the same conjurations to silence in the *Corpus Hermeticum* as in Vettius Valens.

4. CONCLUSION

We have seen that from the Mesopotamian world to the Byzantine era there existed a specific astrological literature, which varied according to its objectives and to the audiences addressed. But also literature itself, in the sense of literary creation and fiction, knew to make use of astrology: in the Graeco-Roman world, astro-theology blended with fiction to produce widely known works. The Greek and Latin novels are a good illustration of this: the *Aethiopica* of Heliodorus, the *Life of Apollonius of Tyana* by Philostratus, or Apuleius’ novel *Metamorphoses*, assign a major role to the supernatural, and notably to the influence of the stars on humanity and the universe.

We have seen to what extent the “science” of astrology resulted in influencing all of Roman society, with satirists such as Martial or Juvenal, in the

1st century A.D., mocking the haste of their fellow-citizens to consult the stars and obey the rulings of the “mathematicians” for the smallest detail of their lives.

A. HISTORY

1. INTRODUCTION

It is a commonly held prejudice that the “middle” ages are a period of a mere transition from antiquity to the higher level of “modernity”. In this view, it was the Renaissance that through its reference to antiquity woke up European culture from the deep sleep of the medieval period and helped making way for the triumph of enlightened rational science over magical-mystical speculation. This suggestive historical construction loses sight of the complex dynamics of this post-antique culture. Although it is true that parts of Christian theology in Rome and Byzantium aggressively attacked the religious and scientific traditions of antiquity, such an attitude should not be generalized. In fact, there are great differences from region to region and from ruler to ruler. Quite a few Christian sovereigns showed a remarkable interest in the sciences, and it was in the monastic schools of the high middle ages that the classical philosophical and scientific texts were tackled. Hence, the notion of a “medieval Enlightenment” (Flasch & Jeck 1997) is not too far-fetched.

Another prejudice that needs to be confronted is the idea of a “Christian occident”. A more accurate picture of medieval culture will not be possible until (at least) the Muslim and Jewish traditions are taken into consideration, that fostered a complex pluralistic discourse and a transfer of knowledge. Those Christian courts that were unacquainted with Greek, Hebrew, and Arabic increasingly felt the need to catch up on Muslim science; as a result, from the 10th century onward Christian scholars became familiar with Arabic science, philosophy, and also astrology. Therefore, although the following overview is – for analytical reasons – divided into Christian and Muslim domains, the dynamic transfers between them must always be taken into account.

2. ASTROLOGY IN ISLAMIC CULTURE

Given the fact that the Qur’an castigates human worship of astral deities but describes the interpretation of astral signs as a fair means to understand God’s will (see, e.g., sura 7:6-7), Muslim rulers from the beginning supported the development of the sciences in general and astrology in particular. Muslim culture – which soon reached from India and China to France and Spain – absorbed many different astrological traditions. Arabic science is therefore considerably more than the Arabs’ science; an important achievement of Muslim scholars was the integration of Indian and Chinese

astrology with the Babylonian and Hellenistic traditions that had been more or less canonized in the works of Ptolemy. In this regard, the Silk Road was an important place of exchange not only for goods but also for ideas, because Muslim, Manichaean, Jewish, Christian, and Chinese traditions were incorporated in new concepts.

2A. THE EASTERN CENTERS

Between the 8th and 10th centuries these traditions were actively collected and studied. The Abbassidian rulers of Baghdad in particular (Abū-Ja’far al-Mansūr, Hārūn al-Rashīd and ‘Abdalla am-Ma’mūn) helped to create a scientific atmosphere which encouraged scholars of astrology to develop new theories and approaches. Under am-Ma’mūn the library of Baghdad reached the height of its influence; Greek manuscripts from Byzantium and Cyprus were collected and teams of translators provided text-critical Arabic editions. Thus, the majority of the extant classical astrological texts – including Ptolemy’s works – were available in Arabic translation. In addition, a new genre was created that became a valuable tool for practicing astrologers throughout the middle ages. The so-called *zīj* is a kind of table that makes easily accessible the planetary constellations for a given time and helps the astrologers to figure ascendants and culminations, the horary movement of the stars, their average speed, the planets’ retrograde phases, etc. (see North 1994 for a detailed description). At the same time, the quality of *astrolabes* was significantly improved, which led to a better foundation of calendrical calculation and astrological analysis.

Among the most important astrologers of the period were Ma’shallāh (Latin Messalah, a Jewish astrologer who calculated the foundation horoscope for Baghdad), Ya’qūb ibn Yšhaq → al-Kindī, Ja’far ibn Muḥammad Abū Ma’shar (Latin Albulmasar, 787–886), Abū Abd ‘Allah Muḥammad ibn Ġabīr al-Battānī (c. 858–929), and Muḥammad ibn Aḥmad al-Birūnī (973–c. 1050). Latin texts from medieval and Renaissance provenance regularly refer to all of them as important scholars, but from the perspective of esotericism al-Kindī and his pupil Abū Ma’shar are without doubt the most influential. Al-Kindī put forward a rational and philosophical foundation of esoteric disciplines which comprised not only astrology but also → magic and other divinatory techniques. In his book *De radiis (stellarum)* (On the Rays of the Stars) he combined Platonism and → Aristotelianism and developed a metaphysical foundation of magic. Applying a Stoic concept of universal sympathy he

argues that sympathy manifests materially in the “rays” between (celestial and sublunary) objects. From this al-Kindî deduces his thesis that a complete comprehension of the cosmos is possible, a thesis that is usually only attributed to Renaissance thought (see Travaglia 1999). But not only the stars send out “rays” but also every material object and even words and actions; therefore ritual, prayer, sacrifice, and magic are powerful ways of influencing the cosmos. This holistic explanation had a strong impact on e.g. → Roger Bacon’s and → John Dee’s philosophy of nature.

Abū Ma’shar grew up in Khurasan and was well acquainted with the doctrines of the Jews, Nestorians, Manichaeans, Buddhists, Hindus, and Zoroastrians who lived in that region. At the age of forty-seven he met al-Kindî and became his most important pupil. Abū Ma’shar’s opus comprises many different texts of astrological provenance, but most influential was the *Introduction into Astrological Prediction* that he wrote in 848 in Baghdad and that became known to the Latin west as *Liber introductorius maior*. For Abū Ma’shar astrology is a mathematical science in the strict sense. In contrast to other – mainly Christian – astrologers who denounced horoscopic astrology and concrete prophecies as *astrologia superstitiosa*, he views these as an important subdiscipline of astrology. Therefore, the *Liber introductorius* gives a complete overview of all classical astrological techniques, including Indian parameters and traditions that Abū Ma’shar weaves into his doctrines. In another work, the *Zīj al-hazarāt*, he adds to the astronomical calculations a philosophical foundation of “hermetic” science. Astrology, he says, was once revealed to the humans by a divine source but was largely forgotten. He holds that his *zīj* was based on a text that had been hidden in Isfahan before the Flood and now was made known to the (learned) public by Abū Ma’shar.

Of particular significance for later astrologers was Abū Ma’shar’s doctrine of Great Conjunctions. He elaborated the well-known ancient speculation about the importance of the threefold conjunctions of Jupiter and Saturn and applied it to the Shiite interest in the return of the Mahdi. Jews and Christians used this doctrine, for their part, to figure out the beginning of the messianic era or the return of Christ; this is but one example of how astrological doctrines fueled the apocalyptic discourse of Renaissance and Reformation Europe.

2 B. AL-ANDALUS

In close contact with the eastern centers of the Islamic world from the 8th to the 15th century the

western caliphates of the Spanish peninsula (*al-Andalus*) formed a second cornerstone of science and astrology. Already before the Muslims came to Spain there had been an astrological tradition, mainly based on the works of Isidore of Seville (see 3A below). But whereas earlier research was mostly interested in calendrical issues, from the 10th century onward new schools of astronomers at the emirate of Córdoba began to contest the hegemonic status of the east. The emir sent agents to Baghdad, Damascus, and Cairo to collect all extant literature; in the second half of the 10th century schools for mathematics, astronomy, and other arts were founded that systematized, commented, and elaborated this material. In Córdoba taught the astronomer al-Majritî († around 1007) who transferred the famous tables of al-Khwārismî to the meridian of Córdoba and adjusted the Islamic calendar. Al-Majritî instructed several well-known astrologers, and his example was followed by other centers of al-Andalus, from Seville and Valencia to Sargasso and Toledo.

As an example of how classical astrological techniques were further elaborated in medieval Islamic culture the teachings of Alcabitius (d. 967 in Aleppo) deserve mention. His *Liber introductorius* became a standard reference work for later astrology, after John of Seville had prepared a Latin translation in 1142. Alcabitius is important also with regard to his new system of dividing the twelve “houses” of the horoscope, i.e. the intermediate divisions between the Ascendant axis and the Medium Coeli axis. Referring to the classical methods of Porphyry and Rhetorius, the Alcabitius system remained in wide practice even after Campanus, Regiomontanus, and Placidus had proposed their new methods.

Of crucial importance for medieval astrology was the work of ‘Alī ibn abī al-Rijāl (Latin Haly Abenragel or Albohazen Haly, c. 1016–1062). Whether or not he was educated in Baghdad is not clear. He worked as notary and court astrologer at the court of al-Mu’izz ibn Bādis in Tunis, where he wrote his main opus: a systematical description of all aspects of classical astrological knowledge in eight books. Although there are several different versions and collections of this work – the versions in Old Castilian and Latin were particularly influential in Europe –, it seems to be clear that the first three books treated astrology and astronomy in general, the fourth and fifth book described the casting and interpreting of horoscopes, the sixth was devoted to “revolutions” (i.e. to transits and related interpretations), the seventh to “elections” (i.e. to catarchic astrology), while the eighth book

analyzed issues of mundane astrology and the turn of historical eras. Haly Abenragel makes extensive use of the old masters such as “Hermes”, Dorotheos, Ptolemy, Ma’shallāh, and al-Kindī, and he not only presents their ideas but also discusses the pros and cons of their theories. That the Muslim astrologer was indeed regarded by later scholars as *Summus astrologus* or even as *Ptolemaeus alter* can be seen from the fact that his book was reprinted six times between 1503 and 1571.

2C. JEWISH ASTROLOGERS

From the beginning of the Muslim era the Spanish peninsula was characterized by a vivid exchange of Christian, Jewish, and Muslim religious traditions. In this situation, Jews had a particularly important position, because many of them were acquainted with several languages. Therefore, it comes as no surprise that the Christian king Alfonso X asked his Jewish physician Jehuda Moshe to prepare a translation of Haly Abenragel’s work. Jews also worked as astrologers and wrote influential treatises in Hebrew (overview in Halbronn 1986). Among these are Abraham bar Chiyya (d. 1143), Abraham ibn Ezra (1098–1164) and Jehuda Halevi (1075–1141). Ibn Ezra published the most important astrological work of medieval Jewry, the *Sepher reshit hokhmah* (The Beginning of Wisdom), which was soon translated into French, English, and Old Castilian. In this book the author gives a concise introduction to nativities, horary astrology, elections, mundane astrology, and astrological medicine; its detailed reflections on the contemporary Aristotelian framework demonstrate the highest standard of medieval Spanish philosophy. In other books Ibn Ezra discussed astrological and theological issues with Jehuda Halevi, Solomon ibn Gabirol, and Abraham bar Chiyya, and he even proposed a calculation of the houses of the horoscope that resembled that of Placidus five hundred years later. Ibn Ezra wrote astronomical tables for Pisa (around 1143), and a London *zīj* that circulated around 1150 is also assigned to his authorship. The dominant position of Jewish scholars in medieval astrology continued until the Jews were expelled from Spain in 1492.

In the 13th and 14th centuries Spanish astrology spread over whole of Europe. The “Alfonsine Tables” gained wide currency due to their improved mathematical quality, and the use of astrolabes reached a new standard (see North 1994, 203–223).

3. ASTROLOGY IN CHRISTIAN CULTURE

Quite against a commonly held position, astrology flourished in regions under Christian control

as well. Christian astrologers tried to determine “licit” from “illicit” astrology, and several emperors drew on astrological techniques to legitimize their power in quite the same way as their Roman predecessors had done (see Stierlin 1988). This holds true for Charlemagne, Louis the Pious, Henri II, and the emperor Frederick II, to mention but the most important rulers.

3A. LATE ANTIQUE INFLUENCES

The classical astrological tradition had been preserved in Latin texts such as Firmicus Maternus and Manilius, and it was handed down to early medieval Christianity mainly by two authors: A.M.S. Boethius and Isidore of Seville. In his crucial work *Consolatio philosophiae* Boethius (c. 480–524) provided medieval culture with a well-versed description of classical philosophy and science. With regard to astrology, his contribution was important insofar as he reinforced → Neoplatonism and summarized the main arguments on the issue of determination, fate, freedom of will, and fatalism.

Boethius’ influence was surpassed, of course, by the writings of Isidore of Seville (c. 570–636). His encyclopedic *Etymologiae* covered in twenty volumes the whole of classical science and culture, and his differentiation between *astrologia superstitiosa* and *astrologia naturalis* became the standard argument for medieval scholars to justify “licit” astrology. For Isidore, astrology is “superstitious” if it wants to predict the character and the fate of a native with reference to his or her horoscope; this branch of astrology had become superfluous with the victory of Christ. Although this branch is not necessarily wrong (like many others, Isidore speculated about the “Star of Bethlehem”), it is definitely illicit. The accepted branch of astrology – *astrologia naturalis* – is focused on meteorological and mundane aspects of nature, and it also includes astrological medicine. Isidore’s claim that every physician needs to have an astrological education remained common in Christian culture right into early modern times.

3B. EARLY MIDDLE AGES

The main centers of Christian astrological research in early medieval times were the monasteries. Boethius’ and Isidore’s reception began with Bede Venerabilis (673–735) who applied their teachings to a reformulation of the Christian religious calendar. This resulted in a new genre of calendrical reckoning, the so-called *Computus* (Borst 1991). To the calendrical considerations were added country sayings and astrological rulings

such as those of Firmicus Maternus. An important achievement of this new understanding was the calendrical reform of Charlemagne; his Imperial Calendar was in use until the 13th century (see Borst 2001). Among the monasteries that helped to establish a Christian astrology were the schools at Fulda, St. Gallen, Reichenau, and Regensburg. Later, in the 9th and 10th centuries, at the monastery of Santa Maria de Ripoll, monks compiled treatises on arithmetic, geometry, astronomy, and calendars, and translations of these documents circulated widely in western Europe. This is the explanation of why Hermann the Lame (1013–1054), a monk at Reichenau, was able to write his detailed description of the use of astrolabes – he simply knew the Ripoll texts. Hermann improved the Beda reckonings and in his book *De mensura astrolabii* transformed the Arabic lunar calendar of his Spanish sources into the Latin Julianic solar calendar.

How deep-reaching the cultural transfers between Christian and Muslim Europe were can be exemplified by the works of Gerbert of Aurillac (940–1003) who in 999 became Pope Sylvester II (Lindgren 1976). Gerbert was educated in Barcelona in the *artes liberales* and was an expert of Arabic, mathematics, arithmetic, and → music. In his writings, he called for a reception of Arabic science in order to improve Christian culture, and he supported Arabic terminology and translations in the monastery schools, where Fulbert of Chartres, Hermann the Lame, or Walcher of Malvern were now studied in detail. In his book on the use of astrolabes – Gerbert had used one already in 989 in the monastery of Reims – he fortified Isidore's differentiation of natural and superstitious astrology. Through these activities, the knowledge of the astrolabe, which also made the casting of horoscopes much easier, became standard in Europe by the 11th century.

3C. THE TRANSLATORS OF THE 12TH CENTURY AND THEIR INFLUENCE

During the 12th century, most learned Christians felt the need to catch up with Muslim and Jewish science, and both with regard to literature and to art and iconography a considerable shift of astrological motives took place (Blume 2000). Isidore's differentiation was now further developed, e.g. by the scholastics Peter Abaelard (c. 1100–1140) at Chartres and Hugo of St. Viktor († 1141) in Paris, who taught that astrology can determine the *naturalia* (the natural causes) but not the *contingentia* (things that are dependent on chance and God's will). This was the official opinion of the Church for hundreds of years.

Adelard of Bath (c. 1080–c. 1150) was a key figure in the interference of Muslim and Christian astrology (see Hastings 1927, 20–42; Burnett 1987), because he actively reformulated astrological tradition. Adelard translated the tables of al-Khwārismī and speculated on Abū Ma'shar's theory of the growth and decline of empires and religions. At the end of the 12th century, astrology was a common issue of almost all monasteries, and astrological knowledge began to spread from the clerical realm to the courts, guilds, and other layers of society (Blume 2000).

Until the 13th century a vivid discussion about astrology developed among scholastic scholars, among them Gerhard of Cremona (1114–1187), → Bernard Silvester († after 1159), → Michael Scot († 1235/6), → Albertus Magnus, → Roger Bacon, Thomas Aquinas (c. 1225–1274), and → Ramon Llull (von Stuckrad 2003, 192–206). Albertus Magnus's *Speculum astronomiae* (written in the 1260s) became one of the most influential treatises on astrology in the high middle ages (Zambelli 1992; cf. Paravicini-Bagliani 2001). In order to establish astrology as an accepted science, he distinguished between (illicit) magical applications and scientific scrutiny. Furthermore, Albert described astronomy and astrology as two distinct branches of this science; whereas astronomy can be regarded as a mathematical discipline, astrology interprets these calculations and is able to predict future events. Since astrology leads every earthly matter back to its divine source, it necessarily leads man to God who is seen as the unmoved mover of everything that exists. With this argument Albert reacted to the scholastic critics of astrology and introduced astrology as an important discipline for the pious Christian.

Albert's position – and also Thomas Aquinas's, who likewise argued that astrology was based on reason and that reason determines the will – came under attack in the context of the (mainly French) Averroists. John Duns Scotus, among others, stressed the primacy of will over reason. Because this is also valid for God, God's will cannot be detected by reason. Hence, astrology is a transgression based upon human curiosity and the theological truths must be believed, not understood. A radically different position was held by Roger Bacon who saw → alchemy, astrology, and magic as the peaks of a natural science that was based on empiricism. Bacon – referring to Ptolemy, Haly Abenragel, Abū Ma'shar, and others – called on the Church to support an *Astrologia sana*, because no serious astrologer had ever claimed a fatalistic or deterministic astrology. In sum, all arguments were

well established long before the “Renaissance” picked up these issues again.

B. LITERATURE

I. INTRODUCTION

By the end of the 4th century, the “classical” astrological literature of Greek and Roman provenance had reached the height of its influence and was spread widely over the ancient world. Ptolemy’s *Tetrabiblos* were seen as the ultimate source of astrological reasoning (on the extant MSS see Boer 1961), but in addition to this scholarly kind of literature there also flourished a variety of philosophical, religious, or popular treatises that had their impact on later astrological discourse. Christian literature in particular – beginning already with Firmicus Maternus in the 4th century – questioned the legitimacy of astrology and developed a framework of interpretation that distinguished between accepted and illicit branches of this discipline. In other religious contexts, that is to say, in Jewish, “Gnostic”, Hermetic, Manichaean, and later in Islamic traditions, Greek and Roman astrology was likewise reshaped and adopted in terms of a (more or less) monotheistic creed.

For the centuries to come, astrological literature can be divided roughly with regard to language. While the Latin west was more or less unaware of the standard astrological Greek works and referred to Latin sources, it was in the cultures under Muslim influence that those documents were not only preserved but also translated, and a rich astrological discourse was developed with a nature of its own. This situation changed only from the 10th century onward, when Christian scholars were becoming more and more acquainted with Muslim astrology and astronomy.

2. ASTROLOGICAL LITERATURE UNDER MUSLIM INFLUENCE

2A. MUSLIM LITERATURE

The first notable astrological author among the Arabs was *Theophilus of Edessa* (c. 695-785). Theophilus was a Greek who in his old age became court astrologer to the Caliph al-Mahdī († 785). He wrote four treatises on astrology in Greek, some excerpts from which are edited in the CCAG, that is to say the *Works on Elections for Wars and Campaigns and Sovereignty* (showing strong Indian influences already, it is the only extant Greek astrological literature devoted entirely to military astrology); *Astrological Effects*, depending on Indian astrology and Rhetorius’ compendium of astrology;

Various [Kinds of] Elections, depending mainly on Dorotheos and Hephaestio of Thebes; and *Collection of Cosmic Beginnings*, a treatise on mundane astrology and annual and monthly predictions.

In the 8th century Indian astrologers such as Kankah were active at the courts of Baghdad and brought Hindu astrology to the Muslim west. Among those who absorbed these traditions, the Basra Jew *Ma’shallāh* (Latin Messalah, c.740-c. 815) stands out as the first real inventor of new approaches. He wrote more than twenty astrological treatises, the most important being *The Revolution of the Years of Nativities* (on Solar returns); *The Revolutions of the Years of the World* (on Aries ingresses); *Conjunctions*; *Letter on Eclipses*; *Reception of the Planets or Interrogations*; and *The Construction and Use of the Astrolabe* (Thorndike 1956; Spanish trans. by D. Santos). A summary of his book *On Conjunctions, Religions, and Peoples* is an outline of world history based on Aries ingress charts (referred to a fixed zodiac) and Jupiter-Saturn conjunctions (trans. and commentary by E.S. Kennedy and D. Pingree).

In the 9th century astrological theory and practice were elaborated by many influential experts. One of them was Ya’qūb ibn Yşhaq → al-Kindī (c. 796-c. 870) who wrote hundreds of treatises on a variety of topics. With regard to astrology, three are particularly well known in the West, namely *De iudiciis astrorum* (The Judgments of the Stars; with works of other authors), printed in translation by Peter Liechtenstein, Venice 1507; *De pluviis, imbris et ventis ac aeris mutatione* (Rains, Storms and Winds, and Change in the Air; again including pieces of other writers), printed in translation by Liechtenstein in 1507. His book *De radiis stellarum* (On the Rays of the Stars) with its combination of Platonism and → Aristotelianism influenced esoteric authors of the Renaissance, from → Roger Bacon to → John Dee.

Ja’far ibn Muḥammad *Abū Ma’shar* al-Balkhī (Latin Albumasar, 787-886) is a key figure of Arab astrology in medieval times. Some fifty books are credited to him and his expertise in things astrological is enormous. His most famous works are *The Great Conjunctions* and the *Introduction into Astrological Prediction*. The latter was an encyclopedic treatment of all aspects of astrological theory and practice. It was translated as *Introductorius maior* by John of Seville (12th century), whose translation was never printed but is preserved in numerous MSS. Another translation by Hermann of Carinthia (as *Introductorium in astronomiam*) was published by Erhard Ratdolt at Augsburg in 1485 (repr. 1489). *The Great Conjunctions* – an

elaborate treatise on mundane astrology with special regard to the (“Great”) conjunctions of Jupiter and Saturn that change their position in one of the four Trignons every 238 years – was also translated by John of Seville and edited by Johannes Angelus (Ernst Ratdolt: Augsburg 1489). Another book by Abū Ma’shar was the *Kitāb al-ulūf* or *Book of the Thousands*. Unfortunately, the original is lost, but D. Pingree (1968) restored a substantial portion of this work from later Arabic writers. The book comprised Albumasar’s outline of world history on a framework of Aries ingresses and conjunctions, but also an elaborate system of so-called “profec-tions”. Very popular in medieval and Renaissance times was Abū Ma’shar’s *Flores astrologiae* or *Liber florum*, i.e. “The Flowers of Astrology” or “Book of Flowers”, translated by John of Seville (Erhard Ratdolt: Augsburg 1488; repr. 1489 and 1495). The “Book of Flowers” is an anthology of Albumasar’s larger writings on mundane astrology. Finally, his general treatise on the *Revolutions of the Years of Nativities* must be mentioned. This book on what today is called solar returns is preserved in the Arabic original and in Byzantine Greek translation; the Latin translation made from the Greek was falsely attributed to Hermes (*Hermetis philosophi de revolutionibus nativitatium libri duo incerto interprete* (Two books of Hermes the Philosopher on the Revolutions of Nativities by an unknown translator; H. Wolf: Basel 1559).

Abū Bakr al-Hasan ibn al-Ḥashīb (Latin *Alubater*, late 9th century) wrote an introduction to astrology, a book on the revolutions of nativities, and a very popular book on natal astrology. This was translated around 1225 by Salio (or Solomon) at Padua as *De nativitatibus* and published in an astrological compendium at Venice in 1492 (ed. and trans. D. Santos) and in another in 1493. Divided into 206 chapters – some of them consisting of only one sentence – all aspects of astrological interpretation are tackled and illustrated with one or more actual nativities.

Alcabitius (d. 967) or, less commonly, Abdilaziz, became famous because of his system of house divisions. But in his most important book, the *Introduction to the Art of Judgment of the Stars*, dedicated to the Sultan Sayf al-Dawlah (c. 916-967), he also presented a complete description of astrological theory and practice, numerous lists of place names by climates and influences, and long passages from Dorotheos and Ma’shallāh (see AAASLT, 137-139). The Latin translation by John of Seville, *Alchabitii Abdilazi liber introductorius ad magisterium judiciorum astrorum* (1142), was printed later more than a dozen times. Beginning

with Erhard Ratdolt’s Venice edition of 1503, it became common to print it along with the commentary of John Danko (14th century).

The writings of Muḥammad ibn Aḥmad *al-Birūnī* (973-c. 1050), a leading scholar at the turn of the millennium and the successor of al-Battānī (c. 858-929), are important, not only because he discussed Abū Ma’shar’s system of Great Conjunctions and kept up correspondence with other learned scholars – among them critics of astrology such as Ibn Sina (→ Avicenna) – but also because he spent a lot of time in India and incorporated further elements of Indian astrology into his own system. Al-Birūnī’s works were not translated into Latin by the 12th-century translators, but *The Book of Instruction in the Elements of the Art of Astrology* (1029; trans. R. Ramsay Wright 1934) with its precise and coherent description of geometry, arithmetic, astronomy, and astrology nevertheless influenced subsequent authors. In *Alberuni’s India* [sic] (2 vols., trans. Edward C. Sachau, Routledge: London 1910) he gives a detailed account of life in India in the early 11th century with special reference to Hindu astronomy and astrology. A treatise on calendars with some information on astrology is also available in English translation: *The Chronology of Ancient Nations*, trans. and ed. Edward C. Sachau, London 1879; repr. Minerva: Frankfurt a.M. 1984.

Next in the line of celebrated scholars was ‘Alī ibn abī al-Rijāl (Latin Haly Abenragel or Albhazen Haly, c. 1016-1062). Particularly responsible for his fame is *The Outstanding Book on the Judgments of the Stars*, which was translated into Old Castilian as *El libro conplido en los iudizios de las estrellas* at the court of Alphonso X the Wise (1226-1284), first edited by Gerold Hilty in 1954. Since the extant Castilian Madrid MS 3065 contains only the first five of the eight books, the Latin translation that was made from a complete Castilian manuscript is important. It was first published as *Praeclarissimus liber completes in judiciis astrorum* by Erhard Ratdolt, Venice 1485. The printed book was as popular in Renaissance times as manuscript copies had been earlier. It was reprinted in 1503, 1520, 1523, 1525, 1551, and in 1571.

2B. JEWISH LITERATURE

Jewish scholars played a crucial role as translators of Arabic literature. Furthermore, they wrote extensively in Arabic themselves and provided medieval (and Renaissance) Jewry with detailed information on astrology in Hebrew. One of the most influential figures was *Abraham ibn Ezra* (1098-1164) who – in addition to Bible

commentaries and a Hebrew grammar – wrote more than fifty books on astrology and astronomy. In his works, he elaborates Arabic astrology into an own system of interpretation that meets Jewish interests. His best known astrological work is *Sepher reshit hokhmah* (The Beginning of Wisdom; 1148), which was translated into Old French by Hagin le Juif in 1273 (for English and French eds. see bibliography). There were also translations into Catalan that combined this book with other treatises of Ibn Ezra; the Latin translations were mostly made from the Catalan compilation. In *The Book of the Fundamentals of the Tables* Ibn Ezra proposed a division of the houses of the horoscope that were calculated in a similar way as Placidus developed it five hundred years later. The Latin version of this book was edited by José Millás Vallicrosa in 1947.

2C. MAGICAL LITERATURE

Another genre that must be mentioned belongs to the field of astrological → magic. The use of talismans and → amulets with astral symbolism flourished during the whole era under consideration, both under Islamic and Christian authority. Since it was important to produce and consecrate the images at a previously chosen time, this “applied astrology” forms a branch of electional astrology. There are a lot of medieval texts referring to planetary images, rings, and amulets (Robson 1931, ch. VII; Caiozzo 2003), a number of them being attributed to Hermes (Thorndike 1923–1958, vol. 1 and 2).

3. ASTROLOGICAL LITERATURE UNDER CHRISTIAN INFLUENCE

3A. EARLY SOURCES

For a long time, Latin Christian culture harked back to two influential works of late antiquity, that is to say, *De consolatione philosophiae* by A.M.S. Boethius (c. 480–524), written around 523, and the massive twenty-volume *Etymologiae* by Isidore of Seville (c. 570–636). Both texts served as major transmitters of late ancient philosophy and science into medieval Christian scholarship, only supplemented by Martianus Capella’s *De nuptiis Mercurii et Philologiae* and Cassiodorus’ *Institutiones*. The introduction of new techniques was limited to calendrical issues, until certain Christian monasteries became increasingly familiar with Arabic astronomy and astrology. This happened in the 10th and 11th centuries, when scholars such as Hermann the Lame (1013–1054; *De mensura astrolabii*) and Gerbert of Aurillac (940–1003, the later Pope Sylvester II) introduced the Arabic art of using astrolabes into Christian culture.

3B. THE 12TH-CENTURY TRANSLATORS AND THEIR IMPACT

But it needed the effort of scholars from the 12th century to translate Arabic treatises into Latin and thus to provide a fair foundation for Christian experts to enter the discussion about astrology. Now, Ptolemy’s works became available in Latin translations: the *Almagest* was translated anonymously in Sicily around 1160; Plato of Tivoli translated the *Tetrabiblos* in 1138 and the *Almagest* in 1160 (note Plato’s order!); Gerhard of Cremona (c. 1114–1187) translated the *Almagest* in 1176. Two other translators of the time have already been mentioned: Hermann of Carinthia and John of Seville. The latter also wrote a short general treatise entitled *Epitome totius astrologiae* (The Epitome of All Astrology; ed. by Joachim Heller. Montani & Neuber: Nuremberg 1548); John’s translation of the Arabic *watad* “peg” or “pin” into Latin *cuspis* was the origin of the English word “cusp” as designation of the point at the beginning of a celestial house.

In this overview, only a selection of important Christian authors who entered the stage in the 12th and 13th century can be discussed. An outstanding example of his age is Adelard of Bath (c. 1080–c. 1150), because he not only translated Arabic tables – his translation of a now lost book by al-Khwārisimī (as *De numero Indorum*) is the closest to the original – and discussed the teachings of Abū Ma’shar but also wrote extensively on astrological magic and related topics. His *Ergaphalau* tackles the position of the science of the stars within a general division of knowledge and was probably meant to introduce a larger work on astrology (see Burnett 1987, 133–145).

Bernard Silvester wrote in 1147/48 an allegorical poem under the title of *Cosmographia*, which must be counted among the most important works of the high middle ages (today more than fifty manuscripts are still extant). The book, divided into *Megacosmos* and *Microcosmos*, adapts the teachings of Abū Ma’shar to a Christian context.

→ Michael Scot († 1235/6), who worked for the emperor Frederick II, translated al-Bitruji’s *De sphaera* (or *In astrologiam*) but was influential mainly due to his major work, *Liber introductorius* (Introductory book), which gives a history of astrology (from → Zoroaster to Gerbert of Aurillac) and provides his contemporaries with an extensive encyclopedic compendium of medieval knowledge about the science of the stars.

The Italian Guido Bonatti (Latin Bonatus, c. 1210–c. 1295) was perhaps the best known

astrologer of the late Middle Ages. His comprehensive textbook *Liber introductorius ad iudicia stellarum* (Introduction to the Judgments of the Stars), written after his retirement from the court of emperor Frederick II, is a collection of ten separate treatises on various phases of astrology. It was printed as *Liber astronomicus* by Erhard Ratdolt, Augsburg, 1491. A contemporary of Bonatti's was Leopold of Austria, who wrote a compendium on astrology, *Compilatio Leupoldi ducatus Austriae filii de astrorum scientia* (Erhard Ratdolt: Augsburg, 1489).

→ Albertus Magnus' fame in matters astrological is based on his *Speculum astronomiae*. The "Mirror" does not only comprise a bibliography of books on astrology available at the end of the 13th century but also stands out as a highly sophisticated discussion of astrology in a scholastic context.

→ Roger Bacon accepts astrology as a valid science in his *Opus maius*, the shorter *Opus minor*, and in the *Opus tertium*, all of them being popular in the 13th century and influencing subsequent generations.

Astrology IV: 15th-19th Century

A. HISTORY

Throughout the Renaissance period, learned astrology enjoyed a flowering that did not fade until the end of the 17th century. The centers of this movement were the courts and the universities, where astrological studies developed in relation to those of astronomy and medicine. Essential to astrology's development were the multiple centers of Italy's political, cultural, and artistic life. At the University of Ferrara, Giovanni Bianchini (born in the first decade of the 15th century) taught and authored important astronomical tables. Also at Ferrara was Lucas Gauricus (1475-1558), whose inaugural lecture of 1507, *De astronomiae seu astrologiae inventoribus*, countered the anti-astrological theses of → Giovanni Pico della Mirandola.

Gauricus also taught at Bologna, spent time in Mantua, Rome, and Venice, and in Germany came into contact with the Wittenberg group. He was the author of a weighty series of works, among them a famous *Tractatus astrologicus* (1552), and was named Bishop of Civitate by Pope Paul III, whose pontificate he had predicted. At the Este court in Ferrara there was also Pellegrino Prisciani, counsellor of Prince Borso and inspirer of the astrological program illustrated circa 1470 by the frescoes of the Hall of the Months in Schifanoia Palace.

At the University of Bologna, astrology was practiced by Domenico Maria Novara, the teacher of Copernicus; by Gauricus; and by the mathematician and astronomer Johannes Antonius Magini (1555-1617), author of astronomical tables and of a comprehensive exposition of all astrology. At Mantua, Bartolomeo Manfredi was active, author of the *Libro del Perché*. In Tuscany under the Medici, Lorenzo Bonincontri (1410-1491) worked, teaching astrology there before moving to Rome, where he was summoned by Pope Sixtus IV, and published a commentary on Manilius in 1484. At Padua teachers included Valentin Nabod and Andrea Argoli, who was named Knight of Saint Mark by the Republic of Venice for his excellence as an astrologer, and was the teacher of Giambattista Zenno, the future astrologer of Wallenstein. At Milan, astrology was in great repute under the Sforza, especially Ludovico il Moro who was accustomed to shower his astrologers with gifts. At Rome, many popes were patrons of astrology, from Pius II (who publicly praised the predictions of Biagio da Cremona) through Sixtus IV (who had his privy astrologer in Bishop Paul of Middelburg), Leo X (who in 1520 instituted a chair of astrology at the University), and Paul III (whose personal astrologer was the Fleming, Albert Pigghe). At Naples, Bonincontri was long resident, called “nobilis astrologus” by Giovanni Pontano (1426-1503), the great humanist who was also devoted to astrology and treated its themes in his *De rebus coelestibus* and in his short poem *Urania*.

Spreading out from Italy, astrology enjoyed great success throughout Europe. At the French court, where Charles V the Wise (1364-1380) had founded an institution named after his astrologer “Collège de Maître Gervais”, Louis XI (1461-1483) employed Galeotti and Angelo Catti; Simon de Pharès (1440-1495), author of the *Recueil des plus célèbres astrologues et de quelques hommes doctes*, was astrologer to Charles VIII; Cosma Ruggeri was in the service of Catherine de’ Medici, who also used the services of Michel de Nostradamus (1503-1566) and Francesco Giuntini (1523-1580).

Catherine entrusted the education of her youngest son to Giuntini, a Florentine Carmelite and author of a monumental *Speculum astronomiae*. Antoine Mizauld (1510-1578), physician and astrologer, worked under Marguerite de Valois; Morin de Villefranche (1583-1650) was protected by Marie de’ Medici and by the cardinals Richelieu and Mazarin.

Italian astrology was also welcomed in the German-speaking world. The Habsburgs were adepts and patrons of it: Frederick III (1440-1493) was constantly surrounded by astrologers, among them Johann Lichtenberger; it was for Maximilian I that Albrecht Dürer engraved the celebrated *Melencolia I*. Ferdinand I had the horoscope of his firstborn, the future Emperor Maximilian II, drawn up by the astrologer and historian Joseph Grünpeck. Charles V’s astrology master was Petrus Apianus, and it was said that his decision to abdicate was connected with the appearance of the comet of 1555. Maximilian II patronized the astrologer Cyprian Leowitz (1524-1574), among others; → Rudolf II employed Tycho Brahe and Kepler. Teaching at the University of Vienna were the humanist and astrologer Georg Peuerbach (1433-1461), whose pupils included Johann Müller, called Regiomontanus (1436-1475), an astronomer-astrologer and the first publisher of a printed edition of Manilius; Stabius, who dedicated to the Emperor an astrolobe called *Horoscopion universale*; Martin Pegius, to whom is due the first astrological treatise in the German language, published in Basel, 1570; Petrus Apianus, author of a long treatise *Astronomicum Caesareum*, dedicated to Charles V; Johann Stoeffler, author of almanacs and ephemerides. Stoeffler’s pupil Johann Schöner (1477-1547) was known as Carlostadius, and in 1545 published a great astrological opus with a preface by Melanchthon. Around Melanchthon at the University of Wittenberg there was an active group of astrologers including Schöner, Caspar Peucer (1525-1602), and Caro, who were also involved in the vexed question of Luther’s horoscope, first calculated by Lucas Gauricus.

In the Low Countries, astrology was cultivated mainly at the University of Louvain, where Johannes Stadius (1527-1579) calculated the annual ephemerides from 1554 to 1606 and proposed a system of houses different from that of Regiomontanus; and at the University of Leiden, where Joseph Justus Scaliger (1540-1609) taught, author of a large commentary on Manilius. Learned astrology was less fortunate in England, where it was practiced without much renown in the 16th century by Leonard Digges and → John Dee; in

1603, Sir Christopher Heydon wrote *A defense of judiciary Astrology*. In contrast, during the 17th century worldly astrology was much used in England, especially in relation to political events. The chief exponent of this tendency was William Lilly (1602-1682), author of *Christian Astrology* (1647) and an outstanding expert on horary astrology.

Worldly astrology is the aspect of learned astrology that most leans toward popular astrology, which in the era of printing gave rise to a vast production of predictions, annual prognostications, almanacs, calendars, lunaries, and books of popular astrological medicine, often printed in many thousands of copies. Some of these genera were also cultivated by important astrologers, e.g. the prognostications of Lucas Gauricus and Girolamo Cardan (1501-1576). Paul of Middelburg's predictions of 1486 were especially popular: repeated in 1488 by Johann Lichtenberger, they treated the effects of the great conjunction observed in the sign of Scorpio on November 25, 1484. This conjunction was interpreted as announcing the proximate appearance of a false prophet and of a religion of great sanctity, which would lead to new laws suppressing the privileges of the nobility and succoring the miseries of the populace. This was taken in contrary ways by Protestants and Catholics, as the former saw Luther as the renovator, the latter as the false prophet. In this way, astrological prediction using the technique of the great conjunctions, favored by the Arab and late medieval astrologers, became linked with Christian prophetism, presenting itself as a tool for pinpointing the dates of the great events announced by biblical prophecies. Thus astrology took on a role of politico-religious agitation, as exemplified by the prophecy of Antonio Arquati *De eversione Europae* (1480); the predictions of the universal Flood, the first of them formulated at the end of the 15th century by J. Stoeffler, connected with the great conjunction in Pisces of 1524; the periodical diffusion of predictions relating to the death of popes and the election of their successors. This type of prediction was restricted in Catholic lands by the inclusion of astrological texts in the *Index librorum prohibitorum* of 1558, and by the papal bulls *Coeli et Terrae* (Sixtus V, 1586) and *Inscrutabilis* (Urban VIII, 1631). In contrast, from the second half of the 16th century astrology flourished in reformed Europe, even though Luther had regarded it with some scepticism, and Calvin had opposed it. Important astronomers such as Tycho Brahe continued to cultivate it, even in its predictive and prophetic modes.

Humanist philology contributed to the development of Renaissance astrology by discovering

ancient texts unknown to the Middle Ages. There was Manilius's *Astronomicon*, found in 1417 by Poggio Bracciolini in the library of the Convent of St. Gall and first printed in Regiomontanus's edition of 1472. Humanism also caused the printing of new and more accurate editions of ancient, Arabic, and medieval texts, such as the *Mathesis* of Firmicus Maternus, printed in Venice in 1499; the *Opus continens X tractatus astronomiae* of Guido Bonatti, published in 1489; the *Tabulae astronomicae* of Alfonso of Castile (Venice 1492); the *Sphaera mundi* of Giovanni Sacrobosco (Venice 1478); the *Compilatio de astrorum Scientia* by Leopold, son of the Duke of Austria (Venice 1489); also Porphyry's Introduction to Ptolemy (Basel 1559), the Commentary on Ptolemy attributed to Proclus (Basel 1554), Arab astrological writings, the *Concordantia* of → Pierre d'Ailly (Augsburg 1490), and texts by → Peter of Abano.

Most importantly, the new translations of Ptolemy's *Tetrabiblos* (in Latin, *Quadripartitum*) and of the pseudo-Ptolemaic *Centiloquium* followed the principles of humanist philology in being no longer made from Arabic versions, but directly from the Greek. The first two books of the *Tetrabiblos* were translated by Joachim Camerarius (Nuremberg 1535), and a complete translation by Antonio Gogava (Louvain 1548) was followed by two more complete editions: one by Camerarius and the second by Melanchthon (printed Basel 1553). The *Centiloquium* was published in Naples in 1512 with a commentary by Pontano, and at Venice by Lucas Gauricus in 1542, using the translation of George of Trebizond. The reformist current of 16th-century astrology was due to these translations, as it tried to include in the humanist *restitutio litterarum* the rediscovery of the authentic nature of Ptolemaic astrology, considered as the highest expression of the art in antiquity. Thus Ptolemy became the tutelary divinity of a trend of study dedicated to purging astrology of Arab superstitions, recovering its genuine nature and removing any magical temptations. This trend found its greatest exponent in Girolamo Cardan (1501-1576) and spread all over Europe, numbering among its proponents the Italians Giovanni Pontano and Agostino Nifo (1473-1546), the Fleming Pigghe, and the German scholars gathered around Melanchthon at Wittenberg. At Paris there were Gervais Mastallerus of Breisgau, active at the College of Beauvais, and, to an extent, Pontus de Tyard. The Ptolemaic *Tetrabiblos* was the subject of many important commentaries. Beside that of Melanchthon, there were those published by Schöner in 1529, by Cardan in 1554, by Johann

Gartze, called Garcaeus (1530-1575) in 1576, by Conrad Rauchfuss, called Dasypodius, in 1578, by Giuntini in 1581, and the ones that remained in manuscript by Ristori and Nabod.

On the technical level, the exponents of the "Ptolemaic" current of astrology in the 16th and 17th centuries kept to the basic procedures of the art as codified in late antique astrology, as far as the theory of the planets, signs, houses, and aspects was concerned. This resulted in the abandonment of many of the references by astrologers who had written in Arabic, contemptuously defined by Cardan and → Campanella as *nugae araborum*, and a widespread revisioning of the technique of the great conjunctions. The latter, especially in Albumasar's version, had already been called into question by medieval astrologers like Ibn Ezra, and fiercely criticized in the most famous anti-astrological work of the Renaissance, the *Disputationes adversus astrologiam divinatricem* by Giovanni Pico della Mirandola (1496). The reference to an untrustworthy parameter such as mean planetary motion gradually disappeared, as did the use of the theory during the prediction of historical events. Astrologers began to place genethliac astrology and the examination of the individual nativity at the center of their studies, drawn on square-shaped diagrams and regularly reproduced in collections of natal horoscopes, which were very popular in this era.

New developments appeared in the procedure of setting up the houses (domification), absent in Ptolemy and mainly practiced by Arab astrologers such as al-Qabisi. The most important innovations in this field, discussed by the Flemish astrologer Gemma Frisius in his *De astrolabio catholico* (Antwerp 1556), were linked to domification *rationalis*, i.e., on a strictly geometrical basis, proposed by Regiomontanus, already delineated in a different version by John Campanus of Novara (1223-1296), and taken up at the end of the 13th century by Leo Hebraeus (Levi ben Gerson), and to domification *naturalis*, connected with the conception of astrology as an aspect of natural philosophy, proposed by Cardan and Magini and codified in the later 17th century by the Olivetan monk Placidus Titi (1603-1668). As for the so-called astronomical revolution, it did not in the least call astrological studies into question: they adopted a representation of the heavens in geocentric perspective, but were not necessarily connected with the geocentric system of the universe. Not by chance, many of the protagonists of the new astronomy also cultivated astrological studies, from G. J. von Lauchen, called Rheticus, to Coper-

nicus himself, and from Tycho to Kepler. Galileo in a letter to Dini, Kepler in *Tertius interveniens*, and Campanella in the *Astrologicorum libri* emphasized the independence of astrology from geocentricity and heliocentricity alike. What did take account of the new developments in astronomy were those fundamental tools of astrological work, the tables and ephemerides. The first to use the Copernican scheme in them was E. Reinhold, with the *Tabulae prutenicae* (1551). Francesco Giuntini embraced the planetary motions both from the geocentric point of view in the *Tabulae alphoninae*, and following the heliocentric scheme of Copernicus. Henri de Boulainvillier proposed the use of planetary positions in heliocentric perspective in a book on practical astrology of 1701. Finally, logarithms, invented in 1619, were soon employed in astrological calculation: Kepler used them in 1624, and Bonaventura Cavalieri in *Nova practica astrologica de far le direzioni . . . per via di logarithmi* (1639).

On the philosophical level, the Ptolemaic stream of astrology during the 16th and 17th centuries saw a revival of that linkage between astrological techniques and Aristotelian natural philosophy which Ptolemy himself had first sketched out. On this point, and also in its rejection of many Arab procedures, this orientation contrasted with the interpretation of astrology in a Platonic and Hermetic key, which found its archetype in the second book of *De occulta philosophia* (1533) by → Cornelius Agrippa of Nettesheim, himself indebted to important astrological pages of → Marsilio Ficino. While for Cardan, astrology formed a part of natural philosophy, for Agrippa it appeared as an instrument for penetrating the web of analogies that links the elementary world, the celestial world, and the divine world. This order of ideas was taken up by → Paracelsus (1493-1541) and → Robert Fludd (1574-1637) in their respective ways. Johannes Kepler (1571-1630) distanced himself from both of them, being a radical critic of Fludd's fantastic mathematics and at the same time reviving the Platonic idea of the cosmos as a perfectly ordered whole, created and directed by a spiritual principle through which everything is made according to harmonious geometrical proportions. On this basis, Kepler's theory of planetary aspects equated to the concords and discords in music (explained both in *Mysterium cosmographicum* and in *Harmonices mundi*) constitutes one of the most relevant technical innovations of astrology in the modern age.

While Kepler's innovations found little response among astrologers, the welding of the procedures

of the art and a natural philosophy of traditionally Aristotelian stamp was proposed again in the last two great *summae* of 17th-century astrology: the *Physiomaematica sive Coelestis philosophia* (1675) of Placido Titi, Professor of Mathematics at the University of Pavia, and the *Astrologia gallica* (1661) in 26 books by Jean Baptiste Morin (1583-1656), Professor of Mathematics at the Collège de France. Placido's work presented astrology as a natural science, assuming that all the significant factors used in it were purely physical realities defined after the categories of Aristotelian physics. In Morin's work, the *Primum mobile* was identified as the primary physical foundation of every event; the zodiac was linked to it, to whose signs a fixed meaning was ascribed on the basis of the planets that governed them in the supposed horoscope of the world. On this point Morin rejected → Campanella's opinion, which held that the zodiacal signs, representing the stations of the sun's course, should be assigned reversed meanings for births in the southern hemisphere.

In much of learned Europe at the end of the 17th century, natural philosophy was becoming linked more and more closely to the mechanistic image of the physical universe, of which René Descartes' work provided one of the most influential versions. The new climate rendered ever less credible the philosophical references to which much of modern astrology was bound, as witness the long and resentful polemic between Morin and Pierre Gassendi, and writings such as those of the astronomer Giovanni Montanari, *L'astrologia convinta di falso col mezzo di nuove esperienza e ragioni fisico-astronomiche* (Venice 1685). This set off a crisis in learned astrology, which was marked by the increase of prohibitions not only against the practice, but also the study of the discipline. In 1666, Colbert prohibited the Academicians from pursuing it; after 1670, astrology was no longer taught at the University. In 1682, Louis XIV extended the ban on astrological calendars to the whole of France; a *Reichstagsabscheid* of 1699 did likewise for the Germanic world. In 1708, in his report to the Académie des Sciences, Bianchini called the planisphere a testimony to human folly; in 1756, an ordinance of Maria Teresa of Austria banned astrological predictions and superstitious conjectures. In the Age of Enlightenment, astrology became ever more alien to cultivated circles: D'Alembert and Diderot's *Encyclopédie* defined it as unworthy of consideration by a man of reason. Voltaire was of the same opinion, as was the archaeologist Charles Dupuis, who equated astrol-

ogy with superstition in his three-volume work *Origine de tous les cultes* (1794).

In reaction to the excesses of a schematic rationalism, the secret societies reconsidered the motives of the Platonic-Hermetizing astrology of the 16th and 17th centuries. During the 18th century, these societies brought about a Hermetic revival with Neoplatonic and Gnostic elements; but astrology was not practiced among them, only studied from a symbolic point of view as an ethical and philosophical doctrine. The *Opus mago-cabbalisticum et theosophicum* (1735) of → Georg von Welling can be ascribed to this kind of orientation, while → Goethe's *Wilhelm Meister* also seems to acknowledge a symbolic and Hermetizing astrology. Goethe opened his own memoirs, *Dichtung und Wahrheit*, with an examination and commentary on his own natal horoscope. The interest in astrology also found a place in German → Romanticism, with a revival of its more strictly technical aspects. The most important exponent of this trend was Wilhelm Andreas Pfaff (1774-1835), who in an essay of 1816 entitled *Astrology* thus described the state of the art: 'Ignored, rejected, abandoned, the most ancient relative of heaven-dedicated Urania, that is, astrology, seeks to regain its own native land and its place among the sciences presided over by the Muses'. To Pfaff also is due a German translation of Ptolemy's *Tetrabiblos* (1822-23), which followed that which the celebrated astronomer J.C. Bode had published in 1795.

The spread of positivism stifled the incipient revival of astrological studies in almost the whole of Europe, with the marked exception of England, where at the same time as Pfaff's edition J. Ashmand had translated the *Tetrabiblos* into English, with an epigraph from Lord Byron and a dedication to Walter Scott. However, three editions of Ptolemy already existed in English: those of J. Whalley (1701), M. Sibly and J. Browne (1786), and J. Wilson (1820), while John Cooper had translated Titi's *Physiomaematica*. Using as its basic reference-points the texts of Ptolemy and Titi, English astrology developed throughout the century with close attention to the technical aspects of the discipline and to its empirical control. This direction differed from that of the esoteric astrology connected with the → Theosophical Society, founded in 1875, whose principal exponents were Sepharial and Alan Leo. From 1800 onwards, annual ephemerides were published under the title *Raphael's Ephemeris*. Among the new treatises on astrology in English were John Wilson, *Complete Dictionary of Astrology* (1819); John Worsdale,

Celestial philosophy or genethliacal Astrology (1824); Raphael (pseudonym of R.C. Smith), *Manual of Astrology*; Zadkiel (pseudonym of Lieut. Morrison), *Grammar of Astrology* (1834). Morrison founded in 1860 the Astrometeorological Society, and held that in genethliacal astrology the planets were to be considered as causes, but in horary astrology as signifiers. Zadkiel II (pseudonym of Alfred John Pearce) wrote *The Science of the Stars* (1881) and *Textbook of Astrology* (1897); George Wilde, *A Treatise of Natal Astrology* (1894). The latter work carried an Introduction by R. Garnett, librarian of the British Museum, who under the pseudonym of A.G. Trent distinguished astrology from theosophy, maintaining that 'Astrology is a physical and verifiable science or it is nothing'. The frequent use of pseudonyms by astrological authors is an evident symptom of the difficulty encountered by the discipline in getting legitimized in the eyes of the learned.

The same phenomenon was common in French culture of the late 19th century, in which astrology was cultivated mainly within the secret societies. Its principal representatives were the Abbé Constant, who wrote under the pseudonym of → Eliphaz Levi, and the physician Gérard Encausse, who wrote as → Papus. In 1888 Papus launched the journal *L'Initiation*, while the occultist Eugène Jacob published under the pseudonym of Ely Star a work of Kabbalistic astrology, *Les mystères de l'horoscope*. At the end of the century, astrology began to attract the interest of astronomers such as C. Flammarion (who furnished a Preface to Jacob's work) and Père Nicoullaud, who in 1897 published under the pseudonym of Fomalhaut a *Manuel d'astrologie sphérique et judiciaire*. The astrologer → F.C. Barlet and the bookseller-publisher Paul Chacornac became the masters of a new generation of students, including H. Selva and Paul Choissard, who were also interested in the problem of the statistical control of the results of astrological work, along a direction of research destined to expand during the 20th century.

B. LITERATURE

The subdivision and ranking of the various branches of astrological study in the late Middle Ages followed the example of the *Speculum astronomiae*, attributed to → Albertus Magnus and inspired by Arabic models. This was radically altered in the Renaissance era, thanks to the rediscovery of the classics of ancient astrology, such as the astrological poem of Manilius; the fresh circulation of texts that had been little read in the Mid-

dle Ages, such as Firmicus Maternus's *Mathesis*; and above all the rediscovery of the true nature of Ptolemy's astrology. The latter was to be found in four books that have entered history under the name *Tetrabiblos* (in Latin, *Quadripartitum*), and which were now translated directly from the Greek.

The return to Antiquity that characterized the age of Humanism affected astrological culture essentially in the form of a return to ancient astrology, and especially to Ptolemy, prince of astrologers. An example of Ptolemy's changed role is the course followed by Girolamo Cardan, the great philosopher, mathematician, and physician. His father had set him on the path of astrological study *iuxta araborum principia* (after the principles of the Arabs), but then Cardan read the integral translation of the *Tetrabiblos*. This caused him to reorient his own studies, freeing himself from the *nugae araborum* and setting himself to write a detailed commentary on Ptolemy.

A new image of astrology now entered circulation, different from the medieval one: a technically more rigorous study, using the precise and sophisticated tools of astronomical mathematics, and ready to re-evaluate and, if need be, to discard formerly sacrosanct references and procedures. The first change was the individualization of the object of study, and the description of the relations between its internal members. The Middle Ages had understood astrology as a kind of knowledge intermediate between cosmology and natural philosophy, mainly oriented towards general events, both natural and historical; at the center of attention were the techniques of worldly astrology, often in the spectacular but debatable form of Albumasar's theory of the great conjunctions. Genethliacal examination, focusing on the drawing-up and analysis of individual horoscopes or birth-charts, had seemed a specialized and less relevant application of worldly astrology. Now this ranking was reversed. From the start of the Renaissance era, genethliacal astrology reclaimed its ancient primacy, together with an increased interest in techniques connected with divination and → magic, such as interrogations and elections. Interrogations would find their great new interpreter in the Englishman William Lilly, but Cardan tended to substitute for them procedures that answered questions on the basis of a chart drawn up not (as in the classical technique) for the moment at which the question was posed, but for the questioner's moment of birth. This type of questioning thus also fell within the field of genethliology. As for

elections, closely connected with forms of astral magic, they found their place mainly in texts devoted to magic, such as *De occulta philosophia* (1533) by → Cornelius Agrippa, or connected with magic in various ways, such as → Tommaso Campanella's *De siderali fato vitando*.

Among the types of astrological literature that continued in a more medieval style, on the frontier between learned and popular astrology, were the calendars. These were full of astronomical, astrological, and liturgical information, explaining in simplified form the symbolism of planets and signs, and adding advice about agriculture and the conduct of life. In the same category were the annual prognostications, sometimes by illustrious astrologers such as Lorenzo Bonincontri, who published them for the years 1484-1491, and Cardan himself; the *Practicae*; and the predictions, both meteorological and prophetic, which determined the astrological procedures suitable for pinpointing the dates of the prophetic events. This category includes the predictions of Lichtenberger (who influenced Paul of Middelburg) regarding the effects of the great conjunction of 1484, and the numerous ones – 135 at least – about the epochal significance of the 1524 alignment of six planets in Pisces, mostly understood as announcing an imminent universal flood. Into this literature flowed the heritage of medieval conjunction lore, also present in Tycho Brahe but used ever more cautiously by astrologers. Already the object of criticism by medieval astrologers such as Ibn Ezra, and of a particularly fierce polemic by → Giovanni Pico della Mirandola, it was refuted, or at least revised, by Lucio Bellanti (*De astrologica veritate*, 1498), Agostino Nifo (*De nostrarum calamitatum causis*, 1505; *De falsa diluvii prognosticatione*, 1524), Pedro Ciruelo (*Apotelesmata astrologiae Christianae*, 1521), Cyprian Leowitz (*De coniunctionibus magnis*, 1564), and Johannes Kepler (*Discorso sulla grande congiunzione*, 1623). On the borderlines between astrology, prophecy, and esotericism falls the visionary work of Michel Nostradamus (1503-1560), very much criticized by the strict Ptolemaic astrologers, and famous for an edition of his *Quatrains* published in Lyon, 1555, in which there seems to be a description of the unusual death of Henri II, killed in a tournament in 1559, with surprising circumstantial detail (though a similar prediction had been made by Lucas Gauricus in 1552).

There has been much emphasis on the role in the history of astrology played by Giovanni Pico della Mirandola's *Disputationes* (1494). This monumental work in twelve books is a true *summa* of the

late-medieval anti-astrological polemic, whose arguments were drawn on by Girolamo Savonarola for his *Tractato contra li astrologi*. Pico's work was certainly discussed at length by astrologers, and many of them wrote replies and refutations of it, from Pontano (*De rebus coelestibus*, 1519) to Bellanti (*De astrologica veritate*, 1498), from Cardan to Kepler. However, its impact on astrological studies from the Renaissance to the modern age came not so much from its arguments (which in the technical part of the work had simply amplified and radicalized doubts and objections already present among astrologers), as from the contact with the ancient sources of the discipline, and from a new vision of the tasks and methods of research, and of technical developments within the art. We have mentioned the role of the *Tetrabiblos*, which in the 15th century was translated directly from the Greek, in an edition of the first two books (translated by Camerarius) in 1535, then in a complete translation by Antonio Gogava in 1548. This work played a fundamental role in opening new perspectives for the discipline. It created a totally new image in which genethliology played the major part, while smaller parts were allotted to the procedures outside it. Interrogations, elections, and the conjunctions beloved of the Middle Ages gave way to a more sober worldly astrology, resembling that of the Greek master. The new general treatises on astrology often took the form of commentaries on Ptolemy, which became almost a literary genre in itself. An unpublished commentary by Conrad Hergartner dates back to the 15th century; the commentary by the Italian humanist and physician Giorgio Valla (1430-1499) was printed in Venice, 1502; Lucas Gauricus's *Paraphrases et annotationes* in 1539; Cardan's very important *Commentaria* in 1554; Conrad Raufuss's *Scholia in Claudii Ptolemaei quatuor libros Apotelesmaticos* in 1578; Francesco Giuntini's commentaries in 1581; Andrea Argoli's *Ptolomaeus parvus* in 1652; Placido Titi's commentary in 1658. Other commentators on Ptolemy were Nabod, Ristori, and Fantoni. As for the *Centiloquium*, that was the object of a commentary by Giovanni Pontano in 1512, and by Gauricus in 1540, who edited it from George of Trebizond's translation; however, doubts were beginning to form about the authenticity of this text, whose chief spokesman was Cardan. There was a great number of general expositions of the material, among the most important of which were *Tractatus praeclarissimus* (1514) by John of Glogau; *Enarratio elementorum astrologiae* (1560) by Valentin Nabod; *Astrologiae methodus* (1576) by Garcaeus; *Astrologicorum libri* (1629) by Tom-

maso Campanella; *Tractatus astrologicus* (1633) by Henry Rantzau; *Astrologia naturalis* (1645) by Dost von Glatz (Origanus); *Isagoge in Astrologiam* by Giovanni Antonio Magini; *Astrologia gallica* (1666) by J.B. Morin; *Physiomatematica* (1675) by Placido Titi. More typical of this era were the treatises devoted specifically to genethliology, sometimes virtual horoscope collections, such as *De iudiciis nativitatium* (1545) by J. Schöner; *Tractatus astrologicus* (1552) by Gauricus, which appeared in Italian the previous year; *Brevis et perspicua ratio iudicandi* (1558) by Leowitz; *Tractatus Astrologiae judicariae de nativitatibus* (1540) by Gauricus; *Tractatus astrologicus* (1633) by the Danish nobleman Rantzau; *Liber de exemplis centum geniturarum* (1547) and *Liber duodecim geniturarum* (1554) by Cardan. The texts were increasingly illustrated with nativities, especially of famous men, with the object of confirming the worth of genethliology and of showing that the well-known events of their lives were in accordance with the astrological diagnosis.

From the middle of the 15th to the end of the 17th century, the Ptolemaic revival conferred on astrology, in the eyes of astrologers themselves, the character of a rational and coherent discipline, and moved the center of debate from the question, so much discussed in the Middle Ages, of its compatibility with Christian doctrine to that of its epistemological status and its position within the world of learning. It is not surprising that these two centuries saw the intensive production throughout Europe of a technical literature aimed at furnishing astrologers with the indispensable tools of their trade, which are ephemerides and the various types of tables. Among the most famous books of ephemerides are the *Tabulae astronomiae* or *Canones super Tabulas*, compiled in the middle of the 15th century by Giovanni Bianchini on the basis of the Alfonsine Tables, and printed in Venice in 1495 by Simone Bevilacqua, with a dedication to Lionello d'Este; *Tabulae prutenicae* (1551) by E. Reinhold; *Teoricæ novae planetarum*, written in 1454 by Georg Peurbach, who revised Bianchini's tables by comparing them with Alfonsine ones; *Ephemerides novae* (1556) by J. Stadius; *Ephemeridum novum atque insigne opus* (1557) by Leowitz; *Ephemerides* (1582) by G.A. Magini; *Tabulae Rudolphinae*, with a *Sportula* for the astrologers, by Kepler. Among tables of other kinds were *Tabulae directionum* (1467) by Regiomontanus; *Tabulae bergenses* (1568) by Stadius; *Tabulae primi mobilis* (1609) by Magini.

The debate over the procedure of domification (division of houses) was very relevant at this time,

not least with regard to the various images of astrology current within the art. In the 13th century the geometrician Giovanni Campanus had proposed a system of houses *modo aequalis*, based on dividing the vertical into equal segments. At the end of the 15th century there was a revival by Regiomontanus and Schöner of domification *rationalis*, already proposed by Ibn Ezra, based on the division of the celestial equator. Cardan, in *De exemplis centum geniturarum* (1547) had adopted the equal method in a version considered to derive from Ptolemy, based on the division of the zodiac into equal segments; later he accepted the rational method, and finally returned to the equal one. Leowitz spoke for the rational procedure (*Brevis et perspicua ratio iudicandi genituras ex physicis causis*, 1558). Magini adopted another method, again "in the manner of Ptolemy", based on the trisection of the diurnal arc. Finally Placido Titi proposed a "natural" system of houses that was not geometrical, with a proportional division of the diurnal and nocturnal arcs, in which each division corresponds to two hours of time. This is the Placidus method, still in use.

The panorama of 15th-17th-century astrological literature would be incomplete without mention of the many texts of astrological medicine that punctuate it. In them the ancient doctrine of zodiacal and planetary "melothesia" was revived for diagnostic and therapeutic purposes, following the most diffuse of → Marsilio Ficino's writings, the *De vita libri tres* (1489). The theory of critical days was very much used for studying the course and cure of illnesses. It was explained in texts such as *De diebus decretoriis* by Gauricus; *De ratione et usu dierum criticorum* (1555) by T. Bodier; *Amicus medicorum* (1614) by Jean Ganivet; *De astrologica ratione ac usu Dierum Criticorum* (1607) by Magini; *De diebus criticis* (1639) by Andrea Argoli; *De diebus decretoriis* (1665) by Placido Titi; *De annis climactericis* (1648) by Cl. Saumaise (Salmasius).

After having flourished for almost three centuries, European astrological literature suddenly diminished both in quantity and in quality when, at the end of the 17th century, the triumph of mechanistic physics distanced astrology from the university and from learned circles. The credibility of the discipline was impaired by the close connection made in many texts between its own techniques and a natural philosophy with Peripatetic roots, now become unrepresentable in the learned world. The great *Lexicon mathematicum astronomicum geometricum* (Rome 1668) in which the Theatine monk Gerolamo Vitali, disciple of Titi, had gathered

the fruits of three centuries of astrological labor, classifying all the Greek, Latin, and Arabic terms of the tradition, now appeared as the final homage to a defunct discipline and lay forgotten on the library shelves. From this moment until the second half of the 19th century, references to astrology, as also to alchemy and kabbalah, were used more in a symbolic sense than for any technical validity of the art. They appeared in the ambience of esotericism and secret societies, emerging now and then into the view of intellectuals like → Goethe and the German Romantics [→ Romanticism], who were discontented with a certain 17th-18th century schematic rationalism. One exception to this eclipse of astrological literature was the English environment, in which astrology, while not much in favor on higher cultural planes, still maintained a presence as a practice valued by the public, and fed by a technical literature oriented to the production of tables and ephemerides, which was especially prolific in the 19th century. In France, at the end of that century, there was a new wave of interest in astrology beyond the confines of esotericism: high-quality technical manuals were published, such as those of Fomalhaut and Selva, while Paul Choisonard laid the foundations for an approach to astrology as experimental and controllable research susceptible to the statistical method, thus opening the way to its 20th-century revival.

ORNELLA POMPEO FARACOVI

Astrology V: 20th Century

A. HISTORY

Although the sale of astrological almanacs flourished throughout the 18th and 19th centuries, in most Western countries the times were unpropitious for professional astrologers to expound on astrology as a worldview or interpret charts for clients. In the latter sense, there was thus a period of considerable decline throughout the West, with the partial exception of England where an astrological subculture continued to exist. By the turn of the 20th century, however, astrology had begun a

process of revival. At the beginning of the twenty-first, astrology has regained a remarkably strong position in Europe and North America, especially in popular culture. Polls indicate that roughly a quarter of the population in several Western countries assent to the proposition that the position and movement of the planets against the backdrop of the heavens correlate with personality traits and/or events in one's life. Compared to previous epochs, 20th century astrology has gone through several major transformations. These can be viewed against the backdrop of a general definition of astrology.

Broadly speaking, astrology can be understood as a set of divinatory propositions and practices, sometimes associated with articulated world-views, which attempt to express specific modalities of human existence by means of a canonical language based on elements of celestial mechanics. Under this definition, astrology is an umbrella term denoting a potentially quite diverse set of rituals and doctrinal positions. In contemporary astrology, this diversity manifests itself in conflicting techniques, theories, world-views, and claims of what astrology can and cannot do.

The similarities between older and contemporary forms of astrology typically concern the generalities of this class of divination. Thus, older and newer astrologies share the assumption that there is a correlation between celestial and terrestrial phenomena (often expressed by astrologers in the formula "as above, so below"), and that certain individuals through appropriate training have acquired the skills necessary to unveil the details of this correlation. A commonly (although not universally) held belief in older as well as newer forms of divination is furthermore that astrology works because human life and the larger cosmos are interconnected through a network of non-material links.

The changes that have taken place throughout the 20th century can be briefly summarized in the following six points. (1) 20th-century astrology has joined forces with a variety of other belief systems that are particular to the late 19th and the 20th centuries. Thus, wide-spread forms of 20th century astrology have arisen through a syncretism with theosophically inspired → occultism and → Jungism. (2) Classical (traditional) astrology was associated with prognostication and specific claims about the correlation between celestial events and outward human behaviour. In present-day astrology there is a tendency to put main emphasis on behavioural dispositions, traits, and personality. (3) The coexistence of many independent practitioners, who can disseminate their ideas with rela-

tive ease due to factors such as cheaper printing technologies and the existence of popular media, has led to a considerable divergence of opinion. There is thus no agreement among astrologers e.g. on what symbols should be used in interpreting a chart (midpoints, asteroids, transplutonian planets, etc.), which of several fundamental but conflicting technical systems is valid (house divisions), how selected factors should be combined in chart interpretation, which factors should be accorded the greatest importance in the birth chart or, in the case of psychological astrology, what model of human personality is the most appropriate. The variety of interests within the astrological community has also led to the revival and development of many specialized forms of divination beside the interpretation of birth charts. These include various versions of mundane astrology (attempting to cast horoscopes for nations and organizations rather than individual people), financial astrology (which predicts e.g. fluctuations on the stock market), and even astrological traditionalism (which rejects the psychological interpretation of charts and attempts to go back to Renaissance and Mediaeval methods of predicting one's destiny). (4) Astrology has undergone ambivalent and conflicting forms of adaptation to the cultural context of modernity. The cosmological doctrines that went with pre-modern astrology – the geocentric model of the solar system, the Aristotelian distinction between sublunar and celestial worlds – are defunct. At the same time, the failure of more modern philosophical, astronomical and physical models to provide a plausible underpinning for astrological tenets has resulted in an at least partial allegiance to older theories of → correspondences, all the more remarkable in an epoch that has seen the adoption by many esotericists of theories of instrumental causality. However, these older theories are often unsystematically mixed with theories of mechanical causality, Jungian theories of synchronicity and other attempts at formulating explanatory models. (5) Astrology is no longer part of a culture of accepted claims. Thus, older forms of astrology were routinely invoked in political decision-making; in the contemporary West, the few cases when divination has been similarly used (as during the Reagan era) have caused considerable consternation and controversy. Furthermore, although older forms of astrology also met with criticism, this criticism was usually of an abstract and philosophical nature. Critics addressed topics such as the different fates of people born at the same time, the lack of a plausible *modus operandi* for astrological influences

and the discrepancies between tropical and sidereal zodiacs. Modern opposition to astrological claims typically follows more empirically-oriented approaches. Contemporary skeptical responses typically point at the failure of astrologers in controlled experimental settings to correlate charts with personality profiles with any rate of success higher than chance. Conversely, several attempts have been made by astrologers to anchor their practices in empirical research; the most publicized of these attempts have been the statistical studies carried out by Michel Gauquelin (1928-1991). (6) Astrology is nevertheless practiced in a social context that bespeaks its positioning in contemporary society. Whereas practicing astrologers in pre-modern society characteristically plied their trade as independent agents, contemporary astrologers have the option of learning their craft through structured courses, to become members of organized bodies and to disseminate their ideas and advertise their practices through specialized journals. And whereas pre-modern astrology was treated as an arcane science in a male-dominated society, and was therefore dominated by male practitioners, contemporary astrology is integrated in a cultic milieu that is largely constituted by women, and is hence practiced by many women.

The revival of astrology began independently in England and in the USA. The key figure in England was Alan Leo (1860-1917), whose given name was William Frederick Allan. Leo, who had taught himself astrology, in 1890 became a member of the → Theosophical Society. In 1915 he founded an Astrological Lodge of the Theosophical Society. Leo was both a prolific writer and a very successful practicing astrologer. Numerous people became acquainted with astrology through Leo's textbooks.

In the USA astrology was to a large extent resuscitated from its slumber by Luke Dennis Broughton (1828-1898), who learned astrology in his native England and emigrated to America. He lectured and wrote extensively on astrology from the 1870s until his death, and introduced large numbers of people to the craft of chart interpretation.

The revival of astrology in countries such as France and Germany came a few years later, and was also largely ushered in by individual enthusiasts. In France, the astrological reawakening began during the last years of the 19th century with treatises published by → F.-Ch. Barlet (pseudonym of Albert Faucheux, 1838-1924) and Fomalhaut (pseudonym of abbé C. Nicollaud, 1854-1923). In Germany, Karl Brandler-Pracht (1864-1945) had a similar role in introducing astrology to the public around 1905. He was followed by a number of

astrologers who attempted to create innovative versions of astrology. The most successful of these attempts, in terms of the number of adherents, is Alfred Witte's and Reinhold Ebertin's theory that the midpoints between the positions of the traditional symbols of the chart should be accorded an important role. In the 1930s, the situation of astrology in Germany was marked by the rise of national socialism. After a period of favor, when several high-ranking members of the Nazi party including Heinrich Himmler and Rudolf Hess were interested in the subject, astrology was repressed once the National Socialists came into power.

The astrology of the first decades of the 20th century largely continued to be event-oriented, each symbol generally correlated with physical features, places, specific fortunes and misfortunes. To the extent that it dealt with character, astrologers tended to use static and common-sense theories of personality. The key figure to effect the decisive turn towards incorporating more dynamic psychological models into astrology was Dane Rudhyar (1895-1985). Rudhyar, who was a follower and friend of → Alice Bailey's, became acquainted with → C.G. Jung's work in the early 1930's. His synthesis of psychology, theosophy and astrology was published as *The Astrology of Personality* in 1936. In a thoroughly spiritualized Jungian vein, Rudhyar saw the chart as a map to the particular path of individuation for the person concerned. The astrologer's function is very similar to that of a spiritual guide, who discerns for the client the meaning of being born at a particular time and place.

The prediction of events remained an important part of astrology well after the publication of Rudhyar's first volumes. However, the counterculture of the 1960s signified a major boost for astrology in general and its psychological and Jungian variety in particular. The awareness among the population at large was to a large extent heightened due to the concept of the advent of a new era in history, the Age of Aquarius (not least as popularized in the 1969 musical *Hair*). Among the astrological cognoscenti, Rudhyar, who had worked in relative obscurity for many years, became a major source of inspiration. Since the late 1960s, interest has exploded, measured in terms of the number of practicing astrologers, in the output of literature and the number of potential clients.

Whereas political constraints for the following two decades limited widespread interest in astrology to the Western world, the fall of the Iron Curtain has brought about yet another boost, since the 1990s entailed a surge of interest in the former East Bloc countries. The wider effects of globalization

have spread modern Western, psychologizing forms of astrology well beyond the confines of Europe and North America, and have also introduced Indian and Chinese forms of astrology in the West.

At the same time, the very popularity of astrology in the last decades of the 20th century has given it the curious role of being a major catalyst behind the rise of organized skeptical movements. In 1975, 186 scientists signed a document against astrology which was published in the journal *The Humanist*. The following year, the *Committee for the Scientific Investigation of Claims of the Paranormal* (CSICOP) was formed largely as a response to the wide-spread support for astrology. Within the next few years, many similar skeptical organizations were created, most of which continue to devote considerable effort to debunking and combating belief in astrology. 20th century astrology thus has an indirect influence that goes well beyond the ranks of the “believers”.

B. LITERATURE

The astrological literature of the 20th century is characterized by its scope and diversity. The vastness of the literature can be judged from the fact that at the beginning of the 21st century, catalogues of books in print list over three thousand astrology titles in the English language alone. The diversity is apparent from the fact that this literature ranges from elementary general introductions to highly specialized works, and covers many distinct branches of astrology, from the Jungian-inspired analysis of birth charts to various versions of mundane and predictive astrology. The following remarks can thus only give some ideas of the main trends of this literature.

Much astrology in the first decades after its revival at the beginning of the 20th century was characterized by the affinity of many of its practitioners with theosophy [→ Theosophical Society], and with the gradual transition from an event-oriented to a psychologizing practice. An important part of the literature on astrology of those decades is marked by this double affiliation. Among the “modern classics” of this genre one can single out *Esoteric Astrology* and other books written by the prolific Alan Leo (1860-1970) and *The Astrology of Personality* by Dane Rudhyar (1895-1985). Theosophically inspired astrology received its most extensive theoretical manifesto with → Alice Bailey’s *Esoteric Astrology* (1950). However, predictive astrology represented a larger sector of the astrological literature during those first decades than it does today. Early 20th century handbooks on astrology, such as → Max Heindel’s *The Mes-*

sage of the Stars (1913) and Oscar Schmitz’ *Der Geist der Astrologie* (1922) thus devote considerable space to describing how a person’s relation with career, money, marriage and health can be seen in the birth chart.

Whereas much of astrology in older periods was reserved for an intellectual elite that had the astronomical and mathematical knowledge necessary to erect a chart, astrology as it was revived in the early 20th century was a more popular practice. A distinct genre of 20th-century literature consists of elementary handbooks for mass-market distribution. Characteristic examples are Alan Leo’s *Cast- ing the Horoscope* (1902), and *Heaven Knows What* (1935) and *Astrology for the Millions* (1940) by Grant Lewi (1902-1951).

Since astrology was largely practiced by individuals in a loosely knit cultic milieu, the literature also soon evinced a considerable diversity of opinion. Among the literature presenting various technical innovations, a few sub-genres can be mentioned. In books such as *Applied Cosmobiology* Reinhold Ebertin (1901-1988) developed a distinct form of astrology, inter alia by assuming that mid-points between planets represented important forces in the chart. Another distinct direction in astrology are Sabian Symbols, in which every degree of the zodiac has its own meaning. This system of interpretation is the subject of Marc Edmund Jones’ (1888-1980) *The Sabian Symbols* (1953).

Specific applications of astrology (other than interpreting the birth chart) were also revived and codified in founding texts. Charles Carter (1887-1968) published an influential text on mundane astrology, *An Introduction to Political Astrology* (1951). An early precursor of the attempts to analyze stock market fluctuations through astrology is J.M. Langham’s *Planetary Effects on the Stock Market* (1932).

The revival of astrology coincided with a period of unparalleled success for the natural sciences. Already in the first years of the astrological revival, volumes were produced that attempted to ground the claims of astrology in empirical research. A pioneer in this field is Paul Choisonard (1867-1930). Among his titles one might mention *Influence astrale* (1901) and *Étude nouvelle sur l’hérédité* (1903).

Astrological literature of the latter decades of the century, i.e. after astrology made the transition from a specialized subculture into mainstream popular culture in the 1960s, shows characteristics similar to the aforementioned, but in radicalized form. Firstly, the psychologizing trend has become the dominant form of astrology. Much contemporary literature therefore takes for granted that

astrology is a psychological art and thus a mode of understanding others as well as oneself, giving rise to titles such as *Relating* (Liz Greene 1978), *Astrology, Psychology and the Four Elements* (Stephen Arroyo 1975), *Relationships and Life Cycles* (Arroyo 1979), and *The Astrology of Self-Discovery* (Tracy Marks 1985).

Secondly, due to the widespread popularity of astrological beliefs, the existing customer base for literature on the subject is vast. A very large number of titles is thus published each year, making it possible for both broadly appealing subjects and niche interests to coexist on the market. The vast output of astrological texts can be loosely subdivided into genres. For the general public, there are mass-market books, e.g. the commercially highly successful best sellers *Sun Signs* and *Love Signs* by Linda Goodman (1925-1995). For the aspiring astrologer, new instructional texts are published each year, some of which are distributed by major, international publishing houses. Books for a more advanced audience tend to focus on specific interpretive issues. Thus, there are numerous books aiding the advanced practitioner to refine his or her understanding of the astrological houses, of specific planets or of characteristic configurations or events in the horoscope. Characteristic titles are *Saturn: A New Look at an Old Devil* (Liz Greene 1976), *The Twelve Houses* (Howard Saspotas 1985) and *Planetary Aspects* (Tracy Marks 1987). A considerable number of journals, ranging from mass circulation publications to specialized newsletters cater to the interests of those who have a long-term interest or are professionally involved in astrology. Closely related to these genres are astrological texts that are "literature" only by adopting a more inclusive definition. Among these there are the sun sign horoscopes in many newspapers and magazines. TV programs, Internet sites and advertisements in the media also contribute to making basic information on astrology a truly ubiquitous part of contemporary popular culture.

Thirdly, those who practice astrology continue to disagree on many issues. Present-day astrological literature therefore continues to be characterized by its diversity of opinion. The variety of doctrines on a number of technical issues has led to several distinct genealogies of traditions. Literature that presents specific interpretive choices can be subdivided accordingly. There are books linking astrology with Jungian thought. Among these, some of the most influential within the astrological community have been written by Liz Greene and Howard Saspotas, e.g. their joint production *The Development of the Personality* (1987). Others

present a variety of esoteric or occult interpretations of the chart. Books linking → reincarnation and astrology can be placed in this category, e.g. *The Divine Plot: Astrology and Reincarnation* (Tad Mann 1986). The literature of yet another school, that of Uranian astrology, is distinct inter alia in that it hypothesizes the existence of eight planets unknown to astronomy. Yet another sub-genre attempts to incorporate interpretations of major asteroids into the birth chart.

Fourthly, whereas all of the aforementioned are united by their interest in the natal charts of individual people, yet other genres of literature, each with multiple variations, concern distinct branches of astrology such as mundane astrology (the interpretation of the charts of nations and organizations), financial astrology, horary astrology (answering questions by interpreting the chart of the moment when the question was posed), electional astrology (choosing the appropriate moment to begin an activity through astrological considerations), and even astrological gardening (planting and harvesting according to astrological considerations). Thus, mundane astrology is the subject of volumes such as Nicholas Campion *The Book of World Horoscopes* (1992), whereas financial astrology is expounded in texts such as Henry Weingarten *Investing by the Stars* (1996).

Finally, astrology is no longer part of a culture of accepted claims. This fact has led to the rise of a new genre of literature on the subject. The booming interest in astrology has probably been the main impetus behind a genre of literature on astrology characteristic of the later part of the 20th century: the numerous attempts to carry out empirical studies of astrological claims. Excepting a few precursors, rigorous experimental studies of this kind have only been carried out since the mid-1950s. Two avenues of investigation have been followed. Firstly, there are statistical surveys examining whether chart factors can be correlated with specific individual traits. The most publicized and controversial of these are the studies of Michel Gauquelin (1928-1991), who in *The Cosmic Clocks* (1967) and numerous other books attempted to show that there was a statistically significant correlation between certain celestial events at birth and excellence in certain professions. Secondly, there is the skeptical literature that attacks astrology, typically along the line that astrologers consistently fail tests in which they attempt to match personality profiles with chart interpretations. A classic title in this genre is Roger Culver & Philip A. Ianna *Astrology: True or False? A Scientific Evaluation* (1988).

The implicit premise of such studies, whether

favorable or debunking, is that astrology is best analyzed by examining its relation with the empirical sciences; the polemics concern the question whether it is a valid science or a failed one. Almost entirely lacking from 20th century astrological literature are studies that treat contemporary astrology as a culturally constructed divinatory art. Considering the depth and finesse of the anthropological literature on e.g. African systems of divination, this lacuna is all the more remarkable.

OLAV HAMMER

Audians

The Audians were adherents of a Christian sect, which flourished in the 4th century. Only a limited historical and geographical account of their activities can be gleaned from typically marginal references in the available sources (detailed survey in Puech 910/911). The scantness of concrete information is already apparent in the varying names for the group (Gk. *Audianoi*, *Odianoï*; Lat. *Haeresis Audiana*) as well as their founder (Gk. *Audios*, *Audaïos*; Lat. *Audeus*; Syr. *Audi*, *Odi*). Moreover, no original documents of the Audians have survived. All information about the sect derives from the heresiological writings of major Church authors. The statements of Epiphanius of Salamis (*Panarion*, 70) and Theodore bar Konai (*Scholia*, 11,63) are particularly important in this respect.

Audius, the founder of the sect, was a Syrian from Mesopotamia, who lived during the 4th century. Statements concerning the period of his public activity vary widely; Epiphanius (*Panarion*, 70, 1) gives the most plausible date at the time of Arius (ca. 325 A.D.). Audius initially enjoyed great respect as an ascetic and opponent of the growing decadence of the clergy. His break with the Church probably followed soon after the Council of Nicaea. Audius rejected its edict on Easter, and his dissent was initially more schismatic than heretical. Audius had himself illegally consecrated bishop by a follower and founded communities, which

pledged themselves to extreme asceticism. He was thereupon banned by Constantine the Great to Scythia for several years. Afterwards he went on a long missionary journey, which led him into the Kingdom of the Goths, where he was successful as a missionary and monastic founder until his death. The persecution of all Christian communities by a Gothic ruler forced the Audians living there to flee back to the region where the movement had originated. There the sect swiftly declined in importance. In Epiphanius' time it was already small with an insignificant number of followers (*Panarion*, 70.15,5).

Little is known concerning the organisation and lifestyle of the Audians. Presumably the Audians were an initially orthodox ascetic movement, which wanted to restore the purity of the early Church and opposed any form of luxury. Afterwards, there arose an independent Audian church with its own episcopate, which assumed an increasingly heretical character, developed specific doctrines and elaborated its own apocryphal scripture, including a rich apocalyptic literature. Theodore bar Konai names an *Apocalypse of Abraham*, an *Apocalypse of John*, possibly identical with the so-called *Apocryphon of John* (= NHC II, 1 parr.), a *Book of Questions* and a so-called *Apocalypse of Strangers*, which is perhaps identical with the *Apokalypsis Allogenes* (Porphyry, *Vita Plotini*, 16), the text *Allogenes* (NHC XI, 3), and the *Allogeneis* of the → Archontics and → Sethians. This similarity suggests that the Audians shared many ideas with these groups. Moreover, the Audians presumably had various editions of the *Didascalia Apostolorum*.

Audian doctrines have syncretic features, chiefly indicating a proximity to Jewish and Judaeo-Christian views. As quartodecimans, the Audians retained the 14th Nisan as the time of Passover and thereby oriented themselves towards Jewish prescriptions (*Panarion*, 70, 9, 2-14, 4). There is also a markedly anthropomorphic image of God, based on a literal interpretation of Genesis 1:26: As God made man in his image, he also possesses a physical form. Accordingly, texts which endow God with attributes of the human body (e.g. Psalm 11:4; Isaiah 41:20) are understood in concrete terms rather than metaphorically (*Panarion*, 60, 2, 3-8). Here one sees an archaic, Judaeo-Christian conception of God with parallels in other early Christian texts, for example the pseudo-Clementine homilies (Stroumsa, 262).

The Gnostic views held by the Audians can be reconstructed in outline. Their cosmology and anthropology are characterised by a sharp dualism,

expressed in the polar opposites of light and darkness. Darkness and seven other powers form the seven planetary archons, which function as creators of the world and man. The myth of human origin taken from Genesis is expanded: the progeny of a part of mankind resulted from Eve's sexual relations with the archons. The human body is governed by the seven archons and must therefore be overcome; for this reason any kind of sexual activity is condemned and the idea of a bodily resurrection rejected.

The Audians' exemplary fulfilment of an ideal disseminated by the Church coupled with diametrically opposed doctrines led Epiphanius to place the sect outside the usual heresiological scheme, a verdict which has persisted until the present day (Stroumsa 267: '... another case of Christian monks, apparently orthodox in their beliefs and praxis, but ... the carriers of radical, heretical teachings').

GUIDO BEE

Augustine (Augustinus of Hippo), * 13.11.354 Thagaste, † 28.08.430 Hippo Regius

Life and work of Augustinus of Hippo, the most influential Father of the Catholic Church in the West, were inextricably connected with the gnosis of → Manichaeism. In 373, as a young student of rhetoric in Carthage, he made his sudden change to the "religion of Light", which at that time was very attractive to intellectual circles both in Roman North Africa and, for example, Italy. From his nineteenth up to and even beyond his twenty-eighth year, Augustinus was a Manichaean Hearer (*auditor*). In the writings after his return to the

Catholic Church (the definitive conversion to Catholicism took place in the autumn of 386), he was involved in a conflict with his former coreligionists and, at the same time, with his own Manichaean past. This period began with *On the Morals of the Catholic Church and the Morals of the Manichaeans* (started in 387) and came to a provisional conclusion with *On the Nature of the Good* (finished after 404). But also many excursions in his letters, sermons and major works like the *Confessions* (finished about 400) and the *City of God* (413-426/7) are definitely anti-Manichaean. Even towards the end of his life, in his writings against the Italian bishop Julian of Eclanum, Augustinus still had to struggle against the charge of being a Manichaean.

In many respects Augustinus's writings are unique sources for our knowledge of Manichaeism in the Latin West. Apart from the *Fragmenta Tabestina*, the remnants of a Manichaean codex in Latin found near the Algerian city of Tébessa in 1918, nearly all the other primary Latin sources came down to us via the works of Augustinus. Most important in this context are fragments of → Mani's *Treasure of Life* (via Augustinus's *Against Felix* and *On the Nature of the Good*; some other parts via Augustinus's pupil Evodius of Uzalis); fragments of Mani's *Foundation Letter* (mainly via Augustinus's *Against the "Foundation Letter" of Mani*); the *Capitula* of the Manichaean bishop Faustus (via Augustinus's *Against Faustus*) and the Letter of the Roman Manichaean Secundinus (preceding Augustinus's *Against Secundinus* in the manuscripts). The alleged Letter of Mani to Menoch, which the Italian bishop Julian of Eclanum brought to Augustinus's attention (see Augustinus's *Against Julian, an Unfinished Book* III, 166 and 172-173), seems to be a (Pelagian?) falsification, though it gives proof of a profound knowledge of Manichaeism. From Augustinus's *Against Adimantus*, written to refute the disputations of Mani's disciple Addā which seem to have been a collection of quotations from the Old Testament contrasted with selected New Testament texts, we get an impression of Manichaean biblical interpretation. Besides, Augustinus's *On the Morals of the Catholic Church and the Morals of the Manichaeans* and, not least, the 46th chapter of *On Heresies*, provide unique information on Manichaean myth, doctrine, ritual, and ethics.

To what extent Manichaeism exerted a lasting influence upon Augustinus has been a question since the attacks of Julian and other contemporaries. Apart from his marked and life-long anti-Manichaean attitude, more or less distinct positive Manichaean influences seem to have remained in

(certain traits) of Augustinus's doctrine of the two cities (*civitates*), in his doctrine of sexual concupiscentence, and in his appealing mystical spirituality.

JOHANNES VAN OORT

Auvergne, William of → William of Auvergne

Avicenna (Abū 'Alī al-Ḥusayn ibn 'Abd Allāh ibn Sīnā), * ca. 980 Afšana near Buḥārā in Transoxiana, † 1037 Hamaḍān

1. LIFE AND WORK

We know about Avicenna's life through an autobiography, completed by one of his disciples, Ġūzġānī (see critical edition Gohlman, ed.). Avicenna's father held a high position in the Samanid administration. A few years after Avicenna's birth, the family moved to Buḥārā, the capital of the Samanid's. In this intellectually active city, Avicenna received a very good education. He studied islamic jurisprudence (*fiqh*), medicine, and philosophical sciences: logic, mathematics, physics, and metaphysics. At seventeen, he was appointed personal physician of the Samanid Nūḥ ibn Maṣū'ir in Buḥārā; here he had the opportunity to complete his education, thanks to the extraordinary library of the Samanid ruler. After his father's death, he was also given an administrative position. A few years later, for reasons unknown to us, Avicenna left Buḥārā for Gorgānġ in Ḥwārazm (999?-1012), where he came in the service of the Ma'munid Alī ben Ma'mūn. In the next years we find him in Ġorġān (1012-1014), Ray (1014-1015), and Hamaḍān (1015-1024), serving different rulers as a physician, and sometimes as a political administrator as well. Finally he went to Iṣfahān (1024-1037) where he stayed in the service of the Kakuyid 'Alā' ad-dawla until his death, which happened during a trip with his master to Hamaḍān.

A philosopher, physician, and mathematician, Avicenna has left a large corpus that western intellectuals began to discover between the mid-12th and the late 13th century. His *magnum opus* is the encyclopedic *Kitāb al-Šifā'* (Book of the Cure), written between 1020 and 1027. It contains *Summae* (*Ġumal*), i.e. collections on logic, natural science, mathematics and metaphysics. Each one is divided into several sections (*funūn*). A large part of the natural science collection, including the fifth chapter of the first treatise of Meteorology (which is itself the fifth section of the Natural science collection where Avicenna expresses his views on → alchemy), was translated into latin, like the whole of the metaphysics and a small part of the logic. The introduction to the Logic (*al-madḥal*) and a chapter from section 5 on proof (*al-borhān*), a large part of the first section of Natural science (*al-Samā' al-Ṭabī'i*), the section 6 of Natural science which is the Treatise on the Soul (*Kitāb al-naḥs*), and the whole Metaphysics were translated during the second half of the 12th century at Toledo. The names of the two translators of the Treatise on the Soul, the archdeacon Dominic Gundisalvi or Gundissalinus and Avendauth, an "israelita philosophus" are both mentioned in the letter dedicating the treatise to the archbishop John of Toledo. Several sections of Natural science, among which the

1. LIFE AND WORK 2. AVICENNA'S THEORY OF KNOWLEDGE 3. AVICENNA'S LOST ESOTERIC TEACHING? 4. AVICENNA ON ALCHEMY

fifth section on Meteorology, were translated at Burgos toward 1240 by Master John Gonsalvi and Salomon. A version of three chapters of this section had been separately translated at the end of the 12th century (see d'Averny 1952, 1957, 1970).

Using Aristotelian and Neoplatonic conceptual elements, Avicenna elaborated an original system of his own. His theory of knowledge is strictly rationalistic and has its source in his comprehensive philosophical system which is distinctly rationalistic as well. The principles of this system are not compatible with any kind of esoteric teaching. The emphasis on knowledge of what is internal (*bāṭin*) and as such not accessible to sense perception or to discursive thought, as opposed to what is external (*ẓāhir*) and visible – which is a fundamental character of mystical or esoteric thought in Islam –, is strictly alien to Avicenna's philosophical system. Below, we will see how Avicenna has nevertheless become important to the history of gnosis and Western esotericism.

2. AVICENNA'S THEORY OF KNOWLEDGE

The first Principle – i.e. God – in Avicenna's metaphysical system is a pure intellect (*'aql maḥḍ*). As such he has an uninterrupted intellection of himself and through his eternal thought of himself, he eternally and continually emanates the first intellect, which is the mover of the outermost sphere. The first intellect has an intellection of the first Principle and as a consequence of this intellection, a second intellect necessarily proceeds from it. It has itself as a second object of thought, insofar as it is a being that exists necessarily by reason of the first Principle, and it thereby emanates the soul of the outermost sphere. It also has itself as a third object of thought, insofar as it is a being which has a possible existence by reason of itself; and it thereby emanates the body of the outermost sphere. The process is the same for the second intellect, and so on, up to the tenth intellect. The power of the tenth intellect is not strong enough to emanate eternal beings, so it emanates both the substantial forms and the intelligibles (*Kitāb al-Šifā'*, Metaphysics, IX, 4). Each sphere of the Avicennian cosmos presents a triadic structure, an intellect, a soul, and a matter moved by the soul. Each element of this scheme is necessarily linked to the other and each effect can be rationally inferred from its cause. The pure intellect is the ultimate principle of all existents. Reality has an intelligible and a rational structure: the Avicennian rationalist theory of knowledge has its source in this metaphysical truth.

The last intellect of the cosmos, i.e. the active

intellect, contains all the intelligibles and the goal of human activity is to acquire these. This is not possible as long as the rational immaterial soul is joined to the body; but the supreme bliss for this soul is to become like a perfectly polished mirror in which all knowledge is reflected. The destiny of the soul in the hereafter depends upon man's rational activity during his life. The highest state of human activity in this life and in the next is rational activity. A soul who has neglected this noble activity will suffer eternally. To obtain these intelligibles, the human intellect (which is a faculty of the rational soul) has to come into contact (*ittiṣāl*) with the active intellect. At birth, the human intellect contains no intelligibles: it is merely an empty potentiality for thinking, called "material intellect" (*'aql hayūlānī*), and belongs to every member of the species. Then, when it acquires the first intelligibles – i.e. theoretical propositions such as "the whole is greater than the part" – it is called "intellect in habit" (*'aql bi-l-malaka*). When the human intellect obtains the secondary intelligibles which consist of universal concepts and derivative propositions – however without being into contact with the active intellect –, it is called "actual intellect" (*'aql bi-l-fi'l*). Their acquisition normally requires the presence of the first intelligibles and the use of the thinking activity which requires the participation of the external senses (sight, smell and so on), as well as the internal senses (→ imagination, memory, and so on). The next stage, the "acquired intellect" (*'aql mustafad*) is no longer a stage of potentiality like the first three: at this level, the human intellect has established contact with the active intellect and receives the intelligible forms from it. The rationalist character of Avicenna's theory of knowledge is strengthened by two of his fundamental theses. 1) The "contact" between the sublunar and the supralunar realms is only an epistemic one. Avicenna rejects the possibility of an ontic union (the technical term for this used by the mystics is *ittiḥād*) between the human intellect and the transcendental principle of knowledge. 2) Some men possess "insight" (*ḥads*), which is an aptitude to acquire knowledge by establishing contact with the active intelligence without resorting to any kind of preparation (i.e. without using the thinking faculty), or to any teaching. When man establishes contact with the active intellect through insight, he obtains instantaneously the middle term in any syllogism. The knowledge of the intelligible world and of the reality as it is in itself is necessarily a syllogistic knowledge. When the capacity of insight reaches its highest level, it is called "holy intellect" (*'aql qudsī*). This capacity belongs only to proph-

ets: it is the highest of the powers of prophecy and the highest level of the human faculties (*Kitāb al-Šifā*. Treatise on the Soul, V, 5, p. 219). Thus, for Avicenna real knowledge is demonstrated scientific knowledge which follows a strict syllogistic process according to the rules established by Aristotle's logic. In Avicenna's comprehensive philosophical system, prophecy is conceived as a human experience, although an exceptional one, – it is studied in the sixth section of the Natural Science – interpreted in a rationalist manner without recourse to the religious theme of God's election. Moreover, the "mystic" (*al-ʿārif*) described by Avicenna in the *Išārāt wa-Tanbihāt* (Pointers and Reminders) is the man who has purified his soul by asceticism and whose intellect has reached the level of "acquired intellect" (Goichon 1961, 486-489). The function of ascetic exercises, religious prescriptions such as fasting, prayer and so on, is only propaedeutic; they prepare the rational soul for establishing contact with the active intelligence.

Another important aspect of Avicenna's theory of knowledge is linked to his theory of imagination. The souls of the celestial spheres, being joined to a body, are endowed with a faculty of imagination which contains images of the particular things, while the intelligences of the celestial spheres contain only intelligible forms (*Kitāb al-Šifā*, Treatise on the Soul, IV, 2, p. 158). By the medium of his imagination, man usually receives those images during the sleeping state while his senses are at rest. A brief survey of Avicenna's theory of the internal senses is necessary to understand this theory of imagination. To the five external senses, Avicenna adds five internal senses: (1) common sense, (2) retentive imagination, (3) compositive imagination, (4) estimation, (5) recollection. To be perceived, the sensible form grasped by the external senses must be imprinted in the common sense. When an image fashioned by man's compositive imagination is imprinted in the common sense, it is perceived as if it were a sensible form grasped by the external senses. Man's imagination receives the images from the celestial souls during the sleeping state and imitates them. Sometimes, the images framed are similar to those perceived during the visionary experience and sometimes they are not, when the imagination has been disturbed by the other bodily faculties. In the first case, the result brings foreknowledge of the future and in the second case it is only a "confused dream". Some men have a strong imagination and a noble soul. Their imagination is not diverted by the activity of the senses and acquires through figurative images what the soul learns through intellectual prophecy.

Those men are prophets and their experience is the consequence of the prophetic imagination. The prophet transposes his particular vision into symbols and images accessible to everyone. But the status of those images is not clear: are they mere colourful duplicates of the intelligible forms or are they endowed with their own heuristic value? This unresolved point of Avicenna's theory of knowledge has given birth to different interpretations.

→ Henry Corbin has devoted to Avicenna's theory of imagination one of his important studies concerning the Islamic interpretation of the esoteric mystery of God's presence to man (*Avicenna and the Visionary Recital*). Corbin's interpretation has been highly influential among students of western esotericism but it presents some difficulties when we read it in the light of Avicenna's theory of emanation. According to Corbin's acute and in many respects inspired analysis, the Islamic mystic and esoteric literature has produced an original answer to the question of the mystery of the possible meeting between man and the spiritual world. The meeting takes place in a world which is neither the world of sense perception nor the one of universal concepts, but an intermediary world called the *mundus imaginalis*. By his imagination, man participates in this world where it is given him to receive individual revelations which – although they are not sense perceptions – have specific characteristics like smell, colour and sound. The *mundus imaginalis* is the nexus between the sensible world and the angelic world; its existence makes it possible for the mystic to meet an angelic entity which symbolizes his real nature. Henry Corbin confers a specific significance to three Avicennian recitals which he designates as "the visionary recitals' cycle", namely, *Ḥayy Ibn Yaqzān* (Alive, the son of Awake), *Salāmān wa Absāl* and *Risāla-at-Tayr* (The Bird's Recital). He considers them to be the highly individual expression of a single visionary experience. They are not to be considered as allegorical recitals in the sense that the experience they describe could be expressed differently, for example through rational discourse. Rather, each Avicennian recital expresses an individual experience which has taken place in the *mundus imaginalis* through the medium of the faculty of imagination between the mystic (in this case, Avicenna) and an angelic entity who represents his real nature. Each symbol contained in those recitals is unique, being the trace of the authenticity of the experience. Each symbol is a "secret" offered by Avicenna to his reader in order to make him aware of his real nature. Thus, these recitals have an initiatic function which no other

kind of discourse (allegoric or demonstrative) could assume.

For Corbin, Avicenna's recitals revolve around his pivotal doctrine of angelology, of which theory of knowledge and cosmology are only parts. Knowledge is an illuminative process, which leads the human soul to forsake the West and turn toward the East, i.e. toward the focus of its real nature. The angel's gift manifests itself as an inner epiphany of beauty and light invading the human soul and revealing to it its real nature. Knowledge is thus a gnosis, an initiatic process in which each soul experiences an absolutely unique relationship to the divine.

Corbin's interpretation of Avicenna's theory of imagination raises a fundamental question: is true knowledge an initiatic process, an absolutely individual relationship between a singular human soul and a celestial entity, or rather the reception by human souls of the intelligibles contained in the celestial intelligences through a single effusion, each soul receiving the amount of intelligibles it is ready to receive? To answer this question, we have to consider the structure of the process of emanation. In Avicenna's metaphysical system all reality emanates from God through the first intellect. God is the ultimate principle of both existence and intelligible thought. The flux coming from the supralunar realm is always identical to itself; only the disposition of the receptacles to receive it varies. This is a principle that Avicenna has always maintained. Thus, knowledge is one – i.e. it consists of all the intelligibles contained in the intellects of the celestial spheres – and continually emanates from the celestial principles. Only the disposition of men's intellect to receive it varies. The initiatic individual process between an angelic entity and a gnostic is hardly possible in such a rationalistic scheme where a unique flux continually and necessarily emanates from each celestial entity, each being like a mirror reflecting in his own way the supreme gift. Thus, it seems difficult to distinguish the experience related respectively in the three "visionary recitals" – which is an epistemic one – from the rational process of knowledge that man's intellect has to undertake to obtain eternal bliss as described by Avicenna in the *Kitāb al-Šifā'*.

3. AVICENNA'S LOST ESOTERIC TEACHING?

For a long time, western scholars have mistakenly believed that there had once existed a body of esoteric teaching by Avicenna, known as "Eastern philosophy". As shown by Gutas, the origin of this mistake goes back to the medieval Andalusian philosopher Ibn Ṭofayl († 1185) who borrowed the title *Ḥayy Ibn Yaqzān* (Alive, the son of Awake)

from Avicenna's recital to elaborate the myth of the solitary philosopher. In his introduction, Ibn Ṭofayl had drawn a connection between Eastern philosophy and mysticism, and framed the following misleading subtitle: "On the Secrets of Eastern Philosophy". A modern western scholar, M.A.F. Mehren borrowed Ibn Ṭofayl's subtitle for his own edition and translation (into French) of some of Avicenna's treatises (*Rasā'il Ibn Sīnā fī asrār al-ḥikma al-mašriqiyya*, the French title is *Traité mystiques d'Avicenne*) and this title has contributed to the idea that Avicenna had a mystical or esoteric teaching. In a well known paper from 1925, C.A. Nallino established, however, that in the part of his work named by himself "Eastern philosophy", Avicenna did not profess a teaching definitely distinct from the one contained in his systematic works. The fragment subsisting today in the manuscripts under the title *Kitāb al-mašriqiyyīn* (The Book of the Easterners) is a treatise on logic which contains no trace of an esoteric teaching (it is published under the name *Manṭiq al-mašriqiyyīn* by Ṣ. al-Nağğār). The "Easterners", as S. Pines (1952) has suggested, could be the name used by Avicenna to express his own interpretation of some philosophical issues raised by the Aristotelian philosophy. Thus, the idea of a lost avicennian esoteric teaching is incorrect.

4. AVICENNA ON ALCHEMY

Avicenna's views on Alchemy are expressed in the fifth chapter of the first treatise of his *Meteorologica* (i.e. the fifth section of the Natural Science of *Kitāb al-Šifā'*) known in the West as *Avicennae de congelatione et conglutinatione lapidum*. The Arabic title of this treatise is *Kitāb al-ma'ādīn wa-l-ātār al-uluwiyya*. In this treatise, Avicenna gives two different theories of the formation of metals. He accepts the mercury-sulphur theory, usually attributed to Ġābir Ibn Ḥayyān (Geber; 8th-9th century), but he also maintains the Aristotelian theory which explains the diversity of metals by the theory of condensed vapors. It is the relationship between the four Aristotelian qualities – hot, cold, moist, dry – in the mercury and sulphur substance that determines the production of all metals: 'if the mercury is pure and if it be commingled with and solidified by the virtue of a white sulphur which neither induces combustion nor is impure, but on the contrary, is more excellent than that prepared by the adepts (*ahl al-ḥīla*), then the product is silver. If the sulphur, besides being pure, is even better than that just described, and whiter, and if in addition it possesses a tinctorial, fiery, subtle, and non-combustive virtue – in short, if it is superior to that which the adepts can prepare – it will solidify the mercury into gold' (ed. Holmyard and Mande-

ville). Avicenna believes that there is a specific difference between silver and gold; accordingly, it is impossible to transmute one metal into another one. Only the production of a “tincture” that makes a metal externally look like another one is possible. In this treatise, Avicenna clearly rejects the opinion of the alchemists who believe that the transmutation of metals is possible: ‘As to the claims of the alchemists, it must be clearly understood that it is not in their power to bring about any true change of species’ (o.c., 41). In Zetzner’s *Theatrum chemicum* and in Manget’s *Bibliotheca chemica curiosa*, we find not only the *Avicennae De Congelatione et Conglutinatione Lapidum*, but also three other treatises attributed to Avicenna. The first one is the *Liber Aboali Abincine de Anima in arte Alchemiae*. It was translated into Latin in the 12th century and was considered authentic. J. Ruska (1934) has definitely demonstrated however that it is a forgery composed in Spain in the 12th century. The second one is the *Declaration Lapis physici Avicennae filio sui Aboali*. This is likewise a forgery, as has been demonstrated by Ruska in the same article. The third one is the *Avicennae ad Hasen Regem epistola de Re recta*. Modern scholars do not agree about the authenticity of this treatise (the correct latin title of which is probably *Epistola Principis Albolaly cognominis Albinsceni ad Hakasen de Re Tecta*, as emphasized by Ruska). On the basis of the Latin translation, Ruska originally considered it a forgery. Some years later however, A. Atech published a critical edition of the Arabic version (in “Ibn Sīnā, Risālat al-iksīr”) which allowed him to establish the treatise as authentic. Atech identified the minister to whom the treatise is dedicated as Abū-l-Ḥasan al-Sahl b. Muḥammad al-Sahlī or al-Suhaylī, who was minister at Gorgāng where Avicenna lived between 1002 and 1005). Moreover, as Atech notes, all the Arabic manuscripts attribute this treatise to Avicenna and two of them are very old (1192 and 1298). This treatise expresses the view on alchemy of the young Avicenna, who does not yet clearly reject the possibility of the transmutation of the metals as he will do later. H.E. Stapleton likewise believes that this treatise belongs to Avicenna’s early manhood (Stapleton et al. 1962).

Kitāb al-Šifā (Treatise on the Soul, ed. G.C. Anawati & S. Zayed), Cairo, 1974 ♦ *Ḥayy Ibn Yaqzān* and the *Risāla-at-Ṭayr* have been edited by M.A.F. Mehren in his *Traité mystiques d’Avicenne*, Leyde, 1889-1891 ♦ H. Corbin had translated the two treatises into French in his *Avicenne et le récit visionnaire*, Paris: Berg international (2th ed.), 1972 ♦ Of *Salamān wa Absāl’s Recital* we have only an abstract made by Našīr al-Dīn al-Ṭūsī (1201-1274) in his commentary of the *Kitāb al-*

išārāt wa-l-Tanbihāt. For the arabic edition, see *Kitāb al-Išārāt wa-l-Tanbihāt li Abī ‘Alī bin Sīnā ma’a šarḥ Našīr al-Dīn al-Ṭūsī* (S. 12. BAADER'S INFLUENCE

Undoubtedly → Christian theosophy's greatest 19th-century German exponent, Baader is a grand unifying figure, joining in his writings the domains of science, religion, and literature, as well as the three main traditions of Christianity (Protestantism [particularly theosophy], Roman Catholicism, and Eastern Orthodoxy). A peerless aphorist, Baader is intellectually among the most stimulating, profound, and difficult of the theosophers. During his lifetime, Baader stood as at least the equal of, and arguably superior to his more well known philosophical contemporaries, many of whom were awed by his insights into nature and human culture, by his immense command over numerous languages, and by his uniting of religion and science and the arts. Even the most famous of his contemporaries were dazzled by their conversations with him; → Schelling reportedly said that for several hours after talking with Baader he was no longer certain what he himself thought.

I. LIFE

The son of a physician, Joseph Franz von Baader, Baader early on had awakened in him an inclination to study nature; already as a child, he had an extraordinary love of learning. At the age of sixteen, he and his older brother Joseph went to the Universät Ingolstadt, where his father wanted him to study medicine; in 1783, the two went to Vienna to continue their studies. Baader returned to Munich to assist his father in medical practice, but in 1786 decided to pursue his interests in natural science, in particular minerology and chemistry. He studied minerology at Freiberg, befriending such luminaries as Alexander von Humboldt, and spent four years in England beginning in 1792, where he witnessed the social effects of the industrial revolution, especially the appearance of a proletariat class. In 1796, he returned to Germany, where he rose through a series of successively higher administrative positions, in 1800 becoming a chief administrator for a group of factories. In the same

year he married Francisca von Reisky, daughter of Baron von Reisky, who bore him two children, Guido (b. 1801) and Julie (b. 1804). Through various chemical experiments Baader developed a patented formula for glass fabrication that brought him a substantial income. During this period, he met with or became known to the major philosophical and literary figures of his day, including Tieck, → Novalis, → Schelling; he also studied the works of → Louis-Claude de Saint-Martin and → Boehme. In 1814, Baader wrote to the leaders of Austria, Russia, and Prussia, in the hope that he might be instrumental in forming a greater union between East and West, particularly in religious matters. During this time, he moved in very high circles in Russia and Germany, while also studying very intensely the works of Boehme, Saint-Martin, and related authors. His first published work was "Vom Wärmestoff" (On the Substance of Warmth), in 1786, which H. Grassl has termed 'the first fruit of Romantic speculation about nature' (40). In 1792, he published an article on the use of explosives, but for many subsequent years his primary intellectual work took place in journals, where he developed the comprehensive theosophic worldview expressed by 1815 in his seminal "Ueber den Blitz als Vater des Lichtes" (On the Lightning-Bolt as the Father of Light), followed in the next year by his "Sur l'Eucharistie" (On the Eucharist), and in 1817-1818 by writings such as "Ueber die Ekstase" (On Ecstasy) and "Sur la notion du temps" (On the Notion of Time). He maintained his connections with the Russian nobility, in particular with Alexander Galitzin. Baader taught at Ludwig-Maximilian Universität from 1826 onward, offering a series of philosophical lectures at Munich university, lectures which he wrote between 1828-1832 and in which he took issue with Schelling's philosophical views.

On 17 January, 1835, Baader's first wife died after a long illness. Baader was deeply affected by that loss, and shortly thereafter he lost his brother, Joseph, as well. In 1839, Baader married a young woman named Marie Robel, who was his junior by over four decades. Around this same time, he became engaged in a number of controversies concerning the relationships between Catholicism and Protestantism, on which he had views very much colored by his own deep study of the Protestant Boehme while remaining a lifelong Catholic himself. He also engaged in these late years, i.e. 1839-1840 in an intense polemic with Hegel, with whose views he greatly disagreed. In the summer of 1840, Baader's health began to fail, and he died in 1841 after a protracted illness.

2. WORK

Referred to as “Boehmius redivivus” [Boehme reborn] by August Wilhelm Schlegel – a complimentary designation still indissolubly linked to Baader’s name – Baader was a great reader of Boehme, Saint-Martin, and Meister Eckhart, whose works he rediscovered for the modern era. Most famous as a theosopher, Baader’s theosophic writings encompass an unusual range of subjects. Baader’s collected works were edited by Franz Hoffmann and published posthumously (Leipzig 1851). The first several volumes deal with philosophy (the first with “speculative logic”; the second with metaphysics; and the third with nature-philosophy). The fourth volume, which includes his “Sätze aus der erotischen Philosophie” (Statements from the erotic Philosophy), and his “Vierzig Sätze aus einer religiösen Erotik” (Forty Statements from a religious eroticism), is organized around the concept of “philosophic anthropology”. The fifth and sixth volumes center on the theme of social philosophy, while the remaining volumes (especially the seventh through tenth) deal with various aspects of religious philosophy. The eleventh volume includes Baader’s journals, the twelfth his remarks on the writings of Louis-Claude de Saint-Martin, and the thirteenth his observations on the writings of Jacob Boehme. The fourteenth volume is devoted to Baader’s thoughts on concepts of time; the fifteenth includes letters and a biography; completed by an index in the sixteenth volume. Baader’s writings range even more widely than this overview would indicate, however, their scope including politics, social organization, natural science, literature, economics, and religion, revealing a remarkable catholicity and depth of thought.

3. BAADER’S THEOSOPHY

Baader explicitly placed himself in the theosophic current of Jacob Boehme, and indeed, a significant portion of his collected works is devoted to the explication of Boehme’s writing. Christian theosophy in the Boehmean tradition is an esoteric current with the following characteristics: 1) a focus upon Wisdom or Sophia, 2) an insistence upon direct spiritual experience, 3) a spiritual cosmology 4) a spiritual leader who guides his or her spiritual circle through letters and oral advice. These four characteristics describe such figures as → John Pordage, → Jane Leade, Thomas Bromley, and Johann Georg Rapp, all of whom were members of and led Sophianic spiritual groups devoted to direct spiritual experience, and all of whom saw nature in a spiritual light. Theosophy drew upon and in many respects synthesized a variety of pre-

existing spiritual currents in the West, including → alchemy, Sophianic mysticism, and a form of spiritual → astrology. Baader belongs to this current of thought, but his work is far more philosophical than that of visionary theosophers like Pordage. Baader’s work is very much engaged with and part of the intellectual currents of his age; unlike theosophers like Pordage or Bromley, whose works consist largely in accounts of their own spiritual experiences, Baader gave many university lectures, corresponded and argued with all the main philosophers of his day, and in general was much more engaged with the society in which he lived than were the more reclusive theosophers like those mentioned above.

This said, Baader’s work corresponds precisely with all four characteristics of theosophy. His work is certainly Sophianic, albeit in a much more intellectual form than with most theosophers. According to Baader’s complex Sophiology, Sophia is ‘the mirror and the eye of God, or the first idea of God’ (15.447); Sophia corresponds to Plato’s Idea, to the Indian idea of Maya, and to Jacob Boehme’s *magie* (9.182, 219). Sophia is ‘the heavenly Virgin’, but not identical to the Virgin Mary (15.449). Baader also emphasized direct spiritual experience, or gnosis, which he held to be the center of Christianity. He drew explicitly upon the work of Meister Eckhart in this regard, whose work he rediscovered. Baader writes that ‘True gnosis is a circle’, and that ‘the systematic character of gnosis [means that] every single concept leads to the Center, and the Center in turn to all other concepts’ (14.160). Baader’s work certainly emphasizes a spiritual cosmology or, as he puts it, cosmosophy, and much of his work has as its purpose the renewal of a proper relationship between humanity, nature, and the divine. His works include an ecological dimension that now seems strikingly prescient, but this ecological dimension is intimately linked to his spiritual cosmology that derives from Boehme and Saint-Martin. Finally, Baader himself may be seen as a spiritual leader who sought to guide others through his letters, essays, and lectures. His audience was not only a small group, however, but was national and international in scope. In this regard, he is unique as a public intellectual among theosophers.

4. EROTIC PHILOSOPHY

It is for his “Erotische philosophie” that Baader is undoubtedly best known. Baader wrote extensively on love and the erotic impulse, perhaps not least because he recognized that in the Christian tradition as a whole these themes were not adequately dealt with. In his *Sätze aus der Erotischen*

Philosophie, Baader begins by noting that religion and love are intimately connected, and that together they bring the highest happiness possible in life; but if they remain viewed only in the “chiaroscuro of reason” their significance remains far from realized. Baader argues that every union can take place only through a subjection: one cannot have an authentic union without the generosity of giving up, most of all, giving up one’s pride. He points out that the word *Sünde* (sin) has the same root as *sondern* (to separate), and this reveals the underlying meaning of sin as the opposite of love. Love unites in mutual subjection; sin separates through individual pride. But this is not to say that separation does not have its place: Baader provides the example of a parent or of a lover with whom a sharp division eventually gives way to a reconciliation that results in a deeper love. In this example there is also an allusion to the relationship between the creature and God, the creature being separated from God only to be united more strongly in the end.

Baader offers a developed and profound theory of the androgyne as central to understanding the nature of humanity as well as of individual human lives and relationships. Male and female lovers are engaged in the process of realizing in one another the original spiritual androgyne: the man helps the woman to realize masculinity in herself, just as the woman helps man to realize femininity in himself. If the lovers are not engaged in this process, the woman becomes merely a serpent to the man, while he is in turn merely a luciferian proud spirit to her.

According to Baader, love entails service: even God serves his servants. And so, Baader continues, if you want genuine worldly power, be someone who can be loved and admired; for people will only serve well those for whom they have some admixture of love and admiration. The obverse of loving service is doctrinaire blindness: ‘Since the negative spirit is doctrinaire and possesses peoples’ intelligence, out of it emerges a crowd of coldblooded, parched and poisonous heart-rotting philosophic, religious, and moralistic systems, mostly worse than their originator, because they are more obsessed than possessed’ (*Sätze* no. 31). Baader shares his denunciation of doctrinaire systems with other theosophers, like → Gichtel; most important in human relationships is the process of loving reconciliation and deeper union. The relationship between man and woman is analogous to and a reflection of the relationship between humanity and God.

5. ART

Baader’s perspective on the arts is integrally united with his religious philosophy and spiritual anthropology. He profoundly dislikes the notion

that art can be separated from religion, and at one point observes that ‘beautiful art should have a religious aim, or can only be laughable, where it is not flat-out irritating’ (SW II: 432). The task of the great artist is to unite the good, the beautiful, and the delightful, in this way awakening in us the sense of nostalgia (*Wehmut*) over a lost paradise, thus giving us a foretaste of the future indissoluble union of these three in paradise restored. To the degree that modern art is divorced from spiritual significance and does not recall paradise to us, it is degraded and even becomes a kind of self-parody. Art must be understood in a religious context; and in order to be great art, it must also be religious. As an example of the highest Christian art, Baader mentions images of the Madonna and of Christ that in turn reflect the virginal androgyne, the angelic nature prior to and above sexual differentiation. Great art, in Baader’s view, represents the transcendence of sexual desire (as exemplified in heathen works of art). A great work of art reveals the integrated, virginal and transcendent nature of humanity. It reminds the individual lovers of how, when they will step before Christ, they will become integrated, whole beings, who realize the *Urbild*, the archetype of integrated humanity (SW III: 303-310).

6. SOCIAL PHILOSOPHY

Baader’s social philosophy cannot be understood except in light of his integrated religious philosophy as a whole. If great art must be understood as a revelation or reminder of paradise and in relation to Baader’s philosophy of spiritual eros, likewise society as a whole must be understood in the same light. In a striking passage entitled “Der Stamm- baum der Liebe” (The Family Tree of Love), from his writings on the connections between *cultus* and culture (SW V:275-276), Baader observes how the divine love descends to humanity and spreads itself outward, horizontally, toward all humanity, as well as downward in order to raise up nature. In this is the origin of the religious *cultus* and hence of all culture. Humanity comes to realize its potential in culture, which in turn is inseparable from its spiritual meaning in the religious *cultus*. Baader conceives of society as existing in a triadic relationship of love: love for fellow humanity, love for God, and love for nature. He who does not love his brother does not love God or nature either. Thus Baader strongly criticizes modern rationalism, in which all three bonds are sundered. One cannot reverence nature alone, but only in relation to these three elements of the divine, humanity, and nature. The industrial and merely money-based economic worldview exists by virtue of sundering the bonds of inheritance and heritage, dissolving the proper

relationship to nature and the land, and replacing it with mere exploitation. But a proper relationship with the land is a marriage-bond that joins past humanity with future humanity, and joins humanity, nature, and the divine in a profound unity that approaches and reflects paradise. In short: love is the foundation of a just and authentic society.

Baader's theosophic worldview requires a center and respects hierarchy, but does not support despotism. In a lecture on the freedom of the intelligence, Baader argues against both leftist and rightist political positions, the former being defined as a radical insistence on total individual freedom, the latter as stultifying traditionalism (SW I:133). Both of these, like an exclusively scientific viewpoint, represent false and deceptive kinds of freedom, for only through religious perception can one come to understand true freedom, which can be realized only insofar as one realizes that all power rests ultimately in God. Thus the concept of an enlightened monarchy was not foreign to Baader's writings. He saw great hope in the founding of Ludwig-Maximilian Universität in Munich, which he perceived as a sign of a possible new unity of secular and religious learning. This university was, of course, founded under the auspices of the Kaiser by that name, and hence Baader wrote that 'Only a monarch, whose heart burns for religious things, like his spirit and heart, entrusted with the depths of science and art, is gracious, only a monarch who pronounces particularly that he will not knowingly introduce the misuse of intelligence, and who is an enemy alike to unbelief and superstition, at the expense of his people knowing his religiosity, not that he should be religious at the expense of his knowledge – only under the protection and attention of such a monarch, I say, in a full, patriotic, proud and daring testimony, can the world-reconciling bond between the priests and the learned again begin to close!' (SW I:149-150).

Baader saw society as an organic whole – one might even say as an *anthropos*, with head, limbs, and so forth – and fought strenuously against nihilism and disharmony in society. In an organic society, religion and science would be reconciled under the sign of Sophia, or divine Wisdom. Drawing on such prominent mystics as Eckhart and Tauler, Baader insisted that a healthy society is one in which there is an integral unity with the divine, and an absence of selfishness, isolation, and arrogance. Everyone in such a society would be connected with its transcendent religious center and origin. Thus he wrote of the 'necessity of an inner conjoining of religion with politics, love being the organizing principle (as the organizer par excellence' (SW II:117).

7. SCIENCE

Since Baader was himself trained as a scientist, and worked in industry, his views on science and related questions take on a particular force: he sought to conjoin science and religion in himself and in his own theosophic perspective. In 1825, he published a text titled "Alles, was dem Eindringen der Religion in die Region des Wissens sich widersetzt oder selbes nicht fördert, ist vom Bösen" (Everything that opposes or does not further the penetration of religion into the region of knowledge is evil; SW VII:47ff.). Here he strongly denounced the separation of science and religion, insisting instead that the two must be joined together for the good of each. Those who cultivate the attempted suppression of science from religious viewpoints are as destructive, from Baader's perspective, as those who, on the contrary, seek from a scientific viewpoint to ignore and suppress religion. What should be promoted is a religious science or scientific religion: scientific inquiry guided by religious awareness. And Baader goes even beyond this idea to espouse the union of art and science with religion: the striving for the Kingdom of Heaven as an inner experience should be 'the focus for all outwardly effective creations of poetry and art of man, but also it should be . . . the principle of physics as the science and art of the illuminating Idea. Of which our so-called nature philosophy barely has an idea any more, because, having lost what the man of nature should be, science has also lost what the nature of man could and should be' (SW IV:215-216). Thus Baader's central organizing principle, here as throughout his work, is that of the reunion of the arts and sciences, reintegration of humanity as a whole, under the sign of the divine.

8. BAADER AND CATHOLICISM

A lifelong Roman Catholic, Baader nonetheless held somewhat unusual views regarding his own tradition. Most well known in this regard is his opposition to the institution of the papacy. Baader argued that a synodic or collegial structure was the best means of organizing the visible church, and that the papacy was merely an historical accretion, not an intrinsic part of Catholicism (SW V:399-404; V:369-382; X:53-88). He hoped for an eventual reunion of Eastern and Western Christianity, and saw a synodic or collegial organization as the best means toward this end (SW V:391-398; X:89-254). The majority of his essays on these topics date from the last two years of his life, but their themes occupied his attention from relatively early on. Like → Novalis, Baader hoped to see the whole of Europe united in a single overarching Christen-

dom. But in spite of being deeply inspired (also like Novalis) by Boehmean theosophy, he opposed the purely inward trend of Protestant → Pietism, insisting on the necessity of an outward church (SW XII: 538ff.). In his essay “Ueber die sichtbare und unsichtbare Kirche” (On the visible and invisible church) Baader argued for the ‘inseparability of the outer and inner churches’, by which he meant the union of priest, scholar, and artist under the sign of gnostic realization (SW VII:211-222).

9. TIME

Throughout his work, Baader was much concerned with the nature and significance of time. In “Sur la notion du temps (On the notion of time, 1818)” he wrote that there are, in general, two classes of beings outside time: one is above it, the other below, the one paradisaical, the other demonic (SW II:69). Life moves in a cycle of descent, continuation, and re-ascent. We ordinarily assume that eternity is an ‘immoveable and starry present’, whereas in fact it is, strictly speaking, completedness or completion; this is the true definition of eternity. Humanity has fallen from eternity into time. Following Saint-Martin, Baader distinguishes between eternal time and illusory time. Illusory time is what we ordinarily conceive of as time rushing past: it is peripheral and without any ultimate reality. Humanity cannot find God if it remains caught in this illusion-time, trapped in the peripheral. However, it can move from the peripheral to the center once again, for the peripheral illusion-time always carries traces of its transcendent origin. This allows the re-ascent, the reintegration of separated being into transcendence; and such reintegration brings about the restoration of humanity and nature to their original, virginal nature, which is the aim of all true religion. Philosophers like Kant are mistaken because their observations remain limited to illusion-time and do not recognize the primacy of love as the reintegrating principle. As a result, their philosophies are like autopsies on a loveless corpse: their observations are relevant only to fallen beings caught in illusion-time. By contrast, Baader insists that within time itself is the regenerative power of the divine Word, which we can awaken and which ultimately leads to the realization of a higher embodiment beyond mere illusory time.

Drawing on Saint-Martin and Boehme, Baader concludes that ‘The original purpose of man was “to build paradise and to spread it first over the earth, and then over the whole universe” – that is, to turn back in or to enrapture the fallen outward-turned temporal beings (creatures) with the higher,

eternal nature, the crown of their life, enrapturing them again in eternity. But man himself, turning outward from the eternal into this time, does not want to be revealed any more in God, but rather only in this creature, instead of being revealed again through God. And so he then sinks beneath these creatures’ (II.119-120). Thus we see Baader’s theosophic diagnosis of our condition, and its implied cure.

10. NATURPHILOSOPHIE

Baader’s was the era of attempts at great syntheses of religion, science, philosophy, and the arts; and arguably the most complex of these was that of Baader himself. Faivre offers the following as characteristics of → Naturphilosophie: 1. A conception of Nature as a text to decipher by → correspondences; 2. A taste for the living concrete and for a plural universe; and 3. The identity of Spirit and Nature (1994, 83). It is in this latter regard that Naturphilosophie of this period led naturally to a fascination with → animal magnetism, a particular interest of Baader’s. Indeed, Baader wrote quite a bit on animal magnetism, including on the idea that ‘magnetic appearances are anticipations of posthumous conditions’ (II.182; IV.47). In Baader’s view, magnetism offered insight into the ways that spirit enlivens nature, as well as a way of revealing the ultimate unity of science and religion through an authentic Naturphilosophie that takes into account spiritual realities – as opposed to a rationalist philosophy of nature that renders nature merely a collection of objects to be exploited or manipulated. Baader criticized some contemporary nature-philosophers, for ‘whoever . . . confuses himself with this external world will eventually end up believing that he is of the same (empty or inwardly null) nature that it is’ (II.89-90). Baader wrote on Naturphilosophie in such essays as “On the Pythagorean Quaternity in Nature”, where as early as 1798, he pointed out the importance of the triad and the quaternity in completing the triad (III.247, 267). Both Hegel and Schelling proposed triadic philosophic principles, but Baader saw them as incomplete even from a philosophical, let alone a religious perspective (XV.178ff.; IX.307). In other words, Baader opposed to some contemporary Naturphilosophers his own perspective that includes recognition of the divine aspects of both humanity and nature, and that did not render the natural world (and humanity) empty or void as he believed scientific rationalism did. Baader’s religious Naturphilosophie separated his perspective from that of many of his contemporaries, including most notably Schelling and Hegel.

11. BAADER AND HIS CONTEMPORARIES

Even though he did not publish books, Baader was recognized by his contemporaries as a great philosopher. Novalis (Friedrich von Hardenberg) spoke very highly of him, as did Hegel, Schelling, Friedrich Schlegel, Jean Paul, Tieck, Fichte, and many others. Schlegel wrote in a letter that ‘the most remarkable, the most intelligent, the most profound man I have seen in a long time is indeed Baader. He has made many things clear to me’. From all accounts, Baader was a brilliant speaker, and many have described how electrifying an intellectual encounter with him could be. This can still be seen in his aphoristic writings, even though many of his contemporaries lamented the fact that Baader could not write in as organized and lucid a manner as he spoke.

Among Baader’s most important relationships was his friendship with Friedrich Wilhelm Joseph von Schelling. In 1806 Schelling broke with Fichte and Spinoza and, under the influence of Baader, turned to Boehme for inspiration. For more than a decade, the two were friends, Schelling being deeply affected by Baader’s philosophy. However, in 1824 they broke completely, and during the remainder of Baader’s life Schelling was extremely antagonistic toward his former friend, even seeking to block the publication of his *Sämtliche Werke*. Schelling felt personally affronted by several of Baader’s critiques of contemporary philosophy, and put off by Baader’s theosophy. Baader’s *Bemerkungen über einige antireligiöse Philosopheme unserer Zeit* (Remarks about some anti-religious philosophemes of our time, 1824; II.443ff.) Schelling saw as a personal assault. Baader, for his part, said that Schelling had lost his creative spark many years before (SW XV:431ff.), and did not countenance what he saw as Schelling’s pantheism. Baader saw Schelling’s philosophy, like that of Hegel, as too limited and monodimensional. Baader claimed himself as ‘the first one since the introduction of Cartesian philosophy who opened up again the insight into a more profound alliance between the knowledge of natural and divine things’ (*Lettres inédites* IV.367). He saw Schelling as ignoring the hidden principles of nature as revealed by Boehme and before him by → Paracelsus; in Baader’s view, Schelling did not understand the erotic transcendence of male-female polarity, so that his philosophy ends in dualism and ultimately “irreligiosity” (XV.438).

Another important figure Baader knew well was Hegel, and Baader’s influence on him is important but remains relatively little-known. The two first met in Berlin in 1823/24, although Hegel had

known Baader’s work more than two decades before. Hegel was particularly influenced by Baader’s *Fermenta Cognitionis* (SW XV:401ff.), even though in this work Baader criticizes some aspects of Hegel’s thought. Unlike his relationship with Schelling, Baader’s relationship with Hegel remained relatively cordial, in spite of the fact that Baader strongly criticized Hegel’s idealism, his separation of spirit from nature and what Baader saw as his misunderstanding of the nature of God. In Baader’s view, Hegelian philosophy pointed toward the resolution of duality in the triad, but in fact like Schelling’s philosophy results in a dualism and an alienation from nature. Hegel, for his part, did write that their differences were minimal in the end, but this was by no means the view of Baader himself.

12. BAADER’S INFLUENCE

Since the 19th century, Baader has been surprisingly neglected even in Germany, let alone elsewhere in the world. This lack of interest can be attributed in part to the extraordinary complexity of his thought, as well as to the byzantine complexity of his sentences. His notorious prolixity is no doubt a major reason for his relative obscurity. Ramon Betanzos attributes the decline in Baader’s stature in the 20th century to Baader’s not having constructed a single elegant model of philosophy. Yet, as Faivre and Betanzos himself show, Baader’s thought is in fact susceptible to being explained in a clear and organized manner.

Baader’s main influence lies in Russian theosophy. Vladimir Solovyov and Nicolai Berdyayev remain the most important figures to have been clearly influenced by his theosophy and in particular by his erotic philosophy. → Leopold Ziegler is arguably the 20th-century figure who most clearly continues Baader’s highly intellectual current of theosophy. A number of recent studies of Baader as well as works introducing Christian theosophy as a whole – chief among them the works of Antoine Faivre – are bound to spark a reassessment of Baader’s importance.

ARTHUR VERSLUIS

Bacon, Francis (first Baron Verulam and Viscount St. Albans), * 22.I.1561
London, † 9.4.1626 Highgate

Bacon was the son of a renowned attorney. Gifted with rare precocity, he had a brilliant student career at Cambridge. While he was still young (1576-1579), Elizabeth I entrusted him with a diplomatic mission to France, then appointed him Queen's Counsel; he became a member of Parliament in 1584. In 1597, he published *Essayes or Counsels Civill and Morall*. After the Queen's death, her successor James I elevated Bacon successively to the positions of Attorney General (1613), Lord Keeper of the Seal (1617), Lord Chancellor and Baron of Verulam (1618), and Viscount St. Albans (1621). But in the latter year Bacon was accused of bribery, brought before a tribunal, fined

£ 40,000, and imprisoned in the Tower of London. Soon freed, he devoted the last four years of his life to writing various works, notably the utopia *New Atlantis*, published posthumously in 1627 after *Sylva sylvarum* (Forest of Forests), a natural history book that emphasized the necessity of practical experiments. It was in the course of one of these that Bacon met his death.

Fundamentally opposed to scholasticism, Bacon had emphasized scientific activities ever since his *Advancement of Learning* of 1605. As Thorndike has noted, and, following him, Rossi, Bacon's way of envisaging these activities, i.e., his "experimental science", was partly rooted in the "occult philosophy" [→ occult / occultism] of the Renaissance. Thus in *Sylva sylvarum*, Bacon stated that he considered it 'not natural history, but a high kind of natural magic'. This collection of fragments of what was intended to be a kind of grand encyclopedia of nature and the arts was destined to furnish the materials for the "New Science", as he hopefully called it. The influence on Bacon of the magical and alchemical traditions is perhaps nowhere more evident than in these texts. For example, he declares (as also in *New Organon*) that a spiritual or pneumatic body is contained in all substances. He believes in the transmutation of metals, for according to him a metallic spirit exists that is homogeneous and common to all, so that freeing a metal from its impurities amounts to rendering it in the pure state. Matter is reducible to two elements, mercury and sulfur; air can be transformed into water. Conformably with the occult philosophy of the Renaissance, Bacon thought that man is made to "scientifically" dominate nature, of which he is the 'servant and interpreter'. He was very interested in → astrology, which he treats at length in his *De augmentis scientiarum*. And he often says that he believes in the possibility of the indefinite prolongation of human life. Lastly, like many representatives of occult philosophy, he thought that the experimental methods used by the seeker should remain secret and known only to an initiated minority.

For all this, Bacon had no indulgence for → Paracelsus, whom he treats in *Temporis partus masculus* (The Masculine Birth of Time) as a monstrous hatcher of phantasms orchestrated by the trumpets of ostentation, and the author of many obscurities (among other reproaches, he includes that of believing in the magical power of the → imagination exercised at a distance). Bacon is no more tender towards → Cornelius Agrippa, whom he regards as a clown, nor towards Ieronymus Cardanus whom he sees as a spinner of cobwebs. His

basic objection to them is their taste for ostentatious marvels, whereas according to Bacon, one should not flaunt phenomena which give the impression of being marvelous or admirable, but instead study them with a mind motivated solely by scientific curiosity. This is how he tried to modify the rules of → alchemy, to fit them to the needs of a scientific technique. For example, in *New Organon* (Book IV, § 4), where he appropriates the goals of alchemy and makes use of its vocabulary, he nevertheless sees himself as aloof from the alchemists' subjective methods, especially their constant recourse to ancient texts which they consider sacrosanct.

Many authors have tried to associate the person and work of Bacon with the Rosicrucian current [→ Rosicrucianism], mainly basing their allegation on his utopia *New Atlantis*, published as fragments a year after his death, in which he presented the ideal of a society that was both religious and extremely advanced in knowledge. In the college called "Solomon's House", an order of learned priests pursues researches at a very high level in the artistic, scientific, and technological fields, for the service of humanity. This fictional account of a world in which the progress of knowledge, experiment, and technique would contribute to human happiness summed up the ideal that had possessed Bacon all his life. In fact, this work has some analogies with two other utopias: *La città del Sole* by → Campanella, and *Christianopolis* by → Johann Valentin Andreae. The first of these utopias, written circa 1604 in the prison of the Holy Office, had been published in Frankfurt in 1623, thanks to the diligence of Tobias Adami, a relative of Andreae, who had brought a Latin manuscript of it from Italy.

In *New Atlantis*, as in Andreae's *Christianopolis*, the narrator and his companions survive a perilous voyage to arrive at an unknown coast. For Bacon, it is the place that harbored the last survivors of ancient Atlantis. The mariners discover in the New Atlantis a population imbued both with the ideas of Kabbalah [→ Jewish Influences] and with the earliest Christian convictions, which they derived from a Bible that came to the island in a mysterious cedarwood ark. Moreover, the New Atlantis is situated in a place called *Ben Salem*, whilst Andreae's *Christianopolis*, which had appeared in 1619, is built on the island of *Caphar Salama*. Beside these two references to the Hebrew *shalom*, signifying peace, there is the fact that Bacon's *Collegium*, the site of study and research, is called "Solomon's House". It is a center for experimental philosophy, where new animal and vegetable species have been created, and air travel and submarine navigation

have been invented. Certainly Andreae's *Christianopolis* also possessed amphitheatres reserved for the advanced study of mathematics, physics, medicine, law, and astronomy, but the accent there was on the Christian heaven and the mystical numbers, whereas Bacon's Academy is essentially focused on its experimental work, and looks forward to a triumph of science. Even so, Frances A. Yates saw in the inhabitants of New Atlantis, who knew all the languages of Europe, disciples of the Rose-Cross: 'Modern students of Bacon', she wrote, 'are not familiar with Rosicrucian literature . . . But those who read the *New Atlantis* before the *Fama* and the *Confessio* . . . would have immediately recognized the R.C. Brothers and their Invisible College in the denizens of New Atlantis' (Yates 1972, 127). While the correspondence between *New Atlantis* and the two Rosicrucian texts is evident, the fact remains that the influence of the latter on Bacon's work is unproven, and that Yates's assertion can be questioned, to say the least.

Far bolder than Yates, some authors fascinated by the Rosicrucians, or those who call themselves Rosicrucians, have not failed to exploit the person and work of Bacon for their own purposes. Most notable are those who distinguished themselves in the "Bacon-Shakespeare controversy", especially from the middle of the 19th century onwards. This controversy was re-launched during the occultist period by W.F.C. Wigston in 1888 and 1891, then by the widely-read writings of Alfred Dodd in 1931, and it even continues today. → Manly P. Hall, who believed in this legend, compiled its essentials in a chapter of his popular and oft-reprinted folio volume, *An Encyclopedic Outline of Masonic, Hermetic, Qabbalistic and Rosicrucian Symbolical Philosophy* (1928). An 'abundant cryptographic proof' supposedly placed this theory beyond all possible doubt. Hall invites the reader to view a color-portrait of Shakespeare, then to superimpose on it a semi-transparent page carrying the portrait of Bacon, which according to Hall 'establishes beyond all cavil the identity of the two faces'. It is Bacon 'who wrote into the Shakespearian plays the secret teachings of the R.C. and the true rituals of the Freemasonic Order'.

It was in fact easy to make of Bacon one of the original inspirers of speculative → Freemasonry, since he was already considered a Rosicrucian, and Rosicrucianism as having been at the origin of masonry. For example → Elias Ashmole, together with a handful of other learned men including the astrologer William Lilly, took the description of New Atlantis as a model and created in London, in 1646, the "House of Solomon" whose name and

program were directly inspired by Bacon's work. But the program itself was just as much indebted to the "Rosicrucianism" of → Robert Fludd, interpreted in an atmosphere of alchemy, → astrology, medical → magic, etc. It was a small step from there to making Bacon the indirect inspirer, through Ashmole, of the Royal Society's creation. Finally the pre-masonic aspect of the "House of Solomon", as well as the widespread idea that speculative Freemasonry, which appeared in 1717, had emerged from the Royal Society, sparked a flurry of commentaries. After that it was no longer surprising to see Bacon's name listed on a frequent *corpus nominum* in many discourses of an esoteric type, in the company of other notorious and ancient (that is, 17th century) Rosicrucians. To Bacon was even attributed the title of "Imperator" of a Rosicrucian society that allegedly already existed in his time, and his portrait invariably figures in the grand gallery of esoteric worthies, as printed and distributed by societies like the A.M.O.R.C. Hall was a typical representative of this state of mind in not hesitating to assert that Bacon, 'if not actually the Illustrious Father C.R.C., referred to in the Rosicrucian manifestoes, . . . was certainly a high initiate of the Rosicrucian Order'. More than that, Bacon 'was a link in that great chain of minds which has perpetuated the secret doctrine of antiquity from its beginning' (Hall, CLXVI, CLXVIII).

We are dealing here with very typical cases of the tendency to utilize historical personages and works for purposes of legitimization, no matter what violence is done to the objective facts of history. If in truth Bacon's thought has some of its roots in the occult philosophy of the Renaissance, we have seen that that does not make him an integral part of that tradition, in which he occupies a marginal position. Bacon's tenacious presence in the history of modern Western esoteric currents is essentially due less to the intrinsic content of his oeuvre than to efforts at appropriation. What is justified, following Thorndike and other commentators, is the idea that Bacon's influence contributed to developing in the English ruling classes of his time an 'amateurish interest' in the natural sciences and experimentation, which may have played a part in the foundation of the Royal Society, in which can be seen – and this time with justification – one of the sources of inspiration of speculative Freemasonry.

ROLAND EDIGHOFFER

Bacon, Roger, * ca. 1215 place unknown, † ca. 1292 place unknown

English philosopher, educated at the Universities of Oxford and Paris (where he lectured on Aristotle in the 1240s), author of works on a broad array of topics including optics, semantics, physics, and theology. Bacon entered the Franciscan Order in the late 1250s, perhaps after returning to Oxford. Between 1265 and 1268, he compiled his encyclopedic and ambitious works, the *Opus Maius*, *Opus Minus* and *Opus Tertium*, undertaken for Pope Clement IV (Pope from 1265-1268) in the hope of persuading him to authorize a radical program of educational reform for theologians. The Pope's death in 1268 put an end to Bacon's hope of acquiring a papal aegis for his project. An entry in a late 14th-century chronicle of the Friars Minor asserts that Bacon was imprisoned in the late 1270s by the Minister General of the Order who condemned his

doctrine for certain suspect novelties. While the precise nature of these novelties remains a matter for scholarly speculation, it is not implausible that he was indeed imprisoned; the 1270s were a decade of reaction against the influence of Arabic learning and Bacon's thought was connected to a number of potentially controversial issues. His writing (particularly in the three volumes commissioned by the Pope) reveals an opinionated and irascible personality, who was nevertheless a systematic thinker and important synthesizer of new ideas.

Bacon had a wide array of metaphysical enthusiasms and his interest in the new learning often tended to privilege its esoteric content. He was responsible for a careful edition, with introduction and commentary, of the pseudo-Aristotelian *Secretum secretorum*. Like most medieval readers, Bacon believed the *Secretum* to be the genuine work of Aristotle, hence deserving of careful attention. According to Bacon, all knowledge derived from and returned to a single paradigm which might eventually be reconstituted by taking into account both esoteric and exoteric faces of Aristotle's works. Bacon had an investment in the claims of the *Secretum* to reveal (enigmatically) the ancient wisdom delivered at the beginning of time to the Hebrew patriarchs and prophets, who had in turn transmitted it to the Egyptians, Chaldaeans, and others of the wise. This wisdom had fallen into desuetude until after the time of Muhammad, when (according to Bacon) it began to be recuperated by → Avicenna and Averroes and the other Arabic philosophers. The West was now in a position to reassemble the ancient wisdom of the prophets, but could do so only by attending to the new learning of the Arabs, balanced of course by an intensified study of Scripture.

The new learning included astrological and alchemical writings, and both disciplines played important roles in the curriculum advocated by Bacon in the works commissioned by the Pope. In the *Opus tertium*, Bacon urges the importance of a knowledge of → alchemy for medicine. Having derived a recipe for the philosopher's stone from an enigmatic description in the *Secretum secretorum*, Bacon held that this elixir (based on human blood, but with a rectified proportion of humours) could effect not only the transmutation of metals but also the prolongation of human life to the span enjoyed by the Old Testament patriarchs. In the chapter on mathematics in the *Opus maius*, Bacon urges the importance of the study of → astrology and stresses the need to know more about astral and other occult natural powers [→ occult / occultism] in order to combat the Antichrist, whose advent he

believed to be imminent, and who, as he believed, would know how to bring to bear the occult powers of art and nature against Christendom.

When he delivered the *Opus maius* to the Pope, Bacon included a copy of a shorter treatise, *De multiplicatione specierum*, which elaborates his understanding of the optical model of the propagation of species into a broad treatment of natural causation in general with attention to its grounding in mathematics. From Bacon's elaboration of the principle of multiplication of *species* (which he also referred to as forms, similitudes, images, intentions and rays), it is clear that he had a familiarity not only with the most important current writers on optics, but also with the *De radiis stellarum* of the Arabic philosopher → Al-Kindi. While the *De radiis* itself is not cited in the *De multiplicatione specierum* (for obvious reasons; its alternate title was *Theory of Magic Arts*, and is elsewhere mentioned by Bacon as a work containing much wisdom, but corrupted with falsity), its influence clearly underlies many of Bacon's more radical claims for occult powers and astral influences, most notably his varied and potentially controversial claims made *passim* in the *Opus maius* for the *virtus verborum*, the power of words. In the papal *opera*, too, as also in his famous "Letter on the secret works of Art and Nature and on the nullity of Magic", there is evident a strong concern with differentiating bad demonic magic power from legitimate occult natural powers – a concern not dissimilar to that manifested in other writers in the same century (like → Albertus Magnus, most notably in his *Speculum astronomiae*).

Bacon's effect on esoteric philosophy in later periods would appear to be largely indirect. His alchemical theory, basing the principle of the philosopher's stone in organic materials, seems to represent a kind of evolutionary dead end in the alchemical tradition, and other aspects of his thinking about the occult powers of nature apparently wield less influence than the originality of his ideas might sometimes seem to deserve. However, it is clear that his interests in these areas contributed to Bacon's later reputation, and (like several other medieval philosophers) he becomes the subject of some rather fantastic posthumous legends involving bronze heads and magic mirrors. → Agrippa, perhaps influenced by this legendary material, refers to Bacon as a dabbler in goetia, though others assert that he does not deserve this reputation. → Pico della Mirandola upholds him as being among the wise, an early champion of natural magic, while Bacon's standing remains prominent with → John Dee, who owned most of his works

and annotated his famous *Letter*. Later, as most evidently may be seen in Lynn Thorndike's interpretation, he comes to be represented as urging the claims of experimental science against the superstitious fallacies of magic. Scholarly opinion is currently swinging towards giving the esoteric and magical content of his ideas a fairer representation.

CLAIRE FANGER

**Bailey, Alice Ann, * 16.6.1880
Manchester, † 15.12.1949 New York**

Born to Frederic Foster La Trobe-Bateman and Alice Hollinshead, Alice Ann La Trobe-Bateman is best known by the name she assumed when she married her second husband, Foster Bailey. She is chiefly remembered for three accomplishments. First, for serving as the amanuensis for her Tibetan master Djwhal Khul (known simply as The Tibetan or D.K.), the latter's teachings appearing in twenty-four books written from 1922 until the late 1940s, all of which reflect a Theosophically-based inter-

pretation of Humanity and the Cosmos. Second, for establishing an esoteric school known as the Arcane School in 1923. And third, as organizer (with her husband Foster Bailey) of two service activities known as "World Goodwill" and "Triangles".

Her religious upbringing was conservative Christian but with a "mystical" tendency. Although she came from a prominent family (the La Trobes), she led a life that was sometimes troubled in her youth (she had attempted suicide thrice by the age of 15), privileged (she claimed to have lived the life of a "society girl" up to the age of 22, living with her well-to-do grandparents and later, after their death when she was about eight years old, with her aunt), and service-oriented. Regarding the latter, having been stimulated by her upbringing to care for the poor and the sick, she attempted to put her fundamentalist Christian religious ideals into practice first by becoming a Y.M.C.A. worker and later, in her early twenties, by working as an evangelist to the British troops in the Sandes Soldiers Homes in Ireland and India. Despite this fundamentalist upbringing, Alice exhibited esoteric inclinations as well. According to her autobiography, this latter tendency first came to the fore in 1895, when at the age of fifteen, while with her aunt at Kirkcudbrightshire, Scotland, she experienced her initial contact with what she later came to see as a "Master of Wisdom": a member of that spiritually advanced hierarchy believed by Theosophists to disclose elements of the ancient wisdom to humans. The message of the Master – whose name she later discovered was Koot Hoomi or K.H. – was that she should work in the world on his behalf. A second event that she claimed to have occurred around the same time, and which she came to regard as significant, was her participation in a ceremony performed during the "Full Moon of May". The precise nature of this ceremony is unclear, but Alice claimed that it was held every year in a valley in the Himalayas, obviously implying an esoteric ceremony of some sort. Participation in this ceremony helped her realize her spiritual status, and perceive the unity of all existence as a 'divine and living whole' demonstrating 'the glory of the Lord'. For the next fifteen years or so, she led a tripartite life: first, that of evangelist and social worker following fundamentalist dogma; second, that of a budding mystic who retained a sense of the Hierarchy of Masters connected to inner spiritual planes; and third, from her late twenties to her mid-thirties, that of a woman involved in the world as the wife of a clergyman (Walter Evans) and mother of three daughters. The marriage, in 1907 or 1908, re-sulted in the couple

traveling to the United States of America for reasons of her husband's seminary training. But the marriage soon disintegrated due to her husband's mental problems; his increasing violence, including occasional physical abuse of his wife, led to their divorce in 1915. Alice found herself without money, and was forced to make ends meet by working in a sardine cannery in Pacific Grove, California.

At this same time (1915), she first came into contact with the → Theosophical Society and its teachings. Having been exposed to the writings of → Helena P. Blavatsky, especially *The Secret Doctrine*, and those of → Annie Besant, she gradually mastered the Theosophical worldview that was to become basic to her understanding of the ancient wisdom as taught through her other Master, The Tibetan (Djwhal Khul), who appeared to her for the first time in 1919. These teachings included the following main points: (a) that there is a divine Plan in the universe; (b) that those who execute the Plan and who guide Humanity make up a Hierarchy of spiritual leaders led by the Christ; and (c) the Law of Cause and Effect and the law of rebirth (karma and → reincarnation). The “collaboration” with The Tibetan resulted in a vast corpus of teachings, beginning in 1922 with a volume called *Initiation, Human and Solar*.

A Treatise on Cosmic Fire (first published in 1925) provides a detailed description of how the macro- and microcosm have emanated from the “Boundless Immutable Principle”, interpreted by the author as identical with the Parabrahm of H.P. Blavatsky's *Secret Doctrine*. On the macrocosmic level arise the three *Logoi*, described as the “Undifferentiated and Unmanifested”, the aspect of “Duality of Spirit-Matter”, and “Cosmic Ideation” (or the Universal World-Soul, the Creator). From the *Logoi* are manifested the universes, which in turn comprise “Manifesting Stars and Solar Systems”. Three micro- and macrocosmic laws are associated with the three *Logoi* as cosmic functions: Synthesis (expressed as Will), Attraction (expressed as Love), and Economy (expressed as Intelligence). Seven centers of “logoiic Force”, also known as the seven planetary *Logoi* and the seven Rays, emanate from these Laws: Ray I (the Ray of Will or Power), II (Love-Wisdom), III (Active Intelligence), IV (Harmony, Beauty and Art), V (Concrete Knowledge or Science), VI (Devotion or Abstract Idealism), and VII (Ceremonial Magic or Order). These Rays, therefore, are manifestations or emanations of both the macro- and microcosm. By definition, a ray is ‘a name for a particular force or type of energy, with the emphasis upon the qual-

ity which that force exhibits and not upon the form aspect which it creates’ (*Esoteric Psychology* I, 316). Applied to humanity and humans, the doctrine of rays is supposed to explain qualities of all of humanity, of the races, of cycles, of nations, of the soul, of the personality, and of the elements of the human mental, astral, and physical bodies.

Apart from the teachings of the Tibetan, which are published through the Lucis Trust – an entity created by Alice and Foster Bailey (who were married in 1919) in 1922 – the other main source through which Bailey's theosophy has been spread is the Arcane School, established by Bailey in April 1923 as a correspondence school designed to answer the questions raised by readers of her publications. As the name indicates, it is an esoteric school modeled after the original Esoteric Section of the Theosophical Society founded by Blavatsky. The seven principles or propositions of the Arcane School (described at the end of her *Unfinished Autobiography*) are: (1) it is a training school for disciples; (2) it is devoted to training *adult* men and women so that they may take their next step upon the path of evolution; (3) the School recognizes the Spiritual Hierarchy of the planet, and its instructions about the mode whereby that Hierarchy may be approached and entered; (4) it teaches that the ‘souls of men are one’; (5) it teaches the necessity of *living* the spiritual life and rejects all claims to spiritual status; (6) it is non-sectarian, non-political, and international in its scope; (7) it claims to emphasize no theological dogmas, but teach only the Ageless Wisdom as recognized in all countries down through the ages. In addition to these principles, the essential teachings of the Arcane School are described as follows: (1) that the Kingdom of God, the Spiritual Hierarchy of our planet, is already invisibly present and will be materialized on earth; (2) that there has been a continuity of revelation down the ages and that from cycle to cycle God has revealed Himself to humanity; (3) that God Transcendent is equally God Immanent, and that through human beings, who are in truth the sons of God, the three divine aspects – knowledge, love and will – can be expressed; (4) that there is only one divine Life, expressing itself through the multiplicity of forms in all the kingdoms of nature, and that the sons of men are, therefore, ONE; (5) that within each human being there is a point of light, a spark of the one Flame – this is believed to be the soul, the second aspect of divinity, ‘the *demonstration* of the divine livingness in each person which is our goal, and discipleship is a step upon the way to that attainment’; (6) that an ultimate perfection is possible for the individual

aspirant and for humanity as a whole through the action of the evolutionary process (involving a 'myriad of developing lives, each with its place within the scheme . . . [leading] to those exalted spheres where the Lord of the World works out the divine Plan'); (7) that there are certain immutable laws governing the universe, and man becomes progressively aware of these as he evolves, these laws being expressions of the will of God; (8) that the basic law of our universe is to be seen in the manifestation of God as *Love*.

The ideas developed within the Arcane School led to the formation of two organizations that were founded to 'channel activity' in light of the teachings. The first, "Men of Goodwill" (later renamed "World Goodwill") was founded in 1932 in order to establish human relations based on the principle of "brotherhood" and non-discrimination with respect to race, religion, ideology, politics, and economic convictions. The second organization, "Triangles", was established in 1937, and operates according to a principle of networking that allows three individuals to 'link each day in thought for a few minutes of creative meditation'. "Triangles" is linked with "World Goodwill" as a microcosm of relationships established on a personal level, embodying a "spirituality" that purportedly bears no relation to any one religion. World Goodwill emphasizes an ethic based upon the 'Will to Good'. This Will is expressed in the esoteric philosophy of the Arcane School and the publications of the Tibetan through Bailey. Finally, all the teachings and service activities are encapsulated in the 'Great Invocation': 'From the point of Light within the Mind of God / Let light stream forth into the minds of men. / Let Light descend on Earth. // From the point of Love within the Heart of God / Let love stream forth into the hearts of men. / May Christ return to Earth. // From the centre where the Will of God is known / Let purpose guide the little wills of men - / The purpose which the Masters know and serve. // From the centre which we call the race of men / Let the Plan of Love and Light work out / And may it seal the door where evil dwells. // Let Light and Love and Power restore the Plan on Earth'.

Bailey's work has had a great influence on the development of contemporary esotericism. Although it is difficult to ascertain the number of individuals who have been exposed and influenced by her teachings, it may well be in the hundreds of thousands, if one judges from the publication records of Lucis Publishing Companies. Many of the teachings – such as those on spiritual evolution, the perfectibility of humanity, the unity of life, and

emphasis on "Love" – are closely related. These teachings, and the promise of a "New Age" – prominent not only in Bailey's publications but also reflective of the *Zeitgeist* of the 1920s and 1930s, and adopted and further popularized from the 1960s on – also contribute to her popularity: the earlier, England-based, utopian/millenarian phase of the → New Age movement was heavily influenced by Bailey's theosophy. In addition, Bailey's grand esoteric cosmology, rivaling those of Blavatsky, → Steiner, → Gurdjieff and → Ouspensky, helps add to her reputation as a significant thinker. As a result of the interest in this cosmology, a number of groups have developed in addition to the Arcane School and its sister organizations, including the Aquarian Educational Group, Arcana Workshops, the School for Esoteric Studies, the Tara Center, and Meditation Groups, Inc.

JAMES A. SANTUCCI

Ballanche, Pierre Simon, *4.8.1776 Lyons, † 12.6.1847 Paris

The Ballanche family owned a publishing house in Lyons. An encounter with Juliette Récamier during her period of exile under Napoleon transformed Pierre-Simon's ambitions. Upon his father's death in 1816, Ballanche sold the business and moved the next year to Paris, where he devoted the rest of his life to private study and chaste devotion to Mme. Récamier. Ballanche held himself above the political factionalism of the Restoration era, believing that social and political harmony could

be achieved only through an intellectual mediation of old and new values under a vision of a progressive Christianity. It was the elaboration of a progressive Christianity appropriate to the post-Revolutionary age that Ballanche set out to achieve in his works. Election to the Académie française in 1842 only partly assuaged Ballanche's conviction that his contemporaries had neither understood nor appreciated his teaching.

The intellectual career of the deeply, if heterodoxically, Catholic Ballanche began under the influence of → Joseph de Maistre and Louis de Bonald. Ballanche, however, influentially modified Traditionalism by adding to it an element of social progressivism. His work also displays familiarity with a wide range of esoteric thought, including → J. Boehme, → L.C. de Saint-Martin, the magnetizers Jacques Pététin and Johann Carl Passavant, and, above all, → A. Fabre d'Olivet, whom he knew personally.

Ballanche believed that the divine order underlying the material universe is discernible through the complementary mediations of symbolic imagination and primitive revelation. Ballanche's cosmos is the cosmos of → correspondences of the Illuminists: the material universe both veils the underlying spiritual reality and is a symbolic reproduction of it. The symbolic imagination of the poet-seer – exemplified in his *Vision d'Hébal* and discussed in Bk. VII of *Orphée* – intuits spiritual truths and translates them into material form (Ballanche is one of the founders of 19th-century symbolist poetics). Poetry is the intuitive faculty of penetrating the essence of beings and things. The direct and immediate contemplation of the unity and harmony of all things is a vision that lifts the seer out of time and space (Hébal's vision of the entire history of humanity lasts only as long as it takes a church clock to toll the Ave Maria). But this is the privilege of the few. Ballanche's philosophy of history, which is played out in time and space, is the story of the reintegration of all humanity.

As indicated by the titles of Ballanche's major works, *Institutions sociales* (1818) and *Essais de Palingénésie sociale* (1827-1831), the social order receives pride of place in Ballanche's philosophy of history. Social palingenesis, or social evolution, the providential law governing history, is the sequence of births, deaths, and rebirths of societies throughout the centuries of human history. Each new stage of social evolution effects the initiation of a greater proportion of humanity into knowledge of the primitive revelation and full participation in religion and society. Each social evolutionary advance must be won at the price of suffering because it is the

means by which humanity expiates original sin. Social evolution will culminate in full religious and social equality for all humanity. This religio-social utopia, which Ballanche believes to be close at hand, will mark the completion of the terrestrial phase of the rehabilitation of humanity from the Fall.

While the doctrine of correspondences is fundamental to the nature of the world in which social evolution unfolds, the Illuminist themes central to the operation of Ballanche's philosophy of history are those of the identity of the fall and rehabilitation, redemption as the reintegration of lost unity, initiation, and magnetism [→ Animal Magnetism/Mesmerism]. Ballanche posits, prior to all history, a Primordial or Universal Adam. The Fall shattered the original unity of the primordial Adam by casting him into the world of time and space; into, that is, a process of succession and division that sundered the original unity into a multiplicity of individuals and generations. By entering into time and division (sexual and, even more fundamentally, social), humanity is able to expiate its sin over countless generations. The Fall transformed Universal Adam into social evolutionary humanity. And because social evolution is the means by which the lost unity of humanity will be restored, the means of overcoming the consequences of the Fall were produced in the Fall itself.

Social evolution operates by means of initiation, or the acquisition of responsibility. The content of primitive revelation has been transmitted through an unbroken chain of initiations down the ages. Initiation, for Ballanche, comprises the knowledge that the purpose of social life is the spiritual end of overcoming the effects of the Fall. Those in a given society who understand this are the initiators; those who do not are the initiateables. In the cosmogonic age (the first of three ages in Ballanche's philosophy of history), only isolated sages like Orpheus understood the rehabilitatory function of social life. The patrician age is so named because it marks the accession of the patricians to the knowledge that society is an instrument for the spiritual rehabilitation of humanity. History thenceforth chronicles the plebeians' slow acquisition of social responsibility and self-awareness. When, at the culmination of the plebeian age, the entire human race has come into possession of this knowledge, the initiation of humanity will be complete and social evolution will have accomplished its purpose. Each successive initiation represents a social evolutionary advance, the sum of which constitutes the rehabilitation of humanity.

Vision d'Hébal introduces Hébal as a Scottish chieftain endowed with second sight. Released

from the limits of space and time and freed of his individuality, Hébal's consciousness is assimilated to the universal consciousness, he seizes immutable truths, and becomes the Universal Man living an infinite life. This description accords with contemporary theories (J.P.F. Deleuze and A.J.F. Bertrand) about animal magnetism. Allusions to magnetism, in fact, appear throughout *Palingénésie sociale*: Orpheus' account in Book II of *Orphée* of his poetic vision is strongly reminiscent of Hébal's vision; in *Prolégomènes*, Ballanche links magnetic somnambulism and linguistic capability as survivals of a primitive human faculty; and in *Orphée* he suggests that magnetism offers us the possibility of knowledge of the primitive instinctive faculties and suggests that these faculties will be reacquired as humanity evolves.

While it is sometimes difficult to tell what in Ballanche comes directly from Fabre d'Olivet, Saint-Martin, or Boehme, and what comes from these or other theosophical writers via intermediaries, the centrality of Illuminist themes demonstrates how deeply Ballanche's thought is indebted to the Western esoteric tradition. Nevertheless, Ballanche adapted his borrowings from → Illuminism by linking them to the history of social institutions. By reading historical events, not merely as signs of the process of the reintegration of the primordial Adam, but as the necessary and efficacious means of that reintegration, Ballanche historicized what he borrowed from Illuminism. Ballanche, finally, was not, properly speaking, an Illuminist: he never claimed to have experienced interior illuminations permitting him to penetrate the divine understanding; he did not consider himself a disciple of Boehme or any other Illuminist; and he was not initiated into any Illuminist society. Ballanche, moreover, seems less confident than the Illuminists that we can truly know the spiritual world; he does not deny the possibility of inspired theosophical knowledge, but restricts himself in his works to the historical demonstration of the terrestrial mission of humanity.

ARTHUR MCCALLA

Balsamo, Giuseppe → Cagliostro, Alessandro di

Barlet, François-Charles (ps. of Albert Faucheux), * 12.10.1838 Paris, † 24.10.1921 Paris

A civil servant employed in the Registry, after law studies required by his father (librarian at the Bibliothèque de l'Arsenal), Albert Faucheux found in occultism [→ occult/occultism] the compensation for the scientific study he had been denied. First posted in Corsica, where he spent his free time in botanical studies, he then moved near Paris, where initiatic societies were flourishing in the 1880s, and concluded his career in 1899 as departmental director at Abbeville. He had meanwhile married Jeanne Bellchambers, an English singer and widow of a legal adviser, who protected his solitude – a little too much, so his occultist friends thought – and to whom he remained very attached until her death at the beginning of World War I. Thenceforth he lived an ascetic life in the Rue des Grands-Augustins, Paris, dividing his time between occultist societies and working on publications. There were few such societies to which he did not belong, his enthusiasm sometimes extending to frauds pure and simple (e.g., the *Centre ésotérique oriental de France* of Albert de Sarak). In addition to these activities, he regularly attended services in Notre-Dame Cathedral, the ritual of the Catholic Church having long fascinated him. This omnipresence made him a living archive of the occultist world; → Guénon owed him much of his own information on this subject. After having been one of the first members in France of → Madame

Blavatsky's → Theosophical Society, and apparently having belonged to the → Hermetic Brotherhood of Luxor, Barlet played an important role in a group descended from the latter, the Philosophie Cosmique of → Max Théon (Barlet took on the editing of its journal in 1901 and 1902). As a Gnostic bishop consecrated in 1890 by Jules Doinel (1842-1902), Barlet entered the Supreme Council of the Martinist Order [→ Martinism] of → Papus (1891), then became a directing member of the Ordre Kabbalistique de la Rose Croix of → Guaita (1892). It was to → Saint-Yves d'Alveydre that Barlet, after a secular education, owed his interest in Judeo-Christianity, and in a Christianity conceived as the best possible object of study, which would open up to a vision of the synthetic and unitary world: that of synarchy. After the death of his master, Barlet published Saint-Yves' unfinished work, the *Archéomètre*, in Guénon's *La Gnose*. There was nothing in Barlet of the religious founder or the magus; he aspired to make occultism into a positive science, establishing laws and creating a pedagogy. → Astrology seemed to him the most suitable means for reconciling the demands of science with the attainments of tradition, but his publications were extremely varied.

JEAN-PIERRE LAURANT

Barrett, Francis, * 18.12.1774
Marylebone, London, † probably
ca. 1830 London

Barrett described himself, on the title-page of *The Magus*, the book on which his reputation rests, as a 'Professor of Chemistry, natural and occult Philosophy, the Cabala, &c., &c.' This was a somewhat grandiose claim for a man whose profession was that of apothecary and it brought derision from his contemporaries: the poet Robert Southey described him as a rascal who 'professes to teach the occult sciences' while being 'a greater rogue than Solomon'.

This jaundiced view was due in part to the notoriety Barrett had gained in 1802 from a series of unsuccessful attempts at balloon ascents that he had made, in front of very large crowds, first at Greenwich and subsequently at Swansea. Apart from these events little is known of Barrett's life. In his early adult years he travelled in the West of England and in South Wales. He was married at Barnstaple, Devon, in 1800 but returned to London where his son was born in 1801. Nothing certain is known about Barrett's career subsequent to the year 1802.

Equally uncertain is the source of Barrett's enthusiasm for occultism [→ occult/occultism], but in 1801 his one unquestioned work, *The Magus, or Celestial Intelligencer; being a complete system of Occult Philosophy*, was published at London by the prestigious publishing house of Lackington, Allen and Co. This compendium of the theory and practice of the occult sciences is largely derived from earlier books, notably the spurious *Fourth Book of Occult Philosophy* attributed to → Cornelius Agrippa, and the works of → Peter of Abano and → John Heydon. Barrett had access to copies of these and many similar texts from the library of Ebenezer Sibly, which had been acquired, after Sibly's death in 1799, by John Denley, a bookseller specialising in occult books and manuscripts. According to Frederick Hockley, Barrett had borrowed from Denley 'the whole of the materials' that he needed to write *The Magus* but had 'never recompensed him with a copy'.

But however many sources Barrett may have drawn upon, *The Magus* marked a departure in English occult literature. It was the first comprehensive survey of magic to be compiled by an avowed practitioner, and one who also gave 'private instructions and lectures' on the subjects contained in the book. The advertisement for this proposed institution, which was to be limited to twelve students, offered to initiate students into virtually every branch of the occult sciences. Barrett's original plans were much less grand. In the manuscript of *The Magus* (now in the library of the Wellcome Institute) he offered simply to correspond with interested readers, and it seems probable that the printed book, complete with engraved plates of talismans and Barrett's coloured drawings of the heads of demons, so impressed its author that he conceived the idea of a school of occult philosophy.

What success the school met with is unknown, but Barrett did have one apt pupil in the person of "Dr." John Parkins, an unsavoury astrologer, crystal gazer and author of two books on fortune-telling and folk-medicine, who set up a "Temple of Wisdom" at Little Gonerly in Lincolnshire. Barrett

gave Parkins a manuscript on crystal gazing and associated magical practices, and it is clear from annotations by Parkins that he made use of it. But neither Barrett's "school" nor royalties from *The Magus* brought him financial security and Hockley's comment on his career is probably accurate: 'Barrett, notwithstanding his professorship of Magic, lived and died in poverty.'

One later book, the anonymous *Lives of Alchemical Philosophers* (1815) has been frequently attributed to Barrett, but the weight of evidence is against this. His reputation thus stands or falls with *The Magus* which, despite its many faults, exercised a significant influence on the ideas and the writings of the many magicians and would-be Rosicrucians who flourished during the "occult revival" of the later 19th century. Nothing like it was published subsequently until members of the → Hermetic Order of the Golden Dawn began to produce their own editions and translations of magical and kabbalistic texts from 1889 onwards. That *The Magus* also was being regularly reprinted and is still being read late in the 20th century is a testament to the genius of its enigmatic author.

The Magus, or Celestial Intelligencer; being a complete system of Occult Philosophy, London: Lackington, Allen & Co, 1801 ♦ Surviving manuscripts by Barrett: Wellcome Library MS 1072 Holograph of *The Magus* (1800); MS 1073 *Direction for the Invocation of Spirits* (1802), Yale University Library, Mellon Collection MS 140 George von Welling, *Philosophy of the Universe*. ROBERT A. GILBERT

Basilides, 2nd century

1. BASILIDES ACCORDING TO CLEMENT OF ALEXANDRIA, ORIGEN, EUSEBIUS OF CAESAREA AND HEGEMONIUS 2. BASILIDES ACCORDING TO IRENAEUS 3. BASILIDES ACCORDING TO HIPPOLYTUS

Basilides was a free Christian teacher who presumably lived and taught in Alexandria during the reign of the emperor Hadrian (cf. Jerome, *Chronicle*, 201, 1f Helm). He had a son who became his disciple, Isidore. The ancient evidence about Basilides and his school can be divided into three groups: 1. the fragments and testimonies preserved by → Clement of Alexandria, Origen, Eusebius of Caesarea and Hegemonius (*Acta Archelai*); 2. the report of Irenaeus of Lyon, which influenced the heresiology of Pseudo-Tertullian, Epiphanius of Salamis and Filastrius of Brescia; 3. the report of Hippolytus of Rome. Scholarly opinion is divided as to the question whether 2. and 3. contain valid and authentic information. There is some scholarly consensus that 1., particularly the original fragments preserved by Clement of Alexandria, are authentic and might – where possible – be used as a touchstone for 2. and 3. A majority of scholars seems to accept 3. as genuine in one way or another. The view of the present author is that only 1. contains information about the teaching of Basilides and his early circle of disciples (perhaps only Isidore, but that remains unclear in Clement). 2 and 3 are either spurious, i.e. they are not by Basilides and his disciples, or reflect the views of later Basilideans. It is possible that Hippolytus or his source are using information derived from Irenaeus of Lyon and Clement of Alexandria.

1. BASILIDES ACCORDING TO CLEMENT OF ALEXANDRIA, ORIGEN, EUSEBIUS OF CAESAREA AND HEGEMONIUS

Basilides wrote *Exegetica* in 24 books (Agrippa Castor, in Eusebius, *HE* IV, 5, 7-8); this is probably a commentary on a gospel. The identity of this gospel is unclear. Origen mentions in passing that Basilides had written his own gospel (*Homilies on Luke* I, 2); and this claim, which is not confirmed by any other source, is not impossible. Perhaps Basilides had produced his own gospel "edition" upon which he then commented. There are indications that Basilides' gospel is based on the Gospel of Luke (see below). For Basilides' son Isidore, however, the use of the Gospel of Matthew is attested (see below). Three fragments of Basilides' *Exegetica* have been preserved, one in Clement and two in Hegemonius.

Clement of Alexandria presents in *Stromateis* IV, 81, 1-83, 1 a large fragment from the 23rd book of Basilides' *Exegetica*. It addresses the question of how the goodness and justice of God can be reconciled with the execution of persecuted Christians. Basilides rejects the answer that the deaths of

Christian martyrs are the work of the devil. For him, this is God's way of punishing the hidden sins of the Christians; it is a sign of the goodness of God that the Christians are not punished for any misdeeds but rather for their being Christians. Basilides defends the justice of God: if someone has not committed an actual sin, he may still undergo divine punishment, because he has the internal disposition to sin. Divine providence cannot be bad and unjust; every human being is sinful (Job 14:4 LXX), only God is just. It is striking how Basilides here combines two traditionally distinct ideas (cf. Philo of Alexandria): on the one hand, the goodness of a God who benefits his creatures, on the other hand, the justice of a God who judges and punishes. Basilides indicates that God guides human beings (*agein, periagein*); he seems to accept the Platonic and biblical concept of pedagogical and cathartic punishments (cf. Clement's remarks *Strom.*, IV, 83, 2; 88, 2).

Hegemonius quotes in *Acta Archelai* 67, 4-12 two fragments taken from the 13th book of Basilides' *Exegetica*. The first fragment is the beginning of the book indicating its contents: 'The parable of the rich man and the poor man demonstrates where the nature without root and without place which attaches itself to things might have come from'. Basilides' remark seems to allude to Luke 16:19-31. In view of the second fragment, the phrase 'the nature without root and without place' has to be understood as a periphrasis for "evil". It is, however, unclear how Basilides used Luke 16:19-31, in order to explore the nature of evil. In the second fragment Basilides pretends to relate the opinion of anonymous "barbarians" about the origin of good and evil in the world: in the beginning there were two ungenerated principles, light and darkness. Both existed for themselves, liked themselves, were perfect in themselves. Then, at a second stage, Light and Darkness took notice of each other: whereas Darkness desired the Light and pursued it, Light only looked at Darkness, but felt no desire to participate in it. In this way the ontological difference between good and evil was established. Still, by this look of Light at darkness, a reflection of Light was produced in the Darkness. Basilides concludes: 'Therefore there is nothing perfectly good in this world . . . because that which has been received in the beginning, was too little'. The visible creation is this mixture of darkness and light; it is bad, insofar as it falls far short of the perfectly good. It is difficult to tell whether this "cosmogony" reflects Basilides' own views. However, the fact that he adduces it is significant in itself: he emulates philosophers like Plutarch or Numenius

who also invoked exotic lore in order to explain the principles of this world (Löhr, 236-241). Moreover, the "cosmogony" of the barbarians is full of philosophical resonances: e.g. Darkness's pursuit of Light is erotic in the Platonic sense of the word. The "cosmogony" evinces no radical dualism, but is nevertheless more pessimistic about this world than either Plutarch or Numenius.

Apart from these three quotations Clement has several doxographical passages where he transmits various doctrines of Basilides. Since they are taken out of context, the precise meaning of these "doxai" is not always easy to determine. According to *Strom.*, IV, 86, 1, Basilides said that it is the will of God, firstly, to love everything – because everything has a relation to the totality of all things –, secondly, not to desire anything, and thirdly, not to hate anything. According to Basilides the sins that are forgiven by baptism are those that are committed involuntarily and in ignorance before baptism (IV, 153, 4). Basilides assumed an "Ogdoas" of which the virtues of Justice and Freedom were important elements (IV, 162, 1/perhaps an allusion to Ps. 84:11 LXX; 88:15 LXX; 96:2 LXX). "Election" (*ekloge*) is a favourite Basilidean self designation; Basilides – perhaps taking his cue from Gen. 23:4 – taught that the "election" is a stranger (*xenos*) in this world (IV, 165, 3). Basilides's faith is intellectual, is *noësis*; he calls it (V, 3, 2) "faith", "kingdom" and a creation of good things, worthy to exist near the creator's being' (my translation follows a suggestion by R. Peppermüller), the 'unlimited beauty of an unsurpassable creation'. According to Basilides, Moses' temple (sic!, but cf. Hekataios of Abdera apud Diodorus Siculus, XL, 3) proclaims not the one God, but the one world (V, 74, 3); here Basilides probably follows an "interpretatio graeca" of Jewish religion (Löhr, 194f.). Basilides apparently taught the transmigration [→ Reincarnation] of souls (into both human beings and animals); Clement relates a "doxa" and Origen quotes a fragment where Basilides or his disciples use this doctrine in order to interpret two difficult passages from scripture, i.e. Deuteronomy 5:9 and Romans 7:9 (Clement, *Excerpta ex Theodoto*, 28; Origen, *Comm. on Rom.*, V, 1; cf. also Origen, *Comm. on Matth.*, ser. 38).

Clement mentions three writings of Isidore, the son of Basilides. *Strom.*, II, 113, 3-114, 1 quotes a short passage from Isidore's work *On the attached soul*. In this fragment Isidore relates an objection against the doctrine that the soul has attachments (*prosmartemata*) which produce its passions: if you persuade others that the passions of bad people are

caused by these attachments, they will have an excellent excuse for their misdeeds; they will say that they could not help misbehaving. But Isidore insists on human responsibility: we have to fight against these passionate attachments, ‘we must prevail with the help of the rational part of the soul and rule over the lower creation within ourselves’ (a possible allusion to Gen. 1:28; 9:1; cf. Philo, *Questions on Genesis*, II, 56). Shortly before this quotation, in *Strom.*, II, 112, 1ff., Clement presents a Basilidean “doxa” where the doctrine of the attachments is described in some more detail: the attachments are substantially spirits that have become attached to the souls according to an original confusion and mixture. This remark seems to indicate that the attachments derive from chaotic, primeval matter (a Platonic doctrine; Löhr 83, note 11). This first class of attachments seems to be responsible for human passions. To these are added a second class of attachments, i.e. spirits of a bastard and animal nature (wolves, monkeys, lions); they try to assimilate the passions of the soul to those of animals, ultimately even to those of plants and stones. This doxa is probably equally derived from Isidore’s book. It is remarkable that Isidore tries to establish a difference between human passions and lower animal passions.

Strom., III, 1-3 contains three fragments of Isidore’s *Ethica*, probably a writing dealing with moral problems. These fragments discuss the question of whether or not to marry: with reference to Matthew 19:11f. Isidore distinguishes between three kinds of eunuchs: those who have a natural aversion against women, those who refrain from sex either because of their conspicuous encratism or because they have been castrated, and those who wish to devote themselves fully to the kingdom of God and do not wish to be bothered by family cares. As regards those who find it difficult to live without sex, Isidore – interpreting I Cor. 7:9 – advises against a forced abstinence: if your prayer entirely focuses on celibacy you might get separated from Christian hope. If someone is too young or too poor and yet feels the need to marry, he should seek the support of his Christian brother. Isidore criticizes an attitude that avoids sin only out of fear. He concludes his discussion by quoting a Epicurean maxim (cf. Epicurus, *Ep. ad Men.*, 135; Fr. 456 Usener): for human beings, there are some things that are both necessary and natural; other are only natural. Clothing is both natural and necessary, but sex is only natural, not necessary. These fragments from Isidore’s *Ethica* present an example of Christian pastoral advice. Like the pagan philo-

sophical schools, the school of Basilides and Isidore claimed to teach (Christian) philosophy as a way of life; theoretical instruction and practical advice went hand in hand. Like the pagans, Isidore taught his followers certain short maxims which they could recall and meditate at appropriate moments (Löhr, 116ff.).

Strom., VI, 53, 2-5: Clement quotes one fragment from the first and two from the second book of Isidore’s treatise *Interpretations of the Prophet Parchor*. The identity of the Prophet is unclear (Löhr, 199, note 8). Clement’s choice of quotations is meant to confirm his views on the ‘theft of the Greeks’: in the first fragment Isidore refers to a theory of Aristotle according to which all human beings use demons during their life time. Isidore designates this Aristotelian teaching as a “piece of prophetic learning” which Aristotle had purloined without acknowledging his source. The original context of this remark was perhaps a more extended discussion of the phenomenon of prophecy. The second fragment claims that the intellectual property of the Christians should not be attributed to any philosophers; the philosophers simply stole it from the prophets and attributed it to someone whom they spuriously claimed to be wise. In the third fragment this remark is illustrated with reference to a fragment of Pherekydes of Syros (cf. Fr. 68 Schibli); Isidore contends that Pherekydes’ allegorical theology is derived from the prophet Cham. The last two fragments must be read as responding to a pagan theory according to which ultimate wisdom resides in an original true account of reality which is shared by ancient wise men such as Pherekydes, Linus, Musaios and Orpheus. The Platonist and critic of Christianity, Celsus, shared this theory (cf. Origen, *Contra Celsum*, I, 16); Isidore tries to top it by pointing to possible prophetic sources of the ancient pagan sages. With this claim he possibly exploited a tradition according to which Cham had been the ancestor of the Phenicians (Gen 10:6f.) and Pherekydes had been introduced to Phenician wisdom (Fr. 80 Schibli).

Apart from these three quotations from the writings of Isidore, Clement refers several times to opinions which he seems to attribute to the disciples of Basilides. In *Strom.*, II, 112, 1 the phrase ‘those around Basilides’ (*hoi amphiton Basileidên*) seems to refer to Isidore only; the same applies to the phrase ‘the pupils of Basilides’ (*hoi apo Basileidou*) in *Strom.*, III, 1, 1. Perhaps, then, this is also the case in other passages where similar phrases are used in order to introduce Basilidean “doxai”. In *Strom.*, I, 146, Clement relates different opinions

among the Basilideans about the dates of the baptism and the death of Christ (perhaps the Basilideans speculated equally about his birth, cf. I, 145, 6). It is possible that Clement has read a Basilidean work where different chronological hypotheses were discussed. In *Strom.*, II, 10, 1 and 3, Clement relates Basilidean teaching about the correspondence between Christian hope and faith and the spiritual state/level of each Christian. In *Strom.*, II, 27, 2, he quotes a Basilidean definition according to which 'faith is an assent of the soul to those things that do not affect the sense perception because they are not present'. In *Strom.*, II, 36, 1, Clement paraphrases a Basilidean exegesis of Proverbs 1:7 which relates this saying to John the Baptist: when the Archon (i.e. John the Baptist) heard the saying of the servant spirit (that is the divine voice from heaven, the servant spirit being symbolized by the dove; cf. *Excerpta ex Theodoto*, 16), he was shaken and amazed. This amazement (*ekplêxis*) was called fear (*phobos*; cf. Diogenes Laertius, VII, 112) and this fear became the beginning of a wisdom that elects, selects, distinguishes and establishes everything in its proper place. 'This is because the ruler of everything brings forth not only the cosmos, but also the "election" [i.e. the Basilideans] by distinguishing it'. The revelation of Jesus as the Son of God at the river Jordan marks the beginning of a new dispensation, a re-creation of the world: from now on the Archon, a lower deity, is involved in the process of bringing the selves of the true Christians into their transcendent, celestial abodes.

2. BASILIDES ACCORDING TO IRENAEUS

Irenaeus of Lyons, *AH*, I, 24, 3-7, describes a Basilidean system, according to which the unbegotten and nameless Father begets a series of five emanations (Nous, Logos, Phronesis, Sophia and Dynamis). Sophia and Dynamis beget the primary powers, rulers and angels which in turn create the first heaven. From the primary rulers other powers and rulers derive which create a heaven modelled on the first one – and so on, until the number of 365 heavens is complete. The angels of the last, visible heavens have created everything that is contained in this world. They have distributed the earth and the nations amongst themselves, their chief is that angel that is reputed to be the God of the Jews. This angel wished to subject all other peoples to his people, the Jews. Provoked by this aggression, the other angels resisted him; likewise the other nations resisted the Jewish people. The highest God

watched the war between the angels and sent his first born Nous, who is Christ, in order to liberate the world from the rule of the angels. The Nous appeared as a man and performed miracles. He did not suffer, but instead of him Simon of Cyrene had to bear his cross (Mt. 27:32) and suffer, the Nous having exchanged his outward appearance with Simon of Cyrene. The powers crucified him out of ignorance (I Cor. 2:8). Since he is an incorporeal power and the intellect of the unbegotten Father he can change his outward appearance as he likes (cf. Peterson). By this mimicry he becomes invisible for the powers and angels in the 365 heavens and can ascend to his Father. All those who profess the crucified are still under the domination of the angels; those who deny him, on the other hand, are liberated from their oppressive power and have the true understanding of the dispensation of the unbegotten Father. This system probably has an apocryphal writing as its source. In spite of its negative evaluation of the created world, it is not dualistic: everything has the Father as its – albeit distant – source. Evil seems to be a function of the growing distance from the source. The emanations from the father describe a descent from the intellect to practical creative reasoning. The story of Christ's (i.e. Simon of Cyrene's) passion develops and glosses I Cor. 2:8 and Matth. 27:32; Irenaeus tries to suggest a connection between Christological Docetism and a Basilidean rejection of martyrdom: just as the Nous-Son became invisible for the powers and rulers, the believers should aspire to invisibility and the avoidance of martyrdom (I, 24, 6): 'You should know all, but no one should know you!' The Basilideans claimed a higher form of "gnosis": 'Not many people are able to understand this, only one in thousand, two in ten thousand' (cf. *Gospel of Thomas*, log. 23; other parallels, Löhr 265, note 40).

3. BASILIDES ACCORDING TO HIPPOLYTUS

Hippolytus of Rome, *Refutatio*, VII, 20-27/X, 14 gives a totally different account of the teaching of Basilides: according to him, Basilides and Isidore claimed that their doctrine derived from the apostle Matthias who had been privately taught by Jesus. The system starts with a piece of negative theology, the doctrine of the "non-existing" God. This God produces a "non-existing" world, i.e. he sows a seed that contains the cosmos. Everything else emerges from this world seed. Since the world seed was produced by the non-existing God, everything is produced out of nothing. The world seed contains a tripartite sonship: the first sonship,

whose substance is light and subtle, ascends quickly to the God whose great beauty attracts everything. The second sonship needs the help of the “wing” of the Holy Spirit. But the Holy Spirit was unable to ascend to the height of the Father. The third sonship remains in the world seed; these are the pneumatic Christians. The system then distinguishes between the “hypercosmic” region, the boundary-spirit (i.e. the firmament) and the cosmos. Below the firmament two archons with their corresponding sons emerge from the world seed: the Archon of the Ogdoads and the Archon of the Hebdomads. Then the gospel arrives in this world; it comes from beyond the firmament and is transmitted through the sons of the two archons. The archons are illuminated and understand that there is a world beyond them. Finally the process of downward illumination reaches Jesus, son of Mary. The world will continue to exist until the third sonship will have been formed and purified and will have followed Christ into the transcendent realm. The power for this transformation is conveyed by the light that shines from above. Once the whole tripartite sonship has been established in the hypercosmic region, God will cast a great ignorance over the whole cosmos and the two archons; all those souls that belong to this world will no longer come to know anything beyond it, all desire for the hypercosmic region will cease. Since desire means death, this will give them a kind of immortality. Thus the whole process of salvation history consists in the return of everything that was contained in the world seed to its natural position (like returns to like). The passion of Jesus Christ is interpreted accordingly: The death of Jesus is the beginning of the separation of all things; Jesus dissolves into his bodily, psychic etc. components which return to their natural positions.

Since this report has many parallels in other sections in Hippolytus' *Refutatio* where other “Gnostic” systems are reported, some scholars have concluded that Hippolytus' source for these reports was a forgery (Salmon, Stähelin). Even if that conclusion is unwarranted, we still need a theory to explain these parallels and to reconcile Hippolytus' report with the fragments found in Clement of Alexandria, Origen and the *Acta Archelai*. The Basilidean system according to Hippolytus exhibits several remarkable features: an extreme negative theology which possibly develops the information furnished by Irenaeus (or his source) that Basilides called the Father ‘unnamable’ (*innominatus*) (Irenaeus, *AH* I, 24, 4); an idiosyncratic version of the creation out of nothing which is hostile to both emanationism and a Pla-

tonic theory of creation; a peculiar theory of a tripartite sonship; the idea that at the end of salvation history God will bring over this world a state of ignorance. Some traits of the system seem to derive from Valentinian sources, but on the whole this is an original if uneven attempt to improve upon preceding versions of salvation history. However, as in the case of Irenaeus' report, there are no very strong reasons to attribute this system to Basilides and his early circles of disciples (Isidore).

Bernard Silvester (Bernardus Silvestris),
 * year and place of birth unknown,
 † after 1159, place of death unknown

Little is known about his life. An educator in Tours, he died after 1159. He was the author of several works: *Experimentarius*, a book of spells, from Arabian sources; *Mathematicus*, a poem addressing the problem of destiny, in which he stated that 'blind chance stirs up the ridiculous troubles of humanity; our times are play, entertainment for the gods'; and a *Commentary* on Martianus Capella, in which he defined notably his hermeneutics. However, his principal work was the *Cosmography*, an allegorical novel, in which verse and prose alternate, and divided into two parts, the *Megacosm* and the *Microcosm*. Rather than attempt a complete analysis of this dense and complex work, let us concentrate on the major place that → hermetism occupies in it.

Bernard was, like the masters of Chartres (v.g. Thierry of Chartres, to whom his work was dedicated), an heir of Latin Platonism. From Macrobius he borrowed doctrinal elements and the idea that 'nature does not like to see itself exposed naked to every look', which justifies the recourse to 'fabulous narrative' (*narratio fabulosa*), an equivalent of Platonic myth. 'The veil (*integumentum*)', he says, 'is a discourse that contains a true meaning in a fabulous narrative. An example is the legend of Orpheus'. Bernard imitated the *prosimetrum* form of Martianus Capella's *De Nuptiis Philologiae et Mercurii*, which describes the seven liberal arts allegorically. He also borrowed from it the concept that knowledge is a prerequisite in the quest for wisdom. Bernard was sensitive, moreover, to the hermetic atmosphere of the *De Nuptiis*, in which arithmetical onomancy, theurgy, and divination [→ Divinatory Arts] are present alongside the liberal arts. At the term of an initiation *mysterium*, Mercury, that is, Thoth, representing the higher part of the human soul, saves the lower part, Philology, 'which loves reason'. Another major source for Bernard was the *Asclepius*. Bernard drew inspiration also from many classical authors: the great poets, notably Virgil, perceived as a pagan prophet, but also the astrologers such as Firmicus Maternus, Manilius, and Hygin. Among the medieval sources appear the *Liber de sex principiis* and certain Arabic astronomical treatises.

The construction of the *Cosmography* rests on a traditional concept: the correspondence between, on the one hand, the universe, the megacosm (or macrocosm), and, on the other, humanity, the microcosm. Its content consists of the story of the

restoration of the universe, which Nature asked of Noys, who would gain satisfaction at the end of a long initiatory journey pursued from one end of creation to the other, including the different planets. A hermetic tone marks the characters in this novel, whether they belong to Christian theology or to pagan mythology. God is defined according to the Bible, as well as to the *Timaeus* and to Macrobius. He is both Tugaton (Good) and the luminous Trinity. His creation, which is the passage from material and spiritual oneness to the many, conceals a musical [→ Music] and numerical harmony [→ Number Symbolism].

Silva-Yle, matter, proves to have a mysterious duality. It is not only a formless chaos tending toward evil, but also a fertile principle and connected with God. Noys, despite his Nicean definition 'God born of God', is not Christ, but a feminine character, Wisdom and Divine Providence, at the same time as the cradle of life. Nature, a daughter of Noys, constructs the joining of the soul and the body, in parallel to the celestial order. Her sister, Urania, establishes mediation between the divine decrees written in the stars and the spiritual existence of humanity. Endelichia is the spouse of the World, thus its soul. Physis attends to organic life. Imarmene represents the continuity of a time that sees the historical development of matter. The latter is marked by the appearance of notable characters and events, agreeing with that which is written in heaven. Other characters play a role in the *Cosmography*: angels, demons, spirits of sexuality, ousiarchs of each planet operating between two worlds, and an ousiarch Panthomorphus who gives things their form.

The influence of the *Cosmography*, exercised already on medieval authors – Alain de Lille, Jean de Meung, Dante, and Boccaccio –, has continued until our times, as the theologian C. S. Lewis refers to it explicitly in his symbolic science fiction novel, *Out of the Silent Planet* (1938). This success is explainable by the fact that Bernard, in assembling all the elements of European culture and spirituality in a poetic masterpiece, managed to create a true modern myth.

Besant, Annie, * 1.10.1847 London, † 20.9.1933 Adyar (Madras), India

A political and social activist and reformer, one of the outstanding British orators during the late 19th and early 20th centuries, whose main claim to fame today is her long and eventful tenure as the President of the → Theosophical Society (Adyar) from 1907 to her death in 1933, Annie Wood was born to William Burton Perse Wood and Emily Morris in 1847. Three quarters Irish by descent and, as she writes in her *Autobiography*, in her heart all Irish, she was to associate with the plight of the Irish under English domination, especially in her early years. In her later years, the plight of India and its natives was added to her concerns, which led her to advocate Indian Home Rule.

Wood's early education took an important turn at age eight (1855), when Ellen Marryat, perhaps a relative of Wood's now widowed mother, agreed to take Annie in her care. As an Evangelical Christian, Miss Marryat instilled in Annie not only Evangelicalism but also its emphasis on the uplifting of others less fortunate. After eight years with Miss Marryat, Annie returned to her mother, continued her studies, and met a young man who was soon to be ordained an Anglican priest, Frank Besant. They were married on December 21, 1867 and had two children over the next few years, Arthur Digby (b. January 16, 1869) and Mabel (b. August 28, 1870). Annie was soon to question orthodox Christian doctrine – especially the age-old issue about the existence of evil and misery in a world created by a God who is All-Good – when both infants contracted whooping cough in 1871. This doubt eventually led her to radically change her view of Christianity by denying the divinity of Christ. It was a position arrived at largely due to the influence of a clergyman, Revd. Charles Voysey, in 1872, a cleric who only a few years previously (1869) was himself charged with heresy by the Church. It is no wonder that Annie's association with Revd. Voysey caused much dismay with her husband.

The dual influence of Voysey and his associate, Thomas Scott – a free-thinker who sought to undermine the Church and whom Annie also met in 1872 – consolidated her acceptance of “heretical” doctrines, which she soon expressed in print. Her views and her refusal to accept her husband's admonition to return to the Church led to her eventual separation from Frank in 1873.

The following year introduced Annie, who exhibited atheist leanings by 1874, to the free-thinker and atheist Charles Bradlaugh and his National Secular Society through his newspaper,

The National Reformer. She joined the Society in August 1874, wrote extensively for the newspaper – so successfully that she eventually became its co-editor – and gave numerous addresses on behalf of the Society. During her tenure as co-editor, she advocated feminist causes, one of which was birth control, thus becoming the first woman to do so publicly.

By 1878, she assumed the office of secretary of the revived Malthusian League. One year earlier, she and Bradlaugh had reissued the 1832 pamphlet *The Fruits of Philosophy* by Dr. Charles Knowlton, through the auspices of their recently established (January 1877) Freethought Publishing Company. This led to Besant's and Bradlaugh's prosecution, still in 1877, under the Obscene Publications Act. The outcome was a verdict of “guilty”, which was eventually reversed. The reversal of the judgement led Besant to write a series of articles on birth control in *The National Reformer* that was to be published in a pamphlet, *The Law of Population*.

In addition to her continued involvement with Bradlaugh and the National Secular Society, Besant became acquainted with socialism during the early 1880s. At first, she held negative feelings toward the movement, but by 1884 her opinion changed to the point where she decided, in January 1885, to join the Fabian Society, a decision that was carried out a few months later with a member of the society, George Bernard Shaw (1856-1950), sponsoring her. This was the beginning of a relationship – intellectual and perhaps romantic – that was to have an influence over her for some time. Her concern for the poor led her to convert to socialism, but it also led to her surrender her co-editorship of *The National Reformer*.

In 1887, economic conditions had deteriorated to a point where there were numerous demonstrations by the unemployed. One of the most famous sites of London, Trafalgar Square, was especially overridden with the unemployed and destitute, and thus became a rallying ground for the socialist groups. In November, all gatherings in the Square were banned, but an alliance of socialists, Irish, and radicals – together making up the Metropolitan Radical Federation – gathered nonetheless, with Besant as one of the leaders. The result was a clash between the demonstrators and the police known as “Bloody Sunday” (November 13), a *mêlée* that led to 300 people being arrested and 150 hospitalized.

A few days after, the Law and Liberty League was co-founded by Besant and William Thomas Stead, with Besant becoming the editor of its journal, *The Link*. The primary purpose of the League

was to support free speech, to campaign for candidates who were in favor of free speech, and to champion the cause of the poor and downtrodden. By May 1888, a concrete cause presented itself with the unfair labor practice of the Bryant and May matchmaking firm. The working conditions at the factory were such that Besant and Herbert Burrows of the Social Democratic Federation instigated a boycott of the company and a strike by its workers. Both were successful. Subsequently the Matchmakers' Union was established, with Besant playing an active role both in the Union and in trade unionism generally. Later that year, her attention turned to poor children and their plight; she stood for a seat at the London School Board (the Tower Hamlets district) in 1888, won by a large margin, and remained in office for the following two years.

For all her activism in socialist causes, socialist philosophy, and socialist societies (she was by now a member of both the Fabian Society and the Social Democratic Federation), Besant felt there was a lack of adequate philosophy. Socialism was sufficient for solving economic problems, but not for realizing "the Brotherhood of Man", to use her expression. There was much talk at this time (1888) about the idea of Brotherhood, 'in which service to Man should take the place erstwhile given to the service of God', Besant remarked in an article in the February issue of *Our Corner*, a journal she had founded in 1883. But if socialism was insufficient, then where could such a Brotherhood be realized? Besant's attention was first drawn to the occult [→ occult/occultism] with the publication of A.P. Sinnett's *Occult World* in 1881, and to → Spiritualism from 1886 on; but it was her enthusiasm for the ideas contained in → Helena Petrovna Blavatsky's *The Secret Doctrine*, which Besant subsequently reviewed in 1889, that transformed her from socialism to Theosophy. Shortly after her review, which appeared in the *Pall Mall Gazette* in April, she joined the → Theosophical Society, on 10 May 1889, and thereafter visited Blavatsky in Fontainebleau. Blavatsky quickly recognized in Besant a potential asset to the Society, so much so that Besant quickly became Blavatsky's key disciple as a member of the Inner Group of the Esoteric Section and the co-editor of Blavatsky's magazine, *Lucifer*.

After Blavatsky's death on May 8, 1891, the Outer Head of the Esoteric Section (now called the Eastern School of Theosophy) passed to Besant, who was also the president of the Blavatsky Lodge in London, and to William Q. Judge, the Vice-President of the Theosophical Society. Judge was to be the head of the E.S.T. for America, Besant for the

rest of the world, an arrangement that would not last longer than a few years. The arrangement ended in 1895, when Judge and a majority of members of the American Section decided to declare its autonomy from the Theosophical Society, thus leaving Besant as the most influential Theosophist with the possible exception of → Henry Steel Olcott.

Besant's visit to Ceylon (Sri Lanka) and India in 1893 to meet Olcott was the beginning of her lifelong love and devotion for India and its people. From 1896 on, she became a permanent resident of the country, engaging in many activities, the first of which was education. Besant's studies in Sanskrit and Hindu religion and philosophy resulted in her translation of the *Bhagavad Gītā* in 1895, with the assistance of the scholar Bhagavan Das. A year later, she conceived the idea of establishing a college for Hindu boys that would include instruction in Sanskrit. This idea came to fruition with the establishment of the Central Hindu College in Benares (now Varānasi) on 7 July 1898. The College was to have a profound impact on Indian education in the ensuing decades. A few years later (1904), the educational opportunity afforded to Hindu boys was extended to Hindu girls with the opening of the Central Hindu Girls' School, thus cementing the claim that Besant was one of the leading pioneers in the education of Hindus of both sexes.

From the mid-1890s on, Besant became associated with the increasingly popular lecturer and occult writer and investigator → Charles Webster Leadbeater. Although not herself a psychic, it was due to his influence that Besant's interests turned from religion to occult phenomena at this time. By 1895 a collaborative effort was begun to investigate a number of supra-physical phenomena, including → reincarnation and the astral plane. The results of these joint investigations were a number of co-authored books including *Occult Chemistry* (1908), *Talks on the Path of Occultism* (1926), *Thought Forms* (1901), and *The Lives of Alcyone* (1924). As early as 1898, their interest came to extend also to a Theosophical interpretation of Christianity, leading to Leadbeater's *The Christian Creed* of 1899 and Besant's *Esoteric Christianity* of 1901. The collaboration was temporarily halted by charges of immoral conduct brought against Leadbeater in 1906, which led to his resignation from the Theosophical Society in the same year. After Olcott's death in 1907, Besant was elected President of the Theosophical Society on June 28. By August, she and Leadbeater were again conducting occult investigations even before his formal reinstatement

to the Society, which took place eighteen months later, in December 1908.

Leadbeater's reinstatement would soon lead to the defining moment in the history of the Theosophical Society, the discovery on Leadbeater's part of a young boy, Jiddu Krishnamurti, who was expected to be "overshadowed" by the Lord Maitreya, the World Teacher. Although talk of a Master of Wisdom who would appear amongst humanity goes back to H.P. Blavatsky, the discourse of a coming World Teacher, a Maitreya, Christ or Messiah – the identification of Maitreya and the Christ was apparently developed by Leadbeater – seems to have begun with Besant, in a rudimentary form around the turn of the century, and with Leadbeater in more developed form as early as 1901. By the end of 1908 Besant was quite explicit about a "Teacher and Guide" who would once again walk among humans. In April 1909, Leadbeater actually discovered a Brahmin boy whom he claimed would serve as the vehicle for the Teacher, the Lord Maitreya who would incarnate into him. The purpose of this coming was to prepare for the coming sixth sub-race of humanity and the still more remote sixth root race. For the next twenty years, especially after 1924, much of Besant's energy was devoted to furthering the cause of the World Teacher. All came to naught, however, when Krishnamurti dissolved the Order of the Star, the organization that was established to further the claims that he was the coming World-Teacher, by declaring in 1929 that "Truth is a pathless land" and by turning his back on Theosophy and its leadership.

In addition to the World Teacher taking possession of the body of Krishnamurti, a "World Mother" would also be manifested through an earthly vehicle: Mrs. Rukmini Arundale, the wife of George Arundale, who would later become Besant's successor as president of the Theosophical Society. The idea of the World Mother probably originated with Leadbeater, and was then taken up by Besant, who came to represent her as the 'embodiment of womanhood in the occult hierarchy'. Nothing much came of this new teaching, however, and by 1928 it had been forgotten.

Besant's emphasis on service to the Indian nation, in the context of which she attempted to promote a number of reforms (she encouraged inter-caste and interracial relations, championed the cause of the "outcasts" and "untouchables", and encouraged Indian women to engage in the public domain) eventually led her to get involved in the struggle for Indian independence. Although there is evidence of such activity as early as 1910, it was not until 1913 that she claimed to have come into contact with

the Rishi Agastya, a Mahatma whom Theosophists believe is 'the Regent of India in the Inner Government'; this Master supposedly had instructed Besant, as his Agent, to 'form a small band of people, who were brave enough to defy wrong social customs, such as premature marriage'. Once engaged in this attempted reform, Besant established the Home Rule League in 1916, in imitation of the Irish Home Rule movement, and began to work for Indian self-government. As an outlet for her views, in 1914 she bought an old and established paper, the *Madras Standard*, and converted it into *New India*, which was 'to embody the ideal of Self-Government for India along Colonial lines . . .'. As a promoter of independence, she worked with many Indian leaders including the militant nationalist Lokamanya Bal Gangadhar Tilak (1856-1920) and the moderate former Theosophist Gopala Krishna Gokhale (1866-1915). It was during this time, between 1915 and 1919 that her political influence was at its height. Besant worked with all the great leaders of the independence movement, serving as President of both the Home Rule League in 1916 and 1917, and the Indian National Congress in 1917. By 1920, however, Mohandas Gandhi (1869-1948) had effectively assumed an ascendant position, eventually becoming the leader of the independence movement. His methods and goals were different from Besant's, and more attractive to the Indian population. Besant continued to participate in Indian self-rule throughout the 1920s, and supported the Nehru Report (named after Motilal Nehru [1861-1931]) of 1928, which advocated Dominion Status for India, in contrast to Motilal's son, Jawaharlal (1889-1964), who advocated complete independence. Besant did not live to see India receiving independence in 1947.

Throughout the 1920s, Besant became more involved with Krishnamurti and the Order of the Star in the East. After the dissolution of the Order of the Star (as it was called in the late 1920s) in 1929, Besant's health began to decline. On 20 September 1933 she died at the headquarters of the Theosophical Society in Adyar. She was cremated in the Garden of Remembrance on the Theosophical Society's estate, with a portion of her ashes placed in the Garden and a portion scattered over the Ganges at Benares.

Blake, William, * 28.II.1757 London,
† 12.9.1827 London

An engraver by trade, Blake was primarily a self-educated graphic and literary artist whose work reflects the attempt to confront contemporary

political and social problems through a philosophically based spiritualism. Although baptized and buried in the Anglican Church, Blake was born into a family of freethinkers, and himself attempted to get back to the pure form of Christianity he believed to have existed before it was corrupted by organized religion.

Blake's life reflects the conflict between corporeal and spiritual needs. He worked as a commercial artist, engraving illustrations for popular books, including some by Mary Wollstonecraft (1759-1797), Erasmus Darwin (1731-1802), and, notably, the account of John Gabriel Stedman (1744-1797), *Narrative of a Five Years Expedition against the Revolted Negroes of Surinam* (1796). Yet, he was always more interested in executing his own illuminated books, which reflect an increasingly strong influence by the *prisca theologia* (→ tradition), a pure form of theology that had developed as a counterpoint to conventional religion. Attempting to address the sometimes contradictory obligations of his materialistic and idealistic needs, Blake experimented with novel paint formulæ and engraving methods (explained to him, in a dream, by his deceased brother Robert), all designed to make his visions commercially viable. Unfortunately, none of the innovations proved financially successful.

Throughout his life, Blake evinced a strong interest in spiritualism. As a child, he experienced religious visions, and as a young man, he circulated among the mystics who frequented London in the 1780s. He met the neoplatonist Thomas Taylor (1758-1835), as well as the artist Henry Fuseli (1741-1825); and he engraved the frontispiece for Fuseli's English translation of → Johann Kaspar Lavater's *Aphorisms on Man* (1788). Intellectually, he was attracted to the writings of → Emanuel Swedenborg, owning and annotating at least three of Swedenborg's books – *Heaven and Hell*, *Divine Love and Divine Wisdom*, and *Divine Providence* – and was likely familiar with two others – *Earths in the Universe* and *True Christian Religion*. In addition, Blake and his wife both signed the register for the first General Conference of the New Jerusalem Church in 1789. There is no clear evidence, however, that they attended any subsequent meetings, and Blake was eventually disillusioned enough to satirize Swedenborg's *Heaven and Hell* in his own *The Marriage of Heaven and Hell* (1790-1793), transforming Swedenborg's Memorable Relations into his own Memorable Fancies. Renouncing, for a time, Swedenborg's influence, Blake claimed that 'Swedenborg's writings are a recapitulation of all superficial opinions, and an analysis of the more sublime, but no further' (pl. 22, E 43).

From Swedenborg Blake turned to → Paracelsus, the 16th-century Swiss alchemist, and → Jacob Boehme, the 17th-century German visionary, whose works had been translated by the 18th-century English mystic, → William Law. Although Blake spent his entire life in England, he did leave London for a few years, spending 1800-1803 in Felpham, as a guest of minor poet William Hayley (1745-1820). Although the relationship with the practical-minded Hayley quickly deteriorated, the stay in the country afforded Blake access to an extensive library. More successful was the relationship with Thomas Butts, a minor bureaucrat whose patronage during the first decade of the 19th century enabled Blake to illustrate parts of the Bible and Milton, among other things. Later in life, in 1818, Blake was discovered by John Linnell (1792-1882) and John Varley (1778-1842), two young artists whose own interests in the occult helped reinvigorate Blake's final works.

These disparate interests all converge in Blake's own form of a *prisca theologia*, in which he uses a kabbalistic-like myth as the basis for unifying all of his spiritual interests. His thesis in the early tract, *All Religions are One* (1788), that 'The Religions of all Nations are derived from each Nation's different reception of the Poetic Genius which is every where call'd the Spirit of Prophecy', would lead inexorably to a rejection of any particular religious organization, the Swedenborgian New Church included. As he explained in *The Marriage of Heaven and Hell*: 'Till a system was formed, which some took advantage of & enslav'd the vulgar by attempting to realize or abstract the mental dieties from their objects: thus began Priesthood. / Choosing forms of worship from poetic tales. / And at length they pronounced that the Gods had orderd such things. / Thus men forgot that All deities reside in the human breast' (pl. 11).

Intellectually, Blake agreed with the basic assumptions of → Francis Mercurius van Helmont's delineation of the *prisca theologia*, that the universe is an organic, vital, evolving whole, and that humans, having been made in God's image, are to use their imagination to help restore the post-lapsarian world to its original perfection, through the exercise of their intellect and imagination. In the works leading up to *The Marriage of Heaven and Hell*, Blake applies his spiritual principles to contemporary problems. The early unpublished poem, *The French Revolution* (1791), focuses on the war in Europe; *Visions of the Daughters of Albion* (1793) considers English participation in the slave trade; and various lyrics in the collected *Songs of Innocence* (1789), and later, the combined *Songs of*

Innocence and of Experience (1794) explore different forms of social, religious, political and moral hypocrisy.

At the same time that he worked on these exoteric works, Blake also began exploring esoteric themes. *There is No Natural Religion*, the companion to *All Religions are One*, is a series of aphorisms that conclude with the Application: 'He who sees the Infinite in all things sees God. He who sees the Ratio only sees himself only. Therefore God becomes as we are, that we may be as he is'. He also began exploring the dimensions of gnosis in *The Book of Thel* (1789), a neoplatonic poem in which the soul ultimately chooses to stay in the 'vales of Har', Blake's name for what he sees as the debilitation inherent in pre-lapsarian Eden, rather than become part of the corporeal cosmos where, though contributing to the life cycle, she will die. Similarly, in the unengraved *Tiriell* (c. 1789), Blake merges exoteric and esoteric themes, condemning contemporary politics for being a function of the erroneous use of reason, as opposed to intellect. To complete this phase of his artistic development, Blake wrote two prophecies – *America* (1793) and *Europe* (1794) – in which he presents an apocalyptic interpretation of the American and French Revolutions.

In the mid-1790s, Blake began the decades-long process of rendering his kabbalistic *prisca theologia* into mythic form. During this period he completed the four "minor prophecies", in which he worked out specific details of his developing myth. In the first, *The Song of Los* (1795), Blake traces the progress of organized religion, attributed, in *The Book of Urizen* (1794), to the consolidation of the rational factor. The problem, as analyzed in *The Book of Ahania* (1795), is that once consolidated, reason became cut off from its spiritual component. Therefore, as suggested in *The Book of Los* (1795), the relationship between reason and vision had to be reconfigured. Of key importance to Blake's thought process at this stage was the commission, worked on in 1795-1796, to help illustrate the popular poem by Edward Young (1683-1765), *The Complaint, or Night Thoughts on Life, Death, and Immortality* (1742-45), an extensive meditation based on conventional Christian theology. Even though the commission eventually fell through, the detailed analysis required for the project forced Blake to confront point by point his own attitude towards exoteric theology.

During the next ten years, intermittently from 1796 until 1807, Blake attempted to consolidate his criticism into a full-scale epic that would counter the errors propagated by Young's *Night Thoughts*.

The Four Zoas – or *Vala*, as it was originally called – is the first major attempt to transform his *prisca theologia* into narrative form. Written, in many cases, on proof sheets from the Young project, *The Four Zoas* is an early revision and re-presentation of exoteric Christianity in an esoteric form, its nine “nights” corresponding respectively to the kabbalistic *sefirot* (emanations) from *Malkhut* (Kingdom) through *Hokhmah* (Divine Wisdom), tracing the *via mystica* back to *Keter Elyon*, the Supreme Crown. Even though the myth is populated by unique allegorical figures with originally coined names, its structure resembles Francis Mercurius van Helmont’s system of Christian Kabbalism. A major collaborator with → Christian Knorr von Rosenroth (1636-1689) on the *Kabbala Denudata* (2 vols., Sulzbach, 1677-1684), van Helmont contributed the *Adumbratio Kabbalæ Christianæ*, a full-length Platonic dialogue between a Kabbalist and a Christian Philosopher, designed to demonstrate the congruence between the myth generated by Jewish mystic Isaac Luria (1534-1572) and Christianity. According to kabbalistic tradition, our existence is part of a larger cycle of creation, the purpose of which is to provide the opportunity for all souls to be purified. In the *Adumbratio*, van Helmont christianizes the myth, using the Bible to justify his transformation of the Jewish system. In order to add a specifically christological function, he expands what was originally a three-part structure – “Contraction”, “the Breaking of the Vessels”, and “Restoration” – into four phases: “The Primordial Institution”, the Godhead’s original intention for creation; “The State of Destitution”, the fall, as caused by the breaking of the vessels, and the ensuing contamination of souls; “The Modern Constitution”, corporeal existence in which both macrocosm (Christ) and microcosm (man) work, each on his own level, to effect the form of restoration; so that, finally, in “The Supreme Restitution”, Christ can defeat the forces of evil and man can rise.

We do not know Blake’s specific source for Kabbalism. However, in his major prophecies, he generated a universal *prisca theologia* which incorporates into a Lurianic/van Helmontian base all of his esoteric reading, including the neoplatonists, Boehme and even Swedenborg. The result was a four-fold myth about the nationalistic hero, Albion – ‘His fall into Division & his Resurrection to Unity / His fall into the Generation of Decay & Death & his Regeneration by the Resurrection from the dead’ (n. 1, 4:4-5). In this first attempt at an epic narrative, Blake seems incapable of delineating a non-conventional role for the Saviour.

Available only in a heavily revised manuscript, *The Four Zoas* reflects the creative process involved in the attempt to transform abstract theory into a fully realized myth. In its earliest form, originally entitled *Vala*, the epic was apparently intended to focus on the emanation of the spiritual component, her individuation signifying the consolidation of the force that would oppose true vision, and therefore lead inevitably to organized religion. As the poem evolved, however, Blake shifted his focus from the effect to the cause, from *Vala* to the four zoas, his name for the four psychological components that correspond to the four kabbalistic souls. In its final form, *The Four Zoas* depicts the initial disorganization of the four zoas, as Urizen (the Rational Soul) usurps the function of vision, causing Urthona (the Immortal Soul) to grow dark and to limp. Throughout the poem, the action delineates the process by which the zoas are ultimately realigned so that Albion can be regenerated. The problem is that at this point, the action leads almost inexorably to an external catalyst – Christian ransom – for its resolution. Although Blake would work on the poem for at least a decade, and would even complete its apocalyptic vision – ‘The war of swords departed now / The dark Religions are departed & sweet Science reigns’ (n. 9, 139:9-10) – he could never integrate within its action a christological function that was not inimical to the concept of free will.

Blake confronts that specific problem in *Milton*, a brief epic in which the historical John Milton – whose doctrine in *Paradise Lost* was the source, Blake believed, of subsequent theological misapprehensions – returns to correct his error. As a transmigrating soul, Milton has wandered in heaven for one hundred years, unhappy at the legacy he left on earth. Hearing, in the Bard’s Song, the esoteric account of creation and fall, he identifies himself as the source of the exoteric misconception that has been promulgated on earth – ‘I in my Selfhood am that Satan: I am that Evil One!’ – and returns to correct his error: ‘I go to Eternal Death’ (14[15]:30, 32). Once there, he literally reforms Urizen so that Albion can rise, and all of creation can prepare for ‘the Great Harvest & Vintage of the Nations’.

In delineating *gilgul*, the process by which the transmigrating soul returns to correct its error, Blake, like van Helmont before him, associates the kabbalistic *Adam Kadmon* (primordial man) with the christological function, though not as an external Saviour. Instead, he reconfigures Los, the personification that had been associated with the → imagination, into an internal Christ. Becoming

what Blake will call 'the vehicular form' of Urthona (the Immortal Soul), Los is now depicted as having forgotten his originally intended function. But when Milton reforms Urizen, Los 'recollect[s] an old Prophecy in Eden recorded' (20[22]:57), and devotes himself to constructing Golgonooza, the lower Eden where transmigrating souls will be purified in preparation for the apocalypse. Instead of sacrificing himself for the sake of mankind, Los creates the structure through which the individual can, of his own free will, save himself.

If *Milton* creates the form of restoration, *Jerusalem*, Blake's final prophecy, enacts the process in the fullest sense. Consistent with the four-part structure delineated by van Helmont, Blake divides the action of *Jerusalem* into the four-part process 'Of the Sleep of Ulro! and of the passage through / Eternal Death! and of the awaking to Eternal Life' (4:1-2). Juxtaposing the corresponding actions of the macrocosm (*Adam Kadmon/Los*) and the microcosm (*Adam Rishon/Albion*), Blake divides his epic into four chapters, corresponding respectively to van Helmont's four sections. In his first chapter, Blake conveys the inverse of van Helmont's "Primordial Institution", portraying the prelapsarian state in terms of what was lost as a result of the fall, when Albion chose 'demonstration' over 'faith'. At the same time that Albion lapses into despair, the psychological state that prevents restoration of the microcosm, Los confronts his Spectre, the force of negation that attempts to deter him from effecting restoration on the macrocosmic level. In the second chapter, Blake depicts van Helmont's "State of Destitution", when 'Every ornament of perfection, and every labour of love, / In all the Garden of Eden, & in all the golden mountains / Was become an envied horror' (28:1-3). Even though, in his spiritual blindness, Albion turns his back on the Divine Vision, still, Los labors at his furnace, renovating the form of religion so that Albion will be able to rise. Next, corresponding to van Helmont's "Modern Constitution", Albion, the microcosm, confronts the perversions of Christianity that were produced as a result of the fall, while simultaneously, Los, on the macrocosmic level, attempts to align the biblical tribes with Albion's sons, to prepare for the "Supreme Restitution", when Los will confront negation at its very source, as he 'altered his Spectre & every Ratio of his Reason / . . . Till he had completely divided him into a separate space' (91:50, 52). Finally, 'Time was Finished! The Breath Divine Breathed over Albion' (94:18).

Through *Jerusalem*, which he worked on intermittently from 1804 until the 1820s, Blake was able to conceive a kabbalistic version of Christian-

ity, one that enabled Albion to exercise the free will necessary to save himself, but without sacrificing the christological function of Los, who on the one hand, manipulated the form that Albion would actualize, and on the other, confronted the shards of negation that exist as an obstacle to cosmic restoration. Thus, it was through his verbal art that Blake was able to articulate his system. From that point on, however, he would focus on the visual art for its ultimate expression.

In his last works, Blake used the myth he had developed in the composite art as the standard against which to criticize and artistically revise the Bible and other religious works. He returned to the Book of Job, which he had worked on sporadically throughout his life, this time engraving plates that inverted the focus of the composite books. There, the pictures had been used to illustrate the verbal text; now, he uses words to illuminate what is primarily a visual text. In its completed form, Blake faults Job for constructing a rationalistic interpretation of religion, rather than experiencing God directly through the imagination. *The Ghost of Abel* (1822), a two-plate response to Byron's *Cain: A Mystery*, published in December 1821, is subtitled 'A Revelation In the Visions of Jehovah / Seen by William Blake'. For *Laocoön* (c. 1826-1827), his last illuminated work, Blake arranges a vast collection of aphorisms, using Hebrew and Greek, as well as English, all around a statue of Laocoön and his two sons, to convey the disparity between that which is taught and that which is true. Finally, on his deathbed, Blake worked on the 102-water color drawings that criticize and correct → Dante's *Divine Comedy*, demonstrating how organized religion had occluded the medieval Italian poet's true vision.

SHEILA A. SPECTOR

Blavatsky, Helena Petrovna, * 12.8.1831 Ekaterinoslav, † 8.5.1891 London

Undoubtedly one of the most fascinating, controversial, and influential women in the 19th century writing on the ancient wisdom tradition, Blavatsky was born in the von Hahn family on August 12, 1831 (or on July 31, according to the old Julian calendar that was still current in Russia) in Ekaterinoslav (Dnepropetrovsk), the Ukraine. Descended from a prominent family of Russian, French Huguenot, and German background, her father, Col. Peter Alexeyevich von Hahn (1798-1873), was a descendant of the medieval crusader Count Rottenstern and a Captain of Artillery. Her mother, Helena Andreyevna, *née* de Fadeyev (1814-1842), was a woman of great literary talent who wrote novels under the pseudonym of Zeneida R__va. Because of her husband's position, the family traveled constantly. During an interlude in the early 1840s following the death of her mother in Odessa, young Helena was sent to live with her grandparents (Andrey Mihailovitch de Fedeyev and Helena Pavlovna Delgorukova) in Saratov, where she remained until 1845. According to accounts of this period, Helena already exhibited traits of mediumship.

By age eighteen (1849) she married Nikofor Blavatsky (1809-?), a man for whom she obviously had little attachment, given that she left him after only three months. From that time on she em-

barked on years of wandering, presumably in search of esoteric truths and occult training, traveling to a number of destinations, including Constantinople – where the greatest concentration of Sufi mystics resided – Greece, Egypt, and Eastern Europe. While in Egypt (1849-1850), she met the Copt occultist Paulos Metamon, a so-called magician who many years later (1871) was said to have assisted Blavatsky in the establishment of the "Société Spirite" in Cairo. It has been claimed that Metamon was her occult teacher during these early years of her travels. From Egypt, Blavatsky left for Europe, traveling to Paris and London, where she later claimed to have met her Master for the first time in Hyde Park during the summer of 1850.

From Paris, Blavatsky left for North America, inspired by the novels of James Fenimore Cooper and his descriptions of the Native Americans and the promise of secrets possessed by the medicine men or shamans. She arrived in Quebec, but was ultimately disappointed with the group of Native Americans with whom she met. After this meeting, she commenced on a new plan, leaving for New Orleans to investigate Voudouism, then on to Texas, Mexico, and – for much of 1852 – to Central and South America. She then decided to go to India, and together with two other companions – one of them a Hindu she had originally met in Honduras and whom she had selected to be her guru or Master – they sailed first to Ceylon (Sri Lanka) and then on to Bombay (Mumbai) sometime during the latter part of 1852. During the same year she attempted to enter Tibet through Nepal but failed in her attempt. She then journeyed to south India, Java, and Singapore and ultimately back to England. Her probable arrival there was in 1853, and she remained until 1854. Sometime in the second part of the year, she set out once again for the United States, landing in New York, journeying across country through Chicago to her final destination in San Francisco – traveling for part of the journey in a covered wagon caravan – where she remained until 1855.

Her next destination was India (Calcutta), which she reached via Japan. During her second visit there, from 1855 to 1856, she met with a German acquaintance of her father (an ex-Lutheran minister by the name of Kühlwein) and two other companions, all of whom attempted to enter western Tibet through Kashmir to Ladakh. If we trust the account in A.P. Sinnett's (1840-1921) *Incidents in the Life of Madame Blavatsky*, she alone among her traveling companions was taken into Tibetan territory by a Tatar shaman guide, albeit for only a short time.

Blavatsky left India in 1857 for Europe (France and Germany) by way of Java, and finally ended up in Russia. The period from 1858 to 1863 she spent primarily with her family; and during a period of about a year she stayed with her husband, General Blavatsky, in Tiflis. We know that sometime around 1859 she became very ill and came close to death. This period in Russia is significant because the mediumistic or psychic powers she was said to have displayed since childhood now became particularly prominent; this, at least, is what we can deduce from the account of her sister, Vera Petrovna de Jelihowsky (or de Zhelihovsky, 1835-1895), who, when questioned on the subject, replied: 'I remember that when addressed as a medium, she (Mme. Blavatsky) used to laugh and assure us she was no medium, but only a *mediator* between mortals and beings we knew nothing about'. The types of phenomena that were produced during the time of Blavatsky's stay in Pskov are classified and described by Madame de Zhelihovsky as follows: '1) direct and perfectly clear written and verbal answers to mental questions – or "thought-reading"; 2) prescriptions for various diseases, written in Latin, and subsequent cures; 3) private secrets, unknown to all but the interested party, divulged, especially in the case of those persons who mentioned insulting doubts; 4) change of weight in furniture and of persons at will; 5) letters from unknown correspondents, and immediate answers written to queries made and found in the most out-of-the-way mysterious places; 6) appearance and *apport* of objects unclaimed by any one present; 7) sounds as of musical notes in the air wherever Mme. Blavatsky desired they should resound' (Sinnett, *Incidents*, 86). Blavatsky's exact whereabouts between 1863 and 1867 are not altogether certain, but it is reasonable to assume that she left her family and Russia around 1863 and traveled to Italy, the Balkans, Serbia, Egypt, and Persia (Iran). It was an eventful period because of her association with a revolutionary Italian society, the Carbonari, on the one hand, and a controversy surrounding her relationship to her adolescent ward, Yury, on the other. The child was apparently in her care since 1862, when she resided in Tiflis. Although he was the son of Baron Nicholas Meyendorff and an unknown mother, suspicion was placed on Blavatsky as being the actual mother by the sister-in-law of the Baron, who claimed that the latter had an ongoing affair with Blavatsky since she arrived in Russia in 1858. Yet, a medical examination in 1885 revealed that Blavatsky suffered from *Anteflexio Uteri*, 'most probably from the day of her birth', so it is unlikely that the child was hers.

When the boy died in 1867, she arranged, with the assistance of her long-time friend, Agardi Metrovitch, to have him buried in Russia. It was apparently this same Metrovitch who introduced Blavatsky to the cause of the Carbonari, but his identity and his relationship to Blavatsky remain unclear. According to Blavatsky herself, the two had been acquainted since 1850, and she probably knew that this revolutionary half-Italian had ties to the society that included among its membership Giuseppe Garibaldi (1807-1882) and Giuseppe Mazzini (1805-1872), and whose purpose was to break the hold of the Papacy over Italy. Blavatsky actively supported Metrovitch's cause, even to the extent of participating in the battle of Mentana (November 3, 1867). This battle was lost to the Papists and the French, and Blavatsky received multiple wounds, including being shot in the leg and right shoulder and stabbed near her heart.

Blavatsky's travels resumed in early 1868. She left Italy, traveling to India by way of Constantinople; this time she claimed that she was accompanied by her Master. After having reached India later in the year, she claims to have entered Tibet and resided both in Greater and Little Tibet, even staying at the home of the Master Koot Hoomi in Little Tibet and in Shigatse in southern Tibet, the latter close to Tashilhumpo, the residence of the Panchen Lama.

The first so-called Mahatma letter, or letter from the Master KH (Koot Hoomi), arrived at the home of Blavatsky's aunt, Nadyezhda Andreyevna de Fadeyev in 1870. It stated that Helena would be returning shortly to her family. This she did after journeying to Greece and Cyprus at the end of 1870, where she claimed to have met the Master Hilarion (Illarion). From Piraeus (Greece) she boarded the SS *Eunomia* for Cairo in July 1871. On route, the gunpowder magazine in the cargo hold blew up, causing many deaths. Blavatsky was rescued and brought to Alexandria, arriving in Cairo toward the end of the year. Here she made the acquaintance of Emma Cutting, who is known to Theosophists by her married name, Mme. Alexis Coulomb, and who would cause untold grief to Blavatsky thirteen years later.

While in Cairo, Blavatsky founded the "Société Spirite", a society that seems to have had a double agenda: a public and a private one. The first involved the public investigation of passive reception by mediums of spirit communications – a reflection of the → spiritualism that was practiced in the United States since 1848. There appears to have been another agenda, however, that was known only to certain individuals in the society

(including Blavatsky and Metamon, the same Copt magician whom Blavatsky met in 1850). It involved conducting undisclosed occult practices that may very well have been similar to those practiced in the early → Theosophical Society. As far as Blavatsky was concerned, the importance of the “Société Spirite” lay in its private aspect. Within a few months, perhaps weeks, the formal society all but disappeared.

By April 1872, Blavatsky again left Egypt, traveling to Odessa to reunite with her family, but making a number of stops on the way. In March or April 1873 she traveled to Paris via Bucharest before finally taking a passenger liner to the United States, where she arrived on July 7, 1873. This journey marks the conclusion to her earlier life of travel and the beginning of the next major period of her life.

What are we to make of this extended period of travel by a girl who began her journeys as a recently married teenager and who later claimed to have resided in many of the most inaccessible places on earth, sometimes disguising herself as a man, once involved in a battle, meeting with practitioners of magic and the occult arts, and spending the better part of twenty years as a veritable gypsy? In psychological terms one might speak of travel compulsiveness, but if we take Blavatsky’s own words seriously, this compulsion had a purpose. Most of what we know about this period originates from her own reminiscences, from the accounts of acquaintances who affirm having met her during the course of her travels, and from family members who left their own written recollections of her activities. Even if we assume an attitude of healthy skepticism regarding the question of whether all these accounts are to be trusted, it remains that much of it appears to have a basis in fact. Some of Blavatsky’s adventures have been embellished by her, but it seems certain that she met many unusual people and acquired a vast store of esoteric and occult knowledge. Already as a child of fifteen, she claims to have been exposed to an occult library, consisting of several hundred volumes, belonging to her maternal great-grandfather, Prince Paul Vassilyevich Dolgorukov (1755-1837). In all likelihood, this was her first exposure to → alchemy, → magic, and kabbalah [→ Jewish Influences]. Combine this with the psychic abilities that her family claimed she exhibited, and we have the basic conditions for a theoretical as well as practical occultist. Blavatsky’s interests appear to have driven her to seek more knowledge of esotericism and occultism, not just from written sources but also from living teachers. Who these teachers were,

and how they were related to the Theosophical “Masters” who were to play a highly important role in her life, remains a mystery to this day.

Why Madame Blavatsky came to the United States is open to speculation, but in keeping with her propensity for the mysterious, she claimed that she had been sent by her Lodge either to reveal the truth about modern spiritualism or to form a secret society. The events leading up to the foundation of what would become known as the Theosophical Society begin in 1874, with her introduction to Col. → Henry Steel Olcott (1832-1907). According to Olcott’s account in his *Old Diary Leaves* (I, 1f.), their meeting took place in Chittenden, Vermont on October 14, 1874, during his investigation of the spirit or phantom phenomena allegedly occurring at the farmhouse of William and Horatio Eddy. Thus began a lifelong collaboration, sometimes rancorous and turbulent but always productive. Their initial interest involved the investigation of spiritualist phenomena, including the phantom forms at the Eddy brothers’ home in Chittenden, and the reappearance (having first appeared as the spirit guide to Florence Cook in England) of the spirit “Katie King” in Philadelphia through the mediums Mr. and Mrs. Nelson Holmes. There is no doubt that Blavatsky defended → spiritualism in her early correspondence to the New York *Daily Graphic* and spiritualist papers. One example illustrating her high opinion of spiritualism and her belief that the United States was the cradle of that phenomenon appears in the *Spiritual Scientist*, in which she remarks that she ‘came over here [the U.S.] from France with feelings not unlike those of a Mohammedan approaching the birth-place of his prophet’. Comparing these remarks in support of spiritualism, made in December 1874, to those made in February 1875, one can observe a marked change in attitude. In her correspondence of that month with Hiram Corson (1828-1911), a professor at Cornell University, she writes that for her, spiritualism is based not on the modern American variety that began in 1848 but on a much older one, originating ‘from the same source of information that was used by Raymond Lully, Picus della Mirandola, Cornelius Agrippa, Robert Fludd, Henry More, etc. etc. etc.’. Thus she expressed for the first time her concept of an “ancient Spiritualism” or “occultism” [→ occult / occultism] that was later to become the foundation of her theosophy. To Blavatsky, American spiritualism was devoid of ancient wisdom, whereas “ancient Spiritualism” or occultism comprised ‘a system that should disclose . . . the “deepest depths” of the Divine Nature, and show . . . the *real tie which binds all*

things together'. In other words, what we see here is a shift from a form of spiritualism based merely upon investigation of "phenomena" but devoid of doctrinal content, towards one that claims to be rooted in the ancient wisdom of the Western esoteric tradition. Henceforth Blavatsky would continue to emphasize this tradition, while increasingly including Eastern (primarily South Asian) occult teachings as well. By July 1875 the first public statement of her views appears in a response to an article by HIRAF (an acronym for five authors) entitled "Rosicrucianism", which had appeared in the July 1 and 8 issues of the *Spiritual Scientist*. Blavatsky's response, entitled "A Few Questions to 'HIRAF'", appeared in the following two issues (July 15 and 22). For the first time, she presents a rather detailed exposition of her views on occultism and magic – presented by her as the practical and theoretical sides of the Ancient Wisdom. Because it is a response to → Rosicrucianism as interpreted by HIRAF, one important idea evident from this article is her acknowledgement of the existence of a number of "Brotherhoods" devoted to the "Wisdom or Occult tradition", going back as far as the Egyptian → Ophites and persisting through the "Fire-Philosophers" or Paracelsists and European alchemists.

Staying at 46 Irving Place in New York during much of 1875, Blavatsky attracted to her apartment a number of interested individuals curious to hear her views on occultism. From the early months of 1875, she was also involved in the writing of her first major work, *Isis Unveiled*. In addition to this creative activity, she experienced a rather tumultuous period involving domestic problems (her marriage with and divorce from a Russian citizen, Michael Betanely, within the space of a few months) and a serious leg injury caused by a fall.

The meetings at her apartment led to the formation of the Theosophical Society later in 1875. On September 7, a lecture was given here by George Henry Felt (1831-1906) entitled "The Lost Canon of Proportion of the Egyptians". According to Felt's own account, he successfully proved the existence of 'elementals or intermediates, or elementary or original spirits' existing on various levels from 'inanimate nature through the animal kingdom to man'; furthermore, Felt affirmed that these beings were represented in the Egyptian zodiacs (i.e. the forms appearing there were not figments of the imagination but real creatures), and that they could be evoked by chemical means. This lecture incited Col. Olcott to suggest, in a note passed to Blavatsky during the meeting, whether it would 'not be a good thing to form a Society for this kind

of study?' Blavatsky agreed to the proposal, and the other members of the audience concurred, thus initiating the process of formally establishing a society which would soon come to be known as the Theosophical Society, which was to be organized on October 30 and 'constitutionally perfected' on November 17, 1875.

The second significant event that occurred during the New York years (1873-1878) was the publication of *Isis Unveiled* on September 29, 1877. A monumental work in scope, the text extended over 1268 pages in two volumes: the first volume called "The 'Infallibility' of Modern Science" and the second called "Theology". Originally entitled *The Veil of Isis* (which remains on the heading of each page), it had to be renamed once it was discovered that this title had already been used for an 1861 Rosicrucian work by W.W. Reade. Many years later, within a month of her death, Blavatsky revealed that the text was not written primarily for the general public but rather for the members of the Theosophical Society; and she added that much of the work was edited by Col. Olcott and Alexander Wilder (1823-1908) – an old acquaintance of Olcott's, and a member and later Vice-president of the Theosophical Society. Blavatsky writes in the Preface that *Isis Unveiled* 'is a plea for the recognition of the Hermetic philosophy, the anciently universal Wisdom Religion, as the only possible key to the Absolute in science and theology'. This Wisdom Religion is identified with magic, considered in ancient times 'a divine science which led to a participation in the attributes of Divinity itself'. Volume one is devoted to the hidden and unknown forces of nature, discussing subjects such as phenomena and forces (Chapter 2), elementals and elementaries (Chapter 7), cyclic phenomena (Chapter 9), psychic and physical marvels (Chapter 11), and the Inner and Outer Man (Chapter 10), all accompanied by a vast array of supportive and incidental knowledge – ancient and modern, Western and Eastern, esoteric and exoteric. Volume two discusses similarities of Christian scripture, doctrine, history, and personalities with non-Christian systems such as Buddhism, Hinduism, the Vedas, and Zoroastrianism, all based on the notion that they share a common origin referred to as the 'primitive "wisdom-religion"'.

Sometime during the writing of *Isis Unveiled* the idea came up (probably first in Olcott's mind) of a move to India, and eventually this plan was confirmed when the Masters' "Orders to make ready" to leave New York were recorded in his diary on May 24. Shortly thereafter (July 8, 1878) Blavatsky became a naturalized U.S. citizen.

Toward the end of the year, Blavatsky and Olcott departed from New York harbor to England, arriving from there in Bombay on February 16, 1879. Blavatsky was never to return to the U.S. again.

After their arrival in Bombay, accompanied by considerable publicity in the Indian newspapers, Olcott and Blavatsky settled in a home on Girgaum Back Road. One of the newspapers, *The Pioneer* (Allahabad), gave especially favorable accounts of the Theosophists because its editor, Alfred Percy Sinnett (1840-1921), had had an interest in the Theosophical Society and its founders as a result of his involvement with spiritualism. Sinnett's interest in Theosophy eventually led to his and Mrs. Sinnett's meeting the Theosophists for the first time in December 1879, thus resulting in Blavatsky's short-time involvement with *The Pioneer*. She contributed a number of letters, unsigned articles on Russian subjects, and an eleven-part translation of "The Travels of Colonel Grodekoff".

In October 1879, Olcott and Blavatsky initiated a monthly magazine designed as the main organ for the Society, *The Theosophist*, with an initial circulation of 400 copies. Prior to this event, however, far more ambitious plans were being developed. Olcott records in this diary entry of May 23, 1879, that Blavatsky began work on 'her new book on Theosophy', an undertaking that was to culminate in the publication of her greatest work, *The Secret Doctrine*.

In 1880, two significant events occurred. The first was Blavatsky's and Olcott's first tour of Ceylon (Sri Lanka), which resulted in both of them formally accepting the Five Precepts (*pansil*; Pali: *pañcasīla*) and presumably the Triple Gem as well. Thus they formally became Buddhists; although in Blavatsky's case one should perhaps say that she reaffirmed her Buddhism, since she already identified herself as a Buddhist during her New York residency in the 1870s. The outcome of this visit was the establishment of branches of the Theosophical Society in Ceylon and the initiation of a Buddhist revival that, through the sustained efforts of Col. Olcott, would continue to develop throughout the 1880s and 1890s.

In October 1880, a significant event took place: the receipt of the first of a long succession of letters from the Masters K.H. (Koot Hoomi) and M. (Morya) to Sinnett and others. K.H., M. and other Masters, believed to belong to an "Occult Brotherhood" in the East, were assumed to have given their philosophical and ethical teachings to the world through the medium of the Theosophical Society; they were also believed to have been the teachers of Blavatsky, who had first become their pupil (*chela*)

and who had received training and instruction during her visit to Tibet. From the first letter received by Sinnett on October 15, 1880 to the final letter of the series in 1886, 145 were written. The esoteric teachings contained in these letters were summarized by Sinnett in his book *Esoteric Buddhism* (1883).

The year 1884 was eventful for the Founders and for the Theosophical Society. Early in February Olcott and Blavatsky visited Europe – Blavatsky for medical reasons, Olcott on Society business and as an advocate for the Buddhist cause in Ceylon. While in England, Olcott had to intervene in a struggle that was causing considerable distress within the British Theosophical Society. The latter, formed in 1878, consisted in the early 1880s of a small, intellectual group of individuals whose president, George Wyld (1821-1906), attempted to establish an independent Society more in step with the teachings of Christianity and less with the "atheism" of Blavatsky and her anti-Christian views. Having failed, he resigned in 1882. A similar crisis within the Society developed over the next two years involving Mrs. → Anna Bonus Kingsford (1846-1888) and her close associate, Edward Maitland (1824-1897), resulting in the formation of the Hermetic Society [→ Hermeticism and Hermetic Societies]. Early in May, Olcott, Blavatsky and other members of the Theosophical Society assented to a series of meetings with a committee formed by the Society for Psychical Research (established in 1882) on the subject of psychic phenomena, including 'the phenomenal receipt of written documents' and 'the precipitation of Mahatmic writing within closed letters from ordinary correspondents while in transit through the mails'. Blavatsky was questioned in Cambridge in August 9th, and the S.P.R. committee was favorably impressed with her responses. Its 'preliminary and provisional' report came out in December 1884.

In the month following the interview, an explosive event in India lent support to the negative conclusions of a second S.P.R. Report, issued in 1885. These developments were to leave a permanent stain upon the reputations of the Theosophical Society and Blavatsky. Under the title 'The Collapse of Koot Hoomi', *The Madras Christian College Magazine* of September 1884 published the first part of an exposé containing fifteen letters purportedly written by Blavatsky to Emma Coulomb. The letters were intended to be proof of Mme. Coulomb's charge that Blavatsky had committed fraud. Blavatsky vehemently objected to the allegations, but did not bring charges against Mrs. Coulomb and her husband, Alexis, and the magazine.

This was because Olcott had convinced her to leave the decision to a special Committee comprising, among others, a number of prominent Indian legal experts and government officials. The Committee suggested not prosecuting the defamers due to the inherent legal dangers to plaintiffs in libel cases. This position was also supported by the delegates at the 1884 Annual Convention of the Theosophical Society, held in December.

Meanwhile, the S.P.R., which had concluded in its first report that there was some evidence that could not be discounted, decided to continue its investigation by sending an observer, Richard Hodgson (1855-1905), to India in November 1884. He remained there for three months, investigating the charges by the Coulombs; his goal was to determine 'the competency of the witnesses to phenomena, and to ascertain, if possible, the trustworthiness in particular of three primary witnesses, viz., Mr. Damodar K. Mavalankar, Mr. Babajee D. Nath, and Colonel Olcott'. Hodgson's conclusions, issued in December 1885, could not have been more damaging and devastating to Blavatsky and the Society. They included the following: (a) the letters to the Coulombs were written by Blavatsky, (b) the Coulombs were Blavatsky's accomplices in the production of fraudulent phenomena, (c) the primary witnesses to the existence of an Occult Brotherhood, including Blavatsky, had made false statements, (d) the Masters Koot Hoomi and Morya must be fictitious, since their handwriting resembled M. Damodar's and Blavatsky's, (e) no instance of phenomena was witnessed by Hodgson, (f) the objects of the Theosophical Society were political and Blavatsky was a Russian spy. Hodgson concluded with this statement: 'But acting in accordance with the principles upon which our Society [the S.P.R.] has proceeded, I must express my unqualified opinion that no genuine psychical phenomena whatever will be found among the pseudo-mysteria of the Russian lady *alias* Koot Hoomi Lal Sing *alias* Mahatma Morya *alias* Madame Blavatsky'. The S.P.R. Committee concluded: 'For our own part, we regard her neither as the mouthpiece of hidden seers, nor as a mere vulgar adventuress; we think that she has achieved a title to permanent remembrance as one of the most accomplished, ingenious, and interesting impostors in history'.

Blavatsky returned to India at the end of 1884, but within a month she became gravely ill, causing her to resign from the office of Corresponding Secretary of the Society on March 21. Shortly thereafter, she left India for the last time, traveling to Europe. After a sojourn of three months in Italy,

she decided to settle in Würzburg (Bavaria), in August 1885. By the end of the year, she was immersed in the writing of her *magnum opus*, *The Secret Doctrine*, aided by the recent arrival in Würzburg of Countess Constance Wachtmeister (1838-1910).

For the next two years, *The Secret Doctrine* was to be Blavatsky's major project. From Würzburg she moved to Ostend (Belgium) in July before being persuaded by some English Theosophists to settle in London. This she did in May 1887, residing first at the home ("Maycot") of Mabel Collins (1851-1927), the author of *Light on the Path*. Within a few days (on May 19), the Blavatsky Lodge was established, and within a few months (September), the magazine *Lucifer* was founded to provide 'some sort of public propaganda' before the publication of *The Secret Doctrine*, which took place a year later. If the contents of the magazine did not excite the general public, the title certainly did.

In September of 1887, Blavatsky and the Blavatsky Lodge moved to 17 Lansdowne Road, the focal point of Blavatsky's activities for the next two-and-one-half years before she relocated to 19 Avenue Road, St. John's Wood, London in 1890, which became the new headquarters of the Blavatsky Lodge as well as of the British Section and of European headquarters. The headquarters incidentally was the home of → Annie Besant (1847-1933), a recently recruited member (May 1889) and rising star of the Theosophical Society. Thirteen months after the establishment of the Lansdowne Road residence as headquarters of the Blavatsky Lodge (October 9, 1888), a second significant event occurred: the establishment of a new organization that was closely affiliated with the Theosophical Society. This organization, the "Esoteric Section of the Theosophical Society" (E.S.), had as its goal the promotion of 'the esoteric interests of the Theosophical Society'. Blavatsky became Outer Head (the Inner Heads were the Masters or Mahatmas), with the responsibility of giving esoteric teachings to a small group of students who desired chelaship. The E.S. was independent of the administration of the Theosophical Society, or in the words of Olcott, it was 'not the T.S.; nor that its rules are binding only upon members belonging to that special school; nor that it would be violation of the T.S. constitution for it to interfere with their rights of private judgment; nor that the President-Founder is compelled to guarantee to every individual member, of whatsoever religion, race, sex, or color, his or her personal liberty of belief and speech'.

A few days after the founding of the Esoteric Sec-

tion came the publication of *The Secret Doctrine*, consisting of two volumes with a total of 1474 pages. The first volume, *Cosmogogenesis*, discusses cosmic evolution, expanding upon the contents of *Isis Unveiled*, while the second volume, *Anthropogenesis*, discusses the evolution of Humanity through a succession of Root Races, five of which have already appeared. Based on stanzas taken from *The Book of Dzryan* (seven in volume I and twelve in volume II), a work unknown to modern scholarship, said to be composed by an unattested people and in a language unknown to philosophy, *The Secret Doctrine* (SD) contains the following ideas: 1) There exists a single, Supreme, Eternal, Immutable, Unknown and Unknowable, Infinite Principle or Reality (SD I:114); 2) There is a fundamental unity to all existence (SD I:120, 276); 3) The eternal, manifested Universe and everything within it is subject to the ‘law of periodicity, of flux and reflux, ebb and flow’ (SD I:17); 4) The evolution of nature – material and spiritual – reflects progressive development and not merely repetitive action (SD I:43, 277-78; II:653); 5) The evolution of the individual is not limited to one life but continues through innumerable lives made possible by the process of → reincarnation, i.e. the entrance of Self – the trinity of Spirit, Soul, and Mind – into another (human) body (SD II:302-306); 6) This evolution is brought about by the Law of Cause and Effect, or Karma – good actions leading to good consequences, bad actions to bad consequences – thus assigning full responsibility to the individual who performs the actions (SD I:639, 642-47; 7). The structural framework of the universe, humanity included, is by nature septenary in composition (SD II:605-41; 8). The cyclic, evolving universe is hierarchical in constitution, each component – for instance, the planets and the sun in our Solar System – consisting of seven constituents or globes, thus illustrating the correspondence between the microcosm of the human being and the macrocosm of the universe (SD II:68f., 434f.; 9). Human evolution on the Earth is taking place within seven Root Races, each of which is divided into seven sub-races. In our present state of evolution, we belong to the fifth sub-race (the Anglo-Saxon) of the fifth Root Race (SD I:610; II:1f., 86f., 300f., 434f., 688f.); 10) The individual is a microcosm, a ‘miniature copy of the macrocosm’ (SD I:274; 11). The universe is guided and animated by a cosmic Hierarchy of sentient beings, each having a specific mission (SD I:274-77).

Students of *The Secret Doctrine* soon began to ask questions about its contents. Blavatsky’s responses during meetings of the Blavatsky Lodge

in the first half of 1889 led to the publication, in two parts, of the *Transactions of The Blavatsky Lodge of the Theosophical Society* in 1890 and 1891. They cover issues concerning the heart of *The Secret Doctrine*: the “stanzas of Dzryan” included in the first volume.

In July 1889, Blavatsky, while visiting Fontainebleau for rest and recuperation, wrote or “translated” excerpts from “The Book of the Golden Precepts”, entitled *The Voice of the Silence*, allegedly part of the same series of texts from which the stanzas of the *Book of Dzryan* had been derived. Some stanzas she claimed to be pre-Buddhist, others Mahāyāna Buddhist in spirit. The first part, from which the title of the whole work is derived, highlights the progression of knowledge from the ordinary, waking (ignorant) state to the fourth or dreamless state of higher spiritual consciousness, until finally, in Blavatsky’s words, your ‘Self is lost in SELF, *thysself* unto THYSELF, merged in THAT SELF from which thou first didst radiate’. The second part, “The Two Paths”, refers to the ‘*Open PATH*’, i.e. the path of the layman or the exoteric path, that ‘leads to the changeless change – Nirvāna, the glorious state of Absoluteness, the Bliss past human thought’; and it distinguishes this from the second Path of ‘RENUNCIATION’, the ‘Path of Woe’, a ‘*Secret Path* [which] leads the Arhan to mental woe unspeakable’ but which also leads to ‘Paranirvānic’ bliss. The third part, “the Seven Portals”, purports to bring wisdom to the aspirant through ‘a golden key that openeth its gate’, which echoes in part the six *pāramitās* or perfections, discussed in great detail in the *Bodhicaryāvatāra* by the 8th century Buddhist poet Shāntideva.

The same month also witnessed the publication of *The Key to Theosophy*, a popular introduction to the “Wisdom Religion” or Theosophy. Among other subjects, it discusses the septenary nature of humanity and earth, reincarnation, post-mortem states, mind and ego, and gives information about the Theosophical Society and the Theosophical Masters or Mahatmas.

Although Blavatsky’s writing career was open to criticism by non-Theosophist theologians, scientists, and academics, by far the most serious challenge to the credibility of her major contributions – *Isis Unveiled*, *The Secret Doctrine*, and *The Voice of the Silence* – came from a spiritualist, William Emmette Coleman (1843-1909), who claimed that she had plagiarized many of her teachings from sources such as Ennemoser’s *History of Magic* and *Demonologia*, Dunlap’s *Sod: The Son of Man* and *Sod: The Mysteries of Adoni*, King’s *Gnostics*, and

Jaccoliot's *Christna et le Christ* and *Le Spiritisme dans le monde*. Coleman listed a total of about one hundred secondary sources. Plagiarism has been an issue in Theosophy since the charges first appeared in the late 1880s. Blavatsky's methods of citing sources have been defended by Theosophists, but in all fairness no detailed investigation has even been conducted, nor have criteria been established to prove or disprove the allegations. Interestingly, many of the authors who were allegedly the victims of Blavatsky's plagiarism were alive when the charges were made, yet none indicted her.

A final assault on Blavatsky's character came from one of the leading American Theosophists, Elliott Coues (1842-1899). Having failed to retain a position of authority within the newly reorganized Theosophical Society in America in 1886, and having failed to enlist Blavatsky's aid in his efforts to gain control, Coues, in an article written by him appearing in the New York *Sun* in July 1890, attacked Blavatsky as an imposter and the Society for its teachings. This resulted in a lawsuit initiated in Blavatsky's name against both Coues and the *Sun*. The suit was terminated because of Blavatsky's death on May 8, 1891. Although Coues was unrepentant, the *Sun* did retract the story in a separate suit that W.Q. Judge, the General Secretary of the Theosophical Society in America, brought against the paper, and agreed to publish Judge's sketch of Blavatsky's life, entitled 'The Esoteric She', in the September 27, 1892 issue.

In the year before her death, Blavatsky took on additional administrative responsibilities when she became President of the newly established European Section. In *Lucifer* (July 1890), she declared that she would exercise 'the Presidential authority for the whole of Europe', thus effectively becoming the co-leader of the Theosophical Society and declaring independence from Adyar.

On April 26, symptoms of influenza appeared, and her condition grew steadily worse. Blavatsky's final days were described by Laura Cooper, who, with Claude Falls Wright and Walter Richard Old, witnessed her passing. Over one hundred notices appeared in the British press, in addition to numerous letters from Theosophists, all attempting to define Blavatsky's achievements. These achievements, according to the correspondents, were not to be located in her mediumship and psychic abilities, which may or may not have existed; rather, it was in her ability to synthesize with great erudition a vast expanse of knowledge and to articulate the knowledge that she believed to be the Ancient Wisdom of her Masters. Blavatsky's esoteric synthesis has served as a basic source for later esotericists,

literati, scientists, and entire movements, including the → New Age. Unlike most of her contemporaries, she is as visible today as any modern trend-setting guru, and she will most likely remain the most memorable and innovative esotericist of the 19th century.

JAMES A. SANTUCCI

Boehme, Jacob, * ca. 24.4.1575 Alt-Seidenberg, † 17.11.1624 Görlitz

1. LIFE 2. BOEHME'S PERSPECTIVE
3. AURORA 4. THREE PRINCIPLES
5. SUBSEQUENT WRITINGS 6. CONCLUSION

Shoemaker, Lutheran dissenter, and author of numerous writings that exercised a profound and lasting influence on German Spiritualism and → Pietism and its equivalents in other countries, on German literature and philosophy, as well as on mysticism and → Christian Theosophy.

1. LIFE

Despite a rich mythic and legendary overlay, the salient facts of Boehme's life are largely documented. He was born into a prosperous and respected Lutheran peasant family. As a young man, he was given the relatively thorough elementary school education that is reflected by his fine writing skills in German. He took up the shoemaker's trade

as an apprentice and journeyman before acquiring rights of citizenship as a master shoemaker in Görlitz in 1599. In that year, his unexceptional course of life appears to have become firmly established when he purchased a house and married the daughter of a prosperous butcher, out of which union the first of four sons was born in 1600. Although by his twenty-fifth year he was very much engaged in the normal life of his time, place, and station, he was religiously troubled and beset by deep melancholy. In 1600, the luminous experience which launched his career as a visionary author took place. In the famous version recounted by Franckenberg, the young shoemaker was seated in his shop when the gleam of light (presumably a reflection of the sun) in a tin or pewter vessel gave him the impression of looking into a concealed "center of nature", a sense that seemed confirmed during a walk out into the countryside. Boehme's own account in chapter nineteen of *Aurora* recollects a prior melancholy sense that God was remotely situated in the heavens above and that the poor human beings were abandoned in a harsh world down below, in which true piety was not required. Upon realizing that the "true heavens" were everywhere, he felt himself joyously embraced by divine love. This experience initiated his path to authorship and anticipated his themes of good and evil, divine presence, and natural or cosmic intuition.

The two parallel strands – involvement in the life of his times and apparent singularity of inspiration – traverse his career and constitute the central challenge to scholarship. Both as recounted in Franckenberg's early biography and recalled by Boehme himself, the experience of 1600 was a seminal one. From 1600 until 1612, he wrote and rewrote drafts of the book to which he gave the title *Morgen Röte im aufgang* (Morning Glow in the Ascendant). This work circulated beginning in 1612 as the 400-page fragment known by the equivalent title *Aurora*. Circulating in hand-copied manuscripts, *Aurora* caused a local and regional stir in these years of religious and political tension. When a copy of the manuscript came to the attention of the Lutheran chief pastor of Görlitz, Gregor Richter, the humble shoemaker was formally reprimanded by the city council for his unauthorized religious publication.

Authorial silence was imposed and apparently maintained until around 1618, when he resumed composing and circulating religious treatises. Thereupon began an uninterrupted authorial output that coincided with the first, Bohemian phase of the Thirty Years' War. Supporting himself and his family by mercantile activities, Boehme wrote

and disseminated numerous tracts amounting to thousands of pages. *Beschreibung der Drey Principien Göttliches Wesens* (Description of the Three Principles of Divine Being, 1618), the initial treatise of this phase, is pivotal within his development. Most important among the writings that follow are *Vom dreyfachen Leben des Menschen* (On the Threefold Life of Man, 1620), *Vierzig Fragen von der Seelen* (Forty Questions about the Soul, 1620), *Von der Menschwerdung Jesu Christi* (On the Human Genesis of Christ, 1620), *Von sechs theosophischen Punkten* (On Six Theosophical Points, 1620), *De Signatura Rerum* (On the Signature of Things, 1622), and *Mysterium Magnum* (The Great Mystery, 1623). A number of longer works were written as responses to doctrinal controversies in which the author became involved: *Unterricht von den letzten Zeiten* (Teaching on the Final Times, 1620), *Schutz-Schriften wieder Balthasar Tilken* (Apologies against Balthasar Tilke, 1621), *Anti-Stiefel: Bedencken über Esaiä Stiefels Büchlein* (Anti-Stiefel: Remarks about Esaiä Stiefel's Booklet, 1621/22), *Von der Gnaden-Wahl* (On the Election of Grace, 1623), and *Von Christi Testamenten* (On the Testaments of Christ, 1623). The *Theosophische Sendbriefe* (Theosophical Letters, 1618-1624) document his interactions with the like-minded or with opponents and shed light on common experience at the start of the Thirty Years' War. A number of writings emerged as letters but can stand on their own as treatises. These include some essay-like tracts that exerted an influence on posterity, such as *Kurtze Erklärung von sechs mystischen Punkten* (Short Explanation of Six Mystical Points, 1620), a work that came to the attention of the young Schopenhauer and anticipated the latter's mature metaphysics of will. A single collection of mainly devotional tracts, *Der Weg zu Christo* (The Way to Christ, 1624), was printed during his lifetime. Its appearance in print touched off the final rounds of his conflict with Lutheran orthodoxy: his late controversy with the pastor of Görlitz which is documented in his *Schutz-Rede wieder Gregorium Richter* (Defense against Gregor Richter, 1624), as well as his journey to Dresden to answer questions from and direct an appeal to the new clerical and secular overseers of a Lusatian province conquered by Lutheran Electoral Saxony in 1620. Upon his death of natural causes at the age of forty-nine, his reputation was high, though contested; and it was soon to be spread abroad by friends including Franckenberg and Dr. Balthasar Walter. In the subsequent 17th century, Boehme's fame spread through much of Germany, as well as to Holland, England, France,

Russia, and America. He had a significant impact on sectarians, especially those of the Spiritualist or Pietistic type, and on religious authors, including the German Baroque poets Angelus Silesius and Quirinus Kuhlmann. Because of the richness of Boehme's thought and writing, it stimulated and influenced various strands of Christian mysticism, theosophy and dissent, including the English dissenters of the mid-17th century, the ecumenical and kabbalistic thought of → Oetinger, the French Christian philosophy of → Saint-Martin, and the mysticism of the Russian Berdyaev, among others. Boehme's influence declined in Germany after the 17th century. He was known during the Enlightenment in Germany, but was regarded less and less favorably. Leibniz could still write respectfully of various German mystics and Pietists including Boehme. Herder at least knew of him; but Hamann, whose own thought no doubt has considerable affinities with Boehme's, condemned him for his obscurities. Subsequent phases of his influence arose in the Romantic era [→ Romanticism] and around the beginning of the 20th century. Since this influence frequently resulted in a more distanced reinterpretation, it will be discussed below.

2. BOEHME'S PERSPECTIVE

Though massive, complex, and frequently inscrutable in detail and expression, Boehme's oeuvre reflects its historical origins and can be studied to highlight the source materials of its synthesis. The most fundamental origin and source is the Lutheran Reformation, with its elevation of scriptural and lay authority and its agony as the transfer of authority led to strife and confusion instead of to the harmony and renewal of spiritual life anticipated by adherents of the new faith. Before Boehme, conflicts within the Reformation had encouraged the antidoctrinal and sometimes mystical writings of → Paracelsus, Sebastian Franck, → Weigel, and others. Moreover, much of the history of German mysticism can be understood as an attempt to retrench articles of faith during the epochs in which these were undermined in their universality or in their apparent coherence by internal or external conflicts.

The Lutheran Reformation, in bestowing authority and spiritual autonomy on a Bible-reading lay priest, confronted the young Boehme with a set of contradictions which are worked out in his writings. If truth is integral and accessible, how do conflicts over doctrine arise and how can they be resolved? Given the premises of Lutheran theology that Boehme accepted, the answer could only lie in

a more deeply and contextually enriched and spiritualized interpretation of the Bible. It could hardly seem satisfying to maintain a dual standard of two truths, according to which one truth was found in Scripture and another in the knowledge of nature or the experience of life. The injunctions to study nature, know thyself, and heed Scripture must all lead to the same luminous conclusion. This direction of thought correlated with Luther's teaching of divine omnipresence. This doctrine was formulated by Luther to justify his challenged doctrine of Christ's real presence in the bread and wine of Communion, but it was capable, independently of Luther's intentions, of being vivified in symbolic images and elaborated into a kind of religious metaphysics. The resultant metaphysics holds that the deeper core of truth that lies concealed beneath the outer letter is identical with the hidden substrate of nature and with the innermost core of the soul. The inner truths of nature, the soul, and Scripture are at root identical for the simple reason that the same hidden deity is present in all things created or eternal. By the same token, one and the same misapprehended truth had to lie at the root of all conflicting sources of authority, be they scriptural, natural-philosophical, existential-introspective, or even doctrinal. Doctrine – the province of a professional clergy (which Boehme despised as an instigator of religious strife) – fails to apprehend the deeper truth that is revealed by the Holy Spirit and witnessed in external nature and self-knowledge. Doctrine, as the province of the professional clerical class, is exclusionary and authoritarian. By contrast, the writings of Boehme, understood to be guided by the Holy Spirit and tutored by a nature construed as the visible symbol of God, were intended to be non-exclusionary and antiauthoritarian (though certainly their tolerant ecumenicism was doomed to fail almost from the start). Boehme's thought is understood by him as a deconcealment of a deeper truth that encompasses divergent doctrines in a broader harmony. Hence, the coherence of his underlying themes of nature theology, theogony, and theophany fulfills for him a dialectical progression from the simplicity of the divine source to a worldly multiplicity with its confusions, conflicts, and bifurcation of good and evil, to a resolution and synthesis, with a restored eschatological unity which is projected back onto a transcendent plane.

As an intellectual biotope, Görlitz was remarkably rich in humanistic, clerical, and alchemistic conveyers of knowledge and ideas. We can assume that Boehme's writings tapped into this rich soil. His ability to immerse himself in and draw on the

half-clandestine circles is extraordinary, but not without equal in the history of knowledge. Interpreting Boehme is accordingly like interpreting other literature from a remote period. Its historical context is decisive. A hermeneutic approach crediting the author's divine inspiration is appropriately complemented by a sociohistorical approach which may ignore claims of special inspiration. As in Bible scholarship, skeptics and believers can proceed in fertile collaboration. It is only the interpretation that disregards the writings, or projects extraneous constructs onto them, that precludes a shared endeavor. In order to do justice to the express intention of Boehme's work, it is especially necessary to consider not only the originality of his theories but also their roots in the Reformation mainstream, since, for all his idiosyncracies, Boehme is overt in his allegiance to Lutheranism, distinguishing his faith from that of Calvinists, Catholics, and sectarians of several persuasions.

3. AURORA

Boehme's *Aurora* is seminal. The subtitle of this fragmentary work promises to bring to light the "Root or Mother of Philosophy, Astrology, and Theology", as well as a "Description of Nature". The work also undertakes to clarify the relationship of good and evil and promises to reveal eschatological dimensions. Not unlike Hegel's philosophy, the theosophy of Boehme aspires to encompass in essence everything known: as an evolving whole in which the work itself serves as a keystone and final proof, anticipating its own eschatological fulfillment. For Boehme, knowledge resides in the intuited parallels of Scripture, celestial and earthly nature, divinity, and humanity. "Philosophy" in his usage includes not only his intuitive grasp of nature, but also an increasingly informed borrowing from Paracelsus and alchemical philosophy [→ Alchemy]. → "Astrology" gives voice to an echo of the traditional planetary influences that go back to Ptolemy's *Tetrabiblos* (the "source spirits" with their equivalent qualities), as well as to an idiosyncratic understanding of the new heliocentric cosmology. "Theology" includes Boehme's unorthodox defence of his own Lutheranism, with its controversial doctrine of the real presence of Christ's body in the Eucharist, as well as the heterodox Spiritualism Boehme inherited from Valentin Weigel. Although it is certain that Boehme knew of the writings of both Weigel and Paracelsus, it is not known when the acquaintance began or based on which writings. Boehme's extensive contemplation of "the locus of the world" in *Aurora* suggests an early familiarity with Weigel's

Vom Ort der Welt (On the Place of the World, 1576). Boehme's sophiological speculation on the "Noble Virgin of Divine Wisdom" in *The Three Principles* echoes an epistolary exchange that took place between Weigel and the Görlitzer Abraham Behem, an older contemporary of Boehme. The teaching of the first Adam prior to the fall from grace could be of Kabbalistic origin, but it might also signal the influence of Gregor of Nyssa or → Johannes Scottus Eriugena. Though initially reluctant to acknowledge sources other than nature and the Holy Spirit, Boehme admits having studied (without satisfaction!) the works of many "high scholars". His first writing could hardly have been more frank in declaring its intention to harmonize divergent spheres of knowledge.

After the eschatological contextualization of its preface, the *Aurora*-fragment of 1612 begins by proclaiming that, if illuminated by God, one can research the divine being hidden in nature. This is done by means of a phenomenological reading of natural things: these are found to consist of "qualities" or "forces", which are in turn grasped in a reified form as source-spirits (*Quellgeister*), of which the author recognizes seven. The spirits or qualities vary somewhat in description but are sufficiently constant to give his thought its peculiar character. Turning attention to the manifest relations of the macrocosm of earth and the heavenly bodies, *Aurora* discovers in the solar system a visible symbol of the Trinity (a notion found also in Kepler's *Epitome of the Copernican Astronomy* in this same period). *Aurora* also accepts the symbolic and real centrality of the sun in the solar system. This counterintuitive image of things implies that the world is maintained in its stable condition by invisible forces. Therefore, the seven qualities or forces are elaborated into a microcosm of divine being, a kind of dynamic and nature-generating atom of all things and processes: the dry (saturnine) quality is superseded by the sweet quality and the bitter quality. A flash bifurcates the process or interaction of the qualities, giving rise to the qualities corresponding to water or fire. The fifth quality of love is followed by the sixth, known as "sound" (*Ton*) or "mercury" (*Mercurius*) and the seventh (*Corpus*). In the same way that the solar system or the revolving heavens can be said to be a created image of the uncreated God, the sequence of qualities is both manifest in time and a pattern of eternity. In making sense of this seemingly unmotivated sequence, it is helpful to notice how the individual qualities are linked with traditional planetary qualities in chapters 20 and 21. With slight variations, the seven qualities develop as the

trunk of Boehme's inspiration, onto which most other terms of speculation are grafted and out of which the countless individual expressions of his thought branch off or blossom. In *Aurora*, the force-qualities appear in two very different substantive embodiments: as the world of the angels (who are either good in their obedience to God, or evil, as the spirits corrupted by obedience to the fallen Lucifer). The angels have anthropomorphic aspects that allow their world to serve either as a positive model for human society or as a warning against sinful pride, evil hostility, and wanton tyranny. In *Aurora*, the force-qualities are also generalized and understood as the metaphysical substance known as *Salitter*. Like the angels, *Salitter* exists in good and evil or eternal and fallen variants. *Salitter* is another name for *sal niter* or *niter*, a substance of interest to Paracelsus both for its chemical properties and eschatological implications, and about which the alchemists of Boehme's day were formulating sensational theories.

The avantgarde heliocentrism and alchemy of *Aurora* testify to its topicality with respect to the scientific culture of the time. The depiction of the angels as a utopia of freedom and ordered obedience to the sovereign deity echoes the political ambience of desperate optimism during the interval between the death of Rudolf II and the coronation of Matthias as the new Holy Roman Emperor (the compositional dates cited in the autograph manuscript coincide precisely with the months in question). It was a moment of hope against hope, when the long period of peace in Middle Europe and the ecumenical culture of Rudolphine Prague seemed poised between regression and fulfillment. However, the religious tensions and forces of intolerance were on the rise after the founding of the religious-confessional alliances which initiated the Thirty Years' War in 1618. Boehme's irenic utopia of the angels was only one of several reform-minded or antiwar tracts published during the second decade of the 17th century. The same decade saw the publication of the Weigelian or pseudo-Weigelian posthumous tracts against war and orthodoxy, as well as the Rosicrucian manifestoes [→ Rosicrucianism I].

4. THREE PRINCIPLES

When Boehme ended his mandated authorial silence on the eve of and in the first years of the war, his thinking and tone were more somber and esoteric than in 1612. References to persecution, war hysteria, and apocalyptic conflicts darken the exposition of his pivotal *Three Principles of Divine Being* of 1618. The "principles" of his title find

their way into his work at the beginning of this second tract as an interpretation of the Paracelsian *tria prima* of Sulphur, Mercury, and Salt. In connecting these three alchemical substances (found, according to Paracelsus, in all things) with three aspects of the omnipresent trinitarian deity, Boehme was in accord with the master's own statements of intention (though the latter were not widely known at the time). However, the thematic and terminological incorporation of the *tria prima* by Boehme led to an extraordinary complexity. His combination of the three with his seven spirits or qualities could be varied almost endlessly. He utilized these variations as a kind of code in terms of which his discussion of the intractable problems of evil, theogony, creation, and human freedom could be treated. These were the universalized versions of the historical questions of society and the individual in his time. Why did Christian faith lead to religious war? How could obedience to authority be reconciled with spiritual autonomy? How could the supreme source of authority for all Protestants, the Holy Scriptures, be interpreted to reconcile contending doctrines? How could scriptural authority be reconciled with other sources of truth or inner certainty? The resultant synthesis, though surely daunting to modern readers, may have seemed in its very intricacy the more compelling to Boehme's thinking contemporaries in search of alternatives to the inexorable cycle of intolerance and warfare.

The Three Principles introduces the myths of the androgynous Adam and the Noble Virgin of Divine Wisdom into the evolving work. Prior to the hapless Adam whose fall is recounted in Genesis, God had created an angelic Adam to be an eternal angel in place of the fallen angel Lucifer whose fall spoiled the region of the angelic realm that became the place of the created world. This first Adam was not mortal. "He" was neither male nor female: this androgyny and perfection anticipate the state of the reborn souls in heaven whose purpose is to subsist in eternal joy and glorify their Maker. The female aspect of the first Adam was the Noble Virgin of Divine Wisdom. This is a female aspect of the paradoxically trinitarian deity. It is possible that Boehme's female deity owes something to the mariological eternal virgin ("goddess") of Paracelsus's *Liber de Sancta Trinitate* of 1524, but more likely that she was borrowed from Weigel's evocation of a divine "mother" who is instrumental in bringing forth and increasing nature in his *Fourfold Interpretation of the Creation* (circa 1580). Boehme's scriptural allusions link the Noble Virgin to the personified Wisdom of the intertestamental apoc-

rypha. But the author appeals to the reader's introspection to recognize the truth independently of sources. In *Three Principles*, the first Adam shows signs of failure through his base desires of lust and greed. God recognizes that no good can come of this and remakes Adam as a mortal being, with an external companion in Eve. God thus restarts humankind on its long march to self-understanding and redemption. The critical station upon that path is the *now* of the book itself, a time in which the new awareness and renunciation are to come to the fore and recreate the primal work of perfection. Near the end of the pivotal work of 1618, its author appeals to his contemporaries to rally to the chivalric cause of the Noble Virgin by opposing religious war and hatred.

5. SUBSEQUENT WRITINGS

The works written after 1618, especially in his most prolific year 1620, reveal signs of an increasingly formulaic composition. Boehme envisages a single divine process that can be interpreted variously. The same process manifests itself as the articulation of the trinitarian deity within the "pure divinity" or transcendent oneness of the Godhead; as the creation of the finite world; as the resurgence of life in nature; as the birth of an infant; or as the spiritual rebirth of the believer. The divine birth takes place in eternity; however, it is reflected everywhere in time. Theogony is mirrored in the primal separation of the elements or planets out of a primal chaos. The eternal divine birth is reflected in the birth of each human being, and in the spiritual rebirth of the individual believer. Since time is in eternity and eternity in time, the same pattern or process can be discerned everywhere by the illuminated spirit. The birth agony of a mother and the ordeal of a spiritual rebirth correspond to the inner life of a nature that renews itself every springtime. The death or suffering manifest in this process also echoes the suffering and death of Christ. Furthermore, if the moment of redemption in the process is not attained, the course and outcome remain onesided, comparable to an alchemical transformation that goes wrong and spoils its ingredients. The fallen nature of our world, its darkness and death-riddled transience, are Lucifer's own kingdom. In this life, human beings simultaneously inhabit two eternal worlds: the dark world which is ruled by the wrath of God the Father and the light world of the Son as Redeemer (represented also by the Noble Virgin of Divine Wisdom), as well as our world, which mixes light and darkness, much as the dual nature of Christ combines the divine and the human natures without

confounding them. Though Boehme deemphasizes the historical Jesus, his speculation is intensely Christocentric.

In his evolving oeuvre, his presentation of theology becomes ever bolder and more intricate. Evil, though not part of the “pure divinity”, appears to have a counterpart in a divine evolution that is eternal and transcendent, yet also projected into and realized by transient nature and humankind in history. It seems rather as if the contradictions of the age of religious war were to be accounted for theologically by dwelling on the deep mystery of God and the inevitability of evil. It is no doubt the case that the rational mind cannot resolve the paradox of a good and omnipotent God who nonetheless allows, or even causes, evil and suffering to arise; but the paradox generates ever more intricate conceptualizations of the divine process and of the complex depth of the world and human nature. In *Six Theosophic Points*, the “light world” rises out of the “dark world” of evil and suffering. Such aspects of the mature writings may lend credence to the opinion that Boehme’s theosophy is gnostic in character. Yet much suggests that he understood his work as orthodox Christian and even Lutheran. The gnostic emphasis on secret knowledge and on salvation from a fallen realm in which the soul is in exile certainly seems for Boehme compatible with Christianity, even when the shadows deepen and the divine “light” recedes to the scope of the few truly faithful in a world ruled by the wrathful God’s satanic instrument.

In his subsequent books (*The Threefold Life of Man* and *Forty Questions on the Soul*), the “dark world” or “fire world”, ruled by the wrathful God, is counterpoised with the introspective search for the hidden God manifest in the innermost being of the soul. In *The Human Genesis of Jesus Christ*, an orthodox Christology is set forth by means of the coherence of Boehme’s terms of speculation. In the dual natures of Christ, the same pattern of coherence is manifest as in the Virgin Birth in Maria, the eucharistic miracle of Christ’s locally present flesh and blood, or the perfectability of the debased elements upon which alchemy attempts its transforming wonders. The Bible as a history of separate events and disparate persons is transcended in Boehme’s speculative code as it reveals all things in all. The entirety of “our religion”, writes the author at the beginning of chapter nine, resides in only three articles: the creation, fall, and rebirth or restoration. The three represent the eschatological aspect of the coherent pattern of all Boehme’s thought.

Signatura Rerum and *Mysterium Magnum*

return to the exegesis of nature and Genesis (it is an article of faith that the book of the world and the first book of the Bible are correlative and cast light on one another). Boehme’s work on the “Signature of Things” proceeds by spiritualizing alchemistic lore – and thus by decoding what was at its inception a product of religious analogy. Boehme’s doctrine of the “signature of things” elevates a divinely inspired intuition over both doctrine and literalism. In the human realm, this suggests a morality of intention which militates against the doctrinally correct but inhumane conduct of the professional clergy during an era of religious war. The last extensive work, *Mysterium Magnum*, is an exegesis of Genesis that recapitulates his concepts and applies them in a verse-by-verse interpretation of the entire first book of Moses. In this long virtuoso performance, Boehme’s speculative enterprise which had begun with speculation concerning Creator and creation comes full circle. Several lesser writings of his late period establish his eclectic liberality in incorporating sources such as the Kabbalah or the Weigelian speculation concerning the relations of subject and object (cf. *Betrachtung Göttlicher Offenbarung*, *Questiones Theosophicae*, 1624).

5. CONCLUSION

Boehme composed these later writings in a condition of rising optimism encouraged by the temporary decline of hostilities after the first, Bohemian phase of the war, and no doubt reinforced for him by his growing following of like-minded dissenters. Looking back, we recognize this period as one of momentary calm on the eve of the redoubled storm that would sweep his world aside; but to the author who died in 1624, the return of this relative calm under the coreligionist sovereignty of the conqueror of Lusatia, the Elector-Prince Johann Georg of Saxony, could not appear accidental. So it was in a state of rising expectation of new times that Boehme took the unique step of allowing a volume of mostly devotional writings to be printed and sold. This caused a storm of adverse reactions from various Lutheran clergymen. Their anger was transmitted and magnified by Pastor Gregor Richter of Görlitz, who again took his case to the city council. Matters were made worse when the latter was unable to respond decisively by curbing either the inflammatory sermons of Richter or the defiant protests of the author. With the support of his noble adherents, Boehme journeyed to Dresden and met with the high Saxon clergy. By his account, he was treated well. It is altogether conceivable that the Saxon clergy discerned in him a Lutheran loyalist by intention and an anti-Calvin-

ist slandered by a Görlitz pastor whose own Melancthonian leanings would have made him suspect. Even if the Dresden consistory did not pronounce the writings of Boehme unobjectionable, it is beyond dispute that their defenseless author was neither imprisoned nor reprimanded by these protectors of the faith who had shown little restraint in rooting out doctrinal deviation. In all events, the conclusion of Boehme's career is conducive neither to the Christian orthodox attempt to cast him as an outsider, nor to the heterodox attempt to reclaim him as the conscious founder of an alternative spiritual tradition. The history of Christianity or of Lutheranism is full of doctrines that are considered heretical and alien in one time or place but not in others. The posthumous vilification of Boehme's memory in Görlitz was brought about by the incendiary polemics of Richter.

Boehme scholarship needs to look beyond the frequent tendency to segregate the author in an esoteric tradition. Looking back at his work from beyond the "endtime" he envisaged, any appropriation risks misconstruing his intentions. His writings are certainly remote in origin and difficult to interpret; however, the same can be said of other authors in his or our own time. The complexity of Boehme's work is generated by its multiple simultaneous references to Scriptural exegesis, Christian doctrine, theology, philosophy, nature as macrosom and microcosm, alchemical theory, astronomy, meteorology, an introspective or humoral psychology, as well as his personal spiritual experience. Boehme's work is complex because it artfully strives to convey the sense that "all things are in all" (in accordance with its Lutheran tenet of divine omnipresence) and not least because he makes use of a symbolic code in treating his themes. He does this for a reason. The logical and discursive separation of things one from another (Creator from creature, heavens from earth, or wrathful Father from merciful Son) is the root of despair, doctrinal quarreling, and war. The symbolic terms into which he resolves the *separata* allow these to flow into and rise out of one another, perpetually quickened by the seven spirits and their qualities. However, this process is not undirected, nor is his ecumenicism relativistic. If nature and the human being are not redeemed, they must pass into the eternal hellish perdition that surrounds the righteous few in the fallen world of strife and suffering. God appears as an eternal free-flowing process, but God is only God by virtue of the free self-transcendence embodied in the Son (whereby the self-transcendence takes place in eternity, so that the gnostic implications are only apparent). Lucifer and the

evil spirits of our world are a spoiled son: the same evolutionary process gone bad. Adam and Christ are the dominant polarities of religious experience. Both are within the believer. The age of an eschatological enlightenment is near at hand. As the preface of *Aurora* makes evident, Boehme's work is to be a last flowering from the very root of the tree of knowledge. The sense of approaching chiliastic resolution is not bound to any date, but the historical darkness of Boehme's last years appears to him to foreshadow dawn, a belief eloquently expressed in several of the *Theosophic Letters* (esp. 41, 42). This means that to all other difficulties of his thought is added the unretrievable sense of a unique moment in the process of the world, a sense that informs his work. In presenting him as the intentional founder of a continuing tradition, one thus risks overlooking the informing chiliastic horizon of his theories.

Boehme's influence was, however, broad and far-reaching. The Pietists, dissenters, and mystics of the 17th and 18th centuries still maintained his sense of an all-informing chiliastic horizon. The German Romantics, who imagined themselves positioned at a similar, eschatologically exalted, turning point within the life of the world, made good use of him, having recognized, as did their Baroque precursors, the poetic and philosophical implications of his thought. The reception of the German Romantics alone ranged from → Novalis's *Aurora*-inspired vision of a resurgent springtime of nature and of a spirit realm in which all things are only by virtue of their correspondences with all other things and with God; to the early → Schelling's conceptual and terminological borrowings or → Franz von Baader's mysticism of love; to the grim finale of the Romantic period in Schopenhauer's pessimistic reevaluation of the Boehmian voluntaristic metaphysics and theory of the signatures. One of the most abiding virtues of Boehme's work is the poetic fecundity of its impact in Baroque or Romantic Germany, as well as England, Russia, France, or America. The reception of his writings could be facilitated by the understanding that one can appreciate the poetic beauty of his inspiration in the same way one encounters → Dante's great symbolic summa of high medieval knowledge – without embracing the beliefs on which it was founded.

ANDREW WEEKS

Bogomilism

Bogomilism was a religious movement, condemned as heretical, which first appeared in the 10th century in Bulgaria. Its name comes from that of the first preacher of the sect, the pop (priest) Bogomil. The movement spread from Bulgaria to Constantinople and to different regions of the Byzantine empire (Macedonia, Thrace). Since the 12th century, the impact of Bogomilism is attested in the West.

Concerning the doctrinal origins of Bogomilism, scholarly opinions diverge. Medieval authors emphasized the characteristics it had in common with → Manichaeism, Paulicianism and Messalianism. The presence of the Paulicians, members of a dualist sect who moved from Asia Minor to Thrace around 975 A.D., could have favoured the birth of Bogomilism in Bulgaria. Essential components of Bogomilism are an anti-sacerdotal and anti-sacramental tendency, on the one hand, and dualistic beliefs, on the other.

The movement arose at the time of the czar Peter (927-969). Two important documents describe the heresy. The Letter of Theophylact, patriarch of Constantinople, written around 940, characterizes it as a mixture of Manichaeism and of Paulicianism. Indeed, according to this text, the beliefs of these new heretics correspond to those of the Paulicians: opposition between the creators of Good and of Evil, and between the visible and the invisible worlds; rejection of Moses' Law; association of the Prophets with Evil; a docetist Christology; rejection of the real presence in the Eucharist. In addition, they rejected marriage, which they considered a law of the demon.

The tract of the Bulgarian priest Cosmas (around 972) is a polemical text full of biblical quotations, written in order to convert the heretics to the orthodox faith. According to Cosmas, Bogomils attribute the creation of the visible world to the devil, whom some of them identify with a fallen angel, while others call him Mammon, because he ordered men to take women, to eat meat, and to drink wine. The heretics condemn marriage and call children "children of Mammon". They reject the cult of the cross and of the icons. For them, Christ's words about his body and his blood actually refer to the Gospels and the Acts of the Apostles. They understand Christ's miracles in the figurative sense. They do not hold in respect either the liturgy of the Church, or its hierarchy. They condemn the immorality of the priests. They do not accept the Old Testament and do not venerate the Mother of God. According to Cosmas, the Bogomils have their own prayers. They confess their sins to one another, and even women take part in this practice. They reject manual work, and revolt against the powerful.

In the 11th century, Bogomilism arrived in the Byzantine Empire. A letter of Euthymius, monk of Peribleptos (a monastery in Constantinople), written after his stay at Acmonia (in the Opsikion theme, in northwestern Anatolia) before 1025, relates the process against a heretic named John Tzurillas. He had preached in Thrace and around Smyrna, and then established his center of activity

in a village of the Opsikion theme. According to Euthymius, the new heretics are called Phundagiagitae (“bag-men”) in the Opsikion theme, while in the Cibyrhaeot theme (south-west of Anatolia) and in the West (Balkans) they are designated as Bogomils. They reject the Old Testament, the order of the priesthood, the cult of the saints, and the prayers of the Church except the Pater Noster; they do not venerate the cross, and do not practice communion and baptism. According to their cosmogony there are eight skies, seven of which were created by God; the eighth one and all the visible world is the work of the devil, with the exception of the Sun and human souls. The devil had much difficulty in keeping the soul in Adam’s body: he closed Adam’s anus, then vomited in his mouth in order to block the exit of the soul. The heretics do not believe in the resurrection of the body, at the time of the Parousia and the Last Judgment.

At the same time, Michael Psellos describes the beliefs of the Euchites, who were apparently very close to the Bogomils. He makes use of informations given by a Thracian heretic. In their mythology the Godfather has two sons, and the elder son governs the terrestrial world.

At the beginning of the 12th century, Bogomilism had spread in Constantinople even among the aristocratic families. Much attention was attracted by an event that happened ca. 1100, an account of which is given by Anna Komnena (*Alexiad*). A heresiarch named Basil, who has preached his beliefs for more than forty years, was summoned to appear before the Emperor in his Palace in order to explain his teaching. Despite all attempts to convert him, he refused to renounce his convictions and was burned at the stake in the Hippodrome. Several of his followers were imprisoned.

The beliefs of the Byzantine Bogomils were described by the monk Euthymius Zigabenus in his *Panoplia dogmatica* (written between 1111 et 1118). He derives the Bogomils from the Messalian heresy, but mentions the Paulicians too. He begins by presenting the biblical canon of the heretics: they reject → Moses’ books, and the God who appears here. They accept only the Psalms and the Prophets of the Old Testament. Their teaching concerning the Trinity is very particular: they assert that the Father engendered the Son, and the Son in turn engendered the Holy Spirit. The demon, or Satanaël, is the elder son of the Father, born before the Son and the Holy Spirit. He rebelled by pride against the Father and seduced part of the angels, but God expelled them from heaven. Then Satanael created the visible sky and earth, and the body of the first man. When he was trying to animate Adam’s body, his breath, combined with moisture

that ran down from Adam, turned into a snake. Then Satanael asked God to send his breath of life to animate Adam’s body. But later Satanael, in the shape of the snake, seduced Eva, and engendered with her Cain and his twin sister, named Calomena. But God punished him, depriving him of his divine shape and of his power of creation; however He permitted him to govern what he had created. God the Father sent his Word, Jesus Christ (whom the heretics also refer to as an archangel) down to earth. He slipped in through the right ear of the Virgin and then went out in the same manner; his body was immaterial, and physical only in appearance. Likewise it was only in appearance that he was crucified, died, and was resurrected. After having bound Satan, he returned to the Father. The heretics identify the God of the Old Testament with Satanael. They do not venerate icons, the cross and relics; they are against priests, who, according to them, are moved by demons. They think that demons live in everybody except the heretics themselves. They do not baptize with water but with the Holy Spirit, by laying the Gospel of John on the head of the initiate. Before becoming members of their sect, new believers have to practise purification rites and prayers. The heretics condemn the Eucharist and give a purely allegorical meaning to it. For them, the bread of the communion means the prayer of the Pater Noster, because it is a question of one’s daily bread, while the chalice of blood means the new alliance. Reception of both is called the “Secret Supper”. They assert that demons live in churches and Satan himself occupies the St.-Sophia of Constantinople! The only prayer they accept is the Pater Noster, which they recite seven times by day and five times by night. They assert that they have in themselves the divine Word or the Holy Spirit, and transmit it by preaching. According to them, at the time of death they leave the dirty clothes of the body, which will never be resurrected. They then assume the same immortal and divine shape as that of the Christ, and will enter the realm of the Father. The heretics gradually initiate new followers into their secrets. They give a particular interpretation to the Scriptures, frequently attributing an allegorical meaning to the text.

In the period of the 1240s, during the reign of John II Komnenos and of Manuel Komnenos, the Bogomils were condemned several times. According to an anti-heretical treatise (of Anselm of Alessandria, ca. 1270), the people of the West – that is to say, of France – became familiar with the heresy in Bulgaria and Constantinople at the time of the second crusade. At the end of the 12th century, the Bogomil apocryphon intitled *Interro-*

gatio Iohannis, conserved only in two Latin versions, was adopted by the Italian → Cathars of Concorezzo. The contents reveal close similarities with the Bogomil beliefs described by Euthymius Zigabenus.

At the beginning of the 12th century there appears the nickname “Bougre” (Bulgare) as one of the names of Western Cathars. Anselm of Alessandria specifies in his tract ‘because the French have let themselves be deceived by the Bulgares at Constantinople, one referred to the heretics in the whole of France as Bulgares’. In the middle of the 13th century, Raynier Sacconi gives a list of dualistic Churches in the West and the East. He asserts that all the Cathar Churches derive from two Eastern “orders”: from that of Bulgaria and that of Dru-gunthia (the identification of which is very controversial; situated in Thrace or Macedonia). A third Eastern “order”, that of Sclavonia, of which the center was situated in Bosnia, represented an intermediate tendency.

At the end of the 12th century, Bogomilism – referred to as Patarinism – appears in Serbia, where it is severely persecuted. But the heretics are able to take refuge in Bosnia under the protection of the ban Kulin. To the pope’s alarm, Bogomilism prospers in Bosnia up to the Ottoman conquest (1463), even though from the middle of the 15th century king Stepan Thomas starts to persecute it. In 1462, he sends three aristocrats to Rome in order to refute their beliefs. At this occasion, the uncle of the inquisitor Torquemada writes up a list of the fifty errors of the “Manichaeans” of Bosnia. Under the Turkish domination, the Bosnian Patarins probably converted to Islam.

In Bulgaria, Bogomilism is again widespread during the 13th century. The synod of Trnvo condemns it in 1211, along with other sects. At this time, Bogomilism and Messalianism become synonyms. In 1238, the pope asks Hungarian king Béla IV for a military intervention in Bulgaria, which is full of heretics protected by Tsar John Asen. But the crusade cannot be organized: in 1241, the Tartars invade Eastern Europe.

In the Byzantine Empire, Bogomilism persisted up to eve of the Turkish conquest. It is particularly well attested in Thrace and in Macedonia in the 14th century. During the early 1320s the Bogomil heresy was present even on Mount Athos, coinciding with the growth of the Hesychast movement.

It has left very few traces in Russia, but in Russian and Slavonic apocryphal literature there are many themes and motifs that reflect a dualistic worldview and are close to Bogomil beliefs. For example, in the legend of *The Sea of Tiberiad* (conserved in Russian and South Slavic manuscripts,

the most ancient of which are from the 15th and the 16th centuries), there occurs the motif of the world’s creation with the help of Satan, combined with the motif of “cosmic diving”: Satan, in the shape of an aquatic bird, brings up earth and a stone from the bottom of the water. God and Satan together create the earth, angels and demons from this matter.

Because of the unequal reliability of documents about Bogomilism and because of its wide diffusion in the Balkans and the Byzantine Empire during a period spanning six centuries, it is difficult to define its characteristics. Bogomilism was a many-faceted doctrinal heresy that contested orthodox religion and the Church and, in several historical contexts, could be the expression of political commitment.

EDINA BOZOKY

Borborites

The Borborites or Borborians were adherents of a Gnostic sect that flourished in the 4th century and reportedly continued its existence at least until the 6th century. Epiphanius of Salamis, who has left us an extensive report on the Borborites (*Panarion*, 26), says that they were influenced by the teachings of the → Nicolaitans (*Pan.*, 26, 1, 3), who are discussed in *Pan.*, 25. They called themselves “Gnostics”, but were also known as Phibionites, Stratiotics, Levitics, Secundians, Sokratites, Zachaeuses, Coddians and Barbelites (*Pan.*, 25, 2, 1; 26, 3, 7; also *Anacephlaleiosis*, 26). Since we only have Epiphanius’ testimony, we do not know to what extent these Gnostic groups were really identical. The name Borborites means “filthy people”, which suggests that it was not a self-designation

but a contemptuous quibble. *Anacephaleiosis*, 26, suggests what may have prompted it to Epiphanius himself or to others: 'Yet others call them Borborites. These people take pride in Barbelo, who is also called Barbero'. Therefore, another form of the name Barbelites ("Barbelo people") may have been Barberites, and that may have led to the nickname Borborites. Epiphanius' report makes it clear that the Borborites adhered to a "Sethian" form of Gnosticism [→ Sethians], comparable to that of the "Gnostics" in Irenaeus I, 29, and in the *Apocryphon of John* and related texts.

The Borborites made use of many books, which, except for a few quotations by Epiphanius himself, are completely unknown to us: *Noria*, about Noah's wife (cf. NHC IX, 2: *The Thought of Norea*), the *Gospel of Perfection*, the *Gospel of Eve*, the *Greater and Lesser Questions of Mary*, books of Jaldabaoth, books in the name of Seth (cf. NHC VII, 2: *The Second Treatise of the Great Seth*; NHC VII, 5: *The Three Steles of Seth*), *Apocalypses of Adam* (cf. NHC V, 5: *The Apocalypse of Adam*), the *Birth of Mary*, and the *Gospel of Philip* (a quotation, *Pan.*, 26, 13, 2-3, is not found in the *Gospel of Philip* of NHC II, 3). If Epiphanius is to be trusted, which will be discussed below, these books taught a curious Eucharistic ritual, in which instead of bread and wine male semen and female menstrual blood were offered up and eaten by the participants. With the semen on their lifted hands they said to the "Father of All": 'We offer you this gift, the body of Christ', and eating it: 'This is the body of Christ, and this is the Passover because of which our bodies suffer and are constrained to acknowledge the passion of Christ'. And doing the same with the menstrual blood they said: 'This is the blood of Christ' (*Pan.*, 26, 4, 5-8). The ideology behind this ritual seems to be that the divine element in human beings is located in their creative power and that, therefore, salvation is realized by the emission of the bodily fluids, which then are offered to God. In the section on the Nicolaitans, Epiphanius transmits a Gnostic myth about Barbelo, which seems to have been popular among the Borborites (*Pan.*, 25, 2, 2-4). According to this myth, she continually appears to the archons in beautiful form and 'through their lust-caused ejaculation robs them of their seed – to recover . . . her power' (*Pan.*, 25, 2, 4). Epiphanius refers to the Borborites when he says that some of the followers of Nicolaus said: 'We gather the power of Prunicus (i.e. Barbelo) from our bodies through their emissions' (25, 3, 2). In the section about the Borborites, however, he puts all stress on their unbridled licentiousness and promiscuity. They rejected fasting (26, 5, 8) and asceticism (26, 13, 1), but for-

bade procreation (26, 5, 12) and called the female members of the sect "Virgins" (26, 11, 9). To leave their "virginity" unimpaired, they practised coitus interruptus (26, 11, 9-11), and when a woman accidentally became pregnant they aborted the foetus and ate it (26, 5, 4-6), saying: 'We have not been deceived by the archon of lust, but we have gathered up the brother's transgression'. A special group, which they called "Levites", who may have been the same as the "Levitics", practised homosexuality (26, 13, 1). They found their views and practices confirmed by a curious exegesis of biblical texts, of which Epiphanius gives some examples.

For a correct assessment of the evidence presented above the all-important question is: How trustworthy is Epiphanius? At this point, scholarly opinion is divided and varies from almost complete acceptance of Epiphanius' reliability (Benko, Gero) to its almost complete rejection (Williams). Epiphanius claims to have come across this sect when he lived in Egypt, probably in Alexandria about A.D. 330. He had heard their teachings 'out of the mouth of practising Gnostics', who in fact were beautiful young women who tried to seduce and to convert him (26, 17, 4; 18, 2). But after reading their books and understanding their true intent, he reported them to 'the bishops' (probably the college of Alexandrian presbyters), and 'finding out which one were hidden in the church, . . . they were expelled from the city, about eighty persons' (26, 17, 9). He obviously did not participate in the sexual orgies of which he gives a detailed description. The instruction of the beautiful female adherents of the sect was apparently not very specific, since he understood their true intent only after reading their books. We may safely assume that he interpreted these books in the light of what he had heard or thought to have heard about the practices of the Borborites. In many Gnostic texts the divine element in human beings is called semen, which has to be gathered during the process of salvation, but this word is usually used in a metaphorical sense. However, it seems quite possible that some people took the word literally, which led them to practices as described by Epiphanius. Of course, his anti-heretical zeal may have given his fantasy free play, but that does not imply that his report is completely unreliable. Moreover, two Gnostic texts, which are earlier than Epiphanius' *Panarion*, explicitly condemn similar practices (*Pistis Sophia*, 147; *Second Book of Jeu*, 43). It has been objected that these texts are 'once again polemical accusations, not advocacy by practitioners' (Williams), but that does not exclude that there may have been some truth in these allegations. Religiously

inspired sexual rituals, which from the outside look like sheer obscenities, are not uncommon in the history of religions.

According to a number of Syriac, Armenian, Coptic and Arabic sources, the Borborites survived tenaciously in the Christian Near East (Gero). They are reported to have lived in Southern Asia Minor, Armenia and Syria. In imperial legislation, they are mentioned from the 5th century onward: they are forbidden to build churches and to hold religious services. Unfortunately, these sources provide little information on the ideas and practices of these Borborites, and when they become more specific the influence of Epiphanius' report is unmistakable. The 6th-century author Barḥadbešabbā says that the Borborites believed that angels had created the world and that their central rite consisted of the ritual defilement of ten virgins by the priests of the sect. If one of these conceived, she was worshipped 'in the place of Mary' and her foetus was sacramentally consumed (Nau, 190f.): the child was apparently identified with the body of Christ and the woman with the Virgin Mary. There are other testimonies that some groups, which their opponents called Borborites, held the Virgin Mary in high esteem and even attributed to her a divine status. According to some she had a heavenly body, but according to others she was a heavenly power or even a goddess, so that she and her Son were two divinities by the side of God – a view already refuted in the Koran, *Sura* 5, 116. These views can be traced back to the 4th and the 5th centuries (van den Broek, 149-156).

The evidence presented above leads to the conclusion that the Borborites, who called themselves "Gnostics", most probably were an offshoot of the "Gnostics" who adhered to the system described in Irenaeus, *Adversus Haereses*, I, 29 and the *Apocryphon of John*. Their distinctive feature seems to have been a literal interpretation of the metaphor "semen" as indication of the divine element in humankind. There is no reason to push Epiphanius' testimony completely aside and to deny that the "gathering" of the divine sperm through sexual rituals apparently was an important element in their cult. But we need not to take Epiphanius' report at face value; on the contrary, we may assume that also in this case we have the same mixture of truth, hearsay, misunderstanding and sheer slander that so often characterizes his anti-heretical polemics. The strong emphasis Epiphanius lay on the sexual rituals of their cult has obviously obscured other aspects of their beliefs. One of these beliefs may have been the exaltation of the Virgin Mary to a divine status.

ROELOF VAN DEN BROEK

Bourbon, Duchess of → Orléans, Bathilde d'

Bourignon, Antoinette, * 13.1.1616 Lisle (Flanders), † 1680 Franeker (Netherlands)

Bourignon was born to wealthy Catholic parents. Even as a child she spent much time in prayer and reclusion, and at four asked her parents in what country Christians lived, so that she might travel there, since she thought Christians lived in poverty and were not interested in worldly things. Although her father wanted her to marry a rich merchant, she left home in 1636, and spent some time in a convent. As she grew older, she mortified herself for seven years, wearing a shirt of horsehair and sleeping on a board, gave her clothing to the poor, and ate only what was necessary for life, even going so far as to mix ashes with her food to deny herself pleasure from it. She was of a middle stature, slender and delicate. She travelled extensively in Belgium, the Netherlands, and Germany,

bringing a small wooden printing press with her; she also visited England and Scotland. Her works were placed on the Index of forbidden books by the Vatican; she was also condemned frequently by Protestants, including the Scottish Presbyterian general assemblies of 1701, 1709, and 1710. She died in Franeker, Holland, in 1680; her complete works were published in London in 1699.

Her major treatise, *Lumière du Monde* (Light of the World), was occasioned by M. Christian de Cort, Superior of the Fathers of the Oratory at Mechlin in Flanders, a man who regarded her as a spiritual teacher. She went to Holland for the printing of this book, and there encountered sectarians, including Jesuits, Jansenists, Lutheran and Calvinist Ministers, Anabaptists, Quakers, and Labadists, who attacked her as a visionary, a blasphemer, a heretic, and even as a sorcerer. She proposed a series of Rules from God, the first two of which are '1. Do all in good order, and in season; for I am a God of order: And Disorder comes from the Devil, and from Sin. 2. Never be eager in Temporal Affairs; but apply your mind to do well what you do, in quietness; for the wandering of the mind, and disquiet spoils all' (xix).

It is evident from this example of her writing that the works of Bourignon are much tamer than the invective poured out against her would seem to warrant. Her many treatises reveal the work of a very sincere and pious woman intent on spiritual practice. Bourignon, and her publisher → Pierre Poiret, were in fact at great pains to show their own orthodoxy, and for this reason she signed a confession of faith with five points, insisting on her belief in 'all that a true Christian ought to believe', dated 11 March 1675. Widely reprinted, her five points of public confession are: (1) I am a Christian, and I believe all that a true Christian ought to believe, (2) I am baptized in the Catholic Church, in the Name of the Father, in the Name of the Son, in the Name of the Holy Ghost, (3) I believe the Twelve Articles of the Creed, and I do not doubt of one Article of it, (4) I believe that Jesus Christ is True God, and that he is also True Man; as also that he is the Saviour and Redeemer of the World, (5) I believe in the Gospel, in the Holy Prophets, and in all the Holy Scriptures, both of the Old and New Testament.

Seeing herself as an orthodox Christian, in nearly every one of her works Bourignon attacked sectarianism, and in this one can see a bit more clearly why she was herself attacked. She launches into those who claim she is not Catholic – she will live and die a Catholic. But she so opposes sectarianism as to even attack those who take the name Catholic. Those who are Reformed, she writes,

ought to reform themselves. Bourignon strongly critiques those who hypocritically take on a mantle of sanctity while remaining corrupt within. She attacks the corruption of established churches, and insists instead that 'La vraye Eglise consiste en l'assemblée des ames qui sont possédées par l'Esprit de Jesus Christ' (The true church consists in the assembly of souls possessed by the spirit of Jesus Christ) (III.294). She also attacked Quakerism in a separate treatise (*Euvres*, vol. X).

The English translations of *Lumière du Monde* and some of Bourignon's other works, including *Confusion of the Builders of Babel* (1708), *An Admirable Treatise of Solid Vertue*, (1699) and *Collection of Letters* (1708) in turn inspired antimystic sentiments in England even as they later met with approval among non-sectarian spiritual circles like that of the Philadelphian Society. A very informative example of this antimysticism is to be found in a treatise by John Cockburn (1652-1729) entitled *Bourignianism Detected* (London 1698). 'They are not mean and ignorant Persons who follow this Woman', Cockburn wrote, 'they are some of the better sort, who have been reputed, Men of Sense, Learning, and Probity' (i-ii). Cockburn writes derisively that 'Our Quakers and Philadelphians, as well as the Quietists and Pietists abroad, are of the same kidney, and do all stand upon the same foundation; so that what overturns one, overturns all' (iii). Cockburn and others were particularly incensed at assertions of Bourignon's supernatural knowledge. Cockburn claims that she is in fact a messenger of Satan, a 'false prophet', and so forth (11, 25, passim). She was defended by George Garden and others against these charges, notably in Garden's work *An Apology for Antonia Bourignon* (1699).

Although she is occasionally cited as a Boehmenist, Bourignon did not strictly speaking belong to the theosophic tradition [→ Christian Theosophy], but instead represents a strain of Catholic quietist mysticism along the lines of Miguel Molinos. In Bourignon's work, as in quietist mysticism more generally, we see nothing of the visionary imagery that so characterizes the theosophic school. At the same time, quietist mysticism bears some similarities to theosophy in its emphasis on direct spiritual inspiration and on anti-sectarianism. The most complete study of Bourignon thus far is van der Does (1974).

ARTHUR VERSLUIS

Bô Yin Râ (ps. of Joseph Anton Schneider, as of 1920 Joseph Anton Schneider-franken), * 25.11.1876 Aschaffenburg, † 14.2.1943 Massagno (Switzerland)

Schneider studied at the Städelsche Art Institute in Frankfurt, from which he graduated in 1899, and at the art studios of the Municipal Theatre in Frankfurt (1896-1898). Hans Thoma, one of the leading German artists of the time, accepted him as one of his pupils. Later he also came to benefit from the advice and support of Max Klinger. In 1900-1901, he continued his studies at the Academy of Fine Arts in Vienna, and attended the Academy Julian in Paris before returning to Vienna. He then stayed in Berlin (1904-1908) and settled in Munich (1909-1915). While travelling in Greece from 1912-1913, he continued to paint (mostly landscapes), and in 1914 he began publishing his first writings, signed with the initials B.Y.R. Drafted in 1916, he was stationed in Görlitz, where he served as an interpreter in Greek, and met → Gustav Meyrink in 1917. In Görlitz he also founded a Jakob Boehme Society in 1920, exhibited his landscape paintings, and continued to work at his “cycles” – series of prose writings – like *Das Buch der königlichen Kunst* (The Book of Royal Art; 1913-1932). The first version of *Das Buch vom lebendigen Gott* (The Book of the Living God; 1919), his first book signed “Bô Yin Râ”, is also the first of his writings published by Kurt Wolff (Verlag der Weissen Bücher, Leipzig) in the years 1920-1921. It is prefaced by Gustav Meyrink, whose novel *Der Golem* had appeared in 1915, also at Wolff’s.

From then on Bô Yin Râ became a prolific writer. Most of his pieces are of small size, and he often put many of them together to constitute larger books. In the 1920s at least fifteen titles appeared, a number of them beginning with “The Book of . . .” like *Das Buch vom Jenseits* (The Book of the Afterlife; 1920/29), and *Das Buch vom Menschen* (The Book of Man; 1920/28). In 1923, the year when his *Okkulte Rätsel* (Occult Enigmas) appeared, he took up residence in Switzerland, at first in Horgen near Lake Zurich, then in Massagno near Lugano. As before, he continued to devote much time procuring new editions (enlarged or modified) of his former or more recent publications. In Switzerland he became acquainted with the publisher Alfred Köber-Stähelin, who from 1927 on published all his works. Among his last ones in the 1930s are *Ewige Wirklichkeit* (Eternal Reality; 1934) and *Geistige Relationen* (Spiritual Relations; 1939). At his death, Bô Yin Râ left a collection comprising forty books and two hundred paintings.

Bô Yin Râ is lavish in clues about post-mortem life which are sometimes reminiscent of → Swedenborg’s. He explains, for instance in *Das Buch vom Jenseits*, that “life beyond” is in reality the very life we live on earth, only it is experienced by means of different senses. He occasionally touches upon the topic of → reincarnation, discussing under which conditions it may be possible. All his views on such questions are based on his belief in an intricate relationship between the Spirit’s all-pervading radiant substance, and the concrete forms in which this substance manifests itself in material life. Nothing spiritual is ever devoid of form. It is a matter of using our creative → imagination to transform our external life and inner body after the picture of our spiritual life. Such a transformation is destined to prepare our life beyond, and can be achieved by artistic creation. His own paintings were supposed to play such a role.

In some of the writings which constitute the cycle *Hortus Conclusus*, discussions devoted to such topics are combined with a presentation of twenty of his paintings, for example, “Lux in Tenebris”, “Birth of the External Cosmos”, “Astral Luminescence”, and “Inferno”. These are meant to depict the very nature and dynamic structure of eternal life. His views here are reminiscent of those of the classical theosophical current (although he rarely quotes his predecessors), and he evinced a particular interest in → Jacob Boehme.

Most of these works of art have a cosmological or cosmogonic character. In *Welten: Eine Folge kosmischer Gesichte* (Worlds: A Series of Cosmic Visions; 1924), a work introduced by a poem of → Giordano Bruno, he again presents twenty such

paintings. His philosophy of nature, besides being scantily developed, does not call into question the theory of evolution. And when it comes to the evolution of mankind, he is content to explain that the progressive appearance of the human being as we now know him/her is the result of the influence of an eternal and active reality, exercised upon our ape-like ancestors.

Bô Yin Râ called himself a “Bote der Weissen Loge”, a messenger of the White Lodge, claiming, like → H.P. Blavatsky and → Annie Besant before him, that he had received his revelations from a hidden Asiatic Master. As a matter of fact, he occasionally discusses the issue of the Blavatskyian Mahatmas, and his teachings are to some extent influenced by those of the → Theosophical Society, although he readily criticizes the latter, notably in *Mehr Licht!* (More Light!; 1921/1936), where he is also very critical of the Jewish Kabbalah [→ Jewish Influences]. The expression “White Lodge” (possibly linked to the name of Kurt Wolff’s Publishing Company) seems to be meant in a metaphoric sense, and does not refer to any actually existing association. In any case, Bô Yin Râ’s teachings are self-initiatory in character, devoid of any specific ritual.

Besides the “White Lodge” he oftentimes mentions (in particular in *Das Geheimnis* [The Secret; 1923] a “Lichtgemeinschaft der Leuchtenden des Urlichts” (a Light Community of the Enlightening People of the Original Light). These “Leuchtenden” are the wardens of the “original legacy of mankind”. The expression “die Leuchtenden” is very reminiscent of the “Lichtfähigen” (the people able to receive the Light) that → Eckartshausen had written about in *Die Wolke über dem Heiligthum* (1802). In a narrative set within *Das Buch der Gespräche* (The Book of Conversations; 1920), Bô Yin Râ tells us about his own initiation into this community of the “Leuchtenden”, in Greece, but this description appears to be merely metaphorical.

A wide readership (there are countless new editions and translations) bears witness to Bô Yin Râ’s continuing influence, which may be seen operating in various contemporary movements, particularly in neo-Rosicrucian groups [→ Rosicrucianism] such as the A.M.O.R.C. and the Lectorium Rosicrucianum.

Bô Yin Râ has been translated into at least fifteen languages. Since 1928 practically all of his works have been published and/or newly edited at Kober Verlag AG (Bern) in their original language, German, and many of them in English at the same publisher. Most of his works can be found in: *Nachlese: Gesammelte Prosa und Gedichte aus Zeitschriften*, 2 vols., Vol. 1: *Gesammelte Prosa und Gedichte aus Zeitschriften* (contains *inter alia*: *Über meine Schriften* [1930];

Warum ich meinen Namen führe [1927]; *Wer ist Bô Yin Râ?* [1924]). Vol. 2: *Gesammelte Texte aus Zeitungen und Zeitschriften (Aufsätze über Kunst; Abhandlungen; Besprechungen; aus den Zeitschriften Magische Blätter, Die Säule und Theosophie; Dankesadressen; Persönliche Erinnerungen)*, Basel: Kober Verlag AG, 1990 (1st ed., 1953) ♦ Among his works available in English are: *The Book on Life beyond* (1920/29), 1979 (2nd ed., 2002); *Spirit and Form* (1924), 2001; *The Meaning of this Life* (1927), 1998; *The Book on Solace* (1924), 1996; *The Book on Happiness* (1920), 1994; *About my Books, Concerning my Name and other Texts* (articles and shorter pieces), 1977; *Worlds of Spirit* (a compendium of texts and paintings), 2002; *The Book on Human Nature* (1920/28), 2000. *The Wisdom of St. John* (1924), 1975; All: Kober Verlag AG: Bern.

ANTOINE FAIVRE

Boyle, Robert, *25.1.1627 Lismore (Ireland), † 31.12.1691 London

Boyle is a preeminent figure of the 17th century. He is best known as a natural philosopher, particularly in the fields of chemistry and physics, but his scientific work covers many areas including hydrostatics, medicine, earth sciences, natural history, and traditional → alchemy. His avid service to the Christian faith produced devotional and ethical essays, and theological tracts on the limits of reason and the role of the natural philosopher as a Christian. He also funded numerous missions and the translation of the Scriptures into several languages.

Boyle was born into one of the wealthiest families in Britain. He was the fourteenth child and seventh son of Richard Boyle, the Great Earl of Cork, by his second wife Catherine, daughter of Sir Geoffrey Fenton, secretary of state for Ireland. His education began at Eton at age eight where his studiousness was apparent. In October 1638, he and his brother Francis were sent on a Continental

Grand Tour with their tutor Isaac Marcombes. They travelled through France, Switzerland, and Italy. In 1642, owing to the Irish Rebellion, Francis returned home while Robert went to his tutor's home in Geneva to continue his studies. Boyle returned to England in 1644, and took up residence at his hereditary estate of Stalbridge in Dorset, where he began to write ethical and devotional treatises, many borrowing literary styles modelled after the French romances he enjoyed. In 1649 he began his first scientific experimentation, which instantly enthralled him. During these early years he was in contact with Samuel Hartlib, Frederick Clodius, Sir Kenelm Digby, and others. But probably most influential of all was his association with George Starkey (alias Eirenaeus Philalethes) who in the early 1650s tutored him in chemistry and introduced him to the writings and ideas of → Joan Baptista van Helmont. Helmontian ideas would long prove important for Boyle's chemical thought.

In the winter of 1655-1656 he moved to Oxford, where he remained for twelve years. There he associated with the Philosophical Club which included John Wilkins, Richard Lower, John Locke, and others interested in science, medicine, and anatomy. Much of Boyle's best-known work draws its origins from his Oxford period. In 1659, with the help of Robert Hooke, he built his famous air-pump, and studied the air, the vacuum, and pneumatics. In 1660 he acted as one of the founding members of the Royal Society. In 1668 he left Oxford and took up residence with his sister Katherine Jones, Vicountess Ranelagh, in London. There he lived and worked for the rest of his life – setting up an active laboratory, publishing at least one book nearly every year, receiving many visitors, and participating actively in the Royal Society. Throughout his adult life Boyle was sickly, suffering from weak eyes and hands, recurring illnesses, and probably one or more strokes. He was offered the Presidency of the Royal Society and the episcopacy but declined both. He died at age sixty-four after a short illness exacerbated by his grief over Katherine's death a week earlier. He left behind a huge accumulation of papers now at the Royal Society, and a bequest for the annual Boyle Lectures (in defense of Christianity) which continue to this day.

Boyle's work is characterised by its reliance on experiment and its reticence to formulate generalized theories. Boyle was particularly devoted to chemistry, arguing strongly for its usefulness in natural philosophy, and thus has sometimes been

called the "Father of Chemistry". His chemistry was based on a largely (but not entirely) mechanical "corpuscularian hypothesis" – a sort of atomism which claimed that material substances were composed of one universal matter divided into miniscule particles ("corpuscles") and differentiated only by the accidents of shape and local motion. He opposed the doctrine of the *tria prima* as presented by contemporary Paracelsian chymists [→ Paracelsianism]. This opposition, together with Boyle's celebrity as a "heroic figure" of the Scientific Revolution and an exaggeration of the impact and importance of his *Sceptical Chymist* (1661) has led to the simplistic conclusion that he opposed alchemy. In fact, Boyle maintained a life-long interest in and debt to traditional alchemy; while a few signs of this interest have long been known, many others have only recently been brought to light. Boyle's own secrecy regarding the subject, such as his extensive use of codes and ciphers in alchemical contexts, has contributed to the obscurity of his alchemical pursuits.

For example, Boyle believed in the reality of projective transmutation of the metals by means of the Philosophers' Stone. Indeed, Boyle endeavored to discover the secret of the Stone throughout his life, and claimed to have witnessed several transmutations. In the 1670s and 1680s he wrote a *Dialogue on Transmutation* which argued strongly in favor of the real existence of the Philosophers' Stone; only a fragment of this work was published, and that anonymously in 1678 as *A Degradation of Gold by an Anti-Elixir*. His early collaborative work on alchemical projects with Starkey/Philalethes provided him with a substance he believed to be the Philosophical Mercury necessary for making the Stone, and Boyle continued working with this substance for forty years, publishing a veiled account of it in the *Philosophical Transactions* in 1676. In 1689 he helped to effect the repeal of the Act against Multipliers, a 1404 statute outlawing transmutation. His interest in the repeal may stem from his belief that he had succeeded in preparing a transmuting powder – a "red earth" discussed after his death by John Locke and → Isaac Newton. He carried on extensive correspondence with alchemical practitioners throughout Europe.

Boyle considered his theological activities of at least equal importance with his scientific ones. His devotion to Biblical Christianity was the guiding principle of his life and work. Scientific study of God's creation was at heart a devotional activity; his last work, *The Christian Virtuoso* (1690)

treats the interdependence of scientific and religious knowledge for the scientist. Boyle wrote on the literary style of the Scriptures, explored the limits of human reason, and urged readers to theological study.

Boyle also showed a keen interest in occult phenomena [→ occult / occultism], particularly → witchcraft, spirit invocation, second sight, and → magic. In 1658 he funded the English translation of the *Devill of Mascon*, an account by François Perrault of a poltergeist in Burgundy. He later supported Joseph Glanvill's mission of collecting and verifying witchcraft accounts. In dictating autobiographical notes to his friend and confessor, Gilbert Burnet, Bishop of Salisbury, Boyle spent a considerable fraction of the time describing accounts of occult phenomena – magic, spirit invocations, clairvoyance, and so forth – to which he had been witness or about which he had received what he considered reliable testimony. He also amassed such accounts of the supernatural into a collection which he apparently planned to publish as an adjunct to the “Strange Reports” appended to his *Experimenta et Observationes Physicae* (1690). Perhaps most curiously, Boyle seems to have believed that the Philosophers’ Stone of the alchemists might not only be able to transmute base metals into gold, but also be a means for attracting and communicating with angels. These ideas are detailed in a fragmentary dialogue recently edited and published (Principe 1998), although their origins remain rather obscure. One cause behind Boyle’s interest in supernatural phenomenon was his desire to demonstrate the reality of the supernatural realm with its spiritual activity and spiritual denizens. Proofs for the existence of spiritual entities and agencies promised to provide not only a refutation of the creeping atheism so feared by Boyle and others in the late 17th century, but also a counterpoint to the mechanical systems Boyle promoted in his natural philosophy, which, when taken to extremes, ran the risk of denying spirits, souls, and God.

LAWRENCE M. PRINCIPE

Boys des Guays, Jacques François Etienne le, * 1794 Châtillon-sur-Loing (now Châtillon-Coligny, Loiret), † 1864 Saint-Armand-Montrond (Cher)

Le Boys des Guays was the grandson of a special lieutenant in the bailiwick of Montargis (Loiret) who later became Procureur Général under the First Empire, and the son of a member of the military administration of Louis XVI. After earning a law degree, he became an advocate at the Royal Court of Paris, then decided for the magistracy, which he left in 1830 following his nomination as sub-prefect of Saint-Armand-Montrond. He was discharged from this office in 1831 because of his political opinions, marked by a liberalism that was deemed excessive. Nevertheless, for a brief period

he exercised the functions of municipal councillor in that town.

In November 1834, during a ceremony in the Néo-Temple in Paris, Le Boys met a Monsieur Caudron, a reader of the works of the theosopher → Emanuel Swedenborg. Caudron gave Le Boys Swedenborg's treatise on *Heaven and Hell*, in which, he told him, Le Boys would find the explanation of the magnetic phenomena which had motivated his journey. After reading this work, supplemented by other works of Swedenborg's, Le Boys decided to dedicate the rest of his life to the propagation of "Swedenborgism" both in France and abroad. On November 18, 1837, this ardent neophyte opened a public cult in his house at Saint-Armand-Montrond, where at 3 o'clock every Sunday afternoon the local Swedenborgian community would assemble, consisting for the most part of craft professionals. Le Boys was assisted in his tasks by his wife, born Clotilde Rollet, and by his brother-in-law Eugène Rollet, future deputy of the Cher.

Beginning in 1838, Le Boys des Guays undertook the publication of the monthly periodical *La Nouvelle Jérusalem, revue religieuse et scientifique* (The New Jerusalem, religious and scientific review), which held the attention of its readers for ten years. At the end of this period it was forced to cease publication, as a result of severe financial difficulties. Also in 1838, Le Boys began his major work: the translation of Swedenborg's theological works into French, a task brought to completion in 1850. This "orthodox" disciple of the "New Jerusalem" also published analytical tables and indexes, finding the model for the latter in the index of Swedenborg's *Apocalypse Revealed*.

Le Boys des Guays had inserted in his periodical, by way of apologetics, *Les Lettres à un homme du monde qui voudrait croire . . .* (Letters to a man of the world who wants to believe). These were reprinted separately in 1852. After translation, they were presented to the public in England and North America, with several editions in English and German. Intended for future members of the New Church, these *Letters* aroused undeniable interest among the public.

Some of Le Boys des Guays' works benefited from the collaboration of Auguste Harlé (1809-1876), whose knowledge of the Hebrew language was of great advantage. This "indefatigable evangelist", as Marguerite Beck Block calls him, bore witness through his voluminous correspondence to a lasting concern for lending all his energies to the "New Jerusalem". He never ceased to enlarge his acquaintanceship, both in France and abroad, so as to help the New Church to expand. Some of his vis-

itors came from England and Russia. They could see for themselves that Le Boys' proselytism was founded in Swedenborg's doctrine of "uses", which notably emphasized the practice of the "true" and the "good".

Manuscript collection known as "Fonds Chevrier" (Correspondence of J.F.E. Le Boys des Guays and various documents). The collection is in the Bibliothèque Nationale de France, Paris.

ANDRÉ BOYER

Britten, Emma (Floyd) Hardinge, * 2.5.1823
Bethnal Green (near London),
† 2.10.1899 Manchester

1. LIFE 2. WRITINGS 3. THE ORPHIC
CIRCLE 4. THE THEOSOPHICAL SOCIETY
5. IMPACT

One of the most influential figures in the early development of → Spiritualism in the United States and England, both as a medium and trance-lecturer and as a historian and theorist of that religious movement. A founding member of the → Theosophical Society and a member of its first Council. A powerful advocate for the revival of the study of → magic, and for its essential identity both with 19th-century mediumship and with medieval → witchcraft. A strong proponent of the mythological theory of Christian origins. A social reformer interested in marriage reform and in the abolition of slavery. Although her name and works are now largely forgotten, the combination of religious, magical, occult [→ occult / occultism], social and political ideals that she articulated has remained influential in the United States and Great Britain up to now, and has left its traces in several new religions, notably in Witchcraft (Wicca) and its cogeners.

1. LIFE

Britten wrote little about the first three decades of her life, which must therefore be painstakingly reconstructed from scattered data. She was the daughter of Ebenezer and Anne Sophia Floyd, and probably the granddaughter of a Baptist minister, William Williams. Her ancestors seem to have come from Somerset and Devon counties and more remotely from Wales. Even as a young child, Britten seems to have been a talented musician and vocalist, and also a visionary. Her father died when she was 11 years old. A year later she began to earn her living as a musician and vocalist, and also by serving as an entranced clairvoyant for the occult lodge that she calls the “Orphic Circle” (see below). It was probably aristocratic members of this lodge who enabled her to obtain some musical training in Paris in her late teens. In Paris, however, she damaged her singing voice; upon her return to England she turned to acting, which career she pursued (as a member of the Haymarket and the Adelphi companies) with modest success for almost a decade.

By 1850 Britten seems to have married E. Hardinge, a medical man, for in that year she began to appear on stage as Mrs. Hardinge. Also in 1850 she made or renewed her acquaintance with the enigmatic person whom she names “Chevalier Louis de B—”, an intimate of the Orphic Circle. In 1853 she seems to have begun serving as a spirit medium for Dr. Hardinge, following the example of two American spirit mediums who were holding public seances in London at that time. In 1854, however, she seems to have left Dr. Hardinge, for she next appeared on stage in Paris and then in New York, where she met with little success. Early in 1856, therefore, she resumed her former career as a spirit medium.

During the years 1856-1857 Britten was employed by the Society for the Diffusion of Spiritual Knowledge to hold free public seances in New York as a test medium, and also to edit the society’s journal, *The Christian Spiritualist*. After that journal ceased to be published (May 1857), one of the society’s trustees arranged for her public debut as a trance-lecturer. As a trance-lecturer, she proved extremely successful. During the next eight years, 1857-1865, she gave numerous trance-lectures in most of the United States, and soon became one of the most influential advocates for the controversial new religion of Spiritualism. During these years Britten also held strong views on several other major controversies of that era, advocating the abolition of slavery, reforms in the legal and social position of women, and – most notably! – that the

Bible should no longer be regarded as a divinely inspired book, but rather viewed as the confused remnants of myths and symbols from several very ancient religions that had venerated the sun, the human sex organs, and serpents.

In 1865 Britten returned to England for the first time in ten years. Among her first English trance-lectures was one advocating a revival of the study of ancient and medieval magic and witchcraft, which she supposed could shed much light on the phenomena of spirit mediumship. During the years 1865-1881 she shuttled back and forth across the Atlantic many times. In 1870, while in the United States, she married Dr. William G.P. Britten (ca. 1821-1894), like her a British subject. The years immediately after her marriage were ones of unusually diverse activities. Retiring for a while from the Spiritualist platform, Britten began to assist her husband in the practice of electrical medicine. Also, she and her husband edited and published two books for Chevalier Louis de B—, based on the doctrines and practices of the Orphic Circle: *Art Magic* (1876), a treatise on the history and theory of magic, and *Ghost Land* (1876), an occult biographical novel. In 1875-1876 she and her husband were two of the founding members of the Theosophical Society. In 1878 she returned to the Spiritualist platform, traveling overseas with her husband as far as Australia and New Zealand. In 1881 she and her husband returned to England for the last time, to spend their remaining years there.

2. WRITINGS

Britten was a prolific writer from her early years onward. Even before coming to the United States, she had contributed articles on musical and other subjects to several journals. From 1856 until the end of her life she was a frequent contributor to many Spiritualist journals, using several pseudonyms as well as her own name. She also edited several Spiritualist journals. In addition to *The Christian Spiritualist* at New York (May 1854-May 1857), which she edited only during the last year of its publication, she founded and edited *The Western Star* at Boston (July-December 1872) and *The Unseen Universe* at Manchester (April 1892-March 1893). More significantly, she edited the English Spiritualist journal, *The Two Worlds*, for the first four years of its long existence (November 1887-February 1892).

Britten was also the author of two massive histories of Spiritualism, *Modern American Spiritualism* (1870) and *Nineteenth Century Miracles* (1883). She presented her critique of Christianity in *Six Lectures on Theology and Nature* (1860), and with

somewhat greater sophistication in *The Faiths, Facts and Frauds of Religious History* (1879); these two works should be read in connection with Chevalier Louis de B—'s two books mentioned above, *Art Magic* (1876) and *Ghost Land* (1876).

Britten also wrote a few brief guides for Spiritualists, including *Rules to be Observed When Forming Spiritual Circles* (1870) and *On the Road; or, The Spiritual Investigator: A Complete Compendium of the Science, Religion, Ethics, and Various Methods of Investigating Spiritualism* (1878). Together with A. Kitson and H.A. Kersey she compiled a short manual for Spiritualist schools, *The English Lyceum Manual* (1887).

A small number of Britten's trance-lectures appeared as separate publications, beginning with two that she delivered at Boston in 1859 on *The Place and Mission of Woman* and on *Marriage*. They were shortly followed by her *Six Lectures on Theology and Nature*, delivered at Chicago in 1860. A series of trance-lectures that she delivered at London in 1865-1866 on various subjects was published under the title *Extemporaneous Addresses*. Britten also published a dozen of her short stories as *The Wildfire Club* (1861); many of them had first appeared in Spiritualist journals. And she was the author of a small book on the medical uses of electricity, *The Electric Physician; or, Self-Cure through Electricity* (1875). A few months after Britten's death, her sister, Margaret (Floyd) Wilkinson, edited and published the *Autobiography of Emma Hardinge Britten* (1900).

3. THE ORPHIC CIRCLE

As noted above, for several years in her teens Britten was employed as an entranced clairvoyant by the occult society that she calls the Orphic Circle (not its real name, see below). Among the members of this society were Philip Henry, the fourth Earl of Stanhope (1781-1855), Richard James Morrison, also known as Zadkiel the astrologer (1795-1874), the writer → Edward Bulwer-Lytton (1805-1873), and in later years perhaps also the explorer → Richard Burton (1821-1890). If not a formal member, the renowned occultist Frederick Hockley (1808-1885) was at least a welcome visitor, as was Chevalier Louis de B—.

The Orphic Circle admitted women as well as men to membership. Its members met as a lodge presided over by a Grand Master (one of whose titles seems to have been "Venerable") and were sworn to secrecy. The true name of the society was one of the society's secrets (though Britten is reported to have said on one occasion that it was a

Rosicrucian society). At any given time it employed several young women and men (such as Britten had been) as entranced clairvoyants, also called *lucides* and *somnambules*. During its lodge meetings it undertook to project the double (i.e., to travel on the astral plane) and to invoke spirits into mirrors and crystals. It carried out these essential activities within a ritual practice that owed something to renaissance ceremonial magic as well as to mesmerism [→ Animal Magnetism] and that employed both hymns and specially prepared fumigations. However, it was not the members of the Orphic Circle themselves whose doubles were projected, or who saw and heard spirits in the mirrors and crystals, but the young entranced clairvoyants whom the society employed. Moreover, the spirits invoked into these mirrors and crystals were not, for the most part, spirits of dead men and women, but rather spirits that had never been human.

Such a synthesis of these three elements – Freemasonry, mesmerism and ceremonial magic – seems first to have been made at Lyon in the 1780s by a group of aristocrats and gentlemen. Among the most influential of these men were → Jean-Baptiste Willermoz and → Louis-Claude de Saint-Martin, both of whom were already members of the Order of the Elus Coëns, founded some decades earlier by Martines de Pasqually. From France this synthesis probably spread through aristocratic channels to England, where the Orphic Circle may have been just one of several groups formed to experiment with these new occult arts. The Orphic Circle seems already to have been in existence for some years when Britten began to work for it in 1835 or 1836; also she speaks of it as still in existence in the late 1880s, when most or all of its original members would have been dead.

The Orphic Circle clearly played an influential role in the development of magic and occultism in England during most of the 19th century; it is greatly to be regretted that so little is known of its history and membership, and only slightly more about its doctrines and practices. What is known so far comes exclusively from isolated comments that Britten made in several of her writings and from the two books and several articles published by Britten and her husband as the works of Chevalier Louis de B—. The true identity of the man behind that pseudonym, therefore, is of some historical interest. In the present author's monograph on Britten, it is argued that he is Ernest Christian Louis de Bunsen (1819-1903), second son of the renowned scholar and Prussian ambassador to England, Chevalier (later Baron) Christian Carl Josias de Bunsen

(1791-1860). Ernest de Bunsen was the author of a dozen substantial works in English and in German on the secret history of the world's great religions, on the occult symbolism and secret doctrine concealed in the Bible, and on the development of Christianity from a series of misunderstood myths and symbols originally pertaining to the cycles of heavenly phenomena, to sexuality and fertility, and to chthonic serpent worship. It remains to be seen whether this identification will stand the tests of further scholarly examination.

4. THE THEOSOPHICAL SOCIETY

Towards the end of 1875 a small group of occultists and Spiritualists met four times, twice in September at → H.P. Blavatsky's apartment and then twice in October at Britten's house in New York. At those four meetings the Theosophical Society was founded, its purposes determined, its organizational structure and bylaws devised and adopted, and its first officers elected. The society continued to meet twice a month from November 1875 to November 1876, generally in a rented meeting-room, but occasionally in a private home. Shortly after its formation the Theosophical Society adopted a policy of absolute secrecy about its activities. At this time it also seems to have begun a systematic program of occult training for its less qualified members, which was divided into three degrees (with a further six degrees said to be available "in the East"). However, in the following months several of its officers and most qualified members left New York for one reason or another, with the result that the society largely ceased to meet. Later its President (→ Henry Steel Olcott) and its Corresponding Secretary (Helena Petrovna Blavatsky), who both had moved to India in 1878, reestablished and revitalized it. Yet only a few of the founding members of the Theosophical Society took much part in its activities after 1878.

Just two of the founding members of the Theosophical Society were women, Britten and Blavatsky. Yet they not only had some of the strongest personalities, but also held some of the strongest credentials as occultists, in the fledgling society. Moreover, they seem to have held rather differing views concerning the purposes and program of the society. Blavatsky's views on this subject are well known from her voluminous writings, but Britten's must be inferred from scattered hints in her later articles and essays on occultism and in other texts (including the original records of the first years of the Theosophical Society). From all these sources it is very clear that Britten's views were strongly

influenced by Chevalier Louis de B—'s views on the nature of magic in general and by his program for establishing a "school of the prophets" that would train qualified young people in a wide range of occult disciplines (clairvoyance, mediumship, crystalgazing, magnetic healing, prophesy, ministry, magic, etc.), all of which disciplines were to rest on an advanced understanding of animal magnetism and psychology (*Art Magic* [1876], chapters 10, 20, 23). Reflecting this divergence of views, the original printed *Preamble and By-Laws of the Theosophical Society* (1875) opened with two ambiguous paragraphs, carefully worded so as to accommodate each woman's point of view equally well.

In light of all this, it is likely that Britten enrolled herself and her husband as founding members of the Theosophical Society, and that she became a member of its Council, not because she greatly esteemed the occult skills, much less the personality and character, of H.P. Blavatsky, but rather because she hoped to shape the Theosophical Society into just such a "school of the prophets" as Chevalier Louis had programmatically delineated in *Art Magic*. She was unable to achieve her aims because she and her husband moved from New York to Boston in late April, 1876; because after November, 1876, the Theosophical Society ceased to meet regularly; and finally because from 1878 onward Olcott and Blavatsky in India – and in the United States William Quan Judge (1851-1896) – were able to take decisive personal control of the society's affairs and to reformulate its purposes and program as they alone saw fit. In consequence Britten ceased to take much part in the business of the Theosophical Society. Eventually she resigned from its Council, and later she publically criticized its new purposes and its methods of achieving them.

5. IMPACT

Britten lived and worked in close contact with esotericists, magicians and other occultists for nearly two-thirds of a century, with Spiritualists for nearly half a century, and with Theosophists for nearly a quarter of a century. By the end of her life, therefore, she had developed an extremely far-reaching network of acquaintances within these three overlapping groups of people, although it was largely limited to the United States and England. It is along this network that her direct and indirect influence made itself felt. Her original synthesis of religious, magical, occult, social and political ideas and ideals was an extremely powerful

and attractive one in its day, and retains considerable power even now.

The impact of this synthesis was all the stronger because of the force and charm of Britten's personality and also because of the theory that she had developed in various articles to explain and justify her work in the world. According to this theory, true spirit mediums (seers, magicians, prophets, witches, magnetic healers – they are all much the same thing in her view) differed *physiologically* from the common run of humanity, and it was this difference that enabled them to see and do what most people could never see and do, but at the same time endowed and burdened them with special callings that most people never had. Such a medium or magician 'must be born so from his mother's womb' (in principle ordinary people can bring about the necessary physiological changes in their bodies by training and self-discipline, but that way is so slow, painful and difficult as to be beyond the capacity of most people). Britten strongly claimed to be such a born medium and magician herself, as evidenced by the early development of her special powers and the seemingly fortuitous training that she received in the Orphic Circle. Yet this meant that Britten had also been set apart from other women and men by Spirit Powers more real than the empty deities preached in various churches, to present to the world their controversial messages of religious and social reform and the revival of magic. The difficulty of such a calling was well expressed by her chosen motto, 'The Truth against the World!'

ROBERT MATHIESEN

**Bruno, Giordano (Filippo), * January/
February 1548 Nola, † 17.2.1600
Rome**

1. LIFE 2. PHILOSOPHY 3. MAGIC

1. LIFE

Filippo Bruno was born in Nola, near Naples, as the son of Giovanni Bruno, 'uomo d'arme' (armiger), and Fraulissa Savolino. He first studied in Naples under the direction of Giovan Vincenzo Colle, known as "Il Sarnese", and the Augustinian father Teofilo da Vairano. In 1565 he entered the Neapolitan monastery of San Domenico Maggiore, taking the name of Giordano. Ordained priest in 1572, he completed his course of theological studies in 1575 with a dissertation on the *Summa contra Gentiles*. In June 1576 he was accused of having read and studied prohibited books. The seriousness of the accusation induced him to move to Rome, but after learning that the works he had surreptitiously used had been traced in Naples, he decided to quit the Dominican Order.

There then began a period of wandering through Italy: first to Savona, Turin, and Venice (where he published the small, lost work *De' segni de tempi* [On the Signs of the Times]), then to Padua and Brescia, where he appears to have cured a demoniac. In 1578 he passed into France, and after a stay at the monastery of Chambéry, moved to Lyon, then to Geneva. He was received by Gian Galeazzo Caracciolo, Marchese of Vico, and entered into contact with the Italian exile community. He worked as a proof-reader, and on March 20 matriculated at the University. In August 1578 Bruno was accused of defaming the Professor of Philosophy, Antoine de la Faye, and was arrested and brought before the Consistory Court. The incident caused him to abandon Geneva and return to France, where he stayed briefly at Lyon before settling in Toulouse. Here he obtained the title of "magister artium" (Master of Arts) and the post of "ordinary reader" in philosophy. The increasing bitterness of religious differences caused him to move to Paris, where he gave a successful course of lectures on the divine attributes. In addition, his courses on the Art of Memory [→ Mnemonics] aroused the interest of King Henri III, who, after having invited him to court to ascertain 'whether the memory he possessed and professed was [obtained] through natural art or through science', appointed him "extraordinary reader". In 1583 there appeared the works *De umbris idearum* (On the Shadows of Ideas), *Cantus Circaeus* (Circean Song), *De compendiosa architectura et comple-*

mento artis Lullii (On the Compendious Architecture and the Completion of the Lullian Art), and the comedy *Il Candelaio* (The Candlestick).

For motives that are not altogether clear, in 1583 he left France for England in the train of Michel de Castelnau, ambassador at the court of Elizabeth I. In the summer he held a course of lectures at Oxford, but on being accused of plagiarism, he was removed from the chair. In the same year appeared works on the subject of memory: *Ars reminiscendi* (The Art of Remembering), *Explicatio triginta sigillorum* (Explication of Thirty Seals), and *Sigillus sigillorum* (The Seal of Seals). Between 1584 and 1585 he composed the cycle of Italian dialogues: *La Cena de le Ceneri* (The Ash-Wednesday Supper), *De la causa, principio et uno* (On the Cause, the Beginning, and the One), *De l'infinito, universo et mundi* (On Infinity, the Universe, and the Worlds), *Lo spaccio della bestia trionfante* (The Expulsion of the Triumphant Beast), *La Cabala del cavallo pegaseo* (The Cabala of the Horse Pegasus), and *De gl'eroici furori* (On the Heroic Furies).

Returning to Paris in October 1585, he undertook a detailed critique of Aristotelian doctrines, first with *Figuratio Aristotelici Physici auditus* (The Shape of Aristotelian Physics), an original exposition of Aristotle's physical writings in a mnemotechnical and mythological vein, then with the harsh criticism of *Centum et viginti articuli de natura et mundo* (120 Articles on Nature and the World), a short work published under the name of his disciple Jean Hennequin, into which was incorporated the material used by Bruno for a public disputation at the College of Cambrai. To this period also belong the polemic with the Salerno geometrician Fabrizio Mordente, evidenced in *Dialogi duo de Fabricii Mordentis Salernitani prope divina adinventione ad perfectam cosmimetriae praxim* (Two Dialogues on Fabrizio Mordenti the Salernitan on the Divine Invention for the Perfect Practice of World-Measurement) which Bruno issued with the publisher Chevillot.

The worsening of the religious situation prompted him to move to Germany. He passed through Mainz, Wiesbaden, and Marburg, then between 1586 and 1588 stayed in Wittenberg. Matriculated as "doctor italicus" (Italian Doctor), he held private courses on Aristotle, commenting on the physical and rhetorical writings. A cycle of lectures on *Rhetorica ad Herennium* (Rhetoric to Herennius) was published in 1612 by Heinrich Alsted under the title of *Artificium perorandi* (The Art of Pleading). In 1587 Bruno published *De lampade combinatoria lulliana* (On the Lullian Combinatorial Lamp), *De progressu et lampade venatoria logico-*

rum (On the Progress and Hunting Lamp of the Logicians), and *Animadversiones circa Lampadem Lullianam* (Thoughts on the Lullian Lamp), and worked on the first version of *Lampas triginta statuarum* (Lamp of the 30 Statues) and *Libri physico-rum Aristotelis explanati* (Aristotle's Books on Physics Explained), which were published posthumously in the edition of the *Opera* edited by Tocco and Vitelli. In 1588, after publishing a second edition of *Centum et viginti articuli*, entitled *Acrotismus Camoeracensis*, he left Wittenberg with the *Oratio valedictoria* (Farewell Oration).

Next he went to Prague, where he published *Articuli centum et sexaginta adversus huius tempestatis mathematicos atque philosophos* (160 Articles against the Mathematicians and Philosophers of this Time), dedicated to → Rudolf II, and *De lampade combinatoria R. Lullii* (On the Combinatorial Lamp of R. Lull). In 1589 he was in Helmstedt at the Academia Iulia: on the occasion of the death of Herzog Julius II von Braunschweig, founder of the Academy, he read an *Oratio consolatoria* (Consolatory Oration) that was printed in the same year. Beside this, he devoted himself to writing magical treatises: *De magia mathematica* (On Mathematical Magic), *De magia naturali* (On Natural Magic), *Theses de magia* (Theses on Magic), *De rerum principiis et elementis et causis* (On the Principles, Elements, and Causes of Things), and *Medicina lulliana* (Lullian Medicine). In 1590 he published at Frankfurt the trilogy of Latin poems, *De triplici minimo et mensura* (On the Triple Minimum and Measure), *De monade numero et figura* (On the Monad, Number, and Figure), and *De immenso et innumerabilibus* (On the Immense and Innumerable Things). Expelled from the city, in 1591 he went to Zurich, where he gave a cycle of lectures collected and published by his pupil Raphael Egli under the title *Summa terminorum metaphysicorum* (Summa of Metaphysical Terms). In the spring he returned to Frankfurt and published *De imaginum signorum et idearum compositione* (On the Composition of Images, Signs, and Ideas).

In August 1591 he was invited to Venice by Giovanni Mocenigo, who wished to learn the art of memory. On returning to Italy, Bruno stayed in Padua and Venice, and composed *De vinculis in genere* (On Bindings in General), *Praelectiones geometricae* (Geometrical Pre-elections), and *Ars deformationum* (The Art of Deformations). On May 23, 1592 Mocenigo denounced Bruno to the Venetian Inquisition; the philosopher was arrested and taken to the prison of San Domenico di Castello. On January 9, 1593 his trial began in

Rome. In 1599, at the end of a long and complicated legal proceeding, Bruno was invited to abjure eight heretical propositions, singled out by Cardinal Roberto Bellarmino. On December 21, Bruno's stubborn attitude precipitated the result of the trial: he was handed over to the secular arm and was burned at the stake in the Campo dei Fiori on February 17, 1600.

2. PHILOSOPHY

The pyre of Campo dei Fiori certainly marked the essential moment of creation for Bruno's reputation, and his myth. Beyond the myth, the "Nolan philosophy" turns out to have been based from the very beginning on a series of crucial motifs. Already in the first Parisian work, *De umbris idearum*, the exposition of mnemonic practice resolves itself into a lucid analysis of nature and man, in which Bruno underlines on the one hand the character of "vanity" and "shadow", and on the other, the capacity to grasp the "primal, true and good" even within the shadowed horizon of the manifested universe. In the Italian dialogues written in London between 1584 and 1585 (*La Cena de le Ceneri, De la causa, principio et uno, De l'infinito, universo et mundi, Lo spaccio della bestia trionfante, La Cabala del cavallo pegaseo*), the themes enunciated in *De umbris* flow together in a more profound theoretical context, deeply marked by fundamental theoretical acquisitions such as the doctrine of living matter and the "discovery" of Copernicus.

In the first Italian dialogue published in London, the *Cena de le Ceneri*, Bruno expounds the Copernican hypothesis in radical terms, showing how the doctrine of earthly motion presupposes the existence of a universe that is infinite, peopled by innumerable individuals and worlds, animated altogether and without distinction by a unique life-principle. The motion of the earth is in fact produced by the vital impulse that is innate in matter, and which drives every planet to revolve around its own sun, so as to draw life and nourishment from it: 'The cause of such motion', writes Bruno in *La Cena de le Ceneri*, discussing the earth's motion, 'is the renewal and the rebirth of this body, which cannot last forever under the same disposition. Just as things which cannot last forever through the individual (speaking in common terms) endure through the species, [in the same way,] substances which cannot perpetuate themselves under the same countenance, do so by changing their configuration. For the matter and substance of things is incorruptible and every part of it must be the subject of every form, so that every part can become every thing (insofar as it is able), and be every thing

(if not in the same time and instant of eternity, at least at different times, at various instants of eternity, successively and alternatively). For even though the matter as a whole is capable of all the forms at once, each part of the matter, nevertheless, is not capable of all the forms at once' (*Cena de le Ceneri*, dialogue V, in *Dialoghi filosofici italiani*, p. 119, trans. Gosselin & Lerner). Change and mutation thus characterize reality at every level: 'So, everything within its own kind has every [possible] alternation of dominion and servitude, of happiness and unhappiness, of that state we call life and that we call death, of light and dark, of good and evil. And there is nothing to which it is naturally appropriate to be eternal, except for the substance which is matter, to which it is no less appropriate to be in continuous mutation' (*Cena de le Ceneri*, dialogue V, in *Dialoghi filosofici italiani*, p. 120, trans. Gosselin & Lerner). The hierarchies and distinctions proper to the Aristotelian cosmos dissolve in view of the one living matter: there is no difference between the earth and the other planets. In the infinite universe, change figures as a fundamental structure of being at every level: man, like the worlds, is moved by a continual "transmutation".

Following the thread of this reflexion, Bruno touches on the delicate problem of the relationship between science and religion and defines the proper domains of each discipline, only to reaffirm vigorously the absolute autonomy of rational research. He observes, therefore, that a correct interpretation of Scripture must needs take account of the moral intentions of the prophets: 'those divine books which serve our intellect do not deal with demonstrations and speculations about natural matters, as if with philosophy. Rather, with a view to our understanding and feelings, the scriptures direct the practice of moral actions through laws. Having then this object before his eyes, the Divine Legislator did not bother, in addition, to discuss that truth which would not have helped the common people in turning away from evil and following good. Rather, he leaves this meditation to contemplative men, and speaks to the common people according to their way of understanding and speaking, so that they can understand what is most important' (*Cena de le Ceneri*, dialogue IV, in *Dialoghi filosofici italiani*, p. 91, trans. Gosselin & Lerner). Theologians and prophets work on the plane of civil communication in order to control peoples who are still barbaric: thus they have to use a simple and direct language that suits the nature and beliefs of the individuals they are addressing. Philosophers and scientists, on the other hand, are not proposing to educate the people, but address-

ing a few intellectuals in order to communicate a truth that is often in clear contradiction to the common way of thinking. Thus it is altogether wrong to confuse the language of science and the language of morals, using the sacred writings to confirm or reject a given physical theory: prophets and scientists are addressing different publics and pursuing different ends. Resuming this argument, Bruno would conclude in his dialogue *De l'infinito*: 'This is why theologians no less learned than religious have never opposed the liberty of philosophers, while the true philosophers of civil worth and of good custom have ever fostered religions. For both sides know that faith is required for the rule of the rude populace who must be governed, while demonstration is for the contemplatives who know how to govern themselves and others' (*De l'infinito, universo et mundi*, dialogue I, in *Dialoghi filosofici italiani*, p. 119, trans. Singer).

In the second dialogue published in London, *De la causa principio et uno*, Bruno's reflexion illustrates the theoretical core of the "Nolan philosophy" in the form of a vigorous debate between three speakers: he rethinks in fresh terms the problem of the matter of the universe, replacing the traditional notion of an inert receptacle of forms with the radically original image of a material principle endowed with life and inexhaustible vigor, from which new forms continually germinate. To this end, Bruno criticizes the Aristotelian distinction between potency and act, showing how the two terms are intimately linked: every act, in fact, can be explained only in relation to a pre-existing potency. But if that is true, then even the infinite act of the divinity appears linked inseparably to the infinite potency of matter. Emboldened by these theoretical premises, Bruno completely overturns the interpretation of matter, transforming it into an attribute of the divinity.

The cosmological problem of the first three London dialogues opens up in *Spaccio della bestia trionfante* to a closely-argued reflection of an ethical order that directly attacks the concept of religion. In the first three Italian dialogues, the phenomenon of religion appears as an instrument of government invented by the wise in order to control 'wild and ignorant peoples'. From this point of view, the reasoning of the *Spaccio* introduces a strongly original element: Bruno in fact defines the nature and function of civil law on the basis of the close link that joins human laws to the inaccessible divine truth. The point of departure of the argument developed in this work is the knowledge that the divinity never ceases to communicate with the world: thus the divine action is expressed either in the natural

universe, in the form of providence, or else in human society, in the historic forms of wisdom and laws: 'Above all things', Bruno writes, 'is situated Truth . . . That goddess who is joined to and close to Truth has two names: Providence and Prudence . . . Sophia is followed by her daughter, Law; and through Law, Sophia wishes to operate, wishes to be employed; through Law princes reign, and kingdoms and republics are maintained' (*Spaccio de la bestia trionfante*, dialogue II, in *Dialoghi filosofici italiani*, pp. 536-538, trans. Imerti).

In the light of the link which exists between human laws and the inaccessible divine truth, Bruno shows how the legislator's work is responsible for causing the principles that regulate the action of God in the universe to reverberate in the human community, selecting and favoring, beyond distinctions of titles, blood, and wealth, the action of those who can contribute in positive ways to social life. Civil law thus becomes the divine instrument that permits mankind to remove itself from the animal condition, to become, through community life and the practice of wisdom, the true "gods of the earth": 'the gods . . .' – as we read in the *Spaccio* – 'have instituted laws, not so much in order to receive glory, as to spread it among men. Thus the farther human laws and opinions are removed from the goodness and truth of Law and Judgment, the farther they remove themselves from regulating and approving that which is especially contained in the moral actions of men in relation to other men' (*Spaccio de la bestia trionfante*, dialogue II, in *Dialoghi filosofici italiani*, p. 542, trans. Imerti).

On this basis, Bruno reinstates the Machiavellian idea of civil religion and contrasts with the positive model offered by the Roman cult the sterile and inert preaching of Christianity. The political and religious crisis troubling Europe is thus no casual event, according to Bruno, but has deep theological roots and was born from none other than the reversal of values produced by Christianity, which put civil virtues in second place and exalted as supreme values humility, ignorance, and the passive obedience to the divine law. According to Bruno's interpretation, the seeds of decay introduced by Christian preaching culminated in Luther's Reformation, which represents the "evil angel" foreseen in the ancient Hermetic prophecy. Luther's theses, founded on the doctrine of predestination, have in fact severed every tie between divine justice and human justice: thus religion has lost its proper function of civil control and become a source of fanaticism and discord. The Reformers, Bruno writes, do not 'bring any fruits other than those

used to suppress discussions, to dissipate harmony, to dissolve unity, and to cause children to rebel against their fathers, servants against their masters, subjects against their superiors; to cause schisms between peoples and peoples, nations and nations, comrades and comrades, brothers and brothers; to create division among families, cities, republics, and kingdoms' (*Spaccio de la bestia trionfante*, dialogue II, in *Dialoghi filosofici italiani*, p. 545, trans. Imerti).

In contrast to this politics centered on intolerance and violence, Bruno juxtaposes the enlightened action of Henri III of France, whom he evokes at the end of the dialogue as the model of the true "Christian prince", able to meet head on the deformities caused by Paul and Luther with an interpretation of Christianity in the spirit of civil law, resting on the values of peace and tolerance. In the closing passage of the *Spaccio*, Bruno adopts in secularized form the best inspirations of the Christian beatitudes, thus evoking themes on which he would long reflect. Analogous points recur in the preface to the *Articuli adversus mathematicos*, written in Prague in 1588. In this text, which may well be defined as Bruno's "profession of faith", the philosopher speaks one of the loftiest eulogies to freedom of thought: 'Everywhere', he writes, 'this law of love lies neglected, though so widely celebrated: this law born not of the malevolent demon of a single race, but in truth of God father of all, in that it conforms to the universal nature. It proclaims the love of the human race, whereby we should also love our enemies, hence not resemble the brutes and barbarians, but become the image of him who makes his sun shine on good and bad alike, and rains his grace on the just and the unjust. This is the religion that I follow without any controversy and prior to any disputation, whether by conviction of the soul, or through the ancient custom of my homeland and my people' (*La professione di fede di Giordano Bruno*, p. 69). Looking back to the tradition of Florentine → Neoplatonism and re-reading Erasmus, Bruno describes a model of religion that simplifies as far as possible its dogmatic and doctrinal apparatus and draws on the essential principles of the Gospels, interpreted ethically and free from any outside influence. Similarly in the civil realm, Bruno's religion serves as a place of unity, not of separation.

In the *Spaccio*, within an argument that dwells on the universal crisis, Bruno stresses the close connection of Christianity with decadence, and includes in his condemnation the whole Judeo-Christian tradition. He shows how the decadence of Europe has deep theological roots, derived from

the reversal of values produced by Christianity, which, as we read in the *Cabala del cavallo pegaseo*, has put civil virtues in second place and exalted as supreme values "asinine" ignorance and the passive obedience to the divine law. Finally, in the *Eroici furori* Bruno takes up again themes and images from *De umbris* to show how, by moving out of the limit and the shadow, it is possible to forge a new relationship with the absolute truth, so as to transform an environment that is structurally finite and limited into an experience of the infinite.

As can be seen from this, it is the doctrine of matter and the closely connected theme of change that, for all the plurality of starting-points and motives that vary from time to time, constitute the axis on which Bruno's research rests: in this sense, it is significant that the theoretical positions of the *Dialoghi italiani* animate the speculation that unfolds in the three Frankfurt poems: *De triplici minimo et mensura*, *De monade, numero et figura*, and *De innumerabilibus, immenso et infigurabilibus*. These three works mark the stages of a rigorous speculative movement: in *De minimo*, Bruno focuses on the infinite atoms whose ceaseless collisions mark the cycles of natural life; in *De monade*, the doctrine of Lucretius blends with the idea of universal animation to highlight the one and only motive principle that operates in the inmost part of every being; in *De immenso*, in the course of a close criticism of Aristotle and Ptolemy, he reconstructs the salient points of the cosmology illustrated in the Italian dialogues.

3. MAGIC

Bruno constantly grafts magical reflections onto his philosophical arguments. As evidence of this, it is worth noting that most of the problems treated in the magical works find their theoretical basis in the reflections of a work written in the same period, but on a very different subject from → magic: the *Lampas triginta statuarum*. It is apparently paradoxical, not only because kabbalistic and Hermetic themes are almost entirely absent from this work, but because the few allusions to magic are without exception negative in tone: rather than exalting the abilities of the magus, Bruno aims to mock the blind credulity of those who open themselves to suggestions from another's will, to the point of becoming "vessels" and "instruments" of extraneous forces. Magical doctrines, having no contact with true wisdom, play a completely irrelevant role within a reflection that is supposed to describe the structure of the manifested universe, following a program symbolized by the figure of the "natural scale". The image which pervades the treatise in a

series of close variations is not original in itself: it was sketched by Aristotle and filled out by the commentators of late Antiquity and the Middle Ages, who insisted on the hierarchical structure of the cosmos, in which every being is placed in an absolute ranking according to a rising scale that goes from the imperfection of matter up to the divine fullness, via ever-increasing degrees of perfection.

But Bruno rethinks the theme in a deeper way, modifying the traditional concept at two critical points. At the first level, Bruno dismantles the ontological structure erected by the Aristotelians by blending a series of elements taken from Aristotle's *Physics* with a conception of matter profoundly marked by the theoretical arguments arrived at in *De la causa*. At the base of the scale of nature, Bruno places not an imperfect and passive mass, but a matter animated by an insatiable desire for being, which compels it to make itself all and to become all. Between God and matter, or between the base of the scale and its summit, the only difference is given by the fact that matter can only act progressively, at different times and moments, to possess those infinite forms that coexist simultaneously in the divine plenitude. By placing the emphasis on matter and its "insatiable will", Bruno annihilates the hierarchical structure that is symbolized by the scale, which then becomes a simple metaphor for the "scientific method" described in the *Lampas*: to know nature it is not enough to grasp the profound unity underlying multiplicity, but one must first recognize the specific dignity of each being – for however small it is, it still participates in life and sense – and then comprehend one by one the relationships that unite it in infinitely varied ways to the other beings.

To describe such a process in imaginative form, Bruno takes one of the most suggestive personages of Greek mythology and shows through the figures of Thetis and Peleus the archetype of the action through which the human operator continually confronts the divine matter. Plunging deep into the rich fund of mythic material concerning Thetis, Bruno focuses on the long and laborious course which Peleus follows to conquer the goddess, alternating references to the episodes told in Apollodorus's *Bibliotheca* with direct quotes from the *Metamorphoses* of Ovid: the latter being a work which he obviously knew and loved, for he uses it frequently both in his Italian and Latin writings. If it is no surprise that one of the most detailed sections of the *Lampas* is full of references to Ovid, it is still significant that Bruno chooses to cite and to comment analytically only on those verses devoted

to the difficult conquest of Thetis. His choice is anything but automatic or indifferent, for his choice of passages is limited to those in which Ovid gives original expression to the mythological data, suppressing the heroic element so as to highlight instead the strength of desire that spurs Peleus on to find, beyond the succession of metamorphoses, the true face of the goddess.

In the *Lampas triginta statuarum*, Ovid's poem becomes the poetic figure of the long apprenticeship through which the "efficient cause" and the "operator" learn to imitate the inexhaustible cycle of natural metamorphoses, with a procedure that is never linear or pacific, but perennially liable to failure: this is evidenced, as Bruno reminds us, by Peleus's adventures, in which his laborious efforts to conquer the watery goddess often go in unexpected directions, resulting in consequences that are the opposite of what was foreseen. In this sense, one of the cardinal concepts of the chapter devoted to Thetis refers specifically to "labor", to the concentrated and meditated effort required by all operations in which man seeks to control the inner dynamism of the material substratum. Again, in an implicit polemic against those who maintain that human artifice inevitably exhausts the vigor of nature, Bruno insists that the gift of perfection, rare and extreme as it may be, can only arise out of human art. The myth of Peleus, who progressively dissolves the horrible metamorphoses of Thetis until he captures the goddess in all her splendor, show that absolute perfection, absent in nature, is always born from the informed work of an artifex, who, molding matter, directs it towards those "best forms" which nature never produces spontaneously, and which in any case are encountered only 'exceptionally', 'rarely', and 'in few individuals'.

It is thus in the relationship with matter, and specifically in the attempt to attain perfection, breaking up the inexorable rhythm of change, that Bruno sees the element that distinguishes the specific "fate" of man. And thus, having dissolved the ontological foundations of the scale of nature as traditionally understood, he returns to this image and introduces a second and significant variation on the ethical plane, to demolish any vision inspired by a rigid determinism and to celebrate, instead, the importance of human responsibility and action. In a rigorous speculative gesture, Bruno first reduces to a minimum the distance that separates man from the animal, and instead posits the maximum disproportion between the various destinies open to man. As the fruit of the metamorphoses of a unique and identical material, man is not superior by nature to other animate beings,

with which he shares, albeit in different forms, sense and intellect. Nor does he stand out in his physical constitution, for animals exist, as Bruno reminds us, that have an affinity to him, such as the ape. Much less does man enjoy any superiority on the gnoseological level, because many animals – and here he cites the classic examples of the horse and the elephant – know how to reason most acutely. Thus the primacy of man is not a natural given: on the contrary, it is the fruit of the assiduous effort that carries man beyond his own natural limit, transforming him into a “sage” and a “hero”. As Bruno recognizes, this is an extremely rare experience; however, it is only by virtue of this effort that access is gained to the highest class of living beings: beyond the plane of beings endowed with reason and intellect there is situated the “heroic” dimension, attained not by natural destiny, nor by divine beneficence, but only by conscious choice, after a long, laborious process of inner refinement.

Bruno is then able to use this carefully thought-out texture of variations for a profound rethinking of the concept of the scale of nature. In the *Lampas*, in fact, the symbol of the scale does not represent the finite steps of the descent of God into the sensible cosmos, because the communication between different levels of being is already guaranteed by matter, whose endless unfolding abolishes the traditional hierarchies. Nor does it allude to the orderly progression that goes from the animal to man, because the experience of man is configured in the very terms of a fracture with respect to his own natural role. Through these two important variants, the *Lampas* brings forth an extremely original image of nature: the universe is a living organism in which the incessant mutations of matter abolish every hierarchy and every order; combining with the work of man, it creates multiple orders that are different from those naturally given. The “scale of beings” is anything but stable and eternal (as Aristotle thought), but reveals a dynamic reality open to infinite mutations produced by the vitality of matter, which combining with the work of man opens up to diverse and unexpected forms and creates orders different from those naturally given. In the same way, the hierarchical order of beings can be subverted by the responsible action of man, who learns to know and to mold nature, and thereby learns to mold his own destiny, so that he can free himself from the animal condition and become wise and divine. From the speculations of the *Lampas* there emerges the primacy of knowing and of *praxis*, which allow one to comprehend and modify nature: and it is in the

light of this knowledge that Bruno decides to proceed to a confrontation with magic.

In the magical art, the philosopher sees the paradigm of a non-dogmatic knowledge, which, through the model of a cosmos that is animate and woven of relationships and consonances, teaches him to recognize and value the infinite differences between things, and the infinite variety of human sentiments, suggesting the most efficacious strategies to act on the relationships between the various beings, to change and control the course of metamorphoses and the play of emotions. From the start, the attention to the role played by *fides* (faith) in magical operations bears witness to the precise will to naturalize magical *praxis*, depriving it of any linkage with astrological or theurgical doctrines: the fulcrum of the magical operation is thus identified within man and his passions.

In fact, in the most interesting and original of his magical writings, *De vinculis in genere*, Bruno distances himself from a hierarchical vision of magic and politics, to show how the action of the magus – similar to that of the politician – can result in good effects only if it succeeds in breaking down the consolidated hierarchies, recognizing the nature and specific dignity of the subjects which it addresses, and elaborating, in the light of an experience that is infinitely varied and dissimilar, the most effective techniques for acting on the multiform play of emotions and serving as vehicle for this *consensus* on which every kind of magic is basically rooted: ‘It is necessary’, Bruno writes, ‘that he who would operate on reality by making use of bindings should possess in a certain way a universal theory of things, to be in the position of binding man, who of all things is so to speak the recapitulation. And this is so because – as we have said elsewhere – it is principally in the human species that one may discern the species of all things, especially through mathematics: thus some men resemble fish, others birds . . . Moreover, each man possesses a variety of customs, habits, intentions, inclinations, temperaments, and age, and, just as they imagine in the case of Proteus and Achelous that it is possible to take on a single material substratum capable of transmigrating into different forms, even so for binding one should continually use ever-varying kinds of knots’ (*De Vinculis*, in *Opere magiche*, pp. 416-417).

And it is significant that at the heart of this reflection, Bruno revives the precise system of symbols that he used in the *Lampas triginta statuarum*, to show how every magical action is based on the play of attraction and repulsion which successively join the operator – the hero Peleus – to a specific

material or a specific individual – the nereid Thetis – : ‘that which is subject to binding is something profound and scarcely apparent to the senses . . . , it is subject to transformations moment by moment, behaving towards him who would bridle it no differently than Thetis when she tried to escape from Peleus’s embrace: thus it is necessary to note the rhythm of its change, discerning beneath the preceding form the potentiality of the next one’ (*De Vinculis*, in *Opere magiche*, pp. 447-449). Whoever wishes to throw bonds around individuals or people must thus decipher the cycle of metamorphoses, so as to discern beyond the apparent chaos the order that allows him to see, time after time, the most propitious moment to throw the bond: ‘Therefore’, Bruno concludes, ‘after considering the subject’s disposition and quality at the present moment, Peleus prefigures and predisposes the bindings for this Thetis, before she flees to take a definite form, knowing well that it is one thing to bind a serpent, another to bind a lion, and yet another, a boar’ (*De Vinculis*, in *Opere magiche*, p. 449).

We are evidently dealing with a broad and articulate argument, in the course of which the philosopher recapitulates and elaborates in original fashion themes that were circulating in European culture, ranging from astrological concepts to Hermetic doctrines. The latter, which constituted an important point of reference for Bruno’s thought, have been interpreted by F.A. Yates as the sole key for understanding the sense of his biographical and intellectual environment. Recent criticism has amply dwelt on the limits of this interpretation, but the thesis of the English scholar in her now classic study, *Giordano Bruno and the Hermetic Tradition*, has had the merit of shedding new light on aspects generally overlooked by interpreters; and the suggestive image of Bruno as “Hermetic magus” thus represents an essential stage in the philosopher’s fortunes during the second half of the 20th century.

The passages from Bruno’s works quoted in the text are from the following English translations: *The Ash Wednesday Supper* (ed. & tr. Hamden, Ct.: Edward A. Gosselin & Lawrence S. MICHELE CILIBERTO

Bulwer-Lytton, Edward George
(Edward George Earle Lytton Bulwer), *
25.5.1803 London, † 18.1.1873 Torquay

Novelist and statesman. Youngest son of General William Earle Bulwer and Elizabeth Barbara Lyt-

ton. He first went by the name of Edward Bulwer. In 1838 he was created a baronet, and became Sir Edward Lytton Bulwer, Bt. In 1843, under the terms of his mother's will, he changed his surname to Bulwer-Lytton. In 1866 he was created 1st Baron Lytton of Knebworth, and was thereafter known as Lord Lytton.

Bulwer-Lytton's father died when he was four years old, leaving him to be raised by his mother in her ancestral home, Knebworth House, Hertfordshire. "Teddy" was a precocious child and, from an early age, a wide reader in his grandfather Lytton's library. As a boy, he came under the influence of the Rev. Chauncey Hare Townshend (1798-1868), an advocate of Mesmerism [→ Animal Magnetism], who remained a lifelong correspondent. After education at preparatory schools and by private tutors, Bulwer-Lytton attended first Trinity College, then the smaller college of Trinity Hall, Cambridge, and won the Chancellor's Gold Medal for his poem *Sculpture*. He spent two years in Paris (1825/26), developing into an elegant social figure with a dandified air, yet with a need for solitude and a keen, ironic eye that laid the foundations of his career as a novelist.

As a young man, Bulwer-Lytton was of a high-strung, romantic temperament. The first woman he loved was forced by her father to marry another man. Three years later she died, after confessing that she had always loved him. She remained an influence on him, appearing in his last novel, *Kenelm Chillingly*, as Lily Mordaunt. Later, while at Cambridge, he was involved with Lady Caroline Lamb (1785-1828), formerly Lord Byron's lover, who introduced him to the literary circles around the novelist and reformer William Godwin (1756-1836). After his return from Paris, she also introduced him to a beautiful, penniless Irish protégée of hers, Rosina Doyle Wheeler (1802-1882). After a stormy engagement, Bulwer-Lytton married Rosina in 1827. Bulwer-Lytton's mother was strongly opposed to the match, and cut off her son's allowance. Henceforth he had to earn his living by writing.

The Bulwers had two children, Emily (1829-1848) and Robert (1831-1891). For some years they kept up a brilliant social façade, but in 1836 they were legally separated. Rosina Lytton devoted the rest of her life to harrasing her husband, writing a novel that cruelly lampooned him (*Cheveley, or the Man of Honour*, 1839) and heckling him at his election meetings. His attempt to have her certified as insane only backfired on him by alienating the public and his son. It is not known

whether Bulwer-Lytton had any later alliances, but he was close to Lady Blessington (1789-1849), who presided over a famous literary and social salon in Gore House, Kensington. Over a hundred of her letters to Bulwer-Lytton survive, dating from 1824-1849.

Bulwer-Lytton entered Parliament in 1831 as Liberal (Whig) member for St. Ives, Huntingdon, and a supporter of the Reform Bill. During the Prime Ministership of Lord Melbourne (Lady Caroline Lamb's husband), he caused a motion to be carried exempting the freed slaves in British colonies from a compulsory twelve-year apprenticeship. He left Parliament in 1841, to return as Conservative (Tory) Member for Hertfordshire from 1852-1866. His conversion was due to his friend Benjamin Disraeli (1st Earl of Beaconsfield, 1804-1881), who also had a career as a novelist. During 1858-1859 Bulwer-Lytton was Secretary for the Colonies, and presided over the incorporation of two important new colonies, British Columbia (Canada) and Queensland (Australia). After he was raised to the peerage in 1866 he sat in the House of Lords, but increasing deafness prevented him from debating. Although the conferral of a peerage satisfied a long-held ambition of the Lytton family, Bulwer-Lytton's last years were clouded by ill-health, depression, and unceasing troubles with his wife. Bulwer-Lytton left instructions that after his death he should be buried without Christian ceremony, next to his mother in unconsecrated ground. His son ignored these wishes, and took advantage of his father's fame to have him interred among the writers and politicians in Westminster Abbey.

Bulwer-Lytton's literary career was highly successful from the start. His first novel, *Pelham*, depicted the excesses of social life that he had witnessed in Paris, and is said to have started the fashion for masculine evening dress. His novels and plays, first published without disclosure of his authorship, assured him of a lifelong income and enabled him to lavishly restore his Tudor mansion, Knebworth. They also won him the friendship and respect of Charles Dickens (1812-1870), with whom he founded the short-lived Guild of Literature and Art (1854) for the benefit of poor authors. Bulwer-Lytton also edited literary magazines (*The New Monthly Magazine*, 1831-32; *The Monthly Chronicle*, 1841-?), and, less successfully, wrote poetry, including the epic poem *King Arthur* (1848). His baronetcy was awarded for services to literature. The subjects of his novels range over social satire and social criticism, crime, historical

fiction, politics, science fiction, and the occult [→ occult/occultism].

Bulwer-Lytton's involvement with the occult began in the atmosphere of Mesmerism, or "magnetism", which was popular in the 1830s both as a social diversion and as a field of scientific research. Bulwer-Lytton's friend C.H. Townshend was an authority in the matter, and wrote *Facts in Mesmerism* (1840). Lady Blessington's salon was a hotbed of crystal-gazing, in which an entranced medium would speak messages read or seen in a crystal or glass. Here Bulwer-Lytton met the 4th Earl of Stanhope (1781-1855), previously guardian of Caspar Hauser (1813-1833) and a keen researcher into Mesmerism and crystal mediumship, and the painter John Varley (1778-1842), astrologer and friend of → William Blake. Bulwer-Lytton himself practiced geomancy (using dots drawn randomly on paper) and → astrology, making horoscopes and predictions for his friends. He foretold through geomancy the political career of Disraeli at a time (1860) when the latter was still better known as a novelist.

During the 1850s Bulwer-Lytton conducted researches and experiments in → spiritualism and Mesmerism, joining Lord Stanhope in séances with the American rapping medium Mrs. Hayden (1852). Bulwer-Lytton probably received → Eliphas Lévi on the latter's first visit to England in 1854. In 1855-1856, Daniel Dunglas Home (1833-1886) gave séances for Lytton in London and at Knebworth. Bulwer-Lytton was one of three persons present at Lévi's 1861 evocation of "Apollonius of Tyana" on the roof of a Regent Street store. But Bulwer-Lytton disappointed the spiritualist and the nascent occultist movements by refusing to lend his reputation to their causes. *The Spiritual Magazine*, 1867, reported him as saying: 'All the experiments I have witnessed, if severally probed, go against the notion that the phenomena are produced by the spirits of the dead; and I imagine that no man, who can take care of his goods, would give up his property to a claimant, who could bear cross-examination as little as some alleged spirit, who declares he is your father or friend, and tells you where he died, and then proceeds to talk rubbish, of which he would have been incapable when he was alive. I can conceive no prospect of the future world more melancholy, than that in which Sellaires and Shakespeares are represented as having fallen into boobies – or at best, of intellects below mediocrity'. Bulwer-Lytton expressed a similar opinion when he consented to be interviewed for the 1869 Report of the London Dialectical Soci-

ety. His skepticism did not prevent him from using the themes of ceremonial → magic in his short story *The Haunted and the Haunters*, and of mediumship in his novel *A Strange Story*.

Contrary to later rumors and claims, Bulwer-Lytton is not known to have belonged to any secret society or Order. He was not a Freemason. The Societas Rosicruciana in Anglia (S.R.I.A.), apparently unaware of this, elected him their "Grand Patron" in 1872, but without his consent, for which the head of the Manchester College, John Yarker, humbly apologised. Most likely Bulwer-Lytton was "self-initiated" through following practices he found in books. He wrote to a friend: 'I know by experience that those wizard old books are full of holes and pitfalls. I myself once fell into one and remained there forty-five days and three hours without food, crying for help as loud as I could, but nobody came. You may believe that or not, just as you please, but it's true!' (*Life*, II, 32) It has been claimed, without evidence, that Bulwer-Lytton contacted the → Asiatic Brethren, the Fratres Lucis, and/or the "Jewish Lodge" in Frankfurt during his travels in Germany (1841-1843). In a letter to → Hargrave Jennings (1872) he stated that, unlike current pretenders to → Rosicrucianism, he possessed the 'cipher sign of the "Initiate"', and that the Rosicrucian Brotherhood still existed, only not under any name recognizable by outsiders.

Lacking concrete evidence, Bulwer-Lytton's reputation as initiate rests on his novel *Zanoni*, which is the most significant occult novel of 19th-century English literature. He made the initial sketches for it as early as 1825. Themes from it appeared in a short story, *The Tale of Kosem Kosamim the Magician* (1832), and about half of the text as *Zicci* (1838), but the metaphysical doctrines are fully developed only in the complete novel of 1842.

The story of *Zanoni* purports to be transcribed from a ciphered manuscript acquired from an old gentleman encountered in a London bookshop. Later it emerges that the old gentleman was the artist Clarence Glyndon, one of the protagonists of the story. How far this fictitious author's opinions are Bulwer-Lytton's own is uncertain. The narrative is set in the period of the French Revolution and the Terror (1791-1793). It gives a clear sense of discrimination between good occultism and bad. The narrator rejects Mesmer and → Cagliostro as profiteers, associating them with the errors of the *philosophes* and deists; he praises → Louis-Claude de Saint-Martin alone among the 18th-century llluminates. The initiates of the story hate the

Revolution for its impiety, atheism, and dogma of *égalité*. They hold that the whole of the universe is a hierarchy, from the archangel to the worm, and that it is human inequality alone that holds out the hope of progress.

Besides Glyndon, the narrator, artist, and neophyte, the characters of *Zanoni* include two Chaldean initiates, apparently the only two left on earth of a high and ancient Order. This is not the Rosicrucians, but an older and more illustrious Order of which the Rosicrucians are a branch. It pays special respect to the teachings of the Platonists, the Pythagoreans, and Apollonius of Tyana. Evidently it is not Christian. The two initiates are Mejnour, the senior one, and Zanoni, who has been on earth for 5000 years. While sharing in the same occult knowledge and possessing the secret of indefinite life, these two contrast in character. Mejnour inhabits the body of an old man, with every earthly passion extinguished, in order to accomplish the transmutation of man into superman. He works at his plans with 'cabala and numbers', residing in Olympian calm behind the scenes and cycles of human history, indifferent to others' weal or woe as he is indifferent to his own. Zanoni is an equally mysterious character, but one who becomes less superhuman as the plot unfolds. There is much of the Comte de → Saint-Germain about him: Zanoni is also a cosmopolite, a 'noble traveler' who has seen the world (his servants come from India) and its history, a man who has achieved the elixir of life, who gives away priceless gems and stuns the public with his mystery and his wealth, coming and going as he pleases. Zanoni's choice is to enter the maelstrom of human passion, losing his occult powers in the process but gaining what his master Mejnour has rejected: love and death. The message of the work is that the love of human beings for each other, and their acceptance of death, are things of incalculable value, not to be surpassed even by the highest initiate.

The novel is an encyclopedia of ideas about the occult sciences. In pointing out the extreme ugliness of the French Revolutionary leaders, it supports the thesis of physiognomy. Herbalism is mentioned reverently, along with the general value of research into the mysteries of nature. The doctrines of universal sympathy, of secret affinities in nature, and of hierarchical planes of being permeated by an omnipresent Mind are essential to *Zanoni*. The multiple planes include those that can only be explored out of the physical body. Therefore asceticism is necessary to the aspirant, refusing the demands of the flesh in order to live in the soul and work with the imagination. The artist can do this

as well as the mystic; a Platonic subtheme of *Zanoni* is the sacred nature of art, if only inspired by the "Ideal".

The world-view of *Zanoni* is of a universe populated by beings at every level: not just the physical series from galaxy to microbe that was currently exciting Victorian scientists, but an unseen hierarchy which could, by the proper means, be rendered perceptible. The lowest of them are the spirits of the four elements: the Gnomes, Undines, Sylphs, and Salamanders of → Paracelsus and of the *Comte de Gabalis*. No friends to humankind, these were believed by earlier magicians to be fiends, and their pacts with them to be drawn with the Devil. But no man can sell his soul, says Zanoni, for 'in every human creature the Divine One breathes; and He alone can judge His own hereafter, and allot its new career and home'. This immortal part of man is called by the Neoplatonic term *augoeides*, which manifests when 'the sphere of the soul is luminous, when nothing external has contact with the soul itself; but when lit by its own light, it sees the truth of all things and the truth centred in itself'. Thus man is tripartite, consisting of body, soul, and the *augoeides* or indwelling Divine Spirit. The magus can command the elemental spirits, but more importantly he can establish contact with higher beings. Zanoni twice summons a celestial apparition called Adon-Ai, from whom he has learned all his wisdom. Adon-Ai disputes with Zanoni at the point at which the initiate has decided to renounce his asceticism and embrace human love; when Zanoni is obdurate, the Son of Light smiles. On the second apparition of Adon-Ai, the spirit gives his blessing to Zanoni's decision, for by now Zanoni has also embraced human death, which Adon-Ai calls 'the sublimest heritage of thy race, – the eternity that commences from the grave'. Finally there is the famous "Dweller of the Threshold" whom both Glyndon the neophyte and Zanoni the adept have to face and overcome. This is a hideous personification of one's past thoughts and evil tendencies, which even if not perceived lures the aspirant towards disaster. The only way to conquer it, as Zanoni teaches Glyndon and demonstrates himself, is by overcoming one's fear and persisting in one's resolve to cling to virtue, come what may. Then two paths are open: one, the path to seraphic detachment such as Mejnour has achieved; the other, the path by which one becomes as a little child again, which is Zanoni's choice. *Zanoni* was Bulwer-Lytton's own favorite among his works. It was much read and discussed, especially in France and Germany, where many of Bulwer-Lytton's works were translated.

Bulwer-Lytton's late novel *The Coming Race* was influential in 20th-century science-fiction literature. It depicts a race with superior powers that has long lived beneath the surface of the earth. They have developed a force called "Vril" which they use for advanced technological and seemingly magical effects. In 1870, Lytton explained: 'I did not mean Vril for mesmerism, but for electricity, developed into uses as yet only dimly guessed, and including whatever there may be genuine in mesmerism, which I hold to be a mere branch current of the one great fluid pervading all nature'. Nonetheless, "Vril" has become a cliché of 20th century popular occultism, as has the notion of a hollow earth with its inhabitants.

Bulwer-Lytton's son Robert has sometimes been confused with him, especially by non-English writers, and merits a short note here. Edward Robert Bulwer-Lytton joined the diplomatic service in 1850 and served in Washington and many European capitals. In 1873, on his father's death, he succeeded to the peerage as 2nd Baron Lytton. From 1875-1880 he had the difficult task of Governor-General of India. In 1880 he was raised to an earldom and became 1st Earl of Lytton (but still also styled "Lord Lytton"). He served as ambassador in Paris from 1887 until his death there in 1891. The Earl of Lytton was a prolific poet under the name of "Owen Meredith". His friendship with → Saint-Yves d'Alveydre appears in his translation of the latter's *Le Poème de la Reine* (published 1892), and may be a symptom of a deeper involvement with French esotericists than can be documented. Saint-Yves's personal mythology (as expounded in *Mission de l'Inde*, 1886) gives an important role to India and to a subterranean race with superior technology.

Novels relevant to esotericism: *The Last Days of Pompeii* (1834), *Zicci* (1841), *Zanoni* (1842), *A Strange Story* (1862), *The Coming Race* (1871).

JOSCELYN GODWIN

Burton, Sir Richard Francis, K.C.M.G.,
* 19.3.1821 Elstree, † 20.10.1890
Trieste

Traveler and translator. Son of Lt.-Col. Joseph Netterville Burton and Martha Baker. Childhood in France and Italy, educated by private tutors. Learned several languages before attending Trinity College, Oxford (1840-1842; no degree). Burton was attracted to the occult while at Oxford, when the artist John Varley (1778-1842) drew his horoscope and introduced him to the kabbalah [→ Jewish Influences]. As an officer in the Army of the East India Company (1842-1849), Burton qualified as interpreter for six Indian languages and also studied Arabic, Sanskrit, Pushtu, and Portuguese. On his return he published four books about India. In 1853, disguised as an Indian healer and magician, he made the pilgrimage to Mecca and entered the Ka'aba. His book about this adventure ensured his fame. From 1854-1859 the East India Company supported Burton's expedition to Somalia, where he was badly wounded. In 1856 he served in the Crimea, then began a series of expeditions, partly supported by the Royal Geographical Society, to discover the source of the Nile. On his return in 1859 he was awarded the Founder's Gold Medal of the R.G.S. In 1860 he visited Utah and interviewed Brigham Young. In 1861 he married Isabel Arundell (1831-1896), and joined the diplomatic service. He served as British Consul at Fernando Po in Portuguese West Africa (1861-1863) and at Santos, Brazil (1865-1868), both posts giving him the opportunity for explorations of the interior. From 1869-1871 he was Consul at Damascus; from 1872-1890 at Trieste (1872-1890), varied by journeys to Iceland, India, Egypt, and West Africa. On 12.10.1878 he was elected a fellow of the → Theosophical Society in London. In 1886 he was made a Knight Commander of the Order of St. Michael and St. George. His body was buried in a marble replica of an Arab tent in the Catholic cemetery of Mortlake.

Burton was a many-faceted individual, driven by curiosity to risk his life and ruin his health in some of the most dangerous parts of the world. His superb talent for languages and his retention of all that he saw and learned made him the equal, and the envy, of professional scholars, and his translations of Oriental literature became classics. His intelligence, cynicism, and wit made him as many enemies as friends and his promotion was repeatedly blocked. He was a considerate husband to his devout Catholic wife, who had married him against the wishes of her aristocratic family. Burton

frequently used his wife as a “magnetized” medium, asking her questions about absent persons or future events.

Burton’s interest in altered states of consciousness led him to the use of hashish, opium, and other drugs. He was notoriously well-informed about the sexual practices of non-European peoples. Before his marriage, he took advantage of his postings to explore these in person, and contracted syphilis. He continued throughout his life to add to his encyclopedic knowledge on the subject, much of which is scattered in his twenty-three travel books. In Trieste Burton translated the poetry of Luis Vaz de Camoens (1524-1579/80), the erotic classics *Kama Sutra* and *Kama-Shastra*, *The Perfumed Garden of the Cheikh Nefzaoui*, *The Book of the Thousand Nights and a Night* (16 vols.), the *Pentamerone*, and Greek and Latin erotica. His translation of the “Arabian Nights” was glossed with a mass of erudition and a “Terminal Essay” on the sexual customs of the East that was a landmark in Victorian scholarship. Even more notorious was his book-length treatise *Human Sacrifice among the Sephardine or Eastern Jews* (1877), which has been blocked from publication to this day.

Burton had a sympathetic curiosity for all religions. In India he was inducted as an honorary Brahmin into the Nagar-Brahmin caste. In Karachi he was initiated as a Sikh, and underwent the long rituals to become an initiate of the Qadiri Order of Sufism. He probably had more knowledge of the religion and practices of Islam than any Westerner of his time. His published work, like that of the Theosophists, contributed to the growing appreciation of Oriental philosophy and culture in the later 19th century. Also Theosophical in spirit was his dispassionate acceptance of “occult” phenomena as evidence for the unknown powers of nature and of man, better understood in the East than in the modern West. In an address to the National Union of Spiritualists (1876) he asserted the existence of extra-sensory perception, but attributed it to unknown natural causes, rather than to spirits. As far as one can guess at Burton’s private convictions, they were metaphysical rather than religious, perhaps resembling those of his admired Sufis, for whom all religions are but veils before reality. His deliberate flaunting of taboos and fearless pursuit of knowledge align him with the warrior current within the esoteric tradition.

Byzantium

1. WHY SHOULD A STUDENT OF WESTERN ESOTERICISM PAY ATTENTION TO BYZANTIUM?
2. WHAT DOES “ESOTERIC” MEAN IN BYZANTIUM?
3. BYZANTINE ESOTERICISM VERSUS WESTERN ESOTERICISM
4. HELLENIC ESOTERICISM IN BYZANTIUM
5. ORTHODOX CHRISTIAN ESOTERICISM IN BYZANTIUM

Byzantium has been defined by Western scholars in many different ways, by many different criteria and for many specific purposes. The later Byzantines themselves, however, found their world easy to define. Its irreducible cultural *center* consisted of two things: the doctrines and practices of the Orthodox Church, on the one hand; and on the other, the Greek language. It was a Byzantine’s mastery of the Greek language that distinguished him from the barbarian; it was his adherence to the Orthodox Church that distinguished him from the schismatic, the heretic, the pagan, and other such kinds of people.

But this was only the *center* of Byzantium, for Greek texts had also been translated into “barbarian” tongues. Thus Byzantium, more loosely defined, also encompassed other Christian peoples who were Orthodox in their doctrine and practice, but who had long celebrated the liturgy and read the Bible in languages other than Greek (notably, in Old Georgian and Old Slavonic). Moreover, in every culture there are always dissidents, and so Byzantium also contained individuals or groups of people who were not Orthodox, and others who were not even Christian.

Byzantium, so defined, first began to take shape during the fourth century CE on the territory of the Eastern Roman Empire. In the fifth century two major schisms divided the supra-national, multilingual Christian world into three disjunct communions: the non-Ephesian Church in Persia, the several non-Chalcedonian Churches in various lands of the East, and the combined Orthodox and Catholic Churches of Byzantium and Rome. In the seventh and later centuries Islam conquered large parts of the Byzantine Empire, as well as most of the lands where the non-Ephesian and non-Chalcedonian Churches were at home. In the eleventh

century another schism broke the communion that had hitherto prevailed between the Orthodox Churches and the Roman Catholic Church, and the sack of Constantinople in 1204 by the Fourth Crusade widened this breach into a nearly unbridgeable chasm. Taken together, these developments massively reduced the linguistic and cultural variety of Byzantium, cutting it off from most of the Christian peoples that had long used Old Syriac, Old Armenian, Coptic, Old Ethiopic and Latin as their languages of liturgy and culture. On the other hand, Byzantium was able to extend its boundaries northwards, with the Christianization of Bulgaria in the ninth century, of Russia toward the end of the tenth century, and of other South Slavic realms in later centuries. In 1453, however, the last fortress of the Eastern Roman Empire, Constantinople itself, fell to an Islamic army, and the last Christian Emperor of Rome died fighting on its walls. Yet even after 1453 Byzantium continued to exist, albeit in attenuation, as a subjugated culture in Greek-speaking lands and as a transplanted culture in Orthodox Slavic lands.

1. WHY SHOULD A STUDENT OF WESTERN ESOTERICISM PAY ANY ATTENTION TO BYZANTIUM?

There are at least three answers to this question, each more compelling than the previous one. Firstly, most of the oldest foundation texts of Western esotericism – the dialogues and letters of Plato, the works of the Neoplatonic philosophers [→ Neoplatonism] and theurgists (above all, Iamblichus's treatise *On the Mysteries of the Egyptians*), the *Chaldaean Oracles*, the manuals of the Hellenic astrologers [→ Astrology] and alchemists [→ Alchemy], the *Corpus Hermeticum* [→ Hermetic Literature], the writings of pseudo-Dionysius the Areopagite, various Gnostic texts, and so on – were not only composed in Greek, but also have come down to us almost entirely through Byzantine channels of transmission, whether they are still extant in the original Greek or have now survived only in the form of old translations from lost Greek originals. Secondly, Byzantium never experienced – and never *needed* to experience – the Renaissance, the Reformation, the Counter-Reformation, or the Enlightenment. It is these four successive cultural movements that gave Western esotericism all of its present defining characteristics (as specified by Faivre 1994, 10–15), but the specified characteristics *cannot* serve to define Byzantine Esotericism. Thirdly, over many centuries profound and subtle differences in doctrine and practice developed between Christianity in Byzantium and Christian-

ity in Western Europe. In consequence, esoteric doctrines and practices came to occupy a different position and to play a different role in the Orthodox Churches of Byzantium than they did in the Catholic Church of Western Europe.

Because of these differences, one might legitimately ask whether Byzantine esotericism even exists. It does. Indeed, it is convenient to speak of *two* distinct Byzantine esotericisms. One of them may be termed *Orthodox Christian esotericism*. For over 1500 years this esotericism has been widely cultivated throughout the Byzantine world, especially in the great monasteries of the Orthodox Church such as those of Mt. Athos and Mt. Sinai. The other may be termed *Hellenic esotericism*. It has always drawn its inspiration directly from the pagan texts and traditions of Neoplatonic philosophy and theurgy. Therefore it has always been more or less problematic in Christian Byzantium. After the mandatory Christianization of all Byzantines in the sixth century, Hellenic esotericism seems to have been cultivated only sporadically, by a mere handful of highly educated Byzantines. Each of these two Byzantine esotericisms shares some important features with Western esotericism, although neither possesses all of the significant defining features of the latter (always here referring to Faivre's definition).

These differences between esotericism in Byzantium and esotericism in Western Europe enable a sensitive scholar to arrive at a deeper understanding of the latter by contrasting it with the former: light from the East often throws into very sharp relief, indeed, what could otherwise be only dimly seen in the West. Yet for this to occur, one must first become familiar with each kind of Byzantine esotericism on its own terms, not viewing it solely in terms of Western categories and theories.

One must also be careful to distinguish genuine Byzantine esotericism from various esoteric currents that have claimed to be Byzantine, but in fact have other historical roots. The most wide-spread of all these *pseudo-Byzantine esotericisms* are the ones pertaining to Sophia, the Wisdom of God. Though they are usually presented as genuine old esoteric traditions of the Orthodox Church, in point of historical fact they derive directly or indirectly from the work of the eccentric Russian lay theologian, Vladimir Sergeevich Solov'ev (1853–1900), who combined Orthodox Christian esotericism with elements of two other traditions. One of these other traditions was Western-European Sophiology (cf. → Jacob Boehme or → Gottfried Arnold), which came to Russia through Freemasonic [→ Freemasonry] and Rosicrucian [→ Rosi-

crucianism] channels during the eighteenth century and had an enormous impact on Russian spirituality. The other tradition was Late Antique → Gnosticism, insofar as it had been recovered by nineteenth-century scholarship. Solov'ev's synthesis of these three disparate traditions was presented with such skill and power, and satisfied the needs of its era so well, that it was believed to represent an authentic Byzantine esoteric teaching by many well-educated Orthodox laymen, and even by a few influential clerical theologians of the Orthodox Church.

2. WHAT DOES "ESOTERIC" MEAN IN BYZANTIUM?

To understand Byzantine esotericism in its own terms, we must begin with the word esoteric itself. In ancient Greek, the opposed adjectives ἐσωτερικός (esoteric) and ἐξωτερικός (exoteric) were relatively uncommon. The adjective ἐξωτερικός seems to have been the older of the two, originally meaning "exterior" or "foreign". It was derived from the adjective ἐξώτερος (outer), which was opposed to ἐσώτερος (inner); and those words in turn were derived from the twin adverbs ἔξω (outer) and ἔσω (inner). The adjective ἐσωτερικός seems to have been coined from ἐξωτερικός in order to create a pair of technical terms in philosophy. In philosophy, the use of these terms was originally limited to two contexts. They were used, first of all, to label the two orders into which the philosopher-magician Pythagoras (according to several later sources) appears to have divided his disciples: his *exoteric* disciples were those who might hear the master's teaching only in silence, never actually seeing him as he spoke from behind a curtain, whereas his *esoteric* disciples, tested by five years of silence, were privileged to go behind the curtain, to see Pythagoras himself and to speak with him (Hippolytus of Rome, *Refutatio omnium haeresium* I.2; Origen, *Contra Celsum* I.7; Iamblichus, *De vita Pythagorica* 17, 31, 32). Somewhat later, the writings of the philosopher Aristotle were said to have been divided into two classes: his *exoteric* writings were available for all to read, whereas his *esoteric* writings were restricted to members of his school (Clement of Alexandria, *Stromateis* V.9, cf. Lucian, *Vitarum auctio* 26, Aulus Gellius, *Noctes Atticae* XX.5; as it happens, Aristotle's exoteric writings survive only as fragments; it is his esoteric treatises that have come down to us). In each case, whether applied to pupils or to treatises, the two terms express an opposition between the outer, common world of the general public and the inner, restricted world of favored or accepted students. Even later,

Galen termed certain Stoic teachings *esoteric* (*De Hippocratis et Platonis placitis* III.4).

Under the influence of Christianity the opposition between ἐσωτερικός and ἐξωτερικός was subtly altered. Although neither word occurs anywhere in the Greek Bible – neither in the Septuagint Old Testament nor in the Greek New Testament –, St. Paul (II Cor. 4:16) speaks of ὁ ἔσω ἄνθρωπος (the inward man) and ὁ ἔξω ἄνθρωπος (the outward man), opposing the spiritual to the mundane; later, some pagans came to use the same phrases with similar meanings. Henceforth *esoteric* people in the original sense of the term – privileged students – are implicitly also distinguished by their deeper spirituality, and *esoteric* writings – treatises restricted to such students – are implicitly also writings that convey deeper spiritual truths; the *exoteric*, in contrast, are common and mundane. The Neoplatonists, too, used the terms in this broader sense, e.g. Iamblichus in his *Protrepticus* (I, 4, 21), as does Origen with reference to Christian doctrines in his *Contra Celsum* (III.37). Moreover, in another of his works Iamblichus divides doctrines into *exoteric* and *esoteric*, that is, into ῥητά (effable) and ἄρρητα (ineffable) (*De communi mathematica scientia* 18). This idea that the deepest spiritual truths are not only *esoteric*, but also *ineffable*, that is, they are inherently beyond the power of any language to express, colors all subsequent use of the term *esoteric* in Byzantium.

3. BYZANTINE ESOTERICISM VERSUS WESTERN ESOTERICISM

In Western Europe, too, there were texts and people, doctrines and practices that a Byzantine observer might have labeled *esoteric*. Even so, the borrowed words *esotericus* and *exotericus* seem to have been hardly ever used in Ancient and Medieval Latin. When they were used before and during the Renaissance, they seem to have been used almost exactly as their Greek equivalents were in Byzantium, although perhaps sometimes without the Neoplatonic association between the esoteric and the ineffable.

Beginning with the Renaissance, however, the term *esotericus* came to be used more commonly in the West. Yet as its use grew, it acquired a new connotation, which the corresponding Greek word lacked: henceforth whatever was esoteric was necessarily *opposed* in one way or another to the prevailing judgement of the generally recognized experts. Thus in the West esotericists became proponents of rejected or forgotten knowledge (*wrongly* rejected or forgotten, they would claim), and Western esotericism eventually became – to

lapse into contemporary jargon for a moment – a radical challenge to the “dominant paradigm” of its age, a form of “counter-culture”. In the Byzantine world, by contrast, Orthodox Christian Esotericism always remained a fully integrated part of the “dominant paradigm”, and never formed the nucleus of any Byzantine “counter-culture”.

This contrast arose largely because of developments in Western Europe, not in Byzantium. During the final centuries of the Middle Ages, Aristotelian modes of knowledge and investigation came to dominate all the great universities and to shape the programs of education for all the learned professions. As a consequence of this, Platonic and esoteric modes of knowledge and investigation were widely rejected by these same universities and professions, and could be cultivated only outside of these institutions. Although the Renaissance challenged the dominance of Aristotle in the schools and professions, its challenge was only partly successful (chiefly in the liberal arts). Soon the Reformation and Counter-Reformation developed their own competing Protestant and Catholic forms of Aristotelian scholasticism. Also, from the late Middle Ages onward, the recovery of Roman law encouraged the development of powerful judicial institutions designed to investigate and repress all forms of deviance and dissidence. Individual or uncommon kinds of spirituality or → mysticism that had long been unchallenged now came to be severely repressed by the newly codified Protestant and Catholic orthodoxies, and this repression continued until the Enlightenment, which had its own radical views on the separation between Church and State. Despite its strong anti-ecclesiastical tendencies, the Enlightenment continued to reject Platonic modes of knowledge – along with → magic, occult philosophy [→ occult / occultism] and esoteric studies – as inconsistent with its own Cartesian principles, severely criticizing such things as works of deceit, delusion and folly. From this time onward, Western esotericism could only be cultivated as a radical challenge to the schools and professions, as a kind of counter-epistemology.

In Byzantium, however, everything was on a much smaller scale, especially during the latter centuries of its independence. Its schools and professions were less developed as institutions, Aristotle was never strongly privileged over Plato, and the line between Church and State was never as sharply drawn as it had long been in the West. Only among the very few Byzantine intellectuals who studied Hellenic esotericism after the sixth century does there seem to have been anything remotely like the Western impulse toward a counter-culture. It is

because of this likeness that we shall examine Hellenic esotericism first.

4. HELLENIC ESOTERICISM IN BYZANTIUM

Hellenic esotericism drew its inspiration from the same Greek authors, texts and practices that originally nourished Western esoteric studies: from Plato, the pre-Byzantine Neoplatonists such as Plotinus, Porphyry and Iamblichus, the *Chaldaean Oracles*, the *Corpus Hermeticum* and the other writings ascribed to → Hermes Trismegistus, astrologers such as Ptolemy, and alchemists such as Theosebia and → Zosimos of Panopolis. In another key, it also used manuals of divination [→ Divinatory Arts], books of omens, treatises on the construction of → amulets and talismans, the recipes of the *Kyranides*, and even a few texts of demonic ritual magic such as *Solomon's Magical Treatise* (Ἀποτελεσματικὴ πραγματεία Σαλομώντος) a Greek work related to the *Western Clavicula Salomonis*, and the *Testament of Solomon*.

From the late fourth through the sixth century, of course, many highly educated Greeks not only remained pagan, but also studied the above-mentioned texts (and other texts of the same sort that have now been lost). Among these men and women were Maximus of Ephesus and his disciple the Emperor Julian, Plutarch the Neoplatonist and his daughter Asclepiogeneia, and finally Proclus (cf. Marinus, *Vita Procli* 28). During those few centuries it was still lawful to be pagan in Byzantium, and pagans still could and did cultivate Hellenic esotericism, or even practice theurgy, without having to worry overmuch about the Church's censure.

Even after the sixth century, of course, some of these traditions survived in attenuated form, generally among less well educated Byzantines, who did not always know which notions and ideas about demons had been accepted by the Orthodox Church, and which had been rejected; or which exorcisms and small rites were permitted, which forbidden. Thus there arose what Richard Greenfield has termed ‘alternative traditions of belief and practice’ about demons, in contrast to the well-defined ‘standard tradition’ of the Orthodox Church; there are also alternative traditions for other rites and rituals. These alternative traditions, of course, were not clearly distinguished from the standard tradition by the masses, but what may surprise is the extent (as Greenfield has shown) to which even educated Byzantines combined the standard and alternative traditions during the last centuries of Byzantine independence. However, this was simply a matter of ignorance or confusion,

not a deliberate foray into forbidden territory. Deliberate forays into forbidden territory remained rare, even in the late Byzantine period.

No more than a handful of named Byzantines are known to have made a serious study of Hellenic esotericism after the final repression of paganism in the 6th century. The best known are Michael Psellus in the eleventh century and Georgios Gemistos Plethon in the 15th. However, there must have been others whose names have not come down to us, but for whom the various extant manuscripts of the relevant Greek texts were copied during the last centuries of Byzantine independence.

Michael Psellus (1018-1081) was one of the greatest polymaths in all Byzantine history, even serving for a time as a sort of philosopher-in-residence to the Imperial court. His surviving works treat history, law, rhetoric, logic, Platonic philosophy, theology – and include not quite a dozen short theoretical tracts on demonology, the *Corpus Hermeticum*, the *Chaldaean Oracles* and theurgy! His principal sources seem to have been various works (some now lost) by Porphyry, Iamblichus and Proclus on these subjects. Indeed, Iamblichus's long work *On the Mysteries of the Egyptians* may owe its survival to Psellus's efforts, for he appears to have read it, and all extant manuscripts appear to descend from a single manuscript (now lost) that had been copied during or not long after his lifetime and also contained some of his treatises on esoteric themes. Yet despite his esoteric interests, Psellus remained thoroughly Christian in his own eyes, and in some of his writings justified such studies from a Christian perspective.

Georgios Gemistos Plethon (ca. 1360-1452) had many of the same esoteric interests as Psellus, but pursued them to a much more radical conclusion, for in his old age he went so far as to argue in favor of restoring Neoplatonic paganism and theurgy in place of Christianity. The work in which he made his strongest arguments for this, *On Laws*, was burned shortly after his death by order of Patriarch Gennadius II Scholarius, but significant fragments of it have survived (thanks in part to extracts made during Plethon's lifetime by several interested friends and students). Here and in other writings Plethon displays considerable interest in the *Chaldaean Oracles*, but the only source that he has for them is one of Psellus's commentaries on them. By the 15th century almost every earlier source – not only the complete *Chaldaean Oracles* themselves, but also various Neoplatonic commentaries on them – seems to have been lost.

When Plethon was almost 80 years old, he attended the great ecclesiastical council that met at

Ferrara and Florence in 1438-1439. Although his impact on the council's proceedings was relatively slight, he was able to meet a number of Florentine scholars and statesmen, and to impress them greatly with his passion for Plato and the Neoplatonists. Cosimo de' Medici's Platonic Academy owes something to Plethon's inspiration, as does the program of Latin translations from the Greek that Cosimo de' Medici commissioned from → Marsilio Ficino. Ficino's translations, it should be noted, included the works of Plato and Plotinus, the *Corpus Hermeticum*, Iamblichus's *On the Mysteries of the Egyptians* (to which were appended translations of several short works by Porphyry, Proclus and Michael Psellus), and two of the works of pseudo-Dionysius the Areopagite (*The Divine Names* and *The Mystical Theology*) – in short, many of the most important Greek foundation texts of Western esotericism.

5. ORTHODOX CHRISTIAN ESOTERICISM IN BYZANTIUM

Although Hellenic esotericism developed somewhat in opposition to the prevailing norms of Byzantine culture, Orthodox Christian esotericism developed very much in agreement with these same norms, in sharp contrast to Western esotericism since the Renaissance. As noted above, this contrast owes much to specific developments in the cultural history of Western Europe. Yet the ease with which Orthodox Christian esotericism accommodated itself to the norms of Byzantine culture has a lot to do with certain characteristic features of the Orthodox Church, in particular, with some specific patterns of Byzantine liturgy and worship, with the privileged position that apophatic theology is given over cataphatic theology, and with the doctrine of *theosis*, or deification. We must consider these three points as we seek to present Orthodox Christian esotericism in its own terms.

One of the most significant characteristics of the Orthodox Church, for our purposes, is that a priest does not celebrate the eucharist by or for himself alone, apart from any congregation. This is a point of eucharistic theology and canon law. However, it is also a matter of simple necessity, for the worship of the Orthodox Church in all its complex fullness is the cooperative work of several different classes of people, lay as well as ordained – priests, deacons, rectors, singers, laity, and so forth – and the prescribed texts are scattered among a considerable number of liturgical books, several of which must be used together during any service. In the course of an entire year's worship, most of the texts in these various books must be woven together in a

very complicated pattern. This pattern, moreover, changes somewhat from year to year according to the date of Easter, which moves back and forth along a range of thirty-five consecutive days according to a complex cycle that lasts 532 years from start to finish.

Instead of liturgical work, what the Orthodox Christian – whether a priest or not – does in solitude is to pray. Even though a near-by church may happen to be unlocked and empty, the traditional place for private prayers remains one's home, one's room or one's monastic cell. Even a parish priest – who is a married man – will use his home for this purpose, and a priest-monk will use his cell (in the Orthodox Churches most monks are not priests).

There is nothing, therefore, anywhere in the traditional practice of the Orthodox Church that corresponds very well to a Catholic priest as he celebrates a Low Mass by himself from a Missal, or as he reads his daily office from a Breviary in private, or as he offers up his personal prayers before a consecrated altar in solitude. This Catholic pattern has greatly influenced Western esoteric practices, which as often as not employs a consecrated altar before which initiates work their esoteric rituals in private and in a somewhat priestly manner. In Orthodox Christian esotericism, however, this priestly pattern played no role: rather, the dominant pattern was that of a solitary monk at prayer in his unadorned cell. In principle, therefore, Orthodox Christian esotericism does not need either ceremonies or ceremonial objects as foci for its practice. Additionally, it is an esotericism of solitude that one ideally practices by oneself, not in a group. It operates, therefore, without temples or lodges, and its practitioners are not quasi-priests, much less members of some esoteric priesthood or consecrated order that answers to a higher authority than any institutional church. Indeed, such a person is not part of any secret institution or organization at all, but just a simple Christian man or woman who seeks in solitude and silence to attain the most esoteric *mysteria* (μυστήρια) of all, which are also Divine.

However, these mysteries are ineffable (ἄρρητα), that is, they lie far beyond the power of any language to express. Indeed, they are incomprehensible, that is, they lie far beyond 'all things that can be perceived and understood (αἰσθητὰ καὶ νοητά), that are not or that are' (pseudo-Dionysius the Areopagite, *Mystica theologia* I.1), and must therefore be experienced by other means than words, concepts or even ordinary percepts. To express these other means, the same author says that they are to be attained 'in the hyper-luminous darkness

of a hidden silence' (*ibidem*). Indeed, he even says that they are 'beyond all being (ουσία) and knowledge (γνώσις)', a matter of θεοσοφία (theosophy) as well as of θεολογία (theology) (*ibidem*).

This kind of theology, which leads the reader upward by means of denials rather than affirmations, is called *apophatic* (from Greek ἀπόφασις, denial), in contrast to the other kind, *cataphatic* theology (from Greek κατάφασις, affirmation). The two kinds loosely correspond to what in the West are usually called *negative* and *positive* theology, but the correspondence is not exact. If the Catholic Church (especially since Thomas Aquinas) has favored an Aristotelian sort of positive theology, and has used negative theology mostly to supplement positive results, it is otherwise in the East. The Orthodox Church, much less wedded to Aristotelian modes of knowledge, has long delighted in apophatic theology. In this one point it favors the Neoplatonists, although it otherwise diverges enormously from them in matters of doctrine and practice.

The best way into this 'brilliant darkness of a hidden silence' is precisely specified in several works by Gregory of Sinai (ca. 1265-1346) and especially in an anonymous treatise of unknown age sometimes titled *The Three Methods of Prayer* (the latter treatise is attributed to Simeon the New Theologian, but is not by him). The tradition of practice expounded in these works is at least as old as the 4th century. In the 14th century it became, for a few decades, a subject of great controversy, which called forth the brilliant writings of Gregory Palamas (ca. 1296-1359) on the theory behind the practices. The tradition later came to be called *hesychasm*, derived from Greek ἡσυχία, *tranquility, quietness* and ἡσυχάζειν, to practice hesychia (despite the similarity in their names, there is no close relation between hesychasm and Western quietism).

The first of pseudo-Simeon's three methods of prayer demands the careful cultivation of what some esotericists now call the imaginal world. The second demands an equally careful withdrawal from this same imaginal world and from the senses and the mental processes that nourish it. These two methods are emphatically *not* recommended. On the one hand, the careful cultivation of the imaginal indeed results in sensible visions, but sensible visions are always delusions, simply because they are *sensible* (αἰσθητά). This method is sure to produce a visionary whose desires have been inflamed and whose heart is exalted, and very often it will derange him in the end. On the other hand, a careful withdrawal from the sensible and imaginal

worlds produces false impressions of the opposite character, for which there is no good name in English: let us call them “certainties” for lack of a better term. These “certainties”, in contrast to visions, derive their form and content from understanding (νοησις) rather than from sense-perception (αἰσθησις). Just as visions are delusions simply because they are sensible, so “certainties” are delusions simply because they are *understandable* (νοητά). Sense-perception (αἰσθησις) and understanding (νόησις) are equally dangerous, are equally productive of delusions, and equally need to be transcended (cf. pseudo-Dionysius the Areopagite, as quoted above).

The third of these methods, and the only one which is free from the dangers of these two kinds of delusion, requires neither that one cultivate the imaginal world in one’s heart nor that one uproot it. Instead, one fills one’s heart with attentiveness and constant prayer, which soon crowd out the imaginal entirely. If at first this constant prayer may be verbal, with repetition it becomes automatic and then it soon ceases to need words or images at all. It is this absence of words and images alone that prepares the heart for the ineffable mysteries that lie ‘in the hyperluminous darkness of a hidden silence’, and that constitute the theosophy ‘beyond all being and knowledge’, to use the words of pseudo-Dionysius the Areopagite (in this tradition of practice, as in the Old Testament, the *heart* is the site of human knowledge and understanding, the place where words, concepts and percepts operate).

If this sounds easy to do in principle, it is extremely hard in practice, and usually requires the assistance of an experienced guide. One should not undertake it at all until one has first learned how to be free of every anxiety and care, how to keep one’s conscience wholly pure, and how to take no thought for anything worldly, not even one’s own bodily comforts and discomforts. Having learned how to do these three things, one can begin one’s practice of attentiveness and constant prayer, aided by a simple specified stable posture and method of regulated breathing. At first one experiences delusions of sense-perception and understanding. When these delusions have all finally been dispelled, one next experiences empty, heavy darkness (which, perhaps, may be regarded as the last delusion). Persevering in one’s practice, this darkness is replaced at last by an experience beyond all understanding and sense-perception, beyond all words and images, beyond all concepts and percepts, beyond all previous experience of the body and mind. It is said to be an experience of something that may be called φῶς, *light*, but even that word is

greatly inadequate to convey what is experienced: pseudo-Dionysius the Areopagite has coined the word ὑπέρφωτος, hyperluminous, to refer to it (*Mysica theologia* I.1).

This experience transforms one completely, in a way that is precisely specified by the Orthodox Church. One undergoes a process that is called *theosis* (θέωσις) in Greek, a word which means *becoming God*, but may conveniently – yet somewhat misleadingly! – be rendered as *deification*. According to the blunt words of Athanasius the Great, the Word of God ‘became man that we might become God’ (Athanasius of Alexandria, *De incarnatione Verbi* 54; cf. Irenaeus of Lyon, *Adversus haereses* IV.38-39, V.praef.). This is the ultimate goal of human life, which every member of the Orthodox Church is allowed to pursue from birth to death: an esotericism that is wholly integrated into Byzantine culture.

It is these ineffable mysteries, this hyperluminous realm that lies ‘beyond all being and knowledge’, it is this precisely specified, difficult method of practice that opens the way into these mysteries and that realm, and finally it is this possibility of becoming God, that constitutes the open secret of Orthodox Christian esotericism – an esotericism that is freely offered to every inquirer. Despite the brevity and simplicity of the present summary, it is an extremely rich and subtle tradition of doctrine and practice, which cannot easily be rendered in any other language than its original Greek. It is also Byzantium’s single most interesting contribution to the esoteric currents and traditions of the world.

ROBERT MATHIESEN

Cagliostro, Alessandro di (ps. of Giuseppe Balsamo), * 2.6.1743 (?) Palermo (Sicily), † 26.8.1795 San Leo (Rimini)

A legendary Italian adventurer and magus, the self-styled Alessandro Count of Cagliostro first appeared in London in 1776. He claimed to have been born in a noble Italian family in 1749, and to have been initiated into the highest esoteric secrets by a Master Althotas in Malta. In London, he rapidly gained popularity for his accomplishments as a healer, and was initiated into → Freemasonry in 1777. He also managed to make some powerful enemies, who accused him of being none other than Giuseppe Balsamo, an adventurer born in Palermo, Sicily, on June 2, 1743, who had disappeared in 1775, when the Sicilian police were about to arrest him as a professional con man. In 1777, Cagliostro established in Naples a new Masonic rite, the High Egyptian Freemasonry. As extraordinary a traveller as he was a healer, Cagliostro moved in the 1770s and 1780s from England to Italy, and from the Netherlands to Germany, Poland, and Russia.

In France, he was befriended by Louis René Edouard Cardinal de Rohan (1734-1803). This friendship facilitated Cagliostro's introduction at the Court of the French King Louis XVI (1754-1793), from which circles a number of dignitaries were initiated into his Egyptian Freemasonry, the Supreme Council of which was established in Paris in 1785. In the same year, however, Cardinal de Rohan was arrested in connection with the infamous affair of the diamond necklace. The Cardinal, more naive than dishonest, had been duped by Countess Jeanne de La Motte (1756-1791) into believing that Queen Marie Antoinette (1755-1793) wanted him to purchase, on her behalf, a diamond necklace of enormous value. The jewels were subsequently stolen, and Cagliostro was accused of being La Motte's accomplice. He was

arrested in 1785 together with Serafina Feliciani (1754-1794), a young and beautiful Italian whom Cagliostro claimed was his wife, the "Countess of Cagliostro". The *affaire du collier*, about which not everyone was convinced that Marie Antoinette was completely blameless, played a role in the run-up to the French Revolution.

Eventually, both Cardinal de Rohan and the Cagliostros were found innocent at the 1786 trial, although they both fell from favour, and were counselled by the King himself to keep a low profile. Increasingly controversial, Cagliostro lost many followers, and tried to revive his Egyptian Freemasonry in England, Germany, and Italy. In 1789, he was persuaded that Rome would be a promising seat for Egyptian Freemasonry (the Vatican's prohibition of Freemasonry notwithstanding), and that he would probably be protected there by the Order of Malta, amongst which he had some friends and followers. In Rome, Cagliostro also met Serafina's parents. He kept his distance from them, however, because they were not the kind of people a Count was supposed to associate with. This upset both Serafina's family and the "Countess of Cagliostro" herself, who ended up writing to the Pope and co-operating with the Papal police who, in the meantime, were investigating Cagliostro as a Freemason and a heretic. After the French Revolution, Rome's police were particularly nervous, and Cagliostro was arrested on December 27, 1789. Serafina, who would ultimately be Cagliostro's main accuser at the trial, did not escape arrest herself; she was taken into custody at the Convent of Saint Apollonia, where she underwent a mild form of imprisonment until her premature death in 1794.

Cagliostro was found guilty in 1791 both of Freemasonry and of heresy, as well as of past petty crimes committed under the name of Giuseppe Balsamo. On April 7, 1791, a death sentence was imposed on him, but Pope Pius VI (1717-1799), following the recommendation of the Court's large majority, commuted the sentence to life imprisonment in the fortress of San Leo, near Rimini. Conditions in the dreaded fortress-prison were extremely harsh, and Cagliostro's physical and mental health quickly deteriorated. He was a frequent victim of hallucinations but, nonetheless, stubbornly refused, right to the end, to admit guilt and be converted. After five years of imprisonment, he died at 3 a.m. on August 26, 1795. That, in any case, is what the official documents said, but Cagliostro's legend was so persistent that many did not believe he was really dead. In fact, it was rumoured in certain occult and Theosophical milieus well into the

19th century that no prison could ever hold Cagliostro and that he was still alive as an immortal and ascended master. Followers also refused to believe that Cagliostro was actually Giuseppe Balsamo, but many contemporary historians would disagree with them.

Cagliostro's legend has been perpetuated in countless novels and several movies. He shows up frequently in popular literature, and even the immensely popular Arsène Lupin (the gentleman-thief created by French novelist Maurice Leblanc, 1864-1941) crossed swords with a Countess of Cagliostro, a fictional daughter of the adventurer. It is much more difficult to establish exactly how much the historical Cagliostro really contributed to modern Western esoteric tradition. He did not write much; during his lifetime, he only published ten memoirs in defence of various accusations made against him, none of them particularly rich in esoteric details. Marc Haven (pseudonym of medical doctor Emmanuel Lalande, 1868-1926) collected Cagliostro's rituals of High Egyptian Freemasonry and the related "catechisms", published in their most complete form only in 1948, after Haven's death. Most rituals were probably written down in 1784, when Cagliostro was in Lyon, France. Not everything here is original work by Cagliostro, since he liberally included portions of earlier rituals of high degree Freemasonry, a movement flourishing in 18th century France and Germany.

Different rituals were intended for men and women. Central tenets in the rituals included the existence of God and the immortality of the soul (firmly placing Cagliostro in the spiritualist camp within 18th century Masonic controversies, against rationalists and atheists). There was also a concept of the fall from grace of human beings, originally spiritual, into the darkness of the material world, and the need for a restoration. This restoration comprised three stages: spiritual, intellectual, and physical. Spiritual restoration would be achieved through charity and the love of God, although Cagliostro spoke of a "natural religion" and an "eternal Christianity" which was more kabbalistic than it was Christian in the conventional sense of the word. Intellectual restoration meant that humans could enter the "sanctuary of nature" through a "natural philosophy" (in the German sense of *Naturphilosophie*, and including → alchemy), theurgy, and a technique for invoking the names of God. Cagliostro also recommended the use of a small child ("dove" or "pupil"), who would gaze into a water mirror and obtain visions, which were then interpreted by the initiated. Finally, mention was made of a mysterious physical restoration,

which would grant the magus some visible advantages, but also carried a symbolic meaning.

Thrice restored, the initiated became an "elected master", capable of prodigious facts of both theurgy and healing. The initiated could also transfer powers magically to his or her own pupils. As a consequence, in Cagliostro's system, the members of High Egyptian Freemasonry themselves possessed the power to heal and to perform the evocation of various spirits, but these powers were derivative and dependent on their continuing link with the order's "Grand Copthe" (i.e. Cagliostro himself). As for Cagliostro, his powers were not presented as natural abilities, but as coming from God.

Marc Haven, whose interpretation of Cagliostro was mostly Christian and mystical, regarded his two "quarantines", or magical retreats of forty days, as the weakest part of the Italian magus' system. The 19th and 20th century occult milieu has been enormously influenced by them, however, and claimed that the quarantines were regarded by Cagliostro and his immediate disciples as his *Arcana Arcanorum*, or greatest secrets. The first of the two quarantines was a magical retreat of forty days devoted to rituals and prayers. After thirty-three days, the retreatant would begin to 'enjoy the favours of visible communications with the seven primeval angels and know the seals and the numbers of these immortal Entities'. After the fortieth day, he or she received the first 'Pentagon, that is the virgin paper, on which the primeval angels place their numbers and seals', together with seven other 'secondary Pentagons on which only one of the seven angels has placed its seal'. Through the Pentagons, the retreatant 'commands the immortals in the name of God', with the 'effect to bind or to command the aerial spirits, and to effectuate many wonders and miracles'. This constitutes a typical theurgical ritual; Cagliostro's aim was to 'obtain the Pentagon and become morally perfect'. Although it also included original elements, parts of it were derived from the German Order of the Gold- und Rosenkreuz and from its schism (or, according to others, its "inner circle") known as the Order of the → Asiatic Brethren, founded by Baron Hans Heinrich von Ecker-und-Eckhoffen (1750-1790). The evocation of angels, or "guardian angels", on the other hand was quite common in 18th century occult movements. It may be concluded that Cagliostro's *Arcana Arcanorum*, in the first meaning of the term, included the theurgical evocation of one or more angels through talismans, seals, pentagons, and other techniques.

In the second quarantine, the second forty days, the intention was to 'become physically [rather

than morally] perfect'. Although the texts of Cagliostro's quarantines in Manuscript No. 245 of the Biblioteca Nazionale in Rome, and in the version conserved at the library of Musée Calvet in Avignon, include some variants, the second quarantine in both versions required the retreatant to retire to a secluded place in order to 'seriously fast'. On the seventeenth day, he or she 'gives a small emission of blood' and 'begins to take certain white drops, that one cannot explain what they are made of', increasing the dose until on the thirty-second day, when, with 'another small emission of blood', the retreatant 'begins to take the first grain of *Materia Prima*'. The next day, 'a second grain of *Materia Prima* will produce a strong fever or delirium, and will cause the retreatant to lose his skin, hair and teeth'. After other rituals and practices, on the thirty-sixth day, the last grain of *Materia Prima* 'will cause the hair, teeth and skin to grow back', until the fortieth day when the retreatant 'returns home rejuvenated and perfectly recreated'.

All this might well seem, even to admirers of Cagliostro, an extremely bizarre practice destined, above all, to create sensation – an attitude not at all alien to the Italian magus. In reality, however, this is not the case. When we consider the second quarantine historically, with reference to its antecedents in the German Gold- und Rosenkreuz and within the context of a broader magical tradition (although some unclarities remain about it) it becomes possible to interpret the ritual at various levels. In fact the Gold- und Rosenkreuz, in a text entitled *Thesaurus Thesaurorum* (dated 1580, but certainly more recent), propagated a similar ritual. This, in turn, was interpreted (and probably practiced) in two different ways. At the level of "laboratory" alchemy, a "philosopher's stone" is obtained from the alchemical distillation of one's own blood, adding other components (in the *Thesaurus*, gold and urine), and consuming the result in the form of grains or drops. At the second level, of "internal" or sexual alchemy, the "laboratory" is the magician's body, and the main component is the male semen. Whether Cagliostro personally taught and practised both techniques is unclear, but certainly the text of the second quarantine makes sense only within the context of an already-existing occult tradition, and it was interpreted in both ways in the 19th and 20th century.

In the history of modern magical movements, Cagliostro's *Arcana Arcanorum*, as understood by a subsequent magical tradition in which the Italian magus is venerated as the founder, stands for three different things. Firstly, it indicates a theurgical system of evocation, by use of various techniques, of

the Holy Guardian Angels, or other angels. Secondly, it means a practice of laboratory alchemy, in which dew drops, blood, gold and urine were variously combined. Thirdly, it means a practice of inner alchemy, i.e. of sex magic.

Cagliostro ultimately taught (to the obvious annoyance of his Catholic critics) that immortality was not for everybody. His system proposed a form of self-redemption in which the magical will of a person captured his or her own immortality, and achieved eternal life. It is here, rather than simply in his tragical larger-than-life adventures, that lies Cagliostro's continual fascination.

MASSIMO INTROVIGNE

Cainites

The Cainites are presumed adherents of a Christian gnostic sect named by several of the church fathers. They are associated with "Ophians" or → "Ophites" by Clement of Alexandria (*Stromateis*,

VIII, 17), Hippolytus (*Refutatio*, VIII, 20), and Origen (*Contra Celsum*, III, 13), but these authors provide no discussion of the sect's teachings. Tertullian (*De baptismo*, 1) refers to a female 'vipser of the Cainite heresy' trying to subvert Christian baptism. The author of Pseudo-Tertullian's treatise, *Adversus omnes haereses*, a 3rd-century document possibly based on a lost work by Hippolytus, is the first to describe a system of teachings explicitly associated with the heresy of the Cainites (c. 2). But his account is manifestly dependent upon a system of teachings earlier described by Irenaeus (*Adversus Haereses*, I, 31, 1-2). Irenaeus adds to his account of the system of the "Gnostics" (I, 29) related material ascribed to unnamed 'others' (I, 30), to which he then appends a short account of beliefs held by still 'others' (*alii*, I, 31, 1).

These "others" are said to regard Cain as a superior being and to confess such other biblical anti-heroes as Esau, Korah, and the Sodomites, all of whom were protected by the intervention of Sophia. Judas is honored for accomplishing the 'mystery of the betrayal', and they use a document called the *Gospel of Judas*. Irenaeus claims to have access to writings of theirs that promote the destruction of 'Hystera' (the womb), associated with the creation of heaven and earth. They are also alleged to advocate the libertine behavior also attributed to the → Carpocratians (cf. *Adu. Haer.*, I, 25). Each misdeed is associated with an angel ceremonially invoked, which they refer to as 'perfect knowledge'. This account, in context, can be taken as referring to a sub-group of the "Gnostics" earlier described by Irenaeus.

It is the author of the aforementioned Latin treatise, falsely attributed to Tertullian, who expressly attributes such teachings to a special group of heretics called "Cainites". In chapter 2 of his work, he gives an account of heretics he identifies as "Ophites", partially summarizing Irenaeus' account of the unnamed 'others' in *Adu. Haer.* I, 30. Later in the same chapter he refers to 'another heresy', that of the Cainites. In his account of the Cainites he closely follows Irenaeus (*Adu. Haer.* I, 31, 1), but he leaves out the material beginning with the reference to Hystera (I, 31, 2). Instead, he elaborates on the motivations of the betrayer Judas, one group claiming that Judas betrayed Christ because he was subverting the truth, the other saying that Judas betrayed Christ so that human salvation could be effected.

Epiphanius of Salamis has a lengthy description of the Cainites (*Panarion* 38, 1, 1-3, 5), manifestly based on Irenaeus and Pseudo-Tertullian, to which the bishop has added numerous vituperations.

Only a few extra details emerge: the Cainites honor the wicked, and repudiate the good. Cain's superiority to Abel is based on his having been begotten of a higher power. The angels invoked by the Cainites are the same ones who blinded → Moses, and protected Korah, Dathan, and Abiram (Num. 16). They use a book called the *Ascension of Paul*, which is also used by the "Gnostics" (or "Borborites", cf. *Pan.* 26).

Two questions emerge from these patristic accounts: 1. Is there any primary evidence that Christian heretics, of whatever sort, honored the biblical Cain? 2. Was there ever a sect of people who called themselves "Cainites"? In answering the first question, the primary evidence to which we must turn consists of that found in the Coptic sources making up the so-called "Nag Hammadi Library". It turns out that all of those texts that mention Cain at all portray him in a negative light: the so-called "Sethian Gnostic" texts [→ Sethians] (*Apocryphon of John* II, 10, 34; 24, 8-25 and parallels; *Hypostasis of the Archons* II, 91, 12-28; *Gospel of the Egyptians*, III, 58, 15; cf. *Apocalypse of Adam*, V, 66, 25-28 [Cain unnamed]), and Valentinian texts [→ Valentinus and Valentinians] (*Valentinian Exposition*, XI, 38, 24-27; cf. *Gospel of Philip*, II, 61, 5-10 [Cain unnamed]). Of these the passage comprising *Ap. John* II, 24, 8-25 requires further elaboration. There we read that the 'chief archon' Yaldabaoth, after the banishment of Adam and Eve from paradise, seduced Eve and begot in her two sons: Eloim-Cain, and Yave-Abel. The demonic origin of the biblical murderer Cain (but not of Abel) is a Gnostic interpretation of a Jewish exegetical tradition, interpreting the difficult passage in Genesis 4:1, the Hebrew text of which can be translated: 'I have gotten a man, namely Yahweh'. The Aramaic *Targum Ps-Jonathan* Gen. 4:1-2 contains an ancient exegetical tradition to the effect that Cain was the product of a liaison between the angel of death Sammael and Eve, who proclaims, 'I have acquired a man, the angel of the Lord'. The aforementioned passage in *Ap. John* reflects this Jewish tradition, but reinterprets it, although still presenting Cain in a negative light.

There is, however, one text which presents Cain in a positive light. The treatise *On the Origin of the World* contains an interesting passage which narrates the birth of 'the Instructor', who then enlightens Adam and Eve in paradise. The reference here is to the serpent of Genesis 3. The text goes on to state that Eve is the 'first virgin', who bore a son without her husband. In a hymnic passage featuring Eve, several 'I am' sayings end with the exclamation, 'I am the process of becoming; yet I have

borne a man as lord' (II, 114, 14-15). In this passage Cain and the 'Instructor'-serpent are virtually identified, and Cain is honored as the lordly revealer of gnosis. Thus, it turns out that there is primary Gnostic evidence for associating Cain with the gnosis requisite for salvation. Moreover, the specific association of Cain with the biblical serpent, in a positive evaluation, is found in Hippolytus' description of the teachings of the "Peratae" (*Refutatio* V, 16, 8-9).

As to the second question, whether there ever was a sect of people who called themselves "Cainites", a complete analysis of all of our evidence must lead to a negative answer. The "Cainite" sect is, finally, an invention of the church fathers. There were evidently some Gnostics who honored Cain, but none who called themselves "Cainites".

BIRGER A. PEARSON

Camillo, Giulio, * ca. 1480 Portogruaro (?), † 15.5.1543 Milan

Camillo was born around the year 1480 in Friuli, a region in the northeastern part of Italy, perhaps in the town of Portogruaro. It seems that the family originally came from Croatia (according to → Francesco Patrizi, both he and his father were also

called "Delminio" after the ancient Dalmatian town of Delminium). After pursuing his literary studies in Venice and Padua, Camillo taught rhetoric and logic in several towns in Friuli and later in Bologna; he also spent long periods in Rome and Genoa. He is best known for his "theatre of memory" (see below), an ambitious project for the construction of a universal memory system [→ Mnemonics] which won the admiration of intellectuals all over Europe, although it eventually also became the object of criticism and ridicule. Francis I of France expressed an interest in the project, and so Camillo set off for France in 1530. The king agreed to finance the realisation of Camillo's theatre on the condition that the author reveal its secret to him alone. Thus encouraged, Camillo went to Venice to commission a scale model of his theatre in wood, which was seen and described by a friend of Erasmus, Viglio Zuichem, in February 1532. Between 1533 and 1538 Camillo remained in France, apart from trips to Italy as part of the entourage of Cardinal Jean of Lorraine in 1534 (for the election of Pope Paul III) and in 1536. As time passed and his remarkable theatre failed to materialise, however, Camillo began to lose favour at court; his enemies multiplied as the king's interest in the interminable project waned. In 1538, advanced in years, tired and in ill health, Camillo left France and returned home to Italy, hoping to find a new sponsor for his theatre. An attempt some years earlier to gain an invitation to the court of the new lord of Ferrara, Duke Ercole II d'Este, had already failed. Finally Camillo managed to attract the interest of Alfonse d'Avalos, the governor of Milan, and in 1543 he entered into his service. The universal theatre was destined never to be realised, however, for Camillo died unexpectedly on May 15th in Milan.

During his lifetime, Camillo had a wide circle of friends and admirers: artists such as Titian, Lorenzo Lotto and Pordenone, the architect Sebastiano Serlio, with whom he had maintained close ties, and writers such as Ludovico Ariosto, Pietro Aretino and Torquato Tasso, all of whom praised him in their works. We have seen that Camillo had begun his career as a master of rhetoric, and he shared the classicist ideals of his friend Pietro Bembo (1470-1547), who believed that in order to write well one must imitate the great authors – Cicero and Virgil if one was writing in Latin, and Petrarch and Boccaccio if one was writing in Italian. According to Camillo, the imitation of great literary models was an attempt to capture the idea of eloquence that was present, even in imperfect form, in the works of the greatest masters.

Thus, rhetoric would be transformed into a metaphysical art which could teach the user how to ascend from the particular to the universal and descend from the universal to the individual. Whoever mastered this art of rhetoric would be able to manipulate words and rhetorical artifices at will and subject them to an infinite variety of transformations. Camillo included rhetoric among the three arts of metamorphosis, together with → alchemy (the art of transforming physical objects) and deification (the art of transforming the human mind into a divine one).

To imitate his literary models and to create variations upon them, Camillo applied a series of procedures based on two principles: the first was the use of topical places, a traditional component of both rhetoric and logic; and the second was the Spanish philosopher → Ramon Llull's *clavis universalis*. In his analysis of a literary model, Camillo tried to identify the device or artifice used and break it down into its separate parts, each one of which could lead the user back to an original universal category (to *locus*, topical place). At this point the author would have before him all the possible combinations of arguments and artifices that might be used for his text. Thus, literary procedures also had a metaphysical dimension, and both were closely intertwined with the techniques of rhetoric.

From a philosophical point of view Camillo was fundamentally a syncretist; like → Pico della Mirandola, he was engaged in a search for the common elements that united different philosophical and religious traditions, the first principles that lay hidden between the lines of the text and which only a select few, versed in the neoplatonic, hermetic and kabbalistic traditions, were capable of reading. Camillo was less interested in abstract philosophical principles, however, than in the results that could be obtained by their application; the goal of his reinterpretation of philosophical traditions was to demonstrate that his theatre could actually work.

Camillo's theatre was conceived as a universal memory system, containing not only all the words and rhetorical artifices necessary to compose persuasive texts, but all of man's knowledge as well. He called it a "theatre" because its intent was to make visible the images which usually lay hidden in the mind. The basic scheme consisted of 49 loci generated by the permutation of two different orders; one acting in the vertical dimension (seven columns representing the seven planets); and one acting in the horizontal dimension (corresponding to the seven degrees of the cosmos). As the user

passed from locus to locus and viewed the images placed in each, he could learn and "remember" the first principles of the cosmos, and see how they manifested themselves in the material world. The seven columns symbolised not only the planets but also seven of the ten Sefiroth, the secret names of God in the kabbalistic tradition. These passed across the seven degrees of the cosmos, and thus from the principles of the divine world to those of the natural world, of man and the arts and sciences. Camillo's theatre was designed to function on various levels: as a kind of data bank for those wishing to write poems or orations; as an easy-to-use encyclopaedia; or – on its most rarified and secret level – as a guide to the opus of alchemy and deification. We have seen that Camillo's theatre was never finished. We may read a summary description of it in his *Idea del teatro*, which was published posthumously (1550). To reconstruct the project in all of its parts and to understand its secret meanings, we must refer to several texts which have remained unedited for many centuries.

Campanella, Tommaso, * 5.9.1568 Stilo (Calabria), † 21.5.1639 Paris

Tommaso Campanella, one of the most original philosophers of the 16th-17th centuries, tried to reconcile the natural philosophy of the Renaissance with a radical reform of the sciences and of society. He was born at dawn on September 5, 1568, at Stilo in Calabria (then under Spanish rule), to a very modest family: his father, Geronimo, was an illiterate cobbler. At fourteen, Tommaso decided to enter the Dominican Order because this seemed to him the best way to pursue his studies, for which he had shown a keen disposition from his earliest years. He gives rare glimpses of his youthful development in the *Praefatio* to his *Philosophia sensibus demonstrata*, written when he was not yet 21. Describing the period spent in the Dominican monasteries of Calabria, the young Campanella recalls how the Aristotelian teaching-texts seemed to him full of contradictions, and unable to offer convincing answers to the most important philosophical and metaphysical problems. Their reading had left him deeply unsatisfied, arousing in him more doubts than certainties. The teachers were unable to clear up his doubts, and the young student found himself in a parlous state of fear and loneliness, until the intuition dawned within him of a new philosophy, drawn not from books or from the minds of Aristotle and his commentators, but from the direct reading of the great “book of nature”. He was accused of holding doctrines similar to those of a certain Telesio; but this judgment, intended as a severe censure, filled him with joy at having finally found a companion and a guide. He traveled to Cosenza, the home of Telesio, and was able to read the first edition of *De rerum natura iuxta propria principia*. From the first pages he felt the novelty and coherence of a doctrine which, in conformity with his own aspirations, derived its truth not from words written in books but from the direct examination of natural facts. Campanella was not able to meet Telesio in person (he had died in October 1588), but he paid homage to his bier in the cathedral and attached verses to the catafalque. It was an idealized encounter in which the young Dominican seemed to receive the spiritual legacy of the new philosophy; and in the sonnet no. 60 of the 89 poems which constitute the *Scelta di alcune poesie filosofiche* (1st ed. 1622), he did not fail to celebrate “Cosentine Telesio” who with his arrows had struck and slain Aristotle, the ‘tyrant of the intellectuals’, restoring to man the *libertas philosophandi* which is inseparable from the truth.

Campanella had written the eight disputations of

the *Philosophia sensibus demonstrata* in the first eight months of 1589, to defend the Telesian philosophy from the attack on it by the Neapolitan jurist Giacomo Antonio Marta in his *Pugnaculum Aristotelis*. In his work, Campanella lays out a systematic criticism of Aristotle on the physical, cosmological, and metaphysical planes, in the light of the Telesian principles. These are integrated, in the first place, with motives derived from Plato’s writings, from the Neoplatonic philosophers [→ Neoplatonism], and from the Hermetic tradition [→ Hermetic Literature] that had been made accessible through the Latin translation of → Marsilio Ficino; also with Campanella’s knowledge of the medical works of Hippocrates and Galen, naturalists such as Pliny, atomists and Stoics – all the reading that had nourished him and rendered ever more intense his enormous appetite for knowledge. The *Philosophia* appeared in 1591 in Naples, to which Campanella had been transferred, residing in the palace of the Marchese Del Tufo. In the Viceroy’s capital he was able to frequent aristocratic and intellectual society, especially the circle of Giovanni Battista Della Porta, author of celebrated works on natural → magic and physiognomy, whose palace was a place of pilgrimage for students from all over Europe. At Naples, however, the suspicions against Campanella grew, and in spring 1592 he was imprisoned in the convent of San Domenico, accused on the grounds that his exceptional knowledge had a diabolic origin, though the real imputation was that of supporting the “new” doctrines of Telesio against the scholastic and Aristotelian ones. Acquitted from the charges, before returning to Calabria Campanella went to Rome, then to Florence, where he was received cordially by the Grand Duke. However, the Duke did not confer on the young friar the hoped-for chair at a Tuscan university, having heard reports that were not altogether positive about him. During a stay at Bologna, the Inquisition caused the manuscripts of the works Campanella carried with him to be sequestered; he would see them again two years later in the Holy Office in Rome, when he was summoned to clear himself of the doctrines contained in them. Settling at Padua, he came to know Galileo, and this early meeting marked the beginning of a constant admiration and friendship for the scientist whose discoveries would contribute to the fall of the Aristotelian cosmos. There was no lack of disagreement between Campanella’s and Galileo’s doctrines, but as Campanella wrote in a late letter to Grand Duke Ferdinand II, ‘the discord of intellects can cohabit with the concord of their wills’.

A fruitful period followed at Padua, as Campanella pursued his studies and wrote various works (all of them lost), until he became involved in another, more serious trial. He was arrested at the beginning of 1594, together with two friends, by order of the Inquisition. After a failed attempt to escape in the summer, he was transferred to the prison of the Roman Inquisition, where for some time the Florentine “heretic” Francesco Pucci and → Giordano Bruno had been incarcerated. In one of the sonnets of the *Scelta*, he compares the dark palace to ‘Poliphemus’s cavern’, to the ‘Labyrinth of Crete’, and to the ‘Palace of Atlas’, in which, as though by fateful appointment, the free spirits meet who have abandoned the stagnant waters of conventional knowledge in order to venture boldly on the ‘sea of truth’. Accused of having written a sonnet against Christ and a short atheistic work, *De tribus impostoribus* (which, he said, had been printed thirty years before he was born), and of having held Democritean doctrines, he was sentenced in 1595 ‘on the gravest suspicion of heresy’ to make a solemn and public abjuration. At the end of 1597 he was consigned again to the Superiors of the Dominican Order, who enjoined him to return to Calabria.

On the return journey, Campanella spent some months in Naples, where he completed the *Epilogo magno*, in whose first five books he expounded his own system of natural philosophy, inspired by Telesian principles, while the sixth and last book treated ethics. The work, translated into Latin, became the *Physiologia*, the first of the four parts of the *Philosophia realis*, which would be published at Frankfurt in 1623; the other parts comprise *Ethica*, *Politica*, and *Oeconomica*, dealing with the conduct of home and family. The editions of Campanella’s works which appeared at Frankfurt between 1617 and 1623, contributing greatly to his European reputation, were made possible thanks to the work of Tobias Adami, a German savant who during a stay in Naples between 1612 and 1613 had managed to make contact with the friar, then prisoner in the city jail, and had been given the manuscripts of his works.

The *Physiologia* develops Telesio’s principles of natural philosophy, beginning with the affirmation that when the first Being, omnipotent, wisest and best, decided to create the world, defined as his ‘statue’ and ‘image’ of his infinite wealth, opened up a ‘quasi-infinite’ (*pene infinitum*) space in which to place it. This occurred at the beginning of that duration and vicissitude of things that we call Time, and which is the image of the Eternity from which it flows. Space, defined as ‘primal substance,

or seat, or immobile and incorporeal capacity to receive every body’, is homogenous (“high” and “low,” “back” and “forward,” “right” and “left” are human terms referring to located bodies). If the world did not exist, we would have to imagine it as void; but in fact it desires fullness and is invested with an attractive force such that it ‘rejoices in sustaining beings’ and abhors emptiness. The bodies, on their part, ‘rejoice in mutual contact’ and hate the void that separates them. In space, God collects matter, which is considered as a physical entity, lacking form, shape, and action, but fit to extend, divide, and unite itself and to take on every shape, just as wax can receive every seal. This is in clear contrast to Aristotle’s and Averroes’s conception, which defines matter as privation and a pure *ens rationis*. Campanella calls matter ‘a second substance, the basis of forms, the passive principle of the composition of things’. Into this corporeal mass, God inserts heat and cold, two principles that are active and diffusive in themselves, incorporeal but unable to subsist without bodies. From their conflict – derived from the fact that each wants to dominate and occupy the greatest possible quantity of matter – originate the two first bodies or elements of the world: heaven, which is hottest, subtle, mobile, being formed from matter transformed into heat; and earth, made from matter rendered immobile, dark, and dense from cold. All the secondary beings take their origin from the fight between heaven and earth, heat and cold, and God uses the oppositions of the primal elements for the production of natural beings, which in their infinite multiplicity and diversity realize the infinite degrees of the primal, divine Idea.

Heaven, being unitary and not divided into spheres as in the traditional view, moves because it is hot, in virtue of its own intrinsic operation which conserves and vivifies it, without any need for recourse to extrinsic motivating intelligences. The motions of the heavenly bodies and the sun, extremely various and complex, transmit to the earth all these degrees of heat and light which constitute the essence of every single thing. In the light of these principles, Campanella explains every aspect of the natural world, from the celestial and meteorological phenomena to the formation of the waters, the constitution of minerals and that of plants, analyzing with particular attention animals and men. To explain the origin and the formation of these more complex organisms, he draws on a fundamental element of his philosophy: *spiritus*. This is made from material rendered extremely subtle by the solar heat; it is a sort of hot breath, which due to its subtlety and movement is capable of separating

from the portion of matter in which it finds itself enclosed, and of acting upon it. Not being able to exhale from matter and return to heaven, as it would wish, the *spiritus* organizes and shapes matter from the inside in the best manner for its needs, and being aware of the dangers that threaten it from without, it constructs the bodily organs which are the instruments that guarantee its conservation and life.

On August 15, 1598, approaching his thirtieth birthday, Campanella returned to Stilo after a decade-long absence. The following year he became embroiled in the most dramatic events of his life, which would condition all the years to come. The reading of astrological [→ Astrology] and prophetic texts announcing a profound renewal of the Church; the appearance of signs in the heavens and of unusual natural events like eclipses, comets, earthquakes, invasions of locusts, torrential rains, and overflowing rivers; above all, the conditions of misery and injustice affecting the populace and the severe social and political disorder, convinced Campanella that with the end of the century there would come a period of tremendous changes. Thus a grand conspiracy was organized, of which he was the indisputed spiritual head, which proposed to turn the province into a republic, removing it from the tyranny of the King of Spain, while Campanella, regarded by his accomplices as a new legislator and Messiah, would promulgate 'new laws and restore every man to his natural liberty'. The plot failed at birth, for on August 10, 1599 it was denounced to the Spanish authorities by two of the conspirators. An army was immediately dispatched, leading to harsh repression. After frantic efforts to escape, Campanella was arrested, and in November four galleys reached the port of Naples laden with dozens of prisoners, some of them hanged to instill terror. Thus began the Neapolitan trials, whose course was much complicated by the double charge of rebellion and heresy against the accused, who were both laymen and ecclesiastics. In the 19th century the trials were reconstructed by Luigi Amabile, who has left an impressive documentation of these events that is still fundamental.

To avoid capital punishment, which could not be inflicted on the insane, Campanella resorted to the expedient of faking madness, which was ratified through the dreadful torture of the *veglia* [deprivation of sleep], which he evokes at the close of the *Città del sole* and in later pages, as proof of the freedom of the human spirit which cannot be forced or constrained even by the most extreme physical pressures. During his first period in prison he wrote his most famous short work, the *Città del*

sole, in the form of a "poetic dialog" between one of Columbus's sailors and a knight, which has been seen both as the program of a failed insurrection and as its philosophical idealization. The work was published in Latin translation in 1623, in the Appendix to the third part of the *Philosophia realis* mentioned above, and in presenting it to the readers, Tobias Adami states that this ideal republic is superior to the model proposed by Plato in antiquity, or by Thomas More in recent times, because it is inspired by the great model of nature. In fact, the return to nature, understood as the expression of God's intrinsic "art" and wisdom, and the criticism of existing society, unjust and unhappy because divorced from that model, is the simplest and most convincing key to the reading of Campanella's utopia. It depicts a "political body" in which the parts are integrated so as to make a unitary organism, and the separate members, many and various according to their functions, are all coordinated for the common good. Political reflection is a primary and constant aspect of Campanella's thought, present from his youth until his last years of exile in Paris. He also treats other themes than those of utopia and prophecy, especially the relations between religion and politics, temporal and ecclesiastical power, and between the prospect of a universal monarchy and the reunification of humanity in 'one flock under one shepherd'. In his *Monarchia di Spagna* he emphasizes the universalist and providential function of the Catholic king, identified with the biblical Cyrus, liberator of the Church from the infidels and gatherer of the people in a single faith.

Campanella was sentenced to perpetual imprisonment in 1603, but in view of an exceptional astral event, the "great conjunction" of Jupiter and Saturn in the fiery sign of Sagittarius, he expected great changes and devoted himself to the practice of magic and demonic invocations, confident that he would soon be released. His hopes were dramatically disappointed. In June of the following year, after a plan of escape had been discovered, the prisoner was transferred to a harsher prison, the "pit" of Castel Sant'Elmo: an underground cell, damp and lightless, where he lived for the most dreadful years of his imprisonment. But it was from this darkness that came some of the most exalted and intense poetic compositions of that extraordinary songbook, the *Scelta*.

The composition of the *Senso delle cose e della magia* also dates from this period. Here Campanella expounds his vision of the natural world as a living organism whose single parts have life and sensibility. Every natural being aims at its own conser-

vation, and to this end is endowed with “sense” according to various degrees and modalities. This sense is its capacity to distinguish what is positive and beneficial to its own life, which it thus pursues and seeks, from that which is perceived as negative and destructive, which is thus fled and avoided. Some beings, such as the heavenly bodies and light, possess a sense that is much more acute and pure than that of animals, while others, such as minerals and metals, have a more obtuse and obscure sense because of the weight of matter. As already said, the vital and cognitive functions in animal organisms are connected with the *spiritus*. Hot, mobile, passive, identified with the organic soul, the *spiritus* has its seat in the brain, whence it runs through the finest of nervous canals to fulfill its multiple vital and cognitive functions. As it enters, via the sense organs, into contact with external reality, it undergoes those modifications from which come all its passions and knowledge. All aspects of the cognitive process, from memory to → imagination, from discursive thought to the intellect itself, are attributable to the activity of the *spiritus*, which is capable of preserving the modifications and impressions it receives, of re-using them when similar situations occur, and of confronting and extending them.

The dimension of sensible knowledge is where the animal and the human levels can be compared, in order to learn their affinities and differences. Campanella rejoiced in the extraordinary powers of animals, which know how to achieve marvelous works and are endowed with forms of reasoning, language, natural prophecy, and perhaps even religiosity. But such analogies should not obfuscate or cast doubt on the difference and special quality of man, who is furnished with a *spiritus* far more refined and pure than the animal sort, capable of moving with agility between more spacious brain-cells, which allows him to construct far more complex chains of arguments. The true and radical difference between the two levels consists in the fact that man is also endowed with an incorporeal *mens*, divine in its origin, which constitutes and underlies his specific dimension and his excellence. His capacity to extend himself through thought and desire to infinity – and such a leap is not vain imagination, as Aristotle thought – proves that he is not the child of sun and earth alone, but of a pre-eminent and infinite cause. The connection of man with a supernatural world is confirmed by the fact that he can go beyond bodily possessions and the limits of natural self-preservation, turning, as philosopher and religious man, to higher possessions and ends. He can achieve higher forms of prophecy and ecstasy, not explainable by physiological or medical theories. Above all, man is

endowed with a free will, thanks to which he can resist outside pressures, can value the objects of his choice, choosing the greater good even if no immediate advantage or utility results from it.

The fourth book of the *Senso delle cose* is devoted to natural magic. Della Porta, while listing the most curious occult properties of minerals, plants, and animals following the magical tradition, maintained that it is impossible to give a rational explanation for the relations of sympathy and antipathy, affinity and repulsion, that exist between natural entities. Campanella, on the contrary, proposes a re-reading and re-interpretation of this tradition in the light of the doctrine of the sense of things and of the *spiritus*. The magus is he who knows the specific quality of sense inherent in every entity, and is capable of using it in the appropriate way and of imposing specific alterations and passions on the *spiritus*. He knows how to potentialize the vital energies, suggesting food, drinks, ambiances, sounds, herbal and animal remedies which rejuvenate and increase them. He knows the secrets of generation and of diseases, and can arouse passions sufficient to achieve definite goals. Moreover, he knows how to explain strange phenomena such as the premonitions in dreams, seeing that the causes that prepare determined events are already present in the air (which is a shared “soul”) and can be perceived before the events themselves occur. He knows the true and exact metamorphoses that take place in those who are bitten by a rabid dog, or in Apulian peasants bitten by tarantulas: the physical and psychological changes derive from the fact that the vital temperament in such unfortunates is hindered in its diffusion and dominance of their organism by the spirit of the animal which attacked them. Always resorting to the doctrine of sense, which in some cases may even persist in entities after their death, and to the capacity of the air to join persons and actions that are far apart and to preserve the passions in latent and dormant form, which can be reawakened on certain occasions, he can explain facts such as the bleeding of a corpse in the presence of its murderer. The same accounts for the possible efficacy of the “weapon salve”, thanks to which it is believed possible to cure a wound by acting on the instrument that caused it, or the reason why (to cite a famous example repeated in every book on magic) a drum made of sheepskin shatters when a drum made of wolfskin is beaten, as an ancient terror reawakens in it.

Still in the pit of Sant-Elmo, Campanella composed the work that the German scholar Kaspar Schoppe suggested he call *Atheismus triumphatus*, and to which the author would also refer as *Anti-machiavellismo*. He intended to prove in it that

religion is not a human invention, as politicians and supporters of state agendas maintain; it is not a useful fiction invented by priestly cunning and by rulers for maintaining their power, but a *virtus naturalis* that is intrinsic in man and in all of nature. Campanella also wrote the *Articuli prophetales*, in which, amplifying a document of his self-defense, he collected the texts of saints and prophets, literary writers and philosophers, astrologers and sibyls, which prove that it is legitimate to expect the coming of an epoch of renewal and the age of gold.

After being transferred to more comfortable prisons, during his long years of detention Campanella sent petitions and memoranda to popes and sovereigns in which he proclaimed his own innocence and pleaded for release, promising to undertake useful and marvelous tasks and books. Above all, he was dedicated to that grandiose work of reform and re-foundation of the entire encyclopedia of knowledge which had blazed within him since his early years. Beside the known works and numerous lost small works and texts, we mention the literary writings which were collected in the five parts of the *Philosophia rationalis* (Paris 1638); the *Theologia* in 30 books, finished in 1624 and left unpublished, whose publication, begun and continued by Romano Amerio, is still in progress; an *Astrologia* in six books, in which the author aims at freeing the doctrine from the superstitions of the Arabs, in order to re-establish it as a natural and conjectural doctrine; the *Medicine* in seven books, which was published at Lyon in 1635 thanks to the French savant Jacques Gaffarel, who had already prepared for the press an *Index* to the philosopher's works (Venice 1633), warmly emphasizing its novelty; and above all the most grandiose work which the author defined with justifiable pride as "the Bible of philosophy", the *Metaphysica*. The latter work, sketched in Campanella's youth and rewritten in subsequent years, finally appeared as an imposing folio edition of 18 books subdivided into three parts, published in Paris in 1638, a few months before the author's death. The work is extremely complex and various in its themes; here we must mention at least the distinction between knowledge *innata*, in virtue of which every entity knows and loves its own self, and knowledge *addita*, which derives from contacts and relations with the multiple objects of the external world. This latter knowledge can obfuscate the original knowledge that the soul has of itself, inducing a sort of self-forgetfulness in it; and the doctrine of the "primality", according to which the first, infinite Being is constituted from the infinite principles of Power, Wisdom, and Love, and all the sec-

ondary, finite entities which derive from it are constituted, as beings, from this very primality following their different modalities and proportions, and inasmuch as they are finite, from infinite degrees of non-entity. Nothingness does not exist either in God or outside him, but God makes use of it to give beings their distinction and finitude.

On January 13, 1611, after reading Galileo's *Sidereus nuncius*, Campanella wrote an elaborate Latin epistle to the scientist that reflects the emotions aroused by the extraordinary celestial messenger: a mixture of enthusiasm and perplexity, of praise and reservations. During the years that followed, he showed the greatest interest in Galileo's teachings about sunspots, floaters, and comets (and at the end of 1618 was able to observe those which spawned the debate of the *Saggiatore*). This fervid dialogue reached its climax in the drafting of the courageous *Apologia pro Galileo*. Written in 1616, when Galileo's teachings were arousing the first difficulties of a theological nature, and printed at Frankfurt in 1622, the *Apologia* was an act of great courage and intellectual honesty on its author's part, not only because Campanella took up this delicate question while he was in prison (and as he recorded later, his was the only voice in Europe that was raised in defence of the astronomer), but also because he was defending doctrines that were not his own. His image of a living and organic book of nature was, in fact, quite different from Galileo's idea of a book written in mathematical characters. Besides, Campanella had reservations about the Copernican doctrine, hard to reconcile with Telesian physics especially regarding the earth's motion. The *Apologia* is not so much a defense of the heliocentric system, as a defence of Galileo's *libertas philosophandi* and in general of the Christian scientist, whose first right and duty should be to set the reading of the book of nature above that of books by men. With great lucidity, Campanella touches on the nub of the problem, identifying it as the marriage of Aristotelianism with theology. Aristotelian philosophy does not contain a dogmatic and absolute truth, but, like every human doctrine, is modified and corrected in the light of reading the book of nature. When it no longer corresponds to experience, it should be discarded and replaced with a new doctrine that better reflects the data, exactly as Galileo has done, without fearing that this dismissal of Aristotelianism should have negative repercussions for theology.

After alternate hopes and failed promises, exhausting negotiations and delays, finally on May 23, 1626, after almost 27 years of prison, Campanella left Castel Nuovo, and a month later, by order of the Holy Office, was transferred secretly to

Rome and incarcerated in the palace of the Inquisition. The first period of his time in Rome was marked by disappointment and bitterness which even caused him to regret the last years of his Neapolitan imprisonment, due to the hostility towards his person and even more towards his books, pursued with ceaseless accusations and censures. But the most sensational episode of his Roman period was connected to Campanella's astrological skill, and the desire of Pope Urban VIII, secretly interested in such doctrines, to exploit it. The Pope wished to silence the rumors, already current in 1626 and becoming ever more insistent in the succeeding years, of his imminent death due to ill-omened astrological aspects. Campanella did not only reassure him about the length of his life, but, summoned to the papal palace, put into action those practices of natural magic described in the short work *De fato siderali vitando*. If the Pope seemed to gain reassurance from such counsels, the scandal exploded in 1629 when the book appeared in print at Lyon as the seventh and last volume of the *Astrologici*, risking compromising the Pope himself with accusations of superstitious practices. Campanella insisted that the work had been printed without his permission, as part of a plot organized by powerful enemies within his own Order who wanted to ruin him and destroy the Pope's favor towards him. Urban VIII hastened to promulgate in the first months of 1631 the most severe Bull *Inscrutabilis* against astrologers, and to imprison and put to death Don Orazio Morandi, abbot of Santa Prassede, in whose monastery astrological practices had become mixed up with political intrigues; but the scandal of the publication of *De fato* inexorably cooled Urban's sympathy for Campanella. It little helped that the friar hurriedly wrote an *Apologeticus* in defense of the astrological work, in order to demonstrate that the practices suggested in *De fato* were licit and natural.

In the political field, the Roman years saw Campanella's transference, at first cautious, then ever more obvious, to the French position. In a *Dialogo politico* he deplored the dissensions within the royal family, which risked enfeebling the energies of the whole nation, and praised the policies of Cardinal Richelieu. In his judgment, the Cardinal was not intent on egotistic personal power, as his enemies wanted to make believe, but on the reinforcement and centralization of the powers of the state, in order to make the nation stronger, more prosperous and coherent. But between 1633-1634 new and dramatic events brought the Roman period to a brusque end. In August 1633 one of Campanella's disciples, a young Dominican friar from

Calabria called Tommaso Pignatelli, was imprisoned in Naples on the charge of having hatched an anti-Spanish plot. When the following year Pignatelli, condemned to death, was strangled in prison, the situation suggested an opportunity, approved by the Pope himself, for Campanella's expatriation to France. On the night of October 21 he fled from Rome as far as Livorno in the carriage of the French ambassador, François de Noailles. There he embarked for Marseilles, continuing stage by stage through Aix-en-Provence, where he was warmly welcomed by his erudite friend Nicolas-Claude Fabri de Peiresc, at whose house he was able to meet Pierre Gassendi. Resuming the voyage to Paris, on November 15 he stayed at Lyon, where he saw with satisfaction that the first four books of his *Medicina* had been printed, and reached the capital on December 1st.

Campanella was received warmly and sympathetically by Richelieu and Louis XIII, and enjoyed the favor of the learned. During his Parisian years he resumed his philosophical activity and devoted himself to the printing of his own *Opera omnia*, which despite innumerable obstacles began to appear, to his great satisfaction. During 1635-1636 he was involved in an intense resumption of political reflections, aimed at demonstrating that France, for all its difficulties and conflicts, was positioned in a rising phase of "waxing fortune", whereas the Hispano-Habsburg power was traversing the downward parabola of an inexorable decline. Nor did Campanella neglect the prophetic prospects, always dear to him. In a letter to the Grand Duke Ferdinand II, recalling his links with the Medicean house and his constant friendship towards Galileo, he affirmed his own faith that the messages of prophets survive their death: 'The coming century will judge us, because the present one always crucifies its benefactors, but then they are resurrected on the third day, or the third century'. On the occasion of the much hoped-for birth of the Dauphin, the future Sun King, which came on the same day as Campanella's own 70th birthday, he composed an inspired *Ecloga* in Latin. Taking up astrological and prophetic themes, he begs the Muse of Calabria to free him from old age, so that he can communicate his faith in the approach of a new epoch, in which the 'dark colors, signs of mourning and ignorance' will be shed, and immaculate hearts will put on white garments; an epoch in which 'impiety, fraud, lies, and strife will be exiled, the lambs will no longer fear the wolf, nor the herd fear the lion; the tyrants will learn to rule for the good of the people, and idleness will cease, after which hard labor will also cease; work shared

by many in friendship will be play, for all will acknowledge one father and God'. Seized by dark presages at the approach of a solar eclipse, he tried to foil its threats, but died at dawn on May 21, 1639.

The only available resource for a complete description of Campanella's works and their complicated interrelations is still the volume by L. Firpo, *Bibliografia degli scritti di Tommaso Campanella*, Turin 1940. Because of the editions, discoveries of documents, and literature of succeeding years, both by Firpo himself and by other scholars, we must warn that this bibliography, while still valuable, needs many additions and corrections. There is an exhaustive compilation of Firpo's Campanella editions and studies in E. Baldini, "Luigi Firpo e Campanella: cinquant'anni di ricerche e di pubblicazioni", *Bruniana & Campanelliana*, II (1996), 352-358. This journal (from Year 1, 1995) should be consulted both for its updating of the editions and texts of Campanella since 1990, and for recent studies and documents about him.

GERMANA ERNST

Canseliet, Eugène Léon,* 18.12.1899
Sarcelles (France), † 17.4.1982
Savignies (France)

Eugène Canseliet, alchemist and writer, was born to a modest family of Belgian origin that settled in the Paris suburbs at the end of the 19th century. As

a youth, he was interested in art, especially drawing, and competed for entrance into art schools. During World War I he attended that of Marseille, where his family had moved to protect him from the war. Canseliet never lost his passion for painting and drawing.

At Marseille he met → Fulcanelli, who, according to Canseliet's account, was already an old man; he made a habit of visiting him, listening to him, and running errands for him, while beginning to study the classic texts of → alchemy. At Fulcanelli's, Canseliet met Jean Julien Champagne (1877-1932), who is often presented as having been the real Fulcanelli. Champagne was a gifted painter, versed in practical alchemy, and close to some of the Parisian esotericists; he exercised a profound influence on Canseliet.

On returning to Paris from Marseille, Canseliet worked variously as an office employee, book-keeper, etc., while continuing his alchemical studies. He visited Fulcanelli, who had returned to Paris after the Armistice in 1918, and Champagne, who from 1925 to 1932 occupied a room adjoining Canseliet's. Some paintings survive from this period of Champagne's life. Canseliet spent part of his income on acquiring old alchemical books, and those he could not obtain, he copied himself at libraries or in private collections such as Lionel Hauser's.

At the beginning of the 1920s, Fulcanelli invited Canseliet to a strange rendezvous. At the Sarcelles gas factory he asked his pupil to perform a transmutation, using materials that he himself provided. This operation, according to Canseliet, produced a small quantity of gold that was later cast into a ring. After this experiment, Fulcanelli handed Canseliet three manuscripts and entrusted him with preparing them for publication. The first, *Le Mystère des cathédrales et l'interprétation ésotérique des symboles hermétiques du Grand Œuvre* (The mystery of the cathedrals and the esoteric interpretation of the Hermetic symbols of the Great Work) appeared in June 1926 from Jean Schemit (1867-1945), a publisher specializing in erudite and artistic works. At Fulcanelli's request, Canseliet added a preface, and signed as "F.C.H." (i.e. Frère Chevalier d'Héliopolis), referring to a secret society of alchemists to which Fulcanelli had supposedly belonged. The illustrations that accompany Canseliet's redrafting of the text are all by Champagne.

Fulcanelli's second book appeared four years later: *Les demeures philosophales et le symbolisme hermétique dans ses rapports avec l'art sacré et l'ésotérisme du Grand Œuvre* (Philosophic residences

and Hermetic symbolism in its relationship to sacred art and the esotericism of the Great Work). But the third manuscript, entitled *Finis Gloriam Mundi* (The end of the world's glory) was taken back by Fulcanelli and kept from publication.

During the 1930s, Canseliet made lasting contacts and friendships, such as with the Christian alchemist André Savoret (1898-1977); Paul Le Cour (1876-1954), founder of the journal *Atlantis*, to which Canseliet contributed for the rest of his life; the polyglot philosopher Philéas Lebesgue (1869-1958); and Claude d'Ygé (alias Claude Lablatinière, 1912-1964). In 1945, Jean Schemit's widow honored her husband's promise and published Canseliet's first book. Although issued under difficult postwar conditions, the result was successful. From 1946 onwards, Canseliet lived in Savignies, near Beauvais.

In 1953, Canseliet was unexpectedly invited to make a journey by car from Paris to Spain. In Seville he was received by Fulcanelli, then aged about 114 by Canseliet's calculations. The purpose of this meeting, according to Canseliet, was for Fulcanelli to give his disciple advice and new information of a practical nature; in brief, to guide him in his research. Thenceforth Canseliet followed the so-called "dry way", re-reading in this spirit the works of Basil Valentine, → pseudo-Nicolas Flamel, A.T. Limojon de Saint-Didier, and Eirenaeus Philalethes (the "dry way" in alchemy is supposedly an accelerated process of obtaining the Philosopher's Stone that dispenses with the lengthy procedures of the more common "wet way", but is more difficult and hazardous).

In 1955, Canseliet began his collaboration with a new journal founded by Robert Amadou, *La Tour Saint-Jacques* (1955-1963). Other contributors included René Alleau (born 1917), Henri Hunwald (1908-1961), and Claude d'Ygé. Thanks to the latter, Canseliet was introduced to Jean Lavritch, owner of Omnium Littéraire (a branch of Editions des Champs-Élysées), a house specializing in esotericism and notable for publishing the journal *Initiation & Science* (1945-1963). In 1957 and 1960, Lavritch re-issued Fulcanelli's two books, augmented by Canseliet with new Introductions and two hitherto unpublished chapters. However, after differences arose between author and publisher, Canseliet was introduced to Jean-Jacques Pauvert, already well known for publishing the Marquis de Sade, André Breton, etc. Pauvert was convinced of the value of Fulcanelli's and Canseliet's writings, and agreed to publish them. The third edition of Fulcanelli's works (1964, 1965) and a volume of collected articles by

Canseliet (1964) met with immediate success. Thanks to Fulcanelli's literary qualities, but also to Canseliet's own writings, alchemy suddenly became respectable in the French literary world. The press and radio took hold of the phenomenon, and from then onwards, Canseliet was frequently solicited by journalists.

The 1970s were rich and active years for Canseliet. He wrote many articles, especially in *Atlantis*, then from 1977 in *La Tourbe des Philosophes*, a journal founded by Jean Laplace. He wrote several introductions, re-published Fulcanelli's works, completed his own *Alchimie expliquée sur ses textes classiques* (Alchemy explained on the basis of its classic texts), prepared augmented editions of his other books, published in facsimile the alchemical treatises he had copied in the 1920s, and co-authored a volume of interviews with Robert Amadou (see Bibliography). These efforts came to a dramatic close when Canseliet suffered a heart-attack in 1974. His long convalescence (during which he treated himself with dew) forced him to reduce his visits to Paris.

In his last years, Canseliet was busily giving interviews, answering the many letters he received, and ensuring that Fulcanelli's works remained in print; he also wrote his memoirs, which remained unfinished. His death, following a winter attack of influenza, left his work with no designated heir. It remains inseparable from that of his master, which in many respects it clarifies or completes. For nearly 60 years, this combined corpus has continued to have a strong influence, especially in France, where it has brought about a veritable renaissance of laboratory alchemy.

In the English-speaking world, Canseliet is best known as Fulcanelli's one and only disciple through Kenneth R. Johnson's biography of the latter; also through the publications of Frater Albertus (pen-name of Albert Richard Riedel). In an interview with Albertus (1976), Canseliet emphasizes the role of harmony in all alchemical endeavors: harmony with the material, with oneself, and with the cosmos. He mentions the difficulty of achieving the Great Work today because of pollution in the atmosphere and changes in the weather: these hinder the performance of alchemical operations, which are crucially timed by season, moon phase, and the state of the sky. Worst of all, he says, is the pollution of the human brain. A similar animus toward the modern age appears in his censure of the post-conciliar Catholic Church, particularly of its sanctioning cremation (Preface to 3rd ed. of *Le Mystère des cathédrales*, 31-33).

Unlike many 20th century interpreters, and even

self-defined practitioners of alchemy, Canseliet insisted that it is first and foremost a physical activity requiring laboratory work. He had little tolerance for the symbolic interpretations of Gaston Bachelard, the pontifications of → René Guénon on the 'merely cosmological' and theoretical nature of the Hermetic tradition, and the psychologized alchemy of → Carl Gustav Jung (*L'Alchimie expliquée*, 75-90). On the other hand, he was ready to read alchemical wisdom into the literary works of François Rabelais and Jonathan Swift. The key to this reading lies in the supposed secret language of the alchemists, the *langue des oiseaux* (language of the birds) revealed by phonetic equivalents: thus the name of Swift's hero Gulliver conceals the words *gueule* (Fr., "throat") and *ver* (Lat., "spring"), which Canseliet eventually translates as 'the philosophic vase' (*L'Alchimie expliquée*, 109). Alongside this creative hermeneutics, Canseliet continued Fulcanelli's practice of discovering and interpreting symbolic programs found in the architecture of French buildings of the Medieval and Renaissance periods. Yet despite such a wealth of information, the essential mysteries are guarded: the aspiring alchemist must deduce for himself, with the help of prayer if lacking that of an accomplished master, the actual nature of the materials and what is practically to be done with them. In this respect, Canseliet's teaching contrasts with the tendency to openness and the setting of modest and accessible goals, as in the "alchemical" schools of Frater Albertus or of Jean Dubuis' "Philosophers of Nature".

RICHARD CARON

Carpocratians

The Carpocratians belong to the broad spectrum of Christian schools in the 2nd century that teach Christianity as a philosophy. Their founder, the Alexandrian Christian Carpocrates, was married to a lady called Alexandria who came from the island of Kephallenia in the Adriatic sea. They had a son called Epiphanes who received from his father an “encyclopaedic education”, wrote some treatises and died at the age of seventeen. Clement reports that the deceased Epiphanes was given divine honours: a temple and a *mouseion* were erected in Same on the island of Kephallenia and every new moon a celebration commemorated his divinization (Clement of Alexandria, *Stromateis*, III, 5, 1-3). Clement does not assign a date to either Carpocrates or Epiphanes. Irenaeus of Lyons, however, who discusses the Carpocratians in *Adversus Haereses* (AH), I, 25, provides some elements of chronology. He refers to a Roman group that was headed by a certain lady called Marcellina. According to Irenaeus, Marcellina came to Rome in the time of bishop Anicetus and ‘exterminated many’. Thus Irenaeus sees Marcellina as a contemporary of Polycarp (AH, III, 3, 4) and Valentinus [→ Valentinus and Valentinians], who, having come to Rome under bishop Hyginus, lived until the time of Anicetus (AH, III, 4, 3). Cerdo, who arrived in Rome under Hyginus (AH, I, 27, 1), is older, as is probably Marcion. Whether Irenaeus is correct in connecting Marcellina and her group with the Carpocratians is not quite certain: the pagan philosopher Celsus distinguished in his anti-Christian treatise the *True Doctrine* between ‘Marcellians’ as followers of Marcellina and ‘Harpocratians’ as followers of Salome (Origen, *Contra Celsum*, V, 62).

Another contemporary of Marcellina is Hegesip-

pus who likewise came to Rome under bishop Anicetus. He wrote a work comprising five books; there he mentions the Carpocratians among the Christian sects that have sprung from the Jewish sects. He enumerates Menandrians, Marcianists (?), Carpocratians, Valentinians, Basilidians and Saturnilians (Eusebius of Caesarea, *Historia Ecclesiastica*, IV, 22, 5). It is, of course, impossible to draw any chronological conclusion from the sequence presented by Hegesippus. We can only surmise that Carpocrates and his son lived in the first half of the 2nd century and that Marcellina came to Rome sometime after ca. 160 C.E. Justin Martyr who wrote between 150 and 160 C.E. nowhere mentions Carpocratians. The Roman group was probably still active when Irenaeus composed his *Adversus Haereses* about 185 C.E.

Irenaeus relates some further details about the Roman Carpocratians, the followers of Marcellina: they called themselves “gnostics” and tattooed the back of their right ear with a red hot iron. Moreover, they possessed images of Christ as a human being, executed in different materials, amongst them a portrait of Christ made by Pilate. They placed Christ’s image among those of other philosophers like Pythagoras, Plato and Aristotle and paid them the kind of homage customary among pagans. This last piece of information is important because it suggests that the Carpocratians, like other philosophical schools, celebrated their founder as a divinized philosopher hero. This seems to confirm Clement’s report mentioned above according to which Carpocrates’ son Epiphanes was honoured as a deified philosopher-child prodigy in Same on the island of Kephallenia.

As to Carpocratian literature and doctrine, our knowledge is scarce and confined to the reports and quotations offered by Clement of Alexandria and Irenaeus of Lyons. Both writers evince a definite heresiological perspective: they wish to demonstrate that the Carpocratians are libertinists. Accordingly, they highlight those features of Carpocratian teaching that they consider as evidence for Carpocratian libertinism.

1. Epiphanes is the author of a work called *On Justice* of which Clement of Alexandria has preserved three fragments (*Strom.*, III, 6, 1-9, 3). There Epiphanes develops his concept of divine justice: divine justice is defined as ‘community combined with equality’ and as manifesting itself in the cosmic order. Every living being gets an equal share of e.g. light or food; no one has more than the other or something in which the others have no share. The law of divine justice is unwritten. Human laws that introduce private property violate this princi-

ple of divine justice. For example, the grapevines are for everyone; the idea that they are anyone's private property creates the thief. Epiphanes quotes Rom. 7:7: 'It is through the law that I got acquainted with sin'. The same applies to the union of male and female: since God has created the male with sexual desire in order to ensure the continuous existence of the human race, the commandment not to desire what belongs to your neighbour (including his wife) is absurd and ridiculous. Hence no one can lay exclusive claim to his own wife, for this would manifestly contravene the will of the divine creator.

In these fragments Epiphanes is not primarily interested in proposing the Platonic ideal of the community of wives. He rather presents an interesting example of a non-dualist rejection of the God of the Old Testament. Clement, *Strom.*, III, 5, 3 designates Epiphanes as the founder of the 'monadic gnosis'. Perhaps this means that Carpocrates – like Marcion's disciple Apelles (Eusebius of Caesarea, *Historia Ecclesiastica*, V, 13, 5) – assumes one principle rather than two. For him, God is, according to the platonic phrase, the 'creator and father of all' (Clement, *Strom.*, III, 7, 1; cf. Plato, *Timaeus*, 28 c3); his will manifests itself in the order of the kosmos. The Mosaic law is ridiculous. It does not even reveal, *pace* Marcion, a lower God who is legislator and creator. Here Epiphanes again seems to agree with Marcion's disciple Apelles who in his *Syllogisms* also tried to prove that the Old Testament with its many contradictions does not contain divine revelation.

2. It is not quite clear how the information Clement offers us about Carpocrates and Epiphanes can be combined with Irenaeus' report about the Roman (?) Carpocratians. There is some likelihood that Irenaeus is paraphrasing and summarizing an original document, but we cannot be sure whether Carpocrates himself or one of his followers is the author of this source. According to Irenaeus, the Carpocratians believed that Jesus was an ordinary human being, the son of Joseph. However, since his soul had not forgotten that in its pre-existence it had contemplated the sphere of the unbegotten father (cf. Plato, *Phaedrus*, 247c), it was exceptionally strong and pure. Therefore God the Father sent him a force that allowed him to escape the angels that have created this world and to ascend to God. The soul of Jesus received a Jewish education, but despised it. It was granted the power to eradicate those passions that it had acquired as a punishment for its sins. All those that, like Jesus, despise the angels that created the world will, like him, receive the power to do as he did.

Those human beings that are endowed with souls from the same sphere as that of Jesus can achieve the same or an even higher degree of perfection.

Here it is interesting to observe how the Carpocratians conceptualize Christ as a philosopher hero by proposing a Christian reinterpretation of the Platonic doctrine of the soul: according to them there are special souls that remember their pre-existent state. However, the ascent to the highest God is not simply a function of that memory with its consequent strength and purity, but is rather dependent on the gift of a divine *dynamis* that allows them to escape the creator angels. To follow Christ, then, means to take part in the Carpocratian variety of the late antique "cult of learning" (Zanker), to imitate Christ the philosopher hero in one's own life.

Apart from this report concerning the main tenets of Carpocratian doctrine, Irenaeus has also preserved a Carpocratian exegesis of the parable in Luke 12:58-59 / Matthew 5:25-26 (*AH*, I, 25, 4; the text quoted by the Carpocratians is a mixture of Matthaean and Lukan readings). The Carpocratians identified the adversary with the devil who is one of the creator angels. The diabolical psychopompus leads the souls to the Archon, the first of the creator angels. He exercises the function of the judge and delivers the soul to a third angel, a bailiff, who imprisons the soul in a new body. Jesus' saying: 'You will not leave until you have paid back the last penny' is taken to mean that the soul will have to wander from body to body until it has 'carried out all the actions that are in this world'.

Irenaeus gives this Carpocratian gloss a robustly libertarian reading: according to him, the Carpocratians wish to suggest that the soul can only be liberated if it devotes itself to all possible misdeeds, blasphemies and debaucheries. If it realizes its total freedom in one life, it does not have to return into the body. This reading, however, presses the Carpocratians' doctrine too far: they probably read Jesus' saying as teaching the transmigration of the souls [→ Reincarnation], not as proposing a new ethics. Moreover, Irenaeus himself is doubtful as to whether it is correct to view the Carpocratians as endorsing libertinism (*AH*, I, 25, 5).

This Carpocratian exegesis must be seen in context: the so-called *Sentences of Sextus*, a collection of Christian ethical aphorisms that originated probably in Alexandria in the 2nd century, allude to the same parable (*Sent.* 39 Chadwick): after death the sinner will be punished by a demon 'until he has paid the last penny'. Origen agrees with the Carpocratians that the persons mentioned in the parable are to be identified as angels: the adversary

is a personal demon that accompanies every human being tempting him or her to sin. The archon is the highest angel of every nation, the adversary tries to subject the human being in his care to him. Only those who practise the four cardinal virtues of wisdom, justice, courage and self-restraint can hope to get rid of their personal demon. The judge to whom the adversary escorts the human being is Christ himself who determines the appropriate punishment (Origen, *Homilies on Luke*, 35). Tertullian has read Irenaeus; in *De anima*, 35, he discusses the Carpocratian exegesis of Luke 12:58f. / Matth. 5:25f.

3. Finally, we must mention the fragment of a letter ascribed to Clement of Alexandria which the American scholar Morton Smith discovered in the Mar Saba monastery near Jerusalem (Clemens Alexandrinus, IV, ed. Stählin-Treu, XVII-XVIII). The letter is addressed to a certain Theodorus. It starts with a polemical injunction against the Carpocratians and informs us that Carpocrates had forced an Alexandrian presbyter to deliver to him a copy of the second, secret gospel of Mark. Carpocrates allegedly then altered this gospel and used it as the basis for his own teaching. The letter quotes fragments from the secret gospel of Mark that suggest that Jesus was involved in a homoerotic relationship. The authenticity of this letter is doubtful; it agrees with the heresiology of both Irenaeus and Clement insofar as it suggests that Carpocrates was a libertine. However, neither Irenaeus nor Clement suggest homosexual libertinism.

Catharism

1. INTRODUCTION
2. SOURCES
3. HISTORY
4. BELIEFS
5. RITUALS
6. HIERARCHY
7. DIFFUSION OF CATHAR BELIEFS
8. THE END OF CATHARISM

1. INTRODUCTION

Catharism was a dissident movement in medieval Western and Southern Europe, considered heretical by the Church. The name Cathar, which derives from the Greek *katharos* (pure), was first used in 1163, by the German monk Eckbert of Schönau. Heresiological literature also employed terms such as Neo-Manichaeans, Patarins (Italy), *Albigensis* (Languedoc, Lat. *Albigenses*), *Bougres* (Lat. *Bulgari*) and *Texerants/Tisserants* ("weavers"). Members of the sect called themselves "Good men" or "Good Christians".

The origin of Catharism is very controversial. Some scholars are convinced that → Bogomilism played a determinant role in the genesis of Catharism, since Bogomil and Cathar beliefs and rites are very similar. Others think that Catharism intensified dualistic tendencies within Christianity itself, and is in fact an attempt to return to the spirit of apostolic times. G. Volpe emphasized that the Cathars adhered to a religiosity that was close to the Gregorian Reform, characterized by nostalgia for primitive Christianity. R. Morghen put Catharism back in its contemporary Christian context,

defining it as a reaction against the temporal ambitions of the Church, itself claiming to be a spiritual Church. Some scholars go even further: according to A. Brenon, who almost completely neglects its dualistic aspects, Catharism is an “ordinary Christianity”. Today, a hypercritical approach of the sources sometimes even leads to doubts about the real existence of Catharism: some scholars present Catharism as a “construction by orthodoxy”. According to this interpretation, partisans of a rigorous spiritual reform were incited by the Church to radicalize their ideas.

As far as the social aspects of Catharism are concerned, there was no question of marginality whatsoever. The Cathars penetrated all strata of urban and rural society and were often recruited from the middle class (merchants, lawyers, physicians, etc.). In the South of France, their protectors belonged to the chivalry of the castles, and in Italy members of the Ghibelline party were among their defenders. The involvement of women in the movement was important; they could also become Perfects, wholly initiated members of the sect.

2. SOURCES

Catharism is known through a considerable number of writings composed by its enemies and through only a few original Cathar documents. Among the indirect sources, anti-heretical treatises and “sommès” (summaries of heretical beliefs and practices for inquisitorial use) were written especially in Italy, from about 1200 onward. The acts of the inquisitorial tribunals also give abundant information about persons, places, practices and beliefs. Finally, passages in historical writings, political correspondence and anti-heretical laws and decrees throw light on the historical circumstances of the development of Catharism and on the reactions it provoked.

Among the original Cathar sources, there are two rituals (one in Latin and one in Occitan), a theological treatise, *The Book of Two Principles*, attributed to John of Lugio, and another one, reconstituted from Durand of Huesca’s anti-heretical treatise. A Latin apocryphon entitled *Interrogatio Iohannis* (“Questions of John”), used by the Italian Cathars in particular, has probably a Bogomil origin.

3. HISTORY

Since the 11th century, chroniclers mention Neomanichaeans, but they describe them so insufficiently that we cannot know whether we are dealing here with proto-Cathars or with partisans of a return to apostolic times, beyond the objectives of the actual movement of ecclesiastical reform. Catharism can

be clearly identified only from the second half of the 12th century onward. From the 1160s onward, Cathars often appear in the documents because of the repression they provoked from the side of both civil and ecclesiastical authorities.

According to the treatise of Anselme of Alessandria (*Tractatus de hereticis*, c. 1270), Western (French) people became acquainted with heresy in Constantinople during the Second Crusade. After returning to their country, they ordained there a bishop. Later on, the new heresy was diffused South of the Loire and in Lombardy.

Eckbert, abbot of Schönau, is the first author who described the Cathars with many details. In his *Sermons* (1163), he denounced Cathars who rejected the Catholic sacraments, marriage, the consumption of meat, and the intercession for the dead. He also revealed some of their beliefs, for example the creation of the human body by Satan, the negation of Christ’s Incarnation, or the idea that human souls originated from rebelling angels.

The last three decades of the 12th century are characterised by a great expansion of Catharism. A document of which the authenticity is disputed gives an account of a heretical council at Saint-Felix-de-Caraman (between Carcassonne and Toulouse), held in 1167. On this occasion, a heretical dignitary, named Papas Nicetas (Niquinta), who went here from the East, confirmed the already existing episcopal boundaries in Languedoc and consecrated Cathar bishops. It is a fact that in 1177 a letter of Raymond V, count of Toulouse, sounded the alarm against the heresy. Religious missions first began in 1178, with the participation of Cistercian monks.

By this time, legal documents inform us about the Church’s reaction against Cathars and other heretics, who are condemned to be deprived of their goods and to be reduced to servitude if they do not convert (council of Tours, 1163; council of Lateran, 1179). In 1184, at Verona, Emperor Frederick Barbarossa and Pope Lucius III take severe measures against heretics (banishment, infamy, civil incapacity). It is also the inauguration of the inquisitorial search for heretics. North of the Loire, the first heretics are burned at the stake (1172, Arras; 1182-1184, Campagne); in the realm of Aragon, kings Alphonse II and Peter II promulgate grave sanctions against heretics (1194, 1196).

Repression seems very efficient in the North, but in the North of Italy and in Languedoc the Cathar movement is still growing. According to the anti-heretical treatises, Italian Catharism was characterized by a great doctrinal diversity, which also reflected corresponding struggles for power. Pope Innocent III tried to impose anti-heretical measures

in Lombardy, in Sicile and in Saint Peter's Patri-mony, but, just as the Emperor Frederick II, he encountered fierce resistance in many cities of Lombardy and Venetia. Because of constant more or less exacerbated tensions between the partisans of the Emperor and the Pope (Ghibellines and Guelfs), the heretical communities persisted in Italian cities, where Cathars from Languedoc could take refuge until the end of 13th century.

But after the failure to convert the Cathars by preaching, Innocent III wanted to incite a military expedition in order to eradicate heresy in Languedoc, and he promised a crusade indulgence for participants. After the murder of his legate Peter of Castelnau (1208), the pope redoubled his efforts to organise a crusade in a Christian country. Though the French king Philippe Auguste did not participate in it personally, he allowed 500 knights to take the cross. The "Albigensian Crusade" began in the summer of 1209. Its first phase ended in 1215: at the IVth Lateran Council, Innocent III decreed that the town of Toulouse and the whole country which had been conquered would be conceded to count Simon of Montfort, the crusaders' commander-in-chief. But the political and religious resistance was revived by count Raymond VII. After a long series of struggles, the French king Louis IX imposed his conditions on Languedoc (Treaty of Paris, April 1229). In the same year, a council held at Toulouse specified the methods of religious repression, establishing the proceedings of inquisitorial inquiry. Shortly after this (1233-1234), the Papal Inquisition, an exceptional tribunal for the persecution of heretics, was created, for which Dominican friars became responsible. The last places of Cathar resistance fell in 1244 (Montségur) and in 1256 (Quéribus). The county of Toulouse was annexed to the French kingdom in 1271. Since the beginning of the Crusade, many people – Cathars and also their protectors – were arrested, imprisoned and burned.

Hunted by the Inquisition, the Cathars of Languedoc could still take refuge in Lombardy or in Aragon. The last Cathars were arrested round about 1320, during the meticulous enquiry of Bishop Jacques Fournier (future Pope Benedict XII), charged with the Inquisition in the diocese of Pamiers.

4. BELIEFS

Cathar beliefs are known through anti-heretical writings, depositions and confessions before the Inquisition and through two theological treatises and an apocryphal writing of the Cathars themselves.

The anti-heretical treatises invariably present Cathar beliefs in a systematic arrangement, emphasizing their contradictions with Catholic doctrine.

At the same time, they underline the diversity and divergences between the Cathar currents, opposing them to the unity of orthodox faith. Confessions and depositions recorded by the Inquisition indeed testify to varying features of Cathar myths and beliefs, which were almost exclusively orally spread. For Cathars, the principal preoccupation was the salvation of the soul. But they generally rejected the Catholic solution and emphasized the duality between Good and Evil, soul and flesh, proposing a new interpretation of the Holy Scriptures. Medieval heresiologists distinguished two principal currents within Catharism, which, already in 1849, the German scholar Ch. Schmidt designated as "absolute dualism" (radical current) and "mitigated dualism" (moderate current, closer to Catholic orthodoxy).

"Absolute dualism" characterized the Catharism of Languedoc and of the Church of Desenzano (near the lake of Garda) as well as that of the order of Drugunthia in the East (Macedonia or Thrace). According to this system, there existed from the beginning two realms: that of God, who is invisible and without evil, and that of the God of darkness, who is material and perishable. The equilibrium between them was broken by an intrusion of Satan into the divine world. The son of the God of darkness invaded the celestial court and seduced a part of the angels. Thrown out of heaven by God, together with his cohort, he created the material world and imprisoned the fallen angels in human bodies.

Moderate Cathars, who were particularly numerous in Italy (Church of Concorezzo) and more close to the Bogomils, believed that God had created angels and the elements of material world. Lucifer was an angel created by God, but moved by pride he raised a rebellion at the celestial court. Expelled to the world here below, with its still unorganized matter, he moulded the visible world and the body of the first human couple, with the permission of God. Like the radical Cathars, the moderate ones imagined that the evil creator had imprisoned two fallen angels in them.

The story of the fallen angels was spread in multiple variants and the modalities of Lucifer's promises were embellished with many imaginative details. In some versions, Lucifer imprisoned the angels after his fall, in order that they should forget their celestial origin. According to radical Cathars, the souls were condemned to migrate from one body to another (metempsychosis; → Reincarnation) until they arrived in the body of Perfects where they could be saved.

Christ played an essential role, but in compari-

son to Catholicism, there was an important difference: since they despised matter and flesh, Cathars could not agree with the dogma of the Incarnation. According to them, Christ had not a real but a phantom body. He went through Mary's body without taking on anything of her flesh. He did not suffer on the cross and did not bodily arise from death. All these beliefs restricted Christ's role; he was considered a messenger of God rather than the sacrificed Redeemer.

In the same way, the Cathars did not accept the dogma of the resurrection of the bodies after the Last Judgement. Concerning the fate of human souls, there were divergent opinions among the Cathars. The majority believed that all souls would go back to heaven; others thought that only the angels who had been forced to rebel but did not really sin would return to their celestial home. According to others, souls that could not be saved after nine incarnations would perish definitively.

The Cathars based their beliefs on the authority of the Bible. They made use of biblical texts that did not differ from those of the Catholic Bible. But they rejected the major part of the Old Testament, identifying the God of Genesis with Satan. Nevertheless, they accepted some books of the Old Testament, particularly the Psalms, the prophets, Job and the Books of Wisdom. Among the Gospels, they appreciated mostly that of John, of which they also made use in their rituals.

The Cathars had their own writings but most of them have disappeared. The treatise entitled *Book of Two Principles*, probably by John of Lugio, a radical Cathar, attributed the origin of the evil to the evil principle and denied free will as well.

The apocryphal *Interrogatio Iohannis* ("Questions of John"), used by Italian Cathars, is conserved in two Latin versions. According to Anselme of Alessandria, Nazarius, assistant ("greater son") of the bishop of Concorezzo, received this writing from the bishop and greater son of de Church of Bulgaria around 1190. The myths and beliefs expressed in this apocryphon are very close to those of the Byzantine Bogomils as they are described at the beginning of the 12th century. The text is qualified "secret" by Nazarius himself and also by the Inquisition: it means that its contents were reserved to initiated members of the sect. The apocryphon contains all major themes of sacred history, from the creation of the world to its end. Satan, head of the celestial powers, seduced by pride a great part of the angels, up to those of the fifth heaven; after their fall from the celestial world, God permitted Satan to organise matter for seven days. Satan arranged the visible world, and then he

made the bodies of the first human couple, into which he introduced two angels. He seduced Eve in the shape of the snake. God authorised Satan, that is the God of the Old Testament, to reign for seven centuries. He deceived Henoah and → Moses, and sent John the Baptist to baptize in water. Christ was sent by God the Father to redeem humanity; his mother, Mary, was also an angel sent by God. Christ entered into Mary through her ear and came out in the same way. The apocryphon condemns baptism in water, emphasizes the special value of the Lord's Prayer and extols chastity. Its eschatology is essentially based on the New Testament. The Cathars also used the apocryphal *Ascension of Isaiah*.

5. RITUALS

Cathars recommended a return to the ritual of the first Christians and, at the same time, rejected the material components of the sacraments. For them, baptism in water did not have any value, and the Eucharist consisted of ordinary bread, without the real presence of Christ's body.

They practised their own rites: the daily breaking and blessing of bread, in the manner of the first Christians, and the monthly collective confession of faults (*apparellamentum*). Their principal rite, called *consolamentum*, was a spiritual baptism and an ordination of the "Perfects", who devoted themselves entirely to the Cathar faith, renouncing the pleasures of the world, and promising to observe chastity, truth, humility, obedience, and abstinence from meat of animal origin. When administering the *consolamentum*, the officiant laid the Gospel on the head of the new initiate and all the Perfects laid their right hand on his head or shoulder. The ceremony comprised also the sevenfold recitation of the Lord's Prayer and a lecture of St. John's Gospel.

6. HIERARCHY

The basis of the Cathar Church was formed by simple sympathizers, the "Believers", who could be married and have children, even though Catharism severely condemned procreation because of the imprisonment of the souls in human bodies. The Believers were necessary to support the Perfects in their mission, but also because they once could become Perfects themselves. One can imagine that many Believers waited until their last hour to renounce the pleasures of the world and to be "consolated" with the certainty of salvation. Only those who had received the *consolamentum* became full members of the Cathar Church. Before the systematic persecutions, these initiates or "Perfects" were wearing black clothing and for that reason were called "clothed heretics". Perfects had the mission

to preach Cathar faith and to administer the *consolamentum*, and they were travelling from place to place even during the persecutions. According to Cathar belief, souls could be saved only in the body of a Perfect; thus the Perfects played a decisive role in the process of salvation. But if a Perfect or a bishop committed a grave sin, he lost his spiritual power, and the persons whom he had consoled or ordained should be reconsoled or reordained.

The Cathar dioceses were administrated by bishops, assisted by a "greater" and a "lesser son". In Italy, dissensions between bishops and their orders often crystallized around doctrinal questions.

Ca. 1250, Raynier Sacconi, a former Cathar who had become inquisitor, established a list of Cathar Churches, specifying their doctrinal filiation. In Lombardy, he distinguished three orders: *Albanenses*, *Concorrenses* and *Baiolenses* (the two first ones corresponding to absolute and moderate Catharism, and the third to an intermediary current), and he specified that everywhere in Italy and in the Provence, the Cathars followed one of these currents. Raynier estimated that in his time there were 4000 Perfects in Italy.

7. DIFFUSION OF CATHAR BELIEFS

Even after the beginning of the persecutions, Catharism continued its proselytism. Nevertheless, the Cathars did not immediately reveal the core of their faith to their listeners and believers. Their preaching method was a progressive one and only the Perfects were initiated into all their secrets. According to Bernard Gui's *Handbook for the Inquisitor* and to testimonies registered by the Inquisition, the Cathar manner of preaching consisted of three steps. Firstly, they emphasized that their behaviour was in accordance with the evangelic ideal, even asserting that they held the position of the Apostles. Then they opposed their attitude to the bad way of life of the Roman Church, which was characterized by pride, cupidity, avarice, and dishonesty. Because of the moral decline of the Church, God had deprived catholic priests of their power to absolve sins and He had given it to the heretics. They underlined that nobody could be saved outside their sect. Having made their listeners sensitive to the problem of salvation, the Cathars began to reveal their beliefs, starting generally with their opinions about the sacraments. Anti-heretical treatises make mention of some of their "secret" beliefs. According to Eckbert of Schönau, new heretics could know the true doctrine only after 15 years. Some other authors enumerate several secret Cathar beliefs, for exam-

ple that of the sin of Lucifer in heaven, the creation of four creatures by the evil God, Christ's body, and metempsychosis.

8. THE END OF CATHARISM

The Albigensian Crusade, the Inquisition and the anti-heretical measures progressively weakened the Cathar Church. In Italy, Catharism persisted without too much difficulty until the decline of the Ghibelline party (mid-13th century). After the 1280's, because of political changes and increased persecutions Catharism lost ground in the Italian towns. The last Cathar bishop (Cione di ser Bernardo) was captured in 1321. In Languedoc, a revival of Catharism can be observed between 1295 and 1310 in the mountains of Ariège, which came to an end with the action of the Inquisition in 1318-1325. The last Perfect, Guillaume Belibasta, was arrested and burned in 1321.

The disappearance of Catharism can also partly be explained by the introduction of new pastoral methods of the catholic Church, particularly by the activity of the Preaching Orders, i.e. the Dominicans and Franciscans. By involving laymen to a great extent in religious life, the Church also proposed to them new forms of piety and new structures (religious fraternities, new feasts, and processions) to practise them.

EDINA BOZOKY

Catharism, Neo- → Neo-Catharism

Cayce, Edgar, * 18.3.1877 Hopkinsville, Kentucky, † 3.1.1945 Virginia Beach, Virginia

Known to the American public as the “sleeping prophet”, Edgar Cayce became an influential forerunner of New Age spirituality [→ New Age Movement] through the voluminous body of clairvoyant “readings” he left behind at his death in 1945. The transcripts of these trance sessions were catalogued and organized by the Association for Research and Enlightenment, the institution Cayce created in June 1931. Through the publishing initiatives of Cayce’s son, Hugh Lynn Cayce, books discussing everything from alternative health therapies to the lost continent of Atlantis, and from the Dead Sea Scrolls to → reincarnation flooded the occult/metaphysical book market beginning in the 1950s, bringing a hodgepodge of Eastern and Western esoteric and alternative reality teachings to the American public.

Cayce’s rural Kentucky early life inculcated into him the values of family loyalty, Bible study, and dedication to Christ. He was fascinated by the Bible and developed a habit of reading it from cover to cover each year. Cayce’s biographers all relate stories of his budding clairvoyant abilities, including imaginary playmates, visions of deceased relatives, and the memorization of books he slept on. When he was thirteen, he had a vision of a beautiful woman to whom he confided that his deepest desire was to help the sick, especially children.

Cayce quit school early to help with the family finances. He worked as a farm laborer, bookstore clerk, and traveling salesman. His life took a sudden turn in 1900 when he came down with severe laryngitis that left him unable to speak or work for a year. He found a job as a photographer’s assistant in Hopkinsville and resigned himself to his seemingly chronic disability. A traveling hypnotist heard about Cayce’s condition and convinced him to be hypnotized. To the amazement of his family, Cayce was able to speak normally while in the trance

state. Upon regaining normal consciousness, however, his disability returned. A New York specialist and a local amateur hypnotist convinced Cayce to diagnose his own condition while under hypnosis. This first “reading” claimed that his illness could be healed by suggesting, while unconscious, that blood circulation be increased to his throat area. The treatment was successful, and after some initial hesitation, Cayce began giving “health readings” for local people with intractable health problems. It was discovered that Cayce needed only the person’s name and location in order to give the reading. He refused to accept payment for these services. One of the most remarkable of the readings was for a five-year-old girl who was suffering from convulsions and arrested mental development as a result of a spinal injury and influenza. After Cayce had diagnosed her condition, the girl was completely healed by means of osteopathic adjustments. Cayce married Gertrude Evans in 1903 and moved to Bowling Green, Kentucky. There he opened a photography studio with a partner.

Cayce gained national fame in 1910 after meeting Dr. Wesley Ketchum, a homeopath, who published a paper on Cayce in the American Society of Clinical Research. In October, the *New York Times* published an article summarizing the journal piece, and Cayce began receiving requests for readings from around the world. Cayce, Ketchum, and several others formed the Psychic Reading Corporation to handle these requests. Some of the therapies suggested in the readings were unorthodox, but most proved successful and Cayce’s fame spread. In order to address the difficulty of finding doctors willing to carry out his unorthodox treatments, Cayce began formulating plans to build a hospital dedicated to his patients.

In 1923, Cayce gave his first reading mentioning → reincarnation. It would take much soul-searching before he could reconcile reincarnation with his Christianity, but eventually he was able to do this. Out of this development came the first “life readings”, whose purpose was to assess a person’s past lives in order to give guidance on the present life’s course. It was out of the life readings that Cayce’s teachings on meditation, dream interpretation, ancient civilizations such as Lemuria and Atlantis, spiritual development, and reincarnation would emerge.

Cayce moved his family to Virginia Beach, Virginia in 1925. He founded the Association of National Investigators in 1927 to conduct research on the information given in the readings. In 1928, with the assistance of a New York businessman named Morton Blumenthal, he opened the Edgar

Cayce hospital. Patients at the hospital obtained readings, diagnoses, and recommendations for treatment. Cayce’s medical philosophy was that all schools of medicine should be consulted and that whatever was best for the patient should be employed to assist in the healing process. The hospital and Atlantic University, begun in 1930, were forced to close in 1931 because of the Great Depression. What remained was the Association for Research and Enlightenment, Inc. (A.R.E.), whose purpose was to both investigate and make public the information in the readings. The A.R.E. has survived until the present time and has been responsible for the worldwide dissemination of Cayce’s peculiar mélange of theosophy, Eastern religions, mysticism, alternative healing therapies, dream study, and Christ-centered spiritual development.

Many skeptics came to Virginia Beach to debunk Cayce’s work. One of them, a Catholic writer named Thomas Sugrue, became convinced of Cayce’s authenticity and wrote *There is a River* (1943), the first and most popular Cayce biography. *Coronet* magazine published an article shortly thereafter on Cayce, “Miracle Man of Virginia Beach”, and this greatly increased Cayce’s notoriety and influence.

Cayce was besieged with requests for readings during World War II and felt a deep obligation to help all those who came to him for assistance. As a result of this overwork, he began to suffer from nervous exhaustion. In 1944, he suffered a stroke, and died on January 3, 1945. His wife died three months later. It was Cayce’s loyal secretary, Gladys Davis, who assumed responsibility for cataloguing and indexing Cayce’s 14,000 readings. Her work was not completed until 1971, by which time a new generation of spiritual seekers had discovered Cayce’s legacy and joined the A.R.E. In time, the complete set of readings was made available on CD-Rom. The readings are also available for study at A.R.E. headquarters in Virginia Beach.

The present-day organizations that study and disseminate the Cayce readings include the A.R.E., the Edgar Cayce Foundation, Atlantic University (reactivated in 1985), the Health and Rejuvenation Research Center, and the Cayce/Reilly School of Massotherapy.

PHILLIP CHARLES LUCAS

Cazotte, Jacques, * 17.10.1719 Dijon,
† 25.9.1792 Paris

A Catholic all his life, Cazotte was educated at a Jesuit school in Dijon. He went on to study Law, and went to Paris in 1740, where he took up a position in the Administration of the French Fleet. In 1741 he published some original fairy tales (*La patte du Chat*), and in 1742 a number of fantastic “oriental” tales such as *Les Mille et une fadaises*, inspired by the French translation (by Galland, 1704) of the *Arabian Nights* (in French, *Les Mille et une nuits*). His professional duties obliged him to sojourn in various French harbours (such as Le Havre and Brest) between the years 1743 and 1747. Appointed in 1747 by the French Administration as “Contrôleur” in Martinique, he was to serve there only for a few months. Back in Paris he frequented the artistic and literary milieu, published ballads, and dabbled in music criticism, taking the side of Jean-Jacques Rousseau on behalf of French music (*Observation sur la lettre de Jean-Jacques Rousseau*, 1753). Later, he was sent to Martinique again, where he remained at his post from 1754 to 1759. He had married a native woman of the island, Élisabeth Roignan, and had two children by her. He was, however, plagued by financial problems, due in part to expenses he had incurred in a lawsuit against the Jesuits. Suffering ill health as well, he returned to France. But Cazotte’s fortunes improved with the inheritance of his brother’s estate. This provided him sufficient income to become a full-time writer. In this capacity, he and his family settled in Pierry, a village near Epernay, in Champagne in 1761. There, he wrote a long poem in twelve prose cantos intermixed with verse, entitled *Ollivier* (2 vols., 1763), followed by another romance, *Le Lord Impromptu* (1771), and what was to become by far the most popular of his works, *Le Diable amoureux* (1772). Other tales by Cazotte followed. Notable among them was a series of “oriental” works, entitled *Continuation des Mille et une nuits* (1788). Cazotte opposed the French Revolution during its earliest phases because he saw in it a great incarnation of Satan. Several personal letters he had written to friends

were seized in August 1792 by the revolutionary authorities. On the 18th of August in the same year he was imprisoned, but he made a brief escape thanks to the courage of his daughter. Captured again soon after, he was sentenced to death on September 24th, and guillotined on the following day.

Both *Le Diable amoureux* and some activities of its author pertain to the esoteric current called → Illuminism. The plot of *Le Diable amoureux* concerns a young man, Alvare, who has learned how to conjure spirits, and one night succeeds in summoning the Devil. The Devil appears, first with an ugly camel’s head, then with the head of a spaniel, and finally with that of a young page who turns out to be a very attractive girl, with whom he quickly falls in love. Like Mephistopheles in the Faust story, she offers Alvare the power of ruling over ‘mankind, all the elements and the whole of nature’. She says she can do so, thanks to a ‘higher science’, the knowledge of which she swears to teach him. In the end, Alvare never attains the promised powers, for although he wants to marry the lovely page, she suddenly vanishes and abandons him forever. This novel heralds the development of the literature of the fantastic and can claim to have inspired a number of poets. Indeed, its influence has been far-reaching and lasting, beginning with E.T.A. Hoffmann, → Gérard de Nerval and Charles Baudelaire, and proceeding through to Guillaume Apollinaire. The narrative of the invocation and corporal presence of a spirit – albeit a satanic one – attracted the attention of many readers of the time: not only people with refined tastes in literature, but also Illuminists fascinated with “theurgy” in relation to theosophical speculations.

In a long letter dated 6 February 1790 (see *Correspondance* ed. by Décote, 132), addressed to an unidentified correspondent, Cazotte explains that he had written *Le Diable amoureux* in a playful mood, inspired by stories he had heard from Freemasons [→ Freemasonry] dabbling in occult sciences [→ occult / occultism]. However, after its publication he was visited by numerous serious “seekers” after the secrets of the occult, who sought his advice because they believed him more knowledgeable than they were themselves. Some of these devotees of the occult suggested that he read *Des Erreurs et de la Vérité* (1775) by → Louis-Claude de Saint-Martin. Shortly thereafter, in 1777 or 1778, he agreed to be initiated into the Order of the → Elus Coëns founded by the theosopher and theurgist → Martines de Pasqually. The letter continues by relating how he eventually became disillusioned with the Martinists [→ Martinism], and joined the Marquise de La Croix in a crusade

against them and the disciples of → Cagliostro. In the same letter he calls → Swedenborg ‘the most extravagant of all visionaries’.

It is well documented, by two of his letters, that Cazotte did in fact belong to Pasqually’s fringe-masonic and theurgic Order. Additionally, Saint-Martin’s autobiography, *Mon portrait*, attests to him having known Cazotte personally, and gives details of Cazotte’s initiation by the Elect Coën Duroy d’Hauterive. Finally, two documents listing the names of members of the Order also mention Cazotte. He seems to have been an Elect Coën until 1781 or so. Several possibly interconnected reasons may account for his decision to tender his resignation. He may have deemed Pasqually’s teachings too great a departure from the tenets of his strict Catholic creed. He may have been disappointed with his own inability to conjure up angels. Or, again, he may have considered that → Freemasonry in general held certain political dangers, especially for the monarchy – a political stance he shared with his son, the Illuminist Scévole. Interestingly enough, the latter wrote in a letter to Cazotte, dated 15th July 1792 – the very day after the Revolution’s Fête de la Fédération had taken place on the Champ de Mars – that a day earlier he had performed certain magical operations ‘designed to put [the Champ de Mars] under the protection of the Lord’.

A previously unpublished text, brought to light in 1806 and written by the literary critic J.F. La Harpe, provides details about a story that circulated shortly after the Revolution. The setting is Paris at the beginning of 1788, at a banquet in the house of an unnamed member of the French Academy. A number of famous persons were present, among whom, besides La Harpe and Cazotte, were Nicolas-Sébastien Chamfort, Antoine-Nicolas Condorcet, Jean-Sylvain Bailly, and the Duchess of Gramont. All of them were rapturous about the great Revolution that was under way, because they felt that superstition and fanaticism would be replaced by enlightened philosophy. Cazotte jumped into the conversation, and addressed each guest face to face, predicting in detail his or her death by execution or suicide during the aftermath of the Revolution. True to his predictions, during the reign of the Terror, each of the guests died precisely as he had said they would. Over the past two hundred years, this text has been reproduced in various forms and commented upon many times. Scarcely two years after its first publication, → Johann Heinrich Jung-Stilling translated it into German in his famous *Theorie der Geister-Kunde* (*Theorie of the Science of Spirits*, 1808). In the

extensive commentary which accompanies the translation, Jung-Stilling claimed to have met people who were able to attest to the accuracy of La Harpe’s story, and went on developing the theory that Cazotte’s prophecies were inspired by spirits with whom he communicated. ‘Has there ever been’, Jung-Stilling wrote, ‘since the time of the Apostles any testimony more remarkable and more important bearing witness to the existence of the world of spirits and its action upon the visible world?’ Sir → Edward Bulwer-Lytton contributed to the popularity of the prophecy by introducing it into *Zanoni* (1842), the most celebrated esoteric novel of the 19th century. The hero, Zanoni, is said to have been present at the banquet and prompted Cazotte to make the prophecy. Historians, however, tend to suggest that La Harpe only wanted to write an attractive literary piece that expanded on a tiny incident or even upon a simple rumour.

Published in 1852, → Gérard de Nerval’s book *Les Illuminés* contains several chapters, each devoted to an Illuminé. Along with Cagliostro, → Rétif de La Bretonne, Quintus Aucler and others we find in this gallery the author of *Le Diable amoureux*. Nerval gives a slightly romantic biography of Cazotte, along with a laudatory presentation of his literary work. He dwells extensively on both the esoteric milieu to which Cazotte had belonged for some time, on *Le Diable amoureux*, and, not surprisingly, on the prophecy reported by La Harpe. In addition to that portrait drawn by the pen of the great Romantic, the place that → Eliphaz Lévi devotes to him in his *Histoire de la Magie* (1860, Book V, Chapter 2) has contributed in no small measure to Cazotte’s reputation as not only a poet and a novelist, but as mostly a man endowed with mysterious gifts.

ANTOINE FAIVRE

Cerdo, before 150

Cerdo was a Christian teacher who worked in Rome during the episcopate of Hyginus (ca. 136-142). The main sources for his life and teaching are the anti-heretical works of Irenaeus (ca. 180) and some later authors, who might be dependent on Hippolytus (ca. 220). Their information possibly derives from local Roman traditions but is very problematic. According to Irenaeus, *Adversus haereses*, III, 4, 3, Cerdo came under Hyginus ‘repeatedly back to the church as a penitent: now teaching in secret, then doing penance, then again being convicted of heretical teaching on certain points and leaving the community of the brothers’. Though the same is told of more famous teachers such as → Marcion and → Valentinus (Tertullian, *De praescriptione haereticorum*, 30, 2f.: ‘semel et iterum eieci’), there is no reason to doubt the reliability of this report. It perfectly fits the evidence that the Roman church in the fourth and fifth decade of the 2nd century was still in a process of defining its theological identity and communal boundaries. Just as Valentinus and Marcion, Cerdo obviously considered himself a good Christian and wanted to be a member of the Church, but became a “heretic” because the church was closing its previously open border.

Of Cerdo’s specific ideas very little is known. Irenaeus, *AH*, I, 27, 1, says that he was connected with the followers of → Simon Magus and makes

him the forerunner and teacher of Marcion, which is repeated by Hippolytus, *Refutatio*, VII, 37. He is said to have taught ‘that the god proclaimed by the law and the prophets is not the Father of our Lord Jesus Christ, for the one is known and the other is unknown, one is just and the other is good’. As a matter of fact, this is the core of Marcion’s doctrine of the contrast between the ignorant but just God of the Jews and the God of love, the Father of Jesus Christ. The alleged connection with the Simonians is determined by Irenaeus’ idea of a Gnostic genealogy and his wish to present Cerdo as a Gnostic. The later anti-heretical tradition, recorded by Pseudo-Tertullian, *Adversus omnes haereses*, 6, Filastrius, *Diversarum haereseon liber*, 44, and Epiphanius, *Panarion*, 41, who possibly all reflect the section on Cerdo in Hippolytus’ lost *Syntagma*, has a lot to say about Cerdo. The only reliable element in this tradition may be the information, transmitted by Filastrius and Epiphanius, that Cerdo came from Syria. For the rest these authors ascribe to Cerdo a complete Marcionite theology. He is said to have taught the doctrine of the two gods (including the rejection of the creator-god and the Jewish bible), the resurrection of the soul only and a docetic Christology. Moreover, he would have accepted as authoritative scripture the expurgated Gospel of Luke and some of the letters of the apostle Paul only. The doctrine of scripture is typically that of Marcion, but for the rest Cerdo is described in these sources as a full-fledged Gnostic.

This presentation of a rather obscure Christian teacher as a proto-Marcion and a Gnostic [→ Gnosticism] served an anti-Marcionite aim. In the 2nd and 3rd centuries, the Marcionite church became a forceful rival of the early-catholic church. It was in the interest of the anti-heretical writers to strip Marcion of his originality. Therefore, they tried to show that he was no more than an ordinary Gnostic and that even his most characteristic doctrines, about the two gods and about scripture, were not his own but had been borrowed from his teacher Cerdo.

This biased attitude of our sources makes it virtually impossible to come to firm conclusions about the nature of Cerdo’s teaching, especially his doctrine of God. According to Irenaeus, Cerdo taught that the god of the Hebrew bible was just (*dikaïos*) and Pseudo-Tertullian says that he was cruel (*saevus*). Both characteristics apply to the Jewish god as Marcion described him: he is just, but his justice is that of a despot. If it is true that Pseudo-Tertullian reflects Hippolytus’ *Syntagma*, then we may assume that the latter also had described Cerdo’s creator god in Marcionite terms.

Filastrius and Epiphanius, however, who also belong to the conjectured “Hippolytan” tradition, simply say that the lower god is evil (*malus, ponēros*), which makes him identical with the Gnostic Demiurge. This may be due to their intention to describe Marcion and his alleged teacher as ordinary Gnostics.

In the middle of the 2nd century there was a fierce debate on the interpretation of the Jewish bible in the context of the Christian message concerning Jesus the Saviour. The positions taken in this debate were strongly determined by the participants’ assessment of the relationship between God, Jesus Christ and the creation. It is conceivable that Cerdo took a radical stance in this debate and in some way denied the authority of the Jewish bible for the Christian church, with a degradation of the Jewish god as its corollary. Since Marcion developed his radical “Gospel of the Alien God” from a similar starting point, in retrospect Cerdo may have been considered Marcion’s teacher. It is unlikely, however, that the latter’s very original doctrine of the two gods was no more than a further development of Cerdo’s ideas.

ROELOF VAN DEN BROEK

Cerinthus, ca. 100

Cerinthus was a Christian teacher who lived in Asia Minor at the end of the first or the beginning of the 2nd century. The reports about his teaching are contradictory, and as a result modern scholars have described him either as an early Gnostic [→ Gnosticism] or as a primitive Christian who had been strongly influenced by Judaeo-Christian ideas.

Cerinthus appears as an arch-heretic in the first document that mentions his name, the so-called *Epistula apostolorum*, which was written ca. 150, most probably in Asia Minor. It claims to have been composed ‘because of the false apostles Simon and Cerinthus’ (1), who are ‘enemies of our Lord Jesus Christ, who in reality alienate those who believe in the true word and deed, namely Jesus Christ’ (7). That Cerinthus is mentioned here together with → Simon Magus does not necessarily imply that Cerinthus was considered a Gnostic too. But that he was seen as a serious heretic at an early date also emerges from a curious story told by Irenaeus, *Adversus haereses*, III, 3, 4, on the authority of Polycarp (ca. 150). The apostle John once went into the bathhouse at Ephesus and, seeing that Cerinthus was within, he rushed out of the bathhouse without bathing, exclaiming: ‘Let us fly, lest even the bathhouse fall down, because Cerinthus, the enemy of truth, is within’. According to the same Irenaeus, John had ‘proclaimed the Gospel’ in order to refute the error that had been promulgated by Cerinthus (*AH*, III, 11, 1), but it seems possible that Irenaeus has simply inferred this from the bathhouse story. Irenaeus is also the first, in *AH*, I, 26, 1, to give more detailed information about Cerinthus’ ideas. According to him, Cerinthus separated the creator god from the highest god and Jesus from Christ. The world was not made by the supreme God but by ‘a certain Power’, which was far removed from the ‘Principality’ that transcended the universe and of which the creative Power was ignorant. Cerinthus denied the virginal birth of Jesus and considered him the natural son of Joseph and Mary who surpassed all other human beings in righteousness, prudence and wisdom. At his baptism Christ descended upon Jesus, who from then on

proclaimed the unknown Father. But at last Christ flew away from Jesus, who 'suffered and rose again while Christ remained impassible, being a spiritual being'. Hippolytus of Rome (ca. 220) has only one new element to add, namely that Cerinthus 'was trained in the education of the Egyptians' (*Refutatio*, VII, 33, 1; X, 21, 1: 'trained in Egypt'), which most probably was Hippolytus' own invention (Markschies, 59f.).

According to many New Testament scholars, the first Epistle of John can be read as an indirect source for Cerinthus' ideas, since there are indications that the opponents combated in this letter adhered to some kind of 'separation Christology' (see e.g. 1 John 2, 22; 4, 2f.). It is by no means certain, however, whether or to what extent this view was comparable to that ascribed to Cerinthus by Irenaeus. If the opponents of 1 John were actually Cerinthus and his disciples, one would expect a clear reference to Cerinthus' explicit separation between Jesus and Christ, which, however, is not the case.

Irenaeus and Hippolytus apparently saw in Cerinthus no more than an early Gnostic, but Eusebius, in his *Historia Ecclesiastica*, has preserved a tradition on Cerinthus that points in quite another direction. According to Gaius, a Roman anti-Montanist writer (ca. 200), Cerinthus appealed to revelations, 'said to be written by a great apostle' (probably the Apocalypse of John). He taught that 'after the resurrection the kingdom of Christ will be set up on earth, and that in Jerusalem the body will again serve as the instrument of desires and pleasures'. There would be 'a marriage feast lasting a thousand years' (Eusebius, *HE*, III, 28, 2). Bishop Dionysius of Alexandria (ca. 250), in a lost work called *On the promises*, related that according to some of his predecessors Cerinthus had written the Johannine Apocalypse himself. Dionysius denied this, but had to admit that Cerinthus had taught a radical millenarianism, which included the expectation that the millennium would be characterized by 'festivals and sacrifices and the slaying of victims' (Eusebius, *HE*, VII, 25, 3 and III, 28, 4-5). This would imply that Cerinthus expected that in the thousand years of Christ's kingdom the Jerusalem temple and its sacrifices would be restored, which points to a strong Jewish-Christian influence. Similar ideas are attacked in Origen's polemic against simple Jewish or Judaizing Christians who claimed that in the millennium 'their destroyed and collapsed city' would be rebuilt and that the resurrected would enjoy the pleasures of the body, including marriages and the begetting of children (*De principiis*, II, 11, 2). It is conceivable that Dionysius' description was coloured by Ori-

gen's polemic, but there are no compelling arguments to doubt the trustworthiness of the tradition that Cerinthus was a radical chiliast. This view is much more likely than the idea, suggested by Hill, that Cerinthus was not a millenarian himself but, just as → Marcion after him, expected a millenarian kingdom of the Jewish Messiah.

The millenarian expectation has its roots in Jewish eschatological speculations. It might simply have been because of this background that the chiliast Cerinthus became depicted as a radical Jewish Christian. This picture is first found in the 4th century, in Epiphanius of Salamis (*Panarion*, 28), who remarkably enough does not make any mention of Cerinthus' millenarianism. Unfortunately, as so often, Epiphanius' report is a curious mixture of earlier literary traditions, hearsay, unwarranted assumptions and slander. He ascribes to Cerinthus everything he knows or thinks to know about the Jewish Christians and makes him a contemporary of the apostles and their main opponent in all the controversies with Jewish and Judaizing Christians that are reported in the New Testament.

Is it possible to harmonize the conflicting traditions concerning Cerinthus' teaching? The first observation to be made is that the expectation of a millennial kingdom of Christ on earth, characterized by marriages and procreation, is incompatible with the Gnostic view of the body and of matter in general. In the first two centuries, chiliastic expectations were widespread, especially, but by no means exclusively, among Jewish Christians. That Irenaeus does not mention Cerinthus' millenarian ideas may be due to the fact that he was a chiliast himself. Moreover, the idea ascribed to Cerinthus by Irenaeus that Jesus was the natural son of Joseph and Mary and that he was adopted as Son of God at his baptism in the river Jordan, was also a common Jewish Christian view. That Jesus allegedly proclaimed the Unknown God after his baptism may be no more than an inference by Irenaeus from his assumption that Cerinthus was an early Gnostic. At the turn of the 1st century AD, there was not yet a clearly distinguishable Christian Gnosticism over and against a non-Gnostic, ecclesiastical Christianity. As testified by the Johannine writings and Ignatius of Antioch, there was at that time, especially in Asia Minor, a fierce debate about the Christian interpretation of Jesus Christ and about the identity of the Creator. Most probably, Cerinthus took part in that debate from a Jewish-Christian position. The creation of the world by lower divine beings had already been discussed by Jewish and Greek theologians and philosophers. In the Gospel of John (1:3) it is ascribed to the Logos.

Cerinthus may have taught the more Jewish view that the world had been made by one or more angelic powers. With respect to Jesus, he apparently made a clear distinction between the human person Jesus and the divine Christ, the spirit who descended to him at his baptism. Cerinthus remains a shadowy figure, but it seems quite certain that his position in Irenaeus' catalogue of early Gnostics is unjustified.

ROELOF VAN DEN BROEK

Champier, Symphorien, * early 1470s
Saint-Symphorien-le-Château,
 † 1539 or 1540 Lyons

French humanist, neoplatonist, physician, and author on medicine and occult sciences. Champier's father was a notary and apothecary. Symphorien studied for some time at the university of Paris, and next attended medical school in Montpellier, where he matriculated in 1495. Soon after, he was practicing medicine and teaching the liberal arts in the Dauphiné and probably the Bourbonnais. In 1498 he published his first book, *Janua logicae et physicae*, largely devoted to Plato and Aristotle and their commentators → Lefèvre d'Étapes (a friend of Champier and a major influence on his thought) and → Marsilio Ficino. It was followed in the early years of the 16th century by two companion volumes concerned with moral advice to members of the aristocracy, that would remain his most well-known ones: the *Nef des Princes* (1502) and the *Nef des Dames* (1503). Both *Nefs* (ships) again show the strong influence of Ficino, and together with Champier's earlier work are among the first books that introduced Florentine Platonism in Renaissance France. The first contains French translations of editions and commentaries on Plato by Ficino, and the *Livre de Vraye Amour* (book four of the *Nef des Dames*) is largely based on Ficino's *De Amore*. Champier had hoped by

these books to find patronage at the Bourbon court, but without success.

In 1503 in Lyons Champier wrote a *Dyalogus . . . in magicarum artium destructionem* which discusses the origins and nature of → magic and divination [→ Divinatory arts], frenzies, dreams and visions, the magical effects of the → imagination, and the supposed activities of witches and demons, including incubi and succubi. From a pronounced Christian-orthodox perspective, and quoting multiple authorities, it attempts to separate truth from fiction in these matters, insisting that stories about demonic activities are often based upon delusion, and that many phenomena attributed to supernatural agency can in fact be explained along naturalist lines. In the same year 1503 Champier married a noble lady, Marguerite de Terraille, and returned to Montpellier to study for his doctorate in medicine, which he obtained in 1504. In the following years he published various small books on medical subjects, which together with his new title brought him increasing recognition.

The very titles of Champier's *De quadruplici vita* (1507) and *De triplici disciplina* (1509), two of his most important works, reflect the influence of Ficino's *De vita libri tres*, often referred to as *De triplici vita*. Like Ficino, Champier based his choice to combine medical with theological/philosophical discussion on the concept of *spiritus*, understood as the medium that joins body and soul and is therefore relevant to doctors as well as priests. In addition to Ficino, one notes a strong influence of → Giovanni Pico della Mirandola as well as his nephew Gianfrancesco Pico della Mirandola; and *De quadruplici vita* contained the first printed version of → Lazzarelli's Latin translation of the last three tractates of the *Corpus Hermeticum* (under the title *Diffinitiones Asclepii*; it does not contain the *Asclepius* itself, as one might infer from Walker 1958, 169). Indeed, Champier's books of 1507 and 1509 are largely compilations based on other authors' works, and are filled with references to authorities such as e.g. Pliny, Isidore of Sevilla, and platonic, hermetic and orphic sources. They are important not for any innovative ideas (Copenhaver [1978, 56] emphasizes Champier's 'undeviating unoriginality'), but for the role they have played in the transmission of the new Italian neoplatonic and hermetic philosophy to French intellectual circles. Champier is a typical example of how the *prisca theologia* associated with Ficino was received in France: with considerably more caution than in the Italian context, particularly regarding the dangers of → astrology, astral magic,

and idolatry. While rejecting the notorious hermetic “god-making” passages (*Asclepius* 23-24, 37-38) as idolatrous, Champier believed them to be written by Apuleius, not → Hermes Trismegistus.

Around 1509 Champier was appointed as chief physician to Duke Antoine of Lorraine, whom he would henceforth follow on his many military expeditions. The year 1515 was of great importance to him: his Lord bestowed the order of chivalry on him, and he was honourably invited to join the medical college of Pavia. During this period and up to the end of his life he continued writing numerous books, most of them on medical subjects, and by the 1520s he had gained an international scholarly reputation. Having returned to Lyons, he became a member of that city’s ruling council of twelve. Due to a tax recommendation that was taken badly by the populace, his house was sacked by a mob during the great *rebeine* (probably a food riot) of 1529 – an event that Champier believed was caused by heresy rather than economic despair. The last ten years of his life he kept writing and practicing medicine. He died in Lyons, leaving a daughter and two sons.

WOUTER J. HANEGRAAFF

Charbonneau-Lassay, Louis, * 18.01.1871 Loudun, † 26.12.1946 Loudun

Born Louis Charbonneau (Lassay being a village near Loudun, wherefrom came several of his direct ancestors), he began his career as a member of a Roman Catholic congregation mostly dedicated to teaching, the “Frères de Saint Gabriel”. On his own, as well as in the company of some competent local scholars, he was to gain proficiency in the historical disciplines which were later to occupy most of his intellectual activity: archeology, numismatics, sigillography, heraldry, folklore and local traditions of the areas surrounding his native Poitou. In 1921, having in the meantime been allowed back into laity and achieved for himself a solid scholarly reputation, he began to contribute to the Catholic monthly *Regnabit*, the main purpose of which was the enhancement of the symbolic and theological status of the devotion to the Sacred Heart. Most of his *Regnabit* articles are concerned with the many-faceted emblematics of Jesus Christ and illustrated with quaint, neomedieval woodcuts in his own hand; for the most part, these texts along with many others were later incorporated into his main work, *Le Bestiaire du Christ* (1940).

It was in a 1929 *Regnabit* article about the dove (‘La colombe’) as an emblem of Christ that Charbonneau-Lassay first disclosed the informations about certain “mystic-hermetic fraternities” (‘fraternités hermético-mystiques’) which have made him conspicuous in esoterically-minded circles to our day. Briefly told, our author claimed to be in contact with a few restricted *milieux* of scrupulous Roman Catholic orthodoxy, still in possession of materials pertaining to what he considered a valid expression of authentic Christian esotericism. Supposedly dating back without interruption to late medieval or early modern times, and having furthermore remained essentially secluded until then, the groups in question (mainly the “Chevaliers et Dames du Divin Paraclet” and “Estoile Internelle”) had nevertheless taken the initiative, through the agency of their leader, Canon T. Barbot of Poitiers (1841-1927), of lending him some documents containing symbolic and “hermetic” elements, which he made use of in the book which was to become the above-mentioned *Bestiaire*. Somewhat later it

was disclosed that Charbonneau-Lassay had in fact also been entrusted with the actual continuation of the first of these fraternities, that is, with its ritual transmission, which he bestowed on a few chosen individuals (mostly selected in parisian “guenonian” circles) just before the Second World War (this particular story is dealt with in specific studies mentioned below).

The original archives alluded to by our author being hitherto unavailable to scholars, it seems difficult (to say the least) to form a square opinion about the purely historical aspects of these fraternities, not to mention the exact nature and contents of their alleged esoteric teachings. Even as regards their real impact on Charbonneau-Lassay’s work, we are in fact only made aware of it when he happens to explicitly quote these arcane sources along the way. It must, nevertheless, be kept in mind that he was in no way attracted to occultism [→ occult/occultism] as such, shared the rejection of → Freemasonry common to so many Roman Catholic writers of his time but, notwithstanding, looked favourably upon the practice of symbolism, which he conceived of as a convenient and lawful way of deepening one’s understanding of the faith. For this very reason, he was – up to a point – an admirer (and personal friend) of → René Guénon, whom he had been instrumental in roping in for collaboration to *Regnabit* (1925-1927). To most occidental readers and members of the “traditionalist” French school, the main attraction of Charbonneau-Lassay’s disclosures has been, however, to suggest a decidedly Christian alternative to Guénon’s incitements to pursue one’s quest for a ritual initiation preferably within a Sufi environment.

JEAN-PIERRE BRACH

Chester, Robert of → Robert of Chester

Chevaliers Bienfaisants de la Cité Sainte

The Order of the “Chevaliers Bienfaisants de la Cité Sainte” (CBCS) is the “Inner Order” (“Ordre Intérieur”) of the Rectified Scottish Rite, and its character and history cannot be understood without taking into account the history of its insertion in this masonic-chivalric System (or “rite”). The Rectified Scottish Rite was founded about 1780 by a group of French freemasons under the leadership of → Jean-Baptiste Willermoz (1730-1824) who intended to reform → Freemasonry, which they deemed had lost touch with its essential nature and aim. This reformation was carried out in the so called “Convent des Gaules” held in Lyons in 1778 and in the subsequent Convent of Wilhelmsbad held in 1782, and the foundation of the Order of the CBCS was part of it. The Rectified Scottish Rite, as it emerged from the Convent des Gaules, was (and has been up to now) an original system of Freemasonry consisting of two classes: a “symbolical” class and a chivalric one. The symbolical class comprises the three common degrees of “Craft” Freemasonry – Apprentice, Fellow Craft and Master Mason – plus a fourth and last degree called “Maître Ecossais de Saint-André”. This is a synthesis of the essential contents of several French “higher degrees”, namely the various degrees of “Ecossais” and the degree of “Chevalier d’Orient”, the elements taken from these degrees (which are found independently in Royal Arch Masonry) being reworked according to the special perspective of the Rectified Scottish Rite. The Mason who has moved through the four symbolical degrees may

then, if judged apt, be admitted in the “Inner Order”, that is, the Order of the CBCS. He is first admitted in the quality of “Novice”; then, after the end of his novitiate, he may eventually be armed Knight after having made a profession of Christian faith, for the Order of the CBCS is a Christian Order of chivalry. The way this chivalric Order is related to the “symbolic” class is well marked in the ritual of the fourth degree. This ritual – and with it the whole symbolical teaching of the four degrees – culminates in a vision of the celestial Jerusalem; at the same time the candidate is warned that he has reached the end of his symbolical career, and that he is at the door of a new temple in which a new career may begin for him. The mention of the “Holy City” in the name of the Order of the CBCS thus refers to Jerusalem, which means both the terrestrial Jerusalem and the celestial one, of which the candidate in the fourth symbolical degree has had the vision.

This structure of the Rectified Scottish Rite as a masonic-chivalric system takes its origin from the previous but analogous German system which was called “Rectified Masonry” or (after 1764) “Strict Observance” (SO). This system was founded in the 1750s by Baron von Hund (1722-1776) and, after years of struggle with competing systems, it obtained a rather large extension and brilliant standing in Germany and in other European countries, having as its *Magnus Superior* the Duke Ferdinand of Brunswick. This system, like the Rectified Scottish Rite later, consisted of a masonic class and a chivalric one, the latter having the status of an “Inner Order”. A notable feature of this chivalric Order is that it claimed to be a revival of the Order of the Knights Templar which, although suppressed by Pope Clement V under the pressure of the King of France Philip the Fair, was supposed to have survived in secret; and the SO went as far as contemplating an official restoration in itself of the said Order. By the time when the SO was expanding in Europe, Jean-Baptiste Willermoz was looking both for a convenient setting in which he could carry out his intended reform of Freemasonry and – already being a disciple of → Martinez de Pasqually (1727-1772) – for a source of further esoteric knowledge. He entered in connection with the SO in the early 1770s and obtained admission in it for himself and his team. In 1774 the SO “re-established” what was supposed to be the Templar Province of “Auvergne” (with headquarters at Lyons), and Willermoz along with eleven other French Brethren was admitted in the Inner Order, as Knight. A little later, the SO similarly re-established the “Templar” Province of “Occitania” with headquarters at Bor-

deaux, but this Province was not very active, while the brethren of Strasburg, belonging to the previously existing Province of “Burgundy”, collaborated efficiently with Willermoz in the work of reforming Freemasonry, which he took up in the newly-established setting of the French branch of the SO. As we have already seen, this task was essentially carried out in the national Convent of Lyons of 1778 (gathering representatives of the Provinces of Auvergne, Burgundy and Occitania); it was the work of the French Brethren, to be confirmed and completed at the general Convent (which gathered representatives of all the Provinces of the SO throughout Europe) held at Wilhelmsbad in Germany in 1782. It is at the Convent of Lyons that the Inner Order received the new name of Order of the CBCS (or, more completely, “Ordre Bienfaisant des Chevaliers Maçons de la Cité Sainte”, a name which makes explicit the connection of this chivalric Order with Freemasonry). The structure of the SO was conserved, but it must be emphasized that its spiritual content was changed considerably. On the one hand, Willermoz and his companions worked out new rituals and instructions which carried out, under the veil of symbols, a spiritual doctrine strongly influenced by Martinez de Pasqually’s doctrine of the “reintegration of beings”. On the other hand – and this concerns the Order of the CBCS more in particular – the claim to the historical and temporal succession of the Knights Templar was given up; only some kind of spiritual kinship was maintained (see below). Although this reformation was approved (not without difficulty) at the Convent of Wilhelmsbad, this did not have many consequences in Germany, because the Strict Observance did not survive the troubles of the wars of the French Revolution and of the Napoleonic wars. But the Rectified Scottish Rite – and in particular the Order of the CBCS – survived, and is now well alive in several countries, mainly in Switzerland (which was at one time the conservatory of the Rite extinct in other countries), Belgium and France.

The Order of the CBCS has a double aspect, an exoteric and an esoteric one. The exoteric aspect is expressed by the word “bienfaisant”. Each member is bound, as he already was as a Mason, to practice beneficence in all its forms, but he is all the more vowed to this because he is also a Christian Knight. As such, he has vowed to defend the Christian religion; but at being admitted into the Order, he is taught that he no longer has to do so by the sword, as was the case for the medieval Knight: he must ‘defend it by his speech, when in his presence it suffers undeserved attack; he causes it to be loved

and respected by a mild and enlightened tolerance, by good morals, by a regular conduct and by the good examples he gives'. In one word, the exoteric content of the Order essentially consists in the same moral teaching as that of Freemasonry, but in a more explicitly Christian setting. It is interesting to notice, from an historical point of view, that this exoteric content is a synthesis, which intends to be harmonious, of Christian spirituality and of an Enlightenment humanism rid of its anti-Christian aspects. But this remark is not of merely historical interest: for the CBCS, this synthesis is still valuable as a directive in one's present everyday life.

The esoteric aspect of the Order is in continuity with that of the symbolical degrees, which essentially consists in teaching, under the veil of symbols, a doctrine of the spiritual destiny of man, the main moments of which are the primordial state, the fall, and the reintegration – the present condition of man being located between the second and third moment. In the Inner Order, this symbolic teaching, which has culminated in the fourth degree of the symbolic class, has been brought to an end; the member of the CBCS, who is supposed to have assimilated the teaching with his intelligence and his heart, is vowed to make it work in his inner spiritual life as well as in his outer life, striving to obtain his personal reintegration and making a contribution to the universal one by using all the means which divine Providence and masonic initiation put at his disposal.

It is important to understand clearly the conception which the founders of the Order of the CBCS had of its relation with the Order of the Knights Templar. They assumed without restriction that the latter had possessed an important esoteric knowledge, and even that, after their suppression, they had transmitted that knowledge to lodges of operative masons, from which it later passed to speculative Masonry. This is what they kept of the current "templar legend". But the founders purified (so to speak) the legend in two ways. First, they did not insist on aspects of that knowledge which were especially attractive to many Masons – namely the art of making gold – but put the emphasis on the most spiritual aspects – those which concerned the essential term of masonic initiation, namely, according to their fundamental doctrine, the reintegration of all beings. On the other hand, as we have said, they renounced the claim, which had been that of the SO, to historical succession from the Knights Templar. This was partly due to prudence since, in France, such a claim would likely be judged subversive by the Crown, but it also had a deeper motivation, which is clearly expressed in the ritual of the admission to the novi-

tiat and in the corresponding instruction. The founders of the Order of the CBCS held that there is a transhistorical and hidden Order which goes back to the origin of the world, which carries the primordial and perfect initiation, and from which all historical Orders and all historical initiations are issued – whether chivalric or not (since at the level of that primordial Order this distinction is transcended). For that reason, a historical link with the Order of the Knights Templar was of no interest to them, the only important thing being the mystical link with the transcendent Order: 'Do not', says the instruction of the novitiate, 'mistake the sublime, secret, primitive and fundamental Order for the Order of the Knights Masons of the Holy City, nor for the Order of the Knights Templar. All are issued from this hidden Order; Masonry owes it its existence, and we are placed between the symbolic initiation and the perfect initiation, to help those whom the divine Providence calls to it to return back to this primitive Order'. This concept indicates to which level of transcendence the spirituality of the Order of the CBCS reaches. The place of the Order in this scheme must be carefully noted: it does not pretend to be able to confer the perfect initiation, and the only role it claims is to help each Knight to reach this level by himself, under the guidance of divine Providence.

Christian Kabbalah → Jewish Influences III

Christian Theosophy

1. FIRST PERIOD (17TH CENTURY)
2. THE TRANSITIONAL PERIOD (FIRST HALF OF THE 18TH CENTURY)
3. FROM PRE-ROMANTICISM TO ROMANTICISM, OR THE SECOND GOLDEN AGE: 1750-1850
4. EFFACEMENT AND PERMANENCE (CA. 1850-2000)

For the historian of modern Western esoteric currents, “theosophy” is not to be understood in an essentialist sense, which would be based, for example, on its etymology (*Theo-Sophia*, wisdom of God), but in the sense commonly accepted within the academy. As such, it designates either a specific esoteric current in the wake of the emergence of modern Western esotericism from the end of the 15th century onward (e.g., neo-Alexandrian → hermetism, Christian Kabbalah [→ Jewish Influences], → Rosicrucianism, “spiritual” → alchemy, etc.), or matters pertaining to the much more recent history of the → Theosophical Society (established in 1875). It is in the former sense that “theosophy” is used in this article.

There is very little doctrinal unity among the representatives of the Christian theosophical current, but besides the fact that they are Christians they do share some common traits:

1. *The God/Human/Nature Triangle*. The inspired speculation of the theosopher bears simultaneously on God and the nature of God (intra-divine processes, etc.), on Nature (whether external, intellectual, or material), and on Man (his origin, his place in the universe, his role in the workings of salvation, etc.). Essentially, it deals with the relations between these three. Between the three components God–Man–Nature a complex network of relationships/correspondences is believed to exist, characterized by dramatic processes closely related to the narratives of Scripture; it is through “active imagination” that the theosopher believes he is capable of apprehending these → correspondences (see further below: 3).

2. *The Primacy of the Mythic*. The theosopher practices an ongoing, creative hermeneutic of authoritative religious texts (in most cases those pertaining to the Judaeo-Christian Revelation, i.e. the Bible), whereby he privileges the most mythic elements of the latter (for example, those found in Genesis, the vision of Ezekiel, the book of Revelation, etc.). Thus, great emphasis is placed on the roles of such characters as Sophia and the angels, which are present in the Bible, but to which they give further developments in “completing” the latter with stories about the Falls of Lucifer and of Nature, the adamic androgyne, etc.

As Pierre Deghaye has felicitously written, ‘Theosophy is a kind of theology of the image’. One could speak here of a multi-faceted imaginary originating in the same primary material used by theologians (in the strict sense of the term), but which they usually present in a rather rational or conceptual mode.

3. *Direct Access to Superior Worlds*. According to the theosophers, man possesses in himself a faculty – generally dormant but always potentially

present – that enables him to connect directly with the divine world or generally with superior beings, and that is able to “branch out” to them. This faculty is due to the existence of a special organ within us, a kind of *intellectus*, which is none other than our → imagination – understood in quasi-magical fashion as a force of creation as well as perception. Once achieved, this contact (1) permits an exploration of all levels of reality, (2) assures a kind of co-penetration of the divine and the human, and (3) gives our spirit the possibility of “fixing” itself in a body of light, that is to say, of effectuating a “second birth”. Here we can see a rapport with the mystical experience (understood here as an experience of union, or as a quest for union with a personal God or the Godhead). However, the mystic *stricto sensu* purports to abolish images whereas, to the contrary, for the typical Christian theosophers the image signifies accomplishment.

None of these three traits is exclusive to theosophy, but the simultaneous presence of all three makes for the specificity of the theosophical discourse. Moreover, in terms of literary style the discourse of theosophy appears to adapt itself remarkably to the literary styles of its contemporary contexts. For example, in 17th-century Germany it espoused the baroque style, and in → Saint-Martin’s writings (see below) either the style of the pre-Romantic writers (see his *l’Homme de désir*), or that of the philosophers of the Enlightenment (see his *Des Erreurs et de la Vérité*).

The theosophical current appeared at the beginning of the 17th century and went through four distinct periods: (1) The period from its appearance at the beginning of the 17th century and its development throughout that century, which may be called its first “Golden Age”. (2) A modest, albeit specific and influential, prolongation lasting through the first half of the 18th century. (3) The revival of theosophy in the pre-Romantic and Romantic eras, which can be considered a second “Golden Age”. (4) The period of its decline from the mid-19th century onward.

1. FIRST PERIOD (17TH CENTURY)

The theosophical current is not without forebears. Born in Germany at the beginning of the 17th century, it has a great deal of affinity with → Paracelsianism. → Paracelsus, whose works had not been published until the end of the 16th century, had introduced a new, specific mode of reflection on Nature: a cosmology comprised of → magic, medicine, chemistry, experimental science and complex speculations about the networks of → correspondences uniting the different levels of reality in the universe. However, for the most part,

Paracelsus remained within the limits of an immanent philosophy of Nature (strongly tinged with alchemical notions). Subsequently, it fell to a few inspired thinkers to fit that cosmosophy into a more global vision, thus ensuring a transition from Paracelsian thought to theosophy proper. These thinkers, all of them Germans, can be seen as “proto-theosophers”: → Valentin Weigel (1533-1588), → Heinrich Khunrath (1560-1605) and Johann Arndt (1555-1621).

Weigel, a Saxon pastor whose works were written from 1570 to 1584, may be considered one of the foremost direct precursors of German theosophy. He is the first, indeed, to have blended together the Rheno-Flemish mystical tradition, rather intellectual and abstract in character, and the colorful and concrete thought of Paracelsus. He was, indeed, very familiar with both. For example, his thoughts on the spiritual body of the new birth (a kind of celestial naturalism grafted onto the mystical tradition) introduced into the history of German thought the theme of the corporeality of the spirit, which the theosophers of the ensuing centuries (with the notable exception of → Swedenborg) would develop. His influence upon → Friedrich Christoph Oetinger, → Franz von Baader and many others could hardly be overestimated.

Khunrath's *Amphitheatrum Sapientiae aeternae* (Amphitheatre of Eternal Wisdom; first ed. 1595) has most likely influenced → Jacob Boehme, not least with regard to the theme of the Divine Wisdom (Sophia). As for Arndt, he formulated, particularly in Book IV (1610) of his *Vier Bücher vom wahren Christenthum* (Four Books on True Christianity) what would come to be known as “mystical theology”. Arndt's system, not unlike Weigel's, brought medieval mysticism together with both the Paracelsian legacy and the alchemical tradition, and furthermore elaborated a theory about the possibility for the elected soul to acquire a “new body”. Other names could be added to the list, like → Gérard Dorn (ca. 1530-ca. 1584), in whose alchemical writings we find a richly developed Philosophy of Nature – a visionary, highly elaborated *Physica* that in some essential aspects foreshadowed that of Boehme.

With Jacob Boehme (1575-1624), a shoemaker from Görlitz in Silesia, the theosophical current acquired its definitive characteristics, the Bohemian work representing something like the early nucleus of what would constitute the “classical” theosophical corpus proper. One day in 1610, while contemplating a pewter vessel, he is said to have had an experience that determined his spiritual vocation. He had had the impression of grasping at one stroke the networks of correspondences

and implications between different worlds or levels of reality (terrestrial, celestial, etc.). He then wrote his first book, *Morgen Röte im auffgang* (Morning-Glow Arising) also known as *Aurora*, which emerged from this enlightenment, and in which it is permissible to see the birth certificate, as it were, of the theosophical current strictly speaking. It was followed by many others, all written in German, but only *Der Weg zu Christo* (The Way to Christ) appeared during his lifetime, in 1624. From his abundant production, one of the most astonishing in Baroque German prose, mention should be made of *De tribus Principiis* (On the Three Principles; written in 1619), *De signatura rerum* (On the Signatures of Things; written in 1621), and *Mysterium Magnum* (The Grand Mystery; written in 1623), only the titles of which are in Latin. Even more strikingly than Weigel's and Arndt's, Boehme's system is a kind of amalgam between the medieval mystical tradition as continued in 16th-century Germany and a cosmology of the Paracelsian, alchemical type, along with some neo-kabbalistic ingredients. Not only Judaeo-Christian in character, but strongly Lutheran more specifically, given its historical, cultural roots, it presents itself as a visionary hermeneutic applied to biblical texts. Germanic in language, it is “barbaric” in character, in the sense that it owes practically nothing to ancient Greek or Latin “esoteric” currents such as Alexandrian → hermetism (a trait shared by Paracelsus too, for that matter). In contrast to medieval and even Neoplatonic concepts of the Divine, Boehme did not see the latter as static but rather envisaged it as a passionate struggle of opposing principles. His God is never *in esse*, but always *in fieri*, He is the Supreme Being who ontologically “sees” in His living mirror, i.e. the Divine Wisdom or Sophia, all the potentialities of the worlds He creates. The theme of Sophia leads into the major visionary avenues of Boehme's works, which are built up like a great Baroque cathedral: the Fall of Lucifer and Adam, the spiritual corporeality of the angels, the idea that all exterior form is language or *Figur*, the seven “spirit-sources” existing from all eternity, etc. This “prince of German theosophy”, as he has often been called, contributed in large measure to the formation of a specific spiritual conscience in the general religious turmoil of 17th-century Germany.

Animated by Boehme's spirit and thinking, theosophy henceforth flourished in other countries as well. Its success at its beginnings was due to a number of factors. First, it emerged from Lutheran soil. Lutheranism allows free inquiry, which in certain inspired souls could take a prophetic turn. Second, Lutheranism is characterized by a paradoxical

blend of mysticism and rationalism, whence the need to put inner experience under discussion, and inversely to transform doctrinal discussions into inner experience. Third, at the beginning of the 17th century, less than a hundred years after the Reformation, the spiritual poverty of Protestant preaching and the dryness of its theology were sorely resented by some, whence a need for spiritual revitalization. The fourth factor which came into play presented itself as a challenge. Indeed, if in the milieu where theosophy was born there was a certain freedom vis-à-vis ministers of the cult, prophetic activity was nevertheless not well tolerated (Boehme was a scapegoat of the Lutheran minister in his town of Görlitz). Hence the “re-formist” slant of the theosophers (in the general sense, not in the protestant one) – and of most esotericists, for that matter –, which was fostered as a reaction against the religious intolerance and theological feuds of the time. The fifth factor is linked to a strong desire among most intellectuals for a unity of sciences and ethics – a need to unify thought. The idea of a solidarity of thinkers, and of a “total” science, formed part of the spiritual and intellectual climate of the 17th century. Theosophy appeared to respond to that need, because of its globalizing character. It represents a tendency to integrate everything within a general harmonious whole. The same is true in the same period for → Rosicrucianism (see *Fama Fraternitatis*, 1614, and *Confessio*, 1615) and for the pansophic current linked to the latter. Pansophy also presented itself as a system of universal knowledge: → Amos Comenius (1592-1670) held that all things are ordained by God and classified according to analogical relations; knowledge of divine things is gained by starting from the concrete world, from the entire universe, whose “signature” or hieroglyphs it is first a matter of deciphering. Bound up with such a theosophical and pansophical program is the need of proposing an alternative worldview opposed to the emerging mechanistic view of the universe, i.e. to an epistemology that seemed to end up emptying the universe of its “correspondences” and living, spiritual complexity. Theosophy thus reaffirmed the place of the microcosm in the macrocosm; in so doing it was not “scientific” in the modern sense of the word, and never went beyond the project stage. Nevertheless, it appeared to many people as a promise, a hope, a new dawn of thought. Moreover, the poetic aspect of its discourses favored a co-penetration of literature and science, and by virtue of this indirectly contributed to the development of the popularization of science.

In the century under discussion, the main representatives of theosophy and some of their main

writings are, in Germany (besides Boehme): → Johann Georg Gichtel (1638-1710), *Theosophia Practica* (Practical Theosophy; published in 1722, but written much earlier); Quirinus Kuhlmann (1651-1689), *Kühlpssalter* (1677); → Gottfried Arnold (1666-1714), *Das Geheimnis der göttlichen Sophia* (The Secret of the divine Sophia; 1700); Aegidius Gutmann (1651-1689), *Offenbarung göttlicher Majestät* (Revelation of divine Majesty; see above) and Julius Sperber (? - 1616), *Exemplarischer Beweiss* (Exemplary Proof . . . ; 1616). In the Low Countries, → Joan Baptista van Helmont (1618-1699), *The Paradoxical Discourses concerning the Macrocosm and the Microcosm* (1685). In England, → Robert Fludd (1574-1637), *Utriusque Cosmi . . . Historia* (History of both Cosmoses; 1617/26); → John Pordage (1608-1681), *Theologia Mystica, or the Mystic Divinitie of the Æternal Invisibles* (1683); → Jane Lead (1623-1704), *The Laws of Paradise given forth by Wisdom to a Translated Spirit* (1695); → Henry More (1614-1687), the main “Cambridge neo-Platonist”. In France, → Pierre Poiret (1646-1719), *L'Économie Divine, ou Système universel et démontré des œuvres et des devoirs de Dieu envers les hommes* (The Divine Economy . . . ; 1687), and → Antoinette Bourignon (1616-1680), *Œuvres* (edited by Pierre Poiret in 1679 and 1684).

Many of these authors were prolific, and many of their works have not been cited here. With rare exceptions (like Fludd), they did not write in Latin but in the vernacular, their mother tongues being more advantageous than Latin for the expression of visions and feelings. And alongside writings proper, it is appropriate to call attention to the existence of a rich theosophical iconography – a “theosophy through images” –, which Khunrath’s *Amphitheatrum* (see above) had inaugurated in a particularly lavish and radiant way, and which is also found beautifully exemplified in e.g. Gichtel’s 1682 edition of the complete works of Boehme. More generally, this period is rich in esoteric engravings, a fact which is attested to by the numerous illustrated alchemical books published throughout the first half of the 17th century. Likewise, at the turn of the century, Freher (see further below) would draw a beautiful series of thirteen figures, also illuminating Boehme’s works.

2. THE TRANSITIONAL PERIOD (FIRST HALF OF THE 18TH CENTURY)

During the second period an additional theosophical corpus was constituted, primarily in the German language. This continuity was favored by the same factors that were enumerated above with

respect to the 17th century, because the same or similar questions continued to be asked on philosophical, political and religious levels. This new theosophical output was characterized by two main tendencies or families:

(1) A tendency that appears to qualify as traditional in that it is closely akin to the original Boehmean current. It was represented notably by the Swabian → Friedrich Christoph Oetinger (1702-1782), whose first book was dedicated to Boehme (*Aufmunternde Gründe zur Lesung der Schriften Jacob Böhmens*; Cheering reasons for reading the writings of Jacob Boehme; 1731), and whose production for the most part overflowed from this period into the third (see below, “Three Areas”). It is also represented by the English Bohemian → William Law (1686-1761), the author of *An Appeal to All that doubt, The Spirit of Prayer* (1749-1750) and *The Way to Divine Knowledge* (1752). A German who had emigrated to England, Dionysius Andreas Freher (1649-1728) proved to be one of Boehme’s most inspired interpreters. His writings in English, and his translations from German into the same language, enjoyed a wide circulation. This was also the period of Gichtel’s *Theosophia Practica* (1722), of *Le Mystère de la Croix* (The Mystery of the Cross; 1736) by the German → Melchior Douzetemps, and of *Explication de la Genèse* (Explication of Genesis; 1738) by the Swiss Hector de Saint-Georges de Marsais (1688-1755), who was akin to spiritual thinkers from the city of Berlebourg (the famous Bible of Berlebourg is an edition of the Bible that is rich in both theosophical and quietist commentaries).

(2) The second tendency was of a more paracelsian and alchemical orientation. Four German authors stand out here. → Georg von Welling (alias Salwigt, 1655-1727), *Opus mago-cabbalisticum et theosophicum* (1719, reprinted several times with additional chapters); A.J. Kirchweger (?-1746), *Aurea Catena Homeri* (The Golden Chain of Homer; 1723); Samuel Richter (alias → Sincerus Rhenatus), *Theo-Philosophica Theoretica et Practica* (Theoretical and Practical Theo-Philosophy; 1711); and → Hermann Fictuld (several works, among which *Aureum Vellus* [The Golden Fleece], 1749). Welling and Richter were extremely influential, mostly in Germany where they became part and parcel of the referential corpus of the neo-Rosicrucian fringe-masonic Rites in the second half of the century and well into the 19th.

With few exceptions, the theosophy of these two tendencies no longer evinces the visionary outpouring which characterized the beginning of the first period (exemplified by Gichtel, for instance).

Of course, we are dealing here with similar speculations about Scripture and Nature, but this dampened theosophy, more intellectual in character, hardly springs forth from a personally experienced *Zentralschau* (“central vision”) like in Boehme, Gichtel, Jane Lead, etc. Not until the next period will such a personal “central vision”, linked to strong intellectual speculation, reappear, in Saint-Martin and a few others. In any case, for the theosophers in the following decades, the new corpus produced during the second period would serve as a reference, albeit less than would the corpus of the first one.

During this second period, theosophy became the object of many discussions among scholars who were themselves, for the most part, aloof from the esoteric current, but who through their presentations contributed to ensuring its presence within the cultural and philosophical landscape of Europe. Among the forerunners of this critical output, mention should be made of two authors. Ehregott Daniel Colberg (1659-1698), a Protestant minister from Greifswald, attacked theosophy in his *Das Platonisch-Hermetisches [sic] Christenthum* (Platonic-Hermetic Christianity; 1690-1691, 2 vols., reprinted in 1710), also targeting Alexandrian Hermetism, Paracelsus, → astrology, → alchemy, etc. And Gottfried Arnold (1666-1714), a theosopher himself (see above), who authored *Unpartheyische Kirchen- und Ketzerhistorie . . .* (Unpartial History of Churches and Heretics; 1699-1700, reprinted in 1729) and *Historie und Beschreibung der mystischen Theologie oder geheimen Gelehrtheit . . .* (History and Description of the Mystical Theology or Secret Knowledge; 1702). Arnold’s first book contains a wealth of information (it remains an oft-consulted reference work on the subject of Western spiritual trends, not only on theosophy) and is something of a response to Colberg’s book. Less critical of theosophy than Colberg and less laudatory than Arnold are Friedrich Gentzken (*Historia Philosophiae . . .*) (1724) and Johann Franciscus Buddeus (*Isagoge . . .*, 1729). More critical, but extremely knowledgeable and erudite is Jacob Brucker, a pastor of Augsburg, one of the founders of the modern history of philosophy, who authored a voluminous *Historia critica Philosophiae . . .* (1742-1744) in Latin, preceded by a shorter version in German, *Kurtze Fragen aus der philosophischen Historie . . .* (Short Questions from Philosophical History; 1730-1736). Never before had theosophy been made the object of such systematic treatment as was the case in these two treatises. A few years after Brucker’s books, the great *Encyclopédie*, edited by

Denis Diderot (see vol. XVI, 1758, new ed. 1765, article “Théosophes”), dedicated a twenty-six-page entry to the subject. Diderot himself wrote the article, therein plagiarizing Brucker. The presence of theosophy in the *Encyclopédie* is all the more interesting as the word does not seem to appear in the dictionaries of the time.

3. FROM PRE-ROMANTICISM TO ROMANTICISM, OR THE SECOND GOLDEN AGE: 1750-1850

After a fifty-year period of latency, interrupted only by Swedenborg’s writings (see below), theosophy once again began to come to life during the 1760s, and experienced a second Golden Age that lasted until the mid-19th century. Such a renewal was connected with the continuation and recrudescence of other esoteric currents (like Paracelsianism and Rosicrucianism), which, along with theosophy, constitute what is generally called → Illuminism, over the period ca. 1760 to 1820. Not a surprising occurrence, indeed, in a period pervaded by both optimism and uneasiness, a spirit of enterprise and one of meditation. Some specific factors can at least partly account for this renewal of theosophy. First, the increasing importance that was given to the idea of the “invisible” Church, understood by many people as the intimate experience of the believer, independent from any confessional framework. Man does not find God in any outward temple but only in the temple of his heart, which was often understood as an organ of knowledge. Second, a widespread interest in the problem of Evil, and more generally in the myth of the Fall and reintegration, which may be considered the great romantic myth *par excellence*. This myth was explicated through secularized art forms and in political projects, as well as in theosophical discussions. Quite a few masonic or fringe-masonic organizations became intent on “building the New Jerusalem” or “reconstructing Solomon’s temple”. Third, an interest in the sciences, not least in → animal magnetism, on the part of an increasingly wide public. Indeed, Newtonian physics had encouraged speculations of a holistic type, the main business being here to reconcile science and knowledge. Besides, experimental physics was popularized and introduced into the salons, in the form of picturesque experiments with electricity and with magnetism well suited for stimulating the imagination, because they hinted at the existence of a hidden life or an invisible fluid that traverses all the material realms. Eclecticism is inseparable from this third factor, a trait which also characterized the preceding period, which likewise had been fond of

curiosa and of anything likely to harmonize the data of knowledge. Within the theosophical scene that stretches over these eight decades or so, it is possible to distinguish three different areas (although these appear to be more or less interconnected).

(1) The first area is occupied by some authors located in the wake of the 17th century, in the sense that they are more or less Boehmian in outlook. Even when they do not claim allegiance with Boehme or even ignore him, their works generally bear on the same themes as his. → Martines de Pasqually somehow inaugurated the renaissance of European theosophy in this third period, with his *Traité de la Réintégration des Êtres créés dans leur primitives propriétés, vertus et puissances spirituelles divines* (Treatise on the Reintegration of Beings created in their original properties, virtues and spiritual and divine powers). Written in the 1750s and 1760s, it was read almost exclusively by the Freemasons [→ Freemasonry] who were the author’s disciples and it remained unpublished until 1899. But during the period it had considerable influence, albeit mostly indirect.

Louis-Claude de Saint-Martin, one of Pasqually’s disciples in the fringe-masonic Order of the → Elus Coëns, made some important elements of Pasqually’s esoteric work known through his books *Des Erreurs et de la Vérité* (On errors and the Truth; 1775), and then *Tableau Naturel des rapports qui unissent Dieu, l’homme et l’univers* (Natural tableau of the connections that unite God, man and the universe; 1781). Saint-Martin’s own theosophy took a different turn after he had come across the works of Boehme, in 1789-1791. He henceforth blended together Pasqually and Boehme, and considered himself mostly a follower as well as interpreter of the latter, by means of the translations of his works into French. But Saint-Martin’s own works are no less original for that (*L’Homme de Désir* [The man of desire], 1790; *Le Ministère de l’Homme-Esprit* [The Ministry of Spiritual Man], 1802; *De l’Esprit des Choses* [On the Spirit of Things], 1802; etc.). Within the history of the theosophical output of that time, his originality is twofold. First, he was the most productive and creative theosopher of the period, authoring treatises, essays, poems, and a novel, and taking an active part in philosophical discussions with representatives of the Enlightenment. He was also the most original one; for example, his book *De l’Esprit des Choses* (2 vol., 1802) stands out as the only one in French which pertains to *Naturphilosophie* in the German sense of the term. Indeed, we find in it less visionary speculations than in his other works;

instead, it is mostly devoted to precise observations concerning animals, plants, natural phenomena, etc., along with theosophical interpretations of them. Second, Saint-Martin may be rightly considered the theosopher whose reception was the strongest throughout the 19th century in Europe, with the exception of Swedenborg's (see below). This was due not only to his literary qualities, but quite as much to the fact that he translated works of Boehme into French. These translations sparked a renewed interest in Boehme in Germany – where most cultivated people read French – and were influential on German → Romanticism, in particular, and German philosophy, in general. Conversely, Saint-Martin's major works were translated into German in the first half of the 19th century.

Among the other theosophers of some importance in the pre-romantic French-speaking area, mention should be made of at least two of them. → Bathilde d'Orléans, duchess of Bourbon, authored two works (*Opuscules, ou Pensées d'une âme de foi sur la religion chrétienne* [Opuscules, or thoughts of a believing soul about the Christian religion], 1811; *Correspondance entre Mad[ame] de B[ourbon] et Mr. R[uffin] sur leurs opinions religieuses* [Correspondences between Mme. De B. and Mr. R. on their religious opinions], 2 vol., 1812), strongly inspired by her friend Saint-Martin. She played the part of *inspiratrice* among various members and groups of the theosophical family. In Switzerland, → Jean-Philippe Dutoit-Membrini (alias Keleph Ben Nathan, 1721–1793), wrote *La Philosophie Divine, appliquée aux lumières naturelle, magique, astrale, surnaturelle, céleste, et divine* (The Divine Philosophy, applied to the natural, magical, astral, supernatural, celestial and divine lights; 2 vol., 1793), a book which owed little to Boehme and even less to Saint-Martin.

In German-speaking countries, within a new, abundant production a few names come to the fore. Friedrich Christoph Oetinger (see also above, second period) is one of the “Fathers” of Swabian → Pietism, but primarily the main German theosopher of the second half of the 18th century. He was also the most erudite in terms of esoteric literature in general. He was a great commentator on various theosophical works, like those of Boehme and Swedenborg, and of Kabbalistic works (e.g., *Lehrtafel [der] Prinzessin Antonia* [Educational Tableau of the Princess Antonia; 1763]). → Karl von Eckartshausen, a native of Munich, was a polygraph (author of novels, short stories, political pamphlets, physical and alchemical treatises, etc.) whose most interesting theosophical writings were published posthumously (*Über die Zauberkräfte*

der Natur [About the Magical Powers of Nature], 1819; *Ueber die wichtigsten Mysterien der Religion* [About the most important mysteries of religion], 1823). → Johann Heinrich Jung-Stilling, in Marburg (*Blicke in die Geheimnisse der Naturweisheit* [Views into the mysteries of the wisdom of Nature], 1787), also stands in that wake, and so does → Frédéric-Rodolphe Saltzmann, in Strasbourg (*Alles wird neu werden* [All will become new], 1802–1812), a disciple of Pasqually and Saint-Martin through → Jean-Baptiste Willermoz, to whose Masonic circle he belonged.

Later, and even more importantly, the Roman Catholic → Franz von Baader (1765–1841), a native of Munich (Professor at that University and a friend of both Friedrich Hegel and → Friedrich Wilhelm Schelling), stands out as the most important theosopher of the 19th century. Furthermore, he is the best commentator on both Boehme and Saint-Martin. He is also the major representative (along with Schelling) of the romantic *Naturphilosophen*, and probably the most powerful and original thinker of them all. His publications range between 1789 and 1841. Interestingly, one sees the receptions of these thinkers operating in several directions: Saint-Martin has greatly contributed to Boehme's reception in Europe during the pre-Romantic and Romantic period. Furthermore, Saint-Martin's marked influence on Baader's thought (himself a highly influential philosopher) resulted in the introduction of both Boehme and Saint-Martin into German philosophy. To wit, the twelfth (published in 1860) of the sixteen volumes of Baader's *Sämmtliche Werke* (Complete Works) is entirely devoted to reflections on Saint-Martin, and is preceded by a long foreword by Friedrich von Osten-Sacken, which likewise has contributed to the Unknown Philosopher's reputation among German philosophers.

If Baader can rightly be taken as an accomplished theosopher within the German romantic *Naturphilosophie*, some other authors representative of the latter have shown to be deeply influenced by theosophy. For instance, Friedrich von Hardenberg (alias → Novalis, 1772–1801); Johann Wilhelm Ritter (1776–1810); → Gottfried Heinrich von Schubert (1780–1860); Carl Gustav Carus (1789–1869); Carl August von Eschenmayer (1758–1852); Gustav Theodor Fechner (1801–1887), → Johann Friedrich von Meyer (1772–1849). As a matter of fact, the Romantic *Naturphilosophie* has features that connect it more or less directly to theosophy, namely: (a) a conception that Nature can be viewed as a text that must be deciphered with the help of correspondences, (b) the postulate

that the universe is a living being comprised of several levels of reality, and (c) the affirmation of an identity, or at least a co-naturality, between Spirit and Nature.

(2) The second area, which cannot be said to be of a Boehmean kind, is original for at least two reasons. First, it can be summed up by evoking the name of one single author. Second, it seems to owe nothing to the theosophy that preceded it or was contemporaneous with it. The author in question is Emanuel Swedenborg (1688–1772), a learned Swedish scientist and renowned inventor who, in 1745, interrupted his properly scientific activities on account of dreams and visions, which had come to him quite suddenly and transformed his inner life. Henceforth, he gave himself up to the study of Holy Scripture and wrote his *Arcana Coelestia* (Secrets of Heaven; 1745–1758), followed by many other books (like *De Nova Hierosolyma* [The New Jerusalem], 1758; *Apocalypsis revelata* [The Apocalypse Unveiled], 1766; *De coelo et ejus mirabilibus, et de inferno* [Heaven and its Wonders and Hell], 1758; *Vera Christiana Religio* [True Christian Religion], 1771).

If we consider the three main features of theosophy (see above: the triangle God-Man-Nature; the pre-eminence of the mythical; and the idea of direct access to the higher worlds), certainly we find all three to be present in Swedenborg's thinking. However, Swedenborg's theosophy differs from that of most other Christian theosophers by the following characteristics. First, it is devoid of dramatic elements. Second, we do not find the mythical figures that make the stories of "classical" theosophy. Third, and consequently, the entire framework of Fall and Reintegration of Eternal Nature by means of "alchemical" processes of transmutation (for example, the new birth or fixation of the spirit in a body of light) is absent. Swedenborg's universe is interconnected by innumerable correspondences, but given these three characteristics he sees them in a way which is different – more static – from that of most other theosophers. His works leave more an impression of meandering through a garden than of participating in a tragedy. Sophia is conspicuous by her absence; angels are merely the souls of deceased humans. But Swedenborg's views and works are of no less arresting interest for that. In terms of creative power he is the equal of Boehme and one of the most formidable thinkers of his century. Significantly enough, Oetinger and later Saint-Martin as well have been unsparing in harsh criticisms against Swedenborg, in whose theosophy they lamented the lack of notions like "spiritual corporeality", incarnation of the Spirit, and

the like. Jean-Jacques Bernard, in his *Opuscules Théosophiques* (1822), attempted to unite the theosophy of Swedenborg with that of Saint-Martin. As might be expected, the attempt fell rather short of being convincing, but the manner in which he tackled that task is nevertheless interesting. Indeed, it seems that the attempt was never seriously renewed. Be that as it may, the Swedenborgian theosophy, both more accessible and more "reassuring" than the ones otherwise prevailing, promptly met with tremendous success. Even more than the other aforementioned theosophical "areas", it influenced the works of such artists and writers as → William Blake, Charles Baudelaire, Honoré de Balzac, etc., and had a strong impact on initiatory societies in the Anglo-Saxon world and elsewhere. In terms of reception, it is certain that Swedenborg's success was very instrumental in overshadowing the other important theosophers, thereby limiting their reception in European culture.

(3) The third theosophical area of this period is occupied by a number of initiatory societies. Indeed, the last third of the 18th century witnessed a rapid proliferation of such organizations, particularly Masonic Rites (or "Systems") with "side degrees", otherwise called "higher grades" (i.e., those that include degrees above the three Masonic ones proper: Entered Apprentice, Fellow Craft, and Master Mason). In quite a few Masonic Rites of this kind, the side degrees borrowed from the literature of such esoteric currents as Kabbalah, Rosicrucianism, alchemy, and not least, theosophy. For this reason it is appropriate to speak of the presence of esotericism within → Freemasonry. That said, in making such borrowings, some of these Rites not only introduced theosophical elements into their rituals and instructions; not unfrequently they also engaged in publishing enterprises, thus contributing in no small measure to the dissemination of theosophical elements among the wider public. This is the case of the Order of the → Elus Coëns (established by Pasqually) whose teachings were in part made accessible through Saint-Martin's books. Other Masons, for example those who belonged or had belonged to the Rite called Rectified Scottish Rite (created in Lyon around 1768 by → Jean-Baptiste Willermoz) wrote books containing perspectives more or less inspired by that Order. Such is the case of Saltzmann (see above) and of → Joseph de Maistre (*Les Soirées de Saint-Petersbourg*, 1821). The Rectified Scottish Rite soon spread throughout Europe and Russia, and contributed strongly to propagating the theosophy of Saint-Martin and Pasqually among an ever

widening public. Russia occupies a peculiar place within that context. In Moscow, the publishing companies of Christian Freemasons like → Nicolas Novikov and → Vladimir Lopukhin, from the 1780s to ca. 1820, had many books of theosophy translated into Russian. In this connection, it seems appropriate to recall that the term “Martinism” [→ Martinism: First Period] in the Russia of that time has at least three connotations. It may refer either to Saint-Martin or Pasqually; to the Rectified Scottish Rite; or to a general and vague notion encompassing these three names together. That said, most Masonic Rites in Europe had hardly anything of a “Martinist” blend, despite their oftentimes strong theosophical inspiration at the level of the side degrees, which were rather inspired by the works of authors like Welling and Sincerus Renatus (see above, “Second period”). This is the case, for example, of the Order of the Gold- und Rosenkreuz, established around 1777 in Germany; of the Order of the → Asiatic Brethren, created around 1779; of the Order of the “Illuminated Theosophers”, born around 1783, which was of a Swedenborgian type; and of the Ancient and Accepted Scottish Rite, created in France around 1804.

4. EFFACEMENT AND PERMANENCE (CA. 1850-2000)

During the second half of the 19th century (beginning with → Eliphas Lévi) appeared an esoteric current known as occultism [→ occult / occultism], which continued well into the 20th. One of its main characteristics is that it sought to combine the findings of both experimental science and the occult sciences cultivated since the Renaissance. Its representatives thereby wanted to demonstrate the emptiness of materialism. Occultism essentially restricted itself to the domain of “secondary causes”, but its strong propensity for eclecticism caused it to touch on a number of diverse fields, including various earlier esoteric currents, among which theosophy. Hence the sometimes fluid boundary between occultism and theosophy. Such is the case, in France, with Albert Faucheux (alias → Barlet, 1838-1921) and Gérard Encausse (alias → Papus, 1875-1916). This is also why some theosophically inspired initiatory societies flourished, albeit in limited number, within the occultist current; for example, the Martinist Order [→ Martinism: Second Period] founded by Papus in 1891. As its name indicates, that Order was inspired by the works of Saint-Martin, and in that sense it was also close to the Rectified Scottish Rite (see above), which had continued to be very much practised in Masonic Obediences. Furthermore, a number of

the representatives of the occultist current edited books of or on theosophy. Pasqually's *Traité de la Réintégration* was published for the first time in 1899, edited by one of them. Papus edited texts by, and comments on, Saint-Martin and Pasqually.

Among works in Russian, those of some theosophically-tinged Orthodox philosophers are noteworthy: Vladimir Soloviev's (1853-1900) *Conferences on Theantropy* (1877-1878), *The Beauty of Nature* (1889), *The Meaning of Love* (1892-1894); and Nicholas Berdiaev's (1874-1945) *Etudes sur Jacob Böhme* (1930, in French). They are traversed by a sophiological inspiration and in some not negligible aspects stand in Boehme's wake.

There would be little to say about theosophy in the first half of the 20th century, besides the fact that it was (and still is, for that matter) present in the aforementioned initiatory societies. It was present, furthermore, through a few noteworthy authors, like → Leopold Ziegler (1881-1958) in *Überlieferung* (Tradition; 1948) and *Menschwerdung* (Humanization; 1948), and Auguste-Edouard Chauvet (1885-1955; *L'Esotérisme de la Genèse* [The Esotericism of Genesis], 1946-1958). As a matter of fact, the continuation of the theosophical current seems to have been (and still to be) hampered by the appearance of a new one, widely represented in the esoteric scene: perennialism (otherwise called the Traditionalist School) [→ Tradition], founded on the idea of a “primordial Tradition” overarching all the traditions of the world. It began to come to the fore with → Edouard Schuré's *Les Grands Initiés* (1889) and → Mme Blavatsky's first works when the occultist current was flourishing. It made great headway in France as early as the 1920s with → René Guénon, and later on in the United States with → Frithjof Schuon. To a large extent due to the ever-growing influence of perennialism, the theosophical current (always understood here, of course, in the sense of Christian theosophy and its developments), which over the preceding hundred years had been fading away, practically dried up.

Guénon himself was not interested in the western theosophical corpus of the past, first, probably because of its Germanic roots (he was not a great admirer of German culture), and second, because he hardly dealt with the Western esoteric currents proper. It seems that the only text in which he portrayed modern western theosophy in positive terms consists of four lines only, in a book (*Le Théosophisme, histoire d'une pseudo-religion* [Theosophy: History of a Pseudo-Religion], 1921) which, as it turns out, is dedicated to a radical demolition of the Theosophical Society founded by H.P. Blavatsky –

part of whose roots are embedded in the occultist current and which has only tenuous connections with the theosophical one. In his introductory part, Guénon quotes as genuine theosophers Jacob Boehme, Johann Georg Gichtel, William Law, Jane Lead, Louis-Claude de Saint-Martin, and Karl von Eckartshausen. Obviously, the “classical” theosophical current only serves as a foil here. Guénon almost never mentioned it anywhere else, and was probably barely knowledgeable about it. Granted the difference in terms of contexts, it seems permissible to consider his influence to have been at least as instrumental as Swedenborg’s had previously been, in overshadowing theosophy and thereby limiting its reception and continuation.

The Anthroposophical Society [→ Anthroposophy], originally a schism of the Theosophical Society, and founded by → Rudolf Steiner (1861-1925) in 1913, can be viewed as another competing movement by virtue of its goals and its large membership. Steiner’s thought plunges its threefold roots into Early Rosicrucian literature, German Romantic *Naturphilosophie*, and the Theosophical Society of Mme Blavatsky, more than into the theosophical current proper.

Could the renowned Islamicist → Henry Corbin (1903-1978) be considered a Christian theosopher? For many years an active participant of the Eranos Conferences in Ascona, he was a philosopher and a savant interested not only in Islamic theosophy (Isma‘ilyya, Shi‘ism, Suhrawardi, Ibn ‘Arabi, etc.), but also in the theosophy of the West. His scholarly work (for example, *L’Imagination créatrice dans le soufisme d’Ibn ‘Arabi* [Creative Imagination in the Sufism of Ibn ‘Arabi], 1958; *Terre céleste et corps de resurrection* [Celestial Earth and Body of Resurrection], 1960; *En Islam iranien* [In Iranian Islam], 1971-1972) is pervaded by an outspoken personal – religionistic – approach of a theosophical character. Corbin was the proponent of the idea of a “comparative theosophy” among the three great religions of the Book; but it is very telling that his main reference in terms of Western theosophy was, in line with the very nature of his Islamic preferences and his docetist slant, Emanuel Swedenborg.

Apart from Corbin, special mention should be made of an esotericist who, after having sojourned for a long time within the hothouse of the Anthroposophical Society and eventually left it, may be considered one of the rare contemporary representatives (and actually, an outstanding one) of the theosophical current. This is → Valentin Tomberg (1901-1973), a Russian of Baltic German origin, whose *Méditations sur les Arcanes Majeurs du*

Tarot was written directly in French, published first in German in 1972 and then in several other languages, and represents one of the most outstanding books in 20th century Western esotericism.

In conclusion, the history of theosophy has had a development and a destiny similar to those of other esoteric currents. It appeared in a specific cultural milieu – the Baroque of the late Renaissance, late German Lutheranism – from which it cannot be divorced. Given the essentials of its specificity, its very nature disposed it to find a new impetus during the Enlightenment, then in the pre-Romantic and Romantic periods. Later on, it has survived through some epigones and only a few original thinkers as well; but its persisting influence within the esoteric landscape could and still can be seen operating in several directions, albeit mostly indirectly, in the form of its various migrations and derivations.

Church Universal and Triumphant → Summit Lighthouse

Clement of Alexandria (Titus Flavius Clemens), † before 215

Clement was a Christian teacher who worked in Alexandria and left us some important writings, but about whose life only little is known. He was born in a pagan family, probably in Athens. After his conversion he studied with Christian teachers in Greece, Southern Italy, Syria and Palestine, and finally settled in Alexandria (ca. 180), where he became a pupil of Pantaenus, a non-Gnostic Christian teacher. According to Eusebius, *Church History*, VI, 6, Clement became Pantaenus' successor as head of the so-called Catechetical School, but that is by no means certain, since the existence of this ecclesiastical institution before 200 is far from being an established fact. Everything in Clement's preserved works suggests that he was an independent lay teacher and thinker, without any official connection with the Alexandrian church. About 203, under the pressure of a persecution, he fled from Alexandria to Asia Minor, where he died shortly before 215.

Clement may be called the first Christian scholar: he had a vast knowledge of Scripture and of Greek and Christian literature (more than 360 different quotations from Greek literary and philosophical works). His eagerness to show how learned a Christian could be sometimes tends to pedantry. He was well read in at least Homer and Plato, but, like many of his contemporaries, he knew most of the authors from whose works he is quoting only through anthologies and excerpts. Sometimes he obviously borrows a passage from another author's work without any notice. An interesting example of this procedure is his report on a procession of Egyptian priests who carry forty-two fundamental Hermetic books (*Strom.*, VI, 35-37; → Hermetic literature). The most important of his own works are: *Exhortation to the Greeks*, an apology which proclaims the supremacy of the Christian religion; *Paedagogue*, in three volumes, about Christian ethics; *Stromateis*, "Miscellanies" (lit. "Patchwork", "Carpets"), his most important work, in eight volumes; and *Excerpts from Theodotus*, quotations from the Valentinian [→ Valentinus and Valentinians] Gnostic Theodotus and others, with Clement's own comments.

In 2nd-century Alexandria, Christian intellectuals were almost exclusively found on the side of the Gnostics [→ Gnosticism]. Clement was a non-

Gnostic Christian intellectual and he had to defend his position against Gnostics and pagan critics of Christianity on the one hand and simple ordinary church members on the other. The Gnostics held that faith (*pistis*) was in fact irrelevant and that only knowledge (*gnōsis*), in the sense of esoteric insight in things divine, led to salvation. Clement's answer was that every believer who had been baptised was saved and that, therefore, Gnosis was not necessary. With the help of Greek philosophical ideas about the activity of the mind he defined the concept of *pistis* and defended its indispensability. This was not only directed against the Gnostics but also against Greek intellectuals who reproached the Christians for accepting everything by faith and not on the basis of rational reasoning. The simple believers, for their part, held that faith was all-sufficient: the faithful had simply to accept on authority what was taught by the church, and, therefore, philosophical or Gnostic speculations were suspect and had to be avoided. Against them, Clement argued that faith is indeed sufficient and even indispensable for salvation, but that personal knowledge is better than belief on authority, since it brings the believer to a higher level of religious comprehension and makes spiritual growth possible. For that reason, Clement defended the use of philosophy in theological speculation. He even went as far as to sustain that Greek philosophy and the Old Testament were equal preparatory stages for the Christian message. His religious thinking was strongly influenced by Jewish Alexandrian philosophy (Philo), Middle-Platonism, and Christian Gnosticism. He shared with these currents the idea that the highest doctrines about God, the world and man cannot be revealed to everybody but should be reserved to a small circle of initiates who are worthy to comprehend them. In his *Stromateis*, Clement set himself the task 'to speak hidily, to expose concealingly, and to point out silently' (I, 15, 1). From Philo of Alexandria he learned, *int. al.*, that by means of allegorical exegesis all kinds of philosophical and religious truths could be found in the divine scriptures. Middle-Platonism provided him with a philosophical framework that directed his thinking about God and Christ. Christ was for him the divine Logos, the Pedagogue and Teacher of mankind, who had revealed the divine truth, first and only partly to Greek philosophers and Hebrew prophets, and then completely when he himself became man in Jesus Christ. With Christian Gnosticism Clement was convinced that there existed a secret and esoteric Christian tradition alongside that which was openly transmitted by the Church: 'This knowl-

edge (*gnōsis*), handed down in unwritten form from the apostles through a succession of teachers, has come to a few people' (*Strom.* VI, 61, 3). Clement attacked the Gnostics for their claim to be the only true Christians and their rejection of faith as a sufficient base for salvation, but he had also much in common with them. He quotes many Gnostic teachers from the 2nd century, and not always disapprovingly. One of the scholarly problems of his *Excerpts from Theodotus* is the difficulty to distinguish clearly between the Gnostic quotations and Clement's own comments.

Clement's religious thinking culminates in his description of the ideal Christian, the "True Gnostic", to which especially books VI and VII of the *Stromateis* are devoted. A first and indispensable characteristic of the true Gnostic is his moral perfection and detachment from worldly things (strong influence of Stoic ethics). His knowledge not only concerns God and good and evil, but also the whole world: 'He possesses the most precise truth about the world from its creation to its end, having learned it from the Truth itself' (*Strom.* VI, 78, 5). It is a spiritual knowledge, which derives from revelation and is to be found in the words of the Logos, i.e. in the divine scriptures. Therefore, an important part of the esoteric tradition is the capacity to read the hidden meaning of Scripture by means of allegorical exegesis. This provides the Gnostic with a perfect knowledge of past, present and future, and leads him to an ever-deeper understanding of the divine world and to the contemplation of God.

ROELOF VAN DEN BROEK

Comenius (Komenski), Jan Amos,
* 28.3.1592 Niwitz (Moravia),
† 15.11.1670 Amsterdam

Comenius' family belonged to the Fraternity commonly known as the Moravian Brothers and named *Jednota Bratska* in Czech, that is, Unity of Brethren. From the 15th century, this *ecclesiola* had greatly developed despite persecutions, and it had received some of the Vaudois driven out of Brandenburg. After studying Latin and theology, Comenius went to Hess, in Herborn, then to the Palatinate, in Heidelberg, and experienced the double influence of Calvinism and the millenarianism professed notably by Johann Heinrich Alsted. Returned in 1614 to Moravia, Comenius was ordained pastor in 1616 and got married. However, the victory of Tilly, commander of the Catholic League, at the White Mountain, over the Bohemian army commanded by the Palatine Frederick V – the *Winterkönig*, king of Bohemia for a single winter (1619-1620) – would change the course of Comenius's life. Having lost his wife and children, he was henceforth constrained to lead a wandering life throughout Europe. In 1624, an imperial edict issued a ban on all non-Catholic priests and forced Comenius to take refuge in Lissa, on the Silesian border, where he could enjoy the protection of the powerful family of the Lezcynski. He was able to remain there until 1641, surrounded by a community of Moravian Brothers, of whom he was the bishop. It was there that his passionate interest in problems of pedagogy developed, which manifested in writings such as *Janua linguarum reserata* or *Didactique, Conatuum*

Comenianorum Praeludia and *Conatum pansophicorum dilucidatio*. Invited to London by Samuel Hartlib in 1641, he traveled to Sweden the following year, then to Elbing in Prussia. In 1643, Comenius published *Irenica quaedam scripta pro pace ecclesiae*, an ecumenical work before the term existed. After the peace of Westphalia, he fell under the influence of a visionary and went to Hungary with the idea of establishing a *Schola Pansophica* there. If he did not succeed in this, he at least completed an encyclopedic collection under the title *Orbis sensualis pictus* and an innovative method of teaching languages entitled *Schulus ludus seu encyclopedia viva*. During the many conflicts between Poland and Sweden, Comenius, who had returned to Lissa, suddenly had to leave this city captured and destroyed by the Polish, because he had sided with the king of Sweden. He spent the last years of his life in Amsterdam and further published his *Opera didactica omnia* (1657), *De irenico irenicorum* (1660) and his beautiful literary testament *Unum necessarium* in 1668.

Of the many works by this man of an often-tragic destiny, and beyond his priestly activities with the Moravian Brothers, we mainly retain his pedagogical innovations partly inspired by Ratichius (Wolfgang Ratke, 1571-1635). In fact, his interest in didactics was only a means for him to arrive at the “general reform of the world” through “pansophy”, that is, a total science, universal knowledge making it possible to decode the “signatures” of the divine realities inscribed in the concrete world. Now, these ideas preoccupied a number of minds in the first half of the 17th century. The *Vier Bücher vom wahren Christentum*, completed in 1610 by Johann Arndt, and the different plans for Christian society proposed by the celebrated Swabian theologian → Johann Valentin Andreae (1586-1654) after the vogue of the Rosicrucian myth [→ Rosicrucianism I], aimed to “reform the Reformation” toward a pansophic Christianity. The utopian story of *Christianopolis*, published by Andreae in 1619, described its pedagogical program. It is thus not surprising that Comenius should have seen himself as a disciple of Andreae who, according to him, had been able in his writings both to detect the ills from which the Church, the State and culture were suffering, and to suggest the appropriate remedies. Comenius had read the main works published by Andreae between 1616 and 1619. From 1628, Comenius and Andreae established an exchange of correspondence, which accompanied the sending of Comenius’s *Christianae Societatis Imago* (1620) with a commentary that evoked both the “ludibrium” of the *Fama Fraternalis* and its efforts,

engaged as early as 1614, to create a true *societas christiana*, with the purpose of “cleaning the Augean stables”. Having been prevented from achieving this vast project, Andreae suggested to Comenius, in a letter of 16 September 1629, that he pick up the torch and promote an authentically Christian pansophy, one that is thus not content to ally the creator God with nature-philosophy. Comenius was indeed strongly subject to J.V. Andreae’s influence, to the point of repeating in his *Labyrinth sveta a raj srdce* (Labyrinth of the World and Paradise of the Heart), composed in 1622/23, entire passages from *Peregrini in Patria errores*. However, he granted the Christianization of pansophy a much broader sense in his plan to establish a universal alliance of Men of good will. His *Panegersia* aspired to the creation of a “Collegium Lucis ad fundandam Ecclesiam vere Catholicam philadelphiam” whose prelude he saw in the Rosicrucian brotherhood. In his *Pansophiae templum ad ipsius supremi Architecti, Omnipotentis Dei ideas, normas legesque extruendum*, Comenius divided pansophy into seven parts, making it possible for the mind to pass through successive stages from the knowledge of nature to the contemplation of the supreme God.

ROLAND EDIGHOFFER

Constant, Alphonse Louis → Lévi, Éliphas

Corbin, Henry, * 14.4.1903 Paris, † 7.10.1978 Paris

A philosopher by training, as early as 1925 Corbin developed a strong interest in Islamology, under the influence of Étienne Gilson, whose course on Latin Avicennism in the Middle Ages he took at the École pratique des Hautes Études (Vth section). A graduate in scholastic and general philosophy, with diplomas from the École pratique des Hautes Études and the École des langues orientales, librarian at the Bibliothèque Nationale, friend of, among others, Louis Massignon, Alexandre Kojève, Alexandre Koyré, Denis de Rougemont, and Joseph and Jean Baruzi, he concurrently studied and translated works by Sohrawardî, Karl Barth and Heidegger. From 1939 to 1945 he was at the French Institute of Archaeology in Istanbul, before joining the Franco-Iranian Institute of Teheran, where he created the Department of Iranology and then the collection of the Iranian Library. From 1949 he was a regular participant in the Eranos meetings in Switzerland, where he was in significant contact with → Carl Gustav Jung, Mircea Eliade, and Gershom Scholem. In 1954, having recently published *Avicenne et le récit visionnaire*, he was appointed Professor of “Islamism and Religions of Arabia” at the Vth section of the École pratique des Hautes Études. From the following year on, until 1973, he directed the Department of Iranology that he had created, and taught history of Islamic theology and philosophy at the faculty of literature of the University of Teheran. In 1958 appeared *L'imagination créatrice dans le soufisme d'Ibn 'Arabî*; in 1961, *Terre céleste et corps de résurrection*; in 1962, *Histoire de la philosophie islamique*; in 1971, the first two volumes of *En Islam iranien* and *L'homme de lumière dans le soufisme iranien*. In 1973 he became a member of the very recent Iranian Imperial Academy of Philosophy and founded the International Center for Comparative Spiritual Research, better known as the Université Saint Jean de Jérusalem. The same

year he published the last two volumes of *En Islam iranien*, and in 1977 *Philosophie iranienne et philosophie comparée*. He died on 7 October 1978. During all these years he was intensely active in the publication and translation of texts (besides Sohrawardî, Barth and Heidegger: Hamann, Heschel, → Avicenna, Sejestânî, etc.) and contributed to many periodicals, colloquia, and miscellaneous collections. Some of the latter contributions later appeared grouped together in posthumously published volumes.

Corbin's first text devoted to Iranian Sufism, and more particularly to Sohrawardî, was published in 1933 in *Recherches philosophiques*. Here he emphasized the connection established by Sohrawardî between an illuminative philosophy of Platonic inspiration, a hermeneutics of myth and an angelology – all tied together in a mystical experience of the assumption of Man into a higher reality. Most of his later works would relate specifically to this point, as developed by Ismaelian gnosis. At the same time, refusing categorization, he ceaselessly engaged and promoted a comparative approach, illustrated with particular clarity in his study ‘Herméneutique spirituelle comparée’ (1964) that is devoted to Swedenborgian theosophy [→ Swedenborg] and Ismaelian gnosis. Corbin explains here that the object of his hermeneutics is ‘a *spiritual fact*, . . . a phenomenon of *understanding*’. He readily admits his debt to Heidegger, who provided him with the key to understanding first Shi'ite gnosis, and then ‘the Christian gnosis and . . . the Jewish gnosis that are its immediate neighbors’. The task of spiritual hermeneutics is different from that of the historian, for it is not a matter of simply rediscovering and understanding the past, but of personally “taking charge” of it. For Corbin, this means interpreting historical materials in terms of “hierohistory”, which he believes reveals ‘the hidden esotericism under the phenomenon of the literal appearance . . . of the Holy Books’ which is fulfilled in each believer. For Corbin, spiritual hermeneutics is thus a path of personal spiritual realization under the aegis of theosophy. This hermeneutics is considered to be equivalent to the Sufi *ta'wil*, and to reveal hidden and spiritual esoteric meanings to which correspond as many degrees of being as are felt by the hermeneut's own conscience. Thus Corbin is in fact concerned with what he calls, in commenting on Avicenna, an ‘exegesis of the soul’.

Here we encounter a basic notion in Corbin's thinking: the → imagination. Drawing inspiration from Ibn 'Arabi and Sohrawardî as well as from → Ficino, → Bruno, → Boehme and Swedenborg,

Corbin draws a distinction between the imaginary, which is utopian and unreal, and the imagination, which is cognitive and creative. The imagination constitutes an autonomous world, the *Mundus imaginalis* or the imaginal, the place of theophanic apparition, vision, and prophecy; this is what he calls the “disjoined imagination”. But it is also the response of the cordial and prayerful imaginative awareness of the subject, who perceives the imaginal in his beliefs and perceives himself through it as a moment of the theophanic imagination; this he calls the “conjoined imagination”. By this double movement of the imagination, a union of subject and object (a *unio sympathetica*) and a reversal of interiority and exteriority are accomplished. The spiritual interiority supports the exteriority and, through its “magical” and creative operation, gives it body: ‘In short, because there is imagination, there is *ta’wil*; because there is *ta’wil*, there is symbolism; because there is symbolism, there are two dimensions in beings’.

The centrality of this conception of the imagination as a faculty of *coincidentia oppositorum* and of *unio sympathetica* is not without its consequences for the notion of esotericism upheld by Corbin. He attaches a very special importance to the notion of *significatio passiva* as understood by Luther, and even makes it one of the main keys of his hermeneutics. It means that the divine attributes can be understood only insofar as they are in relationship with us, and insofar as the divine “*esto*”, the “*Be!*”, makes us be (‘the being that we are has this same imperative, but in its *significatio passiva!*’). The two dimensions in each being are present in a docetist manner: ‘. . . the *mysterium conjunctionis* uniting the two terms is a theophanic union (from the Creator’s viewpoint) or a theopathic union (from the creature’s viewpoint), but in no case a “hypostatic union”’. Incarnation takes place only in a *caro spiritualis*, and not as “physical incarnation”: ‘. . . the *subjectum incarnationis* is not God or man, but a middle term between the two, an extra-divine divine person, as well as an extra-human human person’, in other words, the Angel, archetype of the person and self-revelation of the divine Being. Docetism is thus the foundation of the imagination, since by elevating material realities to the rank of an apparition it restores their value as image of the true spiritual reality – precisely that to which the hermeneut who follows the path of *ta’wil* aspires. Hence, Corbin clearly denies any esoteric potential to “orthodox” Christianity, for as a religion of Incarnation it closes the door to prophetism: ‘. . . the Incarnation is a unique and irreversible fact; it exists in the web of material

facts; God has personally incarnated at a moment in history; this “occurs” in the chronology with definite dates. There is no more mystery, therefore no more esotericism necessary’. Esotericism even becomes impossible, as soon as dogmas are irremediably fixed, thus closing the door to ‘any possibility of a new prophetic revelation dispensed by the Angels, but also [to] any initiative of a prophetic hermeneutics’. This docetist foundation of Corbin’s spiritual hermeneutics is certainly the reason why he clearly favors, in the domain of Western esotericism, the figure of Swedenborg.

Given these foundations, although at one occasion he called on ‘esotericists of all religions’ to unite, Corbin in fact proved remarkably exclusive. In Christianity, only those who place themselves (or whom Corbin places) outside the dogmatic and institutional boundaries of the Great Church can be qualified as “esotericists” and can appeal to his “Inner Church” that requires no act of belonging for one to belong and which is ‘the community, the *omma*, of esotericists from everywhere and for always’. Along the same lines, Corbin also refers to the ‘Church of John [that] can be neither secularized nor socialized, just like it is impossible to secularize and socialize the esoteric community of the Friends of God’. Thus, Corbin’s definition of “esotericism” (understood, in terms of its etymology, as “interiorism”) is, on the one hand, very comprehensive – even to the point of being applicable to phenomena completely different from esotericism in a historical sense – but, on the other, ultimately very restrictive as well. For in addition to his exclusion of Christian “orthodoxy” he also wants to demarcate himself from “pseudo-esotericisms” (undoubtedly the occultist currents, although he never names them explicitly). Since Corbin introduces into the heart of his approach a process in which the commentator identifies with his subject, he ends up creating a spiritual hermeneutics, not a hermeneutics of spiritualities. In studying and commenting on theosophers from East and West, he would clearly like, to some extent, to be a theosopher himself: ‘. . . one cannot remain a stranger [to the spirituality that] one wants really *to understand* and *to make understood*’. This method of hermeneutics, that Corbin claims to discover among the theosophers, he appropriates for himself to make of it, if not a universal method, at least a workable method for interpreting the religions of the Book (inasmuch as they are prophetic religions, that is, that they are ‘professing the necessity of superhuman mediators between the divinity that inspires them, and common humanity’). Hence the comparativism that Corbin brings into play has as its

prime vocation the rediscovery of the similarities and convergences that are revealed by the spiritual hermeneutics of each religion of the Book, and that are based upon the archetypes common to different spiritual worlds.

In this respect Corbin, since he makes the theosophers' approach into his own, deserves being studied as an esotericist probably more than as an "esoterologist". His perspective permits him to posit a very broad definition of esotericism (interiorism), while retaining from the actual history of esotericism only what agrees with his definition. Nevertheless, Corbin's contribution to the history of religions is undeniable: besides having been one of the principal initiators of Iranian studies in France, his works have greatly contributed to the legitimization of university research in esotericism. Moreover, his involvement in the Eranos meetings and his establishment of the "research community" called the Université Saint Jean de Jerusalem have undoubtedly stimulated interdisciplinary studies in this area. Finally, while the methodological assumptions underlying his spiritual hermeneutics are certainly subject to criticism, his deepening of the notions of the imagination and the *mundus imaginalis* have contributed to the development of a criteriology of esotericism as heuristic as that of Antoine Faivre – who, on this point, recognizes his debt to Corbin while distinguishing himself from him in other respects.

JÉRÔME ROUSSE-LACORDAIRE

Correggio, Giovanni da, * ca. 1451? Bologna?, † after 1503 place unknown

Apocalyptic prophet and hermetic messiah. We know about Correggio's activities from an anonymous "Epistola Enoch" and three dedicatory epistles written by his pupil → Lodovico Lazzarelli, and from scattered references in the works of contemporaries, including the famous abbot → Johannes Trithemius. Correggio's year of birth cannot be established with any certainty: all we know is that Lazzarelli describes him as being 'about thirty-three years old' in 1484, but this may reflect an attempt on Lazzarelli's part to emphasize parallels between the ages of Jesus and Correggio at the time of their public entrance in Jerusalem and Rome respectively (see below). Most probably Correggio was a bastard son of Antonio da Correggio (?-1474), which means he came from an old and powerful family belonging to the higher nobility. Although in his later life Correggio and his entire

family were roaming through Italy and France while begging for their daily bread, he may have done this for spiritual reasons; there are indications that he had a house in Bologna, and suffered no serious financial problems.

Nothing is known about Correggio's life prior to his first appearance in Rome, on November 12, 1481. The cardinals were gathering for a consistory meeting, and Correggio appeared on the stairs of the papal palace holding up a Bible 'mystically closed with seven seals': an obvious reference to Revelation 5:1. He held an apocalyptic sermon and called for repentance. One of the bystanders was the young poet Lazzarelli, who followed him as his first pupil. Lazzarelli has left us a much more detailed description of Correggio's second appearance in Rome, on Palm Sunday, April 11, 1484. He first attracted a crowd by riding through the streets of Rome to the Vatican, clothed in rich garments and accompanied by four servants. Having left the city he changed his clothes, putting on a blood-stained linen mantle and a crown of thorns. Over his head was fixed a silver-plated disk in the shape of the crescent moon, with a text that identified him as God's or Jesus's servant Pimander and contained a quotation from the alchemical *Tabula Smaragdina*. Decked out with various symbolic paraphernalia, described in detail by Lazzarelli, he mounted a white ass and entered the gate of Rome, surrounded by his servants on horseback. He headed towards the Vatican, but made several stops to proclaim the coming judgment, identifying himself as 'Giovanni Mercurio da Correggio, the Angel of Wisdom Pimander'. People leaving the churches, with in their hands palm branches that they had received during high mass, started following him through the streets, thus greatly amplifying the similarity with Christ's entrance in Jerusalem. According to Lazzarelli's account, the guards at the gate of the St. Peter made way for him and allowed him to enter. Having dismounted, Correggio is said to have walked to the altar, offered up his mystical apparell and a paper entitled "The Eternal Gospel", prayed to God, and left the St. Peter. We know from the contemporary Jewish author Abraham Farissol that at one time Correggio was imprisoned in Rome. Although Lazzarelli describes him as freely entering and leaving the St. Peter, this is hardly credible. It is more likely that he was arrested at this particular occasion, without ever making it to the altar. He is said to have escaped from prison, and to have fled together with his friends and devotees. Back in Bologna he was imprisoned anew, on suspicion of heresy, but was apparently released.

In 1486 Correggio made another prophetic

appearance, this time in Florence. He was on his way to the court of king Ferdinand I (Ferrante) in Naples, who had requested to see him, undoubtedly at Lazzarelli's suggestion. But Lorenzo il Magnifico ordered his arrest and imprisonment, and he was severely harrassed by a Franciscan inquisitor. Ferrante obtained his release, but we do not know whether Correggio ever made it to Naples. We then again lose track of him for several years, but sometime after 1492 he must have visited Rome with a considerable following, calling himself "the younger Hermes". In 1497 he preached in Venice; and in 1499 he passed through Cesena on his way from Milan, dressed in sackcloth and accompanied by his entire household, including his wife and five children. In 1501 he traveled to Lyon, still with his family, where he was granted an audience with king Louis XII, whom he impressed with his learning and with promises about sensational alchemical and magical secrets. Sometime later Correggio seems to have returned to Rome, where he claimed to possess an alchemical cure against the plague. His last writing was addressed to pope Julius II, and suggests that he was now in urgent need of a protector: 'Protect, protect me . . . and I will protect you. Bestow your help on our Giovanni Mercurio . . .'. And that is the last glimpse we have of Correggio: we do not know what became of him and his family, or where and when he died.

It is likely that Correggio started out as a Christian apocalyptic prophet, and that his striking self-proclamation as "Pimander", "Mercurio" and "the younger Hermes" reflects the influence of his pupil Lazzarelli. Lazzarelli believed that the great being Poimandres who appeared to Hermes in *Corpus Hermeticum* I was in fact no one else but Christ, who had now returned in the person of Correggio: the hermetic Christ. According to Farissol, in the years after 1484 Correggio referred to himself as 'Son of God, Mercurius, Trismegistus, Enoch and Methuselah', described himself as 'a son of God emanating from the Godhead with the divine spirit sparkling in him', and taught that 'whoever elevated himself and endeavored to gain perfection would attain . . . the status of a son of God'. Correggio seems to have continued calling himself "Mercurio" to the end of his life, but his writings – several of which were published during his lifetime – show only scant hermetic references, and the later accounts contain no evidence that he kept presenting himself as Christ. In his meeting with king Louis XII in 1501 he presented himself, rather, as a great alchemist and magus, modeled after Apollonius of Tyana.

All Correggio's writings, written in a characteris-

tic excited and ponderous style, are heavily apocalyptic and frequently call on worldly and spiritual leaders to take the lead in the final battle between good and evil. His last works, notably his as yet unpublished *De Quercu Iulii Pontificis sive de lapide philosophico* (The Oak of Pope Julius, or the Philosopher's Stone), show an increasing preoccupation with → alchemy: an aspect of his activities that has not yet been studied in sufficient detail. Likewise his indebtedness to Christian eschatological traditions, and to Joachimism in particular, requires further investigation. It remains that Correggio's self-presentation as a hermetic messiah makes him a striking example of how Christian hermeticism could be integrated in the popular apocalypticism of the late 15th century.

Correspondences

1. INTRODUCTION 2. CORRESPONDENCES FROM ANTIQUITY THROUGH THE RENAISSANCE 3. CORRESPONDENCES SINCE THE ENLIGHTENMENT

1. INTRODUCTION

The idea that reality consists of multiple "levels" which in some manner mirror one another is extremely widespread in all traditional societies: it is basic to the various → divinatory arts, → magic, and → astrology; but can also be found e.g. in the architectural design of premodern villages, cities, temples and court complexes; in the ways that the orders of gods, angels or demons are imagined; in systems of → number symbolism; and in various cosmologies, including notions of the human being as microcosm mirroring the structure of the macrocosm. In the wake of Marcel Granet's *La pensée chinoise* (1934) and the second volume of Joseph Needham's *Science and Civilization in China* (1956), the fundamental importance of "correlative thinking" to traditional Chinese culture has come to be widely recognized by sinologists, but its role in other premodern cultures has been curiously neglected, even to such an extent that it is often considered to have been unique to premodern China. In fact, however, correlative thinking is ubiquitous in all pre-modern and even early modern cultures, and its expressions (such as e.g. the elaborate systematic tables of correspondences that can be found in Chinese, Indian, Middle-Eastern, Mesoamerican as well as in pre- and early modern European contexts) are often strikingly similar. Rather than considering correspondences as a "doctrine" that can be traced back to specific philosophical sources and authors, correlative thinking may therefore be considered a spontaneous tendency of the human mind; in fact, neurobiological research suggests that its ultimate foundations may lie in the way the human brain uses "topographical maps" to organize data into functional hierarchies (Farmer, Henderson & Witzel 2000 [2002]). While taking this into

account, the following overview will be restricted to correspondences in Western culture specifically, and focus on the philosophical and theological frameworks that were developed here to account for and systematize correlative thinking.

Ancient and medieval cosmology was steeped in theology, in the sense that a primary importance was awarded to cosmogony and to an ontological perspective: philosophically considered either as a divine creation, or as an emanation of the highest Principle, the world was primarily understood as a reflection of the Godhead, meant to reveal its will and wisdom and, although closed and consisting of a finite (even if innumerable) number of components, expressing something of its supernal origin. Seen from such an angle, any interest in the universe (and/or its contents) was bound to assume the essential shape of an inquiry into the divine mysteries, conceiving of the world in terms of an ontological ladder leading back up to the divine sphere; or of a scrutiny of the symbolic “signs” which the natural world displays for the spiritual and moral edification of mankind.

The gradual development of these views into the notion of a “Book of Nature”, complementing the “Book of Scripture” – that is to say, the emergence of a partially autonomous concept of “nature” (and consequently of “physics”, or “natural philosophy”) as such – required a concept of “secondary causes” mediating between God’s will and its creation. The actual working of the universe (prior, of course, to the emergence of any sort of “mechanistic” insights, or to any concept of natural “laws”) was maintained and regulated according to divine ordinance *by* and *through* these intermediary causes, whether they were regarded as angelic entities, celestial influences, numbers or otherwise. As is well known, this shift in philosophical outlook was inspired by the 12th-century commentaries on the book of *Genesis* and Plato’s *Timæus* (stemming for instance from the School of Chartres, mainly Thierry of Chartres and William of Conches) and by the progressive assimilation, during the following century, of arabic and aristotelian cosmology by the Scholastics (commentaries of → Albertus Magnus on Aristotle’s *Physics* and *De cælo*). Historically, these conceptions mediate in turn between the earlier perception of the world as theophany, and the later, Renaissance view of nature as a living garment or organic expression of the divine being. The same period also witnessed the gradual substitution of a mathematical paradigm for a metaphysical one within natural philosophy, partly owing to the emphasis on the idea of a cosmic numeric harmony.

2. CORRESPONDENCES FROM ANTIQUITY THROUGH THE RENAISSANCE

Theoretical formulations of correspondences reflect several tenets which, until (and well into) the Renaissance, were among the mainstays of the dominant world picture(s) of Western culture.

(1) The first is *the unicity of creation*, which implies that a perfect ontological continuity connects all levels of the universe, throughout the overall hierarchy of being. This theme of the “great chain of being”, to which no precise historical origin may be assigned (it is present in Plato’s *Ion* but certainly antedates Greek civilization), is perhaps one of the most important metaphysical foundations of ancient cosmological systems.

(2) Second comes *the doctrine of “participation”*, of platonic origin, in which “love” constitutes the universal link or bond between the constituents of the universe, in a horizontal sense as well (*Symposium*, 186b-188d). Frequently understood as more or less equivalent to the stoic scheme of *sympatheia/antipatheia*, the cosmic pattern of attraction/repulsion which determines the relations and interactions of all things, properties and beings within the world, it may be construed as some kind of “immanent determinism” permeating the cosmos, and as one of two main driving forces at work behind its active dynamisms.

(3) The second driving force, as well as the third tenet, consists in seeing *the universe as a living being*, endowed with an animating soul, and whose parts are utterly complementary and interdependent, exactly like the limbs of a body. Again, the unicity and “wholeness” of its structure is frequently understood as an organic image of the human body.

(4) This leads us to the fourth tenet, *the doctrine of universal analogy*. Through analogy, which refers to a primarily “vertical” perspective, all levels of existence within the hierarchy of being (or, for that matter, all things they comprehend) actually mirror each other, in the sense that the lower in ontological rank is considered as a “symbol” of the superior, essentially endowed with the same virtues, features and properties, the main difference between them being one of scale (or of “proportion”, the original meaning of the Greek *analogia*). One of the most fundamental and widespread of these analogies is precisely that of the macrocosmos/microcosmos, which harks back to Plato’s *Timæus* (although, in itself, it certainly dates from time immemorial and is also found in non-Western contexts, e.g. Taoism), envisaging the world as a “grand man” and man as a synthetic abridgement of the universe.

In a restricted sense, correspondences may be interpreted as the “horizontal” counterpart of the network of universal analogies; but according to a more encompassing understanding, they overreach from one natural realm or plane to another and, moreover, overlap quite frequently with analogies proper. Such ambiguities are rather common in this domain; one may think, for instance (and *mutatis mutandis*) of the equally ambivalent conception of the elements, often presented as both the foundations *and* the components of reality.

The network of correspondences appears as the outward expression of the hidden dynamics of *sympatheia/antipatheia*; as a system of “signs” canvassing the qualitative interactions of natural things and beings, and manifesting the manner of their distribution; as well as the practical means of their philosophical understanding, and of their magical or therapeutical use. Life and death, good and evil, illness and cure, and the general complementarity of natural qualities in bodies, result on the cosmological level from such a network, on the basis of which Plotinus described nature as “the great sorceress”.

Correspondences were considered to possess in themselves a dual aspect, external and internal. The external one was based on plain outward resemblance in shape or characteristics – for example between a plant and a human limb, or between a given animal and a natural body, both being considered to stand under the dominion of the same astral influence and therefore to manifest (each in its own way) similar properties. The inner aspect refers to some internal “essence” of things, which is supposed to be at the root of all corporeal features, either of one single natural item or of a number of them, to which it is common. The external features, being visible, “manifest” the inner principle, and lead on to an easier and better knowledge of it.

Whenever such a “hidden” essence is being considered, the notion of “sign” – understood both in a natural and in a semantic way – is called upon to mediate between the internal and external properties. Yet the “sign” as such essentially denotes or indicates the presence of an invisible counterpart to the outwardly observable characteristics, whereas the term (and concept) of *signatura* (made famous by → Paracelsus [*Astronomia magna, Von der natürliche Dinge*] and, later, → Jacob Boehme [*De signatura rerum*]) applies to the very *relation* between occult [→ occult /occultism] and manifest, and constitutes an attempt to explain it in terms of the “imprint” or translation of an archetype into material reality. It must be noted that this relation

works, and therefore must be accounted for, in both directions: from the invisible to the visible, but from the visible to the invisible as well. The latter is the case when Paracelsus recommends close observation of “astronomy” as revealing the outward, visible manifestation, on a large scale, of what is hidden and inscrutable within man or natural things on a smaller scale, that is to say their inner essence and “occult qualities”, thus postulating a fundamental connaturality of internal archetype(s) between the two orders. Occasionally *signatura* is taken to mean the mere external resemblance mentioned above between two different natural bodies, in which case it likewise points to a relation, albeit a different and more “superficial” one.

Conceptions of causality implied by the theory of correspondences are, again, nuanced, varied and ambiguous. Envisaged as depending on the cosmic network of sympathies and antipathies, correspondences may be understood in terms of a “preestablished harmony”, or “immanent determinism”, embedded as such in material reality and independent, for this reason, of causality in a strict sense. Yet, as we have seen, the doctrine cannot be cleared from astrological implications. In that context, the “occult” relation between celestial bodies and configurations and terrestrial beings may be interpreted – in line with the non-causal notion of “preestablished harmony” just mentioned – as purely dynamic and interactive, based on a common set of components (elements and qualities) held in common by the different realms; but it may also be seen as based on one of the many available conceptions of a physical, although invisible, astral influence (this might be referred to as a notion of “occult causality”), or as based on the presence of an invisible *archè* at work within all natural things (this may be referred to as “ontological” causality, with a cause being seen as transcending its effects, similar to the “essence” and its corporeal transcriptions, referred to above).

Seen from any such perspective (or from several of them at the same time), correspondences expressed an important understanding of how life was believed to be infused into the whole universe, and of the ontological intentionality which made it possible for “signs” to convey the properties of being along with those of structure, and fully reveal the invisible through the manifest (and vice versa).

3. CORRESPONDENCES SINCE THE ENLIGHTENMENT

The explicit worldviews and implicit assumptions that made it natural in pre-modern and early

modern contexts to think of reality in terms of correspondences gradually came to be compromised and called into doubt under the impact of the scientific revolution and, especially, of Enlightenment rationalism. Since the assumptions basic to the newly emerging world picture(s) were largely incompatible with correspondences, the nature and internal logic (in terms of its own guiding assumptions) of the latter was no longer understood; as a result, a new generation of scholars, in studying pre- and early modern cosmologies, found itself deeply puzzled by what seemed to them obvious “irrationalities” and “absurdities”. Friedrich Max Müller’s reference to the Brahmanas as ‘the twaddle of idiots, and the raving of madmen’, or E.B. Tylor’s description of magic as a ‘monstrous farago’ and a ‘contemptible superstition’ based upon incorrect thinking [→ Magic I], are only two well-known examples that demonstrate the failure of 19th-century scholars and intellectuals to understand correspondences in terms of its own premises. With respect to systems of correspondences in Western culture specifically, and with considerably more sophistication, 20th-century historians of science such as Brian Vickers (1984, 1988) have analyzed them as based upon a failure to recognize the distinction – formulated in terms of Saussurian linguistics – between signifier and signified; referring to Plato’s *Cratylus*, Vickers correctly draws a parallel between correspondences and the concept of natural signs on the one hand, and modern scientific worldviews and the understanding of signs as conventional, on the other. In short, concepts of correspondences as based upon a non-causal connection, as well as notions of “occult causality” (see above), are deeply problematic from the alternative perspective of “instrumental causality” basic to modern scientific and rationalist worldviews; and the latter’s implicit or explicit “nominalist” assumptions are no less incompatible with the “realist” ones that underly traditional correlative thinking.

→ Emanuel Swedenborg’s famous “doctrine of correspondences” is a particularly good example of how traditional and modern notions clashed during the Age of reason. On the one hand, Swedenborg’s doctrine is clearly based upon non-causal connections and formulated in a deliberate attempt at overcoming the limitations of instrumental causality, and his Biblical exegesis is grounded in an extreme version of linguistic realism; but on the other hand, Swedenborg thinks about correspondences along post-Cartesian lines, and about biblical exegesis in terms of a rationalist protestantism that relies exclusively on direct divine revelation for unveiling the real meaning of

linguistic signs (Hanegraaff 1996/1998; 2005). The result is a streamlined scholastic system that formally exemplifies traditional correlative thinking, but is curiously presented in Protestant and rationalist language.

While Swedenborg developed his system of correspondences with considerable intellectual sophistication, the same can hardly be said about most other authors who have defended or used it since the 18th century. Due to its incompatibility with the instrumental causality, rationalism and nominalism basic to modern science and philosophy, correspondences became a typical example of “rejected knowledge” seldom taken seriously by others than esotericists; and the latter, in turn, were mostly so influenced by the very worldviews to which they sought to find an alternative, that they unintentionally ended up interpreting correspondences in modern (rationalist, nominalist, quasi-materialist) terms. Tables of correspondences used by 19th- and 20th-century occultists (with → Aleister Crowley’s volume 777, consisting largely of such tables, as perhaps the ultimate example) tend to be used quite pragmatically, on the nominalist assumption that its various terms – names of gods, angels, demons, colours, substances, numbers etc. – are mere conventional signs that can be rearranged or replaced by others according to the user’s individual preferences (Hanegraaff 2003).

The major exception is → Carl Gustav Jung’s theory of synchronicity. Explicitly presented as a principle of acausal connection between nature and the psyche (that is to say, as an alternative to a worldview based upon instrumental causality), and with many references to the major representatives of esoteric currents from antiquity to the Renaissance, it is in fact a sophisticated restatement of correspondences in modern psychological terms. In the general context of → New Age spirituality, Jung’s theory has strongly contributed to a new popularity of correspondences – very seldom presented explicitly as a worldview, but broadly accepted in practice. Whereas 19th- and early 20th-century occultists were highly conscious of positivism and materialism as a serious threat that had to be countered by alternative worldviews, since the 1960s and increasingly since the 1980s one may observe a pragmatic attitude that implicitly assumes the presence of correspondences (for example in the use of → tarot or astrology) but seldom bothers to try and work out their theoretical implications or convince critics. In the wake of Jung himself, participants in the New Age milieu may sometimes invoke modern scientific theories, especially in the field of quantum mechanics, in support of correspondences or syn-

chronicity; but such theories are seen less as “proof” than as additional confirmation of a perspective that would have been adopted in any case, with or without scientific support. Such a relaxed and pragmatic acceptance of correspondences may well reflect a post-modern relativism that fails to see why scientific naturalism should be more credible than a “spiritual” worldview of correspondences. This phenomenon may well be seen as confirmation of the perspective (referred to in the introduction) that sees correlative thinking as a spontaneous and perhaps neurologically-based tendency of the human mind, which may clothe itself in theories or worldviews, but ultimately does not need them to assert itself.

JEAN-PIERRE BRACH & WOUTER J. HANEGRAAFF

Court de Gébelin, Antoine (Antoine Court), * 1725 near Nîmes, † 12.5.1784 Paris

Son of a pioneer of Protestant restoration in France, Antoine Court (1695-1760), Court is a figure typical of the late European Enlightenment. He lived in Lausanne until 1763, when he moved to Paris. In Switzerland he associated with Charles Bonnet and Isaac Iselin. The latter maintained relations with → Lavater and → Kirchberger, and was a member, like Court and Johannes Rudolf Frey, of the Economic Society of Bern; his theories on anthropology inspired Court de Gébelin and, after him, Chavannes. From that period on, Court de Gébelin had affiliations with a secret society connected to the “Order of the Knights of the Star”, a para-Masonic order dedicated to the restoration of Protestantism in France. This so-called “Céphalégie” had been founded officially in 1749 by J.-Ph. Loys de Chéseaux, and was established in Paris, Berlin, and Dresden.

From 1763 on, Court de Gébelin played a major role in the Masonic lodges in Paris. In 1777, the Mother Lodge of the Philosophical Scottish Rite complimented him for his teachings on ‘the most credible allegories contained in the grades of the Freemasons’. The general chapter of France probably used his work in 1784 for the thirty-first and the thirty-third degrees of the Scottish and Accepted Rite. Although not one of its founders, he was a member of the United Friends (Les Amis Réunis), probably from 1778 on. He was a twelfth-class Philalèthe and a commissioner to the archives (10 Feb. 1781), until his removal by Savalète de Lange (for absenteeism; actually illness) in 1783. His participation in the Lodge of Saint John of Scotland and his membership of the Elus Coëns (mentioned

by Robert Amadou in an article “Court de Gébelin” in the *Encyclopédie de la franc-maçonnerie* are disputed; he did correspond, however, with → Willermoz and → Saint-Martin. Court most distinguished himself in the Lodge of the Nine Sisters (between 1778 and 1781), of which he was a very influential member, secretary, and eventually second supervisor (1778). He also founded the academic offshoot of this lodge, the Museum of Paris (1780), whose president he remained until his death. Court became a patient of F.A. Mesmer and proselytized on his behalf (presenting a *Lettre sur le magnétisme* to the king, and joining the Société de l’Harmonie). He died while undergoing therapy with Mesmer, thus ruining all the good publicity he had provided him.

Court is especially known for his main work, *Le Monde primitif analysé et comparé avec le monde moderne* (The Primitive World Analyzed and Compared with the Modern World), published in nine volumes between 1773 and 1782. Strongly influenced by → Neoplatonism, this book aims to revive the ancient world and its lost harmony through rediscovery of the original, perfect language. This language, in which signs and things are perfectly related, is believed to be still in existence; it is hidden, but once revealed it will be accessible to everyone. By researching the common roots of all ancient and modern languages, Court believed he could recover the words of the original language, which are similar to onomatopoeia (in this he is clearly influenced by Warburton, Vico, and especially Charles de Brosses; he in turn influenced Nodier). His philological enterprise is supported by a decipherment of ancient traditions, which are seen as allegories; thus we see him interpreting myths (vol. I), calendars and rites (vol. IV), blazons, ancient history, and the → Tarot (vol. VIII). To prove his theories, Court relied on the Church fathers, the *Hieroglyphica* of Hor-Apollo, the → Hermetic literature, and his knowledge of kabbalah [→ Jewish Influences].

Court thus attempts to establish a link between ancient and modern knowledge, and between academic and hidden learning; and in renewing the study of Antiquity, he seeks to revive an interest in the Egyptian mysteries (his French etymologies suggest an Isiacal origin for the city of Paris). Nonetheless his interpretations are most often marked by a rationalist and utilitarian approach. Numbers are considered figures of the universal harmony, marking the rhythm of time-reckoning; myths are stories about the invention of agriculture and astronomy. Until 1783 (*Lettre sur le magnétisme*), he was adamantly opposed to → astrol-

ogy. The Tarot is presented with great prudence as a game of the Egyptians, in which we find their ‘civil, political and religious’ ideas and an ‘emblem of life’. He mentions its use by the Egyptians for purposes of divination [→ Divinatory Arts] only as a matter of curiosity and in referring to a text, which he reproduces at length, by another author (the count of Mellet, according to J.-M. Lhote). This rationalist tendency (or posture) seems to have progressively weakened under the pressure of various influences, such as that of Saint-Martin, who sought to win him over to his own worldview in their conversations at the time when Court was writing the final volumes of *Monde primitif*. Its first volume, on the one hand, and the *Lettre sur le magnétisme*, on the other, represent the two extreme poles of this evolution.

Finally, Court was an important link in the history of the relationship between → Illuminism and Protestantism: vacillating between a strict interpretation of the Scriptures, on the one hand, and → Pietism, on the other, and likewise between a condemnation of prophetic inspiration (and of divination) and a conviction that the lineaments of the future are contained in the sacred texts, he affirmed that vestiges of all previous knowledge can be recovered by deciphering “the harmony of the world”.

ANNE-MARIE MERCIER-FAIVRE

Crowley, Aleister (born Edward Alexander), * 12.10.1875 Leamington, † 1.12.1947 Hastings

One of the main figures in the history of English occultism [→ occult / occultism]. Despite his bad reputation and the controversies that have marked his life, his ideas have heavily influenced contemporary new religious movements of a magical [→ Magic] and neo-pagan bent [→ Neopaganism]. Crowley has left an enormous literary output, including almost any genre: from poetry and fiction to essay and autobiography. Apart from his occult interests and activities he is also remembered as a poet, mountaineer, and chess player of some talent.

The scion of a wealthy family of brewers, Crowley's early life and education were those typical of a member of the middle upper class in England of his time, but for the fact that both his parents were strict Plymouth Brethren (the fundamentalist evangelical sect founded by John Nelson Darby [1800-1882]). This element would play an important role in his future intellectual development. In fact, even if Crowley would eventually repudiate Christianity

altogether, he always remained bound to the legacy of symbols and images of the Bible, especially its apocalyptic parts. Crowley seems to have been at ease with his parents' religious persuasion until 1887, when his father died prematurely. This event provides us with one of the keys for understanding Crowley's psychology, as it is probably at the origin of his unquenchable desire for revolt against traditional social and religious values. He had much admired his father, who, according to Crowley's later autobiographical account, does not seem to have held narrow views concerning his upbringing and education. But after his father's death, his mother and her family, whom Crowley accuses of sheer bigotry, began to have a much stronger influence over his life. This development, coupled with some unpleasant experiences he had in some of the schools he attended later, was certainly at the origin of his hatred of Christianity.

In 1895 Crowley entered the prestigious Trinity College, Cambridge, as an undergraduate student. Even though he did not conclude his studies, his university years would have a profound influence on him. In this period he publishes his first books of verses at his own expenses, which receive some favourable press reviews. He also begins to feel attracted by spirituality, and in particular by the occult. The turning point in his early life comes when, in 1898, he meets two members of the → Hermetic Order of the Golden Dawn (GD), who introduce him into the Order. He is initiated as a Neophyte in the Isis-Urania Temple of the GD, in London, in the autumn of that year. This is the first crucial event in Crowley's spiritual career. He dedicates himself with enthusiasm to the study of the teachings imparted by the Order, and rapidly climbs the initial steps of the Order's initiatic system. He also decides to follow the instructions contained in *The Book of the Sacred Magic of Abra-Melin the Mage*, a grimoire which had been edited and published in that same year by → S.L. Mathers, then the leader of the Order. In the context of the GD he meets two persons who will have a strong influence on him. The first one is Allan Bennett (1872-1923), who would later convert to Buddhism and become one of the first Buddhist missionaries in England. Bennett teaches Crowley the first rudiments of ceremonial → magic, and, during their experiments together, Crowley begins taking drugs in the context of magical practice – something that will remain an important aspect of Crowley's life in the subsequent years and, indeed, up to his death. The second important person is Mathers himself. In 1900 Crowley is directly involved in the feud which opposes Mathers, then

living in Paris, to the London high-ranking members of the GD. He decides to side with Mathers and is therefore expelled, together with his mentor, by the London faction. The impact of the GD system on Crowley would remain fundamental, however.

The end of Crowley's experience in the GD marks the beginning of a period of travels around the world, which would last, with some interruptions, until 1906. He spends a long period in Mexico, and then in India, where, together with his friend Bennett, he discovers the practice of yoga and Buddhist doctrines. In 1902 he takes part in an important, but unsuccessful, expedition to conquer the K2, the second highest peak in the world. On his return to Europe he spends several months in Paris, getting acquainted with artists and intellectuals in the bohemian circles of Montparnasse. In 1903 he marries Rose Kelly (1874-1932), sister of his close friend, the painter Gerald F. Kelly (1879-1972). The couple then leaves for a long journey through the East. During their return journey occurs the second fundamental event in Crowley's spiritual career. In Cairo, in the Spring of 1904, he is reportedly put in contact, through the mediumship of his wife, with a *præter-human* entity named Aiwass. He receives from him the text of the *Book of the Law* (*Liber Legis*, also called *AL*), which he would later consider the sacred text of a new religion called "Thelema" (ancient Greek for "will").

After another unsuccessful expedition on the Kangchenjunga, in 1905, Crowley makes a long tour across southern China. During this travel he performs the ritual of the *Augoïdes*, which is a continuation, in another form, of the ritual of Abramelin for the attainment of the knowledge of his Holy Guardian Angel. The ritual lasts thirty-two weeks, and has the peculiarity of being performed only in an imaginative – or rather "astral" – form. This means that Crowley, while travelling on horseback, imagines himself being in a magical temple and performing all the ritual acts necessary for this kind of working.

After his return to England, he publishes a collection in three volumes of his youthful works, mostly poetry (*Collected Works*, 1905-1907), a collection of essays (*Konx Om Pax*, 1907), and an important synthesis of his system of → correspondences, developed on the basis of the GD system (777, 1909). In this period he also meets an English officer, John Frederick Charles Fuller (1878-1966), who had spent a long time posted in India and had become interested in his works. Fuller writes the first critical work on Crowley, *The Star in the West* (1907), and in 1909 helps Crowley to found his

own magical Order, the A.:A.: (the initials are usually interpreted as "Astrum Argentinum", or "Argenteum Astrum", i.e. Silver Star). In relation to this project, Crowley also starts the publication of a biannual periodical, *The Equinox* (1909-1913, 1919), which is presented as the official organ of his Order. In it he publishes its official teachings, but also poetry and fiction, both by himself and by other authors belonging to his circle. Also in 1909, together with his disciple Victor B. Neuburg (1883-1940), he "explores" the magical system of → John Dee, through an important series of invocations and astral travels in the desert of Algeria. The account of these magical experiences would be published in 1911 in *The Equinox* (I, 5) as "The Vision and the Voice".

Around 1910, rumours begin to find an echo in the press about Crowley's homosexuality and the alleged immorality of his Order's activities. It is the beginning of a campaign of vilification which will continue practically for the rest of Crowley's life, and will reach its climax after World War I. The A.:A.: suffers from these exposures, and several members decide to resign. In the same period Crowley meets the journalist and occultist Theodor Reuss (1855-1923), a figure very active in the European fringe-masonic and occultist scene. Reuss wishes to launch a new fringe-masonic Order, whose main purpose is the teaching and practice of sexual magic: the → *Ordo Templi Orientis* (OTO). He asks Crowley for his collaboration and the latter accepts, in 1912, to create and run a British section of the Order under Reuss's authority. Crowley, now definitely convinced of his prophetic role in relation to Thelema, undoubtedly looks at the OTO as a convenient channel for the propagation of his new religious message. After having published, in 1912, the first two parts of his *Book Four*, where for the first time he systematically expounds his theories on magic, he begins in the following year to experiment with sexual magic, whose basic technique had been transmitted to him by Reuss.

Crowley spends the period of World War I in the United States. He has by then exhausted his financial resources, and at times finds himself close to destitution. He works as a journalist and editor for the German propaganda in America, an activity that will later cause him to be reproached for betraying his country. In this period he works with the American astrologer Evangeline Adams (1859-1932) on a project of writing a comprehensive treatise on → astrology. However, their collaboration ends prematurely, and Adams eventually, in the 1920s, publishes the result of their joint efforts

under her own name. Crowley's astrological writings related to this project would not be published until 1974 (a more complete edition, restoring previously missing parts, has been published in 2002).

In this period, the number of his disciples (whether in the OTO or in the A.∴A.∴) has shrunk considerably. Among them, however, is the important figure of Charles Stansfeld Jones (1886-1950), who would come to play a significant part in the doctrinal development of Thelema, and would later (especially under the pseudonym of Frater Achad) gain some reputation as an author in his own right. Crowley himself writes, among several other works, the novel *Moonchild* (published in 1929), in which many figures of his past experience in the Golden Dawn are lampooned. In 1918 he meets Leah Hirsig, a schoolteacher, who will remain his lover and partner for several years afterwards. In 1919 he publishes the first volume of a new series of *The Equinox* (the so-called "Blue Equinox"), largely devoted to the OTO. Soon afterwards he leaves the United States and returns to Europe. In 1920 he settles in Cefalù, Sicily, where he establishes his "Abbey of Thelema", a sort of commune with Hirsig and other disciples, in which he tries to put into practice the principles of his new religion. It is a very productive period. He publishes another novel, *The Diary of a Drug Fiend* (1922); writes his enormous "autohagiography", *The Confessions* (partially published in 1929); and works on the third part of his *Book Four*, intended to be his *magnum opus* on magic (published between 1929 and 1930 as *Magick in Theory and Practice*). Crowley's experiment at the Abbey lasts only three years. In 1923 he is expelled by the Italian authorities, probably because of a renewed campaign of attacks in the English press. Subsequently he moves to Tunis, and later to Paris. In this period he also succeeds Reuss, who had died in 1923, as leader of the OTO. In 1925 there is a meeting in Weida, Germany, aimed at establishing his leadership of a German Rosicrucian movement, closely related to the German OTO, and led by the bookseller Hermann Tränker (1880-1956). But only a portion of the persons involved decide to follow Crowley and accept his new religious message. Among them are the businessman Karl Germer (1885-1962), who in the following years supports Crowley financially and will succeed him, after the latter's death, as head of the OTO.

During the years 1926-1929 Crowley's headquarters are mainly in Paris. Around 1928 two new young disciples join him, after having been in correspondence with him for some time: Israel Regardie (1907-1985) and Gerald Yorke (1901-

1983). They collaborate closely with Crowley until the early 1930s, when they part ways with him. Regardie would later become an influential author on magic and esoteric subjects in his own right, also contributing in the 1960s and the 1970s to the rediscovery of Crowley's ideas through new editions of his writings and an important study (*The Eye in the Triangle*, 1970). Yorke, for his part, would later become the owner of the largest collection of Crowleyana in the world (rare first editions, manuscripts and documents), thereby playing a fundamental role in the preservation of Crowley's intellectual legacy. His collection is now housed in the Warburg Institute, London.

In March 1929 Crowley is forced to leave France as well. He moves first to England, and then to Germany. In 1930 he makes a short trip to Portugal and meets the poet and esotericist → Fernando Pessoa, with whom he is on friendly terms, and whose esoteric ideas have been influenced to some extent by Crowley.

In 1932, at the eve of the nazi seizure of power in Germany, Crowley moves back to England. He will not leave the country again. In 1934 he is defeated in a libel suit against a publisher. Unable to pay the costs, he is declared bankrupt. He now lives almost entirely on the allowances sent to him by his disciples, especially the members of the only surviving body of the OTO at the time, the Agape lodge in California. But despite his material difficulties, he continues to write and publish extensively. Among the significant publications of this period, mention must be made of *The Equinox of the Gods* (1936), in which he narrates the events related to the revelation of the *Liber Legis* in 1904, and *The Book of Thoth* (1944), in which he expounds his personal interpretation of the → Tarot. This is also implemented by the design, made jointly with the artist Frieda Harris (1877-1962) of a new Tarot deck, which incorporates Crowley's peculiar symbolism and attributions. The deck would be published only posthumously in 1971. It has become one of the most widespread tarot decks in the world, frequently used also by persons who are not acquainted with – let alone accept – Crowley's philosophical or religious ideas.

Crowley spends the difficult years of World War II first in London, and then in various country retreats. His last resort is a boarding-house near Hastings, where he dies in 1947. Some other important works have been published after his death, such as *Magick Without Tears* (1954), written in his last years and containing an introductory exposition, in epistolary form, of his doctrine; the *Liber Aleph* (1961), a compendium of teachings originally

written during the American period for his disciple C.S. Jones; and an edition of the *Confessions* (1969) including the hitherto unpublished volumes.

Because of his controversial reputation Crowley has often been dismissed, without adequate analysis of his works and ideas, as a mere quack or charlatan. One of the most popular misunderstandings has led to him being labelled a Satanist, which, if we exclude theological definitions of → Satanism, he was not (although he has certainly influenced contemporary Satanist movements). From a symbolical point of view, Satan plays no significant role in Crowley's ideas. His mythical and symbolical references went well beyond Christianity, and his aim was to propose a full-blown, original religious alternative to it. Despite the prominence of anti-Christian elements, his system can hardly be considered as a mere reversal of Christianity, as the classic definition of Satanism would require.

Crowley's doctrine, expounded in a large number of writings, is considerably more complex than it would appear at first sight. His works require careful study and analysis, especially as Crowley's literary style is sometimes – more or less on purpose – quite obscure. In the context of English occultism he was one of the very few authors to have received formal higher education in a traditional university, and all his life his cultural interests remained extremely wide and eclectic. As a result, he drew ideas and inspiration from many disparate sources, both Western and Eastern, and blended them into his own peculiar system. His Western sources include ceremonial magic, astrology, the Tarot, Kabbalah, Egyptian lore, John Dee's Enochian system, and → alchemy; his Eastern ones include yoga, Buddhism, Taoism, and the I-Ching. Two aspects stand out as fundamental in his work: magic (which, for various reasons, he chose to spell “Magick”) and Thelema.

In a general sense, Crowley saw magic as a convenient term to define his doctrine as a whole, including Thelema. More specifically, Crowley understood magic mainly in two ways, both of which are far from uncommon in the context of occultist literature. The first one is mostly pragmatic in nature, and considers magic as a technique for achieving specific goals by means which cannot as yet be explained scientifically, but the results of which can (in theory at least) be tested in an empirical way. Gaining considerable sums of money or the effortless acquisition of extensive knowledge in a particular field could be mentioned as classic examples. Crowley's most famous definition of magic, which was subsequently adopted by a plethora of authors, is closely related to this idea:

“Magick is the Science and Art of causing Change to occur in conformity with Will” (*Magick in Theory and Practice*, 1929-1930, xii). According to this definition any intentional act could be defined as magical, which would of course seem to reduce the specificity of magic as a particular field of action. In reality, in referring to magic in this context Crowley usually had in mind a rather precise set of practices and ideas, based mostly on traditional ceremonial magic. He had learned their fundamentals during his membership in the GD, and considerably developed them on the basis of his subsequent experiences. In later years, his discovery of sexual magic led him to significantly change his understanding and practice of magic; in fact, sexual magic made most of the material apparatus of ceremonial magic superfluous. Sexual magical workings, based on notions of subtle physiology mostly borrowed from Eastern doctrines (in particular *hatha yoga*), may use only the body of the magician as a magical tool, eliminating the need for external implements such as a temple or the traditional “weapons” of ceremonial magic. The aim of magic in this sense is not necessarily material in nature: magic can also be used to obtain communications from spiritual entities, or to explore the “astral plane” by means of the techniques of astral travel that Crowley had learned in the GD. The messages that he received through these magical practices often had a meaning that was specific to his own spiritual evolution (but they could also be on a grander scale and concern the evolution of mankind, as in the case of *Liber Legis*). By the same token, through these practices Crowley thought he could improve his knowledge of the symbolic network of correspondences, which are supposed to create a unifying link between all the parts of the universe. It is to be noted that, especially in relation to this first, pragmatic sense of magic, Crowley claimed to have a scientific, rational approach – again, something far from uncommon in the context of occultist literature.

The other sense in which Crowley understood magic was certainly seen by him as the most important, although it can be considered to be complementary to the first one. According to this second perspective, magic is not so much oriented towards immediate ends, but rather becomes a way to achieve what Crowley considered the supreme goal of one's life: spiritual attainment. Magic then loses its instrumental character, and becomes instead a practice and a worldview which encompass all aspects of a person's life. It is not so much a matter of different practices, but of a different interpretation of them. Traditional ceremonial and sexual

magic could be used, in Crowley's vision, both for immediate purposes and as a means to achieve the ultimate spiritual goal. Ideally, in the latter case, the individual should fully dedicate himself to this pursuit, and be ready to sacrifice all his earthly possessions and affections for its sake. Crowley uses various expressions to define the aim of magic in this spiritual sense. In some passages he describes it as comparable to the mystical "union with God", but he also equates it with the ultimate goal of classic yoga practice, i.e. the ecstatic trance of *samādhi*. But perhaps his most famous definition describes it as the attainment of the "knowledge and conversation of the Holy Guardian Angel", a notion taken from the *Book of the Sacred Magic of Abra-Melin*. Among the members of the original (pre-1900) GD, Crowley was certainly the one most influenced by this book (which, it should be noted, was never a part of the official curriculum of this Order). He is probably also the only one who actually tried to put its instructions into practice. Crowley claimed to have attained the goal described in the book in 1906, and this was certainly a very important step in his spiritual career.

It has sometimes been assumed that his Holy Guardian Angel corresponded to Aiwass, the entity who had dictated to him the text of the *Liber Legis* in 1904, but this is not entirely correct and requires some qualifications. In fact, Crowley's notion of the Holy Guardian Angel evolved with time. At the beginning, it corresponded for him to the idea of "Higher Genius", "Higher Self", or "Augoeides" – a notion that was prominent in GD teachings and had been borrowed originally from theosophical literature. The Higher Self was not considered as an independent entity, but as the superior, spiritual element present in every human being. The aim of magical (or "mystical") practice was therefore to open one's consciousness to that higher part of oneself, which is normally not perceived by the non-initiate. Aiwass, on the other hand, was always seen by Crowley as a personal being, not necessarily discarnate, and completely independent from his own consciousness or psyche. In that sense Aiwass rather resembled the "Secret Chiefs" of the GD, or the "Mahatmas" of the → Theosophical Society. Subsequently, however, Crowley's ideas about his Holy Guardian Angel began to shift, and he came to identify it more and more with Aiwass. This evolution might be interpreted as a sign of Crowley's increasing personal identification with his own mission as the prophet of Thelema.

It is important to note that this "mystical" notion of magic is closely related to the idea of an

initiatic path, which is another fundamental aspect of Crowley's magical doctrine. The stages through which the aspirant must proceed in order to achieve spiritual attainment correspond to the system of degrees in Crowley's own Order, the A.: A.:, which was modelled on the one of the GD. But apart from the similarities, there were also significant differences between the two systems. One has already been mentioned: the added emphasis in Crowley's Order on Eastern doctrines and practices, especially yoga. Another difference lies in the fact that, in the original GD system, initiatic advancement was effected through a formal ceremony, akin to a masonic ritual. This made group meetings between members a common feature of the Order's activities. In Crowley's Order, on the other hand, this social aspect was increasingly reduced, the only form of contact between members being an individual relationship between the aspirant and his immediate superior in the Order's hierarchy. By the same token, initiation was supposed to take place mostly on the astral plane, which made the actual performance of a dramatic ritual less important than it was in the GD. But perhaps the most important difference between Crowley's Order and the original GD is that, in the latter, only the two first Orders which compose it (the GD proper and the Ordo Rosae Rubeae et Aureae Crucis [RR et AC]) were in principle accessible to members. It was assumed that the Third Order, including the three final grades of the system, was so elevated that only the "Secret Chiefs" could have access to it. But Crowley's ambition to reach the highest peak of initiation could hardly be restrained by this theoretical limitation. Therefore, not only did he introduce into his system a whole new doctrine concerning the import of these last degrees for the initiate; but he eventually claimed to have attained, in the early 1920s, the last degree, which he chose to call "Ipsissimus" (in the original GD system this grade had been left unnamed). For him, attaining this grade was equivalent to becoming a god. In this respect, an important element should be considered. The "union with God", or the knowledge of the Holy Guardian Angel, only correspond to an intermediate grade in Crowley's initiatic system, i.e. that of Adeptus Minor. After it, there remain several grades before the highest one is achieved. This would seem to imply that if the knowledge of the Holy Guardian Angel is the final goal of magic, as Crowley states on several occasions, the highest goal of initiation transcends it and goes much further. In reality Crowley was not particularly consistent on this point, and it can be concluded that magic, understood in its widest

sense, included for him both the knowledge of the Holy Guardian Angel *and* the process leading to the highest step of initiation.

The other fundamental aspect of Crowley's doctrine is Thelema. Indeed, this complex religious element is what mainly differentiates Crowley from previous occultists. The doctrinal principles and beliefs fundamental to Thelema are combined with the practice of magic, so as to form an organic and coherent worldview. According to Crowley, the revelation of the *Book of the Law* in 1904 marked the beginning of a new "æon", i.e. a new cosmic age. The old age of Christianity, and more generally of paternalistic religions, symbolised by the image of the "Dying God" (borrowed from J.G. Frazer), was at its end. The new age is symbolised by the Egyptian god Horus, whose image as "son" is contrasted to that of his "father" Osiris (symbolising the previous age), and also to that of his "mother" Isis (symbolising a yet older, matriarchal age). The rebellious, individualistic, and iconoclastic energy of youth is therefore opposed to the decaying power of authority and tradition. The clearest example of an old-fashioned religion destined to swift extinction is of course Christianity, which for Crowley represents all that he rejects, both from a social and a moral point of view. Despite the prominence of images borrowed from the New Testament, Thelema and Christianity are seen as largely incompatible, and almost as exact opposites. Indeed, anti-Christian attacks are a recurrent theme in Crowley's writings. The negative charge of some biblical images (some examples of which will be given below) is reversed in Crowley's system, and becomes essentially positive.

The transition from the old to the new æon is concomitant with the activity of enormous cosmic energies, and is not supposed to take place quietly or peacefully. The effects of this cosmic storm on earth are a period of violence and wars, and Crowley saw a confirmation of his doctrine in various historical events that took place during his lifetime, notably the two world wars. As our planet enters the new æon, the old morality will expire, and will eventually be replaced by a new one based on Thelema.

The principles of this new religion are obviously taken from the *Liber Legis*, the holy scripture of Thelema. We mention here the three fundamental ones. The first is: "Do what thou wilt shall be the whole of the Law" (AL, I, 40). According to Crowley's interpretation, this principle does not justify the satisfaction of mere whimsical fancies or desires, and does not imply a notion of absolute individual freedom either. On the contrary, it

implies that every human being is called to accomplish his/her "true Will", i.e. to follow his/her real nature and fulfil the role that the universe has assigned to him/her, whatever that may be. The second principle is: "Every man and every woman is a star" (AL, I, 3). The true Will of any individual is similar to the trajectory of a cosmic body, such as a star or a planet. If all human beings would follow their proper trajectory, conflicts would disappear, for they actually result but from ignorance of this trajectory. The ultimate goal of an initiate thus consists firstly in discovering his/her own true Will, and then in following its lead. It is at this point that magic plays a fundamental role in the system, since it is through magic that this process of discovery and accomplishment can be achieved.

Magical work also aims at the reunification of the opposites which, on a cosmic plane, are represented by a feminine and a masculine force, referred to respectively as Hadit and Nuit. The polarity between the two notions is not purely sexual: Hadit represents mostly the infinitely small, whose image is the geometrical point, full of still unfolded potentialities; Nuit represents the infinite space of the universe, whose image is the starry night sky. These macrocosmic notions appear already in the *Liber Legis*. Clearly of Egyptian origin, they correspond on a microcosmic plane with notions derived from biblical images, in particular the book of Revelation. Crowley in fact came to identify his role as prophet of Thelema with the image of the Great Beast described in Revelation, related to the number 666 (Rev. 13:1-18). Especially since the early 1920s, Crowley publicly used "The Great Beast 666" (or its Greek equivalent, "To Mega Therion") as his main alias. To complete the polarity, a female figure accompanies the male prophet figure; she is referred to as "Babalon" (obviously a slightly modified spelling of "Babylon") or the "Scarlet Woman", the prostitute who rides the Beast in Revelation (17:1-7). This role was actually fulfilled, during Crowley's life, by his partners. The two most significant "Scarlet Women" were undoubtedly his wife Rose and, later in his life, Leah Hirsig. Fundamental to the work of unification of these two poles, both on a macrocosmic and on a microcosmic level, is the third basic principle of Thelema: "Love is the law, love under will" (AL, I, 57). Love is seen by Crowley as the force that makes the union of the opposites possible. But this aspect of thelemitic doctrine can also be considered the theoretical basis of sexual magic. The "Will" that controls love is in this case the concentration of the magician focused on the aim of the magical working during the sexual act.

What has been said so far concerning the basic tenets of Thelema should be complemented by another important element. It is possible to detect an influence on Crowley's doctrine of the solar-phallic theories which had become fashionable in England particularly in the second half of the 19th century. According to these theories, all religions had originally developed from the worship of the generative powers represented by the sun and the phallus. Most living religions supposedly still bore the remnants of this ancient legacy, and their symbolism could be interpreted accordingly. In Crowley's doctrine, great importance is given to the image of the Sun as giver of life, which corresponds on the human plane to the phallus. The correspondence between the two is completed by a strict analogy – certainly not original with Crowley – between light (radiated by the Sun) and semen (ejaculated by the phallus). Crowley, especially in his role as the “Great Beast 666” sees himself as a mediating figure between the two, incarnating a solar and phallic force at the same time. Finally, it must be noted that the prominence of the male-female polarity in Thelema does not in itself exclude other forms of sexuality than the heterosexual. In his personal development of sexual magic, Crowley made frequent use of practices based on homosexual intercourse, even if these could not be explained in terms of his doctrine of polarity.

No assessment of Crowley's importance in contemporary esotericism would be complete without a consideration of his legacy. Crowley's “Magick” and Thelema have both exerted an enormous influence on subsequent occultist and magically-oriented literature, so that it is sometimes impossible to understand aspects of the latter without an elementary grasp of Crowley's doctrine. Crowley's influence can be seen in the work of major authors such as → Dion Fortune, and that of his ex-disciples Israel Regardie and Kenneth Grant (b. 1923). Gerald Gardner (1884-1964), the founder of the neopagan movement known as Wicca, was certainly influenced by Crowley's writings on magic as well. The same can be said of the most prominent authors of contemporary Satanism, Anton Szandor LaVey (1930-1997) and Michael Aquino (b. 1946). The two magical Orders of which Crowley was the leader, the OTO and the A.:A.:, still exist today despite recurrent schisms, and are among the major vehicles for the transmission of his ideas.

Cryptography

1. INTRODUCTION
2. HISTORICAL BACKGROUNDS
3. CLASSIFICATION
4. AN EXAMPLE

1. INTRODUCTION

Cryptography in the context of Western esotericism can be understood simply as a means to

2. HISTORICAL BACKGROUNDS

A proposal for tracing the development of various forms and manifestations of cryptography in the West has been presented by Le Pape (1999). From the 10th to the 12th century, due to the numerous translations of hermetic and related writings from Arab into Latin, a domain for mutual fertilization between the three Scriptural Religions was created, which was instrumental in fostering esoteric and scientific ideas in general and, by the same token, the emergence of a *philosophia occulta* in particular (see e.g. the numerous Arabic magical alphabets reproduced in Hammer [1806]). The most interesting type of cryptographic writings to be found in this literature, and undoubtedly the most typical one, is known and referred to, in English, as “ring-letter writing(s)” (or ring-writing, ring-alphabet[s]; in French, *écriture[s] à lunettes*), since their baroque characters are partly made of tiny balls or rings. Such writings already appear in some Greek papyri of the 3th-5th centuries (see Ruelle [1913], in which few of the alphabets are complete, and Kenyon [1893], Nrs. CXXI-CXXV) but their sources might well be more ancient. They were widely disseminated during the Middle Ages, but occasionally at the expense of their actual purpose, since they came to be used without restraint in the fashioning of objects such as talismans. A series of small books, frequently ascribed to → Albertus Magnus (1206-1280), have punctuated their historical development. They are known as *Claviculae Salomonis* (see many examples in Thorndike [1923-1958] II, 279ff.), and have remained popular throughout the centuries. We find echos of them in Cornelius Agrippa’s *De occulta philosophia* (1533), where planetary magic and demonic magic meet up again. In modern times this abundant heritage has undergone several modifications, and has been, as it were, polished and refined: the medieval “formulas” were, for the most part, rejected in favour of a more “noble” theurgy. For instance, Pasqually’s cryptographic signs appear to be used mostly as instruments for attaining a redeeming personal gnosis, based on communication with angelic beings.

3. CLASSIFICATION

Within the esoteric context that interests us here, it is not so much the formal characteristics of cryptographic writings which matters, but rather their actual purpose, the needs they are supposed to meet. Hence the following classification is based upon a distinction between three main types of magical communication. It still remains, however, that a sharp borderline between such categories is

not possible (as will become particularly clear in the case of the first category).

A. *Talismanic communication*. This category implies a communication with the celestial world from the perspective of the terrestrial, i.e., a communication based upon and subject to man’s initiative. This appears to be the most frequently used type. For example, the signs engraved in talismans are closely linked to the nature of the celestial influences that one seeks to attract. The talisman, therefore, acts as a catalyst or receptacle for the radiance of the stars or of the angels. It is supposed to operate by means of identification, i.e. by assuming the characteristics of the celestial things to which it corresponds. This entails the necessity of knowing the affinities (patterns of sympathy and antipathy) which govern the relations between all parts of the universe, i.e. the ability of deciphering the book of Nature. Moreover, signs usually have to be engraved, and the talisman has to be prepared under the correct astrological constellation. The use of alphabets is here limited to selecting some of the signs necessary to a given magical operation; therefore we rarely find, in this context, a whole group of words or sentences. Alphabets used for this first type of communication are a common component of the so-called Solomonian literature (the numerous writings going under the name of *Claviculae Salomonis*, comprised, *inter alia*, of a number of small works attributed to Honorius or to Albertus Magnus). Likewise, the ring-alphabets known as those of Jupiter, Solomon, Syrianus or Brachmanicum (as documented in the writings of Joseph Hammer, Blaise de Vigenère, Cornelius Agrippa, → Athanasius Kircher) are typical of this means of communication; but many other alphabets used in the context of the other two types of communication occasionally appear here as well, since talismanic practitioners have erratically borrowed from various systems. Quite widespread in the Middle Ages, the golden age of “talismania”, the ring-alphabets and the other alphabets mentioned here did not fall into oblivion but were still in use far beyond the 15th century.

B. *Natural communication*. This category involves communication from the celestial world to the terrestrial world. It is unilateral, not being the response to a request. The intermediate beings use, as it were, the supposed symbolic characteristics of the heavenly bodies, like comets, stars or planets, to build up words and messages that only the human beings in possession of a given secret alphabet will be able to decrypt, so that ‘the Great Book of Nature be open for all to see though only a few can read it or understand it’ (Rosicrucian

Confessio, 29). These messages, usually assumed to have been directly inspired by God, are mostly supposed to be the bearers of news concerning political events to come, but they can also refer to serious epidemics, such as the plague. Alphabets belonging to this type are called “Celestial writing” (*Scriptura Coelestis*, cf. Agrippa, *Occ.Phil.* III, 30), “Writing & Language of Heaven” (Ms Harley 6482 fol. 75), or *Malachim* (“Alphabet of Angels or Kings”, as again in Agrippa, *Occ. Phil.* III, 30). The characters of these alphabets have sometimes the form of stars and are generally similar to the square Hebrew alphabet, but the extremities of these characters usually have the shape of rings. The relation between Celestial writing and stars is somewhat obscure in the *De Occulta Philosophia*, but two maps by J. Gaffarel (in his *Curiositez inouyes . . .*) indicate how to find the correspondence between each letter and each star (or constellation of stars, similar to the constellation of the zodiac) in the northern and southern hemispheres. Other authors have also reproduced the forms of these alphabets with great clarity. Among them are J.B. Hepburn (in his *Virga Aurea* [1616] he calls them *Super caeleste* and *Enochaeum*), Jacques Gaffarel, Athanasius Kircher or T. Bangius (*Caelum orientis et prisci mundi*, 1657). This group of alphabets is frequent in the Middle Ages and during the Renaissance, that is, in a period when the idea of a connection between the stars and their signs was rarely called into question. The ecclesiastical authorities sometimes took up arms against cryptographic views and practices, but could not deny that the star of Bethlehem bore witness to the role of a celestial object in helping humanity.

C. *Theurgic communication*. This type of communication is bilateral and therefore makes a dialogue possible. It left its mark in the 17th century in western Europe with a theurgy that turned out to be, so it seems, the most accomplished example of communication between angels and man. Here the angel, representative of the “subtle” realm, and Man, or part of the “gross” one, cooperates with a view to ‘working out the miracles of one thing’ (if it is permissible to make use here of the oft-quoted formulations of the *Tabula Smaragdina*) and establishing a kind of theurgical union in tune with heaven’s harmony. Pasqually’s system is a typical example of this form of “co-operative” theurgy in which the signs and hieroglyphs are used, as seen above, to invoke (and/or identify) each angel by his name. Further examples of this category are the alphabets called *Seraphicum* (in J.B. Hepburn, *Virga aurea* [1616], pl. I), *De transitu fluminis* (in Agrippa, *Occ.Phil.* III, 30; → Guillaume Postel,

Linguarum Duodecim Characteribus, 1538 etc.) or the series of alphabets referred to as “of Raphaël” (in Ms Harley 1921 fol. 56). Writings of this third type often appeared together in one single treatise (as is the case in books by A. de Balmis, 1523; Blaise de Vigenère, 1586; Julius Bartolucci, 1675-1694; Geoffroy Tory, 1529 or Athanasius Kircher, 1652-1654). An exceptionally long text, written in the *De transitu fluminis* alphabet, has been analysed and transliterated by M. Danon (1910). The alphabets that belong to this category enjoyed a broad success as early as the beginning of the Renaissance, and flourished at least as far as Martines de Pasqually’s time.

4. AN EXAMPLE

To illustrate the nature of cryptographic writings, let us take the seal of Saturn as Agrippa presents it (it was also reproduced by → F. Barrett, *The Magus . . .* II, 1, plate 3, along with much of the text of Agrippa’s book, which contributed to its dissemination), and compare it with the letter “S” as it appears among the hieroglyphs of the aforementioned “Register of 2400 names” (Prunelle de Lière Ms in Grenoble) by Martinez de Pasqually. We see that these signs are similar, but not identical. The seal which can be found in Agrippa (*Occ.Phil.* II, 149) is, under the name of Saturn, accompanied by the magical square of that planet. This square is composed of the numbers 1 to 9, the sum value of each line of numbers being 15. The key to the construction of this seal as based upon a magical square was provided by → Louis-Claude de Saint-Martin (in *Des nombres*): by simply following the order of the numbers, one gets the seal. Different magical squares yield different seals:

F. Barrett
*the seal of
Saturn*

M. de Pasqually
hier. “S”, n° 33

Ms. BRI. Har.
6482 fol. 92

Magic
Square of
Saturn

This method only concerns the seals and is not true, of course, for ring-alphabets, since the latter are in the order of letters proper: they are transliterations.

The way these alphabets are organized, the number of letters, and their order, are very reminiscent of the Hebrew characters, and this is emphasized by the name given to each alphabet (frequently “old hebrew”, e.g. Ms Harley 1921 fol. 58; “alphabetum hebraicum”, e.g. Ms Harley 6030 fol. 15). Many Arabic authors (e.g. Ibn Wahshîya)

tried to establish a correspondence between a ring-alphabet, the Hebrew alphabet, and the Arabic one. The problem that the Arabic alphabet has six more letters than the Hebrew, these authors usually solve by putting the remaining Arabic letters (which have no correspondance to the Hebrew alphabet) at the end of their ring-alphabet to get 28 letters, and trying to draw them in a style reminiscent of the graphism of the ring-writing. For example, if one compares the celestial alphabet of Agrippa to that of "Syrianus the philosopher" of Ibn Wahshiya (9th-10th cent., cf. Hammer, 36), one notices that the six Arabic letters unrelated to the Hebrew alphabet are gathered together at the end of the alphabet and are very similar to one another. In fact, the majority of cryptographic alphabets, whether they came from the Western world or from the Islamic one, have originated from adaptation of the Hebrew alphabet, over a period of more than one thousand years.

GILLES LE PAPE

Cudworth, Ralph, * 1617 Aller (Somerset), † 26.6.1688 Cambridge

Cudworth was the leading philosopher of the group known as the Cambridge Platonists. He was born in Aller, Somerset, in 1617, the third son of Ralph Cudworth († 1624). He was educated at Emmanuel College, where he was elected to a fellowship in 1635. His contemporaries at the college included many of the Cambridge Platonists: Benjamin Whichcote, John Smith, Peter Sterry, Nathaniel Culverwell. Cudworth's friends at Emmanuel included Samuel Cradock, John Wallis and John Worthington, and the future Archbishop of Canterbury, William Sancroft. During the upheavals of the Civil War, Cudworth was appointed Master of Clare Hall and Regius Professor of Hebrew. In 1646 he gave a series of lectures on the Temple of Jerusalem and on 31st March 1647 he preached a sermon to the House of Commons. In 1654 he was elected Master of Christ's College, where his friend, → Henry More (1614-1687), was a fellow. In 1656 Cudworth advised

Cromwell on the readmission of the Jews to England. He retained his college and university appointments after the Restoration of monarchy and in 1662 was presented to a living in Hertfordshire by Archbishop Sheldon. In 1664 he preached a sermon at Lincoln's Inn. In 1669, he was involved in the expulsion from Cambridge of Daniel Scargill, a self-confessed Hobbit. But he received no preferment in the new ecclesiastical and political order, probably because of his earlier links to Cromwell, his latitudinarianism and his de-emphasis on the institutional aspect of religion. In his lifetime he published only one major book, his *True Intellectual System of the Universe* (1678). This was intended as the first part of a more extended treatise on liberty and necessity that was never completed. Two further parts were published posthumously: *A Treatise Concerning Eternal and Immutable Morality* (1731) and *A Treatise of Freewill* (1838). Two manuscripts on the same theme, "On Liberty and Necessity", remain unpublished to this day.

Cudworth's *The True Intellectual System of the Universe* is a compendious philosophy of religion in which he undertakes an anti-determinist defence of theism against atheism and materialism. In it he makes extensive use of *consensus gentium* arguments to demonstrate that the idea of God is natural to all mankind. In so doing he classifies all ancient thinkers as either theists or atheists, interpreting pagan polytheism as corrupt forms of monotheism. *The True Intellectual System* broaches a number of epistemological and ethical themes more fully treated in his unpublished writings "On Liberty and Necessity", and his posthumously published *Treatise Concerning Eternal and Immutable Morality* (1731), where he argues that mental reality transcends and precedes the physical world, and seeks to establish the certainty of knowledge and the existence of unchangeable moral principles. As the most fully worked out epistemology produced by any of the Cambridge Platonists *A Treatise Concerning Eternal and Immutable Morality* is the most important statement of innate-idea epistemology by any British philosopher of the 17th century. The natural philosophy espoused in his *System*, is a form of vitalistic atomism, which accepts Descartes' idea of body as inert extension, but explains movement and life in terms of the action of immaterial spirit. His most distinctive causal theory is his doctrine of "Plastic Nature", a vitalistic hypothesis framed to account for phenomena inexplicable in merely mechanical terms. Analogous to the Platonic doctrine of *anima mundi*, and the Stoic conceptions of

pneuma, "Plastic Nature" is conceived of as an incorporeal medium between God and creation designed to maintain the orderly day-to-day operations of nature and perform the directives of God, which it does unconsciously. By this theory Cudworth sought to oppose the mechanistic models of causality offered by contemporary thinkers like Hobbes, and to overcome two unacceptable features of Cartesianism: occasionalism and rejection of final causes.

As this example shows, Cudworth drew on both ancient and modern philosophy. Cudworth's extensive knowledge of ancient sources included both the philosophers of antiquity – especially those in the Platonic tradition, but also Aristotle – and the presocratic philosophers. He also believed that evidence of monotheism could be gleaned from the Orphic mysteries, Sibylline Oracles and writings of the ancient poets. Although he sided with Casaubon against → Kircher on the matter of the authenticity of the *Pimander* of → Hermes Trismegistus, he nevertheless argued that forged writings were evidence of some truth, because they would not have been credible had it not been for the presence of monotheistic beliefs among the ancient Egyptians. He also accepted the historicity of Thoth and the authenticity of other Hermetic texts [→ Hermetic Literature], notably the *Asclepius*. He rejected Casaubon's dismissal of the entire Corpus Hermeticum as forged, arguing that these texts were not part of a single book and that there were, in any case, non-extant texts known to the Fathers. Cudworth's view of both ancient and modern philosophy was shaped by his belief in the essential unity of philosophical truth, to which some philosophers came closer than others. Like his Renaissance forbears, Cudworth regarded all philosophy as belonging to a *philosophia perennis* [→ Tradition] and much of his intellectual energy was devoted to demonstrating the kernel of truth that was expressed in different ways by different thinkers. He explained philosophical diversity, both ancient and modern, as resulting from partial or distorted interpretations of the original truth, which he refers to as a "cabbala". To the extent that he believed that this original truth was contained in more or less obscure form within the writings of pagan thinkers, he accepted the existence of an occult tradition. In this he was influenced by the Platonic tradition of veiling mysteries from the uninitiated. He argued that Egyptian religion, in particular, had a double aspect, one part of it being secret and the other intended for public consumption. However, Cudworth did not believe in a separate esoteric wisdom that could only be accessed

by unlocking the mysteries of the ancients. On the contrary, he held that the wisdom transmitted by the philosophers of the perennial tradition, and grasped dimly by others, was the original wisdom of Adam and Moses and that it was compatible with the teachings of Christianity. The perennial philosophy to which Cudworth subscribed was, therefore, as much an ancient theology (*prisca theologia*) as an ancient philosophy (*prisca sapientia*). Cudworth did, however, subscribe to the view that by this means there had been a revelation to the pagans prior to the advent of Christ, as a *praeparatio evangeliae*, a claim which was sustained by the belief that the most virtuous pagans, like Plato and Pythagoras, had benefited from contact with the prophets of Israel or those who had been taught by them.

Although the idea of a perennial philosophy did not survive the critique of the early-enlightenment classical scholars like Richard Bentley, Cudworth's philosophical legacy continued long after his death. His English admirers included John Ray, John Locke, Lord Shaftesbury, Sir Andrew (Le Chevalier) Ramsay, Richard Price and Thomas Reid. He was also read by Leibniz and → Newton, and his doctrine of "Plastic Nature" became the focal point of a dispute between Bayle and Le Clerc (1703-1706). Through J.L. Mosheim's translation of his works (1733, reprinted 1773) Cudworth's writings were transmitted to the German Enlightenment.

SARAH HUTTON

Cusa, Nicholas of (Niklaus Krebs), * 1401 Kues, † 11.8.1464 Todi

Born in 1401 in Kues, a small village on the banks of the Moselle not far from Trier, Nicolas Krebs studied the liberal arts at Heidelberg, law at Padua and theology at Cologne. He played an important part in the Council of Basel, which he joined in 1432 as a member of the conciliar party. This party considered the Pope to possess supreme authority in the Church, but to be nonetheless subject to the general Council, which better represented the community of the faithful and which hence had a greater legitimacy for promoting a true reform of the Church. Nicolas was disappointed by the narrow-mindedness of his side and by the loss of a legal case. In 1435 he joined the party of Pope Eugenius IV, who soon made him one of his foremost collaborators. As such, Nicolas was sent to Byzantium to appear before the Eastern Emperor and the Patriarch, who were to come to Italy with their entourage to seal anew the union of the Churches. The promised ships did not arrive, and Nicolas spent about six months in Byzantium, where one can imagine that he must have had fruitful conversations with the Greek scholars assembled there in view of the coming Council.

On his voyage back to Italy, Nicolas had his famous intuition of the "coincidence of opposites", according to which God, the infinite being, is above all oppositions and unites in himself the predicates that are judged incompatible in the finite world,

such as being and non-being, absolute necessity and possibility, the *maximum* (the fact of encompassing all beings within himself) and the *minimum* (the fact of being contained in all beings). Thereupon Nicolas searched the philosophical and theological tradition for conceptual tools that would allow him to give an account of this discovery and explain its contents. He wrote several books, among which the most notable are *De Docta Ignorantia* (Learned Ignorance, 1440), *De Coniecturis* (Conjectures, 1443-5), *Idiota de Mente* (The Layman on the Mind, 1450), *De Visione Dei* (The Vision of God, 1453), *De Pace Fidei* (The Peace of Faith, 1453), and *De Non-aliud* (The Non-Other, 1462). The object of all of them was a dialectic approach to God, to the human mind and its capacity for knowledge limited by its finitude, and the consequences that result for the universe. Nicolas also had a great interest in mathematics, especially in the squaring of the circle, which he considered as the geometrical equivalent of the conjunction of opposites. His rich intellectual production came out of the little leisure time at his disposal, for he served the Pope with an intense diplomatic activity in the states of the Empire, to convince their rulers to support the papal point of view. In 1448 he was created Cardinal, with the title of the church of San Pietro in Vincoli. From 1450 to 1452, he was charged with the great legation throughout the Empire, for which he was given extensive powers to reform the Church, promulgate reforms, convoke synods, condemn the recalcitrant, grant indulgences on the occasion of the "Holy Year" of 1450, etc. After that he assumed pastoral duties as Bishop of Brixen before returning to Rome in 1458 and becoming in 1459 the Pope's Vicar General for the temporal world. He died on August 11, 1464.

Nicolas of Cusa passed rapidly into posterity as a man of universal knowledge. Beside his proven competence in civil and canon law, in philosophy and theology, he was seen as an expert in Greek and even in Hebrew, though he had only a very elementary notion of the latter. Likewise his competence in the scientific field, such as in mathematics and astronomy, has been largely overestimated. His mathematical works show that he did not surpass the level of a good amateur, and those more expert in this field, such as Toscanelli (1397-1482) or Regiomontanus (1436-1476) easily detected his limitations. His rich library, still preserved in the St. Nikolaus Hospital of Bernkastel-Kues, certainly contributed to this reputation; but owning a work in one's library does not necessarily mean that one has mastered its contents. The fact that Nicolas

was one of the first to incarnate the humanist ideal, according to which literature and the sciences determine a new relationship of man to the world and have value in themselves, also played a definite role here.

From *Learned Ignorance* onwards, his first great book of speculative theology, Nicolas belonged explicitly to the tradition of Pythagoras. He saw the latter as the first to have clearly perceived that man can only approach wisdom, without ever being able to attain it, for which reason Pythagoras was content with the title of "philosopher", and did not claim that of "sage" like his predecessors. Socrates, too, with his awareness of his own ignorance, is an especially pure illustration of true philosophy as Pythagoras conceived it. By promoting learned ignorance as the ideal of human knowledge, meaning a knowledge aware of its limits and of the element of unknowing that it carries within itself, Nicolas placed his own approach under the protection of these two illustrious figures.

Moreover, Pythagoras had regarded mathematics as the supreme instrument for knowing reality, and Nicolas also belonged unreservedly within this perspective. Numbers, produced by the human mind, are certainly not the very essence of things, but they approach the latter's secrets more closely than any other means [→ Number Symbolism]. Mathematical objects can represent higher realities, such as the theological verities; thus the coincidence of opposites that exists in God is imaged by the progression of geometric figures towards infinity. If a circle infinitely extended is identical to two straight lines, one can sense there the union and coincidence of realities which on the finite level remain opposed.

Nicolas also wrote a short eschatological treatise, *Coniectura de ultimis diebus* (Conjecture about the Last Days, 1448), which was much esteemed during the Renaissance. The life of Christ, to which Nicolas assigned 34 years, contains symbolically the whole subsequent history of the Church. Each year of Christ's life counts as 50 years in the life of the Church, which, having been born in A.D. 34, will last for 34 jubilees of 50 years each, and thus will end around 1734. Corresponding to the public life of Christ, preceded by the preaching of John the Baptist, will be an evangelical renewal becoming ever stronger from the 29th and 30th jubilees onwards. The persecutions suffered by Christ at the end of his life will also be repeated for the Church. This will be the triumph of the Antichrist: the Church will seem to be dead, but it will experience a resurrection before the actual return of its master. Given that Nicolas's pre-

diction of the evangelical renewal corresponded in effect with the Protestant Reformation, one can easily understand the impact that this little treatise had on contemporary minds.

The treatise *Idiota de Mente* (The Layman on the Spirit, 1450) presents a humble workman who makes wooden shelters, but beneath his modest exterior possesses a very profound wisdom; a philosopher and a specialist in rhetoric come to him for initiation. He uses the simple gestures of his craft as analogies of the highest realities: God and his creative act, the human spirit as image of God, the status of numbers, mathematics as displaying the inner fecundity of thought. Nicolas is clearly criticizing here the book-learning of the scholastic thinkers; true knowledge is sometimes found among the ignorant, the fools, and those who are despised by the established intellectual or religious authorities.

In another short work, *Idiota de Staticis Experimentis* (The Layman on Static Experiments, 1450), Nicolas erects a general philosophy of measurement for natural phenomena. Using a simple balance, one can measure the different weights of waters from various origins: light and airy ones, good for habitation, or heavy, earthly, and noxious waters. One can draw up a table with the numerical characteristics of various waters and the specific mixture of elements that characterize them. One can do likewise for the metals, the airs, the humors, such as blood, urine, etc. The blood of a German is not exactly the same weight as that of an Italian, or an inhabitant of some other land. The blood and urine of an individual vary according to whether he is well or ill. A table of the ponderable differences of urine would certainly render great service to medicine by facilitating diagnosis. Evidently Nicolas grasped the idea of the functional variation of nature's measurable quantities, as revealing the hidden relations that things have with one another.

In 1453, Nicolas was deeply affected by the Turkish conquest of Byzantium and the disastrous consequences of wars waged for religious motives. He wrote one of his most penetrating books on this subject, *The Peace of Faith*, where he tries to show that all religious beliefs – Judaism, Islam, Zoroastrianism, paganism, philosophy (regarded as a religion worshipping Wisdom) – are founded on common assumptions. This common core can be explained as a faith that is the precondition of all religious confessions, and by this very fact unites them rather than opposes them. From this point of view, the differences between confessions amount to differences between rites, and do not call into question the common faith that unites them. For

Nicolas, this common faith is Christianity. It is not, however, a religion of reason – understood as the faculty of mind subject to the laws of traditional logic, and thus fit to grasp finite realities – which would be opposed to all the other religions that contradict reason; it is, rather, a religion of the *intellect*: the faculty of the spirit which is open to the conjunction of opposites, because it is higher than reason and situated at the principle of the latter, as light is to shadow. Even when the “rational” religions explicitly contradict some point of “intellectual” religion, they are implicitly admitting that it is part of their very conditions of possibility. Hence Christianity should not want to impose itself by force, because it is not opposed to other beliefs, being at another level than they. With *The Peace of Faith*, Nicolas made the most extensive contribution of the Latin Middle Ages to the problem of religious pluralism.

The central theme of Cusanus's thought, the “coincidence of opposites”, may have given birth to the conviction that he was an “initiate” in the esoteric sense of the word. According to this principle, all affirmation about God is merely partial: it has to be completed and relativized by the contrary affirmation, because God unites in himself that which is incompatible in the finite. This often gives Nicolas's arguments a paradoxical aspect, being very respectful of the truth that some opinion may contain, but equally conscious of the necessity to integrate these diverse perspectives in a higher synthesis, which goes beyond the competence of reason, the latter being observant of the principles of non-contradiction and the excluded middle. Thus God is nowhere in the world, while being everywhere in it; the world has no limits, and thus may be called infinite, but on the other hand, being only a reflection of the true infinity which is God, it is better called indefinite; the cosmos has no clearly marked center or frontiers, but each point in the universe may be considered as both its center and its frontier.

Human thought can only divine this coincidence of opposites, without ever mastering it; that is why man's knowledge is always “learned ignorance”. It is important to note that certain mystics believed that they could interpret Nicolas of Cusa as promoting a suppression of intellectual activity in order to unite with God in ecstatic love, following the emotional interpretation of the *Mystical Theology* of → Pseudo-Dionysus by Thomas Gallus. But Nicolas clearly rejected this understanding of his doctrine: “learned ignorance” requires the intellectual recognition that God, “coincidence of opposites”, is incomprehensible. There really is an

authentic intellectual activity existing beyond the domain of reason, and one cannot reduce all mental activity to an emotional impulse alone. From this point of view, Cusanus is close (*Sermons dionysiens et eckhartiens*) to the way in which → Albertus Magnus and his Dominican disciples in Cologne (often miscalled the “Rhineland mystics”) understood Pseudo-Dionysus’s *Mystical Theology*: as a *divinization* of the intellect, and not as an annihilation of its activity.

J.M. COUNET

Cusanus, Nicolas → Cusa, Nicholas of

Dante Alighieri, * 1265 Florence,
† 1321 Ravenna

Exceptional poet and political figure involved in the dispute between the Guelphs and the Ghibellines, Dante took part in the *Dolce stil novo* movement alongside Guido Cavalcanti (ca. 1255-1300) and declared on several occasions that his poetic message addressed the mysterious → “*Fedeli d’amore*” (for ex. *Vita nuova*, III, 12). It is unknown whether these formed an ideal community of learned and loving poets or designated a secret society of an initiatory vocation. The characteristic of the work of Dante indeed consists in expressing this supposed initiatory dimension in the sole vocabulary of courtly poetry and the sorrows of love. Thus, in both his prose and his verse, and finally in the total work that is the *Divine Comedy*, he always speaks of love for a woman or for women, whose life and death mark the rhythm of the course of individual life as well as universal history and the entire cosmos. The esotericism of Dante could not employ any other basis or symbol.

After the death of the beloved woman, Beatrice (who cannot be reduced to Bice Portinari, a real woman whom Dante seems to have loved from late adolescence), came a successive series of tribulations. These mixed a political life of the first order, serious philosophical training in Florence and Bologna, and personal trials that were to culminate in exile. A mission in Rome to Boniface VIII in 1301, when Dante was Prior of Florence, proved to

be a trap since he never returned to his hometown and was sentenced *in absentia* to exile and the stake. Only then did he find his definitive vocation in writing first the *Convivio*, a vast unfinished commentary on some of his *canzone*, and then the *Commedia* published in stages, whose last thirteen cantos would be known only after his death. We can consider, however, that every composition by Dante not only is a preparation for his mature work, but also is a specific and irreplaceable viewpoint on the final work. Thus, not a single line attributed to Dante fails to contribute to the development of a system of an unbelievable complexity that immediately provoked a wave of commentaries.

It would be superfluous, however, to dwell here on the function of the Florentine poet in Italian history and in the literary renaissance of the end of the Middle Ages. Nevertheless, if we define the work of Dante as the greatest poetic synthesis of Roman and Catholic civilization, we risk misunderstanding how such a sum could have served as a major source for an almost indefinite number of esoteric, revolutionary, or theosophical interpretations, always heterodox. Thus, we must move away from a general cultural evaluation of the work of the poet and enter into the complexity of his literature to detect the elements, in this apparently unequivocal celebration of a dogma, comprising subversion so profound and enigmatic that no clear-cut opinion on this subject can be formulated even today. Moreover, even if we return to the letter of the text, the debate remains far from easy, because most scholars since Bruno Nardi (1884-1968), who apply the rules of historiography to interpreting the work, restrict themselves to an interpretation of the literal sense and refuse for reasons of either psychological probability or epistemology to enter into any "esoteric" dimension.

Generally cited to justify this specific dimension is a verse that nevertheless seems more applicable to its immediate context than to the whole work: 'O voi ch' avete gl'intelletti sani, / Mirate la dottrina che s'asconde, / Sotto il velame delli versi strani' (*Inf.*, IX, 61-63 [O you who have clear understanding, / Consider the doctrine that is hiding, / Under the veil of strange verses.]) Furthermore, we must not underestimate at least two major roads into the esotericism of Dante. First, as early as the beginning of book II (II, I, 2-12) of the *Convivio*, that is, when the commentary of the first *canzone* begins, Dante gives a complete theory of the different meanings of poetry. Far from merely repeating the traditional theory of the four meanings of Scripture, the author takes care to distinguish between the plurality of meanings of Holy

Scripture and the plurality of meanings appropriate to poetry (II, I, 4). Therefore, Dante indeed made during that period, that is, after the composition of the great allegorical *canzone*, a distinction between poetic fiction, regulated to produce a variety of meanings according to the understanding of the poet, and the work of God that is Holy Scripture. The latter would regulate, according to an infinite understanding, the meanings and the events in the real history of the world.

This system of meaning was to unfold throughout the four books of the *Convivio* and result in a development of exceptional depth, particularly in the use of the analogy between the liberal Arts and the Heavens. In this passage, whose importance → René Guénon has rightly emphasized in his *L'Esotérisme de Dante* (chap. II, regarding *Conv.*, II, XI, 9), Dante not only relates his words to the Heaven of Venus, but also announces the foundation of a completely analogous cosmos. The Crystalline Heaven identified with Ethics propels this cosmos, which finishes in the Empyrean Heaven identified with a kingdom of Peace foreign to any discursive content (*Conv.*, II, XIII-XIV, and René Guénon, *Autorité spirituelle et pouvoir*, chapter VIII).

However, this first construction does not suffice, because the famous Letter XIII to Cangrade della Scala, a name on which the esotericists have exercised their sagacity by finding in it the name of Gengis Khan and the symbol of the ladder, announces a revolution in the initial balance between poetry and theology. Some doubt the authenticity of this letter, but its breadth of vision can only be that of Dante or the group that inspired him. In its paragraphs seven and eight, we read that the poet of the *Divine Comedy* used theological allegory to his advantage: an allegory, that is, in which the literal meaning is not a fiction, but a reality like that which God assigns to the history that he is guiding. The poet is hence in the situation of an absolute Creator, whose visions are existences and whose allegories are as powerful as those of the Bible.

On this basis, the plurality of meanings in the work of Dante takes on a prophetic significance and makes the work a true universe, whose hidden meanings are as necessary and established as those governing Revelation. In this regard, we could nonetheless still speak of the wanderings of a poet or the hallucinations of an author, if another element of primordial importance did not invite us to cross to another level. In fact, the most enigmatic element permeating the work is indeed the worship of woman that commands his every statement.

Anyone looking at the assertions of Dante with the eye of Catholic dogma could only be struck by

the strangeness of such allegory, always present and never clarified, all the more so as it penetrates to the very heart of the most sacred statements of dogma. The work of Dante, from this viewpoint, risks appearing as nothing less than an erotic parody of the religion of Christ, which no resurgence of Marian worship could justify in a simple manner. In this sense, the esotericism of Dante is invisible, because instead of hiding, it is present throughout, from the first line of the work telling of the meeting with Beatrice to the last, where the poet merges into universal Love. In a Catholic orthodoxy, Christ is the only mediator, but rather than acting primarily as a mediator, he represents the immediacy of the Trinitarian God, and the Virgin is the only intercessor. Within this context, a simple young woman from Florence, through the effect of her beauty, becomes the ultimate term of all joy and spiritual development. She becomes this to the point where she can epitomize the meanings of all civilization, whether it is a matter, as in the *Vita nuova* (chap. XXX), of the politics of the rulers of this world, or, as in the *Comedy*, of the destiny of the Church and the Empire (*Purg.*, XXIX-XXXIII). Dante continues along this line the undertaking to challenge the clerical order begun by the *Roman de la Rose*. It is not surprising that scholars attribute to the Florentine poet a manuscript of 232 sonnets, signed by a certain “ser Durante”, rediscovered in Montpellier in the 19th century and proceeding from the library of Troyes. These sonnets, entitled *Il Fiore* (the collection appears in the complete works published by the *Società Dantesca italiana*), summarize the highlights of the *Roman de la Rose*. They convey a very strong protest against established society and the need to divert the dogmas of Catholicism in order to transmit a secret wisdom both highly erotic and profoundly heretical (for example sonnets V and XV). However, here we would have to reconsider all the poetry of Dante before the *Comedy* and especially the disturbing *canzone* to the woman “of stone” (the “*Rime pietrose*”), which crown the Dantean doctrine of *Fin Amor* (cf. *Il Fiore*, IV, 8).

This return of the pagan (and Virgilian) mysteries amidst Dantean condemnations of the ‘*puzzo del paganesmo*’ (*Par.* XX, 125), the stench of paganism, has attracted the attention of interpreters, who have well perceived the risk involved in such an increase of religious mediations. Among them, certainly → Marsilio Ficino went the furthest in recognizing the need for a spiritual revolution in order to understand Dante’s gift to Florence. The letter prefacing the great humanist commentary on Dante by Cristoforo Landino (1424-1498)

contains this same idea. Even if we consider this commentary a key to Florentine culture and the beginnings of the art of printing, it does not exclude the idea of a “poetic theology” of neo-Platonic origin, for which poetry is simply the “veil” of philosophical wisdom. This writing, which is primarily a celebration of the unity of Florentine culture, does not address the idea that Dante is esoteric *because heterodox*. It was only with the Romantic annotator of Dante, Gabriele Rossetti (1783-1854), that the thesis of the “esotericism of Dante”, founded on the deliberate use of ancient mysteries, the allegorical worship of woman, Templarism (in particular because of *Purg.* XX, 93), and militant Ghibelline politics, found free and systematic expression. His immediate predecessor was probably Ugo Foscolo (1778-1827) and his well-known *Discorso sul testo della divina Commedia* of 1825. Foscolo, a great nostalgic poet of a paganism both Jacobin and virtuous, tried to show that the entire work of Dante stood in the service of a political and moral reform of Pythagorean origin, which Dante could express only indirectly, given the convictions of his time. That is why Foscolo proposed a primarily political coding of the writings of Dante. Influenced by → Freemasonry and → Rosicrucianism, Rossetti, on his side, suggested a similar interpretation, but he pushed the esoteric interpretation to a degree of complexity worthy indeed of a poet schooled in the Neapolitan baroque.

The works of Rossetti are little read, but they were plundered, in particular by his detractor Aroux. In explaining Rossetti’s theses, Aroux intended to denounce the Romantic cult of Dante before the Roman authorities. He declared that Dante was a revolutionary and an atheist, heir to the Ghibelline doctrine of Frederick II (however condemned by Dante in Canto X of the *Inferno*). The book of Aroux, with his ambiguous vocation as both denouncer and continuator, was nevertheless very influential, because it was from reading Aroux, and not Rossetti, that Guénon would draw the first theses of his esoteric reading of Dante (*Esoterism of Dante*, chapter III). It remains that Rossetti, very influential in the symbolist culture through the works of his son and disciple, the painter Dante Gabriele Rossetti, could marshal with a sufficiently broad view and a peerless knowledge of Dante, although not without repetition and obsession, the most precise arguments in favor of the esoteric reading of the Florentine poet.

For Rossetti, Dante belongs to a millenarian tradition of primarily political protest against power, through a gnosis whose coding according to the terms of dominant ideologies serves only to divert

the attention of censors, so that the “Faithful of love” – that is, of the love of this gnosis – may assemble to liberate humanity. However, this libertarian and naïve socialism would not retain us, if it did not lead to a permanently divided reading of the work. In this regard, Rossetti is decisive more by the attention he brings to bear on the intrinsic ambiguity of the work than by the unequivocal solution that he serves.

Let us retain, in this context, his interpretation of the overlapping of the letters C and O, in the first syllable of *COMOEDIA*, his meditation on the dual display of the earth and the sea in the *Quaestio terrae et aquae* (the last text of Dante known to us), and his relentless criticism of any psychological and sentimental interpretation of the platonic love for Beatrice. These approaches reappear in Valli, but without the breadth of vision and the humanist culture of Rossetti, or again in the poet Giovanni Pascoli, who attempted in his turn to decipher the work from the recurrent motifs of the eagle and the cross. Esoteric interpretations of Dante indeed proliferated, mixing → astrology, numerology [→ Number Symbolism], Templarism, Joachimism, → alchemy, and so on, as though modern readers were seeking in Dante the secret of a spirituality that was no longer accessible. It is from such a perspective that René Guénon contributed his analyses on the esotericism of Dante (which are not limited to the book by the same name), as did → Julius Evola, whose Ghibelline Dante adopts a magical and heroic tone, rather foreign to traditional thinking according to Guénon. To finish, let us not forget the nominalist tendency of Umberto Eco, who did not think of engaging his great novelistic machinery without declaring a merciless war on any esoteric interpretation of the Florentine poet.

The “adepts of the veil”, as Eco ironically calls them, nevertheless have a promising future, since the writings of Dante keep resisting usual intertextual or psychological interpretations. There is in this work such a thirst for truth, such a power of conviction, and such an enigma concerning the symbols intended to manifest them, that it seems to summarize in itself all the forces of Western thought and the virtue of its peoples. There will always be authors who believe that commenting on Dante is not so much clinging nostalgically to a medieval ruin, as it is evaluating our own capacity to understand the forms and the resources of our spirit.

BRUNO PINCHARD

Davis, Andrew Jackson, * 11.8.1826
Blooming Grove, New York,
† 13.1.1910 Watertown, Massachusetts

Writer, clairvoyant, physician, lecturer, reformer, and forerunner of → New Age spirituality, Davis can rightfully be called the major theologian and philosopher of 19th-century → Spiritualism in the United States. Although most of our information concerning his early life comes from an autobiography whose veracity is questionable, it is likely that he grew up in humble circumstances in rural New York state and was deeply dissatisfied with the conventional Presbyterianism and Methodism of his time. Davis showed little promise in the several apprenticeships – including as a shoemaker – he tried, but was rescued from a life of obscurity when a tailor named William Levingston asked him to serve as a subject for his experiments in mesmerism [→ Animal Magnetism] in 1843. Levingston had learned snippets of mesmerism from the traveling lecturer J. Stanley Grimes. Davis proved to be a natural trance performer and reportedly traveled clairvoyantly to remote places, conversed with spirits, diagnosed physical ailments, and read from books while blindfolded.

In 1844, Davis had a visionary experience in which he spoke with both the Greek physician Galen and the Swedish mystic and scientist → Emanuel Swedenborg. Galen gave him a magical staff constructed so as to represent symbolically the complete correspondence between the natural order and Galen's medical system. The Greek physician also proclaimed Davis's future mission as a clairvoyant healer. Swedenborg told him that he was to become a conduit for a coming revelation of wisdom and truth to humanity. Bolstered by this vision, Davis and Levingston opened a clinic where Davis practiced clairvoyant healing. While in a trance state, the young seer would visualize the inner organs of the sick person and prescribe cures. This shaman-like practice would be replicated and made famous by the "sleeping prophet" → Edgar Cayce, whose clairvoyant readings would become an important element in the emergence of New Age spirituality in the latter half of the 20th century.

By 1845, Davis had moved to New York City with Dr. Silis Lyon and the Universalist minister William Fishbough, both of whom were impressed with his clairvoyant abilities. The two arranged for a series of public lectures during which Lyon mesmerized Davis and Fishbough acted as a scribe. The one hundred fifty-seven talks Davis delivered in the trance state impressed a wealthy patron named Silone Dodge, who arranged for them to be published in 1847 under the title, *The Principles of Nature, Her Divine Revelation, and a Voice to Mankind, By and Through Andrew Jackson Davis, the "Poughkeepsie Seer" and "Clairvoyant"*. Although some scholars see the book as a derivative melange of Swedenborgian cosmology and Fourierist socialism, *The Principles of Nature* is significant for two reasons: (1) it became the first of an important genre of esoteric treatise – purportedly received in a trance state or from spirit beings, including, for example, → H.P. Blavatsky's *Isis Unveiled*, the *Oahspe Book*, the *Aquarian Gospel of Jesus the Christ*, the writings of → Alice Bailey, the *Urantia Book*, and the Seth material – that would provide the conceptual categories and dominant themes for such popular alternative spiritualities in the United States as Spiritualism, → New Thought, Christian Science, Theosophy [→ Theosophical Society], and New Age; (2) the book – which went through thirty-four editions – and its ideas helped provide a philosophical and theological underpinning for the nascent Spiritualist movement of the 19th century.

The Principles of Nature discussed the origin and development of the universe, the laws that governed the intercourse between spirits and humans,

and various schemes for social reform. Among the book's primary ideas is that of eternal progress, whereby human beings, created in God's image, continue to evolve after death through six (Swedenborgian) spheres that surround the earth. Each sphere surpasses in beauty and wisdom the one which precedes it. Those spirits closest to the earth could communicate with embodied humans, and new cosmic spheres would appear for further development once all humans had progressed to the highest, or sixth sphere. Since deceased persons would move into the sphere that best corresponded with their moral stature, there was a strong incentive to live according to the highest moral code while on earth. This progressive view of human destiny resonated well with the optimistic and egalitarian tenor of 19th-century American society and provided a welcome alternative to the pessimistic Calvinist vision of selective salvation for the few and eternal damnation for the many. Davis's spiritual anthropology also paralleled that of Mormon founder Joseph Smith, who taught that humans had the opportunity to evolve into god-like beings and to rule their own planets and solar systems.

Davis continued to write books, pamphlets, and articles throughout his life and to support such Spiritualist periodicals as *The Univercoelum*, *Spirit Messenger*, and *Herald of Progress*. His most ambitious book, *The Great Harmonia*, was published in five volumes during the 1850s. This tome advanced Davis's grand scheme for societal transformation and made him a leading voice in the abolitionist, women's rights, lyceum, and marriage and health reform movements of the 19th century. His adamant support of abolition alienated him from the Spiritualist movement in the South.

Davis's Harmonial philosophy is an emanationist vision of the universe, with all creative power enthroned in a great spiritual sun and all natural phenomena reflecting eternal forms in the Divine Mind. By developing their spiritual senses in harmony with their physical senses, human beings could come to realize the → correspondences and relationships between the spiritual and the natural worlds and the divine laws and principles that order existence in both realms. Both societal and personal reform in this philosophy came about through a cultivation of harmony with nature, which was seen as the next highest level of existence emanating from the divine center. When persons recognized their places in the divine hierarchy of being, all would operate harmoniously as organs in a single whole, and mutual cooperation would lead to welfare for all living beings. The correspondences of this philosophy with → Neoplatonism, →

Hermetism, Swedenborgianism [→ Swedenborg], and Transcendentalism are obvious.

Davis's vision of children's education derived from his belief that those who died in childhood grew to maturity in the spirit world. The system of education in the "Summerland" for these children was called the lyceum. Davis believed that children held within themselves an image of perfect being and were therefore unlimited in their potentials. The mission of education was not to indoctrinate children into social conventions but to draw out their divine genius through conversation and discussion that was especially geared to each child's mentality and temperament.

In later life, Davis married a women's rights activist from Western New York, Mary Fenn Love. He also moved to distance himself from the physical phenomena associated with the spiritualist séance and to insist on the need for social reform in addition to spirit communication. When widespread fakery and quackery associated with mesmerism resulted in a New York law prohibiting mesmeric healers from practicing medicine, Jackson encouraged his colleagues to gain licenses from legitimate medical colleges. He himself enrolled in the United States Medical College in New York and graduated in 1883 with degrees in anthropology and medicine. Davis spent the last twenty-five years of his life treating patients regardless of their ability to pay from his clinic in Watertown, Massachusetts.

PHILLIP CHARLES LUCAS

Dee, John, * 13.7.1527 London,
† 26.3.1609 Mortlake

1. BIOGRAPHY: FROM HUMANISM
TO MAGIC 2. MAGICAL SCIENCE:
ASTROLOGY, ALCHEMY, "ARCHEMASTRIE"
3. DEE'S OCCULT PHILOSOPHY: ENOCHIAN
MAGIC 4. OCCULTIST AND LITERARY
RECEPTION

Humanist, mathematician, geographer, antiquarian, astrologer to Queen Elizabeth I. A cultural traveller on the Continent, including East-Central Europe. One of the most intriguing representatives of occult philosophy [→ occult/occultism] in the late-Renaissance period.

1. BIOGRAPHY: FROM HUMANISM
TO MAGIC

Dee was born into a well-to-do textile merchant family which traced its origins to the nobility of Wales. From his father he inherited the intense ambition to fashion himself as a gentleman and conduct his life as near to the court as possible. A way towards this goal was a good education. He pursued university studies at St. John's College, Cambridge, where he received his BA in 1546 and his MA two years later. Among his college fellows he could count the children of the aristocracy newly created by the Tudors. Indeed these youngsters became the key politicians of the future Elizabeth I, and many of them proved to be important patrons of the aspiring scholar.

An interesting episode during Dee's school years was when he constructed a "flying scarabaeus" as a stage prop in a production of Aristophanes' *The Peace*. The invention later caused him much trouble, since the occasional charges of sorcery leveled against him would not fail to mention this act of "wizardry". Another important preoccupation, Dee's passionate love for books, also manifested itself during his student years: in 1544 he bought the first two volumes of his later legendary library.

After graduation Dee went to Louvain in order to learn about such areas of applied mathematics that were not available at home. He studied geometry and cartography with Gerard Mercator and Pedro Nuñez, and medicine and mathematics with Gemma Frisius. In 1550 he went to Paris where he met a great number of famous humanists, among others Pierre Mondoré, the librarian of the French king, Oronce Finé, professor of mathematics, Pierre de la Ramée, the innovator of logic, and → Guillaume Postel, a scholar of oriental languages

who would later experience a magical-enthusiastic turn in his life similar to Dee's "enlightenment". It was in Paris that Dee held a famous lecture on Euclid's geometry, which he later remembered as follows: 'I did undertake to read freely and publicly Euclide's Elements Geometricall, Mathematicè, Physicè, et Pythagoricè; a thing never done publicly in any University of Christendome. My auditory in Rhemes Colledge was so great, and most part elder than my selfe, that the mathematicall schooles could not hold them; for many were faine, without the schooles at the windowes, to be auditors and spectators . . .' (*Autobiographical Tracts*, 7).

In the 1550s Dee lived in England as a tutor to children of aristocratic families, including the young king, Edward VI. Although the Catholic Queen Mary did not favour the ardent protestant Dee (he even found himself briefly in prison), this did not prevent the Doctor to propose to the Queen that she should establish a court library by collecting the manuscripts and valuable books dispersed as a result of the dissolution of the monasteries (cf. *Supplication to Queen Mary*). As his proposal remained unanswered, he himself saw to the establishment of a major library. During the next thirty years he devoted most of his income to purchasing books, maps, astronomical and other scientific instruments, until he had at his disposal England's largest private library, consisting of about four thousand volumes, as well as a scientific centre with an observatory and an alchemical laboratory (see the Introduction to *Dee's Library Catalogues*).

1558 was an important year in Dee's life. The accession of Elizabeth returned him to favour, and as a particular sign of this, Dee was entrusted the task of astrologically determining the day of the coronation. In the same year he constructed a mathematical table which was to help the sailors of the Muscovy Company to find the correct location of the North Pole. Most important of all, this year witnessed the publication of his first full-size scholarly book, the *Proopaedeumata aphoristica*: a combination of mathematics and → astrology which claimed to provide an improved and corrected system for registering the stellar oppositions for the calculation of astrological charts.

From 1558 through the 1560s Dee's scientific interests broadened and changed: traditional mathematics and astrology were complemented by the neoplatonic-hermetic philosophy of the Florentine Academy also popularized by such "Renaissance magi" as → Francesco Giorgi da Veneto and → Heinrich Cornelius Agrippa. Beside these, another important influence on Dee was that of → Paracel-

sus. Dee was a pioneer in England in recognizing the importance of Paracelsus, and in these years he purchased a remarkably great number of books written by the German doctor or ascribed to him.

Between 1562-1564 Dee embarked on a long Continental journey, visiting Flanders, France, Switzerland and Germany. In Italy he edited an Arabic mathematical treatise with an Italian scholar; in Pressburg (Bratislava) he participated in the coronation of Maximilian II of Habsburg as king of Hungary, and, finally, in 1564 in Antwerp he wrote his major work, the *Monas hieroglyphica*, which appeared from the printing press of the Dutch Willem Silvius and was dedicated to Maximilian. This difficult work has become a basic text of occult-magical literature and is subject to ever new interpretations. In Holland he also came across a manuscript of → Trithemius' *Steganographia*, a work on the possibility of communication with angels. Later on Dee himself became a notable theoretician and practitioner of angel magic.

From the mid-1560s through 1583 Dee again stayed in England, enjoying a growing scholarly reputation and continuing to build his library. In 1578 he married Jane Fromond, who bore him many children and seems to have been a particularly supportive wife. Later that year he briefly travelled in Germany, 'to consult some famous doctors about the Queen's health', and met the German occultist scholar, Leonhard Thurneysser, in Frankfurt an der Oder. This is the time when he acquired his famous house in Mortlake, a village near London in the vicinity of Hampton Court. Four or five rooms were filled with the Doctor's library, and the place functioned as a "private academy" where not only pupils were frequent visitors but also members of the aristocracy, famous explorers, military leaders, members of the government, and occasionally even the Queen herself (on the "Elizabethan think tank" gathering at Dee's house see French 1572 and Sherman 1995, 29-53).

In 1570 Dee published his *Mathematicall Preface*, prefixed to Sir Henry Billingsley's translation of Euclid's *Elements*. Much more than a simple explanation of geometry, it is rather an elevated eulogy of the importance and usefulness of mathematics, including the magical sciences. Later in the same decade, in 1577, he published another important English work, the beautifully illustrated *General and Rare Memorials Pertayning to the perfect Art of Navigation*, which shows another face of the Doctor: the patriotic *homo politicus*, who was deeply concerned with England's advance as a sea power. Simultaneously he also compiled an ornate

scroll, establishing the Virgin Queen's rights to the American territories: *Her Majesties title Royall*. It is clear that during these years Dee was much occupied not only with science and → magic but also with what Frances Yates has called "Elizabethan English imperialism", which combined the program of national expansion with religious associations, a reformed Tudor empire (Yates 1975, 84ff.).

Historians of science have noticed with regret that from the early 1580s Dee did not produce anything worthy of the attention of serious scientists. This is when his overtly esoteric period started, with ambitions and ideas that are highly intriguing to contemporary intellectual historians and historical anthropologists. Cultural historians have given various explanations for the development of Dee's interest in the occult. Recurring arguments are his disappointment with the natural sciences, his frustration about self-fashioning himself within the Elizabethan patronage system, and, finally, a growing preoccupation with one particular kind of magic, *scrying*, that led to his "angelic conversations".

According to the biographical evidence, this shift of orientation did not happen all of a sudden; rather, it was related to his changing scholarly and philosophical ideas, prompted, probably, by his discovery of Trithemius' *Steganographia* and the completion of the *Monas hieroglyphica*. What had started as an intellectual change in the 1560s, became a psychic reality by the late 1570s: his diaries relate more and more about strange dreams, sounds, and visions.

The angel magic Dee developed around this time comprised a kind of ritualistic seance during which, with the help of crystal balls and "scryers", he tried to obtain information from spirits and angels (on various techniques of scrying cf. Clulee 1988; Harkness 1999; Szőnyi 2004, Whitby 1988; on Dee's indebtedness to the medieval tradition of *ars notoria*, or Solomonian magic, see Clucas forthcoming). The "angelic conversations" could deal with various themes, ranging from dignified metaphysical questions to everyday problems, but it is important to emphasize that Dee's primary aim with angel magic was to gain a universal knowledge of natural philosophy. The first "full-scale" angelic conversation took place on 22 December 1581, with the help of a medium called Barnabas Saul. Events took a dramatic turn in 1582, when Dee met Edward Kelley, a wandering alchemist who proved to be a perfect medium for the scrying sessions. From this time on Dee needed the conversations on a daily basis and kept a detailed journal about their course, which survives today and is a

fascinating document of early modern esoteric mentality.

In May 1583 a Polish nobleman, Olbracht Łaski arrived in England, where he accomplished a noteworthy program, more cultural than political in nature. His guide was Sir Philip Sidney, the exemplary courtier and Renaissance poet. With him, Łaski witnessed → Giordano Bruno's debate with the Oxford philosophers at the ancient university, after which he was taken to Mortlake to meet Doctor Dee. The encounter determined the future life of Dee, Kelley, and their families. After participating in a few scrying sessions, Łaski suggested that the Englishmen go with him to Poland and try magic and alchemical transmutations there. Dee obtained the Queen's permission, and from 1583 through 1589 he lived on the Continent, pursuing the guidance of the angels as well as trying to gain profitable patronage at various Central European courts.

In 1584 Dee moved his "headquarters" to Prague where he secured an interview with Emperor → Rudolf II, hoping to gain a permanent position as court mathematician. When this failed, he repeatedly visited the Polish king Stephan Batory in Cracow, with the same purpose. After some conflicts during which he and his company were almost arrested by the Catholic Inquisition, and were subsequently expelled from the lands of Rudolf, they got permission to settle in Třeboň, on the estate of Vilém Rožmberk, a prominent Czech magnate and patron of arts as well as → alchemy and magic. There the angelic conferences continued with the occasional participation of the patron, who, however, was clearly more interested in the production of gold. Kelley, who had more experience with alchemical experimentations, soon overshadowed his master and finally Rudolf "borrowed" him back from Rožmberk.

In April, 1587 a rather controversial affair took place: the Doctor and Kelley – who then was trafficking between Prague and Třeboň – 'together with their wives, *nocte profundis*' made a covenant, following the instructions of Archangel Raphael: 'Note and remember that on Sunday the third of May, ann. 1587 (by the new account), I, John Dee, Edward Kelley and our two wives covenanted with God and subscribed to the same, for indissoluble and inviolable unities, charity and friendship keeping between us four, and all things between us to be common, as God by sundry means willed us to do' (*True & Faithful Relation*, 20-1 [new numbering]). As Fenton remarks, 'this new and strange doctrine' of marital cross-matching shows how far Dee was prepared to go in the pursuit of divine knowledge, but he also gives reasons

why Kelley may have invented this shocking divine demand: possibly he wanted to bring the angelic conferences to an end – never expecting that Dee would accept the terms (*The Diaries of John Dee*, 209). Even this covenant could not mend the deteriorating relationship between master and medium. Kelley was building his own career in Prague while Dee obviously became homesick for England; in 1589 he finally petitioned Lord Rožmberk to give him permission to return home.

Back in England, Dee, now past sixty, reestablished himself in his Mortlake library, continued to enjoy the favour of Queen Elizabeth, and still had interesting encounters with men of learning, such as the mathematicians Thomas Harriot and William Digges, and the scholar Richard Cavendish. He also met influential persons – among them Walter Raleigh and the Archbishop of Canterbury – and maintained his Continental contacts by corresponding, among others, with Prince Moritz, Landgrave of Hessen-Kassel.

In 1592 Dee submitted an elaborate autobiographical memorandum to Elizabeth. This is known as the *Compendious Rehearsall* that aimed to convince the Sovereign about his knowledge, religious honesty, and strong loyalty to the Queen (see *Autobiographical Tracts*, 1-45). In return Elizabeth covered for him a bill of no less than £ 2306, related to his journey from Germany. In 1595 he received a wardenship in Manchester by Archbishop Whitgift, but he was never happy with that position. Up to 1605 Dee divided his time between Manchester and Mortlake with occasional visits to London. After the death of Elizabeth he sunk into oblivion and, in spite of several petitions, he never managed to attract the interest of James I – not even with his last considerable work, *THALATTOKPATIA BPETTANIKH, sive de Imperii Brytannici Jurisdictione in mari . . .* in which he suggested the extension of Britain's rights for the open seas (for details see Sherman 1995, 192-201).

Due to the plague of 1605 Dee lost his beloved wife and several of their children. Seventy-eight years old, he returned to Mortlake, never to leave the place again. Hard though it may be to believe, he still continued the angelic conversations, now with a medium called Bartholomew Hickman. And as if wanting to restart his life, the doctor still pondered yet another journey, probably to visit the Landgrave Moritz in Germany. The Archangel Raphael actually encouraged him: 'John Dee, thou hast been a traveller, and God hath ever yet at any time provided for thee in all thy journeys. He that hath commanded thee to take this journey in hand,

will provide for thee in Germany, or any other country wheresoever thou goest' (*A True & Faithful Relation*, 37 [new numbering]).

The last entry in the spiritual diaries is from September 1607, but we know from another notebook that Dee still conducted alchemical experiments between December 1607 and January the following year (Oxford, Bodleian, MS Ashmole 1486, cf. *The Diaries of John Dee*, 303). He died on 26 March, 1609, at the end of an extraordinary career that continues to present historians of science and culture with intriguing problems.

2. MAGICAL SCIENCE: ASTROLOGY, ALCHEMY, "ARCHEMASTRIE"

Dee's early career was dominated by mathematics; but already at that time, it was intertwined with mystical-occult concerns, the principal goal of which was to acquire perfect knowledge. His first important work was entitled *Propaedeumata aphoristica*: 'an aphoristic introduction . . . concerning certain virtues of nature' (1558). The work was dedicated to Gerard Mercator, the distinguished mathematician. Although based on the concepts of traditional → astrology, the book attempted to approach prognostication by a strictly scientific method. While the neoplatonist magi of the early Renaissance tried to gain control over the influence of the stars through talismanic magic and ritual incantations, Dee thought of accomplishing this task through mathematically constructed optical mirrors; and for this he needed an exact number of stellar constellations (Clulee, 1988, 39-70). While traditional astrologers usually settled for 120 constellations, Dee's book – which consists of 120 aphorisms – computed the number as 25341. The major setback of this result was that, centuries before the age of megacomputers, calculations with such a quantity could not be carried out. Dee tried to derive astrology from Nature alone, and avoid the danger of demonic intelligences, which haunted even his learned contemporary Giordano Bruno. Next to this seeming rationalism Dee also incorporated elements of the organic natural philosophy and the theory of macrocosmic/microcosmic → correspondences which provided an open gateway toward pythagorean → number symbolism as well as hermetic and magical ideas: 'The entire universe is like a lyre tuned by some excellent artificer, whose strings are separate species of the universal whole. Anyone who knew how to touch these and make them vibrate would draw forth marvelous harmonies. In himself, man is wholly analogous to the universal lyre' (*Aphorism XI*). In this passage,

which seems to echo → Ficino, and elsewhere, the modern reader detects the author's longing for a transcendental and universal knowledge, the full vision of which was expanded in Dee's next work, the famous and much discussed *Monas hieroglyphica* (1564).

Dee himself defined the genre of this work as 'a magical parable'. It consists of a lengthy introduction dedicated to Maximilian II, Holy Roman Emperor, followed by 24 very concise aphorisms or theorems. All these serve the interpretation of "the hieroglyphic monad", a mystical-magical sign, entirely the product of Dee's visual imagination. The monad incorporates the simplest geometrical elements: a circle with a point in its centre on top, two straight lines crossing each other in right angle under it, two touching semi circles at the bottom and all enclosed by an oval. Dee constructed it with the intention of condensing all the natural and supernatural → correspondences of the Cosmos into one single sign which would provide the beholder with a complete understanding of the created universe. In the Preface he emphasized that the monad was to be 'mathematically, magically, cabbalistically, and anagogically explained' (Josten ed. 1964, 155). The theorems elucidate the cosmic image on two levels. On one level, they explain how its elements and proportions express in a mystical but at the same time strictly "scientific" manner the ultimate cause of the World, the Oneness. The theorems make clear how all principal numbers can be derived from the geometrical elements in the core of the diagram. Dee also elucidates how these elementary figures can be used to generate all the signs of the planets as well as the metals, thus referring to the major spheres of the universe (macro- and microcosms).

On the second level the monad refers to the Magus, regarded as an experimenting scientist, emphasizing his potential to recreate the lost unity of existence. This layer of meaning stands in close relation to the alchemical significance which is alluded to by Dee when he identifies the two semi-circles with the Zodiacal sign of Aries, a fire sign bringing about the alchemical transmutation. This process naturally includes the spiritual transformation of the operating Magus as well. The oval frame of the image stands for the Egg of the Philosophers, the alembic in which the alchemical process is taking place. In the sign's basic pattern one can recognize the sign of Mercury, the key element of alchemy which at the same time has astrological importance. In *Theorem XVIII*, Dee calls attention to the interrelatedness of astrology and alchemy; he calls alchemy '*astronomia inferior*'.

In sum: considering the two layers of meaning we can see the hieroglyphic monad as an astrological cosmogram on the one hand, and as a talismanic summary of the alchemical transmutation on the other. The latter plane of reference entails the deification of man the Magus, i.e. the doctrine of *exaltatio*. The creation of the quintessential Mercury is nothing else but the liberation of the human spirit, the elevation of the operator's soul to the sphere of perfect knowledge. Dee's philosophical originality lies in the graphic construction of the monad (no identical diagram can be identified from earlier literature), while on the conceptual level he follows and elaborates the magical → neoplatonism of the Florentine Academy, primarily Ficino's *De vita*, which itself reaches back to Plato, Plotinus, Pythagoras, the Hellenistic "neoplatonici" and, last but not least, the lore of the *Corpus hermeticum*. Considering the possible employment of the hieroglyphic monad, one has to conclude that it was not simply meant to serve or illustrate a discursive and logical explanation; rather it was meant to conjure up a condensed mystical image, the purpose of which was to lead the meditating beholder to revelative illumination. The working of such revelative images might be compared to the Eastern practice of using mandalas (on the theory of revelative images see Gombrich 1972, 157-60; on interpretations of the Monad, see Clulee 1988, 75-143; Harkness 1999, 77-90; Josten in Dee 1964, 102-108; Szőnyi 2001 & 2004, Yates 1964, 148-150).

Although the *Mathematicall Preface* (1570) is usually considered to be a conservative summary of Dee's earlier scientific theories, in this work Dee in fact took a step further. This becomes clear when looking at his explanation of a discipline called "archemastrie". In the *Preface* Dee created a hierarchy of sciences which culminated in this discipline: 'This Arte, teacheth to bryng to actual experience sensible, all worthy conclusions by all the Artes Mathematicall purposed, & by true Naturall Philosophie concluded. . . . And bycause it procedeth by Experiences, and searcheth forth the causes of Conclusions, by Experiences: and also putteth the Conclusions them selves, in Experiences, it is named of some, Scientia Experimentalis' (A.iiij^v). This passage has often been cited by historians of science as proof that Dee was concerned with the experimental and practical disciplines and, what is more, advocated science in the vernacular; accordingly, he could be regarded as an important forerunner of the Scientific Revolution. But if Dee's "Scientia Experimentalis" is seen within the wider context of the *Mathematicall*

Preface, it becomes clear why such a conclusion must be regarded with caution. While introducing the chief auxiliary sciences of *Archemastrie*, Dee enlisted the following disciplines: ‘the Science Alnirangiat, great Service. Under this, commeth Ars Sintrillia, by Artepheus, briefly written. But the chief Science, of the Archemaster, as yet knowen, is an other OPTICAL Science: whereof, the name shall be told when I shall have some (more just) occasion, thereof, to Discourse (ibid.)’. Although Dee never seems to have given a clear definition of optics as he understood it, it has been suggested, by Clulee and others, that for him these sciences were part of magical activity rather than of experimental natural science. There is reason to suspect that optics meant “scrying” (crystal gazing), which by 1570 definitely entered the horizon of Dee’s interest. And the purpose of this kind of optical magic, of course, was to attain a supreme superhuman knowledge.

Dee’s burning desire to have a glimpse of the mysteries of Creation had a background similar to that of the Florentine neoplatonists and, later on, of Johannes Trithemius, Cornelius Agrippa, Paracelsus, Guillaume Postel, Giordano Bruno, and → Robert Fludd: it reflects the new self-consciousness of Renaissance Man who considered himself God’s almost equal partner and who claimed his share of the secrets of Nature.

3. DEE’S OCCULT PHILOSOPHY: ENOCHIAN MAGIC

We have seen that, all along, Dee’s career was characterized by the pursuit of perfect knowledge; and this ambition finally crystallized into his search for the *lingua adamica*, the antediluvian perfect language, from the time of his construction of the hieroglyphic monad. It is only recently that Nicholas Clulee and Umberto Eco have perceived in the *Monas hieroglyphica* the germs of Dee’s later explorations into the universal, angelic language (Clulee 1988, 71-116, Eco 1995, 186-189). In the *Theorems* Dee manipulated the Monad in various ways (rotation, dismantling, combination and permutation of its elements), not unlike the way in which kabbalistic numerology works with the letters of the Hebrew alphabet. Already Guillaume Postel had suggested that the characters of the three sacred languages derive from a common geometrical base (Eco 1995, 188), and Dee entertained the same idea. It seems that he constructed the Monad not only as a mystical emblem for contemplation, but also as a “geometrical automaton” which could generate the alphabet of all languages and would thus represent the universal principle of

language (for a detailed analysis of the pertinence of the *lingua adamica* to Dee’s thought see Håkansson 2001, 84-109 and Szőnyi 2004).

From this point on, Dee’s thinking became more and more imbued with a spiritual-cosmic vision, and eventually he turned away entirely from the exact sciences. He became convinced that knowledge based on discursive logic and “booklearning” could not lead to the ultimate and universal comprehension for which he was striving. In 1584 he straightforwardly told this to Emperor Rudolf II, when the monarch gave him an audience in the Prague Hradčany: ‘All my life I had spent in learning: but for this forty years continually, in sundry manners, and in divers Countries, with great pain, care, and cost, I had from degree to degree sought to come by the best knowledge that man might attain unto in the world: and I found that neither any man living, nor any Book I could yet meet withal, was able to teach me those truths I desired and longed for: And therefore I concluded with my self, to make intercession and prayer to the giver of wisdom to send me such wisdom, as I might know the nature of his creatures; and also enjoy means to use them to his honour and glory’ (*A True & Faithful Relation*, 231). This speech confirms what he had admitted to his secret diary already in 1581, spelling out that after his failure to find ‘radical truths’ in the Book of Nature the only way for the scholar of universal wisdom remained to pray to God directly for an ‘Extraordinary Gift . . .’ (*Mysteriorum Libri Primus*, Sloane MS 3188, published by Whitby 1988, vol. 2).

This Gift was to be similar to Enoch’s privileged knowledge, revealed to him by God, of the angelic language (see Gen. 5:24, Heb. 11:5, and the pseudepigraphical Books of Enoch). On the one hand Dee became convinced that Adam’s language was a perfect medium to obtain directly from God the kind of knowledge he was craving (see Genesis 1:26-7 and 2:19), on the other he also shared the belief of many Renaissance philosophers that the Holy Scripture offered promise and hope for Man’s regaining the dignity lost at the time of the Fall, provided the angelic language would be restored to humankind (see Psalm 8:4-6, Wisdom 7:15-21 and Sir. 17:3-7; the biblical background of Dee’s angelic conversations was clarified by Whitby 1988, vol. 1). From these Biblical passages the early modern thinker could infer that by recovering this lost sacred language all his ambitions and desires concerning *exaltatio* could be fulfilled. This train of thought is the key to Dee’s later scientific and philosophical investigations and there is ample evidence to think that he considered himself second

only to Enoch to acquire the *lingua adamica*. Dee's solution was remarkably simple, yet rather unique among the "Renaissance magi": since science was unable to reconstruct the language of angels, one had to contact them and learn it from them directly.

Accordingly, Dee devoted the last decades of his life to this goal. Surprisingly, this scholar who was perfectly intimate with the subtle traditions of intellectual magic of his day, chose a rather primitive method of popular magic to contact the angels, namely scrying, or crystal gazing. This practice of divination [→ Divinatory Arts] was mostly used by village sorcerers in order to find lost property or call on the dead for advice. Inspired by Old Testament stories, Dee worked out a theory according to which the use of the "shew-stone" was to develop into the technology of a grandiose project leading to universal knowledge. His main problem was that personally he saw no visions in the shew-stone, so that he needed scryers, or mediums to communicate with the celestial beings. The sessions required two basic actors: the Magus and the Scryer. The Magus performed the conjurations, chants and prayers which prepared the evocation of Angels and spirits from the shew-stone. It was the Scryer who gazed at the ball, and the apparitions spoke via his tongue. In the case of the tandem of Doctor Dee and Edward Kelley, the Magus also acted also as a scribe, meticulously recording the actions. The most important requisite, thus, was the crystal ball, completed by other instruments, such as the Holy Table and some seals (on the choreography of the scrying sessions see Szönyi 2004; these are also usefully introduced in Geoffrey James' thematically arranged selection of the spiritual diaries [Dee, James ed., 1994]). The Doctor firmly believed that he had succeeded in establishing the transcendental contact by the help of his medium. In his spiritual diaries he wrote down whatever Kelley dictated to him. Much of this material is still unpublished but the pioneering selection of Meric Casaubon (*True & Faithful Relation . . .*), which had been commissioned by Sir Robert Cotton, represents the character and the complexity of the document very well.

It is certainly not easy to distil the sense of Dee's speculations concerning the perfect language. In the 1970s an Australian linguist, Donald Laycock subjected the angelic language to the most thorough examination so far, and distinguished two layers in it. The specimen of the *lingua adamica* that was communicated through Kelley during the first scrying sessions (known as the *Liber Logaeth*) is rich in repetition, rhyme, alliteration and other

patterns characteristic of poetry and magical charms. From this Laycock has concluded that Kelley must have been in trance, "speaking in tongues", when receiving these messages. As opposed to this, the Enochian language received later (*48 claves angelicae*, 1584, partly published in James 1994, 65-103) appears more like a real language, generated from set elements. In Dee's diaries there is a translation provided for these texts, which would allow speculation about its grammar. We also know that these texts were dictated to Kelley letter by letter, as opposed to the earlier trance-like flow of speech. As Laycock suggests, 'this is exactly the type of text produced if one generates a string of letters on some random pattern' (Laycock 1994, 40). Although the Enochian language appears to be very strange, it is not entirely impossible to reconstruct its morphology and syntax. Interestingly, according to Laycock, there is nothing strikingly un-English about the grammar, and he was able to compile an extensive dictionary of more than 2400 words, together with phonology and alphabet. About the transcendental validity of the angelic language, he sceptically suggested that the angels' 'limitations are those of Kelley; their occasional sublimities, those of Dee. If the true voice of God comes through the shewstone at all, it is certainly as through a glass darkly' (op. cit., 64).

The historian cannot avoid asking what we are to make of Dee's Enochian magic. While some practical occultists continue to use his keys and invocations even today, we should, rather, pinpoint Dee's importance in the context of Renaissance ideology, at the crossroads of the new science and the reformed religion. The spiritual diaries enable us to assemble an idiosyncratic mythology about the Fall of Mankind, the glorification of Enoch, and a burning desire for the dignity of man, i.e. *exaltatio* – a drive behind so many magical-esoteric programs. While Dee deserves only a minor place in the history of science, we might say that in the end – by turning directly to the angels – he created an almost perfectly consistent anti-theory of science, that still bemuses us with its coherence and faithfulness to its own premises. Rather than towards the rationalism of the Enlightenment, his system points in the direction of alternative intellectual developments of the Western esoteric tradition hallmarked by → Swedenborg, → Blake, → Yeats, Berdjajev and others.

4. OCCULTIST AND LITERARY RECEPTION

Apart from having a distinguished place in the history of early modern magic, Dee is important as

an inspiring model for some modern occult trends as well as many works of literature and art.

The first to reconstruct and try out the Enochian system from Dee's surviving papers was → Elias Ashmole, who attempted a series of seances between 1671 and 1676. Following his example, → Wynn Westcott of the → Hermetic Order of the Golden Dawn included Enochian Calls as required materials for the Adeptus Minor degree. Furthermore, → Aleister Crowley took the Enochian system very seriously and published the (reinterpreted and developed) Calls in his occult journal, *The Equinox* (1909-1913). A further important development in the reception of Enochian magic is found in Anton Szandor LaVey's Church of Satan, developed in California in the 1960s; LaVey's *Satanic Bible* reproduces Crowley's Calls by changing words referring to "the Highest" to the name of "Saitan". Enochian magic features heavily in esoteric internet sites even today.

Dee's "literary career" begins with speculations that he may have been the model for Marlowe's Doctor Faustus or Shakespeare's Prospero (Yates 1979, 115-67). His name is first mentioned in Ben Jonson's *The Alchemist* and Butler's *Hudibras* in the 17th century, but the most exciting chapter of his literary fame has been unfolding since the early 20th century, and today it is in full bloom: in the 1920s the Austrian novelist → Gustav Meyrink – writer of the famous *Golem* – chose Dee as the main character of his novel *The Angel of the West Window*. In 1985 Simon Rees published a novel on Dee, entitled *The Devil's Looking Glass*. Three years later Umberto Eco gave a key episodic role to Dee in his *Foucault's Pendulum*. In 1992 the post-modern mystery writer Peter Ackroyd presented the Doctor as a creator of homunculi in his *The House of Doctor Dee*. The famous film director Derek Jarman not only commemorated Dee in his films *Angelic Conversations* and *Jubilee*, but he also painted Enochian topics and arranged his home garden on the basis of Dee's hieroglyphic principles. One could add to this list Stephen Lowe's play *The Alchemical Wedding* and the opera by John Harle and David Pountney, *Angel Magick*.

GYÖRGY E. SZŐNYI

Deunov, Peter Konstantinov,
 * 11.7.1864 Hadurcha (presently
 Nikolaevka) (Bulgaria),
 † 27.12.1944 Izgreva (Bulgaria)

Deunov was born in a rural Bulgarian village in 1864, and went on to attend the American School of Theology and Science, run by American missionaries in the Danubian city of Svishtov. In 1888 he went to the United States, where he took courses at several Bible colleges and universities, including Boston University. He also became acquainted with several Theosophical and Rosicrucian bodies.

In 1895, Deunov returned to the Bulgarian city of Varna, where in 1896 he published his first book, *Science and Education*. According to his disciples, the Spirit of God descended onto Deunov on March 7, 1897 (Julian calendar), thus making him into one of the Masters of the White Brotherhood, Master Beinsa Douno. In the same year he founded the Society for Enlightening the Bulgarian People’s Spirit, and started lecturing on his conversion experience and the White Brotherhood, gathering his first faithful disciples, including Penyo Kirov (1868-1918), Todor Stoimenov (1872-1952), and Georgi Mirkovich (1875-1950) around him. These three disciples attended the first “annual meeting” of the White Brotherhood, held on April 6, 1900 in Varna (Julian calendar: “Meeting of the Chain”). They were later joined by Maria Kazakova (1852-1908).

The Brotherhood spread to most Bulgarian cities, and in 1902 Georgi Mirkovich became the editor of the spiritualist [→ Spiritualism] magazine *New Light*, which changed its name to *Videlina*. Whilst at the start the Brotherhood maintained an interest in spiritualist phenomena, magnetism [→ Animal Magnetism], and phrenology, the focus

gradually shifted to a Theosophical [→ Theosophical Society] doctrine, including references to secret Masters and the occult history of humankind, mostly derived from Madame → Blavatsky.

Deunov’s very successful lectures in Sofia during World War I ultimately elicited a reaction from the Bulgarian Orthodox Church, accusing him of heresy; its leaders also persuaded the government to exile him to Varna. Deunov’s insistence that the ancient Bulgarian heretics, known as → Bogomiles, were part of the White Brotherhood, certainly did not endear him to the Orthodox hierarchy. After the war, however, the Brotherhood met with renewed success, and in 1922 was able to open a school in Sofia, offering a “General Occult Course” and a “Special Occult Course” for the youth. The Orthodox Church reacted again by declaring Deunov “self-excommunicated”, and excommunicating some of his leading disciples at the same time.

Under the authoritarian regime of the Democratic Union Party, which came into power in 1923, the large annual meetings of the Brotherhood were banned. Deunov continued his teaching activities, however, launching in 1924 the new magazine *Wheat Grain* (the first editor of which was Georgi Radev, 1900-1940), establishing in 1927 an ashram in Izgreva (near Sofia), and opening a school near the Rila lakes in 1929. In the 1930s, most of Deunov’s efforts were focused on the teaching of Paneurhythmy, a discipline which encompassed music, songs and body movements.

In 1936, at the Izgreva ashram, Deunov was assaulted by a political opponent and suffered a brain haemorrhage. After his recovery, however, he supervised the spread of the Brotherhood in the West, and a center under the authority of the Bulgarian community was established in Paris in 1936 by Vittorio (1887-1976) and Annina Bertoli (1912-1989). In 1937, a Bulgarian disciple, Mikhail Ivanov (“Omraam Mikhaël Aïvhanov”, 1900-1986), emigrated to France, where he established an independent Universal White Brotherhood. Although several of Deunov’s disciples later accused Aïvhanov of having down-played the role of his master, misrepresenting himself as the founder of the Brotherhood, relations between the Bulgarian and the French branches have since become generally friendly, although they remain separate, and in several countries there are competing centers of both branches.

During World War II, bombing raids on Sofia forced the Brotherhood to move from Izgreva to the house of disciple Temelko Gyorev (1896-1990) in rural Murchaev. Soon after the Soviet invasion of Bulgaria, they returned to Izgreva, where a

weakened Deunov died on December 27, 1944. He had appointed no successor, and a Supreme Council took over the leadership of the Brotherhood, which achieved official government recognition in 1948.

Religious liberty was short-lived in the new Bulgaria, however, and state recognition was again withdrawn in 1956. The government then confiscated all of the Brotherhood's properties; several leaders were jailed and the Izgreva buildings were firstly nationalized, and then demolished in 1970. In the same decade of the 1970s, however, the Brotherhood cells, which had continued to operate underground throughout Bulgaria, won a certain degree of acceptance and some public meetings became possible again. In the 1970s and 1980s, expatriate disciples were also able to publish several of Deunov's works in both English and French. After the fall of communism, the Brotherhood again won legal recognition in Bulgaria in 1990, and started rebuilding a "New Izgreva" in 1995.

In the meantime, Deunov had become a popular name in neo-Theosophical and → New Age circles in the United States and Western Europe, and many who are not members of the Bulgarian Brotherhood (nor of its French counterpart established by Aïvhanov) today recognize Deunov as a significant master of Western esotericism. A smaller number of committed disciples still practice the exacting exercises of Paneurhythmy, and regard Deunov as more than simply a brilliant teacher; to them, he is the human embodiment of the White Brotherhood's Master, Beinsa Douno.

MASSIMO INTROVIGNE

Dianetics → Scientology

Dinter, Art(h)ur, * 27.6.1876
Mühlhausen (Alsace), † 21.5.1948
Offenburg (Baden-Württemberg)

Antisemitic author and one of the early members of Hitler's NSDAP. During the 1920s and 1930s propagator of an "Aryan" Christianity that was

"cleansed" of Semitic influences and inspired by gnostic beliefs [→ Gnosticism].

Arthur Dinter was born as son of a Prussian customs official. His mother, Berta Dinter-Hoffmann, who like her husband originally came from Silesia, raised him as a Catholic along with his brother and three sisters, while his father contributed a nationalist perspective. Starting in 1895, Dinter studied physics at the universities of Munich and Strassbourg, receiving his doctorate at Strassbourg in 1903. After a brief career as teacher, he became dramaturg of a theatrical company in Alsace. In 1908 he founded, in Berlin, with two others, the *Theaterverlag des Verbandes deutscher Schriftsteller* (Association of German Dramatists). During these years Dinter developed his *völkisch* (nationalist and racist) and alternative religious sympathies, which would later make him into a propagator of "Aryan" Christianity. The racist philosophy of history of Houston Stewart Chamberlain's *Die Grundlagen des 19. Jahrhunderts* (The Foundations of the Nineteenth Century) – published in 1899 and frequently reprinted – was of paramount importance in Dinter's ideological maturation. His attempts to perform nationalist plays, in order to enhance nationalist feelings in the audience, met with resistance from the audience and colleagues and finally resulted in Dinter's removal from the Association.

From 1914 to 1916 Dinter served as an officer on the Western front. The traumatic experience of the defeat of Germany in 1918 increased Dinter's radical *völkisch* belief in the nefarious Jewish influence which had led Germany to disaster. After the war he joined the influential antisemitic *Deutschvölkischer Schutz- und Trutzbund* (German People's League of Self-Defence), in which he occupied a leading position.

Dinter gained notoriety after World War I as author of a trilogy of literary works (see bibliography). Between 1918 and 1928 more than 365.000 copies were printed. The first and best known part of this trilogy, *Die Sünde wider das Blut* (The Sin against the Blood), had been printed 260.000 times by 1934 and reached an audience of millions of people. In this extremely antisemitic novel Jews are portrayed as a demonic force, trying to subjugate the "Aryan" nations through "racial mixing".

In April 1923 Dinter met with Hitler in Munich and joined the NSDAP. Convinced of the idea that politics, religion and "race" are one, and that the political and moral regeneration of Germany had to be preceded by spiritual-religious regeneration, Dinter founded the *Geistchristliche Religionsgemeinschaft* (Spiritualistic Christian Religious

Community) in November 1927. In this community, later renamed *Deutsche Volkskirche* (German People's Church), Dinter preached his "Aryan" Christianity to his followers. The foundation of this community, intended as a *völkisch*-religious base for Hitler's NSDAP, led to a break with Hitler. Hitler wanted to keep the NSDAP away from sectarian influences, which would only curtail his ambitions of making the organization into a mass-party and hence would hinder his quest for power. Dinter was expelled from the NSDAP in October 1928. In 1937 all activities of the *Deutsche Volkskirche* – which by then had some 70.000 members – were banned by the National-Socialist authorities. In the spring of 1945, Dinter, who by this time had been completely forgotten, fled from the Red Army from Thuringia. Three years later he died in Offenburg.

Dinter's doctrine, which he called *Geistchristentum* (Spiritualistic Christianity), had clear gnostic characteristics. According to Dinter in the beginning there was a world of pure spiritual entities created by God. After a break in this divine sphere a great number of worlds came into being through emanations. The material cosmos is the lowest and most impure of these worlds. However, in this impure cosmos there still exists a part of the divine primeval light, that seeks reunification with God and the decomposition of matter.

The cosmos, according to Dinter, is inhabited by good (pure) and demonic (impure) spirits. Every spirit has the task, by way of a process of "self-purification" (the gnostic motive of self-deliverance), to return to God. In this divine movement the human individual is nothing more than a transitional phase in the process that has to lead to reunification with God. In Dinter's system human races are the carriers of the spirits; they are the vehicles the spirits use to achieve their aims. Good spirits will use the human body to purify themselves in order to finally return to God and transcend the cycle of birth, death and rebirth. Selfish and materialistic spirits, on the other hand, incarnate only to satisfy their low, demonic urges.

According to Dinter the "Aryans" are the carriers of the good spirits, while the Jews are the embodiment of impure, demonic spirits. They are only after money and sex, and try to corrupt the "Aryans" in order to keep them from achieving their self-purification. This is also evident from the Jewish religion: according to Dinter the Old Testament is nothing but a set of rules created by a demonic God (Jahweh) to cheat and deceive the "Aryans". In Dinter's view Christ (an "Aryan" of absolute purity) came as a messenger from God

to push aside the Old Testament and replace it by Christianity and to preach "spiritualisation" ("self-purification") or *Geistchristentum*. Christ's mission however was interrupted by the Jews, who crucified him and falsified his message. For the latter, Dinter holds Paul particularly responsible. It is clear that Dinter's view is heavily influenced by gnosticism; the ancient christian-gnostic view of Christ as a messenger from the benign, a-cosmic God who came to dethrone Jahweh, the demiurge, is evident in his message.

Dinter saw himself with his *Geistchristentum* as a reformer, a second Luther. According to Dinter, Luther had tried to restore idealistic, "Aryan" Christianity, and Dinter saw himself as the person called to "fulfill" Luther's Reformation. Dinter wanted to "cleanse" Christianity of Semitic influences in order to restore "true" Christianity in all its splendor and glory and bring closer the deliverance of "Aryan" humanity. Apart from Luther, Dinter also invoked → Marcion, the 2nd century Christian gnostic, whom he regarded as a precursor.

Dinter's efforts to instigate a total "religious revolution" and to make his church into the new national church were thwarted in the end because of the political realities of the National-Socialist state.

Dionysius Areopagita (Pseudo-), ca. 500

Dionysius Areopagita, a mystical theologian, was so named in the belief, which generally prevailed until the last century, that a body of writings in Greek was produced by Dionysius of Athens, the convert of the Apostle Paul (Acts 17:16-34). In fact, the writings were produced ca. 500 A.D. and probably in Syria. Scholars are not agreed on their author; one possibility is Peter Fuller, Patriarch of Antioch (471-488). The surviving *corpus* includes four treatises (*Celestial Hierarchy*, *Ecclesiastical Hierarchy*, *Divine Names* and *Mystical Theology*) and ten letters. Written in a lofty tone with a rich vocabulary and cosmic in scope, they largely represent a fusion of Christian angelology with the → neoplatonism of Proclus († 485) and others. Hierarchy is defined in the *Celestial Hierarchy* III.1 as ‘sacred order, knowledge and activity assimilating itself, as far as it can, to the likeness of God (deiformity), and raising itself to its utmost, by means of the illuminations granted by God, to the imitation of God’. The object of hierarchy is assimilation and union of the soul with God. Parallels have been suggested by modern scholars between Dionysius’s writing about divinisation through sacred knowledge and enlightenment and → Hermetism, but even if not strictly paralleled in or by “hermetic” literature *per se*, Dionysius believed that supradiscursive knowledge is capable of effecting an ontological transformation in man. For Dionysius, nine orders of angels in heaven and six orders of ministers in the church on earth are like mirrors which receive illumination from God and in turn mediate this illumination to the beings who come below them, with a view to purifying, enlightening, perfecting and thus uniting them with God. In *Divine Names* Dionysius proposes two types of theology: one affirmative, which arises from God’s revelation of Himself to creatures but which entails the metaphorical use of names (such as Light or Beauty or Being) for the transcendent Thearchy; the other negative, which arises from the unknowability of God. In seeking deification or union with God, Dionysius starts with the sensible, created world and the material sacraments which provide symbols. But the inadequacies of human concepts and symbols when applied to God render the affirmative way inferior to the negative one, in which the human soul dispenses with the knowledge provided by the senses and by human reason, defines God by negatives (e.g. not light, not beauty, not being but beyond all these), and arrives through not knowing and not understanding at an ineffable union with Him. Because the negative way is supe-

rior, Dionysius also preferred dissimilar images of sacred realities (e.g. wild animals) to apparently similar ones (e.g. winged angels with human bodies and perfect faces), in order to highlight the illusory nature of the latter.

His writings, in Greek but translated into other languages (including Latin in the 9th century), have had a profound influence in both the eastern and western churches and were the subject of repeated commentaries in both. One direction to which they pointed was to debate about hierarchy and its role in society, both heavenly and human. But another direction was → mysticism within the traditions of the Catholic church. Mystical theology is the secret knowledge and incommunicable experience of God, non-intellectual and distinct from both natural theology and revealed theology. Two phrases of Dionysius enjoyed great fortune: the ‘ray of darkness’ and the ‘cloud of unknowing’ (*Mystical Theology*, chapter 1). His short treatise on *Mystical Theology* was especially influential during the late Middle Ages and in Spain and France during the 16th and 17th centuries. Thomas Gallus (d. 1246), Meister Eckhart (c. 1260-c. 1328), John Tauler († 1361), Ruysbroeck (1293-1381) and the Carthusian Denis Ryckel (1402-1471) drew generously from the *Mystical Theology* as did, in England in the mid-14th century, the author of *The Cloud of Unknowing* who, in addition, translated Dionysius’s work into English under the title *Denis Hid Divinity*. St John of the Cross (1542-1591) analysed the successive stages through which the soul passes, of purgation, illumination, and union with God; similarities have been found between *The Cloud of Unknowing* (a work which John probably did not know) and his *Dark Night of the Soul*.

Unlike the medieval commentators, many Renaissance humanists understood that Dionysius was a neoplatonist. They also found connections between divinisation according to Dionysian teaching and traditions of secret → magic deriving from the kabbalah [→ Jewish Influences] and from → Hermetism. → Ficino, who re-translated some of Dionysius’s works, is highly important in this context. He drew out more fully the similarities between Dionysius’s negative theology and the teaching in the *Asclepius* that God has no name but also has all names, as well as the associations between the Sun’s light and the Trinity and between the celestial spheres and the angelic powers. The connection between angelic intelligences and → astrology had long been familiar to the medieval scholastics, influenced as they were from the 13th century by → Avicenna. But Ficino, followed by → Giovanni Pico della Mirandola, → Cornelius

Agrippa, Hannibal Rosseli (fl. c. 1590) and → Giordano Bruno, fostered the association between astral powers, sun magic and the Dionisian hierarchies by turning also to Hermetic and kabbalistic sources.

Divinatory Arts

1. DIVINATION AND THE CLASSIFICATION OF THE DIVINATORY ARTS IN THE MIDDLE AGES
2. PROGNOSTICS AND BOOKS OF LOTS IN THE MIDDLE AGES
 - (A. PROGNOSTICS B. BOOKS OF LOTS)
3. FROM THE 12TH CENTURY TO THE CONTEMPORARY EPOCH: THE PRINCIPAL DIVINATORY ARTS (A. PHYSIOGNOMY B. CHIROMANCY C. GEOMANCY D. SPATULOMANCY E. CATOPTROMANCY)

Divination, in general, is the art of divining the past, present, and future by means of various techniques. According to Cicero (*De Divinatione*) these can be divided into two main categories: "natural" or "intuitive" divination (*divinatio naturalis*) and "artificial", "inductive", or "reasoned" divination (*divinatio artificiosa*). For Cicero, the revelations bestowed by the gods on men in states of possession (*furor*) or in certain dreams belong to natural divination, whereas inductive or conjectural divination looks at sacred "signs" of whatever kind and submits them to interpretation, a procedure that requires a certain "art". Even though this aspect of interpreting sacred signs disappeared rapidly in the Latin West with the spread of Christianity, the distinction between natural, intuitive divination and artificial, inductive divination remains valid, most of the divinatory methods used belonging to the latter category. It must be emphasized that neither in the Middle Ages nor in later periods divination consisted of an established and coherent body of doctrine; rather, it consisted of a collection of "arts", or techniques, some of which are attested from the High Middle Ages onwards, and may appear to be legacies from classical Antiquity, whilst others did not develop until after the 12th century, with the diffusion of treatises translated either from Arabic or, much more rarely, from Greek.

Recent research into the divinatory methods used during the Middle Ages, and particularly those introduced from the 12th century onwards, presents us with a fairly accurate picture of the main techniques in use during that period, whereas this seems more difficult for the modern and contemporary periods. Therefore the emphasis here will be, first, on the conception and classification of the divinatory sciences in the Middle Ages; next, on the methods used in the High Middle Ages; and finally, on a certain number of techniques which have persisted with more or less success from the 12th century to the present. This study excludes

some techniques that enjoyed an important independent development and are no longer seen as belonging to the field of divinatory arts, such as → astrology, oneiromancy, and necromancy, the latter being classified within the field of → magic.

I. DIVINATION AND THE
CLASSIFICATION OF THE
DIVINATORY ARTS IN THE MIDDLE
AGES

The medieval concept of divination is essentially based on the chapter that Isidore of Seville (circa 560-636) devotes to the magicians (*magi*) in his *Etymologies* (*Etymologiae*, Book VIII, chapter IX *De magis*). This chapter, the elements of which recur in many medieval treatises, assimilates divination with magic, and as such has undoubtedly been responsible for subsequent confusion between magic and divination and for their common condemnation, as frequent in the Middle Ages as in the modern era. However, the canons of the Church Councils of the 4th, 5th, and 6th centuries, while condemning both of them, often took care to distinguish between divination (*divinatio*) and the magical art (*ars magica*). For example, the Synod of Agde (506) included within the science of divination (*divinationis scientia*) auguries (*auguria*), lots (*sortes*), and dreams (*somnia*).

Like the whole of the *Etymologies*, the chapter *De magis* makes no effort at coherent organization, but assembles information culled from various ancient Greek and Latin authors: those of late Antiquity, such as Tertullian (circa 155-220), or Church Fathers such as → Augustine (354-430) and Jerome (circa 342-420). As regards divination, Isidore first adopts the distinction established by Varro (116-27 B.C.) between four types of divination that make use of the four elements of earth, water, air, and fire, respectively known as geomancy (*geomantia*), hydromancy (*hydromantia*), aeromancy (*aeromantia*), and pyromancy (*pyromantia*). Isidore's next paragraph borrows simultaneously from Augustine and Cicero. He states first that those who practice divination are called diviners (*divini*), as if they were 'filled with God' (*quasi Deo pleni*); assimilating themselves to divinity, they fraudulently predict the future. Then, following Cicero, Isidore distinguishes two types of divination, *ars* and *furor*, giving the definition of a series of terms, some of which derive from divination, others from magic, while most denote magical and divinatory practices belonging to Antiquity: haruspices (*aruspices*), augurs (*augures*, *auguria*), auspices (*auspicia*), pythonesses (*pythones*), astrologers (*astrologi*, *genethliaci*, *mathematici*,

horoscopi), and casters of lots (*sortilegi*). This last-mentioned term belonged to the vocabulary of divination at least until the 10th century, and applies to those who try to predict the future by consulting books of lots. Thus in the 7th century (Council of Narbonne, 619) and the 8th century (capitulary of 769) it is associated with the terms *divinatores* and *divini* (diviners). The anti-divinatory literature that developed after the introduction of Arab astrology into the Latin West still continued to condemn, along with magic and astrology, which were its main target, all the divinatory techniques described by Isidore of Seville, sometimes adding physiognomy, chiromancy, and geomancy. John of Salisbury (circa 1115-1180), in his *Policraticus*, adds nothing to Isidore's picture and invariably sees in divination, as in magic, the work of demons. Hugh of St. Victor († 1141), in his *Didascalicon*, distinguishes magical practices (*praestigia* and *maleficia*) from the various divinatory arts, and particularly from astrology. Mantics or divination (*mantice quod sonat divinatio*) itself contains five types (*species*): necromancy, which is divination through the dead; geomancy, divination through the earth; hydromancy, divination through water; aeromancy, divination through air; and pyromancy, divination through fire. Hugh divides mathematics (*mathematica*) into three types: haruspicy (*aruspicina*), auguries, and horoscopes (*horoscopica*). In the 13th century, Thomas Aquinas (1224/5-1274), especially in his *Summa theologica*, likewise dissociates divination from magic but invariably forbids its use, since for him all divination proceeds from the operation of demons. Again, in the 14th and 15th centuries, neither Nicole Oresme (circa 1320-1382), in *Le Livre de divinacions* (Book of divinations) written around 1356, nor Laurent Pignon (circa 1368-1449), in his treatise *Contre les devineurs* (Against the diviners) written around 1411, deviate much from this position.

These various classifications, which mostly refer to the types of divination used in Greek and Latin Antiquity, only cover a small part of the types that were practiced during the Middle Ages. Setting aside the treatises of astrology and oneiromancy which are not our concern, the surviving texts of the Middle Ages belong to two different traditions. On the one hand we have a literature of prognostics in Latin or the vernacular, stemming from the 10th to the 15th century and mostly comprising short texts, to which can be added a few books of lots; on the other, actual treatises explaining the methods of one or another divinatory technique, in Latin or in a few cases in the vernacular, from the

12th century onwards. From the present state of research it appears that the only arts that were particularly studied, if not the only ones practiced, during the Middle Ages were physiognomy, chiromancy, geomancy, and to a lesser extent scapulomancy and catoptromancy.

2. PROGNOSTICS AND BOOKS OF LOTS IN THE MIDDLE AGES

A. PROGNOSTICS

There are several different types of prognostics, nearly all constructed on the same model. The manuscript prognostics that begin with the 1st of January, of which the oldest go back to the 10th century, attribute their texts sometimes to the Venerable Bede, sometimes to Esdras, and in a slightly different version to → (pseudo) Dionysius Areopagita. These Latin texts, of which several French versions exist both in prose and verse, give information for each day of the week, from Sunday onwards, on which the year can begin; they give general indications on what the weather will be in each season, on the abundance of harvests and vintages, on the sicknesses that will afflict men and animals, and on events of collective import such as wars or epidemics.

On the same model, in the Latin and French manuscripts we also find prognostications for the coming year, sometimes attributed to Ezekiel, based on the day of the week on which Christmas falls, together with a short text on the significance of the winds that blow on Christmas Day, depending on the direction from which they come.

We also find prognostics in the Latin and vernacular manuscripts based on the day of the lunar month, following two types: either giving general indications of the actions to be undertaken, or avoided, on the 1st, 2nd, 3rd, etc. day of the lunar month, or, in addition to these, explications of the character and destiny of a man or woman (under two separate rubrics) born on these days, which refer more specifically to astrological physiognomy.

Another group of prognostics, in Latin and vernacular languages, concerns thunder, according to the day of the month or week when it is heard, and the direction from which it comes. These prognostics generally give indications of a meteorological and agricultural nature for the coming month or week. The quite numerous texts on “Egyptian Days”, or more generally on “dangerous” days for undertaking some action, belong more to astrology.

B. BOOKS OF LOTS

Among the surviving medieval books of lots, one can distinguish several types of work. Aside from the *sortes sanctorum* or *apostolorum*, based on choosing by lot passages from the Scriptures, of which few manuscripts exist, the books of lots or books of judgments all work on the same principle: a series of general questions (success of a voyage, outcome of an illness, conception or birth of a child, etc.) is linked to answers classed under rubrics of varying titles, e.g. proper names (generally with an Arabic sound), names of flowers, or animals. The manner of use is not always specified, and it seems that in certain cases the choice of an answer to the question depended on a throw of dice. There is another group of texts, often very brief, that are onomantic in character, in which the answer is obtained from the sum of numerical values attributed to the letters of the questioner's name, and from what remains after dividing this sum by a given number, the remainder referring to groups of prognostic tables.

We should also mention the medical-astrological spheres attributed to Pythagoras, Petosiris, or Apuleius, which are Greek in origin and were diffused in the West from the 9th century onwards, whose prediction system rests on numerological criteria. This type of treatise seems to persist in the modern age in the form of predictions in almanacs and booklets belonging to so-called “popular” literature. From the 12th century onwards, beside these books of lots and prognostics, we see the introduction and development in the Latin West of a certain number of divinatory methods whose transmission rests on an important tradition, first through manuscripts, then in print.

3. FROM THE 12TH CENTURY TO THE CONTEMPORARY EPOCH: THE PRINCIPAL DIVINATORY ARTS

A. PHYSIOGNOMY

Physiognomy belongs within the field of divination insofar as it claims to predict a person's destiny from his facial traits, the general look of his body, or the patterns of lines in his palm. Chiromancy, properly speaking, is only a subdivision of physiognomy, but treatises entirely devoted to this divinatory art have circulated since the Middle Ages. Physiognomy only developed in the West from the 12th century onwards, with the introduction of Greek and Arab science via the first Latin translations. Thus Western physiognomy stems from two different traditions, Greco-Latin and Arab.

Physiognomy was certainly born in Greece, the first treatises claiming Pythagoras or Hippocrates as its founder. Although the latter's works contain no physiognomy as such, they justify its use by their insistence on the close interdependence of the soul and the body. The first surviving treatise on physiognomy is attributed to Aristotle; those of Loxus and Polemon of Laodicea (or Palemon, 2nd century A.D.) are lost. There is in fact an Arabic translation of Polemon's treatise, probably made at the beginning of the 9th century, but neither this nor the abbreviated version made by the Jewish physician Adamantius in Alexandria during the 4th century was transmitted to the Latin West. The only treatises that reached the Latin West from classical Antiquity are that of Pseudo-Aristotle, translated directly from the Greek circa 1260 by Bartholomew of Messina at the request of King Manfred of Sicily, and an anonymous compilation attributed to Apuleius, probably translated from the Latin by the end of the 11th century. According to both Pseudo-Aristotle and Pseudo-Apuleius, the procedures for making a physiognomic judgment is to take account of a person's behavior, his resemblance to some animal, his belonging to one people or another, and also his sex, and then to examine in turn the various parts of his body, beginning with the legs and ending with the face.

The Arabic treatises form the second source of Western physiognomy. The Arabs were aware very early on of Polemon of Laodicea's treatise in a translation by an unknown author. Their physiognomy developed in two directions: the naturalist tradition, akin to medical interests, with the *Secretum secretorum* (Secret of Secrets) and part of the *Liber Almansoris* (*Kitâb al-frâsa*) of Rasis; and the astrological physiognomy represented in most of the treatises of astrology. Rasis devoted the second book of his *Liber Almansoris* to the study of the different temperaments and their signs. In the Latin translation by Gerard of Cremona (1114-1187), dating from 1187, this book contains 58 chapters. After showing how to diagnose the temperament by examining the color and shape of the face, the general aspect and that of the various members, Rasis reviews the characteristic physical signs of the different temperaments, then treats the signs of each member and draws up the portraits of several types of individual. The *Secretum secretorum* (also known under the title *Letter to Alexander*) is a compilation in Arabic that is probably quite late (11th-12th century), existing in both a short and a long version. Only the latter, translated into Latin by Philip of Tripoli at the beginning of the 13th century, contains a physiognomic section. Edited and

commented upon around 1257-1267 by → Roger Bacon, this work was attributed during the Middle Ages to Aristotle, probably thanks to → Albertus Magnus. Its physiognomic section is inspired both by Polemon and by Rasis: the goal of physiognomy is not the search for acquired characteristics, but for natural dispositions. The author reviews the general aspect of man and studies the signs of the different parts of the face and body. In addition, most of the Arab astrological treatises, such as those of Haly Abenragel or Abraham ibn Ezra, expound an astrological physiognomy: a physical and moral type, described at length, corresponds to each planet and to each sign of the zodiac.

The original production of the Latin Middle Ages rests mainly on four treatises: those of Pseudo-Apuleius, Pseudo-Aristotle, Rasis, and the *Secret of Secrets*. However, there are two works that predate these Latin translations: that of Gilles de Corbeil, physician to Philip Augustus, and that of → Michael Scot, whose *Liber phisonomie* (Book of physiognomy) probably derived from the Greek tradition via Arab sources. The most striking treatises are those of Albertus Magnus and, above all, of → Peter of Abano, completed towards 1295, who for the first time introduces astrology into the Latin physiognomic tradition; but we should also mention Michele Savonarola, who in the *Speculum physionomiae* (Mirror of physiognomy), circa 1450, prefaces his physiognomic study with an anatomical description of the relevant parts of the body.

The success of physiognomy did not wane in the modern and contemporary epochs. It was especially popular in the periods from the beginning of the 16th century until the second third of the 17th, and from the 1780s until the middle of the 19th century. The work of Bartholomaeus Cocles, *Chyromantiae ac phisonomie Anastasis* (Awakening of chiromancy and physiognomy), published in Latin in Bologna, 1504, was translated into Italian in 1531, and into German, French and English in 1550. That of Giovanni Battista della Porta (1538-1615), *De humana phisognomia* (On human physiognomy), published in Latin in 1586, translated into French in 1655 and reissued in 1665 under the title *De la phisionomie humaine*, remarkable for its extent and its exhaustiveness, dominates an abundant 16th-century production. The principle at the heart of 16th-century physiognomy was that of the analogy between the human microcosm and the macrocosm, although there was a noticeable separation of physiognomy from astrology in the last years of the 16th century, after the papal bull *Caeli et terrae creator* of Sixtus V (1520-

1590) in 1586 condemned the divinatory sciences. The naturalist tradition stemming from Aristotle then overtook the astrological and divinatory tradition. This new tendency is illustrated in 1660 by the appearance of the treatise by Louis XIV's physician, Martin Cureau de la Chambre (1596-1669), *L'Art de connoistre les hommes* (The art of knowing men), which contains no astrological element whatever. But the major event in the history of physiognomy during the 17th century was the *Conférences sur l'expression des passions* (Lectures on the expression of the passions), a series of lectures given by the painter Charles Le Brun (1619-1690) before the Royal Academy of Painting and Sculpture. Le Brun no longer held that the face is the mirror resembling the soul, but saw it as the physical expression of its passions. Physiognomy suffered a decline in the 18th century, despite the success of the *Lettres philosophiques sur les physionomies* (Philosophical letters on physiognomies) published in 1746, which rejected comparative or zoomorphic physiognomy. It revived at the end of the century with → Johann Caspar Lavater (1741-1801), whose four-volume *Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe* (Physiognomic fragments for the furthering of the knowledge and love of man), published between 1775 and 1778 and translated into French as *Essais sur la physiognomie destinés à faire connaître l'homme et à le faire aimer*, met with success as well as hostility throughout Europe. Lavater's volumes, synthesizing all the tendencies and the whole history of physiognomy, remain the reference work in this field.

B. CHIROMANCY

Chiromancy has as its goal the prediction of the future or the divining of a person's character through studying the palm of the hand, and more particularly its lines. Although this technique is probably of ancient origin, either Greek or Latin, as attested by a number of references to texts attributed to Artemidorus, Pollux, or Suidas, no ancient treatise on chiromancy has been preserved in either language. The only known treatise in Greek appears in two manuscripts dating respectively from the 13th and 15th centuries.

In the Latin West, chiromancy did not appear before the middle of the 12th century. John of Salisbury, in his *Policraticus*, alludes to it as a new form of divination. Although chiromancy claims justification from the Bible (Job 37:7), its sources are of Arab origin, particularly a short work attributed to Rasis, *Knowledge of the Lines of the Hand*. Chiromancy is present in several medieval treatises

on physiognomy, but it also circulated in books devoted to it alone. Two of these, attributed to Aristotle, were printed in Ulm as early as 1490. Two others go under the name of Albertus Magnus, and numerous anonymous works show that the practice of this art was widespread. These treatises study only the three principal lines of the hand (life-line, median line, and mensal line), or the four lines (these, plus the base of the triangle), or else the four lines and the "mounts" that separate them. Most of these texts are very brief and technical, detailing the study of the various lines of the hand, the angles formed between them, and the mounts. The set of → correspondences established between the bodily organs and the lines of the hand allows for multiple interpretations. The interpretation becomes even more complicated when, certainly before the end of the 14th century, astrological correspondences enter this field (like that of physiognomy), relating the parts of the hand to the various planets. Some texts draw virtual portraits of people as a function of the importance of the line attributed to a certain planet.

During the 16th and 17th centuries, chiromancy was always associated with physiognomy. This was the case, for example, in Bartholomaeus Cocles's treatise *Chyromantiae ac physionomie Anastasis cum approbatione magistri Alexandri de Achillinis*, published in Bologna, 1504; and also in John of Indagine's *Introductiones apotelesmaticae in chyromantiam, physiognomiam, astrologiam naturalem, complexiones hominum naturas planetarum* (Astrological introductions to chiromancy, physiognomy, natural astrology, human complexions, and the natures of the planets) first published in Latin in Strasbourg, 1522, and frequently re-issued. This work appeared in French in 1662 (*La Chiromancie et physiognomie par le regard des membres de l'homme*) under the name of Jean de Hayn. The case was the same with the treatise of Jean Bebot, published in Paris, 1619, *Instruction familière et très facile pour apprendre les sciences de chiromancie et physiognomie* (Familiar and very easy introduction for learning the sciences of chiromancy and physiognomy), and that of Martin Cureau de la Chambre, *L'Art de connoistre les hommes*, published in Amsterdam, 1660. However, Cureau's book was one of the last treatises of this type, associating physiognomy, metoposcopy (study of the forehead), and chiromancy, before Lavater, in his *Physiognomische Fragmente*, definitively separated chiromancy from physiognomy. Even so, chiromancy remained extremely widespread, and it certainly still ranks among the most popular divinatory methods.

C. GEOMANCY

Geomancy is a divinatory technique which took on, in the West, the name of one of the four types of divination defined by Varro after the four elements (see section 1, above). It was introduced to the Latin West in the 12th century by way of translations of Arabic works. It did not aim, as did ancient geomancy, at the interpretation of the earth's "movements", such as earthquakes and volcanic eruptions, but rather at knowledge of the past, present, and future through interpretation of a "theme", consisting of "houses" in which are placed "figures" formed by the combination of even and odd markings in four columns, each figure containing four to eight points. These figures, originally drawn on sand or earth on the basis of points cast at random with the finger or a stick, and later on paper with pen and ink, are sixteen in number, comprising eight couples of complementary or opposing figures: *Via/Populus*, *Conjunctio/Carcer*, *Fortuna Major/Fortuna Minor*, *Acquisicio/Amissio*, *Laetitia/Tristitia*, *Puer/Puella*, *Albus/Rubeus*, *Caput/Cauda*. Certain qualities, properties, and meanings are attributed to each figure and to each house.

The first twelve geomantic houses, assimilated to the astrological ones, soon found the significations of the latter ascribed to them. Only the four last houses have strictly geomantic meanings, being called respectively the houses of the witnesses, of the judge, and of the over-judge. In geomantic treatises, the prognostications that answer the questions are generally grouped by houses according to their subject, and drawn from the combination of the respective properties and meanings of the figures and the houses.

The first Latin treatises are presented as translations of Arab texts, but it seems that their Arabic originals are lost. The oldest surviving text in Arabic is that of Abû Abdallâh az-Zanâti. Cited by Ibn Khaldûn in his 14th-century *Prolegomena*, this work, very likely dating from the 12th or 13th century, is in use to this day in the countries of the Maghreb and black Africa, as well as in Madagascar. There is also a tradition of Arab geomancy in Hebrew, certain Arab treatises only surviving in their Hebrew translations. These medieval translations seem to have been the work of the Jewish community settled in Spain, and especially in Toledo. Hebrew may therefore have played a role in the transmission of Arab geomancy to the Latin world. Arab geomancy is equally the probable origin of the development of geomancy in the Byzantine empire from the 13th century onwards, although the work of Nicholas of Otranto, for

example, borrows much from the first Latin treatise on geomancy, that of Hugh of Santalla.

The first geomantic treatises in Latin, Hugh of Santalla's *Ars geomancie*, and the treatise known by its incipit as *Estimaverunt Indi*, which certain manuscripts attributed to Gerard of Cremona date from the 12th century and, as said, are presented as translations from the Arabic. They already explain the essentials of geomantic technique as it would be practiced in the West: the casting of points, formation of the "theme", significance of the figures and houses, elements of interpretation, examples of resolving geomantic questions. Astrology, closely associated with geomancy, is already present: the figures are connected to the planets and the signs of the zodiac; the meanings of the first twelve geomantic houses are those of the astrological houses; the geomancer is to take account in his interpretation of the aspects formed between the figures. The later medieval treatises, by Gerard of Cremona, Bartholomew of Parma, William of Moerbeke, John of Murs, and Rolandus Scriptoris, present few differences on a technical level, although the role of astrology tends to increase. Most of these Latin treatises were translated into the vernacular from the 14th century onwards: into German, French, Provençal, English, or Italian. Surviving inventories of medieval libraries bear witness to the existence of a large number of geomancies in the vernacular, showing that this divinatory technique was widespread beyond the restricted circles of the learned. Several original treatises appeared in the 16th century and even later, such as those of Christophe de Cattan in French, Bartholomaeus Cocles in Italian, → Heinrich Cornelius Agrippa, and → Robert Fludd; but eventually geomancy seems to have become no more than a curiosity for the erudite.

Beside these divinatory arts, which are in a sense the major ones and essentially derive from the written tradition, mention may also be made of some other divinatory methods whose practice has left few written traces, and whose importance is often difficult to evaluate: besides spatulomancy and catoptromancy (see below), examples are onychomancy (divination from the fingernails), crystalomancy, and pyromancy.

D. SPATULOMANCY

Spatulomancy (from Latin *spatula*, shoulder-blade) is a divinatory technique practiced by interpreting the "signs" (lines, marks, grooves, etc.) found on the right shoulder-blade of a sheep. Its use is attested in many cultural areas and over very different epochs. In the Latin West, the first known

treatises were written in Arabic in Spain, then translated into Latin in the first half of the 12th century. We have four different Latin treatises, two of which were translated by Hugh of Santalla, who dedicated them before 1151 to Michael, Bishop of Tarazona. This new technique then spread all over Europe, but its practice does not seem to have given rise to much literature.

E. CATOPTROMANCY

Catoptromancy, divination by the mirror, probably appeared in Greece as early as the 6th century B.C., and was then diffused through East and West. A. Delatte distinguishes two principal forms. In the first, 'no appeal is made to any supernatural force, and one is content to use the somehow magical property possessed by reflective surfaces to foster the imagination'. The hidden persons, things, or events that form the object of the consultation appear in the mirror before the eyes of the consultant, the diviner, or a third party acting as medium. In the second form of catoptromancy, the revelation 'is procured through signs or words from supernatural beings – gods, angels, or demons – whose appearance in the mirror is solicited by magical or religious rituals'. It is this second type that developed in the Middle Ages and the modern epoch, but without giving rise, so it seems, to the writing of real treatises. The practice was mentioned and condemned as early as the 12th century by John of Salisbury in his *Policraticus*. It was again condemned by John XXII (Pope 1316-1334) in 1318 and around 1326-1328; by the theological faculty of Paris in 1398; and by Sixtus V in 1586, in his bull *Caeli et terrae creator*. Although Ronsard mentions it in one of his Hymns, from the 16th century onwards divination by the mirror seems to have given way to divination by the crystal ball.

While it is possible to draw up a more or less representative account of the written tradition of divinatory arts in the medieval and modern periods, it is far more difficult, given the current state of research, to know which divinatory techniques were really practiced, since their constant condemnation by the Church doubtless induced the "diviners" to dissimulate or at least to keep silent about their activities in this field.

Dorn, Gérard, * ca. 1530-1535
 Malines (Belgium), † after 1584
 Frankfurt-am-Main

Dorn was one of the many followers of → Paracelsus who, like Petrus Severinus (1542-1602), Adam von Bodenstein (1528-1577) or → Jacques Gohory, contributed through their commentaries and translations to the dissemination of their German master's work in the scholarly circles of 16th-century Europe. Dorn's birthplace, by general agreement, seems to have been Malines in Belgium, but his frequent travels most often led him to reside in Germany, Switzerland or France. His biography remains known only in a fragmentary manner. Thus, everything about his childhood and his education is unknown. Of his student years, we know only that in 1559 he enrolled at the University of Tübingen where he probably studied medicine and where he may have met the Paracelsian Eisenmenger, known as Siderocrates (1534-1585). In 1565, he sojourned in Besançon, where he offered the manuscript version of his *Clavis totius philosophiae chymistae* to Cardinal de Granvelle (1517-1586), keenly interested in alchemy himself. Dorn was found again in Lyon the following year, where he published his *Clavis*, dedicated to Adam von Bodenstein (1528-1577), with whom he was probably associated and of whom he described himself as 'the very least disciple, just like of Theophrastus [Paracelsus] himself'. Shortly after the publication of the *Clavis*, in 1567, Gohory in his *Theophrasti Paracelsi . . . Compendium* lashed out against Dorn, accusing him of being unfaithful to the Paracelsian teachings. From 1568 to 1578, Dorn settled in Basel. He worked there for some time translating Paracelsus's writings into Latin on behalf of the publisher Petrus Perna. His dedications reveal his contacts, at that time, with some German princes such as Karl von Baden or Wilhelm IV von Hessen-Kassel, or the French ambassador Pierre de Granrye. Owing to the latter, he further gained the protection of prince François de Valois (1555-1584), brother of King Henri III (1551-1589). Dorn reappeared three years later in Frankfurt-am-Main. He published there some ten more works before his death, in 1584 or shortly thereafter.

Dorn's abundant production reflects the diversity of his culture and of his centers of interest. The first version of his *Clavis* (1565) bears the stamp of an alchemical tradition principally represented by → Hermes Trismegistus, pseudo-Geber, → Jean de Roquetaillade, → Marsilio Ficino and G.A. Pantheus. However, his understanding of this alchemy

is not a traditional one: over the transmutatory operations of the gold-makers, for whom Dorn shows mainly contempt, he prefers the search for a universal medicine based upon the therapeutic powers of the quintessence. His speculations also borrow from → astrology and → magic, the latter as understood by → Johannes Trithemius, as a form of wisdom leading to the understanding of physical and metaphysical things. According to Didier Kahn, Paracelsian influence in Dorn's work did not become manifest until the 1567 edition of the *Clavis*. This edition revealingly opens with a homage to the great German master, followed by two prefaces in which the author vows to be an ardent defender of medical alchemy against the traditional concepts of medical science, those of Galen in particular. This commitment to the Paracelsian cause led him to combine his works as a translator, commentator and lexicographer with polemics against others. Thus he published a severe *Admonitio* (1583) directed against Thomas Erastus (1523-1583), a commentary on *De vita longa* by Paracelsus (1583) and a *Dictionarium Theophrasti Paracelsi* (1584) that, because of its obscurity, aroused the wrath of the alchemist Andreas Libavius (1555-1616). His competence as an exegete also led Dorn to follow in the footsteps of the Italians Aurelio Augurelli (1456-1530) and Giovanni Bracesco (toward 1481-?) and take an interest in alchemical interpretations of pagan mythology (see his *Colloquium quo Titan Paterfamilias, Oceanitische Mater, de sua prole consulunt*, 1568). In addition, it is noteworthy that, in making an effort at popularizing Paracelsus, Dorn moved toward a mystical and theosophical concept of alchemy. The second part of the *Clavis* already bears witness to this spiritual orientation: there he refers to the 'seven degrees of a speculative philosophy' that assimilate the operations of the great work with the different stages of asceticism. He reaffirmed this program of conjoining chemical work and moral accomplishment in his *Congeries Paracelsicae Chymiae* (1581), where the experiments performed in the laboratory are understood as the visible manifestations of a spiritual process developing in the intimate psyche of the alchemist. → C.G. Jung would later propose something similar in reference to the mechanisms of projection and transfer in his book *Psychologie und alchimie* (1944). It is interesting to note, finally, that Dorn gives the outlines of his wisdom in his *Monarchia triadis* (1577), where his speculations ally cosmology, operative research and → Christian theosophy.

The presence of many works by Dorn in the first volume of *Theatrum chemicum* (1602) reflects his

importance in the history of alchemical literature. Certainly, the author of *Clavis* and *Congeries* appears as one of the major figures to carry the thinking of Paracelsus into the 17th century. A heir to the current of Renaissance *philosophia occulta* [→ occult / occultism] represented by Johannes Trithemius, Cornelius Agrippa, or → John Dee, his work moreover encouraged the emergence of an alchemical and Christian theosophy, whose main representatives are → Heinrich Khunrath, → Robert Fludd and → Jacob Boehme.

FRANK GREINER

Douzetemps (or Douz[e]aidans),
Melchior, * 1668/1669 place unknown,
† after 1738 probably Offenbach am
Main

Very little is known about Douzetemps's life: even his first name was not documented until 1984 (by R. Breymayer). This French Lutheran settled in Germany early in his life as a consequence of the revocation of the Edict of Nantes in 1685. His book (see below) gives the impression that he associated with people shaped by the spirituality of Quietism and → Pietism. He is reported to have met, in Aachen in 1730, a lady who was a disciple of Madame Guyon. She may have exerted a certain influence on him since, at that time, Quietism was making headway among German Lutherans.

In 1731 appeared a small text by Douzetemps, "Geliebte in dem Geliebten!" (Beloved in the Beloved!), to which R. Breymayer has recently called attention. It consists of 14 pages and was published in a collective volume *Bewährte und Harmonische Zeugnisse* (Warranted and Harmonious Testimonies). The authors seem to have belonged to the "Harmonisten", an irenic and pietistic group. The same year, a Saxon political agent had become aware of a letter in which Douzetemps had used the term "White Eagle", and as a result he was believed to be planning a conspiracy against the Polish Kingdom: for the heraldic arms of that monarchy contain such a bird. But actually, what Douzetemps had had in mind was nothing but the alchemical [→ Alchemy] "Mercurium Philosophorum", also called "White Eagle". Nevertheless, upon a request by the Count of Brühl who was in the service of Prince August II, Douzetemps, who was sixty-three at the time, was taken into custody around November, and imprisoned in the fortress of Sonnenstein near Dresden. He was released on 4 September 1732.

According to his own testimony in *Mystère de la Croix affligeante et consolante* he began writing that book – probably the only one he authored – after having spent ten months and thirteen days in the prison at Sonnenstein, ‘deprived of paper, pen and ink’. On this point he may be exaggerating, since the book was published as early as 1732. He goes on to explain that he chose to write it in French rather than Latin or German because French was the most appropriate language for his work to be read by most of his friends.

The book has fifteen chapters, each of which ends with a short poem in Latin. It furthermore has an appendix of about 40 pages titled *Hortulus Sacer varii floris, coloris, odoris*, which is comprised of poems (some of which are alchemical, like “Lapis Transmutans”), also in Latin. According to Paul Chacornac, this *Hortulus* is inspired or even partly copied from *La Christiada* (1535), a work by Girolamo Vida.

The term “mysterium crucis” had always played a great role in systematic theology and Latin liturgy. It is not all that surprising that Douzetemps preferred that title rather than an esoteric, theosophical [→ Christian Theosophy] or alchemical one, since the majority of the discussions contained in the book are more “mystical” in nature, such as prayers, devotional meditations, etc. But these discussions are interspersed with many neo-kabbalistic, alchemical and theosophical passages which are really more “esoteric” in character. Foreexample, Douzetemps devotes a long passage to the ontological meanings of the seven letters of IEHOVAH and their connections with one another. In so doing, he draws a series of triangles and other related geometrical figures from which a variety of crosses emerge. These are supposed to throw some light upon the mysteries of the Trinity and the Creation.

Chapter thirteen, titled “On the Wonders of the Cross within External Nature”, and also the last chapter, resonate with Paracelsian [→ Paracelsianism] and Bohemian tones. Here we find a vivid evocation of the ontological role of the Sun, the “door of Light” situated at the very place where Lucifer stood before he fell. The Sun produces blood, sulphur, and everything that is oily; the Moon produces milk, salt, and everything that is watery. Such pages have a definite alchemical ring, enhanced both by the choice of technical terms like salpeter, niter, and vitriol, and by the names of the authors or works quoted, such as → Paracelsus, → Arnau de Vilanova, Basilius Valentinus, and, not the least, the *Aurea Catena Homeri* published in Frankfurt in 1723.

In French, the book was newly edited in Lausanne

in 1786, then in 1791 at the same place upon the initiative of → Jean-Philippe Dutoit-Membrini. The latter highly praises Douzetemps in his book *La Philosophie divine* (Lausanne 1794), also partly a theosophical work. The edition of 1786 was reprinted in London in 1860 with a short, anonymous introduction in English. In April 1911, Alexandre Thomas, under the pen name Mandres, edited extracts from *Le mystère de la Croix* in the journal *La Gnose, revue mensuelle consacrée à l'étude des sciences ésotérique*. In the same journal and the same year appeared a series of articles by → René Guénon entitled *Le symbolisme de la Croix* which was published in 1931 as a book. The number of translations and testimonies in other languages bears witness to a rather discreet, but steady reception over a few decades. Johann Christoph Lenz, who was also a translator of → Swedenborg, translated it into German in 1782. The following year, the famous publicist Friedrich Nicolai, who had printed an edition of the Rosicrucian Manifestos in 1781 [→ Rosicrucianism], noted that esoteric philosophy was finding its way to Germany via French books like those written by Douzetemps and → Louis-Claude de Saint-Martin. At the end of his widely disseminated *Missiv an die Bruderschaft des Ordens des Goldenen und Rosenkreutzes* (1783), Nicolai wrote that *Le Mystère de la Croix* was ‘one of the best Rosicrucian works’. In 1784, Johann Friedrich Kleuker quoted Douzetemps as an authority in his *Magikon*, which is for the most part a discussion of Louis-Claude de Saint-Martin’s first two books.

The year 1786 saw the first Russian translation, edited by → Nicholas I. Novikov at the Typographic Society directed by → I. Lopuchin – two figures whose editorial activity consisted to a large extent of translations of books of an esoteric and more specifically theosophical character. At the time of Novikov’s arrest the book was confiscated and burnt, in 1793, along with others of the kind, in compliance with Catherine II’s edict on → Freemasonry and related matters. But as early as 1814, Alexander Labzin, an esotericist influenced by Novikov, procured a new edition in St. Petersburg which he prefaced under the initials Y.M. He used these initials in his introductions to quite a few other works as well, such as those of → Jacob Boehme, → Karl von Eckartshausen, Louis-Claude de Saint-Martin, Emanuel Swedenborg *et alii*. Theosophers occasionally quoted Douzetemps, albeit sometimes anonymously, like → Friedrich Christoph Oetinger in his *Lehrtafel der Prinzessin Antonia* (1763) and → Franz von Baader in *Fermenta Cognitionis* (Book II, 1823).

In view of the intrinsic interest, the context and the influence of the book, it would seem desirable that a critical, scholarly edition be prepared.

Dürckheim, Karlfried, Graf von Dürckheim-Montmartin,
* 24.10.1896 Munich, † 28.12.1988
Todtmoos-Rütte

Dürckheim served in the First World War 1914-1918 and studied Philosophy and Psychology at Munich University from 1919 to 1923. After an educational stay in Italy from 1924 to 1925 he was Assistant of Felix Krüger (1874-1948), founder of "Holistic Psychology", from 1927 to 1931. He became university teacher in 1930 and was subsequently Professor of Philosophy at Breslau and Kiel Universities. From 1935 on he was staff-member in the office of Joachim von Ribbentrop (1893-1946), who was later to become foreign minister of the Third Reich, after which from 1937 he held a research assignment in Japan, where he received instruction in meditation (za-zen) and Japanese archery. In 1939 he briefly returned to Germany because of the death of his wife and his father. In 1945 he was interned by the American occupying power. During his imprisonment he decided to become a psychotherapist. In 1947 he returned to Germany, moving to Todtmoos-Rütte in the Black Forest in 1951, where he established the "Existential and Psychological Training and Encounter Centre" together with his former student Maria Hippus (born 1909), whom he married only as late as 1985. Dürckheim remained active as psychotherapist and international lecturer until his death.

Dürckheim had his first numinous experiences as a child. While under fire in the Great War, he sensed the 'indestructible' within himself and found it a 'liberating experience'. During his student years in Munich he enjoyed a large circle of friends including the poet Rainer Maria Rilke (1875-1926), the painter Paul Klee (1879-1940), and the sinologist Richard Wilhelm (1873-1930). In 1919 a chance encounter with the *Tao Te Ching* led to his first illumination, which he claims stayed with him all his life. He formed a meditation circle with friends and later studied the writings of Meister Eckhart, Lao-Tzu, and Gautama Buddha. During his ten-year stay in Japan, interrupted only once, Dürckheim met the famous Zen teacher Daisetz Teitaro Suzuki (1871-1966), which led to an intensive study of theoretical and practical Zen Buddhism. He saw all Japanese arts, from painting through fencing to the tea ceremony, as a path of self-attunement leading to the discovery of one's own "buddha nature". Most of Dürckheim's books can be traced to his existential experiences in Japan. They made his name well-known in the German-speaking world

as well as in France, the Netherlands and the United States. His literary work comprises some 20 books, many of which are anthologies of lectures and journal articles. His influence on the contemporary spiritual scene was quite extensive and already 1954 he was invited by the Dutch Queen to hold a lecture on Zen Buddhism. In France Henri Hartung, a pupil of Sri Ramana Maharshi (1879-1950), and Gabriel Monod-Hertzen, a follower of Sri Aurobindo (1872-1950), worked with him. Dürckheim was also called the "spiritual father" of the so called Frankfurter Ring, a spiritual study centre where people like Frithjof Capra (b. 1939), Lama Anagarika Govinda (1898-1985), John Lilly (b. 1915), Raimundo Panikkar (b. 1918), George Trevelyan (1906-1996), and others came to teach.

Dürckheim's chief interest lay in relating Eastern wisdom to Western psychotherapy. He addressed the contemporary Westerner, whose spiritual and religious distress cries out for healing. He attributed this distress to the loss of spiritual meaning in all human activity, which focuses only on man and his worldly affairs while excluding God or "Divine Being". The inevitable result in Dürckheim's views is an achievement-oriented culture and a loss of tranquillity, a suppression of the feminine, and the decay of the spirit of community. The transcendent centre, which should provide a firm foundation of existence, is lost, and the individual is reduced to a purely rational unit of production. The resulting spiritual hunger cannot be assuaged by social, rational or economic measures. Dürckheim seeks to liberate the individual from his profane or mundane ego (*Welt-Ich*) and bring him into living contact with his true Self or Being (*Wesen*) beyond time and space. The transcendent Divine Being, present in each individual, thus manifests itself in the world, and the profane ego becomes transparent to its immanent transcendence. Dürckheim offers his "Initiation Therapy" as a means of supporting man on the path to wholeness and healing. His concept of initiation was borrowed from → Julius Evola, whom he studied and got to know personally. Dürckheim also read → René Guénon. According to Dürckheim man proceeds from his first initiatory experience of Being along a continuous process of development, without ever reaching a final goal. The state of being on the path, of becoming ever more transparent to the Divine Being, is the goal itself. Dürckheim is not concerned with the attainment of Nirvana as in Eastern religions. In his later works he describes this path as a way to Christ, whom he calls the eternal inner master. Dürckheim's work rests on four pillars:

1. Depth psychology, especially deriving from → C.G. Jung, which seeks to integrate the shadow on the path to the true Self. In this process the limits of the profane ego are surpassed and there is a breakthrough of Being on a transcendent plane.

2. "Personal Body Therapy" differentiates "the body one has" (*Körper*), important for health and vitality, from "the body one is" (*Leib*), the spiritual and mental life revealed by one's physical condition, gestures and expressions. The true or false inner attitude is outwardly reflected in the posture of the body. In an ideal case, the transcendent Being can even shine through the body. Various physical exercises (e.g. T'ai Chi, Aikido, cult dancing) promote this transparency. Dürckheim emphasizes the importance of being physically centred, allowing the physical centre, the inner centre of gravity, to come to rest in the *Hara* (belly). Firmness in the *Hara* brings certainty and thus alters the constitution of the whole person. This promotes new confidence and enables one to transcend more easily the limits and restrictions of the profane ego. Dürckheim also speaks of the subtle body and the aura.

3. "Creative Therapy" comprises artistic exercises such as dancing, singing, clay modelling and, most importantly, the method of "guided drawing" developed by Maria Hippius. The manifestation of Being is facilitated by creative action which, like the blockages which oppose it, derives from the unconscious.

4. Meditation also serves to open oneself towards the transcendent centre. Especially important is the practice of za-zen, sitting absolutely still in an erect position, whereby the belly and pelvic region provide a firm basis. Horizontals and verticals must be so ordered as to create the inner conditions for transcendence to manifest. Man should not actively seek God, but allow himself to be found by God. One should let go while breathing out, and open up while breathing in. The importance of meditation was evident at Dürckheim's Centre at Todtmoss-Rütte, where each day began with communal za-zen, another session following in the afternoon.

Initiation Therapy is primarily a path of practice and personal experience available to modern man who has lost his connection with traditional religion. Although Dürckheim has found a very positive reception in Christian circles, some theologians wonder whether Dürckheim's path may be too "subjective", representing an "autonomous ethic of self-realisation" which values personal "experience" over authentic "faith".

HANS THOMAS HAKL

Dutoit-Membrini, Jean-Philippe,

* 27.9.1721 Moudon near Lausanne,
† 21.1.1793 Lausanne

Dutoit-Membrini studied Protestant theology in Lausanne. Later, in 1750, during an illness, he had a mystical experience in which he heard a voice telling him: 'Thou shalt eat of the flesh of thy Redeemer and drink of His blood'. Shortly after, he vowed never to marry and steeped himself in the writings of Madame Guyon, assisting with the

preparation of new editions of her works in forty volumes (1767-1791 [in the Musée du Vieux Lausanne one can see his oratory, which contains a chalice on which are inscribed the names of Jesus, Mary, Joseph, and Madame Guyon]). Over many years, he preached in the churches at Lausanne, but in 1759 bad health compelled him to resign his clerical position. From then on he devoted himself mostly to the study of mystical literature, gathering about him a number of followers. The latter, like Dutoit-Membrini himself, were part of a general religious current that was widespread within the Canton of Vaud. In that French speaking part of Switzerland, many Christians distanced themselves from both Calvinist and Catholic influence and created a kind of eclectic, irenic and esoterically tinged "mystical Church" of their own. Before Dutoit-Membrini, Hector de Saint-Georges de Marsais and then Fleischbein had played the role of spiritual leader to this community in the said Canton.

Dutoit-Membrini's "mystical" Christianity is most marked, to the extent that it has an external inspiration, by Quietism. His main book may be compared to that of → Melchior Douzetemps' *Le mystère de la Croix* (1732), in that it is replete with passages of a theosophical character, which to a large extent are presented in long footnotes. The author is fully cognizant of the esoteric literature of his time and frequently takes his stands with regard to it. Especially in his book *La philosophie divine* (1793), he expresses his views and personal experiences. Among his privileged conceptions is the notion of "astral spirit", which is a third category of knowledge, beside sensory perception and divine illumination, made possible by the action of the stars and planets upon us. Unfortunately, this spirit is quickly spoiled and corrupted by the venom of Lucifer and his kin, and made spurious by other entities who are neither angels nor demons. From this perspective, Dutoit-Membrini is critical of both → animal magnetism and → Swedenborg's visions, which he finds highly dubious. He has read *Des erreurs et de la vérité* (1775) by → Louis-Claude de Saint-Martin and is more indulgent toward this theosopher, whose views are to some extent rather similar to his own, even though he faults Saint-Martin for trusting his imagination too much. He praises Douzetemps' book, but advises readers not to take into consideration the alchemical speculations contained therein. Dutoit-Membrini's esoteric formulations also concern → number symbolism (his book has a section on "the numbers of the Cross" that echoes some of the inferences of Douzetemps). Other speculations are

of an even more theosophical character, such as those he produces on the Elohim, the “nothingness beneath nothingness”, Sophia, and Lucifer and Adam (their Falls and the terrible consequences thereof). Dutoit-Membrini’s statements are delivered in tones reminiscent of → Jacob Boehme, whose follower he assuredly does not claim to be. In fact, he happens to stand more in the tradition of Saint-Georges de Marsais.

La philosophie divine was influential among his followers in the Canton of Vaud, for whom he wrote it in the first place. Beyond that circle, immediately after its publication, it became an authoritative reference among the people and authors belonging to, or touched by, the “illuminist” current [→ Illuminism]. Early in the 1790’s, Dutoit-Membrini’s book was discussed in letters exchanged between Saint-Martin and → Niklaus Anton Kirchberger. The publication of that correspondence in 1862 (English translation, 1863) once more called attention to Dutoit-Membrini among theosophically oriented readers.

ANTOINE FAIVRE

**Eckartshausen, Karl von, * 28.6.1752
Haimhausen, † 13.5.1803 Munich**

Eckartshausen attended school in Munich before going to study at the University of Ingolstadt, then directed by the Jesuits. They would have a lasting

influence on his thought, and he later said that he had been guided ‘along the ways of the marvelous’ from the age of seven. An Aulic Councilor in 1776, he became a member of the Academy of Bavaria in 1777 and a secret archivist in 1784. His official functions, which he took very seriously, also provided him with a pretext for moralizing, preaching love of one’s neighbor and tolerance. Married in 1778, he lost his spouse in 1780; in 1781 he remarried, with Gabrielle von Wolter, who would bear him eight children. After her death, in 1794, he married Theresa Weiss, with whom he had two children.

A conservative in politics, Eckartshausen was a theocrat, a monarchist, a friend of the Jesuits and a fierce enemy of the Bavarian → Illuminaten. At first he had mistakenly affiliated himself with this revolutionary and rationalist Order established by Adam Weishaupt, believing that he was dealing with a traditional initiatory society. Having left it, he strove to combat it. From 1780 to 1783, he mostly wrote juridical tracts but also took an interest in literature. He published theatre plays, pamphlets and brochures on the most diverse subjects. He defended the Jesuits against Nicolai, while identifying himself with an “authentic” *Aufklärung*. In the years 1784-1785 he published a number of “moral papers” (*Sittenblätter*) exemplifying the taste of the period for sentimental literature in the manner of Richardson. Intrigues and professional worries did not prevent him from becoming First Archivist in 1789.

From 1788 on he broke away from edifying literature and theatre plays, and devoted himself almost exclusively to esoteric thinking. Despite a certain taste for illusionism that recalls → Cagliostro, he was sincerely interested in → illuminism, → Christian theosophy, and speculative → mysticism, while opposing the pneumatological experiments of certain charlatans. His own experiments, which evoked the interest of the Prussian Court, were to some extent based on arithmology (or science of numbers symbolically understood [→ Number Symbolism]), which he believed gave access to the “principle of things”. His *Zahlenlehre der Natur* (1794) is testimony to this research. Arithmology is the linchpin of his system; by means of it, this emulator of Pythagoras intended to resolve the Kantian opposition between *noumenon* and *phenomenon* and to achieve the synthesis of all knowledge. The ten Sephiroth of the Kabbalah are considered the ten numbers of the Holy Names of God. No less than seventeen symbolic dreams were conducive, he tells us, to making him elaborate his complex arithmological system.

As fruits of this method, his works proliferated – he produced more than one hundred –, of which one of the best known, *Die Wolke über dem Heiligthum* (1802) would go through many translations and reprints. An indefatigable reader, he drew upon the Jewish and Christian Kabbalah [→ Jewish Influences] and was highly interested in → alchemy; in fact, he published works considered so outstanding that the Hermetic Society of Karlsruhe adopted them as basic manuals.

Eckartshausen's correspondence was gigantic. He exchanged letters with his friend Johann Michael Sailer (the ex-Jesuit who would become bishop of Regensburg), Conrad Schmid, Franz Joseph von Thun (the magician, and friend of → Johann Caspar Lavater), → Johann Heinrich Jung-Stilling, → Niklaus Anton Kirchberger, Friedrich Herbort, Johann Gottfried Herder, Friedrich Nicolai, → Franz von Baader, → Ivan Vladimir Lopukhin, and many others. With Ignaz Lindl he readily shared the dream of voluntary exile and emigration to Russia that characterized the *Erwecktenbewegung*. Through Tsar Alexander I, who highly valued his works, he became famous in Russia. His *Kostis Reise* (1795) resembles the initiatory roman à clef by Jung-Stilling, *Das Heimweh*. In his correspondence with Kirchberger (1793-1797), there is much talk of → Louis-Claude de Saint-Martin, the great master, after → Boehme, of → Christian theosophy. Eckartshausen claimed to have received secrets and theosophical revelations from an angel who spoke through the voice of a young woman. The revelations of Mme de la Vallière in Lyon seem comparable to these astonishing manifestations claimed by Eckartshausen, in which illusionism and a sincere belief in the intermediary world of angelic entities are constantly mixed. Just as striking is his claimed discovery of the secret of all possible inventions, through a contemplative path that is supposed to have given him access to the mysteries of the pneumatic world.

One finds in Eckartshausen the three panels of the theosophical triptyc: cosmogony, cosmology and eschatology. Moreover, he saw in the celebrated *Tabula Smaragdina* attributed to → Hermes Trismegistus the very image of the permanent exchanges that operate at the level of the three worlds (divine, angelic and human). Spirit and nature are two complementary forces that refer to a higher and unique reality. Like Boehme, he often treats of Sophia, the divine Wisdom who, at work in the creative process, is reflected in Christ, "Salt of Light" and revelation of Her splendor. However, Eckartshausen traces his system even more readily to the ten Sephiroth of the Kabbalah. Man is seen

as an image of his creator. The divine Word is made manifest by the Son in the material world, which is the middle term between good and evil. In the myth of the "two Falls" he finds the solution to the problem of evil. Lucifer, the greatest of the angels, fell on account of his self-pride, thus introducing into the universe the first catastrophe. The primordial Adam, a spiritual being of immense virtues created to lead the rebel angels back to the narrow path, was unfortunately seduced by them. Attracted by the perspective of illusory material enjoyment, he fell as well, dragging along the whole of nature in this catastrophe and losing nearly all his spiritual faculties. However, within the opaque world in which it has come to be enclosed as a result of these falls, mankind is still capable of spiritual development. The Nature that surrounds us is full of divine signatures, and it is incumbent upon each one of us to decode them with a view to achieving our "regeneration". The latter would have been impossible without the redemption effectuated by the sacrifice of the Son of God. Christ has "raised up" Nature and Man, making them capable of a new spiritual birth (*Wiedergeburt*), and making possible the liberation of the paradisiacal substance enclosed in matter since the fall. The initiates, who practice 'the true royal and priestly science according to the Order of Melchisedech' – as Eckartshausen puts it –, will receive a luminous body on a regenerated earth.

A Catholic and a friend of the Jesuits, Eckartshausen nevertheless professed an ecumenism close to the notion of the "Inner Church" dear to → Ivan Vladimir Lopukhin. The process of regeneration described by him is considered compatible with his conception of the Roman Catholic Church, of which he remained a member all his life. He certainly considered religion to be a universal phenomenon, as attested by the mythologies of paganism and the great philosophers of Antiquity, notably Plato; but in the end, it is in the biblical revelation and in Christianity that religion finds its accomplishment. Jesus came to fulfill the Mosaic Law and redeem all of humanity through His blood. Jesus is all love, and Man must give Him life in the innermost part of himself. Against what he calls the Protestant error, Eckartshausen exalts not only the value of Catholicism and the necessity of worship and the sacraments, but also an attitude of the quietist type, similar to that of Fénelon or Madame Guyon. The heart of Man is the Temple par excellence. The true Christian community is thus the Inner Church always potentially present in the deepest part of the human heart. It does not require the believer to cut himself off from the world.

Man must act upon nature, knowing its laws. Eckartshausen shares with other *Naturphilosophen* of the pre-romantic period the idea that Nature is pervaded by a circular movement which is the result of two antagonistic forces, namely action/contraction, and/or active and passive states. There is no radical gap between spirit and nature because these two forces, which are both antagonistic and complementary, are at work within the four basic elements themselves, which function rather as a vehicle for them. As for Light, it is the organ of divine Wisdom (i.e., of Sophia, who engenders the elements). The initiate who possesses the right knowledge can act upon Nature, that is, pass from the material world to the world of the spirits. There is certainly some danger involved in dialogue with these entities: a secure inner sense is necessary, by means of which, through true → imagination (in the Paracelsian sense of the term), Man can be raised to the level of the higher forces to which his nature is indissolubly linked. “True → magic” has its foundation in the harmony of invisible links that interconnect God, Man and the universe. The calcinations of certain plants make it possible for an authentic magician to make their essence appear in aerial and etheric form. Transmutation is the goal of true alchemy, whose material foundation serves spiritual purposes. → Animal magnetism, of which Eckartshausen studied the theories and practices, could not but appeal to him, were it only because it was based on the idea of a universal fluid flowing through the whole cosmos.

The influence of Eckartshausen and his work extended to all of Europe and was especially perceptible in Germany, England, France and Russia. His system, which is nevertheless in no way innovative, is testimony to a scope and a depth of vision that command admiration. This richness makes him, next to Franz von Baader, one of the most representative gems of Christian theosophy in the last two decades of the German 18th century.

JACQUES FABRY

Egyptomania

In modern times, ancient Egypt has inspired many works of literature, → music, and art. There are two distinct characteristics to Egypt in this context. First, it differs widely from the common European heritage of Greco-Roman culture, thus readily lending itself to mystery and appealing to a taste for exoticism. Second, its antiquity has caused it to appear in the Western imagination as the cradle or depository of a buried primordial or “traditional” knowledge; this applies especially to the Renaissance and the 17th century, when the Orient was still little known and the Far East even less so (Asia often being a synonym for Egypt). For these two reasons, many works of the esoteric type have been marked by Egyptophilia. Two postulates are found there, either implicitly or explicitly: first, that the hieroglyphs, pyramids, etc., are bearers of hidden meanings of a gnostic, initiatic, or soteriological nature; and second, that Egypt, having long been the most ancient known civilization, was closer to the primordial → Tradition. Moreover, → Moses was thought to have been initiated there, and → Hermes Trismegistus – often assimilated to Thoth – had left books that figured chronologically (for the Renaissance imagination) among the earliest manifestations of *prisca theologia* or *philosophia perennis*, whose scattered members now had to be reassembled. Following the second postulate, Egyptomania of the esoteric type belongs within a more general context: that of the place of the Orient in Western esotericism [→ Orientalism]. From the present perspective, it is an altogether secondary matter whether or not the esotericists’ Egypt conforms to that of contemporary scientific Egyptology: it is above all Egypt as

present in the esoteric → imagination that is relevant here for being studied on its own terms.

The *Asclepius*, one of the texts rich in Egyptian mysteries that belonged to the → Hermetic literature of 2nd century Alexandria, circulated in Latin throughout the Middle Ages; and in 1471 → Marsilio Ficino published his Latin translation of the recently discovered *Corpus Hermeticum*. The new current of Hermetism enjoyed a remarkable flowering for over two centuries. The Hermetic texts were believed to contain, in substance, the hidden wisdom of the Egyptian priesthood; and moreover, ancient Egypt was interesting from an esoteric point of view on account of its mythology – for while scrutinizing the hidden meanings of the latter (as well, incidentally, as that of the Greeks), some authors believed they were reading an encrypted account of the processes of the alchemical Great Work (e.g., → Michael Maier, *Symbola aureae mensae duodecim nationum*, and *Atalanta fugiens*, 1617; → Dom Antoine Joseph Pernety, *Fables égyptiennes et grecques dévoilées*, and *Dictionnaire mytho-hermétique*, 1758). Neo-Alexandrian Hermetism and → alchemy are thus the two principal depositories of Egyptianizing esoteric discourse. The latter scarcely occurs in esoteric currents of the Bohemian type, i.e., in → Christian theosophy, nor in → Rosicrucianism, except for a few 19th and 20th century initiatic orders, such as AMORC. A learned Egyptologist with esoteric leanings appeared in the middle of the 17th century: the Jesuit → Athanasius Kircher (*Lingua aegyptiaca restituta*, 1643; *Oedipus Aegyptiacus*, 1652/1654), who was one of the prime movers of the great Egyptophile current that would follow. Kircher was soon followed in England by → Ralph Cudworth (*The True Intellectual System of the Universe*, 1678), who was also very widely read.

It was above all from the end of the 18th century that esoteric discourses and practices, apart from Neo-Alexandrian Hermetism and alchemy, began to find their inspiration in ancient Egypt. One can distinguish between pure speculation on the one hand, and the use of Egyptian symbols and themes in rituals, on the other. On the speculative level, J.G. Herder searched the ancient documents for their hidden meaning (*Ueber die älteste Urkunde des Menschen-geschlechts*, 1774/1776), and → Court de Gébelin, in his *Monde Primitif* (1773/1784) presented Egypt as the depository of the highest knowledge. In Book VIII of this encyclopedic work, he traced the origin of the → Tarot cards to this ancient civilization, followed in this by → Etteilla soon after. In another vein, Alexandre Lenoir (*Nouvelle explication des hiéroglyphes*,

1809) and A.P.J. Devismes (*Nouvelles recherches sur l'origine et la destination des pyramides d'Égypte*, 1812), then → Gérard de Nerval (*Voyage en Orient*, 1850), opened up new paths for the boldest speculations about the powers that the Egyptian priests were supposed to have wielded. Henceforth, the theme of the Great Pyramid never ceased to be repeated, especially after the publication of *The Great Pyramid* (1858) by John Taylor. → H.P. Blavatsky and her → Theosophical Society took up the torch of these speculations (*Isis Unveiled*, 1877), followed by → Edouard Schuré (*Les Grands Initiés*, 1889), and many others up to the present, including → Jan van Rijckenborgh, *De Egyptische oer-gnosis* (1960-1965). All of these belonged to the speculative domain.

As for the usage of Egyptian elements in rituals, hence in practice, one should first note the long-lasting influence of the Egyptophile and initiatic novel of Abbé Jean Terrasson, *Séthos, histoire ou vie tirée des monuments, anecdotes, de l'ancienne Égypte* (1731), which inspired the authors of many masonic and fringe-masonic rites [→ Freemasonry]. At least a dozen of the latter existed in the later 18th and early 19th centuries, including the “Architectes Africains”, created by Friedrich von Köppen around 1767, the “Rite Hermétique”, inaugurated around 1770, explicitly inspired by the teaching of → Hermes Trismegistus, and the “Egyptian Rite” of → Cagliostro, which dates from 1784. The beginning of the French Empire witnessed the appearance in Italy of the Rite known as Misraïm, imported to France by the Bédarride brothers (and not very Egyptian), followed in 1815 by the Rite known as Memphis – to which one might add that of the Mages of Memphis, created at the end of the 18th century. A number of present-day initiatic societies continue the trend, including the AMORC, founded in 1916, and the Theosophical Society, founded in 1875. Among the most popular contemporary examples of the esoteric fascination with Egypt are the novels *Einweihung* (Initiation, 1978) by Elisabeth Haich, and *Winged Pharaoh* (orig. 1937) by Joan Grant, both of them based on memories of previous Egyptian incarnations.

Eirenaeus Philalethes → Starkey, George

Elchasai/Elxai, ca. 100

According to Early Christian and Manichaean sources, Elchasai or Elxai was the founder of the sect of the Elkesaites and the recipient of a book of revelation. The main Christian sources about Elchasai are Hippolytus of Rome, who speaks of “Elchasai”, and, independently, Epiphanius of Salamis, who always calls him “Elxai”. Additional information comes from the Cologne Mani Codex and the Arabic writer Ibn an-Nadim. According to Epiphanius, *Panarion* 19, 2, 2, the name Elchasai means “Hidden Power” (Aramaic: *ḥail keṣai*), which is generally accepted by modern scholars. If Elchasai was a historical person, which has been doubted, he may have considered himself a manifestation of God, just as → Simon Magus claimed to be or was said to be a manifestation of the “Great Power”. Epiphanius reports that Elchasai was of Jewish descent, had lived in the Trans-Jordan region at the time of the Emperor Trajan (98-117) and was the author of a book, ‘ostensibly based on a prophecy or inspired by divine wisdom’ (*Pan.*, 19, 1, 4). According to Epiphanius, the teachings of Elxai were adopted by several baptist sects in the Trans-Jordan area, the Jewish Osseans, the Jewish-Christian Ebionites, and the Sampseans, ‘also called Elkeseans’ (*Pan.*, 19, 30, and 53, resp.). The reliability of Epiphanius’ assertions is very difficult to assess, but there is no doubt that the Elkesaites were a baptist sect that took its origin somewhere east of the river Jordan and practised repeated purifying immersions. The Mesopotamian baptists among whom → Mani grew up also traced their rites back to Elchasai. In the Cologne Mani Codex, 94, 1-97, 17, Mani argues against the leaders of the sect that his refusal of ritual immersions and of agricultural work was in accordance with the teaching of ‘Alchasaiois, the founder of your Law’, himself. In order to prove this surprising claim, he tells some stories about Elchasai, which actually support the Manichaean views but of which origin and meaning are disputed. In his work *Kitāb al-Fihrist*, IX, 1 (ca. 988), the Muslim scholar Ibn an-Nadim also deals with the baptists among whom Mani grew up. According to him, their founder was known as *al-ḥasīb*. Most scholars consider Epiphanius’ information about Elchasai’s background in the Trans-Jordan region more

or less reliable. It finds some support in the fact that still in Epiphanius’ lifetime there lived two highly venerated female descendants of Elchasai among the Sampseans (*Pan.*, 53, 1, 5-6; also 19, 2, 4-5). Other scholars, however, locate the beginning of Elchasai’s career more eastward: in the Syrian-Parthian borderland (Strecker) or in Parthia (Northern Mesopotamia) itself (Luttikhuisen). This view is based on Hippolytus, whose report is rather cryptic at this point but nevertheless shows that there were Elkesaites who did not think of the Trans-Jordan region but of Parthia as the place of origin of Elchasai and his book (*Refutatio* IX, 13, 1). During the episcopate of Callixtus (217-222), a certain Alcibiades came from Apamea in Syria to Rome and propagated there the Elkesaite doctrines, basing himself on the book of Elchasai (Hippolytus, IX, 13, 1-4). He said that Elchasai had proclaimed his message in the third year of the Emperor Trajan (A.D. 101). This might be a mistake, for the book itself contained a prophecy that an eschatological war would break out in the third year after Trajan had subjected the Parthians (A.D. 116), which shows that at least part of it was written towards the end of Trajan’s reign (Hippolytus, IX, 16, 4). The book had been revealed by an angel of enormous measures (height: 96 miles, breadth: 24 miles, etc.), who was called the Son of God. A female angel of the same measures, called the Holy Spirit, had accompanied him (IX, 13, 2-3). The same information is given by Epiphanius, *Pan.*, 19, 4, 1-2 (also 30, 17, 6-7 and 53, 1, 8) who says that the male angel was Christ, ‘the great King’ (this expression apparently came from the book, cf. below Hippolytus, IX, 15, 1). This vision suggests a Jewish-Christian background, for also in the *Ascension of Isaiah*, 9, 33-42 the visionary sees two glorious angels, the Lord, i.e. Christ, and the ‘Angel of the Holy Spirit’ (Stroumsa, Fossum). Other Jewish-Christian tenets are the prescription of circumcision and marriage and of praying toward Jerusalem, a life according to the Law, the rejection of the temple cult, the view that Christ was a normal human being, and the idea that Christ had repeatedly appeared in the course of history (Hippolytus, IX, 14, 1; Epiphanius, *Pan.*, 19, 1, 7 and 3, 5; 30, 3, 1-6 and 17, 5). According to Hippolytus, they claimed to have foreknowledge, practised → magic and → astrology (IX, 14, 2), and had to maintain → secrecy with respect to the content of the book of Elchasai (IX, 17, 1). In case of persecution they were allowed to deny with their lips what they believed in their heart (Origen in Eusebius, *Church History*, VI, 38; Epiphanius, *Pan.*, 19, 1, 8).

Hippolytus had personally combated the ideas of

Alcibiades (IX, 13, 4), since he recognized in his teaching the same heresy he repudiated in his opponent Callixtus, i.e. a second remission of sins. This remission was effected by a second baptism 'in the name of the great and most high God and in the name of his Son, the Great King' and could be administered 'as soon as he (the sinner) had heard this book' (IX, 15, 1). It seems possible that in Rome this baptism was interpreted as a second baptism for the Christians who converted to Alcibiades' Elkesaitism but that it originally meant the initiatory ritual for those who joined the sect. Origen also mentions the remission of sins for those who believe in the book (which, he says, reportedly had fallen from heaven), but he does not speak of a second baptism (Eusebius, *Church History*, VI, 38). According to Hippolytus, IX, 15, 1, it was meant for the remission of sexual sins in particular and had to be undergone fully clothed. During the ceremony seven witnesses 'written in this book' were called upon, i.e. heaven, water, holy spirits, angels of prayer, oil, salt and earth (IX, 15, 2). The same witnesses are also mentioned by Epiphanius, *Pan.*, 19, 1, 6, together with another series of witnesses (salt, water, earth, bread, heaven, ether, and wind). The seven cosmic powers were also called to witness at the reiterated immersions that were characteristic of the Elkesaites. People who suffered of consumption and those possessed of demons had to immerse themselves in cold water forty times during seven days (Hippolytus, IX, 16, 1). The book of Elchasai also gave instructions about how to act in case of the bite of a rabid dog, 'in which there is a spirit of destruction' (Hippolytus, IX, 15, 4-6). The person to whom this had occurred immediately had to run to a river or a spring in order to immerse himself fully clothed. It has been suggested that the rabid dog in fact refers to forbidden sexual desires (Peterson), which might be possible. Most probably, the oath that according to Hippolytus had to be sworn in that connection originally had nothing to do with the actual bite of a rabid dog or with sexual sin, but was spoken at the baptism that marked the admittance to the sect. It runs: 'I shall sin no more, I shall not commit adultery, I shall not steal, I shall not do injustice, I shall not be greedy, I shall not hate, I shall not break faith, nor shall I take pleasure in any evil deeds'. There are strong indications that the book of Elxai was originally written in Aramaic and translated into Greek at a later date. Epiphanius has even preserved a cryptic Aramaic sentence (*Pan.*, 19, 4, 3), which according to him was introduced by the words: 'Let nobody search for the meaning but only speak in prayer the following words'. This

must be an addition of the Greek translation, since for Aramaic speaking people the meaning of the enigmatic words must have been clear: 'I bear witness to you on the Day of the Great Judgement'. This raises the question of how far the Greek translation differed from its Aramaic original. It has been suggested that the book of Elxai originally was a Jewish apocalyptic writing that was christianized at a later stage (Luttikhuisen). Since we know very little of the beginnings and the history of the Elkesaite movement, this might be possible, but in view of the fact that all available sources already show a combination of Jewish and Christian elements, a Jewish-Christian milieu seems more likely. We know at least for sure that Jewish-Christian baptismal groups claimed Elchasai as their founder and held his book in high esteem. The man who became known as Elchasai, whether he called himself so or not, must have been a strong religious personality, who was able to amalgamate various religious ideas into a new and persuasive message of personal salvation. The Elkesaite movement has been characterized as a 'Gnostic Ebionitism' (Schoeps) or a 'syncretic-Gnostic Jewish Christianity' (Strecker). Its syncretic character is beyond doubt, but there are no indications that it adhered to typically Gnostic ideas, such as the separation between the supreme God and the creator or salvation through Gnosis.

ROELOF VAN DEN BROEK

Élus Coëns

→ Martinès de Pasqually bestowed upon the Freemasons [→ Freemasonry] initiated into the movement created by him in the second half of the 18th century the title "The Order of the Masonic Knights Élus Coëns of the Universe". Adopting the name that the angel Gabriel had given to Daniel (Dan. 9:23), he invited these *hommes de désir* (men of aspiration) to partake in the practice of a divine religion and exercise a priestly function; they would participate in a theurgic rite, involving invocations (referred to as "operations") that sometimes resulted in a divine "manifestation" from the higher planes. Like Aaron who had been chosen by the Lord to be a priest in His service (Ex. 40:13), they were – theoretically at least, for few of them seem to have really experienced manifestations – chosen priests: elect coëns or cohens (Kohen, plur. Kohanim, meaning priests in Hebrew), according to the two spellings used. In the 1760s, aristocrats of both the old and the new nobility, well-to-do bourgeois who aspired to spiritual ennoblement, and members of the clergy, frequented the lodges. The Elus Coëns were representative of all these different social groups comprising the Masonic milieu.

Like many Freemasons – in a period when the preeminence of reason over religious dogma began to be affirmed, which saw the publication of the *Encyclopédie* between 1751 and 1772, and the spread of new scientific knowledge within the framework of scholarly societies and lodges – the Élus Coëns were in search of the meaning of life and its authentic religious and spiritual dimension; they were in quest perhaps of the irrational and the marvelous, perhaps of power, perhaps of the absolute. In their own way they reflected the premises of → Illuminism. Having met Pasqually, they followed his movement and his school, which united theory and practice, study and exercises, collective and individual theurgic work, discipline of body and mind, and which sought to reintegrate Man into the divine plan, of which he was believed to have been a part but from which he had been excluded through his errors and his faults.

Pasqually seems to have begun presenting his ideas in Marseille, Avignon and Montpellier. Nevertheless, the first known archives place the beginning of his movement around 1760, when he was in Toulouse. A Freemason, he held a patent from 1738, delivered by Charles Stuart to a certain Don Martinez Pasqualis who was supposed to have transmitted it to his eldest son, Joachim Don Martinez-Pasqualis. At the time, if some doubted the authenticity of the patent, no one seems to have disputed that he really was the son of this Martinez-Pasqualis. Some current research, however, furnishes evidence of biographical contradictions. However that may be, Pasqually proposed to the members of a lodge in Toulouse a Masonic system and theurgic exercises for entering into communication with the invisible. He did not manage to achieve a convincing demonstration and was expelled. He succeeded, however, in gaining disciples, who maintained a Temple Coën after his departure for Bordeaux in 1762. Pasqually enjoyed a favourable reception in the only active lodge in Bordeaux, the lodge *la Française*, and may even have functioned as its master. He made disciples there, or rather, "emulators": he preferred this expression because it implied that a student does not have to remain dependent on his instructor, but may equal and even surpass him.

In 1765, the regiment of Foix arrived in the garrison at Bordeaux. A military lodge was constituted, the lodge Joshua, some of whose members met with the lodge *la Française*. A few of them, won over by Pasqually, were initiated as Élus Coëns. These officers, who may have been more readily available or more motivated than the other emulators, played an important role in helping Pasqually structure his movement into an Order comprising ten "Scottish" grades, the highest of which was that of a Master Réau-Croix, who was entitled to direct a theurgic ceremony. For the benefit of the new Élus Coëns and the new temples set up in France and in the colonies, they copied the rituals, the catechisms, and the instructions that Pasqually refined, specified or modified as time went by, as well as the grades. They also formed the first tribunal for the Order in Bordeaux, instituted to handle internal and external conflicts in the Temple Coën. The secretariat, finally, was taken charge of by one of them, a new officer who had joined the regiment in Bordeaux and was to become a recognized writer and Christian theosopher: → Louis-Claude de Saint-Martin. The officers regularly came to spend their winter quarters near Pasqually, take notes of his instructions and comments, and later communicate them to their absent comrades.

Little by little, these lessons in biblical exegesis were systematized in the form of a treatise which interpreted Old and New Testament texts in the light of Pasqually's theories: *la Réintégration et la Réconciliation de tout Être spirituel créé avec ses premières Vertus force et Puissance dans la jouissance personnelle dont tout Être jouira distinctement en la présence du Créateur* (The Reintegration and Reconciliation of every created Being with his original Virtues, Force and Power, in the personal delight of which each Being will partake in the presence of the Creator). Pasqually here reviews biblical themes from the perspective of various esoteric doctrines: kabbalah [→ Jewish Influences], → alchemy, → Rosicrucianism, gnosis, → hermetism, → astrology, and arithmosophy [→ Number Symbolism]. His sometimes "surprising" translations of Hebrew words are actually based on associations, and sometimes even on homonyms and puns. Interrupted in 1772 by Pasqually's departure to Santo Domingo, the treatise was not published until 1899. It is written without any interruption and must be seen as an edited transcription of notes taken during an oral teaching. Reminiscent of rabbinical oral teachings, it takes recourse to parables, symbolic stories, → correspondences, and analogies to transmit a correct understanding of the sacred texts. It also explains to the Élus Coëns the double fall into matter: God emanated "emancipated" spiritual beings – that is to say, endowed with free will – who had to practice a form of worship prescribed by the Divinity. But these beings sought to act as demiurges. As a punishment, the Creator enclosed them in a circumscribed material space; and Man, an androgynous being with a glorious body, was emanated and emancipated in his turn to guard them and help them regain their original state. But this Man-God, Adam, allowed himself to be seduced by the perverse angels and wanted, in his turn, to imitate God by creating spiritual beings. He fell, pulling the entire material world down with him. The whole work of reconciliation and reintegration in the heart of the divinity, as taught to Pasqually's "emulators", is based on the cult of worship initiated by the Creator, in which Men of Aspiration must render supreme honour to God. This cult requires moral, spiritual, even physical discipline: prayers, daily exercises, invocations, fasts and preparatory exercises for the theurgic meeting, and preparations for warding off negative forces, for purification, and for attempting to enter into contact with the higher spirits, with the angels, and indeed with Christ. During an "operation", the operator knew that he had succeeded in making

contact if "manifestations" took place, in the form of "passes" that could be visually or auditorily perceived. These signs, referred to by Pasqually as *La Chose* (the Thing) showed the operator that he was on the path towards reconciliation with the Creator. Pasqually did not explain why he chose the term; but it is noteworthy that prior to Descartes, the unknown in an equation was called "the thing" and could be resolved only by trying out various operations; and also that → Pernety defined "the thing" as the work of the philosopher's stone.

One might ask what attracted Freemasons to the movement created by Pasqually. They may have been attracted by the spiritual exercises; by the strict and unusual daily discipline; by the human and theurgic qualities of this enigmatic man, whose personality deeply influenced some of them; or by his profound and original exegesis of the biblical texts, which had to be of interest to these men raised in Catholicism. They do not seem to have been shocked by the ideas of Pasqually, who in any case required them to continue following their religion. It is true though that a certain number of Élus Coëns became discouraged. One of the officers of the Regiment of Foix, Grainville (1728-1793), wrote in 1798 to an Élus Coën from Lyons, → Jean Baptiste Willermoz (who would become famous by creating a new Masonic movement, the Rectified Scottish Rite): 'We had a temple in the Regiment; we have let the stones fall away imperceptibly . . . now we would hardly be able to find three stones joined together, of the more than twenty-five that once were there'.

Despite Pasqually's efforts to establish the Order in France – he twice went to Paris, where he enjoyed some success with Masonic personalities such as Bacon de la Chevalerie (1731-1821), and set up his supreme tribunal that delivered patents –, the success of his Order really depended on his actual presence. However, constrained by financial problems, he could not regularly go to Paris and visit the Temples Coën open in France. He left for Santo Domingo in 1772, under conditions that are still somewhat unclear: perhaps they had to do with a small inheritance that he had to collect there, but more plausibly with a trial in which the Élus Coëns were involved in giving evidence, and that complicated his life in Bordeaux. After his departure, the order went downhill. Pasqually died two years later, leaving his wife's cousin, Caignet de Lester (1725-1778) as his successor, in Santo Domingo – no doubt hoping that the latter would keep the school alive until his son, born in 1768, could succeed him. Nevertheless, the "regent"

soon died and the second successor, de Las Casas, officially closed the Temples Coëns in 1780.

The Élus Coëns were dispersed, but Pasqually had been able to create good contacts among the Réaux-Croix, who were accustomed to participating in the rites wherever they might be. If invited by the master of the Élus Coëns or by one of the “very powerful masters” (that is, a Réau-Croix), they would join the initiation rituals for the supreme grade in “sympathetic” cooperation (that is to say, at a distance), and might do the same in other rites, such as those at the equinoxes, considered favorable to theurgic work. Furthermore the Reaux-Croix made a vow of loyalty, which was respected by most of them. Already at Caignet de Lester’s death, Saint-Martin made a tour of the centers that remained active: Lyons with Willermoz, Toulouse, where a new Temple Coën was open, Paris with Bacon de la Chevalerie, and Bordeaux, where the faithful remained in contact with Mrs. de Pasqually (17?-1813), admitted into the Order together with a few other women. With her was one of the most loyal members, a tonsured cleric called Abbot Fournié (1738-1825), who was a simple person but favored by “the Thing”. He had been one of Pasqually’s secretaries and was now given the assignment by his brothers to guide the education of the young Pasqually (1768-1838) who, in the minds of several Coëns and Willermoz in particular, was destined to make the Order rise again when the time would be ripe. But the Revolution caused them to lose trace of him, thus dashing their last hopes.

Pasqually and his Order, however, were not forgotten. In a new form, without theurgy, it was continued by Willermoz in Freemasonry; by Saint-Martin, whose writings served to disseminate some of Pasqually’s ideas, and inspired many 19th century authors, such as Balzac (1799-1850); and finally by Abbot Fournié who, exiled in London, did not create a following there but wrote a treatise like his instructor. Many so-called initiatory movements today still claim to be inspired by the master of the Élus Coëns.

MICHELLE NAHON

Encausse, Gérard-Anacleto-Vincent → Papus

Eriugena, Johannes Scottus, * 810 Ireland, † 877 France ?

Born in Ireland, where he may have been exposed to the Greek language, Eriugena first surfaces as a liberal arts teacher at the Palace school of Charles the Bald in Northern France around 850 C.E. Few details of his career are known. His knowledge of Greek was probably limited to the use of rhetorical terms. At the request of archbishop Hincmar of Reims he became involved in the ecclesiastical debate on predestination, although it seems he never held any ecclesiastical office himself. His treatise *On divine predestination* refutes the theory of a double predestination (to life and to eternal death) which had been put forth as the true Augustinian position by the monk Gottschalk of Orbais. Claiming that even this lofty religious matter ought to be settled before the forum of human reason, Eriugena argued that God’s predestination equals a kind of divine prescience, thereby not undermining a human being’s free will. Gottschalk’s reasoning was judged faulty due to his poor knowledge of the liberal arts and his ignorance of the Greek language. Having received severe criticism from all sides for his radical intervention, Eriugena withdrew from public debate. Shortly after Charles the Bald commissioned him to translate some important Greek theological texts: *De hominis opificio* (On the Making of Man) by Gregory of Nyssa (ca. 331-395) and especially the important works by → Pseudo-Dionysius the Areopagite (ca. 500). A codex containing the latter had been donated to the Franks by the Byzantine emperor Michael the Stammerer and deposited in the monastery of St. Denis. Furthermore, Eriugena translated the so-called *Ambigua* by Maximus the Confessor (580-662), which is an attempt to harmonize passages in Gregory Nazianzus (ca. 329-390) and Dionysius. Due

to his translation efforts his knowledge of Greek was much improved, while gradually broadening into a remarkable interest in and affinity with the basic structure of Neoplatonic philosophy [→ Neoplatonism].

Eriugena's training in the liberal arts and his knowledge of the Greek Christian-Platonic heritage stemming from his translation efforts come to fruition in his *opus magnum*, *Periphyseon* or *On the Division of Nature* (862-866), in which he synthesized eastern and western thought. While Eriugena believes that → Augustine (354-430) and Dionysius, his preferred western and eastern authorities, never contradict each other, he generally favours the Greek theologians as more astute. This reveals Eriugena's own affinity with Neoplatonic thought, with its emphasis on the dialectical process of *exitus* and *reditus*. Underneath it, there hides a transparently stratified cosmos, which is unified and diversified at the same time so as to bridge the abyss between Creator and creature. By adhering to the *exitus* – *reditus* model, Eriugena was able to overcome the static subject-object dichotomy of the Creator – creature model in favour of a more dynamic and organic view of the cosmos. For Eriugena, the preferred view of reality is to see God as belonging to nature, as *natura* encompasses both created and divine aspects, rather than seeing nature (i.e., creation) belonging to God. Moreover, the *exitus* – *reditus* model allows Eriugena to synchronize cosmic development and human self-awareness, as the end goal of his project is both rational and mystical (culminating in oneness with God).

In matters of scriptural exegesis, Eriugena naturally preferred the allegorical expositions of Origen and Ambrose over most literal or historical approaches, with the notable exception of the literal *Homilies on the Hexaemeron* by Basil of Caesarea (330-379), through which Eriugena gained access to the tradition of Greek natural philosophy. Eriugena's deepest intellectual debt is to Dionysius, whose characteristic preference for the so-called *via negativa* he implemented in his own thought, even though he claimed to have learned how to read Dionysius properly only with the aid of Maximus. From Maximus the Confessor he derived his specific interest in the interface between cosmology and anthropology which gives the *Periphyseon* its unique flavour. While Dionysius' *via negativa* taught him to polish human language so as to make it a fitting tool to analyze God's transcendence, Maximus gave him a sense of God's immanence, for the mystery of the Christian redemption embraces the entire cosmos. In conformity with

this, Eriugena developed a Christology in *Periphyseon* IV-V which highlights the event of the incarnation as a paradigmatic change in both human and cosmic history, as the entire cosmos will be redeemed. Rather than refining existing Christological terminology, Eriugena keenly brings out the paradisaical quality of Jesus' human nature. At times, Eriugena's synthesis of western and eastern thought translates into an oscillation between eastern and western authorities, as is the case in his angelological analysis. While the angelology of Gregory the Great was generally dominant in the West, Eriugena propagated the angelic hierarchy of Pseudo-Dionysius instead (*Periphyseon* I, 444C). In this way the tradition of Greek angelology became an important influence in the West.

In the domain of → number symbolism Eriugena's eastern and western influences reinforce each other. Augustine's dialectical reflections on the triad, as God created everything *in pondere, numero et mensura* (cf. Wisdom 11:21), resonate nicely with the Dionysian tradition of negative theology in Eriugena's view of the universe as reflecting a created infinity and in his speculations on the divine monad in *Periphyseon* III.

Eriugena works with a wide array of sources as he unites Greek and Latin authorities. Next to the Bible, he had a mostly indirect knowledge of philosophical Neoplatonism and a direct knowledge of many Greek and Latin Church Fathers. He demonstrates a specific interest in the symbolism and scriptural allegories of paradise in *Periphyseon* IV. He equates the first man with *Nous* (the mind) and the first woman with *Aisthesis* (the senses), while the serpent represents their experience of *delectatio* (temptation). His views in this matter derive from Ambrose (339-397), through whom he is connected indirectly to the Middle Platonic tradition of Philo of Alexandria (20 B.C.-50 C.E.).

While it is unclear whether or not Eriugena had access to gnostic [→ Gnosticism] or hermetic sources [→ Hermetic Literature], his overall reasoning displays a definite mystical tendency. This is clear from his preference for the heretical notion of the *apokatastasis pantoön* at the end of the *Periphyseon*. In a more orthodox fashion it comes out in his commentary on Dionysius' Celestial Hierarchy, where he engages in the kind of light metaphysics that would re-emerge in Robert Grosseteste in the early 13th century. The famous dictum *omnia quae sunt lumina sunt* (Pseudo-Dionysius, *In Ier. Cael.* 1.1) is a phrase that has been much quoted in this context.

The *Periphyseon* seems not to have been read widely, as its idiosyncratic nature generally defied

understanding. Ignorant indifference turned into hostility when the heretic Amalric of Bene used Eriugena's name to pass off some of his own teachings, for example on the absence of gender division in paradise. As a result, pope Honorius III ordered in 1225 that all copies of the *Periphyseon* be sent to Rome to be burned. When Thomas Gale published the first printed version of the *Periphyseon* in 1681, it was immediately put on the Index. Not until the early 20th century did the critical study of Eriugena's thought begin, following the publication of a seminal biography by M. Cappuyns in 1933. The work on modern editions is now nearly completed.

Esotericism

1. ESOTERIC 2. ESOTERICISM 3. TYPOLOGICAL AND HISTORICAL MEANINGS 4. WESTERN ESOTERICISM

1. ESOTERIC

The adjective "esoteric" (ἑσωτερικός) has often been attributed to Aristotle, but in fact he uses only the word "exoteric" (ἐξωτερικός; see references in Riffard 1990, 65) and opposes it to "acroamatic" (from ἀκρόαμα, oral instruction). It is in a satire by Lucian of Samosata (2nd century C.E.) that the term "esoteric" makes its first appearance. Zeus and Hermes are selling various philosophers as slaves on the market, and claim that if you buy a disciple of Aristotle, you will get two for the same price: 'One seen from without, another seen from within . . . So if you buy him, remember to give to the first one the name of exoteric, and to the second that of esoteric' (*Vitarum Rustio* 26). In → Clement of Alexandria, the term "esoteric" is for the first time associated with → secrecy: 'the disciples of Aristotle say that some of their treatises are esoteric, and others common and exoteric. Further, those who instituted the mysteries, being philosophers, buried their doctrines in myths, so as not to be obvious to all' (*Stromata* V, 58, 3-4). Hippolyte of Rome first applied the terminology to the pupils of Pythagoras, who are said to have been divided into two classes, one exoteric and one esoteric (*Refutation of all Heresies* I, 2, 4), and the same claim is made by Iamblichus in his *Life of Pythagoras*. From here the adjective "esoteric", as referring to secret teachings reserved for a mystic elite, was taken up by later authors, such as Origen and Gregory of Nyssa. It appears in English in Th. Stanley's *History of Philosophy* (1687), as referring to Pythagoras' elite pupils, and in French in a Dictionary of 1752, where it denotes things 'obscure, hidden, and uncommon', orally transmitted by the Ancients to an elite (*Supplément to Dictionnaire universel françois et latin*, 1066).

2. ESOTERICISM

The substantive is of much more recent date: it first appears in French (*l'ésotérisme*) in Jacques Matter's *Histoire critique du gnosticisme et de son influence* published in 1828. Matter describes the → gnosticism of the 2nd century in terms of a syncretism between the teachings of Christ on the one hand, and Oriental, Jewish and Greek religio-philosophical traditions on the other. The gnostic 'theosophers of Christianity' had adopted the Pythagorean system of progressive initiation into the mysteries, with years of silent preparation: 'These ordeals and this esotericism existed throughout Antiquity, from China to Gallia . . .' (o.c., 83; and Matter again wrote about 'the esotericism of the gnostics' in an article in *La France littéraire*, febr./march 1834). → Jacques Etienne Marconis de Nègre adopted the neologism in 1839, writing that one of the principal points of the ancient priestly doctrine was 'the division of the sacred science in exotericism or external science and esotericism or internal science' (*L'Hiérophante* . . ., 16). And one year later Pierre Leroux spoke, again with reference to Pythagoreanism, of 'esotericism, the secret school, the religious and political sect, a kind of superior caste elevated to understanding by means of initiation' (*De l'humanité* [1840], II, 397). "Esotericism" was recognized as a new word, finally, in Maurice Lachâtre's *Dictionnaire universel* of 1852, where it is defined as 'From the Greek *eisôthêô*, the entirety of the principles of a secret doctrine, communicated only to affiliated members'. Perhaps it would have remained no more than an obscure technical term, had it not been popularized by → Eliphas Lévi in his influential books about → magic, from where it entered the vocabulary of occultism [→ occult / occultism]. Thus the theosophist A.D. Sinnett introduced the term into English with his *Esoteric Buddhism* (1883). Since the days of Lévi and Sinnett, various authors and currents have adopted the terms "esoteric" and "esotericism" as a self-designation, each one defining it according to their own preferences. For example, → Alice Bailey defines esotericism as the school of thought – her own – which recognizes 'that behind all happenings in the world of phenomena . . . exists the world of energies' (*Education in the New Age* [1954], 60).

3. TYPOLOGICAL AND HISTORICAL MEANINGS

As can be seen from the preceding overview, the term "esotericism" was not originally a self-designation by which certain religious authors or

currents identified themselves or their own perspectives. Rather, it originated in Matter's work as a scholarly label, applied a posteriori to certain religious developments in the context of early Christianity. In current academic research the term is still used as a scholarly construct, according to two main perspectives that must be clearly distinguished.

a. According to *typological* constructs as commonly used in the context of religious studies, "esoteric" and "esotericism" refers to certain types of religious activity, characterized by specific structural features. Thus the term is commonly associated with the notion of "secrecy", and then stands for the practice in various religious contexts of reserving certain kinds of salvific knowledge for a selected elite of initiated disciples. As we have seen, this usage is in line with the original connotations of both the adjective and the substantive. In this typological sense, the term "esotericism" can be applied freely within any religious context, for concerns with secret knowledge reserved for elites can be found throughout history, and all over the world: in pre-literate and literate societies, from antiquity to the present, in east and west. The same is true for another, related typological understanding of the term, that associates it with the deeper, "inner mysteries of religion" as opposed to its merely external or "exoteric" dimensions. Such an understanding, which is also found among the proponents of perennialism [→ Tradition], is particularly congenial to religious studies of a "religionist" orientation (represented by scholars in the tradition of e.g. Mircea Eliade, → Henry Corbin, and → Carl Gustav Jung). Such approaches tend to promote the esoteric or "inner" dimension of religion as its true core, and oppose it to more "superficial", merely "exoteric" dimensions, such as social institutions and official dogmas. Traditionally, many scholars of Western esotericism as understood according to the second, historical usage of the term (see below) have had religionist leanings and therefore adopted this typological usage as well, resulting in considerable confusion about what they really meant by "esotericism".

b. According to *historical* constructs, "esotericism" is understood not as a type of religion or a structural dimension of it, but as a general label for certain specific currents in Western culture that display certain similarities and are historically related. For this reason, and in order to avoid confusion with typological usage, most scholars now prefer to speak of "Western esotericism". Although there is considerable debate about the precise definition and demarcation as well as the historical scope of Western esotericism (see below), there exists

widespread consensus about the main currents that form its core domain. If restricted to the modern and contemporary period, the field consists in any case of the Renaissance revival of → hermetism and the so-called “occult philosophy” [→ occult / occultism] in a broadly neoplatonic context, and its later developments; → alchemy, → paracelsianism and → roscrucianism; Christian kabbalah [→ Jewish Influences] and its later developments; theosophical [→ Christian Theosophy] and illuminist currents [→ Illuminism]; and various occultist and related developments during the 19th and 20th centuries, up to and including phenomena such as the → New Age movement. If the period is extended backwards so as to include late antiquity and the middle ages, it also includes → gnosticism, hermetism, neoplatonic theurgy, and the various occult sciences and magical currents that later fed into the Renaissance synthesis. From such a historical perspective, the question of whether the currents in question included initiations into secret knowledge or opposed some “inner” knowledge to mere “external” religiosity is irrelevant as a criterion for what does and does not count as “esoteric”: emphases on secrecy and interiority can certainly be found within quite a few of the historical currents just listed, but they are absent in many others, and therefore cannot be seen as defining characteristics.

4. WESTERN ESOTERICISM

That at least some of the major currents such as listed above hang together, and should be seen as a field in its own right, seems to have been suggested first by the end of the 17th century. Ehregott Daniel Colberg attacked what he referred to as “platonich-hermetic Christianity” (*Das Platonisch-Hermetisches* [sic] *Christenthum*, 1690-1691), and not much later → Gottfried Arnold, in his famous “Impartial History” (*Unpartheyische Kirchen- und Ketzer-Historie*, 1699-1700) defended the “heretical” types of Christianity he saw as congenial to his own Christian-theosophical beliefs. In the following century, Jacob Brucker’s massive *Historia critica Philosophiae* (1742-1744) likewise treated a range of currents that would nowadays be referred to as “Western esotericism”, and straight lines from ancient gnosticism via → Jacob Boehme to German Idealism were drawn by the influential church historian Ferdinand Christian Baur (*Die christliche Gnosis oder die christliche Religions-Philosophie in ihrer geschichtlichen Entwicklung*, 1835). While authors like Colberg and Arnold approached the currents in question from a theological perspective, Brucker and Baur saw them mostly as examples of religious philosophy.

In the wake of the Enlightenment, mainstream 19th-century historiography seems to have largely neglected the domain nowadays referred to as Western esotericism. The specific currents belonging to it tended to be marginalized as the products of irrational *Schwärmerei* or as belonging to the prehistory of “real” science or philosophy (see e.g. the perception of → alchemy as proto-chemistry, or → astrology as proto-astronomy). It must be emphasized, however, that the portrayal of Western esotericism in 19th-century academic historiography has not yet been systematically investigated. Western-esoteric currents may in fact have received more serious attention from historians than might seem to be the case; there is reason to assume that often such research either did not make it into the main works of those historians whose names are still quoted today, or if they did, those works themselves often came to be quoted selectively by later generations, who concentrated in their turn on what they found most relevant and paid little attention to the rest. The progressive neglect of Western esoteric currents by 19th century historiography was undoubtedly aggravated by the fact that contemporary occultist authors such as → Éliphas Lévi or → H.P. Blavatsky *did* begin to write large “histories” of the field, in which their own fantasies took the upper hand over any critical approach to historical evidence. It is not hard to see that this new genre of popular occultist historiography was bound to make the field appear “tainted” in the eyes of academic historians, who therefore had all the more reason to avoid it: a scholar who published a book about Western esoteric currents was likely to be suspected of occultist sympathies by his colleagues, and in fact such suspicions remain common even today.

Important pioneers of the late-19th-century and early 20th-century academic study of Western esotericism are Carl Kiesewetter (whose *Geschichte des neueren Occultismus* [1891-1895] treated the occult sciences from → Agrippa to Du Prel), Auguste Viatte (whose 1927 study *Les sources occultes du Romantisme* [2 vols.] remains a standard reference on pre-Romantic and Romantic → illuminism even today) and Lynn Thorndike (whose massive *History of Magic and Experimental Science* in eight volumes [1923-1958] remains equally indispensable for anybody studying the history of → magic and the “occult sciences”). But the first 20th-century author to really conceive of Western esotericism in an integral fashion somewhat similar to how it is seen today seems to have been Will-Erich Peuckert, with his *Pansophie: Ein Versuch zur Geschichte der weissen und schwarzen*

Magie (1936; 2nd ed. 1956) followed by *Gabalia: Ein Versuch zur Geschichte der magia naturalis im 16. bis 18. Jahrhundert* (1967) and *Das Rosenkreutz* (orig. 1929, posthumously published in 1973). Peuckert began his *Pansophie* with the Florentine platonism and → hermeticism of → Ficino and → Pico della Mirandola, and from there continued with the occult philosophy of the Renaissance, → Paracelsus and → Paracelsianism, → Christian theosophy and → Rosicrucianism.

While Peuckert's narrative gave special prominence to the historical antecedents of the figure of Faust as archetype of the magician, another and eventually more influential historiographical current emphasized, rather, the figure of → Hermes Trismegistus. The modern academic study of Renaissance hermeticism was launched by Paul Oskar Kristeller, with a pioneering and influential article on Ficino and → Lazzarelli published in Italian in 1938 (repr. in *Studies in Renaissance Thought and Letters* I [1956], 221-247); and in 1955 appeared a first collection of Renaissance "hermetic" texts edited by E. Garin, M. Brini, C. Vasoli and P. Zambelli (*Test umanistici su l'Ermetismo*, 1955). Basing herself upon Italian researches along these lines, Frances A. Yates then published in 1964 her *Giordano Bruno and the Hermetic Tradition*, which definitively put the study of "the Hermetic Tradition" on the map of international academic research. Yates' "grand narrative" of hermeticism [→ Hermeticism and Hermetic Societies] created what was in fact the first comprehensive academic paradigm for the study of Western esotericism (although she herself did not use that term). It conceived of the field as based upon an intrinsically magical "hermetic philosophy" carried by great Renaissance "magi" such as Pico della Mirandola, → Giordano Bruno or → John Dee and continued (as argued in her later work) by the → Rosicrucianism of the 17th century; and this hermetic philosophy was presented as having given an essential impulse – perhaps *the* essential impulse – to the scientific revolution. This "Yates thesis" was highly provocative because it presented magic as the master-key to understanding the rise of modern science. Authors like Mary Hesse attacked it right away, arguing that scientific thinking had to be understood as emerging from its own internal history. The result was a vehement debate among historians of science and philosophy about the relevance of hermeticism to their domains of research. Once the question of a possible role of "hermetic" currents in the scientific revolution had been put on the agenda, there was a basis for investigating e.g. the importance of

alchemy in the work of great figures such as → Isaac Newton (as demonstrated by B.J.T. Dobbs, R.S. Westfall and others) and Robert Boyle (as demonstrated more recently by L. Principe), as well as many lesser ones. Nowadays Yates' thesis is no longer accepted in its radical form, and her interpretations are criticized in other respects as well, but it is nevertheless thanks to her that the study of hermeticism is now considered an acceptable pursuit in the context of history of science and philosophy.

A more problematic result of Yates' work, at least as far as academic scholarship is concerned, was the appropriation of what may be called the "Yates Paradigm" by a variety of more or less esoterically tinged "religionist" authors in the wake of the counterculture of the 1960s. It was easy for them to embrace hermeticism as a traditional counterculture rebelling against the forces of the establishment. Yates' narrative portrayed the Renaissance magi as emphasizing personal religious experience against the dogmas of the church, and trying to bring "the imagination to power" (*l'imagination au pouvoir*: the famous slogan of the 1960s student generation) against the cold "reign of quantity" associated with mechanistic science. As far as the religious (or "spiritual") dimensions of hermeticism were concerned, religionist authors interpreted them in the light of approaches associated with "Eranos" scholars such as → Carl Gustav Jung, Mircea Eliade, → Henry Corbin or Joseph Campbell (see Wasserstrom 1999; Hakl 2001), all of whom are themselves inspired by esoteric worldviews to a greater or lesser extent. The result was a religionist and often crypto-esoteric style of writing about esotericism that, predictably, tended to be treated with suspicion by scholars who insisted on academic rigor: once again, the agenda for the study of Western esotericism risked being dominated by apologists rather than scholars. With respect to post-18th-century developments, which fall beyond the scope of the "hermetic philosophy" covered by the Yates paradigm, the situation was even more unsatisfactory: as a rule, it can be said that serious studies in this domain (by e.g. James Webb, Joscelyn Godwin, Nicholas Goodrick-Clarke, Christopher McIntosh) have been published in spite of the academy rather than thanks to it.

It is only as late as the 1990s that the study of Western esotericism, under that title, has begun to be seriously recognized as an academic field of study in its own right. In these years the Yates paradigm, as well as its religionist interpretation from a countercultural perspective, has come to be challenged by a different one, introduced by

Antoine Faivre. Faivre defined Western esotericism as based upon a “form of thought” that could be recognized by the presence of four intrinsic characteristics, to which two non-intrinsic ones might be added. The intrinsic characteristics are (1) a belief in invisible and non-causal “correspondences” between all visible and invisible dimensions of the cosmos, (2) a perception of nature as permeated and animated by a divine presence or life-force, (3) a concentration on the religious → imagination as a power that provides access to worlds and levels of reality intermediary between the material world and God, (4) the belief in a process of spiritual transmutation by which the inner man is regenerated and re-connected with the divine. The two non-intrinsic characteristics – frequently but not always present – are (1) the belief in a fundamental concordance between several or all spiritual traditions, and (2) the idea of a more or less secret transmission of spiritual knowledge (Faivre 1994, 10-15; the definition was first formulated in a French publication in 1992).

The heuristic value of Faivre’s definition is undeniable. Other than the Yates paradigm it can be seen as encompassing the entire period from the Renaissance to the present, while still clearly demarcating the field from non-esoteric currents. As a result, during the 1990s it has been adopted by many other scholars and has largely replaced Yates’ grand narrative as the major paradigm in the field. Simultaneously, of course, various aspects and implications of it have come to be challenged. It has been suggested that the definition works best for the Renaissance “occult philosophy” and the late 18th/early 19th century Illuminist and Romantic context, but can only partly account for developments in the “spiritualist”/pietist context since the 17th century and the secularization of esotericism during the 19th and 20th centuries (Hanegraaff 1996, 2004); its restriction to modern and contemporary periods has been questioned, and it has been suggested that the limitations of Faivre’s phenomenological concept of a “form of thought” could be overcome by a discursive approach (von Stuckrad 2004); and the nature of the relation of Western esotericism *sensu* Faivre to Christianity and to the other great religions of the book constitutes an ongoing subject for debate as well (Hanegraaff 1995, 2004; Neugebauer-Wölk 2003; von Stuckrad 2004). Undoubtedly these discussions will cause the present paradigm for the study of Western esotericism to further evolve into new directions. It is clear, however, that largely thanks to the emergence of the Faivre paradigm in the 1990s, Western esotericism is now increasingly recognized

as an area of research that deserves serious academic attention, and the implications of which are likely to transform our perception of Western religious history as a whole.

WOUTER J. HANEGRAAFF

Essenes, Esoteric legends about

The Essenes were a distinct group of Jews which, until the 20th century, was known only from a few

descriptions in Greek and Latin texts. They are described by Philo in *Hypothetica* (11.1-18) and *Every Good Man Is Free* (12.75-13.91). Josephus writes of the Essenes in passages of several of his books. The most detailed description is found in *The Jewish War* (2.119-161). A shorter passage on them is included in *Jewish Antiquities* (18.18-22). Pliny the Elder wrote briefly about the Essenes in his *Natural History* (5.73). Since the discovery of the Dead Sea Scrolls at Qumran in 1947, the group associated with the scrolls was for the next five decades generally assumed to be the Essene community described by these Greek and Roman authors. This assumption has again been increasingly questioned during the 1990s (Boccaccini 1998).

Philo and Josephus describe the Essenes as an all-male order, divided into distinct classes and organized under officials to whom obedience was required. They are depicted as a tightly knit group following an austere and pious rule of conduct, living communally and strictly observing Mosaic law. Neophytes were initiated into the order and received three symbols of their new status: a hatchet, a loin-cloth, and a white garment. After a lengthy period of probation, the initiate swore an oath binding himself to piety, justice, a moral life and secrecy regarding the content of Essene teachings.

In his *Ecclesiastical History* (book II chapter 17), Eusebius of Caesarea (260-339) understands Philo's remarks on a group living in Egypt, whom he called Therapeutae, as describing forerunners of Christian monastic life. Through a mistaken identification of the Therapeutae and the Essenes, the latter group in time came to be used as an important topos in post-Reformation controversies concerning monasticism. A discussion developed about the acceptability of Christian monasticism, to which the Protestants were opposed. On the other side, it was especially the Carmelites – who claimed descent of their Order, through the Essenes, from Elia and Elisa – who defended the thesis that the Essenes were an early Christian monastic community. Several texts that claim that the Essenes were Christians also argue that Jesus had been one of that community, thereby giving monasticism even stronger rhetorical support.

The idea that Jesus had been an Essene was interpreted quite differently in Johann Georg Wachter's (1673-1757) influential *De primordiis Christianae religionis*, written in 1703 and revised in 1717. The Essenes are here described as a link in a long chain of transmission of "natural theology", i.e. a moral and philosophical deist tradition that had its ori-

gins among the Egyptians and included the kabbalah. Christianity is thus interpreted by Wachter as the outcome of a historical development and not of a revelation. Wachter's text was not published, but circulated widely in manuscript form. The first reference in print to his Essene hypothesis is found in Humphrey Prideaux *The Old and New Testament Connected in the History of the Jews and Neighbouring Nations* (1716-1718). Thereafter it becomes a common element in various Enlightenment critiques of Christianity as a revealed religion. It is also against this background that, from 1730 onwards, Masonic authors [→ Freemasonry] join into the discussion about the Essenes.

In 1730/1731, the anonymously published *A Defense of Masonry* appears to be the first Masonic text in which the Essenes are mentioned. They are described in terms that make them appear as Freemasons avant la lettre. By associating the two, the moral respectability of the Essenes as stressed in the ancient sources is used as a defense of Masonry. This pamphlet may at first have made little impact, but it was reprinted in the second edition of Anderson's widely disseminated *Constitutions* in 1738 (pp. 216-226, esp. 221).

A manuscript of a Masonic neo-Templar Order, the *Ordre Sublime des Chevaliers Elus*, dated 1750, radicalizes the parallelism by presenting the Freemasons as being, via several links, the ultimate historical descendants of the Essenes. → Jean-Baptiste Willermoz adopted this claim and in 1778 included statements to that effect in a text entitled *Instruction pour la réception des Frères Écuyers novices de l'Ordre bienfaisant de Chevaliers Maçons de la Cité Sainte*. These claims were repeated in successive versions of the text. From then on references to the Essenes are abundant in masonic literature.

By the end of the 18th century, diverse legend elements had been created that drew selectively on the characteristics of the Essenes as presented in the classical sources. From Masonic literature comes the image of the Essenes as a morally elevated brotherhood with secret initiation rituals and a set of symbols marking them off from the uninitiated. Wachter's book is the source of the legend element that makes the Essenes into covert rationalists, and places Jesus as a member of the Essene brotherhood. The Freemason Karl Bahrdt (1741-1792) is the first writer to have synthesized the various elements and to present for the public a detailed version of the legend. In *Briefe ueber die Bibel im Volkston* (1782), Jesus and several other central New Testament characters are presented as members of this initiatic order. The Essene faith is

portrayed as a form of enlightened humanism, and the life and mission of Jesus are reinterpreted in rationalist terms. In Bahrdr's account, the Essenes spread their rational faith by staging fake miracles in order to convince the spiritually less enlightened masses. Jesus survived the crucifixion and was healed by Joseph of Arimathea and Nicodemus, who were also Essenes. Jesus then withdrew from public life and lived into old age. Karl Heinrich Venturini (1768-1849) fleshed out the details of Bahrdr's account in his four-volume novel *Natuerliche Geschichte des grossen Propheten von Nazareth* (1800-1802).

The main lines of the legend were later summarized in a widely spread anonymous text, *Wichtige historische Enthüllungen über die wirkliche Todesart Jesu* (1849), also known as the *Essäerbrief*. The author of this text was soon thereafter established as Philipp Friedrich Hermann Klencke (1813-1881), a medical doctor from Braunschweig. Although it consists of a summary of sections of Venturini's novel, Klencke's slender volume is purported to be a translation of a previously unknown Essene text in Latin. The text was vigorously attacked for being spurious, which led its author to publish several rejoinders on the same theme. The influence of the *Essäerbrief* can be judged by the fact that it went through numerous reprints since its first appearance, was translated into several languages and inspired several pastiches with similar themes.

19th-century esotericism was deeply influenced by the discovery of the Orient. From the early 19th century and onwards, attempts were made to explain the apparent similarities between Indian and Western forms of religion by claiming that there were historical links between the teachings of Jesus and Buddhism. This motif was combined with the Essene legend by the British author Godfrey Higgins (1772-1833). In his *Anacalypsis* (1833-1836), he presents a vast, speculative history of the human race and its spiritual development. The various religions of the world are placed into an overarching historiographic scheme, and are seen as reflexes of a perennial philosophy [→ Tradition]. The Essenes are included in this historiography in terms that recall all of the main themes encountered previously. The teachings of Jesus are at heart a set of moral precepts. Jesus was a member of the Essene order, a brotherhood that taught the same philosophy as the ancient Indians. Higgins surmises that the lost sacred writings of the Essenes may have been identical to the Vedas. Through the Essenes, this ancient wisdom was also passed on to both the Carmelites and the Freema-

sons. Several texts by later authors continue to give the Essenes various roles as links between diverse Eastern and Western traditions. Examples are Ernest de Bunsen *The Angel-Messiah of Buddhists, Essenes and Christians* (1880) and Arthur Lillie *Buddhism in Christendom or Jesus, the Essene* (1887).

Higgins' *Anacalypsis* is a major source of → Helena Blavatsky's worldview, and appears to have been the principal channel of transmission of the Essene legend into theosophical and post-theosophical currents. References to the Essenes are ubiquitous in the occultist literature, and the examples below are drawn from a large set of such accounts. The Essene legend thus also figures prominently in books by → Edouard Schuré, Otto Hanisch (founder of the Mazdaznan movement), → H. Spencer Lewis, → Manly Palmer Hall and many others. Whereas earlier accounts often claim that the Essenes were initiated into a more rational faith than that of the masses, many such late 19th and 20th century occultist versions of the legend present Essene initiatic knowledge as mysterious and esoteric.

Although the Essene motif is a minor one in Blavatsky's writings, mentions of the Essenes as a secret brotherhood and Jesus as an initiate into the wisdom of this group are scattered through her work. The Essenes are thus in *The Secret Doctrine* (vol. II: 111) seen as a group that taught the doctrine of → reincarnation, as supposedly did Jesus himself. In *Esoteric Christianity* (1902), second-generation theosophists → Annie Besant and → Charles Leadbeater expand on the topic of induction into arcane secrets, explaining that Jesus began his spiritual career in an Essene monastery but later continued to Egypt, where he received various further initiations.

→ Rudolf Steiner gives a wealth of details on the Essenes and their purported connection with Jesus, especially in *Das Matthäus-Evangelium* (1910) and *Aus der Akasha-Forschung: Das fünfte Evangelium* (1913). The Essenes were a brotherhood of initiates devoted to a complex process of spiritual development and clairvoyant investigation. Steiner also gives them a role as link between Buddhism and Christianity, but the connection is due to the intervention of spiritual entities rather than to any mundane historical transmission. Jesus is said to have entered the Essene community because he had acquired clairvoyant faculties similar to theirs. This fact came to the attention of some Essenes who lived in Nazareth, who admitted him to their order without requiring that he go through the usual initiatory rituals. Jesus stayed among them

until his twenty-eighth year and was given esoteric knowledge in the form of visions.

→ Edgar Cayce associates the Essenes with Mount Carmel rather than Qumran, and states that they were part of a spiritual lineage established by Elijah. According to his readings, Mary and Joseph had previously come into contact with this group, and the initiations of Jesus were planned beforehand. The principal aim of being initiated among the Essenes was to receive instructions in → astrology, numerology, phrenology and the doctrine of reincarnation. Furthermore, in his past-life readings, Cayce often claimed that his clients had been acquaintances of Jesus and/or members of the Essene community. In time, a whole gallery of characters supposedly involved in this period of Jesus' life emerged from these trance sessions.

In the contemporary period, the writer most heavily reliant on the Essene motif was Edmond Bordeaux Szekely (1905-1979). In numerous books, notably *The Essene Gospel of Peace* (1974/75), Szekely portrayed the Essenes as links in the transmission of the perennial philosophy, but also as the forerunners of such modern preoccupations as holistic health and natural foods. Several organizations formed around the ideas and practices presented in Szekely's books, including the Essene School of Life and the First Christians' Essene Church.

The Essene legend entered the → New Age movement in the 1970s through compilations of Cayce's readings, as well as through channeled texts ascribed to discarnate entities such as Seth and Ramtha. From then on, the Essene motif is freely combined with other Jesus legends prevalent in the New Age milieu, not least his purported travels in Asia. As one example among many of this historical *bricolage*, New Age healer Diane Stein in her book *Essential Reiki* (1995) explains that the magi were in reality Buddhist monks who took Jesus on a tour of Egypt and India. Inspired by what he learned, Jesus became a member of an Essene order. He survived the crucifixion and lived near Srinagar until he died of natural causes at the age of 120 years.

OLAV HAMMER & JAN A.M. SNOEK

Etteilla (ps. of Jean-Baptiste Alliette),

* 1.3.1738 Paris ?, † 13.12.1791 Paris ?

According to a long but spurious tradition, later refuted by Decker, Alliette was a barber and wig-maker. The truth of the matter is that, at least until 1768, he was a seed and grain merchant, like all the rest of his family members; and from 1768-1769 he was a print seller. In one of his books (1789) he refers to himself as a 'Professeur d'Algèbre', but this fancy title, although "confirmed" by his burial certificate, probably lacks any professional basis. In all likelihood, Alliette was more of a fortune-teller. In his publications, he freely advertised his rather expensive lessons and consultations in → Tarot, → astrology and healing. As early as 1772, in *Le zodiaque mystérieux* he gave a colorful description of how a spirit had appeared and spoken to him.

Alliette shared the fashion of his day for membership in esoteric societies and study groups. In this connection, he created in 1788 a "Société littéraire des interprètes du livre de Thoth", which aimed at using the seventy-eight Tarot cards as the structure of a universal language. On July 1st 1790 he also opened a "Nouvelle Ecole de Magie" (New School of Magic) in Paris. It seems to have attracted quite a few students. Lessons were offered on the Book of Thot (i.e., the Tarot of Marseille, see below) and many other related subjects. In his

Cours théorique published the same year, Alliette gave detailed commentaries on the essentials of the program of the “School”.

At the latest, Alliette’s interest in the Tarot dates from 1770, when his first book appeared: *Etteilla, ou Maniere de se Récréer avec le Jeu de Cartes Nommées Tarots*. Then, in 1783 and 1785, he published a series of four books (“Cahiers”) under that same title. These contained many further developments of the ideas presented in the earlier book, and added fresh perspectives on them. Due to these publications, he stands out as the first author in the history of Tarot literature to have ever presented an esoteric interpretation of the Tarot of Marseille, or at least, such a detailed one. Alliette’s initiative sparked a “tarotic” esoteric current of interest, which has never really diminished until the present time. Many Tarot decks posthumously published under his name are, however, of dubious provenance. In his “Cahiers”, he informs his readers that the cards are not meant as a game, but as a tool for divination and meditation, and that he considers himself a restorer of their original meaning. He claims, for example, that the deck of Marseille (for this is what he means by “the Book of Thot”) had been revealed by priests in ancient Egypt. With regard to this point in particular, it seems that only the Comte de Mellet was earlier in making a similar claim; it can be found in an article by him that was inserted into → Antoine Court de Gébelin’s *Le monde primitif* (vol. XVII, 1781).

But Alliette goes much further than Mellet. In 1783 he assures us that the Book of Thot had been devised by a committee of seventeen magi, presided over by → Hermes Trismegistus himself in the 171st year after the Flood, some 3953 years ago. He was not content just to make this contribution, which strongly influenced the contemporary craze for Egypt [→ Egyptomania]. In *Le zodiaque mystérieux* (1772), and even more so later, in the fourth “Cahier” (1785), he claimed to have discovered strong connections between Tarot and astrology; in fact, this last “Cahier” is devoted to discovering → correspondences between the cards of the Tarot and the stars. He also occasionally drew upon what he knew of Jewish Kabbalah, notably when attempting to relate each trump card to a letter of the Hebrew alphabet. In 1786 and 1787 he published books dealing with other esoteric matters as well. First, there were two publications devoted to physiognomy; and second, a – better known – book on alchemy, *Les Sept Nuances de l’Oeuvre Philosophique-Hermétique*, in which he presents himself as a disciple of the Comte de → Saint-Germain. Alliette claimed that Saint-Germain, who

was supposed to have died in 1784, was still alive. Alliette also boldly presents a full description of “le Grand Oeuvre” (the alchemical Opus Magnum) and gives impressive descriptions of what he calls the “hautes sciences” (that is to say, the “higher” or “occult” sciences) notably in his book of 1785 published under that title.

In 1787, when the Philalèthes were preparing their Masonic Convention in Paris, they decided to consult Alliette for his knowledge of → magic, despite the fact that he was not a Freemason. Alliette later became the object of some curiosity as a source of knowledge about esoteric literature, and was recognized as such by the fountainhead of the Occultist movement, → Eliphas Lévi, in his *Dogme et Rituel de la Haute Magie* (1858). Lévi wrote some critical commentaries on the works of Alliette, to whom he referred as ‘the inspired whigmaker’. Thanks to Lévi we know that certain unpublished manuscripts of Alliette circulated in the first half of the 19th century: ‘The writings of Etteilla’, writes Lévi, ‘have not all been printed, and some manuscripts of this father of modern cartomancers are in the hands of a Paris bookseller who has been good enough to let us examine them. Their most remarkable points are the obstinate perseverance and incontestable good faith of the author, who all his life perceived the grandeur of the occult sciences, but was destined to die at the gate of the sanctuary without ever penetrating behind the veil’.

Outside the circles of esoteric literature, Alliette inspired several authors of fiction. For example, Alexandre Dumas used him as a picturesque, albeit short-lived figure in one of his tales, ‘L’Histoire merveilleuse de don Bernardo de Zuniga’. In a series of short stories by the same author, *Les mille et un fantômes* (1831) Alliette is cast in the role of an “illuminé” who knows “the secret of the elixir of life”, is a friend of the Count of Saint-Germain, and has reached the age of three hundred years at the time of the French Revolution.

The bibliography of Alliette’s works is fraught with technical difficulties. For more details see Decker et al. ANTOINE FAIVRE

Eugenius Philalethes → Vaughan, Thomas

Eugenius Theodidactus → Heydon, John

Evola, Giulio Cesare (Julius or Jules),
* 19.5.1898 Rome, † 11.6.1974 Rome

Writer on philosophy, cultural and religious history, esoteric traditions and politics. Many details concerning the circumstances of Evola's life remain uncertain, since he neither discussed his private life nor kept correspondence. Evola had probably sprung from Sicilian landed gentry, was educated as a Roman Catholic, but soon fell under the intel-

lectual sway of Arthur Rimbaud (1854-1891), Friedrich Nietzsche (1844-1900), Carlo Michelstaedter (1887-1910) and Otto Weininger (1880-1903). He served in the First World War as an artillery officer. Following demobilisation, he underwent an existential crisis, compounded by experiments with ether, which led to a transcendent experience of the self. He became acquainted with the Futurists Giovanni Papini (1881-1956), who got Evola interested in Eastern wisdom and Meister Eckhart (c. 1260-1328) as well as Filippo Tommaso Marinetti (1876-1944), who probably introduced Evola to Benito Mussolini (1883-1945). He next turned to Dadaism and became friends with its chief representative Tristan Tzara (ps. Samuel Rosenstock, 1896-1963). Evola's paintings (exhibitions in Rome and Berlin), poetry and theoretical writings established him as a co-founder of Italian Dadaism. Evola broke off his engineering studies shortly before graduation, as he had no wish to become "bourgeois". He never married nor practised a "bourgeois" profession. In 1922 he ended his provocative, artistic activity and developed his own philosophy, which he called "magical idealism" → after Novalis (Friedrich von Hardenberg, 1772-1801). He brought his philosophical works to a conclusion around 1926. From 1924 onwards, he launched into an intensive study of Western esoteric traditions (chiefly → alchemy and → magic) and Eastern → mysticism (especially Taoism and Tantrism) and established close contacts with the independent Theosophical group Ultra in Rome, where he also lectured. In spite of his personal friendships he became very sceptical of Theosophy [→ Theosophical Society] and → Anthroposophy. Thanks to the important Italian esotericist → Arturo Reghini (1878-1946), Evola made his first contact with the idea of an "integral Tradition" (i.e. the idea that all essential religions and cultures stem from a unified primal → Tradition of transcendent origin) in the sense of → René Guénon (1886-1951), with whom Evola began to correspond. In the period 1927-1929 he assumed leadership of the magical initiatory Group of Ur, in which esotericists such as Reghini and Guido de Giorgio (1890-1957) participated, as well as, anonymously, representatives of Italian intellectual life including Emilio Servadio (1904-1995), the father of Italian psychoanalysis, Aniceto del Massa (1898-1976), art critic and writer, and the anthroposophically influenced poets Girolamo Comi (1890-1968) and Arturo Onofri (1885-1928). In the second year of Ur a dispute between Evola and Reghini caused the end of its practical group work, which was intended to influence politics spiritually

by the formation of magical chains and the creation of subtle energies. The reports of the group that remained around Evola were published under the name Krur. During this period Evola took up mountaineering, and became the first person to make certain Alpine ascents.

From 1925 onwards Evola had tried to intervene in the spiritual and political struggles of fascism in order to give it a sacral and imperial orientation. After the Group of Ur had dissolved, Evola immediately began to publish an intellectual and political periodical *La Torre*, which was discontinued by the order of Mussolini after ten issues, because Evola's spiritual imperialism was too intransigent. At this time Evola even had to protect himself against fascist hard-liners. His polemic *Imperialismo pagano* (1928) unleashed violent controversy in both fascist and the highest ecclesiastical circles. Around this time Evola became acquainted with the philosophers Benedetto Croce (1886-1952) and Giovanni Gentile (1875-1944), with whom he collaborated on the *Encyclopedia Italiana*. During the 1930s Evola adapted the Integral Tradition of Guénon in his own warrior fashion and made a profound study of alchemy, contemporary esoteric groups and the → Grail myth. In these years he undertook Traditionalist critiques of history and culture and wrote several of his most important books. He also traveled widely through Europe, to meet representatives of political currents corresponding to his own sacral, holistic, anti-liberal and anti-democratic ideas; these contacts include Edgar Julius Jung (1894-1934), the conservative revolutionary murdered by the National Socialists, Karl Anton Prince Rohan (1898-1975), the Roman Catholic monarchist founder of the *Europäische Revue*, and Corneliu Codreanu (1899-1938), founder of the Iron Guard in Romania. During a visit to Romania Evola met Mircea Eliade (1907-1986), the later historian of religion, who had adopted some of Evola's ideas and would remain in touch with him. He also had meetings with the constitutional lawyer Carl Schmitt (1888-1985) and the poet Gottfried Benn (1886-1956). At the same time Evola wrote widely for the contemporary press.

Evola had an ambivalent attitude to Fascism: on the one hand he hoped it would lead Italy back towards the pagan and sacral values of the Roman empire, but on the other hand he found it devoid of any transcendent foundation. With his spiritual ideas rejected by the Fascist bureaucracy, he turned to National Socialism, especially the SS, which he initially regarded as a military spiritual order. An acquaintance with Adolf Hitler (1889-1945) and

Heinrich Himmler (1900-1945) may have taken place but is not proven. By 1938, however, an official SS report dismissed Evola as a "reactionary Roman and fantasist", and recommended that his further activities be kept under observation. His efforts to bring the "two eagles" (Italy and Germany) closer together were frustrated by opposition in both countries. From the mid-1930s Evola made an intensive study of racial questions, in the hope of gaining official recognition and influence, as Mussolini had spoken positively about Evola's thesis of "spiritual" racism. Mussolini was interested in developing a counter-balance to the "materialistic biological" racism of National Socialism, but this came to naught as both Italians and Germans opposed it. During the Second World War, Evola studied Buddhism. In 1943 he was present in Rastenburg as multilingual confidant at the meeting of Mussolini and Hitler in the latter's headquarters, where a future German-backed government in Italy was discussed. Following the American invasion of Rome in 1944, Evola fled to Vienna, where he is said to have had an official assignment writing the history of secret societies. In 1945 he suffered a severe spinal injury during a Russian bombardment of Vienna, which left him paralysed in the legs for the rest of his life.

After three years in hospitals and sanatoriums, in 1948 Evola returned to Rome, where he immediately resumed writing. He soon became the intellectual focus of a small troop of mostly young disciples who sought to emulate his spiritual and political outlook. In April 1951 Evola was arrested, accused of being the "intellectual instigator" of secret neo-fascist terrorist groups and of "glorifying fascism". Complete acquittal followed after six months' investigative custody. Since the practical realisation of his ideas seemed impossible in the absence of party support, Evola's political orientation now changed in the direction of an "apoliteia", an attitude of disengagement from current politics. Studies of the links between sex and esotericism led to another of his principal works. Around the same time he produced countless periodical essays and numerous translations from the work of Mircea Eliade (1907-1986), Arthur Avalon (1865-1936), Daisetz Teitaro Suzuki (1877-1966), → Karlfried Graf Dürckheim (1896-1988), Oswald Spengler (1880-1936), Gabriel Marcel (1889-1973), Otto Weininger and Ernst Jünger (1895-1998). Together with his translations of Johann Jakob Bachofen (1815-1887), → Gustav Meyrink (1868-1932) and René Guénon during the 1930s and 1940s, these writings made Evola an important transmitter of wider European

spirituality to Italy. In 1974 he died, propping himself up beside the window of his apartment in order to meet death upright, like his heroes. In accordance with his will, he was cremated. He expressly forbade a Roman Catholic funeral, and his ashes were lowered into a crevasse on Monte Rosa.

All Evola's creative work is characterised by his desire to surpass the merely mortal aspects of existence and his radical orientation towards transcendent principles, which he perceived as immanent at the same time. As early as his Dadaist phase he regarded art as 'a disinterested creation, which comes from the individual's higher consciousness'. He was unsatisfied by purely academic philosophy and sought a breakthrough to the completely different level of reality to which his own transcendent experience of the self had given him access. Based on the philosophy of German Idealism, chiefly represented by → Schelling (1775-1854) and Fichte (1762-1814), supplemented by Max Stirner's (1806-1856) solipsistic notion of the Ego, and by the ideas of French Personalism, as well as Nietzsche and Weininger, Evola arrived at the demand of an "absolute I", which – freed of any intellectual or material restriction – sees freedom, power and knowledge as an indivisible whole, and seeks to realise it. Teachings from Taoism, Hinduism, Tantrism, alchemy, magic, and Meister Eckhart are woven into this "magical idealism". Evola's "absolute I" is related to the Hindu *atman* (= *brahman*), and his notion of power corresponds to the *maya* of Tantrism, which subsumes both illusion and creative magic, as well as to the emptiness of the *Tao Te Ching*. The individual can find his only solid basis and his sole point of certainty in the transcendental I, the personality's deepest ground of being. However, philosophy should not remain an end in itself but must surpass itself and find its consummation in absolute action leading to higher levels. Evola's philosophy thus represents a propaedeutic for the attainment of transcendent initiatory realms. Thus it was only logical that his so-called philosophical phase should be followed by a magical phase.

From Evola's perspective magic has nothing to do with sorcery for gain or harm. He is concerned with a complete self-transformation and integration into transcendent realms, and with the higher dignity and freedom that result from it. This is supposed to happen by way of experiments 'according to those very principles of open-mindedness, scepticism and unflinching exploration which characterise the exact sciences'. Thus Evola prefers self-experiment and knowledge to faith, and represents a thoroughly modernist and post-Enlighten-

ment form of magic. Later in his life Evola speaks of a 'divine technology, traditional in the higher sense' and concludes with → Roger Bacon's definition of magic as "practical metaphysics". The writings of the "magical" Group of Ur therefore contain original texts from Tantrism, Buddhism, Taoism, ancient theurgy and especially alchemy, all of which in Evola's view are oriented towards transcendent self-realisation. Evola uses the concept of initiation to describe the quest and the conscious attainment of transcendent realms. This attainment is also connected with achieving continuous consciousness during sleep, and even beyond physical death. Evola believes neither in → reincarnation nor in the natural immortality of the human soul. Rather man must build up a "diamond body" around an absolutely stable centre of consciousness, which is capable of surviving the trauma of physical death and will replace the mortal body as a new vehicle in more subtle realms of existence.

Evola's emphasis on man's potential self-transformation through asceticism and discipline also explains why he recognized the same purpose in magic and alchemy. Alchemy as the royal art is not just a specialised knowledge concerning the transformation of metals, but a comprehensive physical and metaphysical system embracing cosmology and sacred anthropology, and aims at the spiritual transformation of men *and* metals. Evola championed a spiritual conception of alchemy before → C.G. Jung (1875-1961) and Mircea Eliade, who were both influenced by his view. Accordingly, he sees in the symbolic language of alchemy a universal code for all mysteriosophical fields: hence his equation of alchemy with Hermeticism in toto which was criticised by Guénon, who thought Evola likened alchemy too much to magic. Evola identified himself with the warrior *kshatriya* caste and similarly viewed the "Traditional sciences" in an activist and combative light. He thus differed markedly from Guénon, who emphasised the traditional primacy of the contemplative, priestly *brahmin* caste. Hence Evola's emphasis on the dynamic, magical and mutable aspects of the world, which also explains his controversial involvement in practical politics; and hence also his preference for activist Tantrism, whereas Guénon devoted himself to philosophical Vedanta. It is therefore an oversimplification to regard Evola merely as the Italian representative of Guénon. However, in common with Guénon, Evola rejected the Theosophy of → Helena Blavatsky (1831-1891), the Anthroposophy of → Rudolf Steiner (1861-1925), → spiritualism, and other contemporary neo-spiritualist groups. He was also definitely

hostile towards the psychoanalysis of Sigmund Freud (1856-1939), and even more so towards Jung. In contrast to Guénon, Evola made positive statements on → Giuliano Kremmerz (1861-1930) and his *Fratellanza Terapeutica Magica di Miriam*, of which he was not a member, but whose doctrines influenced him. Likewise he was positive about the magical doctrine of → Aleister Crowley, with whom he was only superficially acquainted, and about → George Ivanovitch Gurdjieff (1877-1949). Nor does Evola's opinion of Christianity and → Freemasonry accord with that of Guénon, who recognised Traditionalist survivals in both institutions, which he therefore believed could lead to at least a virtual initiation. With the possible exception of fraternities completely hidden from us, Evola recognised no initiatory groups in modern times. Christianity, on the other hand he saw as a primary cause of spiritual decline in the West, because it preaches humility and submission rather than the self-determination of man. To Freemasonry he attributed an initiatory character only in its operative period, before the foundation of the Grand Lodge of England in 1717. Freemasonry had thenceforth turned into a speculative, purely rational association, devoted to the politics of the Enlightenment and thus acting in the sense of what Guénon referred to as "counter-initiation". Here one may detect the influence of Catholic world-conspiracy theorists extending from Louis de Bonald (1754-1840) and Leon de Poncins (1895-1975) to Evola's friend Giovanni Preziosi (1881-1945). In his own theory of world-conspiracy, probably derived originally from Guénon, Evola did not so much accuse specific human groups (Freemasons or Jews) of seeking to conquer the world. Rather he regarded them as the tools of extra-human spiritual powers.

In Grail mythology Evola sees a hidden initiatory mystery, and the Grail kingdom he regards as the specifically Western medieval manifestation of the Traditionalist idea of a supreme world centre under the "royal-spiritual" authority of a "world ruler". The quest for the Grail therefore symbolises "the desire to establish contact with this mysterious centre". In Evola's view, the Grail is a Nordic mystery on account of its links with Germanic and Celtic traditions as well as in its Hyperborean symbolism, and it also relates to the Ghibelline imperial tradition as opposed to papal supremacy.

In his works on culture and history, Evola uses the so-called "Traditional method". It accords greater importance to myths and symbols than to actual historical facts and highlights the intersection between sacred metahistory and profane

history. Using Graeco-Roman and Vedic sources, Evola speaks of a Hyperborean centre located in the prehistoric Arctic where Nordic god-men ruled in a Golden Age. Due to cosmic catastrophes, they had to leave their homeland, as a result of which their heaven-oriented, solar and heroic-masculine world-view came to be over most of the world. A culture characterised by hierarchy, spiritual regality, ritual and initiation represented the primal Tradition which a man living by the Tradition should hope eventually to reinstate. On the opposing side stood the earth-oriented, lunar and matriarchal culture of the Southern peoples (here the influence of Bachofen is obvious), which led to wars but also to interbreeding with the Northern peoples. Thus the solar element in the West increasingly lost its vitality during a cyclical history of decline. A final efflorescence was felt in medieval Catholicism, as this was less Christian than inclined to sacral imperialism. The Renaissance and, above all, the French Revolution represented further stations of decline. Modernity would finally perish in a state of collectivism, lawlessness and materialism, as already prophesied in Indian religious texts (*Vishnu-purana*). World history is therefore not an evolution but a downward devolution ending with the present iron (dark) age (*kali-yuga*). An authentic restoration of the Tradition will only be possible after the complete collapse of the modern world, because there can be no gradual transition between Traditional culture and modernity: we are dealing with two totally separated, *entirely different* concepts of time, values, and the sacred.

Evola made extensive studies of wisdom teachings from the East. He became acquainted with Tantrism, which is described by him as the only remaining regular path to transcendence in the *kali-yuga*, through the writings of Arthur Avalon (ps. John Woodroffe; 1865-1936), with whom he corresponded. Evola was particularly impressed by the active side of Tantrism as well as the practices of the left-hand path, which though highly sacred run contrary to customary moral and religious notions. That in Tantrism the divine female Shakti symbolises motion, energy and power, in contrast to the motionless male Shiva, influenced Evola's own ideas of "sacred eros" to a high degree. The philosophy of Taoism was exemplary for the life-style of a sage in Evola's view, and "inactive action" (*wei-wu-wei*) was the best possible description of effective magic for him. In 1923, and again in 1959, Evola published two completely different translations of the *Tao Te Ching*, with commentaries by himself. He was also profoundly interested in the internal alchemy (*nei-tan*) of Taoism.

In Buddhism, Evola concentrated on the original teaching of Prince Siddhartha Gautama (c. 560–c. 480 B.C.) as well as on Zen. In contrast to the contemporary focus on pacifism and neighbourly love, Evola emphasised the warrior-like and aristocratic nature of early Buddhism pointing out that Gautama was not a brahmin but a member of the warrior caste (*kshatriya*). He also stressed the initiatory character of Buddhist asceticism, which as a “dry path” of non-identification and letting-go aims at the extinction of all “thirst” and the “great liberation” in the “void” (*sunyata*). Evola also published numerous essays in the periodical *East and West* edited by the Tibetologist Giuseppe Tucci (1894–1984), with whom he was acquainted for many years.

Evola regarded sex as virtually the only practical possibility open to contemporary man to experience something of the higher transcendental world. Only in the sexual act does man escape his all-encompassing profane ego and open himself to higher spheres. For Evola, male (= the unmoved spiritual mover) and female (= the malleable matrix) are transcendent categories, and the biological differences between man and woman are merely a reflection of these. Evola also refers to the Platonic myth of the androgyne whose division led to the two sexes which strive to regain their original unity. Sexuality offers the possibility of a breakthrough to transcendence through certain practices, in which man has to combine his inner masculinity with his inner femininity. The practices of kundalini yoga, Taoism, the → “fedeli d’amore” (Liesges of Love) as well as Arabic and European secret orders show the way in this direction.

Evola’s political philosophy is based on hierarchical thinking and expressed in the “organic state”. Its precondition is a centre founded on purely transcendental principles and permeating all areas of public life – without the need for violence, as in totalitarianism – by virtue of its superior spiritual power. The principal duty of the state is to lead its citizens towards transcendence, as in Plato. At the same time, Evola opposes the concept of nations and advocates a spiritual-monarchic imperial theory. Evola’s notions of race derive from a tripartite division. From above to below he distinguishes between a “race of the spirit” (the various attitudes to sacral principles from fearful submission to an upright and self-relying relationship), a “race of the soul” (the various types of character from emotional to detached) and a “race of the body” (which covers the usual physical definition). As he dismissed the physical racial characteristics as the least important, he found himself in opposi-

tion to other racial theorists and increasingly lost influence among them.

Evola regarded Jewry primarily as a symbol of the dominance of materialism and economics in modernity. His statements range from polemical attacks and conspiracy theories to his warning ‘not to make the Jews a kind of scapegoat for everything that Gentiles were really responsible for’, (‘Inquadramento del problema ebraico’ in *Bibliografia Fascista*, XIV, No. 8/9, 1939, 717–728). One notes a certain tendency towards vulgarisation of these notions in his journalistic writings, as compared to his books. Due to his involvement with Fascism (Evola was never a party member, however), National Socialism and racism, Evola has been little read since the Second World War, except by keen opponents or supporters. Only since the early 1990s has he become more widely discussed as an artist and has he become the subject of numerous university dissertations. His uncompromising ideas have also been taken up by the underground youth music scene. Thus a compact disk was produced to honour Evola’s centenary. Musical bands like Blood Axis, Alraune, Camerata Mediolanense, Allerseelen and Ain Soph composed and played themes inspired by Evola’s writings. Practically all of his twenty full-length books, approximately 300 longer essays, and much of his collected journalism, numbering more than 1000 articles and countless reviews in newspapers and magazines, are in print. A growing number of translations has made Evola known outside of Italy as well – chiefly in France, but also, interestingly, throughout Eastern Europe. A foundation dedicated to his work in Rome is engaged in publishing definitive editions of his major writings, and in collecting and editing his scattered essays and biographical material.

HANS THOMAS HAKL

Faber Stapulensis, Jacobus → Lefèvre d'Étaples, Jacques

Fabre d'Olivet, Antoine, * 8.12.1767 Ganges, † 27.3.1825 Paris

The immensely curious and massively erudite self-proclaimed Neo-Pythagorean Fabre d'Olivet was born to a wealthy Protestant family. As a young man, he came under the influence of Delisle de Sales, an Enlightenment rationalist with a penchant for historical speculation. Under Delisle's influence, Fabre d'Olivet wrote *Lettres à Sophie sur l'histoire* (1801), a resume of ancient and modern cosmogonic systems together with a history of civilizations. Fabre d'Olivet's other notable pre-theosophical work is *Le Troubadour: Poésies occitaniques du XIII^e siècle* (2 vols., 1803-1804). This compound of poetry, a study, a dissertation on the Occitan language, and a vocabulary was intended to revive interest in the poetry of the Troubadours and to defend the Occitan language. A mystification and celebration rather than scientific linguistics or philology, *Le Troubadour* closely resembles Macpherson's *Ossian*.

Fabre d'Olivet underwent a religious and vocational crisis between 1800 and 1805. He emerged as a theosopher. The key to his conversion seems to have been his discovery, the details of which are

unknown, of a Unity that is the source and end of all diversity. → Tradition, or a primitive revelation granted to humanity by Providence, bears witness to this Unity. The existence of this Tradition, in turn, is demonstrated by the agreement of all cosmogonies. The homeland of the ancient wisdom was Egypt, from where it was transmitted to other peoples through initiation, most notably by → Moses, Pythagoras, and Orpheus.

Fabre d'Olivet's Illuminism, set out in a series of works published between 1813 and 1824, belongs to the esoteric tradition of thought that in its modern western form derives above all from → Jakob Boehme (1575-1624). He was an autodidact who acknowledged no master and belonged to no sect. Nevertheless, even if he never met → Saint-Martin, Fabre d'Olivet was in constant contact with his friends and disciples from 1800 onwards. Similarly, though he was never initiated into the Order of → Elus-Coëns, Fabre d'Olivet was thoroughly acquainted with the theurgic activities of → Martinès de Pasqually and → J.B. Willermoz. His principal works are *Les Vers dorés de Pythagore* (1813), *La Langue hébraïque restituée* (1810, published in 1816/1817), *Caïn: Mystère dramatique de Lord Byron* (1823), and *Histoire philosophique du genre humain* (1824; first published in 1822 as *De l'Etat social de l'homme*).

Vers dorés presents Fabre d'Olivet's theosophical views in the form of a commentary on his own translation of Pythagoras' *Golden Verses*. It is prefaced by a lengthy discourse, 'Sur l'essence et la forme de la poésie'. Pythagoras, for Fabre d'Olivet, is only a name for Tradition. Since all true knowledge derives from the primitive revelation, the universal truths may be found in all cosmologies and philosophies that have not separated themselves from Tradition. Fabre d'Olivet demonstrates the unity of the sacred tradition by correlating passages from Pythagoras with passages from other Classical writers, from Indian, Chinese, and Persian texts, and from modern philosophers. So, while it is true that → neopaganism and even Pythagoreanism itself were fashionable during the Empire, Fabre d'Olivet's "Pythagoreanism" is not a rejection of biblical religion but symbolic of the theosophical truths contained in the universal primitive revelation. And since Moses received the same Egyptian initiation as Pythagoras, the Pentateuch, correctly interpreted, contains the same doctrines as the *Vers dorés*, as Fabre d'Olivet set out to demonstrate in *La Langue hébraïque restituée*.

La Langue hébraïque restituée is Fabre d'Olivet's free translation and commentary on the first five books of the Bible. He believed that Hebrew, as one

of the three primordial idioms of the language revealed directly to humanity by God, was a hieroglyphic language that veiled deep esoteric truths. The books of Moses, particularly Genesis, preserve this ancient wisdom, but it has been inaccessible until now because knowledge of the true esoteric meaning of Hebrew degenerated soon after Moses' death and has been lost since the Babylonian Captivity, except among the → Essenes. The Essenes, however, whom Fabre d'Olivet depicts as a small group of Alexandrian sages, were bound by oath to keep the ancient doctrines secret. When the Ptolemaic ruler of Egypt requested a translation of the Pentateuch for the great Library at Alexandria, the Essenes faced a dilemma: they did not want to flout the authority of the civil power, but religious law forbade communication of the divine mysteries. Their solution was to distinguish between the literal and the esoteric senses of the text. Thus they produced a literal translation, the Septuagint, in which the incommunicable mysteries remained veiled. Present-day versions of the Pentateuch are deficient and misleading because they reproduce only the literal sense of the ancient text. In *La Langue hébraïque restituée*, Fabre d'Olivet announced that he had rediscovered the esoteric meaning of Hebrew and reestablished the primitive theosophical cosmogony of Moses.

In 1811 Fabre d'Olivet claimed, in *Notions sur le Sens de l'Ouïe*, to have healed a deaf-mute named Rodolphe Grivel through the application of principles established in the as-yet unpublished *La Langue hébraïque restituée*. The Mosaic cosmogony, he asserted, contains the principles of all sciences, ancient and modern. The healing of Grivel vindicates the accuracy of his reconstruction of the primitive revelation. According to Léon Cellier's brilliant analysis, Fabre d'Olivet considered hearing, like the exercise of any sense, to be a manifestation of the volitive faculty. It follows that deafness may be cured by awakening the volitive faculty of the deaf person. Genesis 2:21 recounts that Eve was created from Adam's rib while Adam was in a deep sleep. In his commentary in *La Langue hébraïque* Fabre d'Olivet identifies "deep sleep" with magnetic sleep or somnambulism. Eve, in Fabre d'Olivet's system, corresponds to the volitive faculty. The Genesis passage therefore tells us that the volitive faculty is awakened through magnetized sleep. Fabre d'Olivet claimed to have healed Grivel's deafness by plunging the subject into magnetized sleep (Fabre d'Olivet was a practising magnetizer; he protested against the name → *animal* magnetism because it degraded what he considered to be a high spiritual phenomenon) and

through the action of his own will awakened in the subject the faculty of hearing.

De l'Etat social de l'homme, reflecting in part the sense of historical evolution that Fabre d'Olivet acquired during the Bourbon Restoration, is an exposition of the 12,000-year history of the human race from earliest times to Bonaparte. Inasmuch as it is a philosophical history built on the cosmological principles set out in his earlier books, Fabre d'Olivet follows his Illuminist [→ Illuminism] predecessors in predicating history on cosmogony. He republished it two years later in the vain hope that the more fashionable title, *Histoire philosophique du genre humain*, would increase its sales. *Histoire philosophique* is prefaced by a lengthy 'Dissertation Introductive', which summarizes (and in places revises) the metaphysical foundation established in the earlier works on which the philosophical history is built. In it Fabre d'Olivet declares that conventional history is false because it has been written without knowledge of the true principles that govern the cosmos and history. If we are to understand the successive development of humanity, its moral faculties and their action, we must first grasp the metaphysical facts of the spiritual nature of humanity and its place in the hierarchy of the universe.

The cosmogonic drama of *Cain* counters Byron's "blasphemous" version of the Genesis story by translating it together with a corrective commentary drawn from Fabre d'Olivet's own speculations on the meaning of Genesis in *La Langue hébraïque restituée*.

Fabre d'Olivet's epistemology takes up and purports to refute Kant's epistemological pessimism. Fabre d'Olivet's argument is based on a distinction between rationality and reason. Rationality, he says in *Vers dorés de Pythagore*, is a secondary faculty that corresponds to soul, the middle term of the triple nature of humanity as body, soul, and spirit; reason, or intellectuality, is a principal faculty that corresponds to spirit, the highest term of our triple nature. Fabre d'Olivet argues that Kant misled himself because, confusing rationality with intellectuality, he failed to understand the spiritual nature of reason. The result of Kant's error is a philosophy that first strips humanity of its spiritual faculties, then attempts to grasp spiritual truths with a faculty incommensurate with them, and finally, the attempt having necessarily failed, declares the spiritual truths to be unknowable. Fabre d'Olivet overcomes Kant's epistemological pessimism by redefining reason as an intuitive faculty capable of grasping the ontological Absolute.

Fabre d'Olivet's Illuminist drama is played out in

a Boehmenist cosmos in which divine emanation bathes the universe in divine forces and humanity, created as primordial Adam, is a spiritual being of great power. Fabre d'Olivet identifies unfallen humanity with the Will, which, along with Providence and Destiny, is one of the three powers, or cosmogonic principles, of the universe. The Fall has obscured, but not effaced, this glorious identity. Fabre d'Olivet refers to humanity as the *règne hominal*; that is, the fourth kingdom, following the mineral, vegetable, and animal kingdoms. Nevertheless, he insists that the human essence is distinct from lower essences and that there is no continuity between the natural world and humanity. The *règne hominal*, in fact, is Fabre d'Olivet's name for the Universal Adam of the Illuminist tradition. Fallen humanity displays a triple nature, at once body, soul, and spirit, and lives a triple life, instinctive, passionate [*animique*], and intellectual (i.e., spiritual). These three lives, when they are fully developed, intermingle and are confounded into a fourth, or volitive, life. Through the exercise of the volitive life, which is proper to it, humanity gradually reintegrates primordial Adam and raises itself to the reattainment of its cosmogonic status. Humanity's (future) achievement of this status is the prerequisite for the reestablishment of harmony among the three cosmogonic principles of Providence, Will, and Destiny. The reestablishment of cosmogonic harmony, in turn, will create, replicating on the macrocosmic level the fourth life of humanity, a fourth power that is the very image or mirror of divinity and the realization of Fabre d'Olivet's version of Illuminist reintegration.

In his commentary in *Cain*, Fabre d'Olivet interprets the Genesis narratives concerning the three sons of Adam and Eve as allegories of his cosmogonic principles. All future humanity was contained in prelapsarian Adam, in whose nature Will and Providence co-existed in perfect harmony. The Fall shattered the harmony within Adam's nature, precipitating both descent into the material universe of time and space and dispersal of the primordial Adam into the successive generations and myriad individuals of the human race. Adam's posterity divided his integrated nature: Cain embodied the faculty of Will and Abel that of Providence. This division was to be perpetuated in their descendants, creating in effect two races: *hommes volatifs*, who rely on their own powers, and *hommes providentiels*, who trust in God's love for humanity. Adam's sons and their respective descendants were intended to co-operate in the redemption of the human race. The free submission of human will to Providence would have quickly reintegrated pri-

mordial Adam, but Lucifer intervened. Knowing that he would not be able to dominate the providential race, Lucifer (actually a hypostatization of Will, and thus identical to Cain) persuaded Cain to kill his brother. Henceforth, Providence, annihilated by Will, no longer acts directly in the world. After the murder of Abel, Adam and Eve had another son, Seth. Seth, however, embodied, not Providence, but Fabre d'Olivet's third cosmogonic principle, Destiny, or blind fate. Human history is henceforth a struggle between *hommes volatifs*, the descendants of Cain who champion anarchic liberty, and *hommes fatidiques*, the descendants of Seth who preach submission to necessity. Caught in this dismal struggle, humanity calls out to Providence for assistance, but in vain since, save for rare exceptions like Orpheus, Moses, and Buddha, *hommes providentiels* no longer walk the earth. Nevertheless, though Providence no longer intervenes directly in human affairs, it still operates indirectly. Like Hegel's "cunning of reason", Fabre d'Olivet's Providence uses wilful human intentions to effect its own end of the redemption of humanity in the reintegration of Adam. Not only is God not responsible for evil in the world, but Providence ensures that, despite its best efforts to the contrary, humanity will be redeemed in the end. This is Fabre d'Olivet's version of theodicy, and indicates the central place the defense of Providence holds in his theosophical oeuvre.

Humanity may be a power in the cosmos, but since the Fall it is a power only in germ. Through the interaction of humanity with Fabre d'Olivet's other two cosmogonic powers, Providence and Destiny, humanity must develop its potential as Will. The essences of all species, including humanity's ontologically unique essence, were placed in them by God at the creation. Because the will of a being corresponds to its essence, individuals and species alike develop – that is, progressively realize the external characteristics appropriate to their preexistent essences – by means of the repeated exercise of the will. Fabre d'Olivet's fundamental image of development is the growth of a plant as the unfolding of what is contained in its seed (this is a variant of preformationism in which the voluntarism of Boehmenist Illuminism has been added to the organic language of biological preformationism). Fabre d'Olivet finds authority for this image in the Hebrew Bible (albeit in the theosophic version of Moses' teaching he himself "restored" in *La Langue hébraïque restituée*). The first word of Genesis, *bereshith*, according to Fabre d'Olivet, ought not be translated "in the beginning" but rather "*in principio*", "in principle", "in potential".

Creation signifies not the act of bringing something into being out of nothing but a process of bringing something from potential being into actual being.

History, for Fabre d'Olivet, is the progressive unfolding of what is already in humanity as its essence. The result is a teleological philosophy of history, in which the consequences of humanity's constitutive metaphysical principles are played out in time and space. In the 'Discours sur l'Essence et la Forme de la Poésie', Fabre d'Olivet addresses the relationship between the spiritual process of reintegration and the succession of historical events in his distinction between allegorical history and positive history. Positive history chronicles events that happened but that have no spiritual significance, whereas allegorical history arranges events that may never have happened into a dramatization of the spiritual destiny of humanity. Allegorical history alone, Fabre d'Olivet declares, is worthy of study. Fabre d'Olivet insists that history is meaningful only when it is explicitly subordinated to metaphysics; to, that is, the knowledge of its origin, end, and purpose.

As sketched in *Histoire philosophique du genre humain*, the development of humanity was at first subject to Destiny, but the divine germ humanity carries within itself – a spark of the divine will – develops, by reacting against Destiny itself, into an opposing volitional force whose essence is liberty. This is not a smooth or uniform process. Ever since the murder of Abel, history has been an incessant struggle between the human Will and Destiny. When the human Will sides with or yields to Destiny, centuries of decadence and oppression result. Conversely, the Will allied to Providence leads humanity toward perfection. For Fabre d'Olivet, theocracy is the political correlate of the principle of unity and thus the balance among the principles that Fabre d'Olivet desires can be attained only under theocratic government. *Histoire philosophique* concludes with a call for France, Europe, and ultimately the whole world, to form a single theocratic empire under the final authority of a Supreme Pontiff, thereby uniting at last the three cosmogonic principles in the ideal social structure. Cosmically speaking, the Will of humanity functions as a mediating power, entering elementary nature in order to bring harmony there and reuniting Destiny and Providence. The full development of the volitional germ constitutes the restored Will of the Universal Man, and thus the restoration of the *règne hominal* to its original and proper dignity as a cosmogonic principle. Through the action of human volition the *règne hominal* is reintegrated and the great ternary of Providence, Will, and

Destiny harmonized into the fourth principle that is the mirror of divinity.

Fabre d'Olivet's christology distinguishes him from most other Illuminists. He reduces Christianity to merely one manifestation of primitive revelation. And while he calls Jesus a divine man, he awards this title to all *hommes providentiels* (including Krishna, Odin, and Apollonius of Tyana). What makes Jesus great, in Fabre d'Olivet's opinion, is that he showed by his death and resurrection what the human will is capable of when it knows itself to be in conformity with the will of Providence. Similarly, all religions are true, and agree with each other, to the extent that they derive from the primitive revelation. Fabre d'Olivet is willing to concede that Christianity has changed the world on the moral or historical plane, but insists that Christianity has brought nothing new on the religious plane. Jesus, in Fabre d'Olivet's theosophy, ceases to be the unique and necessary Redeemer; Christ as saviour is replaced by the development of humanity into the cosmogonic *règne hominal* through the exercise of its will.

Fabre d'Olivet gathered around himself a group of disciples whom in 1824 he organized into a sect, *Théodoxie universelle*, whose ritual and theology he himself, as supreme Pontiff, provided. Fabre d'Olivet cast his new cult in the form of a masonic lodge except that he replaced the traditional masonic and architectural symbolism and paraphernalia with substitutes derived from agriculture (once again, the fundamental analogy between the soul and a seed). Fabre d'Olivet outlined the teachings of his sect in a work titled *La Vraie Maçonnerie et la Céleste Culture*, which remained unpublished until edited by Léon Cellier in 1953.

Fabre d'Olivet's posthumous reputation exceeded anything he had enjoyed during his lifetime. He was a figure of authority on a wide range of subjects for Illuminists of the 1830s and 1840s. Beyond Illuminism proper, he was an important influence on religio-social theorists of the Romantic period [→ Romanticism], most notably → P.S. Ballanche and P. Leroux. His fame reached its peak during the Symbolist period, when → Saint-Yves Alveydre offered an interpretation of him as a modern pagan that was taken up by the Symbolist poets, though it is impossible to point to a direct, decisive influence on any major poet.

ARTHUR MCCALLA

Fabré-Palaprat, Bernard-Raymond, * 1773 Cordes (Tarn), † 18.2.1838 Pau (Southern France)

Bernard-Raymond Fabré-Palaprat was the founder of modern neo-Templarism [→ Neo-Templar Traditions]. Although he styled himself a "medical doctor", he was actually educated in a Catholic seminary but was unable to complete his training there because of the French Revolution. He later worked as a pedicure performing small surgical operations (an activity not requiring a formal medical education at that time).

After the Revolution, Fabré-Palaprat joined Paris → Freemasonry in the lodge of the Knights of the Cross. In 1804, he and some of his Masonic companions declared that they had discovered, quite by chance and hidden in furniture which had belonged to Duke Louis-Hercule-Timoléon de Cossé-Brissac, who had been killed during the Revolutionary Terror of 1792, a number of documents "proving" the century-old theory, or legend, of a secret prosecution of the Order of the Knights

Templar (formally suppressed in 1307). The theory had many proponents in Masonic circles, but Fabré-Palaprat claimed not only to have found solid evidence for it, but also documents left by the last Grand Master in an uninterrupted line of succession dating back to the Middle Ages (namely, Cossé-Brissac himself), authorizing certain Masonic bodies to elect a new Grand Master after his death. Fabré-Palaprat concluded that the Knights of the Cross lodge held sufficient authority to appoint the Templar Grand Master, and had himself elected to the position in 1805.

Restoring the Order of the Temple was somewhat attuned to the imperial rhetoric of the time, and Napoleon I (1769-1821) himself even agreed to preside at one of its solemn ceremonies in 1808. Fabré-Palaprat's claims went beyond establishing yet another order of chivalry, however. Firstly, he proclaimed that modern Freemasonry had been founded by Templars, and that the Grand Master of the renewed Order of the Temple had authority over all the Masonic lodges throughout the world.

In 1812, Fabré-Palaprat went still further, and claimed to have purchased from a Paris *bouquiniste* an original version of the Gospel of St. John entitled *Evangelicon*, together with an old commentary known as *Leviticon* or *Levitikon*. Historians today believe that these works, rather than forgeries authored by Fabré-Palaprat himself, were actually 17th or 18th century creations. Fabré-Palaprat, however, regarded them as ancient scriptures revealing the very truth about Christianity. They explained that Jesus Christ was not the Son of God, but a genial esoteric master educated in Alexandria. Before dying, according to the *Leviticon*, Jesus established an "Order of the East", with secret but unquestionable authority over the Church of the West. The first Grand Master of the Order of the East was John the Beloved; in the Middle Ages the Order ceased to exist under that name and became instead the Order of the Temple.

The implication was that Fabré-Palaprat, being the current Grand Master of the Order of the Temple, was both St. John's successor and head of the Order of the East, with full apostolic authority over the whole of Christianity. In 1812, Fabré-Palaprat was thus able to establish what was in fact a new religion, the so-called "Johannite Church", and to proclaim himself Sovereign Pontiff of that "John's Church", a body invested with full authority over "Peter's Church" (i.e. the Roman Catholic Church). Most neo-Templars regarded themselves as good Roman Catholics, and had no intention whatsoever of following Fabré-Palaprat into the Johannite Church. A schism followed in Fabré-

Palaprat's Order of the Temple between the "Johannite" (also called "Palapratian") and the "Catholic" factions. Both continued as separate entities, with Fabré-Palaprat gathering his followers from among the most anticlerical of the French Freemasons of his time.

In 1831, Fabré-Palaprat met the defrocked priest Ferdinand-François Châtel (1795-1857), who had founded an anticlerical and overtly socialist "French Catholic Church" independent of Rome. Châtel joined Fabré-Palaprat's "Johannite" wing of the neo-Templar order and was consecrated by Fabré-Palaprat (on the basis of the authority he claimed to have as successor of St. John) as "Bishop" and "Primate of France" in the Johannite Church. Châtel was able to recruit other politically radical ex-priests, but his anti-Catholic excesses alienated even more neo-Templars, who left Fabré-Palaprat, outraged also by a "Johannite Mass" which Fabré-Palaprat (who had never been ordained a priest) publicly celebrated in 1834. The Johannite Church ultimately collapsed; Châtel continued to operate a "Radical French Church" for some years after that, but eventually abandoned all such projects altogether, and in his later years simply worked in a Paris drugstore. Fabré-Palaprat left Paris due to ill health in 1837 and died in Southern France in 1838.

After Fabré-Palaprat's death, the "Palapratian" and the "Catholic" wings of the neo-Templar order tried to merge by electing the British Admiral William Sidney-Smith (1764-1840), whom Fabré-Palaprat had appointed as Grand Prior for England in 1813, as Grand Master recognized by both branches. The merger proved short-lived, however, and the "Palapratian" (Masonic and anticlerical) and the "Catholic" branch of Fabré-Palaprat's Order of the Temple went their separate ways. Eventually, a "Catholic" wing in continuity with Fabré-Palaprat's initiative ceased to exist, and the "Palapratian" wing separated into several dozens of conflicting Orders and Priors.

Today, "Catholic" neo-Templar orders have again been established (some of them recognized by the Roman Catholic Church, which does not regard them as being in continuity with the Medieval Knights Templars, however, but as simple private associations), whilst more than a hundred "Palapratian" neo-Templar obediences, divided by a century-old history of schisms and separations, continue an independent existence with different degrees of success. A controversial figure throughout his life, Fabré-Palaprat stands at the gateway of modern neo-Templarism as such, and its endemic proclivity for division and schism.

MASSIMO INTROVIGNE

Falk, Samuel Jacob,

* ca. 1710 Podhayce (Poland),

† 17.4.1782 London

Jewish Kabbalist known as the “Baal Shem of London” (master of the divine names). Scorned by rabbinic opponents as an ignoramus and charlatan, he was revered by mystical Jews as a healer and visionary. Through his association with occultist Freemasons [→ Freemasonry], his fame spread from England to the Continent, Scandinavia, Russia, and North Africa. Some Masons believed that he was the “Old Man of the Mountain”, an “Unknown Superior” of illuminist Freemasonry – a belief that later fueled the anti-Semitic polemics of Edouard Drumont, Benjamin Fabre, and Nesta Webster. Scholem suggests that the youthful Falk was influenced by the antinomian Sabbatianism of Baruchia Russo, who interpreted Sabbatai Zevi's conversion to Islam in 1666 as a “holy sin”, a necessary descent into the realm of evil (the *kellipoth*) in order to transform evil into good. Some radical devotees condoned public conversion to the dominant religion of one's region, combined with private adherence to Sabbatian beliefs. After moving to Fürth, Falk became well-versed in New Testament teachings, which he utilized in religious disputations with Christians, whose patronage he sought for his alchemical and magical exploits.

In the 1730's Falk visited aristocratic courts in Germany, where he dazzled witnesses with feats of kabbalistic healing, vision-inducement, angelic conjurations, treasure-finding, and political predictions. According to the *Mémoires du Comte de Rantzow* (Amsterdam, 1741), Falk was driven from Cassel by jealous Jesuits, who wanted him burned at the stake. In 1736 he found refuge with Baron de Donop and Count Alexander Rantzow, whose son George published Falk's startling pronouncements and magical feats. While boldly defending the superiority of the Jewish religion, Falk argued that ‘the Jews are in ignominy, so that in a true sense they are the only Christians’: moreover, their debasement will soon lead to their deliverance. His prediction of a universal war leading to

a messianic consummation frightened Rantzow, who was ordered to abandon ‘the pretended liberator of the Jews’.

Falk then fled to Holland, where he possibly met Moses Hayim Luzzatto, the great messianic kabbalist and suspected Sabbatian, whose writings he would long cherish. He also befriended Tobias and Simon Boas, wealthy bankers and Freemasons, who became his admirers and patrons. After Falk moved to London (ca. 1739-1740), Rantzow heard that ‘the Portuguese Jews of the highest reputation rendered him honors as their prince and sovereign pontiff’. However, Parliament ordered the Jew's arrest but then released him on condition that he ‘no longer Kabbalize’. A later Masonic colleague, General Charles Rainsford, reported that Falk was also censured for Kabbalistic indiscretions by certain Jewish authorities, who punished him and forced him to ‘pass the rest of his life in solitude, without daring to communicate his knowledge, which he had the imprudence to make apparent for ostentation’.

As has been argued by the present author, over the next decades in London, Falk's path often crossed that of → Emanuel Swedenborg, the Swedish scientist and mystic, and the Papal Inquisition later linked their names as ‘chiefs of the Illuminés’. During his residence in 1744-1745, Swedenborg was in contact with two unnamed Jews, who witnessed his visionary trance state and whom he defended as ‘these good Israelites’. When he suffered an hallucinatory illness, he was treated by his ‘intimate friend’ Dr. William Smith, an eccentric Mason, who was studying Kabbala [→ Jewish Influences] with Falk. Until Swedenborg's death in 1772, whenever he visited London he lived in close proximity to Smith and Falk in their mutual neighborhood of Wellclose Square. In his diaries, Swedenborg referred to “Falker” (a surname also used by Falk), and his many descriptions of a Jewish magician in London bear striking similarities to those in the diary of Hirsch Kalisch, Falk's factotum. From their overlapping network of Masonic admirers (Rainsford, Thomé, → Cagliostro, etc.), a shadowy tradition of Falk-Swedenborg collaboration developed.

Though Falk remained a devout Jew, his ambivalent religious behavior provoked puzzlement among Jews and Christians alike. Their questions were intensified by the scandals erupting around other crypto-Sabbatians, such as Jonathan Eibeschütz, Jacob Frank, and Moses David, who were accused by orthodox rabbis of Sabbatian deception and debauchery. Frank, who publicly converted to Catholicism, was linked with Falk by some illuminist Masons. David, who participated in Falk's

“brotherhood” in London in 1759, was associated with a secret Sabbatian sect on the Continent that attempted to combine Judaism with Christianity.

From 1764 on, Falk received financial support from the Goldsmid brothers, who moved from Amsterdam to London, became Freemasons, and gained great influence in the Jewish and Christian communities. Now visited by diplomats and aristocrats from Europe, he attracted politically-minded Masons who hoped to gain his magical assistance for their causes. Prince Adam Czartorisky, leader of the Polish nationalists against Russian oppression, visited Boas and then Falk, and received their blessing and funding. The Duke of Chartres, Grand Master of the Grand Lodge of France, sought his support in London, and Falk consecrated a talismanic ring that would ensure Chartres's succession to the French throne. The Marquise de la Croix, protector of Jews in Avignon, and the Marquis de Thomé, founder of a Swedenborgian lodge in Paris, received Kabbalistic instruction from him.

But his most famous disciple was Joseph Balsamo, alias “Count Cagliostro,” who in 1776 helped Falk develop the Egyptian Rite, which Cagliostro carried to lodges in Holland, France, Germany, Poland, and Russia, where – according to Catherine the Great – the Masons were infatuated with Swedenborg's teachings and thus welcomed Cagliostro, who possessed the secrets of Dr. Falk. In 1780 in Strasbourg, Cagliostro praised Swedenborg as a great man but stressed that the greatest Mason was the celebrated Falk of London. In 1782 at Wilhelmsbad, delegates to an international Masonic convention investigated Falk's kabbalistic influence on various *Illuminés* (questions which arose again at the *Philalèthes* conferences in Paris in 1783-1787).

During Falk's final year, Rainsford hoped to work with him on the development of a Judeo-Christian rite (the → “Asiatic Brethren”), dedicated to a transcendent form of kabbalism which did not require conversion from either religion. In October 1782 Rainsford sadly recorded, ‘As to the Kabbalah, all is upset by the unexpected death of Dr. Falk’. However, the secretive order survived, and F.J. Molitor, a later Christian initiate, recorded in 1829 that the ‘Asiatics’ drew on the teachings of Sabbatai Zevi, Jacob Frank, and Dr. Falk, ‘the *Baal Shem* of London’.

MARSHA KEITH SCHUCHARD

Faucheux, Albert → Barlet,
François-Charles

Fedeli d'Amore

We owe the expression “Fedeli d'Amore” (faithful of love, Love's lieges) to → Dante Alighieri. In his *Vita Nuova*, the work in which he crystallizes his experience of human love, he records how after a dream-vision of his lady he decided to write a sonnet in which, he says, ‘I would greet all the Faithful of Love’ (*Vita Nuova*, III, 9), asking them

to judge his vision. He may have meant by this expression a group of poets gifted with a higher intellectual faculty, because in the same work he writes that some of his words whose meaning is uncertain should not be further explained; 'no one can resolve this uncertainty who is not as much a devotee of Love as I am; but those who are, will easily find the solution of these uncertain words' (*Ibid.*, XIV, 14). According to the commentary of the *Ottimo*, Dante the love-poet makes words mean something other than their usual meanings. Francesco da Barberino shares this claim to a hidden meaning: he reserves his *Documenti d'Amore* for initiated or enlightened readers, and at the end he presents a warrior with sword drawn to defend them, and to threaten any attempt at reading by the ignorant. The work is, in fact, obscure, and Francesco uses every artifice of double meaning in order to say in secret what he cannot evoke openly. Several of these poets give lyrical expression to the deep anguish felt at not being able to speak the truth out loud: '... I am not blind, yet I must act as though I were . . .', says Cecco d'Ascoli in his *Acerba*; '... I die, gazing at a beautiful face covered by a veil' (*L'Acerba*, 156). Dante, Francesco da Barberino, Guido Cavalcanti and Guido Guinizelli all celebrate in an enigmatic way the love of a woman they call *sapientissima* (wisest). The lyric poetry of the group well known under the sobriquet *Dolce Stil Nuovo* (sweet new style) is full of words like *dottrina* (doctrine), *intendimento* (understanding), *sapienza* (wisdom) and *intelligenza* (intelligence), the latter being the actual name of the woman whom Dino Compagni hymns in his eponymous poem.

Are the Faithful of Love simply the same as the poets of the *Dolce Stil Nuovo*, and is there a hidden meaning beneath the literal sense of their poetry? Is it a philosophical, theological, or political meaning? If we use the traditional scholastic division between matter and form, Love would be the outer form of the poetry, while the poem's soul would be an essential thought different from Love. In that case the loved ones whom the poet celebrates – *Madonna*, *Beatrice*, *Giovanna*, etc. – are masks for a significance which is not immediately grasped, but reserved for those gifted with a certain mental acuity. The starting-point of all poems in "stilnuovist" style is the love of a woman whose femininity is only the clothing for a profoundly abstract idea. The theme of the angel-woman (*donna angelicata*) allows the poet to objectify perfectly the Aristotelian and, later, the scholastic theory of potency and act. Applying the principle of analogy, the woman arouses in the man a love of the same

nature as that through which God, the unmoved mover, is the source of movement. Every noble heart is virtually capable of realizing its perfection as a knowing being, with which divine wisdom has endowed it. Unlike the angels, who have immediate perception of the first principles, man starts from sense-data and rises, through a process of abstraction from the *signum formale* (formal sign) living in the subject as *intentio* (intention) or potency, to the very idea of divine beauty. The woman, as a vestige of the first creative Intelligence and mirror of divine Wisdom, awakens the capacity latent in every man of lifting himself, thanks to the principle of analogy, to the contemplation of the transcendent, which he perceives only through the Lady's beauty. To encounter beauty is to sense a beckoning presence. The loved one is a gift of God, *de sursum descendens* (descending from above), a creature whose reality manifests the divine Wisdom to human sight and intellect, and the loving of whom is an initiation into the mysteries of the Uncreated. The soul of Guido Guinizelli, arriving in the presence of his Creator, argues in its own defence that 'she had the appearance of an angel' (*Al cor gentile repara sempre Amore* [Love always cures the gentle heart], in *Poeti del Duecento* [Poets of the 13th century], 460). The love of this creature is an *amor sapientiae* (love of wisdom).

The most famous poem of Guido Cavalcanti, *Donna me prega* (*Ibid.*, 522), concentrates on this same theme of the passage from potency to act through the intercession of the phenomenon of love. At the request of a lady who is interrogating him on what "Love" is, he expounds a perfectly orthodox theory: love resides in that union of the possible and active intellects, the passage from potentiality to the effective actuality of knowledge. The scholastics even used for it the term "copulation". In Cavalcanti's verse the love of a lady is none other than the love of *Sapientia* (Wisdom). It consists in a sort of stirring of the possible intellect (just as the beloved attracts the lover to her) towards its supreme beatitude, which is the actualization of all its potentialities of knowledge. The "tension" towards the woman is a metaphor for the aspiration towards the supreme intelligence of things that the being carries within itself. Cecco d'Ascoli says the same when, in his *Acerba*, he sings of that woman who gives form to the intellect, who existed before the beginning of all things, who grants light and salvation. A ray of the divine Wisdom, she is assimilated to the phoenix, symbol of the one and only wisdom that is reborn throughout the ages.

The endless quest for God is often described in

images borrowed from → alchemy. The love of Madonna allows Francesco da Barberino, throughout his *Reggimento e Costumi di Donna* (Ladies' behavior and customs), to tread a path through various initiatic stages whose meaning may be expressed as going from "faithful" to "intelligent", from loyal belief to intellectual penetration. The quest for the Lady is crowned by the award of the philosopher's stone, whose 'reading by concentric circles' (as Francesco puts it) permits him to realize the communion of the knowing nature with the realities intelligible by the human being. Intellect, who awaits the poet at the portal of Madonna's palace, is the possible intellect, held in tension by this aptitude for knowledge that the reading of the stone (pointing to the East) will illuminate, thus permitting the passage from the virtuality of knowledge to its actuality, which constitutes the supreme beatitude. To attain beatifying Wisdom: is that not to possess the rose which is brandished by the strange figure with both male and female heads, illustrated in Francesco da Barberino's *Tractatus amoris et operum eius* (Treatise on love and its works)? Its bodily union would then symbolize the perfect fusion between the possible intellect (male) and the active Intelligence (female). The millennial dream of the transformation of base matter into gold is realized on the spiritual plane.

All these poets of the *Dolce Stil Nuovo* share the celebration of the love of a beautiful, pure, luminous lady, the quest for whom is basically the tireless pursuit of Wisdom. This belongs within a venerable tradition, of which the Italian poets seem to reflect two versions: the more "philosophical" and Aristotelian version, interpreted especially by Cavalcanti and by Dino Compagni in his poem *L'Intelligenza*; and the more "mystical" version, Platonic in essence, as expressed in the Song of Solomon and in Catholic thought. Saint → Augustine and Richard of Saint Victor, for example, incarnate the divine Wisdom in Rachel beloved by Jacob; and the poetry of Guinizelli, Dante, and Francesco da Barberino certainly resonates with these mystical accents. Original sin, for them, has thrown a dark veil over the human intellect and prevented it from *scire recte* (knowing rightly). The Redemption alone was able to draw man out of his profound darkness, out of this *ignorantia* (ignorance), and make a part of the eternal verities again accessible to human intelligence. Thus one can see why the quest and love of the Lady allow the lover to be reborn into the true life, the life of a regenerated nature, reconciled with God towards whom it aspires as its ultimate perfection. The "Liegés of Love", pilgrims on the path of transcendence that

leads to the Truth, did not only have a spiritual and theological message to convey, but sought to bear witness through their personal quest to man's necessity of leaving the path through which he has gone astray.

The esotericism of these devotees of Love consists in the multiplicity of meanings which Dante himself evokes at the entrance to the city of Dys, carefully distinguishing the apparent meaning of his verse from its hidden meaning. Beneath the quest for Wisdom, incarnated by a woman and depicted in the Fedeli's cryptic language, these poets concealed their profound aspiration to reach God through personal and individual paths: the way of mystical ecstasy, the contemplative way, free from earthly constraints. In contrast to the Church's worldly and deviant immanence, they sought a transcendence that climaxes in meeting God face to face.

During the 19th century and the beginning of the 20th, well before Dante's Catholic rehabilitation in the encyclical *In praeclara* (1921), several Italian writers followed in the footsteps of some Renaissance scholars (Corbinelli, → Postel) by supporting the thesis that Dante's entire work holds a hidden meaning. Often motivated by ideologies hostile to the Roman Church, their various theses maintain that Dante was masking an urgent call for reform, especially Ghibelline or heterodox (e.g. Foscolo, Rossetti, Caetani) or else mystical or sapiential (e.g. Perez, Pascoli). These mysterious meanings were supposedly both dissimulated and conveyed by the secret language ("jargon") common to Dante and the stilnuovist poets. This systematic argument has been fiercely discussed and contested up to the present day by a number of historians of medieval Italian literature. It has also found defenders in France (Delécluze, Aroux, Péladan, Vulliaud), while Valli, Ricolfi and Alessandrini have taken it further from a historical and stylistic perspective. It is obviously a small step from there to representing Dante's "secret doctrine" as essentially esoteric, and the Fedeli d'Amore as an initiatic circle, inspired by chivalry and especially by the Knights Templar. The step was duly taken in 1925 by → René Guénon, who was followed in turn, and to various degrees, by authors both within and outside the Traditionalist current, e.g. (respectively) J. Canteins or R.L. John. In an entirely different spirit, this time academic, → Henry Corbin (1903-1978) pointed out some remarkable parallels between the "Fedeli d'Amore" of East and West, based on the love poetry of certain Persian Sufis (e.g. Ruzbehan, 1128-1209), whose esotericism likewise presents human love as a "support" for

divine love, and as naturally destined to be transfigured ultimately into the latter.

1. LIFE AND WORKS

Ficino, the eminent Florentine Platonist and one of the most learned and influential thinkers of his age, lived a somewhat uneventful life as a brilliant, networking scholar, patronized by the Medici, ordained in 1473, and elected a canon of Florence's cathedral in 1487 (his notable bust still adorns the south side of the nave). Originally destined for a medical career by his father, a doctor in the service

of the Medici, and trained as an Aristotelian, he acquired, in addition to much medical learning, a rare mastery both of the difficult Greek of Plato, Plotinus, and Proclus, and of the ancient and medieval history of Platonic philosophy. Under the patronage of Cosimo de' Medici who gave him a villa at Careggi in 1463, Ficino set out to render all of Plato's dialogues into Latin, but interrupted this task almost immediately in order to translate the *Corpus Hermeticum*, under the title *Liber de potestate et sapientia Dei* but generally referred to as the *Pimander*, after the title of the first of the fourteen treatises known to him (Tommaso Benci subsequently produced a vernacular version). In 1464 he actually read his versions of Plato's *Parmenides* and *Philebus* to Cosimo on his deathbed. Eventually, with financing from Filippo Valori and other admirers, and having selectively consulted the renderings of various dialogues by such humanist predecessors as Leonardo Bruni, he published the complete Plato in 1484 (on a date coinciding with a conjunction of Jupiter and Saturn) and dedicated it to Lorenzo de' Medici. Ficino included prefaces (*argumenta*) for each dialogue, as well as a long commentary he had written by 1469 on the *Symposium* and entitled *De amore* (a vernacular version of which he also prepared). This became the seminal text of Renaissance love theory. Later he composed other magisterial Plato commentaries, some incomplete, on the *Timaeus*, *Philebus* (also the subject of a public lecture series), *Parmenides*, *Phaedrus*, *Sophist*, and on the Nuptial Number in book VIII of the *Republic*.

While continually revising his Plato during the 1470s, Ficino published the Latin text of his *De Christiana religione* in 1476 (which, as we now realize, was indebted to earlier anti-Jewish and anti-Moslem polemicists), as well as compiling his original philosophical masterpiece, an eighteen-book *summa* on metaphysics and the immortality of the soul, which he published in 1482. Indebted to → Augustine and Aquinas, it was nonetheless the fruit of his conviction that "Platonism" – actually → Neoplatonism, since he regarded Plotinus as Plato's most profound interpreter – was reconcilable with Christianity. He called it his *Theologia Platonica*, borrowing the title of Proclus's *magnum opus* to which he was considerably though secretly indebted; and then subtitled it, echoing both a Plotinian treatise and an early Platonizing treatise of Augustine, *De immortalitate animorum*.

In the 1480s Ficino turned again to Plotinus, with whom he had been familiar since the 1460s, and rendered the entire *Enneads* into Latin. For these he also wrote extensive notes and commen-

aries, publishing the whole in 1492 with a dedication to Lorenzo. Meanwhile he also worked on a three-book treatise on prolonging health, the *De vita*, having begun it apparently as part of his Plotinus commentary. It was full of encyclopedic pharmacological and other learning, and daringly combined philosophical, astrological, magical and psychiatric speculations. When it appeared in 1489, Ficino was threatened with a Curial investigation into its orthodoxy; but he fended this off successfully, if disingenuously, by asserting that he was presenting ancient views rather than his own. In the last years of his life he published translations of other Neoplatonic authors, including Iamblichus, Porphyry, Proclus, Synesius and the 11th c. Byzantine Psellus; he translated and commented on the works of → Pseudo-Dionysius Areopagita and embarked on a commentary on St. Paul's epistle to the Romans. Finally, he first supported but then vehemently attacked Savonarola.

Unlike most scholars, Ficino was able to exert a formative influence on his own age and on two subsequent centuries. Several reasons contributed to this. First, there was the intellectual fascination and novelty, bordering on unorthodoxy (even heresy, as we shall see), of his revival of Neoplatonism and the unfamiliar nature of what he had to say about the complementary roles of religion and philosophy in nurturing the spiritual and noetic life. His ecumenism, his delight in the notion that divine worship is natural and inherently varied, and his diverse interests, would align him with the very liberal wing of Christian theologians even today. Second, a revered teacher of the *signori* and their sons, he cultivated and sustained a learned and pastoral correspondence with well over a hundred pupils, friends, patrons, and admirers, many of them, including Lorenzo and various cardinals, in the highest offices of church and state, in Italy and abroad (this circle is often, if rather misleadingly, referred to as his Platonic Academy). His twelve books of letters in Latin (and there are others besides) range from elegant thank-you notes and witty compliments to philosophical treatises, and were later rendered into Italian. Finally, he was one of the first early modern intellectuals to enjoy the accelerated Europe-wide exposure made possible by the invention of the printing press. His works are now among the most splendid and valuable of the incunabula; and the *De amore* and *De vita*, along with the *Pimander* and Plato translations, became bestsellers.

Although Ficino had a humanist training and freely quoted the Roman poets, and although at one level he was a pious philosopher-apologist-

priest with a missionary goal, he was also the first of the Renaissance mages dedicated to the notion of a World Spirit and a World Soul. Apart from metaphysics, ethics and psychology, his interests embraced mythology (for him, poetic theology), → astrology, → magic, magical and figural numbers [→ Number Symbolism], demonology and the occult [→ occult / occultism], → music (especially harmonics) and musical therapy – interests which he found in Plato himself and therefore saw as authentic aspects of the Platonic tradition. While the depth of his technical understanding of later Platonism has rarely been equalled (his works of translation and interpretation bear witness to an enlightened and dedicated scholarship), his original philosophical, theological, and magical speculations constitute one of the enduring monuments of Renaissance thought and were enormously and diversely influential. The first edition of his own *Opera omnia* appeared in Basel in 1561, the second (and better) edition in 1576, and the third (a reprint, strangely, of the first) in Paris in 1641; and his *Platonis opera omnia* was printed a number of times too, as were other works or groups of works. Furthermore, dubious, spurious and lost works testify to his authority as an *érudit* and magus, as do many unpublished manuscripts.

2. PRISCA THEOLOGIA

The path to gnosis, though perfected by Plato, had a distant origin, and Ficino was one of the first Renaissance authors to champion the notion of a secret, esoteric, and (as Agostino Steuco would later call it) perennial wisdom that preceded and prepared the way for Christianity as the climactic Platonic revelation. As such it paralleled the Mosaic wisdom transmitted to the Hebrews by the Pentateuch, by the secrets of the Mosaic oral tradition later inscribed in the books of the kabbalah [→ Jewish Influences], and by the revelations of Moses' successors, the psalmists and the prophets. For symbolic and numerological reasons Ficino propounded the idea that Plato was the sixth in a succession of gentile sages, six being the sum of its integers and the product of its factors and thus, according to the arithmological tradition, the perfect number. It was also the number of Jupiter, of the days of biblical creation, of the links in Homer's golden chain from which hangs the pendant world (which the Neoplatonists interpreted allegorically), and of the six primary ontological categories in the *Sophist* (essence, being, identity, alterity, rest and motion). Indeed the hexad was such an authoritative category for charting the gentle succession of sages that Ficino had to adjust its

members, since he had many more sages than slots available for them; but eventually he decided on → Zoroaster, → Hermes Trismegistus, Orpheus, Aglaophemus, Pythagoras, and Plato. This is remarkable on several counts. It omits such important figures as Socrates, Timaeus, Parmenides, and Empedocles whose dicta Ficino often quoted as Platonic. It also omits the sibyls whose authority he accepted and in whose company he included Diotima, Socrates' teacher in the metaphysics of love. And it insists in the Neoplatonic manner on Plato's Pythagorean wisdom, a wisdom embodied in the *aurea dicta* and *symbola* which Ficino found in Iamblichus's life of Pythagoras, translated into Latin, and published at the conclusion of his *Opera Omnia*.

Ficino knew Orpheus from the many fragments quoted in Plato's works and in the works of his commentators, and from the eighty-seven *Orphic Hymns* now thought to be products of later antiquity but that he and his contemporaries believed authentic. From early on, when he first translated them, he treated these *Hymns* as sacred but dangerous texts. Certainly they testified to Orpheus being the gentiles' David, and his songs, their psalms, and they listed the attributes of the deities they addressed in an aretology, a listing of virtues, hiding under a polytheistic rind a monotheistic core (a much revered prefatory palinode explained away the polytheism). But they also appeared to invoke demonic powers; and Ficino was careful to circulate only a few fragments in his Latin translation to some choice friends. Orpheus himself, though Plato's *Symposium* 179D condemns him as faint-hearted for his refusal to die for Eurydice (etymologized as "breadth of [the] judgment"), had been the master of incantation, the paradigmatic magus who bent the natural world to his will and whose music derived from the fundamental harmonies of the cosmos. Ficino was himself flatteringly addressed by various poet-friends as another Orpheus, and the figure of Orpheus was painted on an "Orphic" lyre he played in his Platonic hymn recitals – apparently to great effect, since onlookers describe him as both entranced and entrancing. At the onset of his career as a Medicean teacher and sage he seems indeed to have presided over a neo-Orphic revival. Orphic incantation became the key to his conception of Platonic or Platonizing poetry and, in general, of musical images and models, and the affective bearer, the perfect medium of philosophy.

Nonetheless Orpheus was subordinate to the two most ancient of the sages: first to Hermes Trismegistus, whose *Pimander* Ficino continually cited and whose *Asclepius* he knew from the Latin trans-

lation attributed to Apuleius, as well as from hostile notices in Augustine and more sympathetic ones in Lactantius. The two commentaries on these works, incidentally, which were eventually printed in Ficino's *Opera* interleaved with his own translation of the one and Apuleius' translation of the other, and which have long been attributed to him, were actually by his French disciple → Lefèvre d'Étaples (Faber Stapulensis). However, while Hermes' authority remained intact, Ficino retained a guarded approach to Egypt's religious tradition. This may have been partly because Egypt appears in the Bible as the land of exile even though → Moses could have taught or been taught by the Egyptian priests (and here determining whether Hermes was coeval with Moses or succeeded him was critical, though Ficino never entertained a later view that Hermes preceded Moses!). But Egypt was also known for its zoomorphic deities and pagan rites, and Hermes had devised a sacred, hieroglyphic alphabet utilizing animals, birds, and plants to convey his wisdom. The strange little myth of Theuth and Ammon in Plato's *Phaedrus* 274Bff may have played a decisive role here; for it portrays Ammon (Jupiter) rebuking Theuth (identified with Hermes) for inventing writing and thereby opening up the possibility of debasing or profaning teachings that should only be transmitted orally, in the fullness of time, by a master who had properly prepared his disciples for their reception and comprehension. An apotropaic story also attributed to Pythagoras, it created a dilemma for a committed interpreter such as Ficino, who was faced with voluminous texts of, and commentaries on, a wisdom that from the outset he felt impelled to explore and explain and yet considered sacred and thus needing protection from the eyes of the vulgar. It set private, esoteric teaching steadfastly against public exposition, and so went to the very heart of his commitment to educating and converting the elite of Florence.

Prior even to Hermes, however, was Zoroaster. Ficino must have derived this notion primarily from the controversial Byzantine, → George Gemistos Plethon, a Proclan revivalist who had made a great impression on the Florentines during the ecumenical council of Ferrara/Florence in 1438-1443 (the abortive attempt to reconcile the Roman and Greek churches). But he was also following the odd sympathetic references to Zoroaster in Plato's works, notably in the I *Alcibiades* 121E_{ff}, and in the works of such Platonizing thinkers as Plutarch; and responding too to the authority of the *Chaldaean Oracles*, attributed to Zoroaster, a late antique compilation which he and

others deemed authentic and whose derivative and eclectic Middle Platonism was therefore assumed to be the originary Platonism. For Ficino, however, Zoroaster's primacy was preeminently something that highlighted the centrality of the Epiphany and the Magi. The three wise Chaldaeans who had come from the East, following a star, were the followers of Zoroaster (whose very name in Greek has the word "star" in it, and who was supposedly the founder both of astronomy/astrology and of the magic associated with it). Thus they symbolized the coming of the ancient wisdom to the cradle of a new philosopher-king-magus: the new Zoroaster. Moreover, having set out from the very land from which Abram had departed, they symbolized the reunion of the two ancient branches of wisdom, the Hebrew and the Zoroastrian stemming from Noah's sons (since the Ark had come to rest allegedly in a province of Persia – and Persia, Chaldaea and Babylon were often confused). Insofar as Zoroaster was also, in Ficino's view, the discoverer of writing, since he used the stars and constellations, and not animals, birds, and plants, as the "letters" of his sacred alphabet, he was, in a way, the sage who had transcribed the wisdom of the stars, had brought the stars into men's language and had taught men to write with the stars. Hence the Magi were primarily astronomers and practitioners of a star-based magic, whose knowledge of the heavens had enabled them to find the Christ child and to worship him as the Zoroastrian, the supreme Platonic guardian in Bethlehem. Thus to Plato's Pythagorean, Orphic, and Hermetic predecessors, we should add Zoroaster as the original *priscus theologus*, the founder of the ancient gentile wisdom that Ficino himself was dedicated to reconciling with the theology of Abraham as perfected in Christ.

3. THEOLOGIA PLATONICA

The history of gnosis after Plato was also subject to revision by Ficino, since he believed that the Proclus-inspired writings nowadays attributed to the Pseudo-Dionysius of the late 5th century had been composed by the Dionysius mentioned in Acts 17:34 as an Athenian converted by St. Paul's preaching on the Areopagus, in other words by a thinker of the 1st century. Since one of the Dionysian treatises is a masterpiece of a negative theology inspired by the second part of Plato's *Parmenides* as interpreted by Plutarch of Athens, Proclus's teacher, this had the effect of transferring the fully fledged late Neoplatonism of Proclus back to the time immediately following the Ascension. Suddenly the opening of St. John's Gospel, the epis-

cles of St. Paul, and the Pseudo-Areopagitean treatises coalesced to form an impressive body of Christian-Platonic writing, a body that indeed signifies the perfection of the Platonic wisdom in the Christian revelation. Given the centrality of the *via negativa*, moreover, it had the effect of foregrounding Platonic dialectics as a mystical rather than a logical instrument, and thus of transforming the old Socratic scepticism or agnosticism into a kind of super- or supra-gnosis.

This pivotal misdating in turn impacted Ficino's perspective on the centuries we would now assign to the Middle Platonists, and led him to embrace the notion that the Ammonius Saccas who was Plotinus' teacher had been a Christian Platonist, and that the Origen whom Porphyry mentions as Plotinus' fellow disciple was the Christian heresiarch, author of the *De principiis* and *Contra Celsum*. Consequently, Plotinus emerges as a Christianized Platonist if not as a Christian. This was all-defining given the centrality of the *Enneads* in Ficino's own understanding of Plato, and his belief that Plotinus was Plato's beloved intellectual son 'in whom' – thus Ficino imagines Plato using the very words used by God according to the Gospels – 'I am well pleased'. After all, Ficino's supreme scholarly achievement was to render the fifty-four Plotinian treatises into Latin, and to devote his interpretational life to arguing that Plotinian and Christian metaphysics were almost one and the same, that Plotinus had written a *summa platonica* just as Aquinas would later write a *summa theologica*. Moreover, succumbing to a common temptation, Ficino read most of Proclus' subtle distinctions back into Plotinus, and thence into Plato, the *Hermetica*, the *Orphic Hymns*, and the *Oracula Chaldaica*, thus creating an ancient Platonic, but in effect Proclan, theology that had begun with Zoroaster but been perfected in the works of Plato, Dionysius, and Plotinus. Finally, since so much of Proclus had become incorporated into medieval theology by way of the Pseudo-Areopagitean writings – and, indeed, had become embedded in the Augustinian mystical traditions of the Middle Ages – Ficino was able to argue with conviction that the time was ripe for a Platonic revival that would unite wisdom and faith, philosophy and revelation, as they had once been united in the golden age, the pre-Noachian time of Enoch himself who had walked with God. Interestingly, this whole fabric is built on some fundamental mistakes in attribution and dating; but they were mistakes that the vast majority of Ficino's learned contemporaries shared. Thus Ficino was able to present a Neoplatonic view of the history of

philosophy, and to propel that history back into the remotest past.

4. ESOTERIC MEDICINE AND THE SPIRIT

Ficino was also familiar with a number of ancient texts that he regarded as an integral part of the Platonic tradition but that were not strictly speaking philosophical (although they often included philosophical speculations and adduced philosophical premises). These included medical, pharmacological, and medical-astrological texts, some of them of Arabic provenance, that formed part of his intellectual training as a doctor – a role he never abandoned, since he regarded himself, in the Socratic sense, as a doctor of souls, a *medicus* even to the Medici. His *De vita libri tres* of 1489 is a treatise in three books on regimen, diet, abstinence, salves, beneficent powders and sprays, aromas, psychosomatic exercises, meditation and mood-elevation techniques, and astrological and demonological attuning. The third book in particular, entitled *De vita coelitus comparanda* (“On bringing one’s life into harmony with the heavens”), is a rich and complex exploration of scholarly melancholy, holistic medicine and psychiatry. It makes continual reference to zodiacal and planetary influences, to stellar oppositions and conjunctions, to astrological election, to the theory of universal sympathies, and to synastry, the assumption that particular people are born under the same planet under the same astral configurations and are therefore star twins. Additionally, following → Albertus Magnus and Thomas Aquinas, Ficino treats of the therapeutic powers of talismans and → amulets when properly made and inscribed. Here he is drawing both upon Scholastic notions of acquired form and the hylomorphic structuring of corporeal and (contra Aquinas) incorporeal entities, and upon the Galenic and subsequently medieval notions of the vital, vegetable, and animal spirits that can be refined, like sugar, into the pure spirit. The spirit’s health is the goal of all the various interlocking therapies, since the body will be well, that is, perfectly tempered, if the *spiritus* is well.

Ficino sees this spirit both as an image of the soul (like the meteor’s tail) and as an envelope, vehicle, or aethereal body linking soul to body, the intellectual to the corporeal: it functions as the soul’s chariot, first as the body in which we endure the cleansing purgatorial fires, and then as the glorified body of the resurrection and of paradise. Ficino believed that Zoroaster had been referring to this spirit or pneuma in such Chaldaean oracles as no.

104, which exhorts us not to add depth (that is, three-dimensional corporeality) to what is plane (that is, to the planar two-dimensional spirit); and no. 158, which asserts that even the pneuma (*idolum*) will be with us ‘in the region of utmost clarity’.

Governing the amulets, talismans, salves and drugs, and the aethereal spirit alike are the astrological powers and influences, ever-changing in their dance; and governing these in turn are the musical consonancies and harmonies that rule the universe. Plato had described these in the *Timaeus*, in the famous passage on the two quaternaries of 1-2-4-8 and 1-3-9-27 (traditionally seen as a Greek *lambda*) used by his demiurge to create the mathematical-musical structure of the World-Soul. This Soul itself, in Ficino’s speculative view, animated a World-Spirit that mediated between it and the World-Body; and to this Spirit our own spirit was originally attuned, and even united. An integral part of the healer’s training therefore consisted in learning to understand a complex pneumatology with reference both to the cosmos (the great man, according to the famous Macrobian phrase), and to the human being, the little world. Indeed, rather than being a soul chained to or entombed in a body, according to the hallowed Platonic and Christian images, man is to be identified here with his spirit in this non-Pauline, quasi-medical sense: a spirit imaged as a talismanic inscription, an airy powder, an attar of roses, a musical chord, a diffused light, a planetary ray even, and subject to the influences of salves, songs, spells, incantations, and prayers. Ficino often responds to this world of “spiritual” therapies in fact not as a realm of insidious evil or of base matter but as a bountiful pharmacopoeia of lenitives and cures, a musical, a magical *concordia discors*.

It is this visionary dimension of Ficino’s Aesculapian thought, with its many striking parallels to current → new age therapies on the one hand (to whose practitioners, however, his work is largely unknown), and on the other to features of Jungian depth psychology (see the work of James Hillman, Thomas Moore and others) that makes him, arguably more than → Paracelsus or Cardano, the most important speculative medical theorist of the Renaissance. Indeed, his arresting envisioning of the mind-body linkage and of our own demonic condition, and his holistic approach to health and to the importance of our inner sense of well-being and of well-being’s power over the external world, make his general orientation, if not many of his specific ideas, enduringly attractive, and some would argue relevant.

5. DEMONOLOGY AND THE OCCULT

Other ancient or medieval texts Ficino studied carefully treat of aspects of arithmosophy and arithmology (Theon of Smyrna), oneirology (Synesius), angelology and demonology (Porphyry, Proclus and Psellus), and the occult (Iamblichus). Iamblichus in particular was an authority Ficino encountered at the onset of his Platonic studies; and among his first attempts at translating philosophical Greek were the four Iamblican treatises that constitute a kind of Pythagorean handbook, dealing with Pythagoras' life and with various mathematical and numerological issues. The *De Mysteriis* probably served as his basic introduction to occult lore and to the notion of theurgy, of converting oneself and others – even wood, clay and stone statues – into gods.

While he identified the highest order or chorus of demons in ancient theology with the angels of Christianity, he also inherited a hierarchy of lower orders of demons who were principally beneficent spirits caring for the earth. Said by Hesiod to be thirty thousand in number, or divided into as many legions as there are stars in the night sky, with as many individual demons again in each legion, they were ruled by twelve princes in the twelve zodiacal signs. By virtue of their intermediate nature between the gods and men, they dwelt in the intermediate zone of the air, particularly of the upper or fiery region of air often identified with the aether; and their mandate embraced the airy realm of sleep and the production of omens, oracles and portentous dreams. Essentially airy beings, though they could be found throughout elemental creation, the demons were called by the ancients the *rectores* (helmsmen) and *exploratores* (spies or examiners) of men. They were apportioned and linked to the seven Ptolemaic planets, and assigned the guardianship and ministration of lunar, venerean, mercurial, solar, martian, jovian and saturnian entities (collective or individual) such as kingdoms, institutions, homes, places, people, animals, plants, and stones. The Jews, for instance, along with melancholics, were supposedly saturnian; all scribes, keen-scented dogs, and the city of Her-mopolis, mercurial; Socrates, lions, and cockerels, solar; and so on. Their airy nature meant they were particularly sensitive to aromas, mists, fumes, and smokes. Thus the fumigation instructions accompanying many of the *Orphic Hymns*, quite apart from other invocatory dimensions, would make the chanting of such hymns attractive to the class of demons attending the deity who was the subject of the hymn, since they could materialize, if only momentarily, in the wafts of burning aromatics

ascending from the thuribels, hearths, altars, or lamps used for igniting fumigants. A solar demon for instance would be drawn to the eighth *Hymn to Helios*, which was sung to the smoke of incense and manna, a jovian demon to the nineteenth *Hymn to Zeus the Thunderer* sung to the smoke of styrax (while some of the hymns have identical fumigant instructions, the majority prescribe “aromatics” generally, and some lack any instructions at all).
